Attachment B: Modeling Results Files

DEFINITIONS, ACRONYMS, AND ABBREVIATIONS

Acronym	Definition
Acute Health Impacts	Non-cancer health impacts for short-term, 1-hour peak exposures to potential facility emissions. The total sum of the ratio of concentrations of each toxic air contaminant (TAC) to its acute reference exposure level (REL).
Chronic Health Impacts	Non-cancer health impacts for long-term exposure to potential facility emissions. The total sum of the ratio of concentrations of each toxic air contaminant to its chronic reference exposure level (REL).
8-Hour Chronic Health Impacts	The ratio of the predicted air toxic exposure to the air concentrations at or below which health impacts would not be expected with repeated daily 8-hour exposures over a significant fraction of a lifetime. The 8-hour noncancer hazard index is considered a chronic risk as it uses an 8-hour concentration that represents the long-term average of repeated 8-hour daily averages that occur.
Cancer Risk	The health risk associated with long-term exposures resulting from emissions of carcinogenic agents.
AADT	Annual Average Daily Traffic
AB	Assembly Bill
AERMOD	American Meteorological Society / Environmental Protection Agency regulatory air dispersion model
ANSI/ASHRAE	American National Standards Institute / American Society of Heating, Refrigerating and Air-Conditioning Engineers
CalEEMod	California Emissions Estimator Model
Caltrans	California Department of Transportation
CARB	California Air Resources Board

DEFINITIONS, ACRONYMS, AND ABBREVIATIONS

Acronym	Definition
CEQA	California Environmental Quality Act
CO	carbon monoxide
DEM	Digital Elevation Model
DPF	Diesel Particulate Filter
DPM	Diesel Particulate Matter
EF	Emission Factor
EPA	U.S. Environmental Protection Agency
HARP2	Hot Spots Analysis and Reporting Program 2
HHDT	Heavy Heavy Duty Truck (>33,000 lbs)
HI	Hazard Index
HRA	Health Risk Assessment
HVAC	Heating Ventilation and Air Conditioning
I-	Interstate
lb	pound
LDA	Light Duty Automobiles
LDT1	Light-Duty Trucks (0-3,750 lbs)
LDT2	Light-Duty Trucks (3,751-5,750 lbs)
LHDT1	Light-Heavy-Duty Trucks (8,501-10,000 lbs)
LHDT2	Light-Heavy-Duty Trucks (10,001-14,000 lbs)
LRT	Light Rail Transit
m	meter
MCY	Motorcycle
MDV	Medium-Duty Trucks (5,751-8,500 lbs)
MEIR	Maximally Exposed Individual Resident
MEIW	Maximally Exposed Individual Worker
MERV	Minimum Efficiency Reporting Value
MH	Motorhomes
MHDT	Medium-Heavy Duty Truck (14,000-33,000)
mph	miles per hour
NAFA	National Air Filtration Association
NO_x	nitrogen oxides
OBUS	Other Bus
OEHHA	Office of Environmental Health Hazard Assessment
PeMS	Caltrans Performance Measurement System
PM	particulate matter
PM_{10}	particulate matter less than 10 microns in diameter
PMI	Point of Maximum Impact
REL	Reference Exposure Level
RHNA	Regional Housing Needs Allocation
ROW	right-of-way
SBUS	School Bus
SCAQMD	South Coast Air Quality Management District

DEFINITIONS, ACRONYMS, AND ABBREVIATIONS

Acronym	Definition
SCAG	Southern California Association of Governments
SR-	State Route
TAC	toxic air contaminant
UBUS	Urban Bus
UTM	Universal Transverse Mercator
VMT	vehicle miles traveled
VOC	volatile organic compound

Summary

The City of Santa Monica (City) is preparing the 6th Cycle 2021-2029 Housing Element Update to achieve the Regional Housing Needs Allocation (RHNA) issued by the Southern California Association of Governments (SCAG). The impacts of highway traffic on the areas identified for future development have been assessed through the preparation of a Health Risk Analysis (HRA). The HRA is prepared following the guidelines promulgated by the South Coast Air Quality Management District (SCAQMD) for Assembly Bill (AB) 2588 and compliance with the California Environmental Quality Act (CEQA) to the extent that the modeling assumptions are applicable.

This HRA addresses the full range of vehicles that utilize Interstate (I-) 10 (Santa Monica Freeway) and State Route (SR-) 1 (Pacific Coast Highway) through the City of Santa Monica (City), and addresses time-of-day vehicle flows, fleet mix, truck percentages and diesel and gasoline vehicles. Emissions are based on the U.S. Environmental Protection Agency (USEPA) MOVES program as well as EMFAC2017 emissions levels for volatile organic compounds (VOCs) and diesel particulate matter (DPM).

Results

The analysis examined operation of the I-10 and SR-1 in the year 2030, which would be the year that the development is anticipated to be completed. As cancer risk is an average exposure over 30 years, this a reasonable estimate of the cancer risks that a new development would be exposed to.

In total, 1,842 parcels are located in zones that experience a 10 in a million (1.0×10^{-5}) cancer risk or greater from the highways, or about 7.8% of the parcels in the City.

The principal risk drivers for pollutants are DPM (92.6%), benzene (3.8%), arsenic (2.8%) and naphthalene, chromium, ethylbenzene and dioxins (less than 0.2% each).

The principal risk drivers for vehicle types are heavy duty trucks (59%), medium heavy duty trucks (20.3%), light heavy duty trucks (7.3%), autos (3.9%), buses (3.1%), motorcycles (2.3%), light duty trucks (1.9%) and others (2.2%).

A number of measures could be implemented for developments proposed for these parcels to minimize air quality impacts, including:

- Heating, ventilation, and air conditioning (HVAC) filtration system Minimum Efficiency Reporting Value (MERV) rating levels or 13 or above;
- Vegetation located between the highways and the development areas;
- Window placement and operability away from the highways;
- Building air-tightness requirements with air leakage rate of no more than 3.0 unit volumes per hour using the blower door ACH50 or similar leak test;
- Vents and roof penetrations located on the walls and roofs facing away from the highway wherever possible and air intakes away from the highways; and
- Doorways, entryways, and occupied outdoor areas (e.g., patios and balconies) located away from highways to the extent feasible.

