> *Site Preparation* involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
>
> *Grading* involves the cut and fill of land to ensure that the proper base and slope is created for the foundation.
>
> *Building Construction* involves the construction of the foundation, structures and buildings.
>
> *Architectural Coating* involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and curbs, and the painting of the walls or other components such as stair railings inside parking structures.
>
> *Paving* involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

[15] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9

[16] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 31.

As such, by disproportionately altering individual construction phase lengths without proper justification, the models' calculations are altered and underestimate emissions. Thus, by including unsubstantiated changes to the Project's anticipated individual construction phase lengths, the model may underestimate the Project's maximum daily construction-related emissions and should not be relied upon to determine the significance of the Project's air quality impacts.

Failure to Include Total Amount of Demolition

According to the DEIR, 254,000-SF of demolition would be required for the construction of the proposed RAB component of the Project (p. 3-37). However, review of the Project's "UCSF CPHP RAB Construction" CalEEMod model demonstrates that the model fails to include the total amount of required demolition for RAB construction. As a result, the model underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance.

According to the CalEEMod User's Guide, "[h]aul trips are based on the amount of material that is demolished, imported or exported assuming a truck can handle 16 cubic yards of material."[17] Therefore, the air model calculates a default number of hauling trips based upon the amount of demolition material inputted into the model. Inputting 254,000-SF of building demolition would result in a default demolition hauling truck trip number of 1,155 trips. However, review of the Project's "UCSF CPHP RAB Construction" CalEEMod output files demonstrates that the model calculated a default value of only 1,060 hauling truck trips (see excerpt below) (Appendix AIR, pp. 1179).

Phase Name	Offroad Equipment Count	Worker Trip Number	Vendor Trip Number	Hauling Trip Number	Worker Trip Length	Vendor Trip Length	Hauling Trip Length
Demolition	5	13.00	0.00	1,060.00	10.80	7.30	20.00
Site Preparation	3	8.00	0.00	4,954.00	10.80	7.30	20.00
Grading	4	10.00	0.00	3,420.00	10.80	7.30	20.00
Draiange/Utilities/Subgrade			0.00	0.00	10.80	7.30	
Foundations/Concrete Pour	8	86.00	44.00	0.00	10.80	7.30	20.00
Building Construction	8	86.00	44.00	0.00	10.80	7.30	20.00
Architectural Coating	1	17.00	0.00	0.00	10.80	7.30	20.00

As you can see in the excerpt above, the model for RAB construction fails to account for the full amount of demolition required for the Project. This presents an issue, as the total amount of demolition material is used by CalEEMod to determine the fugitive dust emissions associated with this phase of construction.[18] By failing to account for the demolition of all existing structures, the model underestimates the Project's fugitive dust emissions associated with demolition. Thus, the model underestimates the Project's construction-related emissions and should not be relied upon to determine the significance of air quality impacts.

[17] http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14
[18] CalEEMod User Guide, Appendix A, *available at:* http://www.caleemod.com/, p. 34.

Unsubstantiated Changes to Acres of Grading Values

Review of the Project's CalEEMod output files demonstrates that the "New Hospital Construction" and "UCSF CPHP RAB Construction" models include unsubstantiated reductions to the anticipated acres of grading values and as a result, the models may underestimate the Project's construction-related emissions.

First, the "New Hospital Construction" model includes reductions to the default acres of grading values (see excerpt below) (Appendix AIR, pp. 1114).

Table Name	Column Name	Default Value	New Value
tblGrading	AcresOfGrading	76.00	2.00
tblGrading	AcresOfGrading	228.00	3.00

As you can see in the excerpt above, the acres of grading value was reduced by roughly 97% during the grading phase of construction, from a default value of 76 acres to 2 acres, and by roughly 99% during the site preparation phase of construction, from a default value of 228 acres to 3 acres.

Second, the "UCSF CPHP RAB Construction" model includes reductions to the default acres of grading values (see excerpt below) (Appendix AIR, pp. 1174).

Table Name	Column Name	Default Value	New Value
tblGrading	AcresOfGrading	109.50	3.00
tblGrading	AcresOfGrading	99.00	4.50

As you can see in the excerpt above, the acres of grading value was reduced by roughly 97% during the grading phase of construction, from a default value of 109.5 acres to 3 acres, and by roughly 96% during the site preparation phase of construction, from a default value of 99 acres to 4.5 acres.

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[19] According to the "User Entered Comments & Non-Default Data" table for the "New Hospital Construction" model, the justification provided for these changes is: "Project site is two acres" (Appendix AIR, pp. 1112). Furthermore, according to the "User Entered Comments & Non-Default Data" table for the "UCSF CPHP RAB Construction" model, the justification provided for these changes is: "Excavation volume provided by applicant" (Appendix AIR, pp. 1172). However, these justifications are insufficient, as neither the dimensions of the Project site, nor the excavation volume, are utilized to determine the correct acres of grading values. According to the CalEEMod User's Guide:

> "[T]he dimensions (e.g., length and width) of the grading site have no impact on the calculation, only the total area to be graded. In order to properly grade a piece of land multiple passes with equipment may be required. The acres is based on the equipment list and days in grading or site

[19] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9

> preparation phase according to the anticipated maximum number of acres a given piece of equipment can pass over in an 8-hour workday."[20]

As you can see in the excerpt above, the acres of grading value is calculated based on the equipment list and grading or site preparation phase length, not the dimensions of the Project or grading site or excavation volume. As a result, these justifications are insufficient, and we cannot verify the revised acres of grading values. This presents an issue, as the acres of grading values are used by CalEEMod to estimate the dust emissions associated with grading.[21] Thus, by including unsubstantiated reductions to the Project's default acres of grading values, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine the significance of air quality impacts.

Unsubstantiated Reduction of Hauling Trips

Review of the Project's CalEEMod output files demonstrates that the number of hauling trips required for construction of the Initial Aldea Housing Densification was reduced from 313- to 312-acres in the "UCSF Aldea Housing Initial Phase Construction" model (see excerpt below) (Appendix AIR, pp. 1087).

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	HaulingTripNumber	313.00	312.00

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[22] However, no justification is provided in the corresponding "User Entered Comments & Non-Default Data" table (Appendix AIR, pp. 1086). Furthermore, the DEIR fails to mention or substantiate this change whatsoever, and as a result, we cannot verify the revised hauling trip number. This unsubstantiated reduction presents an issue, as the number of hauling trips and associated vehicle miles traveled ("VMT") are used by CalEEMod to determine both the exhaust emissions associated with on-road vehicle use and fugitive dust emissions.[23] By including an unsubstantiated reduction to the Project's anticipated hauling trip number, the model may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Incorrect Application of Tier 4 Final Mitigation

According to the DEIR, the Project would implement CPHP Mitigation Measure AIR-1a, which states:

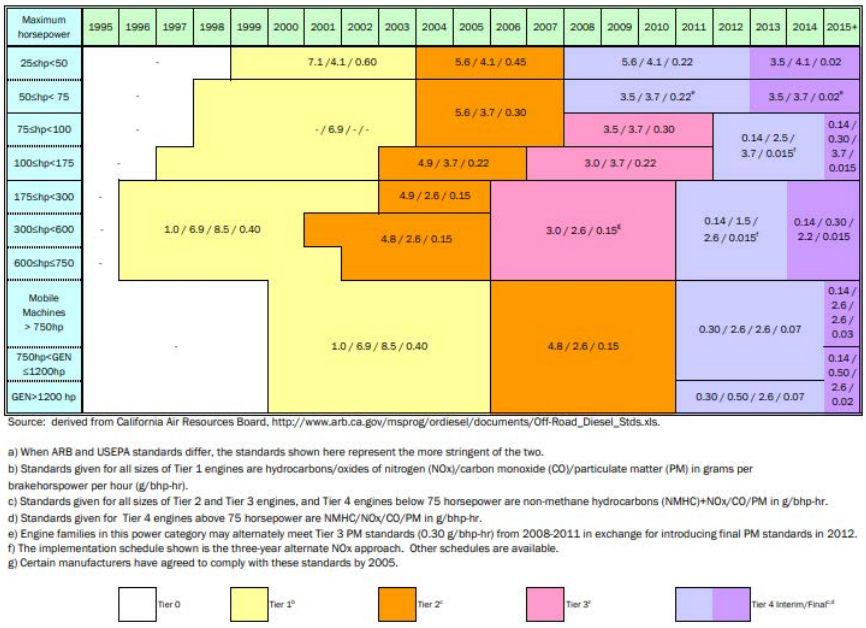
> "All mobile diesel-powered off-road equipment larger than 25 horsepower and operating on the project site for more than two days continuously shall be equipped with engines meeting USEPA emissions standards for ***Tier 4 engines*** or equivalent" (emphasis added) (p. 2-13, Table 2-3).

As the above excerpt demonstrates, CPHP Mitigation Measure AIR-1a requires the use of *Tier 4* equipment, but does not specify whether the Project would implement Tier 4 *Interim* or Tier 4 *Final*

---

[20] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.
[21] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.
[22] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[23] CalEEMod User Guide, Appendix A, *available at:* http://www.caleemod.com/, p. 13.

mitigation. However, review of the Project's CalEEMod output files demonstrates that the models estimated emissions assuming that the more efficient Tier 4 ***Final*** equipment would be used (Appendix AIR, pp. 1086-1087, 1113, 1147, 1173). This presents an issue, as the DEIR does not commit to the use of the more efficient Tier 4 ***Final*** equipment. The United States Environmental Protection Agency ("U.S. EPA") has slowly adopted more stringent standards to lower the emissions from off-road construction equipment since 1994. Since that time, Tier 1, Tier 2, Tier 3, Tier 4 ***Interim***, and Tier 4 ***Final*** construction equipment has been phased in over time. Tier 4 ***Final*** represents the *cleanest* burning equipment and therefore has the lowest emissions compared to other tiers, including Tier 4 ***Interim*** equipment (see excerpt below):[24]



Source: derived from California Air Resources Board, http://www.arb.ca.gov/msprog/ordiesel/documents/Off-Road_Diesel_Stds.xls.

