Response GO17-177 Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project’s Draft EIR and does not appear to have been prepared for that purpose. As discussed in the Topical Response, the authors of the UCLA Study at the Mobility Lab have issued a statement that the UCLA Study is considered preliminary. Moreover, Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR.⁵⁶ Stantec is an internationally respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR.

Comment GO17-178 Other fundings of the UCLA Mobility Lab Study are as follows:

a) Contrary to the Draft EIR, the gondola system would not significantly reduce traffic or greenhouse gas emissions around Dodger Stadium.

⁵⁵ Fehr & Peers. 2023. Los Angeles Aerial Rapid Transit Project, Parking Management Implementation Plan.

⁵⁶ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

Response GO17-178 Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study, and Response GO17-177 for discussion of Stantec’s Peer Review.

Comment GO17-179 b) The gondola system would carry fewer passengers than the Draft EIR claims. About 4,690 passengers would take public transportation on game days. Of these, the model predicted 2,500 would use the Dodger Stadium Express buses, meaning that only 2,190 new passengers would take the gondola system. Doubling the number of buses would more than accommodate passengers that could be expected to ride the gondola.

Response GO17-179 Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study, and Response GO17-177 for discussion of Stantec’s Peer Review.

Comment GO17-180 c) Fewer people would take the gondola after the game resulting in more traffic and emissions. The model disclosed about 2,500 passengers switching from the free Dodger Stadium Express buses to the gondola to the stadium, and about 1,000 fans switched back to the shuttle buses after the game. Only about 1,380 fans were forecast to use the gondola after the game as they would have to wait in long lines to use the gondola.

Response GO17-180 Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study, and Response GO17-177 for discussion of Stantec’s Peer Review.

Comment GO17-181 d) Very few people were predicted to use the gondola for transportation other than getting to or from the games. Only 60 people, about one gondola carload, were forecast to travel to Dodger Stadium during the day, and only about 140 passengers would travel from Dodger Stadium to Chinatown or Union Station during the day.

Response GO17-181 Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study, and Response GO17-177 for discussion of Stantec’s Peer Review.

Comment GO17-182 Shuttle Busses and the Coachella Festival

As City Transportation Engineer for the City of Indio for 15 years, I was deeply involved in getting patrons to and from the Coachella Festival over two weekends in April each year. Shuttle buses from across California and adjoining states were contracted to travel various pre-planned routes throughout the Coachella Valley to and from the festival grounds each of the three days.

The successful transportation program developed by the festival promoter, Goldenvoice, split the attendees into three separate but approximately equal groups. These included those who arrived the day before and camped at the site until the day after the festival ended, those who commuted daily to and from the site using

Uber/Lyft/taxi, and those who rode Festival provided shuttle buses from hotels to and from the venue each day.

About one-third of the 250,000 daily festival attendees used the shuttle buses, with separated priority lanes on City streets for the shuttle buses near the festival site leading to a designated area within the festival site for shuttle bus loading and unloading. This system involved rapid turnover within the Festival shuttle bus lot with buses quickly filling empty bus parking stalls, loading/unloading passengers, and departing.

Response GO17-182 The Coachella Festival shuttle system is different from the Dodger Stadium Express in that the service is spread throughout the day over the multiple days of the festival, not focused on a few hours during urban peak congestion typical of a weekday evening game or event at Dodger Stadium. As a multi-day weekend music festival beginning at noon and ending at approximately midnight to 1:00 AM and with attendees that travel to the Palm Springs area for the festival, the Coachella Festival is fundamentally different than three-hour games at Dodger Stadium with fans coming from their daily places of residence or work. The Coachella Festival access system is designed with limited parking at the festival site and the shuttle system is designed to transport out-of-town attendees from various hotels throughout the Palm Springs area, most of whom do not have alternate transportation to the festival site. Given the amount of parking at Dodger Stadium, a substantial increase in Dodger Stadium event attendees using transit to travel to the Stadium would depend on reduced travel times, which an expanded Dodger Stadium Express service would not provide.

Comment GO17-183 Summary and Conclusion

When it was evaluated over 30 years ago, the gondola finished last in comparison with five other transportation alternatives to serve Dodger Stadium. Such a comparison today ends up with similar results.

Response GO17-183 As discussed in Response GO17-155, the Dodger Stadium Access Study was prepared 33 years ago and evaluated a tramway, which is a different type of aerial technology than the proposed Project, which is a detachable 3S gondola with a capacity of 5,000 people per hour per direction. Comparisons between the two are not relevant. Refer to Section 4.0, Alternatives, of the Draft EIR and Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for an evaluation of alternatives to the proposed Project.

Comment GO17-184 The proposed Gondola is better suited for sightseeing rather than being an effective transportation measure to move large volumes of people in short periods of time. Shuttle buses together with Uber/Lyft/taxi services now serve Dodger Stadium well at a fraction of the cost. An expansion of the shuttle bus operation between Dodger Stadium Express in lieu of the proposed gondola system would efficiently meet the

demand to transport people in a cost-effective manner on game days and on special event days.

Response GO17-184 Regarding the comment that the proposed gondola is not an effective way to move large volumes of people in short periods of time, similar modern 3S systems are in use for urban transit systems in a number of cities around the world including Koblenz, Germany, Phu Quoc, Vietnam, and Toulouse, France (see Table 2-1 on page 2-4 in Section 2.0, Project Description of the Draft EIR). Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the safety features of the proposed Project and how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphpd). Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for a discussion of potential capacity of an expansion of the Dodger Stadium Express shuttle bus system. The commenter does not provide any independent technical analysis to support the allegation in the comment that such an expansion in lieu of the proposed Project would efficiently meet the demand in a cost-effective manner.

Regarding the comment that shuttle buses together with Uber/Lyft/taxi services now serve Dodger Stadium well, as indicated on page 3.17-27, in Section 3.17, Transportation, of the Draft EIR, only 4.7 percent of Dodger Stadium game attendees rode the Dodger Stadium Express in 2019. Furthermore, Dodger Stadium generates traffic congestion and annual VMT and associated emissions.⁵⁷

Comment GO17-185 The omissions and errors summarized and detailed throughout this letter require that each of these issues and items be reanalyzed and reevaluated through additional study before the Proposed Project is considered further by Metro.

If you have questions regarding these comments, please contact me at your convenience.

⁵⁷ As shown in Table 3.17-3 on page 3.17-30, in Section 3.17, Transportation of the Draft EIR, Dodger Stadium is estimated to have generated 53,549,000 VMT in 2019. As shown in Table 3.8-1 on page 3.8-17, in Section 3.08, Greenhouse Gas Emissions in the Draft EIR, Dodger Stadium is estimated to have generated 19,655 metric tons of on-road mobile emissions in 2019. As shown in Table 3.3-5 on page 3.3-23, in Section 3.03, Air Quality of the Draft EIR, Dodger Stadium is estimated to have generated an average of 565 daily pounds of CO, 1.15 daily pounds of SO_x, 40.3 daily pounds of NO_x, 34.8 pounds of VOC, 103.4 pounds of PM₁₀, and 26.2 pounds of PM_{2.5} in 2019.

Response GO17-185 Responses GO17-154 through Response GO17-184 respond to each of the comments raised in Enclosure 5 to Letter GO17. The analyses and conclusions in the Draft EIR regarding the transportation impacts of the proposed Project are appropriate and supportable. Reanalysis and reevaluation is not warranted.

Comment GO17-186 Enclosure 6

Dear Mr. Carstens:

Environmental Audit, Inc. (EAI) has reviewed portions of the October 2022 Draft Environmental Impact Report (Draft EIR) for the Los Angeles Aerial Rapid Transit (LA ART) Project in the City of Los Angeles prepared by AECOM for the Los Angeles County Metropolitan Transportation Authority (Metro).

Sections of the Draft EIR that we have reviewed include:

- Executive Summary
- Chapter 2 – Project Description
- Chapter 3.3 – Air Quality
- Chapter 3.6 – Energy
- Chapter 3.8 – Greenhouse Gas Emissions
- Chapter 3.11 – Land use and Planning
- Chapter 3.17 – Transportation
- Appendix A – Scoping Report
- Appendix B – Construction Assumptions
- Appendix D – Air Quality and Health Risk Assessment Technical Report
- Appendix H – Energy Technical Report
- Appendix J – GHG Technical Report
- Appendix N – Transportation

The following are our comments.

Response GO17-186 This comment provides a general introduction to the comments raised in Comments GO17-187 through GO17-201 (Enclosure 6). Responses to these comments are provided below in Responses GO17-187 through GO17-201.

Comment GO17-187 1. GENERAL COMMENT

The Draft EIR indicates that the tramway will move 5,000 people per hour, with 30-40 people per gondola. If that is correct, a total of approximately 43 gondolas per hour would be needed (35 people x 143 gondolas = 5,005 people). To transport that many gondolas, a gondola would need to arrive, load and leave every 20 to 30 seconds. Each time a gondola arrived at Dodger Stadium, it would also have to empty every 20 to 30 second. This timing does not allow for the additional time required for children, the elderly or handicap people and would be difficult, if not impossible to achieve. These assumptions are overly aggressive and lead to an overestimate of the number

of people that would use the LA ART as an alternative to driving vehicles or using other forms of transportation.

Response GO17-187 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphpd). Based on the current design, the calculated characteristics when operating at system capacity (e.g., during Dodger games or events at Dodger Stadium) would be approximately 53 cabins in service on the system. Under this scenario, the cabins would move at an approximate speed of 13.4 miles per hour with headways of approximately 23 seconds, which represents the time between cabins arriving at a station. As one hour consists of 3,600 seconds, approximately 156.5 cabins would arrive every hour (3,600 seconds / 23 seconds). The proposed Project's 3S cabins typically carry between 30 to 40 passengers each, depending on the exact configuration of seating and cabin amenities selected. At a capacity of 35 passengers per cabin, at 156.5 cabins per hour, 5,478 passengers would arrive at each station per hour (35 passengers per cabin x 156.5 cabins per hour). Given that the same headway applies in each direction, the total, calculated system capacity is therefore 5,478 pphpd. To account for variations in the exact configuration of seating and cabin amenities, as well as operational considerations (including, for example, fewer than 35 people boarding a cabin or cabins being either slowed or stopped in the station for boarding purposes), the proposed Project has included an approximately 10 percent reduction in capacity from 5,478 pphpd to 5,000 pphpd. Furthermore, the station boarding process and cabins would comply with all accessibility requirements of the Americans with Disabilities Act ("ADA"). If needed, cabins could be either slowed or stopped in the station for boarding purposes. The time necessary to slow or stop cabins is factored into the overall system capacity of the proposed Project.

Comment GO17-188 2. AIR QUALITY

- The air quality and GHG emission benefits of the project have been overstated. The mobile emissions take credit for non-Project (Regulatory) related emissions reductions for future years. This misrepresents the actual impacts of the proposed Project. The actual analysis should only receive reductions for changes created by the proposed. For example, the proposed Project claims reduction in vehicle miles travelled, therefore, emission reductions were directly attributed to the proposed Project. This would be a correct application for reductions from the proposed Project. However, the proposed Project also compares 2019 mobile emission factors to 2026/2042 emissions factors. The latter emission factors get the benefit of regulatory/technology changes not related to the proposed Project. This mistakenly credits the proposed Project with emissions reductions that are not created by the proposed Project. Instead, the analysis should have used the same basis (emissions factors) to show the real impacts from the

proposed Project, without influence from external sources (e.g., unrelated regulations).

Response GO17-188 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. CEQA Guidelines section 15125 provides that an EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. As the CEQA Guidelines make clear, an EIR normally compares a project’s impacts against the “baseline” conditions as they exist at the time the CEQA document is prepared. For air quality and GHG emissions, this translates to evaluating the difference between the existing pre-project emissions and the estimated post-project emissions (as estimated by running air quality modeling). This approach of comparing the project’s estimated emissions against the existing “baseline” emissions is consistent with guidance from the South Coast AQMD and represents standard practice for EIRs prepared within the South Coast Air Basin and the state.⁵⁸ The Draft EIR appropriately followed this recognized methodology by establishing the baseline as the actual environmental conditions existing at the time of the CEQA analysis. For this proposed Project, the baseline was set to evaluate the conditions that existed in 2019 based on the available air quality data. The proposed Project buildout year is 2026. To accurately estimate the proposed Project’s emissions when it commences operations in 2026, the Draft EIR utilized the SCAQMD-recommend model (CalEEMod®), which takes into account vehicle emission factors (EMFAC2021) recommended by the expert agencies. Specifically, EMFAC2021, used to estimate vehicular emissions, is USEPA-approved and developed by the California Air Resources Board to capture statewide efforts to reduce mobile source emissions and accurately project those future emissions. The CalEEMod® model was developed by SCAQMD in coordination with other California air districts and is recommended for use by SCAQMD. These models incorporate existing regulations that require vehicle emissions to decline over time as more stringent air quality mandates are imposed, thereby EIRs accurately estimate emissions at the buildout year. The Draft EIR followed this agency-recommended approach by applying the latest versions of CalEEMod® and EMFAC2021 to estimate the air quality and greenhouse gas emissions impact, as was described in the Draft EIR’s methodology sections. See Section 3.03, Air Quality, and Section 3.08,

⁵⁸ See, e.g., South Coast Air Quality Management District (SCAQMD). 2021. Quemetco Capacity Upgrade Project. Available at: https://files.ceqanet.opr.ca.gov/8174-2/attachment/7bvblgECW7xJV9wgG2iJtxOnqiCHDXVYZLEIXRtEw6yx_ZV_m7nE0LafkaH0CyHRtX_pxrlrz99FgzFP0. Accessed August 2023 (analyzed existing conditions as the baseline compared against future estimated project emissions).

Greenhouse Gas Emissions, of the Draft EIR for an analysis of the proposed Project’s air quality and greenhouse gas emissions impacts, respectively.

In addition to aligning with agency-recommended guidance for preparing EIRs, the Draft EIR’s baseline methodology is consistent with other net-zero GHG emissions projects that have been approved by the California Air Resources Board—the state expert agency on climate and air quality matters—and the Governor’s office under the 2011 Jobs and Economic Improvement Through Environmental Leadership Act (commonly referred to as “AB 900”). Specifically, the California Air Resources Board determined that AB 900 projects achieved net-zero GHG emissions by comparing the estimated future project emissions against the existing conditions at the time the CEQA analysis was prepared—the analogous baseline methodology applied by the Draft EIR.⁵⁹

Therefore, the comment’s assertion is not correct that “air quality and GHG emission benefits of the project have been overstated.” Rather, the Draft EIR appropriately evaluated the proposed Project’s air quality and greenhouse gas emissions consistent with agency guidance and precedent by comparing the pre-Project baseline to the modeled post-Project condition, and identified the emission reductions (i.e. “benefits”) based on those calculations. The Draft EIR and supporting appendices included all the relevant calculations and modeling files supporting the analysis and conclusions. Lastly, the comment also incorrectly suggests that “unrelated regulations” are incorporated to the benefit of the proposed Project. The comment itself is not supported by citation or evidence and is not consistent with agency-recommended guidance because any “unrelated regulations” would not impact the proposed Project emissions and therefore should not be taken into account.

Comment GO17-189

- The haul trips to move soil during construction activities were based on 20 miles per trip. If any hazardous soil is encountered during the excavation, the mileage could be grossly inadequate since contaminated soil needs to be hauled to a hazardous waste facility, the closest of which is Clean Harbors in Buttonwillow, California approximately 140 miles from Union Station. Further, it is likely that the project construction team would know the distances to the landfills that will be used for clean soil. The likely landfills for clean soil in the area are the Azusa (21.7 miles from Union Station), Chiquita Canyon (40 miles from Union Station), and Simi Valley Landfills (42 miles from Union Station). The air quality impacts associated with these construction activities must be revised and updated with accurate assumptions.

⁵⁹ See, e.g., Eyestone Environmental. 2016. Crossroads Hollywood Project. Available at: https://planning.lacity.org/eir/CrossroadsHwd/Deir/Deir_EX/AgencyCorrespondence/Files/2016.11.18%200201pm%20-%20FW_%20ARB%20Determination%20AB%20900.pdf. Accessed August 2023 (applied existing conditions as the baseline compared against future estimated project emissions). Ramboll. 2018. Portrero Power Plant Mixed-Use development GHG Emissions Methodology and Documentation. Available at: http://docs.ppsmixeduse.com/ppp/AB_900/2018_0831_carb_ab900-determination.pdf. Accessed August 2023 (applied existing conditions as the baseline compared against future estimated project emissions).

Response GO17-189 Refer to Section 3.03, Air Quality, and Appendix D, Air Quality/Health Risk Assessment Technical Report, of the Draft EIR, for discussion of how the emissions from haul truck trips would not result in a significant impact.

The Draft EIR analyzed air quality impacts, including those related to emissions from haul truck trips during construction, in accordance with applicable SCAQMD guidance and using California Emissions Estimator Model® (CalEEMod®), the most current air quality model endorsed by the SCAQMD and the California Air Pollution Control Officers Association.⁶⁰ The CalEEMod® model was developed by SCAQMD in coordination with other California air districts and is recommended for use by SCAQMD.⁶¹ Based on this analysis, the Draft EIR concludes that the proposed Project will not cause an exceedance to any SCAQMD significance threshold, including construction emissions.

Specifically, the Draft EIR addressed the assumptions for trip lengths, as being derived from regional data and incorporated in CalEEMod®, in Section 3.03.3 of the Draft EIR, with additional technical details in Section 4.3.2.2 of Appendix D, Air Quality/Health Risk Assessment Technical Report, of the Draft EIR. The analysis presented in the Draft EIR and Appendix D estimating air quality impacts of construction was based on a combination of Project-specific data and CalEEMod® model default data. CalEEMod® technical documentation notes that the default hauling trip length is 20 miles, which is meant to serve as a reasonable approximation for hauling material to and from a project site in the absence of project-specific data.⁶²

The comment raises concerns regarding the potential for contaminated soil and the assumed haul trip distance for exported soil. As noted above, the Draft EIR addressed haul trip length assumptions in Section 4.3.2.2 of Appendix D, of the Draft EIR. The final use and/or disposal location of excavated soil is not known at this time; thus the haul trip length used in the analysis was the model default, which represents a reasonable estimate for exported soil (which, as referenced in Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, does not necessarily need to be disposed of as waste at a landfill) because some disposal sites may be located closer than the regional 20-mile default assumption and some disposal sites may be located farther away.

An EIR need not identify the exact location of the haul route because those details are frequently determined during construction based on actual excavated soil conditions, which cannot be known at the time of the EIR preparation.

Nevertheless, in response to this comment, additional analysis was prepared of construction emissions based on a potential need to dispose of certain excavated

⁶⁰ California Air Pollution Control Officers Association (CAPCOA). 2021. CalEEMod® User Guide Version 2020.4.0. Available at: http://www.aqmd.gov/docs/default-source/caleemod/user-guide-2021/01_user-39-s-guide2020-4-0.pdf?sfvrsn=6. Accessed: August 2023.

⁶¹ South Coast Air Quality Management District (SCAQMD). 2023. Air Quality Modeling. Available at: <https://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-modeling>. Accessed: August 2023.

⁶² California Air Pollution Control Officers Association (CAPCOA). 2021. CalEEMod® Appendix A: Calculation Details for CalEEMod®. Available at: <http://www.aqmd.gov/docs/default-source/caleemod/user-guide-2021/appendix-a2020-4-0.pdf?sfvrsn=6>. Accessed: August 2023.

material as waste at certain identified landfills that may be located farther than the 20-mile default CalEEMod[®] assumption.

Specifically, Ramboll evaluated how the estimated hauling vehicle emissions provided in Table C.1-1 through Table C.2-4 in Appendix D, would be affected in the event excavated material required disposal at a landfill as either non-hazardous or hazardous waste.⁶³

Using historical soil information from prior site evaluations at the proposed Project component locations, Appendix M, Potential Excavated Material Disposal Analysis, of the Final EIR, was prepared, which conservatively estimated that approximately 14,119 cubic yards (cy) of material could potentially require disposal at a landfill as waste. Based on the potential contaminants and their concentrations in the excavated material, such material may be classified as 1) non-hazardous, 2) non-RCRA hazardous, or 3) RCRA hazardous. As summarized in Appendix M, Potential Excavated Material Disposal Analysis, of the Final EIR, it was estimated that 11,802 cy of the 14,119 cy may require disposal at a landfill as non-hazardous waste.

Three landfills, Azusa Landfill (approximately 21.5 miles from the furthest proposed Project component site), Chiquita Canyon Landfill (approximately 39.1 miles from the furthest proposed Project component site), and Waste Management Simi Valley Landfill (approximately 42.3 miles from the furthest proposed Project component site) as potential disposal locations for impacted, non-hazardous material, all of which landfills have adequate capacity to accept the potential export materials. As a conservative assumption, it was assumed that all exported material in this category would be transported to the furthest Waste Management Simi Valley Landfill, even though it is anticipated that some export material in this category could be exported to the more proximate landfills during construction.

It was conservatively estimated that 3,037 cy of the 14,119 cy may require disposal as non-RCRA and/or RCRA hazardous waste. Two landfills, Waste Management Kettleman Hills Landfill (approximately 177 miles from the furthest proposed Project component site) and Clean Harbors Buttonwillow Landfill (approximately 139 miles from the further proposed Project component site), were identified as potential disposal locations for non-RCRA and RCRA hazardous waste, both of which landfills have adequate capacity to accept the potential export materials. All landfill trip distances from the furthest proposed Project component site were obtained from Google Maps. As a conservative assumption, it was assumed that all exported material in this category would be transported to the further Waste Management Kettleman Hills Landfill, even though it is anticipated that some export material in this category could be exported to the more proximate Clean Harbors Buttonwillow Landfill during construction.

⁶³ Note that excavated material that does not require disposal at a landfill as non-hazardous hazardous or hazardous waste could be sent to Hanson Aggregates in Irwindale and Scholl Canyon in Glendale, both of which are less than 20 miles away from the proposed Project.

The maximum daily construction emissions difference based on these conservative hauling distances is as follows:

	Maximum Daily Construction Emissions (lb/day)					
	ROG	CO	NOx	SOx	PM ₁₀	PM _{2.5}
Draft EIR Analysis Using Model Default Model Distances	24	258	51	0.5	11.8	3.8
Additional Analysis Based on Site Conservative Hauling Assumptions	24	258	79	0.7	18.7	5.9
SCAQMD Significance Thresholds	75	550	100	150	150	55
Exceedance of the Threshold for Any Year of Construction?	NO	NO	NO	NO	NO	NO

Accounting for the analysis more conservative hauling distances for exported material does not change the significance conclusions related to the proposed Project's construction emissions, meaning that the proposed Project's construction emissions would not exceed the applicable significance thresholds even assuming the longer hauling distances suggested by the comment and maximum daily construction emissions would remain less than significant.

Comment GO17-190

- Emissions for the gondola operations are shown as a negative number (Table 4-8 of Appendix J), which is disingenuous. It would be understandable to calculate the potential emissions from the electricity use then apply GHG credits for a mitigation measure, but showing the value as a negative number implies the proposed Project is generating the GHG credits, which is false.
- Emissions for the backup battery system are shown as a negative number (Table 4-10 of Appendix J). The same logic applies. The proposed Project is not generating GHG credits for using backup batteries. Using battery power instead of diesel should be a mitigation measure.

Response GO17-190 Refer to Section 3.08, Greenhouse Gas Emissions, and Appendix J, Greenhouse Gas Emissions Technical Report, for a discussion of the proposed Project's potential greenhouse gas emissions from operations. The Draft EIR concludes that the Project would not cause a significant GHG impact and, as an innovative alternative mode of transportation, will reduce GHG emissions over time by reducing VMT. The comment misstates Table 4-8, which is not intended to show "GHG credits" for a mitigation measure. Rather, Table 4-8 shows the GHG emissions from the gondola if power from LADWP's Green Power Program were not used. As discussed in Footnote 5 of Table 4-8, the negative number referenced in the comment does not represent a "GHG credit" but instead shows the emissions benefit gained by the proposed Project by committing to LADWP's Green Power Program pursuant to GHG-PDF-A, which is supplied by 100% renewable resources. The depicted number is "negative" to show the potential emissions that are avoided through the use of renewable resources. If

the proposed Project did not commit to sourcing electricity through this renewable program, the emissions would be positive and would be included within the proposed Project emissions inventory. Thus, the table shows the benefits of utilizing power from 100% renewable resources by comparing emissions from more conventional power supplies. The table does not, as the comment suggest, show a “GHG credit” and the Draft EIR does not rely on GHG credits to reach its determination that the proposed Project results in a less than significant GHG impact.

Refer to Section 3.08, Greenhouse Gas Emissions, and Appendix J, Greenhouse Gas Emissions Technical Report, for a discussion of the proposed Project’s potential greenhouse gas emissions from operations. The Draft EIR concludes that the proposed Project would not cause a significant GHG impact and, as an innovative alternative mode of transportation, will reduce GHG emissions over time by reducing VMT. The comment misstates Table 4-10, which is not intended to show “GHG credits” for a mitigation measure. As discussed in Footnote 3 of Table 4-10, emissions are shown as negative to represent the emissions benefit gained by the proposed Project by committing to batteries as the backup power supply. The number is negative because the number represents the emissions that are avoided by avoiding use of conventional diesel backup generators. Thus, the table shows the benefits of using batteries by comparing to emissions from more conventional power supply systems. The table does not, as the comment suggests, show a “GHG credit” and the Draft EIR does not rely on GHG credits to reach its determination that the Project results in a less than significant GHG impact. Accordingly, the incorporation of battery power rather than diesel as a mitigation measure is not required because there is no significant impact requiring mitigation pursuant to CEQA Section 21002.1(a).

Refer to Section 2.0, Project Description, for a discussion of how backup power would be provided by battery storage located at each station and tower and the non-passenger junction.

Comment GO17-191

- The DEIR relies on the 2016 AQMP, which is outdated. The 2022 AQMP has been drafted and is scheduled to be approved by the SCAQMD Governing Board on December 2, 2022. Appendix D).

Response GO17-191 This comment is noted and will be provided to the decision makers for review and consideration. Refer to Section 3.03, Air Quality, and Appendix D, Air Quality/Health Risk Assessment Technical Report, of the Draft EIR, for a discussion of the proposed Project’s consistency with the 2016 Air Quality Management Plan (AQMP) as that was the adopted AQMP and the AQMP incorporated into the State Implementation Plan (SIP) at the time the Draft EIR was prepared. Furthermore, the Draft EIR addressed the 2022 AQMP in Section 2.3.5.1 of Appendix D and acknowledged the draft status of the plan at the time of the Draft EIR preparation. While the SCAQMD Governing

Board approved the 2022 AQMP, it has not yet been approved by USEPA and thus not yet been incorporated into the SIP. The analysis completed by the Draft EIR is still appropriate in terms of assessing consistency with the 2016 AQMP.

It is noted that the proposed measures of the 2022 AQMP build off similar programs in the 2016 AQMP to reduce mobile source emissions through further adoption of advanced technologies for on-road emissions sources and zero-emission infrastructure for mobile sources. A key goal identified in the 2022 AQMP, as with the 2016 AQMP, is to reduce vehicle-related emissions in the air basin, including through the reduction of VMT. The proposed Project is consistent with the adopted 2022 AQMP for many of the same reasons the proposed Project is consistent with the 2016 AQMP. The proposed Project is an innovative alternative transportation that reduces air pollutants and GHGs by reducing VMT (see Draft EIR, Section 3.8.4), thereby advancing key objectives of the 2016 AQMP and proposed 2022 AQMP. Vehicle emissions are a major source of ozone-forming emissions and reducing ozone is a critical component of the 2022 AMQP; therefore, the proposed Project aligns with and supports the adopted 2022 AQMP's goals, as with the 2016 AQMP.

It is also noted that the 2022 AQMP estimates future emissions inventories and targets assuming growth in population and economic output of the region, as supported by SCAG projections. The purpose of referencing such growth in the 2022 AQMP is to underscore potential challenges to achieving necessary emissions reductions while upholding general growth of the region. The proposed Project would offer a mode of transportation that would support the population and economic growth of the region by enabling regional ridership capacity through an innovative technology with the benefit of reducing emissions.

Comment GO17-192 3. ENERGY

- Appendix H Energy Technical Report (page 22). The Draft EIR indicates that electricity will be supplied using the LADWP's Green Power Program, indicating that the primary electricity for the project would come from renewable energy sources. As this is one of the primary ways the project is minimizing increases in GHG emissions, an enforceable mitigation measure must be provided to ensure this project assumption is enforced.

Response GO17-192 Refer to Section 3.08, Greenhouse Gas Emissions, and Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR. for a discussion of greenhouse gas emissions from operation of the proposed Project. The Draft EIR concludes that the proposed Project will not cause a significant GHG impact and, as an innovative alternative mode of transportation, will reduce GHG emissions over time by reducing VMT.

Because the Draft EIR concludes that the proposed Project's GHG emissions are less than significant, no mitigation measures are needed to reduce the proposed Project's GHG emissions. The proposed Project's use of electricity supplied from LADWP's

Green Power Program is a voluntary commitment by the proposed Project to further demonstrate the proposed Project's leadership towards sustainable transportation and reducing GHG emissions. In response to comments suggesting that this commitment is illusory, an addition to the Draft EIR has been provided for Section 3.08, Greenhouse Gas Emissions, to add this Project commitment as an enforceable Project Design Feature, GHG-PDF-A. The addition of GHG-PDF-A has been incorporated into Section 5.0, Corrections and Additions, of this Final EIR. As discussed in Section 5.0, Corrections and Additions, of this Final EIR, LADWP confirmed that its renewable electricity portfolio would be able to accommodate the proposed Project's demand for electricity, including through the purchase of power under the LADWP Green Power Program.

Comment GO17-193

- Section 3.0 of the Draft EIR indicates that the environmental setting is the physical conditions in the vicinity of the proposed project at the time of publication of the Notice of Preparation (NOP), which is October 1, 2020. However, data used to calculate baseline conditions varies. For example, 2019 was considered to be the baseline conditions for the energy analysis (see page 3.6-13). The Draft EIR must explain the appropriate environmental setting and why the impact analysis for different resources used different years. Further data regarding the existing fuel consumption was based on 2016 data, which is at least 8 years old (see page 3.6-13) and not consistent with the release of the NOP.

Response GO17-193 Data used to evaluate baseline conditions were based on the availability of complete data at the time of preparation of the Draft EIR. As described in Section 3.6.2, Environmental Setting, of the Draft EIR, the electricity usage was based on the most currently available data (from 2020) as of the preparation of the Draft EIR. Similarly, the cited fuel usage was based on the most currently available data (from 2016) as of the preparation of the Draft EIR. The comment raises concern regarding the fuel consumption data from 2016 but does not provide any explanation for the concern. The fuel consumption data was the most recent data available at the time the Draft EIR was prepared. Fuel consumption has generally remained relatively steady in California in recent years based on annual natural gas and gasoline consumption data published by the United States Energy Information Administration (EIA); therefore, even if more current data were available at the time the EIR was prepared, it would not likely have a material change in the data presented and would not have changed the significance conclusions because the Project reduces fuel usage over time by reducing VMT.

Comment GO17-194

- Page 3.6-15: The DEIR indicates that construction would result in a demand of approximately 864,544 kWh of electricity. Please provide the assumptions used to calculate the electricity use during construction.

Response GO17-194 Refer to Section 3.6.4.2, Electricity, of Section 3.06, Energy, of the Draft EIR, for the value used for electricity consumption during construction, with further technical details provided in Table 4-6 of Appendix J, Greenhouse Gas Emissions Technical Report. This value reflects the sum of estimated electricity consumption for construction of each gondola station, tower, and non-passenger junction. Electricity demand was estimated by the proposed Project’s construction consultant for anticipated sources of electricity consumption including trailers, welders, site lighting, and charging for battery-powered equipment. The construction consultant determined the electricity consumption for each source based on the daily electricity consumption and days of operation for the total quantity of sources. The estimated electricity consumption for sources pertaining to each gondola station, tower, and non-passenger junction were summed to obtain the total electricity consumption value during construction.

Comment GO17-195

- DEIR page 3.6-15 and Appendix H: The DEIR states that the Project’s construction electricity use represents a small percentage of regional estimates for the LADWP. It further states that: “The CEC estimates that energy demand in the LADWP planning area will increase to approximately 27,000 to 28,000 GWh in the 2024 to 2026 timeframe, meaning the proposed “project’s demand contribution in that period would be approximately 0.002 percent of the projected demand.” (see DEIR page 3.6-15). According to the footnote, the peak demand or LADWP is based on a CEC reference from 2016 and used data from 2015. With the move toward renewables and the problems that the electricity grid had maintaining electricity during peak demand periods in 2022, more recent data should be used. Further, for the same reason, the DEIR should explain whether the LADWP has excess RENEWBABLE electricity available for the proposed project. Per the DEIR assumptions, it is assumed that all electricity use associated with the operation on the project will be renewable. A mitigation measure should be developed to enforce this assumption.

Response GO17-195 Refer to Response GO17-196 for a discussion of the proposed Project’s electricity consumption. Refer to Section 3.06, Energy, and Appendix H, Energy Technical Report, of the Draft EIR, for a discussion of the proposed Projects energy demand. The purpose of the discussion on Draft EIR page 3.6-15 and in Appendix H, Energy Technical Report, was to support the significance determinations made in relation to the Project’s energy consumption. Energy significance is defined by two thresholds under CEQA Guidelines Appendix G, which is in turn summarized in Section 3.6.4 of the Draft EIR, providing:

Would the project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation?

Would the project conflict with or obstruct a State or local plan for renewable energy or energy efficiency?

Comparison of the CEC estimates to the proposed Project's anticipated construction electricity demand was made based on the most currently available data at the time of the Draft EIR preparation. Additionally, future demand projections made by the National Renewable Energy Laboratory (NREL) in March 2021 for LADWP align with the referenced projections made by the CEC. The demand dedicated to proposed Project construction represents a very small fraction of the total estimated electricity demand from LADWP, and the energy significance determinations made for the proposed Project remain consistent when relying upon data from either source.

The availability of electricity is addressed in Section 3.19, Utilities and Service Systems, of the Draft EIR, which confirmed that there would be sufficient electricity available for the proposed Project. , Further, as discussed in Section 5.0, Corrections and Additions, of this Final EIR, LADWP confirmed that its renewable electricity portfolio would be able to accommodate the proposed Project's demand for electricity, including through the purchase of power under the LADWP Green Power Program. The Draft EIR concluded that the proposed Project's GHG emissions are less than significant, and thus there are no required mitigation measures. The proposed Project's use of electricity supplied from LADWP's Green Power Program is a voluntary commitment to further demonstrate the proposed Project's leadership towards sustainable transportation. In response to comments suggesting that this commitment is illusory, an addition to the Draft EIR has been provided for Section 3.08, Greenhouse Gas Emissions, to add this Project commitment as an enforceable Project Design Feature, GHG-PDF-A. The addition of GHG-PDF-A has been incorporated into Section 5.0, Corrections and Additions, of this Final EIR.

Comment GO17-196 Further, the DEIR indicates that the peak demand in the LADWP planning area is expected to reach 6,400 to 6,500 MW in the 2024 to 2026 timeframe. Please note that the LADWP reports that the record peak demand was 6,502 MW on August 31, 2017.¹ Therefore, this peak demand has already been reached and the data provided in the DEIR is not valid, likely because the information used for the baseline is outdated. The potential energy impacts are significant as LADWP does not currently have the excess electrical supply capacity to provide electricity to the proposed project.

Footnote 1: LADWP Facts and Figures.
https://www.ladwp.com/ladwp/faces/ladwp/aboutus/a-power/a-p-factsandfigures?_adf.ctrl-state=10n9mool8q_4&_afLoop=494270252036354

Response GO17-196 Refer to Section 3.06, Energy, and Appendix H, Energy Technical Report, of the Draft EIR for a discussion of how the proposed Project’s potential energy impacts would be less than significant. The comment suggests that the analysis needs to be redone based on data it has listed regarding peak demand. The data used in the analysis were based on availability of complete data at the time of preparation of the Draft EIR. As previously stated, Appendix H was prepared to evaluate energy significance under CEQA via the CEQA thresholds regarding wasteful, inefficient, or unnecessary consumption of energy resources and regarding conflicting with or obstructing a state or local plan for renewable energy or energy efficiency. The data presented by the comment on peak demand does not change the analysis nor the conclusions of the Energy analysis. Section 5.1.3.1 of Appendix H of the Draft EIR, cited the increase in peak demand from 6,400 to 6,500 MW in the 2024 to 2026 timeframe to demonstrate how the proposed Project would have a negligible effect on LADWP peak demands. The estimated peak electricity demand from Project construction is 2.0 MW, and the peak demand value noted by the commenter further supports the proposed Project’s minimal contribution to LADWP peak demand during construction because the Project’s construction demands are temporary in nature and are well within LADWP’s planned power supplies. LADWP recently published a Draft Power Strategic Long-Term Resource Plan (SLTRP) which serves as a comprehensive roadmap through 2045 that guides the LADWP Power System in its efforts to supply reliable electricity in an environmentally responsible and cost-effective manner. In this SLTRP, LADWP states plans to add approximately 3,000 MW of new renewable projects in order to accelerate its renewable energy target to 80% renewables and 97% zero-carbon resources by 2030. The electricity consumption within LADWP’s service territory is forecasted to decrease 0.3% over the next five years as energy efficiency and customer-installed solar photovoltaic (PV) expansion offsets growth from economic activity. As discussed in Section 5.0, Corrections and Additions, of this Final EIR, LADWP confirmed that its renewable electricity portfolio would be able to accommodate the proposed Project’s demand for electricity, including through the purchase of power under the LADWP Green Power Program. Refer to Section 3.06 for a discussion of the 2017 SLTRP, and Section 2.2.4.2 of Appendix H, Energy Technical Report, of the Draft EIR, for a discussion of the 2017 SLTRP as an expansion of the existing Power Integrated Resource Plan.

Comment GO17-197 Further evidence of the use of an inappropriate baseline is the Proclamation of a State of Emergency signed by Governor Gavin Newsom on August 31, 2022. The Proclamation declared that immediate action was required to reduce the strain on the energy infrastructure and increase energy capacity during the Extreme Heat Event (late August through early September, 2022). The California Independent System Operator (CASIO) forecasted high electric demand due to the extreme heat event with peak load projected to exceed 48,000 MW and which would exceed the available electricity.² Further, this event was classified as an “emergency event” which allowed

existing portable generators including diesel generators) to operate under emergency conditions, regardless of any permit conditions.

Footnote 2: <https://www.gov.ca.gov/wp-content/uploads/2022/08/8.31.22-Heat-Proclamation.pdf?emrc=78e3fc>

Response GO17-197 This comment provides a general recitation and characterization of Governor Newsom’s Proclamation of a State of Emergency signed August 31, 2022, but does not raise a substantive issue on the content of the Draft EIR. The discussion in this comment on forecasted electricity demand does not provide relevant information that would impact the selection of the baseline conditions used in the proposed Project’s energy significance determination. Section 3.6.1.4 of Section 3.06, Energy, and Appendix H, Energy Technical Report, of the Draft EIR, discuss the current LADWP Strategic Long-Term Resource Plan (SLTRP) in place at the time of preparation of the analyses. Since that time, the Draft 2022 SLTRP has been released and provides additional forecasting out to 2045. The LADWP’s 2021 load forecast is used to project customer demand for electricity over the next 20 years, and the modeling in the SLTRP set the capacity requirements to ensure that LADWP has sufficient capacity to meet customer load, even during extreme events. As discussed in Section 5.0, Corrections and Additions, of this Final EIR, LADWP confirmed that its renewable electricity portfolio would be able to accommodate the proposed Project’s demand for electricity, including through the purchase of power under the LADWP Green Power Program

Comment GO17-198

- Page 3.6-16. The DEIR indicates that the proposed project would result in electricity demand of approximately 6.9 GWh/year and dismisses the impact because the electricity increase would be 0.002 percent of the projected statewide demand in 2026. However, currently the electricity demand is not sufficient to meet current demands during peak electricity use periods (e.g., hot summer months). The DEIR should compare the proposed project’s electricity use with the current electricity generation by LADWP, since LADWP will supply electricity to the project beginning in 2026 first. There is currently not sufficient electricity system should not only be compared to the projected electricity production in 2042 (which may or may not actually occur).

Response GO17-198 Refer to Section 3.06, Energy, and Appendix H, Energy Technical Report, of the Draft EIR, for a discussion of the proposed Project’s potential energy-related impacts, concluding that the proposed Project would result in a less than significant impact. The comment suggests that electricity production is not sufficient to meet current demands; however, it has not provided any new citations or data not previously addressed. Therefore, no new response is required. Furthermore, Section 3.06, Energy, of the Draft EIR, evaluated the proposed Project’s energy-related impacts against the relevant significance thresholds from Appendix G of the CEQA Guidelines

and found those impacts to be less than significant. Importantly, it was found that the proposed Project would not result in wasteful, inefficient, or unnecessary consumption of energy resources nor would it conflict with or obstruct a State or local plan for renewable energy or energy efficiency. Refer to Section 3.6.4.2 of the Draft EIR, for an evaluation of how the proposed Project's potential impacts considered the effects of the proposed Project on peak and base period demands for electricity, which included evaluations of the proposed Project's electricity demand against projections of LADWP's future electricity demand. In this analysis, the Draft EIR does not speculate on LADWP's future supply. As discussed in Section 5.0, Corrections and Additions, of this Final EIR, LADWP confirmed that its renewable electricity portfolio would be able to accommodate the proposed Project's demand for electricity, including through the purchase of power under the LADWP Green Power Program.

Comment GO17-199

- Assumption regarding the use of transit service. The DEIR assumes that ridership for transit will increase (need page no.). Since 1990, the SCAG region added over 100 miles of light and heavy rail in Los Angeles County and over 530 miles of commuter rail region-wide. These investments have not been matched by increases in transit ridership. Transit ridership in the southern California area reached its peak in 1985 and has been mostly declining since 2007, and has fallen consistently since 2013.³
- Further, about two percent of the population rides transit very frequently (averaging 45 trips/month), another 20 percent of the population rides transit occasionally (averaging 12 trips/month), and more than three-quarters of SCAG-region residents ride transit very little or not at all less than 1 trip/month).

Footnote 3: UCLA Institute of Transportation Studies, prepared for the Southern California Association of Governments, January 2018. Available at: https://scag.ca.gov/sites/main/files/file-attachments/its_scag_transit_ridership.pdf.

Response GO17-199 This comment provides a general recitation and characterization of the changes in the transit network and references studies on regional transit ridership. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model, which is based on extensive data sources and assumptions validated by data. Given the uniqueness of a gondola as a mode of transportation, a model specifically tailored to games and events at Dodger Stadium was developed to estimate ridership of the proposed Project, and the results of this model were used to project ridership and associated potential operational effects including queuing. As detailed in Appendix N, Ridership Model Development Memorandum, of the Draft EIR, the model is based on the statistical relationship between cost and travel time, using data from a variety of sources including mode choice surveys for Angelenos travelling to sporting events in

Downtown Los Angeles, travel time and cost to Dodger Stadium and LAUS for driving and transit, parking costs, value of time, mode of access intercept surveys of Dodger Stadium Express riders, and many other data. As described in Appendix N, the proposed Project transit access model analyzes the proposed Project ridership that is expected to come from the transit system, primarily Metro and Metrolink services connecting to the proposed Project at the Alameda Station or the Chinatown/State Park Station. The park and ride model analyzes proposed Project ridership that would come from riders parking within a ½ mile walking distance of either station, or from vehicle drop-offs at either station from a TNC service such as Uber or Lyft. The existing model was then calibrated to existing conditions for the share of Dodger Stadium Express riders that take transit to LAUS based on data prepared by Metro in reports to the South Coast Air Quality Management District (SCAQMD) for the 2011-2015 Dodger seasons. Metro also provided Fehr & Peers with intercept survey data collected in the 2014 season. Attachment A to Appendix N includes the 2014 data provided by Metro and summarizes the range in mode of access for Dodger Stadium Express across the years that Metro analyzed. Mode of Access to Dodger Stadium ranged from 91% non-auto to 74% non-auto. Fehr & Peers applied the mode of access percentages from the 2014 data, because they offered substantially higher number of samples compared with the data cited in Metro's reports to SCAQMD. Metro's data indicated an evening game non-auto mode of access of 74%, and a daytime game non-auto mode of access of 91.4%. In the vehicle miles travelled (VMT) benefit calculation in the transportation section of the EIR, Fehr & Peers applied the evening mode of access to all evening games, and the daytime mode of access to day games. While transit mode of access is expected to improve with the expansion of the Measure R & M network and improved transit travel time competitiveness, for a more conservative estimate, Fehr & Peers held the 2014 mode of access constant for future forecasts. However, even in 2012 when fewer Metro rail stations were open than at present, Metro's intercept survey data for Dodger Stadium Express riders indicated that 88% of riders arrived via transit, walking, or biking.

Additionally, in contrast to systemwide bus ridership, which represents the vast majority of ridership decline as noted in the SCAG/UCLA study referenced by the commenter, ridership on the Dodger Stadium Express has grown considerably within the same time period indicating strong and growing demand for transit travel between LAUS and Dodger Stadium. As indicated by Metro "In 2010, the [Dodger Stadium Express] service's first year, 122,273 passengers rode the DSE to Dodger Stadium. By 2019, the passenger count increased to 307,124. This is a 250% increase over the service's first year."⁶⁴

Comment GO17-200 A defining attribute of regular transit riders is their relative lack of private vehicle access. Between 200 and 2015, households in the SCAG region, and especially lower-

⁶⁴ Los Angeles County Metropolitan Transportation Authority (LA Metro). 2021. Metro Final Report: MSRC Contract MS21001 Dodger Stadium Express 2019 Season. Available at http://www.cleantransportationfunding.org/sites/default/files/projects-final-reports-2020-04/MS21001_Metro_Dodgers_Final_Report.pdf. Accessed August 2023.

income households, dramatically increased their levels of vehicle ownership. Census data show that from 1990 to 2000, the region added 1.8 million people but only 456,00 vehicles (or 0.25 vehicles per new resident). From 2000 to 2015, the SCAG region added 2.3 million people and 2.1 million vehicles (or 0.95 vehicles per new resident). The results strongly indicated that increasing private vehicle access helped depress transit ridership. Further car ownership has grown fastest among the most frequent transit riders.

From 2012 to 2016 the SCAG lost 72 million annual rides on public transportation. In addition, while fares on LA Metro's trains and bus have decreased, ridership has also decreased.⁴

Footnote 4: California Transit Association, Ridership Study Revisited, Stephanie Jordan. Available at: <https://caltransit.org/news-publications/publications/transit-california/transit-california-archives/2019-editions/may/ridership-study-revisited/>

Response GO17-200 Refer to Response GO17-199 for a discussion of the proposed Project's estimated ridership model, and how the measured ridership growth in the Dodger Stadium Express in contrast to systemwide bus ridership has declined, indicating strong and growing demand for transit connections between Dodger Stadium and Los Angeles Union Station.

Comment GO17-201 The Green Power for Green LA program gives LADWP customers the opportunity to replace electricity from polluting power plants with energy generated from renewable resources like sun, wind and water. For a slightly higher price than power generated from conventional sources such as coal and oil, the program allows residential customers to choose 100 percent renewable energy with 20 percent coming from new sources. The Green Power for a Green LA Program has been offered since May 1999.

Response GO17-201 The proposed Project's use of electricity supplied from LADWP's Green Power Program is a voluntary commitment to further demonstrate the proposed Project's leadership towards sustainable transportation. An addition to the Draft EIR has been provided for Section 3.08, Greenhouse Gas Emissions, to add this Project commitment as an enforceable Project Design Feature, GHG-PDF-A. The addition of GHG-PDF-A has been incorporated into Section 5.0, Corrections and Additions, of this Final EIR.

Comment Letter GO18 – Coalition for a Safe Community, Dr Clyde T. Williams

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO18

Comment GO18-1 Project description, assessments, and alternatives considerations are totally inadequate and incomplete and without engineering and construction considerations and descriptions. Many references mention future studies, engineering, and designs to be done before construction, but all such would be without public review and comments and thereby not in compliance with CEQA.

Response GO18-1 Section 2.0, Project Description, of the Draft EIR, included a description of the proposed Project construction, and the potential effects of the proposed Project construction are evaluated throughout Section 3.0, Environmental Setting, Impacts, and Mitigation. The detailed construction assumptions for the proposed Project are set forth in Appendix B, Construction Assumptions, of the Draft EIR. The level of detail and specificity for an EIR should correspond with the nature of the project and the degree of specificity involved in the underlying project (14 Cal. Code Regs. § 15146). CEQA does not require that detailed engineering plans be prepared or circulated publicly for review and comment. The information set forth in the Draft EIR concerning the proposed Project complies with CEQA's requirements.

Environmental review under CEQA is encouraged to occur as early as feasible in the planning process (14 Cal. Code Regs. § 15004). As such, it is common for an EIR to identify the requirement for more detailed design and engineering studies that must occur prior to construction reflecting the further advanced project design and on the ground environmental conditions at the time of construction. Refer also to Topical Response I: Use of Project Design Features and Plans in Mitigation Measures.

Comment GO18-2 Although Goals/Purposes and Objectives are required for a DEIR, this DEIR provides vague and ambiguous descriptions and totally inadequate development of the Project, its objectives, and its alternatives and their numerical/quantified comparisons. Thus, the discussion of alternatives and Project and their numerical/quantified comparisons are totally inadequate.

Response GO18-2 The Draft EIR addressed the Project Objectives and the Project Description in Section 2.0, Project Description. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project's objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project's fundamental purpose of providing a permanent transit connection to Dodger Stadium. Also refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives pursuant to CEQA.

Comment GO18-3 Although directly related to the DEIR descriptions and assessments, the DEIR does not even minimally use/mention the LA City Department of City Planning database, ZIMAS, which must be fully incorporated if the Project is to be placed within the City of Los Angeles. As no Memorandum of Understanding or Agreement between the sponsor, Metro, and City of Los Angeles is provided or even mentioned, this absence is understandable avoidance, but renders the DEIR unacceptable, incomplete, and inadequate.

Response GO18-3 The City of Los Angeles Zone Information and Map Access System (ZIMAS) is a web-based mapping application that links together maps and databases designed to provide zoning related information for specified properties located in the City.⁶⁵ ZIMAS is not a distinct land use plan or zoning document. Refer to Section 3.11, Land Use and Planning, for discussion of the proposed Project’s potential impacts to land use and consistency with relevant land use plans, policies, and regulations adopted for the purpose of avoiding environmental effects, including City of Los Angeles land use plans, policies, and regulations. The Draft EIR appropriately relies on a comprehensive list of resources listed in Section 9.0, References, of the Draft EIR. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts.

Comment GO18-4 Without an adequate and complete DEIR, alternatives to the proposed Project cannot be adequately formed and compared. Thereby the consideration of alternative cannot be considered adequate nor complete, but should include ZE/NG buses and dedicated bus lanes and perhaps with congestion pricing for DTLA and the Project site.

Response GO18-4 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR’s consideration of a range of reasonable alternatives pursuant to CEQA. An EIR need not consider every conceivable alternative. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Improving the connection between LAUS and Dodger Stadium via the proposed Project would

⁶⁵ City of Los Angeles. ZIMAS User Guide. Available at: <http://zimas.lacity.org/webhelp/pdf/ZimasUserGuide.pdf>. Accessed September 2023.

provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project.

Comment GO18-5 For detailed comments see below, including pertinent identified portions of the DEIR with highlighted issues of the current texts for the specific comments.

ES-1/3 When complete, the proposed Project would have a maximum capacity of approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes.

$5000\text{passengers/hr and }40\text{p/gondola} = 125\text{ gondolas(g)/hr} = 1\text{ g/29 sec}$

Travel ROT = 14 min including loading/unloading = 3 sec/person x 40 = 120 sec = 7min transit + 2 min ld/uld = 60/9 = 7 g-trips/hr x 40pgr = 280 total passenger/hr

x 2 hr = 560 p/game – nine/9 gondolas/cabins operating each game/event

Provide Project operations for peak passenger processing and gondola travel for 2 hours prior to Stadium events.

Provide seating/standing design floor capacity for each gondola/cabin used for Project's process flow and movements.

Provide total weight of all loaded gondolas and angular load distribution for each tower (one way loaded/opposite way unloaded).

Response GO18-5 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (Id., § 15204.)

Comment GO18-6 ES-2/3 The standards of adequacy of an EIR, defined by Section 15151 of the CEQA Guidelines, are as follows:

An EIR should be prepared with sufficient level of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effect of the proposed project need not be exhaustive, but sufficiency of an EIR is to be reviewed in light of what is reasonably feasible....The courts have not looked for perfection but for adequacy, completeness, and good faith effort at full disclosure.

First of 79 mentions of feasible, vs financial and fiscal of <10, and must be considered as an acceptable alternative for costs. Provide “costs” comparisons for each use of “feasible” or “fiscal” and for alternatives throughout the DEIR.

Provide documentation of database for the “analysis” and numerical/quantified assessments and comparisons in table forms.

Provide Project definitions and demonstrations of feasible and infeasible conditions within the Project. Definitions of feasible commonly include “practical” issues, costs, funding, probability of changed conditions, and unexpected costs for safety, hazards, and changed conditions claims.

Overall the DEIR is inadequate and incomplete for reasonably public accessible considerations (review and comments) of the Project, its impacts, mitigations, and alternatives.

Lack of use of LACity-DCP-ZIMAS database for issues along the entire route and for specific facilities located along the route. Provide ZIMAS database for any DEIR references to equivalent data from elsewhere, e.g., seismicity, landslide, liquefaction, etc..

Response GO18-6 The comment provides a recitation and characterization regarding the standards of adequacy for an EIR. The issues raised in this comment related to particular impact areas studied in the Draft EIR are provided below in Responses GO18-7 through GO18-120. The general comments regarding the adequacy of the Draft EIR are either not specific to the analysis contained within the Draft EIR or are requesting formatting and content beyond what CEQA requires. Refer to Response GO18-3 regarding ZIMAS.

Comment GO18-7 ES-3/4 The ART system has the ability to overcome grade and elevation issues between LAUS and Dodger Stadium, and would provide safe, zero-emission, environmentally friendly, and high-capacity transit connectivity in the Project area that would reduce greenhouse gas (GHG) emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways. The proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Provide engineering design drawings and calculations and all derived assessment of engineering forces on towers and cableway given the imbalance of cabin loads during specially events with no passengers on one side and full capacity loads on the opposing cableways.

Response GO18-7 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, of the Draft EIR, for a description of the proposed Project system, including its design and cables and ropeway technology. The proposed Project would be designed to operate safely with loads which are imbalanced, consistent with comparable aerial transit systems. Ski lifts, for example, are routinely designed for loads which are imbalanced, as the majority of passengers ride uphill and nearly no passengers ride downhill. Designing for this imbalance, as well as other operating and non-operating conditions, involves a variety of load scenarios which would be completed at future design stages of the proposed Project. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-8 ES-4/2 The proposed Project “alignment” includes the suspended above-grade cables and cabins following the position of the Project components along the ART route....

Provide assessment of engineering forces on towers and cableway given the imbalance of cabin loads during specially events with no passengers on one side and full capacity loads on the opposing cableways.

Response GO18-8 This comment provides a general recitation and characterization of text from the Draft EIR. Further, CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) Nevertheless, refer to Response GO18-7 for a discussion of the proposed Project’s design considerations.

Comment GO18-9 ES-4/4 When complete, the proposed Project would have a maximum capacity of approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes.

Provide Gondola loading/unloading/travel timing cycles as part of the overall 23 second/7 minute travel patterns including a time chart for each cycle element.

e.g., Loading/unloading 3 sec / passenger 40p/g = 120sec each for loading and unloading

Provide same cycles including 10% ADA passengers.

Response GO18-9 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response J, Gondola Design and Operations, for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphpd). The station boarding process and cabins would comply with all accessibility requirements of the Americans with Disabilities Act (“ADA”). If needed, cabins could be either slowed or stopped in the station for boarding purposes. Station attendants would be located within each station to assure safe boarding and to execute stops for unloading or boarding purposes, if necessary. Attendants would also provide customer interaction and observation; if a passenger needs special assistance, an attendant may either further slow or stop a cabin. A separate operator would be stationed in a control booth monitoring screens, which would show activities in each cabin and station, as well as the system controls. The time necessary to slow or stop cabins is factored into the overall system capacity of the proposed Project.

Comment GO18-10 ES-4/7 The alignment then crosses over the western edge of the Los Angeles State Historic Park and the Metro L Line (Gold) tracks.

No mention of Buena Vista til pg.3.11/20. Provide currently proposed building outlines for both ground area and heights compared to this Project along with full cabin presents during target events.

Response GO18-10 This comment provides a general recitation and characterization of text from the Draft EIR. The proposed Buena Vista project is discussed as a related project in Section 5.0, Other CEQA Considerations, of the Draft EIR. Refer to Table 5-1: Related Projects and Figure 5-1: Related Projects Map. As discussed in Section 5.0, the list of related projects includes projects that are anticipated to be constructed during the same timeframe as the proposed Project and operational at the same time as the proposed Project. The list of related projects is derived from information provided by the City of Los Angeles Department of City Planning and the Los Angeles Department of Transportation (LADOT). The proposed Buena Vista Project was also addressed in several sections of the Draft EIR, including Section 3.11, Land Use and Planning, and Section 4.0, Alternatives. Section 5.2, Cumulative Impacts, discusses potential cumulative impacts of the proposed Project and the related projects, including the proposed Buena Vista project. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided

sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts.

Comment GO18-11 ES-10/2 The Dodger Stadium Station....The Project Sponsor will request consideration by the Los Angeles Dodgers of the potential for the Dodger Stadium Station to include a mobility hub...to access Elysian Park and other nearby neighborhoods, including Solano Canyon.

No specific design or drawings are provided for the mobility hub or for the access to surrounding neighborhoods, and no beneficial effects are proposed for such a hub and accesses. No proposed schedules for LA ART are proposed for daily services, frequencies and loads or for pedestrian/bike/handicapped movements from/to hub and the neighborhoods.

Provide Daily and Daytime schedules, frequencies, and ridership access for non-games days public access.

Provide definition of specific considerations by LAD for non-game day operations and riderships.

Response GO18-11 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, of the Draft EIR for Figure 2-32: Dodger Stadium Station Buildout Conditions, which shows the buildout conditions for Dodger Stadium Station, including the mobility hub, pedestrian esplanade, and landscape improvements. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game and the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the proposed Community Access Plan. Refer to Section 2.6, Ridership, of the Draft EIR for a discussion of how the proposed Project would be configured to operate based on the anticipated ridership for Dodger games and special events at Dodger Stadium, events at the Los Angeles State Historic Park, commuters and residents in adjacent neighborhoods, and visitors to Los Angeles. The proposed Project has the flexibility to operate at varying speeds and capacity

depending on ridership. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the safety features of the proposed Project and how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphd), and the station boarding process and cabins would comply with all accessibility requirements of the Americans with Disabilities Act (“ADA”). As discussed in Section 5.0, Corrections and Additions, of this Final EIR, access to Elysian Park, the City’s second largest park, comprising 575 acres, would be provided through a mobility hub at Dodger Stadium Station, where passengers would be able to access a suite of first / last mile multi-modal options, such as a bike share program.

CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (Id., § 15204.)

Comment GO18-12 ES-10/6 At the Chinatown/State Park Station, cabins would detach from the rope and decelerate to the station speed. Since passenger access would be provided at this station, the cabins would decelerate to about one foot per second (less than one mile per hour) and the doors would open.

Provide station speeds schedules and pathways other than zero/dead stop and temporal sequencing for unloading and reloading of 40 passenger each. Provide same for at least 10% ADA related passengers and seniors (65+yr olds).

Response GO18-12 This comment provides a general recitation and characterization of text from the Draft EIR. Further, refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR for discussion of the safety features and operation of the proposed Project, including boarding and compliance with ADA requirements. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (Id., § 15204.)

Comment GO18-13 ES-11/1 Operation of the proposed Project would require approximately 20 personnel. Station attendants would be located within each station to assure safe boarding or to execute stops, if necessary. Attendants would also provide customer

interaction and observation; if a passenger needs special assistance, an attendant may either further slow or stop a cabin.

Provide personnel/staffing levels for each Project element during an event operations. Provide for full element operations, e.g., three stations and as to any staff shifting during event operations, e.g., No staff at Park Station and rotating staffs for initial Alameda Out-bounds vs later Stadium outbounds.

Provide Gondola loading/unloading/travel timing cycles as part of the overall 23 second/7 minute travel patterns including a time chart for each cycle element e.g., Loading/unloading 3 sec / passenger 40p/g = 120sec each for loading and unloading

Provide same cycles including 10% ADA passengers.

Provide requirements for agent-initiated stoppage (=0.0fps).

Response GO18-13 This comment provides a general recitation and characterization of text from the Draft EIR. Further, refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphpd) and how the station boarding process and cabins would comply with all accessibility requirements of the Americans with Disabilities Act (“ADA”). Station attendants would be located within each station to assure safe boarding and to execute stops for unloading or boarding purposes, if necessary. Attendants would also provide customer interaction and observation; if a passenger needs special assistance, an attendant may either further slow or stop a cabin. A separate operator would be stationed in a control booth monitoring screens, which would show activities in each cabin and station, as well as the system controls. The time necessary to slow or stop cabins is factored into the overall system capacity of the proposed Project. Pathways to the boarding areas would be ADA compliant with redundant vertical circulation and appropriately sized passageways. The entry widths and interiors size of each cabin would comply with the requirements of the ADA. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-14 ES-13/2 The proposed Project’s stations, junction, towers, and gondola cabins would incorporate energy efficient, sustainable, water and waste efficient, and resilient features, as feasible. The proposed stations and junction are designed to be open-air buildings, allowing for passive ventilation strategies and providing direct access to

outdoor air and natural daylight, while also providing adequate shade protection from heat. The cabins would be ventilated to enhance air quality for passengers.

Provide definitions for sustainable (40+ years operations) and feasibility calculations.

Provide definition and design for cabin ventilation and for any station ventilation (e.g., fans).

Provide definitions and designs of Passive Ventilation and enclosing solar panels for shading.

Response GO18-14 This comment provides a general recitation and characterization of text from the Draft EIR. A comprehensive list of the proposed Project’s sustainability features, including the sources from which they were drawn, is provided in Section 2.7.9, Sustainability Features, of Section 2.0, Project Description, of the Draft EIR. Cabins would feature a ventilation system and sealed windows for viewing purposes, which, for security reasons, would not open. As a sustainability feature, the stations, junctions, and boarding platforms of the proposed Project would be designed to be open air, allowing for natural ventilation and natural daylighting. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-15 ES-13/3 Materials for the stations, junction, and towers would be locally sourced where possible, and would include recycled content where possible.

Provide conditions for “possible” sourcing and recycled contents, rather than “where feasible”.

Response GO18-15 This comment provides a general recitation and characterization of text from the Draft EIR. A comprehensive list of the proposed Project’s sustainability features, including the sources from which they were drawn, is provided in Section 2.7.9, Sustainability Features, of Section 2.0, Project Description, of the Draft EIR. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-16 ES-14 Table ES-1: Proposed Project Construction

Maximum Depth of Drilled Piles Maximum Depth below pile cap

Clarify Maximum depth of pile tip = 10ft + 120ft bpc = 130ft bgs

Maximum Depth of Excavation Provide Maximum Depth to base of pile cap and top of pile

Amount of Excavation

Provide excavation volume including bulking for pile cap, 10ft depth = 3 cuyd/sq yd plus times surface area.

Provide piles boring/auguring volumes for all Project stations, towers, and junction e.g., = 1 yds x 40yd = 40 cu yd/pile x 25-40 piles = 1000-1600 cu yd, Stn Pile 55-80-125 Exc 2700-6300 cuyd, and Twr Pile 120-125 Exc 1300-6400 cuyd.

Provide clarifications regarding pile depth below ground levels vs pile lengths (feet and below pile cap bottom/floor.

Response GO18-16 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR for discussion of construction assumptions, including drilled piles and excavation, of the proposed Project. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (Id., § 15204.)

Comment GO18-17 ES-19/1 Furthermore, the existing DSE service operates up to 8 buses per hour, while the TSM Alternative would require 77 buses per hour.

Based on 5000-6000 passengers/hour, bus loads would be 65-80 passengers (sitting and standing). Provide a round trip flow chart and process flow (in seconds) including times for unloading/loading, start up and stopping times, and travel times (loaded and unloaded).

Provide comparative table for both cabin- and bus-based alternatives, especially for unloading/loading of single-door-cabins vs double-door-buses and for total cabin/bus seated/standing capacities.

Provide calculations and design requirements for bus-only lane access to Stadium Station site. Provide a Project Alternative and comparisons for single- vs double door

cabins/gondolas along with examples of existing operational double-door ART systems worldwide.

Response GO18-17 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a reasonable range of alternatives pursuant to CEQA Guidelines section 15126.6(a), and how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. CEQA does not require the consideration of alternatives to a component of a project, such as the variations on cabins suggested in this comment, and instead should focus on alternatives to a project as a whole. Further, CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (Id., § 15204.)

Comment GO18-18 ES-19/4 Of the alternatives analyzed in this Draft EIR,...Although the No Project Alternative would not meet any of the Project Objectives, it would avoid all of the Project’s significant impacts, including the Project’s significant and unavoidable construction noise and vibration impacts. Conversely, the No Project Alternative would not result in ART connections between the neighborhoods noted above.

Additionally, VMT and vehicle congestion would not be reduced, and the associated reduction in GHG emissions and air quality improvements would not take place.

Provide non-game days road transportation equivalent to that of the Project. Assume all electric buses with solar shade panels on buses and transit stops.

Response GO18-18 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of how the environmental benefits of the proposed Project would not be realized through the “No Project Alternative.” CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided

sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-19 ES-19/5 Because the TSM Alternative would also avoid the Project’s significant and unavoidable impact with respect to construction noise and vibration without the need for mitigation, and would reduce the range of impacts to the greatest extent listed in Table 4-3, it is deemed the Environmentally Superior Alternative. However, the TSM Alternative would not meet the majority of the Project’s Objectives in full or in part. Conversely, the Spring Street Alignment Alternative would meet all of the Project Objectives.

Provide comparisons of TSM and proposed Project numerical rankings for each Project Objective. Provide required mitigations for full or equivalent compliance for each objective compared to the proposed Project alternative configuration.

Response GO18-19 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 4.0, Alternatives, of the Draft EIR for an analysis of how well the proposed Project and each alternative, including the Transportation Systems Management Alternative, would fulfill the Project Objectives and for a summary of the same in Table 4-1: Alternatives Conformance with Objectives. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-20 ES-22 - ES-84/Table ES-2: Summary of Environmental Impacts

No references to sections/pages/paragraphs.

Project Design Feature(s) (PDF) and/or Mitigation Measure(s) (MM) without clear references within 62 pages of text tables and columns.

Table provisions are inadequate, incomplete, and unrelatable to the DEIR for public review and comments. Provide revised table including specific page/paragraph references to Project and alternatives descriptions.

Response GO18-20 This comment provides a general recitation and characterization of text from the Draft EIR. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. The purpose of Table ES-2 is to provide a summary of the environmental impacts identified in Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (Id., § 15204.)

Comment GO18-21 ES-29/4 ES 13. SUMMARY OF ENVIRONMENTAL IMPACTS Table ES-2 provides a summary of the environmental impacts of the proposed Project evaluated in this Draft EIR. Based on the analysis in Chapter 3.0, Environmental Impact Analysis, implementation of the proposed Project would result in significant and unavoidable impacts related to Noise and Vibration.

The Table is not coordinated and referenced with the text to assure consistency and thereby renders the table irrelevant, inadequate, and incomplete for public review and comments.

As indicated elsewhere below, significant, unavoidable, and unmitigated impacts would arise in the Hydrology, Geology, Visual, Aesthetics, and Services/Infrastructure elements of DTLA.

Provide a fully cross-referenced table with text citations to each sector, and clearly identify significant impacts and required mitigation/compensation.

Response GO18-21 This comment provides a general recitation and characterization of text from the Draft EIR. The purpose of Table ES-2 is to provide a summary of the environmental impacts identified in Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR. Section 3.0 examines the potential environmental effects associated with implementation of the proposed Project by issue area. As provided in Table ES-

2, Section 3.0, and Section 5.1, Significant and Unavoidable Adverse Impacts, of Section 5.0, Other CEQA Considerations of the Draft EIR, the only significant and unavoidable impacts associated with the proposed Project are related to construction noise and vibration (human annoyance). Refer to Section 3.13, Noise, of the Draft EIR for discussion of proposed Project mitigation measures applicable to construction noise and vibration. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-22 ES-29/5 Project Design Features (PDFs), while not necessary for the impact significance determination, are included in Table ES-2 because they are inherent in the design of the proposed Project. Best Management Practices, or other measures required by law and/or permit approvals, are also requirements of the proposed Project. Additionally, Mitigation Measures have been identified and are additional actions designed to avoid, minimize, or compensate for significant environmental impacts and are required where significant impacts have been identified based on the analyses in Chapter 3.0 of this document. Where applicable, Mitigation Measures are described on Table ES-2.

54 pages of Table ES-2, while not necessary, are confusing and distractive compared to Chapters 3 and 4 for public reviewing the EIR. Especially distractive when the DEIR repeatedly references preparation of future final design studies and documents and final design conditions based on further site conditions analyses, descriptions, and changes of Project design conditions.

Provide fully rectified/cross-referenced table or eliminate.

Response GO18-22 This comment provides a general recitation and characterization of text from the Draft EIR. Further, refer to Response GO18-21, and to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project's use of mitigation measures and project design features is consistent with the requirements of CEQA. The Draft EIR includes 7,877 pages of detailed analysis from experts intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts. The shorter executive summary, including the summary of the proposed Project's impacts analysis provided in Table ES-2, explains the Draft EIR's analysis and conclusions in clean and simple language for the public and decisionmakers. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for

the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-23 ES-30 – ES-84 – Table ES-2

No coordination of table summaries and texts (pages/paragraphs). Table is a morass of uncoordinated words in boxes and texts. Totally inadequate and incomplete for public review and comments and purposefully distractive and destructive of meaningful public review/comments.

Response GO18-23 Refer to Response GO18-20.

Comment GO18-24 ES-50 Table ES-2: Summary of Environmental Impacts Geology and Soils

MM-GEO-A: Prepare a Site-Specific Final Geotechnical Report. The Project Sponsor shall engage a California-registered geotechnical engineer to prepare and submit a site-specific final geotechnical investigation and report to the City of Los Angeles for review, consistent with the requirements of the CBC, applicable Los Angeles amendments, and California Geological Survey Special Publication 117 (as amended). A site-specific geotechnical exploration program, along with associated laboratory testing, is necessary to complete a design-level evaluation of the geologic hazards and conditions, seismic hazards, grading conditions, and foundation capacities. The site-specific final geotechnical report shall provide a description of the geological and geotechnical conditions at the site; the findings, conclusions, and mitigation recommendations for potential geologic and seismic hazards;

and

design-level geotechnical recommendations in support of grading and foundation design....recommended measures to reduce potential impacts related to landslides, subsidence, liquefaction, differential settlement, expansive soils, soil corrosivity, or other potential ground failures induced by the proposed Project. ...ES-51...The submittal and approval of the final geotechnical report shall be a condition of the grading and construction permits issued by the City of Los Angeles Department of Building and Safety. The Project Sponsor shall implement the recommendations contained in the approved report during project design and construction.

Geology and hazards/hazardous materials sections both reference the "Site Specific Final Geotechnical Report" which must be prepared and considered during final pre-construction stages and which will not be available for public review and comments.

This current discussion of impacts clearly is biased, vague, inadequate, and incomplete for descriptions and assessments and not provided by qualified specialists.

Provide a sites specific geotechnical report based on actual borehole and sediments/groundwater chemical analyses as part of a revised/subsequent Environmental Impact Report for the Project.

Current literature reviews and discussions do not include Metro’s extensive experiences with soil and groundwater contamination experienced during construction of the Red Line Station at Union Station which required millions of additional change-order costs, major groundwater collection and treatment of contaminated groundwater. Then experiences indicated that methane, numerous hydrocarbons, and creosote had sources between Chavez and Broadway from oil fields, oil processing facilities, railroad yards, and railroad ties/wood soaking pits.

Provide review of existing conditions and potential impacts from foundations/pile caps, pile drilling, and pile placement/formation at each tower and project support features. Provide geotechnical/chemical composition testing and drilling/sampling in at least four borings per tower and revise the Project area description and impact assessment accordingly.

Response GO18-24 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Plans in Mitigation Measures and Project Design Features, for discussion of how the use of plans in mitigation measures does not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to geology and soils upon implementation of Mitigation Measures GEO-A. Refer to Section 3.09, Hazards and Hazardous Materials, of the Draft EIR for discussion of how the proposed Project would have less than significant impacts with implementation of Mitigation Measures HAZ-A and HAZ-B. Also, CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-25 ES-52 A PRMMP shall be developed by a qualified paleontologist meeting the criteria established by the Society for Vertebrate Paleontology. The plan shall apply to paleontologically sensitive deposits, including older Quaternary alluvium and Puente formation deposits, that may be impacted by the proposed Project, as determined by a qualified paleontologist in consultation with the construction team and guided by geotechnical coring. The qualified paleontologist shall supervise the paleontological

monitor, who shall be present during construction excavations into older Quaternary alluvial deposits and Miocene Puente formation deposits. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains, and where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. The frequency of monitoring inspections shall be determined by the paleontologist, and shall be based on the rate of ground-disturbing activities, the material being excavated, and the depth of excavation; and if found, the abundance and type of paleontological materials. If any paleontological materials are found, the paleontological monitor shall temporarily divert or redirect ground-disturbing activities in the area of the exposed fossil to facilitate evaluation, and if necessary, salvage. The paleontologist shall assess the discovered material(s) and provide a recommendation(s), if necessary, for the preservation, conservation, or relocation of the resource, as appropriate. The Project Sponsor shall comply with the recommendations of the...53...evaluating paleontologist, and ground-disturbing activities may resume once the paleontologist's recommendations have been implemented to the paleontologist's satisfaction. If paleontological materials are found, the paleontologist shall prepare a report identifying the resource and the recommendations proposed and implemented, within 1 year of completion of the fieldwork. A copy of the report shall be submitted to the Los Angeles County Natural History Museum.

Compared to 6-37/1 "Mitigation Measures GEO-A (prepared a site-specific final geotechnical report) and GEO-B (prepare a paleontological resource monitoring and mitigation plan (PRMMP)) would also be implemented."

Unlike other future mitigation measures, the PRMMP is laced with "shall" rather than "would" although no such document is or would be available for public review and comments prior to approval of the Project by Metro Board. Provide all mitigation measures with "shall" and remove any conditional instructions as a required and dependent condition for all impact assessments. Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (S-DEIR) for public review and comments.

Response GO18-25 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Plans in Mitigation Measures and Project Design Features, for discussion of how the use of plans in mitigation measures does not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review. Refer to Section 7.0, Mitigation Monitoring and Reporting Program, and Table 7-1, Mitigation Monitoring and Reporting Program (MMRP), of the Final EIR. The Mitigation Monitoring and Reporting Program will prescribe for agency enforcement of mitigation measures for the proposed Project, including Mitigation Measure GEO-B. Further, Mitigation Measure GEO-B prescribes the mandatory elements of the Paleontological Resources Monitoring and Mitigation

Plan (PRMMP), including what deposits and actions are subject to the plan, when monitoring is required, and how monitoring should be conducted. Mitigation Measure GEO-B further outlines potential steps for mitigation, and requires that the Project Sponsor comply the evaluating paleontologist's recommendations. No ground-disturbing activities may continue until these recommendations have been implemented to the paleontologist's satisfaction. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5.

Comment GO18-26 ES-53 MM-HAZ-A: Prepare a Soil and Groundwater Management Plan. The Project Sponsor shall retain a qualified environmental consultant to prepare a Soil and Groundwater Management Plan prior to any re-grading, decommissioning, or construction activities. The Soil and Groundwater Management Plan would be prepared and implemented to specify methods for handling and disposal in the event contaminated groundwater, contaminated soil, or structures are encountered during Project construction. The Soil and Groundwater Management Plan shall provide a summary of...54...the environmental conditions at each Project component site, including stations and towers.

The Soil and Groundwater Management Plan shall include methods and procedures for sampling and analyzing soils and/or groundwater to classify them as either hazardous or non-hazardous; and if identified as hazardous, shall include additional methods and procedures for the proper handling and removal of impacted soils and/or groundwater for off-site disposal and/or recycle.

Methods and procedures in the Soil and Groundwater Management Plan shall be in accordance with current federal, state, and local regulations, and be protective of workers and the environment.

Unlike other future mitigation measures, the S&GWMP is laced with some "shall" and a "would", although no such document is or would be available for public review and comments prior to approval of the Project by Metro Board.

Provide a S&GWMP with all mitigation measures with "shall" and remove any conditional instructions as a required and dependent condition for all impact assessments.

Response GO18-26 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Plans in Mitigation Measures and Project Design Features, for discussion of how the use of plans in mitigation measures does not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible

at the time of CEQA review. Nevertheless, refer to Section 5.0, Corrections and Additions, of the Final EIR, for a discussion of how in response to comments requesting additional clarification on the enforcement mechanisms and standards in Mitigation Measure HAZ-A, an addition to the Draft EIR has been provided to clarify that the Soil and Groundwater Management Plan shall be submitted to the Los Angeles Department of Building and Safety for review prior to the commencement of demolition and construction activities and as a condition of the grading, construction, and/or demolition permit(s). The addition also recognizes that Mitigation Measure HAZ-A requires full compliance with all applicable local, state, and federal regulations (including but not limited to, as applicable, OSHA Safety and Health Standards, Cal/OSHA requirements, federal, state and local waste disposal regulations, SCAQMD Rule 1166, as well as any other applicable requirements of the California Department of Toxic Substances, the Los Angeles Regional Water Quality Control Board, and the City of Los Angeles) related to the identification, excavation, transportation, and disposal of hazardous materials, including those encountered in excavated soil and dewatered groundwater.

Comment GO18-27 1-1/4 The aerial gondola system would consist of cables, three passenger stations, a non-passenger junction, towers, and gondola cabins. When complete, the proposed Project would have a maximum capacity of approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes.

Attempts to confirm passenger transport requires more specific information than provided, the DEIR is inadequate to confirm Project capacities and therefore is incomplete and inadequate for public review and comments.

Provide full engineering drawings for any type of gondolas to be used for this Project and demonstrate typical event passenger positions and the total number of passengers to be safely transported.

Provide a numerical and timed flow chart for passenger conveyance from Alameda to Stadium stations using 420 seconds for total trips (including loading/unloading, seating/standing, Park Station stops/goes and other identifiable activities).

Response GO18-27 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphpd). CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA also does not require "a lead agency to conduct every test or perform all research, study, and experimentation

recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (Id., § 15204.)

Comment GO18-28 1-1/6 1.2 PURPOSE OF THIS DRAFT ENVIRONMENTAL IMPACT REPORT In accordance with Sections 15050 and 15367 of the CEQA Guidelines, Metro is the Lead Agency for the proposed Project, and has the principal responsibility for approving the proposed Project. This Draft EIR has been prepared for the following purposes:

Given the number of agencies involved in Project, absence of an Memorandum of Agreement/Understanding must be provided especially for the responsibilities and origins of design and engineering aspects, without such the DEIR is incomplete and inadequate for CEQA.

Provide MOA/MOU regarding Lead Agency agreement, parties, status, and responsibilities.

Provide MOA with LACity-DPW, DOT, DB&S.

Provide submission date for DEIR and NOA via SCH/OPR. NOP was issued to SCH but not so far for NOA/EIR.

Provide MOA of Metro and Calif. State Lands Commission.

Response GO18-28 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority. Refer to the proposed Project’s SB 44 website for documents related to the proposed Project, including the Notice of Availability (NOP) for the Draft EIR: <https://laartsb44.net/#!/documents>. The NOP for the proposed Project was released on October 1, 2020, and the Draft EIR for the proposed Project was released on October 17, 2022.

CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (Id., § 15204.)

Comment GO18-29 1-2/2 • To inform public, agency decision makers and the public of the environmental effects of the proposed Project, including any significant environmental effects, as

well as possible ways to minimize those significant effects, and reasonable alternatives to the proposed Project.

- To enable Metro to consider environmental consequences when deciding whether to approve the proposed Project.
- To enable other responsible public agencies that must approve activities undertaken with respect to the proposed Project, including permits and other approvals, to consider the environmental effects of the proposed Project.

Given the number of agencies involved in Project, absence of an Memorandum of Agreement/Understanding must be provided especially for the responsibilities and origins of design and engineering aspects, without such the DEIR is incomplete and inadequate for CEQA.

Provide definitions and requirements for use of Possible vs Feasible,

Provide draft MMRP for summary of mitigation and enforcement.

Provide contracts (drafts of issued) for inspection and construction operations.

Provide drafts of Preliminary/Final Design Documents and their use in construction contracts.

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Response GO18-29 This comment provides a general recitation and characterization of text from the Draft EIR. The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Project was prepared consistent with the requirements of CEQA Guidelines section 15097. As demonstrated in Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR, the MMRP prescribes for agency enforcement of mitigation measures for the proposed Project. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. Refer to Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR for details on the proposed Project construction. The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-30 1-2/3 As described in CEQA and the CEQA Guidelines, lead agencies are charged with the duty to avoid or substantially lessen significant environmental impacts of a project, where feasible. For some effects, significant environmental impacts cannot be mitigated to a level considered less than significant; in such cases, impacts are considered significant and unavoidable. In discharging this duty, a lead agency has an obligation to balance the economic, social, technological, legal, and other benefits of a project against its significant unavoidable impacts on the environment. This Draft EIR is an informational document, designed to identify the potentially significant impacts of the proposed Project on the environment; to indicate the manner in which those significant impacts can be minimized; to identify reasonable and potentially feasible alternatives to the proposed Project that would avoid or reduce the significant impacts; and to identify any significant unavoidable adverse impacts that cannot be mitigated.

Provide Citations/References list including specific page and paragraph for each document reference.

Provide clear definition of feasible and economic benefits, including costs/financials/fiscal aspect and apply same to all aspects of the Project.

Provide financial assessments of all construction and operations activities and public/private cost/economic sharing/distributions.

Provide financial and economic analyses for first five years of operations after stated targets of event ridership are attained.

Provide summary list of all significant impacts based on current level of design and those following detailed construction design documentation.

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Response GO18-30 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 9.0, References, of the Draft EIR for a list of references. Refer to page ES-17, in the Executive Summary, and page 5-1, in Section 5.0, Other CEQA Considerations, of the Draft EIR, for a summary of significant and unavoidable impacts. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to

“provide all information requested by reviewers.” (Id., § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-31 1-2/4 1.3 CEQA RESPONSIBLE AND TRUSTEE AGENCIES

The information in this Draft EIR may also be used by other agencies involved with the Project that have a responsibility under CEQA, including but not limited to, the following:

- California Department of Parks and Recreation
- California Department of Transportation
- City of Los Angeles

Provide a list of all agency and the lead-agency agreements (MOA/MOU) and all assigned responsibilities for each and for Metro/MTA.

Provide all funding requirements and assignments for full implementation of construction and initial operations for each responsible agency.

Provide a list of organizations and assignees for LA City Boards/Commissions and Dept.s of Transportation, Building and Safety, and Public Works (City Engineer, Bureaus of Street Services and Engineering).

For CEQA OPR/SCH# SCH# 2020100007, Add County departments (DPW, DRP, LASD, etc).

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Response GO18-31 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.10, Required Permits and Approvals, in Section 2.0, Project Description, of the Draft EIR, for a list of required permits and approvals from responsible agencies for the proposed Project. Refer to Section 1.0, Introduction, of the Draft EIR, for discussion of the CEQA Responsible and Trustee Agencies. The County of Los Angeles is not a responsible agency for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code

Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-32 2-42/2 During peak operations, the proposed Project would carry up to approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes. The cabins would move at a maximum speed of 13.4 miles per hour with headways of approximately 23 seconds, which represents the time between cabins.

40 passengers/gondola loading in 19sec w/ 2sec / closing and opening doors = 4 pass/sec
40 out = 10sec + 40 in = 9sec

Provide a quantified flowchart/model for a single RT Cabin travel with speeds and durations to confirm the stated speeds and headways, along with durations of travel, stopping/starting, loading/unloading, and total RT.

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Response GO18-32 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphpd). CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-33 2-9/5 2.3.6 Project Purpose, Need, and Objectives

Remove “Need” which is a federal NEPA replacement for Objective-CEQA, perhaps replace all “Purposes” with “Goals”.

2-10/1 2.3.7 Purpose and Need

2-12/1 Within two hours prior to the start of and after a game or event at Dodger Stadium, more than 10,000 people could be transported to the stadium via the proposed Project. The average attendance at a Dodger game was approximately 49,000 for the 2019 season.¹⁸ Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Remove “Need” which is a federal NEPA replacement for Objective-CEQA, perhaps replace all “Purposes” with “Goals”.

Response GO18-33 This comment provides a general recitation and characterization of text from the Draft EIR. The Draft EIR addressed the Purpose and Need for the proposed Project in Section 2.3.7 and the Project Objectives in Section 2.3.8. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project’s objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project’s fundamental purpose of providing a permanent transit connection to Dodger Stadium.

Comment GO18-34 2-12/4 2.3.8 Project Objectives

Provide clear and quantifiable definitions of Goals/Purposes, their directly related objectives, and the policies/programs related thereto for the specifics of this Project and its alternatives.

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Response GO18-34 This comment provides a general recitation and characterization of text from the Draft EIR. The Draft EIR addressed the Purpose and Need for the proposed Project in Section 2.3.7 and the Project Objectives in Section 2.3.8. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project’s objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project’s fundamental purpose of providing a permanent transit connection to Dodger Stadium. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead

agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) Finally, the CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-35 3.5-1/1 3.5 CULTURAL RESOURCES This section evaluates the potential impacts of the proposed Project as it relates to cultural resources, including built resources and archaeological resources. The analysis in this section is based in part on information contained in the Archaeological and Paleontological Resources Assessment for the...Project and the Historical Resource Technical Report for the...Project prepared for the proposed Project (Appendices F and G of this Draft EIR, respectively).

Provide specific page/par citations for all base information for this description and assessment. Provide a mandatory Mitigation, Monitoring, and Report Plan, including recovery of significant remains for all foundation and piling construction activities.

Response GO18-35 This comment provides a general recitation and characterization of text from the Draft EIR. The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Mitigation for archaeological resources addresses the potential for encountering archaeological resources during ground disturbing construction activities (see, e.g., Mitigation Measures CUL-A, CUL-C, CUL-D, and CUL-E). Refer to Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR for the Mitigation Monitoring and Reporting Program. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-36 3.5-24/1 Overall, the mitigation measures discussed above would ensure that the proposed Project, when combined with other related projects, would not result in significant impacts to historic resources. Therefore, cumulative impacts with respect to historic resources would be less than significant.

No identification of “other related projects” has been provided related to either historic, archaeological, or paleontological resources.

Use of conditionals for assurances is vague and uncommittable for this and any other environmental sector. Provide replacements of “shall” for all “would’s”.

Response GO18-36 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Table 5-1: Related Projects and Figure 5-1: Related Projects Map. As discussed in Section 5.0, the list of related projects includes projects that are anticipated to be constructed during the same timeframe as the proposed Project and operational at the same time as the proposed Project. The list of related projects is derived from information provided by the City of Los Angeles Department of City Planning and the Los Angeles Department of Transportation (LADOT). Refer to Section 5.2.5, Cultural Resources, of the Draft EIR, for discussion of cumulative impacts to cultural resources. Refer to Section 3.07, Geology and Soils, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts to paleontological resources upon implementation of Mitigation Measure GEO-B. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts.

Comment GO18-37 3.7-1/3 Before a project can be permitted, a geologic investigation is required to demonstrate that proposed buildings would not be constructed across active faults capable of surface fault rupture. An evaluation and written report of a specific site must be prepared by a licensed geologist. If an active fault capable of surface fault rupture is found, a structure for human occupancy cannot be placed over the trace of the fault, and must be set back from the fault (generally 50 feet).\2 Because no active faults capable of surface rupture cross the Project alignment, a fault investigation is not required. The fault closest to the Project alignment is the Elysian Park fault. The Upper Elysian Park fault is a north-to-northeast–dipping fault that underlies the northern Los Angeles basin from Griffith Park to Garvey Reservoir. However, the Elysian Park fault is a blind thrust fault, which means it is not capable of surface fault rupture, and therefore is not subject to the conditions of the Alquist-Priolo Act.

The Project is planned for elements (Stadium and Park Stations, Broadway Junction, & SR-110 Tower) to be located “Within Fault Zone” (ZIMAS) on the surface of the Upper Elysian Park Fault.

As a signatory agency for this Project, such assignment of seismic hazards to the ground for this Project must be considered reliable and worthy of evaluation and assessment.

The Project must provide a thorough review of the ZIMAS backup/-ground for the Upper Elysian Park Fault. Such review must be available for public review and

comments under CEQA and therefore must be included in the supplemental/subsequent DEIR.

Response GO18-37 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes, including all standards addressing environmental factors such as seismic effects, and would have less than significant impacts related to geology and soils upon implementation of Mitigation Measures GEO-A. Refer to Response GO18-3 regarding ZIMAS. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-38 3.7-11/1 Additionally, the Stadium Tower and Dodger Stadium Station sites are in a City-designated hillside area, which increases the sites’ potential susceptibility to landslides. Because of the steep slopes and high seismicity in the vicinity of the proposed Stadium Tower and the...Stadium Station, the potential for earthquake-induced slope failure could be considered moderate to high in the landslide hazard zone. FN City of Los Angeles. Zone Information and Map Access (ZIMAS). Interactive map available at: <http://zimas.lacity.org/>. Accessed August 2022.

Provide map of “City-Designated Hillside Area” including various failure considerations mentioned and pertinent references for such. Such review must be provided for public review and comments under CEQA and therefore must be included in the supplemental/subsequent DEIR.

Response GO18-38 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR. Section 3.07 and Appendix I discuss the location of the Stadium Tower and Dodger Stadium Station in a City-designated hillside area for the purposes of evaluating their susceptibility to landslides. Further, Figure 3.7-2, Seismic Hazards with the Project Area, maps the earthquake-induced landslide zones in the proposed Project area. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test

or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-39 3.7-11/2 3.7.2.6 Subsidence Subsidence is the loss of surface elevation due to the removal of subsurface support. Subsidence is caused by the reduction of pore space in the ground that was formerly occupied by a fluid such as water or oil, caused by activities that contribute to the loss of support materials within the underlying soils, such as agricultural practices or the overdraft of an aquifer. The existing alluvium of the Project area is susceptible to collapse or settlements; therefore, there is a moderate potential for subsidence to occur.

No factual backup is provided for such statements, nor is any reference provided for both the alluvial and bedrock areas of the alignment.

Provide all LiDAR sources and topographic reference materials and conduct assessments of past and thereby potential future subsidence of ground surfaces along the alignment and at each ground facility to be constructed. Provide review of past and potentials for subsidences at all ground facilities sites, especially those within the Elysian Park Fault surface zones (ZIMAS).

Provide estimates of dewatering requirements for towers, junction, and stations.

Such assessments and reviews must be provided for public review and comments under CEQA and therefore must be included in the supplemental/subsequent DEIR.

Response GO18-39 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report of the Draft EIR for discussion of subsidence. As discussed in 3.07, Mitigation Measure GEO-A would require development of a site-specific geotechnical investigation and report that would include geotechnical recommendations for project design and construction based on grading conditions and foundation capacities, including an evaluation of risk of subsidence. The submittal and approval of the final geotechnical report would be a condition of the grading and construction permits issued by the City of Los Angeles and recommendations would be implemented during project design and construction. Also, refer to Section 3.10, Hydrology and Water Quality, for a discussion of groundwater. Based on groundwater depths, none of the proposed excavations for foundations are anticipated to encounter groundwater; however, removal of nuisance water that seeps into boreholes during construction may be required for the pile installations at each of the components. Groundwater may be encountered during installation of piles, and any nuisance water removed would need to be analyzed prior to disposal. CEQA does not require extensive detail beyond that

needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-40 3.7-8/1 The southern California area contains numerous active and potentially active earthquake faults....The Project site is not in a State of California Earthquake Fault Zone for known Holocene active faults capable of fault surface rupture, or in an Alquist-Priolo Earthquake Fault Zone.\13

The Project must provide a thorough review of the ZIMAS backup/-ground for the Upper Elysian Park Fault. Such review must be provided for public review and comments under CEQA and therefore must be included in the supplemental/subsequent DEIR.

Response GO18-40 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for discussion of the Elysian Park Fault. As discussed in Section 3.07, the Elysian Park Fault is not capable of producing surface rupture and the Alquist-Priolo Earthquake Fault Zoning Act is not applicable, including the requirement to prepare a geologic investigation. Refer to Response GO18-3 regarding ZIMAS. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-41 3.7-8/2 The fault closest to the Project site is the Elysian Park fault. According to the U.S. Geological Survey Quaternary fault and fold database, the location of the Upper Elysian Park fault is inferred to cross under the alignment. The Upper Elysian Park fault is a north-to-northeast-dipping fault that underlies the northern Los Angeles basin from Griffith Park to Garvey Reservoir [Monterey Park]. However, the Elysian Park fault is a blind thrust fault, which means it is not capable of surface fault rupture,....The Elysian Park thrust fault is considered to be seismogenic (capable of generating earthquakes) from a depth of approximately 2 miles below ground surface in the south-southwest, to approximately 10 miles below ground surface in the north-northeast.

Provide reference to USGS Quaternary fault and fold database.

The Project is planned and located for Project elements (Stadium and Park Stations, Broadway Junction, & SR-110 Tower) to be located “Within Fault Zone” (ZIMAS) on the surface of the Upper Elysian Park Fault.

As a signatory agency for this Project, such assignment of seismic hazards to the ground for this Project must be considered reliable and worthy of evaluation and assessment.

The Project must provide a thorough review of the ZIMAS backup/-ground for the Upper Elysian Park Fault. Such review must be available for public review and comments under CEQA and therefore must be included in the supplemental/subsequent DEIR.

All areas south of Broadway are indicated by ZIMAS as being subject to liquefaction during an earthquake. Provide all engineering design consideration for liquefaction, subsidence, and shaking from a 6.4 magnitude earthquake in the Upper Elysian Park Fault.

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Response GO18-41 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, and Appendix F, Memo on Structural Engineering, of the Final EIR for discussion of how the proposed Project would meet applicable standards, requirements, and building codes and would have less than significant impacts related to geology and soils, including liquefaction, landslides, subsidence, and seismic shaking, upon implementation of Mitigation Measures GEO-A. As discussed on page 3.7-8 and page 17 of Appendix I, according to the U.S. Geological Survey Quaternary fault and fold database, the location of the Upper Elysian Park fault is inferred to cross under the alignment. This reference to the U.S. Geological Survey Quaternary fault and fold database on page 3.7-8 of Section 3.07 and page 17 of Appendix I, has been incorporated into Section 5.0, Corrections and Additions, of this Final EIR. Refer to Response GO18-3 regarding ZIMAS.

In addition, the detailed construction assumptions for the proposed Project are set forth in Appendix B, Construction Assumptions, of the Draft EIR. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-42 3.7-11/2 3.7.2.6 Subsidence Subsidence is the loss of surface elevation due to the removal of subsurface support. Subsidence is caused by the reduction of pore space in the ground that was formerly occupied by a fluid such as water or oil, caused by activities that contribute to the loss of support materials within the underlying soils.... The existing alluvium of the Project area is susceptible to collapse or settlements; therefore, there is a moderate potential for subsidence to occur.

EIR does not mention any subsidence experienced over the Union Station and Los Angeles Oil Fields and their production.

As these fields and their underlying reservoirs were not subject to injection and other returns of fluids/pressures, subsidence would be assumed to be dominant, and the DEIR would be considered incomplete and inadequate.

Provide a review and engineering considerations for an earthquake on the Upper Elysian Park Fault and associated impacts from liquefaction and subsidence associated for the Project.

Response GO18-42 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of the Final EIR for discussion of how the proposed Project would meet applicable standards, requirements, and building codes and would have less than significant impacts related to subsidence and liquefaction upon implementation of Mitigation Measure GEO-A. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-43 3.7-11/4 The majority of the Project area is on the floodplain of the Los Angeles River and its tributaries: Cemetery Ravine, and Chavez Ravine. As shown in Figure 3.7-1, the geologic unit for the Project area is mapped as younger Quaternary alluvium, and consists of unconsolidated deposits of silt, sand, and gravel deposited relatively recently by the meandering Los Angeles River and its tributaries. The sediments were deposited during the Holocene, within the last approximately 11,700 years, and are

therefore too young to typically contain significant fossil deposits. Along the Los Angeles River, the younger Quaternary deposits can be tens of feet thick.

DEIR requires facts rather than conjecture and possibilities; DEIR requires borings and samplings at each tower/station/junction sites, and assessment of ages and potential scientific importance of fossil contained within each site.

Provide 1-4 borings for each construction site and assess for pollen, wood, micro-fossils, and bone fragments

Provide usage of consistent terms, younger Quaternary or Holocene or <11,700 years old, throughout the document. Encountering of any remains would be significant as Paleoindian deposits are known from more than 10,000 years old and associated with mammoth elephants.

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Mitigation Measures GEO-A (prepared a site-specific final geotechnical report) and GEO-B (prepare a paleontological resource monitoring and mitigation plan (PRMMP)) would also be implemented.

Use of conditionals for mitigation renders the document inadequate. Provide an adequate and well-established MMP for paleontological and archaeological remains and include as required plans before certification of the CEQA documents and processes..

Response GO18-43 This comment provides a general recitation and characterization of text from the Draft EIR. The comment questions the consistent use of the terms “younger Quaternary or Holocene or <11,700 years old.” The term “younger Quaternary” in the cited text describes how the term is employed in Figure 3.7-1. Figure 3.7-1 is based on Figure 3 in Appendix I, Los Angeles Aerial Rapid Transit Geotechnical Document in Support of the Environmental Impact Report. The data used in Figure 3 are derived from the Preliminary Geologic Map of the Los Angeles 30’x 60’ Quadrangle, California, produced by the California Geological Survey. The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to archaeological resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project. As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the mitigation measures for the proposed Project would not impermissibly defer mitigation. The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Project was prepared consistent with the requirements of CEQA Guidelines section 15097. As demonstrated in Section 7.0,

Mitigation Monitoring and Reporting Program, of the Final EIR, the MMRP prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) Not only are the requested borings unnecessary to evaluate potential environmental impacts, such borings are impracticable. As discussed in Topical Response I, as noted on page 3.7-19, of Section 3.07, Geology and Soils, of the Draft EIR, "[c]onstruction work is anticipated to reach up to 125 feet in depth for installation of the piles and an excavation depth of up to 10 feet, except for at the proposed Dodger Stadium Station, which has an excavation depth of 42 feet." Therefore, monitoring described in Mitigation Measure GEO-B is appropriately reserved as part of the construction in order to avoid the need to excavate more than once in connection with the proposed Project. Likewise, as discussed in Section 3.09, Hazards and Hazardous Materials, Appendix K, Phase I Environmental Site Assessment, and Appendix L, Hydrology Technical Report, of the Draft EIR, the Draft EIR conducted an extensive preliminary investigation of the proposed Project's sites to determine whether the site exhibited contamination from hazardous materials or would otherwise have impacts to groundwater. Based on this investigation, the Draft EIR concluded that additional investigation may be appropriate, although a full investigation is impracticable at this time because the Project Sponsor does not have access agreements for all the underlying properties and would have to obtain these agreements prior to testing. Moreover, it is appropriate for the Project Sponsor to test soils for contamination at the time the soil is disturbed and properly handle and remove any contaminated soil or groundwater at this time for off-site disposal and/or recycling, as outlined in Mitigation Measure HAZ-A. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, §15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-44 3.7-12/4 / 71/2 There are also significant fossil deposits in the Miocene Puente Formation near the Area of Direct Impacts. Northeast of the Area of Direct Impacts, near the intersection of North San Fernando Road and Humboldt Street, a fossil snake mackerel....At locality LACM 4967, just outside the Project area in Elysian Park, an extinct fossil herring (*Clupea tiejei*) was recovered. Fossil fish and marine mammals

are commonly found at localities in the Puente Formation, which is considered to have a high sensitivity for significant fossil remains.

Identify potential significant impacts for paleontological remains for the Broadway Junction, Tower, and Stadium Station construction and mitigation provided by an adequate MMP for paleontological resources and specifically for excavations and pile borings for these sites.

Provide for thorough investigation of boring samples for ostracodes, diatoms, and foraminifera within Project sites.

Provide results for potential and mitigation from Buena Vista Project investigations.

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Response GO18-44 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts to paleontological resources upon implementation of Mitigation Measure GEO-B. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) Finally, the CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified. Refer to Response GO18-43 for a discussion of why boring sampling for paleontological resources is impracticable at this juncture.

Comment GO18-45 3.7-14/1 As discussed above, the Elysian Park fault traverses the Project area; however, it is a blind thrust fault, which means it is not capable of surface fault rupture. Accordingly, the risk of surface rupture due to faulting is considered low. Construction of the proposed Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. Impacts related to rupture of a known earthquake fault would be less than significant.

The EIR is totally inadequate and incomplete, as the City of Los Angeles ZIMAS (DCP) Database clearly designates northern half (north of College St. to Casanova St.) of the

Project route within the “Fault Zone” of the Upper Elysian Park North Fault in surface parcels.

As a signatory agency for this Project, such LA City assignment of seismic hazards to the ground for this Project must be considered reliable and worthy of evaluation and assessment.

The Project must provide a thorough review of the ZIMAS backup/-ground for the Upper Elysian Park Fault. Such review must be available for public review and comments under CEQA and therefore must be included in the supplemental/subsequent DEIR.

All areas south of Broadway are indicated by ZIMAS as being subject to liquefaction during an earthquake. Provide all engineering design consideration for liquefaction, subsidence, and shaking from a 6.4 magnitude earthquake in the Upper Elysian Park Fault.

Response GO18-45 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-3 regarding ZIMAS. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes, including all standards addressing environmental factors such as seismic effects, and would have less than significant impacts related to geology and soils, including liquefaction and subsidence, upon implementation of Mitigation Measure GEO-A. Refer to Section 3.09, Hazards and Hazardous Materials, of the Draft EIR for discussion of how the proposed Project would have less than significant impacts related to hazards and hazardous materials upon implementation of Mitigation Measures HAZ-A and HAZ-B. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-46 3.7-14/2 The Alameda Station,...are in an area mapped as potentially subject to liquefaction, as shown on Figure 3.7-2. The Stadium Tower and Dodger Stadium Station are approximately 20 feet and 60 feet from a mapped liquefaction zone, respectively.