1.0 Introduction

The City of Santa Monica (City) is preparing the 6th Cycle 2021-2029 Housing Element Update to achieve the Regional Housing Needs Allocation (RHNA) issued by the Southern California Association of Governments (SCAG). The impacts of highway traffic on the areas identified for future development have been assessed through the preparation of a Health Risk Analysis (HRA). The HRA is prepared following the guidelines promulgated by the South Coast Air Quality Management District (SCAQMD) for Assembly Bill (AB) 2588 and compliance with the California Environmental Quality Act (CEQA) to the extent that modeling assumptions are applicable.

The California Air resources Board (CARB) recommended in 2005 to avoid siting new sensitive land uses within 500 feet of a freeway, urban roads with 100,000 vehicles per day, or rural roads with 50,000 vehicles per day. State law restricts the siting of new schools within 500 feet of a freeway, urban roadways with 100,000 vehicles per day, or rural roadways with 50,000 vehicles with some exceptions. However, no such requirements apply to the siting of residences, day care centers, playgrounds, or medical facilities (CARB 2005; California Education Code Section 17213 and California Public Resources Code Section 21151.8).

This HRA addresses the full range of vehicles that utilize Interstate (I-) 10 (Santa Monica Freeway) and State Route (SR-) 1 (Pacific Coast Highway) through the City of Santa Monica, and addresses time-of-day vehicle flows, fleet mix, truck percentages and diesel and gasoline vehicles. Emissions are based on the USEPA MOVES program as well as EMFAC2017 emissions levels for volatile organic compounds (VOCs) and diesel particulate matter (DPM).

2.0 Highway Operations

Information compiled on the highways that are utilized as part of the HRA are the following:

- Annual average traffic volumes;
- Time-of-day vehicle traffic levels;
- Truck traffic volumes;
- Fleet mix;
- Vehicle speed; and
- Fleet gas/diesel fuel use mix.

2.1 Annual Average Traffic Volumes

Annual average traffic volumes are compiled by the California Department of Transportation (Caltrans) annually for all highways in California. Table 2.1 shows the data gathering locations within the City and the surrounding area as well as the traffic volumes complied by Caltrans for 2019.

Table 2.1 Annual Average Daily Traffic

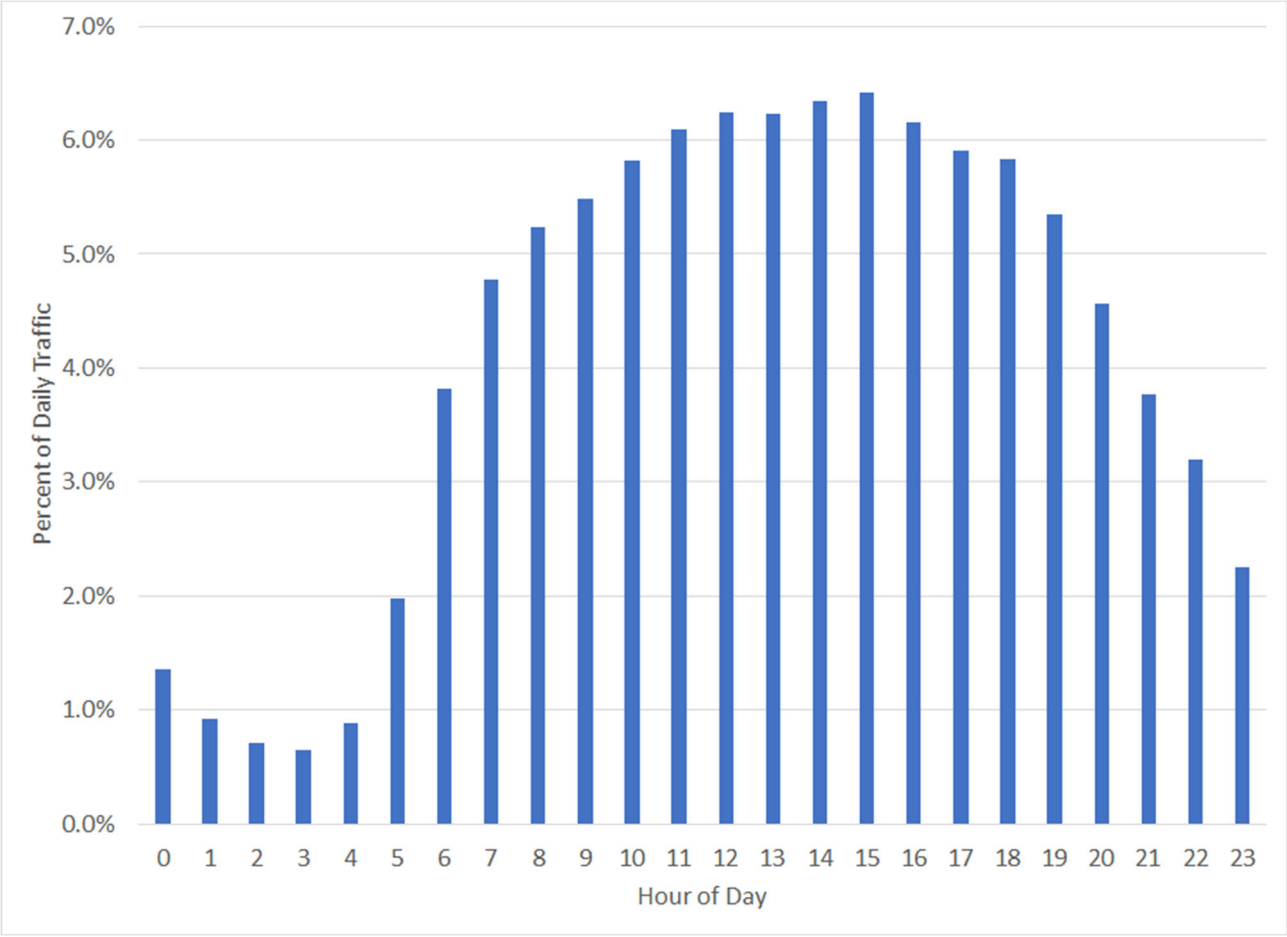
Highway	Intersection	Average Annual Daily Traffic (AADT)
10	LOS ANGELES, JCT. RTE. 405	251,000
10	LOS ANGELES, BUNDY DRIVE	238,000
10	SANTA MONICA, CENTINELA AVENUE/PICO BOULEVARD	194,000
10	SANTA MONICA, CLOVERFIELD BOULEVARD	188,000
10	SANTA MONICA, JCT. RTE. 1	150,000
1	SANTA MONICA, JCT. RTE. 10	62,000
1	SANTA MONICA, OCEAN AVENUE	73,000
1	SANTA MONICA, CALIFORNIA AVENUE INCLINE	79,000
1	LOS ANGELES, CHAUTAUQUA BOULEVARD	80,000
1	LOS ANGELES, SUNSET BOULEVARD	70,000