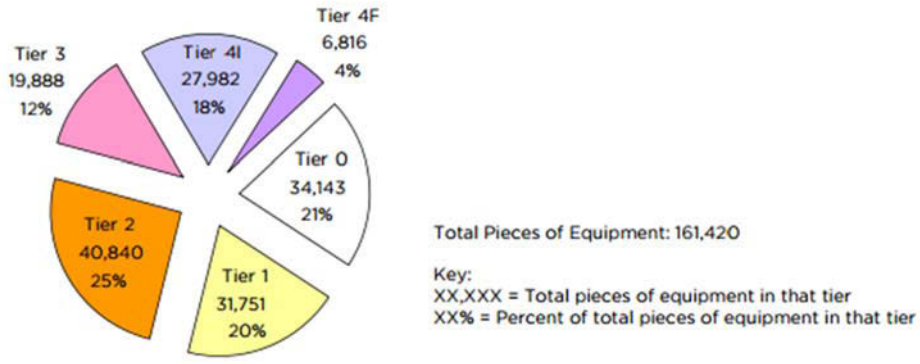
a) When ARB and USEPA standards differ, the standards shown here represent the more stringent of the two.
b) Standards given for all sizes of Tier 1 engines are hydrocarbons/oxides of nitrogen (NOx)/carbon monoxide (CO)/particulate matter (PM) in grams per brakehorsepower per hour (g/bhp-hr).
c) Standards given for all sizes of Tier 2 and Tier 3 engines, and Tier 4 engines below 75 horsepower are non-methane hydrocarbons (NMHC)+NOx/CO/PM in g/bhp-hr.
d) Standards given for Tier 4 engines above 75 horsepower are NMHC/NOx/CO/PM in g/bhp-hr.
e) Engine families in this power category may alternately meet Tier 3 PM standards (0.30 g/bhp-hr) from 2008-2011 in exchange for introducing final PM standards in 2012.
f) The implementation schedule shown is the three-year alternate NOx approach. Other schedules are available.
g) Certain manufacturers have agreed to comply with these standards by 2005.

As demonstrated in the figure above, Tier 4 ***Interim*** equipment has greater emission levels than Tier 4 ***Final*** equipment. Therefore, by modeling construction emissions assuming nearly a full Tier 4 ***Final*** equipment fleet, the DEIR failed to account for higher emissions that may occur as a result of the use of Tier 4 ***Interim*** equipment. Since CPHP Mitigation Measure AIR-1a fails to specify whether the Project will use Tier 4 ***Interim*** or Tier 4 ***Final*** equipment, it is incorrect to model emissions assuming that the *more efficient* Tier 4 ***Final*** equipment will be used. Until the DEIR demonstrates that the Project will actually use Tier 4 ***Final*** engines during all phases of construction, and not Tier 4 ***Interim*** equipment, the DEIR's modeling should not be relied upon to determine Project significance.

[24] "San Francisco Clean Construction Ordinance Implementation Guide for San Francisco Public Projects." August 2015, *available at:* https://www.sfdph.org/dph/files/EHSdocs/AirQuality/San_Francisco_Clean_Construction_Ordinance_2015.pdf, p. 6

Furthermore, the DEIR failed to evaluate the *feasibility* of obtaining Tier 4 equipment. Due to the limited amount of Tier 4, especially Tier 4 ***Final***, equipment available, the DEIR should have assessed the feasibility in obtaining equipment with Tier 4 engines (see excerpt below).[25]

Figure 4: 2014 Statewide All Fleet Sizes (Pieces of Equipment)



As demonstrated in the figure above, the Tier 4 *Final* and *Interim* equipment only account for 4% and 18%, respectively, of all off-road equipment currently available in California. Thus, emissions are modeled assuming that the Project will be able to obtain Tier 4 ***Final*** equipment even though this equipment only accounts for 4% of available off-road equipment currently available in California. As a result, the model represents the best-case scenario even though obtaining these types of equipment may not be feasible. Until the Project evaluates the feasibility of obtaining Tier 4 equipment, the model may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Vehicle Emission Factors

Review of the Project's CalEEMod output files demonstrates that numerous operational vehicle emission factors were manually altered in several of the models (Appendix AIR, pp. 1218-1232, 1298-1312, 1329-1343, 1389-1402). As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[26] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "EMFAC 2017" (Appendix AIR, pp. 1327). Furthermore, the DEIR states:

> "Operational emissions for the Irving Street Arrival, RAB and initial Aldea Housing Densification projects were estimated using the CalEEMod (version 2016.3.2) adjusted with recently EPA-approved Emfac2017 emissions factors" (p. 4.2-23).

However, these justifications are insufficient, as EMFAC refers to an ***entire database***, not a specific set of vehicle emission factors.[27] Thus, the DEIR and associated appendices should have either specified which

[25] "San Francisco Clean Construction Ordinance Implementation Guide for San Francisco Public Projects." August 2015, *available at:* https://www.sfdph.org/dph/files/EHSdocs/AirQuality/San_Francisco_Clean_Construction_Ordinance_2015.pdf.
[26] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[27] "EMFAC2017 Web Database." CARB, *available at:* https://arb.ca.gov/emfac/2017/.

input parameters were used to obtain the vehicle emission factors inputted in the model or disclosed the specific set of emission factors inputted into the model from the database. Without specific input parameters or a specific set of emission factors, we cannot verify the revised operational vehicle emission factors inputted into the models. This presents an issue, as the vehicle emission factors are used by CalEEMod to calculate the Project's emissions associated with operational on-road vehicles.[28] Thus, by including unsubstantiated changes to the Project's operational vehicle emission factors, the models may underestimate the Project's operational emissions and should not be relied upon to determine Project significance.

Unsubstantiated Change to Consumer Product Emission Factors

Review of the Project's CalEEMod output files demonstrates that the models include a manual reduction to the Project's anticipated consumer product reactive organic gas/volatile organic compound ("ROG/VOC") emission factor ("ROG_EF") value (see excerpt below) (Appendix AIR, pp. 1218, 1251, 1298, 1388).

Table Name	Column Name	Default Value	New Value
tblConsumerProducts	ROG_EF	2.14E-05	1.51E-05

As you can see in the excerpt above, the ROG_EF value was reduced by 29%, from 2.14E-05 to 1.51E-5 pounds of ROG/VOC per square foot per day ("lb ROG/SF/day"). As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[29] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "SF specific ROG Factor" (Appendix AIR, pp. 1218, 1250, 1297, 1388). However, this justification fails to provide a source for the revised emission factor or disclose what "SF specific" even means. In addition, the DEIR fails to mention this change whatsoever. As a result, we cannot verify the updated emission factor. This presents an issue, as consumer product emission factors are used by CalEEMod to calculate the Project's ROG/VOC emissions.[30] Thus, by including an unsubstantiated change to the Project's anticipated consumer product emission factor, the models underestimate the Project's area-source operational emissions and should not be relied upon to determine Project significance.

Unsubstantiated Reduction to Road Silt Loading Value

Review of the Project's CalEEMod output files demonstrates that the road silt loading value was manually reduced from the default value of 0.1- to 0.048-grams per square meter ("g/m^2") in the "CPHP Operational Existing," "CPHP Operational CPHP Campus Wide 2050," "UCSF Initial Phase Projects Operational," and "CPHP Operational 2050 No Project" models (see excerpt below) (Appendix AIR, pp. 1218, 1298, 1329, 1388).

Table Name	Column Name	Default Value	New Value
tblRoadDust	RoadSiltLoading	0.1	0.048

[28] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[29] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[30] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

As you can see in the excerpt above, the Road Silt Loading value was reduced from the default value of 0.1- to 0.048-g/m^2. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[31] According to the "User Entered Comments & Non-Default Data" table, the justification provided for this change is "CARB Method 7.9" (pp. 1218, 1297, 1328, 1388). However, review of the DEIR demonstrates that neither the road silt loading value nor CARB Method 7.9 is mentioned whatsoever.

Furthermore, review of CARB's *Miscellaneous Process Methodology 7.9* ("CARB Method 7.9") reveals that this change is unsubstantiated and incorrect for two (2) reasons. First, CARB Method 7.9 demonstrates that the Road Silt Loading values provided are outdated and have not been updated since 2008. As CalEEMod was most recently updated in 2016, values from 2008 would already be considered and should not be used to "update" the model. Second, review of CARB Method 7.9 reveals that a Road Silt Loading value of 0.048 applies to *San Diego*, not San Francisco (see excerpt below).[32]

Air Basin	County	Air District	2012 VMT (million VMT per year)	2008 HPMS Travel Fractions (2)			
				Freeway	Major	Collector	Local, Local Urban (3)
SD	San Diego	SD	30,297	0.553	0.319	0.080	0.048

As you can see in the excerpt above, the Road Silt Loading value of 0.048, as manually inputted into the models for the proposed Project, applies to *San Diego*, not San Francisco. As a result, we cannot verify the revised road silt loading value.

This presents an issue, as the road silt loading value is used by CalEEMod to calculate the fugitive dust emissions associated with operational vehicle trips on paved roads.[33] Thus, by including an unsubstantiated reduction to the Project's anticipated road silt loading value, the models may underestimate the Project's operational emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Trip Rates

Review of the Project's CalEEMod output files demonstrates that the operational vehicle trip rates were manually reduced in the "UCSF Initial Phase Project's Operational" model (see excerpt below) (Appendix AIR, pp. 1343).

Table Name	Column Name	Default Value	New Value
tblVehicleTrips	ST_TR	10.18	9.00
tblVehicleTrips	SU_TR	8.91	8.55
tblVehicleTrips	WD_TR	13.22	12.00

[31] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[32] https://ww3.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2016.pdf, Table 6, pp. 18.
[33] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.caleemod.com/, p. 29.

As a result, the model calculated Weekday, Saturday, and Sunday daily trip numbers of 2,734.28 (see excerpt below) (Appendix AIR, pp. 1349).

Land Use	Weekday	Saturday	Sunday
Apartments High Rise	147.68	147.68	147.68
Research & Development	2,586.60	2,586.60	2586.60
Total	2,734.28	2,734.28	2,734.28

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[34] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "Rate changes to match Adavant VMT" (Appendix AIR, pp. 1327). However, while the DEIR provides estimates of daily vehicle miles traveled ("VMT") per capita, the DEIR fails to indicate the *number of daily trips* that the Initial Phase of the proposed Project is expected to generate (p. 4.15-37, 4.15-42, 4.15-45). Furthermore, the DEIR indicates that the CPHP Future Phase would generate 52,200 daily trips, which is 1,809% higher than the number of trips included in the CPHP Initial Phase model (p. 4.15-29). As a result, we cannot verify the revised trip rates utilized in the model. By including unsubstantiated reductions to the Project's operational vehicle trip rates, the model may underestimate the Project's mobile-source operational emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Energy Use Values

Review of the Project's CalEEMod output files demonstrates that two (2) of the Project's operational models include unsubstantiated reductions to the Project's anticipated energy use values. As a result, the models may underestimate the Project's operational emissions.

First, the operational energy use values were manually reduced to 0 kilowatt hours per land use size per year ("KWhr/size/yr") in the "UCSF Initial Phase Project's Operational" model (see excerpt below) (Appendix AIR, pp. 1328).

Table Name	Column Name	Default Value	New Value
tblEnergyUse	LightingElect	741.44	0.00
tblEnergyUse	LightingElect	2.99	0.00
tblEnergyUse	NT24E	3,054.10	0.00
tblEnergyUse	NT24E	3.36	0.00
tblEnergyUse	T24E	426.45	0.00

As you can see in the excerpt above, the lighting electricity ("LightingElect"), Nontitle-24 electricity energy intensity ("NT24E"), and Title-24 electricity energy intensity ("T24E") values were each reduced to 0 KWhr/size/yr. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[35] According to the "User Entered Comments & Non-Default Data" table for the

[34] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[35] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

"UCSF Initial Phase Project's Operational" model, the justification provided for these changes is: "UCSF Net zweo electricity by 2030" (Appendix AIR, pp. 1328). Furthermore, regarding the Project's energy use, the DEIR states:

> "UCSF has committed to net zero electricity by 2025 and no GHG emissions are predicted from electrical usage under full buildout of the CPHP" (p. 4.7-36, Table 4.7-3).