The EIR is totally inadequate and incomplete, as the City of Los Angeles ZIMAS (DCP) Database clearly designates the parcel including the tower and station as being subject to landslides AND liquefaction and being within the “Fault Zone” for the Upper Elysian Park North Fault.

Response GO18-46 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-3 regarding ZIMAS. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes, including all standards addressing environmental factors such as seismic effects, and would have less than significant impacts related to geology and soils, including liquefaction and subsidence, upon implementation of Mitigation Measures GEO-A.

Comment GO18-47 3.7-14/2 Liquefaction-induced settlement can occur during a seismic event, but can also be exacerbated by increased loading during construction activities. Because there is potential for liquefaction-induced settlement and collapse during a strong to severe ground-shaking event, damage to on-site structures and infrastructure could occur during construction of the proposed Project. Therefore, impacts related to strong seismic ground shaking, seismic-related ground failure, and/or liquefaction during construction of the proposed Project would be potentially significant.

Seismic impacts on the Project facilities would be significant if occurring during construction but would even be more significant if occurring during operations and especially during a game day operations. Provide revised DEIR and add “operations” of at least 50 years. Provide Project safety and operations response plans to the DEIR and Mitigation, Monitoring and Report Plan.

Although stated as “potentially significant”, the DEIR does not clearly identify such as significant, only noise and vibration. Revise throughout the DEIR to include seismic impacts as significant and provide for suitable mitigation measures in the subsequent/supplement DEIR when recirculated.

Response GO18-47 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes, including all standards addressing environmental factors such as seismic effects, and would have less than significant impacts related to geology and soils, including liquefaction and subsidence, upon implementation of Mitigation Measures GEO-A. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project’s use of mitigation measures and project design features is consistent with the requirements of CEQA.

The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Project was prepared consistent with the requirements of CEQA Guidelines section 15097. As demonstrated in Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR, the MMRP prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified. This comment also does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5.

Comment GO18-48 3.7-14/3 The proposed Project...would ensure structural integrity and safe construction. Additionally, Mitigation Measure GEO-A, development of a site-specific geotechnical investigation and report to be approved by the City of Los Angeles, would be required. The geotechnical investigation and report would include geotechnical recommendations for project design and construction. With compliance to existing standards and codes and implementation of Mitigation Measure GEO-A, impacts related to the strong seismic ground shaking, seismic-related ground failure, and/or liquefaction during construction of the proposed Project would be reduced to less than significant.

Conditional references and allusions to future studies and assessment cannot be considered as Project commitments especially as no design nor construction contract designs and specifications have been provided. Provide contract specifications and drawings to confirm “recommendations” will be incorporated into the Design and into the construction contract documents.

As the investigation, report, and recommendations are not part of the current DEIR, they cannot be considered in the review for completeness and adequacy and the potential for seismic related impacts must be considered significant and the DEIR must be considered as incomplete and inadequate.

Once provided, the DEIR must be recirculated as a supplement, subsequent DEIR for public review and comments.

Response GO18-48 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time

the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5.

Comment GO18-49 3.7-15/1 Therefore, impacts related to earthquake-induced slope failure could be considered moderately significant to significant. However, compliance with existing laws and regulations, and implementation of Mitigation Measure GEO-A, requiring the development and implementation of geotechnical recommendations to be incorporated into the design plans and specifications, including applicable site stabilization based on grading conditions and foundation capacities, would prevent instability of the slope during construction, and reduce impacts to less than significant under the proposed Project.

Based on ZIMAS assignments of the Elysian Fault Zone. Provide description and assessment for facilities located in the LA City-documented fault zone and liquefaction/landslide risks.

Provide technical evaluation of current designs for a proposed 6.4 magnitude earthquake at >10,000 depth, and specifically the effects on a gondola with 40 passengers between Park Station and Broadway Tower.

As the investigation, report, and recommendations are not part of the current DEIR, they cannot be considered in the review for completeness and adequacy and the potential for seismic related impacts must be considered significant and the DEIR must be considered as incomplete and inadequate. Once provided, the DEIR maybe recirculated as a supplement, subsequent DEIR for public review and comments.

Response GO18-49 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed project would meet applicable standards, requirements, and building

codes and would have less than significant impacts related to seismic-related ground failures upon implementation of Mitigation Measure GEO-A, as well as for a discussion of regional seismic hazards and seismic hazards within the proposed Project area (depicted in Figure 3.7-2, Seismic Hazards within the Project Area). Section 3.7.1, Regulatory Setting, recognizes that the Elysian Park fault is the fault located closest to the Project alignment. The Elysian Park fault is a blind thrust fault, which means it is not capable of surface fault rupture. As discussed in Section 3.07, the proposed Project would result in less than significant impacts with mitigation for construction impacts and less than significant impacts for operational impacts related to the risk of loss, injury, or death involving rupture of a known earthquake fault, strong seismic ground shaking, seismic-related ground failure, including liquefaction or landslides. Refer to Response GO18-48 for a discussion of how mitigation measures may appropriately include additional studies, how CEQA does not require the EIR to include all information requested by commenters, and how recirculation or a supplemental or subsequent EIR is not required.

Comment GO18-50 3.7-15/3 In addition, the proposed Project would adhere to its Emergency Operations Plan, as described in Chapter 2, Project Description....would include emergency response protocols, and would state that in the event of a major earthquake, the system would be fully evacuated and shut down, and would not operate. The proposed Project would be designed and constructed in accordance with applicable building codes, and therefore would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault; strong seismic ground shaking; seismic-related ground failure, including liquefaction; or landslides, and the impact would be less than significant.

No draft EOP has been provided and references to it are incomplete, inadequate, and conditional without any public review or comments. Provide a draft Emergency Operations/Response Plan within the EIR and recirculate EIR.

Provide definition of “potential”, “substantial”, and adverse effects.

As mentioned, once the system is shutdown, provide detailed response plan to remove 30-40 passengers from a gondola above the Park.

As the Plan, protocols, report, plans, designs, and recommendations are not part of the current DEIR, they cannot be considered in the review for completeness and adequacy and the potential for seismic related impacts must be considered significant and the DEIR must be considered as incomplete and inadequate. Once provided, the DEIR maybe recirculated as a supplement, subsequent DEIR for public review and comments.

Response GO18-50 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, of the Draft EIR, and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how

the proposed Project is equipped with security features. For example, to provide added security to system passengers, each gondola cabin would have a security camera on board with a feed to the control room, as well as a “push to talk” button, which would open two-way communications with the control room. The control room would be able to address all cabins at once, or an individually selected cabin. Control room operators would have the ability to contact local security, law enforcement or other emergency response agencies as needed. The Emergency Operations Plan for the proposed Project would also include emergency response protocols and safety procedures developed in conjunction with the operator, system provider, and local authorities, and would address operational changes and communication protocols required in response to a range of potential emergencies such as a medical emergency in a cabin or in a station or a fire near the alignment. The plan would consider a wide range of scenarios for which default operational responses would be determined. In addition, the plan would include communication protocols with local authorities for further instruction and coordination. Refer to Topical Response J, Gondola Design and Operations, for discussion of how an Evacuation Plan would be developed as part of the Emergency Operations Plan for the proposed Project. Refer to Section 3.07, Geology and Soils, of the Draft EIR and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the structural design of the proposed Project’s stations, junction, and towers would meet the rigorous safety standards of applicable standards, requirements, and building codes, including all mandated standards addressing environmental factors such as wind and seismic effects and gravity forces, including all impacts from the height and tilt of the structures, to ensure structural integrity and safety. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5.

Comment GO18-51 3.7-19/5 Construction Impacts Less Than Significant Impact with Mitigation. Surface deposits in the majority of the proposed Project alignment and surrounding area consist of younger Quaternary alluvium deposited by the Los Angeles River. These deposits are younger than 10,000 years, and have a low probability of yielding scientifically significant fossils....deposits are underlain with older Quaternary

Alluvium and Miocene Monterey or Puente Formation, where fossils have been encountered at depths ranging from 35 feet to 100 feet at locations southeast and northeast of the Project site. An assessment of paleontological resources in the Project vicinity indicated that older Quaternary alluvium is expected to be present at differential depths in the Project area. Construction work is anticipated to reach up to 125 feet in depth for installation of the piles and an excavation depth of up to 10 feet, except for at the proposed Dodger Stadium Station, which has an excavation depth of 42 feet, and therefore may encounter paleontological deposits.

Differential/different spelling error for depths of pile cap block and tops of piles beneath the capping block.

Revise as pile-caps are estimated to be based at about 10ft below ground surface and piles extend from the base of the pile-cap to 125 ft below the base, = 135ft below ground surface.

Younger Quaternary (Holocene) deposits, south of Broadway, are known to contain “paleo-indian” remains and artifacts elsewhere in the US and California. Paleo-indian remains and artifacts could be encountered during pile borings. Similarly at depths of 5-feet and deeper American Indian remains and artifacts could be expected.

Provide for archaeological monitoring and protection programs for all foundation excavations and representative sampling of produced debris for all pile boring at all Project sites, and a special paleontologic and archaeologic monitoring program be required for the Stadium Station and SR- 110 Tower.

Response GO18-51 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for discussion of how the depth of the piles is not described relative to the ground surface but indicates that the piles would reach depths of 125 feet. The piles would be driven from excavation depths of 10 feet with the exception of Dodger Stadium, where the excavation depth would be 42 feet. Refer to Section 3.05, Cultural Resources, Section 3.07, Geology and Soils, and Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, for discussion of how the proposed Project would have less than significant impacts related to geology and soils, including paleontological resources, upon implementation of Mitigation Measures GEO-A and GEO-B. Further, as discussed in Section 3.5.6 of the Draft EIR, Mitigation Measure CUL-A provides for development of a Cultural Resources Monitoring and Mitigation Plan by a qualified archaeologist. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research,

study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-52 3.7-20/1 To avoid potentially high sensitivity areas for paleontological resources, or in the event paleontological resources are encountered, implementation of Mitigation Measure GEO-B would minimize impacts that would directly or indirectly destroy a unique paleontological resource or site, or unique geologic feature. Mitigation Measure GEO-B would require the development of a Paleontological Resources Monitoring and Mitigation Plan (PRMMP) to provide direction on the identification of high-sensitivity areas and appropriate monitoring, excavation, and preservation processes during construction excavation activities. With the implementation of Mitigation Measure GEO-B, impacts related to paleontological resources would be reduced to less than significant.

The Mitigation Measure requires additional studies before construction and development of a specific PRMMP monitoring and reporting plan to mitigate potential significant impacts for fossils.

A tentative “mitigation measure” does not provide adequate nor complete mitigation or compensation for potential paleontological impacts from excavations for towers and stations foundations and >100 borings for piles. Provide a draft PRMMP for all excavations deeper than 3ft and recirculate DEIR.

As no PRMMP is available for review, revision, and comments, the impacts on paleontological resources must be considered as greater than significant, or at least “significant”. With the supplemental provision of the MMGeo-B and PRMMP, such impacts maybe mitigated but not without the full reports for public review and comments.

Response GO18-52 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for a discussion of how mitigation measures may appropriately include additional studies and how CEQA does not require the EIR to include all information requested by commenters. Refer to Response GO18-25 for further discussion of the sufficiency of Mitigation Measure GEO-B.

Comment GO18-53 3.7-20/3 3.7.5 Mitigation Measures The following mitigation measures are proposed to reduce significant impacts related to geology and soils to a level that is less than significant. MM-GEO-A: Prepare a Site-Specific Final Geotechnical Report: The Project Sponsor shall engage a California-registered geotechnical engineer to prepare and submit a site-specific final geotechnical investigation and report to the City of Los Angeles for review, consistent with the requirements of the CBC, applicable Los Angeles amendments, and California Geological Survey Special Publication 117 (as amended).

As proposed the provision of a future FINAL geotechnical investigation and report does not mitigate impacts and does not provide for public review and comments on the adequacy of the future document. Provide a site specific (for each excavation site) investigation and a Geotechnical Report based on at least four borings to the same or deeper depths than the proposed 100+foot soldier piles and recirculate the augmented DEIR for public review and comments.

Impacts on geological resources must be considered as greater than significant, or at least “significant” until such a report has been provided. With the supplemental provision of the MMGeo-B and PRMMP, such impacts maybe mitigated but not without the full reports for public review and comments. Geological impacts must be considered as significant until such a report is available.

Response GO18-53 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to geology and soils upon implementation of Mitigation Measures GEO-A. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. Further, no feasible project alternative or mitigation measure considerably different from those previously analyzed in Section 4.0, Alternatives, of the Draft EIR, or outlined in Table ES-2, Summary of Environmental Impacts, of the Draft EIR, that could clearly lessen the proposed Project’s environmental impacts has been proposed. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5.

Comment GO18-54 3.7-21/2 Implementation of Mitigation Measure GEO-B would include the preparation of a PRMMP to provide direction on the identification of high sensitivity areas for paleontological resources and appropriate monitoring, excavation, and preservation processes during construction activities. Upon implementation of Mitigation Measures GEO-A and GEO-B, significant impacts related to geology and soils would be reduced to less than significant.

Therefore only after implementation of the MM-GEO-A/-B including their public presentation can impacts be considered “less than significant”. Therefore the DEIR must be considered incomplete as the MM-GEO-A/-B have not been prepared, reviewed, nor implemented. Provide the mitigation monitoring and report plan for all

geological, paleontological, and archeological resources sectors along with mandatory requirements for agencies and contractors.

Provide complete and adequate MM-GEO-A/-B as part of the FEIR or as part of a SEIR.

Response GO18-54 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to geology and soils and paleontology upon implementation of Mitigation Measures GEO-A and GEO-B. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Project was prepared consistent with the requirements of CEQA Guidelines section 15097. As demonstrated in Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR, the MMRP prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. Finally, the CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-55 3.9-1/1 Hazards and Hazardous Materials This section evaluates the potential impacts related to hazards and hazardous materials from construction, operation, and maintenance of the proposed Project. This section is based in part on the Phase I Environmental Site Assessment (ESA) that was prepared for the proposed Project by AECOM in July 2022 (Appendix K of this Draft EIR). The environmental regulatory database report and records review prepared for the proposed Project in April 2022 is provided in Section 6 of Appendix K.

The "database report" is not based on specific borings at the Project's tower, junction, and station locations and in the vicinity of proposed foundation and piling sites for towers and stations. And thus the DEIR is inadequate and incomplete for the geotechnical setting of hazardous materials. The same situation occurred for the excavation of the Union Station and US-Yard tunnels which lead to major contaminations and massive change orders for mitigation of groundwater and soils

contaminations. Provide specific citations (appendix, page, and paragraphs) when referencing other sources and add such information herein.

Provide four borings and appropriate gas, fluids, and soil monitoring and samples for analyses of hazardous materials and potential impacts from such during excavations and boring at each of the Project tower/station sites prior to certification of the FEIR.

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Response GO18-55 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.09, Hazards and Hazardous Materials, and Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hazards and hazardous materials upon implementation of Mitigation Measures HAZ-A and HAZ-B. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) Refer to Response GO18-43 for a discussion of why boring sampling for contamination is impracticable at this juncture. Finally, the CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-56 3.9-10/1 City of Los Angeles Municipal Code The Los Angeles Municipal Code, Chapter IX (Building Regulations), Article 1 (Buildings), Division 71 (Methane Seepage Regulations), commonly known as the City Methane Ordinance *No references*, describes methane testing and control requirements based on building type, building use/occupation, and whether a structure is in a methane zone or buffer zone. Requirements for new construction in such zones include methane gas sampling; and depending on the detected concentrations of methane and gas pressure at the site, application of design remedies for reducing potential methane impacts *No references*. The City has prepared a map of methane zones and methane buffer areas in the City *No references*. The proposed Project alignment crosses a methane zone and buffer zone and may require site-specific methane testing for particular structures, depending on the final architectural design.

Entire paragraph is incomplete and inadequate for this DEIR. No references/mentions (report/pg/par) are to given to ZIMAS where parcel-parcel notations are given as to presence in methane or buffer zones.

As known and designated gas zones lie within the Project area and construction site, methane gas issues must be considered significant and require an appropriate mitigation program in a supplemental/subsequent DEIR.

Provide for a thorough review and provisions of all relevant references are provided. Provide a gas survey of each site with gas probes/boring and their analyses and assessments. Provide such along with pertinent mitigation measures for a supplemental/subsequent DEIR.

Response GO18-56 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-3 regarding ZIMAS. Refer to Section 3.09, Hazards and Hazardous Materials, with supporting data provided in Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for discussion of the proposed Project relative to Methane Zones and Methane Buffer Zones and for discussion of how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) Finally, the CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.* § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-57 3.9-10 22/6 Division 71 (Methane Seepage Regulations) describes methane testing and mitigation requirements based on building type, building use/occupation, and whether a structure is located within a methane zone or buffer zone. The proposed Project alignment crosses a methane zone and buffer zone and may require site-specific methane testing for particular structures, depending on the final architectural design.

As known and LA City designated gas zones lie beneath the Project area and construction sites, methane gas issues must be considered significant and require an appropriate mitigation program in a supplemental/subsequent DEIR.

Provide final Project designs and documents, their description, and their bases for draft Mitigation, Monitoring, and Reporting Plans for public review and comments prior to preparation of the Project FEIR.

Provide for a thorough review and provisions of all relevant references are provided. Provide a gas survey of each site with gas probes/boring and their analyses and

assessments. Provide such along with pertinent mitigation measures for a supplemental/subsequent DEIR.

Response GO18-57 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.09, Hazards and Hazardous Materials, with supporting data provided in Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for discussion of the proposed Project relative to Methane Zones and Methane Buffer Zones and how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. Refer to Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR for discussion of the construction of the proposed Project. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) Finally, the CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-58 3.9-18/2 3 Methane Zones Methane zones are usually a result of naturally occurring tar and crude oil, or shallow soil contamination by old oil drilling wells....Non-pressurized methane is not normally problematic if properly monitored and controlled per Cal/OSHA regulations....Methane and associated oil field gas exposure to workers during construction can be hazardous at higher levels, especially in confined spaces. In addition, methane seepage can result in an explosion if an adequate concentration of methane gas exists where combustion is possible.

During 1985 Ross Dress for Less Store Explosion, RTD/Construction Management staff for Phase 1 Red Line assisted LAFD in monitoring, control, and treatment of methane leakage and fire and such activities laid base for the Methane Gas ordinances and restrictions.

Methane and Methane-buffer zones are identified for all Project sites, except for Alameda Station. Revise/recirculate the DEIR based on significant impacts related to methane for the Project. Provide MMRP within the SDEIR for the Project sites in methane and methane-buffer zones based on gases found in soils/boring of each Project site for public review and comments of the recirculated DEIR.

Response GO18-58 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.09, Hazards and Hazardous Materials, with supporting

data provided in Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for discussion of the proposed Project relative to Methane Zones and Methane Buffer Zones and for discussion of how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. Refer to Figure 3.9-1, Methane Zones Within the Project Area, in Section 3.09 of the Draft EIR. As shown, Alameda Station is not located within a Methane Zone. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Project was prepared consistent with the requirements of CEQA Guidelines section 15097. As demonstrated in Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR, the MMRP prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. Finally, this comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. No new significant environmental impact would result from the proposed Project or from a new mitigation measure proposed to be implemented.

Comment GO18-59 3.9-18/3 Methane gas is known to be generated in the area. The City of Los Angeles Department of Building and Safety's Los Angeles Methane Zone Map categorizes two types of zones: Methane Zones and Methane Buffer Zones...based on the proximity to a methane gas source. According to the City of Los Angeles Department of Building and Safety maps, portions of the proposed Project alignment pass through identified Methane Zones and/or Methane Buffer Zones (Figure 3.9-1). The proposed Chinatown/State Park Station, Broadway Junction, Alpine Tower, and Stadium Tower are in a Methane Zone and/or Methane Buffer Zone.

RTD/MTA project experience of Red Line Phase 1 Union Station Tunnel/Station construction included major change orders for groundwater and methane, creosote, and hydrogen sulfide gases released from groundwater and dry soils.

Methane and Methane-buffer zones are identified for all Project sites, except for Alameda Station. Revise/recirculate the DEIR based on significant impacts related to methane for the Project. Provide MMRP within the SDEIR for the Project sites in

methane and methane-buffer zones based on gases found in soils/boring of each Project site for public review and comments of the recirculated DEIR.

Response GO18-59 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.09, Hazards and Hazardous Materials, with supporting data provided in Appendix K, Phase I Environmental Site Assessment, of the Draft EIR for discussion of the proposed Project relative to Methane Zones and Methane Buffer Zones and for discussion of how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. As indicated on page 3.9-18 to 3.9-19 of the Draft EIR, the City of Los Angeles Department of Building and Safety's Los Angeles Methane Zone Map lists and categorizes Methane Zones and Methane Buffer Zones. The proposed Project would be designed and constructed to comply with regulations of Division 71 of the Los Angeles Municipal Code. Compliance with Division 71 Section 91.7104.1, which includes appropriate methane exposure or release identification protocols based on a site-specific evaluation of the risk during construction, would be required to ensure worker health and safe construction as applicable. Anecdotal information regarding an unrelated project is noted for the record. Refer to Response GO18-58 for discussion of how an MMRP is not required to be provided with the Draft EIR under CEQA, but has been provided with the Final EIR. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. No new significant environmental impact would result from the proposed Project or from a new mitigation measure proposed to be implemented.

Comment GO18-60 3.9-19/Fig.3.9-1: Methane Zones Within the Project Area

No source for figure is provided as reference and hazard zone seems different from CalGEM boundaries for the Los Angeles Oil Field, and map appears to also differ from parcel designations in ZIMAS. Provide references for all gas issues.

Provide sources and analyses for development of map. Provide comparison with ZIMAS and basis for comparisons and mitigative requirements for safe construction of the Project.

Response GO18-60 Refer to Section 3.09, Hazards and Hazardous Materials, with supporting data provided in Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for discussion of the proposed Project relative to Methane Zones and Methane Buffer Zones and for discussion of how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. As stated on page 3.9-19, Figure 3.9-1, Methane Zones Within the Project Area, is a City of Los Angeles Department of Building and Safety map, which lists and categorizes Methane Zones and Methane Buffer Zones. As stated on page 42 of Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, this information was

referenced on March 31, 2022 from the City of Los Angeles (2004). Refer to Response GO18-3 regarding ZIMAS. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-61 3.9-26/3 As shown in Figure 3.9-1,...portions of the proposed Project alignment pass through Methane Zones and/or Methane Buffer Zones....Chinatown/State Park Station, Broadway Junction, Alpine Tower, and Stadium Tower are in a Methane Zone and/or Methane Buffer Zone....usually a result of naturally occurring tar and crude oil, or shallow soil contamination by old oil-drilling wells. Non-pressurized methane is not normally problematic if properly monitored and controlled.... If the gas accumulates to high concentrations and becomes pressurized, detectable levels may enter the interior of a structure through cracks or other penetrations present in floor slabs.

Given methane's buoyancy, the gas must be pressurized or contained or released in massive volumes in order to reach monitorable levels. Provide MTA/Metro action levels for construction sites and for publicly occupied/used areas, e.g., gas alarm levels for Red Line tunnel, Union Station-Civic Center.

Provide borehole monitoring for 24 hours and of at least borings within the excavation areas for stations, junction, and towers.

Revise/recirculate the DEIR based on significant impacts related to methane for the Project. Provide MMRP within the SDEIR for the Project sites in methane and methane-buffer zones based on gases found in soils/boring of each Project site for public review and comments of the recirculated DEIR.

Response GO18-61 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.09, Hazards and Hazardous Materials, with supporting data provided in Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for discussion of the proposed Project relative to Methane Zones and Methane Buffer Zones and for discussion of how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. Refer to Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for discussion of Metro/MTA construction sites. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the

time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Project was prepared consistent with the requirements of CEQA Guidelines section 15097. As demonstrated in Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR, the MMRP prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure.

CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. No new significant environmental impact would result from the proposed Project or from a new mitigation measure proposed to be implemented. Furthermore, per section 15097(a) of the CEQA Guidelines, the preparation of an MMRP is required only when a public agency has made findings related to an EIR in conjunction with approving a project. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-62 3.9-26/4 Methane exposure to workers during construction can be hazardous at higher levels, especially in confined spaces. In addition, methane seepage can result in an explosion if an adequate concentration of methane gas exists where combustion is possible. The anticipated construction methods for the proposed Project involve relatively shallow and wide excavations and would not be considered confined spaces; therefore, this reduces the likelihood of construction workers being exposed to methane gas concentrations that would be hazardous due to inhalation. Further, construction activities and workers would be required to comply with OSHA and Cal/OSHA regulations, including but not limited to 29 CFR Section 1926.55 and 8 CCR Section 5416, to develop and enforce workplace safety standards and ensure worker safety during construction, and project contractors would be required to comply with OSHA and Cal/OSHA regulations regarding any potential construction activities that may cause methane release.

Provide approved MTA construction requirements for methane and exposure. Provide for mandatory requirements and enforceable statements of certainty rather than “would”, “could”, or “should”.

Provide borehole monitoring for 24 hours and of at least borings within the excavation areas for stations, junction, and towers.

Revise/recirculate the DEIR based on significant impacts related to methane for the Project. Provide MMRP within the SDEIR for the Project sites in methane and methane-buffer zones based on gases found in soils/boring of each Project site for public review and comments of the recirculated DEIR.

Response GO18-62 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.09, Hazards and Hazardous Materials, with supporting data provided in Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for discussion of the proposed Project relative to Methane Zones and Methane Buffer Zones and for discussion of how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Project was prepared consistent with the requirements of CEQA Guidelines section 15097. As demonstrated in Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR, the MMRP prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) Refer also to Response GO18-61 for further discussion of when an MMRP is required. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA

Guidelines section 15088.5. No new significant environmental impact would result from the proposed Project or from a new mitigation measure proposed to be implemented. Furthermore, per section 15097(a) of the CEQA Guidelines, the preparation of an MMRP is required only when a public agency has made findings related to an EIR in conjunction with approving a project. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-63 3.9-27/1 The proposed Project would also be required to be designed and constructed to comply with the regulations... Compliance...which includes appropriate methane exposure or release identification protocols based on a site-specific evaluation of the risk during construction, would be required to ensure worker health and safe construction.

Recognition of a potential threat/risk has not led to provision of a Methane Plan/Protocol presented in the DEIR.

As the project has not been designed, provide a thorough investigation and appropriate gas control designs to avoid/treat methane and other heavier hydrocarbon gases (e.g., BTEX and PAHs) and perhaps contaminated soils before construction begin, during construction, and for operations.

Following review and assessment of methane monitoring, provide appropriate protocols for mitigation of methane exposures and appropriate assessment of hazards and impacts upon the Project and environment. Integrate findings, mitigations, and residual impacts for significance and in cooperate in a supplemental/subsequent DEIR and recirculate for public review and comments.

Revise/recirculate the DEIR based on significant impacts related to methane for the Project. Provide MMRP within the SDEIR for the Project sites in methane and methane-buffer zones based on gases found in soils/boring of each Project site for public review and comments of the recirculated DEIR.

Response GO18-63 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Responses GO18-61 and GO18-62 for further discussion of Methane Zones and Methane Buffer Zones, as well as the proposed Project's MMRP.

Comment GO18-64 3.9-27/2 With adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, impacts related to methane gas exposure or release during construction of the proposed Project would be less than significant.

As no methane plan/protocol is presented in the Project, no adherence can be reviewed or assumed. Provide mandatory measures for gas controls, releases, and safe exposures.

Provide gas-vapor monitoring results from any/all geotechnical borings conducted to date. If no monitoring, provide for gas monitoring of soil vapors from at least 5 borings of 20ft into the underlying soils/alluvium with specific mandatory mitigation for all impacts.

Revise/recirculate the DEIR based on significant impacts related to methane for the Project. Provide MMRP within the SDEIR for the Project sites in methane and methane-buffer zones based on gases found in soils/boring of each Project site for public review and comments of the recirculated DEIR.

Response GO18-64 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Responses GO18-61 and GO18-62 for further discussion of Methane Zones and Methane Buffer Zones, as well as the proposed Project's MMRP.

Comment GO18-65 3.10-21/1 Groundwater levels in the Project study area generally range from depths of approximately 20 to 60 feet below ground surface (bgs).\37 \38 Groundwater levels range from 20 to 25 feet bgs in the vicinity of LAUS, 25 feet bgs near the intersection of North Alameda Street and North Main Street, 27 to 35 feet bgs in the vicinity of the southern portion of the Los Angeles State Historic Park, more than 60 feet bgs in the vicinity of the intersection of North Broadway and Bishops Road, and estimated at 60 feet bgs below the proposed Dodger Stadium Station.\39

\38 State Water Resources Control Board. 2022. GeoTracker. Available at: <https://geotracker.waterboards.ca.gov/map/>, accessed May 2022.

\39 ENGEO Incorporated. September 2022. Los Angeles Aerial Rapid Transit Project Geotechnical Document in Support of the Environmental Impact Report.

No direct citations and cannot confirm/deny values given. Provide direct web address and process to locate values by page/paragraph/Figure No..

No map of groundwater level, sources of such information, nor the surface elevations. Provide map of elevations and depths to groundwater at 100ft intervals along proposed alignment.

Provide for and conduct preliminary groundwater characterization at each Project facility site based on at least four borings at each facility site with appropriate testing and monitoring for ground gases, contaminations, and water qualities for each site as part of supplemental review and assessment and then circulate a revised-subsequent/supplemental DEIR for public review and comments.

Revise/recirculate the DEIR based on significant impacts related to methane for the Project. Provide MMRP within the SDEIR for the Project sites in methane and methane-buffer zones based on gases found in soils/boring of each Project site for public review and comments of the recirculated DEIR.

Response GO18-65 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, and Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Direct citations and documented values for water and groundwater have been drawn from Appendix L. As indicated beginning on page 3.10-18 of the Draft EIR, citations 27 through 39 provide data and mapping related to groundwater. As discussed on page 3.10-30 of the Draft EIR, the proposed Project would have less than significant impacts on sustainable groundwater management of the basin from construction activities. The proposed Project would include excavation and concrete work, and installation of drilled piles that would generate less than significant volumes of nuisance water. These activities would be limited to the construction phase only. Additionally, no large volumes of groundwater would be extracted that could decrease groundwater supplies. With adherence to existing regulations, potential impacts to groundwater supply and recharge during construction would be less than significant. As discussed on page 3.9-25, in Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, further construction activities and workers would be required to comply with OSHA and Cal/OSHA regulations. As discussed on page 3.9-46, in Section 3.09, Hazards and Hazardous Materials of the Draft EIR, the Project Sponsor shall prepare a Soil and Groundwater Management Plan (Mitigation Measure HAZ-A) prior to re-grading, decommissioning, or construction activities. The Soil and Groundwater Management Plan shall include methods and procedures for sampling and analyzing soils and/or groundwater at identified Project component locations in order to classify soils and/or groundwater as hazardous or non-hazardous, and if identified as hazardous, shall include additional methods and procedures for the proper handling and removal of impacted soils and/or groundwater for off-site disposal and/or recycle. Methods and procedures included in the Soil and Groundwater Management Plan shall be in accordance with current federal, State, and local regulations and be protective of workers and the environment. The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Project was prepared consistent with the requirements of CEQA Guidelines section 15097. As demonstrated in Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR, the MMRP prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are

not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified. Release of a draft MMRP as part of the Draft EIR is not required under CEQA and an MMRP for the proposed Project will be prepared and adopted consistent with the requirements of CEQA Guidelines section 15097. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. No new significant environmental impact would result from the proposed Project or from a new mitigation measure proposed to be implemented. Refer to Responses GO18-61 and GO18-62 for further discussion of Methane Zones and Methane Buffer Zones, as well as the proposed Project’s MMRP.

Comment GO18-66 3.10-21/2

Groundwater Quality Regional groundwater basin water quality is poor in some areas due to natural conditions resulting in high total dissolved solids (TDS) levels, while in other areas groundwater quality has been degraded due to infiltration from commercial and industrial discharges, agricultural chemical application, and contaminants from urban runoff. \40

Deterioration of water quality in some areas has occurred due to inadequate storage, handling, and disposal of chemicals resulting in releases to groundwater. The groundwater in the portions of the Central Basin is known to contain elevated levels of TDS, volatile organic chemicals, perchlorate, nitrate, iron, manganese, and chromium.\41 \40 Greater Los Angeles County Integrated Regional Water Management Region. 2014. The Greater Los Angeles County Integrated Regional Water Management Plan, 2013 Update. Available at: <https://dpw.lacounty.gov/wmd/irwmp/FileList.aspx?path=docs\2014%20Public%20RWMP%20Update>, accessed May 2022.

\41 *Ibid.*

Citations are only to the general documents and do not lead to groundwater quality descriptions. Provide specific chapters, pages, and paragraphs to summary provided.

Provide Metro contracts and specific citations to Metro files for Red Line and Gold Line CEQA documents and construction files dealing with groundwater and water quality from Los Angeles Str. to Broadway.

Provide revised descriptions and assessments along with appropriate mitigation or compensation and then circulate a revised-subsequent/supplemental DEIR for public review and comments.

Revise/recirculate the DEIR based on significant impacts related to groundwater for the Project. Provide MMRP within the SDEIR for the Project sites in groundwater

zones based on chemical and gas found in soils/boring of each Project site for public review and comments of the recirculated DEIR.

Response GO18-66 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, and Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Refer to Response GO18-65 for further discussion of hydrology and water quality, as well as the proposed Project's MMRP.

Comment GO18-67 3.10-21/3 There are multiple records of sites in the Project study area at which commercial and industrial activities resulted in documented releases; these cases are generally overseen by the SWRCB, LARWQCB, and/or California Department of Toxic Substances Control (DTSC) cleanup programs.^{42,43} State Water Resources Control Board. 2022. GeoTracker. Available at: <https://geotracker.waterboards.ca.gov/map/>, accessed May 2022.

⁴³ California Department of Toxic Substances Control. 2022. EnviroStor. <https://www.envirostor.dtsc.ca.gov/public/>.

Searches appear totally inadequate and incomplete with regard to Metro and City departments and relevant files related to Gold and Red Line construction along with the Park reviews.

Citations are only to the general document and do not lead to or support groundwater quality descriptions. Provide specific chapters, pages, and paragraphs to summary provided.

Provide Metro contracts and specific citations to Metro files for Red Line Station and US<>CC twin tunnels and Gold Line CEQA documents and construction files dealing with groundwater and water quality along the alignment from Los Angeles Str. to Broadway.

Provide revised descriptions and assessments along with appropriate mitigation or compensation and then circulate a revised-subsequent/supplemental DEIR for public review and comments.

Response GO18-67 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, and Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. As discussed on page 39 of Appendix L, Hydrology and Water Quality Technical Study, to the Draft EIR, specific files from Metro related to groundwater and water quality were accessed through databases such as Geotracker. Further, as indicated beginning on page 3.10-18, citations 27 through 39 provide data and mapping related to groundwater. Citations to general documents are sufficient because the reference documents were used holistically rather than for only specific

data. Moreover, CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-68 3.10-24/3 3.10.2 Methodology To establish baseline conditions, a search of publicly accessible databases and information from various sources and agencies was conducted...include but are not limited to the SWRCB, California DWR, State of California Natural Resources Agency, FEMA, Los Angeles RWQCB, Los Angeles County Department of Public Works, Los Angeles County Flood Control, City of Los Angeles Department of City Planning, LADWP, and Metropolitan Water District of Southern California.

Search appears totally inadequate and incomplete with regard to Metro and City departments and relevant files related to Gold and Red Line construction along with the Park reviews.

Provide Metro contracts and specific citations to Metro files for Red Line Station and US<>CC twin tunnels and Gold Line CEQA documents and construction files dealing with groundwater and water quality along the alignment from Los Angeles Str. to Broadway.

Provide accessible databases for roads and construction information along the proposed alignment for Department of Public Works (Bureaus of Engineering, Streets LA, Sanitation/Environment, etc.) and for Metro construction and CEQA related departments.

Provide revised descriptions and assessments along with appropriate mitigation or compensation and then circulate a revised-subsequent/supplemental DEIR for public review and comments.

Response GO18-68 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, and Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Refer to Response GO18-67 for discussion of how databases such as Geotracker were accessed as part of the Draft EIR. Refer to Appendix L, Section 3.0, Regulatory Setting, for the publicly available data sources and information, including

accessible databases for roads and construction information along the proposed alignment, reflected in the baseline methodology.

The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (14 Cal. Code Regs. § 15162(a).) The EIR for the proposed Project has not been certified. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. No new significant environmental impact would result from the proposed Project or from a new mitigation measure proposed to be implemented.

Comment GO18-69 3.10-25/4 Construction Impacts Less Than Significant Impact. Construction of the proposed Project components would include site preparation and installation of foundations and columns; erection of stations, towers, and the junction; replacement or restoration of paving, sidewalk, and landscaping; and cable and cabin installation.

No design and related supportive studies/designs have been provided and references indicate none may exist and await final design. No foundation drawings are provided to establish how deep excavations and dewatering may be required. No specific locations and numbers of deep piles (mentioned to be >50ft depths) are located along with their capping foundations. Provide final design drawings and specifications for all towers and stations prior to approval and further considerations.

Current documentation is totally inadequate and incomplete for a pronouncement of “Less than Significant Impacts”. Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Provide contract drawings and description and revised Supplemental EIR for public review and comments.

Response GO18-69 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, and Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Refer to Section 2.0, Project Description and Appendix B, Construction Assumptions, of the Draft EIR, for discussion of the proposed Project construction. Environmental review under CEQA is encouraged to occur as early as feasible in the planning process (CEQA Guidelines section 15004). As such, it is common for an EIR to identify the requirement for more detailed design and engineering studies that must occur prior to construction, reflecting the further advanced project design and on the ground environmental conditions at the time of construction. Refer to Table 2-4: Proposed Project Construction Details, on page 2-51 in Section 2.8, Construction, for details on piles and caps included in the proposed Project. Table 2-4 identifies the maximum depth of drilled piles, the maximum depth

of excavation, amount of excavation, and amount of materials exported. Refer also to Exhibit 1 in Appendix B, Construction Assumptions, of the Draft EIR. As shown therein, Appendix B maps the locations of all foundations and piles for construction of each component. Moreover, CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-70 3.10-25/5 Groundwater Construction activities associated with foundations would involve general earthwork and concrete work to prepare the foundations, with excavations for foundations at depths ranging between seven feet and 42 feet, and piles to be installed between 55 feet and 125 feet below pile depth....; therefore, the proposed Project may require the removal of nuisance water that seeps into boreholes during construction. Water removed from the boreholes would be containerized, and analyzed to determine the proper disposal method.

Provide pre-construction contract drawings of all foundations and pilings, especially for the Union Station facilities and their relation to the Un.Stn.<>Civic Center Tunnels and the groundwater levels (and copies of all boring records for the same).

Provide definition and differentiation between "nuisance" water and dewatered groundwater. Also provide definition of seeps, gal/min, and how big (provide dimensions) the "containers" would be.

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-70 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, and Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Refer to Section 3.10.4, Environmental Impacts, of the Draft EIR, for discussion of groundwater. Refer to Exhibit 1 in Appendix B, Construction Assumptions, of the Draft EIR. As shown therein, Appendix B maps the locations of all foundations and piles for construction of each component. Refer to Section 3.10, Hydrology and Water Quality. Refer to Response GO18-39 for discussion of how based on groundwater depths, none of the proposed excavations for foundations are

anticipated to encounter groundwater. Furthermore, as stated in Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, a Soil and Groundwater Management Plan would be prepared to specify methods for handling, sampling, and disposal of contaminated groundwater in the event it is encountered during construction (Mitigation Measure HAZ-A). CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (Id., § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (Id., § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-71 3.10-25/6 Groundwater levels range from 20 to 25 feet bgs in the vicinity of LAUS. The foundations for the Alameda Station would be at a depth of 10 feet. Based on these anticipated depths to groundwater, it is considered unlikely groundwater would be encountered during construction of the foundations; however, piles would be drilled to 125 feet below pile depth, and may require removal of nuisance water that seeps into boreholes during installation of the piles of this station.

Provide pre-construction contract drawings of all foundations and pilings, especially for the Union Station facilities and their relation to the Un.Stn.<>Civic Center Tunnels and the groundwater levels (and copies of all boring records for the same).

Define: "drilled to 125 feet below pile depth" provide specific dimensions of below ground level or below foundation levels.

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-71 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, and Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Refer to Table 2-4, Proposed Project Construction Details, in Section 2.0, Project Description, for maximum depth of drilled piles. Refer to Exhibit 1 in Appendix B, Construction Assumptions, of the Draft EIR. As shown therein, Appendix B maps the locations of all foundations and piles for construction of each component. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g.,

14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-72 3.10-26/1 Groundwater occurs at a depth of approximately 25 feet bgs near the intersection of North Alameda Street and North Main Street. The foundations for the Alameda Tower and the Alpine Tower would be at a depth of 10 feet....; however, piles for the Alameda Tower and the Alpine Tower would be drilled to 120 feet below pile depth, and may require removal of nuisance water that seeps into boreholes during installation of the piles of these towers.

Provide engineering considerations loads and dimensions for the Alameda/US Station and the higher angled Alameda and Alpine towers foundations.

Provide geotechnical boring logs and reports for each of the aerial structures considered.

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-72 This comment provides a general recitation and characterization of text from the Draft EIR. The detailed construction assumptions for the proposed Project are set forth in Appendix B, Construction Assumptions, of the Draft EIR. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project’s use of mitigation measures and project design features is consistent with the requirements of CEQA. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-73 3.10-26/5 Based on groundwater depths, none of the proposed excavations for foundations are anticipated to encounter groundwater; however, removal of nuisance water that seeps into boreholes during construction may be required for the pile installations at each of the components.

Groundwater may be encountered during installation of piles, and any nuisance water removed would need to be analyzed prior to disposal.

Detections of total petroleum hydrocarbons TPH and volatile organic compounds VOCs including BTEX are known to be present in groundwater at the Los Angeles State Historic Park property, which is directly beneath the proposed Project alignment.\53 Although the groundwater quality in the remainder of the Project study area is not specifically known, it may contain elevated levels of constituents such as petroleum hydrocarbons and solvents resulting from commercial and industrial discharges, in addition to potentially elevated TDS and metals related to natural conditions. Uncontrolled discharge of groundwater carrying these potential pollutants could result in degradation of groundwater and surface water if it is not properly.

As pile boring will extend well below the top of groundwater, Provide two mitigations for hydrological impacts and potential water discharge violations for groundwater and nuisance waters removal, storage/monitoring for all VOCs, H2S, dioxin, creosote, and other chemicals encountered and treated for in construction for the Metro Union Station in 1980s.

RTD/MTA Red Line Union Station groundwater dewatering required aeration, activated carbon, and H2O2 treatments.

Provide all pile boring drilling systems with H2S and CH4 monitoring sensors and shutdown and require for monitoring, gas/liquids treatment and shutdown, if needed.

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-73 Refer to Section 3.10, Hydrology and Water Quality, and Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Refer to Response GO18-39 for discussion of how based on groundwater depths, none of the proposed excavations for foundations are anticipated to encounter groundwater. Refer to Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, for discussion of how Mitigation Measure HAZ-A, would require that a Soil and Groundwater Management Plan be prepared to sample and analyze soils and groundwater encountered during construction and would require the identification and implementation of methods and procedures necessary for proper handling and removal of impacted soils and/or groundwater for off-site disposal if required. CEQA

does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-74 3.10-27/1 Additionally, as stated in Section 3.9, Hazards and Hazardous Materials, a Soil and Groundwater Management Plan would be prepared to specify methods for handling and disposal in the event contaminated groundwater is encountered during construction. Because..., there is the potential that excavation in certain areas would encounter groundwater, and therefore, dewatering could be required....Discharges from dewatering operations can contain high levels of fine sediments, which if not properly treated, could lead to exceedance of the NPDES requirements....The temporary system would comply with all relevant NPDES requirements related to construction and discharges from dewatering operations. If dewatering is required, the treatment and disposal of the removed water would occur in accordance with the requirements of LARWQCB's WDRs for Discharges of Groundwater....

As no specific plans have been prepared and presented in the DEIR, references to such is totally inadequate and incomplete and requires full presentation of such to establish adequacy and completeness of the assessment and mitigation. Provide a draft groundwater management plan for the Project and specific areas most probable to encounter groundwater in excavation and/or pile drilling for public review and comments.

None referenced/cited and no summary of conditions provided.

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-74 As indicated in Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, the Project Sponsor shall prepare the Soil and Groundwater Management Plan prior to re-grading, decommission, or construction activities. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the use of plans in mitigation measures does not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review. Refer to Response GO18-39 for further discussion of groundwater. CEQA does not require extensive

detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-75 3.10-36/4 Nuisance groundwater may be encountered during installation of piles for each of the components, which may result in degradation of groundwater quality if not addressed properly....Refer to Section 3.9 (Hazards and Hazardous Materials) for additional details should contaminated groundwater and/or soil be encountered. However, construction activities are not anticipated to interfere substantially with groundwater recharge, groundwater resource supplies, or groundwater quality.

No definition nor reference is provided for “nuisance groundwater” and no relationships are provided regarding contamination of the groundwater, its recharge, supplies, and quality during Project construction. Provide definitions for “nuisance groundwater” and its expected characteristics and qualities. Provide a mitigation plan for its control and reduction of all impacts derived from its presence. Provide review and assess potential impacts of construction on the recharge, supplies, and quality of groundwater within and beneath the Project area.

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-75 This comment provides a general recitation and characterization of text from the Draft EIR. As discussed on page 2 of Appendix L, Hydrology and Water Quality Technical Study, to the Draft EIR, nuisance water is water generated during construction that seeps into boreholes. As discussed in Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, the Project Sponsor shall prepare the Soil and Groundwater Management Plan prior to re-grading, decommission, or construction activities. The Soil and Groundwater Management Plan shall include methods and procedures for sampling and analyzing soils and/or groundwater at identified Project component locations in order to classify soils and/or groundwater as hazardous or non-hazardous, and if identified as hazardous, shall include additional methods and procedures for the proper handling and removal of impacted soils and/or groundwater for off-site disposal and/or recycle. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be

developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified. Refer also to Response GO18-73 above regarding this issue.

Comment GO18-76 3.10-36/6 With adherence to these laws and regulations, impacts related to implementation of a water quality control plan or sustainable groundwater management plan during construction would be less than significant.

Provide specific laws and regulations and the Project compliance measures with such and include in a specific plan with requirements for direct and continuing compliance with requirements on the part of the agencies and contractors. Provide such to be incorporated into all construction contracts along with specific documentation of measures and achievement of regulatory limits.

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-76 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10.1, Regulatory Setting, of Section 3.10, Hydrology and Water Quality, for applicable laws and regulations applicable to hydrology and water quality. Applicable laws and regulations would include, but not be limited to, the Clean Water Act of 1972 (including 1977 and 1987 Amendments); Antidegradation Policy of 1968; Porter-Cologne Water Quality Control Act of 1969; State of California Antidegradation Polices – State Water Resources Control Board Resolution 68-16; 3.2.540 CFR 131.38 – California Toxics Rule; NPDES General Construction Permit regulations; MS4 Permit regulations; Los Angeles Regional Water Quality Control Board Basin Plan; City of Los Angeles General Plan; the City of Los Angeles LID Ordinance; the City of Los Angeles Municipal Code; the City of Los Angeles Water Quality Compliance Master Plan; and all other applicable regulations for all construction activities. The existing Construction Stormwater General Permit expired

on September 2, 2014, and is administratively extended until the effective date of a reissued permit. The proposed Project would comply with the statewide NPDES Construction General Permit (CGP) for stormwater discharges associated with construction activities in effect at the time of construction. In accordance with the CGP, the proposed Project Sponsor would be required to prepare and submit a construction Stormwater Pollution Prevention Plan (SWPPP) to the State Water Resources Control Board (SWRCB) prior to—and adhered to during—construction, as referenced in Appendix L, Section 3.0, Regulatory Setting (pages 16 to 24). CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-77 3.10-37/1 As discussed above, the Sponsor would comply with all applicable federal, State, regional, and local agency water quality protection laws and regulations, water quality control and/or sustainable groundwater management plans, including the Basin Plan and City of Los Angeles General Plan, as well as commonly used industry standards.

As indicated the Basin Plan and appropriate sections of the LA General Plan are referenced but without any specifics as to what would mitigate this specific Project.

As indicate the Project would comply at some time in the future, supposedly before construction contracts, would be approved for construction but without public review and comments before sponsor and relevant authorities would certify completion of the CEQA process. Provide a specific groundwater plan for the Project and all elements specifically venturing into the groundwater resources of the Project area.

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-77 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time

the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. As discussed in Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, the Project Sponsor shall prepare the Soil and Groundwater Management Plan prior to re-grading, decommission, or construction activities. The Soil and Groundwater Management Plan shall include methods and procedures for sampling and analyzing soils and/or groundwater at identified Project component locations in order to classify soils and/or groundwater as hazardous or non-hazardous, and if identified as hazardous, shall include additional methods and procedures for the proper handling and removal of impacted soils and/or groundwater for off-site disposal and/or recycle. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-78 3.10-37/4 It would also comply with all applicable federal, State, regional, and local agency water quality protection laws and regulations, water quality control and/or sustainable groundwater management plans, including the Basin Plan and City of Los Angeles General Plan, the MS4 Permit, as well as commonly used industry standards.

Provide references (doc and page/paragraphs) for mentioned laws, regulations, and requirements.

Provide commonly used industry standards references (docs, pages, and paragraphs) and compiled regulations, laws, and standards requirements as a mandatory compliance mitigation measure.

Provide revised supplemental/subsequent DEIR for public review and comments.

Response GO18-78 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10.1, Regulatory Setting, for laws and regulations applicable to Hydrology and Water Quality. Refer to Response GO18-76 for discussion of applicable laws and regulations related to hydrology and water quality. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts.

CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-79 3.10-38/2 With adherence to these laws and regulations, and groundwater management plans, impacts related to implementation of a water quality control plan or sustainable groundwater management plan during operations would be less than significant.

As no specific plans have been prepared and presented in the DEIR, references to such is totally inadequate and incomplete and requires full presentation of such to establish adequacy and completeness of the assessment and mitigation.

Provide differentiation between compliance and adherence and provide draft construction contract sections for both and for mitigation measures.

Provide a draft groundwater management plan for the Project and specific areas most probable to encounter groundwater in excavation and/or pile drilling for public review and comments.

Provide above in a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-79 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. Refer to Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, for discussion of the Soil and Groundwater Management Plan. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that

the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-80 3.10-38/3 3.10.5 Mitigation Measures With adherence to applicable federal, State, regional, and local laws and regulations, including compliance with applicable stormwater permits, wastewater permits, and other water quality regulations, construction and operation of the proposed Project would result in less than significant impacts to hydrology and water quality. No mitigation measures are required for the proposed Project.

Provide references (doc and page/paragraphs) for mentioned laws, regulations, permits, and their requirements.

Provide commonly used industry standards references (docs, pages, and paragraphs) and compiled regulations, laws, and standards requirements as a mandatory compliance mitigation measure.

Provide contractual requirements for all construction contracts and differentiate between requirements and mitigations.

Provide revised supplemental/subsequent DEIR for public review and comments.

Response GO18-80 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10.1, Regulatory Setting, of Section 3.10, Hydrology and Water Quality, for laws and regulations applicable to Hydrology and Water Quality. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-81 3.10-38/4 Mitigation Measures With adherence to applicable federal, State, regional, and local laws and regulations, including compliance with applicable stormwater permits, wastewater permits, and other water quality regulations, construction and operation of the proposed Project would result in less than significant impacts to hydrology and water quality. No mitigation measures are required for the proposed Project.

Provide references (doc and page/paragraphs) for mentioned laws, regulations, permits, and their requirements.

Provide commonly used industry standards references (docs, pages, and paragraphs) and compiled regulations, laws, and standards requirements as a mandatory compliance mitigation measure.

Provide contractual requirements for all construction contracts and differentiate between requirements and mitigations.

Provide revised supplemental/subsequent DEIR for public review and comments.

Repetitive comments as required by repetitive references and deficiencies.

Response GO18-81 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Responses GO18-76 through GO18-80 regarding applicable laws, regulations, and industry standards. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, §15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-82 Mineral Resources

3.12-2/2 The majority of wells in the Los Angeles City Oil Field, including the wells closest to the proposed Project alignment, are either plugged or idle. The nearest active well is approximately 1.5 miles west of the proposed Project alignment.\5

Provide a map of all known well sites within 1000ft of the Project excavations and provide and assess historic (1920-1950) aerial photos of the Project site for historic well sites and on-ground facilities which may have contaminated the Project sites. Assess potential impacts and provide specific mitigations for such, and recirculate the DEIR for further public review and comments.

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-82 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for Figure No. 7, Regional Oil Wells and Methane Zones. Refer to Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for analysis of historic well-sites and on-ground facilities. CEQA does not require extensive detail beyond that needed for evaluation and review of the

proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.). The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. No new significant environmental impact would result from the proposed Project or from a new mitigation measure proposed to be implemented.

Comment GO18-83 3.12-3/3 Additionally, although the proposed Project alignment is in the Los Angeles City Oil Field, the closest active well is approximately 1.5 miles west of the proposed Project alignment, and would not be affected by implementation of the proposed Project. Therefore, the proposed Project would not result in the loss of availability of a known mineral resource that would be of value to the region or State, and no impact would occur.

Plugged and idled wells lie within 500ft of the Project surface footprint and within 1000ft of the Park Station and Broadway Tower. Plugged and idled wells can be easily renovated for production of mineral resources (oil and gas) and can impact the Project construction excavations. More than 50 idled but not plugged wells lie within 1/2mile of the Park Station, and idled (and even plugged) wells can be returned to service cheaply and within a matter of months.

Revise and provide adequate review and assessment of the Project on return to service of more than 50 idled wells to the west of Park Station. Provide a revised review and assessment of mineral resources in a revised and recirculated DEIR.

Response GO18-83 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.12, Mineral Resources, of the Draft EIR for discussion of how the proposed Project would not result in the loss of availability of a known mineral resource. The majority of wells in the Los Angeles City Oil Field, including the wells closest to the proposed Project alignment, are either plugged or idle, with the nearest active well situated approximately 1.5 miles west of the proposed Project alignment. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by

commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) CEQA does not require speculation as to possible future environmental consequences, and the Draft EIR need not analyze uncertain, hypothetical future events. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. No new significant environmental impact would result from the proposed Project or from a new mitigation measure proposed to be implemented.

Comment GO18-84 3.15-20/6

The plan would also address the unlikely scenario where the system cannot be moved to unload passengers normally at stations. The robust design, periodic and preventative maintenance, and equipment redundancies are intended to minimize these potential impacts. However, the plan would include procedures to evacuate passengers directly from cabins, if needed. An Evacuation Plan would be developed as part of the Project-specific Emergency Operations Plan, as required by industry standards and State regulations....would describe the preferred methods....would also include the required equipment and procedures for evacuation, site control, and passenger communications....would be performed in advance of opening the system....would document the procedures, equipment, and personnel necessary to evacuate the system,..... Such analysis, practice, and documentation is required by OSHA.

Provide a draft Project description demonstrating a robust design vs typical design for the Project. Provide a draft maintenance manual for the Project, along with a clear assessment of equipment redundancy and service cycling of such.

Provide a draft evacuation plan for in-station and on-line gondolas and related equipment for such operations.

Provide draft comparisons of industry standards and preferred measures for this Project and relate such to potential impacts or mitigations.

Provide a listing and citations for related references of industry standards and regulations related to the above.

Provide a draft for all OSHA related analysis, practices, and documentation for such a Project, and provide references for such for at least three similar elevated projects in the US.

Provide a completely revised Supplemental DEIR with the above requests along with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-84 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, of the Draft EIR and Topical

Response J, Gondola Design and Operations, of the Final EIR, for discussion of the proposed Project's safety features, maintenance, evacuation plans, and applicable industry standards. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-85 3.16-31/3 3.17.1 Regulatory Setting Federal Americans with Disabilities (ADA) Act of 1990 Titles I, II, III, and V of the ADA have been codified in Title 42 of the United States Code, beginning at Section 12101....establishing minimum standards for ensuring accessibility when designing and constructing a new facility or altering an existing facility. The Project will be designed to meet all ADA design requirements.

Provide a thorough and complete review and draft illustrations/drawings for all ADA design sites within Project and related equipment, especially for wheelchair and walker/stroller devices.

Provide

Provide a completely revised Supplemental DEIR with adequate descriptions, assessments, and mitigation for ADA compliance along with alternative projects and their numerical/quantitative comparisons and selection.

Response GO18-85 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would comply with the accessibility requirements of the ADA. The station boarding process and cabins would comply with all accessibility requirements of the ADA. If needed, cabins could be either slowed or stopped in the station for boarding purposes. Station attendants would be located within each station to assure safe boarding and to execute stops for unloading or boarding purposes, if necessary. Attendants would also provide customer interaction and observation; if a passenger needs special assistance, an attendant may either further slow or stop a cabin. A separate operator would be stationed in a control booth monitoring screens, which would show activities in each cabin and station, as well as the system controls. The time necessary to slow or stop cabins is factored into the overall system capacity of the proposed Project. Pathways to the boarding areas would be ADA compliant with redundant vertical circulation and appropriately sized

passageways. The entry widths and interior size of each cabin would comply with the requirements of the ADA. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-86 4-1/1 4.0 ALTERNATIVES 4.1 INTRODUCTION Alternatives have been considered in this Draft EIR to explore potential means to mitigate or avoid the significant environmental impacts associated with implementation of the proposed Project, while still achieving the primary objectives of the proposed Project....an EIR shall describe the range of reasonable alternatives, which may include alternatives to the location of the project, which would feasibly attain most of the basic objectives of the project....EIR...does not need to consider every conceivable alternative or consider alternatives that are infeasible, but rather only alternatives necessary to permit a reasoned choice....No Project Alternative...to determine the consequences of not implementing the project...., and comparison of alternatives, the relative advantages and disadvantages of each alternative can be determined.

Provide goals/purposes of the Project and their related dependent objectives and policies/program.

Provide definitions of reasonable, feasibly, infeasible, and reasoned-choice and provide examples of such within the Project description and alternatives.

As required by CEQA, provide a numerical/quantified comparison of all environmental sectors and for all alternatives.

Provide a completely revised Supplemental DEIR in accordance with above deficiencies with adequate descriptions, assessments, and mitigation for alternative projects along with numerical/quantitative comparisons and selection.

Response GO18-86 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 2.0, Project Description, for a discussion of the purpose and need for the proposed Project, and the Project Objectives. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives, properly identifying an "environmentally superior" alternative and analyzing a "No Project" alternative, pursuant to CEQA. Section 4.0, Alternatives, also discusses alternatives considered

but dismissed from detailed analysis during the scoping process due to infeasibility, as required by CEQA Guidelines section 15126(c). CEQA Guidelines section 15126(f)(1) provides that the factors taken into account to address the feasibility of alternatives include “site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent).” Section 4.0’s assessment of impact areas for each alternative studied is in compliance with CEQA and the Guidelines, and to the extent this comment requests further numerical or quantified details for each alternative, this is not what CEQA requires. (See CEQA Guidelines, § 15126.) Table 4-1, Alternatives Conformance with Objectives, and Table 4-3, Alternative Impact Comparison, of the Draft EIR, provide a comparison of the proposed Project and the Project Alternatives impacts, and the Project Alternatives’ ability to meet the Project Objectives. Refer to Topical Response H: The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for further discussion of the CEQA requirements for an Alternatives analysis, the basis and range of alternatives evaluated in the Draft EIR, and the purpose and basis for the stated project objectives. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-87 Apdx K 1979/ & 1980/ During the late nineteenth and early twentieth centuries, crude oil was extracted from multiple small oilfields nearby and processed at the former Southern Refining Company located immediately northwest of the Site. Historical aerial photos and Sanborn maps indicate that the refinery contained four aboveground storage tanks (ASTs) for storing crude oil. The refinery was apparently dismantled by 1921 and the ASTs were removed sometime between 1921 and 1928. The Site has been used as a railroad junction for over 100 years and is currently maintained as such for use by three major passenger and freight lines.

Revise mis-directions of historic uses (SE rather than NW) and provide historic aerial photos of such site.

Provide address of site: e.g., 1300 CARDINAL STREET 1700 ft SE-E of Alameda for Southern Refining Company and Amalgamated Oil Company, now Williams Mead Housing Project.

Provide historic aerial photos and maps and revised Apdx K.

The entire DEIR and appendices do not consider or provide information provided in ZIMAS, LA City Dept. City Planning online database Very limited references in DEIR with singular mentions in the DEIR and geotechnical report, only. Withdraw current

DEIR, revise, and update and recirculate as supplemental/subsequent DEIR with incorporated ZIMAS information for all pertinent descriptions.

Response GO18-87 This comment provides a general recitation and characterization of text from the Draft EIR. The directions described on page 1979 of Appendix K, Phase I Environmental Site Assessment, to the Draft EIR, was provided in the EDR Environmental Database Report. Site addresses are provided as part of the EDR Radius Map, beginning on page 652 in Appendix K, Phase I Environmental Site Assessment, to the Draft EIR. Historic aerial photographs are provided beginning on page 342 in Appendix K, Phase I Environmental Site Assessment, of the Draft EIR. Refer to Response GO18-3 regarding ZIMAS. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. No new significant environmental impact would result from the proposed Project or from a new mitigation measure proposed to be implemented.

Comment GO18-88 Sept. 2022 Los Angeles Aerial Rapid Transit 16037.000.000 Geotechnical Document in Support of the Environmental Impact Report

APPENDIX I

Apdx. I-1 GeoTechnical Report ENGEO Project No. 16037.000.000

We are pleased to submit this document characterizing the general geologic/geotechnical conditions of the Los Angeles Aerial Rapid Transit (LA ART) project in Los Angeles, California. This report is a compilation of adjacent publicly available previous geotechnical assessments and explorations to assist in preparation of the Draft Environmental Impact Report (EIR).

Provide references (doc and page/paragraphs) for mentioned assessments and explorations. Provide geotechnical documentation for RTD/MTA Red Line Union Station and US-Civic Center rail Tunnels beneath this Project and adjacent to the Project’s Alameda Station.

Provide review and pertinent information from geotechnical documents related to the Buena Vista Project along south side of Broadway and under and adjacent to the Broadway/Bishop Tower.

Provide commonly used industry standards references (docs, pages, and paragraphs) and compiled regulations, laws, and standards requirements for geotechnical settings and impacts as a mandatory compliance mitigation measure.

Provide contractual requirements for all construction contracts and differentiate between geotechnical requirements and mitigations.

Provide revised supplemental/subsequent DEIR for public review and comments.

Response GO18-88 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to page 31 of Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for references to documents used in preparation of Appendix I. Refer to Section 3.7.1, Regulatory Setting, of the Draft EIR, for discussion of laws and regulations applicable to geology, soils, and seismic conditions in the proposed Project study area. Refer to Section 3.7.5, Mitigation Measures, of the Draft EIR, for discussion of Mitigation Measure GEO-A. Mitigation Measure GEO-A would require the Project Sponsor to engage a California-registered geotechnical engineer to prepare and submit a site-specific final geotechnical investigation and report to the City of Los Angeles for review, consistent with the requirements of the CBC, applicable Los Angeles amendments, and California Geological Survey Special Publication 117 (as amended). CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-89 Apdx. I - 2/1 This document was prepared based on a desktop study of readily available publicly accessible geotechnical reports and data. Geotechnical explorations and laboratory testing were not a part of this initial preliminary study scope.

No project borings, No records of vicinity geotechnical borings, Including Red Line Phase 1, Alameda – Tunnel and UStn, Buena Vista, Cornfields/Historic park, and William Mead Project.

The DEIR is totally deficient and inadequate regarding to geotechnical (and other EIR elements') settings, impacts assessments, and mitigations. Provide at least 4 borings per Project element to establish geological conditions and potential impacts of the Project on the area resources, and their hazards upon the Project.

Provide review of all recorded seismic events within 5000ft of the Project area limits and potential sources (including SCEC, Pasadena).

Response GO18-89 Refer to Section 3.07, Geology and Soils, of the Draft EIR, with supporting data in Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes, including all standards addressing environmental factors such as seismic effects, and would have less than significant impacts related to geology and soils upon implementation of Mitigation Measure GEO-A. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) Refer to Response GO18-43 for a discussion of why excavation for geotechnical borings is impracticable at this juncture.

Comment GO18-90 Apdx. I-13/1 approximately 10 miles within the earth (Wallace, 1990). The predominant fault system affecting the Project area is the Transverse Ranges fault system, which trends east-west and relieves strain primarily through reverse-slip, and left-lateral, strike-slip displacement.

Provide review of all recorded seismic events within 5000ft of the Project area limits, potential sources (including SCEC, Pasadena).

Provide review of the Elysian Park North Fault (see ZIMAS and others) underlying the Project sites and others north of Broadway.

Response GO18-90 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, of the Draft EIR, with supporting data in Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes, including all standards addressing environmental factors such as seismic effects, and would have less than significant impacts related to geology and soils upon implementation of Mitigation Measure GEO-A. Refer to Section 3.7.2.5, Regional Seismic Hazards, in the Draft EIR, and Section 4.2.1.1 in Appendix I, Geotechnical Document in Support of the Environmental Impact Report,

to the Draft EIR, for discussion on the Elysian Park Fault. The proposed Project area is in a seismically active region in southern California, but the proposed Project alignment is not in a State of California Earthquake Fault Zone (Alquist-Priolo Earthquake Fault Zone) for known Holocene active faults capable of fault surface rupture. The Elysian Park fault does traverse the proposed Project area, but it is a blind thrust fault and is not capable of surface fault rupture. Therefore, the risk of surface rupture due to faulting is considered low and construction of the proposed Project would not directly or indirectly cause potential substantial adverse effects. Refer to Response GO18-3 for discussion on the ZIMAS tool. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-91 Apdx. I-13/2 4.1.2 Site Topography The majority (3/4) of the proposed Project alignment occupies a gentle, south-sloping alluvial plain located approximately ½ mile west of the Los Angeles River (Figures 1 and 2).

Provide measurements in feet: 4057/6260 ft (65%) of length and 2880-3500ft west of LA River low flow channel rather than two different units (% and miles)in same sentence.

Response GO18-91 This comment provides a general recitation and characterization of text from the Draft EIR. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-92 Apdx. I -13/5 [Qyf 1 Holocene-Pleistocene] This geologic unit was deposited primarily from flood deposits and debris flows.

As used, Qyf includes the entire Quaternary (Holocene and Pleistocene). Provide specific technical term usage, Holocene is an interval of the Quaternary, not Pleistocene.

Response GO18-92 This comment provides a general recitation and characterization of text from the Draft EIR. As stated on page 13 of Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, "West of North Broadway, the

alignment is underlain by Holocene to Pleistocene alluvial fan deposits (Qyf1) fed by southeast-trending drainages including Chavez Ravine emanating from the highlands of the Elysian Park area.” Appendix I states “Holocene to Pleistocene,” not “Holocene and Pleistocene,” as noted in the comment.

Comment GO18-93 Apdx. I-13/6 4.1.3.3 Flood and Stream Channel Deposits According to geologic mapping by Campbell (2014), the alignment from the southern end to where it crosses North Broadway is underlain by late Pleistocene alluvium (Figure 3 - Qya2).

Provide accessible, specific sources (page/paragraph) for reference or provide copy of map in Appendix.

Provide differentiation between Late Pleistocene (Qo) and Holocene (Qy), as this designation would indicate all surface deposits would have potential for important fossils.

Response GO18-93 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to page 31 of Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for reference to the Preliminary Geologic Map of the Los Angeles 30'x 60' Quadrangle, California, produced by the California Geological Survey. Refer also to Figure 3.7-1 in Section 3.7.2.2, Local Geology, of the Draft EIR, and Figure 3 in Appendix I, for a depiction of a subset of the referenced map focused on the proposed Project area which includes areas of Late Pleistocene and Holocene deposits. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-94 Apdx. I -14/2 The geologic structure in the area of the site is characterized by the northeast-southwest-trending Elysian Park Anticline and the underlying Elysian Park Blind Thrust fault. The Project site is located over the southwest limb of the anticline. Bedding in the Puente Formation in the area generally dips from 25 to 50 degrees towards the southwest.

Other geotechnical sources (ZIMAS, et al) indicate that the EPBT Fault is aligned NW-SE rather than NE-SW beneath the Project.

Similarly general anticline axis orientation of NE-SW would require the flanks to dip from the axis to the NW and SE, rather than the SW; anticline axis (top of fold) maybe to SW.

Provide review and revisions by qualified geologist for review of relevant appendices and DEIR text for a Supplement DEIR.

Response GO18-94 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-3 regarding ZIMAS. As noted on page 3 of Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, the report was prepared by a certified geologist. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-95 Apdx. I -16/ TABLE 4.2.1.1-1: Nearby Active Faults (USGS 2008) Lat.=34.065019; Long.=-118.235495 FAULT NAME Elysian Park (Upper)*

Provide a single consistent name/term for the fault.

Response GO18-95 This comment provides a general recitation and characterization of text from the Draft EIR. The nomenclature employed in Table 4.2.1.1-1: Nearby Active Faults (USGS 2008) Latitude = 34.065019; Longitude = - 118.235495, is derived from the U.S. Geological Survey fault database.

Comment GO18-96 Apdx. I -17/2 Elysian Park Fault (Blind Thrust Fault) The fault closest to the Project site is the Elysian Park fault. According to the USGS Quaternary fault and fold database, the location of the Upper Elysian Park fault is inferred to cross under the alignment.

The Upper Elysian Park fault is a north-to-northeast-dipping fault that underlies the northern Los Angeles basin from Griffith Park to Garvey Reservoir. ZIMAS

However, the Upper Elysian Park fault is a blind thrust fault, which means it is not capable of surface fault rupture and; therefore, is not subject to the conditions of the Alquist-Priolo Act. ZIMAS

It is thought to be seismogenic (capable of generating earthquakes) from a depth....

Because there is no surface expression of the Elysian Park fault, constraints on the long-term slip rates on the fault..., rather than from paleoseismic data.

Although these constraints are limiting, the most current models (UCERF3) indicate... it has approximately 1.2% probability of participating in an earthquake of magnitude greater than 6.7 before 2038....The likelihood of experiencing an event of Magnitude > 7.0 is 0.8%, and the likelihood of experiencing an event of Magnitude > 7.5 is less than 0.1% in that time period.

Provide references for all such statements along with page/paragraph so that discussion of faults can be verified as accurate.

As ZIMAS shows the Project to cross and extend through the fault zone, this discussion needs to be thoroughly and adequately displayed and rectified as it is wrong, based on LACity ZIMAS.

Provide specifics assessments/mitigation regarding fault/design inclusions for Park Station, Broadway and Elysian towers, and Stadium Station and supports within the ZIMAS designated surface fault zone.

Provide accessible reference for UCERF3 as applied to this fault and location.

Provide seismic assessment of structural responses for towers, stations, cables, and gondolas during a 6.4-6.7 magnitude on the Elysian Park Fault.

Provide description and assessments reflecting the LACity-DCP ZIMAS info-base.

Response GO18-96 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of this Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes and would have less than significant impacts related to geology and soils, including seismic shaking, upon implementation of Mitigation Measure GEO-A. The proposed Project area is in a seismically active region in southern California, but the proposed Project alignment is not in a State of California Earthquake Fault Zone (Alquist-Priolo Earthquake Fault Zone) for known Holocene active faults capable of fault surface rupture. The Elysian Park fault does traverse the proposed Project area, but it is a blind thrust fault and is not capable of surface fault rupture. Refer to page 31 of Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for references to documents used in preparation of Appendix I. As indicated beginning on page 3.7-8, citations 11 through 18 provide data and mapping related to surface zones, liquefaction, and landslides. Refer to Response GO18-3 regarding ZIMAS. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-97 Apdx. I -17/4 These portions of the Project alignment are located in an area mapped as potentially subject to liquefaction on the Safety Element Exhibit B of City of Los Angeles General Plan and the State of California Seismic Hazards Zones map as shown on Figure 5. The Alameda Station, Alameda Tower, Alpine Tower, Chinatown/State

Park Station, and Broadway Junction are located in an area mapped as potentially subject to liquefaction.

Provide appropriate ZIMAS references. No specific references to ZIMAS.

Response GO18-97 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-3 regarding ZIMAS.

Comment GO18-98 Apdx. I -18/4 The proposed Project alignment is located in an area classified as MRZ-3 as shown on Figure 6. MRZ-3....” The proposed Project alignment is also located just beyond the eastern end of, but not within, what is designated as the Los Angeles City Oil Field.

Although not within the surface delineation of the LA Oil Field, close enough that may reflect the underlying oil/gas occurrences and production zones.

CalGEM Wellfinder shows the route alignment within the mapped oil field. North of Bruno/Alameda intersection, the Project Park Station lies within the well field along with 1200+ft of the cableway, and the Broadway Junction lies 550 ft east of the mapped field.

As many parcels through which the Project alignment passes are designated as “Methane Zones” they would be within the land above the designated Los Angeles Oil Field.

No references given. Provide appropriate ZIMAS references and DOC CalGEM WellFinder site.

Response GO18-98 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, for discussion of how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. As discussed on page 6-18 of Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, the California Department of Conservation’s online Geologic Energy Management Division (CalGEM) was accessed to identify potential methane releases within the proposed Project area. As noted on page 19 of Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, the proposed Project is located just beyond the eastern end, but not within, what is designated as the Los Angeles City Oil Field. The proximity to the proposed Project is noted in Figure 7, Regional Oil Wells and Methane Zones, which also shows the location of some proposed Project elements within Methane and/or Methane Buffer Zones. As stated on page 3.9-19, Figure 3.9-1, Methane Zones Within the Project Area, is a City of Los Angeles Department of Building and Safety map, which lists and categorizes Methane Zones and Methane Buffer Zones. As stated on page 42 of Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, the information was referenced on March 31, 2022, from the City of Los Angeles (2004). Refer to Response GO18-3

regarding ZIMAS. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-99 Apdx. I -19/1 ...located in a City-designated hillside area, indicating the sites may have an increased susceptibility to landslides.\3 \3 City of Los Angeles. Zone Information and Map Access (ZIMAS). Available at: <http://zimas.lacity.org/>. Accessed May 2022

Only reference to ZIMAS in the entire DEIR although landslides are indicated by ZIMAS for parcels NW of SR-110 and for the Alpine Tower and Stadium Station areas.

Provide review of all Project element locations with regard to ZIMAS database information, e.g., faults, landslide, and liquefactions.

Provide review of liquefaction potential as indicated by ZIMAS for Project area and facilities south of Broadway. Provide appropriate mitigation for liquefaction and for landslides especially when seismically induced

Response GO18-99 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-3 regarding ZIMAS. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes and would have less than significant impacts related to geology and soils, including liquefaction, upon implementation of Mitigation Measure GEO-A. As discussed in Section 3.7.5, Mitigation Measures, of the Draft EIR, Mitigation Measure GEO-A provides for preparation of Site-Specific Final Geotechnical Report that will include recommended measures to reduce potential impacts related to liquefaction induced by the proposed Project. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-100 Apdx. I -20/1 ...which require monitoring before and during construction. Although long-term methane controls are not required, preliminary construction planning should adhere to Section 91.7101 of the Los Angeles Municipal Code, which

controls for methane intrusion emanating from geologic formations. The need for methane controls may be reduced or eliminated by conducting site-specific methane testing for elements constructed within the methane zones and buffer zones to evaluate the potential hazard, pursuant to Section 91.7104.1.

ZIMAS clearly indicates parcels which are designated as being in a Methane Zone or Methane Buffer Zone, is not so designated in the DEIR setting and no mitigation measures are proposed.

As no methane surveys, testing, and monitoring has been conducted within the Project sites, the needs for methane monitoring and controls must be implemented before and throughout construction, especially for towers, the junction, and Park Station.

The appendix does not clearly describe the Project sites but states that monitoring will be conducted before construction and hopefully would be assessed before construction contracts are offered. Without any direct information or assessment, the DEIR assesses that construction and longer term methane controls will not be needed, even though the Park Station and Broadway Tower lie within designated Methane Zones.

Provide a thorough description of methane gas conditions of surface and subsurface based on >10ft borings for each Project site and as required by Metro for construction of major surface and subsurface facilities. Provide suitable mitigation and safety plans for those sites with methane gases in soils and groundwater.

Provide specific contractor programs to monitor, to control, and to assess measures required for continuing safe operations at all Project facilities located in ZIMAS recognized Methane Zones.

Response GO18-100 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-3 regarding ZIMAS. Refer to Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, with supporting data provided in Appendix K, Phase I Environmental Site Assessment, for discussion of the proposed Project relative to the Methane and Methane Buffer Zones and how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. As discussed, beginning on page 3.9-25, in Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, during construction, ground-moving activities such as excavation for the foundations of the stations and towers would include disturbance of soils and pass through Methane Zones and/or Methane Buffer Zones. Methane exposure to workers during construction can be hazardous at high levels, but it is anticipated that construction methods for the proposed Project would involve relatively shallow and wide excavations and would not be considered confined spaces, which therefore reduces the likelihood of construction workers being exposed to gas concentration that would be hazardous due to inhalation. Further,

construction activities and workers would be required to comply with OSHA and Cal/OSHA regulations. As discussed on page 3.9-27 in Section 3.09 of the Draft EIR, although the stations, junction, and towers are open-aired structures, enclosed vertical circulation elements (stairwells and/or elevators) would be required to be designed and constructed to comply with Division 71 of the LAMC and Cal/OSHA regulations to ensure worker health and safety. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-101 Apx. I -21/1 5.2.2 Seismic Hazards Mapping Act of 1990...addresses earthquake hazards other than surface fault rupture, including liquefaction and seismically induced landslides....identifying and mapping seismic hazard zones and mitigating seismic hazards to protect public health and safety.

Provide specific page/paragraph citations and include specific parcel references for ZIMAS assignments to surface zones, liquefaction, and landslides.

Provide a thoroughly revised and supplemented Subsequent Draft Environmental Report (SDEIR) for public review and comments.

Response GO18-101 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-3 regarding ZIMAS. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes and would have less than significant impacts related to geology and soils, including liquefaction, with implementation of Mitigation Measure GEO-A. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-102 Apdx. I -21/1 It requires the California Department of Conservation, Division of Mines and Geology, to map seismic hazards and establishes specific criteria for project approval that apply within seismic hazard zones, including the requirement for a geological technical report. The California Department of Conservation has mapped seismic hazards or established specific criteria for the area that includes the Project site (CGS, 1998).

Provide specific page/paragraph citations and include specific parcel references for ZIMAS assignments to surface zones, liquefaction, and landslides.

Provide parcel specific seismic hazard zones for all Project construction sites.

Response GO18-102 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-3 regarding ZIMAS. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for data and mapping related to surface zones, liquefaction, and landslides and for discussion of how the proposed Project would have less than significant impacts related to geology and soils, including liquefaction, with implementation of Mitigation Measure GEO-A. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-103 Apdx. I -21/2 The geological reports prepared for the Project satisfy the requirements of the Seismic Hazards Mapping Act at the preliminary project level. Additional site-specific studies designed to explore the subsurface conditions in areas of planned development will be completed prior to submittal of final plans.

Define “preliminary project level” and provide schedule/contents for final plans (and designs) and current/2023 industry standards for designs and project description used for basis of CEQA/EIR compliance and agency certification of this Project.

Provide list, outlines, and completion schedules for all site specific studies. Provide requirements for all such future studies to be incorporated into a subsequent DEIR.

Provide above and a total revision of DEIR, and especially geotechnical considerations, and resubmit as a supplemental/subsequent DEIR for public review and comments.

Response GO18-103 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or

prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in the proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-104 Apdx. I -22/5 5.2.2 Seismic Hazards Mapping Act of 1990 The California State Seismic Hazards Mapping Act of 1990 addresses earthquake hazards other than surface fault rupture, including liquefaction and seismically induced landslides....The geological reports prepared for the Project satisfy the requirements of the Seismic Hazards Mapping Act at the preliminary project level. Additional site-specific studies designed to explore the subsurface conditions in areas of planned development will be completed prior to submittal of final plans.

Define "preliminary project level" and provide schedule/contents for final plans (and designs) along with citations + page/paragraph of any references and provide current/2023 industry standards for designs and project description used for basis of CEQA/EIR compliance and agency certification of this Project.

Provide list, outlines, and completion schedules for all site specific studies.

Provide the above and total revision of DEIR, and especially geotechnical considerations, and resubmit as a supplemental/subsequent DEIR for public review and comments.

Response GO18-104 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. CEQA does not require extensive detail

beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-105 Apdx. I -22/6 Division 71 (Methane Seepage Regulations) describes methane testing and mitigation requirements based on building type, building use/occupation, and whether a structure is located within a methane zone or buffer zone. The proposed Project alignment crosses a methane zone and buffer zone and may require site-specific methane testing for particular structures, depending on the final architectural design.

Provide and implement a methane monitoring and assessment program for all construction sites prior to preparation of a supplemental/subsequent DEIR for public review and comments.

Provide all of the above and total revision of DEIR, and especially geotechnical considerations, and resubmit as a supplemental/subsequent DEIR for public review and comments.

Response GO18-105 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.09, Hazards and Hazardous Materials, of the Draft EIR with supporting data provided in Appendix K, Phase I Environmental Site Assessment, for discussion of the proposed Project relative to the Methane and Methane Buffer Zones and how, with adherence to OSHA, Cal/OSHA, and Division 71 of the Los Angeles Municipal Code, the proposed Project would have less than significant impacts related to methane gas exposure or release. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental

impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-106 Apdx. I-24/1 Impact: There is potential for the proposed Project to expose people or structures to seismic hazards listed above. Mitigation measures would be required to reduce impacts to a less than significant level.

Provide review and assessment of all fault and seismic impacts given for an event equal to 6.4 magnitude as noted in ZIMAS. Provide for pre-construction and ongoing microseismic monitoring for the Upper Elysian Park Fault zone beneath the Project.

Replace all “would’s” with shall’s or must’s.

Provide for additional mitigation programs for at least 120 minute emergency evacuation programs and for damage prevention for surrounding land uses in the event of tower collapses or toppling.

Provide all of the above and total revision of DEIR, and especially geotechnical considerations, and resubmit as a supplemental/subsequent DEIR for public review and comments.

Response GO18-106 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Plans in Mitigation Measures and Project Design Features, for discussion of how the use of plans in mitigation measures does not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet applicable standards, requirements, and building codes, including all standards addressing environmental factors such as seismic effects, and would have less than significant impacts related to geology and soils upon implementation of Mitigation Measures GEO-A. The proposed Project area is in a seismically active region in southern California, but the proposed Project alignment is not in a State of California Earthquake Fault Zone (Alquist-Priolo Earthquake Fault Zone) for known Holocene active faults capable of fault surface rupture. The Elysian Park fault does traverse the proposed Project area, but it is a blind thrust fault and is not capable of surface fault rupture. Refer to Response GO18-3 regarding ZIMAS. Refer to Topical Response J, Gondola Design and Operations, for discussion of how an Evacuation Plan would be developed as part of the Emergency Operations Plan of the proposed Project. CEQA does not require

extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-107 Apdx. I -24/2 To mitigate the shaking effects, structures should be designed using sound engineering judgment and the current CBC requirements, as a minimum.

Provide definitions and comparisons for should’s and would’s vs shall’s and will’s. Replace all “should’s” with shall’s or must’s.

Provide all of the above and total revision of DEIR, and especially geotechnical considerations, and resubmit as a supplemental/subsequent DEIR for public review and comments.

Response GO18-107 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Response GO18-106. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-108 Apdx. I -24/2 However, the proposed Project alignment is not located within a State of California Earthquake Fault Zone for known Holocene-active faults capable of fault surface rupture (CGS, 2017) or located within an Alquist-Priolo Earthquake Fault Zone. Accordingly, the risk of surface rupture due to faulting is considered low. As such, the Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. Impacts would be considered less than significant.

Replace all “would’s” with shall’s or must’s.

No reference to ZIMAS nor to Buena Vista Scoping and related studies. No references to competent certified reviewers for such statements and use of conditionals.

Provide an adequate and complete technical review and statement of significance by competent certified engineer. All such additions must be provided in a subsequent/supplemental DEIR prior to further consideration of the Project and public review and comments.

Response GO18-108 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Plans in Mitigation Measures and Project Design Features, for discussion of how the use of plans in mitigation measures does not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review. Refer to Response GO18-3 regarding ZIMAS. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed project would meet applicable standards, requirements, and building codes and would have less than significant impacts related to seismic-related ground failures upon implementation of Mitigation Measure GEO-A. As indicated beginning on page 3.7-8, of Section 3.07, Geology and Soils, citations 11 through 18 provide data and mapping related to surface zones, liquefaction, and landslides. Moreover, CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-109 Apdx. I -24/4 The actual risk of the liquefaction hazard and related damages should be evaluated in the site-specific geotechnical report. The Project would be required to comply with all standards, requirements, and conditions contained in construction-related codes (e.g.,...), which would ensure structural integrity and safe construction.

Actual risks and mitigation measures must be evaluated in a sites-specific review and assessment by a competent, certified engineer(s), must be based on adequate and complete geotechnical studies and assessments, and must provide appropriate mitigation and compensation measures to warrant a less-than-significant risks to structures and passengers.

Provide an adequate and complete technical review and statement of significance by competent certified engineer. All such additions must be provided in a subsequent/supplemental DEIR prior to further consideration of the Project and public review and comments.

Response GO18-109 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, with supporting data in Appendix I, Geotechnical Document in Support of the Environmental Impact Report, for discussion of how the proposed Project would have less than significant impacts related to geology and soils upon implementation of Mitigation Measure GEO-A. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation

Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-110 Apdx. I -25/1 Therefore, impacts related to earthquake-induced slope failure could be considered moderately significant to significant and should be addressed per Mitigation Measure GEO-A.

Use of could/should and ranges of significance are inconsistent with CEQA and must be based on factual evidence for the Project sites and assessments by competent, certified reviewers.

Provide an adequate and complete technical review and statement of significance by competent certified engineer. All such additions must be provided in a subsequent/supplemental DEIR prior to further consideration of the Project and public review and comments.

Response GO18-110 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of this Final EIR, for discussion of the structural design of the proposed Project and how the proposed Project would have less than significant impacts related to geology and soils, including seismic shaking, upon implementation of Mitigation Measure GEO-A. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The

CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-111 Apdx. I -25/2 Compliance with existing laws and regulations, and implementation of Mitigation Measure GEO-A, requiring the development and implementation of geotechnical recommendations to be incorporated into the design plans and specifications, would reduce impacts to less than significant.

As indicated in text, the current DEIR finds current designs would generate significant impacts for seismicity/Geological Resources, as the referenced programs have not been conducted and the public has not had a public review and comments for the mitigation measures to be considered.

Response GO18-111 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of this Final EIR, for discussion of the structural design of the proposed Project and how the proposed Project would have less than significant impacts related to geology and soils, including seismic shaking, upon implementation of Mitigation Measure GEO-A. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact.

Comment GO18-112 Apdx. I -25/3 Operation Upon completion of the construction activities, the proposed Project would have complied with..., as well as Mitigation Measure GEO-A. Operation of the aerial gondola system would have a less than significant impact with respect to exposing people or structures to seismic hazards if appropriate mitigation measures are applied during construction.

As indicated, appropriate mitigation measures (which are unknown in this DEIR and not based on evidence) are not available for public review and comment.

As indicated in this text, the current DEIR finds current designs would generate significant impacts for seismicity/Geological Resources, as the referenced programs have not been conducted and the public has not had a public review and comments for the mitigation measures to be considered.

Provide an adequate and complete technical review and statement of significance by competent certified engineer prior to further considerations of this DEIR.

Provide such additions in an adequate and complete subsequent/supplemental DEIR prior to further consideration of the Project and public review and comments.

Response GO18-112 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project’s use of mitigation measures and project design features is consistent with the requirements of CEQA. CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of this Final EIR, for discussion of the structural design of the proposed Project and how the proposed Project would have less than significant impacts related to geology and soils, including seismic shaking, upon implementation of Mitigation Measure GEO-A. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-113 Apdx. I -29/8 8. CONCLUSION The proposed Project would have less than significant impacts with respect to geologic and geotechnical hazards with application of the recommended mitigation measures. Prior to grading and construction permits being issued, a site-specific final geotechnical report should be prepared, as recommended in Mitigation Measure GEO-A. ...should include site-specific measures and design considerations for the stations, junction, and towers. The recommendations may vary depending on the geologic and geotechnical conditions at each location.

Replace ALL would’s + should’s with shall or musts and provide specific and contractual required (must) mitigation along with numerical evaluation of assessed impacts before and after required mitigation.

Provide such additions in an adequate and complete subsequent/supplemental DEIR prior to further consideration of the Project and public review and comments

Response GO18-113 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Topical Response I, Use of Plans in Mitigation Measures and Project Design Features, for discussion of how the use of plans in mitigation measures does not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, and Appendix F, Memo on Structural Engineering, of this Final EIR, for discussion of the structural design of the proposed Project and how the proposed Project would have less than significant impacts related to geology and soils upon implementation of Mitigation Measure GEO-A. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-114 Apdx J Greenhouse Gas Emissions Technical Report 20/4 2.2.2.5 Senate Bill 44 Senate Bill (SB) 44, signed October 7, 2021, provides specialized procedures for the administrative and judicial review of processes and approvals for an “environmental leadership transit project.” SB 44 defines an “environmental leadership transit project” as “a project to construct a fixed guideway and related fixed facilities” that meets all of the following conditions:

A. The fixed guideway operates at zero-emissions.

B. (i) If the project is more than two miles in length,...

(ii) If the project is no more than two miles in length, the project reduces emissions by no less than 50,000 metric tons of greenhouse gases directly in the corridor of the project defined in the applicable environmental document over the useful life of the project, without using offsets.

C. The project reduces no less than 30,000,000 vehicle miles traveled in the corridor of the project defined in the applicable environmental document over the useful life of the project.

Provide a specific table of SB44 requirements and Project achievements in quantitative form consistent with the specific requirements of SB44, including for events only and for non-event calendar only.

Provide a useful life period for events-based and full-time base for Project operations.

Provide such additions in an adequate and complete subsequent/supplemental DEIR prior to further consideration of the Project and public review and comments.

Response GO18-114 This comment provides a general recitation and characterization of Senate Bill 44. Refer to Section 1.0, Introduction, Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, and Section 3.17, Transportation, of the Draft EIR, for discussion and quantitative analysis demonstrating how the proposed Project is consistent with the requirements of SB 44. Refer to Topical Response A, SB 44, for discussion of the proposed Project’s consistency with the requirements of Senate Bill (SB) 44. Refer to Appendix R, Senate Bill 44 (Public Resources Code Section 21168.6.9), of the Draft EIR, and Appendix E, Senate Bill 44 (Public Resources Code Section 21168.6.9), of the Final EIR. Refer to Topical Response A, SB 44, for discussion of how the proposed Project would reduce emissions by no less than 50,000 metric tons of greenhouse gas emissions directly in the proposed Project’s corridor as defined within the EIR over the useful life of the proposed Project, and without using offsets the proposed Project’s lifetime VMT reduction over its useful life (30 years based on SCAQMD’s guidance for GHG significance thresholds) would be a reduction of greater than 30,000,000 VMT at 129,629,500 VMT saved, substantially more VMT saved than is required under SB 44. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-115 Apdx L-58/1 7. Conclusion Construction and operation of the proposed Project could result in adverse effects to surface water and groundwater quality in the Los Angeles River and Central Basin, and violate water quality standards and waste discharge requirements, if not appropriately managed. However, adherence to applicable federal, State, regional, and local laws and regulations would result in less than significant impacts.

Provide Project-specific definitions, procedures, and designs of “appropriate” management and adherence. Provide hydrologic model and numerical results based on specific design and operational conditions for each Project construction site.

Response GO18-115 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, in the Draft EIR, with supporting data provided in Appendix L, Hydrology and Water Quality Technical Study, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. As discussed on page 3.10-29, in Section 3.10, Hydrology and Water Quality, Table 3.10-3: Existing and New Impervious Surface Area, indicates numerical results of the changes in impervious surface area affecting surface water quality. The proposed Project would be designed to incorporate several sustainability features for the proposed Project’s post-

construction design to control/treat runoff. The proposed Project would incorporate best management practices (BMPs) to ensure the treatment of the first flush or the equivalent of the greater between the 85th percentile storm and first 0.75-inch of rainfall for any storm event. The proposed Project and low impact development (LID) Plan incorporating BMP design features would comply with all applicable federal, State, regional, and local agency water quality protection laws and regulations, as well as commonly used industry standards. Refer to Response GO18-76 for discussion of laws and regulations applicable to hydrology and water quality. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.)

Comment GO18-116 Apdx L-58/2 Additionally, the proposed Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge....Although the proposed Project would result in increases to impervious surfaces, the additional impervious surface areas are nominal, and all proposed Project components would comply with the LID ordinance as applicable, thereby reducing runoff. Impacts would be less than significant.

No numerical description and assessment are provided for current and Project conditions and no definitions of "substantially" or "nominal" are provided. Provide numerical analyses for each project construction site and provide specific LID measures and their mitigative effects to bypass rainfall into groundwater for each site, none are provided here and elsewhere.

Provide designs and flowcharts for all LID related designs for collection, conveyance, storage, and recharging for each Project site.

Response GO18-116 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, with supporting data provided in Appendix L of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Refer to Response GO18-115 for a discussion of the proposed Project's hydrology and water quality impacts. Each drainage area on the proposed Project site would include design elements that serve to capture and re-use stormwater in accordance with current LID requirements—thereby minimizing the potential for both on- and off-site erosion, siltation, and flooding while simultaneously providing irrigation supply and reducing potable water consumptive use. LID design features slow (detain or retain) stormwater that reduces the runoff volume discharged from the proposed Project and decreases the peak runoff discharge velocity for design storms—also ultimately

reducing the amount of stormwater runoff burden into the City’s stormwater conveyance systems. As a result, less flow with fewer pollutants would be transported through the conveyance systems and ultimately into surface waters, including ancillary exfiltration to the groundwater table. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO18-117 Apdx L-58/4 The proposed Project could potentially conflict with or obstruct implementation of water quality control or sustainable groundwater management plans. Although construction and operation of the proposed Project would potentially impact the water quality of the Los Angeles River and Central Basin..., adherence to applicable federal, State, regional, and local laws and regulations would ensure the proposed Project would comply with all federal, State, and local water quality control or sustainable groundwater management plans. Impacts would be less than significant.

No numerical description and assessment are provided for current and Project conditions and no definitions of “substantially” or “nominal” are provided. Provide numerical analyses for each project construction site and provide specific LID measures and their mitigative effects to bypass rainfall into groundwater for each site, none are provided here and elsewhere.

Reference to adherence to laws and regulations is totally unacceptable and must be replaced with a design-operations based mitigation manual with assigned actions/procedure and equipment for all contractors, and associated approved permits from regulatory agencies.

Provide designs and flowcharts for all LID related designs for collection, conveyance, storage, and recharging for each Project site.

Provide a revised, supplemental/subsequent DEIR for all hydrologic elements.

Response GO18-117 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Responses GO18-115 and GO18-116 for a discussion of the proposed Project’s hydrology and water quality impacts. Refer to Section 3.10, Hydrology and Water Quality, with supporting data provided in Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project’s use of mitigation measures and project design features is consistent with the requirements of CEQA.

Refer to Response GO18-76 for discussion of laws and regulations applicable to hydrology and water quality. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-118 Apdx L-58/5 The proposed Project could have potential adverse impacts related to hydrology and water quality; however, with adherence to applicable..., significant impacts would be less than significant level. The proposed Project would not result in any significant impacts related to hydrology and water quality.

No numerical description and assessment are provided for current and Project conditions and no definitions of "substantially" or "nominal" are provided. Provide numerical analyses for each project construction site and provide specific LID measures and their mitigative effects to bypass rainfall into groundwater for each site, none are provided here and elsewhere.

Provide designs and flowcharts for all LID related designs for collection, conveyance, storage, and recharging for each Project site.

Provide a revised, supplemental/subsequent DEIR for all hydrologic elements.

Response GO18-118 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.10, Hydrology and Water Quality, with supporting data provided in Appendix L, Hydrology and Water Quality Technical Study, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts related to hydrology and water quality. Refer to Responses GO18-115 through GO18-117 for a discussion of the proposed Project's hydrology and water quality impacts.

Comment GO18-119 Apdx.F Archaeological and Paleontological Resources Assessment

No mentions are made in DEIR regarding significant historic/archaeological remains recovered from excavations conducted at the Union Station area (for mitigation of suspected impacts from Union Station and subway construction for Red Line Phase 1.

Archaeology – SW Park Station and Alameda/Chavez location (China town 2, 1900-1925) and American Indian – (1800-1900)

Bishop Str. Historic uses of Italian (1890-1925) and Chinese (Post 1920) origins – Chinatown 2

Provide four borehole drilling/analyses to depths of 10ft and assessment for potential historic archaeological remains at each Project construction sites, and especially those from Alameda – Broadway sites. Provide at least two boreholes for sites north of Broadway.

Apdx F-70/2 The results of the records search, shown in Table 7, indicated that there are no known NHM vertebrate fossil localities within the Area of Direct Impacts. Moreover, the majority of the Area of Direct Impacts, consisting of surficial deposits of younger Quaternary alluvium, is not anticipated to contain significant fossil remains in its uppermost layers because the sediment is too young to contain such fossils.

Provide the specific technical basis for such identification of “younger”, “uppermost” (?= 0.1ft or 10ft) and their distribution. Provide 4 or more borings of 10 ft for each site south of SR-110. Provide thorough and adequate analyses and assessments of potential fossils and remains to document age and resources.

Apdx F-94/2 Quaternary alluvium is expected to be present at differential depths within the Project Area. Planned Project excavation is anticipated to reach up to 10 feet, except at Dodger Stadium Station where the maximum depth would be 42 feet, and piles would be drilled to a max depth of 125 feet; therefore, Project construction may encounter paleontological deposits.

Replace “differential” with different and “up to” with down to.

Provide four borehole drilling/analyses to depths of 10ft and assessment for potential historic archaeological remains at each Project construction sites, and especially those from Alameda –Broadway sites. Provide at least two boreholes for sites north of Broadway.

Provide a thorough construction mitigation program for archaeological and paleontological remains with specific contractual requirements for assessment, encountering, and recovery of all paleontological and archaeological remains. Include in a thoroughly and adequately revised DEIR for public review and additional comments.

Response GO18-119 This comment provides a general recitation and characterization of text from the Draft EIR. The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related

to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR, for discussion of how the proposed Project would implement Mitigation Measure GEO-B, requiring the preparation of a Paleontological Resources Monitoring and Mitigation Plan (PRMMP). CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., 14 Cal. Code Regs. § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (*Id.*, § 15204.) Refer to Response GO18-43 for a discussion of why boring sampling for paleontological resources is impracticable at this juncture. Boring sampling for archaeological resources is impracticable for similar reasons. As discussed in Topical Response I, as acknowledged on page 3.5-2, Section 3.05, Cultural Resources, of the Draft EIR, "an archaeological resource may not be recognizable or even observable without ground-disturbing activities." Mitigation Measures CUL-A and CUL-C through CUL-E accordingly outline actions that would be taken in the unlikely event that archaeological resources are discovered once excavation begins on-site. Excavation or other such ground disturbance prior to approval of the proposed Project to discover any potential additional resources is impracticable at this juncture. The CEQA Guidelines specify that the standards for preparation of a subsequent or supplemental EIR apply only after an EIR has been certified or a negative declaration has been adopted for a project. (*Id.*, § 15162(a).) The EIR for the proposed Project has not been certified.

Comment GO18-120 A Paleontological Resources Monitoring and Mitigation Plan (PRMMP) shall be developed by a qualified paleontologist meeting the criteria established by the Society for Vertebrate Paleontology. The plan shall apply to paleontologically sensitive deposits, including older Quaternary alluvium and Puente formation deposits, that may be impacted by the proposed Project, as determined by a qualified paleontologist in consultation with the construction team and guided by geotechnical coring.

Provide a consistent approach throughout the DEIR regarding the use of conditional and declaratory verbs which herein reflects the direct copying of texts from other, unreferenced sources into this DEIR. Provide consistent approach to all remains encountered during excavation.

Provide a thorough construction mitigation program for archaeological and paleontological remains with specific contractual requirements for assessment, encountering, and recovery of all paleontological and archaeological remains. Include

in a thoroughly and adequately revised DEIR for public review and additional comments.

The qualified paleontologist shall supervise the paleontological monitor who shall be present during construction excavations into older Quaternary alluvial deposits and Miocene Puente formation deposits. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains, and where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains.

Provide a consistent approach throughout the DEIR regarding the use of conditional and declaratory verbs which herein reflects the direct copying of texts from other, unreferenced sources into this DEIR.

Provide consistent approach to all remains encountered during excavation.

Provide a thorough construction mitigation program for archaeological and paleontological remains with specific contractual requirements for assessment, encountering, and recovery of all paleontological and archaeological remains. Include in a thoroughly and adequately revised DEIR for public review and additional comments.

The frequency of monitoring inspections shall be determined by the paleontologist and shall be based on the rate of ground-disturbing activities, the material being excavated, and the depth of excavation, and if found, the abundance and type of paleontological materials found.

Provide a thorough construction mitigation program for archaeological and paleontological remains with specific contractual requirements for assessment, encountering, and recovery of all paleontological and archaeological remains. Include in a thoroughly and adequately revised DEIR for public review and additional comments.

95/2 The areas of paleontological sensitivity include all locations where undisturbed Older Quaternary alluvium or the Monterey/Puente Formation may be impacted by the Project. The identification of exact locations to be monitored would be guided in part by geotechnical boring for the Project.

Define “undisturbed” and require all fossils, even in disturbed deposits be recovered and assessed.

Provide a thorough construction mitigation program for archaeological and paleontological remains with specific contractual requirements for assessment, encountering, and recovery of all paleontological and archaeological remains. Include in a thoroughly and adequately revised DEIR for public review and additional comments.

Response GO18-120 This comment provides a general recitation and characterization of text from the Draft EIR. Refer to Section 3.07, Geology and Soils, and Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, of the Draft EIR, for discussion of how the proposed Project would have less than significant impacts to paleontological resources with the implementation of Mitigation Measure GEO-B. Mitigation Measure GEO-B would require the development of a Paleontological Resources Monitoring and Mitigation Plan (PRMMP) to provide direction on the identification of high-sensitivity areas and appropriate monitoring, excavation, and preservation processes during construction excavation activities.

