Attention: Mr. Ralph Karubian

Subject: Report of Phase I Environmental Site Assessment

Project: **Proposed Development**
NWC of Jersey Boulevard & Milliken Avenue
Rancho Cucamonga, California

Dear Mr. Karubian:

As you requested Earth Systems Southwest has completed this Phase I Environmental Site assessment (ESA) of the site referenced above. Note that this report was prepared for your exclusive use. It was prepared to stand as a whole and no part should be excerpted or used in exclusion of any other part. This project was conducted in accordance with our proposal dated November 6, 2002. This report completes the scope of services outlined in our proposal.

Thank you for this opportunity to be of service. If you have any questions regarding this report, or the information contained herein, please contact this office at your convenience.

Sincerely,
EARTH SYSTEMS SOUTHWEST

Jim Goyich, RG 6325
Senior Geologist

**REPORT OF PHASE I
ENVIRONMENTAL SITE ASSESSMENT
NORTHWEST CORNER OF MILLIKEN AVENUE
AND JERSEY BOULEVARD
RANCHO CUCAMONGA,
SAN BERNARDINO COUNTY, CALIFORNIA**

1.0 INTRODUCTION

1.1 Project Description

This report presents the finding of the Phase I Environmental Site Assessment (ESA) conducted by Earth Systems Southwest (ESSW) for proposed development on three underdeveloped parcels on the northwestern corner of Milliken Avenue and Jersey Boulevard in Rancho Cucamonga, California. Figures depicting the site location and layout are presented in Appendix A. This project was conducted for Kentmaster MFG. Co., Inc. in accordance with our proposal dated November 11, 2002

1.2 Purpose and Scope of Work

The purposed of an ESA is to evaluate the potential for the presence of soil or groundwater contamination that may be present because of the past use, handling, storage, or disposal of hazardous materials or petroleum products on or near the property. The scope of work for this evaluation is based on ASTM Standard E-1527-00, Standard Practice for Environmental Site Assessments, and consisted of the tasks listed below

Site Reconnaissance: This involved: (A) a visual reconnaissance of the site, noting physical evidence of potential contamination or possible sources of contamination; (B) interviews with persons familiar with the site (if possible) regarding present and past site usage; and (C) observation of adjacent properties to identify visual evidence of possible impacts to the subject site. Significant on-site conditions were photographed to document current conditions. Selected site photographs are presented in Appendix B.

Site History Assessment: The history of the site was assessed regarding past land use at and near the site, specifically as it relates to the storage, production, use, or disposal of hazardous materials. The sources of information for this evaluation are listed in the references section of this report, and included the following categories of information:

- Aerial photographs
- Topographic maps
- Munger Oil maps
- Prior reports for an adjacent property

Due to the minimal prior development of the site, building department records were not reviewed.

Regulatory Agency Record Review: Many regulatory agencies compile information concerning sites that generate, store, use, and/or release hazardous materials. This

information can be accessed by reviewing lists published by the regulatory agencies. A report listing known sites that generate, store, use, and/or have released hazardous materials was obtained from Track Info Services, LLC (TRACK), a firm that specializes in maintaining a database of this type of information. A copy of the TRACK report is presented in Appendix C, and is discussed in Section 4. The search radius for this review was in accordance with ASTM standard E-1527, plus ¼ mile to accommodate the size of the site. In addition, selected government conditions at or near the site.

Report Preparation: This report was prepared to present our findings, conclusions, and recommendations. A qualifications statement regarding the personnel who performed this evaluation is presented in Appendix D.

Exclusions: Testing the air, groundwater, soil, or building materials for the presence of hazardous constituents was beyond the scope of this evaluation. As stated in the proposal, land title information would only be reviewed if furnished by the Client. Land title information was not provided to ESSW, and therefore was not reviewed.

1.3 Limitations

This report has been prepared for the exclusive use of Kentmaster MFG. Co., Inc. The conclusions and recommendations rendered in this report are opinions based on readily available information obtained to date within the scope of the work authorized by the client. The scope of work for this project was developed to address the needs of the client as part of a property transaction (buy, sell, refinance, etc.) and may not meet the needs of other users. Other parties participating in the transaction for which this project was conducted may also use the information presented in this report, provided said parties agree that ESSW shall have no additional liability arising from such use than described in the contract under which this project was conducted (a copy of that contract will be provided upon request). Any other use of or reliance on the information and opinions contained in this report without the written authorization of ESSW is at the sole risk of the user.