However, simply because UCSF has a zero net electricity *goal* for *2025* or *2030*, does not guarantee that it will be achieved locally on the Project site. Furthermore, without a substantial justification, the proposed Project cannot claim that the *campus-wide* zero net electricity *goal* will result in a project-level reduction in electricity use. Moreover, we are unable to verify if this goal is for 2025 or 2030, as the DEIR and "User Entered Comments & Non-Default Data" table provide contradictory years. Finally, the DEIR acknowledges that this goal is for 2025, which is 5 years away, and the "User Entered Comments & Non-Default Data" table acknowledges that this goal is for 2030, which is 10 years away. As a result, we cannot verify that the Project would result in zero electricity use throughout the Project's *entire* operation.

Second, the operational energy use values were manually reduced in the "RAB Energy Emissions Only" model (see excerpt below) (Appendix AIR, pp. 1371-1372).

Table Name	Column Name	Default Value	New Value
tblEnergyUse	T24E	1.21	0.97
tblEnergyUse	T24NG	17.85	14.28

As you can see in the excerpt above, the T24E and Title-24 natural gas energy intensity ("T24NG") values were each reduced by 20%. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[36] According to the "User Entered Comments & Non-Default Data" table for the "RAB Energy Emissions Only" model, the justification provided for these changes is: "UCSF to meet 20% reduction over Title 24. ADjuste T24 demand 20%" (Appendix AIR, pp. 1371). Furthermore, while CPHP Mitigation Measure AIR-2a requires the Project to "[i]ncrease building energy efficiency below Title 24," CPHP Mitigation Measure AIR-2a fails to specify *what specific percentage below Title 24 standards would be required* (p. 2-15, Table 2-3). The DEIR and associated documents also fail to disclose any of the assumptions or calculations used to conclude this 20% reduction. Without disclosing this information, including an analysis of the feasibility of achieving this reduction, we are unable to confirm that it will actually be achieved on the Project site. As a result, we cannot verify the revised T24E and T24NG energy use values.

These unsubstantiated changes present an issue, as the energy use values are used by CalEEMod to calculate the Project's emissions associated with building electricity and natural gas usage.[37] Thus, by including unsubstantiated reductions to the Project's anticipated energy use values, the models

[36] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[37] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 43

underestimate the Project's operational emissions and should not be relied upon to determine Project significance.

Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated

The DEIR includes health risk assessments ("HRAs") for construction of the Irving Street Arrival, RAB, New Hospital, and Initial Aldea Housing Densification components of the Initial Phase of the Project and concludes that the resulting cancer risks would be 1.17, 2.91, 4.72, and 0.67 in one million, respectively, after the implementation of CPHP Mitigation Measure AIR-1a (see excerpts below) (p. 4.2-53-56, Table 4.2-15, Table 4.2-16, Table 4.2-17, Table 4.2-18).

Irving Street Arrival Construction:

TABLE 4.2-15
MITIGATED PROJECT HEALTH IMPACTS ESTIMATED, IRVING STREET ARRIVAL CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Resident – Offsite Receptor			
Project Construction[d]	1.17	<0.01	<0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

RAB Construction:

Project Construction[d]	4.72	<0.01	0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

Initial Aldea Housing Densification Construction:

TABLE 4.2-18
MITIGATED PROJECT HEALTH IMPACTS ESTIMATED, INITIAL ALDEA HOUSING DENSIFICATION CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Resident – Offsite Receptor			
Project Construction[d]	0.67	<0.01	<0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	N	N	No

As you can see in the excerpts above, the DEIR concludes that the construction of Irving Street Arrival, RAB, New Hospital, Initial Aldea Housing Densification components of the Project would result in mitigated cancer risks of 1.17, 2.91, 4.72, and 0.67 in one million, respectively. As a result, the DEIR concludes that the Project's mitigated construction-related cancer risks would not exceed the BAAQMD threshold of 10 in one million (p. 4.2-53-56, Table 4.2-15, Table 4.2-16, Table 4.2-17, Table 4.2-18). Furthermore, regarding the Project's operational health risk impacts, the DEIR states:

> "[P]otential incremental cancer risks associated with operation of the RAB were estimated. As discussed below, no new TAC sources such as emergency generators are included in the Irving Street Arrival or for the Aldea Housing Densification projects and therefore, these projects are not analyzed below for potential cancer risk from operational TAC sources" (p. 4.2-61).

Thus, as a result of an operational HRA prepared to evaluate the health risk impacts associated with the *emergency generators* included in the RAB component of the Project *only*, the DEIR concludes that the Project would result in an operational cancer risk of 0.26 in one million (see excerpt below) (p. 4.2-62, Table 4.2-19).

TABLE 4.2-19
ESTIMATED OPERATIONAL HEALTH IMPACTS OF THE RAB

Receptor Type	Cancer Risk	Chronic Hazard Index	Acute Hazard Index	$PM_{2.5}$ Concentration ($\mu g/m3$)[d]
Resident – Offsite Receptor				
Project Operations	0.26	<0.01	<0.01	0.01
Significance Threshold	10	1.0	1.0	0.3
Significant (Yes or No)?	N	No	No	No
Resident – Onsite Residence				
Project Operations	0.04	<0.01	<0.01	<0.01
Significance Threshold	10	1.0	1.0	0.3
Significant (Yes or No)?	N	No	No	No

As a result, the DEIR concludes that the Project's operational cancer risk would not exceed the BAAQMD threshold of 10 in one million (p. 4.2-62, Table 4.2-19). However, the DEIR's evaluation of the Project's health risk impacts, as well as the subsequent less-than-significant impact conclusion is incorrect for four (4) reasons.

First, as previously discussed, the DEIR's mitigated construction-related cancer risks rely upon the implementation of CPHP Mitigation Measure AIR-1a, which is included in the Project's CalEEMod models

as Tier 4 *Final* construction equipment. However, this is incorrect, as CPHP Mitigation Measure AIR-1a fails to indicate whether Tier 4 *Interim* or Tier 4 *Final* construction equipment would be required and as such, impacts may be reduced by an overestimated amount. Furthermore, as discussed above, the DEIR fails to evaluate the feasibility of obtaining a construction fleet of entirely Tier 4 *Final* equipment. As a result, the application of Tier 4 *Final* mitigation in the DEIR's CalEEMod models is unsupported, and the DEIR's reliance upon this mitigation measure is incorrect. As such, without specifying which type of Tier 4 mitigation would be implemented and evaluating the feasibility of obtaining this equipment, the DEIR should not rely on CPHP Mitigation Measure AIR-1a to reduce the health risk impacts associated with Project construction to a less than significant level.

Second, while DEIR includes an HRA assessing the health risk impacts associated with the *emergency generators* associated with the operation of the RAB component of the Initial Phase of the Project, the DEIR fails to evaluate the health risk impacts resulting from the Project's *entire* operation. This is incorrect, as the DEIR indicates that the CPHP would result in 52,200 daily vehicle trips throughout operation, which will result in additional exhaust (p. 4.15-29, Table 4.15-7). Furthermore, while the DEIR indicates that operational emissions of toxic air contaminants ("TACs") would occur as a result of mobile sources, in addition to stationary sources, the DEIR fails to provide any evaluation of the potential health risk impacts associated with these emissions whatsoever (p. 4.2-58). As such, this *partial* operational HRA cannot be used to determine impacts from the *entire* Project's operations, and the DEIR's less than significant health risk impact should not be relied upon. As such, we recommend that an updated assessment of health risk impacts posed to nearby sensitive receptors from Project operation be included in an updated EIR for the Project.

Third, review of the DEIR demonstrates that, while the Project did conduct several *partial* construction HRAs, as well as one *partial* operational HRA, that evaluate the health risk impacts to nearby, existing receptors, the HRA fails to evaluate the *cumulative* lifetime cancer risk to nearby, existing receptors as a result of Project construction and operation *together*. According to OEHHA guidance, as referenced by the DEIR, "the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location".[38] However, the HRAs conducted in the DEIR fail to sum each age bin to evaluate the total cancer risk over the course of the Project's construction and operation, as is required by the guidance. This is incorrect and thus, an updated analysis should quantify the Project's construction and operational health risks and then sum them to compare to the BAAQMD threshold of 10 in one million, as referenced by the DEIR (p. 4.2-16).

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR concludes that the Project would result in an annual increase in greenhouse gas ("GHG") emissions of 61,815 metric tons of carbon dioxide equivalents per year ("MT CO_2e/year"), as well as a service population efficiency of 10.9 metric tons of carbon dioxide equivalents per service population

[38] "Guidance Manual for preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf p. 8-4

per year ("MT CO_2e/SP/year"), which indicates a significant GHG impact (p. 4.7-36). As a result, the DEIR includes CPHP Mitigation Measure GHG-1c, which states:

> "[Mitigation Measure GHG-1c] is identified to reduce GHG emissions under the CPHP to a net zero increase and a less than significant impact with mitigation. To achieve the net zero increase, CPHP Mitigation Measure GHG-1c sets forth a numerical performance standard based on the existing GHG emissions inventory for the Parnassus Heights campus site and requires any GHG emissions in excess of the existing inventory of 125,426 MT CO2e per year to be offset" (p. 4.7-37).

Furthermore, the DEIR relies upon the Project's consistency with CARB's 2017 *Scoping Plan* and the Plan Bay Area 2040 in order to conclude that the Project would result in a less than significant GHG impact (p. 4.7-44 – 4.7-45). Specifically, the DEIR states:

> "By implementing the updated GHGRS and CPHP Mitigation Measures GHG-1a through 1c, thereby achieving consistency with UCSF's CNI, the CPHP would be consistent with CARB's 2017 Scoping Plan Update and with Executive Order S-3-05, which established a goal of reducing California's GHG emissions to 80 percent below the 1990 level by the year 2050. The CPHP would also be consistent with Plan Bay Area 2040, which includes the Regional Transportation Plan, and was adopted as the Bay Area's Sustainable Communities Strategy pursuant to California Senate Bill 375" (p. 4.7-44 – 4.7-45).

However, the DEIR's quantitative and qualitative GHG analyses, as well as the subsequent less than significant impact conclusion, are incorrect for the following three (3) reasons:

1) The DEIR's quantitative analysis of the Project's GHG emissions relies upon an incorrect and unsubstantiated air model;
2) The DEIR incorrect relies upon the Project's consistency with CARB's 2017 *Scoping Plan* to determine Project significance; and
3) The DEIR incorrect relies upon the Project's consistency with the Plan Bay Area 2040 to determine Project significance.