Comment Letter GO19 – Maria S. Salinas

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO19**Comment GO19-1** Dear Chair Najarian

On behalf of the Los Angeles Area Chamber of Commerce representing more than 1,400 companies and small business owners in Los Angeles, I write to express our support for the proposed Los Angeles Aerial Rapid Transit (LA ART) project. As you know, aerial gondolas are used across the world to connect key districts in cities to improve mobility, reduce greenhouse gas emissions, reduce congestion, and provide entertainment district patrons efficient alternatives to existing travel options.

Response GO19-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world and their features to enhance and provide additional benefits to the surrounding communities, including increased mobility options, greater accessibility, shorter travel times, and traffic and emissions reductions for surrounding communities.

Comment GO19-2 The LA ART also has the historic potential to connect El Pueblo, Union Station, Chinatown, Mission Junction, and Solano Canyon, while also providing access to the Los Angeles State Historic Park, the Los Angeles River, and Elysian Park. These are important centers of the Los Angeles culture, history, green space, entertainment, and underserved populations that would see immense mobility benefits should LA ART progress.

Response GO19-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first and last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. The proposed Project would also provide new connections to and between currently underserved neighborhoods and uses along the proposed alignment, including El Pueblo, Chinatown, Mission Junction, the Los Angeles State Historic Park, Elysian Park, and Solano Canyon. To facilitate this

transportation connectivity, the proposed Project would include pedestrian access enhancements including pedestrian improvements between Metro’s L Line (Gold) Station and Chinatown/State Park Station consistent with the Connect US Action Plan, shade structure, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge. As discussed in Topical Response N, Environmental Justice, the proposed Project would be free to ride for anyone with a ticket to a Dodger game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment GO19-3 Further, these neighborhoods and areas would see measurable benefits for local small businesses and entrepreneurs who thrive on greater numbers of pedestrians, transit riders, and tourists. With a speedy approval of this project it will be built in time for the 2028 Olympic Games and will be a necessary piece of regional mobility for the influx of tourists.

Response GO19-3 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. As discussed in Section 2.0, Project Description, the proposed Project will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. As detailed in Appendix N, Potential LA ART Tourist Ridership of the Draft EIR, tourism related ridership is estimated from an analysis prepared by HR&A, which determined the potential for the proposed Project to capture a share of the tourism attraction market in the County of Los Angeles.

Comment GO19-4 Importantly, the LA ART proposal includes a “Community Access Program” that would allow residents and employees of businesses close to the project to ride the gondola using their LA Metro fare, at no additional cost. LA Art proposes a comprehensive vision that considers neighborhood needs, pedestrian improvements, business growth, and mobility enhancements.

For these reasons I strongly support advancing LA ART. If you have any questions, please contact Senior Public Policy Manager Cameron Gil at CGIL@LACHamber.com.

Sincerely,

Maris S. Salinas
President & CEO

Response GO19-4 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical C, Project Features, for discussion of the proposed Project team’s outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project’s features to enhance and provide additional benefits to the surrounding communities. Refer to Responses GO19-1 to GO19-3 for discussion of the proposed Project’s pedestrian improvements, economic benefits to local businesses, and mobility enhancements.

Comment Letter GO20 – Arts District Community Council, Todd Terrazas

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO20

Comment GO20-1 Dear Mr. Zelmer:

Below are comments for the Los Angeles Aerial Rapid Transit Project DEIR.

Arts District Community Council LA (ADCCLA) is a 501c3 nonprofit focused on creating and reserving public green space. We further address government infrastructure and sustainability decisions that could negatively impact the Arts District Community.

ADCCLA became aware of the Project in 2018. In reviewing the scant material provided by LA ART, ADCCLA engaged its board and community members in researching the impacts of the Project.

Response GO20-1 This comment provides a general introduction regarding the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO20-2 through GO20-24.

Comment GO20-2 Description

LA ART intends to build a private aerial tramway on behalf of Frank McCourt to go 1.2 miles from Union Station to near the gold line stop and then over the LA State Historic Park and residential communities to Dodger Stadium. The Project has been billed as a sustainable project that will take 3,000 cars off the road. It purports to be a “privately” funded project created to move people to a single private for-profit enterprise and is being billed as a PUBLIC transportation project. Various non-committal mitigations have been offered in the future that continue to be moving targets for stakeholders to try and unwind.

Response GO20-2 This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO20-3 through GO20-24. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provides detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response A, SB

44, for discussion of how the proposed Project is public transportation. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project's use of mitigation measures and project design features is consistent with the requirements of CEQA.

Comment GO20-3 Comments:

1. The entirety of the NOP and DEIR is a farce.
 - a) The purpose of CEQA is to lay out in detail all aspects of the Project in order for the public and the communities impacted to have a clear and complete understanding of the Project.
 - b) To date, the Project has been driven by non-disclosure agreements (NDA) signed by both Metro (the agency overseeing the Project?) and State Parks. The NDA's gave and has continued to give LA ART and Metro cover to hide the full intent and scope of the Project.

Response GO20-3 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of public outreach during the Draft EIR public review period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. For example, after initially offering two options for the proposed Project alignment in the Notice of Preparation, responding to stakeholder input, the Project Sponsor announced it would proceed with the proposed Project alignment studied in the Draft EIR, including the intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park. This decision was in direct response to both State Park and Chinatown stakeholders. Located within a short walk to many Chinatown businesses and Metro's L Line (Gold), this station also addresses the goal of creating a stronger connection with the Metro L Line and would also enhance transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River.

As discussed in Appendix A, Public Outreach Report, of the Final EIR, during the Draft EIR public review period, eight public meetings were held immediately preceding, during, and immediately following the public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four

held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR

- Comment GO20-4**
- c. Early “public meetings” and requests for support by LA ART were based only on PR comments that have consistently been debunked, along with a host of confused and moving “options” for “mitigation.”
 - d. LA ART’s claims of extensive outreach were also debunked, when only 40 people were allowed into those same meetings, and no one was allowed to ask questions except in the chat, most of which went ignored.

Response GO20-4 Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public during this period led directly to changes to the proposed Project to incorporate public feedback. The two virtual public outreach meetings conducted by the Project Sponsor in June 2021 were held via Zoom Webinar with a maximum attendance of 500 participants. These meetings included a question and answer session, and attendees could ask questions using the Zoom Q&A and chat functions. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project’s use of mitigation measures is consistent with the requirements of CEQA. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how Section 6.0, Design and Use Options, of the Draft EIR includes design and use options responsive to public comments and stakeholder feedback and describes how environmental impacts from implementation of each design and use option would differ from the proposed Project’s potential environmental impacts described in the Project Description and analyzed in Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR, with respect to the particular project component variation. The design and use options provide flexibility for decision makers to potentially adopt one or more minor variations to components of the proposed

Project should the decisionmaker determine such a minor variation is desirable as part of the proposed Project.

Comment GO20-5 e. LA ART failed to provide reasonable alternatives to the Project. Only two alternatives were produced and discussed with the public. When the community screamed the loudest over one alternative, it was removed, leaving only one flawed alternative to be publically discussed.

Response GO20-5 Refer to Appendix A, Scoping Report, of the Draft EIR, for a copy of the Notice of Preparation of the proposed Project, which initially offered two options for the proposed Project alignment. In response to stakeholder input during the public scoping period, the Project Sponsor announced it would proceed with the proposed Project alignment studied in the Draft EIR, including the intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park. Located within a short walk to many Chinatown businesses and Metro’s L Line (Gold), this station addresses the goal of creating a stronger connection with the Metro L Line (Gold) and would also enhance transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. The Draft EIR also considered the Spring Street Alignment Alternative and the Transportation Systems Management Alternative. Further, Section 4.2.1, Alternatives Considered but Dismissed from Detailed Analysis, of the Draft EIR, considered five potential alternatives, including alignment and station location alternatives and direct alignment alternatives. Refer to Section 5.0, Corrections and Additions, of this Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project, in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. This alternative was considered but dismissed from further detailed analysis in the Final EIR because it did not meet most of the basic objectives of the proposed Project.

Comment GO20-6 f. The entirety of the DEIR claims zero environmental impacts on the community and state park. That means:

- (1) No noise
- (2) No vibrations
- (3) No construction impacts
- (4) No visual blight
- (5) No impact on traffic

(6) No impact on parking

(7) No impact on residential stakeholders

(8) No impact...anywhere. None, nothing.

Response GO20-6 As discussed on page ES-17 of the Executive Summary of the Draft EIR, based on the analysis contained in Section 3.0, Environmental Setting, Impacts, and Mitigation, construction of the proposed Project would result in significant and unavoidable cumulative impacts with regard to Noise and Vibration (human annoyance). As demonstrated in the Executive Summary to the Draft EIR, the proposed Project would not result in any other significant and unavoidable construction impacts. The proposed Project would not result in any significant and unavoidable operational impacts.

Comment GO20-7 g. Visual elements have been egregiously misrepresented in the DEIR, including the park viewshed. Perspective drawings appear to be deliberately skewed. Heights and distances are increased and stretched to create a “nice view.” Even the incorrect number of cables has been used to skew and reduce the visual blight the Project would bring.

Response GO20-7 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. KOPs critical or representative of the visual character of the area were identified within each Landscape Unit (LU) and utilized for before and after photorealistic and true to scale visual simulations and locations of sensitive viewers that potentially would be visually impacted by the proposed Project. KOPs within each LU were selected based on existing knowledge of important viewsheds and through consultation with responsible agencies. KOPs selected for simulation will appear larger and more distinct than visual elements further in the distance even though the foreground element may be of a smaller dimension, consistent with how pedestrians experience their surrounding environment. Further, visual simulations were created to reflect the proposed project components within the existing landscape and, as such, include the existing landscape planting, buildings, and other visual elements such as open space resources, trees, and building frontages as they existed at the time the photos were taken. Refer to Appendix C, Visual Impact Assessment, of the Draft EIR, for detailed discussion about the implementation and results of the visual simulation. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, for additional visual simulations of the proposed Project, including simulations provided for additional clarity regarding ropeway cable design for the gondola cabins. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than significant. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, of the Final EIR, for a discussion of how the view simulations were prepared, including discussion of how the ropes

would be 1.75 to 2.5 inches in diameter, but are shown in the model with a 6-inch diameter so that they would be visible in the renderings. Additionally, renderings include 3 cables, though some imagery may show only 2 visible cables due to perspective. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.

Comment GO20-8 2. Metro is the wrong agency for this Project

As will be opined on by legal experts, Metro is the wrong agency to take the lead on this Project. While it’s convenient to place this Project with an agency that has little accountability, it is not a governing agency, meaning that the lead agency must have the governing capacity and natural decision-making powers. Metro has no jurisdictional authority to be the lead.

Response GO20-8 Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of why Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority. Under CEQA, a lead agency is the public agency with the greatest responsibility for supervising or approving the project as a whole.” (CEQA Guidelines, §15051(b).) Under state law, Metro has broad authority over public transportation planning and coordination for the Los Angeles region’s transportation system and is authorized to do “any and all things” to carry out these purposes. (Public Utilities Code, § 130105(f).) For the proposed Project, Metro is tasked with considering approval of all plans for design, construction, and implementation under Public Utilities Code section 130252, as well as with consideration of the written approvals to operate the proposed Project, pursuant to its authority under Public Utilities Code Section 130252. Thus, Metro has primary responsibility for implementing the proposed Project and integrating it into the regional transportation system, consistent with

Metro’s statutory purpose. Metro is the appropriate lead agency for the proposed Project. Contrary to this commenter’s assertion, CEQA does not require a lead agency to be an elected decision-making body. (See generally Pub. Resources Code, § 21067; CEQA Guidelines, § 15367.) Further, CEQA’s various requirements for consultation with agencies and for public review and comment ensures the full transparency and accountability of the lead agency.

Comment GO20-9 3. The Project has been improperly placed on Federal funding bundle lists

This would imply that this Project is a done deal which many of us have been told repeatedly by staff members in the former Mayor’s Office. This suggests backroom discussions and agreements, pushed through at an all-cost mentality.

Response GO20-9 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. The proposed Project is not included on federal funding bundle lists. Refer to Response GO20-12 for discussion of the proposed Project’s capital, operation, and maintenance costs and planned sources of funding.

Comment GO20-10 4. LA ART relies on Vague, Unenforceable, or Deferred Mitigation Measures.

The PR voice of Mitigation has not been taken seriously in this DEIR as the document fails to lay out in detail, nor does it incorporate any of the mitigations publicly spoken about into the overall design of the Project.

Response GO20-10 Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the mitigation measures for the proposed Project would not impermissibly defer mitigation. Refer to Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR, for an overview of the mitigation measures required to mitigate or lessen the proposed Project’s potential environmental impacts, including the enforcement mechanisms for each mitigation measure. This comment does not propose any specific mitigation measures that were not incorporated into the Draft EIR, and accordingly no further analysis is warranted.

Comment GO20-11 5. Metro awarded a sole source contract to an unqualified, untested entity.

Frank McCourt, nor LA ART, nor Climate Resolve, nor any other entity formed around the same people are qualified to engineer or construct a private gondola, let alone one claiming to be public transit.

Response GO20-11 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. ARTT LLC’s donation of LA ARTT LLC and the proposed Project includes ARTT LLC’s continued support of the proposed Project with financial support and expertise,

including funding for consultant and technical work for the EIR. As set forth in Section 8.0, List of Preparers, of the Draft EIR, and Section 9.0, List of Preparers, of the Final EIR, consultant and technical work for the EIR would include analysis by a team of qualified experts, consultants, and engineers, including Fehr & Peers as to transportation; SCJ Alliance as to gondola systems; PCL Construction Services, Inc. as to construction; and Nabih Youssef Associates Structural Engineering as to structure engineering. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Comment GO20-12 6. The “privately funded” Project appears to no longer be “privately funded”

Since efforts to add the Gondola to a federal transportation improvement bundle and improperly pass ownership to another entity that is untested and unqualified again change the playing field.

The right for communities not to be assaulted by backroom deals should override tainted officials.

Response GO20-12 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. As part of this process, Metro has not undertaken any actions or “backroom dealing” that would absolve Metro of its independent judgment in considering the proposed Project and its potential environmental impacts. The proposed Project is not included on federal funding bundle lists.

Comment GO20-13 7. This Project is an assault on communities of color.

The sordid history of the Dodgers and Chavez Ravine in addition to the aberrant treatment of Chinese migrants, seems to have alluded LA ART and McCourt. The idea of “we know what’s best for you” is tone-deaf, to say the least.

Response GO20-13 Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, how the proposed Project supports Metro’s goal of prioritizing equity opportunities, is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, how the public outreach for the proposed Project was designed with environmental justice principles in mind, how the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region’s most visited venues and would alleviate existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety, and how the proposed Project is designed to be ADA compliant. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefit to the surrounding communities, and how the Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period, including opportunities for public testimony. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and in writing or verbally during the four public hearings.

Comment GO20-14 8. Politics are winning over what is best for our communities

At a recent metro Meeting, former Mayor Garcetti likened his colleague representing the impacted community to Mitch McConnell’s treatment of SCOTUS because she was doing what her constituents asked her to do. These kinds of comments speak to backroom deals (NDAs), corruption, and an astounding lack of sound judgment.

Response GO20-14 The fundamental goals of environmental review under CEQA are to provide information and allow for a meaningful opportunity for the public to participate in the environmental review process. Metro has and will continue to comply with CEQA and any other applicable statutes or Metro policies regarding public participation and access to information in the decision-making process. As part of this process, Metro has not undertaken any actions or “backroom dealing” that would absolve Metro of its independent judgment in considering the proposed Project and its potential environmental impacts.

Comment GO20-15 9. Over 75 mature-growth trees ranging between 15 and 50’ are slated to be removed to accommodate thousands of pounds of concrete.

Response GO20-15 Refer to Section 3.04, Biological Resources, of the Draft EIR, and in Appendix K.1, Updated Tree Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, for discussion of tree removal and replacement. The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located.

Comment GO20-16 30 / 30 California Initiative (CA climate change report) is being entirely ignored by LA ART, Climate Resolve, the City, and Metro.

30 / 30 calls for the preservation/conservation of ALL HABITAT in red zones. Los Angeles County is officially a red zone.

Response GO20-16 The comment cites California’s 30x30 initiative, following Governor Newsom issuing the October 2020 Executive Order N-82-20, which committed California to the goal of conserving 30% of its lands and coastal waters by 2030.⁶⁶ Under that goal, “an area is considered a ‘30x30 Conservation Area’ if it meets the following definition: land and coastal water areas that are durably protected and managed to sustain functional ecosystems, both intact and restored, and the diversity of life that they support. ‘Durably protected and managed areas’ within California’s 30x30 initiative encompass” areas under government ownership or control or under perpetual easements that are designated to protect species and their habitat. (Pathways to 30x30 California, p. 25.) In implementing this initiative, the California Natural Resources Agency recognizes that the “best available datasets for identifying 30x30 Conservation Area lands in California assign protected areas into [USGS GAP Analysis Program] codes based on the degree of biodiversity protection for conserved areas. GAP status codes 1 and 2 are generally consistent with” the definition of 30x30 Conservation Areas “as they include areas with a high degree of durable protection and management for biodiversity or ecosystem values.” “Examples of lands and waters that are often coded as GAP 1 in California include most national parks, wilderness areas, ecological reserves, and wild and scenic rivers . . . Areas coded as GAP 2 in California include most national wildlife refuges, state parks, state conservation areas national seashores, as well as some local and regional open space, private conservation lands and easements.” (Pathways to 30x30 California, p. 29.) Based on a search of the California Protected Areas Database⁶⁷ and California

⁶⁶ Administration of Governor Gavin Newsom. 2022. Pathways to 30x30 California. Available at: https://resources.ca.gov/-/media/CNRA-Website/Files/Initiatives/30-by-30/Final_Pathwaysto30x30_042022_508.pdf. Accessed July 2023.

⁶⁷ Map Collaborator. 2023. California Conservation Easement Database. Available at: <https://www.mapcollaborator.org/cpad/?base=map&y=37.51844&x=-123.95874&z=6&layers=notes%2Cced&opacs=100%2C100>. Accessed September 2023.

Conservation Easement Database,⁶⁸ and their associated GAP codes,⁶⁹ the proposed Project alignment is not located within a 30x30 Conservation Area.

The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.04-23, in Section 3.04, Biological Resources, of the Draft EIR, and in Appendix K.1, Updated Tree Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio. As discussed on page 3.4-23, in Section 3.04, Biological Resources, of the Draft EIR, it is anticipated that mitigation ratios for trees on land administered or managed by responsible agencies would be agreed to as part of the approvals required for implementation of the proposed Project. The proposed Project would provide a minimum replacement ratio of 1:1 for all trees removed in the Los Angeles State Historic Park and a replacement ratio of 1:1 for all large trees removed in the State Route (SR) 110 California Department of Transportation (Caltrans) ROW. As discussed in Section 4.1.3, Impacts to Wildlife from Tree Removal, of Appendix G, the quality of wildlife habitat provided by the trees proposed for removal is relatively low, given that the trees are primarily non-native tree species. In addition, the only areas of tree removal that could be potentially described as wooded habitat are the following: the small grove of Fremont cottonwood trees at the western end of the Los Angeles State Historic Park, the non-native woodland at the Stadium Tower and associated fire buffer, and the non-native woodland at the Dodger Stadium Station location. The total area of wooded habitat that would be removed in each of these areas is 0.24, 1.02, and 0.39 acres, respectively. This area of wooded habitat is relatively small compared to the amounts available in the immediately surrounding areas, such as Elysian Park (approximately 600 acres alone, much of which is wooded), Radio Hill Gardens, Victory Memorial Grove, and Point Grand View Park. Accordingly, while the removal of trees will result in a marginal reduction of suitable tree habitat in the short-term, such habitat loss would not result in substantial population level impacts. Moreover, in the long-term, the replacement of trees proposed for removal would more than offset any realized impacts associated with the proposed Project.

Comment GO20-17 10. Gondolas are not, in any way, shape, or form, new technology.

New for LA is not new and innovative to anyone but LA ART.

Response GO20-17 Although forms of aerial transit technology have been available and utilized for the last 100 years, modern applications have seen the evolution of the technology as a feasible mode of urban rapid transit. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would have a maximum capacity of approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes. As discussed in Appendix D, Technology Penetration Analysis, of Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, a large capacity for a new mode of transportation in Los Angeles will allow passengers to see the potential for other emerging innovations to be integrated into the public transit system, and will introduce the first aerial gondola system to the Los Angeles area, which represents the first aerial gondola system in a densely populated area of the United States since 2007. The proposed Project would thus exemplify how alternative transportation technology can be integrated into a city's transportation infrastructure and will show that new technology can successfully operate in concert with other existing modes of transportation.

Comment GO20-18 11. This Gondola is NOT public transportation.

This is a private project, benefitting a private entity. Period. Public Transportation moves people to and from more than one environment. A stop at the Chinatown station is duplicative and is not needed. Additionally, the Dodger express represents non-invasive buses (soon to be fully electric) already routed and funded.

Response GO20-18 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of

the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express.

Comment GO20-19 12. LA LART continues to offer no evidence that communities will benefit from increased foot traffic in their neighborhoods.

Indeed, the reverse seems to be true in that the hike to reach Broadway would be unreasonable and time prohibitive in both directions.

Response GO20-19 Refer to Topical Response C, Project Features, discussing how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses along the proposed Project alignment while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. Additionally, the proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/ last-mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station, and would include signage to support wayfinding for transit passengers. Refer to Section 3.17, Transportation, and Section 3.11, Land Use and Planning, of the Draft EIR, for discussion of how multi-modal access—for both local and emergency response—to local businesses, neighborhoods, LAUS, and the Los Angeles State Historic Park would be maintained throughout construction of the proposed Project, and disruptions to local businesses would be minimized. The Project Sponsor would create a Business and Community Support Program to assist local businesses financially affected by proposed Project construction activities.

These features of the proposed Project, including the intermediate Chinatown/State Park Station closer to the core of Chinatown, were provided in direct response to input from the public during the public scoping period for the Draft EIR in October 2020 hosted by Metro, and the June 2021 virtual public outreach meetings conducted by the Project Sponsor. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. For example, after initially offering two options for the proposed Project alignment in the Notice of Preparation, responding to stakeholder

input, the Project Sponsor announced it would proceed with the proposed Project alignment studied in the Draft EIR, including the intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park. Located within a short walk to many Chinatown businesses and Metro's L Line (Gold), this station also addresses the goal of creating a stronger connection with the Metro L Line and would also enhance transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River.

As discussed in Topical Response C, Project Features, while not proposed as part of the proposed Project, the Draft EIR includes an analysis of the State Park's proposed bike and pedestrian bridge as part of Design and Use Option E. The bridge would provide important connections for students at Cathedral High School, as well as between the park and the Chinatown, Savoy, and Solano Canyon neighborhoods to support convenient access for the community. The analysis serves to provide environmental clearance for the bike and pedestrian bridge as a benefit to the Los Angeles State Historic Park, as while the bike and pedestrian bridge was mentioned in the Los Angeles State Historic Park General Plan and studied in the State Park's Bridge Feasibility Study, the bike and pedestrian bridge was never environmentally cleared. Support for the Los Angeles State Historic Park bike and pedestrian bridge would otherwise be provided as part of the proposed Project. Accordingly, the proposed Project is furthering the bike and pedestrian bridge by providing the necessary environmental clearance and support for the bridge.

Comment GO20-20 13. Climate Resolve is not included in the DEIR as the managing/contracting entity.

Despite press releases and conferences, Climate Resolve, the latest entity to have become embroiled in this sham of a Project, is actually not included in the DEIR as there is no agreement in place, making the claims appear to be more about taking the heat off of McCourt and moving it to yet another unqualified entity. The legality of doing this midstream CEQA is also questionable at best.

Response GO20-20 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Response GO20-11 for discussion of the preparation of the Draft EIR.

Comment GO20-21 14. Digging into severely toxic soil

While significant remediation was done in the park to make sure that it was safe for all, deeper levels of soil, both at the park and surrounding areas, have a long, dark history of toxic and deadly soil contamination. No study was presented or addressed

that would show that the public would be safe stirring up and unearthing severely toxic soil.

Response GO20-21 Refer to Section 3.09, Hazards and Hazardous Materials, and Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, for discussion of the potential for soil contamination. The Draft EIR acknowledges and discloses the historical use of the Los Angeles State Historic Park site, including past use and storage of petroleum products and other materials that resulted in impacts to soil and groundwater. The status of remediation efforts and the potential for encountering contaminated soils at this location is disclosed on pages 3.9-16, 3.9-17, 3.9-23 and 3.9-24. Additional information, including a summary of database search results, remediation efforts, and reviewed documents related to the Los Angeles State Historic Park site is set forth in Appendix K, Phase I Environmental Site Assessment, of the Draft EIR, on pages 6-8, 6-9, and 10-2.

Mitigation Measure HAZ-A requires implementation of a Soil and Groundwater Management Plan (Management Plan) during work at the Los Angeles State Historic Park site. The Management Plan will include the methods and procedures for sampling and analyzing soil and groundwater during construction to classify them as either hazardous or nonhazardous; and if identified as hazardous, the Management Plan will specify the applicable methods and procedures (1) for the proper handling and removal of impacted soils and/or groundwater for offsite disposal and/or recycle in accordance with current federal, state, and local regulations, and (2) to be protective of workers and the environment.

Comment GO20-22 15. Project Alternatives

Both the no-project alternative and the Dodger Express were left out of all public communication of available alternatives offered during all aspects of the process. The existing Dodger Express has been consistently cited as the preferred method of transport by community stakeholders.

The infrastructure already exists, and the Dodger Express team has committed to electrifying all the buses as a response to climate change. This alternative is preferred by our community and stakeholders at large as it does not pour thousands of pounds of concrete into an already stressed community and DOES NOT REMOVE ANY EXISTING HABITAT.

Response GO20-22 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives, properly identifying an "environmentally superior" alternative and analyzing a "No Project" alternative, pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's

underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Refer to Responses GO20-16 and GO20-17 for discussion of how impacts to biological resources from construction and operations of the proposed Project would be less than significant with implementation of mitigation. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR, for discussion of the environmental setting of the proposed Project and the lack of wildlife habitat and native vegetation within the Biological Survey Area (BSA). No native plant communities occur within or adjacent to the BSA and there are no wildlife corridors within the BSA to support movement of wildlife species. No sensitive habitats such as wetlands, oak woodlands, or coastal sage scrub habitat are present within the BSA. Refer to Response GO20-16 for a discussion of how although the removal of trees in connection to the proposed Project will result in a marginal reduction of suitable tree habitat in the short-term, such habitat loss would not result in substantial population level impacts. Moreover, in the long-term, the replacement of trees proposed for removal would more than offset any realized impacts associated with the proposed Project.

Comment GO20-23 Conclusion

It is our observation and assumption that this Project is yet another lousy idea being rammed down the throats of our communities to satisfy a check box for the Olympics. The Olympics has traditionally created unwarranted hardships on communities, and this Project is no exception.

The manner in which electeds and Metro have conducted this process is utterly shameful and displays a flagrant disregard for the residents and communities being impacted, not to mention the law. Simply reframing the argument to make it look awesome doesn't change the fact that the premise is based on a lie with a complete and appalling disregard for CEQA and the law in general.

We ask that this Project be summarily "wished back into the cornfields." As of this letter 3,501 signatures have been collected from the surrounding neighborhoods vehemently opposing this Gondola.

Response GO20-23 This comment provides a general summary regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO20-2 through GO20-22. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical C, Project Features, for

discussion of the proposed Project team’s outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project’s features to enhance and provide additional benefit to the surrounding community. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Further, the Draft EIR complied with CEQA’s requirements, providing the necessary analysis to adequately inform the public and decision makers regarding the proposed Project and its potential environmental impacts.

Comment GO20-24 It is not wanted. It is not needed. It will exacerbate the climate crisis within LA City by pouring thousands of pounds of concrete into a community already registering at a 2% or lower tree canopy.

Response GO20-24 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Responses GO20-16 and GO20-17 for discussion of how impacts to biological resources from construction and operations of the proposed Project would be less than significant with implementation of mitigation.

Comment GO20-25 This Project is riddled with violations of process, violation of the law, willful disregard of the public’s right to know, and a willful disregard for communities of color.

This Project should be immediately terminated, and Mr. McCourt be told, “thanks, but no thanks.”

Sincerely,

Todd Terrazas
President

Cc: Supervisor Hilda Solis
Mayor Karen Bass
Congressmember Jimmy Gomez
Assembly Member Miguel Santiago

Response GO20-25 This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO20-2 through GO20-24.

Comment Letter GO21 – LA River State Park Partners

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO21**Comment GO21-1** Dear Mr. Zelmer

I write to express our deep concerns with the proposed Los Angeles Aerial Rapid Transit Project (LA ART). I represent the Los Angeles River State Park Partners (LARSPP), the nonprofit support organization (and State Parks Cooperating Association) for the three state parks along the Los Angeles River – Los Angeles State Historic Park, Rio de Los Angeles State Park, and the Bowtie Parcel. These three urban state parks serve historically underserved, park-poor communities and represent an intentional investment by the taxpayers of the State of California to re-dress historic inequities and preserve key historic elements of Los Angeles.

As Executive Director of LARSPP, I have extensive on-the-ground experience with the day-to-day operations of these parks, as well as knowledge of their creation, development, and ongoing needs.

Response GO21-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment GO21-2 Our focus is on the considerable impacts of this project to Los Angeles State Historic Park (LASHP), a publicly funded green space that residents fought for decades to establish. The proposed gondola tramway route would cross one end of the 32-acre park with cables carrying gondola cars just 26 feet overhead, and a station building with a 98-foot-tall tower. The project would require the taking of park land for the footprint of the station, replacing 81 mature trees with hardscape...

Response GO21-2 Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. ANSI B77.1 requires the following vertical clearances: vehicles – five feet; vegetation or terrain – five feet; at-grade

where pedestrians are present – eight feet; buildings – five feet; and roadways or railways – to be determined with the authority having jurisdiction. The proposed Project’s vertical clearance to the bottom of the cabins would range from 26 to 53 feet with an average of approximately 40 feet from ground level over the park. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms.

The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.4-23, in Section 3.04, Biological Resources of the Draft EIR, and in Appendix K.1, Updated Tree Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio.

Comment GO21-3 ...and would permanently alter the carefully designed vistas of the park, key features identified in the park’s 2005 General Plan.

Response GO21-3 Refer to Response S2-5 for a discussion of aesthetic impacts to the park. The Draft EIR addressed aesthetic impacts in Section 3.01, Aesthetics, with supporting data provided in Appendix C, Visual Impact Assessment of the Draft EIR. The Draft EIR and Visual Impact Assessment both specifically addressed and disclosed potential impacts on changes in the visual environment and existing viewsheds into and from within the Los Angeles State Historic Park. The Draft EIR included thirty Key Observation Points (KOPs), including nine that simulated views of or from Los Angeles State Historic Park. The Draft EIR analyzed each of these KOPs, describing the existing viewpoint along with a visual simulation of the proposed Project. With respect to views from within

the park, the Draft EIR concluded that certain southwest-facing views of the downtown Los Angeles skyline, particularly close to the proposed Chinatown/State Park Station, would be partially interrupted due to the proposed Project. However, the Draft EIR noted that these views are already partially interrupted by trees and intervening development, and the nature of the proposed Project (i.e., cables with similar characteristics to prevalent existing powerlines and cabins that are constantly moving in and out of view) means that the proposed Project would not significantly impact views from the park. The Draft EIR concluded that the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park. The Final EIR includes additional KOPs to further analyze viewshed impacts to Los Angeles State Historic Park. Refer to Appendix H.1, Memorandum Regarding Preparation of KOPs, and Appendix H.2, Supplemental KOPs in Response to Comments, of this Final EIR, for a discussion of the supplemental KOPs' preparation and the supplemental KOPs, respectively. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than significant. In addition, refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including views from a cabin over the park, providing a new and unique perspective of the park and its surroundings, including the Roundhouse Observation Deck and the exposed Zanja Madre, which is currently not visually apparent from inside the park.

Comment GO21-4 Despite these major impacts, the DEIR states that “The proposed Project would not result in any significant and unavoidable operational impacts,” and concludes that “no mitigation measures required” (ES 10 p.29 and ES 12 p.31). We strongly disagree with this conclusion.

Response GO21-4 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Refer to Response GO21-5 for a discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan and Mitigation Measure LUP-A.

Comment GO21-5 This unsubstantiated finding is further complicated by the fact that the DEIR does identify as a “Significant Impact” the conflict with the LASHP General Plan. The DEIR describes as a “mitigation measure” the need to: “Obtain a Los Angeles State Historic Park General Plan Amendment (page 58, DEIR Executive Summary, Land Use and Planning element, LUP-2). The project asserts that “Pursuant to Public Resources Code 5002.2, the proposed Project shall obtain an amendment to the Los Angeles

State Historic Park General Plan to allow transit uses within the Los Angeles State Historic Park General Plan.” The current general plan for this park does not allow for transit uses within the state park because it is a park, a vital public green space in a historically underserved community. Putting a transit use within the park was never envisioned during the park development process and it will significantly impact the park user experience. Yet the DEIR simply claims that as long as the general plan document is amended to allow for transit, that mitigated the impact. In no way does an amendment in a document mitigate the on-the-ground impacts of an aerial highway through a park, or the project’s usurpation of public property.

This notion that the impacts to the park will disappear with a General Plan amendment is absurd on its face.

Response GO21-5 Refer to Response GO21-4 for a discussion of how the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment.

Comment GO21-6 Amending the General Plan of a State Park to make way for a private transit station represents a terrible precedent. Beyond these fundamental objections, we identify the following specific areas where the DEIR analysis has either been insufficient or where impacts are incorrectly dismissed as not significant.

1. Use of Park Land

The DEIR describes the Chinatown/State Park station located in section 2.5.1.3. It notes that the southern portion of the station would be on a City of Los Angeles ROW, while the northern portion of the station would be integrated into the southern

boundary of the Los Angeles State Historic Park. This statement is highly misleading. Integration into a boundary implies something welcome and beneficial. This, rather, is a very tall, obtrusive building encroaching on state park land. Our public park has only 32 acres and cannot afford to lose acreage to a private project that benefits a private owner and individuals choosing to attend private events at a private stadium. The DEIR states that the station would take 2,195 square feet of state park property and an additional 9,320 square feet over the park from the station canopy. This would transform the park's entrance from one that feels pastoral and peaceful to a shaded, dense, built space. It shrinks the size of the park and takes parkland away from a community who fought hard to create it.

Response GO21-6 This comment provides a general recitation and characterization of the Draft EIR. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. While the Chinatown/State Park Station's footprint will occupy 2,195 square feet within the park, through continued collaboration with State Parks, which has been ongoing and will continue through the General Plan Amendment process, the proposed Project would be fully integrated into the park such that it would add to, rather than take away from the park's purpose and objectives. Through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro's L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. In addition, the Chinatown/State Park Station would also include a mobility hub where passengers would be able to access a suite of first and last mile multi-modal options, such as a bike share program. Pedestrian access enhancements could include pedestrian improvements between Metro's L Line (Gold) Station and the

Chinatown/State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge. The Chinatown/State Park Station would provide passenger access to Chinatown, LASHP, and to nearby neighborhoods and land uses, including the Mission Junction neighborhood, which includes the William Mead Homes public housing complex. In addition, the station canopy would provide much needed shade. As discussed in Topical Response F, Los Angeles State Historic Park, the Project Sponsor would work with State Parks through the General Plan Amendment process to develop an “Interpretation Plan” to identify unique ways to use the proposed Project to provide interpretation for the park and its history. The Interpretation Plan would help ensure that the proposed Project is a benefit to Los Angeles State Historic Park by providing visitors with, consistent with the park’s existing General Plan, an engaging and informative experience that deepens their understanding and appreciation of Los Angeles State Historic Park’s culture and history as a former and current (should the proposed Project be developed) transportation hub.

Comment GO21-7 On pages 2-61, the DEIR also outlines various approvals the applicant would need to obtain from the CA Department of Parks and Recreation (DPR). It notes the need for a lease or an easement to allow for the construction and operation of the project.

We wish to point out that the application could not obtain an easement because easements are governed by PRC 5003.5 and require the department to specify conditions to allow minimum alteration to the physical features of the park and minimum interference with the use of the park by the public (emphasis added). Taking parkland permanently for a large station is a substantial alteration of the physical features of the park. This station would interfere with the uses of the park currently enjoyed by the public who paid for its creation. Furthermore PRC 5012 restricts easements to public agencies for public purposes. The gondola is a private project.

Response GO21-7 Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project’s use of Los Angeles State Historic Park.

Comment GO21-8 We further note that this project could not proceed using a lease from DPR. The PRC 5003.17 specifies that the department may lease any parcel only if the director finds that the use would be compatible with the use of the real property as a unit or part of a unit, and with the sound management and conservation of resources within the unit. A new private gondola station is not compatible with the uses of the park and is certainly not in furtherance of sound management and conservation of the resources of LASHP.

Response GO21-8 Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project's use of Los Angeles State Historic Park.

Comment GO21-9 2. Tree Removal

The DEIR states that the project for the Chinatown/State Park Station would require the removal of 30 trees, and the aerial rights across the park would remove an additional 51 trees. The DEIR states that in place of the lost trees would be hardscape and replacement trees elsewhere in the park. Mitigating the loss of mature trees, particularly protected native trees, with new trees is insufficient; mature trees have established complex and interconnected ecologies not easily replicated, and they sequester much more carbon than do young trees.

The DEIR also does not indicate where the replacement trees would be sited and does not provide sufficient information to demonstrate that the alternative locations of new trees would maintain the current park experience and ecosystems. The park was thoughtfully designed by landscape architects with specific outcomes in mind to accommodate a variety of human and wildlife activities. The park is a careful balance of open space and tree canopy that allows for flexible uses, including special events such as music festivals. The landscape plan was developed based on an extensive public planning and visioning process, and further refined to accommodate large-scale special events.

It is not possible to simply plant 81 trees on the remaining property without potentially altering the use patterns of the park.

Response GO21-9 The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.4-23, in Section 3.04, Biological Resources of the Draft EIR, and in Appendix K.1, Updated Tree Inventory Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio. Refer to Section 4.1.2, Location of Tree Replacement, of Appendix G, for a discussion of how replacement trees would be planted as near to the location of removal as possible, and that tree replacement locations would be coordinated with the landowner or party responsible for managing the land, including the California Department of Parks and Recreation.

Refer to Response GO21-11 for a discussion of how over time, replacement trees would obtain similar carbon sequestration benefits as the existing trees.

Comment GO21-10 In addition, the ratio of tree replacement should not be a 1:1 ratio, but rather, a mitigation ratio such as 5:1. In the case of native cottonwoods, for example, mature trees are not available for purchase, so it could be a matter of planting 5 immature trees for every mature tree removed (at 6-7 years old, the park trees would be considered mature). Replacement at this rate in other areas of the park may not be feasible as it would reduce the amount of overall open space and diminish the capacity for flexible use. Thus, the public ends up losing open space in the rest of the park with this proposed mitigation scheme.

Response GO21-10 Refer to Response GO21-9 for a discussion of how the proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio.

Comment GO21-11 Trees also require proper space and maintenance, especially in the early years. This project is setting back a decade of tree growth and shifting the burden of maintaining new trees on to the DPR staff. There is no guarantee that the same level of carbon sequestration could be replicated (we believe it would not), thus negating the ‘zero emission’ claim currently used by LA ART. The destruction of 81 mature trees is not “insignificant” as the DEIR claims.

Response GO21-11 Refer to Response GO21-9 for a discussion of tree removal and replacement in the Los Angeles State Historic Park. Refer to Section 3.08, Greenhouse Gas Emissions, of the Draft EIR for discussion of how the proposed Project would result in a net decrease of in GHG emissions compared to existing conditions. While there may be short-term losses in carbon sequestration related to the removal of trees, the proposed Project would implement BIO-PDF-F and would comply with applicable tree replacement requirements, based on the jurisdiction of the property where each tree is located. Accordingly, the short-term losses in carbon sequestration would occur only in the interim as replacement trees grow to the size of the existing trees. Nevertheless, over time, replacement trees would obtain similar carbon sequestration benefits as the existing trees and would be coupled with a net decrease of approximately 6,375 metric tons of CO₂e per year in GHG emissions from the proposed Project. Even if the sequestration achieved from replacement trees is less than the sequestration that would have occurred from the existing trees, it would not change the impact conclusion related to Greenhouse Gas Emissions because the proposed Project will not result in a net increase in GHG emissions. As indicated in Section 3.08, Greenhouse Gas Emissions, the proposed Project is an innovative

alternative transportation development with the benefit of reducing VMT, which reduces air pollutants and GHG emissions associated with vehicle trips. The Draft EIR demonstrates that the proposed Project would result in a net decrease of approximately 6,375 metric tons of CO₂e per year at its horizon operational year 2042, resulting in a less than significant impact related to GHG emissions.

Comment GO21-12 3. Impact on Historic Resources: the Zanja Madre and Roundhouse

The Zanja Madre, or “mother ditch,” is the original water conveyance pipeline that brought water from the LA River to El Pueblo de Los Angeles. During excavations in the late 1990’s, Metro unearthed a portion of the original brick pipeline on the site that is now the park. This was one of the key factors of historic significance that led the State Park Commission to classify this new park as a State Historic Park. This exposed section of the Zanja Madre near the Metro track is currently a major historical attraction of the park, the views of which would be significantly impacted by the overhead gondola route.

Response GO21-12 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources, including the Zanja Madre, would be either less than significant or reduced to less than significant with mitigation. The exposed section of the Zanja Madre located northwest of the Los Angeles State Historic Park near the intersection of North Broadway and Bishops Road is denoted as P-19-190309. This resource will not be directly impacted by construction given that it is located outside of the proposed Project footprint. Further, operational impacts to the setting, including potential visual impacts, are less than significant because the resource’s setting has already been substantially altered from its historic state. Refer to pages 42, 52, and 91 of Appendix F for further information about P-19-190309. The views of the Zanja Madre would not be impacted by the proposed Project. Refer to Response S2-5 for a discussion of how the proposed Project would not substantially impact views, and how the proposed Project would provide a view of the exposed Zanja Madre, which is currently not visually apparent from the park.

Comment GO21-13 There has also been a long-standing interest in looking for other elements of the original Zanja Madre in El Pueblo Historic Monument. This archaeology has not yet been conducted. It is possible that the construction of the proposed Alameda Station could unearth and damage this resource, yet the EIR is silent on the potential of this finding.

Response GO21-13 Refer to Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project of the Draft EIR for a discussion of the proposed Project’s potential impacts to archaeological resources, including the Zanja Madre. As noted on page 3.5-58, the section of the Zanja Madre recorded within the western area of the proposed Alameda Station is denoted as P-19-000887. This segment was capped in 1978 for preservation, is currently denoted by decorative pavement, and would not be impacted by the proposed Project. As noted on pages 3.5-58 and -59, the proposed Project has potential to significantly impact buried, unrecorded material in other portions of P-19-000887 and, as such, mitigation measures related to archaeological testing and recovery have been proposed that will reduce impacts to the resource to less than significant. Refer to Section 3.5.6 for a list of proposed mitigation measures for cultural resources for the proposed Project, including Mitigation Measure CUL-A, which requires a Cultural Resources Monitoring and Mitigation Plan (CRMMP) be prepared by a qualified archaeologist prior to project construction. Additionally, Mitigation Measure CUL-A requires the CRMMP be applicable to all ground disturbance extending into native soil with known archaeological sites and other areas of high sensitivity, and accounts for the unanticipated encounter of previously unknown and undocumented archaeological resources, requiring protocols for such an event. Mitigation Measure CUL-A also would incorporate specific requirements related to the Alameda Station, requiring monitoring for ground-disturbance activities to the maximum depth of planned excavations at Alameda Station. In addition, Mitigation Measure CUL-C requires an archaeological testing plan to mitigate potential impacts to portions of the Zanja Madre. The testing plan will propose limited archaeological excavations to identify the location, integrity, and significance of archaeological deposits that may be impacted by the proposed project and, if preservation in place is not feasible, require data recovery excavations and a data recovery plan if significant archaeological remains are encountered that appear to contribute to the significance of the overall site.

Comment GO21-14 As an organization committed to preserving the history of Los Angeles as embedded in the elements of the LASHP, we would also like to note that the Alameda Station would significantly alter the historic and cultural setting of El Pueblo Historic Monument, particularly Olvera Street. It is important to remember that as recently as 2015, the American Planning Association named Olvera Street as one of the 15 Great Places in America. El Pueblo is listed on the National Register of Historic Places. These designations look at both the buildings and setting. The DEIR dismisses the impacts of its large Alameda station on this historic resource without confirming that the project would not jeopardize these national designations. El Pueblo is also an essential stop along two national historic trails: the Juan Bautista de Anza National Historic Trail and the Old Spanish National Historic Trail.

Response GO21-14 Refer to Section 3.05, Cultural Resources, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR), of this Draft EIR for discussion outlining the proposed Project’s potential construction and operational impacts to the Los Angeles Plaza Historic District. As discussed on pages 3.5-45 to 3.5-46 of the Draft EIR, the only direct impacts from the proposed Project would be to a non-contributing feature, the Placita de Dolores, which was constructed after the historic district was designated, and accordingly impacts would be less than significant. With respect to indirect impacts, while the proposed Project’s Alameda Station would add another non-original element to the broader setting, mere visibility of a new building, structure, or feature from certain vantage points alone would not result in an indirect impact. The proposed Project would introduce a visible new feature to the historic district’s setting, but Alameda Station, with the exception of the vertical circulation and associated alterations to the non-contributing plaza space, would be located outside of the historical resource’s boundary, and contributing buildings would retain their visual and physical relationships with one another. As discussed in Section 3.05, construction and operational impacts associated with the proposed Project will not cause a “substantial adverse change” to the significance of this historical resource and, therefore, impacts will be less than significant. Moreover, while the “Great Places in America” list does not have any CEQA or historical significance, as it is simply a listing of a professional, educational organization’s (the American Planning Association) recognition of 303 “great places” that “make communities stronger and bring people together through good planning,”⁷⁰ the proposed Project would help strengthen Olvera Street’s placement on this list. The APA recognized that “[t]he adjacent Union Station Master Plan work will continue to improve pedestrian connections between Olvera Street and the key transit hub of the greater Los Angeles area.”⁷¹ Further, the website recognizes that “Los Angeles’s Union Station is directly east of Olvera Street, and has become the hub of the city’s Metro Rail system. Implementation of the Union Station Master Plan will link the revitalized transit hub directly to Olvera Street and the Plaza.” As discussed in Section 2.0, Project Description, of the Draft EIR, the Alameda Station location was selected because of its safe and convenient pedestrian connection to and from the LAUS passenger terminal and El Pueblo, inclusive of Olvera Street. The proposed Project would also include a new pedestrian plaza at El Pueblo. Accordingly, the proposed Project would bolster pedestrian and transit connections to El Pueblo and Olvera Street, consistent with the APA’s recognition of Olvera Street as a “great place.” Additionally, as the comment notes, the Los Angeles Plaza Historic District (El Pueblo National Monument) is located along two historic trails, the Juan Bautista de Anza National Historic Trail, and the Old Spanish National Historic Trail. The Juan Bautista de Anza National Historic Trail is a trail comprising the

⁷⁰ American Planning Association (APA). 2023. Great Places In America. Available at: <https://www.planning.org/greatplaces/>. Accessed August 2023.

⁷¹ American Planning Association (APA). 2015. Olvera Street Great Places. Available at: <https://www.planning.org/greatplaces/streets/2015/olverastreet.htm>. Accessed August 2023.

overland route traveled by Captain Juan Bautista de Anza of Spain during the years 1775 and 1776 from Sonora, Mexico, to the vicinity of San Francisco, California, of approximately 1,200 miles through Arizona and California. The Old Spanish National Historic Trail is an approximately 2,700-mile-long trail extending from Santa Fe, New Mexico, to Los Angeles, California, that served as a major trade route between 1829 and 1848. The proposed Project would serve to provide greater access to these historic trails. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents.

Comment GO21-15 Another key historic element of LA State Historic Park is its history as the Southern terminus of the Transcontinental Railroad and home of Southern Pacific Railroad’s River Station, built in 1875. Often referred to as “LA’s Ellis Island, the Station was where many 19th- and early 20th-Century newcomers first arrived to the city. The original roundhouse footings have been carefully excavated and this sensitive area is protected by department staff whenever staged events are considered (this point will be further discussed in section 6).

Response GO21-15 Refer to Section 3.05, Cultural Resources, and Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, of the Draft EIR for a discussion of archaeological resources at the Los Angeles State Historic Park. As discussed in Section 3.05, the Chinatown/State Park Station footprint is entirely located within the boundary of Resource 19-003120 (consisting of the remains of the Southern Pacific Railroad’s River Station). Extensive archaeological work has been conducted at the site, and when the Chinatown/State Park Station (including the construction staging area) is overlaid on an archaeological sensitivity map developed by California State Parks, it appears that the Chinatown/State Park Station is located in an area not identified as low sensitivity for archaeological resources by State Parks. The Draft EIR therefore concluded that impacts related to construction of the Chinatown/State Historic Park Station could be potentially significant if an unknown archaeological resource is identified during construction. To mitigate for these potential impacts of an inadvertent discovery of the resources known to exist in the resource boundary, Mitigation Measure CUL-E would be required, which would necessitate an archaeological testing plan be prepared and implemented, and a data recovery plan be prepared and implemented if significant archaeological remains are encountered during test excavations which cannot be avoided (i.e., if preservation in place is determined to be infeasible). This would be done in consultation with California State Parks and consultation with SHPO would also be required pursuant to Public Resources Code section 5024.5.. This consultation would be specific to the possible archaeological features that might be encountered at the Chinatown/State Historic Park Station and the park amenities. The testing plan would propose limited archaeological excavations of a portion of the

site overlapping the Area of Direct Impacts intended to identify the location, integrity, and significance of archaeological deposits that may be impacted by the proposed Project. If significant archaeological remains are encountered within the footprint of the Station foundation and columns, rendering preservation in place infeasible, a data recovery plan would be implemented to mitigate the impacts to less than significant. The data recovery plan would specify what is to be excavated, describe the specific tools, screening size, and methods to be used, and describe how structural remains, if any, would be exposed and mapped. If significant archaeological remains are encountered that appear to contribute to the site's NRHP and CRHR eligibility during the test excavations, that contribute to the significance of 19-003120 are identified in the area where the park amenities (e.g., the concessions and restrooms) are proposed, Mitigation Measure CUL-F would provide for a redesign for those structures to attempt to avoid the remains. If redesign is not possible, then the above data recovery plan would cover this area as well in order to mitigate impacts to less than significant. With implementation of Mitigation Measures CUL-A, CUL-B, CUL-E, and CUL-F construction of the proposed Chinatown/State Park Station would result in a less than significant impact related to a substantial adverse change in the significance of archaeological Resource 19-003120, as discussed in further detail on pages 3.5-61 to 3.5-62 of the Draft EIR.

Comment GO21-16 4. Impact on Viewsheds

The park's 2005 General Plan identifies and emphasizes the view of downtown LA from this park, "...the Park site is a large open space that is in stark contrast to the dramatic skyline of downtown Los Angeles. Sometimes referred to as the "front porch" of the City, there are no other sites that capture this welcoming view of downtown Los Angeles (p. 38). The park design was created to optimize the opportunities for visitors to experience this view – a major park element accessible from most vantage points.

The station and gondola lines with their constant movement will degrade that viewshed, blocking the view from some vantage points. The DEIR images are inadequate to fully capture the impact of the station on the view of downtown from numerous places in the park. Putting a large-scale station at the end of the park will affect the park experience from multiple vantage points, especially from the bridge. What is currently a spectacular vista will now be marred by a new large building that encroaches on state park land, with constant movement emanating out of that building. This is a fundamental change in the park experience and is inconsistent with the original vision outlined in the General Plan.

Response GO21-16 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain

viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including at Los Angeles State Historic Park. Refer to Response S2-5 for a discussion of the proposed Project’s consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relates to aesthetics.

Comment GO21-17 We are also concerned that views of Elysian Park and the Historic Broadway Viaduct will also be severely impacted from certain vantage points within the park.

Response GO21-17 Refer to Response GO21-16 and Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. As discussed in Section 3.01, the Chinatown/State Park Station location in the southernmost portion of the park would not block any designated scenic vistas, alter scenic resources, or block panoramic views, including views of Elysian Park and the Broadway Bridge to the north. Impacts to scenic or panoramic views would be less than significant.

Comment GO21-18 5. Impact on Park Users

One of the key elements that came out of the numerous public meetings during the park’s design was the desire for quiet and tranquility. This gondola’s continuous movement a mere 26 feet overhead will fundamentally alter the sense of peace and quiet in the park, a rare place of respite in a very dense, park-poor area of Downtown LA. The DEIR illustrations are highly misleading and show gondola cars, cables, and towers from a far distance, not from the vantage point of being directly overhead park users. The renderings are purposely not to scale and fail to demonstrate how the project would impact an individual sitting on a knoll right under the gondola line.

Response GO21-18 Refer to Response GO21-2 for a discussion of how with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the noise impacts from the proposed

Project, including in the Los Angeles State Historic Park. As detailed therein, operational noise impacts would be less than significant. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, to this Final EIR for a discussion of how the KOPs were prepared. The renderings were not altered and accurately depict how the proposed Project will appear in the existing environment. The “after” KOPs are visual simulations that reflect the proposed project components and were prepared using a digital model to accurately place the proposed Project into context without distortion. Because the proposed Project is rendered in perspective to match the pedestrian eye level vantage point of the existing photographs, visual elements in the foreground of the KOP will appear larger than visual elements further in the distance, consistent with how pedestrians experience their surrounding environment. As such, visual elements that are in the foreground can sometimes block the full view of visual elements at a distance even though the foreground element may be of a smaller dimension. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including additional visual simulations of the Park to further analyze viewshed impacts to the Park, in response to comments received on the Draft EIR during the public review period.

Comment GO21-19 The DEIR dismisses the importance of open space to provide a respite from urban life when it states “Los Angeles State Historic Park is in a highly urbanized area north of downtown Los Angeles. Recreationalists that may reside in the area are assumed to be accustomed to the urban edge of the park, of which the proposed Project would become a part.” (p.74). In other words, LA ART claims it is acceptable to eliminate a portion of a public park simply because urban residents who live in an urban area are used to urban edges.

Response GO21-19 Refer to Response GO21-2 for a discussion of the footprint and location of the proposed Project within the park; how with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park would not be affected by the proposed Project; and the proposed Project’s additional benefits to the Park. The Chinatown/State Park Station would provide passenger access to Chinatown, LASHP, and to nearby neighborhoods and land uses, including the Mission Junction neighborhood, which includes the William Mead Homes public housing complex. Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems for a discussion of how other urban aerial transit systems have been successfully incorporated into their surroundings, including public open space and public parks.

Comment GO21-20 The entire point of the considerable investment of state taxpayer dollars to acquire and develop LASHP was to create an anecdote to urban life, bringing a major open green space, with all the associated health and wellness benefits, to those who had no such amenity. The DEIR is highly misleading to suggest that taking scarce park land and 81 mature trees, replacing them with hardscape, bathrooms and a new concessions building, and running an aerial highway across the park with gondola cars

passing every 30 seconds is somehow making the project a “part of the park.” It is, in fact, destroying the park’s southern end, not enhancing it, or providing contributing elements.

Response GO21-20 Through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.4-23, in Section 3.4, Biological Resources of the Draft EIR, and in Appendix K.1, Updated Tree Inventory Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project’s Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Comment GO21-21 State Parks, LARSPP, and one of our key community partners, Clockshop, stage an annual Kite Festival at LASHP. Kite flying is an identified use in the park’s General Plan, and the park’s design ensured kites would have adequate space. The Kite Festival has grown year over year and now attracts thousands of visitors. The south lawn is an important part of this event, and the gondola would preclude that use, thus moving more people into a smaller space. This represents an additional project impact that the DEIR dismisses as insignificant.

Response GO21-21 Refer to Response GO21-2 for how, as discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the

vast majority of the Park for kite flying would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Comment GO21-22 The DEIR asserts that the project is consistent with a goal of the Cornfield Arroyo Seco Specific Plan (CASP) to increase access to open space. It claims that the gondola would provide greater access to the park. However, the existing Metro L (Gold) Line already provides convenient public transit access to the park. We would argue that eliminating open space through the taking of park land is not consistent with increasing access to open space, especially when this “increase” is merely duplicative of an already existing transit service.

Response GO21-22 Refer to Topical Response C, Project Features, for discussion of how the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. The proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first / last-mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. Moreover, compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project’s Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less Refer to Response GO21-2 for a discussion of the footprint and location of the proposed Project within the park; how with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park would not be affected by the proposed Project; and the proposed Project’s additional benefits to the Park. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Comment GO21-23 6. Impact on Park Operations & Revenue

The proposed project alignment cuts across areas that are frequently used as concert venues, a carefully planned designated use in the park’s planning process. These evening concerts are an essential part of the financial viability of the park and provide necessary revenues that directly fund ongoing park maintenance and preservation, habitat creation, and a rich array of free community programs – from arts and culture events, school programs, and our new Farmers’ Market, to food distributions for seniors and wellness classes of all kinds. Since concert events restrict the public’s use of the park, State Parks limit the number of large events so as to maximize revenues while minimizing park access restrictions.

During the design phase of LASHP, the staff of State Parks met with concert promoters, cultural resource experts, and natural resource specialists. This process resulted in the identification of two preferred concert areas that minimize noise,

protect the cultural resources such as the roundhouse, and protect wildlife, especially birds that are now populating the wetland portion of the park's north end.

The main stage is on the main lawn in the middle of the park, and the second stage is directly underneath the proposed flyway of the gondola, rendering it unusable in the future.

Every major concert that books an event at LASHP currently uses both stages. Eliminating the southern stage would cause promoters to seek other venues and result in lost revenues.

Response GO21-23 Refer to Response GO21-2 for a discussion of the footprint and location of the proposed Project within the park and how with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Section 5.5.2, Special Events at the Los Angeles State Historic Park, of Section 5.0, Other CEQA Considerations, of the Draft EIR, for a discussion of how due to the location of the proposed Project alignment, which crosses over a small portion of the park not typically used for screens and stages, and because events can still take place under the majority of the proposed Project alignment, the proposed Project does not significantly reduce the event space area within the Los Angeles State Historic Park. Refer to Response GO21-24 for a discussion of the potential stage locations for events at the Los Angeles State Historic Park, and how it will continue to be possible for most events to take place under the majority of the alignment within the park and adjacent to the alignment. In addition, the access road currently used for event set-up and breakdown would continue to be available for use. The proposed Project could affect the ability to use areas directly beneath the alignment for certain specific special event structures, however, the proposed Project alignment over the park is largely over a hill where it is difficult to stage special events, and the park does not include in their planned locations for special events. Due to the location of the proposed Project alignment, which crosses over a small portion of the park not typically used for screens and stages, and because events can still take place under the majority of the proposed Project alignment, the proposed Project would not significantly reduce the event space area within the Los Angeles State Historic Park or limit the number of people that can attend events at the park.

Comment GO21-24 As noted in section 3 of this letter, the roundhouse is a significant archaeological site. The second stage therefore cannot be relocated to the roundhouse area, contrary to the claims of the DEIR in Figure 5-3. This graphic suggests that the second stage could be moved directly OVER the roundhouse area. The department has never allowed a large stage with loud music to be placed over the round house. The vibrations from the music could potentially damage the excavated archaeological site that lies below ground level here. The second stage cannot be moved closer to the northern part of the park either because that would disturb wildlife that has taken up residence as the park's native habitat matures.

Thus, the gondola path effectively eliminates the second stage, thereby reducing the size of events that hence would reduce revenues. State Parks could not maintain the revenue stream by substituting more frequent, smaller events without having a major impact on park users. Every event requires partial closure so increasing the frequency to make up for the loss of the major events is not compatible with a public park. These indirect impacts on the gondola cables over the southern part of the park are not disclosed in the DEIR and represent a significant impact to the operations and financial viability of the park, as well as the ability of the state to staff and maintain the park.

Response GO21-24 Refer to Response GO21-2 for a discussion of the footprint and location of the proposed Project within the park and how with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Section 5.5.2, Special Events at the Los Angeles State Historic Park, of Section 5.0, Other CEQA Considerations, of the Draft EIR, for a discussion of how due to the location of the proposed Project alignment, which crosses over a small portion of the park not typically used for screens and stages, and because events can still take place under the majority of the proposed Project alignment, the proposed Project does not significantly reduce the event space area within the Los Angeles State Historic Park. The referenced Figure 5-3 was obtained from the California Department of Parks and Recreation and the aerial easement required for the proposed Project was layered on top. The map sent by the California Department of Parks and Recreation shows the “typical layout options for large events based on past experience.” Indeed, as an example, the event diagram from the 2018 La Tocada Music Festival shows stages in approximately the same locations as displayed in Figure 5-3.

Comment GO21-25 We are also concerned that the parking lot at the park will fill up during game days with people heading up to Dodger Stadium, thereby restricting access to those who wish to visit the park. The DEIR identifies numerous parking opportunities in the

Chinatown area, including the State Park. Given that the park's lot will be the most convenient for gondola riders, we would expect our lot to fill first.

Response GO21-25 Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The Los Angeles State Historic Park has and would continue to have the ability to implement parking management of its parking lot.

Comment GO21-26 7. Meaningless Offer of ‘New’ Facilities

The addition of a concession building, and a restroom as noted in Section 2.5.1.3 does not improve the park. There already exists a viable concession at the park, Cargo Cafe, which would be negatively impacted by this project. The bathrooms outlined in section 2.5.1.3 serve the needs of the private gondola station, not the public State Park. If State Parks had additional funds for bathrooms, this is not the likely location they would site them.

Response GO21-26 Refer to Response S2-4 regarding how the proposed Project would be integrated into the park. The proposed Project does not propose to demolish, nor does it need to demolish the Cargo Snack Shack concession or restrooms. The Project Sponsor would coordinate with State Parks and the concessionaire on the potential to provide alternative seating locations during construction. Through continued collaboration with State Parks which has been ongoing and will continue through the General Plan Amendment process, the proposed Project would be fully integrated into the park such that it would add to, rather than take away from the park's purpose and objectives. For example, in addition to the concessions, restrooms, and breezeway, the Chinatown/State Park Station would also include a mobility hub where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program. Pedestrian access enhancements could include pedestrian improvements between Metro's L Line (Gold) Station and the Chinatown/State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge. The Chinatown/State Park Station would provide passenger access to Chinatown, LASHP, and to nearby neighborhoods and land uses, including the Mission Junction neighborhood, which includes the William Mead Homes public housing complex.

Comment GO21-27 The bridge over Broadway, identified as Design Option E (p. 21 Exec Summary), is a red herring. This bridge has already been identified as a key missing element, has

been designed by State Parks, and has been targeted as a long-range goal to be funded by State Parks.

Response GO21-27 As discussed in Topical Response C, Project Features, while not proposed as part of the proposed Project, the Draft EIR includes an analysis of the State Park’s proposed bike and pedestrian bridge as part of Design and Use Option E. The bridge would provide important connections for students at Cathedral High School, as well as between the park and the Chinatown, Savoy, and Solano Canyon neighborhoods to support convenient access for the community. The analysis serves to provide environmental clearance for the bike and pedestrian bridge as a benefit to the Los Angeles State Historic Park, as while the bike and pedestrian bridge was mentioned in the Los Angeles State Historic Park General Plan and studied in the State Park’s Bridge Feasibility Study, the bike and pedestrian bridge was never environmentally cleared. Support for the Los Angeles State Historic Park bike and pedestrian bridge would otherwise be provided as part of the proposed Project. Accordingly, the proposed Project is furthering the bike and pedestrian bridge by providing the necessary environmental clearance and support for the bridge

Comment GO21-28 LA ART makes no promises of funding this bridge so including it in the DEIR merely confuses and misleads the public into thinking these two projects are somehow linked. They are not. Eventually the Broadway bridge will be funded and built, if not now then from a future bond measure.

State parks typically take decades to be fully realized and we recognize that LASHP still has missing elements. However, the inclusion of Design Option E in the DEIR suggests a quid pro quo: destroy the southern part of the park in exchange for a bridge up to Broadway that would be funded by taxpayers. It is a cynical attempt to confuse the public into thinking the gondola project would be the reason a bridge would be built, when in fact, this bridge will become a reality anyway in the future with public funds.

Response GO21-28 Refer to Response GO21-27 regarding Design and Use Option E.

Comment GO21-29 In Conclusion

We find this project highly objectionable from an environmental justice perspective. LA State Historic Park was born from an outpouring of community activism from those who had historically been ignored. Community members joined with a coalition of 35 neighborhood, urban environmental, and social justice organizations to form the Chinatown Yard Alliance to fight a proposed warehouse development in favor of a new park. Recognizing the site’s significance to the history of Los Angeles, as well as the need for neighborhood green space, the State of California purchased the parcel in 2001. In 2003, the Cornfield Advisory Committee was established to mirror the complexity and diversity of the original Alliance and lead a community-driven planning process that established an overall vision for the new park design.

After this long-fought struggle to transform a railyard brownfield into a lush, green oasis, park users deserve to have their original uses and designs for the park respected, and their public land protected. A project such as this would never be proposed over New York's Central Park, so why should the residents of Northeast LA be treated any differently?

Response GO21-29 Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. The Draft EIR also considered and analyzed the proposed Project's consistency with land use policies related to environmental justice. The proposed Project is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, providing connections to Metro's growing regional public transit system. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Further, public outreach for the proposed Project was designed with environmental justice principles in mind and the proposed Project provided translated materials in four different languages, and interpretation services in five different languages, to reflect the surrounding community, and provided opportunities for in-person and virtual meetings with toll-free dial in options and ADA accessibility features. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger

Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. On the other hand, this commenter mentions New York City's Central Park, which already is served by multiple modes of public transportation including bus and subway.

Comment GO21-30 This infrastructure project now threatening LASHP joins a long history of other projects once considered vital and worthy of sacrificing a State Park. In the early 21st century, high voltage power lines through Anza Borrego Desert State Park to bring solar energy to urban areas, and a toll road through San Onofre State Park to reduce congestion, both raised this question: when, if ever, is it acceptable to sacrifice a state park for a new proposed use? In both of the above instances, alternatives were found that saved the parks AND met the goals of the proposed projects.

Response GO21-30 As discussed in more detail in Topical Response F, Los Angeles State Historic Park, in response to Los Angeles State Historic Park stakeholders' comments on the proposed Project's Notice of Preparation and discussions with State Parks, numerous design considerations have been incorporated into the proposed Project to minimize the aesthetic effect of the proposed Project on Los Angeles State Historic Park, including reducing the size and scale of the station to be further in line with the neighborhood characteristics, integrating the existing historic granite pavers, and carefully considering the optimal location for the station.

Comment GO21-31 Today, we note that there is indeed another way to meet the goals of reducing emissions and vehicle miles traveled (VMT) for Dodger Games: the Dodger Stadium Express. Electrifying the buses used for the Dodger Express and expanding their number would both meet the goals of this gondola and provide additional opportunities to reduce VMT and emissions elsewhere in the city on non-game days. We therefore support the Transportation Systems Management Alternative, also identified as the Environmentally Superior Alternative, described in the Executive Summary on page 19.

Today LA State Historic Park is well used by residents, neighbors, and visitors from throughout the city, and has also become a vital, climate resilient native landscape supporting local wildlife. We thus urge you to reconsider the DEIR's claim of "not significant" park impacts from the gondola project.

With sincere regards,

Kathleen Johnson
Executive Director
Los Angeles River State Park Partners

Cc: Karen Bass
Eunisses Hernandez
Kevin de Leon

Response GO21-31 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Response S2-4 for additional discussion regarding the impact of the proposed Project on the park.

Comment Letter GO22 – Latino Outdoors

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO22

Comment GO22-1 Dear Mr. Zelmer:

This letter is submitted on behalf of Latino Outdoors (LO) – a national organization of 200+ volunteers currently operating in over 30 regional locations across the United States. Our mission is to inspire, connect, and engage Latino communities in the outdoors and embrace our cultura y familia as part of the outdoor narrative, ensuring our history, heritage, and leadership are valued and represented.

As an organization, we value our relationship with our community and service as a voice in promoting diversity, inclusion, access, equity and social justice in the outdoors. For the last 10 years, we have grown a strong and trusting relationship with California State Parks, and we continue to enjoy a mutual commitment and partnership for expanding access and equity for all Californians to our State’s most treasured beaches, parks, and historic monuments.

Response GO22-1 This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO22-2 through GO22-6.

Comment GO22-2 In recent years, Los Angeles State Historic Park (LASHP) and its staff have hosted many LO events including a national NOLS Outdoor Wilderness Training Session and campout, evening campfire programs and several State Parks/Latino Outdoors interpretive hikes, Cradle LA events and community programs. As it is currently proposed, we believe that the LA ART project poses a serious threat to the LASHP, especially if the project’s developer and supporters impose their political will to require California State Parks to amend the park’s General Plan.

On June 10, 2005, the California State Park and Recreation Commission approved and adopted the General Plan and Environmental Impact Report for LASHP. IN the plan’s opening statement, park planners and commissioners shared a vision for LASHP. They described it as having a unique “Sense of Place.” Their statement begins with the words...

“Who are Angelinos? What is Los Angeles? A noted historian Dr. Leonard Pitt stated, “No other available 32 acres holds as much opportunity to enlighten us about the history and culture of Los Angeles and this region...” The Park site and sits surroundings have a sense of place rooted in a long history of settlement. There are opportunities for discovery and revelation based on the untold stories, some contained in the remnant material culture of the site. The tangible

resources today appear to be few, but we can still hear the whispers of the past resonating in the voices of the present, proclaiming the future of the area.”

Key elements of the LASHP’s General Plan include a Declaration of Purpose and Vision created by the California State Parks General Plan team.

Declaration of Purpose

“The purpose of Los Angeles State Historic Park is to provide the public with a place to learn and to celebrate the ethnically diverse history and cultural heritage of Los Angeles, with an emphasis on its evolution to an economic and industrial metropolis of the 21st Century with extraordinary influence throughout the world. The Park will contribute to the emerging Los Angeles River Greenway, stretching from the San Gabriel Mountains to the Pacific Ocean. The Park will bring a wide range of visitors together to examine and experience the complete story of Los Angeles. It will be a sanctuary from the dense, urban environment that surrounds it. The Park will connect abstract historical and social patterns to the personal experiences of Angelenos and visitors from the city, the state, the nation, and the world.” (LASHP General Plan, page 82, section 4.1)

Vision

“Visitors to Los Angeles State Historic Park will enjoy a rejuvenating respite from the surrounding urban landscape in an expansive open space. The Park will be a desirable destination and important point of interest. Visitors will experience the environment through interpretive media and landscape features that recall the historical events of the region. Educational programs and activities will appeal to the interests of many visitors, from the local to the global community, will be varied in media, scope and diversity, and will emphasize the City of Los Angeles’ cultural, historic, and commercial heritage.” (LASHP General Plan, page 83, section 4.2)

If not for the collective vision of the Cornfield Advisory Group, the California State Parks planning team and local community supporters, our LO volunteers would not be able to bring local area youth and families to LASHP to enjoy the park’s unencumbered open-space, its shared paths, informal picnic areas, and the amazing views of downtown Los Angeles, with the backdrop of the San Gabriel Mountains.

It is our belief that the LA ART Project would permanently alter the core values of the Park’s General Plan, including its Declaration of Purpose and Vision. Yet the Draft EIR (DEIR) fails to describe this impact. In particular, on page 58 of the DEIR Executive Summary, Land Use and Planning element, LUP-2, the report asserts that the preferred project (ES2 Proposed Project) Environmental Impacts shall create “Significant Impact” on LASHP and the project is in conflict with the current LASHP General Plan. Yet the DEIR suggests that the only “mitigation measure” needed to reduce the project’s impact to the park under the category of Potential Environmental Impacts – LAND USE AND PLANNING would be to (LUP-A) “Obtain a Los Angeles State

Historic Park General Plan Amendment. Pursuant to Public Resources Code 5002.2, the proposed Project shall obtain an amendment to the Los Angeles State Historic Park General Plan to allow transit uses within the Los Angeles State Historic Park General Plan.” The DEIR goes on to assert that by doing so, the project proponents will reduce the project’s significant impact to a “Less Than Significant Impact with Mitigation”.

Response GO22-2 This comment provides a recitation and characterization of text from the Los Angeles State Historic Park General Plan and Final Environmental Impact Report. Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project’s required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan’s Preferred Park Concept Elements did not contemplate a transit station like the proposed Project’s Chinatown/State Park Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit

organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO22-3 So rather than identifying potential detailed and specific impacts on the park (archeological/cultural, environmental, historic, viewshed, visual, etc.) and suggesting mitigations, the DEIR merely notes that the process of a granting a general plan amendment would reduce impacts from significant to less than significant ‘with mitigation.’ This tactic shifts the burden of identifying all potentially significant impacts (visual, noise, visitor access, pedestrian and parking, acceptable transit options, use of public airspace and others) from the project applicant onto the shoulders of California State Parks staff, the California State Parks and Recreation Commission, and to the public. This is unacceptable and incompatible with California Environmental Quality Act (CEQA) project review process and mitigation, and it sets an indefensible precedent for granting a private developer access and use of State resources entrusted to the State by its residents.

Response GO22-3 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Accordingly, the Draft EIR complied with CEQA’s requirements to analyze the proposed Project’s potential environmental impacts. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR. As lead agency, Metro has and will continue to comply with all of CEQA’s requirements.

Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be

implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment.

Comment GO22-4 As currently proposed, the LA ART project is viewed by our community as just another environmental justice veiled attempt to degrade land that was hard fought and promised to be “The Central Park of LA” for seven generations of Californians and beyond. Recognizing the need for greenspace in LA’s urban area, three great environmental warriors dedicated their lives to finding a way to create an open-space oasis in the industrial/commercial wasteland of northeast Los Angeles. The work of the late Robert Garcia (The City Project), Theodore “Ted” Jackson (CA State Parks Deputy Director for Operations) and Ron Shaffer (CA State Parks LA District Superintendent), now all diseased, must not be forgotten – but cherished, protected and preserved.

Response GO22-4 Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, how the proposed Project supports Metro’s goal of prioritizing equity opportunities, is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, how the public outreach for the proposed Project was designed with environmental justice principles in mind, how the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region’s most visited venues and would alleviate existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated

air pollution and improving safety, and how the proposed Project is designed to be ADA compliant.

Comment GO22-5 We urge you to reject the DEIR’s faulty premise that California State Parks should be expected to mitigate the many obvious significant project impacts by hastily adopting a revised General Plan Amendment that ignores and papers over clear conflicts between the project and park’s current General Plan. On behalf of our LO community and current and future park users, we urge you to instruct the project proponent to properly identify, analyze, and mitigate all park impacts as required by law, and not usurp their legal responsibility to provide a clear, thoroughly complete and defensible project DEIR.

Response GO22-5 Refer to Response GO22-3. As lead agency, Metro has and will continue to comply with all of CEQA’s requirements.

Comment GO22-6 A failure to do so only reinforces our belief (as well as the majority of local community members) that a privately financed and constructed aerial tram tourist attraction should never be built inside and over Los Angeles State Historic Park.

Respectfully,

Richard A. Rojas, Immediate Past-Chairperson
Latino Outdoors – Advisory Board

Response GO22-6 This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO22-2 through GO22-5.

Comment Letter GO23 – Old Spanish Trail, Conchita Marusich

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO23**Comment GO23-1** Dear Mr. Zelmer

As the President of the Old Spanish Trail Association (OSTA), I am voicing our concerns about the proposed Gondola project also known as the Metro Aerial Rapid Transit Project. OSTA is an organization dedicated to preserving the Old Spanish Trail (OST), and its historic legacy for present and future generations. The Old Spanish Trail, spanning more than 2,700 miles, crosses over the 6 states of California, Nevada, New Mexico, Arizona, Colorado and Utah. Los Angeles was the end destination for most of the trappers that left New Mexico in search for economic opportunity starting in 1829. The Old Spanish Trail was designated a National Historic Trail in 2002 after unanimously passing both the Senate and the House and was signed into law by President George W. Bush.

Response GO23-1 This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO23-2 through GO23-4.

Comment GO23-2 The area now known as El Pueblo de Los Angeles National Monument has been the historic heart, soul and birthplace of Los Angeles since the early traders arrived over the Trail and eventually brought their families to settle in California. A certified site of the Old Spanish National Historic Trail (OSNHT), this area is crucial to telling the story of early Los Angeles. It has many important historic buildings such as the Avila Adobe, the oldest building in Los Angeles, built in 1818. The Plaza Church, La Iglesia Nuestra Senora La Reina de Los Angeles Roman Catholic Church, built in 1822, was the center of life in the Plaza. El Pueblo de los Angeles National Monument is an important historical gem, critical to Los Angeles history.

And now a group wants to use Disneyland-style gondolas which are wrong for this area. The gondola project threatens to destroy the historic importance of this district. The gondolas will arrive at their last stop at the proposed "Alameda Street" terminal which would be located adjacent to Olvera Street and Union Station. I have included the artist's illustration, which shows how the Gondola project's proposed "Alameda Station" would be detrimental to the integrity and view from the courtyard of the historic Avila Adobe, which in and of itself is a "high potential historic site" of the OSNHT. That proposed Station would be immediately east of the Avila Adobe and its courtyard. The proposed station's enormous bulk and height would overwhelm the view and experience in the Adobe's courtyard, compromising visitors' ability to feel back in the Trail's era and diminishing the historic value of the site. The DEIR fails to adequately convey how this project would affect the experience of the visitor to

El Pueblo. For example, it doesn't show the perspective of the project from the vantage point of someone standing in the courtyard of the Avila Adobe.

In addition, the large, modernistic terminal would be totally different from the Spanish style architecture of the area and could be very disruptive to world-famous and charming Olvera Street that is visited by over 2 million people every year.

Response GO23-2 The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to historic resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the proposed Project's potential construction and operational impacts to historic resources, including the Los Angeles Plaza Historic District (referred to as El Pueblo de Los Angeles would be less than significant. As discussed on pages 3.05-45 to 3.05-46 of the Draft EIR, the only direct impacts from the proposed Project would be to a non-contributing feature, the Placita de Dolores, which was constructed after the historic district was designated, and accordingly impacts would be less than significant. With respect to indirect impacts, while the proposed Project's Alameda Station would add another non-original element to the broader setting, mere visibility of a new building, structure, or feature from certain vantage points alone would not result in an indirect impact. The proposed Project would introduce a visible new feature to the historic district's setting, but Alameda Station, with the exception of the vertical circulation and associated alterations to the non-contributing plaza space, would be located outside of the historical resource's boundary, and contributing buildings would retain their visual and physical relationships with one another. As discussed in Section 3.05, construction and operational impacts associated with the proposed Project would not cause a "substantial adverse change" to the significance of this historical resource and, therefore, impacts would be less than significant. Refer to Appendix C, Visual Impact Assessment, of the Draft EIR, and Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, for existing and simulation views looking east at the proposed Project from the courtyard of the Avila Adobe.

Comment GO23-3 Why would Los Angeles want to risk this important business and tourist area for a visually intrusive, potentially dangerous gondola system in earthquake prone Los Angeles? The severe freeway overpass earthquake damage in Sylmar in the 1960's illustrates what earthquake damage can occur in Los Angeles.

Response GO23-3 Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR and Appendix F, Memo on Structural Engineering, of the Final EIR for discussion of how the proposed Project would meet

applicable standards, requirements, and building codes, including all standards addressing environmental factors such as seismic effects, and would have less than significant impacts related to geology and soils upon implementation of Mitigation Measure GEO-A. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of how comparable urban aerial transit systems operate safely in seismically active areas.

Comment GO23-4 There are also potentially many undiscovered archeological and historical sites, including the Zanja Madre, that could be ruined by the excavation for the gondola stations along the route from Dodger Stadium but particularly in the El Pueblo area. Once these artifacts are destroyed, they cannot be brought back and would be an historical loss for Los Angeles.

Response GO23-4 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources, including the Zanja Madre, would be either less than significant or reduced to less than significant with mitigation.

As noted on page 3.5-58, there is no overlap between the known locations of the Zanja Madre within El Pueblo and the proposed ground disturbance for the proposed Alameda Station. The segment of the Zanja Madre, Resource 19-000887, was capped in 1978 for preservation, is currently denoted by decorative pavement, and will not be impacted by the proposed Project. As noted on pages 3.5-58 and -59, the proposed Project has potential to significantly impact buried, unrecorded material in other portions of Resource 19-000887 and, as such, mitigation measures related to archaeological testing and recovery have been proposed that will reduce impacts to the resource to less than significant. Specifically, Mitigation Measure CUL-C notes that although the proposed Project is designed to not impact the portion of the Zanja Madre within Resource 19-000887, but nevertheless requires a testing plan to be prepared for portions of the site that will be impacted outside of the known Zanja location.

Comment GO23-5 As I said in the opening of this letter, the Old Spanish Trail Association is dedicated to preserving the OST wherever there are threats to its historic and cultural legacy and we are very concerned that the gondola project could cause irreversible harm to the OST in downtown Los Angeles, El Pueblo de Los Angeles National Monument, Olvera Street and the surrounding area.

Sincerely,

Conchita Marusich
President, Old Spanish Trail Association

Response GO23-5 This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO23-2 through GO23-4.

Comment Letter GO24 – Jon Christensen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO24

Comment GO24-1 Dear Mr. Zelmer:

I'm writing to express my grave concern about the inadequacy of the Draft Environmental Impact Report for the Los Angeles Aerial Rapid Transit project. I teach and do research at UCLA on environmental equity and access, green gentrification, and equitable community development strategies to prevent displacement and enable communities to thrive in place with new investments in green infrastructure and parks.

My concerns about the DEIR arise from the lack of adequate analysis in four crucial areas:

Response GO24-1 This comment provides a general introduction to the comments raised in this letter. Responses to comments contained in this letter are provided below in Responses GO24-2 through GO24-20.

Comment GO24-2 1) The piecemealing of the whole project:

There is documented evidence that Frank McCourt has plans to develop an entertainment/hotel/retail complex on the parking lots at Dodger Stadium if he can build another form of transportation to bring fans to games. The DEIR only considers the new form of transportation — an aerial gondola. It does not consider the foreseeable end result: the ensuing development on the parking lots. Thus, it does not analyze the whole project. This is a fundamental violation of CEQA. While the McCourt group and its representatives have denied that they have such plans, the plans are documented in a court settlement that they have attempted to keep shielded from public view. I am attaching an investigative research report that I wrote with a student researcher that documents McCourt's plans for developing the parking lots at Dodger Stadium. This report should be considered part of my comments.

Response GO24-2 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. No improper segmentation has occurred and the independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region's most visited venues– has been well established. As discussed in Topical Response G, the adoption of the CC&Rs

over a decade ago does not constitute a currently proposed development project at the Dodger Stadium property; rather, as is customary, the CC&Rs provide regulations and standards to maintain the existing stadium uses, including parking, if approvals are sought for additional improvements by the owner of the parking areas. No such development is proposed, and no environmental analysis is required of the speculations of commenters. Actions from over a decade ago, and speculative comments attempting to assign a motive to such actions, do not evidence a firm and specific commitment to develop the property surrounding Dodger Stadium. The proposed Project is solely comprised of an aerial gondola system connecting LAUS to Dodger Stadium and associated improvements. Accordingly, the Draft EIR did not omit “foreseeable” development from its analysis, and CEQA expressly discourages such speculation. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Response GO24-11 for a response to the “report” attached to this letter.

Comment GO24-3 2) The inadequate analysis of the aerial gondola’s impact on traffic, pollution, and greenhouse gas emissions, and alternative transportation solutions:

The McCourt group and its representatives have made numerous and varying claims about the project’s impact on traffic, pollution, and greenhouse gas emissions. The DEIR’s analysis of these claims is woefully inadequate. The ridership assumptions found in Appendix N are deeply flawed. The modeling and conclusions on travel data were gathered from cell phone for only two zip codes. One zip code is very near Dodger Stadium. The other is located approximately 90 minutes via public transit from the stadium. This sample cannot be considered representative of the population that would or would not use the proposed gondola and the sample size is too small to be statistically significant. Thus, the DEIR analysis is incomplete and inaccurate.

Response GO24-3 The proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel are discussed in Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data. Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR. Stantec is an internationally-respected global design and delivery firm that provides transportation engineering and planning

services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR. The comment alleges that the ridership model's travel data were gathered from cell phone data for two zip codes. This is not accurate. As shown on Figure 1 and Table 1 on pages 3 and 4 of Appendix N, Ridership Model Development, the model used Dodger ticket purchases and GIS ESRI's "Routable Network" data by zip code for all zip codes in the Southern California region from which tickets were purchased. The misperception that only two zip codes were used could arise from two "examples" included in Appendix N to describe how the model produces different transit mode share results for different zip codes based on the travel time and cost characteristics associated with each individual zip code. As examples, the two sample zip codes presented in Table N were not intended to represent the full set of calculations from the model. The model produced custom mode share results for each of hundreds of zip codes in the ticket purchase database. Furthermore, as discussed on page 3.17-28, in Section 3.17, existing mobile source data collected and aggregated by Teralytics and consisting of approximately 2.1 million trip samples was used to calculate average trip length for vehicles traveling to and from Dodger Stadium on game days for zip codes within a 50-mile radius of Dodger Stadium. The sample sizes used in the analysis were robust. The Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO24-4 A simulation done by the UCLA Mobility Lab, attached here, uses actual data of current behavior of people using various forms of transit in the Los Angeles region, and uses "discrete choice" theory (which won a Nobel Prize) to simulate the choices and behaviors of those people when the proposed gondola project is added to the network of available transportation choices to get to Dodger Stadium for baseball games. This simulation is far more statistically representative because it is based on actual transportation choice data and provides a far more realistic assessment of projected ridership. The report on this simulation should be considered part of my comments. It shows that traffic and therefore greenhouse gas emissions would not change significantly with the aerial gondola in service. The EIR should include a much more robust analysis of traffic and greenhouse gas emissions, including effects from the foreseeable development described above.

Response GO24-4 Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project's Draft EIR and does not appear to have been prepared for that purpose. On January 13, 2023, the Mobility Lab issued the following statement regarding the Mobility Lab Study:

Statement from the UCLA Mobility Lab Regarding LA Gondola Ridership Projection

The UCLA Mobility Lab is an engineering and technology lab dedicated to scientific research and innovation around mobility technologies. The lab's data on projected transit ridership of a proposed Dodger Stadium gondola is preliminary in nature. More research would be necessary to draw conclusions about potential use of the gondola. The lab takes no view on whether the project should be built.

Jiaqi Ma

Director, UCLA Mobility Lab

Faculty Associate Director, UCLA Institute of Transportation Studies

Refer to Response GO24-3 for a discussion of how the ridership model, assumptions, and estimates in the Draft EIR were prepared by constructing a detailed model utilizing accepted and tested data from a variety of sources as described in Appendix N, Transportation Appendices, of the Draft EIR, as well as peer reviewed by a respected international consulting firm and found to be appropriate and reasonable. Any differences between the findings in the Mobility Lab Study and the Draft EIR are therefore to be expected and are explainable. Nothing in the review of the preliminary Mobility Lab Study suggests that the ridership modeling and results in the Draft EIR are unreasonable or inappropriate for use.

Comment GO24-5 In the DEIR, LA ART ridership is assumed to ride the gondola both to and from games and events. But there is no proof, nor is there any discussion within the DEIR, that this assumption is correct. As the UCLA study shows, and consistent with Los Angeles County Transportation Commission's 1990 analysis of an aerial tram system, many people would be required to wait from 1 to 2 hours following games and events to return via the proposed gondola. Rather than waiting, many would instead either return via the Dodger Stadium Express or via Lyft or Uber, options that didn't even exist in 1990 when LACTC studied the idea. The assumption that all gondola riders would use it in both directions is entirely speculative and unsupported, and therefore throws off not only the DEIR's ridership conclusions, but also its conclusions regarding energy usage and greenhouse gas emissions. The DEIR therefore fails as an informational document for being inaccurate and incomplete.

Response GO24-5 Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the underlying factors that would influence post-game/event travel conditions and ridership which are built into the ridership model developed for the proposed Project based on extensive data sources and assumptions validated by data. . Based on current behaviors, game attendees gradually start leaving the game around 30 minutes before the end of the game. While most people would leave the stadium at the end of the game, given the crowd in the stadium and the distances from the various seating locations in the stadium, it would naturally take people seated the furthest away from the Dodger Stadium Station more time to walk to the station, much like how it is currently for passengers riding the Dodger Stadium Express. In addition, gondola passengers who would rather not join the line immediately to board the proposed Project in the post-game period

could visit some of the entertainment amenities at the stadium, including at the Centerfield Plaza. Regarding the queue waiting time, Dodger Stadium Express riders today wait in queues to board the service. As discussed in Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, the queues to board, loading times, and travel times for the Dodger Stadium Express are significantly longer and more variable as compared to the proposed Project. In order to quantify the existing service time needed to transport Dodger Stadium Express riders, Fehr & Peers observed four post-game time periods during the 2023 season. These observations indicate that riders are willing to wait for substantial periods of time after a game to board the Dodger Stadium Express, despite its slower travel time and long waits between buses, supporting the concept that riders would also be willing to wait after a game to board the proposed Project with its improved level of service. Moreover, based on 2019 season data, there is an approximate 8 percent reduction in post-game riders of the Dodger Stadium Express on weekday evenings compared to pre-game. The proposed Project model assumed this same reduction for the post-game ridership estimates for the proposed Project. To be conservative, the full reduction of post-game ridership is assumed to shift to TNCs, which are estimated to generate more VMT than private vehicle trips due to the VMT generated by the driver traveling to the pick-up location at Dodger Stadium. Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. As shown in Table 1 of the 1990 Dodger Stadium Transit Access Study (1990 study) referenced in the comment,⁷² the gondola technology evaluated in that study was a reversible tramway system consisting of two 125-passenger cars, similar to the Portland Aerial Tram in Portland, Oregon and the Roosevelt Island Tramway in New York, New York. An aerial tram system typically has two cabins that shuttle back and forth between two end terminals. The proposed Project is a detachable gondola system. An aerial gondola system includes multiple cabins that travel on a continuously circulating cable, which allows for an overall higher system capacity and ability to move more people per hour in each direction than an aerial tram. Furthermore, the proposed Project would be a modern 3S system with the capacity to move approximately 5,000 people per hour per direction with a travel time from LAUS to Dodger Stadium of seven minutes, far greater than the 2,800 persons per hour capacity estimated in the 1990 Study for the two-car reversible tramway system. As such, the two systems are not comparable, and findings in the 1990 Study comparing the tramway system to other modes as analyzed in that 33-year-old study are not relevant to the current proposed Project. The proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel are discussed in Section 3.3, Air Quality, Section 3.6, Energy, Section 3.8, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix H, Energy Technical Report, Appendix J,

⁷² Gruen Associates. 1990. Dodger Stadium Transit Access Study. Available at: https://libraryarchives.metro.net/dpctl/lactc/dodger_stadium_access_study.pdf. Accessed August 2023.

Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO24-6 Finally, I am attaching an analysis that I conducted of the energy efficiency of the proposed aerial gondola compared to alternatives, the Dodger Stadium Express and individual electric vehicles, that shows that the aerial gondola is far less energy efficient per passenger trip than these alternatives. The DEIR fails to adequately consider feasible alternatives and conduct such a comparison and is therefore incomplete.

Response GO24-6 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives, including the No Project Alternative, Spring Street Alignment Alternative, and the Transportation Systems Management (TSM) Alternative. For each alternative carried forward, the alternative was assessed against applicable environmental impact areas and the Project Objectives. Discussion of energy consumption and efficiency was discussed on Page 4-66 for each alternative, including the Transportation Systems Management Alternative, which includes a potential expansion of the Dodger Stadium Express. Refer to Response GO24-20 for further detail as to why the efficiency analysis alluded to in this comment is flawed. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. The Draft EIR considered a range of reasonable alternatives to the proposed Project in compliance with CEQA and the CEQA Guidelines. The Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO24-7 3) The inadequate and inaccurate analysis of the project's impact on Los Angeles State Historic Park:

The DEIR claims that the proposed gondola will not have a significant impact on the park. This is preposterous. Anyone who looks at the plans for the proposed station at the entrance to the park and the path of the gondola over the park can plainly see that it will fundamentally change the character of the historic park and the experiences of park visitors. The station will loom over and dominate the southwestern portion of the park and dramatically change the views of the park from the southwest as well as the views inside the park looking west, both protected by the park's 2005 general plan and EIR. While the DEIR documents some of these views, it does not adequately consider the impact on other views of the park from other locations, such as from Chinatown, Radio Hill Gardens, Elysian Park and other places with iconic views of the park.

Response GO24-7 As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro's L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. The Draft EIR addressed aesthetic impacts in Section 3.01, Aesthetics, with supporting data provided in Appendix C, Visual Impact Assessment of the Draft EIR. The Draft EIR and Visual Impact Assessment both specifically addressed and disclosed potential impacts on changes in the visual environment and existing viewsheds into and from within the Los Angeles State Historic Park. The Draft EIR included 30 Key Observation Points (KOPs), including nine that simulated views of or from Los Angeles State Historic Park. The Draft EIR analyzed each of these KOPs, describing the existing viewpoint along with a visual simulation of the proposed Project. With respect to views from within the park, the Draft EIR

concluded that certain southwest-facing views of the downtown Los Angeles skyline, particularly close to the proposed Chinatown/State Park Station, would be partially interrupted due to the proposed Project. However, the Draft EIR noted that these views are already partially interrupted by trees and intervening development, and the nature of the proposed Project (i.e., cables with similar characteristics to prevalent existing powerlines and cabins that are constantly moving in and out of view) means that the proposed Project would not significantly impact views from the park. The Draft EIR concluded that the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park. The Final EIR includes additional KOPs to further analyze viewshed impacts to Los Angeles State Historic Park. Refer to Appendix H.1, Memorandum Regarding Preparation of KOPs, and Appendix H.2, Supplemental KOPs in Response to Comments, of this Final EIR, for a discussion of the supplemental KOPs' preparation and the supplemental KOPs, respectively. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than significant. In addition, refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including views from a cabin over the park, providing a new and unique perspective of the park and its surroundings, including the Roundhouse Observation Deck and the exposed Zanja Madre, which is currently not visually apparent from inside the park.

Comment GO24-8 The gondola cars will pass over a substantial portion of the park as they travel through the northwest quadrant of the park, passing just 26 feet over the ground as they traverse a popular knoll in the park, in other words just 20 feet over the head of someone who is 6-feet tall. The DEIR does not adequately analyze these impacts and is therefore incomplete and inaccurate. It also does not adequately analyze the impacts of the taking of land and air space from this public park, which would be required for the gondola to be built.

Response GO24-8 As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. ANSI B77.1 requires the following vertical clearances: vehicles – five feet; vegetation or terrain – five feet; at-grade where pedestrians are present – eight feet; buildings – five feet; and roadways or railways – to be determined with the authority having jurisdiction. The proposed Project's vertical clearance to the bottom

of the cabins would range from 26 to 53 feet with an average of approximately 40 feet from ground level over the park. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. The Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO24-9 Furthermore, the DEIR shifts the burden of analyzing these impacts to the California State Park and Recreation Commission, which must complete a general plan amendment should it decide to allow the proposed gondola to take land and air space from the park. This is a fundamental violation of CEQA. The California State Park and Recreation Commission should not have to perform their own environmental analysis of the impact of the proposed gondola. It should be included in this DEIR.

Response GO24-9 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project's Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment. Refer to Topical Response D, Metro Is the

Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of Metro’s consultation with CEQA responsible agencies. Refer to Appendix A, Scoping Report, of the Draft EIR, and Appendix A, Public Outreach Report, of the Final EIR, for documentation of notice to responsible agencies at various stages in the environmental review process. Metro has complied, and will continue to comply, with the CEQA requirements for consultation with responsible agencies at each stage of the environmental review process. This consultation process has included meetings with Metro and the responsible agencies to discuss the scope of environmental review, additional consultation with State Parks as Draft EIR preparers, and comments from responsible agencies on the Draft EIR. This consultation process will continue throughout the course of the environmental review process. Accordingly, State Parks engaged in the consultation process as a responsible agency to ensure that the scope and content of the environmental information that it needs to have included in the EIR for its actions related to the proposed Project pursuant to CEQA section 21080.4(b) and CEQA Guidelines section 15104. Therefore, should the EIR be certified, State Parks will then consider this Final EIR, but retains its own independent judgment whether to approve the action before it pursuant to CEQA Guidelines section 15096.

Comment GO24-10 4) The failure to analyze the impact of the project on gentrification and displacement in the surrounding neighborhoods:

It is well-known that gentrification and displacement can result from green infrastructure projects, including transportation projects. The UCLA Urban Displacement Project has documented these effects around other Metro projects in Los Angeles. This is a well-recognized environmental justice issue at the local, state, and national level. It is inappropriate and unconscionable for a DEIR to fail to analyze these foreseeable impacts in 2022, especially in the disadvantaged communities where the aerial gondola stations are proposed to be located. This DEIR is incomplete and inaccurate in this regard as well.

Given these fundamental flaws, this DEIR should not proceed to the final EIR stage but should instead be sent back to the drawing board so that the public has an accurate and complete understanding of the impacts of the project. Absent that, the public has been deprived of the right to understand and comment on the whole project. Metro would also be justified in scrapping this ill-advised project entirely.

Response GO24-10 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for a discussion how the proposed Project, as a transit project, will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Topical Response N, Environmental Justice, for a discussion of how the Draft EIR addresses environmental justice by considering the proposed Project’s ability to reduce congestion and emissions from on-road

vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. Further, the Draft EIR analyzed the proposed Project's consistency with General Plan policies related to environmental justice, and the proposed Project is consistent with General Plan policies related to environmental justice, including by reinforcing or encouraging the establishment of strong pedestrian orientation in the surrounding communities and facilitating multi-modal access to and from the stations with pedestrian network improvements, and by ensuring quality pedestrian access by facilitating multi-modal access to and from the stations with pedestrian network improvements. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR. No recirculation of the Draft EIR is required pursuant to Public Resources Code section 21092.1 or CEQA Guidelines section 15088.5 because this comment does not raise any significant new information regarding a substantial adverse environmental effect.

Comment GO24-11 Investigative Report

Frank McCourt's Past and Future Schemes for Chavez Ravine

Frank McCourt shows then-L.A. Mayor Antonio Villaraigosa a model of proposed developments in the parking lots surrounding Dodger Stadium at a press conference in 2008. Newly uncovered court documents reveal that McCourt still has permission from the current owners of the Dodgers and plans to develop a massive retail, entertainment, and hotel complex at Chavez Ravine. And a gondola he has proposed from Union Station to the stadium would pave the way for the development. Brian Vander Brug, *Los Angeles Times*, April 25, 2008, via Getty Images.

By Leo Hecht and Jon Christensen, August 9, 2022¹

LOS ANGELES — Former Dodgers owner Frank McCourt is proposing to build a gondola from Union Station to Dodger Stadium, where he still owns a 50% share in 260 acres of land surrounding the stadium. That land, known as Chavez Ravine, represents a huge financial opportunity for the owners of the property if development ever occurs there.² Currently, it is used for surface parking, and the McCourt Global company proposing the gondola — Los Angeles Aerial Rapid Transit — makes no mention of future development plans. But McCourt has long had plans for an ambitious retail and entertainment complex around the stadium. Those plans are evident in McCourt's "Next 50" plan, which was unveiled when he owned the Dodgers, and in court documents that he tried to hide from public scrutiny during the bankruptcy proceedings that forced him to sell the team. McCourt failed to secure funding for "Next 50," but the agreements revealed in the bankruptcy proceeding are still in force and tell a very different story about the relationship between the proposed gondola, McCourt's plans to develop the parking lots around Dodger Stadium, and the future of Chavez Ravine.

This report examines McCourt's history with the Dodgers, the stadium, and his documented intentions to develop the parking lots in light of his current proposal to build a gondola from Union Station to Dodger Stadium. McCourt Global's denial of any current intention to develop the parking lots are belied by McCourt's previous plans, his 50% ownership of the land, and the fact that the gondola makes little or no sense without a major development at Dodger Stadium, which a gondola could facilitate through provisions in the court document that McCourt tried to keep secret. There are only 81 home games in the regular baseball season. And even adding a maximum of 12 post-season games, a couple of exhibition games, a maximum of four special events a month permitted under the Conditional Use Permit issued by the City of Los Angeles for the stadium, and the Los Angeles Marathon, at most the gondola is likely to be used at or near capacity on only 144 days per year.³ Unless, that is, the Dodger Stadium parking lots are developed as an entertainment, retail, and hospitality district like L.A. Live as Frank McCourt has long envisioned.

In 2004, McCourt bought the Los Angeles Dodgers from Newscorp for \$430 million. The purchase was financed primarily with loans, with over a third of the purchase price lent directly from Newscorp.⁴ At the time of McCourt's purchase, no specific plans for development of the parking lots surrounding the stadium were made public. However, on April 25, 2008, McCourt unveiled a sprawling development plan for the stadium itself and the surrounding lots. Marketed as the "Next 50" plan, the proposed development was slated to include a Dodger museum, a Dodger retail store, office space, and two new parking structures. In addition, the project was advertised as a green initiative, including the addition of 2,000 trees in the area around the stadium.⁵ The development was expected to cost \$500 million, more than McCourt's purchase price for the team.

The "Next 50" plan would have turned the stadium into a retail and entertainment venue to attract customers outside of game times, expanding the use of Dodger Stadium beyond baseball.⁶ The William Morris Agency, a Los Angeles talent agency, partnered with the Dodgers to obtain branding deals with companies in an attempt to fund the project by naming parts of the new development after corporate sponsors.⁷ Photographs of McCourt presenting a scale model of development plans at a press conference beside then Mayor of Los Angeles Antonio Villaraigosa show the proposed changes, including large, terraced plazas lined with trees and new buildings outside of the stadium. McCourt's planned development was designed to make use of the parking lots surrounding the stadium to increase the economic productivity of the land and turn Chavez Ravine into a year-round destination.

As part of his plans for the "Next 50" development, McCourt discussed a desire to connect Dodger Stadium to public transit, saying he "hoped local leaders would 'tweak and adjust subway lines' to add a Dodger Stadium stop and provide 'bus access in the interim.'" Then city council member Ed Reyes further endorsed connecting the development to new public transit lines, saying that the "renovation 'hopefully can

stimulate a whole new transit system that gets us in and out of this great place.”⁸ In developing plans for his additions to Dodger Stadium and the surrounding land, McCourt clearly identified expanded public transit options as increasing potential visitors as well as revenue in new retail and entertainment destinations.