Figure 2.1 Highway Locations

2.2 Time-of-day Vehicle Traffic Levels

Vehicle traffic at different times of the day is utilized in the models in order to ensure that the meteorological analysis coordinates with the different activity levels. Nighttime periods, for example, generally have more stable air conditions and allow for pollutants to travel greater distances at levels that can cause health effects. However, nighttime traffic levels are generally lower than daytime traffic levels. This effect is accounted for in the HROFDY flag in the Hot Spots Analysis and Reporting Program 2 (HARP2) and AERMOD modeling. The Caltrans Performance Measurement System (PeMS) was used to gather information on the traffic levels by time of day. The traffic data in PeMS is collected in real-time from over 39,000 individual sensors spanning the freeway system across all major metropolitan areas of the State of California. Figure 2.2 shows the traffic distribution over the 24-hour day.

Figure 2.2 Traffic Volumes Time of Day Distribution



Source: Caltrans PeMS system, April 6 through April 13, 2021 I-10 at the SR-1 interchange. (SR-1 data not available.)

For the AERMOD modeling, the following factors are used to distribute the emissions over the hour of the day.

Table 2.2 AERMOD HROFDY Factors

Hour of Day	Hour of Day Factor	Hour of Day	Hour of Day Factor
0	0.33	13	1.50
1	0.22	14	1.52
2	0.17	15	1.54
3	0.16	16	1.48
4	0.21	17	1.42
5	0.48	18	1.40
6	0.92	19	1.28
7	1.15	20	1.10
8	1.26	21	0.91
9	1.32	22	0.77
10	1.40	23	0.54
11	1.46		
12	1.50	**Total**	**24**

2.3 Truck Traffic Volumes

Caltrans also compiles data on truck volumes along area highways. Caltrans truck data indicates that trucks make up 3.4% of vehicle traffic along I-10 and SR-1 in the City for the year 2018 (i.e., the most recent year data is available at the time of this analysis). This ratio was used to supplement the generalized fleet mix value used from the California Emissions Estimator Model (CalEEMod) Version 2016.3.2 model discussed below.

2.4 Fleet Mix

Different vehicles have different emissions rates depending on the vehicle type. The EMFAC model estimates emissions rates for the aggregate of vehicles on roadways for a range of vehicle types, including automobiles, heavy trucks, etc. Caltrans data records total vehicle traffic flow in addition to truck flow. However, additional resolution is needed in order to accurately estimate the emissions. For this study, the CalEEMod fleet mix is used, which is generalized for southern Los Angeles County, adjusted to account for truck vehicle types as measured by the Caltrans PeMS database for the highways of interest.

Table 2.3 shows the fleet mix of vehicles used in the analysis based on CalEEMod fleet mix for southern Los Angeles County and the Caltrans PeMS data for trucks.

Table 2.3 Vehicle Fleet Mix

Vehicle Type Code	Vehicle Type Description	Fraction of Vehicle Traffic	HARP2 Model Type	Source
LDA	Light Duty Auto	54.8%	Car	CalEEMod
LDT1	Light-Duty Trucks (0-3,750 lbs)	4.5%	Car	CalEEMod
LDT2	Light-Duty Trucks (3,751-5,750 lbs)	20.1%	Car	CalEEMod
MDV	Medium-Duty Trucks (5,751-8,500 lbs)	12.3%	Car	CalEEMod
LHDT1	Light-Heavy-Duty Trucks (8,501-10,000 lbs)	1.7%	Car	CalEEMod
LHDT2	Light-Heavy-Duty Trucks (10,001-14,000 lbs)	0.6%	Car	CalEEMod
MHDT	Medium-Heavy Duty Truck (14,000-33,000)	1.5%	Truck	Adjusted based on PeMS data
HHDT	Heavy Heavy Duty Truck (>33,000)	3.4%	Truck	Adjusted based on PeMS data
OBUS	Other Bus	0.2%	Truck	CalEEMod
UBUS	Urban Bus	0.2%	Truck	CalEEMod
MCY	Motorcycle	0.5%	Car	CalEEMod
SBUS	School Bus	0.1%	Truck	CalEEMod
MH	Motorhomes	0.1%	Car	CalEEMod

Source: CalEEMod Version 2016.3.2, with truck data supplemented by Caltrans 2018 data for I-10 and SR-1.

2.5 Vehicle Speed

Emissions are a function of vehicle speeds, as well as vehicle type. The Caltrans PeMS system also allows for an assessment of vehicle speeds. Speeds along I-10 average 62.7 miles per hour (mph). This value was used to estimate emissions using the EMFAC model described in Section 3.0, *TAC Parameters and Emissions*.

2.6 Fleet Gasoline/Diesel Fuel Use Mix

Vehicle emissions also are a function of fuel type. The EMFAC model allows for estimating vehicle miles traveled (VMT) in the southern Los Angeles County area by vehicle type and fuel. This allows for estimating the fraction of vehicle miles by vehicle and fuel type. Table 2.4 shows the corresponding vehicle type and percentages of gasoline and diesel miles.

Table 2.4 Vehicle Type and Fuel Used

Type	Type Description	Type	Gasoline	Diesel
Automobiles only	Light Duty Automobile	LDA	98.86%	1.14%
Medium trucks	Light-Duty Trucks (0-3,750 lbs)	LDT1	99.98%	0.02%
	Light-Duty Trucks (3,751-5,750 lbs)	LDT2	99.05%	0.95%
	Medium-Duty Trucks (5,751-8,500 lbs)	MDV	96.85%	3.15%
	Light-Heavy-Duty Trucks (8,501-10,000 lbs)	LHDT1	38.33%	61.67%
	Light-Heavy-Duty Trucks (10,001-14,000 lbs)	LHDT2	21.38%	78.62%
	Medium-Heavy Duty Truck (14,000-33,000)	MHDT	11.97%	88.03%
Heavy trucks	Heavy Heavy Duty Truck (>33,000)	HHDT	0.06%	99.94%
Buses	Other Bus	OBUS	27.28%	72.72%
	Urban Bus*	UBUS	12.29%	0.00%
	School Bus	SBUS	40.69%	59.31%
Motorcycles	Motorcycle	MCY	100.00%	0.00%
Motorhome	Motorhomes	MH	66.56%	33.44%

Source: EMFAC2017 for model year 2030. Type based on EMFAC2011 categories, which corresponds to CalEEMod fleet mix categories. EMFAC does not specify mileage for electric vehicles. Urban Bus also included natural gas emissions. These emissions were included in the gasoline type as an estimate.