1) Incorrect and Unsubstantiated Analysis of Emissions

As discussed above, the DEIR concludes that the proposed Project would generate net annual GHG emissions of 61,815 MT CO_2e/year, as well as a service population efficiency of 10.9 MT CO_2e/SP/year. However, the DEIR's quantitative GHG analysis is underestimated and unsubstantiated. As previously discussed, when we reviewed the Project's CalEEMod output files, provided as Appendix AIR to the DEIR, we found that several of the values inputted into the model are not consistent with information disclosed in the DEIR and associated documents. As a result, the model underestimates the Project's GHG emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. An updated EIR should be prepared that adequately assesses the potential GHG impacts that construction and operation of the proposed Project may have on the surrounding environment.

2) Incorrect Reliance upon CARB's 2017 Scoping Plan

As previously discussed, the DEIR relies upon the Project's consistency with CARB's *Scoping Plan* to determine the Project's GHG significance. However, this is incorrect for two (2) reasons.

First, many of the measures include future reduction targets at the city, state, and local levels. However, just because the *state/region/agency* have these *goals* does not mean that they will be achieved locally on the Project site. As such, the DEIR cannot claim that the Project complies with these measures, when they may not even be achieved.

Two, review of CARB's *Scoping Plan* demonstrates that the proposed Project is inconsistent with several measures, including but not limited to the analysis below:

CARB 2017 Scoping Plan[39]	
Measures – Construction	
Divert and recycle construction and demolition waste, and use locally-sourced building materials with a high recycled material content to the greatest extent feasible	Here, the DEIR fails to mention or discuss the feasibility of diverting and recycling construction and demolition waste. Furthermore, the DEIR also fails to mention or discuss the feasibility of using locally-sourced building materials with a high recycled material content. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Utilize existing grid power for electric energy rather than operating temporary gasoline/diesel powered generators	Here, the DEIR fails to mention the use of existing grid power for electric energy rather than operational gasoline or diesel powered generators. Furthermore, the DEIR discusses how the Project site contains two gas turbine generators and 14 diesel generators (Table 4.2-4, p. 4.2-13). As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Measures – Operation	
Allow for new construction to install fewer on-site parking spaces than required by local municipal building code, if appropriate	Here, the DEIR fails to mention or allow the Project to install fewer on-site parking spaces than required by local municipal building code. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.

[39] California Air Resources Board ("CARB") (Jan. 2017) 2017 Scoping Plan, Appendix B-Local Action, *available at:* https://ww3.arb.ca.gov/cc/scopingplan/2030sp_appb_localaction_final.pdf, p. 8-10.

Require on-site renewable energy generation	Here, the DEIR states that "CPHP operations would require long-term consumption of energy in the form of electricity, natural gas, gasoline, and diesel fuel" and that "the CPHP would not require additional power generation plants… to be constructed" (p. 4.5-20, 4.5-25). Thus, the DEIR fails to require or discuss the feasibility of on-site renewable energy generation. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require solar-ready roofs	Here, the DEIR fails to mention or require solar-ready roofs. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require low-water landscaping in new developments (see CALGreen Divisions 4.3 and 5.3 and the Model Water Efficient Landscape Ordinance [MWELO], which is referenced in CALGreen). Require water efficient landscape maintenance to conserve water and reduce landscape waste.	Here, while the DEIR states that UCSF "shall *strive* to reduce potable water used for irrigation by converting to recycled water, implementing efficient irrigation systems, drought tolerant planting selections, and/or by removing turf," the Project fails to require or commit to the implementation of water efficient landscape. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Achieve Zero Net Energy performance building standards prior to dates required by the Energy Code	Here, the DEIR fails to mention or discuss the feasibility of achieving Zero Net Energy performance building standards prior to dates required by the Energy Code. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Develop a rideshare program targeting commuters to major employment centers	Here, the DEIR fails to mention developing a rideshare program to target commuters to major employment centers. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require gas outlets in residential backyards for use with outdoor cooking appliances such as gas barbeques if natural gas service is available	Here, the DEIR fails to mention or discuss the feasibility of requiring gas outlets in residential backyards for use with outdoor cooking appliances. As such, the proposed Project is not consistent

	with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require the installation of electrical outlets on the exterior walls of both the front and back of residences to promote the use of electric landscape maintenance equipment	Here, the DEIR fails to mention or discuss the feasibility of requiring the design of electric outlets on the exterior walls of both the front and back of residences to promote electric landscape maintenance equipment. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require the design of the electric outlets and/or wiring in new residential unit garages to promote electric vehicle usage	Here, the DEIR fails to mention or discuss the feasibility of requiring the design of electric outlets and/or wiring in residential unit garages to promote electric vehicle usage. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Provide electric outlets to promote the use of electric landscape maintenance equipment to the extent feasible on parks and public/quasi-public lands	Here, the DEIR fails to mention or discuss the feasibility of providing electric outlets to promote the use of electric landscape maintenance equipment. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require each residential unit to be "solar ready," including installing the appropriate hardware and proper structural engineering	Here, the DEIR fails to mention or discuss the feasibility of requiring each residential unit to be "solar ready." The DEIR also fails to mention or discuss the feasibility of requiring the appropriate hardware and proper structural engineering to be "solar ready." As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require the installation of energy conserving appliances such as on-demand tank-less water heaters and whole-house fans	Here, the DEIR discusses Energy Efficiency Reduction Measures, specifically that "UCSF *could* establish energy efficiency criteria for appliances installed on the Parnassus Heights campus site" (p. 4.7-37). While the DEIR states that the Project will comply with this measure because "CPHP [is] considered to have net zero electricity by 2025" (p. 4.7-37), this is incorrect. Net zero electricity by 2025 is in reference to the UC system-wide Carbon Neutrality Initiative goal of carbon neutrality across all UC campuses by 2025. Because this is a UC system-wide *goal* for net zero carbon emissions,

	we are unable to verify that this will result in energy efficient appliances locally at the Project site. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require each residential and commercial building equip buildings with energy efficient AC units and heating systems with programmable thermostats/timers	Here, while the DEIR discusses "improvements that involve building renovations are likely to improve building efficiency with potential reduction of operational emissions of the CUP for heating and cooling," DEIR fails to mention or discuss the feasibility of requiring Project to include energy efficient AC units and heating systems (p. 4.2-43). The DEIR also fails to mention or discuss the feasibility of requiring these AC units and heating systems to include programmable thermostats/timers. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require large-scale residential developments and commercial buildings to report energy use, and set specific targets for per-capita energy use	Here, the DEIR fails to mention or require the Project to report energy use or set specific targets for per-capita energy use. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Require the use of energy-efficient lighting for all street, parking, and area lighting	Here, the DEIR fails to provide any explanation of how this measure would be implemented, monitored, and enforced on the Project site. As such, we cannot verify that the proposed Project is consistent with this measure, and the DEIR lacks substantial evidence to support its consistency determination.
Require the landscaping design for parking lots to utilize tree cover and compost/mulch	Here, the DEIR fails to mention or discuss the feasibility of requiring the landscape design for the Project's proposed parking to utilize tree cover and compost/mulch. As such, the proposed Project is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency determination.
Incorporate water retention in the design of parking lots and landscaping, including using compost/mulch	Here, the DEIR fails to mention or discussion the incorporation of water retention in the design of parking lots and landscaping, specifically including using compost or mulch. As such, the proposed Project is not consistent with this measure and the

	DEIR lacks substantial evidence to support its consistency determination.

As the table above indicates, the DEIR fails to provide sufficient information and analysis to determine Project consistency with numerous measures under CARB's *Scoping Plan*. Thus, we cannot verify that the proposed Project will result in less than significant GHG impacts, as claimed in the DEIR. As a result, we recommend that an updated EIR include further information and analysis in order to conclude that the proposed Project would be consistent with CARB's *Scoping Plan*.

3) Failure to Demonstrate Consistency with Plan Bay Area 2040

As discussed above, the DEIR relies upon the Project's consistency with the Plan Bay Area 2040 (p. 4.7-45). However, this is incorrect for two (2) reasons.

First, according to the Plan Bay Area 2040:

> "It is important to emphasize that the region's cities and counties retain local land use authority and that local jurisdictions will continue to determine where future development occurs. Plan Bay Area 2040 is supported through implementation efforts such as neighborhood-level planning grants for PDAs and local technical assistance. *The plan does not mandate any changes to* local zoning rules, general plans *or processes for reviewing projects; nor is the plan an enforceable direct or indirect cap on development locations or targets in the region*. As is the case across California, the Bay Area's cities, towns and counties maintain control of all decisions to adopt plans and to permit or deny development projects" (emphasis added).[40]

As you can see in the excerpt above, the Plan Bay Area 2040 does not have the jurisdiction to *require* any changes. The Plan instead states that it *cannot* be used for reviewing projects or as an enforceable cap on development targets. As such, the DEIR's claim that the Project is consistent with the Plan Bay Area 2040 and can be used to determine less than significant impacts is incorrect and unsubstantiated.

Second, the Plan Bay Area 2040 does not qualify as an adequate GHG reduction plans or Climate Action Plan ("CAP"). CEQA Guidelines §§ 15064.4(b)(3) and 15183(b) allows a lead agency to consider a project's consistency with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. When read in conjunction, CEQA Guidelines §§ 15064.4(b)(3) and 15183.5(b)(1) make clear qualified GHG reduction plans or CAPs should include the following features:

(1) **Inventory**: Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities (e.g., projects) within a defined geographic area (e.g., lead agency jurisdiction);

[40] "Plan Bay Area 2040." Metropolitan Transportation Commission (MTC) and Association of Bay Area Governments (ABAG), July 2017, *available at:* http://2040.planbayarea.org/sites/default/files/2020-02/Final_Plan_Bay_Area_2040.pdf, p. 44.

(2) **Establish GHG Reduction Goal**: Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;
(3) **Analyze Project Types**: Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;
(4) **Craft Performance Based Mitigation Measures**: Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
(5) **Monitoring**: Establish a mechanism to monitor the CAP progress toward achieving said level and to require amendment if the plan is not achieving specified levels;

Collectively, the above-listed features tie qualitative measures to quantitative results, which in turn become binding via proper monitoring and enforcement by the jurisdiction—all resulting in real GHG reductions for the jurisdiction as a whole, and substantial evidence demonstrating that a project's incremental contribution is not cumulatively considerable. Here, however, the DEIR fails to demonstrate that the Plan Bay Area 2040 includes the above-listed requirements to be considered a qualified GHG Reduction Plan for the City. As such, the DEIR leaves an analytical gap showing that compliance with said plan can be used for a project-level significance determination. Thus, the DEIR's GHG analysis regarding the Plan Bay Area 2040 should not be relied upon.

Third, the Plan Bay Area 2040's EIR discloses potential environmental impacts of the Plan, and provides mitigation measures in a Mitigation, Monitoring, and Reporting Program ("MMRP") for the Project. However, review of the Plan Bay Area 2040 EIR reveals that the proposed Project fails to address and is inconsistent with numerous mitigation measures, including but not limited to those listed below:

Plan Bay Area 2040[41]
EIR Mitigation Measures
Transportation
Mitigation Measure 2.1-3-3(b) Transportation demand management (TDM) strategies shall be incorporated into individual land use and transportation projects and plans, as part of the planning process. Local agencies shall incorporate strategies identified in the Federal Highway Administration's publication: Integrating Demand Management into the Transportation Planning Process: A Desk Reference (August 2012) into the planning process (FHWA 2012). For example, the following strategies may be included to encourage use of transit and non-motorized modes of transportation and reduce vehicle miles traveled on the region's roadways:

[41] "Plan Bay Area 2040 Draft Environmental Impact Report." MTC and ABAG, April 2017, *available at:* http://2040.planbayarea.org/sites/default/files/2017-07/PBA%202040%20DEIR_0_1.pdf, p. ES-11, Table ES-2.