Under McCourt’s ownership the Dodgers fell deep into debt, ultimately filing for bankruptcy on June 27, 2011. In addition to bankruptcy court conflicts with Major League Baseball, McCourt was ordered to pay \$150 million in a divorce settlement, and defended a suit by a San Francisco Giants fan who was badly beaten in the Dodger Stadium parking lot.⁹ The “Next 50” development never materialized, as McCourt failed to secure funding.

McCourt was very resistant to selling the Dodgers, and only agreed to a sale in November 2011 after a series of long court battles. After several rounds of negotiations, a group led by Magic Johnson and financed by Guggenheim Partners won the bid to purchase the Dodgers for \$2 billion. As part of the deal, Guggenheim Partners entered into a venture with a McCourt entity to jointly own the stadium parking lots.¹⁰

The terms of the parking lot sale and any potential future development of the land around the stadium was filed under court seal as part of the supplement to the Dodger’s chapter 11 bankruptcy plan on April 6, 2012. Of nine sections totaling 139 pages, the exhibit titled the “Declaration of Covenants, Conditions, Restrictions, and Easements for Chavez Ravine,” consisting of 93 pages of terms and agreements relating to the current usage and future development of Chavez Ravine, is the only piece of the document not available in public court records.¹¹ After objecting to the Dodger’s attempt to block public viewing of the land use plans, the Los Angeles Times was able to obtain the document in 2012.¹² The exhibit was subsequently recorded by the Los Angeles County Recorder’s Office, which is where it was obtained for this report.

The exhibit shows that Guggenheim Partners pays \$14 million a year to the McCourt entity Blue Landco LLC to rent the stadium parking lots. The document also details possible future developments that “may include, but are not limited to (i) office buildings, (ii) hotel and exhibition facilities, (iii) residential buildings, (iv) medical buildings, (v) academic buildings, (vi) parking structures, and/or (vii) retail, dining, and entertainment facilities.”¹³ The document includes a provision stating that Guggenheim Partners agrees “to cooperate with Landco, and to take all steps reasonably requested by Landco, in connection with the general plan of improvement and development of the Landco Parcels,” and “not to oppose, or to interfere in any fashion (including, without limitation, by speaking out at public hearings) with any efforts by Landco to complete development of the Landco Parcels.”¹⁴ This provision effectively grants Landco the sole discretion to develop the stadium parking lot lands.

Although McCourt and Guggenheim Partners claimed at the time of the sale that they did not have plans for development in the immediate future, McCourt’s attorney said that the document outlining potential plans was created to keep possibilities for development open. The document includes an agreement with Guggenheim Partners for a 99-year lease of the land with the Landco LLC half-owned by McCourt. The agreement states that the parking lots contain 19,000 parking spaces, and that any reduction of the number of parking spaces below 16,500 must be approved by Major League Baseball and the City of Los Angeles.¹⁵

An additional section of the exhibit, however, provides a workaround for this provision that is especially significant in light of McCourt’s proposed gondola. It states that “in connection to any Mass Transportation...Landco shall have the right to provide less than the 16,500 Required Parking Spaces.”¹⁶ This would allow for developments in the parking lots that could significantly reduce the number of parking spaces if the developments were completed after or concurrent with the addition of a mass transit connection to Dodger Stadium. Under this agreement, construction of a gondola to the stadium from Union Station could enable McCourt’s vision for additional development in Chavez Ravine to be realized.

McCourt Global’s website trumpeted its ownership interest in the 260-acre Chavez Ravine land as a “current real estate project” through at least October 2021, though that statement appears to have been removed from the website once the company began facing significant opposition to its proposed gondola project.¹⁷ McCourt’s proposal for a gondola from Union Station to land he co-owns at Dodger Stadium could be a necessary first step to allow development there.

On April 26, 2018, Aerial Rapid Transit Technologies LLC submitted an unsolicited proposal to Los Angeles County Metropolitan Transportation Authority (“Metro”) for an aerial gondola from Union Station to Dodger Stadium that it calls Los Angeles Aerial Rapid Transit or “LA ART.” LA ART was founded by Drew McCourt, Frank McCourt’s son. The company claims that the estimated \$125 million project will be privately funded by Frank McCourt’s investment firm and others.

According to LA ART, each gondola cabin will hold 30 to 40 people and the system will be able to move up to 5,000 people per hour to or from the stadium. LA ART claims the gondola will take 3,000 cars off of neighborhood streets and reduce traffic on the 110 freeway before and after Dodger games. Current plans show gondola cars suspended from cables 150 to 175 feet above the ground from Union Station to Dodger Stadium with an intermediate station at Los Angeles State Historic Park adjacent to Chinatown.¹⁸

The Los Angeles Times noted that even though the project director Martha Welborne claimed no future development is planned in 2018, “lenders might be more receptive to finance a gondola that goes to Dodger Stadium 365 days a year — rather than just

on 81 home-game dates.”¹⁹ At that time McCourt Global still listed the parking lots as a “current real estate project.”²⁰

Despite LA ART’s insistence that the gondola is not a precursor to future development, the gondola project would generate significantly more revenue for McCourt if it could deliver consumers to a commercial development with restaurants, retail, entertainment, and hospitality venues on the approximately 220 days of the year when the stadium does not host home games, exhibition games, post-season games, or special events. And McCourt’s share of profit from the real estate development would vastly exceed any profit from a gondola.

The “Declaration of Covenants, Conditions, Restrictions, and Easements for Chavez Ravine” that McCourt secured and tried to hide from the public in the Dodgers’ bankruptcy case shows the proposed gondola is not the end game at Dodger Stadium, but a means to yet another end.

Response GO24-11 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Mere statements on a website are not evidence that such development is currently proposed, nor are they sufficiently firm or committed to such that environmental analysis is required. No improper segmentation has occurred and the independent utility of the proposed

aerial gondola project – the first permanent transit connection to one of the region’s most visited venues – has been well established. In addition, refer to Topical Response G for a discussion of how the proposed Project addresses the need for a permanent transit connection to Dodger Stadium for Dodger games and special events at the Dodger Stadium property, and how the Dodger Stadium property is approved only for Dodger Stadium and ancillary uses and structures as set forth in the Conditional Use Permit for the Dodger Stadium property, with restrictive designations and zoning not consistent with the uses speculated by commenters. Further, the adoption of the CC&Rs over a decade ago does not constitute a currently proposed development project at the Dodger Stadium property; rather, as is customary, the CC&Rs provide regulations and standards to maintain the existing stadium uses, including parking, if approvals are sought for additional improvements by the owner of the parking areas. No such development is proposed, and no environmental analysis is required of the speculations of commenters. In addition, refer to Topical Response G for a discussion of how the “Next 50” project is not required to be included as a related project in the Draft EIR or analyzed as part of the proposed Project in Draft EIR. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodger game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment GO24-12 UCLA Mobility Lab

Study Finds Proposed Aerial Gondola to Dodger Stadium Will Do Little to Reduce Traffic and Emissions

October 24, 2022

University of California Los Angeles

Executive Summary

Los Angeles Aerial Rapid Transit (LA ART), a subsidiary of former Dodgers owner Frank McCourt’s company McCourt Global, wants to build an aerial gondola to take people

from Union Station to Dodger Stadium. Promoters of the gondola claim that it will take 3,000 polluting cars off neighborhood streets and the 110 freeway before and after Dodger games, leading to a net reduction in greenhouse gas emissions.

Transportation researchers from the University of California, Los Angeles (UCLA) examined these claims using a state-of-the-art transportation simulation model and found that the gondola could reduce traffic on major roads around Dodger Stadium on the night of a sold-out game, but the impact would likely be very limited. They found that the gondola likely would take only around 608 cars off the road. The gondola is thus unlikely to significantly reduce greenhouse gas emissions and traffic overall.

Response GO24-12 Refer to Response ML-1 in Topical Response O, Response to UCLA Mobility Lab Study.

Comment GO24-13 Methodology

The UCLA researchers – led by Dr. Brian Yueshuai He and Dr. Jiaqi Ma in the UCLA Mobility Lab at the UCLA Samueli School of Engineering – used the “LA Sim” model they created based on activity-based travel demand and agent-based simulation models. The model is grounded in the theory of “discrete choice,” for which Daniel F. McFadden won a Nobel Prize in economics in 2000. Based on real data about road network, traffic, public transportation, and other modes of moving around the city, including walking and bicycling, LA Sim simulates the individual choices that millions of travelers will make when something changes, such as adding another form of transportation, like a gondola to the Los Angeles transportation network.

The researchers caution that this simulation only models the probable use of the gondola for a sold-out night game and further research could reveal different scenarios for a day game or double-header, for example. But the research does model the most likely scenario for fans to choose the gondola – when traffic around the stadium is likely to be most heavy. Around 85% of baseball games played at Dodger Stadium are night games, starting at 7:10pm.

Response GO24-13 Refer to Response ML-2 in Topical Response O, Response to UCLA Mobility Lab Study.

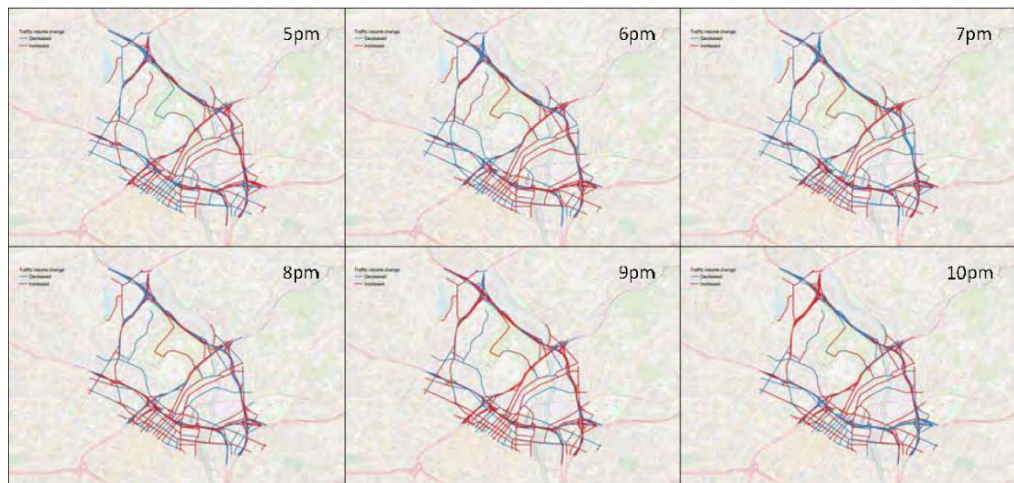

Comment GO24-14

Figure 1: Traffic simulation results by the hour

Findings

- Contrary to claims from LA ART, researchers found that the gondola would not significantly reduce traffic around Dodger Stadium. Results showed the gondola would likely slightly reduce traffic on some roads around the stadium for a sold-out night game and increase traffic on others, leading to little reduction in greenhouse gas emissions. The red lines in Figure 1 above indicate road segments that have a higher traffic volume after the proposed gondola is added to the traffic simulation. The blue lines indicate a decrease in traffic volume. According to the simulation, the total traffic volume would likely be reduced by around 0.9% (less than 1%) on the roads surrounding the stadium if the proposed gondola is built.

Response GO24-14 Refer to Response ML-3 in Topical Response O, Response to UCLA Mobility Lab Study.

Comment GO24-15 It's unlikely the gondola would contribute to a significant net decrease in greenhouse gas emissions. Approximately 608 cars would be taken off the road, not nearly close to the 3,000 LA ART claims. Most of the people who choose the gondola in the simulation – 4,470 – board the gondola at Union Station, with another 220 passengers boarding at a station proposed to be located at Los Angeles State Historic Park near Chinatown. With only 4,690 people taking the gondola in total and of those 2,500 estimated to be regular users of the Dodger Stadium Express clean energy buses there would only be 2,190 new people taking public transportation to the game using the gondola. The average car parking at the stadium carries 3.6 people, which means that the approximate number of cars taken off the road would be around 608. The simulation only models the number of passengers connecting the gondola via public transportation, on foot or by bike. It does not model people who would drive to Union Station or Chinatown to take the gondola. However, people who drive to those stations to take the gondola would not contribute to a net reduction in traffic or greenhouse gas emissions.

Response GO24-15 Refer to Response ML-4 in Topical Response O, Response to UCLA Mobility Lab Study.

Comment GO24-16 The gondola would carry fewer passengers than LA ART has claimed. LA ART originally claimed that the gondola could carry up to 5,000 passengers per hour on game days. Researchers found that the gondola is likely to carry fewer than a total of 5,000 passengers to Dodger Stadium – 4,690 according to the simulation – even when the service is provided free with a game ticket for a sold-out night game like the playoffs. In a recent parking study, LA ART revised their claim, estimating that 6,000 would ride the gondola to games by 2026, with 4,350 arriving to the gondola via public transportation. The project’s Draft Environmental Impact Report contains the same estimate, which corroborates the UCLA estimate of ridership if the gondola were in operation today.

Response GO24-16 Refer to Response ML-5 in Topical Response O, Response to UCLA Mobility Lab Study.

Comment GO24-17 Fewer people would take the gondola after the game – resulting in more traffic and emissions. In the simulation, some fans – around 2,500 – seem to switch from the free Dodger Stadium Express buses to the gondola on the way from Union Station to a sold-out game, reducing the use of that service by close to half of the passengers it has carried to playoff games in the past. But about half of those passengers – more than 1,000 – seem to switch back to the Dodger Stadium Express on the way home, perhaps to avoid having to wait for a gondola car. Only 1,380 fans take the gondola on the way home in the simulation. This suggests that fans are unlikely to wait in line for the gondola after the game, instead taking the Dodger Stadium Express or perhaps opting for a ride-share, which would increase traffic and greenhouse gas emissions after the game.

Response GO24-17 Refer to Response ML-6 in Topical Response O, UCLA Mobility Lab Study.

Comment GO24-18 Few people would use the gondola as a form of transportation other than to get to or from games. The simulated use of the gondola during the daytime before the game suggests that very few people would use it as a form of transportation outside of getting to and from games: in the simulation, only 60 people – around one gondola carload – traveled to Dodger Stadium during the day, and only 140 passengers traveled from the stadium to Chinatown or Union Station during the day.

Response GO24-18 Refer to Response ML-7 in Topical Response O, Response to UCLA Mobility Lab Study.

Comment GO24-19 The model produced very similar results at different costs for a gondola trip. LA ART previously announced that a gondola trip would cost \$15. Later, they announced that game ticket holders could ride the gondola for free. They have also said that local rides could be purchased for a standard Metro fare. The researchers modeled two scenarios: 1) \$10 for residents and free for game ticket holders, and 2) free to the public, and found very little difference in the results, indicating that residents are more likely sensitive to travel time rather than cost. One key factor is that the service

area of the gondola is limited and may not attract residents to choose it for daily travel.

Response GO24-19 Refer to Response ML-8 in Topical Response O, Response to UCLA Mobility Lab Study.

Comment GO24-20 About the Researchers

Dr. He is an Assistant Research Scientist at the UCLA Mobility Lab. He has extensive experience in big data analytics, transportation system analysis, and transportation policy evaluations. In the scope of cyber-physical systems, his research enables interactions between the physical infrastructure and virtual cyber systems by adopting data-driven techniques to support long-term urban system planning, management, and decision-making.

Dr. Ma is an Associate Professor in the UCLA Samueli School of Engineering and Associate Director of UCLA Institute of Transportation Studies. He has led and managed many research projects funded by U.S. DOT, NSF, state DOTs, and other federal/state/local programs covering areas of smart transportation systems, such as vehicle-highway automation, Intelligent Transportation Systems (ITS), connected vehicles, shared mobility, and large-scale smart system modeling and simulation, and artificial intelligence and advanced computing applications in transportation. He is an Associate Editor of the IEEE Transactions on Intelligent Vehicles and IEEE Open Journal of Intelligent Transportation Systems and Journal of Intelligent Transportation Systems. He is Member of the Transportation Research Board (TRB) Standing Committee on Vehicle-Highway Automation, Member of TRB Standing Committee on Artificial Intelligence and Advanced Computing Applications, Member of American Society of Civil Engineers (ASCE) Connected & Autonomous Vehicles Impacts Committee, Co-Chair of the IEEE ITS Society Technical Committee on Smart Mobility and Transportation 5.0.

Response GO24-20 Refer to Response ML-9 in Topical Response O, Response to UCLA Mobility Lab Study.

Comment GO24-21 LA ART Gondola Energy Use Analysis

The UCLA Mobility Lab's traffic study estimates that 4,690 passengers would ride the gondola to a sold-out night game at Dodger Stadium and 1,380 would ride the gondola on their way home. These figures are very close to the figures in the DEIR and LA ART parking study. That's 6,084 passenger miles since the gondola is 1.2 miles long.

The DEIR states that the gondola running at full capacity uses 2.5 mega-watts per hour. If we conservatively estimate that the gondola has to run at full power for one hour before the game to get passengers to the stadium and one hour to get them back, that's 5 mega-watt hours (MWh). Divided by 6,084 passenger miles that is 0.822 kilowatt hours (kWh) per passenger mile, and 1.184 kWh per passenger trip. If the gondola has to run longer than two hours to move the same number of projected passengers, those energy use figures will go up and the gondola's energy efficiency

per passenger mile will go down proportionally. LA ART estimates the gondola will run daily from 6am to 12am.

Each Dodger Stadium Express bus can carry 55 passengers. The average electric bus uses 2.1 kWh per mile. That is 0.038 kWh per passenger mile and 0.061 per passenger trip on the 1.6-mile trip. The Dodger Stadium Express is approximately 19 times more efficient than the gondola.

The average EV uses 0.346 kWh per mile, and the average vehicle carries 3.6 people to Dodger Stadium, that is 0.096 kWh per passenger mile, and 0.154 per passenger trip, assuming a 1.6-mile trip, like the bus. An EV is approximately 8 times more efficient than the gondola.

Response GO24-21 Refer to Response GO24-4, Responses GO24-12 through GO24-20, and Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study.

The comment compares the electricity usage of the proposed Project to the Dodger Stadium Express with electric buses and to individual electric vehicle transportation. The initial basis of the calculations in the comment is flawed as the comment relies upon an incorrect estimate of ridership from the UCLA Mobility Lab Study; refer to Topical Response O, Response to UCLA Mobility Lab Study. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for a discussion of how the ridership estimates for the proposed Project were developed. This included analysis of actual data, including a database of Dodger Stadium ticket sales, and accounted for the various modes of access that attendees choose to use. As reported in Table 3.17-4, Proposed Project Estimated Daily Riders, the estimated number of passengers traveling to Dodger Stadium for a sold-out night game (including Dodger employees) is estimated to be 6,140 for 2026 and 10,140 for 2042.

Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon,

and the Los Angeles State Historic Park. In addition, as discussed in Topical Response H, electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express.

The comment provides no citation for the assumed electricity usage per mile of an average electric bus or individual electric vehicle, and it is unclear if the values provided incorporate the effects of congested traffic and queuing times as would be expected on the roadways surrounding Dodger Stadium on game days. It is also unclear if the values provided incorporate the potential effects of the hilly terrain surrounding Dodger Stadium. It would also be inaccurate to assume that each Dodger Stadium Express bus would operate at full capacity for the full extent of its route and full duration of its operations. Specifically, the buses would be mostly empty for one leg of the trip (e.g., during the pregame period after dropping off passengers at Dodger Stadium and returning to LAUS). Further, the number of passengers on the Dodger Stadium Express buses would be expected to fluctuate and diminish in off-peak hours leading to reduced efficiency values. It is also important to note that through the Transportation Systems Management Alternative, the Draft EIR evaluated the potential expansion of the existing Dodger Stadium Express and found that the alternative would not meet the majority of the proposed Project's objectives in full or in part. Additionally, the Draft EIR concluded that the Transportation Systems Management Alternative would not provide the same level of benefits as the proposed Project, such as providing a direct transit connection between LAUS and the Dodger Stadium property via an aerial rapid transit system and improving connectivity for the surrounding communities by linking to the Los Angeles State Historic Park, Elysian Park, and the region's rapidly growing regional transit system at LAUS. These findings would not change should the Dodger Stadium Express buses run on electricity.

Regarding the commenter's assessment of individual passenger vehicles, it is not logical to compare the electricity usage of the proposed Project to the use of individual electric vehicles, since only a small fraction of those driving to Dodger Stadium are traveling in electric vehicles. Instead, one should compare the proposed Project to the passenger vehicle fleet as a whole, were the proposed Project not adopted. This type of analysis is evaluated through the No Project Alternative in Section 4.0, Alternatives, of the Draft EIR. The Draft EIR concludes that the No Project Alternative would result in higher long-term air quality emissions and increased GHG emissions in comparison to the proposed Project.

Unlike the Dodger Stadium Express with electric buses and to individual electric vehicle transportation noted in the comment, as a breakthrough and innovative technology for the region, the proposed Project would advance future alternative transportation systems and technology in the Los Angeles region while providing a template for other innovative aerial projects elsewhere in California and the United

States. The proposed Project would exemplify how alternative transportation technology can be integrated into a city's transportation infrastructure. It would also demonstrate integration of all transportation modes. Specifically, passengers will be able to transfer from transit at LAUS to the adjacent gondola station. These qualities of the proposed Project would help show that new transportation technology can successfully operate in concert with other existing modes of transportation.

Comment Letter GO25 – Coalition for a Beautiful Los Angeles, Barbara Broide and Wendy-Sue Rosen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO25

Comment GO25-1 Dear Mr. Zelmer:

This letter is submitted on behalf of The Coalition for a Beautiful Los Angeles (CBLA) in response to the Draft Environmental Impact Report (DEIR) released by Metro for the Los Angeles Aerial Rapid Transit Project (LA ART), proposed by LA Aerial Rapid Transit Technologies LLC. The Project, which is proposed to connect Los Angeles Union Station to the Dodger Stadium property with an intermediate station at the Los Angeles State Historic Park via an aerial gondola system, is one of great concern to CBLA.

Our CBLA organization (formerly Coalition to Ban Billboard Blight), is a non-profit organization dedicated to protecting and enhancing the City's visual environment through education and political action on behalf of many important issues, including: reducing visual blight from billboards and other forms of commercial signage to promote traffic safety and improve public health; preserving urban forest and open space; establishing federally-recognized Scenic Byways; undergrounding utility lines; treating our scenic resources as treasures to be passed on to future generations; promoting equitable public policies to accomplish those goals.

Response GO25-1 This comment provides a general introduction to the Coalition for a Beautiful Los Angeles as well as a summary of the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO25-2 through GO25-7.

Comment GO25-2 With the LA Art Project, our main concern is the lack of specificity and vaguely referenced advertising program within the gondola stations, on gondola towers, at the junction, and on the gondolas themselves and the potential significant impacts.

Response GO25-2 Refer to Topical Response K, Signage and Lighting, for a discussion of the proposed Project's signage. The proposed Project's Sign Concept Plan included at Appendix B of the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR, provides that across the entire proposed Project, including stations, the junction, towers, and cabins, the proposed Project is proposing static signage and digital signage. The digital signage would be limited to the Alameda Station and the Dodger Stadium Station. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators.

Signage would be designed to complement the proposed Project design and use and would be consistent with the existing urban condition, as illustrated in Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, which includes Key Observation Points (KOPs) updated in part to incorporate the proposed Project's signage program, as depicted in the signage package included in the Lighting Study. Refer to Section 3.01, Aesthetics, and the Lighting Study of the Draft EIR and Appendix H.1, Memo Regarding Preparation of View Simulations, of the Final EIR, for discussion of how the proposed Project's signage would result in less than significant impacts.

Comment GO25-3 We are also concerned about light glare and aesthetic impacts to the LA State Historic Park over which gondolas will travel at varying heights. In addition, we question whether the visual impact analysis in the DEIR appropriately uses the LA City CEQA threshold guide for analysis of park impacts, because it is a very minimal standard and should not apply.

Response GO25-3 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project which would be less than significant, including at the Los Angeles State Historic Park. The Lighting Study analyzed the entire proposed Project alignment including the Los Angeles State Historic Park. The analysis of light trespass impacts to the Los Angeles State Historic Park is reflected in the analysis at VP-S4 and detailed on pages 41 – 42, 44 – 48 of the Lighting Study and the analysis of glare impacts to the Los Angeles State Historic Park is reflected in the analysis at M4 and detailed on pages 49 – 53 of the Lighting Study. As explained in Section 3.01, Aesthetics, of the Draft EIR, at p. 3-1-32, with respect to light and glare, the proposed Project would have a significant impact if it would “[c]reate a new source of substantial light or glare which would adversely affect day or nighttime views in the area.” The Lighting Study evaluated the potential for impacts related to light and glare using the City of Los Angeles CEQA Thresholds Guide and the California Vehicle Code significance thresholds, and also evaluated the proposed Project for compliance with a number of regulatory standards including the Los Angeles Municipal Code (LAMC), CALGreen, the CASP, and the RIO, to support the conclusion that light trespass impacts would be less than significant. Refer to Response P700-37 for a detailed discussion of compliance with these regulatory standards. CEQA Guidelines section 15064.7(b) encourages lead agencies to adopt and publish thresholds of significance for use in determining whether environmental impacts are significant. While agencies are encouraged to adopt such thresholds of significance for general use, they are not required to do so and have the authority to determine the significance of environmental impacts on a project-by-project basis. Consistent with CEQA, Metro used the thresholds of significance from Appendix G to the CEQA Guidelines in the Draft EIR. As noted above, the analysis of light trespass impacts to the Los Angeles State Historic Park is reflected in the analysis at VP-S4 and evaluated the proposed Project in that location based on the Los Angeles Municipal Code (LAMC), CALGreen, and the CASP, which are the relevant thresholds and

regulatory standards that apply to the proposed Project's lighting in the vicinity of Los Angeles State Historic Park. In sum, the proposed Project would incorporate project design features related to lighting and would not create a substantial source of light or glare that would result in adverse effects to day/nighttime views of the area, and would comply with applicable City regulations related to light and glare. And, as detailed in the Lighting Study, light trespass and glare impacts to the Los Angeles State Historic Park would be less than significant. Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project's signage and lighting, with additional technical detail and information regarding the applicable regulatory framework for review and consideration of aesthetic impacts provided in the Lighting Study.

Comment GO25-4 Neither the DEIR document nor its appendices adequately describe the Project's proposed signage program. The vague description contained in the DEIR that the "proposed Project would include signage" that "may include identification and other static signs, electronic digital displays and/or changeable message light-emitting diode (LED) boards that include both transit information and other content, which may include off-site advertising" does not provide adequate information to assess impacts and attempt to identify mitigations (if possible to mitigate the impacts). The DEIR goes further to state that "Signage would be architecturally integrated into the design of the ART system including its stations, the junction, towers, and cabins." (DEIR p. 2-45)

The Project Description Section 2.7.3 Signage states: "Such signage may include identification and other static signs, electronic digital displays and/or changeable message light-emitting diode (LED) boards that include both transit information and other content, which may include off-site advertising that generates proceeds to support transit system costs and operations." Thus, we know that the operators of the Program seek to raise advertising revenues to help support the operation of the Project. This stated reliance upon advertising revenues to help finance the Project tells us only one thing for certain. That is the potential for the addition of more and more advertising faces, structures and/or panels associated with this program should operating revenues fail to provide the revenues anticipated and/or desired.

There is clearly not sufficient information provided for the public or those responsible for evaluating the Program to assess impacts when we are not provided with any specific descriptions of what lies within the realm of possible signage programs. We request a full analysis of every type, size, and manner of sign and whether static or digital, projection, or video, single or two-faced, lighting source and intensity of lighting, changing messaging, rotation rates, proximity to traffic, whether they will project ambient glare into the Historic Park, nearby residences, and other sensitive uses, etc. A chart that identifies types and numbers of signs must be provided. Will there be inward or outward facing signs on the cabins? Will there be analytics and/or data gathering capabilities on any of the signs which will trigger the need to address privacy issues? Please explain and provide a complete detailed analysis.

Response GO25-4 Refer to Response GO25-2 for discussion of the proposed Project’s signage and lighting. Refer to the proposed Project’s Sign Concept Plan included at Appendix B of the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. The Sign Concept Plan includes detailed drawings showing the proposed location for each sign and a signage schedule that provides sign numbers; sign types; information on whether the sign is static or digital; information on whether the sign is illuminated or non-illuminated; sign design, e.g., platform mounted, hanging, wall-mounted, wrap, etc.; information on whether the sign is interior or exterior facing; sign area including the width and height; and description of each sign.

Comment GO25-5 The provision of wayfinding signage should not present significant negative impacts if done in a consistent, tasteful manner and with signage respectful of its setting. Examples should be provided. Such signage, particularly if seen by passing drivers, should not incorporate changing messaging.

Transit information signage is provided in many cities on singular solar-powered poles with small LED text displays. Metro and LA ART do not need and should not seek to construct massive structures or advertising structures under the guise of providing transit riders with wayfinding information. The reference to “other content” is extremely troubling and opens the door to untold commercial signage.

Response GO25-5 Refer to Response GO25-2 for discussion of the proposed Project’s signage and lighting. Refer to the proposed Project’s Sign Concept Plan included at Appendix B of the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. The Sign Concept Plan includes detailed drawings showing the proposed location for each sign and a signage schedule that provides sign numbers; sign types; information on whether the sign is static or digital; information on whether the sign is illuminated or non-illuminated; sign design, e.g., platform mounted, hanging, wall-mounted, wrap, etc.; information on whether the sign is interior or exterior facing; sign area including the width and height; and description of each sign. The proposed Project’s signage would be designed to be consistent with Metro requirements including Metro’s Advertising Content Guidelines as applicable, which are updated from time to time.

Comment GO25-6 Section 2.7.4 of the Project Description introduces many sources of lighting that are not sufficiently defined or described. The very presence of the LA ART project creates the need for lighting in numerous locations, including but not limited to its stations, junction, and towers. Additional lighting is to be placed underneath stations and along pedestrian access routes. The lighting is an issue not only pertaining to aesthetics, but it carries impacts to biological resources, wildlife, night sky pollution and may negatively impact those individuals who live in the area. There are many studies that document the impacts of lighting on wildlife, including this study done in conjunction with USC for the National Park Service, which is relevant to this Project because of its impacts on parkland: Longcore, T., and Rich, C., 2016. Artificial night lighting and protected lands: ecological effects and management approaches (revised August

2017). Natural Resource Report NPS/NRSS/NSNS/NRR — 2017/1493. National Park Service, Fort Collins, Colorado.

Those who live, work, or travel in the vicinity of this Project, those who visit the Historic Park, those who look upon Union Station and El Pueblo de Los Angeles as landmark and architectural icons for our City may be negatively impacted by a barrage of electronic advertising beamed via electronic displays (digital or otherwise) from stations, gondola towers, junctions, and gondola cabins.

Response GO25-6 Refer to Section 3.01, Aesthetics, and the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR, and Topical Response K, Signage and Lighting, of this Final EIR for discussion of the proposed Project’s lighting. The Lighting Study concluded that the proposed Project would not create a substantial source of light or glare that would result in adverse effects to day/nighttime views of the area and would comply with applicable City regulations related to light and glare. Therefore, impacts would be less than significant. Refer to Topical Response K, Signage and Lighting, for discussion of how digital signage would be limited to the Alameda Station and the Dodger Stadium Station. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage.

Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR. As stated on page 3.4-19 of the Draft EIR, proposed Project lighting could result in indirect impacts to birds and bats. However, the Draft EIR found that, “Lighting would be low-level and primarily integrated into the architectural features. Exterior lighting would be shielded and/or directed toward the areas to be lit, limiting spillover into adjacent habitats potentially suitable for birds and bats. Due to the high level of exterior lighting currently present in the urbanized BSA, lighting proposed by the Project is not anticipated to have an indirect impact on bird and bat species. Due to the high level of exterior lighting currently present in the urbanized BSA, lighting proposed by the Project is not anticipated to have an indirect impact on bird and bat species. Therefore, operation of the proposed Project would have a less than significant impact on species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.” Thus, impacts on wildlife as a result of lighting were analyzed by the Draft EIR and no further analysis is required. Furthermore, refer to Appendix G, Supplemental Biological Resources Report, of this Final EIR, for discussion of how development in the entire LA Basin provides a major source of light pollution, and there is no evidence that light in the vicinity of the proposed Project would draw migrant wildlife to the area, any more than similar lighting in other areas over the LA Basin would be expected to.

Comment GO25-7 We do not accept the language in the DEIR that states that “signage would be in conformance with all applicable requirements of the Los Angeles Municipal Code (LAMC)” as adequate assurance that the negative impacts of the Project’s sign

program will be acceptable or adequately mitigated. Given that the LAMC is subject to change and that the adoption of sign regulations in Los Angeles has proven to be highly politicized, such language provides no long-term assurance to those who value the visual landscape and seek to reduce sign blight and halt its proliferation in the City. The introduction of (digital) signage on moving gondolas in the sky presents an entirely new form of sign blight with the only comparable image being one of the singular Goodyear Blimp that travels across the LA Basin with a very irregular presence in any one given location or community. The blimp travels at much higher elevations than the proposed gondolas and is seen only incidentally while the gondolas would have a fixed route and presence, leading not only to the impacts experienced as viewed, but contributing to harmful cumulative impacts as well.

Response GO25-7 Refer to Response GO25-2 for discussion of the proposed Project’s signage and lighting.

Comment GO25-8 It is vital to consider the impacts of the advertising program on the Los Angeles State Historic Park. Should lighted advertisements appear on the outside of the moving gondola cabins there will be significant visual and aesthetic impacts at visually sensitive locations along the gondola alignment. The DEIR acknowledges the impact of the gondolas and their towers on views from the Historic Park toward the downtown skyline, a protected aesthetic resource, which will “be partially interrupted due to the Project” and this does not even take into account the impacts that would occur should outside mounted advertisements be placed on the cabins. With the advent and advancements seen in LED lighting technology, it is possible that each gondola cabin could have changing ad panels with messages that rotate within seconds. There are no descriptions as to the types, hours of operation, message rotation schedules, etc. included in the DEIR. There are no limits as to what might be installed or operated. It is therefore impossible to assess the light and glare impacts of unknown displays. The project description is faulty, analyses is deferred until later as are proposed mitigations. This makes it impossible to conclude in the DEIR that the impacts will be less than significant.

Please add our comments to the record in this case and keep us informed of any upcoming meetings and/or hearings related to this Project.

Sincerely,

Barbara Broide	Wendy-Sue Rosen
Co-President	Co-President

Response GO25-8 Refer to Response GO25-2 for discussion of the proposed Project’s signage and lighting. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project would not impermissibly defer mitigation measures. Metro has and will comply with its obligations under CEQA.

Comment Letter GO26 – Chinese American Museum, Gay Q. Yuen, Ph.D.

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO26

Comment GO26-1 Dear Mr. Cory Zelmer,

The Chinese American Museum of Los Angeles is in support of LA ART. Our museum is located in the El Pueblo Historical Monument and is adjacent to Los Angeles Chinatown, both are significant locations for LA ART.

Response GO26-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment GO26-2 While CAM's mission is to tell and educate the general public about the history and the contributions of the Chinese in America, it also takes on the advocacy role of protecting and promoting for the betterment of our Chinatown community. From the information shared with the residents of our community, LA ART represents a new innovative mode of transportation that will support our climate goals in communities that have far too long been burdened by poor air quality. We've been pleased to follow the progress of its partnership with zero emissions programs.

Response GO26-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. The proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel are discussed in Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over the useful life of the project would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles traveled. As discussed in the

Technology Penetration Analysis, included in Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, a large capacity for a new mode of transportation in Los Angeles will allow passengers to see the potential for other emerging innovations to be integrated into the public transit system, and the proposed Project would thus exemplify how alternative transportation technology can be integrated into a city's transportation infrastructure and will show that new technology can successfully operate in concert with other existing modes of transportation. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO26-3 The Chinese American Museum recognizes the importance that an infrastructure of this scale represents, and it will be important to leverage such a large investment for the benefit of our community members. We applaud the willingness of LA ART to include us in conversations regarding community benefits to the neighborhoods it aims to serve. We look forward to the ongoing conversations this project is willing to have with us and other stakeholders to ensure that this project reflects the entire community and a true landmark for El Pueblo and Chinatown.

Response GO26-3 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements.

Comment GO26-4 Since the DEIR does not discuss community benefits, we would like you to elaborate on how any additional conversations with stakeholders will be included as an official document. I or other representatives of the Chinese American Museum would be willing to participate in further discussions and conversations in addressing Community benefits.

Response GO26-4 Refer to Topical Response C, Project Features for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to, sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage,

utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The proposed Project would also provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. The proposed Project could partner, for example, with the Chinese American Museum to help in addressing visitor, educational, and customer access to the Museum. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment GO26-5 In addition, the Chinese American Museum is an educational resource for the diverse communities of Los Angeles through our exhibits and educational programming, aiming to ensure that our programs are reflective of our entire community. To that end, we would like to know how will the project's Alameda Station adjacent to El Pueblo de Los Angeles Historical Monument reflect the community that it is located in, including the diversity of Los Angeles?

Response GO26-5 Refer to Topical Response C, Project Features, for discussion of how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area and will be discussed with identified stakeholder groups. In addition, to reflect the diversity of Los Angeles, the Project Sponsor would convene stakeholder groups to identify unique ways to use the proposed Project to provide additional interpretation of the adjacent neighborhood culture and history, particularly aimed at a diverse visitor community.

Comment GO26-6 One of the Chinese American Museum's objectives is to curate contemporary art that is reflective of Chinese American artists. How will the project provide opportunities for local contemporary Chinese American artists to showcase their works?

Response GO26-6 Refer to Topical Response C, Project Features, for discussion of how the Project Sponsor would also utilize local artists for site specific artwork at each station reflective of the unique neighborhood culture, and would create numerous opportunities to collaborate with and showcase local artists, including convening stakeholder groups to coordinate on issues including utilization of local artists and identification of sites along the proposed Project alignment to showcase the work of local artists.

Comment GO26-7 We appreciate the open dialogue LA ART has had with CAM from the beginning stages of this project and how the leaders of the project made concerted efforts to communicate with us at every stage of development. We are looking forward to continuous dialogue that will benefit Chinatown and the El Pueblo communities.

Thank you, Dr. Gay Yuen

??? ??Gay Q. Yuen, Ph.D.

Board Chair, Friends of the Chinese American Museum

Response GO26-7 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter GO27 – Trust for Public Land

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO27

Comment GO27-1 Dear Mr. Zelmer,

I am writing to express my deep concern regarding the proposed alignment of the Los Angeles Aerial Tramway (LA ART). As you may know, this private project, being shepherded by the Los Angeles County Metropolitan Transit Authority (Metro), would connect Union Station to Dodger Stadium via an aerial tram. The DEIR states that "The proposed Project would not result in any significant and unavoidable operational impacts," and concludes that "no mitigation measures required" (ES 10 p. 29 and ES 12 p. 31). Trust for Public Land disagrees with this conclusion.

Response GO27-1 This comment provides a general summary of the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO27-3 through GO27-10.

As stated on page ES-17, Executive Summary of the Draft EIR, there would be significant and unavoidable impacts regarding construction period noise and vibration (human annoyance). Page ES-17 of the Draft EIR states the proposed Project would not result in significant and unavoidable operational impacts.

The Draft EIR identifies several required mitigation measures. Table ES-2: Summary of Environmental Impacts, which begins on page ES-22 of the Draft EIR details the required mitigation measures for each potentially significant impact. Page ES-21 clarifies, "Project Design Features (PDFs), while not necessary for the impact significance determination, are included in Table ES-2 because they are inherent in the design of the proposed Project. Best Management Practices, or other measures required by law and/or permit approvals, are also requirements of the proposed Project. Additionally, Mitigation Measures have been identified and are additional actions designed to avoid, minimize, or compensate for significant environmental impacts and are required where significant impacts have been identified based on the analyses in Section 3.0 of this document. Where applicable, Mitigation Measures are described on Table ES-2." Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO27-2 Trust for Public Land works nationally to protect the places people care about and to create close-to-home parks – particularly in and near cities, where 80 percent of Americans live – ensuring livable communities for generations to come. Since 1972,

Trust for Public Land has protected more than 4 million acres and completed more than 5,400 park and conservation projects including the LA State Historic Park.

Response GO27-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment GO27-3

GO27-3A The finding in the DEIR is further complicated by the fact that the DEIR does identify as a "Significant Impact" the conflict with the LASHP General Plan. The DEIR describes as a "mitigation measure" the need to: "Obtain a Los Angeles State Historic Park General Plan Amendment (page 58, DEIR Executive Summary, Land Use and Planning element, LUP-2). The project asserts that "Pursuant to Public Resources Code 5002.2, the proposed Project shall obtain an amendment to the Los Angeles State Historic Park General Plan to allow transit uses within the Los Angeles State Historic Park General Plan."

GO27-3B The current general plan for this park does not allow for transit uses within the state park because it is a park, a vital public green space in a historically underserved community. Putting a transit use within the park was never envisioned during the park development process and it will significantly impact the park user experience. Yet the DEIR simply claims that as long as the general plan document is amended to allow for transit, that mitigates the impact.

GO27-3C In no way does an amendment in a document mitigate the on-the-ground impacts of an aerial highway through a park, or the project's usurpation of public property

Response GO27-3

GO27-3A Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project's Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A,

impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment.

GO27-3B Refer to Response GO27-3B for a discussion of the Los Angeles State Historic Park General Pan Amendment.

GO27-3C Refer to Response GO27-3A. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park.

Comment GO27-4 Below is a list of additional areas where the DEIR falls short:

1. Tree Removal

The DEIR states the project for the Chinatown/State Park Station would require the removal of 30 trees, and the aerial rights across the park would remove an additional 51 trees. The DEIR states that in place of the lost trees would be hardscape and replacement trees elsewhere in the park. Mitigating the loss of mature trees, particularly protected native trees, with new trees is insufficient; mature trees have established complex and interconnected ecologies not easily replicated, and they sequester much more carbon than do young trees.

The DEIR also does not indicate where the replacement trees would be sited, and does not provide sufficient information to demonstrate that the alternative locations of new trees would maintain the current park experience and ecosystems. The park was thoughtfully designed by landscape architects with specific outcomes in mind to accommodate a variety of human and wildlife activities. The park is a careful balance of open space and tree canopy that allows for flexible uses, including special events such as music festivals. The landscape plan was developed based on an extensive public planning and visioning process, and further refined to accommodate large-scale special events.

Response GO27-4 The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.4-23, in Section 3.04, Biological Resources of the Draft EIR, and in Appendix K.1, Updated Tree Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all

existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio.

Refer to Response S2-2 regarding the Chinatown/ State Park Station and proposed Project alignment within the Park. While there may be short-term losses in carbon sequestration related to the removal of trees, the proposed Project would implement BIO-PDF-F and would comply with applicable tree replacement requirements, based on the jurisdiction of the property where each tree is located. Accordingly, the short-term losses in carbon sequestration would occur only in the interim as replacement trees grow to the size of the existing trees. Nevertheless, over time, replacement trees would obtain similar carbon sequestration benefits as the existing trees, and would be coupled with a net decrease of approximately 6,375 metric tons of CO₂e per year in GHG emissions from the proposed Project.

As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Comment GO27-5 2. Impact on Historic Resources: the Zanja Madre and Roundhouse

The Zanja Madre, or "mother ditch," is the original water conveyance pipeline that brought water from the LA River to El Pueblo de Los Angeles. During excavations in the late 1990's, Metro unearthed a portion of the original brick pipeline on the site that is now the park. This was one of the key factors of historic significance that led the State Park Commission to classify this new park as a State Historic Park. This exposed section of the Zanja Madre near the Metro track is currently a major

historical attraction of the park, the views of which would be significantly impacted by the overhead gondola route.

Response GO27-5 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources, including the Zanja Madre, would be either less than significant or reduced to less than significant with mitigation. The exposed section of the Zanja Madre located northwest of the Los Angeles State Historic Park near the intersection of North Broadway and Bishops Road is denoted as P-19-190309. This resource will not be directly impacted by construction given that it is located outside of the proposed Project footprint. Further, operational impacts to the setting, including potential visual impacts, are less than significant because the resource’s setting has already been substantially altered from its historic state. Refer to pages 42, 52, and 91 of Appendix F for further information about P 19 190309. The views of the Zanja Madre would not be impacted by the proposed Project. Refer to Response S2-5 for a discussion of how the proposed Project would not substantially impact views, and how the proposed Project would provide a view of the exposed Zanja Madre, which is currently not visually apparent from the park.

Comment GO27-6 3. Impact on Viewsheds

The park’s 2005 General Plan identifies and emphasizes the view of downtown LA from this park, "... the Park site is a large open space that is in stark contrast to the dramatic skyline of downtown Los Angeles. Sometimes referred to as the "front porch" of the City, there are no other sites that capture this welcoming view of downtown Los Angeles (p. 38). The park design was created to optimize the opportunities for visitors to experience this view - a major park element accessible from most vantage points.

The station and gondola lines with their constant movement will degrade that viewshed, blocking the view from some vantage points. The DEIR images are inadequate to fully capture the impact of the station on the view of downtown from numerous places in the park. Putting a large-scale station at the end of the park will affect the park experience from multiple vantage points, especially from the bridge. What is currently a spectacular vista will now be marred by a new large building that encroaches on state park land, with constant movement emanating out of that building. This is a fundamental change in the park experience and is inconsistent with the original vision outlined in the General Plan.

Response GO27-6 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Appendix C, Visual Impact Assessment, for detailed discussion about the implementation and results of the visual simulation of the proposed Project using Key Observation Points (KOPs) critical or representative of the visual character of the area within each Landscape Unit (LU) utilized for before and after photorealistic and true to scale visual simulations and locations of sensitive viewers that potentially would be visually impacted by the proposed Project. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including at Los Angeles State Historic Park. Refer to Response S2-5 for a discussion of the proposed Project’s consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics.

Comment GO27-7 4. Impact on Park Users

One of the key elements that came out of the numerous public meetings during the park’s design was the desire for quiet and tranquility. This gondola’s continuous movement a mere 26 feet overhead will fundamentally alter the sense of peace and quiet in the park, a rare place of respite in a very dense, park-poor area of Downtown LA. The DEIR illustrations are highly misleading and show gondola cars, cables, and towers from a far distance, not from the vantage point of being directly overhead park users. The renderings are purposely not to scale and fail to demonstrate how the project would impact an individual sitting on a knoll right under the gondola line.

Response GO27-7 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the noise impacts from the proposed Project, including in the Los Angeles State Historic Park. As detailed therein, operational noise impacts would be less than significant.

As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. ANSI B77.1 requires the following vertical clearances: vehicles – five feet; vegetation or terrain – five feet; at-grade where pedestrians are present – eight feet; buildings – five feet; and roadways or railways – to be determined with the authority having jurisdiction. The proposed Project's vertical clearance to the bottom of the cabins would range from 26 to 53 feet with an average of approximately 40 feet from ground level over the park. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro's L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms.

Refer to Response GO27-6 for discussion of how the aesthetics impacts of the proposed Project would be less than significant, including at the Park. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, to this Final EIR for a discussion of how the KOPs were prepared. The renderings were not altered and accurately depict how the proposed Project will appear in the existing environment. The "after" KOPs are visual simulations that reflect the proposed project components and were prepared using a digital model to accurately place the proposed Project into context without distortion. Because the proposed Project is rendered in perspective to match the pedestrian eye level vantage point of the existing photographs, visual elements in the foreground of the KOP will appear larger than visual elements further in the distance, consistent with how pedestrians experience their surrounding environment. As such, visual elements that are in the foreground can sometimes block the full view of visual elements at a distance even though the foreground

element may be of a smaller dimension. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than significant. Refer to Response S2-5.

Comment GO27-8 The DEIR dismisses the importance of open space to provide a respite from urban life when it states "Los Angeles State Historic Park is in a highly urbanized area north of downtown Los Angeles. Recreationalists that may reside in the area are assumed to be accustomed to the urban edge of the park, of which the proposed Project would become a part."(p. 74). In other words, LA ART claims it is acceptable to eliminate a portion of a public park simply because urban residents who live in an urban area are used to urban edges.

Response GO27-8 As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. The Chinatown/State Park Station would provide passenger access to Chinatown, LASHP, and to nearby neighborhoods and land uses, including the Mission Junction neighborhood, which includes the William Mead Homes public housing complex. Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems for a discussion of how other urban aerial transit systems have been successfully incorporated into their surroundings, including public open space and public parks.

Comment GO27-9 The entire point of the considerable investment of state taxpayer dollars to acquire and develop LASHP was to create an anecdote to urban life, bringing a major open green space, with all the associated health and wellness benefits, to those who had no such amenity. The DEIR is highly misleading to suggest that taking scarce park land and 81 mature trees, replacing them with hardscape, bathrooms and a new concessions building, and running an aerial highway across the park with gondola cars

passing every 30 seconds is somehow making the project a "part of the park." It is, in fact, destroying the park's southern end, not enhancing it or providing contributing elements.

Response GO27-9 Through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro's L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. Refer to Response S2-2 for a discussion of the minimal ways the proposed Project would affect park operations. The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.4-23, in Section 3.04, Biological Resources of the Draft EIR, and in Appendix K.1, Updated Tree Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio. Refer to Response GO27-8 for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Responses S2-4 for additional discussion regarding the ability of uses to continue at the park.

Comment GO27-10 Lastly, I would like to call out the unavoidable impact LA Art will have on the Chinatown residents that will live beneath it. There is no scenario where residents are not impacted by the noise, sight, and regular maintenance the LA ART will cause. It is also no coincidence that this community most at risk of impacts from the LA ART is a low-income community of color. Please consider the people who will be negatively impacted every day by the gondola, not the private entity that stands to benefit from its proceeds.

With sincere regards,

Robin Mark
Los Angeles Program Director
Trust for Public Land

Response GO27-10 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Operational noise impacts would be less than significant. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the proposed Project maintenance.

Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area.

Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, and Appendix A, Scoping Report, of the Draft EIR, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefit to the surrounding community. The Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefit to the surrounding community, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment Letter GO28 – California State Park Rangers Association, David Carle

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO28**Comment GO28-1** Cory Zelmer

Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza Mail Shop 99-22-6
Los Angeles, CA 90012

cc: Armando Quintero, Director, California State Parks
California State Parks Commission

Re: Los Angeles Aerial Rapid Transit Project DEIR

These comments regarding the Los Angeles Aerial Rapid Transit (LAART) Project DEIR, are provided by the California State Park Rangers Association (CSPRA), an organization of active and retired State Park professionals dedicated to advancement of the highest principles of public service, established to support and preserve California State Parks for present and future generations.

Response GO28-1 This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO28-2 through GO28-12.

Comment GO28-2 Our focus is on the impacts of this project to Los Angeles State Historic Park, (LASHP) as the proposed gondola tramway route would cross one end of the 32-acre park, including cables carrying gondola cars just 26 feet overhead, and a station building with a 98-foot-tall tower. To permit a “transportation corridor” across the park would require an amended LASHP General Plan. That amendment process should never begin. This project has no relationship to LASHP’s historic purposes, is not consistent with the mission of a state historic park and would be an abuse of public land designated to be preserved for its historic and open space values.

Response GO28-2 As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project’s required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. ANSI B77.1 requires the following vertical clearances: vehicles – five feet; vegetation or terrain – five feet; at-grade where pedestrians are present –

eight feet; buildings – five feet; and roadways or railways – to be determined with the authority having jurisdiction. The proposed Project’s vertical clearance to the bottom of the cabins would range from 26 to 53 feet with an average of approximately 40 feet from ground level over the park. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms.

Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan’s Preferred Park Concept Elements did not contemplate a transit station like the proposed Project’s Chinatown/State Park Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment. As discussed in Topical Response F, the LASHP General Plan identifies transportation as a “primary theme” of the park, recognizing the site’s long history of transportation uses. The General Plan states: “The movement of people and products has enabled Los Angeles to become the megalopolis it is today. The Park site has been a route of transportation and commerce throughout its history. Located within bustling transportation and river corridors, the Park provides a place to reflect on the commercial and industrial activities that have shaped the city.” (LASHP General Plan, p. 86.) As a safe, zero-emissions, environmentally friendly, and high-capacity transit option which operates daily to link the Dodger Stadium property, Elysian Park, and the neighborhoods along the proposed alignment to the region’s rapidly growing regional transit system at

LAUS, the proposed Project advances this historical transportation theme while simultaneously providing the community a 21st century transportation option.

Comment GO28-3 The DEIR claims, without documentation, that the gondola could remove 3,000 cars from the streets and provide clean energy transportation benefits. Those claims do not hold up to expert analysis in transportation and energy research reports from the University of California, Los Angeles (UCLA).^{*} Instead, little traffic reduction will result, according to the UCLA transportation analysis, while electric busses would be 19 times more energy efficient than a gondola.

Response GO28-3 The Draft EIR does not state or include an analysis result that 3,000 cars would be removed from the streets. The Draft EIR does not analyze “cars from the street” as it is not a transportation-related metric under the California Environmental Quality Act Appendix G or metric under the City of Los Angeles Transportation Assessment Guidelines (TAG). Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project’s Draft EIR and does not appear to have been prepared for that purpose. The proposed Project’s ability to reduce vehicular travel is discussed in Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The lifetime VMT reduction of the project would be a reduction of 129,629,500 VMT. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express.

Comment GO28-4 LASHP was created more than two decades ago, in a successful effort by a coalition of farsighted community members and organizations that pushed for the creation of a unique State Historic Park in the urban core of Los Angeles. The land was set aside to save it from development, to address a critical lack of open space in Los Angeles, and to preserve an area that played important historic roles in the development of the city. After years of public meetings and planning, the California State Parks Commission assigned this parkland the stringent protections that go along with a State Historic Park classification. There is a societal responsibility to preserve, and not diminish that accomplishment. Every state park, including LASHP, is protected as a

unique and special place. It is wrong for developers to target parks as relatively inexpensive routes across what they perceive as “open public land.” This park, and all state park units, are held in public trust for the benefit of the people.

Comments follow about specific concerns in the DEIR.

Response GO28-4 Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. Responses to the comments contained in this letter are provided below in Responses GO28-5 through GO28-13.

Comment GO28-5 Specific comments by CSPRA to LAART DEIR:

Page 58 of the DEIR Executive Summary, Land Use and Planning element, LUP-2, identifies as a “Significant Impact” the conflict with the LASHP General Plan, and describes, as a “mitigation measure” the need to: “Obtain a Los Angeles State Historic Park General Plan Amendment. Pursuant to Public Resources Code 5002.2, the proposed Project shall obtain an amendment to the Los Angeles State Historic Park General Plan to allow transit uses within the Los Angeles State Historic Park General Plan.” This approach pushes analysis of the impacts to the park and its visitors out of the DEIR and onto the shoulders of the California State Parks Commission. However, the appropriate place for that analysis is within the project DEIR, where concerns listed below should have been addressed.

Response GO28-5 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority

related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment.

Comment GO28-6 Appendix C, Visual Elements, includes Table 3-1 on pages 16 and 17, “Los Angeles General Plan Goals and Guidelines.” However, the visual analysis that follows draws conclusions that are inconsistent with those goals and guidelines. Specifically, the General Plan “Natural Resources” topic calls for establishing “the Park as an important natural open space in the Los Angeles Urban area” (emphasis added) and protecting “and enhancing scenic viewsheds and features...by minimizing adverse impacts to aesthetic resources.” An example of the philosophical approach to state historic park management is provided where the Plan calls for “providing visitors with positive natural fragrances and sounds, such as the scent of landscape plantings and sounds of birds and water.”

Response GO28-6 Refer to Response GO28-2 for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. The Draft EIR analyzed the proposed Project’s consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics (see pages 3.11-39 to 3.11-41). As detailed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, consistent with the General Plan’s Aesthetic Goal, the proposed Project would protect and enhance scenic viewsheds and features and preserve the visitor’s experience of the surrounding landscape by minimizing impacts to aesthetic resources. The proposed Project’s design would incorporate appropriate urban design elements at the neighborhood level, preserve natural viewsheds of hillside areas, as well as protect additional open space and aesthetics resources consistent with policies from the Los Angeles State Historic Park General Plan. The proposed Project’s design and building materials would complement the architectural themes of the neighborhood and would complement the visual character of the existing buildings in the area. The proposed Project’s Chinatown/State Parks Station location would not block any designated scenic vistas, alter scenic resources, or block panoramic views.

Additionally, potential impacts to visual quality and character are minimized by the location of the Chinatown/State Park Station, which is in the southernmost portion of the park, away from the open passive park areas. The Chinatown/State Park Station would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and the design would complement the existing buildings in the area, as well as not distract from the visually distinct Chinese architecture within this area. In addition, the new amenity building intended for use by proposed Project riders and park visitors alike are designed to reflect the scale and materiality of the existing visitor amenity buildings located within the Los Angeles State Historic Park.

Comment GO28-7 Appendix C, KOP 16-20, pages 71-74, provide analysis of visual impacts to LASHP, with specific reference to photos 5-18 through 5-22 (comparing existing and simulation views), on pages A18 – A22 of Appendix A. It is challenging to evaluate the text when it references imagery provided later in the document. The focus of the discussion is primarily on distant skyline views and never adequately addresses or effectively illustrates more immediate visual and experiential impacts to park visitors. No consideration is made here of visual awareness or feelings about the invasive presence of cables carrying large gondolas to transport up to 5,000 people per hour in each direction just 26 feet overhead (20 feet for a six-foot-tall person). The photo simulations in Figures F-18, 19, and 20 come closest to depictions of overhead presence. Image 5020a includes groups of park visitors spread out across the area, but adding a simulation to include the cables and cars cannot reveal any reactions from those people to that invasive presence. Still photos cannot portray the attention-grabbing movement of the gondola cars. The DEIR, limited by focusing mostly on distant views, concludes that impacts are insignificant because cables are just part of a busy scene that includes other existing lines, and gondola cabins would be constantly moving in and out of view. That very movement – one gondola cabin after another in rapid motion -- is instead a convincing argument for a significant impact.

Response GO28-7 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Response S2-5 for discussion of the LASHP General Plan. The Draft EIR included thirty Key Observation Points (KOPs), including nine that simulated views of or from Los Angeles State Historic Park. The Draft EIR concluded that the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the park. Nevertheless, the the Final EIR includes additional KOPs to further analyze viewshed impacts to Los

Angeles State Historic Park. Refer to Appendix H.1, Memorandum Regarding Preparation of KOPs, and Appendix H.2, Supplemental KOPs in Response to Comments, of this Final EIR, for a discussion of the supplemental KOPs' preparation and the supplemental KOPs, respectively. As demonstrated by these supplemental KOPs, views from the park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views. Further, The location of the proposed cables and cabins would be adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The cabins would be constantly moving in and out of view, and the cables have similar characteristics to the overhead power lines that are prevalent in views in this area. As such, the proposed cables and cabins would not significantly impact views in this area.

Comment GO28-8 We find these sentences on page 74 to be telling examples of a blindness in this analysis to traditional park values and the unique purpose of LASHP to address a critical lack of open space in Los Angeles: “Los Angeles State Historic Park is in a highly urbanized area north of downtown Los Angeles. Recreationalist that may reside in the area are assumed to be accustomed to the urban edge of the park, of which the proposed Project would become a part.” (Emphasis added). Transforming part of the park into an “urban edge” is unacceptable and inconsistent with the General Plan.

Response GO28-8 Refer to Response GO28-2 for discussion of the location of the proposed Project within the Los Angeles State Historic Park; how with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park would not be affected by the proposed Project; and the Los Angeles State Historic Park General Plan Amendment. Through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms.

Comment GO28-9 The discussion becomes argumentative when addressing iconic distant views towards the downtown skyline: “Existing views of downtown from other areas in the park are already interrupted under existing conditions by trees and intervening development.” The existence of current spots where the views are interrupted does not justify adding more. “A visual benefit of the Project near Los Angeles State Historic Park would also be the Park amenities, potential mobility hub, pedestrian improvements, and installation of hardscaping and landscaping at the southern entrance to Los Angeles State Historic Park, which currently only includes hardscaping.” The text then lists these so-called visually beneficial amenities as 740 square feet of concessions, 770 square feet of restrooms, and a 220 square-foot covered breezeway. It seems exceedingly odd to suggest that this list, plus the associated 98-foot-tall tower

(unmentioned here) provides any visual benefit to a State Historic Park. Rather, they are new and significant changes.

Response GO28-9 Refer to Response GO28-7 for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Response GO28-8 regarding the additional benefits to the Los Angeles State Historic Park.

Comment GO28-10 Unmentioned here is how many currently growing park trees would be removed nearby to accomplish this installation.

Response GO28-10 The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.04-23, in Section 3.04, Biological Resources, of the Draft EIR, and in Appendix K.1, Updated Tree Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio.

Comment GO28-11 Design option E, page 21 of the Executive Summary) addresses the pedestrian bridge from the park over rails toward Chinatown. While that project has been identified as a goal for State Parks, this gondola project, with its many environmental impacts for the park, is not required to accomplish bridge access and inclusion within this flawed proposal is not necessary.

Response GO28-11 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. While not proposed as part of the proposed Project, the Draft EIR includes an analysis of the State Park's proposed bike and pedestrian bridge as part of Design and Use Option E. The bridge would provide important connections for students at Cathedral High School, as well as between the park and the Chinatown, Savoy, and Solano Canyon neighborhoods to support convenient access for the community. The analysis serves to provide environmental clearance for the bike and pedestrian bridge as a benefit to the Los Angeles State Historic Park, as while the bike and pedestrian bridge was mentioned in the Los Angeles State Historic Park General Plan and studied in the

State Park’s Bridge Feasibility Study, the bike and pedestrian bridge was never environmentally cleared. Support for the Los Angeles State Historic Park bike and pedestrian bridge would otherwise be provided as part of the proposed Project. Accordingly, the proposed Project is furthering the bike and pedestrian bridge by providing the necessary environmental clearance and support for the bridge.

Comment GO28-12 Regarding the alignment alternatives described in the Executive Summary on page 19, the Transportation Systems Management Alternative, also identified as the Environmentally Superior Alternative, or the No Project Alternative, are preferred by CSPRA, as having no direct impacts on LASHP.

Response GO28-12 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. As discussed in Section 4.0, Alternatives, of the Draft EIR, the No Project Alternative would not meet the majority of the Project’s Objectives in full or in part, and the environmental benefits of the proposed Project would not be realized through the No Project Alternative.

Comment GO28-13 To repeat a point made earlier in our letter, this project has no relationship to LASHP’s historic purposes, is not consistent with the mission of a state historic park, and would be an abuse of public land designated to be preserved for its historic and open space values.

Stadium Will Do Little to Reduce Traffic and Emissions.” UCLA Mobility Lab at the UCLA

Samueli School of Engineering, October 24, 2022.

Response GO28-13 This comment provides a general conclusion of the comments raised within this letter. Responses to the comments contained in this letter are provided above in Responses GO28-2 through GO28-12.

Comment Letter GO29 – Clockshop, Sue Bell Yank

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO29

Comment GO29-1 Dear Mr. Zelmer:

Below are comments for the Los Angeles Aerial Rapid Transit Project DEIR from Clockshop.

Clockshop is a 501c3 nonprofit that has worked in partnership with California State Parks for nearly a decade to provide free community arts and cultural events in public green spaces. Some of our key programs include an annual Kite Festival in LA State Historic Park, a Reading and Listening by Moonrise concert series, youth arts workshops, and temporary public art installations by some of LA's most rigorous BIPOC visual artists. Over 10,000 community members yearly take advantage of our free cultural offerings. We often work in partnership with environmental justice advocates, because we see our work in the arts as a key pathway for community members to form emotional connections to public land and advocate to preserve it. As part of that work, we speak out against private developments and government infrastructure projects that negatively affect the communities around the public park spaces that we work within, and advocate for those that provide better access and sustainability for those communities. Clockshop became aware of this project in 2018 and has researched and engaged with partners in assessing the impact of this project on the park and the surrounding communities.

Response GO29-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment GO29-2 "The Project" we reference is the private aerial tramway that LA ART intends to build on behalf of Frank McCourt to go 1.2 miles from Union Station to near the gold line stop and then over the LA State Historic Park and residential communities to Dodger Stadium. The Project has been billed as a sustainable project that will take 3,000 cars off the road. It purports to be a "privately" funded project created to move people to a single private for-profit enterprise and is being billed as a public transportation project. We believe that this is a gross misrepresentation of what this project actually is, which is a private development that will steal public land, negatively impact communities of color, and pre-mitigate shady profit-driven future developments that have not been transparently presented to the public.

Response GO29-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero

Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provides detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, and how the proposed Project supports Metro's goal of prioritizing equity opportunities and is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment.

Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property.

Comment GO29-3 Clockshop is strongly opposed to this project, as it would deeply impact our operations as a non-profit, and would incredibly negatively impact LA State Historic Park, which is the key site for most of our arts and cultural activities. Here are some further details:

1. The aerial tramway will eliminate a beloved annual Kite Festival.

Nearly 5,000 people, 70% of whom were people of color from Chinatown, Lincoln Heights, and Solano Canyon (neighborhoods surrounding LA State Historic Park) attended our last Kite Festival in 2022. The tramway will make this annual, free, and beloved community event impossible to produce, as its pathway travels directly over the park.

Response GO29-3 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. ANSI B77.1 requires the following vertical clearances: vehicles – five feet; vegetation or terrain – five feet; at-grade where pedestrians are present – eight feet; buildings – five feet; and roadways or railways – to be determined with the authority having jurisdiction. The proposed Project's vertical clearance to the bottom of the cabins would range from 26 to 53 feet with an average of approximately 40 feet from ground level over the park. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, including the Kite Festival, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice.

Comment GO29-4 2. The tramway will interrupt community arts and cultural programming at the LA State Historic Park.

Free public programming at the park, including readings, conversations, and experimental music, will be negatively impacted by the interrupted viewsheds and noise of the aerial tramway.

Response GO29-4 Refer to Response GO29-3 for discussion of how with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project.

Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including at Los Angeles State Historic Park. Refer to Response to Comment S2-5 for a discussion of the proposed Project’s consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics. Refer to Response S2-5 discussing how the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park.

Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the noise impacts from the proposed Project, including to the Los Angeles State Historic Park. Operational noise impacts would be less than significant.

Comment GO29-5 3. The aerial tramway is an injustice to the communities that fought for LA State Historic Park.

This park was fought for by the community for decades, and now a private developer billionaire will take part of the park away from them. This is a huge injustice, to take their viewsheds and their park for no reasonable purpose.

Response GO29-5 Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Response GO29-4 for discussion of the aesthetic impacts of the proposed Project, which would be less than significant.

Comment GO29-6 4. Over 75 mature-growth trees ranging between 15' and 50' are slated to be removed.

The State's 30 / 30 plan (CA climate change report) is being entirely ignored by LA ART, Climate Resolve, the City, and Metro. 30 / 30 calls for the preservation/ conservation of ALL HABITAT in red zones. Los Angeles County is officially a red zone, and the aerial tramway will destroy important habitat.

Response GO29-6 The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.04-23, in Section 3.04, Biological Resources, of the Draft EIR, and in Appendix K.1, Updated Tree Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio.

As discussed in Section 4.1.3, Impacts to Wildlife from Tree Removal, of Appendix G to the Final EIR, the quality of wildlife habitat provided by the trees proposed for removal is relatively low, given that the trees are primarily non-native tree species. In addition, the only areas of tree removal that could be potentially described as wooded habitat are the following: the small grove of Fremont cottonwood trees at the western end of the Los Angeles State Historic Park, the non-native woodland at the Stadium Tower and associated fire buffer, and the non-native woodland at the Dodger Stadium Station location. The total area of wooded habitat that would be removed in each of these areas is 0.24, 1.02, and 0.39 acres, respectively. This area of wooded habitat is relatively small compared to the amounts available in the immediately surrounding areas, such as Elysian Park (approximately 600 acres alone, much of which is wooded), Radio Hill Gardens, Victory Memorial Grove, and Point Grand View Park. Accordingly, while the removal of trees will result in a marginal reduction of suitable tree habitat in the short-term, such habitat loss would not result

in substantial population level impacts. Moreover, in the long-term, the replacement of trees proposed for removal would more than offset any realized impacts associated with the proposed Project.

The comment cites California’s 30x30 initiative, following Governor Newsom issuing the October 2020 Executive Order N-82-20 which committed California to the goal of conserving 30% of its lands and coastal waters by 2030. Under that goal, “an area is considered a ‘30x30 Conservation Area’ if it meets the following definition: land and coastal water areas that are durably protected and managed to sustain functional ecosystems, both intact and restored, and the diversity of life that they support. ‘Durably protected and managed areas’ within California’s 30x30 initiative encompass” areas under government ownership or control or under perpetual easements that are designated to protect species and their habitat. (Pathways to 30x30 California, p. 25.) The California Natural Resources Agency recognizes that the “best available datasets for identifying 30x30 Conservation Area lands in California assign protected areas into [USGS GAP Analysis Program] codes based on the degree of biodiversity protection for conserved areas. GAP status codes 1 and 2 are generally consistent with” the definition of 30x30 Conservation Areas “as they include areas with a high degree of durable protection and management for biodiversity or ecosystem values.” “Examples of lands and waters that are often coded as GAP 1 in California include most national parks, wilderness areas, ecological reserves, and wild and scenic rivers . . . Areas coded as GAP 2 in California include most national wildlife refuges, state parks, state conservation areas national seashores, as well as some local and regional open space, private conservation lands and easements.” (Pathways to 30x30 California, p. 29.) Based on a search of the California Protected Areas Database and California Conservation Easement Database, and their associated GAP codes, the proposed Project alignment is not located within a 30x30 Conservation Area.

Comment GO29-7 5. The aerial tramway WILL have a negative environmental impact.

Contrary to LA ART's claims, the pouring of thousands of pounds of concrete and the construction of this station will have a very negative environmental impact on the land and surrounding communities.

Response GO29-7 As discussed on page ES-17 of the Executive Summary of the Draft EIR, based on the analysis contained in Section 3.0, Environmental Setting, Impacts, and Mitigation, construction of the proposed Project would result in significant and unavoidable cumulative impacts with regard to Noise and Vibration (human annoyance). As demonstrated in the Executive Summary to the Draft EIR, the proposed Project would not result in any other significant and unavoidable construction impacts. The proposed Project would not result in any significant and unavoidable operational impacts.

Comment GO29-8 6. The aerial tramway is not needed and is not a public infrastructure project.

This is a private project, benefiting a private entity. A stop at the Chinatown station is duplicative and is not needed. The Dodger express represents non-invasive buses (soon to be fully electric) already routed and funded. The existing Dodger Express has been consistently cited as the preferred method of transport by community stakeholders.

The infrastructure already exists, and the Dodger Express team has committed to electrifying all the buses as a response to climate change. This alternative is preferred by Clockshop, and our community and stakeholders at large as it does not pour thousands of pounds of concrete into an already stressed community, does not remove precious park space, and does not remove important natural habitat.

Response GO29-8 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodger game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to

achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express.

As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.16, Public Services, 3.17, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park.

Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment GO29-9 Conclusion

Clockshop strongly opposes this project, which would layer unnecessary negative environmental impact, remove free public park space and viewsheds, and interrupt or remove free community cultural programs that serve primarily surrounding communities of color. It is not fair, and it is not right to do this to the generations of community members that fought for this public green space with blood, sweat, tears. There is no public benefit to this project that does not already exist in another already funded, already public, free form (i.e., the Dodger Express).

The manner in which electeds and Metro have conducted this process is utterly shameful and displays a flagrant disregard for the residents and communities being impacted, not to mention the law.

Clockshop's staff, board, and diverse community of parkgoers agree that this project should be immediately terminated.

Sincerely,

Sue Bell Yank

Executive Director, Clockshop

Cc: Supervisor Hilda Solis, Mayor Karen Bass, Congressman Jimmy Gomez, Assemblymember

Miguel Santiago, Assemblymember Wendy Carillo, Councilmember Eunisses Hernandez

Response GO29-9 This comment indicating opposition to the Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR. This comment also provides a general summary of the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO29-2 through GO29-8.

Comment Letter GO30 – Los Angeles Union Station Historical Society, Thomas R. Savio

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO30

Comment GO30-1 Dear Mr. Zelmer,

The Board of Directors (The Board) of the Los Angeles Union Station Historical Society (LAUSHS), a non-profit, Section 106 designated historic preservation consultant for Los Angeles Union Station (Union Station), a world recognized National Historic Landmark owned by Los Angeles County Metropolitan Transit Authority (Metro), has voted to formally comment against Los Angeles Aerial Rapid Transit's (LA ART) private, for-profit cable car line (aka "Frank McCourt's Gondola") and its public land and air rights development scheme that proposes to link Union Station and Metro's related "Esplanade-Forecourt" project with Dodger Stadium that The Board believes is contrary to Metro's public participation policy and illegal (pending a Superior Court decision) "accommodation" for LA ART. The Board believes that LA ART's proposed "futuristic-Carnaval" Union Station Terminal on Alameda Street and Metro's supporting "Esplanade-Forecourt" project will blight the viewscape of the historic and architecturally significant west facade of Union Station, and that Union Station, its trains and patrons could be physically harmed if aircraft from the nearby Los Angeles Police Department's "Hooper Memorial Heliport" airport become entangled in LAART's overhead cables, gondolas and 13-story towers. Furthermore, The Board opposes Metro's planned removal of all "Disabled Parking" spaces from the "Esplanade-Forecourt" area, without public hearings and reasonable alternatives, to accommodate a new so-called "water feature" (aka a fogging-type water fountain) which will cool LAART patrons cued-up for their rides to New Chinatown and Dodger Stadium. Moreover, the water feature would be contrary to the state's water conservation policy. (Even if the water feature recirculates, at least 10% of its water will be lost to evaporation day after day, year after year.)

Until now, The Board has steadfastly refused to take sides in the above major, billionaire development scheme.

However, in The Board's opinion, Metro and its staff have obviously taken a pro-active role supporting LAART, a potential competitor of Metro's efficient "Dodger Stadium Express" bus service, as well as planning to "gild the lily" of Union Station with its Esplanade-Forecourt Project, all "backstage," using public land, resources and airspace but without public participation as required by Metro policy and the law, before METRO agreed to be "engaged" by LAART.

Among the reasons for The Board's opposition are, but not limited to:

Response GO30-1 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. This comment provides

a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO30-2 through GO30-8.

Comment GO30-2 A) Metro Board member, the former Mayor of Los Angeles Eric Garcetti, who originally introduced the motion for Metro to assist LAART without public participation and to enlist Metro staff to "carry LAART's water" as it were, did receive, according to public records, millions of dollars in both "behest payments" and political cash contributions from Billionaire real estate and LAART developer Frank McCourt and/or his family and various entities and associates, which in The Board's opinion, is an apparent conflict of interest. Consequently, Metro is being sued by the non-profit California Endowment for willfully preventing public participation in Metro's decision to partner with LAART. (Ironically, Metro is using public resources to defend itself before Superior Court.)

Response GO30-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR. This comment also raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project.

Comment GO30-3 B) In The Board's opinion, Metro Deputy Executive Officer Cory Zelmer and/or subordinates falsified an official environmental document--LAART's Draft Environmental Impact Report (DEIR)--by checking-off the DEIR box that states there is no airport within 2 miles [3520 yards] of LA ART's proposed Union Station Terminal,

when he had been informed repeatedly to the contrary by The Board. Moreover, The Board presented proof to Zelmer and his superior, Metro CEO Stephanie Wiggins, that the Los Angeles Police Department's "Hooper Memorial Heliport" (variously described as the country's or the world's busiest airport for rotary-winged aircraft aka helicopters) is only 1/2 mile (880 yards) from LA ART's proposed Union Station Terminal. Furthermore, The Board reminded Zelmer and Wiggins that according to the Los Angeles Police Department, the California Department of Transportation, the California Public Utilities Commission, the Federal Aviation Administration, and the 8th U.S. Circuit Court of Appeals, all heliports are airports officially defined as a location where any flying machine is serviced. The fact that some airports serve only rotary-winged aircraft (helicopters) while others serve fixed-wing aircraft (conventional-winged aircraft) does not change the fact that: all heliports are airports in the eyes of all governing agencies and the Federal Courts. Furthermore, the argument presented by Metro that Hooper Memorial is a police facility, not a civilian facility, and therefore not subject to the LAART DEIR, is illogical and fallacious. A helicopter that becomes entangled in LAART's cables, gondolas and 13-story towers and consequently crashes into Union Station, its trains and patrons, could cause catastrophic harm regardless had that aircraft launched from a police facility or a public facility. Simply put, LAART's proposed location is not safe for the Union Station community and helicopters from Hooper Memorial Heliport airport. Please note, the Rules and Regulations of Los Angeles Union Passenger Terminal has for decades stated: "General Notice A. Safety is of the first importance in the discharge of duty." Or did Metro abolish this paramount railroad safety rule when it bought Union Station?

Response GO30-3 The Draft EIR addresses potential airport hazards in Section 3.09, Hazards and Hazardous Materials, Section 5.5.5, Heliports, in Section 5.0, Other CEQA Considerations, and in Appendix O, Airspace Analysis Technical Memo. The determination on page 3.9-30 of the Draft EIR – that the proposed Project alignment is not in an area covered by an airport land use plan nor located within two miles of a "public airport" – is based on facts and the specific language of CEQA's thresholds of significance for this issue. This threshold is stated in the Draft EIR under Impact HAZ-5, which asks the question: "For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public use airport, would the project result in a safety hazard...?" The Draft EIR concludes that the proposed Project alignment is not within two miles of a "public use airport" as that term is defined under CEQA. Regardless of any distinction between heliports and airports, the Draft EIR immediately follows this conclusion with a clear disclosure that the city-owned Jay Stephen Hooper Heliport is within 0.38 miles of the proposed Project. According to the LAPD and AirNav.com¹, the Hooper Heliport is a city-owned, private use facility. As a private use facility, it does not meet the "public use airport" description in the CEQA threshold. Note that the determination is based on the distinction between public and private facilities, not the definition of "airport." Thus,

comparison to federal or state case law or regulations relying on a different definition of “airport” is irrelevant to the analysis required by CEQA. The analysis in Appendix O, Airspace Analysis Technical Memo, of the draft EIR, is based on FAA analysis standards, and concludes with substantial evidence that construction and operation of the proposed Project is clear of the airspace associated with the existing heliports, including the Hooper Heliport, in the proposed Project's vicinity. As such, no adverse effects related to aeronautical hazards are predicted based on these findings, and no notification is required for the proposed Project construction unless the FAA makes a specific request to the Project Sponsor. In addition, refer to Appendix I, Firefighting Helicopter Response Memo, of this Final EIR, for discussion of how helicopter flight paths would not be impeded as a result of the proposed Project.

Comment GO30-4 C) Contrary to the promises made to The Board by Stephanie Wiggins, Cory Zelmer and LAART, no meeting has ever been organized between them and The Board to discuss the difference of opinions concerning the nature of LAPD's Hooper Memorial Heliport airport and the proposed location for LAART's Union Station Terminal. In fact Metro forbade The Board's examination of the only known 3-D scale model of Union Station's location because, in The Board's opinion, of a deliberate subterfuge that the model dating from former Union Station owner--the Santa Fe Railway--is too old to be accurate today, and furthermore the sharing of the model with The Board would somehow be a "conflict of interest"(?) even though The Board previously had access to the model. However, The Board's use of the model did not depend on the model's age, but only the juxtaposition of Union Station with Alameda Street which has not changed appreciably since the station was opened in 1939. Consequently, at a loss for options, The Board asked LAART to produce a 3-D scale model given its apparent resources, but LAART has never responded. This "shadow play," in The Board's opinion, was being performed by LA Metro and LAART to obfuscate the issues and delay public criticism of LAART contrary to the public weal which Metro is obliged to serve. Furthermore, since the model is public property, The Board's use should have been permitted so it could be compared to LAART's distorted artist's rendering of its Futuristic- Carnival Alameda Street Terminal with Union Station's Hispanic-Cathedral style. Finally, after wasting The Board's time and resources for over a year, in December 2022 Metro provided to the general public an aerial diagram of LAART's Alameda Terminal that is in the worst possible viewscape location--directly in front of Union Station! Cable car rides have their place but not in front of Los Angeles' world famous "Cathedral of Transportation."

Response GO30-4 Refer to Response GO30-3 for a detailed discussion of Hooper Heliport. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which

would be less than significant. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, of the Final EIR, for discussion of the methodology used to prepare the visual simulations included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. As discussed in Section 3.01, Aesthetics, of the Draft EIR, the Alameda Station's platform and canopy would include a light color scheme and warm tones, which has been designed to complement and reflect the materiality of the existing mix of adobe buildings, large Victorian commercial blocks, and Spanish Revival style buildings within the El Pueblo and Olvera Street area. In addition, the "shell" roof design provides a visual lightness with an integrated perforation pattern motif based upon the arched forms that mark openings and entries to Union Station, Pico House, and other historic buildings within El Pueblo. The proposed Project would also integrate physical and visual connections between the proposed Alameda Station and existing adjacent development, such as the new pedestrian plaza at El Pueblo. The new pedestrian plaza at El Pueblo would be open to the public and would extend view corridors between the proposed Alameda Station and existing development in a way that creates an observed visual unity.

Comment GO30-5 D) In The Board's opinion, LAART is designed to compete with Metro's "Dodger Stadium Express," a highly efficient road service that could be further improved if Metro switched to modern, environmentally friendly motor coaches that it might fund by the savings from not building its Esplanade-Forecourt project.

Response GO30-5 Refer to Topical Response O, Response to the UCLA Mobility Lab Study, for a discussion of how the Dodger Stadium Express would not be precluded from operating by the proposed Project. While existing riders of the Dodger Stadium Express may choose to switch to the proposed Project to take advantage of its substantial travel time savings, some riders may prefer to ride the Union Station Dodger Stadium Express for other reasons. The opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of attendees of games or events at Dodger Stadium to ride public transportation. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction,

Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. While some riders of the Dodger Stadium Express are likely motivated by traveling in more sustainable ways than driving, the Dodger Stadium Express already uses clean natural gas (CNG) buses, which are more environmentally friendly than driving. Switching from CNG to a Zero Emissions Bus (ZEB) would have no bearing on the travel time or capacity limitations of the Dodger Stadium Express, so is not expected to materially increase the ridership of the service, and therefore would reduce fewer vehicle miles traveled (VMT) to Dodger Stadium than the proposed Project, which would operate at zero emissions, with the electrical power for the proposed Project supplied by the City of Los Angeles Department of Water and Power (LADWP) through the utility's Green Power Program, pursuant to GHG-PDF-A.

Comment GO30-6 E) Given the seasonal nature of baseball, it is also The Board's opinion that LAART is a "Trojan Horse" scheme to facilitate year-around, for-profit real estate development in Dodger Stadium's vicinity at the expense of public land and airspace as well as the viewscape of magnificent Union Station.

Response GO30-6 Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Response GO30-4 for discussion of the aesthetic impacts of the proposed Project, which would be less than significant including at LAUS. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment GO30-7 F) Metro's proposed Esplanade-Forecourt project, according to Metro employees--who wish to remain anonymous for the sake of their careers--will be funded by so-called "overlap money" that was "peeled-off" from Metro's defunct LINK-US project that itself was rejected because of The Board's and the public's opposition. Moreover,

Metro has stated to The Board’s Executive Director via telephone that ultimately the Esplanade-Forecourt project will come to fruition by a two-step process eliminating all public parking including “disabled parking” from in front of Union Station without public discussion or participation in violation of the Americans with Disabilities Act (ADA). (A disabled motorist has already filed a formal complaint with the ADA authorities against Metro’s Esplanade-Forecourt project.) Step one would be the “temporary” elimination of all Union Station west front parking for the construction vehicles needed to build the Esplanade-Forecourt project followed by step two—well there really isn’t a step two—when the project is completed there won’t be any parking spaces left permanently. Not only will this negatively impact the “disabled Parking” but also the parking for Metro’s tenants the Homebound Restaurant and Brewery, TRAXX restaurant and the numerous social and artistic events that take place in the great “Ticketing Hall” which has fallen from use given computerized ticketing. Furthermore, according to a retired Metro staff person, the Esplanade’s so-called “water feature” (a fogging-type water fountain) will likely attract more “homeless” citizens seeking “showers” contrary to Metro’s stated policy--according to former Metro Union Station supervisor the late Ken Pratt--of not catering to the needs of the “homeless.” In The Board’s opinion, Metro’s Esplanade Project is designed to cool future LAART and Olvera Street tourist attraction visitors as they saunter between Union Station, LAART and Olvera Street. (While Olvera Street’s right-of-way and some of its structures and art works are historic, the “Olvera Street tourist attraction” per se was invented in 1930 by a husband-and-wife real estate development team who went on to develop Los Angeles’ “New Chinatown tourist attraction.” (Ironically, Old Chinatown was demolished in a racist bid to rid Los Angeles of the Chinese who settled after building the railroad to Los Angeles, then Union Station was then built on top of Old Chinatown’s rubble.)

Response GO30-7 Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of Metro’s LAUS Forecourt and Esplanade Improvements Project, which is not part of the proposed Project. The proposed Project does not include a water fountain in the planned LAUS Forecourt.

Comment GO30-8 G) Finally, building the Esplanade-Forecourt project’s water-feature while semi-desert Los Angeles is experiencing one of its worst droughts in history flies in the face of the State of California’s policy to conserve dwindling natural resources. One only needs to recall the classic Los Angeles-based movie “Chinatown” to understand what The Board believes is driving LAART and Esplanade-Forecourt schemes—the greed of land developers, the greed of Metro careerists and ultimately the greed of politicians! Or, to paraphrase the immortal Yogi Berra: “It’s ‘Chinatown’ (the movie) all over again.”

Response GO30-8 Refer to Response GO30-7 for discussion of how the proposed Project does not include a water fountain in the planned LAUS Forecourt. As described on page 2-49 in Section 2.0, Project Description, of the Draft EIR, the proposed Project includes

several sustainability and water efficiency measures, including drought tolerant landscaping and use of reclaimed water for irrigation where available.

Comment GO30-9 For the above reasons, but not necessarily only because of them, the Board of Directors of the Los Angeles Union Station Historical Society opposes construction of LAART and LA Metro’s related Esplanade-Forecourt Projects in the interests of honest government, Los Angeles Union Station preservation, the environment and safety.

Respectfully,

/s/

Thomas R. Savio Executive Director
Los Angeles Union Station Historical Society

Cc: Karen Bass, Mayor of Los Angeles Stephanie Wiggins, Metro CEO

Response GO30-9 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO30-2 through GO30-8.

Comment Letter G031

This comment number has intentionally been skipped.

Comment Letter GO32 – Sue Bell Yank

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO32

Comment GO32-1 Dear Ms. Rockwell,

On behalf of Clockshop, I'm writing to request that the public comment period for the Los Angeles Aerial Rapid Transit Draft Environmental Impact Report (DEIR) be no less than 90-days.

Response GO32-1 The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Accordingly, the Draft EIR public review period was for the 90 days requested in this comment.

Comment GO32-2 From METRO's communication shared on September 28, 2022, there is no clarity on how long the public comment period will last or how community members are expected to participate.

Response GO32-2 The Draft EIR was released on October 17, 2022, for a 60-day public review period. Refer to Response GO32-1 for a discussion of the Draft EIR's 90-day public review period. Refer to Response GO32-3 for discussion of the proposed Project's opportunities for public testimony during the Draft EIR public review period.

Comment GO32-3 The two meetings scheduled after the DEIR is released clearly state that no public comment will be taken. It is imperative that the community be given an opportunity to meaningfully participate in the CEQA process by providing a total of 90-days to comment and a clear pathway to engage.

Response GO32-3 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's opportunities for public testimony during the Draft EIR public review period. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately after the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and during the four public hearings. Comments on the Draft EIR could be submitted by email to LAART@metro.net, by mail to One Gateway Plaza, Mail Stop 99-22-6, Los Angeles, CA 90012, or over the phone by calling (213) 922-6913. Comments could also be submitted at each of the four public hearings. At virtual public hearings, comments could be given verbally. In light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public

hearing held on February 8, 2023. Verbal comments made at the virtual February 8, 2023 public hearing were deemed timely submitted for the purposes of the Draft EIR public review period. At the two public hearings held in person, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during all four public hearings, with interpretation provided in Taishanese during the final two public hearings.

Comment GO32-4 To date, our communities have been shut out of this process, with little to no details being shared. The few details provided by LA ART are wholly insufficient to understand the complexities of a project that will greatly impact surrounding communities.

Response GO32-4 Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language.

Comment GO32-5 Frankly, we deserve better. We must be heard and provided with a chance to meaningfully participate in the CEQA process. From our experience, we know that DEIR’s like this one are lengthy, complex documents with technical information that will require significant time to review and analyze. It is our understanding that similar environmental review processes such as the South Los Angeles and Southeast Los Angeles Community Plan and the LA Zoo Vision Plan have also been extended beyond 45-days.

Response GO32-5 The Draft EIR was released on October 17, 2022, for a 60-day public review period. Refer to Response GO32-1 for a discussion of the Draft EIR’s 90-day public review period. Refer to Response GO32-3 for discussion of the proposed Project’s opportunities for public testimony during the Draft EIR public review period. Refer to Response GO32-3 for discussion of the opportunities for public comment during the public review period.

Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public participation opportunities during the Draft EIR public review period. The format of the in-person public meetings immediately preceding, during, and immediately following, the Draft EIR public review period was an Open House, consistent with standard Metro practice, where attendees could learn more about the proposed Project and the key analyses and conclusions of the Draft EIR, and also a public comment opportunity. Twelve stations were set up throughout the venue, with ten stations focused on specific subject matter areas of the Draft EIR. Attendees could walk around to each station and ask questions to subject-matter experts about the proposed Project. Each station had large, printed boards summarizing the subject matter of that station, including: the Project Description, Aesthetics, Air Quality, GHG, and Energy, Cultural (Archaeology and Historical Resources), Parks and Recreation, Noise, Transportation, and Parking. Each station also included printed materials that attendees could review and/or take with them, including fact sheets in English, Spanish, and Chinese (Simplified) and printed copies of the presentation from the virtual public hearing in English, Spanish, Chinese (Simplified) and Chinese (Traditional). A hard copy of the Draft EIR was also available at the Summary of Impacts station for attendees to review. The meeting was staffed by Metro and AECOM staff, experts on subject matter areas including Transportation and Parking; Archaeology; Historical Resources; Air Quality, Greenhouse Gas, and Energy; Ropeway Engineering; Noise; and Aesthetics, and the Project team, who answered questions from attendees on the Draft EIR key analyses and conclusion. During the two in-person public meetings that were public hearings, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment GO32-6 The DEIR has been delayed numerous times, and if you proceed with a 45-day comment period, what message does that send to our communities? You can delay the release of the DEIR but not extend a public comment period that will be held during the holiday season when it is challenging for community members to participate. There is no need to rush through this process at this stage.

Response GO32-6 Refer to Response GO32- 1 for discussion of how Metro extended the Draft EIR public review period an additional 30 days for a 90-day public review period ending on January 17, 2023.

Consistent with CEQA Guidelines section 15004(b), the Draft EIR was “prepared as early as feasible in the planning process to enable environmental considerations to influence project program and design and yet late enough to provide meaningful information for environmental assessment.” Under CEQA, the purpose of a Final EIR

is to respond to comments received on the Draft EIR during the public review period and incorporate changes to a proposed project in response to such comments. (CEQA Guidelines, § 15088). Consistent with CEQA, comments received on the Draft EIR were responded to in the Final EIR.

Comment GO32-7 Finally, extending the public comment period is critical for transparency and fairness. Councilmember-elect Eunisses Hernandez, who has voiced concerns and will represent the communities most impacted by this project, deserves the chance to review and analyze the DEIR.

Please do the right thing by extending the comment period to a total of 90-days.

Sincerely,

Sue Bell Yank

Response GO32-7 Refer to Response GO32- 1 for discussion of how Metro extended the Draft EIR public review period an additional 30 days for a 90-day public review period ending on January 17, 2023.

Comment Letter GO33 – Sue Bell Yank

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO33

Comment GO33-1 Dear Ms. Rockwell,

On behalf of Clockshop, I'm writing to request that the public comment period for the Los Angeles Aerial Rapid Transit Draft Environmental Impact Report (DEIR) be no less than 90-days.

Response GO33-1 This is a duplicate of Comment GO32-1. Refer to Response GO32-1.

Comment GO33-2 From METRO's communication shared on September 28, 2022, there is no clarity on how long the public comment period will last or how community members are expected to participate.

Response GO33-2 This is a duplicate of Comment GO32-2. Refer to Response GO32-2.

Comment GO33-3 The two meetings scheduled after the DEIR is released clearly state that no public comment will be taken. It is imperative that the community be given an opportunity to meaningfully participate in the CEQA process by providing a total of 90-days to comment and a clear pathway to engage.

Response GO33-3 This is a duplicate of Comment GO32-3. Refer to Response GO32-3.

Comment GO33-4 To date, our communities have been shut out of this process, with little to no details being shared. The few details provided by LA ART are wholly insufficient to understand the complexities of a project that will greatly impact surrounding communities.

Response GO33-4 This is a duplicate of Comment GO32-4. Refer to Response GO32-4.

Comment GO33-5 Frankly, we deserve better. We must be heard and provided with a chance to meaningfully participate in the CEQA process. From our experience, we know that DEIR's like this one are lengthy, complex documents with technical information that will require significant time to review and analyze. It is our understanding that similar environmental review processes such as the South Los Angeles and Southeast Los Angeles Community Plan and the LA Zoo Vision Plan have also been extended beyond 45-days.

This is a duplicate of Comment GO32-5. Refer to Response GO32-5.

Comment GO33-6 The DEIR has been delayed numerous times, and if you proceed with a 45-day comment period, what message does that send to our communities? You can delay the release of the DEIR but not extend a public comment period that will be held during the holiday season when it is challenging for community members to participate. There is no need to rush through this process at this stage.

Response GO33-6 This is a duplicate of Comment GO32-6. Refer to Response GO32-6.

Comment GO33-7 Finally, extending the public comment period is critical for transparency and fairness. Councilmember-elect Eunisses Hernandez, who has voiced concerns and will represent the communities most impacted by this project, deserves the chance to review and analyze the DEIR.

Please do the right thing by extending the comment period to a total of 90-days.

Sincerely,

Sue Bell Yank

Response GO33-7 This is a duplicate of Comment GO32-7. Refer to Response GO32-7.

Comment Letter GO34 – Thomas R. Savio

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO34**Comment GO34-1** Dear Ms. Harper,

This letter is to inform you that the Los Angeles Union Station Historical Society (LAUSHS) Board of Directors, a non-profit, Section 106 historic preservation consultant for Los Angeles Union Station, a National Historic Landmark, has voted to campaign against Los Angeles Aerial Rapid Transit (LA ART), a for-profit cable car development, aka "Frank McCourt's Gondola," that plans to link LA Metro's Los Angeles Union Station with Dodger Stadium where Mr. McCourt owns one-half of the parking lot and leases the other half from the Los Angeles Dodgers, and LA Metro's "Esplanade Project" that our Board believes to be an "accommodation" for LA ART and the Olvera Street Merchants Association.

Response GO34-1 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO34-2 through GO34-11.

Comment GO34-2 Our Board believes that the proposed LA ART "futuristic" Union Station Terminal on Alameda Street and LA Metro's adjacent "Esplanade Project" will blight the very historic, architecturally significant facade of Union Station

Response GO34-2 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, of the Final EIR, for discussion of the methodology used to prepare the visual simulations included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. As discussed in Section 3.01, Aesthetics, of the Draft EIR, the Alameda Station's platform and canopy would include a light color scheme and warm tones, which has been designed to complement and reflect the materiality of the existing mix of adobe buildings, large Victorian commercial blocks, and Spanish Revival style buildings within the El Pueblo and Olvera Street area. In addition, the "shell" roof design provides a visual lightness with an integrated perforation pattern motif based upon the arched forms that mark openings and entries to Union Station, Pico House, and other historic buildings within El Pueblo. The proposed Project would also integrate physical and visual connections

between the proposed Alameda Station and existing adjacent development, such as the new pedestrian plaza at El Pueblo. The new pedestrian plaza at El Pueblo would be open to the public and would extend view corridors between the proposed Alameda Station and existing development in a way that creates an observed visual unity.

Comment GO34-3 which itself could be endangered Union Station and its patrons if helicopters from the nearby Los Angeles Police Department's Hooper Memorial Heliport airport become entangled in LA ART's overhead cables.

Response GO34-3 The Draft EIR addresses potential airport hazards in Section 3.09, Hazards and Hazardous Materials, Section 5.5.5, Heliports, in Section 5.0, Other CEQA Considerations, and in Appendix O, Airspace Analysis Technical Memo. The determination on page 3.9-30 of the Draft EIR – that the proposed Project alignment is not in an area covered by an airport land use plan nor located within two miles of a “public airport” – is based on facts and the specific language of CEQA’s thresholds of significance for this issue. This threshold is stated in the Draft EIR under Impact HAZ-5, which asks the question: “For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public use airport, would the project result in a safety hazard...?” The Draft EIR concludes that the proposed Project alignment is not within two miles of a “public use airport” as that term is defined under CEQA. Regardless of any distinction between heliports and airports, the Draft EIR immediately follows this conclusion with a clear disclosure that the city-owned Jay Stephen Hooper Heliport is within 0.38 miles of the proposed Project. According to the LAPD and AirNav.com¹, the Hooper Heliport is a city-owned, private use facility. As a private use facility, it does not meet the “public use airport” description in the CEQA threshold. Note that the determination is based on the distinction between public and private facilities, not the definition of “airport.” Thus, comparison to federal or state case law or regulations relying on a different definition of “airport” is irrelevant to the analysis required by CEQA. Refer to Draft EIR Appendix O, Airspace Analysis Technical Memo. That analysis, based on FAA analysis standards, concludes with substantial evidence that construction and operation of the proposed Project is clear of the airspace associated with the existing heliports in the proposed Project's vicinity. As such, no adverse effects related to aeronautical hazards are predicted based on these findings, and no notification is required for the proposed Project construction unless the FAA makes a specific request to the Project Sponsor. In addition, refer to Appendix I, Firefighting Helicopter Response Memo, of this Final EIR, for discussion of how helicopter flight paths would not be impeded as a result of the proposed Project.

Comment GO34-4 Furthermore, our Board opposes LA Metro's planned removal of all "Disabled Parking", without public hearings, from the same location to accommodate it's "Esplanade Project's" so-called "water feature" (aka a water fountain)

Response GO34-4 Refer to Section 2.0, Project Description, for discussion of Metro’s LAUS Forecourt and Esplanade Improvements Project, which is not part of the proposed Project. The proposed Project does not include a water fountain in the planned LAUS Forecourt.

Comment GO34-5 which itself would be contrary to water conservation policy. Even if the water feature recalculates its water at least 10% will be lost to evaporation day after day after day.

Response GO34-5 As described in Draft EIR Section 2.0, Project Description, page 2-49, the proposed Project includes several sustainability and water efficiency measures, including drought tolerant landscaping and use of reclaimed water for irrigation where available.

Comment GO34-6 Consequently, it is only right that our Board present the reasons why it has taken these positions. Until now, our Board has steadfastly refused to take sides in these major multi-million-dollar schemes. However, LA Metro and its staff, in our Board's opinion, have obviously taken a supportive role for LA ART, a potential competitor of LA Metro's efficient "Dodger Express" service, as well planning to "gilt the lily" with its Esplanade Project

Among the reasons for our Board's actions are, but not limited to:

A) The LA Metro Board member, Eric Garcetti, who introduced a motion to assist LA ART, without public discussion, and enlist LA Metro staff to "carry LA Art's water" did receive, according to public records, millions of dollars in both political and "behest payments" from Frank McCourt and his various entities and associates, which in our Board's opinion, has the serious appearance of a conflict of interest. Consequently, LA Metro is being sued by the non-profit California Endowment for preventing public participation prior to deciding to "partner" with LA Art.

Response GO34-6 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. Refer to Topical Response O, Response to the UCLA Mobility Lab Study, for a discussion of how the Dodger Stadium Express would not be precluded from operating by the proposed Project. While existing riders of the Dodger Stadium Express may choose to switch to the proposed Project to take advantage of its substantial travel time savings, some riders may prefer to ride the Union Station Dodger Stadium Express for other reasons. The opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of attendees of games or events at Dodger Stadium to ride public transportation. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. This comment also raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate).

There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project.

Comment GO34-7 B) LA Metro Deputy Supervisor, Cory Zelmer, in our Board's opinion, may have falsified an official document--LA ART's Draft Environmental Impact Report--by checking off the box that states there is: "no airport within two miles" of its proposed Union Station Terminal, when he had been informed repeatedly to the contrary by our Board. Moreover, our Board produced evidence that the Los Angeles Police Department's Hooper Memorial Heliport"--variously described as the country's or the world's busiest airport for rotary-winged aircraft (aka helicopters)--is about one-third of a mile from proposed LA ART's proposed Union Station Terminal.

Moreover, our Board reminded LA Metro CEO Stephanie Wiggins and her Deputy Zelmer that according to the Los Angeles Police Department, CalTrans, the California Public Utilities Commission, the Federal Aviation Administration and the 8th U.S. Court of Appeals all "heliports" are "airports." The fact that some airports are restricted to helicopters and others open to both helicopter aircraft and fixed-wing aircraft (passenger airplanes) does not change the simple fact that all "heliports" are "airports."

C) Contrary to the assurances made to our Board, by CEO Stephanie Wiggins, Deputy Zelmer and LA ART, no meeting has been organized between them and our Board to explain the difference of opinions concerning the nature of LAPD's Hooper Memorial Heliport airport.

Response GO34-7 Refer to Response GO34-3 for discussion of Hooper Heliport.

Comment GO34-8 D) LA Metro has forbidden our Board's examination of the only known scale model of Los Angeles Union Station's vicinity, because of, in our Board's opinion, a subterfuge that the model, dating from the former Union Station owner--the Santa Fe Railway--is now dated by simply by age and thus unacceptable, and furthermore the sharing of the model with our Board would be somehow "a conflict of interest" even though our Board previously had access to the model in years past. However, our Board's use of the model does not depend on the date of the model buildings per se but only the juxtaposition of Alameda Street and Union Station which has not changed at all since the station was opened in 1939. Consequently, at a loss for options, our Board asked LA ART to produce model given its great resources, but LA ART never responded. This "shadow play," in our Board's opinion, is being performed by LA Metro and LA ART to obfuscate the issues and delay public criticism in favor of LA ART and contrary to the public weal. Furthermore, since the model is public property its use should be continued by our Board and the public so it can be compared it to LA ART's distorted wide-angle artist's renderings of its proposed "futuristic-style" Union Station Terminal with Los Angeles Union Station's monumental "Hispanic-Art Deco style." Cable car rides belong in San Francisco and Disneyland, not in front of our beautiful "Cathedral Of Transportation.