3.0 TAC Parameters and Emissions

Toxic Air Contaminant (TAC) emissions occur from combustion sources associated with vehicle engines. The CARB EMFAC2017 model was used to estimate the criteria pollutants (i.e., VOC and DPM emissions). The USEPA MOVES modeling program was used to estimate the toxic emissions associated with gasoline powered vehicles with some adjustments.

3.1 VOC and DPM Pollutants

EMFAC2017 was used to estimate the vehicle emissions for VOC and DPM at the highway speeds. The DPM emissions associated with diesel engines are based on the vehicle types and the particulate matter less than 10 microns in diameter (PM_{10}) emissions detailed in the EMFAC 2017. The VOC emissions are used to estimate some of the TAC emissions from gasoline combustion as some of the emissions factors are based on the ratio of TAC to VOC emissions.

3.2 Gasoline TAC Emissions

Gasoline TAC emissions are based on the USEPA MOVES model. Emissions factors of some pollutants were adjusted based on the changes to emissions levels of the gasoline vehicles over time. For example, the USEPA MOVES program arsenic emissions from gasoline combustion are based

on a year 2000 vehicle test. Since the year 2000, vehicles have become substantially cleaner due to regulatory requirements. Therefore, the arsenic emission factor was adjusted based on the ratio of particulate emissions between the study year and the year 2000 (arsenic is a metal more closely associated with the vehicle particulate emissions than VOCs). The adjustments to the USEPA MOVES model emission factors are discussed below.

- Adjusted USEPA MOVES arsenic emissions by the ratio of the year 2000 vehicle particulate emissions to the study year particulate emissions (0.011 factor). Testing was conducted in the USEPA MOVES model on a year 2000 vehicle for arsenic.
- Adjusted USEPA MOVES hexavalent chromium emissions by the ratio of the year 2008 vehicle particulate emissions to the study year particulate emissions (0.31 factor). Testing was conducted in the MOVES model on a year 2008 vehicle for hexavalent chromium.
- Adjusted USEPA MOVES mercury emissions by the ratio of the year 2005 vehicle particulate emissions to the study year particulate emissions (0.20 factor). Testing was conducted in the USEPA MOVES model on a year 2005 vehicle for mercury.
- Adjusted USEPA MOVES dioxin emissions by the ratio of the year 2000 vehicle volatile organic emissions to the study year volatile organic emissions (0.03 factor). Testing was conducted in the USEPA MOVES model on a year 2000 vehicle for dioxin. As dioxin is more of a function of VOC emissions than particulate emissions, VOC was used as the ratio.

3.3 TAC Emission Factors

Table 3.1 shows the TAC emission factors for gasoline vehicles.

3.4 Multi-pathway Substances and Their Pathways

Based on SCAQMD guidelines, the inhalation pathway is addressed for all modeled sources and substances. Residential cancer risks for multi-pathway substances evaluated the following non-inhalation exposure pathways: dermal exposure, soil ingestion, plant ingestion, and mother's milk. The Office of Environmental Health Hazard Assessment (OEHHA) Guidance also lists other pathways, which include water ingestion, dairy and beef, and poultry and eggs.[1] However, these pathways are not applicable exposure routes for the area due to the surrounding land use and are not included as per SCAQMD guidelines. Table 3.3 lists the pathways evaluated for all emitted substances.

4.0 Sources and Dispersion Modeling

Air dispersion modeling was performed to assess exposure in the health risk assessment. This HRA utilizes the most recent version of AERMOD Version 18081 to estimate ambient concentrations of pollutants. Modeled results were then integrated into the latest version of HARP2 Version 21081. The air dispersion analysis was performed in accordance with OEHHA Guidance, the SCAQMD Supplemental Guidelines, and SCAQMD Modeling Guidance for AERMOD. Elevations were determined using AERMAP Version 18081.

4.1 Dispersion Modeling Assumptions

Dispersion modeling assumptions are listed in Table 4.1 below.