- incorporate supporting infrastructure for non-motorized modes, such as, bike lanes, secure bike parking, sidewalks, and crosswalks;
- provide incentives to use alternative modes and reduce driving, such as, universal transit passes, road and parking pricing;
- implement parking management programs, such as parking cash-out;
- develop TDM-specific performance measures to evaluate project-specific and system-wide performance;
- incorporate TDM performance measures in the decision-making process for identifying transportation investments;
- implement data collection programs for TDM to determine the effectiveness of certain strategies and to measure success over time; and
- set aside funding for TDM initiatives.

The increase in per capita VMT on facilities experiencing LOS F represents a significant impact compared to existing conditions. To assess whether implementation of these specific mitigation strategies would result in measurable traffic congestion reductions, implementing actions may need to be further refined within the overall parameters of the proposed Plan and matched to local conditions in any subsequent project-level environmental analysis.

Mitigation Measure 2.1-7

Implementing agencies and/or project sponsors shall implement the following measure, where feasible and necessary based on project- and site-specific considerations. Implementing agencies shall require implementation of best practice strategies regarding construction activities on the transportation system and apply recommended applicable mitigation measures as defined by state and federal agencies. Examples of mitigation measures include, but are not limited to, the following:

- prepare a transportation construction plan for all phases of construction;
- identify arrival/departure times for trucks and construction workers to avoid peak periods of adjacent street traffic and minimize traffic affects;

encourage construction workers to use transit, carpool, and other sustainable transportation modes when commuting to and from the site.

Air Quality

Mitigation Measure 2.2-2)

When screening levels are exceeded (see Table 2.2-8 or those most currently updated by BAAQMD), implementing agencies and/or project sponsors shall implement measures, where applicable, feasible, and necessary based on project- and site-specific considerations, that include, but are not limited to the following:

Construction Best Practices for Exhaust:

- The applicant/general contractor for the project shall submit a list of all off-road equipment greater than 25 horsepower (hp) that would be operated for more than 20 hours over the entire duration of project construction, including equipment from subcontractors, to BAAQMD for

review and certification. The list shall include all information necessary to ensure the equipment meets the following requirement:

1. Be zero emissions OR
2. have engines that meet or exceed either EPA or ARB Tier 2 off-road emission standards; and
3. have engines that are retrofitted with an ARB Level 3 Verified Diesel Emissions Control Strategy (VDECS), if one is available for the equipment being used. Equipment with engines that meet Tier 4 Interim or Tier 4 Final emission standards automatically meet this requirement; therefore, a VDECS would not be required

- All construction equipment shall be maintained and properly tuned in accordance with the manufacturers' specifications.
- Portable diesel generators shall be prohibited. Grid power electricity should be used to provide power at construction sites; or propane and natural gas generators may be used when grid power electricity is not feasible.

Construction Best Practices for Dust:

- All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph.
- Wind breaks (e.g., trees, fences) shall be installed on the windward side(s) of actively disturbed areas of construction. Wind breaks should have at maximum 50 percent air porosity.
- Vegetative ground cover (e.g., fast-germinating native grass seed) shall be planted in disturbed areas as soon as possible and watered appropriately until vegetation is established.
- The simultaneous occurrence of excavation, grading, and ground-disturbing construction activities on the same area at any one time shall be limited. Activities shall be phased to reduce the amount of disturbed surfaces at any one time.
- All trucks and equipment, including their tires, shall be washed off before leaving the site.
- Site accesses to a distance of 100 feet from the paved road shall be treated with a 6- to 12-inch compacted layer of wood chips, mulch, or gravel.
- Sandbags or other erosion control measures shall be installed to prevent silt runoff to public roadways from sites with a slope greater than one percent.

These BMPs are consistent with recommendations in BAAQMD's CEQA guidelines and Planning Healthy Places (BAAQMD 2010b, BAAQMD 2016). Applicable mitigation measures shall be required at the time grading permits are issued.
Here, the

As such, the DEIR is not consistent with this measure and the DEIR lacks substantial evidence to support its consistency evaluation.

Mitigation Measure 2.2-5(a)

When locating sensitive receptors in TAC risk areas, implementing agencies and/or project sponsors shall implement measures, where feasible and necessary based on project- and site-specific considerations that include, but are not limited to the following:

- Install, operate and maintain in good working order a central heating, ventilation and air conditioning (HVAC) system or other air intake system in the building, or in each individual unit, that meets or exceeds a minimum efficiency reporting value (MERV) of 13 (MERV-16 for projects located in the West Oakland Specific Plan area) or higher. The HVAC system shall include the following features: Installation of a high efficiency filter and/or carbon filter to filter particulates and other chemical matter from entering the building. Either high efficiency particulate air (HEPA) filters or American Society of Heating, Refrigeration, and Air-Conditioning Engineers (ASHRAE) certified 85% supply filters shall be used.
- Maintain, repair and/or replace HVAC system on an ongoing and as needed basis or shall prepare an operation and maintenance manual for the HVAC system and the filter. The manual shall include the operating instructions and the maintenance and replacement schedule. This manual shall be included in the Covenants, Conditions and Restrictions (CC&Rs) for residential projects and/or distributed to the building maintenance staff. In addition, the applicant shall prepare a separate homeowners manual. The manual shall contain the operating instructions and the maintenance and replacement schedule for the HVAC system and the filters.
- Install passive electrostatic filtering systems with low air velocities (i.e., less than 1 mph).
- Individual and common exterior open space and outdoor activity areas proposed as part of individual projects shall be located as far away as possible within the project site boundary, face away major freeways, and shall be shielded from the source (i.e., the roadway) of air pollution by buildings or otherwise buffered to further reduce air pollution for project occupants.
- Locate air intakes and design windows to reduce PM exposure (e.g., windows nearest to the roadway do not open).
- If sensitive receptors are located near a distribution center, residents shall not be located immediately adjacent to a loading dock or where trucks concentrate to deliver goods.
- Sensitive receptors within buildings shall be located in areas upwind of major roadway traffic to reduce exposure to reduce cancer risk levels and exposure to PM2.5.
- Planting trees and/or vegetation between sensitive receptors and pollution source. Trees that are best suited to trapping PM shall be planted, including one or more of the following species: Pine (Pinus nigra var. maritima), Cypress (X Cupressocyparis leylandii), Hybrid popular (Populus deltoids X trichocarpa), California pepper tree (Schinus molle) and Redwoods (Sequoia sempervirens).
- Loading docks shall be required to include electric hookups for visiting trucks.
- Idling of heavy duty diesel trucks at these locations shall be prohibited or limited to no more than 2 minutes.
- If within the project site, existing and new diesel generators shall meet ARB's Tier 4 emission standards.

• Emissions from diesel trucks shall be reduced through establishing truck routes to avoid residential neighborhoods or other land uses serving sensitive populations, such as hospitals, schools, and child care centers. A truck route program, along with truck calming, parking and delivery restrictions, shall be implemented to direct traffic activity at non-permitted sources and large construction projects. These BMPs are consistent with recommendations in BAAQMD's CEQA guidelines and Planning Healthy Places (BAAQMD 2011, BAAQMD 2016).
Climate Change and Greenhouse Gases
Mitigation Measure 2.5-4(b) Implementing agencies and/or project sponsors shall implement measures, where feasible and necessary based on project- and site-specific considerations that include, but are not limited to, coordination with BCDC, Caltrans, local jurisdictions (cities and counties), and other transportation agencies to develop Transportation Asset Management Plans that consider the potential impacts of sea level rise over the life cycle of threatened assets.
Mitigation Measure 2.5-4(c) Implementing agencies shall require project sponsors to incorporate the appropriate adaptation strategy or strategies to reduce the impacts of sea level rise on specific local transportation and land use development projects, where feasible, based on project- and site-specific considerations. Potential adaptation strategies are included in the Adaptation Strategies (see Appendix F of this Draft EIR).

As the above table indicates, the DEIR fails to provide sufficient information and analysis to determine Project consistency with the required mitigation measures of the Plan Bay Area 2040. Thus, we cannot verify that the Project is consistent with the Plan, as claimed in the DEIR. As a result, we recommend that the Project not be approved until an updated EIR provide further information and analysis in order to conclude consistency for the proposed Project.

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

Sincerely,

Matt Hagemann, P.G., C.Hg.

Paul E. Rosenfeld, Ph.D.

SWAPE Technical Consultation, Data Analysis and Litigation Support for the Environment

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Coloradao.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

Hagemann, M.F., 2004. Invited testimony to a California Senate committee hearing on air toxins at schools in Southern California, Los Angeles.

Brown, A., Farrow, J., Gray, A. and **Hagemann, M.**, 2004. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to the Ground Water and Environmental Law Conference, National Groundwater Association.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Arizona and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Phoenix, AZ (served on conference organizing committee).

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in the Southwestern U.S. Invited presentation to a special committee meeting of the National Academy of Sciences, Irvine, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a tribal EPA meeting, Pechanga, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a meeting of tribal repesentatives, Parker, AZ.

Hagemann, M.F., 2003. Impact of Perchlorate on the Colorado River and Associated Drinking Water Supplies. Invited presentation to the Inter-Tribal Meeting, Torres Martinez Tribe.

Hagemann, M.F., 2003. The Emergence of Perchlorate as a Widespread Drinking Water Contaminant. Invited presentation to the U.S. EPA Region 9.

Hagemann, M.F., 2003. A Deductive Approach to the Assessment of Perchlorate Contamination. Invited presentation to the California Assembly Natural Resources Committee.

Hagemann, M.F., 2003. Perchlorate: A Cold War Legacy in Drinking Water. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. From Tank to Tap: A Chronology of MTBE in Groundwater. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. A Chronology of MTBE in Groundwater and an Estimate of Costs to Address Impacts to Groundwater. Presentation to the annual meeting of the Society of Environmental Journalists.

Hagemann, M.F., 2002. An Estimate of the Cost to Address MTBE Contamination in Groundwater (and Who Will Pay). Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to a meeting of the U.S. EPA and State Underground Storage Tank Program managers.

Hagemann, M.F., 2001. From Tank to Tap: A Chronology of MTBE in Groundwater. Unpublished report.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education:

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on VOC filtration.
M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.
B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience:

Dr. Rosenfeld is the Co-Founder and Principal Environmental Chemist at Soil Water Air Protection Enterprise (SWAPE). His focus is the fate and transport of environmental contaminants, risk assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling, oil spills, boilers, incinerators and other industrial and agricultural sources relating to nuisance and personal injury. His project experience ranges from monitoring and modeling of pollution sources as they relate to human and ecological health. Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing petroleum, chlorinated solvents, pesticides, radioactive waste, PCBs, PAHs, dioxins, furans, volatile organics, semi-volatile organics, perchlorate, heavy metals, asbestos, PFOA, unusual polymers, MtBE, fuel oxygenates and odor. Dr. Rosenfeld has evaluated greenhouse gas emissions using various modeling programs recommended by California Air Quality Management Districts.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist
Bureau of Land Management, Kremmling Colorado 1990; Scientist

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993.