Response GO34-8 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, of the Final EIR, for discussion of the methodology used to prepare the visual simulations included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Topical Response C, Project Features, discussing how the proposed Project’s design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. As discussed in Section 3.01, Aesthetics, of the Draft EIR, the Alameda Station’s platform and canopy would include a light color scheme and warm tones, which has been designed to complement and reflect the materiality of the existing mix of adobe buildings, large Victorian commercial blocks, and Spanish Revival style buildings within the El Pueblo and Olvera Street area. In addition, the “shell” roof design provides a visual lightness with an integrated perforation pattern motif based upon the arched forms that mark openings and entries to Union Station, Pico House, and other historic buildings within El Pueblo. The proposed Project would also integrate physical and visual connections between the proposed Alameda Station and existing adjacent development, such as the new pedestrian plaza at El Pueblo. The new pedestrian plaza at El Pueblo would be open to the public and would extend view corridors between the proposed Alameda Station and existing development in a way that creates an observed visual unity.

Comment GO34-9 E) In our Board's opinion LA ART is designed to compete with LA Metro's "Dodger Express," a low-fare, highly efficient service that could be even better if Metro switched to modern natural gas and/or battery-powered motor coaches funded by the savings from not building its Esplanade Project.

Response GO34-9 Refer to Response GO34-6 for discussion of the Dodger Stadium Express. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR’s consideration of a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. While some riders of the Dodger Stadium Express are likely motivated by traveling in more

sustainable ways than driving, the Dodger Stadium Express already uses clean natural gas (CNG) buses, which are more environmentally friendly than driving. Switching from CNG to a Zero Emissions Bus (ZEB) would have no bearing on the travel time or capacity limitations of the Dodger Stadium Express, so is not expected to materially increase the ridership of the service, and therefore would reduce fewer vehicle miles traveled (VMT) to Dodger Stadium than the proposed Project, which would operate at zero emissions, with the electrical power for the proposed Project supplied by the City of Los Angeles Department of Water and Power (LADWP) through the utility's Green Power Program.

Comment GO34-10 F) LA Metro's proposed Esplanade Project, according to LA Metro persons--who remain anonymous for the sake of their careers--will be funded by so-called "overlap money" that was "peeled-off" LA Metro's defunct "LINK-US" project that was rejected because of our Board and the public's opposition. According to a former LA Metro professional, the Esplanade fountain will likely attract more disadvantaged "street denizens" seeking showers," contrary to LA Metro policy. The Esplanade's "water feature" (aka "fogging" water fountain) in the opinion of our Board is designed to cool-off future LA ART and "Olvera Street" customers as they walk between Union Station, LA ART's Terminal and the circa 1930's "Hispanic" Olvera tourist attraction. (While Olvera Street's right-of-way and some of its structures are historic, the "Olvera Street" attraction was developed by a wife and husband real estate team that went on to develop Los Angeles' current "Chinatown" tourist attraction. (Alas, historic Chinatown was demolished in a racist bid to rid Los Angeles of the Chinese who settled here, in part, after building the railroad to Los Angeles. Los Angeles Union Station was then built on top of old Chinatown's rubble.) This explains why Union Station is about a mile from downtown when railway stations were traditionally located in the heart of downtown.

Response GO34-10 Refer to Section 2.0, Project Description, for discussion of Metro's LAUS Forecourt and Esplanade Improvements Project, which is not part of the proposed Project. The proposed Project does not include a water fountain in the planned LAUS Forecourt.

Comment GO34-11 Furthermore, erecting the Esplanade water fountain while semi-desert Los Angeles is experiencing its worst drought in recorded history, flies in the face of the State of California's policy to lessen climate change. One only needs to recall the classic Los Angeles-based movie "Chinatown" to understand what our Board believe's drives LA ART and the Esplanade Project. Or to paraphrase the immortal Yogi Berra, "It's 'Chinatown' (the movie) all over again." For the above reasons, but not necessarily only because of them, The LAUSHS Board of Directors has reluctantly voted to oppose construction of LA ART and LA Metro's "Esplanade Project."

Respectfully submitted,

Thomas R. Savio

Executive Director

Los Angeles Union Station Historical Society

Response GO34-11 Refer to Section 2.0, Project Description, for discussion of Metro’s LAUS Forecourt and Esplanade Improvements Project, which is not part of the proposed Project. The proposed Project does not include a water fountain in the planned LAUS Forecourt. As described in Draft EIR Section 2.0, Project Description, page 2-49, the proposed Project includes several sustainability and water efficiency measures, including drought tolerant landscaping and use of reclaimed water for irrigation where available.

Comment Letter GO35 – Martha I. Jimenez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO35

Comment GO35-1 Dear Holly, Stephanie, and Metro Colleagues,

Attached please find our request for a 45 day extension of the minimum statutory DEIR comment period for the Gondola Project. For the reasons indicated, we believe such an extension is both justified and necessary to ensure that the public will have a meaningful opportunity to review, assess, and respond to what we expect will be extensive and voluminous reports related to the construction, operation, maintenance, financing and myriad environmental and community impacts of the proposed Gondola Project.

We appreciate your kind consideration and attention to this request.

Best regards,

Martha

Martha I. Jimenez

Executive Vice President / General Counsel/Secretary (Pronouns: She, Her, Hers)

The California Endowment

Response GO35-1 The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Accordingly, the Draft EIR public review period was for the 90 days requested in this comment. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period.

Comment GO35-2 Dear Ms. Rockwell,

On behalf of The California Endowment ("TCE"), we respectfully request clarification regarding the deadline for the Draft Environmental Impact Report ("DEIR") comment period for the Los Angeles Aerial Rapid Transit ("LA ART") gondola project ("Project" or "Gondola Project"). Additionally, for the below stated reasons, we seek a reasonable extension of 45 days over the minimum statutory comment period, so that the length of the comment period will be no fewer than 90 days.

Response GO35-2 Refer to Response GO35-1 for a discussion of the Draft EIR's 90-day public review period.

Comment GO35-3 **1. PREVIOUS EXTENSIONS HAVE BEEN GRANTED**

There is precedent for such an extension for CEQA projects in Los Angeles.

■ In 2016, the City of Los Angeles extended the comment period for an additional 45 days for the South Los Angeles and Southeast Los Angeles Community Plan updates. (<https://planning.lacity.org/eir/SouthAndSoutheastLA/FEIR/files/1.0%20Introduction.pdf>.)

■ This year, the Los Angeles Bureau of Engineering extended the comment period to 72 days for review of the Los Angeles Zoo Vision Plan. (<https://eng.lacity.org/aboutus/divisions/environmental-management/projects/los-angeles-zoo-vision-plan>.)

A similarly complex project like the Gondola Project clearly warrants an extension.

Response GO35-3 Refer to Response GO35-1 for a discussion of the Draft EIR’s 90-day public review period.

Comment GO35-4 **2. THE PUBLIC HAS NOT BEEN PROVIDED ADEQUATE INFORMATION**

Even though the Project application was submitted four years ago, and the Notice of Preparation was released two years ago, publicly available information regarding the Project has been sparse. Community members remain unclear regarding the details of the Project and its impacts.

We expect that a project like the Gondola Project—which is expected to cost over \$100 million to build and will require construction of large structures in areas like the LA State Historic Park, Union Station, and along Alameda Street—will need to involve numerous complex technical studies. We also expect that complex technical greenhouse gas and transportation studies will be required to support LA ART’s claims of zero emissions and community benefits relating to traffic. Nevertheless, the public has been provided little to no information regarding these and other potential impacts to their community.

Furthermore, prior to the September 15, 2022, Metro Executive Management Committee Meeting, LA ART promised “updated project information, including construction and operation costs and funding and financing plan” on or before September 30, 2022. (September 15, 2022, Los Angeles Metropolitan Transportation Authority Executive Management Committee Board Report). To date, that information has not been made publicly available. Without this information, how can stakeholders be expected to be able to fully evaluate the Project, or community members be sufficiently informed to understand the impact the Project will have on their day-to-day lives?

Response GO35-4 Refer to Response GO35-1 for a discussion of the Draft EIR’s 90-day public review period.

Comment GO35-5 **3. A 45-DAY EXTENSION IS REQUIRED TO ENSURE MEANINGFUL PUBLIC PARTICIPATION**

The notice sent out via email to stakeholders on September 28, 2022, stated that the DEIR will be released on October 17, 2022, for public comment, but did not specify the length of the comment period. The minimum 45-day comment period for this DEIR is far too short, prevents meaningful public engagement and comment, and will likely significantly limit the participation of those who require language assistance.

While we cannot know what issues the DEIR will focus on, we expect the DEIR to be voluminous given the complex and technical nature of the Project. For example, the Notice of Preparation was non-specific in stating the potentially significant impacts. It generally states that the Project will "address all environmental topics listed in Appendix G of the CEQA Guidelines," and presents a list of all twenty topics, including aesthetics, agriculture and forestry resources, air quality, biological resources, cultural and historic resources, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, transportation, tribal cultural resources, utilities and service systems, wildfire. (October 1, 2020, Notice of Preparation; Cal. Code Regs., tit. 14, § 15082 (a)(1)(C).)

Response GO35-5 Refer to Response GO35-1 for a discussion of the Draft EIR's 90-day public review period.

Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public participation opportunities during the Draft EIR public review period. The format of the in-person public meetings immediately preceding, during, and immediately following, the Draft EIR public review period was an Open House, consistent with standard Metro practice, where attendees could learn more about the proposed Project and the key analyses and conclusions of the Draft EIR, and also a public comment opportunity. Twelve stations were set up throughout the venue, with ten stations focused on specific subject matter areas of the Draft EIR. Attendees could walk around to each station and ask questions to subject-matter experts about the proposed Project. Each station had large, printed boards summarizing the subject matter of that station, including: the Project Description, Aesthetics, Air Quality, GHG, and Energy, Cultural (Archaeology and Historical Resources), Parks and Recreation, Noise, Transportation, and Parking. Each station also included printed materials that attendees could review and/or take with them, including fact sheets in English, Spanish, and Chinese (Simplified) and printed copies of the presentation from the virtual public hearing in English, Spanish, Chinese (Simplified) and Chinese (Traditional). A hard copy of the Draft EIR was also available at the Summary of Impacts station for attendees to review. The meeting was staffed by Metro and AECOM staff, experts on subject matter areas including Transportation and Parking; Archaeology; Historical Resources; Air Quality, Greenhouse Gas, and Energy; Ropeway Engineering; Noise; and Aesthetics, and the Project team, who answered questions from attendees on the Draft EIR key analyses and conclusion. During the two in-person public meetings that were public hearings, comments could

be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and during the four public hearings. Comments on the Draft EIR could be submitted by email to LAART@metro.net, by mail to One Gateway Plaza, Mail Stop 99-22-6, Los Angeles, CA 90012, or over the phone by calling (213) 922-6913. Comments could also be submitted at each of the four public hearings. At virtual public hearings, comments could be given verbally. Verbal comments made at the fourth, continued public hearing held on February 8, 2023, held as a continuation of the third public hearing due to disruptions at the third public hearing, were deemed timely submitted for the purposes of the Draft EIR public comment period. At the two public hearings held in person, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during all four public hearings, with interpretation provided in Taishanese during the final two public hearings.

Comment GO35-6 As was previously mentioned, despite promises to the contrary, the public has yet to receive detailed information regarding the multitude of complex studies that will likely be needed for such a major undertaking as this multi-million-dollar Gondola Project. It would be unfair after repeatedly asking for this information for the last several years to give the public just 45 days to digest complex technical studies and attempt to understand their long-term implications. The public needs sufficient time to analyze such studies. Simply put, an extension of the comment period is warranted given the historic and continuing lack of information provided to the public about the Gondola Project.

Response GO35-6 Refer to Response GO35-1 for a discussion of the Draft EIR’s 90-day public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from

the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. Refer to Response GO35-3 for discussion of the opportunities for public participation during the Draft EIR public review period.

Comment GO35-7 Furthermore, public comment regarding the Project has already been stifled and it appears as if it will continue to be limited moving forward. On September 15, 2022, the Los Angeles Metropolitan Transportation Authority ("Metro") Executive Management Committee held a public meeting, during which the Project was presented. During the conduct of that meeting, public comment was limited due to a multitude of issues with providing interpretation services for members of the public who required language assistance and Metro cut off over 40 members of the public who were in the queue to provide oral commentary.¹ With regard to the DEIR comment period, Board Director, Supervisor Hilda Solis forcefully expressed the community's need for more comprehensive community commentary on the Project not just following the release of DEIR, but prior thereto. Likewise, Metro Board Director, Supervisor Janice Hahn, raised concerns regarding the Gondola's impact on Metro's current Free Dodger Express Bus system used by residents throughout the County. Metro has since posted "Community Information Sessions" on its website to "share details on the project", however, not one of the four sessions - two held just the week prior to the release of the DEIR and two the week after - allows for live oral public comment.

¹Metro referred those who were unable to voice their concerns during the conduct of the meeting with an option to email their comments. Following the email option being stated as the sole option to provide comment, this failure to account for the potential lack of accessibility for all members of the community was noted.

Response GO35-7 Refer to Response GO35-1 for a discussion of the Draft EIR's 90-day public review period. Refer to Response GO35-3 for discussion of the opportunities for public participation during the Draft EIR public review period. Refer to Topical Response O, Response to the UCLA Mobility Lab Study, for a discussion of how the Dodger Stadium Express would not be precluded from operating by the proposed Project. While existing riders of the Dodger Stadium Express may choose to switch to the proposed Project to take advantage of its substantial travel time savings, some riders may prefer to ride the Union Station Dodger Stadium Express for other reasons. The opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of attendees of games or events at Dodger Stadium to ride public transportation. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their

Metro fare at no additional cost under the Community Access Plan. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and during the four public hearings. Comments on the Draft EIR could be submitted by email to LAART@metro.net, by mail to One Gateway Plaza, Mail Stop 99-22-6, Los Angeles, CA 90012, or over the phone by calling (213) 922-6913. Comments could also be submitted at each public hearing. At virtual public hearings, comments could be given verbally. Verbal comments made at the virtual February 8, 2023 public hearing were deemed timely submitted for the purposes of the Draft EIR public review period. At the two public hearings held in person, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a "comment station" in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during all four public hearings, with interpretation provided in Taishanese during the final two public hearings.

Comment GO35-8 The comment period is also occurring while the COVID pandemic is still making meetings and public accessibility difficult. According to the latest CDC data, community transmission of COVID-19 in Los Angeles County is "substantial." ([https://covid.cdc.gov/covid-data-tracker/#county-view?listselectstate=California&datatype=CommunityLevels&listselectcounty=6037&null=Risk\[selectdatatypeCommunityTransmission\]](https://covid.cdc.gov/covid-data-tracker/#county-view?listselectstate=California&datatype=CommunityLevels&listselectcounty=6037&null=Risk[selectdatatypeCommunityTransmission]).) It is well-documented that the COVID pandemic has heavily impacted lower income communities and communities of color, like the communities surrounding the Project site. Additional variants and a surge in COVID cases are expected this fall and winter. (<https://www.latimes.com/california/story/2022-10-01/new-coronavirus-subvariants-a-worry-for-winter-covid-wave>.) Community members are only recently receiving updated booster vaccinations. Frequent COVID infections require isolation and rest, and much time is required to devote to taking care of health issues and recovering from COVID and Long COVID, so expecting public attention and review of the DEIR during this period is unreasonable. A 45-day extension would be reasonable and help to ease the impacts of the COVID pandemic on community engagement.

Response GO35-8 Refer to Response GO35-1 for a discussion of the Draft EIR's 90-day public review period. Refer to Response GO35-3 for discussion of the opportunities for public participation during the Draft EIR public review period.

Comment GO35-9 Lastly, it is unreasonable to expect public comments on such an extensive document in a 45-day period that straddles important family holidays including Thanksgiving (on November 24, 2022) and December holiday season. TCE's requested 45-day comment period extension would conclude the comment period after the winter

holiday season and allow the public to have sufficient time to meaningfully review, assess, and respond to the DEIR.

Please confirm that you have received this request, and we hope that you will respond favorably. Given the above-mentioned factors that are impeding the public's review, a 45-day extension of the minimum comment period is clearly justified in this instance. Public participation, a key component and pillar of CEQA, will be substantially improved with additional time and thus an extension would be much appreciated.

Response GO35-9 Refer to Response GO35-1 for a discussion of the Draft EIR's 90-day public review period. Refer to Response GO35-3 for discussion of the opportunities for public participation during the Draft EIR public review period.

Comment Letter GO36 – David Carle

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO36

Comment GO36-1 Dear Ms. Rockwell,

I'm writing on behalf of the California State Park Rangers Association (CSPRA) to request a 45-day extension of the public comment period for the Los Angeles Aerial Rapid Transit Draft Environmental Impact Report so that the total comment period would be 90 days.

Response GO36-1 The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Accordingly, the Draft EIR public review period was for the 90 days requested in this comment.

Comment GO36-2 As this project will impact the Los Angeles State Historic Park, the public deserves to be heard and provided the opportunity to meaningfully participate in the CEQA process. We know that draft environmental impact reports like this one will likely be long and complex, requiring time to review and analyze the full details of this project.

Response GO36-2 Refer to Response GO36-1 for a discussion of the Draft EIR's 90-day public review period. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park.

Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and during the four public hearings. Comments on the Draft EIR could be submitted by email to LAART@metro.net, by mail to One Gateway Plaza, Mail Stop 99-22-6, Los Angeles, CA 90012, or over the phone by calling (213) 922-6913. Comments could also be submitted at each of the four public hearings. At virtual public hearings, comments could be given verbally. In light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held on February 8, 2023. Verbal comments made at the virtual February 8, 2023 public hearing were deemed timely submitted for the

purposes of the Draft EIR public review period. At the two public hearings held in person, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during all four public hearings, with interpretation provided in Taishanese during the final two public hearings.

Comment GO36-3 We have not received information on important details of the project and will need sufficient time to review and understand it.

Response GO36-3 Refer to Response GO36-1 for discussion of the Draft EIR’s 90-day public review period. Refer to Response GO36-2 for discussion of opportunities for public participation during the Draft EIR’s 90-day public review period, including opportunities to participate in virtual public meetings and submit comments on the Draft EIR in writing via email or mail, and by phone, in addition to in-person during the four public hearings, to ensure accessibility for those unable to attend in-person meetings.

Comment GO36-4 A 45-day extension to ensure proper community engagement is necessary for a public comment period that would fall squarely during the holiday season when COVID-19 is likely to spike, thereby limiting the ability for proper outreach and education efforts.

Please extend the comment period by 45-days to give our organization and other interested parties an opportunity to review and participate after the holiday season.

Sincerely,

David Carle

California State Park Rangers Association President

dave@cspra.com

760 709-1181

PO Box 39, Lee Vining, CA 93541

www.cspra.com

Response GO36-4 Refer to Response GO36-1 for a discussion of the Draft EIR’s 90-day public review period. Refer to Response GO36-2 for discussion of the opportunities for public participation during the Draft EIR’s 90-day public review period, including opportunities to participate in virtual public meetings and submit comments on the Draft EIR in writing via email or mail, and by phone, in addition to in-person during the four public hearings, to ensure accessibility for those unable to attend in-person meetings.

**Section 6.3.3
Responses to
Public/Individual
Comment Letters**

Comment Letter P1 - Topher T. Hendricks

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P1

Comment P1-1 Longtime Metro-rider / enthusiast and downtown property owner here. As someone who lives within blocks of Union Station, I am your prime target for being a regular gondola-rider. I almost always take the Dodger Express to the games. The shiny renderings of the gondola are fun and futuristic, but I am shocked at how this project seems to be moving forward without any consideration at all to cheaper, more effective, longer-lasting, simpler, easier-to-maintain solutions.

Response P1-1 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options for a discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA, and how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between Los Angeles Union Station (LAUS) and the Dodger Stadium property and improving connectivity for surrounding communities. Refer to Section 2.0, Project Description, of the Draft EIR for an overview of routine maintenance activities for the proposed Project and how the proposed Project would have a maximum capacity of approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes.

Comment P1-2 The extremely-obvious Occams Razor solution to anyone who isn't just a politician hoping for a photo op that you have been ignoring is a simple sidewalk. Certainly not a perfect solution, or an elegant one, but the fact that a gondola is being discussed AT ALL before the simplest, more pure, cheapest transportation solution exists to the stadium is a joke. The current sidewalks to the stadium are deathtraps, ending abruptly, or going comically so far out of the way that it feels like the city is intentionally punishing anyone who decides to walk. To go from downtown to Dodgers Stadium on foot is currently a cruel experience. How is there not even just a single set of stairs from Lookout Drive to the stadium that is barely a few feet away up a hill? Instead you're forced to go nearly a mile out of your way on an extremely dangerous route (especially if traveling with children).

Response P1-2 As discussed in Section 2.0, Project Description of the Draft EIR, the proposed Project proposes the development of an aerial gondola system to connect LAUS to the Dodger Stadium property. As there is no direct transit option to the Dodger Stadium, the proposed Project would provide one while overcoming grade and elevation issues related to the location of the Dodger Stadium property compared to the surrounding

communities and neighborhoods. As stated in the comment, while pedestrian connections exist from nearby neighborhoods to the Dodger Stadium Property, the proposed Project would provide a means of transit to individuals unable to overcome the grade and elevation changes on foot. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. While this alternative would provide improved pedestrian connections compared to existing conditions, the 25 minute plus travel time from the Metro L Line (Gold) Station to the location of the proposed Dodger Stadium Station would be at least nine times greater than the three minute travel time between those two locations with the proposed Project, and this alternative would be unlikely to attract substantially more people to walk to Dodger Stadium compared to existing conditions given the travel time and the physical exertion. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project.

Comment P1-3 Don't even get me started on the lack of protected bike lanes. It would be a golden opportunity to get new riders to experience the electric bikes of the Metro bike fleet if there were docks at the stadium and convenient & safe protected bike lanes from downtown or at least to Sunset Blvd. (Plus in combination with protected lanes down Sunset Blvd would also help cut down on traffic to/from the stadium, especially for locals)

Response P1-3 As discussed in Section 5.0, Corrections and Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park, the City's second largest park, comprising 575 acres, and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program, and individual bike lockers to access Elysian Park and other nearby neighborhoods, including Solano Canyon. The proposed Project cabins would allow for sitting and standing as well as bicycles.

Comment P1-4 Look at the baseball stadiums that have stood the test of time in our country, like Wrigley and Fenway. These are supremely walkable stadiums, with bars, restaurants, & housing a mere stones throw away. Los Angeles has MUCH better weather for walking around all year, so we deserve a stadium that embraces what makes this city so great. Allowing people to safely and conveniently walk & bike to the stadium would help local businesses thrive, as people get to experience the neighborhood instead of just flying over it in a cramped box after stressfully waiting in long lines. People could get to the stadium earlier, and hang out later, rather than trying to rush in & out because they feel like they have to.

- Response P1-4** Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. While this alternative would provide improved pedestrian connections compared to existing conditions, the 25 minute plus travel time from the Metro L Line (Gold) Station to the location of the proposed Dodger Stadium Station would be at least nine times greater than the three minute travel time between those two locations with the proposed Project, and this alternative would be unlikely to attract substantially more people to walk to Dodger Stadium compared to existing conditions given the travel time and the physical exertion. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.
- Comment P1-5** Metro struggles with funding all the time; a quick glance at our shadeless bus stops, or our dismally infrequent & filthy subway (I say this as a daily rider, metrobike annual pass holder, and huge supporter for the potential our system has), and it is insane to think Metro will be able to keep up the necessary maintenance for a gondola, when a simple sidewalk and a flight of stairs would get so many people up to Dodgers Stadium so much more efficiently (in terms of nearly every metric, like energy, cost, time, labor, etc).
- Response P1-5** Refer to Response P1-4 for discussion of a Pedestrian Enhancement Alternative to the proposed Project. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the safety features of the proposed Project and how maintenance would be performed by the operator and would include daily observation of the overall system as part of the startup routine.
- Comment P1-6** Properly accessible sidewalks (and protected bike lanes with Metro bike docks) are the first step towards making Dodgers Stadium the world class experience that LA deserves, at a fraction of the cost of the gondola, and comparatively require little-to-no-maintenance. I'm not saying a flat-out no to the gondola, but come on. Do the easy obvious stuff first that has been proven to work and then go from there. Lets focus on REAL solutions that will last before we get to the gimmicks.
- Response P1-6** This comment provides a general conclusion regarding the comments raised in this letter. Responses to comments contained in this letter are provided above in Responses P1-1 through P1-5.

Comment Letter P2 - Bert Glatstein

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P2

Comment P2-1 1) Who are the principals behind LA Aerial Rapid Transit Technologies LLC

Response P2-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P2-2 2) who much public money has been expended to date on this project

3) How much public money will be expended in the future

Response P2-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P2-3 4) who is paying for the right of way for this project

Response P2-3 Refer to Section 2.5, Proposed Project Alignment and Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P2-4 5) what contingencies are being made for in the event of LA Aerial Rapid Transit Technologies LLC declaring bankruptcy (particularly given the history of Frank McCourt)

Response P2-4 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. CEQA does not require speculation as to possible future environmental consequences, and the Draft EIR need not analyze uncertain, hypothetical future events. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P2-5 6) would this fare required system be used more frequently than the free Dodger Express

Response P2-5 Refer to Topical Response C, Project Features, for discussion of how the proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data.

Comment P2-6 7) How would the so called 'improvements' to LA Historic Park affect current park usage

Response P2-6 As discussed in Section 2.0, Project Description, of the Draft EIR, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. Refer to Section 3.16, Parks and Recreation, of the Draft EIR. The proposed Project would result in less than significant impacts to parks and recreation.

Comment P2-7 8) Has there been any study to compare cost effectiveness of this project versus adding lighting and sidewalk improvements from Dodger Stadium to Chinatown Station

Response P2-7 Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project.

Comment P2-8 9) Does the 5000 per hour ridership account for waiting times at either end

Response P2-8 Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of how the underlying factors that would influence pre-game/event and post-game/event travel conditions and ridership are built into the ridership model developed for the proposed Project based on extensive data sources and assumptions validated by data. Due to the nature of queue formation, the pre game/event passenger queues at the Alameda Station in 2026 are estimated to be largely contained on the platform and only minimally extend out into the planned LAUS Forecourt. More active queue management would become more frequently needed at Alameda Station as ridership increases toward the 2042 ridership projection of 10,000 riders, but even with the maximum queue length, a person at the end of the line would wait for an estimated maximum of seven minutes before boarding the gondola cabin. Others would wait shorter durations. In addition, post-game queues at Dodger Stadium were estimated based on assumptions about the departure patterns and estimates of walk times from the various seating areas within the stadium. Those seated the furthest away from the Dodger Stadium Station would take more time to arrive at the Station, much like how it is currently for passengers riding the Dodger Stadium Express. In addition, passengers who would rather not join the line immediately to board the proposed Project in the post-game period could visit some of the entertainment amenities at the stadium, including at the Centerfield Plaza. The post-game/event queue for the proposed Project would be constantly moving as cabins would depart every 23 seconds.

Comment P2-9 10) Other than 81 Dodger games per year what is the anticipated usage

Response P2-9 Refer to Section 2.01, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The

proposed Project would be free to ride for anyone with a ticket to a Dodgers game and the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the proposed Community Access Plan.

Comment P2-10 11) does the 1 mph speed at stations accommodate ADA passengers

Response P2-10 Refer to Topical Response J, Gondola Design and Operations, for discussion of how the Emergency Operations Plan for the proposed Project would include emergency response protocols and safety procedures developed in conjunction with the operator, system provider, and local authorities. The station boarding process and cabins would comply with all accessibility requirements of the Americans with Disabilities Act (“ADA”). If needed, cabins could be either slowed or stopped in the station for boarding purposes. Station attendants would be located within each station to assure safe boarding and to execute stops for unloading or boarding purposes, if necessary. Attendants would also provide customer interaction and observation; if a passenger needs special assistance, an attendant may either further slow or stop a cabin. A separate operator would be stationed in a control booth monitoring screens, which would show activities in each cabin and station, as well as the system controls. The time necessary to slow or stop cabins is factored into the overall system capacity of the proposed Project. Pathways to the boarding areas would be ADA compliant with redundant vertical circulation and appropriately sized passageways. The entry widths and interiors size of each cabin would comply with the requirements of the ADA.

Comment P2-11 12) Proposed fare

Response P2-11 Refer to Topical Response C, Project Features, for discussion of how the proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P2-12 13) Cost comparison between TSM Alternative and LA Aerial Rapid Transit Technologies

Response P2-12 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities.

Comment P2-13 14) what effect would the construction and operation have on area residents?, would payments have to be made and if so who would be liable

Response P2-13 Refer to Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR, for discussion of the construction of the proposed Project. As discussed on page ES-17 of the Executive Summary of the Draft EIR, based on the analysis contained in Section 3.0, Environmental Setting, Impacts, and Mitigation, the proposed Project would result in significant and unavoidable cumulative impacts with regard to Noise and Vibration. As demonstrated in the Executive Summary to the Draft EIR, the proposed Project would not result in any other significant and unavoidable construction impacts. The proposed Project would not result in any significant and unavoidable operational impacts.

Refer to Section 3.17, Transportation, of the Draft EIR, for discussion of the proposed Project’s maintenance of local and emergency access during construction. Refer to Topical Response C, Project Features, for discussion of the Business and Community Support Program during construction. Refer to Section 3.17, Transportation, and Section 3.11, Land Use, of the Draft EIR, for discussion of how multimodal access—for both local and emergency response—to local businesses, neighborhoods, LAUS, and the Los Angeles State Historic Park would be maintained throughout construction of the proposed Project, and disruptions to local businesses would be minimized. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how the proposed Project would implement a Construction Traffic Management Plan that would include detours and ensure that emergency access is maintained throughout all construction activities.

Comment P2-14 15) How much money has Frank McCourt contributed to city officials Thank you for your consideration of these questions

Response P2-14 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P3 – Israel Vasquez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P3

Comment P3-1 I am reaching out as a concerned citizen, and I do not support the Gondola.

First and foremost, this is not the most efficient and rapid solution. We either need a tram system that connects directly or nearby the Union Station or establish a dedicated BRT to bring folks to the stadium.

There are several real-world solutions that can benefit the community and local businesses.

Response P3-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. The proposed Project is an aerial rapid transit gondola system connecting LAUS and Dodger Stadium. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Comment Letter P4 - Riley McNair

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P4

Comment P4-1 As a member of the UCLA community, the gondola is a public transportation failure with a low capacity of 5000 per hour. We must strive to to do better.

Response P4-1 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment Letter P5 - Jack Humphreville

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P5

Comment P5-1 How is the Gondola project going to be financed?

Is the metro or the public a source of funding?

Response P5-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P6 - James Martin

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P6

Comment P6-1 I am completely opposed to this project as designed.

Response P6-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P6-2 Please don't build this across LA State Historic Park. It will definitely mess up a complete jewel of a park for the city.

Response P6-2 Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.156, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park.

Comment P6-3 People hate the gondola idea. It should be stopped now.

Response P6-3 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P7 - Alexander M. Kargher

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P7

Comment P7-1 Dodger's Stadium and ostensibly the parking lot owners have done little to nothing to improve access to the stadium for people who do not wish to drive. Every time I bike to the Stadium I am met with fewer and fewer places to park my bike. The pedestrian infrastructure around the stadium is poorly maintained and intersects with huge volumes of vehicular traffic once you get on site. If the City effectively enforced the bus only lanes on Sunset then the buses would work.

Response P7-1 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. As discussed in Section 5.0, Corrections and Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first and last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities.

Comment P7-2 It would be pretty easy and cost effective to make it safer to get to Dodger's Stadium without driving. Improving walking access and upgrading the parking lots to accommodate pedestrians and bikes and buses over private passenger cars is inexpensive. But instead of doing any of these things, the proposal is to build a gondola. This is not "Field of Dreams". If you build it, the multimodals / carbon neutral folks won't come.

Response P7-2 Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment P7-3 Not only is this proposal incredibly expensive and highly engineered, but the long term maintenance costs apparently are irrelevant. And this is all before you consider the impact this will have on one of the best greenspaces near DTLA and the surrounding community in Solano Canyon.

Response P7-3 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park and Solano Canyon. Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment P7-4 At bottom, the City should use its resources (and so should the Dodger's and McCourts) to improve the existing infrastructure before it disrupts everything on this quagmire.

Response P7-4 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Response P7-3 for discussion of the proposed Project's capital, operation, and maintenance costs and planned sources of funding. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses.

Comment Letter P8 - Margaret Light

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P8

Comment P8-1 If this is to be ZERO EMISSIONS and running EVERY DAY, what is the power source?

If the power source is ELECTRICITY, then it can not be zero emissions. We already are short of power in the LA area (rolling brown/black-outs) so our electricity still comes from burning coal and other fossil fuels even if outside of California.

Response P8-1 Refer to Section 3.06, Energy, of the Draft EIR, for discussion of the proposed Project's electricity demand. As discussed on page 2-47, in Section 2.0, Project Description of the Draft EIR, the proposed Project would operate at zero emissions, with the electrical power for the proposed Project supplied by the City of Los Angeles Department of Water and Power (LADWP) through the utility's Green Power Program, pursuant to GHG-PDF-A. When operating at capacity, normal operations are estimated to require a total of approximately 2.5 megawatts of power. Electrical power associated with proposed Project operation would primarily come from renewable resources. Further, as discussed on pages 2-48 and 2-49, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would incorporate sustainability features to lower energy demand, including, open-air station boarding platforms with natural shading and ventilation, energy efficient LED or low voltage lighting fixtures, energy efficient glazing, where it occurs, use of LADWP green power sources, and backup power provided by battery storage as opposed to diesel generators.

Comment P8-2 If the point is to reduce parking congestion, where will the 5,000 people (per hour) park at the "origin" of their trips. Are you not just moving the congestion from dodger stadium to outlying areas (which will create their own problems?).

Response P8-2 Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines ("TAG"). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in

traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to a proposed Project’s stations. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data, and the management of queuing at stations, and pre-game and post-game transportation. Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR.¹ Stantec is an internationally respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR.

Comment P8-3 I’m not sure what problem this solves, and am NOT in favor of it at the moment.

Since it was an UNSOLICITED bid request, I would like to “follow the \$” to see who stands to benefit from this.

Response P8-3 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s sole source determination for the proposed Project.

¹ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

Comment Letter P9 - Aram Hacobian

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P9

Comment P9-1 I don't believe this project is necessary although it would be cool if it was built.

Response P9-1 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment P9-2 Gondolas don't carry nearly as many passengers per hour as buses do and I think the best option is to have exclusive bus lanes for the Dodger Stadium Express for home games or better yet, relocate Dodger Stadium to somewhere more transit accessible.

Response P9-2 As discussed in Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, for discussion of how the proposed Project would carry up to approximately 5,000 people per hour per direction. Refer to Topical Response H, the Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between Los Angeles Union Station (LAUS) and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Refer to pages 4-62 and 4-72, in Section 4.0, Alternatives of the Draft EIR, for a discussion of how in the TSM Alternative, dedicated bus lanes would be implemented on Vin Scully Avenue between Sunset Boulevard and the entrance to Dodger Stadium. Bus-only lanes could also potentially be provided in both directions on Sunset Boulevard and Cesar E. Chavez Avenue. While this would expedite Dodger Stadium Express service (both for the existing Dodger Stadium Express service as well as the Transportation Systems Management Alternative), this would also increase traffic congestion.

Comment Letter P10 - Brian VanRiper

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P10

Comment P10-1 Seems like a cool idea. Will this really tie together a few metro stations and lines, with dodger stadium?!

Response P10-1 As stated in Section 2.0, Project Description of the Draft EIR, the proposed Project would provide a direct connection from the Los Angeles Union Station to the Dodger Stadium. LAUS provides local and regional access via multiple modes of transport and service providers, such as Metro, Metrolink, Amtrak, and municipal and private bus operators, all of which converge at the station. There would be an intermediate station at the Chinatown/State Park Station located adjacent to Spring Street in the southernmost portion of the Los Angeles State Historic Park. In addition, the Chinatown/State Park Station is a 3-minute walk to/from Metro's L Line (Gold) Chinatown station.

Comment Letter P11 - Rachel Orfila

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P11

Comment P11-1 I'm writing in support of the proposed gondola to Dodger Stadium. I think this would be a wonderful way to reduce carbon emissions and give fans another car-free option to get to games. Traffic congestion before and after games is a big problem, and I think the gondola would give fans a great incentive to get out of their cars! I also think it would be a fun addition to the neighborhood, for both tourists and locals.

I really hope this project moves forward quickly. I look forward to riding it someday soon!

Response P11-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P12 - Jean Albrick

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P12

Comment P12-1 Too vulnerable to Crime, Fire, Weather threats.

Response P12-1 Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of how comparable urban aerial transit systems have been shown to reduce violent crime in nearby areas. In addition to statistical studies, residents of cities with aerial transit systems have reported a greater sense of security when riding aerial transit relative to other modes of public transportation. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR for discussion of how the proposed Project is equipped with security features. For example, to provide added security to system passengers, each gondola cabin would have a security camera on board with a feed to the control room, as well as a “push to talk” button, which would open two-way communications with the control room. The control room would be able to address all cabins at once, or an individually selected cabin. Control room operators would have the ability to contact local security, law enforcement or other emergency response agencies as needed. The Emergency Operations Plan for the proposed Project would also include emergency response protocols and safety procedures developed in conjunction with the operator, system provider, and local authorities, and would address operational changes and communication protocols required in response to a range of potential emergencies such as a medical emergency in a cabin or in a station or a fire near the alignment. The plan would consider a wide range of scenarios for which default operational responses would be determined. In addition, the plan would include communication protocols with local authorities for further instruction and coordination. As discussed in Section 3.15, Public Services, Section 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts related to fire protection services and wildfire. The proposed Project would be operable in all anticipated temperatures and would adhere to applicable active weather alerts.

Comment P12-2 ...Please preserve the nostalgic aura surrounding Dodger Stadium!

Response P12-2 Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment P12-3 ...Redundant, and an unnecessary mode of LA transport.

...Baseball here, NOT Disneyland!

Response P12-3

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. As discussed in the Technology Penetration Analysis, included in Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, a large capacity for a new mode of transportation in Los Angeles will allow passengers to see the potential for other emerging innovations to be integrated into the public transit system, and the proposed Project would thus exemplify how alternative transportation technology can be integrated into a city's transportation infrastructure and will show that new technology can successfully operate in concert with other existing modes of transportation. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments.

Comment Letter P13 - Jack Reed

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P13

Comment P13-1 As residents of Angelino heights, we love the idea of the gondola. We cannot continue to allow NIMBYS to hold progress back. Build the gondola!

Response P13-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P14 - Charles W. Ben

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P14

Comment P14-1 I am a resident of the 90012 zip code and frequent Metro rider. I am sending this email to leave a comment in opposition to the Doger Stadium gondola. It is not an efficient solution to the stadium traffic and will disrupt the area of the state park it crosses.

Response P14-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park.

Comment P14-2 I also have concerns about rising rents in the area.

Response P14-2 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement.

Comment Letter P15 - Tanner Vandenbosch

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P15

Comment P15-1 I have some concerns with the project that I wanted to share.

The Draft EIR states that the system would have capacity to transport 5,000 people per direction per hour, but is this realistic in LA, especially with its principal purpose transporting people to baseball games (families with small children, people drinking, etc,) and with what seems to be comparatively slow boarding on the Metro Rail system relative to other cities already?

Response P15-1 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the safety features of the proposed Project and how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphpd). Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data, and the management of queuing at stations, and pre-game and post-game transportation.

Comment P15-2 Would capacity be sufficient to get people to Dodger's games without severe overcrowding, especially after games? How would it manage crowds over an extended wait time? Also, how would concerts and other events be managed?

Response P15-2 Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of how queues would be managed by efficient vertical circulation and by staff at the station and due to the nature of queue formation, the pre-game/event passenger queues at the Alameda Station in 2026 are estimated to be largely contained on the platform and only minimally extend out into the planned LAUS Forecourt. More active queue management would become more frequently needed at Alameda Station as ridership increases toward the 2042 ridership projection of 10,000 riders, but even with the maximum queue length, a person at the end of the line would wait for an estimated maximum of seven minutes before boarding the gondola cabin. Others would wait shorter duration. Post-game queues at Dodger Stadium were estimated based on assumptions about the departure patterns and estimates of walk times from the various seating areas within the stadium. Those seated the furthest away from the Dodger Stadium Station would take more time to arrive at the Station, much like how it is currently for passengers riding the Dodger Stadium Express. In addition, passengers who would rather not join the line immediately to board the proposed Project in the post-game period could visit some of the entertainment amenities at the stadium, including at the Centerfield

Plaza. The post-game/event queue for the proposed Project would be constantly moving as cabins would depart every 23 seconds.

Comment P15-3 -Is there firm evidence that the project would reduce VMTs? Is Metro studying the potential that people drive to ride it as a tourist attraction given the views from it?

Response P15-3 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations.

Comment P15-4 -How is the project addressing concerns it will drive gentrification in Chinatown?

Response P15-4 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement.

Comment P15-5 Will a station in the community actually have any net benefit for residents, given the L line (soon to be A line) has a nearly identical route already in service with better connection to more destinations?

Response P15-5 Refer to Section 2.01, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how the proposed Project's intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park would be located within a short walk to many Chinatown businesses and Metro's L Line (Gold), creating a

stronger connection with the Metro L Line and enhancing transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the proposed Community Access Plan.

Comment P15-6 -It seems more engagement with the Chinatown community is necessary and the community should have more of a say.

Response P15-6 Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical C, Project Commitment to Community Benefits, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities.

Comment P15-7 -Why has Metro not considered non aerial tram alternatives, like a future extension of WSAB light rail or improving the existing shuttle system, to meet the needs of the community? Its construction should not preclude a more efficient, effective, and lower-cost transit option for riders to Dodger stadium.

Response P15-7 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and

businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response O, Response to the UCLA Mobility Lab Study, for a discussion of how the Dodger Stadium Express would not be precluded from operating by the proposed Project. While existing riders of the Dodger Stadium Express may choose to switch to the proposed project to take advantage of its substantial travel time savings, some riders may prefer to ride the Union Station Dodger Stadium Express for other reasons. The opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of attendees of games or events at Dodger Stadium to ride public transportation.

Comment P15-8 -No public money should be spent on the project. The project seems to have nearly no benefits for regular transit riders in LA County and that money would be better spent on other transit improvements, and Metro should consider an option that takes equitability better into account.

Response P15-8 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response N, Environmental Justice, for discussion of how the proposed Project supports Metro’s goal of prioritizing equity opportunities and helps promote public transit as an essential lever in enabling access and improving quality of life for Los Angeles County.

Comment Letter P16 - Michael Smith

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P16

Comment P16-1 What a great idea and a signature attraction for Los Angeles! Please do it... right into the stadium if possible!

Response P16-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P17 - Lynn Miller

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P17

Comment P17-1 I support anything that will reduce the congestion in and near downtown LA. The gondola to Dodger Games will help Dodgers fans and everyone else who gets caught in game traffic.

Response P17-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P18 - Joshua Rangel

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P18

Comment P18-1 The success of the aerial Gondola would be an incredible milestone, I truly wish for the reduction of red tape which leads to the obstruction of the success of this aerial gondola. I believe this will benefit the local fan, the last minute planner, the LA fan visiting from outside of town. This would be an incredible addition to the city and reduce carbon emissions from the dodger express that the busses produce.

Traffic reduction as well.

This is key. I hope this happens and I hope we can make more marvels to downtown Los Angeles.

Let's get a WS next year! Thank you for your time, I hope we can make this work, cheers

Response P18-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P19 - Mark Staples

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P19

Comment P19-1 I would like to submit these comments on the proposed gondolas to Dodger Stadium. This project is not needed in any way shape or form. There is a very limited to no need or use of this gondola system from October to March of each year when there are no home games. Remember there are only 81 home games from April to September.

Response P19-1 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park.

Comment P19-2 There are only 3 stations, which serve no one other than Dodger Stadium guests. This doesn't solve any transit issue or transit need in any functional or convenience manner. One thing this project does prove is that the next subway or light rail line should go by Dodger Stadium the northward under or on Sunset Blvd. As the red and purple lines service Hollywood and Wilshire Blvds, this new subway or light rail could travel westward along Santa Monica or Melrose.

Response P19-2 Refer to Response P19-1 for discussion of the need for the proposed Project. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how the proposed Project's intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park would be located within a short walk to many Chinatown businesses and Metro's L Line (Gold), creating a stronger connection with the Metro L Line and enhancing transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less.

Comment P19-3 In the end this gondola project is a NO for me. I am a Dodger fan and have no need to use it to attend a game.

Response P19-3 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P20 - Ding Kalis

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P20

Comment P20-1 Great idea if the Dodgers pay for it!

Response P20-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P21 - Sarah Back

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P21

Comment P21-1 I live in district 1 and am opposed to this project. There are already public transit options to get to Dodger stadium - and we are in such desperate need of more transit all over the city. This feels like a pet project instead of a huge impact transit investment.

Response P21-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment Letter P22 - Nick

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P22

Comment P22-1 I am writing in SUPPORT of the aerial tram concept from the LA Metro rail line to Dodger Stadium. The concept is an emission-free way to safely transport passengers to and from games. More importantly, it is a an opportunity to utilize a new mode of transportation in Los Angeles that could have positive applications in other circumstances. Los Angeles needs to reduce its over reliance of car transportation.

Response P22-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P23 - Chase Paules

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P23

Comment P23-1 I would like to express my support for this project, and that it should be built. Reducing car dependency and expanding non-car options for getting to and from Dodger Stadium are important goals for this city.

Response P23-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P24 - Stephanie Pincetl

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P24

Comment P24-1 It would be good to have a pedestrian pathway up to Dodger Stadium.

Response P24-1 Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project.

Comment Letter P25 - Neil Larsen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P25

Comment P25-1 I am a resident of Los Angeles County, and a life long Dodgers fan. Unfortunately, due to excessive traffic and congestion at and around Dodgers stadium, I have not attended as many home games as I would have liked to within the past few years.

Response P25-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P25-2 I am in support of the proposed gondola system, as it offers a more convenient (and presumably enjoyable) means of traveling to a game.

Response P25-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P25-3 I understand that not all local residents in the surrounding neighborhoods are in support of the proposed gondola; however, there are only 81 home games during the baseball season and I'm sure certain measures could be put in place to minimize the impact/concerns by local residents.

Response P25-3 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P25-4 The gondola systems is a win all around in my eyes. It will alleviate the traffic problems to Dodger stadium, enhance the experience, and be something the next generation of fans can enjoy.

I support the project and hope that it will be approved.

Response P25-4 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P26 - Matt Schodorf

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P26

Comment P26-1 I am an LA resident, I frequent Dodger games, and I think the gondola is a great idea.

Response P26-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P27 - David Fried

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P27

Comment P27-1 I'm sure you guys usually only hear from the complainers, but believe me there are WAY more who are for it than who are against it.

Response P27-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P27-2 This would not only be a needed boost to public transit, but also a fun and unique draw for tourism.

Please forward my thank you to whomever is working on making this happen.

Response P27-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P28 - Michael Bauer

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P28

Comment P28-1 I missed the informational hearing that was held via zoom last Saturday. Was the meeting recorded and is there a link where I can view it?

Response P28-1 Materials presented at the informational meetings, along with recordings of the October 22, 2022 informational meeting, are available on the proposed Project's SB 44 website.² Refer to Appendix B, Public Hearing Transcripts, of this Final EIR for transcripts of the public hearings.

² Refer to Remainder of the Record Category at <https://laartsb44.net/#!/documents>.

Comment Letter P29 - Yasmin Grewal-Kok

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P29

Comment P29-1 I live in Atwater Village, near Dodger Stadium and am 100% against building this Gondola. It is not needed, will be an eyesore, and will negatively impact the environment and natural habitats.

Response P29-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR, and Appendix G, Supplemental Biological Resources Report, of this Final EIR, for discussion of how the proposed Project would have less than significant impacts to biological resources.

Comment Letter P30 - Mark Whitney

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P30

Comment P30-1 Don't we all know the story of the Chavez Ravene? How it was stolen from it's Hispanic residents with promises (and funds) to build public housing. Then the old bait and switch and it became Dodgers stadium.

Do you honestly plan to do this again, with promises of a Metro sky car only to create a tourist attraction that would spoil the area with overhead wires, that only benefit a few Dogers fans and corporate owners?

Response P30-1 Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P30-2 I suspect whoever is trying to barrel this through is a big Caruso fan. Maybe it's Rick himself. How many Dodgers home games are there is a year? I know traffic sucks when they happen, but haven't we learned to deal with it? It's not like the Stadium is getting any bigger.

Response P30-2 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition,

the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park.

Comment P30-3 I am 100% against this project. It benefits nobody but the greedy business entities which are proposing it and the politicians who readily accept their campaign contributions.

Response P30-3 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P31 - Samantha Smith

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P31

Comment P31-1 Would this service replace the existing services already available to get to dodger stadium?

Response P31-1 Funding sources for Dodger Stadium Express are not known beyond the 2023 season, but the proposed Project would not preclude the continued operation of the Dodger Stadium Express, which would provide further transit capacity to Dodger Stadium. Despite the slower travel time, some riders may prefer to continue riding the service. The opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of attendees of games or events at Dodger Stadium to ride public transportation.

Comment P31-2 Instead, why not offer more carts at Dodger stadium to assist those walking up that super big hill or getting from entrance to entrance. If it?s not broken, leave stuff alone!

Response P31-2 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR’s consideration of a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. Refer to Topical Response B, Ridership Model; Queuing at Stations and Pre-game and Post-game Transportation, for discussion of how, while there are some game attendees who currently choose to walk to and from Dodger Stadium, the walk would take approximately five to eight times as long as the ride on the proposed Project, and the path would be on a steep downward grade which does not meet Americans with Disabilities Act Accessibility Guidelines, and would be challenging for children, seniors, or people with limited physical mobility. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project.

Comment P31-3 There are already plenty of ways to not drive to Dodger stadium. Use that money to avoid further gentrification in all our LA communities! Housing! Something useful since there?s money to be spent

Response P31-3 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Topical Response N, Environmental Justice, for discussion of how the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region’s most visited venues, and would benefit the surrounding community by alleviating existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety.

Comment Letter P32 - Kyle Martin

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P32

Comment P32-1 I am a resident of the Mozaic apartments at union station and I support the Dodger stadium gondola.

Response P32-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P32-2 I see no way that the 3 stations at union station, Chinatown gold line station, and Dodger stadium could gentrify the small area in between; two of them are already rail stations and the other will be in the stadium parking lot! And as much as I love Chinatown, that neighborhood needs some investment, and the gondola could actually boost tourism to the area. And tbh, I wouldn't mind seeing more of the new higher density mixed use buildings that have been built there recently (and they even have tasteful design honoring Chinatown's traditional aesthetic), as long as long-time independent businesses are not pushed out.

Response P32-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment P32-3 If we've learned anything from the wild opening of the new 6th street viaduct, it's that Angelenos are starved for for inspiring new public infrastructure. The bulk of that should absolutely be in the form of parks and other green spaces (the gondola will actually add to the experience at LA historic park, one of our best), but just as the 6th

st bridge has already become an iconic part of the city, I think the gondola will be that and more.

Response P32-3 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how the proposed Project's intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park would be located within a short walk to many Chinatown businesses and Metro's L Line (Gold), creating a stronger connection with the Metro L Line and enhancing transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less.

Comment P32-4 The gondola can be something aspirational, inspirational, and yet also practical. I love the dodger express. But it took an hour in line just to board last time I rode and another 15 mins or so to drive up. The gondola can help relieve congestion in the buses and in traffic while making for a memorable experience unmatched by any sports stadium, and befitting a crown jewel like Dodger Stadium. And it's zero emissions to boot!

Response P32-4 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment P32-5 Short of some major safety, environmental, or ethical concern, I see no reason why the gondola should not be built to help make this great city just that much greater.

Response P32-5 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses.

Comment Letter P33 - Robert Smolkin

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P33

Comment P33-1 The idea of gondolas transporting fans to and from Dodger Stadium by rising above the streets and traffic is an innovative and imaginative solution! I applaud all those who are spearheading this project and strongly encourage City leaders to green light this solution.

Those critics who insists the existing shuttle bus program makes this new solution unnecessary overlook how the buses continue to contribute to street level congestion, air pollution and gasoline consumption.

Count my vote as a YES.

Response P33-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P34 - Steve Cokonis

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P34

Comment P34-1 Looking forward to this being built! Currently commute from Cypress park to Culver City and traffic is horrible during dodger games!

Praying this gets built!

Response P34-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P35 - Neal Roscoe

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P35

Comment P35-1 Please count this Los Angeles resident as in favor of the gondola to Dodger Stadium. I think this is a great option to add to all ways to reach the Stadium. Not only might it entice more people to take public transportation to games and concerts (people who for whoever reason don't currently use the shuttle busses, etc.), but it just might be a great tourist attraction in itself.

Lets give it a try.

Response P35-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P36 - Tami Kagan-Abrams

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P36

Comment P36-1 I am very much in favor of a gondola to Dodger Stadium. I tried to go to Dodger Stadium for the first time in over 10 years for the Fluffy show this summer. It took 90 minutes to arrive and park (which was \$40) from when I left Hollywood, and even though we left before the show ended, it was still a nightmare to get out. I vowed never to return.

Response P36-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P36-2 Going there should be one of LA's best experiences, not one of its worst. The bus is not helpful, because it's stuck in the same automotive traffic but takes away your control of when you want to leave. If I could take the Metro Red Line to Union Station and the the gondola, the process would be lengthy but low cost and hopefully relatively painless. I can't believe the residents around the stadium who currently endure hours and hours of epic traffic and the loss of all available parking find the status quo acceptable.

Response P36-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P37 - Grant Blakeman

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P37

Comment P37-1 I truly do not understand why Metro is allowing itself to be distracted by this project. A gondola itself is not a bad idea in some situations, but for a sports arena it will never be able to serve at the capacity/volume necessary within a game-day timeframe to put a meaningful dent in traffic reduction, carbon emissions, or access that a public transportation project should consider.

Response P37-1 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphpd).

Comment P37-2 Gondola projects that are actually successful connect population centers where demand and volume can be spread over hours and service can equitably be provided to all members of a community.

Response P37-2 Refer to Response P37-1 for an overview of the need for the proposed Project. Refer to Section 2.01, Overview of the Project, of the Draft EIR, discussing how the proposed

Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station.

Comment P37-3 While I like the idea of non-game-day park access, for this aspect of the project to be even remotely considered a win for the entire community of LA, it would need a commitment of no fare or a low-fare commiserate with riding a train/bus (with free transfers). This fare should not fluctuate or change depending on who is trying to access the park. In LA we should provide transit options for all (including visitors).

Response P37-3 Refer to Topical Response N, Environmental Justice, for a discussion of the Community Access Plan. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Moreover, under the Community Access Plan, transfers to and from the Metro regional transit system and the proposed Project would be free. The Community Access Plan would honor Metro's numerous discount fare programs for a variety of needs (i.e., senior fares, student fares, etc.).

Comment P37-4 Ultimately, this is a vanity project for the owner of some Dodger Stadium parking lots and the Dodgers organization itself, at best. At worst it is an abuse of public funds (and a public park, no less) to fund a private tourist attraction.

Response P37-4 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous

Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park.

Comment P37-5 Other projects Metro should implement long before considering this gondola project:

- * Protected bike lanes from Dodger Stadium all the way to the ball field
- * Increasing Metro Bike's e-bike fleet and making them available on game-day
- * Closing most (all?) roads throughout the park to cars at all times
- * Stairs (maybe even escalators) for better pedestrian access to both the park and the stadium
- * Putting in a permanent bus lane (separate and in addition to the protected bike lane) between both Union Station and the stadium
- * Free, frequent bus shuttle service into and around Elysian Park to serve both Dodger games and, more broadly, the park itself at all times

Response P37-5 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives, properly identifying an "environmentally superior" alternative and analyzing a "No Project" alternative, pursuant to CEQA. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. While this alternative would provide improved pedestrian connections compared to existing conditions, the 25 minute plus travel time from the Metro L Line (Gold) Station to the location of the proposed Dodger Stadium Station would be at least nine times greater than the three minute travel time between those two locations with the proposed Project, and this alternative would be unlikely to attract substantially more people to walk to Dodger Stadium compared to existing conditions given the travel time and the physical exertion. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger

Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding community, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment Letter P38 - Matthew Mier

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P38

Comment P38-1 I support this project as long as public funds are not used to build it. It is important to provide non driving fans multiple options to get to Dodger Stadium. As someone who regularly uses the Dodger Stadium Express, I can appreciate how useful it is. It is clear there is a demand for more options as the Dodger Stadium Express often has long lines.

Response P38-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data, and the management of queuing at stations, and pre-game and post-game transportation.

This comment number has intentionally been skipped.

Comment Letter P40 - Abe Ahn

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P40**Comment P40-1** Dear Metro,

I am a Los Angeles resident who opposes the LA Art gondola plan to Dodger Stadium.

While I support innovative alternatives to private automobiles and road traffic in the city, this sounds like the worst kind of boondoggle and grift disguised as public-private partnership.

First of all, being one of the most rapacious and miserly private landowners in the city, Frank McCourt is not a reputable figure. He should not get to influence and impact public spaces for communities of color like Chinatown in ways that would most benefit his private business interests.

Response P40-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, and Appendix A, Scoping Report, of the Draft EIR, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefit to the surrounding community, including in Chinatown.

Comment P40-2 Drew McCourt and Aerial Rapid Transit Technologies LLC may have the benefit of the elder McCourt's funding, but I believe that other firms should get to propose better, more sustainable alternatives that actually meet the needs of city residents (particularly those who are most vulnerable to displacement and dispossession by development projects like the gondola).

The gondola is a short-sighted Mickey Mouse solution that will benefit tourists, the Olympics, and most of all the McCourt family -- NOT the daily lives of everyday Angelos. Please do not let this project happen.

Response P40-2 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's

ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gases through reduced vehicular travel. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station.

Responses to P41

Comment P41-1 Dear LAART,

As a long-term Los Angeles resident, I am thrilled to see the city considering such visionary urban transit options as the LAART for our world-class city. The gondola would be a fantastic resource to help expand mobility options in an area desperately in need of traffic relief. This is a project that will benefit local residents as well as attract tourists to a wonderful area of our city. Please push this forward! Los Angeles is in need of more innovative projects such as this!

Response P41-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P42 - Carleigh Shannon

Comment Letter P43 - Katharina Schmitz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P43

Comment P43-1 We are writing to express our support for the proposed aerial gondola system connecting Union Station and Dodger Stadium. This project represents an opportunity for Los Angeles to become a leader in urban ropeway transit in the United States, and provide an example to other cities of new types of technologies that can be deployed to help reduce emissions and encourage transit ridership.

Doppelmayr reviewed the Alameda Station to Dodgers Stadium alignment early in the planning process to verify both feasibility of the project and the qualifications of the current project team. We are confident that not only is LA ARTT's proposed gondola system realistic, it is the best possible solution for the transportation challenge to Dodger Stadium. Aerial ropeway systems were originally designed to operate in harsh mountain environments but now have successfully proven their application as urban transit worldwide. A recent installation in Mexico City is testimony to this as well as our "soon to be constructed" gondola in Paris. Other examples around the world demonstrate the successful use of gondola systems in the urban environment.

Doppelmayr is the leader in aerial transport technology and our USA subsidiary is located in Salt Lake City, Utah. We employ more than 200 people in various disciplines including sales, engineering, technical support, fabrication, construction, and logistics. Our SLC team is an integral part of the Doppelmayr / Garaventa group with more than 3,000 employees worldwide. To date, Doppelmayr / Garaventa has built more than 15,100 installations for customers in 96 countries. We are committed to providing the best transport solutions now and for the future and would gladly share data from our extensive portfolio of projects as a reference.

Among Doppelmayr's proudest associations is our partnership with the Olympic Games. Los Angeles' future is bright with the reality of hosting another Summer Olympic Games in 2028. While we have provided many aerial systems for the Olympic Games (chairlifts, trams, gondolas, etc), in particular we wish to point out a unique 3S gondola system which was installed for the Sochi Olympics. The organizers faced a challenge in the requirement for providing constant access to competition sites. Much like the Dodgers Stadium, the venues in Sochi lie in an elevated location with a congested access road. The organizers looked to Doppelmayr to provide an innovative means of transport. The 3S system was selected to solve this complex issue, and the system was designed to move people quickly and efficiently. A similar gondola from Union Station to Dodgers Stadium with an intermediary station, would complement and strengthen the transit requirements for Los Angeles Olympic traffic plan.

Finally, and most importantly, the public will benefit most from the gondola solution. When it comes to passenger experience, neither buses, trains, nor automobiles can compare with that of a modern 3S gondola. Continuous cabin movement eliminates the frustrations associated with conventional mass transit waiting lines. After an easy boarding process, the passengers will enjoy a spacious and comfortable gondola cabin with access for all. The smooth flight over the streetscape allows for taking in the breathtaking views through floor to ceiling panoramic windows. Additionally, and perhaps most significant, the gondola system is extremely environmentally friendly. Within the lifecycle of the system, the operational phase is practically “zero” carbon neutral. A study demonstrating the operational efficiencies of a gondola system can be made available upon request.

In closing, we at Doppelmayr look forward to collaborating with LA ART on this exciting project. We remain available and ready to support.

Response P43-1

This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of how comparable aerial transit systems in other cities and countries have brought benefits to their surrounding areas by connecting disparate neighborhoods, promoting commerce, beautifying communities, and enhancing transit system rider safety. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. This commenter, Doppelmayr, is one of two manufacturers of 3S gondola systems in the world, and Metro and the Project Sponsor appreciate the company’s support for the proposed Project.

Comment Letter P44 - Darren Howell

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P44

Comment P44-1 I am in full support of the Aerial Rapid Transit Project. We need creative, clean energy transportation solutions like this. I will attend one of the meetings and show my support.

I also wanted to help support the project by performing at the Grand Opening Celebration when it happens. Please put my name and contact information in your files for when you need it. This will be one less thing you need to plan/worry about.

Response P44-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P44-2 My LA-based band, Acoustic Generation, performs a unique, one of a kind immersive musical experience - "Captain Flashback's Laurel Canyon Love! - Celebrating the '60s/'70s Roots of Classic Rock." It's the best bands and songs from our own legendary music scene, go-go dancers, incredible 3 & 4 part harmonies, a fun peace & love vibe with clean lyrics - crowds of all ages sing and dance along to our show.

Classic Rock appeals to the widest demographic and the good feeling, peace & love vibe will be the perfect LA energy for your Grand Opening event.

Acoustic Generation performs in Hollywood and many other venues including the LA Zoo's "Lights Event," the Green Oasis Private Event at Coachella 2016, the HopCourage Beerfest at the LA Coliseum, "Breakfast with the Beatles" on 95.5 KLOS, "Earthfest Los Angeles" sponsored by California Greenworks, the Lexus Ventura Marathon, the Whisky, Roxy, Viper Room, Boardner's, House of Blues Anaheim and many more.

Here are 2 reviews -

"I had Acoustic Generation perform live on my show and they were FAB! Book "Laurel Canyon Love" as we all need more peace & love."

~ Chris Carter, host 95.5 KLOS "Breakfast with the Beatles"

"A MUST SEE SHOW! I loved the crowd engagement, beautiful harmonies and great set list. The peace & love vibe blew my mind!"

~ Mimi Chen, dj 88.5 KCSN "Peace, Love & Sundays"

Attached is our show logo and reference letters from large corporate events with thousands of guests.

We also organized, hosted and performed the LA Climate Change Concert at the Whisky in 2016. This sold-out event was a huge success and LA Mayor Eric Garcetti gave us a Certificate of Appreciation for our service to the city.

We would like to continue our service by performing at the launch celebration party for your great project.

Best wishes, Darren Howell

Acoustic Generation

Captain Flashback's Laurel Canyon Love! 323.383.8952

Dear Darren,

I wanted to say thanks again for performing at the Lexus Ventura Marathon. I asked Acoustic Generation back again this year because you guys are great to work with. You show up on time with great attitudes, and you put on a great show for our audiences.

Plus you are great about being flexible as something always seems to come up at these large events.

Our events are all ages and require professional entertainment with wide appeal. Acoustic Generation has great original songs, a fun Classic Rock show, and everyone loved the steel drums - there is really something for everyone.

I highly recommend Acoustic Generation to any event coordinator/Corporate planner, and I look forward to having you perform at more of our events in the future.

Thanks again.

Jen Livia

Expo Coordinator

Mile26 Events

805-827-1095

1450 E Thompson Blvd

Ventura CA 93003

To Whom It May Concern,

I am writing to strongly recommend that Acoustic Generation be added to the Musicians Roster of the LA County Arts Commission.

I organize the EarthFest LA Festival, an annual event that includes booths for green companies and organizations, food booths, speeches, entertainment, etc. I met Darren Howell and Acoustic Generation through one of his other concert events, and

I immediately knew that I needed their band and Darren to be a part of my 2015 EarthFest LA Event. The 2015 event was held in the downtown area of Culver City.

Being a supporter of green initiatives, Darren jumped right in and helped me organize the 2015 event. He attended meetings, brought together like minded people to add to the effort, provided important ideas and even got a few new speakers and vendors to exhibit at the event. His band played an excellent set of Classic Rock originals and covers that was well received by the crowd. Acoustic Generation showed up on time, ready to rock with a great attitude. They added some musical energy to the event that was much appreciated.

Because of logistical issues beyond our control, we had to move the event's location in the month before the event, but Acoustic Generation was flexible and adapted to our needs.

I highly recommend Acoustic Generation for any LA County Arts events, Summer Concert Series, etc. - both you, the event organizers and especially the crowds will love the Generation. Darren likes to say, "once you hear the Generation you are part of the Generation" and it is true.

Response P44-2

This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P45 - Jeffrey Holmes

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P45

Comment P45-1 I am writing to comment on the LA Aerial Rapid Transit proposal.

As an architect living in Southern California, and having undertaken complex, large-scale urban projects both across the country and around the world, I am thrilled by this innovative, world-class proposal for LA. The project deftly increases accessibility and connectivity between numerous LA communities while creating a new, unique LA experience that will be sought after by residents and visitors alike. And it does all of this while reducing transportation related pollution and congestion!

I fully support his project and look forward to its completion.

Response P45-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P46 - Jack Humphreville

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P46

Comment P46-1 Who is paying for this?

Response P46-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P47 - Julia Tauscher

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P47

Comment P47-1 Hello Mr. Zellmer,

Please find attached our comments on the above referenced project.

Los Angeles County Metropolitan Transportation Authority One Gateway Plaza, Mail Stop 99-22-6

Los Angeles, CA 90012

LAART@metro.net

RE: PUBLIC COMMENT ON DRAFT EIR FOR THE PROPOSED LAART PROJECT

Dear Mr. Zelmer,

As a LA Historic business, within the boundaries of the proposed project zone, which will be greatly impacted by the LAART project, we wish to submit our opposition to the Draft EIR presented in October 2022. Much like our neighbors, the California Endowment and Homeboy Industries, that joined in a response opposing the LAART, dated November 16, 2022 (attached), we share many of the same opinions for opposing the project.

Due to limited resources, we are currently unable to provide the same detailed response, but with our immediate proximity to both the CA Endowment and Homeboy we wish to join in support with their opposition letter.

Areas of concern:

Response P47-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses P47-2 through P47-7. This comment references an attachment which is a November 16, 2020, letter from The California Endowment and Homeboy Industries regarding the Notice of Preparation (“NOP”) for the proposed Project. Refer to Appendix A, Scoping Report, of the Draft EIR, for the NOP and all comments on the NOP.

Comment P47-2 People not using public transport to arrive in LA

Response P47-2 Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel. The opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of attendees of games or events at Dodger Stadium to ride public transportation.

Comment P47-3 Parking- the study does not reflect accurate information

Response P47-3 Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Comment P47-4 Displacing the traffic to a new area less than 1 mile away

Response P47-4 Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a

transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations.

Comment P47-5 Street closures and loss of business during construction

Response P47-5 Section 3.17, Transportation, of the Draft EIR includes detail regarding proposed Project construction, including anticipated lane closure and detours. As described in Section 3.17, Transportation, of the Draft EIR, the proposed Project would implement a Construction Traffic Management Plan during construction that would include street closure information, detour plans, haul routes, and a staging plan. Refer to Topical Response C, Project Features, for discussion of how the Project Sponsor would create a Business and Community Support Program and a Business Interruption Assistance Program to assist local businesses financially affected by proposed Project construction activities.

Comment P47-6 Overall feasibility of the project

Response P47-6 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. The Draft EIR itself serves as a “feasibility study” for the proposed Project, with 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts. The proposed Project is feasible.

Comment P47-7 There seems to be a need for further development and discussion that we would like to be a part of to come to the best possible ways to reduce the impact of vehicles to the City of Los Angeles and be an equitable partner with the community.

Best Regards,

Julia Tauscher

PHILIPPE THE ORIGINAL

Partner & General Manager jtauscher@phi1ippes.com

Attachment: Letter dated 11-16-2022

Response P47-7 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period.

Comment Letter P48 - Bill Przylucki

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P48

Comment P48-1 Deputy Executive Officer Cory Zelmer,

I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P48-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P48-2 Metro went forward with this project without an open public process and without competitive bidding. Details about the ownership or operation of the project have been hidden from the community. The financial commitments are unclear, and I am worried that public funding will be required to cover and maintenance and construction cost overruns.

Response P48-2 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project.

Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following, the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at

both the in- person meetings and on Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P48-3 The Chinatown communities is one of the poorest areas of Los Angeles. Community members were not consulted about this project, and did not ask for it. Public employees' time and energy would be better spent consulting with residents to identify the real needs of the community, not facilitating the pet project of a wealthy developer at the expense of the entire community.

Response P48-3 Refer to Response P48-2 for a discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Metro sought to engage the community in each stage of the environmental review process. Refer to Topical Response C, Project Features, discussing the proposed Project’s potential partnerships with and benefits to local businesses in Chinatown. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment Letter P49 - Faraz Aqil

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P49

Comment P49-1 Hello. My name is Faraz Aqil, and I'm a resident of Downey, who one day hopes to visit my first in-person Dodgers game by using this new transportation system from Union Station to Dodger Stadium. The concern I have with the ART project is regarding its high capacity (how many riders can fit into a gondola [cabin size]), and the fast access (how many trips can the system quickly get all riders through [especially during High Day events]).

According to the Draft, it states that each gondola cabin has a capacity of 30-40 riders each (pg: 2-18). The travel time for one direction is approximately 7 minutes (pg: 2-42). The system has an approximate max capacity of 5,000 riders for 1-way (10,000 riders if both ways are used at max capacity) (pg: 4-59). And it takes about 23 seconds for a cabin to arrive/departure at a station (pg: 2-42), which means I estimate 36.52 gondola cabins will be needed to have a 14-minute round trip (for that 23 seconds average to happen).

However in practice, I doubt that the Gondola System can drop off and take in passengers around 23 seconds. Unless the ART group can show a computer demonstration (or a live video) of 5,000 different riders using the system during a High Day, I'm seriously worried that the 23 seconds claim is an over estimation. Not to mention if there's something that comes up (like a wheel chair passenger, a baby stroller, bike rider.. etc.) the gondola system will take longer. This is coming from experience using LA Metro's trains, where trains usually take around 1 minute to drop off & pick up passengers. Even in this report, it states that, "a cabin could be stopped to accommodate passenger boarding" (pg 2-18), which I suspect will happen quite often. And as a result of the Gondola pausing to accommodate passengers, the rest of the cabins in the system will be stopped too by being idle (which will cause delays and less transported passengers per hour).

I estimate that each gondola cabin will take around 1 minute on average. And if that's correct, then the Gondola system will only be able to transport an average of 2000 riders 1-way (4,000 riders if both ways are used at max capacity). This would be unfortunate because many riders will see that this transportation system is extremely slow and result in riders not relying on it to reach the Dodgers stadium (especially if this system gets a reputation for very long lines/wait times).

Response P49-1 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the safety features of the proposed Project and how the proposed Project would carry up to approximately 5,000 passengers per hour per direction. The cabins would move at an

approximate speed of 13.4 miles per hour with headways of approximately 23 seconds, which represents the time between cabins arriving at a station. As one hour consists of 3,600 seconds, approximately 156.5 cabins would arrive every hour (3,600 seconds / 23 seconds). The proposed Project's Tricable Detachable Gondola system ("3S") cabins typically carry between 30 to 40 passengers each, depending on the exact configuration of seating and cabin amenities selected. At a capacity of 35 passengers per cabin, at 156.5 cabins per hour, 5,478 passengers would arrive at each station per hour (35 passengers per cabin x 156.5 cabins per hour). Given that the same headway applies in each direction, the total, calculated system capacity is therefore 5,478 passengers per hour per direction (pphpd). To account for variations in the exact configuration of seating and cabin amenities, as well as operational considerations (including, for example, fewer than 35 people boarding a cabin or cabins being either slowed or stopped in the station for boarding purposes), the proposed Project has included an approximately 10 percent reduction in capacity from 5,478 pphpd to 5,000 pphpd. Refer to Topical Response B, Ridership Model; Queuing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data, and the management of queuing at stations, and pre-game and post-game transportation.

Comment P49-2 My recommendation would be to instead use an aerial train/monorail system to transport riders to/from Union Station to the Dodgers stadium. Rail is a more reliable and a faster mode of transportation than a Gondola system. Trains can hold hundreds of passengers per a trip. And it would rely on less staff than the 20 staff needed to run the Gondola system. I'm honestly surprised that of the 3 alternatives mentioned in the report, no Rail option was mentioned. We should be building a transportation system not just for the riders of now, but for future riders as well (especially since this report estimates that ridership demand will only grow larger by year 2042, up to 13,030 daily riders in a High Day) (3.17-35).

Thank you for taking the time in reading this comment.

Response P49-2 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options for a discussion on the range of alternatives considered for the proposed Project. Refer to Section 2.0, Project Description, of the Draft EIR, for a discussion of how the ART system has the ability to overcome grade and elevation issues between LAUS and Dodger Stadium (unlike more traditional forms of rail transit) and provide safe, zero emission, environmentally friendly, and high-capacity transit connectivity in the Project area that would reduce GHG emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. In addition, the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Comment Letter P50 - Greg Camphire

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P50

Comment P50-1 I'm writing with concern about LA ART and Metro's recently released Draft Environmental Impact Report on the potential environmental impacts resulting from the McCourt Gondola.

Response P50-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses P50-2 through P50-4. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P50-2 This report reflects the fact that there has been no considerable input from the communities who will be most affected by this gondola. It is clearly the pet project of a billionaire with too many unanswered questions about safety, cost, maintenance, and even the actual purpose of the gondola.

Response P50-2 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely and efficiently. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and

Operations, of the Final EIR, for discussion of the safety features of the proposed Project and how system components would be equipped with security features for system safety. The gates and entrances to the stations would be locked at night and would be equipped with security features to prevent entrance by unauthorized personnel. The towers would have no publicly accessible gates or entrances and would be inaccessible to unauthorized personnel. Maintenance doors at the base of the towers would be secured at all times and only accessible by authorized personnel. The system components would be equipped with security cameras to monitor activity at stations, the junction, the towers, and in each cabin. Moreover, attendants would be present at each station, and a separate operator would be stationed in a control room to monitor activity throughout the proposed Project. Maintenance would be performed by the operator and would include daily observation of the overall system as part of the startup routine.

Comment P50-3 The gondola is a waste of time and money—a stunning \$300 million price tag—that could be better spent on any number of initiatives that would actually benefit local residents. Since nearly every Metro project has historically gone significantly over budget, the risk for taxpayers to be held financially responsible for expenses beyond the initial construction costs is enormously significant. At the same time, there is already a free shuttle available that serves the same exact function as a costly gondola ride.

Response P50-3 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response N, Environmental Justice, for

discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Comment P50-4 The recent election of Los Angeles' new mayor proves that the people do not want billionaires running or ruining our city. We must stop this wasteful, tacky, bloated, and completely unnecessary gondola from being built. It will be an expensive eyesore from an out-of-touch oligarch that scars the landscape of LA.

Stop the gondola project now!

Response P50-4 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Responses P50-2 through P50-3 regarding the Project Sponsor, the proposed Project's costs, and the need for the proposed Project. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant.

Comment Letter P51 - Daniel Freedman

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P51

Comment P51-1 Hi: Can you please send me a copy of the Oct 22, Scoping Meeting recording for the gondola project? I would be interested in using it for a class I am teaching. Thank you!

Response P51-1 Materials presented at the informational workshops, along with recordings of the October 22, 2022 informational workshop, are available on the proposed Project's SB 44 website. Refer to Appendix B, Public Hearing Transcripts, of this Final EIR for transcripts of the public hearings. An email responding to this request with a link to the recording of the October 22, 2022, informational workshop was sent to the commenter upon receipt of this comment.

Comment Letter P52 - Marceline Phillips

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P52

Comment P52-1 Please do not build a gondola. If you look at the London cable car over the Thames it's either slower or comparable to existing transit modes, except it has a much, much lower capacity and wait times are longer due to this low capacity.

Instead use the money to help fund a northern extension of the WSAB to Dodger's stadium.

Response P52-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Table 2-1, ART Precedents, in Section 2.0, Project Description, of the Draft EIR, which provides examples of gondola systems in cities around the world, including the Emirates Air Line monocabable detachable gondola in London, England, with a capacity of 2,500 persons per hour per direction (pphpd), which carries 10 people per cabin, over a distance of 0.68 miles for a five-minute travel time. In comparison, refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, for discussion of how the proposed Project is a tricable detachable gondola system, or 3S system, with a capacity of up to approximately 5,000 pphpd, which typically carries 30 to 40 passengers per cabin, and would travel over a distance of 1.2 miles for a seven-minute travel time. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world. Additionally, refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment Letter P53 - Martin Hoecker-Martinez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P53**Comment P53-1** Metro,

This project seems laughable. The proposal's "...maximum capacity of approximately 5,000 people per hour per direction" is dwarfed by the needs of Dodger stadium which has a capacity of 56,000 people. It would take over 11 hours to fill the stadium at that rate and another 11 hours to empty it. Even if the system was extended to the other side of Chavez Ravine (Echo Park or Silver Lake or Elysian Valley) so that there are two boarding points to double the capacity the system would be overwhelmed by the needs of the stadium. This project uses a mode of transportation that can not cope with the needs of the stadium. Although I applaud the motivation this project should be sent back to the drawing board. It suffers from a fundamental misunderstanding of the transportation needs. Build a system based on a higher capacity mode of transit (e.g. rail, or Bus Rapid Transit with dedicated right of way) that can handle the departing crowds of more than 30,000 people per hour.

Response P53-1

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system, which is equal to roughly 1,000,000 passengers per year at Dodger Stadium. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of how comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit

systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment Letter P54 – Baldomero Capiz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P54

Comment P54-1 I am Baldomero Capiz and, in my opinion, the project will be financially beneficial to millionaires. It will not bring any benefit to poor migrant communities.

Response P54-1 Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including how the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses within the surrounding communities while unifying and connecting communities through transit mobility access. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P54-2 It will result in more mental, emotional, psychological ailments and death.

The community must organize to defend the future of our families.

Response P54-2 Refer to Response P54-1 for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Refer to Topical Response J, Gondola Design and Operations, for discussion of the safety features of the proposed Project and how aerial transit systems such as the proposed Project represent one of the safest modes of transportation relative to other forms of transit. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Comment Letter P55 – Ruby Andalon

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P55

Comment P55-1 Will the Gondola going to effect the people living down below. (The privacy and safety).

Response P55-1 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the proposed Project’s design and operations, including discussion of the safety, privacy, and operations features of the proposed Project. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses. Refer to Section 2.5, Proposed Project Alignment and Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties.

Comment Letter P56 – Rebecca Ocaqueda

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P56

Comment P56-1 I don't agree with this project.

1. It won't help the environment.

Response P56-1 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting Los Angeles Union Station (LAUS) to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles travelled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles travelled.

Comment P56-2 2. It will take space away from the park.

Response P56-2 As discussed in Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic

Park, the ability to use the vast majority of the park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project.

Comment P56-3 3. It will only be good to fill up the pockets of those who are the most interested in the project.

Response P56-3 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to the Response P56-1 for a discussion of the proposed Project's potential environmental benefits. Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment P56-4 Finally, it won't eliminate the traffic from our roads.

Response P56-4 Refer to Response P56-1 for a discussion of the proposed Project's ability to reduce vehicular travel and therefore vehicular congestion.

Comment Letter P57 –Maria Yglesias

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P57

Comment P57-1 We are fighting hard for clear air and green spaces for our childrens and elderly population. This project is going to be a disaster for the Chinatown community where I live.

Response P57-1 As described in Section 2.0, Project Description, of the Draft EIR, the proposed Project, which would include passenger stations at Los Angeles Union Station (LAUS), the southern entrance of Los Angeles State Historic Park, and Dodger Stadium, would provide new connections to and between currently underserved neighborhoods and uses along the proposed alignment, including Chinatown, Mission Junction, the Los Angeles State Historic Park, Elysian Park, and Solano Canyon. In addition, the proposed Project would provide pedestrian improvements, including hardscape and landscape improvements, as well as amenities at the Los Angeles State Historic Park. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities, including Chinatown. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles travelled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles travelled. In addition, refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting

communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment P57-2 Our Historical Park will be compromised and our streets will be full of traffic and pedestrians wondering around. Please stop the Gondola, we don't need it at all. Mr. McCourt can make money somewhere else. Stop the Gondola!

Response P57-2 As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide open space enhancements, including at the Alameda Triangle, the Los Angeles State Historic Park, and along the pedestrian pathway connecting Dodger Stadium Station and Dodger Stadium. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and

donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P58 – Arturo Gonzalez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P58

Comment P58-1 My name is Arturo Gonzalez with neighborhoods coalition. I honestly believe that Metro has reneged on their commitment to the community it serves.

Serving the interest of a multi-millionaire goes against the very core of Metro and its oath to serve the interest of all communities.

Response P58-1 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P59 – Kevin Jauregui

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P59

Comment P59-1 As a Native Angelino, with roots and history in this town, we already see that many mistakes have been made by our past. The amount of pollution in our city has caused massive disease to our people. Lack of green space negatively impacts our mental health.

Response P59-1 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would include several sustainability features and open space enhancements, including pedestrian enhancements and drought tolerant landscaping, open space enhancements, including at the Alameda Triangle, the Los Angeles State Historic Park, and along the pedestrian pathway connecting Dodger Stadium Station and Dodger Stadium, and improved access to Los Angeles State Historic Park and Elysian Park.

Comment P59-2 This gondola seems to be “killing two birds with one stone” in the sense it’ll be making air quality worse in already under served communities AND taking away green space by building on the park. Please, for the sake of our communities and our future DO NOT BUILD THE GONDOLA

Response P59-2 Refer to Response 59-1 for discussion of the proposed Project’s ability to reduce vehicular travel, improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project’s Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park. Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park

amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms.

Comment Letter P60 – Julie Rico

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P60

Comment P60-1 I have lived in Chinatown at the Senior Metro Lofts for 10 years #. I walk in Chinatown, I use public transportation in Chinatown, I support the community of Chinatown.

Response P60-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P60-2 The Gondola project will create havoc in a senior centric neighborhood. The transmission of disease is possible due to the increased traffic, the pollution impact of the cars that will take our parking spaces.

Response P60-2 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Comment P60-3 The lookieloos, the tourists and the enthusiastic Dodger fans will mow us/seniors and Chinatown residents over. The now idyllic park will be irrevocably destroyed by the traffic and the gondola

Response P60-3 Refer to Response P60-2 for discussion of how the proposed Project would have less than significant operational impacts, including for transportation and at the Park, and how comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments and demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses.

Comment Letter P61 – Patrick Chen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P61

Comment P61-1 As a resident of Chinatown, I am writing to express my concerns and objection to the LA ART gondola project. This Draft environmental impact report does not address serious issues with how the gondola’s construction and operation would negatively affect the working class and aging population of Chinatown. One of the worst problems unaddressed is how this will cause more traffic and traffic safety issues in Chinatown as one of the gondola stations is in Chinatown.

Response P61-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. As discussed in Section 2.0, Project Description, of the Draft EIR, and Topical Response C, Project Features, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. As discussed on page ES-17 of the Executive Summary of the Draft EIR, based on the analysis contained in Section 3.0, Environmental Setting, Impacts, and Mitigation, construction of the proposed Project would result in significant and unavoidable cumulative impacts with regard to Noise and Vibration (human annoyance). As demonstrated in the Executive Summary to the Draft EIR, the proposed Project would not result in any other significant and unavoidable construction impacts. The proposed Project would not result in any significant and unavoidable operational impacts. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill

743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. Refer to Section 3.17, Transportation, of the Draft EIR, for a discussion of how the proposed Project, including the Chinatown/State Park Station, would not substantially increase transportation hazards to vehicle, pedestrian, or bicycle safety due to geometric design feature or incompatible use with the implementation of mitigation.

Comment Letter P62 - Davanna Molinari

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P62

Comment P62-1 There is a moral issue at stake again, where the community of Chinatown is again getting the short end of the stick. There are many inequalities faced by the community but today non is as damaging as the LA ART project that is now at a stage where is waiting for approval without the process ever considering the local community and impacts to its residents and many stakeholders like myself.

Response P62-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts.

Comment P62-2 This lack of a community benefit project and dream of a single individual is quite selfish. Have you all ever been in Chinatown during a Dodger game, a gondola will not solve the issue, the gondola in fact is not local community friendly.

Response P62-2 Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses and other community benefits for Chinatown. As discussed in Section 2.0, Project Description, of the Draft EIR, and Topical Response C, Project Features, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. The proposed Project would improve mobility and accessibility for the region by connecting Los Angeles Union Station (LAUS) to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P62-3 Lastly as a long time resident of northeast Los Angeles and current resident of Lincoln Height, and one of the youth pictured with the Governor Gray Davis when he announced the purchase of what is today LA State Historic Park I am appalled by the possibility that this community resource will be impacted. How can public agencies that will take part of saying yes or no to this project in the approval process, ever consider saying yes. An approval of this project would go against the benefits that they are task with upholding to local constituents. Additional can we please independent traffic and other studies that are being used to approve this project? It is unfair that the more resource get to draft their own document.

Response P62-3

Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park. Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro's L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data. Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR.³ Stantec is an internationally respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the

³ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language.

Comment Letter P63 – Bill Chin

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P63

Comment P63-1 The Dodgers is not a good neighbor for my community of Victor Heights & Fig. Terrace. 80+ days of home games is a bad impact on my life. Traffic is slower on the freeways, Sunset, College Street (Westbound). Fireworks brings other into community to see bombs blow-up in the sky. I see walker coming thor my streets, Beaudry Ave, College Street, Alpine Street, Bartlett Street, Figueroa Street, Sunset Blvd. Many streets are needed for locals to park after working long hours in the evening. They walk thur speaking loudly at night. This is damaging to my community. I feel lose after living here 54 years!

Response P63-1 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment Letter P64 – Frank Hom

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P64

Comment P64-1 The gondola project is an environmentally unsafe solution for traffic to Dodger Stadium on many counts.

Response P64-1 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P64-2 1 – affects entire community of Chinatown residents and businesses

Response P64-2 Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment P64-3 2 – affects businesses in original Mexican town.

Response P64-3 Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents.

Comment P64-4 3 – affects usage of California State Park

Response P64-4 As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary

system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park.

Comment P64-5 4 – construction will upset environment and health of elderly in Chinatown

Response P64-5 Refer to Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR, for discussion of the construction of the proposed Project. As summarized in the Executive Summary of the Draft EIR, the proposed Project would have less than significant impacts related to construction with the exception of Noise and Vibration (human annoyance). Refer to Section 3.17, Transportation, of the Draft EIR, for discussion of the proposed Project's maintenance of local and emergency access during construction. Refer to Topical Response C, Project Features, for discussion of the Business and Community Support Program during construction. As summarized in the Executive Summary of the Draft EIR, impacts related to operations of the proposed Project would be less than significant. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction noise impacts from the proposed Project. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Noise standards, which are generally stated based on the use function of the property and not by age group, are nonetheless developed to protect sensitive populations, including seniors and children. Refer to Section 2.8, Construction, in Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR, for discussion of the duration of construction for each component of the proposed Project.

Comment P64-6 5 – 100% profit motive for 1 man Frank McCourt

Response P64-6 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment P64-7 6 – GREED

Response P64-7 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P65 – Raul Macia Franasco Serran

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P65

Comment P65-1 The failing project does not have a reason to exist because the city does not need it, it is illogical. The community needs other alternatives that do benefit us and lead us to progress, not backwards. No gondolas.

Response P65-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. As discussed in the Technology Penetration Analysis, included in Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, a large capacity for a new mode of transportation in Los Angeles will allow passengers to see the potential for other emerging innovations to be integrated into the public transit system, and the proposed Project would thus exemplify how alternative transportation technology can be integrated into a city's transportation infrastructure and will show that new technology can successfully operate in concert with other existing modes of transportation.

Comment P65-2 Alternatives need to be sought to improve access to the stadium without affecting the neighbors in the area. We have too much pollution in every sense, it is harming not only the area but also a big part of Los Angeles.

Response P65-2 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives, properly identifying an "environmentally superior" alternative and analyzing a "No Project" alternative, pursuant to CEQA. The Transportation Systems Management

Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P65-3 I do not agree with the Gondola Project because it would slow down movement in the community regardless.

Response P65-3 Refer to Response P65-1 for an overview of the need for the proposed Project. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Comment Letter P66 - Herminia G. Andrade

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P66

Comment P66-1 The noise and the environmental impact, along with pollution, would result in psychological and physical harm.

Response P66-1 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Operational noise impacts would be less than significant. Refer to Response G017-129 for a discussion of health impacts from construction and operational noise of the proposed Project. As discussed therein, noise from construction and operations of the proposed Project would not result in health impacts. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P66-2 This Gondola Project should not be approved, the noise will especially affect us, seniors.

Response P66-2 Refer to Response P66-1 for discussion of how operational noise impacts of the proposed Project would be less than significant. Refer to Response G017-129 and Response G017-130 for discussion of the proposed Project's less than significant impact on human health associated with hearing loss, hearing damage, and sleep disturbance. Noise standards, which are generally stated based on the use function of the property and not by age group, are nonetheless developed to protect sensitive populations, including seniors and children.

Comment Letter P67 – Alan K. Weeks

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P67

Comment P67-1 I would like to submit a comment concerning a point in your draft environmental report in the section concerning the State Park there is little or no information as to what changes the Tramway will make. I would like to see more detailed information.

Response P67-1 As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response to S2-4 for additional discussion regarding the ability of uses to continue at the Park. Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro's L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms.

Comment Letter P68 – Antonio Rodriguez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P68

Comment P68-1 The easiest way to solve the issue of traffic and pollution is to extend the Chavez metro underground without affecting communities.

Response P68-1 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between Los Angeles Union Station (LAUS) and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment P68-2 The metro service is being extended but no parking spaces are created in each metro station.

Response P68-2 Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Comment P68-3 The City of Los Angeles is making money with parking fines by metro stations.

Response P68-3 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P69 – Samuel Perez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P69

Comment P69-1 My name is Samuel Perez with AMP Los Angeles and would like to submit the following statement about the LA ART gondola. This gondola is built on public land using public funding then we would use public funds to help generate revenue for a private company. This would not help anything to do with the public and/or emissions.

Response P69-1 Refer to Section 2.5, Proposed Project Alignment and Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR, for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P69-2 Also the gondola system is outdated and surpassed by modern tech. To conclude my statement, I [inaudible] disagree and am against the building of this Gondola.

Response P69-2 Although forms of aerial transit technology have been available and utilized for the last 100 years, modern applications have seen the evolution of the technology as a feasible mode of urban rapid transit. As discussed in the Technology Penetration Analysis, included in Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, a large capacity for a new mode of transportation in Los Angeles will allow passengers to see the potential for other emerging innovations to be integrated into the public transit system, and the proposed Project would thus exemplify how alternative transportation technology can be integrated into a city's transportation

infrastructure and will show that new technology can successfully operate in concert with other existing modes of transportation. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment Letter P70 – Ci Zhang Maory

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P70

Comment P70-1 A. The gondola has much more harm than benefit;
B. Nowadays, technology changes fast. Various advanced transportation tools will emerge in the future. A gondola is an old and outdated way of transit;

Response P70-1 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world and their operations, integration with nearby residential and open space uses, community benefits, promotion of public art and collaborations with local artists, and evidence that such systems can reduce violent crime in nearby areas and promote a sense of security compared to other modes of public transportation. Although forms of aerial transit technology have been available and utilized for the last 100 years, modern applications have seen the evolution of the technology as a feasible mode of urban rapid transit. As discussed in the Technology Penetration Analysis, included in Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, a large capacity for a new mode of transportation in Los Angeles will allow passengers to see the potential for other emerging innovations to be integrated into the public transit system, and the proposed Project would thus exemplify how alternative transportation technology can be integrated into a city's transportation infrastructure and will show that new technology can successfully operate in concert with other existing modes of transportation.

Comment P70-2 C. The gondola has many disadvantages, most people object to building it!

Response P70-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or

raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Response P70-1 for a discussion of the benefits of the proposed Project. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements.

Comment Letter P71 – Ramon Cruz Moya

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P71

Comment P71-1 My name is Ramon Cruz Moya. I am a son of an agricultural laborer and was born back in 1942. Frankly, I do not agree with carrying out this gondola – and metro – project because of the communities that will suffer a lot without their homes, where the metro might be built. Seniors can't take the terrible sadness of losing their homes.

Response P71-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing.

Comment P71-2 Many boys and girls will suffer because of their schools.

Response P71-2 Refer to Section 3.15, Public Services, for a discussion of schools. During proposed Project construction, impacts to schools would be less than significant with mitigation. Impacts on schools during proposed Project operation would be less than significant.

Comment Letter P72 – Joseph Amard

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P72

Comment P72-1 I am concerned that the Gondola will impact (1) the air quality in the area;

Response P72-1 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P72-2 (2) will bring more traffic to the streets;

Response P72-2 Refer to Response P72-1 for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations.

Comment P72-3 (3) will change the Historic Park environment and create visual blight

Response P72-3 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Section

3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant, including at the Park. The Draft EIR and Visual Impact Assessment both specifically addressed and disclosed potential impacts on changes in the visual environment and existing viewsheds into and from within the Los Angeles State Historic Park. The Draft EIR included thirty Key Observation Points (KOPs), including nine that simulated views of or from Los Angeles State Historic Park. The Draft EIR analyzed each of these KOPs, describing the existing viewpoint along with a visual simulation of the proposed Project. With respect to views from within the park, the Draft EIR concluded that certain southwest-facing views of the downtown Los Angeles skyline, particularly close to the proposed Chinatown/State Park Station, would be partially interrupted due to the proposed Project. However, the Draft EIR noted that these views are already partially interrupted by trees and intervening development, and the nature of the proposed Project (i.e., cables with similar characteristics to prevalent existing powerlines and cabins that are constantly moving in and out of view) means that the proposed Project would not significantly impact views from the park. The Draft EIR concluded that the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park. The Final EIR has added additional KOPs to further analyze viewshed impacts to Los Angeles State Historic Park. Refer to Appendix H.1, Memorandum Regarding Preparation of KOPs, and Appendix H.2, Supplemental KOPs in Response to Comments, of this Final EIR, for a discussion of the supplemental KOPs' preparation and the supplemental KOPs, respectively. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than significant. In addition, refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including views from a cabin over the park, providing a new and unique perspective of the park and its surroundings, including the Roundhouse Observation Deck and the exposed Zanja Madre, which is currently not visually apparent from inside the park.

Comment P72-4 (4) increase in noise to the area;

Response P72-4 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Operational noise impacts would be less than significant.

Comment P72-5 (5) why change to a gondola – when we have an alternative with the Dodger's Express Bus!

Response P72-5 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a

range of reasonable alternatives, properly identifying an "environmentally superior" alternative and analyzing a "No Project" alternative, pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between Los Angeles Union Station (LAUS) and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment Letter P73 – Daniel Andalon

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P73

Comment P73-1 As a member of the eastside community we fought long and hard, many years ago, to ensure our city and communities had greenspace for future generations.

Response P73-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P73-2 The EIR p 3.11-42 says the project would be inconsistent with the State Historic Park General Plan and would have to amend it. I am not in any way supportive of a project that would disrupt this plan!

Consider alternatives like the “shuttle bus connectors” which the EIR admits is superior alternative.

Response P73-2 Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the

proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment Letter P74 – Chace Espinosa

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P74

Comment P74-1 Although I may not exist in LA to witness this potential establishment, I highly benefit this project, as it could grant a better view of the entire city and its aspect of transportation, and hopefully others that seem to criticize it can see it as a wide benefit in the mere future.

Response P74-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P75 – Franco Stefano Blancaflor

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P75

Comment P75-1 I SUPPORT this project!!??

Response P75-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P76 – Jacob Lopez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P76

Comment P76-1 As a Cathedral Student, I fully support the Gondola Project.

Response P76-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P77 – DJ Gonzalez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P77

Comment P77-1 i like the gondola and im a cathedral student

Response P77-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P78 – Xavier Garcia

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P78

Comment P78-1 I like it from cathedral student!

Response P78-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P79 – Cayla McCrae

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P79

Comment P79-1 Hello,

As a resident of LA's Chinatown neighborhood, I OPPOSE the LA ART Gondola to Dodger Stadium for the following reasons:

THE McCOURT GONDOLA WOULD ALTER THE CHARACTER AND USE OF LOS ANGELES STATE HISTORIC PARK. The Gondola would undo years of community advocacy for a tranquil green space. The view from the park to the LA Skyline will be littered with cables and gondola cabins, and chase away wildlife, especially birds.

Response P79-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response to S2-4 for additional discussion regarding the ability of uses to continue at the Park. Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, Los Angeles Union Station (LAUS), El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park "visually memorable." As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing

urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Additionally, refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of the Final EIR for discussion of how the risk of avian collisions with the cables or components of the proposed Project is less than significant. Design features of the proposed Project are likely to reduce the risk of avian collisions in comparison to transmission lines. First, the proposed Project's ropeway cables would not include a shield wire, unlike transmission lines, which would be expected to reduce collision risk. Second, the tight clustering of the three ropeway cables, in conjunction with the fact that the cables would be thicker than transmission lines, would make them more visible to birds in comparison to transmission lines. Third, the proposed Project would include devices that support and maintain proper separation between the cables of 3S systems known as slack carriers, which would increase the visibility of the cables to birds. Fourth, the proposed Project would implement BIO-PDF-C. The cabin windows would be designed to be non-transparent (tinted) and/or partially covered with a vinyl window film to be made visible to birds in flight. Reflective surfaces would be reduced as much as possible with opaque or translucent surfaces. Fifth, the gondola cabins travel along the cables at frequent intervals during the periods of operation, further increasing the visibility of the cables along which they are moving. Finally, the proposed Project would implement BIO-PDF-B. The Project Sponsor would develop an Avian Collision Mitigation, Monitoring, and Adaptive Management Plan to address the potential for bird collisions. The Plan would include monitoring, training, adaptive management, and reporting requirements related to avian and bat injuries or mortalities. All of these aspects would make the gondola cables less likely to result in avian collisions, compared to transmission lines.

Comment P79-2 THE McCOURT GONDOLA WOULD USE PUBLIC RESOURCES FOR PRIVATE PROFIT. This project requires the use of public rights of way, public air rights, and public lands and serves only to benefit Frank McCourt.

Response P79-2 Refer to Topical Response L for a discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.5, Proposed Project Alignment and

Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents.

Comment P79-3 THE McCOURT GONDOLA WOULD HARM OUR NEIGHBORHOODS. The enormous gondola cabins would travel over the rooftops of family housing. Neighborhoods located near the gondola stations would experience increased traffic and parking problems, endangering pedestrians, especially seniors and children.

Response P79-3 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for a discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 2.5, Proposed Project Alignment and Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR, for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines ("TAG"). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project

Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified. Refer to Section 3.17, Transportation, of the Draft EIR, for a discussion of how hazard and visibility impacts to pedestrians would be less than significant with mitigation. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would include pedestrian network improvements (such as hardscape and drought tolerant landscaping improvements), open space enhancements, including at the Alameda Triangle, the Los Angeles State Historic Park, and along the pedestrian pathway connecting Dodger Stadium Station and Dodger Stadium, and improved access to the Los Angeles State Historic Park and Elysian Park.

Comment P79-4 THE GONDOLA (LARTT LLC) AND METRO ARE, SEEKING APPROVALS WITHOUT MEANINGFUL COMMUNITY ENGAGEMENT OR TRANSPARENCY. A project that would permanently alter our neighborhoods and the Los Angeles State Historic Park requires a full public review. Basic information has been withheld including the location of the towers, and the height and scale of the stations. The two potential routes were chosen without public input.

Response P79-4 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. For example, after initially offering two options for the proposed Project alignment in the Notice of Preparation, responding to stakeholder input, the Project Sponsor announced it would proceed with the proposed Project alignment studied in the Draft EIR, including the intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park. This decision was in direct response to both State Park and Chinatown stakeholders. Located within a short walk to many Chinatown businesses and Metro's L Line (Gold), this station also addresses the goal of creating a stronger connection with the Metro L Line and would also enhance transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. In addition to this significant modification in response to public input, the proposed Project stations were also redesigned to address public response to the

initial design vision for the proposed Project, by reducing the size by 26 percent and updating the architecture to better reflect the neighboring communities. As discussed in Topical Response C, Project Features, the design for the proposed Project's stations and junction studied in the Draft EIR would provide an opportunity for site specific artwork that is reflective of the unique neighborhood culture and could be commissioned from local artists. In addition, the proposed Project's cabins could feature artwork from local artists or other community programming. Further, as discussed in Section 2.0, Project Description, of the Draft EIR, implementation of the proposed Project's Alameda Tower would include reuse and integration of the existing pavers located at the Alameda Triangle, and both the Alameda Tower and Alpine Tower will provide additional hardscape and landscape updates around the tower bases. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and in writing or verbally during the four public hearings. Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the four public hearings, with interpretation provided in Taishanese during the final two public hearings. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for discussion of Mitigation Measure LUP-A, which would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park and Recreation Commission, which retains its independent authority related to the proposed Project. The General Plan Amendment process would include additional public processes before the Commission. Refer to Section 2.0, Project Description, for a description of the location and design, including dimensions, of the proposed Project's stations, towers, junction, and cabins.