Table 4.1 Dispersion Modeling Assumptions

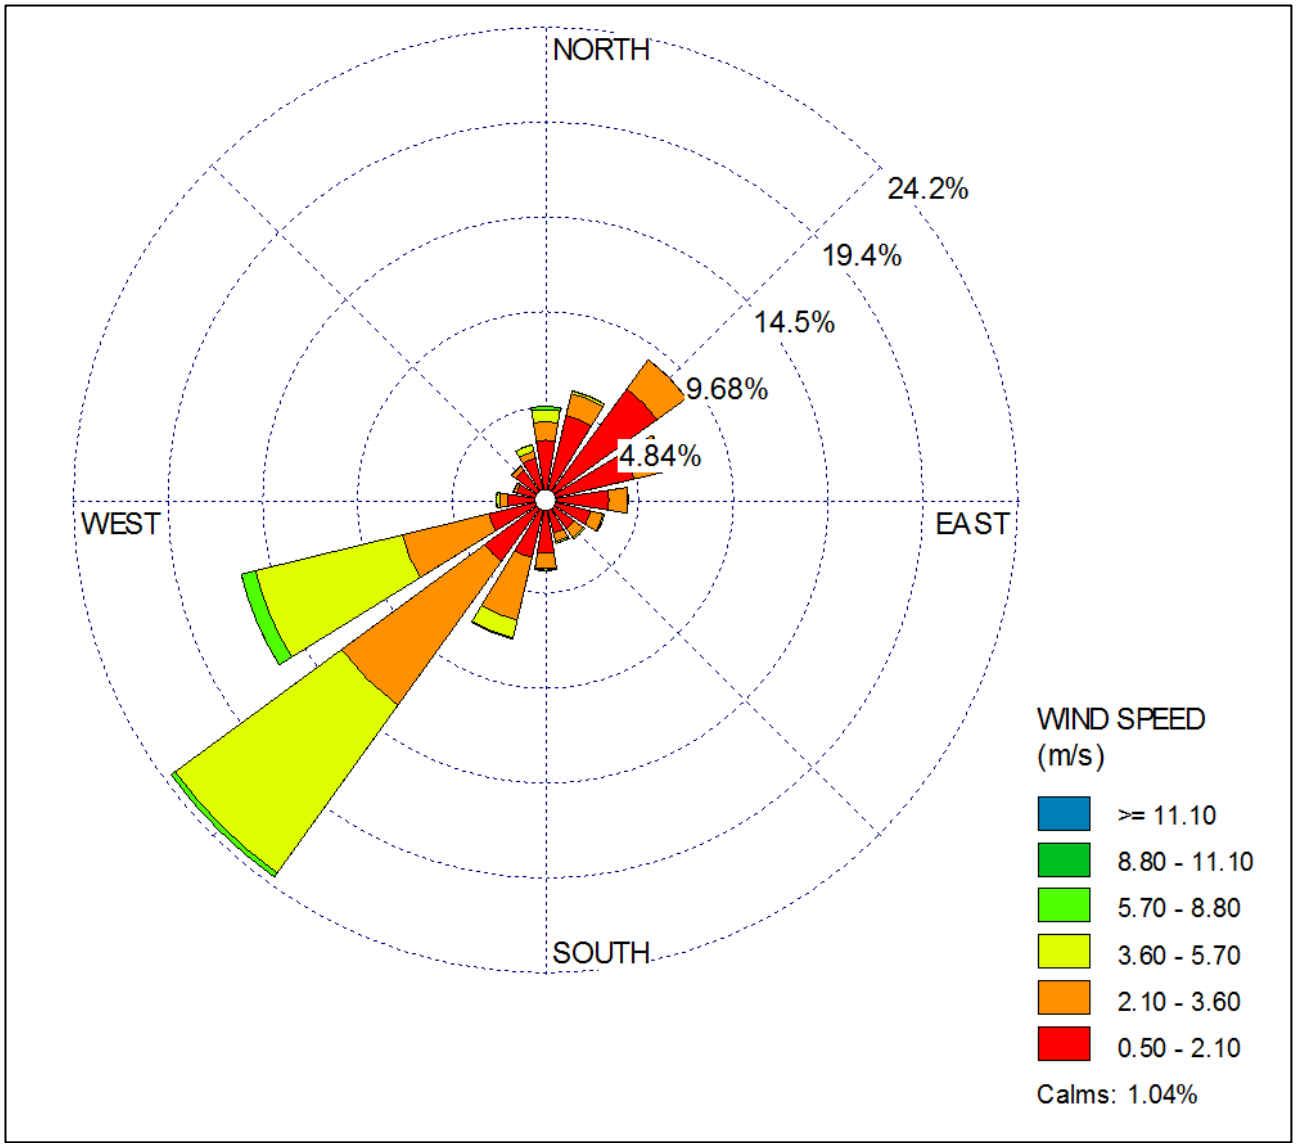
Parameter	Value
Use regulatory default	Yes
Urban or rural	Urban County: Los Angeles Population: 9,818,605
Include Building Downwash	No specified buildings included
Meteorological Data	Santa Monica Airport 2012-2016 Base elevation: = 53 meters (m)
Receptor spacing	25m out to 200m. Then 100m spacing out to 1,000m
Receptor from highways	Out to 1,000m from highways, within City boundaries

Parameter	Value
Coordinate System and Datum	UTM And NAD 83 zone 11 (as per HARP2, NAD83 and WGS84 are very similar and can be treated the same without significant difference)
Analysis Option	Cancer Residential: RMP Derived Method Workers and Non-cancer: OEHHA Derived Method
Deposition rate	0.02 meters per second
Exposure assumptions	HARP2 defaults except dermal pathway = "warm"
Residential exposure duration for cancer analysis	30 years for individual receptors
Cancer burden	Not assessed
Worker exposure duration for cancer analysis	Worker exposure not assessed
Facility Operating Schedule	24 hours per day/7 days per week Variable emissions based on Caltrans time-of-day vehicle traffic in the Caltrans PeMS program.
Urban options	Applied to all sources, population = 9,818,605. Roughness = 1.0m
Flagpole Height	0m
Elevations	Determined through AERMAP: DEM files – Venice, Topanga, Beverly Hills
Appy fraction of time at residence for < 16yrs age	No
Apply fraction of time at residence for > 16yrs age	Yes
Mandatory minimum Pathways	SCAQMD mandatory minimum: inhalation, soil, dermal, mother's milk, homegrown produce
Highway 10 length	Through City and 1 mile to the east.
Highway 1 length	Through City and 1 mile to the west.
Highway vehicle mix	Utilized Caltrans traffic count data for 2019. Truck fractions from 2018 (most recent truck data from Caltrans). Bus/motorcycle/vehicle type population based on CalEEMod fractions for Los Angeles County.
Highway sources	20 line sources for trucks, 20 line sources for automobiles/light duty vehicles. Line source widths: using USEPA recommended roadway width + 6m. Modeled width of 42m near the northern boundary of the City, 35m at I-10 and SR-1 interchange, and 28m along SR-1.
Highway sources terms	Used USEPA 2015 Appendix J: trucks – szinit = 3m, release height = 3.4m automobiles – szinit = 1.21m, release height = 1.3m
Highway emission factors	For diesel trucks DPM, used EMFAC2017 emission factor for PM. For gasoline (automobiles/other), used USEPA MOVES 2014 program, along with modifications to arsenic, hex chrome, mercury and dioxin based on changes in particulate matter and VOC fractions since USEPA MOVES program testing.

4.2 Meteorological Data

The Santa Monica Municipal Airport (SMO) has a meteorological station on-site and data is processed by the SCAQMD for use in the AERMOD and HARP2 models. Meteorological data for the 5-year period between 2012-2016 were utilized. A Wind Rose for the met station is shown in Figure 4.1.

Figure 4.1 Santa Monica Met Station Wind Rose



Years of Data: 2012 – 2016.
Source: SCAQMD.

4.3 Emissions Sources

Emission sources were categorized into two basic types: cars and trucks. The USEPA (2015) specifies the arrangement of source parameters for vehicles and is described below:

- Trucks have a release height = 3.4m
- Automobiles have a release height = 1.3m

The Highways were arranged into 20 line sources for trucks, and an identical 20 line sources for automobiles/light duty vehicles. The line source widths used the USEPA (2015) recommended roadway width plus 6m. The width of the highways was determined from aerials to be 42m near the northern boundary of the City, 35m at the I-10 and SR-1 interchange and 28m along SR-1.