It should be noted that any level of assessment cannot ascertain that a property is completely free of chemical or toxic substances. We believe the scope of work has been appropriate to allow the client to make an informed business decision.

The results contained in this report are based upon the information acquired during the assessment, including information obtained from third parties. ESSW makes no claim as to the accuracy of the information obtained from others. In addition, it is possible that variations exist beyond or between points explored during the course of the assessment, and the changes in conditions can occur in the future due to the works of man, contaminant migration, variations in rainfall, temperature, and/or other factors not apparent at the time of the field services. It should

ESSW has striven to perform these services in a manner consistent with the level of care and skill ordinarily exercised by members of our profession currently practicing under similar conditions at the time and in the site vicinity. No warranty is expressed or implied.

2.0 SITE INFORMATION

2.1 Site Development and Location

The site consists of approximately 7.3 acres of undeveloped land along the western edge of the southwestern quarter of Section 7, township 1 South, range 6 West, San Bernardino Baseline and meridian (see Figure 1 in Appendix A). The subject property is located at the northwest corner of Milliken Avenue and Jersey Boulevard in rancho Cucamonga, California (Figure 2, Appendix A).

The site is bounded by Jersey Boulevard to the south, Milliken Avenue to the east commercial/industrial developments to the north, and a BNSF Railroad spur right-of-way on the west (Figure 3, Appendix A). The elevation of the site is approximately 1,140 feet above mean sea level. The site is graded and relatively flat and elevated about 5 feet above Jersey Boulevard. A small dirt and asphalt path dissects the property from north to south.

2.2 Current Site Condition

ESSW personnel visited the site on November 15, 2002, to observe current site conditions and adjacent land use. The site was observed to consist of undeveloped land sparsely covered by weeds and dead grass (Photo 1 through 6). An access road is also located along the rail spur on the western side of the site (Photo1). A sidewalk is located on the eastern and southern boundaries next to Milliken Avenue and Jersey Boulevard (Photo 2). The site is graded and raised from the elevation at the intersection of Milliken Avenue and Jersey Boulevard southeast of the site. A few piles of concrete rubble, concrete reinforced pipe, and construction debris were noted in several areas of the site (Photos 3 and 4). Two rusted steel 55-gallon drum were noted near the center of the site. The drums were filled with trash. No evidence of spillage was noted near the drum.

A dirt, asphalt and slag gravel road traverses the site from the driveway access along Jersey Boulevard to the fire access road north of the center of the property (see Figure 2). Slag was also noted in Boring B-3 drilled by ESSW during the Geotechnical Investigation conducted by ESSW in November 2002. In that boring, the slag was present to a depth of about 5-1/2 feet deep. Other than the potential for elevated metals concentration and in the slag gravel, no evidence of hazardous materials was observed onsite.

A sewer line was marked near the center of the property by Underground Service Alert. The sewer line has two manhole covers that mark the pipe's location on site. The utility locators noted that the line angles toward the center of the intersection of Milliken and Jersey. Utility lines for gas, water, electrical, and telephone were noted along Milliken avenue. The site visit revealed no additional evidence of hazardous material or petroleum products disposal. Site vegetation did not appear to be unusually stressed.

2.3 Site Vicinity

The site vicinity consisted of a mix of undeveloped, industrial, warehouse, and commercial properties. A fire station was located on the parcel south of the site, across Jersey Boulevard. A steel pipe manufacturing facility and a vacant warehouse are located north of the site. Several new vacant warehouses occupy the parcels east of the site across Milliken Avenue and a polyethylene foam manufacturing plant is located across the rail spur west of the site. Evidence was not observed that the site was adversely affected by properties in the site vicinity.