Comment P79-5 TAXPAYERS WILL LIKELY END UP PAYING FOR THIS PROJECT. How will McCourt pay for it? What will it cost to operate and maintain the system? What happens with cost overruns? Who pays for it?

Response P79-5 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response L for a discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated

to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P79-6 THIS IS A TOURIST ATTRACTION, NOT REAL TRANSIT. At up to \$30 per ticket for a 1.5-mile ride, this project is not transit that community members would use to access essential services.

Response P79-6 Refer to Topical Response C, Project Features, for discussion of how the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for discussion of how the proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station.

Comment P79-7 REAL PUBLIC TRANSIT TO DODGER STADIUM EXISTS AND IS OPERATING. The Dodger Stadium Express which has committed to zero emissions is a wildly popular bus program utilized by many happy Dodger fans.

Response P79-7 Refer to Response P79-6 for an overview of the need for the proposed Project. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities. Further, electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment P79-8 STOP THE CORPORATE WELFARE for billionaires and the privatization of our public spaces.

Help us protect our neighborhoods and the Los Angeles State Historic Park.

Sincerely,

Cayla McCrae

Response P79-8 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This

comment provides a general summary of the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses P79-1 through P79-7.

Comment Letter P80 – Thomas Lemos

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P80

Comment P80-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). This project does nothing for the surrounding neighborhoods and literally makes them irrelevant by placing this eye sore for all to see every day. This is something that would only be utilized part of the year. There are already buses to Dodger Stadium and if more access is needed, maybe they should work on improving access without impacting a neighborhood with a huge eyesore that would be a waste of money. Take the money to be spent on this project and work on making the current system better. Don't build something that won't be used by anyone except on game days.

Response P80-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon,

and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P81 – Marissa Roy

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P81

Comment P81-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

There are many public transportation projects that need to be funded, and this gondola project is duplicative (there is already a bus) rather than expanding access where it currently is absent or underfunded. In general, there needs to be more of a transparent process with community input and feedback to determine priorities.

Response P81-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, and Appendix A, Scoping Report, of the Draft EIR, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Metro engaged stakeholders in neighborhoods along the proposed Project alignment in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from stakeholders in neighborhoods along the proposed Project, including Chinatown, during this period led directly to changes to the proposed Project, including selecting the proposed Project's alignment and the location of Chinatown / State Park Station, as discussed in Section 5.0, Other CEQA Considerations, of the Draft EIR. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for a discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to

meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between Los Angeles Union Station (LAUS) and the Dodger Stadium property and improving connectivity for surrounding communities.

Comment Letter P82 – Tabatha Yelos

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to P82

Comment P82-1 Deputy Executive Office Cory Zelmer,

I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium)

This project will be dangerous for the community. I do a lot of work in the area as an organizer, and I can tell you that people are not truly informed about the impacts of this project. Chinatown has the second lowest AMI in the City after Skid Row. This is a community that needs investment in housing, grocery stores, and healthcare facilities!!

Response P82-1 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of how comparable aerial transit systems in cities around the world operate safely, efficiently, and in concert with nearby residential and open space uses. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, and Topical Response N, Environmental Justice, for discussion of how the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region's most visited venues, and would benefit the surrounding community by alleviating existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety. Additionally, the proposed Project is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, providing connections to Metro's growing regional public transit system. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P82-2 A construction project in the neighborhood will have negative impacts, especially in air quality for a community of majority-elderly residents. That's crazy!

- Response P82-2** Refer to Section 3.03, Air Quality, and Appendix D, Air Quality/Health Risk Assessment Technical Report, of the Draft EIR for discussion of the impacts to air quality from construction of the proposed Project, which would be less than significant. As shown in Table 3.3-4 and Table 3.3-5 on page 3.3-22 and page 3.3-23 of the Draft EIR, respectively, the proposed Project would not exceed daily mass emissions thresholds during construction. Table 3.3-6 and 3.3-7 on page 3.3-24 and page 3.3-26 of the Draft EIR, respectively, show that construction activities would also not exceed thresholds for localized emissions of criteria pollutants or health risk thresholds. As discussed in Section 3.03, the proposed Project’s Health Risk Assessment evaluated the estimated cancer risk and non-cancer chronic hazard index associated with construction of the proposed Project. The HRA was conducted in accordance with SCAQMD risk assessment guidelines, which include a number of conservative assumptions to be protective of human health and to estimate potentially higher risks and sensitivity factors for infants, children, and other sensitive receptors. The HRA also assessed risks for off-site sensitive receptors including residents, daycare children, school children, and senior centers. Table 3.3-7, Maximum Individual Cancer Risk and Hazard Index due to Construction of the Project, of the Draft EIR, provides the results from the construction HRA, showing that the maximum incremental cancer risk and chronic non-cancer impacts would be below SCAQMD significance thresholds for all modeled receptors, which include the sensitive receptors (e.g., senior centers) located near proposed construction areas.
- Comment P82-3** The meetings have also not been conducted in Cantonese, which is the main language spoken in the neighborhood. Vietnamese is also spoken a lot in the area.
- Response P82-3** Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Proposed Project materials and information were provided at both the in-person meetings and on Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.
- Comment P82-4** We all know that McCourt plans on developing the Dodgers parking lot so, will this really reduce traffic? Or just displace it to another neighborhood? Chinatown cannot become a parking lot!!
- Response P82-4** Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project

Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. Parking is not required to be analyzed under CEQA or the TAG. Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to affect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Comment P82-5 This will be devastating to the community. Do better! We need AFFORDABLE HOUSING, GROCERY STORES, AND HEALTHCARE FACILITIES for an aging community. Not this ridiculous project that will destroy the community and poison elderly residents!

PLEASE DON'T BUILD THIS!

Tabatha

Tabatha Yelos

Response P82-5 This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses P82-1 through P82-4.

Comment Letter P83 – Logan Rapp

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P83

Comment P83-1 Deputy Executive Officer Cory Zelmer,

I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

We have known how harmful Frank McCourt has been to this city for quite some time. Why are we allowing Metro to be the vehicle to move this gondola forward, and then turning around and calling this a "private" matter?

Frank McCourt's nonsense should not be allowed to be subsidized by this city. Even to just talk about the details of the project, you have to sign an NDA! This is unacceptable and a complete lack of transparency. END THIS PROJECT NOW.

Response P83-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region's Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region's transportation authority. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period.

Comment Letter P84 – Amy Gatto

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P84

Comment P84-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). This project will drive private profits, but will take public funding away from other important projects, like installing crosswalks and traffic lights.

Response P84-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P84-2 The poles will sit on public land and the gondola will take public airspace. Thank you for your consideration.

Response P84-2 Refer to Section 2.5, Proposed Project Alignment and Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties.

Comment Letter P85 – Akio Katano

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P85**Comment P85-1** Deputy Executive Officer Cory Zelmer,

I am writing to STRONGLY OPPOSE the Gondola to Dodger Stadium. We need actual transit infrastructure, not a vanity project for a sports team. This project would shift the burden of traffic and parking to the vulnerable community of Chinatown, and also lead to gentrification and displacement in that neighborhood.

Response P85-1

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents.

Comment P85-2 To go forward with a project like this without a public proposal process or competitive bidding is an insult to the city. At a time that we're already struggling with corruption

in city hall, to conceal details from the people shows that this is going to be a naked cash grab by developers.

Response P85-2

This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s sole source determination for the proposed Project. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provides detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response L, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P86 – Timothy Hayes

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P86

Comment P86-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). Metro has a history of making important decisions behind a veil of privacy. This lack of transparency is again on display with this absurd proposal. From financing to ownership and operation nothing has been made clear to the public. What makes this is even more infuriating is that the public will probably be left holding the bag by a series of decisions they never got to interrogate or vote on. The gondola is a weird vanity project that neither the city nor the neighborhood needs.

Response P86-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and

Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment Letter P87 – Anthony Weiss

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P87**Comment P87-1** Deputy Executive Officer Cory Zelmer,

I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

I am deeply concerned at the lack of transparency around what is being touted as a transit project but appears, functionally, to be a vehicle designed to serve and enhance the value of private lands owned by the McCourt family. It is unclear why any public funds whatsoever should be devoted to this project when they could be devoted to a long list of projects with genuine public benefits that would benefit me and many other Angelinos: fare-free transit; increased bus service; more frequent rail service; increased cleaning and repairs for all transit vehicles; and much more. This will have a direct impact upon me and my family as transit users whose transit system may well be weakened and impoverished by this project.

Response P87-1 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for discussion of how the proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P87-2 Perhaps even more troubling to me is the apparent constant demands from the chief organizers of this private gondola project to demand that everyone who interacts with them — including government agencies — sign Non-Disclosure Agreements,

likely a violation of law, and undeniably a slap in the face to any sense of public trust. How are we know even basic information about this project? How much it will cost? How much of that cost will be borne by the public? Who will be responsible for cost overruns? Where will the support pillars go? Which communities will they disrupt, which people displace? As a resident of Los Angeles and a taxpayer, I am deeply concerned about how this will affect the finances and economy of my city, as well as my fellow residents.

Response P87-2 Refer to Section 2.0, Project Description, of the Draft EIR, for information about the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alameda Tower, Alpine Tower, and Stadium Tower. Metro has complied with and will comply with all applicable laws. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach during the Draft EIR public review period.

Comment P87-3 Metro is moving forward with this project despite the lack of public interest or desire, beyond the McCourt family real estate empire, without competitive bidding, without community consultation or input.

This project has been embarked upon without proper due diligence. It is not a project that anybody, save the McCourts and their friends, wants. It should be stopped in its tracks and buried, never to be revived.

Response P87-3 Refer to Response P87-1 for an overview of the need for the proposed Project. This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s sole source determination for the proposed Project. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, and Appendix A, Scoping Report, of the Draft EIR, for discussion of the proposed Project team’s outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process.

Metro engaged stakeholders in neighborhoods along the proposed Project alignment in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from stakeholders in neighborhoods along the proposed Project, including Chinatown, during this period led directly to changes to the proposed Project, including selecting the proposed Project’s alignment and the location of Chinatown / State Park Station, as discussed in Section 5.0, Other CEQA Considerations, of the Draft EIR. Eight public meetings were held immediately preceding and during the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. The Draft EIR itself serves as part of the “due diligence” for the proposed Project, with 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts. Refer to Response P87-1 for discussion of the Project Sponsor.

Comment Letter P88 – Betty Doumas-Toto

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P88

Comment P88-1 Deputy Executive Officer Cory Zelmer,

I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P88-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P88-2 Metro went forward with this project without an open public process and without competitive bidding. I don't understand the ownership or operation of the project because the details have been hidden from the community. Who is paying for this project? Will taxpayers be left holding the bag? There has been 0 transparency.

Response P88-2 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period.

Comment P88-3 The community has been neglected and our voices have not been heard. No one asked us our vision for our community.

We never asked for this project, this project is not need and has adds no benefit to the community.

Response P88-3 Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team’s outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project’s features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, privacy features, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment Letter P89 – Eli Jacobovitz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P89

Comment P89-1 Deputy Executive Officer Cory Zelmer,

I am in absolute opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). This is a project that would destroy a community of people of color in the Chinatown area of Los Angeles. This is a project that is geared towards tourists and no one in the community asked for or wants this project.

Response P89-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Response P89-2 for a discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities.

Comment P89-2 It is not needed and will do harm to poor communities and will displace the surrounding community that lives where this project would be constructed. This is another Chavez Ravine and if put forth will live in the same infamy of displacement, increasing number of homelessness, and mistreatment of people of color. Chinatown is a beautiful part of our city that should be respected and preserved, not bastardized with a facade of a metro project that will also eat into their budget when we need metro improvements that Angelinos HAVE asked for.

Response P89-2 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, how the proposed Project supports Metro's goal of prioritizing equity opportunities, is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, including Chinatown, how the public outreach for the proposed Project was designed

with environmental justice principles in mind, how the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region's most visited venues and would alleviate existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment Letter P90 – Jennifer Lei

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P90

Comment P90-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). I don't believe that it will provide any additional benefits to the community. There is already a problem with housing and buying out properties to install the gondola would not be a good use of our resources. Additionally, there is already a free shuttle that is in use with a designated bus lane that goes through Sunset. As a resident that lives near Dodger Stadium, I understand that traffic congestion can get crowded but a research study done by UCLA acknowledges that the gondola would only limit traffic by 1%. The benefits do not weigh out the consequences. Please stop the construction of the gondola.

Response P90-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. The Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment (Assessment) found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft, and recommended the proposed Project work with Metro to identify a transit partnership to further encourage proposed Project riders to take transit, walk, or bike to the proposed Project's stations. This partnership could include providing a free connecting Metro or Metro bikeshare ride with a ticket for the proposed Project, or other measures to further encourage a complete transit trip. By providing efficient, high-capacity, and faster alternative access to Dodger Stadium for games and special events, however, overall vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days would be reduced by the proposed Project because of game/special event attendees shifting to riding public transit rather than driving to Dodger Stadium. Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project's Draft EIR, and does not appear to have been prepared for that purpose.

Comment Letter P91 – Melody McBride

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P91

Comment P91-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P91-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P92 – Gizelle V zquez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P92

Comment P92-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). As a lifelong resident of the city of Los Angeles, I have seen many instances of the displacement of residents. This project would be another instance of this and increase the cost of living in this area. I also do not believe the gondola is necessary for the city, as free transportation already exists to Dodger Stadium. The funds would be better used elsewhere to help the people of Los Angeles.

Response P92-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement.

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned

sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P93 – Dylan Kirk

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P93

Comment P93-1 Deputy Executive Officer Cory Zelmer,

I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). It will negatively affect so many communities, and there is so little research that justifies the funding and execution of this project.

Response P93-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P93-2 There has been a complete lack of transparency, and as a lifelong LA resident and Dodgers fan, I find this project to be a waste of taxpayer dollars. There has been little to no community input, and we're heading into a recession; LA residents, especially those in affected communities, don't want to spend money on a useless gondola. Put the money into improving the public transportation system in LA, and improving the lives of residents who rely on public transportation to support the local economy instead of trying to increase profit. It's a scummy plan, and everyone so know vehemently opposes it. So who actually wants this? Because it doesn't seem like local residents do.

Response P93-2 Refer to Response P93-1 for an overview of the need for the proposed Project and for discussion of the proposed Project's costs and planned sources of funding. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. As discussed in Section 2.0, Project Description, of the Draft EIR, and Topical Response C, Project Features, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment Letter P94 – Cole Barrios

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P94**Comment P94-1** Deputy Executive Officer Cory Zelmer,

I am a student in this community writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). Nobody ever asked for this project. We don't need or want this project. Please don't waste taxpayer money on it. That money could be used on an actually effective method for solving our transit issues. Research has already been conducted at universities that demonstrate its lack of practical effects. This project will only pollute the communities it is built by more than they already are.

Response P94-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements.

Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data, and the management of queueing at stations, and pre-game and post-game transportation. Refer to Topical Response O, Response to UCLA Mobility Lab Study,

for detailed responses to the items in the Mobility Lab Study. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project's Draft EIR, and does not appear to have been prepared for that purpose. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment Letter P95 – Ashley Harmon

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P95

Comment P95-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P95-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P96 – Anne Freiermuth

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P96

Comment P96-1 Deputy Executive Officer Cory Zelmer,

I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

This is ultimately a money making project for the Dodgers and I am alarmed by the prospect that public money would be pulled from Metro's limited budget to fund it. As a resident of Los Angeles, I do not want my tax dollars used for private gain.

Response P96-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P96-2 The Dodgers already regularly violate the agreement they have with local residents about how many events happen each year and when. Now they want a city-funded project to enable them to do even more.

Response P96-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Response P96-1 regarding the Project Sponsor and funding for the proposed Project.

Comment P96-3 This project was effectively fought by the local community in the past. Now it's just moved to another venue with new branding. It needs to be stopped now.

Response P96-3 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P97 – Peter Kwong

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P97

Comment P97-1 Hello LAART:

I have attached a letter of support for the Los Angeles Gondola project. Please let me know if there are any questions or concerns you might have. Best Regards, Peter Kwong
Best Western Plus Dragon Gate Inn Royal Pagoda Motel

Response P97-1 This comment provides a general introduction regarding the comments raised in this letter and indicates support for the proposed Project. Responses to the comments contained in this letter are provided below in Responses P97-2 through P97-4.

Comment P97-2 Dear Ms. Wiggins and Honorable Metro Board Chair, Supervisor Solis:

I am writing to ask for your support for the Los Angeles Aerial Rapid Transit Project. LA ART.

I was raised and lived in Chinatown since 1963 in my local family business which continues to serve and support the Chinatown community.

Unfortunately, I can't say that for many of my neighbors. Many "mom and pop" businesses that were just getting by before the pandemic have now closed. We are slowly losing the fabric of Chinatown that once was the center of local Chinese American Culture. Our amazing restaurants, fabulous gift shops and Chinese Herb store, that always had a Chinese Doctor practicing acupuncture and herbal medicine, are now slowly going away.

Like many other areas of Los Angeles, Chinatown has had gentrification forced upon it. Families that once had a thriving business now face the reality that their business will never recover. These families are sitting on properties where the land value is worth more than the buildings. Having no choice but to sell, new projects are coming online from developers with no connection to the Chinatown community.

Many outside developers all know that Chinatown is the last bastion of affordable land that they can piece together to develop high end residential over commercial retail. I don't think this will ever stop, it's an unfortunate evolution of older neighborhoods having to change to survive. However, it need not be an inevitable one.

Response P97-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response C. Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, and Topical Response C, Project Features, the proposed

Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. Refer to Topical Response N, Environmental Justice for a discussion of how the Draft EIR fully analyzed and disclosed the proposed Project's potential environmental effects, including on the surrounding communities. Specifically, the Draft EIR addressed topics related to environmental justice, including the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution.

Comment P97-3 I believe that the Gondola project will inject economic stimulus for the remaining businesses. Hopefully others will see those businesses thrive and incentivize previous business owners, as well as other local and community interests, to re-invest in Chinatown.

Response P97-3 Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, and Topical Response C, Project Features, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment P97-4 This project has reached out to local people such as myself, to find out what we would like to see from them. There are many companies that never reach out to Chinatown and only reach out to us as an after thought.

I just finished a meeting with the Los Angeles Street Car project. They presented a plan to have the street cars run between 11th street to 1st street. On Hill and Broadway. I asked them why they didn't run the street cars to Little Tokyo, Olvera Street and Chinatown. If the plan was to encourage people to shop, eat and not drive cars. Then why weren't any of these three districts included? Why, because everyone forgets about us.

It is up to people like myself that have a passion for saving our communities to speak out, so that we can teach others about the history, beauty and contributions of Los Angeles Chinatown's culture and community. Hopefully this will have a positive affect in fighting discrimination and promote the survival, understanding and peaceful co-habitation of all the diverse cultures in the great city of Los Angeles.

Thank you for taking the time to read my letter. Please feel free to contact me if I can be of further assistance regarding this project or future developments in Chinatown or surrounding areas.

Best Regards,

Peter Kwong

Best Western Plus Dragon Gate Inn

Response P97-4

This comment provides a general conclusion regarding the comments raised in this letter and indicates support for the proposed Project. Responses to the comments contained in this letter are provided above in Reponses P97-2 through P97-3.

Comment Letter P98 – Ben Kolstad

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P98

Comment P98-1 This must be the worst idea I've heard in years. Please just use more buses. This pie-in-the-sky project reeks of special interest money. It is not a realistic solution to the problem of traffic during Dodger home games. Thanks very much.

Ben Kolstad
Dodger fan since '77:

Response P98-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities and how Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment Letter P99 – Ray Melendez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P99

Comment P99-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P99-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P99-2 And don't add any of those redflex red light cameras scams. Not sure who took payola for the ones in canoga park down canoga ave. What a shame. Someone got bribed.

Response P99-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P100 – Micah Enloe

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P100

Comment P100-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P100-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P101 – Steve Mirkin

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P101

Comment P101-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P101-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P102 – Edgar Mendez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P102

Comment P102-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P102-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P103 – Gabriella Nieves

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P103

Comment P103-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P103-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P104 – Wendy Whitcup

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P104

Comment P104-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P104-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P105 – Phyllis Ling

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P105

Comment P105-1 Are both of the in-person DEIR public hearings for the LA ART Gondola (Aerial Rapid Transit project) being held in the “open house” format with various posters and kiosks stationed throughout the room? If so, how will people be able to make verbal public comment at these in-person meetings?

I’m asking specifically about the meetings on December 10, 2022 and January 12, 2023.

<https://www.metro.net/calendar/laart-public-hearing-in-person/>
<<https://www.metro.net/calendar/laart-public-hearing-in-person/>>
<https://www.metro.net/calendar/laart-public-hearing-in-person-2/>
<<https://www.metro.net/calendar/laart-public-hearing-in-person-2/>>

Response P105-1 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach during the Draft EIR public review period. The format of the in-person public meetings immediately preceding, during, and immediately following, the Draft EIR public review period was an Open House, consistent with standard Metro practice, where attendees could learn more about the proposed Project and the key analyses and conclusions of the Draft EIR, and also a public comment opportunity. Twelve stations were set up throughout the venue, with ten stations focused on specific subject matter areas of the Draft EIR. Attendees could walk around to each station and ask questions to subject-matter experts about the proposed Project. Each station had large, printed boards summarizing the subject matter of that station, including: the Project Description, Aesthetics, Air Quality, GHG, and Energy, Cultural (Archaeology and Historical Resources), Parks and Recreation, Noise, Transportation, and Parking. Each station also included printed materials that attendees could review and/or take with them, including fact sheets in English, Spanish, and Chinese (Simplified) and printed copies of the presentation from the virtual public hearing in English, Spanish, Chinese (Simplified) and Chinese (Traditional). A hard copy of the Draft EIR was also available at the Summary of Impacts station for attendees to review. The meeting was staffed by Metro and AECOM staff, experts on subject matter areas including Transportation and Parking; Archaeology; Historical Resources; Air Quality, Greenhouse Gas, and Energy; Ropeway Engineering; Noise; and Aesthetics, and the Project team, who answered questions from attendees on the Draft EIR key analyses and conclusion. During the two in-person public meetings that were public hearings, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish,

and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment Letter P106 – Jack Tovar

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P106

Comment P106-1 Dear Mr. Cory Zelmer, I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium. The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P106-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P107 – Nancy Hoven

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to P107

Comment P107-1 I would like to make comment on the proposed gondola project between Union Station and Dodger Station. This is not a viable project to serve the greater community of Los Angeles residents.

Specifically:

Response P107-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P107-2 1. It is a for-profit company requesting the project, to be subsidized with taxpayer dollars and will benefit a relatively small percentage of the population. It will cost users considerable money to use the service, unless they hold Dodger tickets. This does not make the service accessible to those on limited incomes, rather only those who can afford Dodger tickets or the fare.

Response P107-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system,

approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P107-3 2. It serves a very limited community of people, specifically Dodger baseball fans and some communities along the route. They have other options such as the free Dodger buses during baseball season, and other Metro buses and trains.

Response P107-3 In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. The proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station.

Comment P107-4 3. Metro dollars would better serve ALL the communities within Los Angeles by making improvements in current Metro bus and train lines. Adding more frequent service, doing a better job at providing safe stations and vehicles, expanding the Metro Micro project, and improving overall cleanliness.

Response P107-4 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Response P107-2 for detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding.

Comment P107-5 4. This would not necessarily reduce traffic and emissions. If it becomes a tourist or local novelty attraction, people will drive to the stations on the gondola route, impacting congestion and parking in surrounding neighborhoods, and not really reduce emissions overall. The sorry state of cleanliness and safety on bus and train lines discourages many people who might consider using current public transit to connect to a gondola station. The gondola will not attract more regular transit riders. We should invest in making our current transit work for those who have no options and must take public transit to their jobs, schools, medical appointments, and more.

Response P107-5 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N,

Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Response P107-3 for discussion of how the proposed Project would also provide daily service for the surrounding communities, would be free to ride for anyone with a ticket to a Dodgers game, and the Community Access Plan. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines ("TAG"). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Comment P107-6 5. It would be unsightly, looming over the State Historic Park, and the light, noise and mechanisms would impact wildlife, especially bird life. These elements would also impact the experience of park users and residents of adjacent communities.

Response P107-6 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant, including at the Park. Specifically, as discussed therein, impacts from light and glare would be less than significant, including at the Park. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project. As detailed therein, construction related noise impacts would be significant and unavoidable even with

implementation of mitigation. Operational noise impacts would be less than significant. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of the Final EIR for discussion of how the risk of avian collisions with the cables or components of the proposed Project is less than significant. Design features of the proposed Project (e.g., the lack of shield wires, the inclusion of slack carriers, presence of moving gondola cabins, and vinyl window film) are likely to reduce the risk of avian collisions in comparison to transmission lines.

Comment P107-7 Again, please don't invest taxpayer dollars into a project with limited benefit to the overall Los Angeles community.

Thank you for your consideration.

Nancy Hoven

Response P107-7 Refer to Response P107-2 for detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding.

Comment Letter P108 - Miguel Nisthal

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P108

Comment P108-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P108-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P109 - Mike Connors

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P109

Comment P109-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P109-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P110 – Karin Costello

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P110

Comment P110-1 I strongly oppose Frank McCourt's vanity project.

Response P110-1 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P110-2 It will not seriously reduce traffic, it's expensive, and it will disrupt a neighborhood that is already greatly challenged.

Response P110-2 The proposed Project's ability to reduce vehicular travel is discussed in Section 3.17, Transportation and Appendix N, Transportation Appendices, of the Draft EIR. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emission. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses.

Comment P110-3 McCourt has never done anything good for Los Angeles, and he won't start now.

I'm a lifetime Dodgers fan and native Angeleno.

Response P110-3 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Response P110-1 for discussion of the Project Sponsor.

Comment Letter P111 – Ben Park

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P111

Comment P111-1 Please do not approve the LA ART Gondola.

This project would bring negative consequences to the neighborhoods it would be built in, from noise pollution, disruptive land use and displacement of residents and businesses, to the gentrification of the communities. Furthermore, all that disruption is unnecessary:

Response P111-1 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment P111-2 A far better solution to improve public transit to Dodger Stadium would be to increase the scale and reach of the Dodger Express bus shuttle routes. This solution can be made sustainable with an all-electric bus fleet, an investment that would cost far less, and be a much easier and more effective solution, in every way, than the LA ART Gondola.

Thanks for your time.

Response P111-2 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park, and how electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Improving the connection between LAUS and

Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment Letter P112 - Desmond Blik

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to P112

Comment P112-1 Hi Cory,

Hope you're doing well. Quick two cents on the Dodger gondola from somebody who's business it absolutely isn't:

Cool project, but 100 event days out of 365 calendar days seems like a low ratio. Would be a shame to have such a great piece of infrastructure with such frequent service to a site that certainly has some high peaks, but also has a lot of valleys. With that in mind is it possible to adjust the project to attain higher and more consistent ridership?

Response P112-1 Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park.

Comment P112-2 1- Is there a way to implement a condition that the Dodgers redevelop at least some of the parking with a mix of housing (potentially affordable) and other uses? This would potentially reduce the peak event parking and traffic load (addressing some of the air quality and congestion concerns) and provide a more consistent source of ridership on the 265 non-event days each year.

Response P112-2 As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project solely proposes an aerial gondola system. The proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Comment P112-3 2- Is there a way to extend the alignment westward to serve Echo Lake? Possibly this involves second or third phases, but critically, locating and designing the stadium gondola terminal in a way that allows for future extension seems like it would be prudent, as one never knows, and it could allow for better service to Echo Lake (which is a bit off the transit track otherwise) and a potential link to the red and purple lines at MacArthur park, making access to Dodger Stadium more convenient from that direction. Pictured below (X is deleted stadium terminal, O is new stadium terminal location; think the lines mostly stick to public right-of-way):

Hope you're enjoying the project and have a good holiday season ahead.

-Des

Desmond Blik

403.370.2330 | desmond.blik@gmail.com

Response P112-3 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P113 - Ovo Xxx

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P113

Comment P113-1 Dear Mr. Cory Zelmer, I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium. The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P113-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P114 - Hugo Garcia

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P114

Comment P114-1 I was wondering if your on-line outreach notices are available in Spanish language. Please let me know.

Response P114-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified).

Comment Letter P115 - Phyllis Ling

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P115

Comment P115-1 Hello, I haven't seen any response to my question yet. Could you please let me know the format of tomorrow's LA ART DEIR hearing at Union Station? Will there be a formal presentation and then a time for people to go up to a microphone to provide verbal comment?

Thanks, Phyllis Ling

> On Dec 7, 2022, at 1:08 PM, Phyllis Ling <pling@yahoo.com> wrote:

<<https://www.metro.net/calendar/laart-public-hearing-in-person-2/>>

Response P115-1 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach during the Draft EIR public review period. The format of the in-person public meetings immediately preceding and during the Draft EIR public review period was an Open House, consistent with standard Metro practice, where attendees could learn more about the proposed Project and the key analyses and conclusions of the Draft EIR, and also a public comment opportunity. Twelve stations were set up throughout the venue, with ten stations focused on specific subject matter areas of the Draft EIR. Attendees could walk around to each station and ask questions to subject-matter experts about the proposed Project. Each station had large, printed boards summarizing the subject matter of that station, including: the Project Description, Aesthetics, Air Quality, GHG, and Energy, Cultural (Archaeology and Historical Resources), Parks and Recreation, Noise, Transportation, and Parking. Each station also included printed materials that attendees could review and/or take with them, including fact sheets in English, Spanish, and Chinese (Simplified) and printed copies of the presentation from the virtual public hearing in English, Spanish, Chinese (Simplified) and Chinese (Traditional). A hard copy of the Draft EIR was also available at the Summary of Impacts station for attendees to

review. The meeting was staffed by Metro and AECOM staff, experts on subject matter areas including Transportation and Parking; Archaeology; Historical Resources; Air Quality, Greenhouse Gas, and Energy; Ropeway Engineering; Noise; and Aesthetics, and the Project team, who answered questions from attendees on the Draft EIR key analyses and conclusion. During the two in-person public meetings that were public hearings, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment Letter P116 - Schenae Rourk

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P116

Comment P116-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P116-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P116-2 In addition, the goals of 35% for local, small, diverse, dvbe and lgbtq is a goal that Metro is also moving towards with their 48x28. They help with economic recovery and that is what we want for our communities.

Response P116-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response C, Project Features, for a discussion of how the Project Sponsor has committed to a goal of 35 percent utilization of minority business enterprises (MBE), women business enterprises (WBE), disadvantaged business enterprises (DBE), small business enterprise (SBE), disabled veteran business enterprises (DVBE), and LGBTQ-owned businesses during the proposed Project's construction phase.

Comment Letter P117 - Christian D. Nívar

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P117

Comment P117-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P117-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P118 - Celeste Salazar

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P118

Comment P118-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P118-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P119 - Anna Menedjian

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P119

Comment P119-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P119-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P120 - Casa Wilson

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P120

Comment P120-1 My name is Casa Wilson, and I live at 419 Solano Avenue near Broadway. I'm writing to provide public comment on the proposed Dodger Stadium Gondola Project.

As a resident of this neighborhood, I am vehemently opposed to this project and very concerned that it's being pushed through with a private company that has links to Dodger Stadium and the McCourt family.

Although there seem to be very few details about the project, these ones concern me:

Response P120-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P120-2 The project would require the construction of those stations, a junction and a few towers, which Metro's EIR states "would result in significant and unavoidable impacts related to noise and vibration." Where? For how long?

Response P120-2 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction noise impacts from the proposed Project. Tables 3.13-17 and 3.13-18 on pages 3.13-35 to 3.13-45 of Section 3.13, Noise, of the Draft EIR, show the locations where on-site construction noise impacts would occur during each phase of construction of the proposed Project, based on the L.A. CEQA Thresholds Guide and FTA analysis methods. Additionally, Tables 3.13-19 and 3.13-20 provide a summary of the proposed Project's construction impacts across all phases of construction of the proposed Project per the L.A. CEQA Thresholds Guide analysis and FTA analysis. As detailed therein, on-site construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Mitigation Measure NOI-A would be implemented during construction of the proposed Project, requiring a Construction Noise Management Plan to minimize construction-related noise impacts to off-site noise-sensitive receptors, which would include construction noise barriers. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the vibration impacts from construction of the proposed Project. Vibration impacts associated with the proposed Project were analyzed in the Draft EIR both for building damage and

human annoyance. Table 3.13-28 on page 3.13-62 of Section 3.13, Noise, of the Draft EIR, shows the location where on-site construction vibration impacts would occur during each phase of the construction of the proposed Project. With implementation of Mitigation Measures VIB-A and VIB-B during construction of Alameda Station, vibration damage impacts at the Avila Adobe, the Old Winery, and El Grito Mural, would be less than significant. As demonstrated in Table 3.13-28 on page 3.13-62 of Section 3.13, Noise, of the Draft EIR, the proposed Project would result in significant and unavoidable human annoyance impacts during construction of the proposed Project. Refer to Section 2.8, Construction, in Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR, for discussion of the duration of construction for each component of the proposed Project.

Comment P120-3 2. The project serves ONLY Dodger Stadium and, for the most part, baseball fans which already have a free transit option (the buses that run from Union Station). As the California Endowment has pointed out, this is a tourist stunt, not an actual, viable transit option that will widely serve the community. I imagine it will also go empty for half the year when there are no Dodgers games!

Response P120-3 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P120-4 3. The apparent conflict of interest between Drew McCourt's company and his family's ties to the Dodgers and the stadium

Response P120-4 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P120-5 4. The invasion of privacy for the residents of Chinatown and Solano Canyon. We're already facing a possible high rise apartment building development at the end of our street on Broadway (funded by another wealthy, connected L.A. family that owns the San Antonio Winery) that will bring more traffic and people to our quiet neighborhood. A gondola will mean that even the skies around our homes are taken up by money-grabbing developers, their projects, and their pollution.

Response P120-5 Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. The proposed Project would be located in a densely-populated, urban environment surrounded by a variety of commercial, industrial, and residential development types. In this type of environment, it is common for public transportation, such as Metro's light rail, to be located adjacent to residential uses and modern aerial transit systems in other cities, including Portland, Oregon and New York City, operate adjacent to residential uses. Nevertheless, as discussed in Topical Response J, Gondola Design and Operations and Section 2.0, Project Description, of the Draft EIR, cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views, and the proposed Project would work with stakeholders adjacent to the proposed Project alignment to identify locations where the use of privacy glass would be warranted. Considerations as to the locations along the proposed Project alignment where the privacy glass could be activated include the subject adjacent sensitive views and the vertical and horizontal distance between the proposed Project cabins and the adjacent sensitive views. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P120-6 5. No details about what will happen to Radio Hill and the unhoused population that live there and if it will still be accessible to the residents of this neighborhood who hike there.

Response P120-6 Refer to Section 3.16, Parks and Recreational Facilities, of the Draft EIR for a discussion of access to Radio Hill Gardens. The proposed Project would not be located

within Radio Hill Gardens, with the closest proposed Project component (Stadium Tower) located approximately 275 feet east of Radio Hill Gardens. As discussed on page 3.16-13 of the Draft EIR, the two entrances to Radio Hill recreation area are located off Stadium Way and Bishops Road and Amador Street between Solano Avenue and SR 110. Although construction would require the temporary closure of Bishops Road, located south of Radio Hill Gardens, access to the area would be maintained as the trail entrance could be accessed via Cottage Home Street.

Comment P120-7 6. The fact that, once again, this neighborhood is being destroyed and sidelined in service to a baseball team, of all things. It seems like an especially audacious move, considering the history of how Dodger Stadium was built and the people who lost their homes for its construction.

Response P120-7 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine.

Comment P120-8 7. I've lived on both the Echo Park side and the Chinatown side of Dodger Stadium. The difference is stark and runs along class lines. When I lived on the Echo Park side, there were times I had to show my drivers license to even be allowed to enter the street I lived on on game days. On the Chinatown side, there are traffic cops that wave Dodger fans onto our tiny residential streets, despite the fact that there are signs all over the place that say "No Dodger Traffic Allowed" and "Local Access Only." To me it's clear that this gondola project is just another example of the disregard Dodger Stadium and the city of Los Angeles has for working class neighborhoods of non-native English speakers. There is no chance that a project like this (basically running buses over our heads on a daily basis for hours at a time) would be allowed

or even considered in a wealthy, gentrified neighborhood like Echo Park, and yet, it's being pushed through on our side with almost no public comment.

Response P120-8 Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. The proposed Project would benefit the surrounding community by alleviating existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety. Further, no displacement of existing residences or housing would occur in connection with the construction and operation of the proposed Project, which would operate primarily over the public ROW and publicly owned property to minimize aerial rights requirements over private properties, taking into account existing and future adjacent land uses. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for

discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding and during the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment P120-9 8. I'm also concerned about more Dodgers Fans flocking to our neighborhood to ride the gondola. My apartment is next to an alley and the Cordoba Corporation parking lot. Every single game day, we deal with Dodgers fans getting out of their cars to urinate on our house and in the alley. Now they'll be over our heads, too.

Response P120-9 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, for discussion of how the proposed Project would be equipped with security features and the Emergency Operations Plan for the proposed Project would include emergency response protocols and safety procedures developed in conjunction with the operator, system provider, and local authorities. Refer to Section 2.5, Proposed Project Alignment and Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses.

Comment P120-10 9. What kind of light pollution should we expect from this project? If the gondolas are running after games or other events, does that mean we can expect a lit up transit system shining into our homes all day and night? Will it be lit 24-hours a day?

Response P120-10 Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project's signage and lighting, with additional technical detail and information provided in the Lighting Study, which is included in Appendix C, Visual Impact

Assessment, of the Draft EIR. The proposed Project lighting would include low-level lighting for security and wayfinding purposes. Signage proposed for the exterior of the cabins is static non-illuminated signage. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, subject to operational changes in response to ridership demand. Additionally, the proposed Project alignment was chosen as it maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties, taking into account existing and future adjacent land uses.

Comment P120-11 Please consider that there are so many downsides for the people who live here and all in service of taking some baseball fans up a hill.

Please end this project. I'm cc'ing Eunisses Hernandez's website on this, as well, with the hope that she'll receive it as our new city council representative.

Response P120-11 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses P120-1 through P120-10.

Comment Letter P121 - Renee Young

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P121

Comment P121-1 Dear Mr. Cory Zelmer, I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium. The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos. Sincerely, LA Resident

Response P121-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P122 - Katherine Chrisman

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P122

Comment P122-1 Please take this project to heart and heart execute.As a homeowner here in West LA for 38 years I value this project for many reasons.

Response P122-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P123 - Daren Cole

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P123**Comment P123-1** Re: Los Angeles Aerial Rapid Transit Project

We would like to express our enthusiastic support for the proposed LA ART gondola system connecting Los Angeles Union Station and Dodger Stadium.

Leitner Poma has extensive experience as a manufacturer, as an operator, and investor in the cable-hauled mass transit sector (both for mountainous and urban environments). We feel confident that the Los Angeles Aerial Rapid Transit (LA ART) project would substantially enhance the safety and the reliability of public transit throughout the area, while enhancing the sustainability of public mass transit and featuring among the lowest cost per mile metrics.

To achieve the benefits of the technology, a capable and dedicated team is required. Our group has been able to work alongside the LA ART team during their planning process and can confirm that LA ART has assembled a highly competent team that has put forward a thoughtful plan that is feasible and buildable.

Furthermore, a gondola system is the safest and most reliable public transportation system for the route.

Safety is the most prominent feature of an aerial gondola. Indeed, a 2022 report of PWC (<https://www.ewc.de/de/branchen-und-markte/oeffentlicher-sektor/pwc-studie-urbane-seilbahnen-im-oelsnv.pdf>) highlights the following:

Aerial ropeways feature 1 accident occurring every 10,563,000 miles travelled

In comparison, street cars display 1 accident every 139,808 miles, and buses have 1 accident every 382,764 miles.

Amongst our approx. 80 urban ropeways built worldwide, we have never experienced any major accidents nor vertical evacuations.

Gondola systems are extremely reliable, as the closed-loop system guarantees delay-free transportation on a uniform schedule with minimal wait times. Moreover, 3S (tricable) ropeways are designed for high passenger capacities allowing for hassle-free peak day / hour transportation, even during busy game days or events at the Stadium. Additionally, aerial gondolas have the capability to operate during windy days and at wind speeds of up to 62 MPH (dynamic wind pressure of 400 Pa), dramatically increasing the reliability of public transportation between Union Station and Dodgers Stadium. Leitner Poma has more than a century of experience in the cable transportation field, with more than 11,000 ropeways manufactured and installed worldwide, in ski resorts, entertainment, and urban settings. We have

pioneered gondolas to be used for public transportation, with approximately 80 systems built across the world, including:

- Roosevelt Island Tramway in NYC
- Teleo 3S in Toulouse
- Cablebùs 2 in Mexico City
- Metrocable lines in Medellin

All of our ropeways have an availability rate of 99.956. Some relevant examples include, but are not limited to:

Zermatt 3S gondola on 12,700ft alt. in Switzerland, featuring a rope span of 1.7 miles between two towers, enduring wind speeds of up to 62 MPH on a daily basis <https://www.youtube.com/watch?v=wPkAcAMgYoc>.

Cablebus 2 gondola in Mexico City, which is the longest urban ropeway project on the planet, built on an earthquake-prone area without experiencing any disruption to the transit service (recently, an earthquake of the magnitude of 6.8 struck the area, without any disruption to the system besides a brief safety stop).

Toulouse 3S gondola which resembles the environment and use of the LA ART project, where our Group installed a tricable gondola to transport passengers from the Sabatier University (intermodal transit hub, connected to the local subway line) to the hospital (middle terminal) and the cancer research center Oncopole (end terminal) <https://www.youtube.com/watch?v=EaDMDXp6df0>.

In closing, we think the justifications for the gondola are many, and would expand as this new mode of transit gains traction and acceptance in the community. This is a positive change to typical American transit modes, and Los Angeles is poised to lead this shift toward a more efficient and sustainable zero emissions future.

Sincerely, -

Leitner-Poma of America, Inc.

Response P123-1 This comment letter indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. As discussed in Topical Response M, Comparable Urban Aerial Transit Systems, discussing numerous aerial transit systems in other locations around the world that serve as precedents for the proposed Project, such comparable systems demonstrate the versatility of aerial transit systems to operate in diverse environments and represent a sample of the numerous models for the proposed Project. Like such systems, the proposed Project would enable faster transit and facilitate commerce for businesses and consumers along the system alignment. This commenter, Leitner

Poma, is one of two manufacturers of 3S gondola systems in the world, and Metro and the Project Sponsor appreciate the company's support for the proposed Project.

Comment Letter P124 – Lauren Fortner

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P124

Comment P124-1 I am writing to express my support for the proposed aerial gondola project, as it carries significant benefits in terms of reducing traffic. The aerial gondola is a great alternative to driving and will provide a reliable alternative to clogged highways and congested streets in Los Angeles. By taking cars off of the roads, we can significantly reduce air and noise pollution, as well as improve the flow of traffic in our city.

By switching to renewable resources, we can help slow the effects of climate change and contribute to a healthier, cleaner, and more sustainable Los Angeles. I enthusiastically support the Los Angeles aerial gondola project and hope that you will give it due consideration.

Response P124-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P125 – Tara Kays

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P125

Comment P125-1 I am writing to express my support for the proposed aerial gondola project, as a passionate Dodgers fan. It is a fast and efficient means of transportation that provides easy access to Dodgers Stadium without having to be weighed down by congested traffic. The aerial gondola project will provide an enjoyable and stress-free ride for fans on game day!

Response P125-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P126 – Jessica Wong

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P126

Comment P126-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P126-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P127 – Abraham Mercado

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P127

Comment P127-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P127-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P128 – Min Polley

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P128

Comment P128-1 I am writing to express my support for the proposed aerial gondola project, as it carries significant environmental benefits. The aerial gondola is a great alternative to both overground and underground rail systems due to its low construction and operational costs, as well as its minimal disruption of natural and existing urban environments.

The aerial gondola project is sure to help reduce air and noise pollution in Los Angeles, and I sincerely hope it gets approved.

Response P128-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P129 - Sharon Coleman

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P129

Comment P129-1 Dear Mr. Cory Zelmer, I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium. The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos. Sincerely, LA Resident

Response P129-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P130 - Navid Nakhaee

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference

Responses to P130

Comment P130-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P130-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P131 - Alejandro Herrera

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P131

Comment P131-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P131-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P132 – Michelle Liu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P132

Comment P132-1 Building a gondola will affect residents' life, privacy, and safety. It is infeasible to build a gondola close to residential houses. I hope the city government can stop it and bring a quiet and safe living environment back to me.

Response P132-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. The proposed Project would be located in a densely-populated, urban environment surrounded by a variety of commercial, industrial, and residential development types. In this type of environment, it is common for public transportation, such as Metro's light rail, to be located adjacent to residential uses and modern aerial transit systems in other cities, including Portland, Oregon and New York City, operate adjacent to residential uses. Refer to Topical Response J, Gondola Design and Operations and Section 2.0, Project Description, of the Draft EIR, for discussion of how cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views. Considerations as to the locations along the proposed Project alignment where the privacy glass could be activated include the subject adjacent sensitive views and the vertical and horizontal distance between the proposed Project cabins and the adjacent sensitive views. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Operational noise impacts would be less than significant.

Comment Letter P133 - Juniper Wong

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P133

Comment P133-1 Hello,

I was in attendance for tonight's Zoom hearing regarding the LA ART proposed gondola. I believe the Cantonese interpreter padded one of the Chinese comments in his English translation.

This comment was given around the *6:49pm mark*. As a Cantonese speaker, I heard the caller say simply "I support the gondola. It is good for Chinatown." The interpreter then translates this to English saying she said "I support the gondola. It is good for local business." Which is not what the woman said and not the point she made.

I request you review all the Chinese verbal comments for this kind of inaccuracy. This is the second time I've experienced unfair treatment through the Chinese interpreters from LA Metro.

Response P133-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. In response to this comment, AECOM conducted an inquiry in conjunction with the consultant providing translation and interpretation services (LAT Multilingual) and summarized its results in a memorandum to Metro dated January 23, 2023.⁴ As discussed therein, the results revealed that the initial interpretation from the virtual public hearing held on December 13, 2022, discussed in this comment, utilized a common translation of the Cantonese phrase used, and the comment thus was not "padded." Refer to Attachment B to Appendix A, Public Outreach Report, of the Final EIR, for links to audio and video recordings of the December 13, 2022, virtual public hearing.

Comment P133-2 On Dec 10 at the Union Station hearing, I was in attendance with Cantonese seniors who submitted written public comment. The Cantonese interpreter at the front desk read one of these comments, came up to me afterwards, and said, in Chinese, that the comment was ineligible. That the senior "misunderstood" the project because her concern regarding affordability in the neighborhood did not apply. I asked him if he would still accept it, and he said yes, as he should have without question to begin with. I still do not understand why he did that as I find this unethical — to give this "feedback" knowing others around us could not understand him — but it did give me insight into what LA Metro considers "eligible" concern.

⁴ AECOM. 2023. Memo documenting AECOM's inquiry into public hearing translator comments.

I hope you will look into all of this, and realize how misguided this project is, from its very idea as a transportation solution, to the very conduct of the people who are supposed to provide accessibility.

Response P133-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. In response to this comment, AECOM conducted an inquiry in conjunction with the consultant providing translation and interpretation services (LAT Multilingual) and summarized its results in a memorandum to Metro dated January 23, 2023.⁵ As discussed therein, LAT’S Multilingual interpreters stated that they did not take part in an interaction like the one described in the comment during the December 10, 2022, public hearing. The interpreters are certified and bound by a code of ethics that would prevent them from advocating a position in a setting such as this public hearing. The comment also describes the interpreter using male pronouns, but the Cantonese interpreters present at the December 10, 2022, public hearing, were both female. Refer to Appendix B, Public Hearing Transcripts, for transcripts of all verbal comments received on the Draft EIR during the two in-person public hearings. In addition, refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

⁵ AECOM. 2023. Memo documenting AECOM’s inquiry into public hearing translator comments.

Comment Letter P134 - Désirée Lenart

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P134

Comment P134-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P134-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P135 - Jorge Leandros Tovar

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P135

Comment P135-1 I support the Gondola project, and I appreciate the goal of 35%, it's unprecedented for local, small, diverse, and DVBE businesses. We need economic recovery and this project can help.

Response P135-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, for discussion of how the Project Sponsor has committed to a goal of 35 percent utilization of minority business enterprises (MBE), women business enterprises (WBE), disadvantaged business enterprises (DBE), small business enterprise (SBE), disabled veteran business enterprises (DVBE), and LGBTQ-owned businesses during the proposed Project's construction phase.

Comment P135-2 Ultimately though, I'm not sure the path is the best path considering all the opposition to the project - especially from residents in the proposed area. I should be considered that the best path is not always a straight line. Additionally, the start and end location should be optimal locations. The path should be designed in a way that does not impede on residential peace, and the natural landscape, but will still add value to the City of Los Angeles.

I propose that we include an analysis study for optimal path in the EIR.

My firm is ready and able to perform and deliver on this analysis to be included in the EIR.

Please don't hesitate to contact me for further discussion.

Response P135-2 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would

convene stakeholder groups to coordinate on issues related to proposed Project features.

Refer to Section 2.0, Project Description, for discussion of the proposed Project alignment, which was chosen as it maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties, taking into account existing and future land uses. As shown in Figure 2-8, the proposed Project alignment is not a straight line but would turn northwest at the Broadway Junction. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a “No Project Alternative,” the Spring Street Alignment Alternative, and the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express. Section 4.2.1, Alternatives Considered but Dismissed from Detailed Analysis, of the Draft EIR, considered five potential alternatives, including alignment and station location alternatives and direct alignment alternatives. In accordance with CEQA Guidelines section 15126.6(f)(2), the Draft EIR declined to carry forward an analysis of the alternative locations studied in the direct alignment alternatives, as such alternatives failed to avoid significant environmental impacts and otherwise would not meet the Project Objectives, and the Project Sponsor would likely be unable to reasonably acquire, control, or otherwise have access to alternative sites required for the direct alignment alternatives. The commenter does not provide any specific alternative alignment recommendations.

Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant.

Comment Letter P136 – Diane Weiss

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P136

Comment P136-1 For heaven’s sake!

Again, a billionaire wants a new ridiculous toy in his name and the city swallows all the green-washing hook, line & sinker and gets excited for another over-blown project which will NOT do what it promises to!

Response P136-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P136-2 Frank McCourt is selling you a lie. You really think a veery slow-moving gondola is going to solve traffic problems to the Dodger games? When people have to drive and park at the stations? After the first game, when the over-priced novelty wears off, no one is going to take the extra time to stand in a gondola line possibly for over an hour, especially when they have to do the same thing in reverse when they’re ready to just get home after the game. It will not be used! You will waste our precious open space, tax-payer money and invaluable environment for nothing if you go through with this horror!

Response P136-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would have a maximum capacity of approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on

the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations.

Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines ("TAG"). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data,

and the management of queuing at stations, and pre-game and post-game transportation. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P136-3 Here the most important fact you should think of every time you have a stupid development plan in front of you:

In the last 50 years, the world has lost two-thirds, (2/3, or 60%) of our wildlife due to development and ruination of habitat. (<https://www.worldwildlife.org/press-releases/69-average-decline-in-wildlife-populations-since-1970-says-new-wwf-report> <<https://www.worldwildlife.org/press-releases/69-average-decline-in-wildlife-populations-since-1970-says-new-wwf-report>>)

We cannot afford frivolous, wasteful, vanity developments like this stupid gondola! At some point, we HAVE to stop being so greedy and short-sighted. This thing will disrupt wildlife all around this development, halting mating seasons, causing more undue stress on animals, causing the permanent loss of local wildlife. It will become a giant eyesore, destroying countless vistas from all over LA, including from some of our most beloved jewels of the city.

Response P136-3 Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of this Final EIR for discussion of how the proposed Project would not result in significant impacts to wildlife populations or to special status species and their habitats. As discussed in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of certain trees for the proposed Project would result in a small reduction of habitat for wildlife species that depend on trees for cover, nesting, roosting, foraging, and other reasons. In the short-term, the removal of trees would result in a marginal reduction of suitable tree habitat for nesting birds, roosting bats, and other wildlife in the vicinity of the proposed Project. Common wildlife species would be expected to utilize adjacent habitats, and substantial population level impacts to common species would not be expected due to the small amount of habitat loss relatively to the amount of habitat available in surrounding areas. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the

Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.

Comment P136-4 We have to learn to treat our city with grace. This kind of ego-driven monster is a God-awful idea, presented by highly-skilled shysters who want you to believe their gold-digging is for your own good.

PLEASE STOP THE @\$%& GONDOLA.

Response P136-4 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses P136-1 through P136-3.

Comment Letter P137 – Miguel Haro Jr.

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P137

Comment P137-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P137-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P138 – Veronica Corona

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P138

Comment P138-1 I support the Gondola!

Response P138-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P139 – Jay Adriano

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P139

Comment P139-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P139-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P140 – Chinatown Station

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to P140

Comment P140-1 Re: Comment Letter on the Draft EIR for the Los Angeles Aerial Rapid Transit Project

Dear Mr. Zelmer:

DLA Piper LLP (US) represents Chinatown Station Owner LLC (“CSO”), and is submitting this comment letter on CSO’s behalf. CSO owns the properties located at 129-135 West College Street and 924 North Spring Street, Los Angeles, California (collectively, the “Property”). The Property is a 4.9-acre site located immediately adjacent to the proposed Chinatown/State Park Station for the proposed Los Angeles Aerial Rapid Transit Project (“Project”) sponsored by LA Aerial Rapid Transit Technologies LLC (“Project Sponsor”). In March of 2019, the City of Los Angeles (“City”) approved the Property for development of a seven-story building containing a maximum of 725 multifamily residential units and 51,600 square feet of commercial uses. All litigation challenging that approval has either been settled or finally concluded in the City’s and CSO’s favor, and development of the Property is proceeding.

Response P140-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P140-2 The Draft Environmental Impact Report dated October 17, 2022 (“Draft EIR”), prepared on behalf of the Los Angeles County Metropolitan Transportation Authority (“Metro”) as lead agency for the Project, is defective under the California Environmental Quality Act (“CEQA,” Pub. Res. Code, §§ 21000 et seq.) and its companion regulations (“CEQA Guidelines,” Title 14, Cal. Code Regs., §§ 15000 et seq.) for the following reasons.

Response P140-2 This comment provides a general introduction regarding the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses P140-3 through P140-55. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR.

Comment P140-3 Metro's Draft EIR fails to fulfill its statutory purpose as an informational CEQA document. It does not adequately describe the Project, leaving key elements unspecified and consequently unexamined. It improperly engages in a piecemeal review rather than analyzing the impacts of the entirety of the true Project, and fails to consider how the Project reviewed in the Draft EIR is a part of, or precursor to, a future environmentally impactful project planned by the Project Sponsor including, without limitation, the redevelopment of the area on and surrounding the Dodger Stadium parking lot. The Draft EIR also unlawfully fails to address, much less analyze, the cumulative impacts of the Project together with this future project, and their potential growth-inducing impacts.

Response P140-3 This comment provides a general summary of the comments raised in this letter. Responses to the comments contained in this letter are provided in Responses P140-4 through P140-55. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P140-4 The Draft EIR not only fails to adequately describe and analyze the whole of the Project, its Project Description is also inadequate, unstable and missing material information. As more fully set forth below, the Draft EIR fails to adequately analyze impacts related to Air Quality, Historic and Archeological Resources, Noise, Transportation, and Aesthetics, and its mitigation measures are legally invalid under CEQA, for the reasons described below.

Metro is obligated by law to revise the Draft EIR to consider the impacts of the entirety of the true Project, and recirculate the Draft EIR, before considering its approval.

Response P140-4 This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses P140-5 through P140-55. This comment and the comments raised in this letter do not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines Section 15088.5.

Comment P140-5 I. THE DRAFT EIR INCLUDES AN INADEQUATE PROJECT DESCRIPTION

The definition of the project analyzed in an EIR is critical to the sufficiency of that EIR under CEQA. “An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR.” (County of Inyo v. City of Los Angeles (1977) 71 Cal.App.3d 185, 193 (“County of Inyo”) (italics in original).) “‘Project’ means the whole of an action, which has a potential for resulting in either a direct physical change in the environment or a reasonably foreseeable indirect physical change in the environment...” (CEQA Guidelines, § 15378.) The definition of the project must include not only the activities to be undertaken immediately, but also all “‘reasonably

foreseeable’ future activities related to the proposed project.” (Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova (2007) 40 Cal.4th 412, 428 (“Vineyard”); Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 396.

Response P140-5 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations, but does not address an environmental issue or raise a substantive issue on the content of the Draft EIR. This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P140-6 An EIR is prepared under CEQA to describe and analyze the significant environmental effects of a project and discusses ways to mitigate or avoid the effects. (Id., § 15362.) The EIR’s analyses must encompass all facilities and components necessary to the project. (Santiago County Water Dist. V. County of Orange (1982) 118 Cal.App.3d 818, 829-831 (“SCWD”).) The EIR’s project description cannot include a broad list of project purposes, some of which are never analyzed in the EIR. (County of Inyo v. City of Los Angeles (1981) 124 Cal.App.3d 1, 6 (“County of Inyo II”).) If an EIR contains a project description that is unstable, or that fails to include components, facilities or actions integral to the project, or if the EIR fails to assess the potential impacts of purposes or components of the project included in the project description, the EIR’s analyses and conclusions are undermined and the EIR is rendered invalid under CEQA. (See, e.g., Vineyard, supra, at p. 429; Santiago County Water Dist., supra, 118 Cal.App.3d at 829-831; County of Inyo II, supra.)

Response P140-6 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations, but does not address an environmental issue or raise a substantive issue on the content of the Draft EIR. This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P140-7 A. THE PROJECT DESCRIPTION IS UNSTABLE

As described in the Draft EIR’s Section 2.0, Project Description, the Project has two overall purposes: (1) to provide an aerial rapid transit option for people traveling from Union Station to events at Dodger Stadium (p. 2-42), estimated at only approximately 100 events per year (Section 2, Project Description, p. 2-10), and (2) to provide transit access for visitors to the Los Angeles State Historic State Park, and for commuters and residents in neighborhoods along the Union Station/Dodger Stadium route, including Elysian Park, Solano Canyon, Echo Park, Mission Junction, Chinatown and El Pueblo (Section 2, Project Description, pp. 2-13, 2-42). The Draft EIR explains that the Project is needed to reduce traffic congestion and associated pollution in and around Dodger Stadium and in the communities along the Project’s alignment, which are

“disproportionately burdened with multiple sources of pollution.” (Id., p. 2-10.) To serve these two purposes, the Project would operate daily from 6:00 a.m. to 12:00 a.m. (Id., p. 2-42).

Response P140-7 This comment provides a general recitation and characterization of Section 2.0, Project Description, of the Draft EIR. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project’s system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Response P140-8 for a discussion of the Draft EIR’s compliance with CEQA’s requirements.

Comment P140-8 However, both logic and the statements and analyses in the Draft EIR demonstrate that the actual Project intended by the Project Sponsor is narrow – simply and only limited to the first purpose of replacing vehicle trips to Dodger Stadium with the Project for the 100 events per year. To the extent that the Draft EIR’s analyses broaden to analyzing the Project’s purported second goal of expanding transit service to the surrounding communities, the Draft EIR is defective for failing to provide a consistent and accurate Project Description. As the County of Inyo court noted, “[a] curtailed, enigmatic or unstable project description draws a red herring across the path of public input.” (County of Inyo, *supra*, 71 Cal.App.3d at 197-198.)

Response P140-8 The Draft EIR complied with the requirements of CEQA to provide an accurate, stable, and finite Project Description, disclosing that the proposed Project would operate daily for surrounding communities in addition to providing service to Dodger games and any special events at Dodger Stadium. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed

Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 2.6, Ridership, of the Draft EIR for a discussion of how the proposed Project would be configured to operate based on the anticipated ridership for Dodger games and special events at Dodger Stadium, events at the Los Angeles State Historic Park, commuters and residents in adjacent neighborhoods, and visitors to Los Angeles. As discussed in Section 2.6, the proposed Project has the flexibility to operate at varying speeds and capacity depending on ridership. The Draft EIR examined the potential environmental effects associated with implementation of the proposed Project on 20 environmental issue areas with detailed analysis based on Section 2.0, Project Description, of the Draft EIR. As the Project Description for the proposed Project complies with the requirements of Section 15124 of the CEQA Guidelines, the Project Description is adequate under CEQA and no further response is warranted.

Comment P140-9 Turning to logic first, the Project is not needed either to transport people to 100 events per year at Dodger Stadium, or to travel a route that currently is generally traveled by the Gold Line. The Gold Line already provides a transit option to alleviate traffic congestion and associated pollution for persons living in Chinatown and Mission Junction; similarly, transit options available at Union Station already serve the El Pueblo neighborhood.

Response P140-9 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the

fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project’s Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less.

Comment P140-10 Nor could the Project provide a transit option at Dodger Stadium for persons living in the Elysian Park and Solano Canyon neighborhoods, despite the Project Description’s representation (p. 2-10); to the contrary, as disclosed at page 2-39 and in Section 3.17, Transportation, at page 3.17-26, the Project and its Dodger Stadium Station cannot provide connectivity to the Elysian Park and Solano Canyon neighborhoods because there is no assurance that the Project Sponsor would be able to negotiate the necessary “potential mobility hub” in the future at Dodger Stadium. Without that mobility hub, there is certainly no need for the Project to operate daily from 6:00 a.m. to 12:00 a.m. to serve a non-existent transit option for the neighborhoods near Dodger Stadium. Similarly, the Project would not serve Echo Park or Mission Junction as there are no proposed stops in those neighborhoods.

Response P140-10 The Draft EIR addressed mobility hubs in Section 2.0, Project Description of the Draft EIR. As discussed in Section 5.0, Corrections and Additions, of this Final EIR, access to Elysian Park, the City’s second largest park, comprising 575 acres, would be provided through a mobility hub at Dodger Stadium Station, where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon. The proposed Project would provide access to the Mission Junction neighborhood via the Chinatown/State Park Station, which also includes a mobility hub.

Comment P140-11 Therefore, logically, the Project is only needed to transport people to Dodger Stadium, as a transit option that can “overcome grade and elevation issues” (Section 2.0, Project Description, p. 2-12). As such, there is no need for the Project to operate daily from 6:00 a.m. to 12:00 a.m. and to build a Chinatown/Los Angeles State Historic Park station and associated “amenities” in the park (“Chinatown Station”).

Response P140-11 Refer to Response P140-9 for a discussion of the need for the proposed Project. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. For example, after initially offering two options for the proposed Project alignment in the Notice of Preparation, responding to stakeholder input, the Project Sponsor announced it would proceed with the proposed Project alignment studied in the Draft EIR, including the intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park. This decision was in direct response to both State Park and Chinatown stakeholders. Located within a short walk to many Chinatown businesses and Metro's L Line (Gold), this station also addresses the goal of creating a stronger connection with the Metro L Line and would also enhance transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Due to the length and geometry of the proposed Project alignment, the Chinatown/State Park Station at its proposed location would support the proposed Project's objective to maximize the proposed Project's alignment along the public ROW and publicly owned property and minimize aerial rights requirements over private properties, taking into account existing and future adjacent land uses. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first- / last-mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would operate daily to serve existing residents, workers, park users (including those attending special events at the Los Angeles State Historic Park such as concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and visitors to Los Angeles.

Comment P140-12 Although the scope of the Draft EIR's analyses varies from broad to narrow, much of the Draft EIR's content is limited to assessing the impacts of the narrow Project, focused only on the impacts of a Project that would eliminate vehicle trips to Dodger Stadium. The majority of the Purpose and Need section of the Project Description discusses the history of Dodger Stadium, its configuration, and its traffic congestion, with only one paragraph devoted to purported unserved neighborhood transit needs. (Section 2.0, Project Description, pp. 2-10, 2-12.) The Project Description lists 13 Project Objectives, seven of which explicitly address reducing vehicle trips to and

congestion at and around Dodger Stadium; the majority of the remainder address the benefits of the sustainability and route of the gondola, itself. (*Id.*, pp. 2-12 – 2-13.)

Response P140-12 Pursuant to Section 15124 of the CEQA Guidelines, the Draft EIR contained an accurate, stable, and consistent description of the proposed Project, with sufficient specific information about the proposed Project to allow a complete and informative evaluation and review of its environmental impacts. Section 2.0, Project Description, of the Draft EIR, included a description of all integral components of the proposed Project for the environmental analysis, enabling Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR, to fully analyze and disclose all impacts of the proposed Project, and Section 4.0, Alternatives, of the Draft EIR, to consider potential alternatives to the proposed Project. Section 2.0, Project Description, of the Draft EIR contains the specific descriptions of the proposed Project required pursuant to CEQA Guidelines Section 15124, including a description of the proposed Project’s location (Draft EIR, § 2.3), a statement of the project objectives (*id.*, § 2.3.8), a description of the project’s technical and environmental characteristics (*id.*, §§ 2.2, 2.4 to 2.9), a discussion of the intended uses of the EIR (*id.*, § 1.2), and a list of the project approvals that will be required (*id.*, § 2.10).

Pursuant to Section 15165 of the CEQA Guidelines, each component of the proposed Project, e.g., each station, tower, and junction, are identified within the Draft EIR and their impacts analyzed. In addition, Section 2.0, Project Description recognizes that the proposed Project will serve different types of riders, noting that in addition to providing an aerial rapid transit option for visitors to Dodger Stadium, the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. Section 2.0 also recognizes the ancillary features of the proposed Project, including pedestrian improvements, amenities at the Los Angeles State Historic Park, and mobility hubs at both the Chinatown/State Historic Park Station and Dodger Stadium Station. The scope of the proposed Project provided in the 62 pages of detailed description in Section 2.0 constitutes the whole of the action considered as the proposed Project for the Draft EIR’s analysis. This proposed Project remains consistent throughout the Draft EIR, which analyzes and discloses the potential environmental impacts of this proposed Project in 7,877 pages of detailed analysis from experts in their respective fields, providing mitigation as necessary for potentially significant impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Contrary to the commenters statement that “much of the Draft EIR’s content is limited to assessing the impacts of the narrow Project, focused only on the impacts of a Project that would eliminate vehicle trips to Dodger Stadium”, the Draft EIR examined the potential environmental effects associated with implementation of the proposed Project on 20 environmental issue areas with detailed analysis as follows: Aesthetics, Agricultural and Forestry Resources, Air Quality, Biological Resources, Cultural Resources, Energy, Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Mineral Resources, Noise,

Population and Housing, Public Services, Recreation, Transportation, Tribal Cultural Resources, Utilities and Service Systems, and Wildfire, examining for each issue area the regulatory setting, environmental setting, methodology, environmental impacts, and as applicable, mitigation measure and level of significance after mitigation.

For example, consistent with the Project Description, Section 3.17, Transportation, of the Draft EIR, analyzed different ridership types in order to calculate the estimated VMT for the proposed Project. As discussed in Section 3.17.3, Methodology, of the Transportation analysis, ridership estimates included “a number of distinct market segments including: Dodger Stadium game and event attendees, employees, tourists, neighborhood riders, and Los Angeles State Historic Park visitors and event attendees.” In addition to Dodger Stadium game and event attendees, as discussed on page 3.17-34 in Section 3.17, Transportation of the Draft EIR, it is estimated that ridership from nearby neighborhoods would range between 200 and 575 riders (400 to 1,150 trips for round-trip), and the daily number of tourists who would ride the proposed Project is estimated to vary between 1,265 tourists and 3,370 tourists. As discussed on page 3.17-26, ridership for the daily park use is included in the ridership estimates for neighborhood riders. Table 3.17-4, Proposed Project Estimated Daily Riders, provides the daily weekday riders and daily weekend riders for Dodger Stadium access, other special events, and neighborhood riders (inclusive of neighborhood/regional and daily Park access). Refer to Section 3.17.4, Transportation of the Draft EIR for a detailed discussion of potential impacts of the proposed Project on the existing surrounding communities, including an overall reduction in vehicle miles traveled (VMT).

Comment P140-13 Many of the critical impact analyses in the Draft EIR are similarly limited assessing the effects of the Project at Dodger Stadium, without regard to the effects of providing transit to and reducing congestion and pollution in the communities along the Project’s route. For example, the analysis of the Project’s operational air quality impacts in Section 3.3, Air Quality, uses mobile source baseline information consisting of the 2019 “vehicular emissions associated with games and special events associated with Dodger Stadium resulting from passengers and vehicles traveling to the game along with employees” (p. 3.3-22). Similarly, the greenhouse gas (“GHG”) emissions reduction analysis in Section 3.8, Greenhouse Gas Emissions, also focuses exclusively on Dodger Stadium (pp. 3.8-17 - 3.8-18). The technical reports supporting both sections clearly state that the operations scenarios assume, for mobile source emissions:

“the availability and use of the gondola system would decrease the number of people traveling to Dodger Stadium (and surrounding areas) in passenger vehicles and increase the number of people using transit. This shift in transportation mode would reduce total VMT and vehicle idling time in and around Dodger Stadium, associated with passenger vehicles.”

(Appendix D, Air Quality/Health Risk Assessment, p. 23; Appendix J, GHG, p. 25.) The GHG Section uses the same 2019 mobile source baseline information from Dodger Stadium and future mobile source estimates that the Air Quality Section used. (See Section 3.8, p. 3.8-x; Appendix D, AQ-J, p. 25.)

Response P140-13 As discussed in Response P140-12, the Draft EIR’s analysis considers the whole of the proposed Project described in Section 2.0, Project Description, of the Draft EIR. For example, as discussed on page 3.3-22, of the Draft EIR, “[t]he proposed Project would also result in operational emissions associated with buildout and originate from area sources (e.g., landscaping-related fuel combustion sources, consumer products, and architectural coatings), energy use, and mobile sources.” “Build-out and horizon year mobile emissions utilize vehicle miles traveled and trip estimates prepared by Fehr & Peers alongside emission factors for light-duty vehicles,” and “the proposed Project would result in a net reduction in criteria pollutant emissions in both 2026 (Build Out) and 2042 (Horizon Year) by reducing vehicle miles traveled and thereby decreasing emissions compared to existing conditions.” As noted on page 3.17.34 and 3.17.35 of Section 3.17, Transportation of the Draft EIR, the proposed Project would generate neighborhood ridership that would reduce vehicle miles traveled (VMT), but to provide a more conservative analysis, only the VMT benefits of the proposed Project were calculated on Dodger Stadium game/event days. Accordingly, while the VMT for other ridership scenarios was calculated, the Draft EIR conservatively only assumes VMT reductions from Dodger Stadium game and event ridership in its analysis, including in Section 3.03, Air Quality and Section 3.08, Greenhouse Gas Emissions, of the Draft EIR. Including VMT reductions from other ridership sources analyzed (e.g., neighborhood riders, tourists) would provide additional air quality and greenhouse gas emissions reductions benefits which were conservatively not assumed in the Draft EIR’s analysis.

Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations.

Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through

reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Due to the COVID-19 pandemic, the 2019 Major League Baseball season was the most recent season with fans in attendance at the time of the Notice of Preparation for the Draft EIR and while the Draft EIR was under preparation that included a full season of games at Dodger Stadium with fans in attendance. Therefore, as noted, in Section 3.17, Transportation of the Draft EIR, data regarding game attendance from the 2019 season with fans in attendance was used in the estimation of VMT.

Comment P140-14 By contrast, in Section 3.17, Transportation, the Draft EIR’s analyses broaden to include the Project’s purported second purpose by, among other things, estimating future ridership from the neighborhoods along the Project’s alignment and from tourists (pp. 3.17-25 – 3.17-26).

Response P140-14 The Draft EIR consistently analyzes the whole of the proposed Project, including the whole of the system (including each station, junction, and tower), its operations, and any ancillary features. Where necessary, the Draft EIR focuses on the component that would potentially affect the environment in the relevant subject area, as discussed in Response P140-12. Section 2.0, Project Description recognizes that the proposed Project will serve different types of riders, noting that in addition to providing an aerial rapid transit option for visitors to Dodger Stadium, the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. Consistent with the Project Description, Section 3.17, Transportation, of the Draft EIR, analyzed different ridership types in order to calculate the estimated VMT for the proposed Project. As discussed in Section 3.17.3, Methodology, ridership estimates included “a number of distinct market segments including: Dodger Stadium game and event attendees, employees, tourists, neighborhood riders, and Los Angeles State Historic Park visitors and event attendees.” The proposed Project would serve a variety of market segments as detailed on pages 3.17-33 to 3.17-35, including neighborhood riders and tourists. As discussed on page 3.17-36, tourist riders are not expected to generate net new VMT as the proposed Project would be capturing a share of the existing tourist market to Downtown Los Angeles. As noted on page 3.17.34 and 3.17.35, the proposed Project would generate neighborhood ridership that would reduce VMT, but to provide a more conservative analysis, the VMT benefits of the proposed Project were only calculated for Dodger Stadium game/event days. Refer to Response P140-19 for further discussion of the tourism ridership analysis. Accordingly, the Draft EIR does not artificially narrow the Project Description in order to minimize the proposed Project’s impacts, but rather does not include certain potential benefits of the proposed Project’s VMT reductions in order to provide a more conservative analysis.

Comment P140-15 The Draft EIR’s shifts between analyzing different project descriptions proves that the Draft EIR’s Project Description is unstable and, therefore, that the Draft EIR fails under

CEQA “as a vehicle for intelligent public participation.” (County of Inyo, supra, 71 Cal.3d at pp. 197-198.).

Response P140-15 The Draft EIR does not shift between analyzing different Project Descriptions. The Draft EIR consistently analyzes the whole of the proposed Project, including the whole of the system (including each station, junction, and tower), its operations, and any ancillary features. Where necessary, the Draft EIR focuses on the component that would potentially affect the environment in the relevant subject area, as discussed in Response P140-12. As discussed in Response P140-12, pursuant to Section 15124 of the CEQA Guidelines, the Draft EIR contained an accurate, stable, and consistent description of the proposed Project, with sufficient specific information about the proposed Project to allow a complete and informative evaluation and review of its environmental impacts. The analyses of the Draft EIR are based on the entirety of the Project Description provided in Section 2.0, and as discussed in Response P140-12 the Draft EIR’s analysis is consistently based on the accurate, stable, and finite Project Description provided in Section 2.0. Because the Project Description for the proposed Project complies with the requirements of Section 15124 of the CEQA Guidelines, the Project Description is adequate under CEQA, and no further response is warranted. Refer to Response P140-23 for further discussion of how the Draft EIR complied with CEQA’s Project Description requirements to allow for informed public participation.

Comment P140-16 B. THE PROJECT DESCRIPTION IS MISSING KEY INFORMATION

The Project Description also omits and fails to adequately describe key elements of the Project, the omission of which leads to a failure to assess the Project’s full impacts. For example, there is no depiction of the Project’s profile in Project Description – no information regarding how the Project’s stations and towers will appear, how high the stations and towers will be, how high the gondolas would run, and the ascending and descending heights of the gondolas as they depart from and approach the stations. The only depiction of this critical information is buried in an appendix, Appendix Q, Proposed Alignment Plan and Profile. The profile is included as the final page of this appendix and provides critical information regarding the height from which the gondolas would be descending into the Chinatown Station and the height to which the gondolas would be ascending from the Chinatown Station. This information, in turn, directly affects the level of impact on the future residents of the Property, particularly the noise and aesthetics impacts. On “game days,” when the gondolas would be running every 23 seconds, these impacts would be significant; however, the Draft EIR fails even to consider them.

Response P140-16 Refer to Section 2.0, Project Description, of the Draft EIR for information regarding the proposed Project components, including figures depicting how the proposed Project’s stations and towers will appear and their heights. Refer to Figure 2-11: Alameda Station Cross Sections, Figure 2-13: Alameda Tower Elevations, Figure 2-15: Alpine Tower Elevations, Figure 2-18: Chinatown/State Park Station Cross Sections, Figure 2-20: Broadway Junction Cross Sections, Figure 2-22: Stadium Tower

Elevations, and Figure 2-25: Dodger Stadium Station Cross Sections. Refer to Table 2-2: Proposed Project Station and Junction Details, and Table 2-3: Proposed Project Tower Details, on page 2-43 in Section 2.0 for the proposed heights of the stations and towers. Additionally, refer to Figure 2-5 and 2-6 on Pages 2-15 and 2-16 for illustrative designs of the proposed stations and towers. Section 2.5.1, Proposed Project Alignment, of the Project Description, discussed the proposed Project profile, stating that “the proposed alignment profile is provided in *Proposed Alignment Plan and Profile* (Appendix Q).” The Draft EIR complied with CEQA’s requirements, providing the necessary analysis in the Draft EIR’s main sections to adequately inform the public and decision makers regarding the proposed Project and its potential environmental impacts. Appendices were appropriately used in the Draft EIR to provide to the public with underlying documents that supported the analysis and findings in the Draft EIR, should they wish to read further on the particular subject, while still balancing CEQA’s desire for clarity and brevity. Such documents were clearly organized and did not require the public to sift or hunt for such information. Refer to Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR, which addresses the potential environmental effects of the proposed Project’s operations. As stated on page ES-17, in the Executive Summary, of the Draft EIR, proposed Project would not result in any significant and unavoidable operational impacts, including to aesthetics and noise and vibration. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of operational noise impacts from the proposed Project, which would be less than significant.

Comment P140-17 As another example, the Project Description mentions in passing that the gondolas would “be equipped with privacy glass that can become opaque while adjacent to sensitive views.” (Section 2.0, Project Description, p. 2-18.) “Privacy glass” and “sensitive views” are not defined and nothing further is said. However, this statement tacitly acknowledges that the Project would significantly adversely affect sensitive land uses and receptors – including the future residents of the Property. Also buried in an appendix, Appendix M, Noise and Vibration Report, again as the final page of that appendix, is the information that the gondolas would run just 35 feet from the windows of the Property’s residents. Gondolas filled with up to 40 persons running by the windows of the Property’s residents every 23 seconds on “game days” would create a significant environmental impact on those residents (as well as an invasion of privacy) that is not analyzed in the Draft EIR.

Response P140-17 Refer to Section 2.0, Project Description, Figure 2-8: Proposed Alignment Over Public ROW/Publicly-Owned Property and Private Property for a depiction of the proposed alignment over public ROW and publicly owned property and the portions of the proposed alignment over private property, Figure 2-17: Proposed Chinatown/State Park Station Location, showing the proposed Project’s proximity to North Spring

Street and the “Approved Mixed-Use Project” (i.e., College Station), and Figure 2-29: Chinatown/State Park Station Buildout Conditions, depicting the proposed Project’s proximity to the “Approved Mixed Use Project” (i.e., College Station). Accordingly, the Draft EIR clearly disclosed the proximity of the proposed Project to existing development and the approved College Station project. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. The proposed Project would be located in a densely populated, urban environment surrounded by a variety of commercial, industrial, and residential development types. In this type of environment, it is common for public transportation, such as Metro’s light rail, to be located adjacent to residential uses and, modern aerial transit systems in other cities, including Portland, Oregon, and New York City, operate adjacent to residential uses. Nevertheless, as discussed in Topical Response J, Gondola Design and Operations and Section 2.0, Project Description, of the Draft EIR, cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views, and the proposed Project would work with stakeholders adjacent to the proposed Project alignment to identify locations where the use of privacy glass would be warranted. Considerations as to the locations along the proposed Project alignment where the privacy glass could be activated include the subject adjacent sensitive views and the vertical and horizontal distance between the proposed Project cabins and the adjacent sensitive views. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR. As discussed in Section 3.01, any references to and analysis of residential views and resident viewer groups, which are assumed to be associated with private residential properties, are provided in the Draft EIR for informational purposes, as the L.A. CEQA Thresholds Guide does not protect private views from residential properties. As discussed in Section 2.0, Project Description, of the Draft EIR, standard operating hours would be between 6:00 AM and 12:00 AM, subject to operational changes due to ridership demand. As discussed in Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Analysis, of the Draft EIR, due to anticipated nighttime operations, operational impacts were analyzed and compared against both daytime and nighttime ambient conditions. Noise impacts from operations of the proposed Project would be less than significant. As shown in Tables 3.13-22 through 3.13-26 beginning on page 3.13-54 of the Draft EIR, project operations would not exceed applicable daytime or nighttime thresholds and impacts would be less than significant.

Comment P140-18 The omitted information regarding the privacy glass, how and when it would become opaque while adjacent to sensitive views, and what would be considered to be sensitive views is critical to both a legally sufficient Project Description and a

comprehensive analysis of the Project’s impacts under CEQA, even under the limited scope of the Project addressed in many of the Draft EIR’s sections.

Response P140-18 Refer to Response P140-17 for a discussion of sensitive views and privacy glass. As discussed in Response P140-12, pursuant to Section 15124 of the CEQA Guidelines, the Draft EIR contained an accurate, stable, and consistent description of the proposed Project, with sufficient specific information about the proposed Project to allow a complete and informative evaluation and review of its environmental impacts.

Comment P140-19 Additionally, the Project Description fails to disclose that the Project is relying heavily on what the Draft EIR admits are uncertain ridership projections for tourists to justify the planned 6:00 a.m. to 12:00 a.m. schedule. While the Project Description does list tourists among the list of expected ridership sectors (Section 2.0, Project Description, p. 2-42), the Draft EIR discloses fundamental uncertainties regarding this sector. The existence of this ridership sector would depend on the Project “capturing a share of the existing tourism in Los Angeles;” and the size of this sector “would not be consistent on a daily basis and would be variable depending on the seasonality of tourism in Downtown Los Angeles” and further, on game days, game day riders with pre-paid timed tickets on the gondola would have priority boarding over tourists. (Section 3.17, Transportation, p. 3.17-25.) Even so, Table 3.17-4 in Section 3.17, Transportation, discloses that the Project is relying on substantial projected tourism-generated ridership to support it:

- 2,575 tourism-generated riders to the Dodger Stadium station on a low weekday in both 2026 and 2042, as compared to
 - 1,225 neighborhood riders to all destinations in 2026 and
 - 1,625 neighborhood riders to all destinations in 2042;
- 3,570 tourism-generated riders to the Dodger Stadium station on a low weekend day in both 2026 and 2042, as compared to
 - 720 neighborhood riders to all destinations in 2026 and
 - 920 neighborhood riders to all destinations in 2042

Response P140-19 As is typical of all public transit, operating schedules and frequencies of the service would ultimately be optimized to meet ridership demand. The commenter overstates the reliance on tourist riders to justify the operating schedule. As noted on page 2-42 in Section 2.0, Project Description, of the Draft EIR, tourist riders are one of five ridership markets anticipated to ride the system, including:

- Dodger game/Stadium event attendees;
- Dodger game/Stadium event employees;
- Tourists or others who want to ride ART;
- Visitors to the Los Angeles State Historic Park and Elysian Park; and

- Commuters or residents in adjacent neighborhoods, including El Pueblo, Chinatown, Mission Junction, Elysian Park, Echo Park, and Solano Canyon.

Independent of ridership demand by a particular market segment, for the proposed Project to provide effective public transit on non-game days, in particular for commuters or residents in adjacent neighborhoods, including El Pueblo, Chinatown, Mission Junction, Elysian Park, Echo Park, and Solano Canyon, and game days outside of peak travel to/from Dodger Stadium, it would provide a sufficient span of service similar to the rail and bus transit serving LAUS. As noted on page 3.17-36 of Section 3.17, Transportation, of the Draft EIR, tourist riders are not expected to generate net new VMT associated with the proposed Project, as the proposed Project would capture a share of the existing tourist market to Downtown Los Angeles. Conversely, the proposed Project would not reduce tourist related VMT. Therefore, the Draft EIR is not reliant on tourism ridership for the quantification of any of the VMT and resulting air quality and greenhouse gas reduction benefits of the proposed Project. Typical practice for ridership estimates for proposed transit projects is to include average weekday ridership. The Draft EIR exceeds this typical practice by providing both weekday and weekend ridership estimates, as well as game day and non-game day estimates, and ridership estimates with events at the Los Angeles State Historic Park, as shown on page 3.17-35 of the Draft EIR. This indicates the range in expected ridership for the proposed Project for typical average days of the types described above.

As detailed in Appendix N, Transportation Appendices, of the Draft EIR, tourism related ridership is estimated from an analysis prepared by HR&A, which determined the potential for the proposed Project to capture a share of the tourism attractions market in the County of Los Angeles. The HR&A Analysis of Potential LA ART Tourist Ridership is included in Appendix N. Additionally, as noted on page 13-14 of the Appendix N Ridership Model Development memo, "Tourism ridership would not be consistent on a daily basis and would be variable depending on the seasonality of tourism in Downtown Los Angeles. However, in a tourism market as large as Los Angeles, the variation is not expected to be substantial, so in order to estimate average daily tourist riders, Fehr & Peers divided the annual number by 365 since the proposed Project would operate every day of the year."

Comment P140-20 The tourism-generated ridership numbers are ostensibly supported by Appendix N, Transportation, but a reader searching for that support must look farther to an attached four-page report prepared by HR&A Advisors, Inc. ("HR&A"). HR&A's report purports to estimate the likely number of tourists who would utilize the gondola per year; while this report lists a number of gondolas and trams currently operating worldwide and purports to separate the commuter ridership from the tourist ridership for each and to identify the characteristics that attract tourists, at the end, the report's estimate that 915,000 tourists would use the Project per year is based on an undisclosed calculation. (Appendix N, HR&A Analysis, p. 4.) As such, this estimate

constitutes mere speculation and unsubstantiated opinion and narrative. Moreover, the Draft EIR cannot rely on information “buried in an appendix” to carry out its obligation under CEQA to inform the public. (*Santa Clarita Organization for Planning the Environment v. County of Los Angeles* (2003) 106 Cal.App.4th 715, 722-723 (holding that an EIR is inadequate where information “is scattered here and there in EIR appendices.”).)

Response P140-20 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Response 140-19 for a discussion of the tourist analysis prepared by HR&A. The Draft EIR complied with CEQA’s requirements, providing the necessary analysis in the Draft EIR’s main sections to adequately inform the public and decision makers regarding the proposed Project and its potential environmental impacts. Appendices were appropriately used in the Draft EIR to provide to the public with underlying documents that supported the analysis and findings in the Draft EIR, should they wish to read further on the particular subject, while still balancing CEQA’s desire for clarity and brevity. Such documents were clearly organized and did not require the public to sift or hunt for such information. For example, page 3.17-25 of Section 3.17, Transportation, of the Draft EIR clearly states that the ridership model inputs and parameters used in model development and calibration and ridership testing are provided in Appendix N. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data. Further, per CEQA Guidelines section 15003 (i), CEQA requires adequacy, completeness, and a good-faith effort at full disclosure in an EIR. Under CEQA Guidelines section 15151, “An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language.

Comment P140-21 The Project cannot justify its 18-hour schedule and Chinatown Station, much less its significant and unmitigated impacts as discussed below, with ridership figures that are inflated with uncertain and speculative tourism-generated numbers. Further, as discussed above, the neighborhood ridership numbers are also speculative, particularly since the Project does not contain a mobility hub at the Dodger Stadium station on which the currently unserved neighborhoods would depend. Moreover, even if the tourism-generated ridership numbers were considered valid, those riders are expected to travel to the Dodger Stadium station, only, which assumption again demonstrates that the Project has only a single purpose – the development of a gondola between Union Station and Dodger Stadium to eliminate vehicle trips to Dodger Stadium.

Response P140-21 As detailed in Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR, the proposed Project would have less than significant operational impacts. Refer to Response P140-19 regarding tourism ridership and for discussion of how in order for the proposed Project to provide effective public transit in particular for commuters or residents in adjacent neighborhoods, including El Pueblo, Chinatown, Mission Junction, Elysian Park, Echo Park, and Solano Canyon, the proposed Project needs to provide a sufficient span of service similar to the rail and bus transit serving LAUS. As discussed in Section 5.0, Corrections and Additions, of this Final EIR, access to Elysian Park, the City's second largest park, comprising 575 acres, would be provided through a mobility hub at Dodger Stadium Station, where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P140-22 As discussed further below, the Project Description also omits a critical portion of the Project that is planned as a later phase, the impacts of which must be analyzed as part of the Project or otherwise in conjunction with the Project's impacts. (Citizens Assn. for Sensible Dev. of Bishop Area v. Cty. of Inyo (1985) 172 Cal.App.3d 151, 165-166.) The Project Description also refers to, but omits, Figures 2-30 through 2-32.

Response P140-22 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project

Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. The proposed Project does not propose development outside of that identified in Section 2.0, Project Description, of the Draft EIR. Pursuant to Section 15165 of the CEQA Guidelines, each component of the proposed Project, e.g., each station, tower, and junction, are identified within the Draft EIR and their impacts analyzed. Section 5.0, Other CEQA Considerations, of the Draft EIR, includes an analysis of the proposed Project's cumulative effects. Furthermore, Figures 2-30 through 2-32 are included on pages 2-58, 2-59, and 2-60 of the Draft EIR, and were not omitted.

Comment P140-23 The omissions from the Project Description carry through into each of the environmental impact discussions in the Draft EIR, rendering the analysis of each topic addressed invalid in the absence of sufficient information about the Project. Without these critical facts about the Project itself, the Draft EIR fails as an informational document. It fails to conduct a valid CEQA analysis of the potential environmental impacts caused by the Project, and likely fails to identify potentially significant impacts. The description of the Project is the foundation of the Draft EIR. The fact that the Project Description here is fatally inadequate is sufficient to invalidate the entire Draft EIR. (See *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 729-730 (EIR set aside for failure to analyze the whole project).)

Response P140-23 Pursuant to Section 15124 of the CEQA Guidelines, the Draft EIR contained an accurate, stable, and consistent description of the proposed Project, with sufficient specific information about the proposed Project to allow a complete and informative evaluation and review of its environmental impacts. Section 2.0, Project Description, of the Draft EIR, included a description of all integral components of the proposed Project for the environmental analysis, enabling Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR, to fully analyze and disclose all impacts of the proposed Project, and Section 4.0, Alternatives, of the Draft EIR, to consider potential alternatives to the proposed Project. Section 2.0, Project Description, of the Draft EIR contains the specific descriptions of the proposed Project required pursuant to CEQA Guidelines Section 15124, including a description of the proposed Project's location (Draft EIR, § 2.3), a statement of the project objectives (*id.*, § 2.3.8), a description of the project's technical and environmental characteristics (*id.*, §§ 2.2, 2.4 to 2.9), a discussion of the intended uses of the EIR (*id.*, § 1.2), and a list of the project approvals that will be required (*id.*, § 2.10). Pursuant to Section 15165 of the CEQA Guidelines, each component of the proposed Project, e.g., each station, tower, and junction, are identified within the Draft EIR and their impacts analyzed.

Comment P140-24 II. THE DRAFT EIR'S PROJECT DESCRIPTION ENGAGES IN IMPROPER PIECEMEALING AND FAILS TO CONSIDER CUMULATIVE AND GROWTH-INDUCING IMPACTS

The requirements of CEQA cannot be avoided by piecemeal review that results from "chopping a large project into many little ones-each with a minimal potential impact

on the environment-which cumulatively may have disastrous consequences." (Bozung v. Local Agency Formation Com. (1975) 13 Cal.3d 263, 283–284.) Such segmented, or “piecemealed,” environmental reviews also “eliminate the opportunity to mitigate interactive impacts effectively.” (Tuolumne County Citizens for Responsible Growth v. City of Sonora (2007) 155 Cal.App.4th 1214, 1230-1231.) A CEQA document must define the scope of a project to include future phases or expansions where: (1) they are reasonably foreseeable consequences of the initial project; and (2) the future phase or expansion will be significant in that it will change the scope or nature of the initial project or its environmental impacts. (Laurel Heights Improvement Assoc. v. Regents, supra, 47 Cal.3d at p. 396.) Courts have also established that an activity falls within the scope of a project if it is among “various steps which taken together obtain an objective” (Tuolumne County Citizens, supra, at p. 1226), or if the activity is a crucial functional element of the larger project such that, without it, the larger project could not proceed (San Joaquin Raptor/Wildlife Rescue Ctr. v. County of Stanislaus (1994) 27 Cal.App.4th 713, 731,-732).

Additionally, CEQA requires an analysis of the "cumulative impacts" from interconnected or related projects. (CEQA Guidelines § 15355; Las Virgenes Homeowners Federation, Inc. v. County of LA (1986) 177 Cal.App.3d 300, 306.) "The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time." (Los Angeles Unified School Dist. v. City of Los Angeles (1997) 58 Cal.App.4th 1019, 1024-1025 (emphasis added).) CEQA also requires an analysis of “growth-inducing impacts,” which assesses the ways in which a project could foster economic or population growth, or future residential or commercial, either directly or indirectly, in the surrounding environment. (CEQA § 21100(b)(5).)

Response P140-24 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P140-25 The Draft EIR fails to recognize that the Project is, in reality, a component of a larger plan to redevelop the current parking lot at Dodger Stadium into a different use and to assess the potential impacts of the whole of that Project. The Draft EIR’s Project (whether narrowly or more broadly defined in the Draft EIR) is simply the first step in the true Project – eliminating the parking lot to make way for the redevelopment. Evidence of this plan has been in the public domain for more than a decade.

Response P140-25 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. The independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region’s most visited venues – has been well established.

Comment P140-26 The Project Description generally describes the Project as an aerial gondola system, spanning only approximately 1.2 miles, consisting of cables, three passenger stations, a non-passenger junction, towers, and gondola cabins. (See, e.g., Section 2.0, Project Description, pp. 2-1.) However, the DEIR fails to disclose that the owner of the Dodger Stadium parking lot has plans to build a significantly larger project to redevelop the area on and around the parking lot with a museum, shops and parking garages. (See Exhibit 1, Dodgers remains fans of football & real estate development, The Eastsider, dated February 25, 2022.) [According to published reports, a court filing reveals that the Dodgers have a \$500 million redevelopment plan that would be serviced by the Project, and even the long-term lease agreement for the parking lot includes provisions for future plans for Dodger Stadium, including the development of offices, shops and entertainment uses.

Response P140-26 This response takes into consideration the comment’s referenced Exhibit 1. Refer to Response P140-25 for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Further, as discussed in Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, the adoption of the CC&Rs over a decade ago does not constitute a currently proposed development project at the Dodger Stadium property; rather, as is customary, the CC&Rs provide regulations and standards to maintain the existing stadium uses, including parking, if approvals are sought for additional improvements by the owner of the parking areas. No such development is proposed, and no environmental analysis is required of the speculations of commenters. As also discussed in Topical Response G, the “Next 50” project referenced in this comment was proposed over 15 years ago, and did not proceed after 2008. The current owners of the Los Angeles Dodgers purchased the team and Dodger Stadium in 2012. Accordingly, the Next 50 Project is not required to be included as a related project in the Draft EIR or analyzed as part of the proposed Project in Draft EIR. As discussed in Topical Response G, the purported “future” development that commenters suggest is contemplated at Dodger Stadium would require additional City designations and

zoning, permits, and approvals, including potentially environmental review, that are not contemplated or analyzed in the Draft EIR because no such development is proposed.

Comment P140-27 (See Exhibit 2, Tear Up the Dodger Stadium Parking Lot, Legal Planet, dated November 2, 2018.) A prominent architecture firm even describes and advertises on its website the Dodgers plans to build a new urban plaza, office building and interactive museum. The development plan boasts a new eight level, 900 car parking structure and a series of food service/retail concession clusters. (See Exhibit 3, available at: <https://johnsonfain.com/projects/architecture/commercial/la-dodgers-stadium-next-50/>.) Here, the Draft EIR fails to analyze, much less even mention, the anticipated future uses at the Dodger Stadium parking lot and the likely effects of those uses, that the Project would make possible.

Response P140-27 This response takes into consideration the comment’s referenced Exhibits 2 and 3. Refer to Responses P140-25 and P140-26 for a discussion of how the proposed Project solely proposes an aerial gondola system and does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property, as well as for a discussion of the “Next 50” project and how any “future” development that commenters suggest is contemplated at Dodger Stadium would require additional City designations and zoning, permits, and approvals, including potentially environmental review, that are not contemplated or analyzed in the Draft EIR because no such development is proposed. Mere statements on a website are not evidence that such development is currently proposed, nor are they sufficiently firm or committed to such that environmental analysis is required. The proposed Project is solely comprised of an aerial gondola system connecting LAUS to Dodger Stadium and associated improvements. Accordingly, the Draft EIR did not omit “foreseeable” development from its analysis, and CEQA expressly discourages such speculation.

Comment P140-28 Further, while the Draft EIR addresses growth-inducing impacts, its discussion is narrowly focused on whether the Project would induce population growth or residential development, and completely ignores the language in Section 15126, subdivision (e) instructing that “the characteristics of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively” should also be discussed. (CEQA Guidelines, § 15126(e).) The Project would clearly “encourage and facilitate” the future plans to redevelop the Dodger Stadium parking lot with commercial uses, and the potential impacts of that future component of the Project should have been assessed.

Response P140-28 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Section 5.4, Growth-Inducing Impacts, of Section 5.0, Other CEQA Considerations, of the Draft EIR, for a discussion of the potential growth-inducing impacts of the proposed Project as required by

Public Resources Code section 21100(b)(5). Pursuant to CEQA Guidelines Section 15126.2(e), an EIR need only discuss “the ways in which” the proposed project could foster growth, and accordingly does not require an EIR to provide a detailed analysis of the proposed project’s effects on growth. A general analysis is sufficient. The Draft EIR’s growth inducing analysis considered the potential growth-inducing impacts from the proposed Project in pages 5-57 through 5-60 of the Draft EIR, concluding that construction and operation of the proposed Project would result in less than significant growth inducing impacts, with respect to whether the proposed Project would foster population or employment growth, or the construction of additional housing, either directly or indirectly, on both a regional and local scale. As discussed in Section 5.4, and as noted in this comment, the proposed Project does not remove obstacles to growth but instead would increase connectivity in the densely urbanized downtown Los Angeles and provide direct linkages to major residential, employment, and tourist destinations, such as LAUS, El Pueblo/Olvera Street, Chinatown, Los Angeles State Historic Park, Dodger Stadium, and Elysian Park. As discussed in Section 3.14, Population and Housing, of the Draft EIR, approximately 25 percent of the residents in the Project Study Area utilize either public transportation or walking for commuting to work. Refer to Response P140-9 for a discussion of the need for the proposed Project. Given that the area in the City where the proposed Project alignment is located is densely urbanized and there are existing planned developments for the area, the proposed Project would be a benefit for existing and planned uses in the area.

Refer to Responses P140-25 through P140-27 for a discussion of how the potential for development at Dodger Stadium is not reasonably foreseeable because the proposed Project solely proposes an aerial gondola system and does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property, which is approved only for Dodger Stadium and ancillary uses and structures as set forth in the Conditional Use Permit for the Dodger Stadium property, with restrictive designations and zoning not consistent with the uses speculated in this comment. Accordingly, the Draft EIR’s growth inducing analysis need not consider speculative potential impacts pursuant to CEQA Guidelines 15145.

Comment P140-29 The failure of the Draft EIR to address and analyze the impacts of the Project together with this foreseeable future project as either being part of the Project, or as “closely related past, present, and reasonably foreseeable probable future projects” creating cumulative impacts, or under the Project’s growth-inducing impacts, is a fundamental violation of CEQA that infects each of the Draft EIR’s impact analyses and renders the Draft EIR void as an informational document. (See Los Angeles Unified School Dist., supra, 58 Cal.App.4th at pp. 1024-1025.)

Response P140-29 Refer to Response P140-28 for a discussion of the Draft EIR’s growth-inducing impacts analysis, and how the potential for development at Dodger Stadium is not reasonably

foreseeable and therefore not required to be analyzed. The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts.

Comment P140-30 III. THE DRAFT EIR'S ANALYSES OF THE PROJECT'S AIR QUALITY AND GREENHOUSE GAS EMISSION IMPACTS ARE LEGALLY DEFICIENT

As discussed above, the Draft EIR's analyses of the Project's operational impacts on Air Quality and GHG emissions are defective because they fail to assess the potential impacts of the entire Project not only with respect to future plans for the Dodger Stadium parking lot, but even as described in the Project Description.

Response P140-30 Refer to Responses P140-25 through P140-27 for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P140-31 As stated above, the analysis of the Project's operational air quality impacts in Section 3.3, Air Quality, uses for its mobile source baseline information the 2019 "vehicular emissions associated with games and special events associated with Dodger Stadium resulting from passengers and vehicles traveling to the game along with employees" (p. 3.3-22; see also 3.3-16). Similarly, the greenhouse gas ("GHG") emissions reduction analysis in Section 3.8, Greenhouse Gas Emissions, also focuses exclusively on Dodger Stadium (pp. 3.8-17 - 3.8-18). The technical reports supporting both sections clearly state that the operations scenarios assume, for mobile source emissions:

"the availability and use of the gondola system would decrease the number of people traveling to Dodger Stadium (and surrounding areas) in passenger vehicles and increase the number of people using transit. This shift in transportation mode would reduce total VMT and vehicle idling time in and around Dodger Stadium, associated with passenger vehicles."

Response P140-31 Refer to Response P140-13 for a discussion of how due to the COVID-19 pandemic, the 2019 Major League Baseball season was the most recent season at the time of the Notice of Preparation for the Draft EIR with fans in attendance, and while the Draft EIR was under preparation that included a full season of games at Dodger Stadium. Therefore, as noted, in Section 3.17, Transportation of the Draft EIR, data regarding game attendance from the 2019 season with fans in attendance was used

in the estimation of VMT. As also discussed in Response P140--13, the proposed Project would generate neighborhood ridership that would reduce vehicle miles traveled (VMT), but to provide a more conservative analysis, only the VMT benefits of the proposed Project were calculated on Dodger Stadium game/event days. (Appendix D, Air Quality/Health Risk Assessment, p. 23; Appendix J, GHG, p. 25.)

Comment P140-32 The GHG Section uses the same 2019 mobile source baseline information from Dodger Stadium and future mobile source estimates that the Air Quality Section used. (See Section 3.8, p. 3.8-x; Appendix D, AQ-J, p. 25.)

Response P140-32 Refer to Responses P140-13 and P140-31 for a discussion of the mobile source baseline and estimates.