The source line lengths vary depending on the curvature of the roadway, with the source line end points shown in Figure 2.1.

4.4 Dose-Response Assessment

A dose-response assessment was performed using HARP2. This HRA evaluates upper-level estimates of potential cancer health effects at different points from the highways. As this analysis was targeted on cancer risk for residences, the worker risks or acute or chronic risks were not evaluated.

4.5 Buildings

Buildings affect dispersion by producing downdrafts in wind fields and increasing the ground-level concentrations of pollutants of sources that are close to buildings. As there are numerous buildings located alongside the highways, and the AERMOD model does not incorporate building effects into line source ground level impact assessments, buildings were not including in the analysis.

4.6 Area Populations and Receptor Grids

In order to identify the maximum impacted receptor locations, receptor networks were constructed at 25m spacing out to 200m from the highways, and then every 100m from the 200m location out to 1,000m. No sensitive populations were included specifically in the analysis.

4.7 Version of the Risk Assessment Guidelines

The HARP2 Version 21081 model was used along with the SCAQMD AB 2588 and Rule 1402 Supplemental Guidelines dated September 2018 (SCAQMD 2018).

4.8 Elevations

Elevations of sources and receptors are determined using AERMAP within the HARP2 modeling program. AERMAP model outputs are included in the modeling files. The Digital Elevation Model (DEM) files are also included: Beverly hills (30m), Topanga (10m), and Venice (10m).

Figure 4.2 Sources and Receptors

5.0 Risk Characterization Results

HARP2 generates the risk characterization data needed to generate the risk results as presented in this report. Attachment B includes HARP2 output files.

The potential cancer risk assesses a residential 30-year exposure period. The report presents the results of a Tier-1 exposure assessment as per HARP2 and OEHHA Guidelines.

The HRA presents the results of the analysis for cancer. Cancer risks are defined as the number of cancer cases that are projected to be generated per million people exposed. The SCAQMD has establish thresholds for AB 2588 analysis of 10 cancer cases per million.

Figure 5.1 shows the cancer risk contours along the highways within the City. Attachment A shows the listing of parcels and their associated cancer risk levels within the 10 in a million contours.

The analysis examined operation of the highways in the year 2030, which would be the year that the development is anticipated to be completed. As cancer risk is an average exposure over 30 years, this a reasonable estimate of the cancer risks that a new development would be exposed to.

The estimate peak cancer risks from the highways varies depending on the location of the highway, with the areas to the north along I-10, where the highest traffic flows occur, experiencing the most cancer risks (as far as 1,300 feet from I-10), and the areas along the west along SR-1, with the lowest traffic volumes, experiencing the lowest cancer risk (as far as 250 feet from SR-1). Cancer risk levels in exceedance of 10 in a million are experienced along all segments of the highways.

Parcels that could experience cancer risk levels in exceedance of 10 in a million are listed in Appendix A. In total, 1,842 parcels are located in zones that experience a cancer risk of 10 in a million or greater from the highways, approximately 7.8% of parcels in the City.

The principal risk drivers for pollutants are DPM (92.6%), benzene (3.8%), arsenic (2.8%) and naphthalene, chromium, ethylbenzene and dioxins (less than 0.2% each).

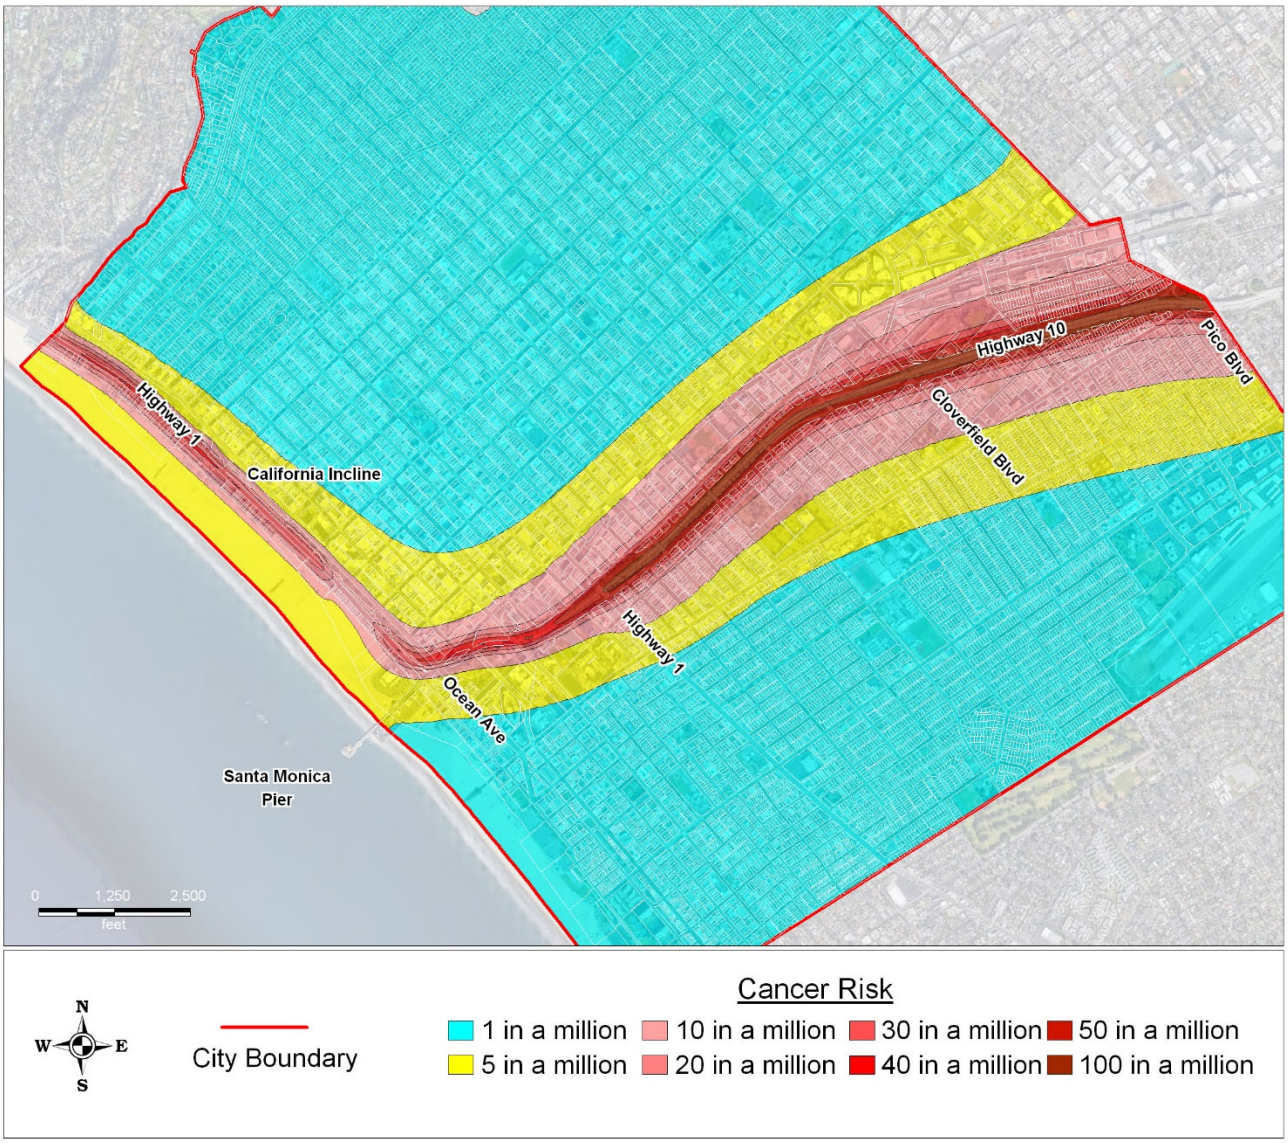
The principal risk drivers for vehicle types are heavy duty trucks (59%), medium heavy duty trucks (20.3%), light heavy duty trucks (7.3%), automobiles (3.9%), buses (3.1%), motorcycles (2.3%), light duty trucks (1.9%) and others (2.2%).