2.4 Geology and Hydrogeology

The site is located within the extreme northwestern portion of the Perris block of the Peninsular Ranges Geomorphic Province. The Peninsular Ranges are characterized by fault-controlled, elongated northwest trending valleys and ranges. These ranges and valleys extend from the southern end of Baja California to the Los Angeles basin. The rocks underlying this province consist of ancient sedimentary and meta-sedimentary (partially metamorphosed sedimentary) rocks that mantle a core of granitic rocks that comprise the Southern California Batholith. The present-day ranges were faulted and uplifted during the Late Tertiary to present time. The Perris block is a northwest trending, elongated structural block, composed of Mesozoic intrusive rocks. It is bounded by the San Jacinto fault zone on the northeast, the Chino-Elsinore fault zone on the southwest, and the Cucamonga fault zone on the northwest; its southeastern boundary is not precisely defined. The San Gabriel Mountains north of the site are part of the Transverse Ranges geomorphic province. This province is characterized by the east-west trending mountain ranges that extend from the north side of the Los Angeles Basin to the Banning Pass area. These ranges are separated from the valleys to the south by a frontal fault system consisting of north-dipping reverse faults, which includes the Cucamonga fault, located along the base of the hills north of the site.

Groundwater was not encountered in the borings during the geotechnical drilling program. These borings extended to a maximum depth of 31.5 feet. Information obtained from the Western Municipal Water District's Cooperative Well Measuring Program indicates that groundwater in a well located about 7,000 feet to the southeast of the site was approximately 383 feet below the ground surface in October or 2001.

3.0 HISTORICAL INFORMATION

Information regarding the history of the site was obtained from historical aerial photographs, topographic maps, prior reports for an adjacent property, and Munger Oil maps. The results of this research are summarized below.

3.1 Aerial Photographs

ESSW aerial photo archives and the aerial photo review from a report for an adjacent property were reviewed to evaluate the history of the site and vicinity, with particular attention to indications of the potential use, storage, or disposal of hazardous materials. Eight sets of photographs for the years 1955, 1970, 1978, 1986, 1991, and 2001 were reviewed (see

references). Our interpretations of these photographs, and excerpts from the prior report are presented below:

- In 1955, the site and all the rest of the neighboring properties in the southwestern quarter section of Section 7 were graded. Milliken Avenue and Jersey Boulevard had not yet been constructed. The rail spur was present along the western edge of the site. The land beyond the quarter section was used for vineyards. The BNSF (AT&SF at the time) rail spur was located along the western boundary of the site, extending north of the main AT&SF rail line, located about 1,000 feet south of the site.
- In 1970, land use at the site and adjacent properties appeared unchanged. An industrial building had been built adjacent to the rail spur, north of the site along the south side of Arrow Highway. Several properties along Jersey Avenue west of the site had been commercially developed with relatively large warehouse/industrial buildings. Vineyard and undeveloped land continued to occupy most of the land south of the rail line.
- In 1978, the site and the rest of the adjacent undeveloped quarter section had remained unchanged. An industrial building had been constructed west of the rail spur, on the west side of the site. Vineyards continue to dominate land usage in the areas south of the BNSF rail line and north of Jersey Avenue. The Interstate 15 freeway had been built about 1 mile east of the site by this time.
- In 1986, the site remained unchanged. A commercial/industrial development had been constructed south of the main BNSF rail line on the east side of Milliken Avenue and a substantial amount of commercial/industrial development had occurred in the site vicinity.
- In 1991, areas of disturbed surface soil were noted in the area of the current access road, the storm drain in the southeast corner of the site, and in the slag fill area. The sidewalk had been constructed along the south and east sides of the site. Jersey Avenue had been extended along the south side of the site and Milliken had been routed along the eastern side. Commercial developments were built east of Milliken Avenue and north of the site along Milliken Avenue and Arrow Highway.
- In 1996, the site remained undeveloped and less disturbed surface soil was noted. It appeared that vehicle traffic at the site was not as evident across the north-south access road or in the slag area. Commercial development in the vicinity continued and several new buildings were noted along Arrow Highway and Jersey Boulevard. A Metrolink rail station and parking area had been built at Milliken Avenue, south of the BNSF rail line.
- In 2001, the site was unchanged. Several light colored dirt paths/disturbed soil areas were discernable across the site between the driveway along Jersey Boulevard and the fire access road west of the building north of the site. Paths were also noted in the northeast quarter of the site in the area of the slag and near the storm drain. Commercial development in the vicinity continued with new large commercial warehouses located

along Jersey Avenue, Milliken Boulevard, Arrow Highway, and in most of the previously vacant lots south of the rail line.

3.2 Topographic Maps

Topographic maps produced by the U.S.G.S. were reviewed for information concerning the development history of the site. The 7.5-minute Guasti, California Quadrangel maps, dated 1953, 1966 and 1981 (Figure 3), were reviewed. The revised map depicts the site as undeveloped land. Commercial buildings were located west of the site and southwest along Jersey boulevard. All land use in the vicinity was vineyards and undeveloped on the earlier map.