Deposition and/or Trial Testimony:

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants

APPENDIX C: 1987 MEMORANDUM OF UNDERSTANDING

On February 17, 1987, UCSF entered into a Memorandum of Understanding (MOU) with the City and County of San Francisco regarding communication and oversight of University master planning, construction and real estate utilization. The MOU was signed by the Chancellor and the Vice Chancellor for Resource Management and Planning Services of UCSF and by the Mayor and Director of Planning of San Francisco. Because of its brevity and importance, the MOU is included here in its entirety:

I. The intent of this memorandum of understanding is to foster harmonious relations between the City and County of San Francisco (hereafter City) and the University of California, San Francisco (hereafter UCSF) regarding the growth and development of UCSF facilities within the City's boundaries.

II. Each party is chartered to operate under provisions of the State Constitution which govern their cooperation with neighboring communities, and these factors are recognized by all parties.

   1. The University of California, Board of Regents, is the overseeing body of UCSF.
   2. Transfer of title to any lands of UCSF must be accomplished in accordance with existing statutes or through the Board of Regents.
   3. The City Charter spells out the duties, responsibilities, and limitations of the Mayor, Board of Supervisors, and Department of City Planning.
   4. The Director of the Department of City Planning is responsible to the City Planning Commission and he is required at all times to represent the best City planning interest.
   5. Existing direct relationships between City departments and UCSF programs located at UCSF will continue without reference to this memorandum of agreement. This specifically includes all health programs and routine operational matters.

III. The principal concerns of this agreement are the responsibilities of the City and UCSF for oversight of land uses and the development, maintenance and use of physical facilities.

   1. The City is responsible for the reasonable development, maintenance and reuse of land in accordance with the Master Plan of the City and County, as adopted and modified from time to time by the City Planning Commission and as expressed in the City's zoning ordinance. The City requires that all major institutions submit institutional master plans to the City Planning Commission for their review.
   2. UCSF maintains a health science center and the requisite facilities to provide educational programs, research and medical services, which may require expansion, contraction or modification over time. The UCSF institutional master plan is submitted to the University of California, Board of Regents for review and approval. The UCSF campus agrees to continue submitting its long-range development plan to the City Planning Commission.

IV. In an effort to improve communication between UCSF and the City regarding changes in the land use and development plans of UCSF, the parties to this memorandum agree that:

   1. UCSF staff and the City Planning Commission staff will meet at least once a year to review long-range development plans for UCSF and City development and services plans. Such meetings will be convened by UCSF and the results of them reported in writing to the City Planning Commission at a regularly scheduled meeting.
   2. UCSF will advise the City in writing of all matters concerning master planning, construction and real property utilization initiated by UCSF which may have an impact on the City. The City Planning Commission will review such proposals and advise UCSF in writing as to the conformance of such development with the Master Plan of San Francisco and Planning Code Section 304.5 (Institutional Master Plans) with recommendations, if any, for amendment to the proposal.
   3. UCSF will modify its 1982 Long Range Development Plan, as required over time, and the City Planning Commission may hold at least one public hearing on all such modifications prior to preparation of written comments.
   4. UCSF shall notify the City of and the City shall attend hearings conducted by UCSF pursuant to the California Environmental Quality Act.
   5. UCSF will maintain campus advisory committees, composed of neighborhood representatives, at both its Parnassus Heights and Laurel Heights campuses, and will invite the City Planning Commission, Municipal Railway and Department of Public Works to participate in those meetings. The Mayor will urge those City departments to participate on the Committees.
   6. The City Planning Commission will advise UCSF in

writing of all matters coming to the Commission's attention concerning master plans, construction and real estate utilization which may have an impact on UCSF.

7. Should the City Planning Commission and UCSF disagree on any matter which is the subject of this MOU, either party may request the participation of the Mayor and the Chancellor in attempting to resolve the dispute.

V. This memorandum does not confer or surrender any authority beyond that already possessed by each party concerned. Further, it does not abrogate any requirement by either party to coordinate matters of master planning with the Association of Bay Area Governments (ABAG) or other appropriate agencies.

1. For the City, the Director of City Planning shall be the responsible designee.
2. For UCSF, the Vice Chancellor for Resource Management and Planning Services shall be the responsible designee.

INTRODUCTION

The California Environmental Quality Act (CEQA)[1] requires governmental agencies to provide a public accounting of all potentially adverse impacts of decisions that change the environment. While some consider CEQA to be concerned exclusively with the physical environment, the aims of CEQA extend to human well being. For example, CEQA's policy goals include maintaining "…conditions under which man and nature can exist in productive harmony to fulfill the social and economic requirements of present and future generations," and "..,providing a decent home and satisfying living environment for every Californian." (California Government Code §21000) Under CEQA, a local agency must consider reasonably foreseeable "… environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly."[2]

Traditionally, health and human impact assessment within environmental review has focused on hazardous environmental agents such as air pollutants. While such impacts are important, the relationships between the physical environment and human health include many other neglected dimensions.

Unmet housing needs in San Francisco result in particularly significant public health costs. Inadequate or unaffordable housing forces San Francisco residents into crowded or substandard conditions; requires them to compromise access to jobs and services, and quality education; and requires them to work multiple jobs to make ends meet. The Department of Public Health witnesses these effects when we care for the homeless, in the course of our enforcement of environmental health and housing standards, and through our efforts to improve the housing of those with environmentally related illnesses such as asthma.

Unmet housing needs also have indirect environmental and economic consequences. High housing costs are disincentives for business development or expansion which also means reduced economic opportunities for residents. High cost housing in regional job centers such as San Francisco is one factor that drives development of lower cost housing on the urban fringe, contributing to traffic congestion and air pollution, as well as the loss of regional farmland and open space.[3]

As one strategy to ensure adequate affordable housing in San Francisco, the San Francisco Department of Health, in partnership with the City's Department of Planning, has researched how environmental impact analysis might more

[1] CEQA, similar to NEPA, predated the more proscriptive environmental regulatory approaches such as the Clean Water Act aiming instead to ensure transparency and accountability in decision making. CEQA requires public agencies to produce an Environmental Impact Report (EIR) prior to making public decision that may have significant adverse environmental effects. (California Public Resources Code, Environmental Protection, §21000) An EIR must analysis on all potentially significant adverse environmental impacts, feasible alternatives, and steps to avoid or limit impacts. If an EIR concludes that a project would have significant impacts, the agency can not approve it until it either they determine that mitigation or alternatives are infeasible or that the project's benefits outweigh the adverse impacts.

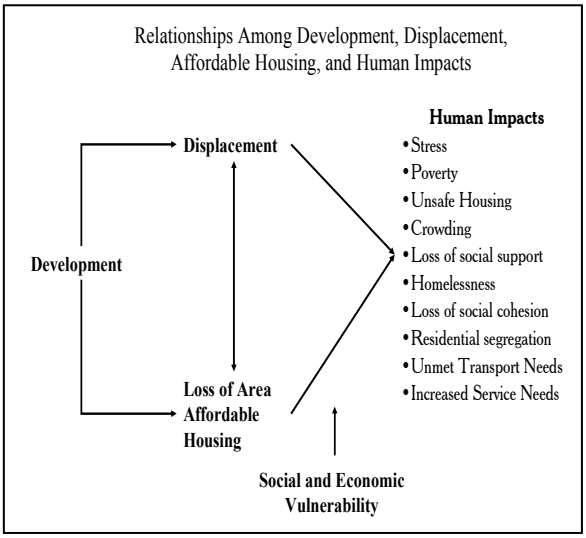
[2] CEQA Guidelines. Title 14. California Code of Regulations. (Accessed at http://ceres.ca.gov/topic/env_law/ceqa/guidelines/)

[3] http://www.brookings.edu/views/speeches/downs/20030529_downs.htm

comprehensively account for impacts on affordable housing and residential displacement.

CEQA guidelines allow cities to determine their own impacts of concern, screening criteria, assessment and evaluative methodologies, and preferred mitigation measures. In addition, though the guidelines provide a list of potential adverse impacts on the environment they do not provide a way of judging whether the effects are significant in a particular set of circumstances. One way for local jurisdictions and public agencies to ensure consistent and objective determinations in their environmental review is to adopt a 'threshold of significance.'[4]

CEQA authorizes local governments to adopt by "…ordinance, resolution, rule, or regulation" locally specific "objectives, criteria, and procedures for the evaluation of projects." (California Government Code §21082). These 'thresholds of significance' are qualitative or quantitative standards that provide local agencies a way to differentiate whether a particular environmental effect is significant. Thresholds may be based on health based standards, service capacity standards, ecological tolerance standards, policies and goals within the city's general plan, or any other standard based on environmental quality. Ideally, threshold development should involve public participation and the documentation of a threshold should include (1) a definition for the effect (2) the reasons the effect is significant (3) the criteria at which effect becomes significant (4) references and sources (5) potential mitigation measures if available.



Methods to consider impacts on housing affordability and residential displacement exist; however, these methods have not been applied to impact assessment practice in San Francisco. In California, several local jurisdictions (Los Angeles, Santa Barbara, and LakeTahoe) have adopted comprehensive, environmental review guidelines which include thresholds of significance for housing impacts. San Francisco adopted level of service standards (LOS) for the evaluation of impacts on automobile and transit in 2002 but does not have consistent evaluative criteria for several other important environmental effects included effects on housing.

This technical report outlines several ways that impacts on housing affordability and residential displacement can be included in the process of environmental review. It also provides the groundwork for developing local significance thresholds criteria for housing impacts. We have organized this document into three sections: (1) Social and health consequences of housing affordability and residential displacement; (2)

[4] Thresholds of Significance: Criteria for Defining Environmental Significance. CEQA Technical Advice Series Govenor's Office of Planning and Research 1994 Accessed May 24th 2004 at: http://ceres.ca.gov/topic/env_law/ceqa/more/tas/threshld.pdf

Interpretation of CEQA policy and guidelines with regards to the analysis of social, health, and environmental justice impacts; (3) Public agency guidelines for affordable housing and displacement impact assessment.

The first section provides a scan of the public health and social science research that relates affordability and displacement to adverse human outcomes. We organized this section using a public health framework that relates project development to residential displacement and housing affordability and these effects to indirect adverse human impacts. (The framework used in this report is illustrated in the figure above.) The second section considers the impacts on affordability and displacement as indirect social impacts, as indirect human health impacts, as environmental justice impacts, and as impacts that affect long term environmental policy goals. The third section provides a scan of impact assessment methods and practice applicable to housing impacts analysis bringing together a number of federal, state, and local tools and guidelines.