6.0 Risk Reduction Measures

A number of studies have examined the potential impacts of pollutant emissions from heavily traveled roadways on nearby residences. Studies summarized by SCAQMD (2012) have found a positive association between living near busy roadways and asthma exacerbation, decreased lung function, increased heart disease, and other respiratory and cardiovascular effects. Several studies examine the potential reductions associated with different pollutant reduction strategies. Some these studies are discussed below, along with their conclusions.

- Journal of Atmospheric Environment 2017 (AE 2017): In open road conditions, vegetation barriers have a positive impact on air quality with thick, dense and tall vegetation. Studies observed considerable pollutant removal through designing vegetation barriers closer to the pollutant source and plume's maximum concentration. In excess of a 50% reduction was observed with a 10m thick green belt for numerous pollutants. The combination of vegetation and solid passive air pollution control measures has the potential to maximize the reduction in pollutant concentrations and improve personal exposure conditions, more than that achieved with any individual intervention in both street canyon and open road conditions.

Figure 5.1 Cancer Risk Contours



- California Air Resources Board 2017 (CARB 2017): Measurement and modeling studies consistently find that solid barriers reduce near-road downwind concentrations by increasing vertical dispersion of pollutants emitted by vehicles. The magnitude of the reduction and its spatial extent depend on the height of the barrier, the width of the road, and micrometeorology. Studies have consistently found that pollution concentrations downwind of the barrier range from a 10% to 50% reduction compared to concentrations measured on or directly adjacent to high-volume roadways. Studies indicate that vegetation has the potential to alter pollutant transport and dispersion. Studies show that particle filtration systems and devices, specifically high-efficiency filtration with mechanical ventilation or portable high efficiency air cleaners, can be highly effective for reducing indoor pollution concentrations. High efficiency filters in ventilation systems can remove from 50% to 99% of particles in the air. However, research shows

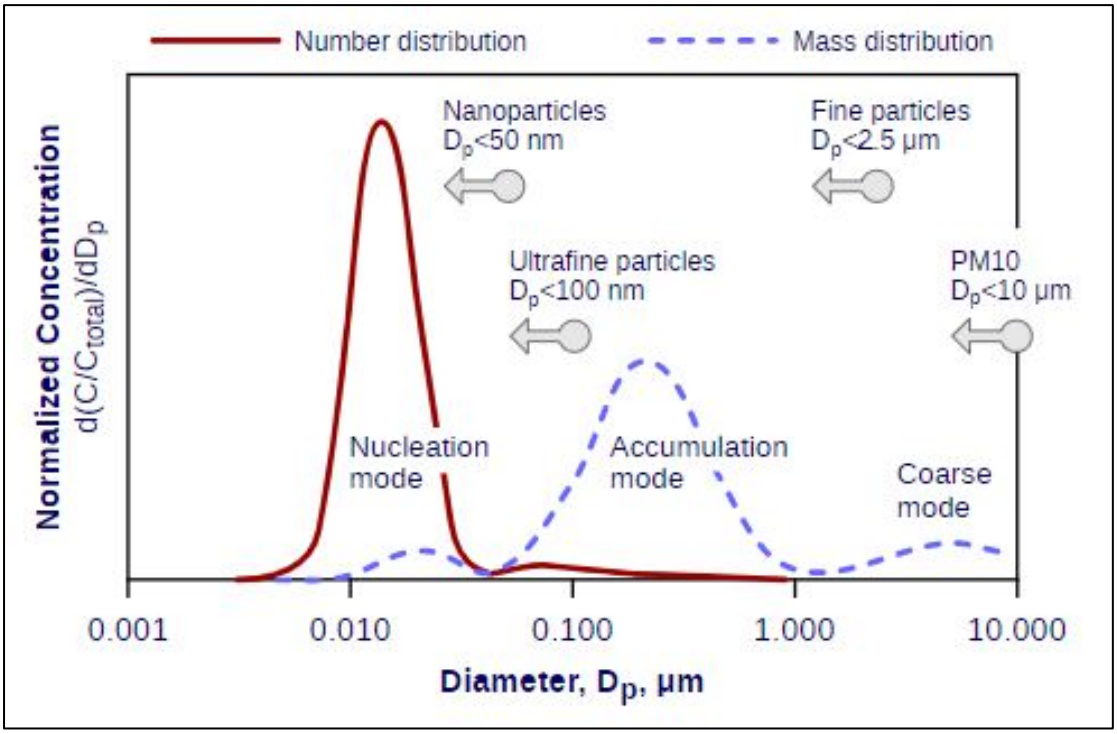
that filtration technologies for gaseous pollutants (i.e., VOCs) are variable in their effectiveness; some remove certain VOCs well, but not others. The greatest reduction in downwind particle concentration was associated with a vegetation-solid barrier combination, whereby trees are planted next to a solid barrier. The greatest effectiveness has been observed with extremely dense vegetative stands that provide a solid barrier. The concentration reductions vary from 4.8% to 28%, depending on the location and wind conditions.