Comment P140-33 The Air Quality section is further deficient by failing to set forth basic construction assumptions upon which its construction emissions calculations were based, including for example, whether all construction equipment was assumed to be operating simultaneously. To the extent that basic information, which is disclosed in virtually every Draft EIR Air Quality section when discussing construction emissions, may be included in Appendix B, Construction Assumptions, it is buried not only in that appendix, but in that appendix's many tables. An EIR that buries basic information such as construction impact assumptions in appendices does not suffice under CEQA as an informational document. (Santa Clarita Organization for Planning the Environment v. County of Los Angeles, supra, 106 Cal.App.4th at pp. 722-23; see also Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova (2007) 40 Cal.4th 412, 442 (“[I]nformation ‘scattered here and there in EIR appendices,’ or a report ‘buried in an appendix,’ is not a substitute for ‘a good faith reasoned analysis.’”).

Response P140-33 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Section 3.03, Air Quality, and Appendix D, Air Quality/Health Risk Assessment Technical Report, of the Draft EIR for a discussion of how the Draft EIR analyzed the proposed Project's potential air quality impacts consistent with guidance from the SCAQMD and the model recommended by SCAQMD and the California Air Pollution Control Officers Association, CalEEMod. The analysis demonstrates that the proposed Project would not cause an exceedance of any SCAQMD significance thresholds during construction or operations. As shown in Table 3.3-5, Maximum Mass Daily Emissions Due to Operation of the Project, of the Draft EIR, the proposed Project would result in a net reduction in criteria pollutant emissions in both 2026 (Build Out) and 2042 (Horizon Year) by reducing vehicle miles traveled and thereby decreasing emissions compared to existing conditions. As an innovative transportation project that will reduce VMT over time, the proposed Project helps advance local and state climate and transportation policies (see Section 3.8.4, Environmental Impacts, of the Draft EIR's greenhouse gas emissions analysis and Table C-1 through Table C-4 provided in Appendix J, Greenhouse Gas Emissions Technical Report, for additional discussion).

The comment is mistaken about the Draft EIR’s description of the construction assumptions upon which the calculations were based. Refer to Section 3.3.3, Methodology, of the Draft EIR’s air quality analysis for the construction analysis’ methodology. The methodology describes the assumptions upon which the construction analysis was based. This methodology section also describes the models which were used to prepare the emissions inventory for construction of the proposed Project and what the proposed Project construction health risk assessment evaluates. In addition, the thresholds that were utilized to assess significance for air quality are outlined in Section 3.3.3. The Draft EIR also cross-referenced the relevant technical appendices where additional information could be found, including Appendix B, Construction Assumptions, which summarizes the key assumptions informing the proposed Project’s construction emissions calculations. Appendix D, Air Quality/Health Risk Assessment Technical Report, of the Draft EIR presents detailed information about the construction equipment (number of pieces of equipment, hours/day of use, horsepower, and load factor) in Table 4-2a and Table 4-2b by construction phase. The timing of these construction phases is presented in the construction schedule within Table 4-1 immediately preceding the equipment tables in this appendix. The Draft EIR summarized the more detailed technical information in the appendices about construction emissions.

The proposed Project construction analysis does not assume that all construction equipment is operating simultaneously because the analysis is designed to reflect the anticipated pace of construction, which would not involve all construction equipment operating simultaneously. In Appendix D, Air Quality/Health Risk Assessment Technical Report, of the Draft EIR, Table 4-1 summarizes each construction activity’s estimated duration and dates of activity. Daily emissions of each criteria air pollutant are provided in Table C.1-1 through Table C.2-4 in Appendix D of the Draft EIR, and each table is meant to capture emissions from overlapping activities through the total emissions provided at the end of each table.

The Draft EIR complied with CEQA’s requirements, providing the necessary analysis in the Draft EIR’s main sections to adequately inform the public and decision makers regarding the proposed Project and its potential environmental impacts. Appendices were appropriately used in the Draft EIR to provide to the public with underlying documents that supported the analysis and findings in the Draft EIR, should they wish to read further on the particular subject, while still balancing CEQA’s desire for clarity and brevity. Such documents were clearly organized and did not require the public to sift or hunt for such information. Contrary to the comment about “burying” information in the technical reports, the Draft EIR appropriately summarized the proposed Project’s potential impacts to construction emissions and cross-referenced more-detailed technical reports where additional information was available. In this way, the Draft EIR balanced the need to provide the public and decision makers the information that they need to meaningfully consider the full range of the proposed

Project’s potential environmental impacts while considering CEQA’s desire for clarity and brevity.

Comment P140-34 Likewise, analysis critical to the GHG Section is missing and/or improperly buried in the appendix. Specifically, the GHG section fails to provide an analysis related to a purported net decrease in GHG emissions, which is only discussed in the Appendix. The GHG Section also lacks analysis as to how the Project would purportedly decrease the number of people traveling to Dodger Stadium or the general area in passenger vehicles. Moreover, the reports buried within the appendix rely on unsupported assumptions, including, but not limited to, conclusions related to the reduction of emissions and trips, flawed data related to ticket sales, and outdated data from 2011 to 2015 related to ridership.

Response P140-34 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The Draft EIR analyzed the proposed Project’s potential impacts from greenhouse gas (GHG) emissions consistent with guidance from the SCAQMD and the model recommended by SCAQMD and the California Air Pollution Control Officers Association, CalEEMod®. The Draft EIR includes a methodology section that describes the assumptions underlying the GHG analysis with appropriate cross-references to the applicable technical appendices. The Draft EIR summarized the more detailed technical information in the appendices about GHG emissions.

The Draft EIR analyzed GHG emissions based on a methodology and data described in the Draft EIR, with appropriate cross-references to the technical appendices. Contrary to this comment’s suggestion, Section 3.8.4, Environmental Impacts, of the Draft EIR clearly describes the GHG impact analysis that was conducted on page 3.8-1 through page 3.8-19 of the Draft EIR. Section 3.08, Greenhouse Gas Emissions, of the Draft EIR concludes that the proposed Project would have a less than significant impact on GHG emissions. As described on page 3.8-18, the proposed Project would result in a net decrease in GHG emissions. As described on page 3.8-18, the proposed Project, as an innovative transportation project that would reduce VMT over time, results in a net reduction of GHG emissions, and helps advance local and state climate policies (refer to Table C-1 through Table C-4 provided in Appendix J, Greenhouse Gas Emissions technical report, of the Draft EIR for additional discussion).

Refer to Response P140-33 for a discussion of how appendices were appropriately used in the Draft EIR to provide to the public with underlying documents that supported the analysis and findings in the Draft EIR, should they wish to read further on the particular subject, while still balancing CEQA’s desire for clarity and brevity. The Draft EIR properly includes an appendix that includes the details and substantial

evidence to support the analysis described in the Draft EIR, which includes Appendix J, Greenhouse Gas Emissions, and Appendix N, Transportation Appendices. Appendix N specifically addresses the proposed Project's VMT analysis regarding the reduction of trips and why data from 2011 to 2015 was used, on pages 13 and 28. The comment has not indicated why the Draft EIR's data and analysis related to ticket sales is flawed, and thus no further response is warranted. Nevertheless, refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data. This data was prepared by Metro in reports to the SCAQMD for the 2011-2015 Dodger seasons and was the most recently available at the time the analysis was conducted. Section 3.8.4 addresses the reduction in GHG emissions. The reduction in GHG emissions is described on pages 3.8-16 to 3.8-19 of the Draft EIR and further expanded upon in Appendix J, on pages 43 and 66. In Section 3.8.4, Environmental Impacts, of the Draft EIR, the summary of the GHG emissions for the proposed Project is presented in Table 3.8-1 and following this table, the contributing sources included in the GHG emissions inventory are described. Discussion regarding proposed Project consistency with applicable GHG reduction plans, policies, and regulations is also highlighted in this section. Refer to Response P140-33 for a discussion of how the Draft EIR appropriately summarized the proposed Project's potential impacts to GHG emissions and cross-referenced more-detailed technical reports where additional information was available. The Draft EIR provided substantial evidence for the determinations made for the proposed Project, while retaining more technical information in cross-referenced appendices to avoid making the Draft EIR sections too lengthy and technical for the average person who may review the Draft EIR.

Comment P140-35 IV. THE DRAFT EIR IMPROPERLY FAILS TO IDENTIFY AND ANALYZE IMPACTS TO HISTORIC/ARCHAEOLOGICAL RESOURCES WITHIN ITS PURPORTED ANALYSIS OF IMPACTS TO CULTURAL RESOURCES

CEQA requires a lead agency to evaluate whether a project would result in substantial adverse impacts affecting the significance of historical resources. (CEQA § 21084.1; CEQA Guidelines § 15064.5(a) and (b).) These resources include resources eligible for listing in the California Register of Historical Resources, and those listed in local historic resource registers. See *Citizens for Responsible Development in West Hollywood v. City of West Hollywood*, 39 Cal.App.4th 490, 503-504 (1995). Additionally, special standards apply under CEQA regarding the mitigation of impacts to historic resources. (See, e.g., Pub. Res. Code § 21084.1; CEQA Guidelines §§ 15064.5, 15126.4; *Citizens for Responsible Development in West Hollywood*, supra, 39 Cal.App.4th at 500-501.)

Response P140-35 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations, but does not address an environmental issue or raise a substantive issue on the content of the Draft EIR. This comment is noted and will be

provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P140-36 Regarding the construction of the proposed Chinatown Station, the Draft EIR ignores the fact that remnants of the Zanja Madre have been found in many areas near the area of direct impacts depicted in Figure 3.5-2. These finds have been documented in studies now public that attached to EIRs prepared for nearby developments. (See, e.g., Exhibit 4, Appendix L to the Draft EIR for the College Station project, esp. the discussions of the Zanja Madre at pp. 12-16, 30-31.) The Draft EIR acknowledges that the Zanja Madre is a unique archeological resource (see CEQA Section 21083.2) in its discussion of the Zanja Madre in connection with the proposed Alameda Station. (Section 3.5, Cultural Resources, p. 3.5-37.) Even so, the Draft EIR fails to acknowledge the likelihood that remnants of the Zanja Madre may be encountered.

Response P140-36 This response takes into consideration the comment's referenced Exhibit 4. The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation, including both the Zanja Madre and archaeological resources in the vicinity of the proposed Project's Alameda Station and archaeological resources in the vicinity of the proposed Project's Chinatown/State Park Station.

Table 3 within Appendix F notes that six resources with at least one segment of the Zanja Madre were recorded within 1/8-mile of the project (P-19-000007, P-19-000887, P-19-003103, P-19-004196, P-19-004741, P-19-190309).

Only one resource, P-19-000887, is located within an area of direct impact. As noted on page 3.5-58 of the Draft EIR, P-19-000887 includes a segment of the Zanja Madre recorded within 500 square feet of the area of direct impacts of the proposed Alameda Station where the proposed vertical circulation elements would be located on an area currently containing a parking and loading area for El Pueblo. As noted on page 3.5-58, there is no overlap between the known locations of the Zanja Madre within El Pueblo and the proposed ground disturbance for the proposed Alameda Station. This segment of the Zanja Madre was capped in 1978 for preservation, is currently denoted by decorative pavement, and will not be impacted by the proposed Project. As noted on pages 3.5--58 and -59 of the Draft EIR, the proposed Project has potential to significantly impact buried, unrecorded material in other portions of P-19-000887 and, as such, mitigation measures related to archaeological testing and recovery have been proposed that will reduce impacts to the resource to less than

significant. Specifically, Mitigation Measure CUL-C notes that although the proposed Project is designed to not impact the portion of the Zanja Madre within Resource 19-000887, but nevertheless requires a testing plan to be prepared for portions of the site that will be impacted outside of the known Zanja location.

All other resources containing segments of the Zanja Madre are located outside of the area of direct impacts. Resource P-19-190309 consists of the 70-foot-long segment of the brick Zanja Madre conduit that is currently exposed and located northwest of Los Angeles State Historic Park near the intersection of North Broadway and Bishops Road. The Draft EIR provides an overview of P-19-190309. P-19-190309's setting has been substantially altered from its historic state, and the resource, which is meant to be buried, is now exposed. A nomination for this portion of the Zanja Madre for NRHP inclusion is considered withdrawn. Refer to pages 42, 52, and 91-92 of Appendix F of the Draft EIR for further information about P-19-190309.

As stated on page 3.5-68, in Section 3.05, Cultural Resources, of the Draft EIR, the proposed Project includes Mitigation Measure CUL-A, Cultural Resources Monitoring and Mitigation Plan, which requires a Cultural Resources Monitoring and Mitigation Plan (CRMMP) be prepared by a qualified archaeologist prior to project construction. Additionally, Mitigation Measure CUL-A requires the CRMMP be applicable to all ground disturbance extending into native soil with known archaeological sites and other areas of high sensitivity, and accounts for the unanticipated encounter of previously unknown and undocumented archaeological resources, requiring protocols for such an event. Mitigation Measure CUL-A also would incorporate specific requirements related to the Chinatown/State Park Station, requiring monitoring for ground-disturbance activities up to approximately 15 feet in depth at the Chinatown/State Park Station. The requirements include SHPO consultation and following practices that seek to avoid and preserve state-owned historical resources, when feasible. As further discussed in Mitigation Measure CUL-A, the General Plan acknowledges the Park has archaeological sensitivities and, as such, recommends continued study of existing and potential resources as well as the need to constantly update and expand the knowledge of historic activities at the Park. As for the cultural resources associated with the Park, the General Plan states that the Park should “[i]dentify, document, evaluate, and interpret cultural resources at the Park,” and “[p]rotect, stabilize, and preserve significant cultural resources within the Park.” The CRMMP is applicable for all ground-disturbance activities extending into native soil within known archaeological sites and other areas of high sensitivity. Accordingly, while there are no known segments of the Zanja Madre within the area of direct impacts at the Chinatown/State Park Station, the proposed Project provides mitigation in the event of an unanticipated discovery.

Comment P140-37 The Draft EIR's failure to acknowledge the possibility of encountering these CEQA-defined unique archeological resources and to assess the Project's potential impacts on them, and as discussed below, to mitigate any potentially significant impacts on

these resources properly as CEQA requires constitute clear violations of CEQA and yet another defect in the Draft EIR.

Response P140-37 Refer to Response P140-36 for a discussion of how all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. The Draft EIR evaluates all known, previously recorded archaeological resources in the Area of Potential Impact (API), as well as the potential to inadvertently encounter previously unknown and undocumented archaeological resources. As stated on page 3.5-68, in Section 3.05, Cultural Resources, of the Draft EIR, the proposed Project includes Mitigation Measure CUL-A, Cultural Resources Monitoring and Mitigation Plan, which requires a Cultural Resources Monitoring and Mitigation Plan (CRMMP) be prepared by a qualified archaeologist prior to project construction. Additionally, Mitigation Measure CUL-A requires the CRMMP be applicable to all ground disturbance extending into native soil with known archaeological sites and other areas of high sensitivity, and accounts for the unanticipated encounter of previously unknown and undocumented archaeological resources, requiring protocols for such an event. Mitigation Measure CUL-A also would incorporate specific requirements related to the Chinatown/State Park Station, requiring monitoring for ground-disturbance activities up to approximately 15 feet in depth at the Chinatown/State Park Station. As stated on page 3.5-69, in Section 3.05, Mitigation Measure CUL-B, Archaeological Resources Worker Training Program, would provide information to construction workers about the known locations of archaeological resources and potential areas that may be sensitive for archaeological resources in order to mitigate unknown historical resources within the Area of Direct Impacts and mitigate potential impacts to them, including with input from the Los Angeles State Historic Park staff for construction at the Chinatown/State Park Station. Further, page 3.5-70, in Section 3.05 details Mitigation Measure CUL-C through CUL-F, which would mitigate the potential impacts to specific, known archaeological resources. Specifically, Mitigation Measure CUL-E provides for an archaeological testing plan for the Los Angeles State Historic Park. As concluded on page 3.5-71, in Section 3.05 of the Draft EIR, with implementation of Mitigation Measures CUL-A through CUL-F, the potentially significant impacts related to archaeological resources would be reduced to less than significant levels.

Comment P140-38 V. THE DRAFT EIR’S NOISE ANALYSES ARE INCOMPLETE

As discussed above, the Draft EIR’s Noise Section fails to assess the Project’s potential operational noise impacts resulting from the gondolas passing close by occupied buildings, particularly sensitive uses. That the gondolas will pass close by such uses is tacitly acknowledged by the fact that the gondolas will ostensibly be fitted with glass that can become opaque when the gondolas pass by “sensitive views,” which are not defined. (Section 2.0, Project Description, p. 2-18.) As stated above, the gondolas will pass particularly close to the windows of the Property’s multifamily units as frequently as every 23 seconds on game days. Yet, the Draft EIR provides no

information regarding the noise levels that would be generated by one gondola running so close to the Property's windows, much less an unbroken line of gondolas every 23 seconds. The potential noise impacts the gondolas would create as a continuous source of noise are not analyzed.

Response P140-38 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the operational noise impacts from the proposed Project. Operational noise would be expected from the equipment and mechanical operations of the stations, junction, and towers, as well as noise from cabins and passengers waiting to board in stations. The impact analysis included an evaluation of potential operational noise impacts resulting from the gondolas passing close by occupied buildings, including sensitive uses. To provide a conservative operational noise analysis, the worst-case scenario was selected which represents a Dodger Game Day, with the highest line speed, cabins per hour, and queuing numbers, and with nighttime operations. Tables 3.13-22, 3.13-23, and 3.13-24 on pages 3.13-53 to 3.13-57 of Section 3.13, Noise, of the Draft EIR demonstrate that operational noise impacts would be less than significant at all receptor locations based on the L.A. CEQA Thresholds Guide, FTA, and LAMC. In addition to the primary operational noise levels evaluated in the Draft EIR, the noise generated inside cabins was also evaluated separately, as demonstrated on Table 3.13-25 on page 3.13-57 of the Draft EIR. Cabin noise might be expected from the people traveling inside the cabin and any heating, ventilation, and air conditioning (HVAC) equipment associated with the cabin. The proposed Project would implement project design feature NOI-PDF-A in Section 3.13.6 that provides specifications regarding the interior-to-exterior noise reduction of the gondola cabins as well as the sound power level of the HVAC system. As shown in Table 3.13-25, with implementation of project design feature NOI-PDF-A, noise from the gondola cabins would be at least 10 dBA less than the existing nighttime noise level at noise-sensitive uses. Because the gondola noise would be at least 10 dBA less than the existing nighttime noise level, cabin noise will not contribute to the overall operational noise levels at any NSRs. Refer to Responses GO17-128 and Response GO17-129 for discussion of the proposed Project's less than significant impact on human health associated with hearing loss, hearing damage, and sleep disturbance.

Comment P140-39 The cumulative operational noise impact analysis is also incomplete. At pages 5-33 and 5-34 of Section 5.2, Cumulative Impacts, the Draft EIR acknowledges that related projects include, inter alia, transportation projects, but fails to identify or assess the noise generated by any transportation project.

Response P140-39 As noted in Section 5.0, Other CEQA Considerations, of the Draft EIR, on page 5-30, the geographic context for the cumulative impact analysis for noise and vibration is the vicinity of the proposed Project alignment and construction haul routes. Draft EIR Table 5-1 shows that the cumulative related projects are primarily residential, restaurant, retail, hotel, and office. The transportation projects referenced on Draft

EIR page 5-33 and included in Table 5-1 are mostly around LAUS. The remaining transportation projects referenced on page 5-33 and included in Table 5-1 would not interact with proposed Project operational noise due to distance attenuation. Vehicle noise from related project operations is accounted for in the projected traffic volumes and discussed on page 5-34. The proposed Project's operational cumulative noise impacts are shown to be less than significant.

Comment P140-40 An obvious related transportation project that would contribute to cumulative noise levels along with the Project is the Gold Line's Chinatown Station, which is located adjacent to the Project's planned Chinatown Station. Particularly on game days, the noise generated by passengers of the Gold Line's Chinatown Station could well substantially contribute to the cumulative noise levels in the area, and should have been added to the cumulative noise levels assessed.

Response P140-40 Refer to Section 5.0, Other CEQA Considerations, for discussion of related projects and cumulative impacts analysis for the proposed Project. The list of related projects for the proposed Project includes transit-related projects that are anticipated to be constructed during the same timeframe as the proposed Project (2024-2026); and operational at the same time as the proposed Project (opening year 2026 and Horizon Year 2042). Under CEQA, projects that already exist at the time the NOP is prepared are considered to be part of the existing physical conditions by which a lead agency determines whether an impact is significant (CEQA Guidelines § 15125(a)) and are not considered related projects, and thus not included in the list of past, present, and probable future projects producing related or cumulative impacts in Table 5-1: Related Projects, on page 5-3 of Section 5.0, Other CEQA Considerations, of the Draft EIR. (CEQA Guidelines § 15130(b)(1)(A).) As discussed in Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, the Metro L Line (Gold) Chinatown Station is an existing Metro light rail station and the related noise levels are captured in the baseline noise measurements (see Draft EIR, Section 3.13.3.1, Figure 3.13-4, and Table 3.13-9). Specifically, measurement locations ML-07 through ML-14 are in the vicinity of the Metro L Line (Gold) Chinatown Station and captured the station's contribution to the noise environment. The noise from proposed Project operations compared to existing measured ambient conditions (which includes noise from the Metro L Line (Gold) Chinatown Station) are evaluated in the operational noise analysis in Section 3.13.15.2 of the Draft EIR.

Comment P140-41 VI. THE DRAFT EIR'S TRANSPORTATION ANALYSIS IS FLAWED

As discussed above, the Draft EIR's Transportation Section relies on speculation to inflate the Project's projected ridership numbers. The Project cannot justify its 18-hour schedule and Chinatown Station when a substantial number of the future riders are assumed to be tourists based on projections that are abstruse and ultimately speculative. Further, as discussed above, the neighborhood ridership numbers are also speculative, whether or not they were validly projected, since the Project does not contain a mobility hub at the Dodger Stadium station on which the

currently unserved neighborhoods would depend. Moreover, even if the tourism-generated ridership numbers were valid, those riders are expected to travel to the Dodger Stadium station, only, which assumption again demonstrates that the Project has only a single purpose – the development of a gondola between Union Station and Dodger Stadium to eliminate vehicle trips to Dodger Stadium.

Response P140-41 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Accordingly, the need for the proposed Project is well established. Refer to Response P140-19 for discussion of how in order for the proposed Project to provide effective public transit in particular for commuters or residents in adjacent neighborhoods, including El Pueblo, Chinatown, Mission Junction, Elysian Park, Echo Park, and Solano Canyon, the proposed Project needs to provide a sufficient span of service similar to the rail and bus transit serving LAUS.

Refer to Responses P140-13, P140-14, P140-19, P140-20, and P140-21 for a discussion of proposed Project need, ability to reduce greenhouse gas emissions and improve air quality, and ridership and ridership assumptions. The Draft EIR's transportation impact analysis is defensible and conservative in its quantification of the vehicle miles traveled reduction benefits. The ridership estimates are based on the best available data, which are documented in detail in Section 3.17, Transportation and Appendix N, Transportation Appendices, of the EIR. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data. Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17,

Transportation, and Appendix N, Transportation Appendices of the Draft EIR.⁶ Stantec is an internationally-respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR.

Comment P140-42 Similar to other sections of the Draft EIR, the Transportation Section relies on reports and models that are either impermissibly buried within or only referenced without being included in the appendix.

Response P140-42 The Draft EIR complied with CEQA’s requirements, providing the necessary analysis in the Draft EIR’s main sections to adequately inform the public and decision makers regarding the proposed Project and its potential environmental impacts. Appendices were appropriately used in the Draft EIR to provide to the public with underlying documents that supported the analysis and findings in the Draft EIR, should they wish to read further on the particular subject, while still balancing CEQA’s desire for clarity and brevity. Models related to the Transportation analysis, provided in Section 3.17, Transportation, of the Draft EIR, are available in Appendix N, Transportation Appendices, of the Draft EIR. Other models referenced are provided in reference to the Downtown Community Plan Update/New Zoning Code for Downtown Community Plan Draft Environmental Impact Report on Page 3.17-24, in Section 3.17,. A website URL to this document is provided in Footnote 8 of Section 3.17, Transportation.

Comment P140-43 VII. THE DRAFT EIR’S FAILS TO ASSESS OTHER CRITICAL PROJECT EFFECTS

As discussed above, the Project Description states that the gondola cabins would be fitted with privacy glass that can become opaque while adjacent to sensitive views.” (Section 2.0, Project Description, p. 2-18.) “Privacy glass” and “sensitive views” are not defined and nothing further is said. However, this statement tacitly acknowledges that the Project would significantly adversely affect sensitive land uses and receptors – including the future residents of the Property. It is also disclosed that, on game days, the gondolas would run every 23 seconds. (Id.)

The need to fit the gondolas with “privacy glass” to protect “sensitive views” is a tacitly acknowledgment that otherwise the Project would significantly adversely affect sensitive land uses and receptors – including the future residents of the Property.

Response P140-43 As stated on page ES-17, in the Executive Summary, of the Draft EIR, the proposed Project would not result in any significant and unavoidable operational impacts. Refer to Response P140-17 for a discussion of “privacy glass” and “sensitive views.”

⁶ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

Comment P140-44 Other information not readily available in the Draft EIR explains why. Although the information is buried in Appendix M, Noise and Vibration Report, the Draft EIR “discloses” that the gondolas would run just 35 feet from the windows of the Property’s residents. Gondolas filled with up to 40 persons running by the windows of the Property’s residents every 23 seconds on “game days” would create a significant environmental impact on those residents (as well as an invasion of privacy) that is not analyzed in the Draft EIR. (See *id.*, p. 2-18.) This impact is not assessed in the Draft EIR.

Response P140-44 Refer to Response P140-17 for a discussion of the Draft EIR’s operational analysis related to nearby residences, and disclosure in the Project Description of the proposed Project’s proximity to the approved College Station development. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the operational noise impacts from the proposed Project. The impact analysis included an evaluation of potential operational noise impacts resulting from the gondolas passing close by occupied buildings, including sensitive uses. As noted on page 3.13-57 of the Draft EIR, an analysis was conducted to evaluate the noise from the gondola cabins as they travel between the stations, towers, and junction in proximity to receptor locations. Cabin noise might be expected from the people traveling inside the cabin and any heating, ventilation, and air conditioning (HVAC) equipment associated with the cabin. The proposed Project would implement project design feature NOI-PDF-A that provides specifications regarding the interior-to-exterior noise reduction of the gondola cabins as well as the sound power level of the HVAC system. Refer to Response GO17-127 for analysis of operational noise impacts associated with sleep disturbance, which includes an analysis that uses the Sound Exposure Level (SEL) acoustics metric. As identified therein, operational noise impacts associated with sleep disturbance would be less than significant. Privacy is not a CEQA issue, accordingly, no further response is warranted. Refer to Response P140-17 for a discussion of “sensitive views” and “privacy glass.” The Draft EIR complied with CEQA’s requirements, providing the necessary analysis in the Draft EIR’s main sections to adequately inform the public and decision makers regarding the proposed Project and its potential environmental impacts. Appendices were appropriately used in the Draft EIR to provide to the public with underlying documents that supported the analysis and findings in the Draft EIR, should they wish to read further on the particular subject, while still balancing CEQA’s desire for clarity and brevity. Such documents were clearly organized and did not require the public to sift or hunt for such information.

Comment P140-45 The Draft EIR attempts to pass any such impact as an aesthetic impact, as a potential effect on a private view that CEQA does not recognize. (Section 3.1, Aesthetics, p. 3.1-13.) However, there can be no argument that gondolas running every 23 seconds just 35 feet from a residential window for hours 100 days per year, and at longer intervals daily from 6:00 a.m. to 12:00 a.m. is a serious impact on the environment that must be assessed. As the preface to Appendix G states, Appendix G

“is a sample form that may be tailored to satisfy individual agencies’ needs and project circumstances. ... Substantial evidence of potential impacts that are not listed on this form must also be considered.”

Response P140-45 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Because visual impacts under the L.A. CEQA Thresholds Guide are assessed based on changes to public views, description of resident viewer groups was provided only for informational purposes as private views from residential properties are not protected under the L.A. CEQA Thresholds Guide. This description of resident viewer groups for informational purposes only was provided with the understanding that, even within different viewer groups, visitors and residents likely hold unique values regarding the significance of views, and the significance of an impact is not based solely on a project’s visibility from public viewpoints. In the evaluation of aesthetics, the Draft EIR analysis considers a range of qualifying factors consistent with methods and guidance provided by the Federal Highway Administration (FHWA) for evaluating visual impacts, as well as the CEQA Guidelines and City of Los Angeles CEQA thresholds. Accordingly, the Draft EIR’s aesthetics analysis more than adequately complies with CEQA’s requirements for a Draft EIR. Refer to Response P140-17 for a discussion of operational analysis related to nearby residences. The impacts to the multifamily residential building referenced by this commenter were addressed throughout the Draft EIR. As discussed in Sections 3.01, Aesthetics, 3.03, Air Quality, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to the multifamily residential building referenced by this commenter. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment P140-46 Further, Section 5.5, Other Additional Evaluations, of the Draft EIR contains an assessment of the Project’s potential impact on kite flying, an impact not customarily recognized under CEQA, and on the use of the Los Angeles State Historic Park for special events and for routine activities such as personal reflection. (Section p. 5-60 – 5.63.) The Project’s effect on a multifamily residential building would be experienced over an 18-hour period every day, and would be a more serious and intrusive effect

than that experienced by recreational users of the Park that must be analyzed in the EIR.

Response P140-46 Refer to Section 5.5.1, Kites, of Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of kites in response to a comment in response to the NOP identifying flying kites in the Los Angeles State Historic part as a known recreational activity of park users. The impacts to the multifamily residential building referenced by this commenter were addressed throughout the Draft EIR. As discussed in Sections 3.01, Aesthetics, 3.03, Air Quality, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to the multifamily residential building referenced by this commenter. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. The proposed Project would be located in a densely-populated, urban environment surrounded by a variety of commercial, industrial, and residential development types. In this type of environment, it is common for public transportation, such as Metro’s light rail, to be located adjacent to residential uses and modern aerial transit systems in other cities, including Portland, Oregon, and New York City, operate adjacent to residential uses. Nevertheless, as discussed in Topical Response J, Gondola Design and Operations and Section 2.0, Project Description, of the Draft EIR, cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views, and the proposed Project would work with stakeholders adjacent to the proposed Project alignment to identify locations where the use of privacy glass would be warranted. Considerations as to the locations along the proposed Project alignment where the privacy glass could be activated include the subject adjacent sensitive views and the vertical and horizontal distance between the proposed Project cabins and the adjacent sensitive views.

Comment P140-47 VIII. THE DRAFT EIR’S MITIGATION MEASURES ARE INVALID UNDER CEQA

An EIR must identify feasible mitigation measures “which could minimize significant impacts” of the project. (CEQA Guidelines § 15126.4(a)(1).) Improper deferral of feasible mitigation occurs where an agency defers the formulation of mitigation measures to some future time, concluding based on “loose or open ended” measures that impacts can be reduced to a less than significant level. (Rialto Citizens for Responsible Growth v. City of Rialto (2012) 208 Cal.App.4th 899, 945.) Reliance on

unspecified programs and practices as mitigation to be adopted in the future without any mandatory commitments or performance standards is insufficient under CEQA. (See *Endangered Habitats League v. County of Orange* (2005) 131 Cal.App.4th 777, 793-794.)

Response P140-47 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations, but does not address an environmental issue or raise a substantive issue on the content of the Draft EIR. This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P140-48 As stated above, the Draft EIR fails to describe key elements of the Project and omits technical data in a manner that frustrates any valid impacts analysis of the Project as described in Section 2.0, Project Description, in addition to impacts from omitted components of the Project such as the future redevelopment of the areas on and surrounding the Dodger Stadium parking lot with commercial uses, which, in conjunction with the Project, could have additional and/or cumulative and/or growth-inducing environmental impacts. The Draft EIR's failure to assess the significance of such impacts eliminates its ability to determine whether the mitigation measures it identifies would in fact reduce the Project's potentially significant impacts below applicable thresholds of significance.

Response P140-48 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Responses P140-25 through P140-29 for further discussion of how the Draft EIR analyzed all reasonably foreseeable impacts of the proposed Project.

Comment P140-49 Furthermore, as set forth above, certain of the mitigation measures identified in the Draft EIR are legally invalid either because they violate CEQA's standards for the particular type of mitigation, or because they lack substance or rely on unspecified and unformulated future measures, practices and plans that provide no substantial evidence supporting the Draft EIR's assertion that they would actually reduce potentially significant impacts to less than significant levels. (See *Endangered Habitats League*, supra, 131 Cal.App.4th at pp. 793-794; *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 309.)

Response P140-49 This comment provides a general summary of comments raised in this letter. Responses to the comments contained in this letter are provided in Responses P140-1 through P140-48, and below in Responses P140-50 through P140-55. Refer to Topical

Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project's use of mitigation measures and project design features is consistent with the requirements of CEQA.

Comment P140-50 For example, Mitigation Measure CUL-A, addressed to unexpected archeological finds, violates the terms of CEQA Guidelines Section 15126.4(b)(3) and improperly defers mitigation. (Section 3.5, Cultural Resources, pp. 3.5-68-3.5-69.) It calls only for the preparation of an as-yet unformulated "Cultural Resources Monitoring and Mitigation Plan" ("CRMMP") that is merely generally and insufficiently described. Among the major defects in the future CRMMP is that it violates CEQA Guidelines Section 15126.4, subsection (b)(3). That subsection mandates that certain factors "shall be considered and discussed in an EIR for a project involving such an archaeological site." The first such factor, listed at Section 15126.4, subsections (b)(3)(A) and (B), states that preservation in place is the preferred manner of mitigating impacts and may be accomplished by at least four means. The future CRMMP breezes by preservation in place: treatment may involve data recovery or preservation in place. (Section 3.5, Cultural Resources, p. 3.5-69.) The Draft EIR neither considers nor discusses any alternatives for preservation in place of any unexpected archeological finds. Yet, such finds are highly likely along the Project's alignment, given the long history of settlement in the area and the numerous built historic resources near and surrounding the proposed Alameda Station. Moreover, preservation in place for archeological finds near El Pueblo, for example, may be the only mitigation measure that would truly reduce the Project's impacts to less than significant, since an unexpected find in that area may well be associated with a larger as-yet undiscovered cohesive archeological find such as the remains of a village, home, or other structure.

Response P140-50 The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to archaeological resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project. As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. The Draft EIR evaluates all known, previously recorded archaeological resources in the Area of Potential Impact (API), as well as the potential to inadvertently encounter previously unknown and undocumented archaeological resources. Refer to Responses P140-36 and P140--37 regarding the adequacy of the Draft EIR assessment of archeological resources and an overview of the Draft EIR's mitigation measures related to cultural resources. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the use of plans in mitigation measures does not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review (for example, where ground disturbance and excavation is infeasible prior to project approval). Refer to

Responses P140-51 and P140-52 for additional discussion of why additional study regarding archaeological resources is not appropriate prior to project approval. As provided in Mitigation Measure CUL-A, on page 3.5-69 of the Draft EIR, the CRMMP will lay out regulatory requirements which will be adhered to, including SHPO consultation and practices that seek to avoid and preserve state--owned historical resources. In addition, the “Project Sponsor shall coordinate with the archaeologist and Metro to develop an appropriate treatment plan for the resources in accordance with California Public Resources Code (PRC) Section 21083.2(i) if they are determined by Metro to be potentially eligible for the CRHR or potentially qualify as unique archaeological resources pursuant to CEQA. Treatment may include implementation of archaeological data recovery excavations to remove the resource or preservation in place.” Accordingly, the best possible treatment for the resource will be determined based upon Public Resources Code requirements in consultation with a qualified archaeologist. CEQA itself recognizes that while preservation in place is the preferred method of mitigating impacts, other approaches may still reduce potential impacts to less than significant if preservation in place is not feasible. For instance, CEQA Guidelines Section 15126.4(b)(3) acknowledges that data recovery through excavation may be the only feasible mitigation, and that a data recovery plan, which provides for adequately recovering the scientifically consequential information from and about the historical resource, shall be prepared and adopted prior to any excavation being undertaken. Refer to Section 5.0, Corrections and Additions, of the Final EIR for a discussion of how Mitigation Measures CUL-A, CUL-C, and CUL-D have been revised consistent with CEQA Guidelines section 15126.4(b)’s recognition that “preservation in place is the preferred manner of mitigating impacts to archaeological sites,” and that data recovery plans may be prepared “[w]hen data recovery through excavation is the only feasible mitigation.”

Comment P140-51 Mitigation Measure CUL-A and its CRMMP also violate CEQA by deferring to the future the details of the measures that would actually mitigate the impacts. No information is provided as to when preservation in place would be required over recovery, or vice versa; in fact, again, it appears that recovery is the preferred measure. (See Section 3.5, Cultural Resources, p. 3.5-69, 3.5-57; see also, 3.5-61.) They also violate CEQA by allowing Metro, a non-expert, to determine whether a discovered resource is potentially eligible for the California Register of Historic Resources or may potentially qualify as a unique archeological resource under CEQA. (Section 3.5, Cultural Resources, p. 3.5-69.)

Response P140-51 Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for a discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be

appropriately tailored to the potential impact. The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to archaeological resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project. Refer to Responses P140-36 and P140-37, above, regarding the adequacy of the Draft EIR assessment of archeological resources, and Response P140--50, above, regarding the nature and adequacy of Mitigation Measure CUL-A. Refer to California Code of Regulations 15064.5 regarding the process by which a Lead Agency may determine significance of a resource and its eligibility for potential listing in the California Register of Historical Resources (CRHR).

Comment P140-52 Mitigation Measures CUL-C, CUL-D and CUL-E suffer from the same defects as does Mitigation Measure CUL-A, but are even more focused on data recovery as the only mitigation solution, without any consideration or discussion of preservation in place, even though the Draft EIR recognizes the archeological sensitivity of the area. (Section 3.5, Cultural Resources, p. 3.5-70.) These measures also improperly defer mitigation and are impermissibly vague by providing that “criteria thresholds that would require data recovery” (p. 3.5-70), an undisclosed “data recovery plan shall be implemented” (id.)

Response P140-52 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to archaeological resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project. Refer to Responses P140-36 and P140-37, above, regarding the adequacy of the Draft EIR assessment of archeological resources and Mitigation Measures CUL-C through CUL-E. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the use of plans in mitigation measures does not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review (for example, where ground disturbance and excavation is infeasible prior to project approval). With respect to Mitigation Measures CUL-A and CUL-C through CUL-E, as acknowledged on page 3.5-2, Section 3.05, Cultural Resources, of the Draft EIR, “an archaeological resource may not be recognizable or even observable without ground-disturbing activities.” Mitigation Measures CUL-A and CUL-C through CUL-E accordingly outline actions that would be taken in the unlikely event that archaeological resources are discovered once excavation begins on-site. Excavation or other such ground disturbance prior to approval of the proposed Project to discover any potential additional resources is impracticable at this juncture. Mitigation Measure CUL-C requires that if avoidance is not feasible, a testing and data recovery plan shall be prepared outlining the procedures for potential discovery, including the criteria thresholds for requiring data recovery following testing, and how data recovery shall describe the specific methods to be used for excavation, mapping, and data recovery. Similar requirements are provided in Mitigation Measures CUL-D and CUL-E. Refer to

Response P140-49 for a discussion of how CEQA provides that data recovery through excavation may be the only feasible mitigation and would reduce potential impacts to less than significant if preservation in place is infeasible. Consistent with the requirements of CEQA Guidelines section 15126.4(b)(3), Mitigation Measures CUL-A and CUL-C recognize that preservation in place is the preferred manner of mitigating impacts to archaeological sites, but may not be feasible, allowing for data recovery in such circumstances. Similarly, Mitigation Measure CUL-E recognizes that if “avoidance/preservation-in-place is not possible,” a data recovery plan should be implemented. Refer to Section 5.0, Corrections and Additions, to the Final EIR, for a discussion of how Mitigation Measures CUL-A, CUL-C, and CUL-D have been revised consistent with CEQA Guidelines section 15126.4(b)’s recognition that “preservation in place is the preferred manner of mitigating impacts to archaeological sites,” and that data recovery plans may be prepared “[w]hen data recovery through excavation is the only feasible mitigation.”

Comment P140-53 Given these defects in these mitigation measures, the Draft EIR contains no substantial evidence supporting its conclusion that impacts on archeological resources would be less than significant.

Response P140-53 This comment provides a general conclusion regarding the comments raised in this letter. Responses to comments contained in this letter are provided above in Responses P140-47 through P140-53. The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to archaeological resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, prepared by experts Marc A. Beherec, Ph.D., R.P.A., and Christy Dolan, R.P.A., of AECOM. Appendix F provides substantial evidence to support the Draft EIR’s conclusion that all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation.

Comment P140-54 IX. ALTERNATIVES

The Draft EIR improperly rejects Use Option D for failing to meet “a majority of the Project’s objectives” because this Option would not include passenger facilities, but would only be a junction. (Section 6.5, Use Option D, p. 6-38.) These Project objectives, according to the Draft EIR, include enhancing community connectivity and providing accessible fare opportunities (a subject not addressed in the Draft EIR). (Id.) The discussion further explains that a junction in place of a station with passenger facilities would not provide transit options for the Chinatown and Mission Junction neighborhoods or for the Park.

Response P140-54 This comment provides a general recitation and characterization of Design Option B. Section 6.0, Design and Use Options, of the Draft EIR, includes discussion of Use Option D referenced by this commenter. Section 6.0 includes design and use options responsive to public comments and stakeholder feedback, and describes how

environmental impacts from implementation of each design and use option would differ from the proposed Project's potential environmental impacts described in Section 2.0, Project Description and analyzed in Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR, with respect to the particular project component variation. The design and use options provide flexibility for decision makers to potentially adopt one or more minor variations to components of the proposed Project should the decision maker determine such a minor variation is desirable as part of the proposed Project. The design and use options are not alternatives to the proposed Project, which are included in Section 4.0, Alternatives, of the Draft EIR. The Draft EIR does not "reject" or otherwise advance forward a particular design and use option. Therefore, the Draft EIR has not "rejected" Use Option D. Use Option D provides for the Chinatown/State Park Station to be a non--passenger junction, similar to the proposed Project's Broadway Junction, instead of the proposed Project's Chinatown/State Park Station which would function as a passenger station. As discussed in Section 2.0, Project Description, the proposed Project's Chinatown/State Park Station would be located near the southernmost entrance to the Los Angeles State Historic Park and would be located within a short walk to many Chinatown businesses and Metro's L Line (Gold). This station would address the goal of creating a stronger connection with the Metro L Line (Gold) and would also enhance transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Use Option D would not provide this connection. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project's objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project's fundamental purpose of providing a permanent transit connection to Dodger Stadium. Refer to Topical Response N, Environmental Justice, for discussion of how the proposed Project is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, providing connections to Metro's growing regional public transit system. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P140-55 However, as discussed above, the Gold Line's Chinatown Station already serves these neighborhoods and is already just one mile from the Park. The Project really only serves Dodger Stadium and therefore a Station at Chinatown would not only be more impactful but also unnecessary. There is no question that a junction, rather than the larger station proposed, would have a lesser impact on the area, particularly since the Gold Line's Chinatown Station already exists.

Response P140-55 Refer to Response P140-9 for discussion of the purpose and need for the proposed Project. Refer to Response P140-54 for discussion of why an intermediate station is

proposed for the Chinatown/ State Park Station instead of a junction. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. As detailed in the Draft EIR, the proposed Project's Chinatown/State Park Station would have less than significant operational impacts.

Comment P140-56 X. CONCLUSION

Based on the foregoing, the Draft EIR fails to suffice under CEQA as an informational document. It fails to assess critical impacts and fails to provide the requisite substantial evidence supporting its conclusions that the majority of the Project's impacts would be less than significant. To the contrary, as noted above there is ample evidence suggesting that the Project, both individually and cumulatively, would have significant effects on the environment that are not identified, assessed or mitigated in the Draft EIR. The Draft EIR must be revised and recirculated to address its fundamental defects before the Project can be considered for approval.

Very truly yours,

DLA PIPER LLP (US)

A. Catherine Norian

Enclosure (Exhibits 1-4)

Response P140-56 This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses P140-1 through P140-55. This comment and the comments raised in this letter do not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines Section 15088.5.

Comment Letter P141 – Bill Haller

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P141

Comment P141-1 Dear Cory,

Hooray! Let's get this done!

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

Kind regards,

Bill Haller

Response P141-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P142 – Justin Carrus

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P142

Comment P142-1 To whom it may concern,

I'm a 90012 resident and have been following this project for the past several months. I attended the event at Union Station and spent over an hour discussing the results of the EIR and project at large with the hosts. After some more research and reflection, I would like to voice some concerns for the project.

Response P142-1 This comment provides a general introduction regarding the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses P142-2 through P142-4.

Comment P142-2 My primary concern is simply about understanding how the project is financed. At the Union Station event I was told that the project will be entirely financed by an external benefactor who will only donate the funds for this project in particular (as opposed to sponsoring other projects). Furthermore that the benefactor would pay for ongoing maintenance and that the cost to users would be the same as the rest of the Metro system.

To me, this seems unlikely to be true (and if true, seems unlikely to work in reality unless there is some kind of endowment created for the ongoing financing of this project), and I'm unable to find confirmation in any legally binding way that this is the case. If you are able to provide authoritative information about this, please include it in your response.

Response P142-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P142-3 My second concern is about the choice of gondola over other alternatives. As far as I can tell, no other alternatives have been considered as this was an "unsolicited proposal". I feel as though the due-diligence for this project has not been done. It seems this project is a solution looking for a problem rather than an optimal plan. I am not able to support a project that assumes that the first solution considered is the best solution.

Response P142-3 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for a discussion of how the Draft EIR considered a range of reasonable alternatives pursuant to CEQA. This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project.

The Draft EIR itself serves as a "feasibility study" for the proposed Project, with 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts.

Comment P142-4 My final concern is that the ART project doesn't address the largest issue with Dodger Stadium: that the venue itself is disconnected from the surrounding urban fabric by its own parking lots. Great urban ballparks (and venues) are connected to the surrounding neighborhoods in a way that allows patrons to arrive early, enjoy food and drink before the event, walk to the park, enjoy the event, and linger after. I would much prefer this project to omit the gondola (which seems very high-risk for the expected value of moving 5k pp/hr) and instead focus on improving the walkability of Vin Scully Ave. and creating connections to the park from Chinatown. Patrons already park in the surrounding area and walk to the park, so the distance is not too great. The Chinatown L Line stop is geographically very close to the park, and the LA Historic Park regularly hosts events with >10k attendees, even without the direct highway access that Dodger Stadium has. Transit options already exist to get to Chinatown and Echo Park from many places in the city and the last-mile improvements would be much more beneficial to the area than a gondola.

Response P142-4 Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. While this alternative would provide improved pedestrian connections compared to existing conditions, the 25 minute plus travel time from the Metro L Line (Gold) Station to the location of the proposed Dodger Stadium Station would be at least nine times greater than the three minute travel time between those two locations with the proposed Project, and this alternative would be unlikely to attract

substantially more people to walk to Dodger Stadium compared to existing conditions given the travel time and the physical exertion. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Comment P142-5 I appreciate you taking the time to solicit and read these responses. If I am misinformed, please send any relevant information along.

Response P142-5 This comment provides a general conclusion regarding the comments raised in this letter. Responses to comments contained in this letter are provided above in Responses P142-2 through P142-4.

Comment Letter P143 – Nidhi Mikhanj

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P143

Comment P143-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Sincerely,

Nidhi Nikhanj, MD

Response P143-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P144 – Jasvinder Bawa

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P144

Comment P144-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Sincerely,

Jas

Response P144-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P145 – Ralph Levinson

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P145

Comment P145-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

What a win-win! Jobs, fight pollution, save fans gas, and help climate change. And fun!

Sincerely,
Ralph Levinson, M.D.

Response P145-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P146 – Susan Levinson

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P146

Comment P146-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Sincerely,

Susan

Response P146-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P147 – Brenda Nuyen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P147

Comment P147-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Sincerely,
Brenda Nuyen

Response P147-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P148 – Dylan Sittig

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P148

Comment P148-1 Hello Mr. Cory Zelmer,

I am writing to express my concern about the LAART project and the environmental impacts that it will have on the community and the City.

While the Environmental Impact Report (EIR) brings to light certain impacts of the project on the environment, the simple fact is that the negative impacts of this project go beyond the scope of an EIR and California Environmental Quality Act review (public funding, privacy concerns, etc.). The EIR lays out the potential for significant and unavoidable impacts and relies on questionable mitigation measures to attempt to address significant impacts.

Response P148-1 The Draft EIR analyzes the whole of this action, as well as reasonably foreseeable potential environmental impacts resulting from this action. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (Id., § 15204.) The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project’s use of mitigation measures and project design features is consistent with the requirements of CEQA.

Comment P148-2 There is no way that the undefined potential benefits of this program would possibly outweigh the clear and obvious negative environmental and societal impacts associated with the construction and operation of the Project. I urge you to halt this program as soon as possible.

Response P148-2 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high- capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los

Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Comment P148-3 The Project is not community serving and does nothing to enhance mobility for existing Chinatown residents. Ample public transit service between Union Station and Chinatown already exists in the form of numerous Metro Buses, multiple DASH buses, the Gold / L Line, and it is a very short walk. In no instance will the non-game day head ways be more efficient than many of these other pre-existing transit options.

Response P148-3 Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project’s ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project’s potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. The proposed Project supports Metro’s goal of prioritizing equity opportunities and helps promote public transit as an essential lever in enabling access and improving quality of life for Los Angeles County. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game and the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the proposed Community Access Plan Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project’s Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less.

Comment P148-4 There will be negative impacts to the efforts to increase the Union Station Alameda forecourt. Having an obtrusive tram station will detract from the pedestrian realm and is antithetical to the type of street activation that is desired near Olvera Street and along Alameda Street.

Response P148-4 As discussed in Section 2.0, Project Description, of the Draft EIR, Metro’s LAUS Forecourt and Esplanade Improvements Project is currently being developed in coordination with the City of Los Angeles, and would include repurposing the existing northwestern parking lot at LAUS into a pedestrian forecourt and gathering space, as well as pedestrian and bicycle enhancements along Alameda Street and Los Angeles Street. In addition, the Project proposes a new pedestrian plaza north of the Placita de Dolores in an area currently used as a parking and loading area for El Pueblo. As discussed in Section 2.0, Project Description, of the Draft EIR, the Alameda Station location was selected in part because of its high visibility and proximity to LAUS and El Pueblo, safe and convenient pedestrian connection to and from the LAUS passenger terminal and El Pueblo, as well as adjacency to public space for passenger access, and because the location is compatible with Metro’s plans at LAUS, including the LAUS Forecourt and Esplanade Improvements Project. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would include several sustainability features and open space enhancements, including pedestrian enhancements and drought tolerant landscaping, how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area, which would be discussed with identified stakeholder

groups, and how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents.

Comment P148-5 Additional exploration of the Transportation Systems Management Alternative should be further explored. The project objectives were too narrowly defined in a way that doesn't truly serve the needs of the people of the City of Los Angeles, or the residents of Chinatown.

Response P148-5 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project's objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project's fundamental purpose of providing a permanent transit connection to Dodger Stadium. The proposed Project's objectives are not so narrow that they preclude consideration of reasonable alternatives – while alternatives for a project must be able to satisfy “most of the basic objectives of a project,” alternatives should not be excluded simply because they would impede attainment of project objectives “to some degree.” (CEQA Guidelines, §15126.6(a)–(b).) The proposed Project's objectives broadly contemplate improving neighborhood connectivity and the Dodger Stadium visitor experience, reducing vehicle congestion and associated emissions in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, improving access to Elysian Park and the Los Angeles State Historic Park, and providing a sustainable form of transit. Aerial rapid transit technology has the ability to overcome grade and elevation issues between LAUS and Dodger Stadium in order to provide a direct transit connection between the two locations, and provide safe, zero emission, environmentally friendly, and high-capacity transit connectivity in the Project area that would reduce GHG emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways. Thus, because the proposed Project's fundamental purpose is to provide a permanent transit connection to Dodger Stadium, and because aerial rapid transit technology can achieve this fundamental purpose, the objectives for the proposed Project are in compliance with CEQA, which does not restrict an agency's discretion to identify and pursue a particular project designed to meet a particular set of objectives.

Comment P148-6 If the project does somehow move forward, Design Option E should be required in order to create at least some public benefit in the form of the bridge to the State Historic Park from Broadway.

Response P148-6 As discussed in Topical Response C, Project Features, while not proposed as part of the proposed Project, the Draft EIR included as Design and Use Option E an analysis of the State Park’s proposed bike and pedestrian bridge. The bridge would provide important connections for students at Cathedral High School, as well as between the park and the Chinatown, Savoy, and Solano Canyon neighborhoods to support convenient access for the community. The analysis serves to provide environmental clearance for the bike and pedestrian bridge as a benefit to the Los Angeles State Historic Park, as while the bike and pedestrian bridge was mentioned in the Los Angeles State Historic Park General Plan and studied in the State Park’s Bridge Feasibility Study, the bike and pedestrian bridge was never environmentally cleared. Support for the Los Angeles State Historic Park bike and pedestrian bridge would otherwise be provided as part of the proposed Project. Accordingly, the proposed Project is furthering the bike and pedestrian bridge by providing the necessary environmental clearance and support for the bridge.

Comment Letter P149 – Daniel Liu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P149

Comment P149-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Sincerely,

Daniel Liu

Response P149-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P150 – Amy Hammond

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P150

Comment P150-1 Dear Mr. Cory Zelmer,

I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Sincerely,

Amy Hammond

Response P150-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P151 – Jodi Sklawer

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P151

Comment P151-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P151-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P152 – Carolyn Weyant

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P152**Comment P152-1 To Whom It May Concern:**

You need to think back to the McCourts' involvement with the L.A. Dodgers and how history will most likely repeat itself. The Dodger fans in all of L.A. County - and there are millions of us - will not contribute one penny to this person's ownership in such a project. Here are a few reasons why . . .

Frank McCourt not only mishandled the finances of the Dodgers, he turned the beloved franchise into the laughing stock of the sports world. Seemingly small things such as parking around the stadium became frustrating once McCourt took over the team.

He drove the once-proud franchise into the ground after years of mismanaging the team's funds, refusing to spend on key player acquisitions through free agency and trades, refusing to invest in international scouting, and tanking the farm system. He did manage to hijack the franchise to make himself filthy rich.

So was he a disaster as an owner? Absolutely. But when you consider that he financed 100% of the \$430 million he needed to complete the purchase of the team in 2004, plunged the franchise into bankruptcy by 2011, and somehow walked away with almost \$1 billion in his pocket, you can't help but admit that McCourt, is as the very least, a savvy businessman who's shrewd tactics made him an extremely wealthy man even if it meant tarnishing the Dodgers iconic brand every step of the way.

Do yourselves a favor and keep this crook out of any money-making venture which will only hurt the people and city and county of Los Angeles.

Regards,
Carolyn Weyant

Response P152-1 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P153 - Aronriti Mey

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P153

Comment P153-1 This project to build a gondola will not do anything to help the Chinatown community. It will do more harm to the community by erasing Chinese American culture.

Response P153-1 Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. The proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. As discussed in Section 2.0, Project Description, of the Draft EIR, and Topical Response C, Project Features, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment P153-2 It will further gentrify Chinatown and bring more unwanted traffic into our neighborhood; residents and business owners already have a hard time finding parking.

Response P153-2 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines

(“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Comment P153-3 It will environmentally impact habitats such as Solano Canyon and the LA River...

Response P153-3 Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of the Final EIR for discussion of how impacts to biological resources from construction and operations of the proposed Project would be less than significant.

Comment P153-4 ...while also displace Chinatown residents.

Response P153-4 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing.

Comment P153-5 The history of Dodger Stadium has always displaced low income and working class families; three communities in Chavez Ravine have been erased and destroyed from Los Angeles’ History La Loma, Palo Verde, and Bishop. We won’t let that happen to Chinatown as well!

Response P153-5 Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine.

Comment P153-6 My family has been living in this community for over 20 years and so much has been destroyed and big development companies have come in and changed the landscape of Chinatown for their own profit without giving back to the community at large.

Response P153-6 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project’s ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project’s potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Comment P153-7 We want the money that will be spent on this gondola to be put into improving Los Angeles' transportation system and street, road, and parking infrastructure instead.

Response P153-7 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provides detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P154 - YueHan Kuang

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P154

Comment P154-1 Building a gondola over private houses makes residents afraid, always worried that accidents may happen. Who suggested building a gondola in Chinatown?

Response P154-1 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the proposed Project's design and operations, including discussion of the safety, privacy, and operations features of the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR.

Comment P154-2 It would be better to build the gondola above their roofs and see if they have objections. I strongly oppose building a gondola in Chinatown.

Response P154-2 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P155 - HZ Liu Zhang

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P155

Comment P155-1 I strongly support the LA Aerial Rapid Transit project as this project will be able to solve traffic jams in Chinatown, make our business thrive, and clean up the environment. Elite Salon.

Response P155-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Responses to P178

Comment P178-1 The information is interesting. I would like to have more information.

Response P178-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to the Draft EIR and this Final EIR for additional information about the proposed Project.

Comment Letter P179 – Disraeli Butler

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P179

Comment P179-1 Great idea to bring Los Angeles into the future, while boosting the economy and spreading diversity to connect our nation and its people.

Response P179-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P180 - Maria Alvarez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P180

Comment P180-1 I think that this project is very important. I think that it is good for the community, especially for the youth, so they can experience something else outside the project.

Response P180-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P181 – Loue Chan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P181

Comment P181-1 How long will construction be? What jobs come from this project?

Response P181-1 Refer Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR for the proposed Project’s construction assumptions. Construction of the proposed Project is anticipated to take approximately 25 months, including construction, cable installation, and system testing. It is likely that the labor force from within the region would be sufficient to complete the majority of Project construction. Refer to Topical Response N, Environmental Justice, for discussion of how the Project Sponsor has committed to a goal of 35 percent utilization of minority business enterprises (MBE), women business enterprises (WBE), disadvantaged business enterprises (DBE), small business enterprise (SBE), disabled veteran business enterprises (DVBE), and LGBTQ-owned businesses during the proposed Project’s construction phase. The proposed Project will enter into a Project Labor Agreement and will work in coordination with the LA/OC Building and Construction Trades.

Comment Letter P182 - Amparo Cabrera

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P182

Comment P182-1 I like the project, it is a good idea. It is beneficial to the community and to youth in the future.

Response P182-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P183 - Socorro Lugo

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P183

Comment P183-1 I agree with this Gondola Project because it is beneficial to the community and to youth in the future, while bringing improvements to the city.

Response P183-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P184 – Lan To

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P184

Comment P184-1 I like your plans about development about communication and landscape

Response P184-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P185 - Sandra Sedano

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P185

Comment P185-1 The project is good if it will be free and more lights are put in the park. I like it as an improvement in the community.

Response P185-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P186 - Marta Prieto

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P186

Comment P186-1 I like this project for everybody else, but I would not ride in it.

Response P186-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P187 – Kin Tsan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P187

Comment P187-1 The project is adorable, especially it could attract tourists for our business in Chinatown.

Response P187-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P188 – Edward Elias

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P188

Comment P188-1 I try to use the Gold Line whenever I come into the Downtown of Los Angeles.

When I come to see a Dodgers Game, we have to use the Bus to get to the stadium. Which may take 20-40 mins depending on the gameday time.

The Gondola project would lower time to and from the station to the stadium.

When I drive into the stadium it takes approx. 20-30 min to get in and another 10-20 mins to find parking.

Lets not even talk about 1 hour – 2 hours to just leave the stadium.

The Gondola Project is a blessing for this 74 yr old man!

Thank you for the opportunity to express my gratitude and appreciation.

Response P188-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P189 – Edgar Ramos

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P189

Comment P189-1 I like what the gondola brings and want it to improve and connect my city.

I think it would be good to experience the city and bring in more tourism.

Response P189-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P190 - Wendy Ortiz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P190

Comment P190-1 I love the idea for my family and me, I am looking forward to riding one of those gondolas! I say “yes.”

Response P190-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P191 - Nazario Arreola

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P191

Comment P191-1 Nazario Arreola Fregozo 323501765

I think that it is a very interesting idea and that things like this benefit the community.

Response P191-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P192 - Mariana Gomez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P192

Comment P192-1 I don't like it.

I am afraid of riding that thing.

Response P192-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P193 - Karina

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P193

Comment P193-1 Concern: what would happen if a power outage occurs due to weather conditions?

What would be the worst case scenario.

Response P193-1 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the proposed Project's design and operations, including discussion of the safety, privacy, and operations features of the proposed Project. Refer to Section 2.0, Project Description, of the Draft EIR for a discussion of how backup power would be provided by battery storage located at each station and tower and the non-passenger junction. The battery storage system would be tested on a regular basis and would provide backup power to allow unloading of the system in the event of a power grid failure.

Comment Letter P194 – Gustavo Gonzalez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P194

Comment P194-1 *Good for environmental purposes.

*It will eliminate traffic.

Response P194-1 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P194-2 Can you ride while under the influence?

Is there any security measures to ensure public safety?

Response P194-2 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR for discussion of how the proposed Project is equipped with security features. For example, to provide added security to system passengers, each gondola cabin would have a security camera on board with a feed to the control room, as well as a "push to talk" button, which would open two-way communications with the control room. The control room would be able to address all cabins at once, or an individually selected cabin. Control room operators would have the ability to contact local security, law enforcement or other emergency response agencies as needed. Refer to Topical Response J, Gondola Design and Operations, for discussion of how the Emergency Operations Plan for the proposed Project would also include emergency response protocols and safety procedures developed in conjunction with the operator, system provider, and local authorities, and would address operational changes and communication protocols required in response to a range of potential emergencies such as a medical emergency in a cabin or in a station or a fire near the alignment. The plan would consider a wide range of scenarios for which default operational responses would be determined. In addition, the plan would include communication protocols with local authorities for further instruction and coordination.

Comment Letter P195 – Taylor Nichols

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P195

Comment P195-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P195-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P196 – Mitchell Mom

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P196

Comment P196-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P196-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P197 – Francis Hayes

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P197

Comment P197-1 Dear Mr. Cory Zelmer, I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium. The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos. Sincerely,

Frank Hayes

Response P197-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P198 – Jennifer Cuevas

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P198

Comment P198-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project (“The Gondola” at Dodger Stadium). I am a resident of CD1, work in the community, and am greatly concerned about the Gondola development that will negatively impact the neighborhood and set a precedent in the wrong direction for future developments, violating civil liberties and privacy. F

I am concerned about this project for the following reasons:

Response P198-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts. Refer to Topical Response J, Gondola Design and Operations and Section 2.0, Project Description, of the Draft EIR, for discussion of how cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views.

Comment P198-2 Built Environment:

- The Gondola Project’s enormous towers will cause aesthetic impacts in my community. I am concerned that the towers will obstruct views, and that the gondola cars will be used for advertising and electronic billboards.

Response P198-2 Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alameda Tower, Alpine Tower, and Stadium Tower. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project’s towers, which would be less than significant, and for visual simulations of the proposed Project’s towers. The Alameda Tower’s modern architectural style is evident and would complement the buildings within The California Endowment. The neutral light-tone gray color scheme of Alameda Tower was designed for consistency with the surrounding urban environment, and to not distract from visually distinct structures such as the United States Post Office Terminal Annex building. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Stadium Tower would

consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral light-tone gray colors and material finishes of the Stadium Tower were selected to complement the surrounding urban environment, and to not distract from existing visually distinct structures, such as Dodger Stadium. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area.

Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project's signage and lighting, with additional technical detail and information provided in the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. The proposed Project's Sign Concept Plan included at Appendix B of the Lighting Study provides that across the entire proposed Project, including stations, the junction, towers, and cabins, the proposed Project is proposing static signage and digital signage. The digital signage would be limited to the Alameda Station and the Dodger Stadium Station. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators. Further, there is existing signage in the Project area, and the proposed Project signage would not substantially degrade the existing visual character or quality of public views. Instead, the proposed Project's design ensures that signage would enhance the public realm. Specifically, signage for the proposed Project would be architecturally integrated into the design of the ART system, including its stations, the junction, towers, and cabins, and would be designed consistent with applicable Metro, City, and State approval requirements.

Comment P198-3 Traffic:

- The Gondola Project's displacement of traffic onto the surrounding neighborhoods will worsen air quality impacts from tailpipe emissions in an already overburdened community...

Response P198-3 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Contrary to the comment, the Draft EIR analysis reports that the proposed Project would reduce air pollutant emissions in the area. As shown in Table 3.3-5, Maximum Mass Daily Emissions Due to Operation of the Project, of the Draft EIR, the proposed Project would result in a net reduction in criteria pollutant emissions in both 2026 (Build Out)

and 2042 (Horizon Year) by reducing vehicle miles traveled and thereby decreasing emissions compared to existing conditions. As a fixed guideway transit project, providing new high-frequency high speed transit connections between the regional transit hub of LAUS and Dodger Stadium, the proposed Project is forecast to reduce vehicle miles travelled (VMT), as game and event attendees shift their travel mode from driving to Dodger Stadium to utilizing transit on the proposed Project. As an innovative transportation project that will reduce VMT over time, the proposed Project helps advance local and state climate and transportation policies (refer to Section 3.8.4 of the Draft EIR and Table C-1 through Table C-4 provided in Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR for additional discussion). The operational VMT and trips for the existing, Build Out, and Horizon Year that are used to calculate these mobile emissions are presented in Table A.2-3 of Draft EIR Appendix D, Air Quality/Health Risk Assessment Technical Report.

Comment P198-4 ...The Gondola Project's will increase traffic around Chinatown and Union Station.

- This project is designed to displace traffic from Dodger Stadium and push it onto the surrounding communities. The existing traffic conditions are already difficult because of stadium events, nearby County park competing events, everyday commuters and this project will make it worse.

Response P198-4 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations.

Comment P198-5

- Historic and Cultural Resources:

The Gondola Project will impact historic and cultural resources such as the Los Angeles State Historic Park, historic Union Station, and the Pueblo de Los Angeles Historic Monument

Response P198-5 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation.

Comment P198-6 Environmental Justice:

- This project will increase the impacts of air pollution from vehicle emissions in an area already overburdened by air emissions.

Response P198-6 Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project’s ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project’s potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P198-7 Gentrification:

- This project will lead to displacement and increase the cost of rent in the area.

Response P198-7 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement.

Comment P198-8 Future development:

- This project will lead to future commercial development in Chavez Ravine, without community input and without disclosure to the community.

Response P198-8 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property,

for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following, the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment P198-9 Lack of transparency:

- Metro went forward with this project without an open public process and without competitive bidding. I don’t understand the ownership or operation of the project because the details have been hidden from the community. Who is paying for this project? Will taxpayers be left holding the bag?

Response P198-9 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s sole source determination for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed

Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Appendix A, (Public Outreach Report), of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period.

Comment P198-10 Lack of community consultation:

- The community has been neglected and our voices have not been heard.
- No one asked us our vision for our community.
- We never asked for this project. We don’t need or want this project.

Response P198-10 Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment Letter P199 - Allen Mom

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P199

Comment P199-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P199-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P200

This comment number has intentionally been skipped.

Comment Letter P201 – Jay de la Torre

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P201

Comment P201-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P201-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P202 – Derrick Davis

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P202

Comment P202-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P202-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P203 – Jennifer Lee

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P203

Comment P203-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P203-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P204 – Peter Saudino

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P204

Comment P204-1 Hello, I'm a Los Angeles resident and I have some thoughts for you. I am writing to voice my opposition to the Gondola project at Dodger Stadium.

The residents in that neighborhood will hate it. It's a huge waste of time and money. And judging from the concept photos we've seen, it's just hideous.

Please don't do this.

Thanks.

Response P204-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. The Project Sponsor would utilize local artists for site specific artwork at each station reflective of the unique neighborhood culture, and would create numerous opportunities to collaborate with and showcase local

artists, including convening stakeholder groups to coordinate on issues including utilization of local artists and identification of sites along the proposed Project alignment to showcase the work of local artists.

Comment Letter P205 – Brian Herrera

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P205

Comment P205-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are essential in addressing climate change and improving the quality of life for Angelenos.

Response P205-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P206 – Veronica L

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P206

Comment P206-1 I received an auto-reply from Mr. Zelmer's e-mail to contact you in his absence.

Aside from appearing in person, will options be provided for remote appearance via video or teleconference? If so, please provide those. I also respectfully request you include such information on the website for those of us that may not have received notice with this information.

Response P206-1 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and during the four public hearings. Comments on the Draft EIR could be submitted by email to LAART@metro.net, by mail to One Gateway Plaza, Mail Stop 99-22-6, Los Angeles, CA 90012, or over the phone by calling (213) 922-6913. Comments could also be submitted at each of the four public hearings. At virtual public hearings, comments could be given verbally. In light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held on February 8, 2023. Verbal comments made at the virtual February 8, 2023 public hearing were deemed timely submitted for the purposes of the Draft EIR public review period. At the two public hearings held in person, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a "comment station" in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during all four public hearings, with interpretation provided in Taishanese during the final two public hearings.

Comment Letter P207 – Nathaniel Ortiz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P207

Comment P207-1 Hello, this message is in regards to the ART proposal.

This LAART project is severely misguided for several reasons.

First and foremost, this project is providing funding for a private enterprise. Metro already subsidizes trips to Dodger Stadium with the Dodger Stadium Express. While these trips are not necessarily the most efficient, they are a marked improvement over the LAART since they provide multiple infill stations, such as Union Station, the J Line infill station (which also connects to the Green Line), and other local connections.

Response P207-1 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment P207-2 Additionally, this project is much more inefficient than improving local heavy/light rail connections. Guggenheim Baseball Management should be fronting the cost for at a minimum of the construction cost of the station, as they are the only stakeholder to actually profit from this venture. As such, they should be subsidizing more efficient projects, rather than subsidizing a for profit venture that simply seeks to profit off of the taxpayers dime.

Finally, any arial transit system is inherently inferior to any current heavy or light rail alternatives due to a lack of passenger capacity.

If there are any questions regarding my statement, please contact me at the following:

Nathaniel Ortiz

Electrical Engineer

Response P207-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment Letter P208 - Peter Shek

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P208

Comment P208-1 I have heard that Metro approved for the construction of a Gondola Project to Dodgers Stadium. This is such a bad idea for reducing traffic, especially when there are shuttle bus in place already. Nowhere in the world are gondolas used in a metropolitan area to help reduce traffic. They are generally used for tourists' sightseeing purpose. I urge you to not waste money on this irrelevant project that will obviously be unlikely to resolve any traffic issues to the Dodgers Stadium. Instead, please focus on resources we already have, which are excellent bus fleets that are readily available.

Response P208-1 The proposed Project is currently in the environmental review process under CEQA and has not been approved for construction. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 3.03, Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities.

Refer to Table 2-1, ART Precedents, in Section 2.0, Project Description, of the Draft EIR, which provides examples of gondola systems in cities around the world which serve as a feasible mode of urban rapid transit. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses and that have brought benefits to their surrounding areas by connecting disparate neighborhoods, promoting commerce, beautifying communities, and enhancing transit system rider safety.

Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time

competitive transit trips from more locations in the region. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P209 - Peter Shek

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P209

Comment P209-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

This is a waste of money and completely irrelevant idea / proposal when there are already shuttle busses. Busses can also take at least 50 cars of the road if they are fully loaded each trip. If they are underutilized, the Metro is responsible for promoting it more like they do for new rail lines. Building a fancy gondola is not going to solve traffic problems.

Response P209-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 3.03, Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the

proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P210 - Jean Brandtt

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P210

Comment P210-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). It is an affront to residents and a huge expense for voters.

Response P210-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P211 - Kristen Wo

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P211

Comment P211-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P211-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P212 - Andrea Valverde

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P212

Comment P212-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Please, this is not the answer to easing traffic in the area and will cause more problems than it solves. The neighborhood does not want this.

Response P212-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 3.03, Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Comment Letter P213 - Manori Sumanasinghe

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P213

Comment P213-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P213-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P213-2 The Gondola Project's enormous towers will cause aesthetic impacts in my community. We finally have a beautiful natural environment in Chinatown that is safe for our children and the elderly. I am concerned that the towers will obstruct views, and that the gondola cars will be used for advertising and electronic billboards.

Response P213-2 Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alameda Tower, Alpine Tower, and Stadium Tower. Refer to Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of the structural design of the proposed Project's towers. As discussed therein, the towers would "meet the rigorous safety standards of applicable standards, requirements, and building codes, including all mandated standards addressing environmental factors such as wind and seismic effects and gravity forces, including all impacts from the height and tilt of the structures, to ensure structural integrity and safety." Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project's towers, which would be less than significant, and for visual simulations of the proposed Project's towers. The Alameda Tower's modern architectural style is evident and would complement the buildings within The California Endowment. The neutral light-tone gray color scheme of Alameda Tower was designed for consistency with the surrounding urban environment, and to not distract from visually distinct structures such as the United States Post Office Terminal Annex building. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Stadium Tower would consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral light-tone gray colors and material finishes of the Stadium Tower was selected to complement the surrounding urban environment, and to not distract from existing visually distinct structures, such as Dodger Stadium. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed

Project would be designed to complement and reflect the unique character of the surrounding area.

Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project's signage and lighting, with additional technical detail and information provided in the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. The proposed Project's Sign Concept Plan included at Appendix B of the Lighting Study provides that across the entire proposed Project, including stations, the junction, towers, and cabins, the proposed Project is proposing static signage and digital signage. The digital signage would be limited to the Alameda Station and the Dodger Stadium Station. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators. Further, there is existing signage in the Project area, and the proposed Project signage would not substantially degrade the existing visual character or quality of public views. Instead, the proposed Project's design ensures that signage would enhance the public realm. Specifically, signage for the proposed Project would be architecturally integrated into the design of the system, including its stations, the junction, towers, and cabins, and would be designed consistent with applicable Metro, City, and State approval requirements.

Comment P213-3 The Gondola Project's will increase traffic around Chinatown and Union Station. This project is designed to displace traffic from Dodger Stadium and push it onto the surrounding communities. The existing traffic conditions are already difficult because of unmanaged traffic during game days in the immediate neighborhood and this project will make it worse. We've had to wait 10-15 minutes to get to our parking lot at Blossom Plaza by the Metro station during game days due to traffic congestion. This is going to make things worse.

Response P213-3 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, and the ridership forecasts of the proposed Project, approximately 20 percent of the fans could take aerial transit

connected to Metro’s regional transit system. This would reduce traffic volumes destined to Dodger Stadium on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles travelled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles travelled. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations.

Comment P213-4 There is also lack of transparency from the Metro. There is a clear lack of community consultation: The community has been neglected and our voices have not been heard. No one asked us our vision for our community. We live AND work in Chinatown. Our voices need to be heard.

Please stop this project and ask us what we want. There is clearly a better way to do this.

Response P213-4 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in

the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, and Appendix A, Scoping Report, of the Draft EIR, for discussion of the proposed Project team’s outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Refer to Topical Response C, Project Features, for discussion of the potential added benefits from the proposed Project, including coordination with identified stakeholder groups.

Comment Letter P214 - Reagan McClymonds

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P214

Comment P214-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project (“The Gondola” at Dodger Stadium).

These were my comments on Urbanize LA relative to an update on the project. I stand by them 3 months later. The public/City of LA/MTA are being sold a bill of goods.

Response P214-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. This comment also provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses P214-2 to P214-6.

Comment P214-2 I am not a homeowner and have no skin in the Chinatown game. I am, however, able to do basic math and do not get distracted by shiny objects.

Response P214-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P214-3 1) Proposed Car Capacity is 30 per car (see link below). 5,000/hour means 30 people are loaded and moving every 20 seconds. No way. If one counts two-way traffic, we now have 2,500/hour capacity going one way which is all that matters in this circumstance (and that requires 40 second headways which is likely a gaping stretch too). That's borderline fraudulent advertising since:

Response P214-3 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphd). The cabins would move at an approximate speed of 13.4 miles per hour with headways of approximately 23 seconds, which represents the time between cabins arriving at a station. As one hour consists of 3,600 seconds, approximately 156.5 cabins would arrive every hour (3,600 seconds / 23 seconds). The proposed Project’s Tricable Detachable Gondola system (“3S”) cabins typically carry between 30 to 40 passengers each, depending on the exact configuration of seating and cabin amenities selected. At a capacity of 35 passengers per cabin, at 156.5 cabins per hour, 5,478 passengers would arrive at each station per hour (35 passengers per cabin x 156.5 cabins per hour). Given that the same headway applies in each direction, the

total, calculated system capacity is therefore 5,478 pphpd. To account for variations in the exact configuration of seating and cabin amenities, as well as operational considerations (including, for example, fewer than 35 people boarding a cabin or cabins being either slowed or stopped in the station for boarding purposes), the proposed Project has included an approximately 10 percent reduction in capacity from 5,478 pphpd to 5,000 pphpd.

Comment P214-4 2) People do not go to Dodger Stadium after the game is over and people generally don't leave before it ends (certainly innings 1-6, let's say). That means the real capacity is 2,500/hour which still requires believing 40-second headways, which I do not.

Response P214-4 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphd). The cabins would move at an approximate speed of 13.4 miles per hour with headways of approximately 23 seconds, which represents the time between cabins arriving at a station.

Comment P214-5 3) But even if one still has faith in 2,500/hour capacity, to get utility out of that number means 1,250 have to arrive 30 minutes before the game and 1,250 have to leave 30 minutes after the game. That will not sit well with fans over long term.

Response P214-5 Refer to Response P214-4 for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphd). Refer to Topical Response B, Ridership Model; Queuing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data, and the management of queuing at stations, and pre-game and post-game transportation.

Comment P214-6 That is an ineffective transit solution for an edifice with a capacity of 55,000 holding time sensitive events. And this gondola only gets one to Union Station where riders are still facing painful train/car commutes to get home at 10-11 PM on most nights.

As a measure of comparison, an NYC subway could transport 2,500 people in less than 10 minutes.

Add it all up and this is a total failure in waiting. But it might have nice views of downtown.

Response P214-6 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but

there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of post-game transportation.

Comment Letter P215 - Thomas Britt

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P215

Comment P215-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). The unsightly towers will cause aesthetic impacts in my community. I am concerned that the towers will obstruct views, and that the gondola cars will be used for advertising and electronic billboards.

Response P215-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alameda Tower, Alpine Tower, and Stadium Tower. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project's towers, which would be less than significant, and for visual simulations of the proposed Project's towers. The Alameda Tower's modern architectural style is evident and would complement the buildings within The California Endowment. The neutral light-tone gray color scheme of Alameda Tower was designed for consistency with the surrounding urban environment, and to not distract from visually distinct structures such as the United States Post Office Terminal Annex building. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Stadium Tower would consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral light-tone gray colors and material finishes of the Stadium Tower was selected to complement the surrounding urban environment, and to not distract from existing visually distinct structures, such as Dodger Stadium.

Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project's signage and lighting, with additional technical detail and information provided in the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. The proposed Project's Sign Concept Plan included at Appendix B of the Lighting Study provides that across the entire proposed Project, including stations, the junction, towers, and cabins, the proposed Project is proposing static signage and digital signage. The digital signage would be limited to the Alameda Station and the Dodger Stadium Station. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to

the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators. Further, there is existing signage in the Project area, and the proposed Project signage would not substantially degrade the existing visual character or quality of public views. Instead, the proposed Project's design ensures that signage would enhance the public realm. Specifically, signage for the proposed Project would be architecturally integrated into the design of the system, including its stations, the junction, towers, and cabins, and would be designed consistent with applicable Metro, City, and State approval requirements.

Comment P215-2 The Gondola Project's displacement of traffic onto the surrounding neighborhoods will worsen air quality impacts from tailpipe emissions in an already overburdened community.

Response P215-2 Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, and the ridership forecasts of the proposed Project, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce traffic volumes destined to Dodger Stadium on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction

of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles travelled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles travelled.

Comment P215-3 Also, this project will lead to displacement and increase the cost of rent in the area.

Response P215-3 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement.

Comment P215-4 More importantly, I am objecting to the lack of transparency on this project. Metro went forward with this project without an open public process and without competitive bidding. I don’t understand the ownership or operation of the project because the details have been hidden from the community. Who is paying for this project? Will taxpayers be left holding the bag? The community has been neglected and our voices have not been heard. No one asked us our vision for our community. We never asked for this project. We don’t need or want this project. Stop bowing down to the uber-wealthy class and listen to the citizens of this city for once.

Response P215-4 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s sole source determination for the proposed Project. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom

webinar. Project materials and information were provided at both the in-person meetings and on Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, and Appendix A, Scoping Report, of the Draft EIR, for discussion of the proposed Project team’s outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project’s features to enhance and provide additional benefits to the surrounding communities. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including coordination with identified stakeholder groups.

Comment Letter P216 - Hayley Marcus

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P216

Comment P216-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P216-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P217 - Nancy Hoven

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P217

Comment P217-1 As a resident of the greater community surrounding Dodger Stadium and Echo Park, I wish to express serious concerns about the proposed gondola project between Union Station and Dodger Stadium.

Response P217-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P217-2 First, I feel there has been insufficient public input and a real lack of communication with community stakeholders. We will have to live with the daily burdens placed upon neighborhoods if this project is completed. This may include increased traffic, parking problems, and pollution generated by the project; the visual impact of the towers; and possible displacement of residents and/or businesses. Frankly, since this project seems to have been jump-started without sufficient communication with the communities, it is unclear what all of the potential impacts will be.

Response P217-2 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice.

Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how the proposed

Project would operate at zero emissions, with the electrical power for the proposed Project supplied by the City of Los Angeles Department of Water and Power (LADWP) through the utility's Green Power Program, pursuant to GHG-PDF-A.

Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines ("TAG"). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project's towers, which would be less than significant, and for visual simulations of the proposed Project's towers.

Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. Refer to Topical Response N, Environmental Justice, for discussion of how the proposed Project would not displace businesses and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. Refer to Topical Response C, Project Features, for discussion of how during construction, the Project Sponsor would create a Business and Community Support Program to assist local businesses affected by proposed Project construction activities. The proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents.

Comment P217-3 Second, as a former municipal employee who has had to follow standard procedures for open bidding for contracts, I don't understand why Metro has not followed this procedure. Did the investors simply negotiate with Metro without due public process or without conforming with typical governmental process for such projects? Does the public know how much this will cost and how much of that burden will be placed upon taxpayers? How much will the developers of this project contribute and how much will they gain in profit? All unanswered questions, which is unacceptable.

Response P217-3 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P217-4 Finally, is this really a necessary project when existing Metro transportation services are not working at the highest level of performance, safety, and cleanliness? More people on a daily basis would choose to use public transportation if it were more reliable, frequent, cleaner, and most importantly, safer. I have transportation options and used to use Metro quite frequently, but now it seems so unsafe and unclean, that I seldom use it. Others, with fewer options, are compelled to use public transportation for work or other activities. I think it's unfair to "indulge" Dodger fans and tourists with an expensive, novelty form of transportation, while others are just trying to live their lives of work, school, shopping, and recreation often on limited incomes. I don't think the majority of Metro users can afford \$30 a ride.

Response P217-4 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for discussion of how the proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P217-5 I strongly urge you to reflect on your commitment to provide accessible, affordable, and safe transportation to ALL the residents that Metro serves, not special projects proposed by investors and for the benefit for a relatively small sector of the total metro population.

Response P217-5 Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents,

workers, park users, and visitors to Los Angeles. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P218 - Ann Dorsey

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P218

Comment P218-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium) for the following reasons:

Response P218-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Responses to comments contained in this letter are provided in Responses P218-2 through P218-7.

Comment P218-2 Built Environment:

The Gondola Project's enormous towers will cause aesthetic impacts in the community such as the obstruction of views and the gondola cars being used for advertising and electronic billboards.

Response P218-2 Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alameda Tower, Alpine Tower, and Stadium Tower. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project's towers, which would be less than significant, and for visual simulations of the proposed Project's towers. The Alameda Tower's modern architectural style is evident and would complement the buildings within The California Endowment. The neutral light-tone gray color scheme of Alameda Tower was designed for consistency with the surrounding urban environment, and to not distract from visually distinct structures such as the United States Post Office Terminal Annex building. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Stadium Tower would consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral light-tone gray colors and material finishes of the Stadium Tower was selected to complement the surrounding urban environment, and to not distract from existing visually distinct structures, such as Dodger Stadium. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project's signage and lighting, with additional technical detail and information provided in the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. The proposed Project's Sign Concept Plan included at

Appendix B of the Lighting Study provides that across the entire proposed Project, including stations, the junction, towers, and cabins, the proposed Project is proposing static signage and digital signage. The digital signage would be limited to the Alameda Station and the Dodger Stadium Station. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators. Further, there is existing signage in the Project area, and the proposed Project signage would not substantially degrade the existing visual character or quality of public views. Instead, the proposed Project's design ensures that signage would enhance the public realm. Specifically, signage for the proposed Project would be architecturally integrated into the design of the system, including its stations, the junction, towers, and cabins, and would be designed consistent with applicable Metro, City, and State approval requirements.

Comment P218-3 Traffic:

The Gondola Project's will increase traffic around Chinatown and Union Station because it is designed to displace traffic from Dodger Stadium and push it onto the surrounding communities. The existing traffic conditions are already difficult because of air quality impacts from tailpipe emissions and this project will make it worse.

Response P218-3 Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting Los Angeles Union Station (LAUS) to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections

to the venue. Given the capacity of this system, and the ridership forecasts of the proposed Project, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce traffic volumes destined to Dodger Stadium on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles travelled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles travelled.

Comment P218-4 Historic and Cultural Resources:

The Gondola Project will impact historic and cultural resources such as the Los Angeles State Historic Park, historic Union Station, and the Pueblo de Los Angeles Historic Monument.

Response P218-4 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR), of the Draft EIR. As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation.

Comment P218-5 Gentrification:

This project will lead to displacement and increase the cost of rent in the area.

Response P218-5 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement.

Comment P218-6 Future development:

This project will lead to future commercial development in Chavez Ravine, without community input and without disclosure to the community.

Response P218-6 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property,

for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period.

Comment P218-7 Lack of transparency:

Metro went forward with this project without an open public process and without competitive bidding. I don't understand the ownership or operation of the project because the details have been hidden from the community. Who is paying for this project? Will taxpayers be left holding the bag?

Response P218-7 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P219 - Janna Wheeler

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P219

Comment P219-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P219-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P220 - Kate Wolf

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P220

Comment P220-1 I am writing to voice my strong opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). Chavez Ravine is already a much contested site in LA's history. As I'm sure you're aware, the construction of Dodger Stadium displaced many generations of families who were promised affordable housing that never came to be. This is a shameful aspect of LA's past that has never been fully addressed or repaired. Building the Gondola project would only add insult to injury.

Response P220-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, how the proposed Project supports Metro's goal of prioritizing equity opportunities, and is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment. The public outreach for the proposed Project was designed with environmental justice principles in mind, and the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region's most visited venues and would alleviate existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety, and how the proposed Project is designed to be ADA compliant. The Draft EIR analyzed the proposed Project's consistency with General Plan policies related to environmental justice, and the proposed Project is consistent with General Plan policies related to environmental justice, including by reinforcing or encouraging the establishment of strong pedestrian orientation in the surrounding communities and facilitating multi-modal access to and from the stations with pedestrian network improvements, and by ensure quality pedestrian access by facilitating multi-modal access to and from the stations with pedestrian network improvements.

Comment P220-2 As a resident of Northeast Los Angeles, I have watched Chinatown slowly hollow out in the last decade-and at an alarming rate ever since the pandemic. The once lively, unique, and ethnically diverse neighborhood has more and more empty storefronts and, unfortunately, more and more horror stories of displacement, particularly of senior citizens from their homes. It's hard to see how the Gondola will do anything to redress these sad developments or make the lives of longtime residents better. It stands to only further fracture the neighborhood and increase pollution, gentrification, and traffic while making a historic area of Los Angeles much uglier

(which may seem like a shallow complaint, but I assure you, it's not. Everyone deserves to live in a beautiful neighborhood and unsightly infrastructure is often only foisted on the less affluent--see the history of LA's freeways.) Meanwhile, I believe the people who really stand to benefit from the Gondola's construction are the owners of the Dodgers and of Dodger Stadium.

Response P220-2 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. The Project Sponsor would convene stakeholder groups to identify unique ways to use the proposed Project to provide additional interpretation of the adjacent neighborhood culture and history, particularly aimed at a diverse visitor community. In addition, the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P220-3 In this day and age, when the city is in such disarray and homelessness is surging yet again, should we really be acting in favor of the already super-abundantly wealthy? I urge you to put the whole city's wellbeing at stake and deny this project. We can no longer change the damning history of Chavez Ravine, but you have the choice, and the power, to change its future.

Response P220-3 Refer to Response P220-1 for discussion of how the Draft EIR addresses environmental justice. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment Letter P221 - Polonia

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P221

Comment P221-1 Subject: No to McCourt's project

Response P221-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P222 - Jean Brandt

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P222

Comment P222-1 1. NO gondola. It is an affront to residents and a huge expense to voters.

Response P222-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team’s outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P223 – Paul Newman

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P223

Comment P223-1 Deputy Executive Officer Cory Zelmer,

I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project (“The Gondola” at Dodger Stadium). I fail to see the need for it and once again feel like the McCourt family has been allowed to inflict their selfish agenda on the city.

Paul Newman

paulvnewman@gmail.com

220 So Irving Blvd

Los Angeles, California 90004

Response P223-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P224 – Lance Paris

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P224

Comment P224-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P224-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P225 – Elizabeth Codiga

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P225

Comment P225-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). I am a 74 year old Los Angeles homeowner who frequents Chinatown and relies on access to the Historic State Park. I have watched the park grow and become more beautiful with each passing season. It provides me with a lovely, safe place to walk, and I see how the workers strive to continually maintain and develop the area. The park has been a perfect place to teach my grandsons, 6 and 8 years old, the wonders of urban nature and provides a great space for them to practice skateboarding and bike riding. The Gondola Project will greatly diminish the entire area, to benefit only a few with all the negatives we already face in much of LA; traffic, pollution, parking, noise and visual ugliness.

Response P225-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/ State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of users to continue at the Park. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park.

Comment P225-2 Chinatown, often ignored by the rest of Los Angeles, is an important historical community that would be horribly affected by the Gondola. The residents and business owners don't deserve this without at least greater community input. The Park and its surrounding neighborhood belong to the people and to history.

Response P225-2 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer also to Topical Response C, Project Features, for discussion of the

potential added benefits from the proposed Project, including potential partnerships with and benefits to local businesses in Chinatown.

Comment Letter P226 – Nelson Abreu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P226

Comment P226-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). I live and work in Chinatown/Lincoln Heights. This "gondola" project is not what would come out of an RFI or university study on alleviating transportation issues related with Dodger Stadium.

Response P226-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment Letter P227 – Mary Koetting

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P227

Comment P227-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P227-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P228 – Catherine Wu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P228

Comment P228-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

As the daughter of a proud Chinatown business owner of nearly 30 years, I grew up supporting local businesses and hold many past and present community members close to my heart. I strongly oppose "The Gondola" project because it does not serve or represent us:

Response P228-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including for businesses in Chinatown.

Comment P228-2 (1) The structure will disrupt the skyline and ruin the aesthetic of the Los Angeles State Historic Park. I remember anticipating the opening of this park as a kid, and it would be a shame for "The Gondola" to impact this gem.

Response P228-2 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant, including at the Park. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park "visually memorable." As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.

Comment P228-3 (a) I worry that gondola cars will be plastered with advertising and ruin one of the few green spaces in the community.

Response P228-3 Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project’s signage and lighting, with additional technical detail and information provided in the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators. The proposed Project’s design ensures that signage would enhance the public realm, and signage would be architecturally integrated into the design of the system, including its cabins, and would be designed consistent with applicable Metro, City, and State approval requirements.

Comment P228-4 (b) Having gondola cars fly so close overhead is unsettling and dangerous. I am concerned park goers will be deterred by the large, shadowy cars, the increased noise, and the potential debris fallout. This would detract from the tranquility of the park and would make the park appear unsanitary, thereby hurting businesses at the resident farmer’s market.

Response P228-4 As shown in Figure 5-2 of the Draft EIR, more than 30 of the park’s 32 acres are not beneath the proposed Project’s alignment. ANSI B77.1 requires the following vertical clearances: vehicles – five feet; vegetation or terrain – five feet; at-grade where pedestrians are present – eight feet; buildings – five feet; and roadways or railways – to be determined with the authority having jurisdiction. The proposed Project’s vertical clearance to the bottom of the cabins would range from 26 to 53 feet with an average of approximately 40 feet from ground level over the park. Given these required clearances and the height at which the cabins would travel over the Los Angeles State Historic Park, it will continue to be possible for most events to take place both under the majority of the alignment within the park and adjacent to the alignment. Use of more than 30 of the park’s 32 acres for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Response P228-2 for discussion of the aesthetic impacts of the proposed Project to the Park, which would be less than significant. As detailed in Section 3.13, Noise, and Appendix

M, Noise and Vibration Technical Report, of the Draft EIR, operational noise impacts, including cabins, would be less than significant. As discussed in Section 2.0, Project Description, of the Draft EIR, cabins would feature a ventilation system and sealed windows for viewing purposes, which, for security reasons, would not open. Any small ventilation panels that would be provided as a feature of the proposed Project cabins would be screened to prevent the tossing of debris from cabins. Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses along the proposed Project alignment while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment P228-5 (2) This project was pushed forward behind closed doors. Why was there an absence of open public process and competitive bidding? Who is paying for this project? These unanswered questions give the impression of corruption/collusion favoring private interests—public good should be the only goal. The lack of community engagement for this project just adds insult to injury.

Response P228-5 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, and Appendix A, Scoping Report, of the Draft EIR, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and

the proposed Project’s features to enhance and provide additional benefits to the surrounding communities.

Comment P228-6 (3) The design of the structure further reinforces community erasure. The generic silver building does not reflect the rich, cultural diversity and history of the community. Instead, the architecture mirrors the “modern” apartment buildings that are already gentrifying the area. We don’t want or need another symbol of gentrification, and this project would only displace more vulnerable residents and hike up rent prices.

Response P228-6 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area, which would be discussed with identified stakeholder groups.

Comment P228-7 (4) Our community deserves clean air and environmental justice. This project will redirect and increase traffic in the area, which worsens noise and air pollution. Residents already suffer disproportionately from tailpipe emissions; don’t overburden us with even more.

Response P228-7 Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project’s ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project’s potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to

improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Contrary to the comment, the proposed Project would reduce air pollutant emissions in the area. As shown in Table 3.3-5, Maximum Mass Daily Emissions Due to Operation of the Project, and discussed in Section 3.3.4 of the Draft EIR, the proposed Project would result in a net reduction in criteria pollutant emissions in both 2026 (Build Out) and 2042 (Horizon Year) by reducing vehicle miles travelled and thereby decreasing emissions compared to existing conditions. As a fixed guideway transit project, providing new high-frequency high speed transit connections between the regional transit hub of LAUS and Dodger Stadium, the proposed Project is forecast to reduce vehicle miles travelled (VMT), as game and event attendees shift their travel mode from driving to Dodger Stadium to utilizing transit on the proposed Project. As an innovative transportation project that will reduce VMT over time, the proposed Project helps advance local and state climate and transportation policies (refer to Section 3.8.4 of the Draft EIR and Table C-1 through Table C-4 provided in Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR for additional discussion). Refer to Section 3.3.4 of the Draft EIR, and Table A.2-3 of Appendix D, Air Quality/Health Risk Assessment Technical Report, of the Draft EIR for the operational VMT and trips for the existing, Build Out, and Horizon Year that are used to calculate these mobile emissions.

Comment P228-8 I urge you to cancel the Los Angeles Aerial Rapid Transit Project. The potential for harm overshadows any benefit.

Thank you for your time.

I am a visitor and supporter of the community, family member of workers in the community, and an outdoor educator and ecologist.

Response P228-8 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P229 - Emily Moncata

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P229

Comment P229-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). I live in the neighborhood of Angelino Heights, so I am familiar with the traffic and congestion that occurs, especially around Sunset/Douglas in the lead up to Dodgers games and stadium events (the bottom of our lovely hill!). That being said, I still am opposed to this project, because the research does not adequately demonstrate that the disruption, fanfare, and purpose of this project will meaningfully reduce congestion in the neighborhood, and benefit the greater public good.

Response P229-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the proposed Community Access Plan. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion

of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Comment P229-2 Furthermore, this is not a community serving project. As it stands, there is no rail connectivity in the neighborhoods of Echo Park and Silverlake. Instead of a community serving transportation project that could connect residents to major transport hubs through innovative public infrastructure, this gondola serves one purpose and one purpose only: to whisk tourists into the hills of Elysian park to attend major sporting events at Dodgers Stadium. It reminds me a bit of Angels Flight, or what the Roosevelt Island Gondola has become in New York– it operates as a spectacle more than it serves an actual, urgent transport need. And when the projects LA Metro can take on are supposedly so limited by resources, I don't think this is where residents want to see a priority investment made. Even in the 50 year transport plans, there remains little connectivity for these neighborhoods. Is this really where we want to prioritize an investment? It may be in the neighborhood, but it's not for the neighborhood.

Response P229-2 Refer to Response 229-1 for an overview of the need for the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Refer to Section 2.01, Overview of the Project, of the

Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the proposed Community Access Plan. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P229-3 And it doesn't even make a meaningful dent in the congestion problem it claims to address. Next, on every tourist to-do guide will be a must-see trip on the Dodgers stadium gondola. But for actual residents of the city, this billionaire passion project has little day-to-day relevancy. There is nothing else up in that parking lot besides Dodgers Stadium. There is no plan for public infrastructure that could bring those people to public gathering places and hiking trails in Elysian Park, no way for residents who, of course, do not live in the parking lot of a major MLB stadium, to access shops and grocery stores, link up to major train stations, and access by rail a greater map of the city. It's very clear who this project is for, and it's embarrassing to call this a public transportation project, when it so clearly serves a private sector. I really hope LA Metro can acknowledge the limited relevancy of this passion project, and can fulfill its duty to the public good, and invest in smart, sustainable, community-serving public transportation with connectivity and far-reaching IMPACT that Los Angeles so desperately needs.

Response P229-3 Refer to Response 229-2 for an overview of the need for the proposed Project. The proposed Project provides access between the Dodger Stadium property, the surrounding communities, including Chinatown, Mission Junction, Elysian Park, and Solano Canyon, and the Los Angeles State Historic Park, to the regional transit system accessible at LAUS. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. The proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/last mile multi-modal

options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities.

Comment Letter P230 - Bert Glatstein

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P230

Comment P230-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). The level of either incompetence or corruption leading to this project is mind boggling. How can city officials reaches deal with serial bankrupteee McCourt? This is obviously a precursor to development of a retail/recreation site in the Dodgers Stadium parking lot. Yet there has been no provision for an EIR. an absolute boondoggle

Response P230-1 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. Accordingly, the Draft EIR analyzes the whole of this action, as well as reasonably foreseeable potential environmental impacts resulting from this action. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters" and lead agencies are not required to "provide all information requested by reviewers." (Id., § 15204.) The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment Letter P231 – Jamie Patterson

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P231

Comment P231-1 First off, WHO ASKED FOR THIS? Literally NO one in the community wants this stupid Gondola and this won't actually do anything to help dodger traffic. I lived on sunset blvd for years and though I was priced out of Echo Park, I still work there and NOTHING about this project will do anything actually help the community.

Response P231-1 Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P231-2 HOW hell did Metro approve this this far? This idea should've been laughed out of consideration and it's appalling I even have to write a letter to you opposing this.

Response P231-2 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P231-3 Consider this my formal opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium) and please PLEASE don't waste Los Angeles money on such a stupid pointless idea that will negatively affect the entire community around Dodger stadium and help only Frank McCourt. There's also no way this will actually take 3,000 cars off the road during dodger season. And why destroy the neighborhood, subject elderly folks homes to a gondola whizzing by their windows of their home nonstop during games for...a stupid gondola? Cue Simpsons Monorail jingle.

Response P231-3 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment Letter P232 – Jane O’Neill

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P232

Comment P232-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P232-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P233 – Laurel Randolph

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P233

Comment P233-1 Hello. I am a Los Angeles resident and I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

I have major concerns about the impact on traffic, historical sites, and commercial development in the area. There's been a total lack of transparency that's deeply concerning as well.

Response P233-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel. The Draft EIR addressed historical resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resources Technical Report of the Draft EIR. Refer to Section 3.17, Transportation, and Section 3.11, Land Use and Planning, of the Draft EIR, for discussion of how multimodal access—for both local and emergency response—to local businesses, neighborhoods, LAUS, and the Los Angeles State Historic Park would be maintained throughout construction of the proposed Project, and disruptions to local businesses would be minimized. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public comment during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion.

Comment P233-2 I do not believe this is an effective use of time and money, and will only further gentrification. LA Metro should serve the better good of the people of Los Angeles, and a flashy, pointless project like this is not the way to do it. Thank you.

Response P233-2 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment Letter P234 – Jill Stevens

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P234

Comment P234-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

I am a resident of Los Angeles and concerned about this project that seemed to be pushed through while the community has been neglected and our voices have not been heard.

Metro went forward with this project without an open public process and without competitive bidding. I don't understand the ownership or operation of the project because the details have been hidden from the community. Who is paying for this project? Will taxpayers be left holding the bag?

Response P234-1 Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements.

This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project.

Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be

sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P234-2 Dodger Stadium was already stolen from the residents of Chavez Ravine, and this project only continues that legacy. Ultimately leading to future commercial development in Chavez Ravine, without community input and without disclosure to the community. Sound familiar ?

Response P234-2 Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period.

Comment Letter P235 – Dorothy Braudy

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P235

Comment P235-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). The voices of regular citizens should be involved in such a drastic decision. Studies of the impact should be made public and published in the LATimes. PLEASE let's don't have another Chavez Ravine or Bruce's Beach.

Response P235-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of how electronic copies of the Draft EIR are and have been available on Metro's project website and the proposed Project's SB 44 website since the Draft EIR was released on October 17, 2022. Hard copies of the Draft EIR were also available at three City libraries in the Project area (Central Library, Chinatown Branch Library, and Cypress Branch Library) and Metro Headquarters' Dorothy Peyton Gray Library, and at the in-person public meetings during the Draft EIR public review period. Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine.

Comment Letter P236 - Max Maslansky

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P236

Comment P236-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). It will do nothing to mitigate traffic or very little and only increase safety concerns and exacerbate gentrification of this area.

Response P236-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/ Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of how comparable urban aerial transit systems have been shown to reduce violent crime in nearby areas. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the safety features of the proposed Project. In addition to statistical studies, residents of cities with aerial transit systems have reported a greater sense of security when riding aerial transit relative to other modes of public transportation.