SECTION I. SOCIAL AND HEALTH CONSEQUENCES OF HOUSING AFFORDABILITY AND RESIDENTIAL DISPLACEMENT

The pathways between affordable housing, residential displacement, and human health and well being are numerous and complex. The impacts of any particular project or program that affects housing affordability or displaces residents depend on both contextual and individual factors including the availability of affordable housing units, the extent of relocation assistance provided, the income and savings of displaced residents, and the availability of social support networks.

This section provides a summary of available evidence on the adverse human consequences of housing affordability and residential displacement. Sources include case studies, interviews, and studies on homelessness, and public health and social science research.

Unmet Needs for Affordable Housing in California and San Francisco

According to *Slum Housing in LA*, a recent publication by UCLA's Advanced Policy Institute, the Federal goal of "securing the health and living standards of its people…" has only been met for upper and moderate income groups, while communities that are poor in both rural and inner city areas lack adequate housing. [5] Three in ten US households have housing affordability problems.

The affordable housing crisis is particularly acute in California. In San Francisco, only 7.3% of households currently earn enough to afford the median sale price of housing.[6] In addition, the fair market rent for a two-bedroom apartment is $1,904 which is affordable only to those who make 90% of the average family's median income of $86,100.[7] Exacerbating this situation, the gap between the minimum wage and the minimum hourly wage required to afford adequate housing has increased. Currently, over 35,000 low income renters pay more than 50% of their income in rent. Even individuals earning modest wages, such as, public service employees and those in the construction trades simply cannot afford to live where they work.[8]

A related factor, affecting low income renters, is the unmet demand for subsidized housing programs. In California, over two-thirds of qualifying low income households remains on waiting lists for housing assistance.[9] The state has 186,000 rental units housing 450,000 low income people which benefited from public finance. About 70% of this stock, over 120,000 units, represents housing in the HUD Section 8 program for which rent subsidy contracts are expiring. The conversion of subsidized housing will further aggravate unmet demand for low income housing.

[5] Richman N, Pitkin B. Understanding Slum: The Case of Los Angeles, USA. 2003 UCLA Advanced Policy Institute. Los Angeles, CA.

[8] Governor' Environmental Goals and Policy Report. Office of Planning and Research 2003

[9] Forbes, Elaine. 2000

While the population of San Francisco is growing, San Francisco is not currently meeting the housing production goals of moderate income, low income and very low income communities. The Mayor's Office of Housing estimates that the City needs to build 19,000 units of affordable housing between 2001 and 2005 to meet its needs. Furthermore, according to the Housing Element of the General Plan, the strongest job growth is expected in the service and retail sectors; however, much of that growth is represented by low and medium wage jobs including cashiers, waiters and cooks, sales people and clerks, and painters, carpenters and electricians.

The Relationship between Displacement and Affordable Housing

Residential displacement has become a critical issue in California where housing shortage disproportionately affects low income and minority populations. Displacement can occur in the context of demolition or redevelopment of residential property or the conversion of rental units to ownership housing. Displacement also occurs in the context of gentrification when neighborhoods change in a way that inflates rents. Structural forces that contribute to displacement of individuals and families and unsatisfactory relocation in San Francisco include the relatively high cost of housing relative to incomes, the large unmet need for housing particularly at lower income levels, and the high cost of land and housing. Given that San Francisco is a setting with a limited supply of affordable housing, residents displaced through eviction or redevelopment are unlikely to be successfully relocated into adequate and affordable housing replacement housing.

Human Health Impacts of Inadequate Housing

Residential displacement or the permanent loss of area affordable housing can be expected to lead to diverse health effects. Both displaced residents and those entering the housing market may have to pay more for housing.[10] Some may accept affordable but inadequate, substandard, or poorer quality housing. Some may move out of the city or region while others may move into a temporary living situation with a friend or family member. Finally, some may become homeless. Low income individuals and families are more susceptible to adverse consequences after displacement as they have limited options for relocation.

Stress Displacement may increase levels of psychological and physiological stress, for example, by creating a new economic strain among low income individuals. If residents are displaced away from jobs or schools, longer commutes may be a further source of stress and reduce time for leisure or family activities. For children, frequent family relocation leads to children's grade repetitions, school suspensions, and emotional and behavioral problems.[11] Living in resource poor neighborhoods, frequent school changes, and substandard housing all contribute to poor child development and school

performance.[12]

A number of scientific studies have demonstrated health consequences of psychosocial stress. For example, a randomized study of healthy human volunteers demonstrated that chronic stress doubled the rate at which inoculation with a common cold virus led to a clinical infection. [13] Other studies have linked the experience of stress with chronic diseases including heart disease, hypertension, and diabetes.[14] Among pregnant women, stress has also been associated with a greater likelihood for pre-term delivery and low birth weight birth – both factors that potentially lead to developmental delays and increased infant morbidity and mortality.

Poverty There is little doubt that poverty leads to poor health. Numerous research studies in diverse countries show that poverty contributes to a poorer subjective sense of health, higher mortality, less emotional stability, worse chronic conditions, and poorer physical functioning.[15]

Unaffordable housing is both a dimension of poverty and a contributor to poverty. Households with incomes several times the full-time minimum wage can pay more than half of their incomes for housing.[16] When housing is unaffordable, people often sacrifice other material needs including food, clothing, and health care services. Nationally, those with incomes in the bottom fifth of the income distribution and paying 50% of their incomes for housing have an average of $417 to cover all non-housing monthly expenses.[17] Lack of affordable housing has also been linked to inadequate nutrition, especially among children. A recent survey of American cities found that low paying jobs and high housing costs are the most frequently cited reasons for hunger.[18] Children from low-income families receiving housing subsidies showed increased growth compared with children whose families were on a subsidy waiting list, an observation consistent with the idea that subsidies provide a protective effect against childhood malnutrition.

Unaffordable housing may add to psychosocial stress. People required to work extra hours or at multiple jobs may sacrifice personal leisure family relationships. Time pressured parents may choose either more punitive or low-effort strategies to resolve conflict with children.[19] Studies have shown that economic strains such as being unable to pay the bills cause depression in mothers and harsh parenting styles. Displacement and relocation may also result in job loss with potential further aggravation of

economic strain and psychosocial stress.

Overcrowding Statewide, 24% of renter households are overcrowded while in San Francisco over 30% of renter households are characterized as overcrowded.[20] [21] Families frequently double up as a way to cope with the lack of affordable housing. Similarly, displaced residents find temporary lodging with families or friends. Overcrowding results in respiratory infections in adults and ear infection in children.[22] Overcrowding also means the lack of quiet space for children to do homework, negatively impacting their development, education, and future life opportunities.[23]

Housing Safety Over half of the San Francisco's housing was built over 50 years ago and requires significant rehabilitation to maintain habitability; 94% of the housing stock was built before 1978. Most of the city's pre-1950 dilapidated housing stock is located in low-income neighborhoods. A number of environmental conditions in older and poorly maintained housing affect health. Inadequate heating can lead to overexposure to cold. Poorly maintained paint leads to lead poisoning. Other unsafe conditions include exposed heating sources, unprotected windows and slippery surfaces that increase risks for injuries. Older units and low-income units tend also to have a greater likelihood of deferred maintenance.

Indoor Air Quality Irritants and allergens present in one's home environments contribute to asthma. Some of the most important allergens implicated in the development and recurrence of asthma include house dust mites, cockroach antigens, cat dander, mold spores, and pollens.[24] Old carpeting serves as a reservoir for dust, allergens and chemicals. Kitchens and baths, particularly in older housing stock, often lack adequate ventilation increasing problems associated with moisture and mold.

Since 1999, SFDPH has conducted several hundred assessments for asthmatic children and adults and identified through evaluation research the role of housing affordability as a barrier to reducing asthma triggers in the home. While SFDPH enforces laws to ensure the safety and habitability of housing, inspectors have found many instances where substandard and unhealthy conditions exist yet tenants are reluctant to initiate enforcement actions. Commonly, tenants are fearful of landlord reprisal or eviction in an unaffordable housing market.

Social Support If displaced residents are forced to relocate outside of their neighborhood, valuable supportive family and community relationships can be lost both for those leaving and well as for those remaining behind. Strong social relationships and community cohesion are protective of health in multiple ways. Neighbors, friends, and family provide material as well as emotional support. Support, perceived or provided, can buffer stressful

situations, prevents damaging feelings of isolation, and contributes to a sense of self-esteem and value.[25] The magnitude of the effect of social support on health is substantial and has been illustrated by several prospective long term studies in the United States. For example, in the Alameda County Study, those with fewer social contacts (e.g. marriage, family, friends, and group membership) had twice the risk of early death, even accounting for income, race, smoking, obesity, and exercise.[26]

Homelessness One of the most severe consequences of both unaffordable housing and displacement is homelessness. Hunger and homelessness are on the rise in major American cities, according to a 2003 survey by the U.S. Conference of Mayors.[27] Requests for emergency shelter assistance increased by an average of 13 percent in the 25 large cities surveyed. Twenty-three participating cities reported that lack of affordable housing was the leading cause of homelessness.

Over 350,000 Californians are estimated to be homeless.[28] A particularly disturbing trend is the rise of family homelessness. It is estimated that between 80,000 and 95,000 homeless children exist in California.[29] The USCM survey documents that Eighty-four percent of the cities have turned away homeless families from emergency shelters due to lack of resources.

Homelessness contributes to a number of other well described physical, behavioral and mental health problems in adults and children. Lack of housing and the overcrowding found in temporary housing for the homeless have been found to contribute to morbidity from respiratory infections and activation of tuberculosis. Substandard housing, such as that used by the homeless population, often lack safe drinking water and hot water for washing; often have ineffective waste disposal, intrusion by disease vectors (e.g., insects and rats); and often have inadequate food storage, all of which have long been identified as contributing to the spread of infectious diseases. [30] A 1994 study of children living in homeless shelters in the Los Angeles area found that the vast majority (78%) of homeless children interviewed suffered from depression, a behavioral problem, or severe academic delay.[31] Among sheltered homeless men and women, age adjusted death rates are several fold higher than in the general population.[32]

Homelessness is strongly linked to hunger. Temporary housing for homeless children often lacks cooking facilities.[33] In the 2003 US

Conference of Mayors' (USCM) survey, requests for emergency food assistance increased by an average of 17 percent over the past year. The USCM survey finds that 59 percent of individuals requesting emergency food assistance were members of families with children and their parents, and that 39 percent of the adults requesting such assistance were employed. Eighty-seven percent of the cities surveyed expect that requests for emergency food assistance will increase again over the next year. Ninety-one percent of cities participating in the survey expect that requests for emergency food assistance by families with children will increase next year. Eighty-eight percent expect that requests for emergency shelter will increase next year, and 80% expect requests for shelter by homeless families will increase in 2004.