- U.S. Environmental Protection Agency 2015 (USEPA 2015): Recommends various measures including air-seal around windows, doors, HVAC ducts, etc. and locating air intake away from the source if roadway/pollution source is near intake vent. Also recommends use of solid and vegetative barriers.
- South Coast Air Quality Management District 2012 (SCAQMD 2012): As modern engines and emissions controls continue to evolve, the mass of combustion-related particulate matter has been dramatically reduced through sophisticated control of combustion conditions, introduction of ultra-low sulfur diesel fuel, and the application of after-treatment control technologies such as Diesel Particulate Filters (DPFs). Measured concentrations of primary pollutants were typically highest in close proximity to a roadway and decreased exponentially with increasing distance from (and downwind of) to upwind background levels after about 300m. The report also detailed that on-highway concentrations of particulates and nitrogen oxides (NO_x) were primarily associated with diesel combustion.
- Journal of Atmospheric Environment 2008 (AE 2008): With winds directionally from the road, concentrations of carbon monoxide (CO) and particulate matter generally decreased between 15% and 50% behind a noise barrier. For particulate matter concentrations, the presence of mature trees in addition to the barrier resulted in consistently lower pollutant concentrations.

6.1 Air Quality Impacts and Diesel Particulate

Emissions from automobiles and particularly diesel trucks have been decreasing substantially over the recent years due to regulatory requirements producing substantially cleaner engines. Yet toxic impacts from vehicle emissions continues to be dominated by DPM. Particulate emissions from diesel combustion are made up of a range of particulate sizes, ranging from larger than 10 micrometers in size to less than 0.1 micrometers. The composition of DPM is dominated by the smaller particles. Figure 6.1 shows the range of DPM sizes in diesel exhaust. Particulate emissions are measured both by mass and by the number of particles, as shown in Figure 6.1. By mass of particles, the range of DPM particle size is dominated by 0.1 to 1.0 micrometers in size. However, the largest number of particles occur in the 0.01 to 0.1 micrometer range.

Figure 6.1 Diesel Particulate Emissions Size Range



Source: DieselNet 2018

6.2 Indoor Air Filtration System Ratings

Air filter systems in buildings are associated with central heating and air conditioning systems. The air is filtered to both prevent maintenance issues in the equipment and to ensure clean air for the building occupants. Air filtration systems are classified according to a rating system called Minimum Efficiency Reporting Value (MERV) which indicates the size of particles an air filter is designed to remove. Higher MERV ratings are more effective at capturing smaller particles. American National Standards Institute / American Society of Heating, Refrigerating and Air-Conditioning Engineers (ANSI/ASHRAE) standard 52.2 defines the requirements for the MERV levels.

Although lower MERV rated filters are less efficient at removing particles, they permit more air to move through the filter, which can improve the operation of the HVAC system. Therefore, the air filtration system for higher MERV systems should be specifically designed to account for the greater flow restriction associated with higher particulate removal.

MERV ratings and associated removal by particle size are shown in Figure 6.2. Note that, in order to address the removal of the diesel particulates, which are primarily in the sub-1.0 micrometer range, MERV ratings of 13 and above are needed to achieve at least a 50% removal rate.

Figure 6.2 MERV Ratings and Particulate Removal

Standard 52.2 Minimum Efficiency Reporting Value (MERV)	Composite Average Particle Size Efficiency, % In Size Range, µm			Average Arrestance, %
	Range 1 (0.3-1.0)	Range 2 (1.0-3.0)	Range 3 (3.0-10.0)	
1	n/a	n/a	E3 < 20	$A_{avg} < 65$

6.3 Recommendations

Mitigation strategies are recommended that produce substantial reductions in exposure to particulate matter from highway vehicles. These are discussed in the articles above and can produce emission reductions on the order of 50% for outdoor areas to over 90% for indoor areas.

The following measures are recommended to reduce exposure to air pollutants from the nearby highways:

1. Eliminate use of operable windows on the highway side of the building.
2. Use of dual-pane windows on all windows.
3. Install an air conditioning or a mechanical ventilation system that includes an air filtration system, such as the Lennox PureAir system, with a minimum MERV of 13 or

better for enhanced particulate removal efficiency capable of removing a significant portion of the sub-1.0 micrometer sized particles expected from diesel combustion.

4. Make the building exterior as "airtight" as possible to minimize air infiltration. The exterior pressure envelope of the units shall be sealed to achieve a tested air leakage rate of no more than 3.0 unit volumes per hour using the blower door ACH50 leak test, or equivalent.
5. Vents and roof penetrations shall be located on the walls and roofs facing away from the Highways wherever possible. Locate any air intakes away from the Highways source.
6. Though not required, doorways, entryways, and occupied outdoor areas (patios and balconies) should be located away from Highways to the extent feasible.

HARP Project Summary Report 4/22/2021 2:19:53 PM

PROJECT INFORMATION
HARP Version: 21081
Project Name: SM_HWY
Project Output Directory: C:\HARP2\Projects\SM_HWY\SM_HWY
HARP Database: NA

FACILITY INFORMATION
Origin
X (m):362781
Y (m):3764777
Zone:11
No. of Sources:40
No. of Buildings:0

EMISSION INVENTORY
No. of Pollutants:1440
No. of Background Pollutants:0

                                        ***     MODEL SETUP OPTIONS SUMMARY       ***
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses URBAN Dispersion Algorithm for the SBL for    40 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9818605.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  OTHER

**Model Calculates  1 Short Term Average(s) of:   1-HR
    and Calculates PERIOD Averages

**This Run Includes:     40 Source(s);      40 Source Group(s); and    5317 Receptor(s)

               with:      0 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:      0 VOLUME source(s)
                and:      0 AREA type source(s)
                and:     40 LINE source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  16216

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    53.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     13.2 MB of RAM.

**Input Runstream File:          aermod.inp
**Output Print File:             aermod.out

**Detailed Error/Message File:   C:\HARP2\Projects\SM_HWY\SM_HWY\SM_HWY_AERMOD.ERR