3.3 Previous Reports

Mr. Ralph Karubian of Kentmaster provided an environmental file review report on the North Point Business Center (NPBC) to ESSW for our review. ENSR consultants in Alameda, California prepared the report on July 9, 1999. The NPBC includes the site as a part of a 110 acre commercial development that included all but one parcel between the west side of the subject site to Boston Place (a quarter mile east of the site), and between Arrow Route on the north and the BNSF rail line on the south. It was the conclusion of the ENSR report that the subject site had not been adversely affected by historical on-site operations. It did identify three industrial facilities within the NPBC and the data for each site is summarized below:

- 1X PFS inc, 11335 Jersey Boulevard: 12 tons of aqueous solution was removed by the owners and no violations or notice-of-enforcement actions were noted for the property.
- Halstead Enterprises, 11355 Arrow Route (Also known as Keep On Trucking Co. Inc.) is a small quantity hazardous materials generator with USTs on the property and no violations reported.
- Schlosser Forge Company, 11711 Arrow route is listed on several databases and is known to have USTs and is a large quantity hazardous waste generator. No violations or releases have been reported

ENSR noted that the lack of reported spills or releases does not eliminate the potential for contamination to be present at industrial sites like the ones listed above and ESSW agrees with that statement. However, the lack of reported releases from these sites suggests the relative risk of contamination affecting properties in the vicinity is low.

4.0 **AGENCY INFORMATION**

4.1 Agency Database Search Report

A report summarizing the information available from regulatory agencies regarding sites which generate, store, use, and/or have released hazardous materials was obtained from TRACK, a firm that specializes in maintaining a database of this type of information. The publications referenced by TRACK are listed in the TRACK report, which is presented in Appendix C. The search radii used for each list were in accordance with ASTM guidelines plus ¼ mile to

accommodate the size of the site. The information obtained during this review is summarized below.

- The site is not listed in the TRACK report.
- 37 sites were listed in the database search radii. Of these, 36 were cross gradient, downgradient of far enough away that they do not pose a significant risk to the subject site.
- Scripto Tokai Corp. at 11600 Millennium Court. is listed as site No. 8 on the TRACK report. It has a permit to generate between 100 and 1000 kilograms of solid hazardous waste per month and no releases have been reported.

4.2 Agency Interviews

Mr. Brian Otter, Mr. Curt Brundage and Ms. Elizabeth Parmenter of the San Bernardino County Fire Department, were contacted regarding known problems at the site or in the site vicinity. They reported that she was not aware of any problems at the site or in the site vicinity that might affect site conditions.

4.3 Agricultural Land Use Evaluation

ESSW previously contacted County Agricultural commissioner's offices for general information regarding historical pesticide use, and have been informed that the pesticide DDT was widely used prior to its ban in the early 1970's. Consequently it should be assumed that SDDT could have been used on all properties used for agriculture prior to that time.

ESSW has previously contacted local County Environmental Health Agencies regarding the current approach to DDT at agricultural sites. While the approach can vary between counties, agricultural soils are not usually required to be tested for DDT residues prior to development for other uses. However, if soils containing DDT (and decomposition by-products) in excess of the 1-mg/kg regulatory limit are exported off-site, they would need to be treated as hazardous waste in accordance with Title 22. If the property is going to be used for residential purposes, it would be prudent to test soils for pesticide residues to evaluate the potential for excessive exposure to future residences.

Information regarding DDT was obtained from the reference books "Agricultural Chemicals: Book I – Insecticides." That reference indicates that DDT is one of the most widely used insecticides in the world. It is stable under most conditions, and accumulates in the body fat of animals and in the soil. In other countries it is used as a human-body insecticide (applied to people to kill lice, etc.).

In other references:

- The half-life of DDT in soil has been estimated to be about 30 years under normal conditions (Saltzman and Yaron, 1986). A shorter half life can be obtained under optimum conditions.

- A 1985 study by the California Department of Food and Agriculture (CDF&A) found DDT and its breakdown by-products in 95 of 97 soil samples collected from agricultural soil throughout California, typically at concentrations of about 1 mg/kg or less. The highest concentration detected was 31 mg/kg (total DDT and its breakdown by-products) in a sample from Los Angeles County.