With respect to concerns of gentrification, Refer to Topical Response E: The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement.

Comment Letter P237 – Julie Williams

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P237

Comment P237-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). This project has not had proper community input, it is a tourist attraction that provides little or no benefit to the community and will invade residents privacy and lessen their quality of life.

Response P237-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefit to the surrounding community. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Topical Response J, Gondola Design and Operations and Section 2.0, Project Description, of the Draft EIR, for discussion of how cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views.

Comment P237-2 The project will not lessen traffic or improve air quality in any significant way.

Response P237-2 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's

ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles travelled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles travelled.

Comment P237-3 I live near by and ride my bike through Chinatown. I have seen the gentrification and displacement of local residents over the years and it seem to me this is another vanity project by a wealthy developer at the expense of the local community.

Response P237-3 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P237-4 Frank McCourt would never allow a Gondola to be built over his house! Please take more time and listen to the community. The city needs real workable solutions to amusement rides.

Response P237-4 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical C, Project Features, for discussion of the proposed Project team’s outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project’s features to enhance and provide additional benefit to the surrounding community. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P238 – Aristotle Acevedo

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P238

Comment P238-1 I'm writing to give my opinion on the proposed aerial rapid transit gondola. I understand the need to alleviate traffic around Dodger stadium but I think this is the wrong way to go. I think it will be an eye sore and ruin the beautiful views of the city we already have. I think it will also be a safety hazard in the event of an earthquake or other emergency inside or around the gondolas. Please do not approve this plan!

Response P238-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. The Project Sponsor would utilize local artists for site specific artwork at each station reflective of the unique neighborhood culture, and would create numerous opportunities to collaborate with and showcase local artists, including convening stakeholder groups to coordinate on issues including utilization of local artists and identification of sites along the proposed Project alignment to showcase the work of local artists Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, for discussion of how the proposed Project would be equipped with security features and the Emergency Operations Plan for the proposed Project would include emergency response protocols and safety

procedures developed in conjunction with the operator, system provider, and local authorities. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR for discussion of how the structural design of the proposed Project's stations, junction, and towers would meet the rigorous safety standards of applicable standards, requirements, and building codes, including all mandated standards addressing environmental factors such as wind and seismic effects and gravity forces, including all impacts from the height and tilt of the structures, to ensure structural integrity and safety, and the proposed Project would adhere to its Emergency Operations Plan which would include emergency response protocols and state that in the event of a major earthquake the system would be fully evacuated and shut down, and would not operate.

Comment Letter P239 – Kama Hayes

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P239

Comment P239-1 Hello - I want to voice a strong opposition of this Gondola Project.

Response P239-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P239-2 First of all, this would destroy views to an already compromised area of Union Station and Pueblo de Los Angeles. This is one of the oldest and most historic areas of Los Angeles and should not be altered any further. It's bad enough that the hideous apt building took over part of the Union Station lot Secondly, this area has become very dangerous and is highly populated with homeless and has not been given any extra security.

Response P239-2 The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to historic resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant. Refer to Section 3.5.4, Environmental Impacts, of the Draft EIR for a discussion outlining the proposed Project's potential construction and operational impacts to historic resources within the vicinity of the proposed Alameda Station, including the Los Angeles Union Station Passenger Terminal and Grounds and the Los Angeles Plaza Historic District (referred to as El Pueblo, and comprised of 29 resources within its boundaries, including the Avila Adobe and The Winery), the El Grito mural, and the Los Angeles Terminal Annex Post Office. As discussed in Section 3.5.4, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the proposed Project's design and operations, including discussion of the safety, privacy, and operations features of the proposed Project.

Comment P239-3 Thirdly, this project just isn't necessary and would be very costly and would have a negative impact on the area during construction and for the long term future. Not only that, it has such a finite use and Dodger Stadium isn't even open for games but for part of the year. WHY? This project is a total joke and there are far bigger traffic concerns in a ton of other parts of Los Angeles.

Vote NO on the Gondola Project!!

Response P239-3 Refer to Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR, for discussion of the construction of the proposed Project. As summarized in the Executive Summary of the Draft EIR, the proposed Project would have less than significant impacts related to construction with the exception of Noise and Vibration (human annoyance). Refer to Section 3.17, Transportation, of the Draft EIR, for discussion of the proposed Project's maintenance of local and emergency access during construction. Refer to Topical Response C, Project Features, for discussion of the Business and Community Support during construction. As summarized in the Executive Summary of the Draft EIR, impacts related to operations of the proposed Project would be less than significant. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel.

Comment Letter P240 – Christian Arana

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P240

Comment P240-1 I am a resident of the City of Los Angeles, and a lifelong Dodger fan. I am also firmly opposed to the construction of the Dodger Stadium Gondola.

Response P240-1 This comment indicating opposition to the Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P240-2 To start, the Gondola Project was never a community priority. As a city that prioritizes the input of its neighbors, this stands in opposition to the values we espouse as a city.

Response P240-2 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment P240-3 Second, I am deeply concerned about the unintended consequences this Gondola will bring to the neighborhood. Already local residents are dealing with traffic congestion and high rents, and bringing an unwanted attraction to the neighborhood will further exacerbate these problems.

Response P240-3 The proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gases through reduced vehicular travel are discussed in Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P240-4 Third, the Gondola Project will impact historic and cultural resources such as the Los Angeles State Historic Park, historic Union Station, and the Pueblo de Los Angeles Historic Monument.

Response P240-4 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources including the Los Angeles State Historic Park, LAUS, and El Pueblo in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation.

Comment P240-5 Finally, if the problem is that Dodger games cause way too much traffic, and that this Gondola is a solution, then that is wrong thinking. For instance, I commute from the San Fernando Valley all the way to Union Station to take the Dodger Express Bus. If such a bus existed in the San Fernando Valley, perhaps be even based at the North Hollywood or Universal Metro Stations, then I am confident that many Dodger fans in the Valley would choose to use this transportation over driving into the Stadium. Think of how many cars we'd remove from the roads if that was an option.

Response P240-5 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. As discussed in Topical Response H, a system of buses from numerous remote locations throughout the Los Angeles region to and from Dodger Stadium events would require a substantial increase in the number of buses which, similar to expanding the fleet for an expanded Dodger Stadium Express service, would result in a fleet of buses that would either be underutilized most of the time or regular Metro bus service that utilizes these vehicles would be disrupted every time a Dodger game or event at the stadium is held. Such a service would also incur substantial costs in paid time and mileage for driving empty buses out to the remote locations before a game and back from the remote locations after a game and paid idle time during

the game. Buses from a variety of remote locations would also need to travel in rush hour congestion to get to Dodger Stadium. With limited regional facilities that provide bus only lanes that these services could utilize, they would not materially improve transit travel time compared with driving. For example, the current Dodger Stadium Express service from South Bay serves a broad area of southern Los Angeles County at stations spread across eight miles, is free, and travels on a priority lane within the I-110 freeway median for most of its trip, but the South Bay Dodger Stadium Express carried an average of only 415 passengers per game in 2019, which is substantially lower than the ridership of 1,895 riders per game on the LAUS Dodger Stadium Express.

Comment Letter P241 – Dylan Sittig

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P241

Comment P241-1 I am writing to express my concern about the LAART project and the environmental impacts that it will have on the community and the City.

While the Environmental Impact Report (EIR) brings to light certain impacts of the project on the environment, the simple fact is that the negative impacts of this project go beyond the scope of an EIR and California Environmental Quality Act review (public funding, privacy concerns, etc.). The EIR lays out the potential for significant and unavoidable impacts and relies on questionable mitigation measures to attempt to address significant impacts.

There is no way that the undefined potential benefits of this program would possibly outweigh the clear and obvious negative environmental and societal impacts associated with the construction and operation of the Project. I urge you to halt this program as soon as possible.

The Project is not community serving and does nothing to enhance mobility for existing Chinatown residents. Ample public transit service between Union Station and Chinatown already exists in the form of numerous Metro Buses, multiple DASH buses, the Gold / L Line, and it is a very short walk. In no instance will the non-game day head ways be more efficient than many of these other pre-existing transit options.

There will be negative impacts to the efforts to increase the Union Station Alameda forecourt. Having an obtrusive tram station will detract from the pedestrian realm and is antithetical to the type of street activation that is desired near Olvera Street and along Alameda Street.

Additional exploration of the Transportation Systems Management Alternative should be further explored. The project objectives were too narrowly defined in a way that doesn't truly serve the needs of the people of the City of Los Angeles, or the residents of Chinatown.

If the project does somehow moveforward, Design Option E should be required in order to create at least some public benefit in the form of the bridge to the State Historic Park from Broadway.

Response P241-1 This is a duplicate of Comment P148-1. Refer to Response P148-1.

Comment Letter P242 – Aaron Y.

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P242

Comment P242-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P242-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P243 – Daniel Samiljan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P243

Comment P243-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). Literally no one wants this.

Response P243-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process.

Comment Letter P244 – William Campbell

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P244

Comment P244-1 As a community stakeholder, frequent visitor to Los Angeles State Historic Park and a lifelong Angeleno and Dodgers fan I am opposed to the Los Angeles Aerial Rapid Transit Project (aka "The Gondola" at Dodger Stadium). I am concerned about this project for the following reasons:

Response P244-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses P244-2 through P244-5.

Comment P244-2 The Gondola Project's towers will cause aesthetic impacts in my community by obstructing views, and the gondola cars will no doubt be used for all manner of advertising. Additionally, the project will open the region around it to the potential for unchecked development that could end up displacing longtime residents and changing the character of these long-standing neighborhoods.

Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alameda Tower, Alpine Tower, and Stadium Tower. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project's towers, which would be less than significant, and for visual simulations of the proposed Project's towers. The Alameda Tower's modern architectural style is evident and would complement the buildings within The California Endowment. The neutral light-tone gray color scheme of Alameda Tower was designed for consistency with the surrounding urban environment, and to not distract from visually distinct structures such as the United States Post Office Terminal Annex building. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Stadium Tower would consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral light-tone gray colors and material finishes of the Stadium Tower was selected to complement the surrounding urban environment, and to not distract from existing visually distinct structures, such as Dodger Stadium. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area.

Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project's Sign Concept Plan. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators. Further, there is existing signage in the Project area, and the proposed Project signage would not substantially degrade the existing visual character or quality of public views. Instead, the proposed Project's design ensures that signage would enhance the public realm. Specifically, signage for the proposed Project would be architecturally integrated into the design of the system, including its cabins, and would be designed consistent with applicable Metro, City, and State approval requirements.

Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing.

Comment P244-3 The Gondola Project will not reduce traffic but instead will simply displace it from Dodger Stadium into and around Chinatown and Union Station, making already difficult traffic conditions worse and further compromising air quality for the area residents and park visitors.

Response P244-3 Refer to Section 3.03, Air Quality, Section 3.8, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, and the ridership forecasts of the proposed Project, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce traffic volumes destined to Dodger Stadium on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles travelled. The proposed Project would

result in a net reduction in criteria pollutant emissions by reducing vehicle miles travelled. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft, and recommended the proposed Project work with Metro to identify a transit partnership to further encourage proposed Project riders to take transit, walk, or bike to the proposed Project’s stations.

Comment P244-4 The lack of transparency involved in the development of this project is infuriating. Metro appears to have moved forward without an open public process and without competitive bidding, leaving the appearance of an apparent disdain Metro has for the the communities that will be directly impacted on a variety of levels.

Response P244-4 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s sole source determination for the proposed Project. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro’s website in English, Spanish, Chinese (Traditional), and

Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment P244-5 By and large the communities don't want this project. Show me one community stakeholder who asked for it -- besides Frank McCourt. And his connection to the community only involves how much money he can make at their expense.

Response P244-5 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P245 – Nicholas De Dominic

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P245

Comment P245-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P245-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P246 – Tyler Tharp

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P246

Comment P246-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

Response P246-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P246-2 The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P246-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P247 – Andrew Mueth

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P247

Comment P247-1 I'm a resident of Echo Park 90026 and a Dodger fan and I'm writing to express my opposition to the LA ART gondola plan in its current form. Gondolas are fun, taking public transit is fun and an essential part of LA's future, and the gondola is a way to increase Metro ridership and visibility.

Response P247-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P247-2 - Will the gondola generate revenue to improve metro services across Los Angeles, or will it fuel profits for Frank McCourt's private company?

Response P247-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P247-3 - Will the Dodger Express bus remain operational? If the Dodgers want to "get cars off the street" as a recent article said was the goal, why is Metro not fighting instead for permanent bus-only lanes on Sunset along the Dodger Express route? And why is it not working with scooter rental companies to paint scooter lanes and allow use of zero-emission motorized scooters on Dodger property? Or building MetroBike docks and increasing the number of pedal-assist e-bike docks at the stadium?

Response P247-3 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Funding sources for Dodger Stadium Express are not known beyond the 2023 season, but the proposed Project would not preclude the continued operation

of the Dodger Stadium Express, which would provide further transit capacity to Dodger Stadium. Despite the slower travel time, some riders may prefer to continue riding the service. The opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of attendees of games or events at Dodger Stadium to ride public transportation. The proposed Project would also not preclude the implementation of any of the additional mobility options described in the comment. Making bus only lanes permanent or all day, and painting scooter lanes, would be subject to the approval and implementation by the City of Los Angeles who own street right of way.

Comment P247-4 - As Metro continues building a citywide transit network, why does the gondola have so few connections to the rest of the Metro network? This is an expensive project for something that will only be used 62 days a year for a few hours around gametime.

Response P247-4 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park.

Comment P247-5 I fully support Metro's efforts to increase transit ridership to and from Dodger games, but I cannot support this plan until these concerns are addressed.

Response P247-5 As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project

alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. Refer to Responses P247-2 through P247-4 for discussion of the purpose of and need for the proposed Project.

Comment P247-6 Instead of creating a new, untested transit method, why not make less expensive infrastructure improvements to increase the use of transportation options for which there is already proven demand? Most importantly, as someone who took the Red line to work for years, why would Metro not want any new Dodger-related plans to increase their revenues, instead of allowing a private company to edge in on your turf? Have a backbone! Don't bow to billionaires!

Response P247-6 Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P248 – Jules Cote

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P248

Comment P248-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project. I am concerned about this project for the following reasons: The Gondola Project will impact historic and cultural resources such as the Los Angeles State Historic Park, historic Union Station, and the Pueblo de Los Angeles Historic Monument. The gondola will increase the impacts of air pollution from vehicle emissions in an area already overburdened by air emissions. And the project will lead to displacement and increase the cost of rent in the area.

Response P248-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement.

Comment Letter P249 – Sophie Li

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P249

Comment P249-1 Hope this email finds you well.

This is Sophie Li, a reporter with The Epoch Times.

I am writing a story about the Dodger Stadium gondola project that LA Metro is working on. Do you have any press pictures that we can use for the gondola?

Please let me know at your earliest convenience. If you can get back to me by 3 p.m. today, it'll be much appreciated.

Thank you!

Response P249-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P250 - Kate Wolf

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P250

Comment P250-1 Hi, I'm a community member and I wrote a letter to Corey Zelmer but I also wanted to just leave a message voicing my opposition to the gondola project. I can't make it to the public hearing on Thursday. But I just wanted to say that I live in Northeast LA. I don't see any positive benefit to this gondola project for the people that actually live in these neighborhoods. It seems to just benefit the owner of the Dodgers and the owner of Dodger stadium. And I think it sounds like a really disruptive project, environmentally hazardous. It sounds like it would also pull the thread apart of the Chinatown neighborhood and the most historic district of Los Angeles even more. And add to the kind of blight that is surrounding that area now. And I just, I think, that the people who live in the neighborhood, their, their quality of life should be put first. And I don't think this project will, you know, increase that quality of life and that's why I am voicing my strong, strong opposition to it. And I hope that Metro will not go ahead with this project. My name is Kate Wolf, and no need to call back. But please mark my opposition. [phone number given] I live in Highland Park, 90002 is my zip code. Thank you.

Response P250-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefit to the surrounding community. Refer to Section 3.09, Hazards and Hazardous Materials, of the Draft EIR for discussion of how the proposed project would have less than significant impacts related to hazards and hazardous materials. Draft EIR fully analyzed and addressed the proposed Project's potential impacts to historic resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant.

Comment Letter P251 – Sarajo Frieden

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P251

Comment P251-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). The Gondola Project will have detrimental impacts on the historic and cultural resources such as the Los Angeles State Historic Park, historic Union Station, and the Pueblo de Los Angeles Historic Monument. Regarding environmental impacts, this project will increase the impacts of air pollution from vehicle emissions. These areas already are overburdened by air emissions. This project will also lead to increased rental costs and therefore displacement for those in our communities who can't afford the increases.

Response P251-1 The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement.

Comment Letter P252 – Bob Vanderet

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P252

Comment P252-1 With all due respect, this project appears to me to be an incredible waste of public resources for what is essentially a private venture - the Los Angeles Dodgers. i am a huge Dodger fan myself. But the taxpayers shouldn't be footing the bill to make it easier for baseball fans to attend games. Seriously, this needs to be jettisoned now.

Response P252-1 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project and Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P253 – Tom Williams

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P253

Comment P253-1 Project description, assessments, and alternatives considerations are totally inadequate and incomplete and without engineering and construction considerations and descriptions. Many references mention future studies, engineering, and designs to be done before construction, but all such would be without public review and comments and thereby not in compliance with CEQA.

Response P253-1 This comment is noted and will be provided to the decision makers for review and consideration. This is a duplicate of Comment GO18-1. Refer to Response GO18-1.

Comment P253-2 Although Goals/Purposes and Objectives are required for a DEIR, this DEIR provides vague and ambiguous descriptions and totally inadequate development of the Project, its objectives, and its alternatives and their numerical/quantified comparisons. Thus, the discussion of alternatives and Project and their numerical/quantified comparisons are totally inadequate.

Response P253-2 This comment is noted for the record and will be provided to the decision makers for review and consideration. This is a duplicate of Comment GO18-2. Refer to Response GO18-2.

Comment P253-3 Although directly related to the DEIR descriptions and assessments, the DEIR does not even minimally use/mention the LA City Department of City Planning database, ZIMAS, which must be fully incorporated if the Project is to be placed within the City of Los Angeles. As no Memorandum of Understanding or Agreement between the sponsor, Metro, and City of Los Angeles is provided or even mentioned, this absence is understandable avoidance, but renders the DEIR unacceptable, incomplete, and inadequate.

Response P253-3 This comment is noted and will be provided to the decision makers for review and consideration. This is a duplicate of Comment GO18-3. Refer to Response GO18-3.

Comment P253-4 Without an adequate and complete DEIR, alternatives to the proposed Project cannot be adequately formed and compared. Thereby the consideration of alternative cannot be considered adequate nor complete, but should include ZE/NG buses and dedicated bus lanes and perhaps with congestion pricing for DTLA and the Project site.

For detailed comments see attached, including pertinent identified portions of the DEIR with highlighted issues of the current texts for the specific comments.

Response P253-4 This comment is noted and will be provided to the decision makers for review and consideration. This is a duplicate of Comment GO18-4. Refer to Response GO18-4.

Comment Letter P254 – Gloria Ramirez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P254

Comment P254-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). I'm a resident of this community and a Dodger fan. The Gondola Project's enormous towers will cause aesthetic impacts in my community. I am concerned that the towers will obstruct views, and that the gondola cars will be used for advertising and electronic billboards. This project will lead to displacement and increase the cost of rent in the area. We never asked for this project and we don't want this project.

Response P254-1 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project's towers, which would be less than significant, and for visual simulations of the proposed Project's towers. The Alameda Tower's modern architectural style is evident and would complement the buildings within The California Endowment. The neutral light-tone gray color scheme of Alameda Tower was designed for consistency with the surrounding urban environment, and to not distract from visually distinct structures such as the United States Post Office Terminal Annex building. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Stadium Tower would consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral light-tone gray colors and material finishes of the Stadium Tower was selected to complement the surrounding urban environment, and to not distract from existing visually distinct structures, such as Dodger Stadium. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. Refer to Topical Response K, Signage and Lighting. No digital signage is proposed on the exterior of the cabins. Refer to Topical Response E, the Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities.

Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process.

Comment Letter P255 – Melissa Arechiga

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P255

Comment P255-1 My name is Melissa Arechiga and I stand here before you as a representative of the surviving families that were violently evicted from Palo Verde, La Loma, and Bishop three Mexican indigenous communities that were destroyed to build Dodger Stadium. I am here today opposing the gondola project from Union Station to Dodger Stadium. Well, this may be exciting to some it is a sign of change and change that is not inclusive to all specific people of color. The Dodger corporation and the city of Los Angeles have a long partnership together working to destroy and exploit communities of color. The gondola represents gentrification the destruction of not only our communities but the environment and our beloved wildlife. The gondola project is no different than the deal that was made to take away our family's generational wealth by destroying our three communities to build Dodger Stadium. The Dodgers and the Los Angeles City council set to build the gondola in the middle of our communities and this would only benefit the Los Angeles Dodgers. Our residences and small business owners will suffer with this so-called revitalization project which is a code word in communities of color as gentrification a long time term that leaves are most vulnerable community members displaced with no benefit. The history between the Los Angeles Dodgers and the Los Angeles City council has left our city in worse condition from the deal in the 1950s when our homes in our three communities were destroyed and the lies that were told to the public about building public housing today leave us with the current issues of our houseless and affordability crisis that affects us all today. It is a win-win for the Dodgers and has been since Black Friday, May 8 1959 when our three communities were bulldozed and our families drugged out. It is time to put a stop to the Dodge corporation exploiting the people of Los Angeles. I strongly urge that everyone in the public and all elected officials oppose this project as it will have damaging effects that will last from generation to generation.

Response P255-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, how the proposed Project supports Metro's goal of prioritizing equity opportunities, is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, how the public outreach for the proposed Project was designed with environmental justice

principles in mind, how the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region's most visited venues and would alleviate existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety, and how the proposed Project is designed to be ADA compliant. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of the Final EIR for discussion of how the proposed Project would not have a significant impact on biological resources.

Comment Letter P256 – Carol Ng

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P256

Comment P256-1 Although I agree with the idea of a non-polluting means of getting people to Dodger Stadium, I don't believe the Gondola Project is the answer.

Response P256-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P256-2 1) The Gondola idea was generated by former Dodger's owner, Frank McCourt. McCourt still owns the property around the stadium and benefits from the parking receipts. He probably thought of the Gondola Project as another way to earn more money. Currently, parking for drive up cars is \$30. If one obtains a pre-game parking ticket, it costs \$25. Although no Gondola fare amount has been set, it's rumored it will be about \$5 less than the above fees or about \$20. Of course by the time the project is completed, who knows how much the parking fee will be?

Response P256-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P256-3 2) The project will include towers and cables and a station at the stadium. The towers will cross Chinatown and other buildings and residences. This could displace some residents and provide unsightly views for others. This would qualify as a "not in my backyard" situation.

Response P256-3 Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alameda Tower, Alpine Tower, and Stadium Tower. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for

discussion of the aesthetic impacts of the proposed Project's towers, which would be less than significant, and for visual simulations of the proposed Project's towers. The Alameda Tower's modern architectural style is evident and would complement the buildings within The California Endowment. The neutral light-tone gray color scheme of Alameda Tower was designed for consistency with the surrounding urban environment, and to not distract from visually distinct structures such as the United States Post Office Terminal Annex building. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Stadium Tower would consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral light-tone gray colors and material finishes of the Stadium Tower were selected to complement the surrounding urban environment, and to not distract from existing visually distinct structures, such as Dodger Stadium. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing.

Comment P256-4 3) Dodger Stadium is located in Elysian Park, a large, relatively under-developed open-space providing walking/hiking areas and sports and recreation venues. It is host to wildlife that would be disturbed and displaced by the construction and operation of the Gondolas. It could disrupt the airspace of the birds.

Response P256-4 As discussed in Section 5.0, Corrections and Additions, of the Final EIR, access to Elysian Park, the City's second largest park, comprising 575 acres, would be provided through a mobility hub at Dodger Stadium Station, where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR, and Appendix G, Supplemental Biological Resources Report, of this Final EIR, for discussion of how the risk of avian collisions with the cables or components of the proposed Project is less than significant. Design features of the proposed Project (e.g., the lack of shield wires, the inclusion of slack carriers, presence of moving gondola cabins, and vinyl window film) are likely to reduce the risk of avian collisions in comparison to transmission lines.

Comment P256-5 4) The promoters try to cite the Gondola Project as a functional benefit for the city. Instead, it will merely be a tourist attraction that will become a destination, much like the Hollywood sign. Others hope it will be in operation in time for the Olympics. They also try to say this will provide transportation for the local residents, but don't

mention having additional stops or stations along the route. Would it require the residents to hike into the stadium station? Or take a Metro bus up to the stadium?

Response P256-5 In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the proposed Community Access Plan. Refer to Section 2.0, Project Description, for a discussion of the proposed Project alignment, which would commence adjacent to LAUS and El Pueblo and terminate at Dodger Stadium, with an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Accordingly, the proposed Project would include three stations. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how the proposed Project's intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park would be located within a short walk to many Chinatown businesses and Metro's L Line (Gold), creating a stronger connection with the Metro L Line and enhancing transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. The proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station.

Comment P256-6 5) Although the promoters tout the fare amount as less than driving into the stadium, most people go with their friends and family. If they're driving, they can share the parking cost. If they're taking the Gondola, they would each have to pay the fare! In addition, most people will drive to Union Station where they would pay the \$6 parking fee. This practice would not "add up" and would not save vehicle emissions. If they take public transportation to Union Station, that would be an additional cost. If it's a night game, will Metro keep all of their lines running late to accommodate the Gondola fans?

Response P256-6 The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report,

Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data, and the management of queueing at stations, and pre-game and post-game transportation. The Project Sponsor would coordinate potential improvements to late night service with Metro, Metrolink, and other transit service providers.

Comment P256-7 6) I was once at the Palm Springs tram and I went back down to the station while a friend I came with stayed at the top a little longer. Well, she and her toddler son got on the tram and, about half-way down, it stopped. It turns out the brakes failed and they had to stop it for repairs. They hung there in a crowded car for as long as it took for the needed parts to be picked up and flown to the top in a helicopter and the repairs made. What emergency plans will this project have in case of a mechanical failure? Will there be a means of evacuating the passengers or will they have to hang there indefinitely?

Response P256-7 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR for discussion of how the proposed Project is unlikely to become inoperable due to a system malfunction given the system's design redundancies, regular maintenance, and backup battery power. The Emergency Operations Plan for the proposed Project would include emergency response protocols and safety procedures developed in conjunction with the operator, system provider, and local authorities. The plan would address operational changes and communication protocols required in response to a range of potential emergencies such as a medical emergency in a cabin or in a station or a fire near the alignment. The plan would consider a wide range of scenarios for which default operational responses would be determined. In addition, the plan would include communication protocols with local authorities for further instruction and coordination. The plan would also address the unlikely scenario where the system cannot be moved to unload passengers normally at stations. The robust design, periodic and preventative maintenance, and equipment redundancies are intended to minimize this scenario. However, the plan would include procedures to evacuate passengers directly from cabins, if needed.

Comment P256-8 I believe this project was conceived not as a convenience for fans or a benefit for the city, but as a money-making venture for the McCourts and the others who have joined them. This project is not a good idea and will not benefit the people of Los Angeles. Please register my objection to the Gondola Project.

Response P256-8 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and

accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding community, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment Letter P257 – Mary Livesay

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P257

Comment P257-1 My name is Mary Livesay and I work in downtown Los Angeles and I am writing to voice my strong opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

My concerns are surrounding lack of transparency and the increased traffic that will result from this project.

Response P257-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately after the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel.

Comment P257-2 From my understanding, Metro went forward with this project without an open public process and without competitive bidding. I don't understand the ownership or operation of the project because the details have been hidden from the community. Who is paying for this project?

Response P257-2 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s sole source determination for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P257-3 The other thing that worries me about the Gondola Project is the increase traffic that will occur around Chinatown and Union Station. As someone who commutes to downtown LA and walks from Union Station to work I already experience the high-volume of traffic and sometimes erratic and unsafe driving that results from this traffic. Increased traffic will pose a greater danger to pedestrians and make LA and even more unfriendly city to those who walk since project is designed to displace traffic from Dodger Stadium and push it onto the surrounding communities.

Thank you for your consideration of my comments,

Mary Livesay

Claremont Resident

Los Angeles commuter and worker

Response P257-3 Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. This partnership could include providing a free connecting Metro or Metro bikeshare ride with a ticket for the proposed Project, or other measures to further encourage a complete transit trip. By providing efficient, high-capacity, and faster alternative access to Dodger Stadium for games and special events, however, overall vehicular congestion in and around

Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days would be reduced by the proposed Project because of game/special event attendees shifting to riding public transit rather than driving to Dodger Stadium.

Comment Letter P258 – Kaitlyn Brine

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P258

Comment P258-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). My name is Kaitlyn Brine and I work in the community in which the gondola project would affect. I am originally from Boston, Massachusetts and since moving to Los Angeles I am constantly overwhelmed by the amount of environmental injustice I witness. This gondola project would further emit pollution into an already environmentally unsafe area and would most affect those at the margins.

Response P258-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/ Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment Letter P259 – Ricky de Laveaga

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P259

Comment P259-1 Am I able to submit written comments on the Aerial Rapid Transit Technology LLC proposal (gondola) here? If so I would like to say:

As a longtime resident of Elysian Heights I am against this proposal with every fiber of my being.

Response P259-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P259-2 Not only will it displace a significant portion of our community, but it will accelerate gentrification and destroy the character of our neighborhood.

Response P259-2 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. The proposed Project also will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Topical Response C, Project Features, discussing how the proposed Project’s design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area.

Comment P259-3 Further, there will be a devastating impact to the area, significantly altering historic view sheds at Union Station and El Pueblo. New stations, towers, wires, and gondolas will result in a major change to this overall area of the city.

Response P259-3 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, including to Los Angeles Union Station (LAUS) and El Pueblo, which would be less than significant. Refer to Section 3.05, Cultural Resources, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR), of the Draft EIR for a discussion outlining the proposed Project’s potential construction and operational impacts to the Los Angeles Union Station Passenger Terminal and Grounds. As discussed in Section 3.05, Cultural Resources, of the Draft EIR, LAUS was designed in response to its proximity to El Pueblo de Los Angeles. As such, one aspect of LAUS’ setting that is important is its axial connection and visual relationship with the Los Angeles Plaza Historic District. The proposed Alameda Station would be located over 100 feet north of the main axis—at the intersection of Los Angeles Street

and Alameda Street—between LAUS and the Los Angeles Plaza Historic District. The location is sufficiently offset so it would not interrupt the physical and visual relationship between the two historical resources. This important aspect of the LAUS' setting would be maintained.

Comment P259-4 I have not spoken to a single neighbor, civic expert, or local leader in favor of the project. This is bad money looking to swindle taxpayers and leave us as collateral damage.

Response P259-4 Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financial Analysis, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment Letter P260

This comment number has intentionally been skipped.

Comment Letter P261 – Rahul Gunasekaran

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P261

Comment P261-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P261-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P262 – Holly Harper

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P262

Comment P262-1 Respectfully, I most **strongly** oppose the LAART gondola project.

Response P262-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P262-2 The most immediate bad outcome for implementing this project is that it will carve-out and occupy **public space** at both el Pueblo de Los Angeles Historic Monument and the Los Angeles State Historic Park for what will ultimately be **private** gain. We don't have open, green space to spare in Chinatown and these two stations will also loom large in the background of both the 1818 Avila Adobe and the State Park.

Response P262-2 Refer to Section 2.5, Proposed Project Alignment and Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties. As discussed in Section 3.16, Park and Recreational Facilities, the construction and operational impacts of the proposed Project would result in less than significant impacts to El Pueblo and the Los Angeles State Historic Park. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown,

and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. Also refer to Section 3.5.4, Environmental Impacts, of the Draft EIR for a discussion outlining the proposed Project's potential construction and operational impacts to historic resources within the vicinity of the proposed Alameda Station, including the Los Angeles Union Station Passenger Terminal and Grounds and the Los Angeles Plaza Historic District (referred to as El Pueblo, and comprised of 29 resources within its boundaries, including the Avila Adobe and The Winery), the El Grito mural, and the Los Angeles Terminal Annex Post Office. As discussed in Section 3.5.4, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation.

Comment P262-3 Neither do I view it in any way as a positive addition to the Union Station Forecourt and Promenade project currently under development, as part of the Connect US plan. Even in its latest watered-down iteration, this proposal makes a *start *at rebalancing the use of this area and connection to el Pueblo away from its prioritization of motorized vehicles and toward all of the rest of us on foot, bicycle or taking transit.

Response P262-3 As discussed in Section 2.0, Project Description, of the Draft EIR, Metro's LAUS Forecourt and Esplanade Improvements Project is currently being developed in coordination with the City of Los Angeles, and would include repurposing the existing northwestern parking lot at LAUS into a pedestrian forecourt and gathering space, as well as pedestrian and bicycle enhancements along Alameda Street and Los Angeles Street. In addition, the Project proposes a new pedestrian plaza north of the Placita de Dolores in an area currently used as a parking and loading area for El Pueblo. Refer to Section 2.0, Project Description, of the Draft EIR for a discussion of how the proposed Project's Alameda Station location was also selected because of its high visibility and proximity to LAUS and El Pueblo, safe and convenient pedestrian connection to and from the LAUS passenger terminal and El Pueblo, as well as adjacency to public space for passenger access, and because the location is compatible with Metro's plans at LAUS, including the LAUS Forecourt and Esplanade Improvements Project. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of Metro's LAUS Forecourt and Esplanade Improvements Project, which is not part of the proposed Project. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. Further, as discussed in Section 5.0, Corrections and Additions, of the Final EIR, the mobility hub at the Dodger Stadium property would provide connectivity to Elysian Park, the City's second largest park, comprising 575 acres, and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/last mile

multi-modal options, such as a bike share program, and individual bike lockers to access Elysian Park and other nearby neighborhoods, including Solano Canyon. The proposed Project cabins would allow for sitting and standing as well as bicycles.

Comment P262-4 Finally: haven't the residents and neighborhoods in the canyons around Dodger Stadium suffered *enough* over the past six or seven decades from the oppressive presence of the Dodgers? McCourt is only the latest in a string of developers in control of all or part of the huge site of the Stadium, its parking lots and the vast potential embodied there.

Response P262-4 Refer to Section 5.0, Corrections and Additions, of this Final EIR, for a discussion of Chavez Ravine. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P262-5 Again, I'd ask why *one square inch* of the public spaces paid for and maintained by taxpayers should be sacrificed to support this theme park-like gimmick or McCourt's dreams of profiting massively from the redevelopment of the Stadium's parking lots? Once again Metro seems to be distracted by the latest shiny object, away from paying attention to the needs or desires of we peons traveling on foot, bike or bus.

Thank you for your time and attention.

Response P262-5 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property.

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment Letter P263 – Carey Bennett

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P263

Comment P263-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

I live in LA and work a full time job that doesn't pay enough for me to afford a car. I take LA metro bus and train 5 days a week as part of my commute. The experience is disgusting, unreliable, inefficient and unsanitary. We need funding to make the LA metro experience less miserable and more reliable - so why not use funds that **could** go into a tourist trap gondola that will disrupt the communities it would run through and instead use it to put a dent in the hideous current situation that is the LA Metro?

Response P263-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financial Analysis, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of how comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses, and how comparable aerial transit systems in other cities and countries have brought benefits to their surrounding areas by connecting disparate neighborhoods, promoting commerce, beautifying communities, and enhancing transit system rider safety.

Comment Letter P264 – Hayk Makhmuryan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P264

Comment P264-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

From gentrification to environmental impact, this project will be absolutely devastating to Chinatown, LA State Historic Park and the surrounding neighborhoods.

Response P264-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts including to Chinatown, Los Angeles State Historic Park, and the surrounding neighborhoods. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment P264-2 As an arts and cultural worker and organizer in downtown LA since 2008, I've been both an attendee and a facilitator at the State Historic Park many many times, and the experience of the park would be completely impoverished by the presence of this project.

Response P264-2 Through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including

pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project’s required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms.

Comment P264-3 As a tenants rights organizer since 2017, I can attest that this project, even if well intentioned will push out and destroy the lives of thousands of most vulnerable locals with callous predictability.

Response P264-3 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. The proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Response P264-4 for discussion of how the Draft EIR addresses environmental justice and supports Metro’s goal of prioritizing equity opportunities.

Comment P264-4 Please do not invest in a project that is a toy of the rich at the cost of hurting the average resident, the poor, and the local neighborhoods.

I'm an avid user of public transportation and I appreciate very much all the transit projects improve the lives of residents across the board (like improvement in bus lines and operation); this Gondola project is not one of them.

Response P264-4 Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, how the proposed Project supports Metro's goal of prioritizing equity opportunities, and is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Further, as discussed therein, the public outreach for the proposed Project was designed with environmental justice principles in mind. And, the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region's most visited venues and would alleviate existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety. The proposed Project is also designed to be ADA compliant.

Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park.

Comment Letter P265 – Freda Shen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P265

Comment P265-1 I am stating my opposition to the creation of this aerial gondola that would link Union Station and Dodger Stadium at Chinatown's expense.

This is as bad as the proposed aerial tram from Warner Brothers to the Hollywood Sign that would have been at the expense of the City's urban wilderness, Griffith Park.

Both proposals belong in the trash heap of ill-conceived ideas.

Response P265-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P265-2 This Dodger Stadium proposal was given unusual no-bid fast tracking after being proposed by Frank McCourt in 2018.

Response P265-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P265-3 The traffic and environmental claims made by this proposal have been strongly challenged by data from the Sierra Club, by UCLA's Mobility Lab, by LA River State Park Partners, and by UCLA's Institute of Environment and Sustainability.

Response P265-3 Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project's Draft EIR, and does not appear to have been prepared for that purpose. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's

ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Responses GO21, PH172, and PH283 and for responses to Los Angeles River State Park Partners. Refer to Response GO12 for responses to the Sierra Club. Refer to Responses GO24 and PH204 for responses to Jon Christensen.

Comment P265-4 Instead of this tram literally hanging over the community, a better option would be dedicated bus lanes for the existing Dodger Express, a shuttle service from Union Station to Dodger Stadium run by LA Metro.

Response P265-4 Refer to Section 4.0, Alternatives, of the Draft EIR and Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of the Draft EIR’s consideration of a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and therefore is unlikely to achieve the GHG benefits of the proposed Project. The Transportation Systems Management Alternative otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment P265-5 The community that would be affected - Chinatown, Lincoln Heights and Solano Canyon - has spoken up vehemently against the tram, most recently at a public meeting on 1/12/2023 that allowed for no public comment, so that the community was forced to take over the meeting in order to have their concerns and protests heard.

Please listen to the community and discard this proposal.

Response P265-5 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and during the four public hearings. Comments on the Draft EIR could be submitted by email to LAART@metro.net, by mail to One Gateway Plaza, Mail Stop 99-22-6, Los Angeles, CA 90012, or over the phone by calling

(213) 922-6913. Comments could also be submitted at each of the four public hearings. At virtual public hearings, comments could be given verbally. At the two public hearings held in person, including the January 12, 2023, public hearing discussed in this comment, comments on the Draft EIR could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). An estimated 143 attendees participated in the January 12, 2023, public hearing, and Metro received 31 verbal comments and 95 written comments on the Draft EIR. In light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held on February 8, 2023. Verbal comments received at this continued public hearing were deemed timely received for the purposes of the Draft EIR public review period.

Comment Letter P266 – Zach

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P266

Comment P266-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium. The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P266-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P267 – The Burgard Family

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P267

Comment P267-1 Please accept this email as our strong opposition to the proposed gondola project terminating at Dodger Stadium.

Response P267-1 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P267-2 The cost/benefit and public use projections are unrealistic and the damage to Chinatown’s cultural identity would be immeasurable.

Thank you for your consideration,

The Burgard family

Response P267-2 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project’s system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data. Refer to Topical Response C, Project Features, discussing how the proposed Project’s design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. The Project Sponsor would utilize local artists for site specific artwork at each station reflective of the unique neighborhood culture, and would create numerous opportunities to collaborate with and showcase local artists, including convening stakeholder groups

to coordinate on issues including utilization of local artists and identification of sites along the proposed Project alignment to showcase the work of local artists.

Comment Letter P268 – Sara Z Mijares

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P268

Comment P268-1 I would lo speak with you about the Gondola Airail project.

I have been a DRAC member for Metro for a few years, participated as a CBO member in the Eastside Corridor Metro Project and we are starting a small contract as a CBO for the LA Transit Traffic Reduction Project.

Please let me know what day and times are convenient for you. This is my cell phone. 562 505 6023. I am out of town until January 23 and there is a 3 hour time difference from California, we are 3 hours ahead of you.

Response P268-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P269 – Ezra Muthiah

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P269

Comment P269-1 I am a Los Angeles resident writing in to urge you to halt all plans for building the gondola. I was born and raised in LA County and have been taking Metro to school, work, and recreationally since I was 12. I love Metro and I am passionate about expanding access to public transportation in LA. But this gondola project is not that.

Response P269-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P269-2 Research has shown that it will do nothing to help ease traffic. Instead, the gondola simply displaces the burden of Dodger's Stadium parking onto poorer communities who are not asking for this gondola and who will not benefit from it. In line with it changing traffic in the surrounding area by less than one percent, it also does nothing to curb greenhouse gas emissions. We want shuttles, not expensive gimmicks!

Response P269-2 The proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel are discussed in Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft

EIR. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations.

Refer to Section 4.0, Alternatives, of the Draft EIR and Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for a discussion of the Draft EIR’s consideration of a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and therefore is unlikely to achieve the GHG benefits of the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. Moreover, the TSM Alternative is not a permanent transit connection as bus routes, and operations are frequently modified and/or eliminated due to fiscal and ridership issues.

Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the

unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment P269-3 Despite financial backing from Frank McCourt, there has been a pattern of projects like these inevitably footing taxpayers with the bill. Taxpayers can especially expect our money to be wasted because there has been zero transparency about long-term operation costs and who ends up paying if/when the project runs over budget. I hope that my personal stake in this is not lost in these more technical talking points. I love this city, I love Metro, I love the Dodger's. I want what's best for all of us, and this gondola just isn't it. I hope you take this into consideration and recognize what this city needs, and what it doesn't need.

Response P269-3 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project, and Section 4.0 Costs and Financial Analysis, of the Final EIR, which provide detail as to the proposed project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment Letter P270 – Tom Zhang

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P270

Comment P270-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project (“The Gondola” at Dodger Stadium).

I worked to serve Chinatown residents with the Chinatown Service Center vaccine clinic in 2021. As someone who has a deep appreciation for the neighborhood and also has an understanding of the history of forced displacement and marginalization of the LA Chinese American community, I am deeply troubled by the plans to build the Gondola Project in and around Chinatown. Union Station was likewise a project that was built at the expense of the LA Chinese population - it rests on the bones of old LA Chinatown and its inhabitants. This Gondola Project doesn't even have the potential to benefit the residents of LA nearly as much as Union Station, and yet it is for some reason being seriously considered, despite the outsized impact it will have on the residents of neighborhoods like Chinatown, which is already facing gentrification, air pollution, and heavy traffic.

Response P270-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, how the proposed Project supports Metro’s goal of prioritizing equity opportunities, is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, how the public outreach for the proposed Project was designed with environmental justice principles in mind, and how the proposed Project would address a need for a permanent transit connection to one of the region’s most visited venues and would alleviate existing congestion on surrounding neighborhood streets,

arterial roadways, and freeways, thereby reducing associated air pollution and improving safety.

Comment P270-2 The idea of building a gondola is not just outdated, it is also a horribly inefficient method of transit - ferrying something like 16 people a cabin (if that). A far better use of the funds needed to construct an air gondola system would be to simply invest in more existing public transit systems - dedicated bus lanes and more metro lines.

Response P270-2 Although forms of aerial transit technology have been available and utilized for the last 100 years, modern applications have seen the evolution of the technology as a feasible mode of urban rapid transit. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would have a maximum capacity of approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes. As in the Technology Penetration Analysis, included in Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, a large capacity for a new mode of transportation in Los Angeles will allow passengers to see the potential for other emerging innovations to be integrated into the public transit system. The proposed Project would thus exemplify how alternative transportation technology can be integrated into a city's transportation infrastructure and will show that new technology can successfully operate in concert with other existing modes of transportation. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between Los Angeles Union Station (LAUS) and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. In addition, Topical Response H discusses how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Comment P270-3 This project will cause environmental damage, increase gentrifying pressures on Chinatown, and add an eyesore to the LA skyline, all in exchange for a negligible reduction in traffic at Dodger Stadium. Again, the solution should be methods like

metro lines, bus lanes, and improving pedestrian/bike accessibility. All the Gondola Project will due is harm an already beleaguered population in LA's Chinatown and the surrounding areas.

Response P270-3 The proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel are discussed in Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement.

Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. While this alternative would provide improved pedestrian connections compared to existing conditions, the 25 minute plus travel time from the Metro L Line (Gold) Station to the location of the proposed Dodger Stadium Station would be at least nine times greater than the three minute travel time between those two locations with the proposed Project, and this alternative would be unlikely to attract substantially more people to walk to Dodger Stadium compared to existing conditions given the travel time and the physical exertion. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project.

Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to

meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. In addition, improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders travelling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment Letter P271 – Tiff H.

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P271

Comment P271-1 Hi Mr. Zelmer, I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

I grew up in Chinatown in the 90's and have seen the gentrification and changes to the neighborhood over the years. The impact of some of these developments have a devastating impact on residents due to corporate greed. Grocery stores that were once convenient to residents, have closed. Gone are the days of mom and pop shops inside tiny stalls that boast a lively neighborhood that drew both locals and tourists alike.

Response P271-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses to drive customers to Chinatown's small businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation represents an opportunity for additional visitors along the proposed Project alignment.

Comment P271-2 Many residents are elderly immigrants that don't speak any english nor possess the necessary tools to communicate their opposition to this project. The lack of transparency with the community has shown that there was no intent to invite any true discussion with the residents.

Response P271-2 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach

meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment P271-3 We should use the funding for better existing transit options for everyone. As we all know, Los Angeles is currently under a state of emergency over the homeless crisis. How about we try to solve a more dire need before we provide luxury transit for visitors? Most Angelenos, including myself, would agree.

Response P271-3 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Comment Letter P272 – Jacqueline Pabst

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P272

Comment P272-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P272-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P273 – David Shorter

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P273

Comment P273-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P273-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P273-2 I am an UCLA professor who works with various communities pertaining to land stewardship and community health. While I personally would be impacted very little, I am writing you because many community members are disempowered by the project and even by the process by which to voice their opposition to the project. On behalf of those who work over sixty hours a week, those who are not privileged with technology, or who might not feel worthy of being heard in official capacities, I write in opposition to the Gondola.

Response P273-2 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, and Appendix A, Scoping Report, of the Draft EIR, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Metro engaged stakeholders in neighborhoods along the proposed Project alignment in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from stakeholders in neighborhoods along the proposed Project, including Chinatown, during this period led directly to changes to the proposed Project, including selecting the proposed Project's alignment and the location of Chinatown/State Park Station, as discussed in Section 5.0, Other CEQA Considerations, of the Draft EIR. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on

Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. The Draft EIR addresses environmental justice by considering the proposed Project’s ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project’s potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Comment P273-3 The Gondola was a vanity project dressed up as a public good where the public served is not the communities negatively impacted by the literal change to their urban environment.

Thank you for paying attention to the calls of the impacted communities.

Response P273-3 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project’s system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment Letter P274 – Grace Doyle

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P274

Comment P274-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

I cannot believe the audacity of this proposal. It's not transit. It's for tourists.

Response P274-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Comment P274-2 And who exactly is paying for it? Even if it's privately funded, it's using a public resource- the historic park. The nature of which will be completely changed when there are massive metal cars dangling above head.

Response P274-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed

Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park.

Comment P274-3 That is not what parks are for. Where have the public commenting opportunities been? Where is the reach out to the community? All I've seen is propaganda in the form of a car displayed in the dodgers parking lot with no mention of any of the concerns opponents have. Just an advertisement as if the gondola is destiny. Stop the corruption. Build transit for the people.

Response P274-3 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment P276-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P276-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P277 – Nick Scottrussell

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P277

Comment P277-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

How is this benefitting the public?

Response P277-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer also to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment P277-2 I know that it's gentrifying Chinatown which hurts a historically oppressed population. I know it's money that won't be going towards building new train lines or making

busses free. Who is paying for this ski lift? Tax payers? Even if it's privately funded, it's using public resources. This project is an obvious "no". A perfect picture of corruption that's run rampant in LA politics for far too long.

Response P277-2 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. The proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. Refer to Response P277-1 for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world and their operations, integration with nearby residential and open space uses, community benefits, promotion of public art and collaborations with local artists, and evidence that such systems can reduce violent crime in nearby areas and promote a sense of security compared to other modes of public transportation. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P278 – Liliana Cortez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P278

Comment P278-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P278-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P279 – Jaime Zavala

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to P279

Comment P279-1 I am writing to tell you I don't want this Gondola project to go through. What is the point of an aerial gondola that services a specific subset of people going from Union Station to Dodger's stadium? What does that do to solve our traffic congestion?

Response P279-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Comment P279-2 How is this conducive to getting more single rider vehicles off the road? How is this lowering emissions? Why aren't you using OUR resources to fund forms of public transit around the city that actually benefit all Los Angelinos? Do not go through with this. It is not worth the displacement of people in the gondola's planned path. It is not worth the potential rent increases to surrounding neighborhoods.

Response P279-2 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed

Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement.

Comment P279-3 I love riding the LA metro bus lines and the new expanded rail lines around the city. Those are a way forward in public transit that stand to benefit everyone. Not a specialized gondola to a sports stadium.

Response P279-3 Refer to Response P279-1 for discussion of the need for the proposed Project. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment Letter P280 – Cassandra Zepeda

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P280

Comment P280-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

As a resident of the solano community, I will be impacted by this project. I am concerned about this project for the following reasons:

Response P280-1 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses P280-2 through P280-4.

Comment P280-2 -This project will increase the impacts of air pollution from vehicle emissions in an area already overburdened by air emissions. My son and I already suffer from asthma caused by the pollution already surrounding us , we try our best to keep ourselves as healthy and safe as possible and building the gondola would only impact me and my 5 year olds health even more.

Response P280-2 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment P280-3 -This project will lead to displacement and increase the cost of rent in the area. I am trying to raise my family as best I can . I live with my husband and 2 children , we are BARELY surviving and making ends meet and to pay rent . This would greatly impact our lives with rent increases , can you imagine the drastic sudden changes we would need to do to survive and keep our children healthy and safe. I am sure this is not something YOU would be happy having to do let alone the unnecessary stress this will cause not only to my children but my children's friends who all live within the neighborhood.

Response P280-3 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed

Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Comment P280-4 -Lack of community consultation: The community has been neglected and our voices have not been heard. No one asked us our vision for our community. You are shutting our voices down and closing us out, when we as a community have been keeping this place safe and clean for all the families and children living here. This is will NOT benefit anyone here Instead it will affect all of us. I am sure you would be very unhappy if this was happening near your home without ever caring about what you had to say about it and without your consent. This unfair to our children they DO NOT DESERVE THIS

Response P280-4 Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and in writing or verbally during the four public hearings. Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the four public hearings, with interpretation provided in Taishanese during the final two public hearings. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and

open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world and their operations, integration with nearby residential and open space uses, community benefits, promotion of public art and collaborations with local artists, and evidence that such systems can reduce violent crime in nearby areas and promote a sense of security compared to other modes of public transportation.

Comment Letter P281 – Dennis Rohatyn

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P281

Comment P281-1 A gondola from Union Station to Dodger Stadium makes about as much sense as a ski lift in the Amazon, or a snowmobile in the Sahara. This is Chinatown, Frank. You can't ignore, let alone, leap-frog over it. One must respect both its presence and its inhabitants, while protecting them from serious problems that any aerial transportation system would surely encounter, be it a snapped cable, an earthquake, a short-circuit, a computer glitch, or mechanical malfunctions that would endanger the lives of passengers, motorists and residents, simultaneously. As it stands, the plan is an invitation to disaster, and a major accident waiting to happen.

Response P281-1 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would be equipped with security features and the Emergency Operations Plan for the proposed Project would include emergency response protocols and safety procedures developed in conjunction with the operator, system provider, and local authorities, and how aerial transit systems such as the proposed Project represent one of the safest modes of transportation relative to other forms of transit. Refer to Section 3.07, Geology and Soils, and Appendix I, Geotechnical Document in Support of the Environmental Impact Report, of the Draft EIR for discussion of how the structural design of the proposed Project's stations, junction, and towers would meet the rigorous safety standards of applicable standards, requirements, and building codes, including all mandated standards addressing environmental factors such as wind and seismic effects and gravity forces, including all impacts from the height and tilt of the structures, to ensure structural integrity and safety, and the proposed Project would adhere to its Emergency Operations Plan which would include emergency response protocols and state that in the event of a major earthquake the system would be fully evacuated and shut down, and would not operate.

Comment P281-2 It is also bound to be expensive and far from cost-effective, hence not worth the risk. If only Vin Scully were alive, he'd explain why, in ways that even City Hall might grasp.

Response P281-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P281-3 Listen in: “Frank McCourt has tremendous local power, especially in the alleys adjacent to freeway traffic. . . waiting for the 1-1 switch: Karen Bass lifts a high ride, deep to downtown—she is going, going, gondola.” Once again, it’s time for political hardball—but why dodger a flying bullet? Or are we still in Chinatown, after all?

Response P281-3 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P282 – Suellen Wagner

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P282

Comment P282-1 To Whom It may concern:I oppose the Los AngelesAerial Rapid Transit Project, due to severe negative impacts on the communities that will be "overflown" at low altitude by the gondolas. These communities are being disregarded, indeed sacrificed, for the purpose of yet another gondola tourist attraction. It won't work in Griffith Park and it won't work here, without imposing harsh impacts on citizens that have little to no defense against the City of Los Angeles, LA Metro, and the unaffected populace.

Response P282-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts. Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. the proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition,

the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, how the proposed Project supports Metro’s goal of prioritizing equity opportunities, and is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Further, as discussed therein, the public outreach for the proposed Project was designed with environmental justice principles in mind. And, the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region’s most visited venues and would alleviate existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety. The proposed Project is also designed to be ADA compliant.

Comment P282-2 This proposed project will not meet the objectives of the project, i.e. reducing traffic by becoming a mobility hub. There are easier, faster, and better ways to meet the objectives, such as making better use of existing bus lanes. In addition, what is a mobility hub? Will this new hub have other purposes, for other modalities such as Advanced Air Mobility/Urban Air Mobility?

Response P282-2 As described in Section 2.0, Project Description, of the Draft EIR, the proposed Project is an aerial gondola system that would provide a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Aerial rapid transit technology is a proven, zero emission, safe, sustainable, high-capacity and highly efficient form of transportation that would function as both a reliable rapid transit system and first/last mile connector. The proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Section 2.3.8, Project Objectives, of the Draft EIR, for discussion of the Project Objectives which broadly contemplate improving neighborhood connectivity and the Dodger Stadium visitor experience, reducing vehicle congestion and associated emissions in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, improving access to Elysian Park and the Los Angeles State Historic Park, and providing a sustainable form of transit. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. As discussed in Section 5.0, Corrections and Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park, the City's second largest park, comprising 575 acres, and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program, and individual bike lockers to access Elysian Park and other nearby neighborhoods, including Solano Canyon. Urban Air Mobility is not under consideration for these mobility hubs.

Comment P282-3 Will such, extremely impactful, deleterious uses be stacked onto the hub, leading to impacts that are unforeseen by the community, who is left out of decision making, but in the already in the works by LA's policymakers and leaders? As a community activist in Studio City, I have seen continually that citizens are continually ignored when it comes to development, on City, State and Federal levels, and are shut out of the process -- their requests for information about safety, environmental impacts, and costs are left unanswered. This must change. Find a better way to get people to Dodger Stadium. There is no need to work around the Developer/Owner's desire to expand his facilities. For once, listen to common sense -- which is not coming from Metro, but rather the affected communities. STOP THE GONDOLA! Sincerely, Suellen Wagner Studio City, CA 91604 Save Coldwater Canyon

Response P282-3 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Response P282-2 for discussion of the proposed Project's mobility hubs. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment Letter P283 – Ric Romero

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P283

Comment P283-1 I have lived in the community of Solano Canyon for 48 years, and have noticed a lot more traffic, events and parking issues around our local community with the Dodger organization. And with no warning or deal with it type business mentality that has affect the community with parking, carbon foot print, and no benefits to the local community. Dodger organization has benefited from events and expansion, but has no regards with the community.

Response P283-1 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Comment P283-2 We have voiced our concerns with previous events and falls on deaf ears. Feels like when people got displaced in the 50s and had no voice for the working community of palo verde and Chavez Ravine.

Response P283-2 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine.

Comment P283-3 Building this gondola doesn't resolve traffic it increases it. Makes. A bigger issue with Carbon foot print, parking issues due to people want to park in the community because it's free vs. parking at the state park because they charge.

Response P283-3 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N,

Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated "vehicle miles traveled" as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment, which found that there could be localized increases in traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines ("TAG"). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Comment P283-4 The local view of the skyline to downtown gets disrupted by a monstrous towers, cables and gondolas. Metro has created more traffic on streets than lessen the impact for traffic, such a bus lanes. This will be another issue for the local Bishop, China town, and area where there will be a stop for the gondola.

Please do not move forward with the gondola.

Response P283-4 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, including to the Los Angeles State Historic Park, which would be less than significant. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, and the ridership forecasts of the

proposed Project, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce traffic volumes destined to Dodger Stadium on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions.

Refer to Section 4.0, Alternatives, of the Draft EIR and Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for a discussion of the Draft EIR’s consideration of a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and therefore is unlikely to achieve the GHG benefits of the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how the proposed Project’s intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park would be located within a short walk to many Chinatown businesses and Metro’s L Line (Gold), creating a stronger connection with the Metro L Line and enhancing transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project’s Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less.

Comment Letter P284 – Sara Z Mijares

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P284

Comment P284-1 I would like to speak with you regarding the Aerial Gondola project.

I have been reading some of the news reports and different quotes of groups, people, orgs, etc. that are against this project.

Since the comment period is due in two days and one of them is a holiday, I would really like to exchange some ideas with you before sending an official comment.

In early September 2022 I was in Bolivia doing some cultural/entrepreneurial training work for indigenous communities and I loved the aerial transportation that they have and I thought "this would be a wonderful way of cutting down dome traffic in LA" not knowing that this project has been in existence. However, as a DRAC Metro member, I know first hand that if community feedback is not secured from the beginning the backlash is harsh.

Please get back to me at 562 505 6023.

Thank you.

Response P284-1 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world and their operations, integration with nearby residential and open space uses, community benefits, promotion of public art and collaborations with local artists, and evidence that such systems can reduce violent crime in nearby areas and promote a sense of security compared to other modes of public transportation.

Comment Letter P285 – Brad Bain

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P285

Comment P285-1 I live at 3036 Atwater Ave, Los Angeles CA 90039 -- close to both Union Station, Elysian Park, and Dodgers Stadium.

I absolutely support this project, and support the Draft EIR. This will be so helpful to so many people and further encourage the crowds to take transit to Dodgers Stadium, which is currently a giant parking lot choked by car traffic

Response P285-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P286 - Xulan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P286

Comment P286-1 Dear city government, city councillors, and relevant persons in charge:

Oppose billionaire and former Dodgers owner Frank McCourt to build a gondola that takes people from Union Station to Dodger Stadium!

Response P286-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P286-2 This is a waste of taxpayers' money to serve the interests of entertainers and to endanger the safety of residents of the Chinatown neighborhood by having gondolas shuttling back and forth over their homes in an extremely dangerous manner.

Response P286-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment P286-3 I hope that the city government, city councillors and the deputy executive Officer of the Los Angeles County Metropolitan Transportation Authority will solve the current primary problem by building \$125 million in apartments for the elderly, homeless and low-income people, as well as building 24-hour emergency hospitals and inpatient department, large supermarkets, public restrooms, and a more convenient, more practical and better environment for the Chinese community to live and work in!

Thank you!

Response P286-3 Refer to Topical Response N, Environmental Justice, for discussion of how the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself

address a need for a permanent transit connection to one of the region’s most visited venues, and would benefit the surrounding community by alleviating existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety.

Comment Letter P287 – Dale Brandenburg

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P287

Comment P287-1 Private investments for this project would be acceptable to me but strongly feel that no public funds should be used until we address the homeless problem and lack of low cost housing in Los Angeles.

Response P287-1 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, and Topical Response N, Environmental Justice, for discussion of how the proposed Project will not displace housing, prevent planned housing, or preclude development of uses including housing in the surrounding communities.

Comment Letter P288 – Crystal Hernandez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P288

Comment P288-1 I think it's a great idea less traffic. More parking.

Response P288-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P289 – Geri Foyle

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P289

Comment P289-1 I think the gondola is a great idea. I am a senior citizen and would use it to go to the stadium.

Response P289-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P290 – Martin Campos

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P290

Comment P290-1 I support the L.A. Aerial Rapid transit project

Response P290-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P291 – Elizabeth Usruitia

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P291

Comment P291-1 I support the Gondola since many people have disabilities and this will make it easier for them to visit the stadium

Response P291-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P292 – Danielle Montoya

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P292

Comment P292-1 I think it's a great idea for the Gondola to be built because of traffic.

Response P292-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P293 – Iris J Ramirez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P293

Comment P293-1 I agree the gondola is a great idea. I truly agree with this.

In fact are they hiring I would love to be part of the team.

Response P293-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P294 – Jade Castillo

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P294

Comment P294-1 I support the Gondola and I think it's beneficial to people with no car and to people that are disabled.

Response P294-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P295 – David Sanchez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P295

Comment P295-1 I support the Gondola to help control traffic since it is bad along Sunset heading to the games.

Response P295-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P296 – Enrique Robles

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P296

Comment P296-1 I think its an amazing idea to get the Gondola so it can decrease the traffic during the Dodger games

Response P296-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P297 – Norma Sanchez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P297

Comment P297-1 I support the Gondola Project especially as it will help control all the heavy traffic in the area while the Dodgers are playing.

Response P297-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P298 – Maria

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P298

Comment P298-1 I support the Gondola since it is going to help with parking at the Dodger game and it take only seven minutes

Response P298-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P299 – Guadalupe Rabadau

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P299

Comment P299-1 I support the Gondola Project as it will lessen all the traffic in the area especially during the Dodger games.

Response P299-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P300 – Alejandro

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P300

Comment P300-1 The Gondola will help with the time it will take to get to Dodger stadium that is why I support this project

Response P300-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P301 – Bertha Garcia

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P301

Comment P301-1 I support the Gondola since it was help with the traffic in the Area

Response P301-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P302 – Noelo Heese

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P302

Comment P302-1 The Gondola will be good as it will help with the traffic to Dodger stadium

Response P302-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P303 – Kimberly Drenas

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P303

Comment P303-1 I support the Gondola due to the transportation problem we have here in California going to sporting events

Response P303-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P304 – Andrew Inema

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P304

Comment P304-1 I support the Gondola since it would only take 7 minutes to get to Dodger Stadium and eliminate a lot of cars at the stadium

Response P304-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P305 – Tina Robles

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P305

Comment P305-1 The Gondola sounds like a great idea so we can have less congestion while going to and from the Dodger games

Response P305-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P306 – Manuel Cruz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P306

Comment P306-1 I like the idea of not driving to the games and just relaxing in the Gondola “whataview”

Response P306-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P307 – Arleen Rivera

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P307

Comment P307-1 We needed something like the Gondola years ago to help with all the traffic going to Dodger games “Great Idea”

Response P307-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P308 – Jose Sanchez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P308

Comment P308-1 I agree with the construction of the Gondola to help with all the traff going to the games

Response P308-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P309 – Diane Brown

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P309

Comment P309-1 The idea of a new way to travel to the Dodger games is a great idea

Response P309-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P310 – Helen Hurtado

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P310

Comment P310-1 I am a senior and will be glad to see and ride the gondola in my lifetime

Response P310-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P311 – Aleena Cruz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P311

Comment P311-1 I was so happy to hear there is a new way to get to Dodger Stadium

Response P311-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P312 – Jorge Hurtado

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P312

Comment P312-1 I like the idea of the Gondola

Response P312-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P313 – Rachel Sanchez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P313

Comment P313-1 I support the Gondola because it will help for us to get to the games in less time without so much traffic

Response P313-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P314 – Monica Cruz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P314

Comment P314-1 This is a godsent to all the people who live by Dodger Stadium

Response P314-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P315 – Mary Jo Cruz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P315

Comment P315-1 What a great convenience why did it not happen sooner

“I support this”

Response P315-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P316 – Danny Rivera

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P316

Comment P316-1 The Gondola is a good idea for all who attend the games at Dodger Stadium we will be able to get home sooner without waiting for all the traffic

Response P316-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P317 – Yolanda Garza

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P317

Comment P317-1 Very interesting concept. Would like to see this happen.

Response P317-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P318 – Monique Bracamontes

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P318

Comment P318-1 I love the idea of the gondola

Response P318-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P319 – Eric Bracamontes

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P319

Comment P319-1 The Gondola would be good to go in and out of the stadium since to get out at the end of the game, and it even better since its free.

Response P319-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment Letter P320 – Anel Becerra

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P320

Comment P320-1 I support the Gondola since it would help with traffic on the streets going to Dodger Stadium.

Response P320-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P321 – Arturo Ortiz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P321

Comment P321-1 I support the Gondola for all the changes that it would bring to our city

Response P321-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P322 – Eleda de Anda

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P322

Comment P322-1 I support the gondola, I believe it will be good for the community

Response P322-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P323 – Jennie Rubio

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P323

Comment P323-1 I'm a dodger fan, and will like to be able to take the gondola to go to the games

Response P323-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P324 – Brian Rubio

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P324

Comment P324-1 I will support the gondola, I don't drive and it will be nice to go see a Dodger game

Response P324-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P325 – Emma Aguila

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P325

Comment P325-1 Im a senior citizen and would like to go to a Dodgers Stadium on the gondola

Response P325-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P326 – Jason Seguda

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P326

Comment P326-1 Driving all week long for work it will be nice to take the gondola to go see a game at Dodgers Stadium

Response P326-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P327 – Patuel Montanez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P327

Comment P327-1 What a great idea great for the community

Response P327-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P328 – Vincent Ruilla

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P328

Comment P328-1 I SUPPORT THE GONDOLA, TO ELEVATE TRAFFIC

Response P328-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P329 – Martha Garcia

Responses to P329

Comment P329-1 The gondola will help handy cap people.

Response P329-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P330 – Adam Reeves

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P330

Comment P330-1 A 7 min trip instead of a 30 min one sign me up!

Response P330-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P331 – Martha Contreras

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P331

Comment P331-1 The gondola is a good project for new transportation in our city.

Response P331-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P332 – Rupert Jones

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P332

Comment P332-1 I support the construction of the gondola.

Response P332-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P333 - Imelda Morales

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P333

Comment P333-1 Let's approve this project and build the gondola for all Los Angeles

Response P333-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P334 – Fatima Lopez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P334

Comment P334-1 I support the gondola

Response P334-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P335 – Javon Newman

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P335

Comment P335-1 Support this project lets build it right away!

Response P335-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P336 – Alexander Black

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P336

Comment P336-1 Great project for the community

Response P336-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P337 – Linda Chen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P337

Comment P337-1 LA ART supports my community I support them build the gondola

Response P337-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P338 – Amy Matthews

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P338

Comment P338-1 I support the Gondola

Response P338-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P339 – Jesus Villanueva

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P339

Comment P339-1 Hopefully open before the olympics

Response P339-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P340 – Clarissa Paredez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P340

Comment P340-1 Build the air cars ASAP!!

Response P340-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P341– Simon Lopez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P341

Comment P341-1 This project would provide transportation from Union Station to Dodgers Stadium it is a wonderful Idea.

Response P341-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P342 – Spencer Rites

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P342

Comment P342-1 Hopefully this cleans up city traffic

Response P342-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P343 – Kaylee Smith

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P343

Comment P343-1 The sooner this is built the better

Response P343-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P344 – Robert Slack

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P344

Comment P344-1 We want less traffic I support the Dodger gondola

Response P344-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P345 - Juliette Lopez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P345

Comment P345-1 I support the project

Response P345-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P346 - Justine Lee

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P346

Comment P346-1 The gondola will make less pollution and make it healthier for neighbors.

Response P346-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P347 – Jason Ramirez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P347

Comment P347-1 I support the dodgers gondola

Response P347-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P348 – Marissa Cortes

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P348

Comment P348-1 We want more zero emission transportation.

Response P348-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P349 – Lesley Gomez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P349

Comment P349-1 The gondola could remove 3,000 cars during the game, it's a great idea.

Response P349-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P350 – Cindy Maciel

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P350

Comment P350-1 It will help with traffic and clean up the air. I support it.

Response P350-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P351 – Destiny Cruz

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P351

Comment P351-1 My neighborhood had bad traffic, this will clean it up.

Response P351-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P352 – Amber Cervantes

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P352

Comment P352-1 LA ART will move 5000 people up and down the mountain every hour. I support it.

Response P352-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P353 – Callie Liley

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P353

Comment P353-1 The gondola would be seven minutes from downtown to Dodgers Stadium. I support the Dodgers Stadium gondola.

Response P353-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P354 - Mariposa Jimenez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P354

Comment P354-1 1. This project is miraculous.

Response P354-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P355 - Victor Balderrama

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P355

Comment P355-1 1. A great community support.

Response P355-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P356 – Leticia Reynoso

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P356

Comment P356-1 I support the Gondola because I think it would be a good means of transportation to get quickly to the Dodgers Stadium and reduce traffic.

I support the gondola because I believe that it will be a good idea for transportation to reduce traffic and gas money.

Response P356-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P357 – Raymond Noriega

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P357

Comment P357-1 I support the Gondola since back in the days traffic on Broadway was bad and is still bad. I grew up in Lincoln Hts.

Response P357-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P358 – Leslie Reynoso

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P358

Comment P358-1 I agree with the Gondola, because I struggle with transportation. So the Gondola will be a great alternative of transportation and not have to deal with traffic.

Response P358-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P359 – Angela Reynoso

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P359

Comment P359-1 I support the Gondola since I feel it will be less traffic to get to the dodgers stadium.

Response P359-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P360 – Celeste Revills

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P360

Comment P360-1 I look for to the Gondola for 2 reasons.

Parking Lot Chaos there will less traffic when leaving the park.

Convenience when traveling alone you have convenience of using different means of transportation.

Response P360-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P361 – Efrain Hernandez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P361

Comment P361-1 I support the Gandola.

I can't wait to use the Gandola to commute to the Dodgers Stadium.

Response P361-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P362 – Gustavo Hernandez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P362

Comment P362-1 I support the Gandola.

Finally modernizing the transportation.

Response P362-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P363 – Maria Hernandez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P363

Comment P363-1 I support the Gandola.

Watching the view from the gandola.

The view of the Dodgers Stadium.

Response P363-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P364 – Tanya Hernandez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P364

Comment P364-1 I support the Gandola.

I can't wait to ride the Gandola.

Response P364-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P365 – Carlos

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P365

Comment P365-1 I like the idea because it will not cause more smog. for that reason alone I will support the gondola project.

Response P365-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P366 – Carlos Aguirre

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P366

Comment P366-1 I believe it will put us up there! So, yes I support it.

Response P366-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P367 – Juan Garcia

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P367

Comment P367-1 They could view the ho city

I support it

Response P367-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P368 – Yvonne Montoya

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P368

Comment P368-1 I think its an amazing idea and convenient, and support it

Response P368-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P369 – Arson Li

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P369

Comment P369-1 Support the gondola.

Response P369-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P370 – Amy Li

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P370

Comment P370-1 Support the gondola.

Response P370-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P371 – Joanne Liu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P371

Comment P371-1 Support the gondola

Response P371-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P372 – Diana Chen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P372

Comment P372-1 [No comment provided.]

Response P372-1 No comment was provided. The comment letter form with signature will be provided to the decision makers for review and consideration.

Comment Letter P373 – Lyn Chan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P373

Comment P373-1 [No comment provided.]

Response P373-1 No comment was provided. The comment letter form with signature will be provided to the decision makers for review and consideration.

Comment Letter P374 – Marina Chen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P374

Comment P374-1 good

Response P374-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P375 – Lyn Chan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P375

Comment P375-1 good

Response P375-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P376 – Leo Lei

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P376

Comment P376-1 Support the gondola.

Response P376-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P377 – Ling

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P377

Comment P377-1 Support the gondola.

Response P377-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P378 – Wu Ainne

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P378

Comment P378-1 Support the gondola.

Response P378-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P379 – S. Li

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P379

Comment P379-1 Support the gondola.

Response P379-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P380 – Angela Chan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P380

Comment P380-1 Support the gondola. Good idea, Good! Good!

Response P380-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P381 – Kelly

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P381

Comment P381-1 Support. SUPPORT

Response P381-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P382 – Cynthia Lu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P382

Comment P382-1 Support SUPPORT GONDOLA

Response P382-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P383 – Kenny Phu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P383

Comment P383-1 I SUPPORT GONDOLA

Response P383-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P384 – Bruce Wong

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P384

Comment P384-1 Support Gondla

Response P384-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P385 – Elaine Cao

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P385

Comment P385-1 Support the gondola.

Response P385-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P386 – Xiu Wei Deng

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P386

Comment P386-1 Support the gondola.

Response P386-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P387 – Lily

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P387

Comment P387-1 Support the gondola.

Response P387-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P388 – C K Ko

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P388

Comment P388-1 Support the gondola, bring benefits to people

Response P388-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P389 – Qingxia Cen

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P389

Comment P389-1 Support the gondola.

Response P389-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P390 - Yiyan Situ

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P390

Comment P390-1 Support the gondola.

Response P390-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P391 - Su Chan Li

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P391

Comment P391-1 Support the gondola.

Response P391-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P392 - Wai Li Kuan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P392

Comment P392-1 Support the gondola.

Response P392-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P393 - Bing Yang Situ

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P393

Comment P393-1 Support Gondola

Response P393-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P394 - Li Shao Xie

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P394

Comment P394-1 I strongly support the gondola transit. It will benefit people.

Response P394-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P395 - Xianen Bai

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P395

Comment P395-1 I support the construction of the gondola. It will benefit people.

Response P395-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P396 - Lan Huang

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P396

Comment P396-1 Support the gondola

Response P396-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P397 - Jie Tang Zhou

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P397

Comment P397-1 Support the gondola

Response P397-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P398 – Guohui Li

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P398

Comment P398-1 The earth needs to be protected. This electric gondola meets the need. It is powered by electricity, which will reduce pollution. Currently, traffic jam is a big problem to Dodger Stadium. It is a great suggestion to build the gondola at Dodger Stadium station, which will bring customers to businesses around. I highly support the construction of gondola. Hope it can be built soon.

Response P398-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how the proposed Project would operate at zero emissions, with the electrical power for the proposed Project supplied by the City of Los Angeles Department of Water and Power (LADWP) through the utility's Green Power Program, pursuant to GHG-PDF-A. Refer to Topical Response C, Project Features, for discussion of the potential added benefits from the proposed Project, including potential partnerships with and benefits to local businesses.

Comment Letter P399 - Rui Fang Feng

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P399

Comment P399-1 I support LA Aerial Rapid Gondola Project. It can significantly reduce pollution and improve traffic. I hope it can be built quickly.

Response P399-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P399-2 Support aerial rapid transit project.

Reduce Pollution; reduce traffic

I hope it can make it fast

Response P399-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P400 – Daniel Rubio

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P400

Comment P400-1 Fantastic Idea defenetly will benefit the community and neighborhood.

Response P400-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P401 – Judy Abarca

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P401

Comment P401-1 I support the project because it will take 5,000 people per hour and it would be there in just 7 minutes. There won't be so much traffic like it is now, and it will be free for the residents of the area.

Response P401-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P402 – Teresa Villa

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P402

Comment P402-1 I like the project because it's going to reduce a lot of traffic and I am not going to be stuck in it at just a few blocks from my home. Please approve it soon.

Response P402-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P403 – Ana C. Sorto

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P403

Comment P403-1 I support the Gondola Project because it is beneficial to all, especially because it will reduce traffic in my area and transportation to the stadium will be faster, just 7 minutes and it takes 30 to 40 people per gondola.

Response P403-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P404 – Maria Orozco

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P404

Comment P404-1 I support it because traffic will move faster.

Response P404-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P405 – Roberto Vucio

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P405

Comment P405-1 It is a good idea for all, less traffic, a lot of business

Response P405-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P406 – Jose Flores

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P406

Comment P406-1 I support the Gondola Project because it is beneficial to us, especially in terms of traffic and transportation.

Response P406-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P407 – Rosaura Ulloa

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P407

Comment P407-1 To me, it is a very good idea, there will be less traffic and everything will be better for businesses, there will be a lot of business, so it is a very good idea for all.

Response P407-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P408 – Guillermina Martinez Hernandez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P408

Comment P408-1 A very good option to reduce traffic and clean up the environment, because it does not pollute, it is also very quiet and it will take only 7 minutes to get there, while the bus departing from Union Station takes between 30 and 40 minutes to arrive there. Please approve it.

Response P408-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P409 – Trinidad Zesate

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P409

Comment P409-1 I love the project. I already want it to be ready to take my family for a ride. And I like even more the fact that it will be free for all the residents in the area.

Response P409-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment Letter P410 – Evangelina Zesate

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P410

Comment P410-1 I support the project, it is something I like a lot and it is free for us, the residents of the area, build it soon so I can take a ride.

Response P410-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment Letter P411 – Elizabeth Acevedo

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P411

Comment P411-1 I support this project because there will be less traffic in this area and people will be arriving faster to the stadium.

Response P411-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P412 – Jessica Suarez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P412

Comment P412-1 It is a very good idea to build the gondola so it can get people faster to their workplaces or wherever they want to go. There is a lot of traffic on the street. There won't be any smog with the gondola.

Response P412-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P413 – Reina Rodriguez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P413

Comment P413-1 The gondola can reduce 3,000 car rides, it can connect the public transit system, including the region and the bus lines, and it can make access to the park easier.

Response P413-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P414 - Maria Martinez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P414

Comment P414-1 Very good project, I like the idea of the gondola a lot to make the city better and have cleaner air, very good progress.

Response P414-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P415 – Mariol Ojeda

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P415

Comment P415-1 A great idea that would benefit all the surrounding community and the riders who are in transit or are going to work in the area, because it would reduce a lot of traffic, I already want to see this project and ride in it.

Response P415-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P416 - Maria Areola

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P416

Comment P416-1 I support the project because traffic is going to be reduced, resulting in cleaner air and a better life. I have heard about this project for many years now, please start building it.

Response P416-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P417 – Alicia Ojeda

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P417

Comment P417-1 I support it because there will be less traffic in the area, because whenever there are games played, it is impossible to get to our homes. We are no longer going to be stuck in the traffic. Please approve it.

Response P417-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P418 - Manina Huna

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P418

Comment P418-1 It is true, as shown in the Los Angeles Aerial Rapid Transit Project.

With this project, businesses will have more sales in general in each of the stations. Gondola rides will have panoramic views.

This will be amazing for many people. I personally have talked about it with my friends and they are really excited to have this project ready!

This trend shows positive growth.

Response P418-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P419 - Carifina Caro

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P419

Comment P419-1 I support the gondola because it will reduce the number of parked cars in my neighborhood, there will be less traffic and air will be cleaner and pure. It will reduce traffic in the area and it will be free for the residents of the area.

Response P419-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gases through reduced vehicular travel. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment Letter P420 - Maria Mosqueda

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P420

Comment P420-1 I support this project because it will benefit my community a lot. Currently, whenever games are played, we can't go anywhere because we just get stuck in traffic and then we can't find any parking; with this means of transportation, we expect that people take the bus, train or metro link to Union Station, and then the gondola, thus preventing them from parking in our neighborhood.

Response P420-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P421 – Barbara Da

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P421

Comment P421-1 Great, idea, gret process

Response P421-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P422 – Ricardo Garcia

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P422

Comment P422-1 It is a very good idea to build the gondola, so people can have faster and safer transportation, while reducing traffic in the street and smog...

Response P422-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P423 – Isabel Hernandez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P423

Comment P423-1 I support the gondola because we will commute faster; I suffer from stress and this will help me get to the stadium faster. Here, it is very difficult to find parking and this will help to prevent people from parking in our neighborhood. I rode the one in Chicago and I liked it a lot, I am telling you, approve it soon.

Response P423-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P424 – Jose Leja

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P424

Comment P424-1 I support the gondola.

Very good idea to reduce traffic.

Response P424-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P425 – Gloria Tucay

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P425

Comment P425-1 Great idea for the Aerial Rapid transit:

Could help with traffic relief in that part of LA

Good for environment because it is electric (pollution)

Quiet transportation because it is electric

Creates jobs or retains jobs to run the ART

Reliefs parking in the Dodgers Stadium for not only Dodger Baseball but other stuff going on in the stadium. This will relief some late night traffic in those residential area around stadium.

Response P425-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P426 – Victoria Tucay

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P426

Comment P426-1 I believe the gondola will be a great idea for many reasons. Some of those reasons are less traffic in that populated area of LA. It will also minus the amount of population due to it being electric. Also I believe it will open up parking in Dodger Stadium.

Response P426-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P427 – Breeana Ramos

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P427

Comment P427-1 I believe the Aerial Rapid Transit project is a good idea because it would help reduce LA traffic

It is also electric so less pollution in the city

Also will reduce traffic to the neighborhood around dodgers stadium. Give patrons a good nice view from Union Stadium to dodger stadium.

Response P427-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P428 – Jenny Rivera

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P428

Comment P428-1 Im in support of the Gondola because I believe it would help with traffic during games, Also it would be good for the air pollution, And I believe it could attract visitors from all around.

Response P428-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P429 – Jennifer Huerta

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P429

Comment P429-1 To whom it may concern I would like to say it would be a great thing to have this cause of transportation with so much traffic issues no only that it will create more jobs for people and it also would be nice to have in our city.

Response P429-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P430 – Sofia Rivera

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P430

Comment P430-1 I think the gondola would be good for the community and also the traffic

Response P430-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P431 – Lisa Villarreal

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P431

Comment P431-1 Having the gondola would be great addition to Los Angeles.

Response P431-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment P431-2 It will take less time to get to the Stadium, its emissions free. Also free to the public. (Ticket Holders)

Response P431-2 The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment P431-3 Thank you for taking my comment.

Response P431-3 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment Letter P432 – Rojelio Esperanza

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P432

Comment P432-1 I think it's a great idea. Hope to see it happen soon.

Response P432-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P433 – Gladys Torry

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P433

Comment P433-1 Aerial transit, best idea ever,

Response P433-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P434 – Maria Vargas

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P434

Comment P434-1 I like the idea because there will be less traffic, the ticket is free for those who live in the area and it does not pollute.

Response P434-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P435 – Ramona Gonzalez

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P435

Comment P435-1 Excellent idea, I approve it 100%, please support this project immediately.

Response P435-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P436 – Yadira Quintero

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P436

Comment P436-1 It will improve traffic a lot and I like that because it is very difficult to live in the area during game season.

Response P436-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P437 – Maria A Coulveros

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P437

Comment P437-1 It will help a lot to improve traffic and there will be more parking spots for us who live here.

Response P437-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P438 – Martina Zuniga

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P438

Comment P438-1 I agree with the project because people won't be parking in the neighborhood, it is very difficult to find parking when a game is played, but with this there won't be any problems.

Response P438-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P439 – Cristian Mara

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P439

Comment P439-1 Love the idea of how quick this is going to get there and hopefully helps with the fans no parking in area no more.

Response P439-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P440 – Araceli Rico

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P440

Comment P440-1 I like it because now the traffic is very bad, but it will be less and I think there will be fewer accidents.

Response P440-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P441 - Jesus Rico

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P441

Comment P441-1 Excellent, I have heard about this for a long time and nothing has been done. I agree 100% and I hope it will be built soon.

Response P441-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P442 – Pablo Covarrubias

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P442

Comment P442-1 Everything is very good, less pollution and fewer problems.

Response P442-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P443 - Teresa Covarrubias

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P443

Comment P443-1 We will be saving a lot of traffic, we won't have to stay at home whenever a game is played and we will be able to go somewhere without worrying.

Response P443-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P444 – Viet Tsan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P444

Comment P444-1 I am greatly support this project w. no condition

Response P444-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P445 – Kin Tsan

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P445

Comment P445-1 It is a really good idea. Thanks Metro

Response P445-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P446 - Qun Hua He

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P446

Comment P446-1 I am surely opposing it. The government had better build low-income housing for seniors. Thanks a lot!

Response P446-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P447 - Maribel Precead

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P447

Comment P447-1 My comment is that the gondola will provide a very good service to the community, because the service can be accessed by anyone who wants to use it. First, it would prevent traffic jams and the ride in the gondola would be very comfortable and using the service would be a good experience.

Response P447-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P448 - Kio Chi Ye

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P448

Comment P448-1 I strongly support the gondola

Strong support Gondola

Response P448-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P449 - Liping Ma

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P449

Comment P449-1 Support aerial transit

Support Aerial Rapid Transit

Response P449-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P450 - Amie Wu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P450

Comment P450-1 Support aerial rapid transit

Response P450-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P451 – Tay Saek You

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P451

Comment P451-1 I agree with building the LA Aerial Rapid Gondola. This will improve traffic and the environment.

Response P451-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P452 – Huang

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P452

Comment P452-1 I agree with the construction of the LA aerial gondola. It will further improve the city infrastructure.

Response P452-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P453 – Huang Im Bo

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P453

Comment P453-1 I agree with building the LA Aerial Rapid Gondola. This will bring more people to Chinatown businesses.

Response P453-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P454 – Hz Liu Zhang

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P454

Comment P454-1 I agree with building the LA Aerial Rapid Gondola. This will generate more business for Chinatown. It also can improve the environment and traffic, and beautify the city. It will advance the urban infrastructure.

Response P454-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P455 – Qing Hing

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P455

Comment P455-1 I strongly support. May Chinatown prosper and business boom.

Response P455-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P456 – Ruo Shun Hu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P456

Comment P456-1 I strongly support. May Chinatown prosper and business boom.

Response P456-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P457 – Ming Hui Liu

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P457

Comment P457-1 Being a resident of LA Chinatown, I greatly welcome the gondola project and support it. Hope it can drive economic growth.

Response P457-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P458 – Zahira Yacoub

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P458

Comment P458-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium) due to lack of transparency!

Metro went forward with this project without an open public process and without competitive bidding. I don't understand the ownership or operation of the project because the details have been hidden from the community. Who is paying for this project? Will taxpayers be left holding the bag? Lack of community consultation:

Response P458-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public comment during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0 Costs and Financial Analysis, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P458-2 The community has been neglected and our voices have not been heard. No one asked us our vision for our community. NO ONE!

Response P458-2 Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the

proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements.

Comment P458-3 We never asked for this project. We don't need or want this project. We don't need more GENTRIFICATION and displacement in this area! #stopthegondola

Response P458-3 Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement.

Comment Letter P459 – Susannah Lowber

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P459

Comment P459-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

It will not relieve traffic but be a huge eye sore obstructing nature. If metro really wants to relieve traffic at dodger stadium how about more shuttles and metro bike docks in The stadium and a bike lane from chinatown to them. Currently there is only one bike rack at dodger stadium. Hundreds of people could be biking in which is better for traffic, and the environment. Metro should be thinking about progressing the city with climate friendly low impact solutions.

Response P459-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Appendix C, Visual Impact Assessment, of the Draft EIR. As discussed in Section 5.0, Corrections and Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park, the City's second largest park, comprising 575 acres, and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program, and individual bike lockers to access Elysian Park and other nearby neighborhoods, including Solano Canyon. Also, refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment P459-2 There is already a shuttle from union station for people to take. The gondola will be a novelty people will ride it once or twice put it on instagram and never think about it again meanwhile park users below will have it disrupting time in nature.

Response P459-2 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's

ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data. Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR.¹ Stantec is an internationally-respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR. The average estimated ridership of the proposed Project (6,000 in 2026 and 10,000 in 2042) is greater than the average number of Dodger Stadium Express riders per game from LAUS (1,845). The methodology for estimating the ridership and vehicle miles traveled (VMT) reduction benefits for the proposed Project is outlined in pages 3.17-26 through 3.17 30 and pages 3.17-34 through 3.17-38 of the Draft EIR. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world that operate safely, efficiently, and in concert with nearby residential and open space uses. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging,

¹ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park.

Comment P459-3 The community has been neglected and our voices have not been heard. No one asked us our vision.

This will be a huge disaster and disgrace if it moves forward.

Response P459-3 Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team’s outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project’s features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and in writing or verbally during the four public hearings. Interpretation was provided in English, Spanish, Mandarin, and Cantonese during all four public hearings, with interpretation provided in Taishanese during the final two public hearings. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice, how the proposed Project supports Metro’s goal of prioritizing equity opportunities, is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, how the public outreach for the proposed Project was designed with environmental justice principles in mind, how the proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region’s most visited venues and would alleviate existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety, and how the proposed Project is designed to be ADA compliant.

Comment Letter P460 – Andy Wong

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P460

Comment P460-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). As a frequent user of the LA State Historic Park (the "Park"), current resident and home owner in Echo Park, I will be impacted by this prospective project. I am also a Dodger fan and am a season ticket holder and would not use the Gondola to go to Dodger Stadium. I don't drive to Dodger Stadium; I mostly walk to the Stadium and if I don't, I either take the existing Union Station shuttle or ride my bike. I personally do not want or need the Gondola. The stated benefits and upside of the Gondola are heavily outweighed by the costs and downsides. I am deeply concerned about this project for various other reasons:

Response P460-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This comment also provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses P460-2 through P460-7. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project.

Comment P460-2 This project will lead to future commercial development in Chavez Ravine, without community input and without disclosure to the community.

Response P460-2 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period.

Comment P460-3 Chavez Ravine already has a negative history related to displacement caused by the construction of Dodger Stadium and the Gondola potentially will repeat the same mistakes. This includes displacement and increase rent in the area. I am Chinese American, immigrated from Hong Kong many years ago and first lived in Chinatown near where the Gondola is planned.

Response P460-3 Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine.

Comment P460-4 The community in Chinatown will be negatively impacted by the Gondola and this community must be heard and considered. The community has been neglected and our voices have not been heard. No one asked us our vision for our community.

Response P460-4 Refer to Topical Response C, Project Features, discussing the proposed Project’s potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses within Chinatown while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to Chinatown and other businesses along the proposed Project alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90 day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

Comment P460-5 The Gondola Project’s enormous towers will cause aesthetic impacts in my community. Even though it is only on the south side of the Park, the Gondola will still

negatively affect the views from the Park and generally affect the experience of visitors to the Park.

Response P460-5 Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alameda Tower, Alpine Tower, and Stadium Tower. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project's towers, which would be less than significant, and for visual simulations of the proposed Project's towers. The Alameda Tower's modern architectural style is evident and would complement the buildings within The California Endowment. The neutral light-tone gray color scheme of Alameda Tower was designed for consistency with the surrounding urban environment, and to not distract from visually distinct structures such as the United States Post Office Terminal Annex building. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Stadium Tower would consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral light-tone gray colors and material finishes of the Stadium Tower were selected to complement the surrounding urban environment, and to not distract from existing visually distinct structures, such as Dodger Stadium. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant, including at the Park. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park "visually memorable." As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations,

of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park.

Comment P460-6 This project will increase the impacts of air pollution from vehicle emissions in an area already overburdened by air emissions and in an area that has an established and very popular and treasured park that serves as a respite for community members to seek peace, nature and cleaner air and natural environments. The Gondola would negatively impact this and is not worth any perceived benefit of this form of transportation.

Response P460-6 The proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel are discussed in Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park.

Comment P460-7 Metro went forward with this project without an open public process and without competitive bidding. I don't understand the ownership or operation of the project because the details have been hidden from the community. Who is paying for this project? Will taxpayers be left holding the bag? I do know that Frank McCourt has proven from his ownership of the Dodgers that his ethics, business practices and

motivations are questionable. I just don't think he should be unjustly enriched by allowing the Gondola to move forward. I just don't trust that he is motivated by addressing transportation and congestion issues and this project is almost all motivated by his commercial interests. The public should not pay for this either in direct funding (tax dollars) or the other costs my comments and others have identified.

Response P460-7 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project. Refer to Response P460-4 for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period and the outreach and community engagement during the Draft EIR scoping period. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P461 – Andrew Beck

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P461

Comment P461-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P461-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P462 – Adrian Herrera Jr

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P462

Comment P462-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P462-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P463 – Jacqueline Lam

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P463

Comment P463-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

Response P463-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment P463-2 I feel like it's disgusting for Metro to move forward with this development without including the people in the community, especially those who will directly be effected by the building of this development. It will also increase the impacts of air pollution and overburden the community it resides in. This is unfair to our taxpayers, it is unfair to our people.

Response P463-2 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately after the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar. Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N,

Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P464 – Jacqueline Lam

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P464

Comment P464-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium).

This development does not directly serve the community. It will directly harm it. We do not need a large gondola, we need more laundromats and hospitals in Chinatown. We need community serving developments. Not a gondola that literally only takes you to the dodger stadium.

Response P464-1 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. Refer to Topical Response C, Project Features, for discussion of the potential added benefits from the proposed Project. The proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. Refer to Topical Response N, Environmental Justice, for discussion of how the proposed Project would not preclude development of uses including healthcare facilities in the surrounding communities. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how the proposed Project's intermediate Chinatown/State Park Station near the southernmost entrance to the Los Angeles State Historic Park would be located within a short walk to many Chinatown businesses and Metro's L Line (Gold), creating a stronger connection with the Metro L Line and enhancing transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less.

Comment Letter P465 – Hillary Barker

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P465

Comment P465-1 I am writing to voice my strong opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). I find it appalling that the LA Metro is making deals with billionaires to fund this vanity project, while the voices of working class people who rely on public transit are being ignored. This is not what the people need or want. This is a shameful use of public resources.

Response P465-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team's outreach efforts to neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project

stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P466 – Margaret Reardon

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P466

Comment P466-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). There are many reasons for which I am proposed. As a case manager for clients experiencing housing insecurity, I am concerned about the displacement and increased cost of rent spurred by this project.

Response P466-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro's considerations regarding gentrification and displacement.

Comment P466-2 As a climate advocate, I know that this project will increase the impacts of air pollution from vehicle emissions in an area already overburdened by air emissions. This is unacceptable.

I demand change.

Response P466-2 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles travelled. The

proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles travelled. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Comment Letter P467 – Robert Brunson

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P467

Comment P467-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road ,increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Response P467-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P468 – Ben Wendel

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P468

Comment P468-1 As a long-time LA resident, Dodgers fan, and transit enthusiast, I fully support LA Aerial Rapid Transit. Los Angeles must build much more transit in general, but especially transit that will take people where they want to go. The ART will cut down on emissions and traffic, a win-win for drivers, pedestrians, cyclists, and all others.

The Gondola will become an iconic part of LA infrastructure, as iconic as Dodger Stadium itself. It will bring tourist revenue as well as revenue from baseball fans visiting businesses around Union Station.

Build it, please.

Response P468-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P469 - Kathie Tetreault

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P469

Comment P469-1 I support the innovative and beneficial zero emission Gondola project, and I appreciate the goal of 35%, it's unprecedented for local, small, diverse, and DVBE businesses. We need economic recovery and this project can help. I know this project will be very beneficial to the community, as I grew up outside of the stadium and commuted into downtown for work and to meet friends.

Response P469-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter P470 - Vicki & Steve Rank

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P470

Comment P470-1 Please DO NOT allow Frank Mc Court to do anymore damage to this city, our California State Historic Park, Chinatown, and the residents/taxpayers of The City Los Angeles. Can we really trust him after what happened to the Los Angeles Dodgers under his ownership? Does he have our city's best interest in mind ? Or is this just another way for him to enrich himself to make money off the land, the parking lot he still owns at the top of Dodger Stadium.

This could be an even bigger land grab, than what was once a quiet, under-served, unnoticed neighborhood in Elysian Park, CHAVEZ RAVINE!

Response P470-1 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine.

Comment P470-2 Where are the cars going to park to take the Gondola ride?

Response P470-2 Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines ("TAG"). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Comment P470-3 What our city needs is to have a firmer grip on installing a well organized Park and Ride system, as there is at the Hollywood Bowl, Greek Theatre, and LA County Arboretum for it's 2plus Lightscape event and more.

Metro and LA City leaders need to get creative using the land, on the ground, not up in the air! With the money that is proposed for this FLAWED LANDGRAB, to benefit a

man(?) that ran the Dodgers into the ground for his own personal enrichment. Think multiple beach houses, city houses, luxury vacations, jewels, cars. Dining Etc.

This is the worst, horrible, most unbelievable idea, that more than reduces the pain and UNFAIRNESS of what was taken away from the residents of Chavez Ravine!.

This deal wrecks of self enrichment, over the well-being for all the people living in the neighborhood, and all those who visit and use the parks and land, in the surrounding areas! ALL of L.A City is completely affected by this plan. Only someone like Frank Mc Court, the Stadium parking lot landowner, could think of something as deceitful as this “giveaway” that is being proposed!!!

Oh sure he’s thinking of us, climate change and traffic\$\$\$\$\$

Response P470-3

As discussed in Topical Response H, a system of buses from numerous remote locations throughout the Los Angeles region to and from Dodger Stadium events would require a substantial increase in the number of buses which, similar to expanding the fleet for an expanded Dodger Stadium Express service, would result in a fleet of buses that would either be underutilized most of the time or regular Metro bus service that utilizes these vehicles would be disrupted every time a Dodger game or event at the stadium is held. Such a service would also incur substantial costs in paid time and mileage for driving empty buses out to the remote locations before a game and back from the remote locations after a game and paid idle time during the game. Buses from a variety of remote locations would also need to travel in rush hour congestion to get to Dodger Stadium. With limited regional facilities that provide bus only lanes that these services could utilize, they would not materially improve transit travel time compared with driving. For example, the current Dodger Stadium Express service from South Bay serves a broad area of southern Los Angeles County at stations spread across eight miles, is free, and travels on a priority lane within the I-110 freeway median for most of its trip, but the South Bay Dodger Stadium Express carried an average of only 415 passengers per game in 2019, which is substantially lower than the ridership of 1,895 riders per game on the LAUS Dodger Stadium Express. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project, which would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project’s system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion

in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 5.0, Corrections and Additions, of this Final EIR for a discussion of Chavez Ravine.

Comment Letter P471 - Veronica L.

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P471

Comment P471-1 It's my understanding that the ELDP requires transcripts of each meeting to be produced and made available to the public in the running administrative record. So far, I don't see any on the website or in the dropbox files. Please advise where I can locate them. If not available online, please advise when they will be produced for public access.

Response P471-1 Refer to Appendix B, Public Hearing Transcripts, of this Final EIR, for the transcripts required pursuant to Public Resources Code section 21168.6.9(e)(4), which requires the “transcript of the hearing to be included as an appendix to the final environmental impact report.”

Comment P471-2 Aside from appearing in person, will options be provided for remote appearance via video or teleconference? If so, please provide those. I also respectfully request you include such information on the website for those of us that may not have received notice with this information.

Response P471-2 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and during the four Public Hearings. Comments on the Draft EIR could be submitted by email to LAART@metro.net, by mail to One Gateway Plaza, Mail Stop 99-22-6, Los Angeles, CA 90012, or over the phone by calling (213) 922-6913. Comments could also be submitted at each of the four public hearings. At virtual public hearings, comments could be given verbally. In light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held on February 8, 2023. Verbal comments made at the virtual February 8, 2023 public hearing were deemed timely submitted for the purposes of the Draft EIR public review period. At the two public hearings held in person, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during all four public hearings, with interpretation provided in Taishanese during the final two public hearings.

Comment Letter P472 - Judy Kameon

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P472

Comment P472-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). There are many areas of concern:

Response P472-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. This comment also provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Response P472-2 through P472-6.

Comment P472-2 1) Who is funding this project?
2) What are the real costs?
3) Is this an equitable solution for the level of investment required?

Response P472-2 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment P472-3 4) How will this be used for non-game days?

Response P472-3 Refer to Section 2.01, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. The proposed Project allow all residents, employees, and businesses

located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the proposed Community Access Plan.

Comment P472-4 5) Will there be further development of Dodger Stadium for non-Stadium events, retail, housing?

Response P472-4 Refer to Section 2.0, Project Description, of the Draft EIR, for a description of the proposed Project, an aerial gondola system intended to be the first permanent transit connection to one of the region’s most visited venues. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property.

Comment P472-5 6) How will this affect the State Historic Park, Union Station and the surrounding community?

Response P472-5 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to LAUS, Los Angeles State Historic Park, and the surrounding community. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Comment P472-6 It is difficult to understand the expense of the proposed gondola and all of the impacts based on the little bit of information provided. Further discussion and study should be given to such a monumental proposal.

Response P472-6 The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental

impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment Letter P473 - Kya-Marina Le

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to P473

Comment P473-1 I am writing to voice my opposition to the Los Angeles Aerial Rapid Transit Project ("The Gondola" at Dodger Stadium). As someone who works in the community, I, Kya-Marina Lê, will be impacted by this project. I am concerned about this project for the following reasons:

Response P473-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. This comment also provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Response P473-2 through P473-6.

Comment P473-2 The Gondola Project's enormous towers will cause aesthetic impacts in my community. I am concerned that the towers will obstruct views, and that the gondola cars will be used for advertising and electronic billboards which will bring light pollution to the surrounding neighborhoods.

Response P473-2 Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alameda Tower, Alpine Tower, and Stadium Tower. Refer to Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of the structural design of the proposed Project's towers. As discussed therein, the towers would "meet the rigorous safety standards of applicable standards, requirements, and building codes, including all mandated standards addressing environmental factors such as wind and seismic effects and gravity forces, including all impacts from the height and tilt of the structures, to ensure structural integrity and safety." Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project's towers, which would be less than significant, and for visual simulations of the proposed Project's towers. The Alameda Tower's modern architectural style is evident and would complement the buildings within The California Endowment. The neutral light-tone gray color scheme of Alameda Tower was designed for consistency with the surrounding urban environment, and to not distract from visually distinct structures such as the United States Post Office Terminal Annex building. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Stadium Tower would consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral

light-tone gray colors and material finishes of the Stadium Tower were selected to complement the surrounding urban environment, and to not distract from existing visually distinct structures, such as Dodger Stadium. Refer to Topical Response C, Project Features, discussing how the proposed Project’s design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area.