DDT is listed as a hazardous material in the California Code of Regulations governing the classification of hazardous waste (CCR Title 22). The Total Threshold Limit Concentration for DDT and its breakdown by-products is 1 mg/kg, which is the concentration of DDT that would classify a waste as hazardous.

The US EPA Preliminary Remediation Goal (PRG) is 1.7 mg/kg in a residential setting. The PRG is a value based on health risks from exposure to the substance in a residential setting for 70 years (US EPA 2000).

4.4 Other Sources of Information

Slag deposits from the nearby Kaiser steel mill in Fontana, California have been used successfully on their property as a source of fill in areas of commercial redevelopment. According to Mr. Sandeep Davankar with Shaw Environmental (the Consultant for portions of the Kaiser Facility), slag deposits on the subject property would need to be tested for semi-volatile organic compounds, metals (including the waste extraction test), and pH, to evaluate if the material would be suitable for use as fill on site. The State of California Department of Toxic Substances Control (DTSC) Voluntary Cleanup Program would most likely have oversight responsibilities for any remedial action or health risk assessment of the slag material (Brundage and Diaz, personal communications, 2002).

5.0 SUMMARY, CONCLUSIONS, AND RECOMMENDATIONS

This report presents the finding of the Phase I Environmental Site Assessment (ESA) conducted by Earth Systems Southwest (ESSW) for a proposed development on three undeveloped parcels on the northwestern corner of Milliken Avenue and Jersey Boulevard in Rancho Cucamonga, California. The purpose of this assessment was to evaluate the potential for the presence of soil or groundwater contamination because of past use, handling, storage, or disposal of hazardous materials or petroleum products on or near the subject property. The scope of work for this evaluation included a reconnaissance of the site and vicinity, a review of the history of the site, and a review of information obtained from regulatory agencies regarding the use, storage, generation, or release of hazardous materials on the site or in the site vicinity. Based on this review, ESSW presents the following summary and conclusions:

1. The site has always been vacant. The site was observed to consist of undeveloped land covered with weeds and sparse native vegetation. A few piles of construction debris and concrete rubble were noted in the northern half of the site. Hazardous materials were not observed within the construction debris and rubble.
2. A deposit of slag fill was noted during the reconnaissance and, based on the results of Boring B-3 in the Geotechnical Investigation (ESSW, 2002) appears to be about 5-1/2

feet thick at that location. The slag was tested for corrosivity and has a pH of greater than 12. This qualifies the slag as hazardous if it were to be transported offsite. Testing for metals concentrations was not conducted. According to Mr. Sandeep Davankar of Shaw Environmental, the material would need to be tested for semi-volatile organic compounds, metals and (waste extraction test), and pH, so that a comparison to the Kaiser steel mill slag material could be made. With comparable material it is conceivable that the DTSC would accept a Health Risk Assessment of the slag based on the results of Kaiser's Health Risk Assessment.

3. The adjacent properties to the site have been used for agriculture from at least the 1950's the earliest historical reference available. Therefore, the potential exists for residues of DDT to be present at the site. Residues of pesticides that result from their application as part of farming operations are not classified as a hazardous material, unless soil is going to be exported from the site (at which time it falls under the waste classification criteria). The site is proposed to be developed as commercial property and future development may limit the exposure potential and health risk from potential residual pesticides in soil.
4. The site vicinity consists primarily of agricultural, commercial, and industrial properties. Evidence was not observed that the site was adversely affected by activities in the site vicinity.
5. The site was not identified in the agency database review. No violations were reported for other sites in the vicinity that were identified in the agency database review. Therefore the sites identified do not appear to pose a risk to the subject site.

Notice of Disclaimer

Due to the limitations, constraints, inaccuracies and incompleteness of government information and computer mapping data currently available to TRACK Info Services, certain conventions have been utilized in preparing the locations of all federal, state and local agency sites residing in TRACK Info Services' databases. All EPA NPL and state landfill sites are depicted by a rectangle approximating their location and size. The boundaries of the rectangles represent the eastern and western most longitudes; the northern and southern most latitudes. As such, the mapped areas may exceed the actual areas and do not represent the actual boundaries of these properties. All other sites are depicted by a point representing their approximate address location and make no attempt to represent the actual areas of the associated property. Actual boundaries and locations of individual properties can be found in the files residing at the agency responsible for such information.

Waiver of Liability

Although TRACK Info Services uses its best efforts to research the actual location of each site, TRACK Info Services does not and can not warrant the accuracy of these sites with regard to exact location and size. All authorized users of TRACK Info Services' services proceeding are signifying an understanding of TRACK Info Services' searching and mapping conventions, and agree to waive any and all liability claims associated with search and map results showing incomplete and or inaccurate site locations.

UST HISTORICAL DATA

This site was listed in the FIDS Zip Code List as a UST site. The Office of Hazardous Data Management produced the FIDS list. The FIDS list is an index of names & locations of sites recorded in various California State environmental agency databases. It is sorted by zip code and as an index, details regarding the sites were never included.

The UST information included in FIDS as provided by the Office of Hazardous Data Management was originally collected from the SWEEPS database. The SWEEPS database recorded Underground Storage Tanks and was maintained by the State Water Resources Control Board (SWRCB). That agency no longer maintains the SWEEPS database and last updated it in 1994. The last release of that 1994 database was in 1997. Oversight of Underground Storage Tanks within California is now conducted by Certified Unified Program Agencies referred to as CUPA s. There are approximately 102 CUPA s and Local Oversight Programs (LOP s) in the State of California. Most are city or county government agencies. As of 1998, all sites or facilities with underground storage tanks were required by Federal mandate to obtain certification by designated UST oversight agencies (in this case, CUPA s) that the UST/s at their location were upgraded or removed in adherence with the 1998 RCRA standards. Information from the FIDS/SWEEPS lists were included in this report search to help identify where underground storage tanks may have existed that were not recorded in CUPA databases or lists collected by Track Info Services. This may occur if a tank was removed prior to development of recent CUPA UST lists or never registered with a CUPA.

ENVIRONMENTAL FIRST SEARCH CALIFORNIA DATABASES AND SOURCES

CAL SITES (STATE SITES)

Source: The CAL EPA, Department of Toxic Substances Control (DTSC)
Phone: (916) 323-3400

The CAL EPA Department of Toxic Substances Control (DTSC) maintains a database of information on properties (or sites) in California where hazardous substances have been released, or where the potential for such release exists. For more information on individual sites call the number listed above.

CORTESE (STATE SITES)

Source: The CAL EPA, Department of Toxic Substances Control (DTSC)
Phone: (916) 445-6532

Pursuant to Government Code Section 65962.5, the Hazardous Waste and Substances Sites List has been compiled by Cal/EPA, Hazardous Materials Data Management Program. The CAL EPA Dept. of Toxic Substances Control compiles information from subsets of the following databases to make up the CORTESE list:

- The Dept. of Toxic Substances Control; contaminated or potentially contaminated hazardous waste sites listed in the CAL Sites database. formerly known as ASPIS are included (CAL SITES formerly known as ASPIS).
- The California State Water Resources Control Board; listing of Leaking Underground Storage Tanks are included (LTANK)
- The California Integrated Waste Management Board; Sanitary Landfills which have evidence of groundwater contamination or known migration of hazardous materials (formerly WB-LF, now AB 3750).

Track Info Services collects each of the above data sets individually and lists them separately in the following First Search categories in order to provide more current and comprehensive information: CALSITES: SPL, LTANK: LUST, WB-LF: SWL

SLIC NORTH BAY/SOUTH BAY (STATE SITES)

Source: The CAL EPA San Francisco Bay Regional Water Quality Control Board
Phone: (510) 622-2358

The CAL EPA San Francisco Bay Regional Water Quality Control Board maintains a report of sites in the north and south bay that have records of spills, leaks, and investigation cleanups. This was formerly referred to as the North Bay Toxics List and South Bay Site Management System. The two lists were combined with other information and now part of the North & South Bay SLIC Report.

SWIS SOLID WASTE INFORMATION SYSTEM (SWLF)

Source: The Integrated Waste Management Board
Phone: (916) 255-2331

The California Integrated Waste Management Board maintains a database on solid waste facilities, operations, and disposal sites throughout the state of California. The types of facilities found in this database include landfills, transfer stations, material recovery facilities, composting sites, transformation facilities, waste tire sites, and closed disposal sites. For more information on individual sites call the number listed above.

Note: This database has poor locational information regarding many sites listed; therefor, some sites may not be locatable or plottable in First Search reports.

WMUDS (SWLF)

Source: The State Water Resources Control Board
Phone: (916) 227-4365

Note: Note: This database has poor locational information regarding many sites listed; therefor, some sites may not be locatable or plottable in First Search reports.

Water Resources Control Board. It tracks management units for several regulatory programs related to waste management and its potential impact on groundwater. Two of these programs (SWAT & TPCA) are no longer on-going regulatory programs as described below. Chapter 15 (SC15) is still an on-going regulatory program and information is updated periodically. The WMUDS System contains information from the following agency databases: Facility, Waste Management Unit (WMU), Waste Discharger System (WDS), SWAT, Chapter 15, TPCA, RCRA, Inspections, Violations, and Enforcement's.

• **Notes Regarding SWAT Ranks 1-5**

In a 1993 Memorandum of Understanding, the State Water Resources Control Board agreed to submit a comprehensive report on the Solid Waste Assessment Test (SWAT) Program to the California Integrated Waste Management Board. The SWAT Program began in 1984. In 1984, legislature was passed requiring testing of water and air media at all solid waste disposal sites. The law required SWRCB to rank all solid waste disposal sites in groups of 150 each, according to the threat they may pose on water quality. The law required the operators of each of the 150 sites in a given rank to submit a water quality "solid waste assessment test" (SWAT) report. Rank groups 1-5 consisted of 750 sites of which 562 submitted a SWAT Report or exemption questionnaire (undetermined leak status). Sites in ranks 1 - 5 contain some detailed information, whereas, sites in ranks 6 and beyond generally do not, therefore per the suggestion of the WRCB sites in ranks 1 - 5 were integrated with the First Search database. The SWAT Program ran from 1985 - 1995.

• **Notes Regarding TPCA (Formerly referred to as Toxic Pits)**

From 1984 - 1991 the State Water Resources Control Board maintained a list of sites referred to as having Toxic Pits containing hazardous substances. Generally these sites were factories and refineries.

• **Notes Regarding SC 15 (Formerly referred to as Sub Chapter 15)**

Subchapter 15 now referred to as Chapter 15 is the current regulatory program enforced by the Water Resources Control Board regarding landfills, surface impoundment's, and other sites. The WRCB maintains a database Chapter 15 to track these facilities. The Chapter 15 Program is part of the Core Regulatory Program for waste treatment, storage, or disposal sites. Statute specifically requires the State Water Resources Control Board to develop regulations to "ensure adequate protection of water quality and statewide uniformity in the siting, operation, and closure of waste discharge sites." These regulations are found in California Code of Regulations [CCR] Title 27 [solid waste, including mining waste] and CCR Title 23, Division 3, Chapter 15 [hazardous waste]. The regulations establish a classification system for waste and disposal sites and include requirements for siting, construction, operation, monitoring and cleanup, and closure. Program functions include issuance and amendment of waste discharge requirements, inspections to determine compliance, review of dischargers' self-monitoring reports, review of other technical reports, review of closure plans, and informal and formal enforcement actions. Statewide, the Program includes over 1100 waste treatment, storage, or disposal sites (landfills, surface impoundment's, waste piles, and land treatment units).

LUSTIS (LUST)

Source: The State Water Resources Control Board
Phone: (916) 227-4416

The State Water Resources Control Board maintains a database of sites with confirmed or unconfirmed leaking underground storage tanks. Information for this database is collected from the states regional boards quarterly and integrated with this database.

AST Aboveground Storage Tank (UST)

Source: The State Water Resources Control Board
Phone: (916) 227-4364

The Above Ground Petroleum Storage Act became State Law effective January 1, 1990. In general, the law requires owners or operators of AST's with petroleum products to file a storage statement and pay a fee by July 1, 1990 and every two years thereafter, take specific action to prevent spills, and in certain instances implement a groundwater monitoring program. This law does not apply

to that portion of a tank facility associated with the production oil and regulated by the State Division of Oil and Gas of the Dept. of Conservation.

SWEEPS / FIDS State Registered Underground Storage Tanks (UST)

Source: The State Water Resources Control Board, &
CAL EPA Dept of Toxic Substances Control
Phone: (916) 227-4404

Until 1994 the State Water Resources Control Board maintained a database of registered underground storage tanks statewide referred to as the SWEEPS System. The SWEEPS UST information was integrated with the CAL EPA's Facility Index System database (FIDS) which is a master index of information from numerous California agency environmental databases. That was last updated in 1994. Track Info Services included the UST information from the FIDS database in its First Search reports for historical purposes to help its clients identify where tanks may possibly have existed. For more information on specific sites from individual paper files archived at the State Water Resources Control Board call the number listed above.

SAN DIEGO COUNTY HE 17/58 PERMITS (PERMITS)

Source: The San Diego County Dept. of Environmental Health

Phone: (619) 338-2231

The HE17/58 database tracks establishments issued permits and the status of their permits in relation to compliance with federal, state, and local regulations that the County oversees. It tracks if a site is a hazardous waste generator, TSD, gas station, has underground tanks, violations, or unauthorized releases. For more information on a specific file call the Haz Mat Duty Specialist at the phone number listed above.

SAN DIEGO HE 17/58 (LUST)

Source: The San Diego County Dept. of Environmental Health

Phone: (619) 338-2231

The San Diego County Dept. of Environmental Health maintains a database of sites with confirmed or unconfirmed leaking underground storage tanks within its HE17/58 database. For more information on a specific file call the Haz Mat Duty Specialist at phone number listed above.

APPENDIX D
QUALIFICATIONS STATEMENT

**EARTH SYSTEMS SOUTHWEST
QUALIFICATIONS STATEMENT FOR ENVIRONMENTAL WORK**

The principals of the Earth Systems companies have been consulting for an average of over 20 years, and the combined staff numbers nearly 100. Earth Systems' multidisciplinary professional staff has extensive experience with and education in chemistry, geology, geophysics, hydrogeology, mechanical engineering, civil engineering, mapping, soil science, drafting, and surveying. Our senior project and staff professionals include Certified Engineering Geologists, Registered Geologists, Registered Environmental Assessors and Professional Engineers. These professionals are highly qualified, holding an average of two registrations and/or certifications in their area of expertise. To continue to meet our commitment to technical expertise, Earth Systems considers it essential to train our personnel in the latest scientific advancements in assessment and mitigation techniques. This involves continuing education in the form of training seminars, literature reviews, and pertinent conferences to remain abreast of recent developments in this complex and rapidly changing field.

The attached resumes describe the credentials of the professionals who performed field, research and/or report preparation work on the project.

Jim Goyich, RG, REA

Registered Geologist
Registered Environmental Assessor

QUALIFICATIONS

Registered Geologist, California, No. 6325
Registered Environmental Assessor, California, No. 4236
Bachelors of Science, Geology, University of Redlands 1985

TRAINING

OSHA 40 Hour Hazardous Waste Health and Safety Training
OSHA 8 Hour Hazardous Waste Supervisor Training
Campbell Scientific CR10X Data Logger Set Up and Operation

PROFESSIONAL EXPERIENCE

Feb 1999 to Present	Senior Geologist	Earth Systems Southwest Rancho Cucamonga, California
1986 to 1999	Project Geologist	Dames & Moore Ontario/Rancho Cucamonga, CA

Mr. Goyich responsibilities include management of the Rancho Cucamonga/Ontario office, hydrogeological evaluations and environmental assessment of industrial, commercial, agricultural and undeveloped properties.

HIGHLIGHTS OF RESPONSIBILITIES AND EXPERIENCE

Project Geologist for FDA Compliance Evaluation of Mountain Spring Water Sources in Los Angeles, San Bernardino, Riverside, San Diego, and Napa Counties, California.

Project Manager for GPS Pipeline Location Survey along a spring water transmission line in Cabezon, California.

Project Manager for Microscopic Particulate Analysis sampling of spring water sources in San Bernardino and San Diego Counties, California

Senior Geologist for an aquifer assessment along the North Slope of the San Bernardino Mountains, California.

Project Geologist for a well siting study in the Santa Rosa Mountains, California.

Senior Geologist for a third-party review of and assessment of a spring water source in the San Gabriel Mountains, California.

Field manager for an environmental and geotechnical investigation of an 18-mile segment of large diameter water transmission pipeline in Highland and Redlands, California.

Project manager for a Phase II investigation and aquifer characterization of a jet engine maintenance facility in Ontario, California.

Project manager for several hundred Phase I Environmental Site Assessments and Phase II Site Investigations throughout California.

Project manager for several soil remediation projects in San Bernardino, Riverside, and Los Angeles Counties, California

PROFESSIONAL AFFILIATIONS

National Groundwater Association, Association of Scientists and Engineers
Inland Geological Society.