Social Cohesion One of the most significant effects of eviction and displacement may be the erosion of social capital and social cohesion which are social indicators strongly associated with health, education, and neighborhood safety.[34]

The New York Times recently profiled a community, Franklin Square, as one of the few places in the NY area where housing affordability is promoted resulting in the integration of generations residing side-by-side. In addition to the richness of sharing experiences across generations, the Franklin Square community benefits from long-term residents who invest in maintaining the built environment, invest in the community, and contribute to community cohesion and youth development:

> "'[Franklin Square] It's just a wonderful, very stable community,' said Julie Soffientini, an assistant school superintendent who moved in 30 years ago and raised two daughters with her husband, Raymond. She said she appreciated the clean streets, well-kept properties and convenient local shopping."
>
> "Pupils begin at the Franklin Square Union Free School District, an elementary district with an enrollment of 1,975 in three schools, all for kindergarten through Grade 6. Statistics released by the state Department of Education in October showed that 99.3 percent of fourth grade students in the district met or exceeded state standards in math. Elementary school students in the Franklin Square district consistently score above state averages on other standardized tests."

The example provided above illustrates the positive impacts on society by long-term resident investment: cleaner streets, resulting in reduced cost of City-subsidized loitering cleaning; higher school performance, particularly among the younger aged-group, which results in higher school completion.

In contrast, the erosion of neighborhoods as a result of forced displacement results in the reduction of long-term residents who are most likely to invest in their communities. In areas where residents feel less invested because of the continual threat of displacement, one can find depilated environmental conditions, such as broken windows on buildings, loitering and illegal disposing of hazardous substances. Furthermore, neighborhoods where residents have little incentive to invest are shown to have higher high school drop out rates, as well as crime rates.

[34] Putnam, Robert. Social Capital: Measurement and Consequences. ISUMA. 2001(Spring): 41-51.

Segregation The loss of affordable housing and displacement may also lead to residential segregation and 'ghettoization'. Displacement may contribute to residential segregation (by ethnicity, income, or class) if available housing for displaced residents is not available in integrated neighborhoods. A study that examined expiring HUD Section 8 agreements with private owners in California, found that, on average, families relocated to relatively more racially-segregated communities.[35]

Racially segregated neighborhoods tend to have less neighborhood amenities such as schools, libraries and public transportation due to economic, political and linguistic isolation, and racism. Research has documented the health impacts of residential segregation. Many studies have shown, for example a strong association between segregation and homicide rates. Besides an excess in mortality, studies have also demonstrated a relationship between residential segregation and negative health outcomes including teenage childbearing, tuberculosis, cardiovascular disease, availability of food establishments serving healthy fare and exposure to toxic air pollutants.[36]

Strong evidence for the effects of segregated environments comes from the HUD Moving to Opportunity demonstration program. This program, implemented in five US cities, evaluated the health and social effects of relocating households from public or subsidized housing in high poverty neighborhoods to private rental housing in non-poverty neighborhoods. The program design involved a random assignment of families to an experimental group (vouchers for housing in low poverty neighborhoods and relocation assistance) a section 8 group (geographically unrestricted vouchers), and a control group and longitudinal follow-up of families over 10 years. The executive summary of the interim evaluation (midpoint of follow up) testify to the social value of non-poverty area residence. [37]

> From the families' perspectives, the principal benefit of the move was a substantial improvement in housing and neighborhood conditions. Families who moved with program vouchers largely achieved the single objective that loomed largest for them at baseline: living in a home and neighborhood where they and their children could feel and be safe from crime and violence. On a list of observable characteristics, their homes and neighborhoods were substantially more desirable than those where control group members lived. These benefits accrued to families in both the experimental group and the Section 8 group, although the improvements tended to be roughly twice as large for experimental group families, who were required to move to low-poverty areas, at least initially.
>
> Perhaps not surprisingly, these improvements in living environment led to significant gains in

mental health among adults in the experimental group. The levels of psychological distress and depression were substantially reduced in this group. In addition, adults in both the experimental and Section 8 groups experienced substantial reductions in obesity for reasons we do not yet understand. Among the children in these families, girls appear to have benefited from the move in several ways. They experienced improved psychological well-being, reporting lower rates of psychological distress, depression, and generalized anxiety disorder, and improved perceptions of their likelihood of going to college and getting a well paid, stable job as an adult. These girls' behaviors changed as well, with a smaller proportion working instead of attending school. They were less likely to engage in risky behavior or to use marijuana. Finally, both these girls and society as a whole benefited from a reduced number of arrests for violent crimes.

Increased Transportation System Demands Displaced residents may find that affordable and adequate replacement housing only exists far from their current neighborhoods, potentially, meaning that they will live far from jobs and schools. Relocation may thus create a new demand for public transportation services or alternatively new demands for automobile purchase and use. Studies on the effects of urban sprawl have found that low income families, children and the elderly are disproportionately affected by the longer distances needed to travel as a result of relocation to the outskirts of a city or a region. The working poor rely on both urban public transit systems to hold steady jobs and access health care, child care and other critical social services. Former welfare recipients are particularly dependent upon the provision of reliable and convenient transportation services.

Increased Demands for Social Services For a project that results in significant displacement or relocation to non comparable housing, the magnitude of human health and social impacts may be severe. This may result in the need to fund and develop new social services to address the human impacts. For example, displacement may potentially result in new demand for safety net services for health and welfare, for mental health services, and for special educational services for children. In San Francisco, services for homeless adults and children cost the City millions of dollars and over the past several years demand for services has greatly exceeded capacity. The demand for such services is indirectly related to the magnitude of the adverse displacement outcomes.

Displacement in California and San Francisco

During the period from March 2002 through February 2003, a total of 1,643 various eviction notices were filed with the department. This figure includes 93 notices given due to failure to pay rent, which are not required to be filed with the department. The number of notices filed with the department for this period represents a 22% decrease over the prior year's filings (2,101).

The largest declines were in owner occupancy evictions, 516, or a 29% decrease, nuisance declined by 10% to 251 and eviction notices for breach declined by nearly 40% to 231. The only increases were in temporary capital improvement evictions which increased from 44

to 68, or a 26% increase and Ellis Act evictions, from 148 buildings to 187 for a 26% increase for the period. In San Francisco, the Ellis Act, a state law which says that landlords have the unconditional right to "go out of business" is used by property owners to 'change the use' of the building (condominium conversions) resulting in evictions.

Reasons for Just-Cause Evictions 2001/02 and 2002/03[38]

Just Cause	2001/02	2002/03
Owner-Occupied	726	516
Demolish/remove unit	113	67
Capital improvement (temporary)	44	68
Ellis eviction	148	187

While the issues of affordable housing, displacement, and gentrification are high on the public agenda, limited recent research has tracked the direct consequences of displacement on people. A 1999-2000 analysis of Ellis evictions in San Francisco conducted by the San Francisco Tenants' Union reveals that:

- Seniors, people with disabilities and children are most likely to become victims of the Ellis Act, comprising 51% of all Ellis Act evictions since 1999.

- Those most apt to be evicted are renters with long-term tenancies and affordable rents. Those evicted under Ellis had an average tenancy of over 11 years and were paying an average rent of $1,024 for a 2 bedroom apartment.

- Further, the Ellis Act is resulting in the loss of thousands of affordable units. For every new affordable unit that is built, 5 affordable units are lost.

Accounts from local housing advocacy organizations reveal some consequences of forced eviction among low-income families and the elderly. St. Peter's Housing, a Mission district-based non-profit organization serving low income families around housing issues and landlord/tenant problems, for example, report that a significant proportion of the families they serve are forced to separate to obtain temporary shelter, while other families resort to overcrowding in illegal units and yet other families are forced to leave their neighborhoods and the City in order to secure an affordable place to live.

St. Peter estimates that at least 20% of their clients have one or more family member aged 60 years or older. According to St. Peter's Housing, elderly residents and families are more frequently displaced, experience particularly high levels discrimination in securing housing, and are most vulnerable for separation as a result of eviction. The following case history illustrates the complexity of housing issues confronted by families with elderly members:

> An elderly couple was forced to separate (from their daughter and grandchildren) and to resort to live in an illegal in-law unit. The unit was so poorly maintained that the stairs leading to the entrance of the unit collapsed resulting in the broken hip of the elderly woman. The elderly woman reported the incidence to St. Peter's for advice. St. Peter reported this case the

[38] Rent Stabilization and Arbitration Board, April 28, 2003

> Department of Building Inspections (DBI) whose inspector cited the owner for the illegal unit, and forced the owner to shut down the illegal unit. DBI's inspection is in itself intended to protect families from living in substandard conditions and yet, in this particularly case, served to aggravate the elderly couple living situation. The elderly couple was not only forced to separate from their family, but were now suffering from the injured hip and its incurred health care cost, and as a result of the inspection was now faced with displacement. [Personal communication, St. Peter's Housing, December 2003]

The effects of displacement as a result of the lack of affordable housing among the senior population are heightened among its Gay and Lesbian subgroups. Recent, cross-sectional evidence of GLBT elderly living in the greater Los Angeles Area shows that:

- Same-sex partners cannot share a room in most care facilities, forcing many GLBT older adults retreat back into the closet, in order to secure housing at nursing homes.
- Same-sex partners cannot receive Social Security survivor benefits.
- GLBT older adults do not have the same family support systems as their heterosexual counterparts.
- There are many government programs that target the elderly, but none are geared towards GLBT older adults.[39]

SECTION II SOCIAL, HEALTH, AND ENVIRONMENTAL JUSTICE IMPACTS IN CEQA POLICY

As discussed in the section above, the lack of housing affordability in California and its human impacts suggests that environmental impact assessment (EIA) should consider how a development project might impact housing affordability or displaced residents. Four ways in which these issues fit into the framework of the California Environmental Quality Act (CEQA) include:

- As potential indirect social and economic impacts on population and housing;
- As indirect health impacts of physical or social impacts;
- As environmental justice impacts;
- As impacts requiring evaluation for consistency with city, regional and state housing and environmental policy goals.

Adverse Social and Economic Effects of Impacts on Population and Housing

CEQA considers the loss of housing requiring construction of new housing and the displacement of people as potential adverse environmental impacts requiring analysis in the environmental checklist provided in CEQA Guidelines. The checklists screening questions include:

- Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?
- Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

However, impacts on population and housing may have particular adverse effects on parts of the population. For example, if a project replaces low income housing with market rate housing, this may disproportionately and adversely impact those with lower income. This type of impact may be considered an adverse social impact. Under CEQA, adverse social and economic impacts may be analyzed in determining the significance of physical environmental changes. Title 14, section 15064, subsection (e) of the California Administrative Code provides the following guidance:

> Economic and social changes resulting from a project shall not be treated as significant effects on the environment. *Economic or social changes may be used, however, to determine that a physical change shall be regarded as a significant effect on the environment.* Where a physical change is caused by economic or social effects of a project, the physical change may be regarded as a significant effect in the same manner as any other physical change resulting from the project. Alternatively, economic and social effects of a physical change may be used to determine that the physical change is a significant effect on the environment. *If the physical change causes adverse economic or social effects on people, those adverse effects may be used as a factor in determining whether the physical change is significant.* [Emphasis added]

For example, if a project would cause overcrowding of a public facility and the overcrowding causes an

adverse effect on people, the overcrowding would be regarded as a significant effect.

Despite the guidance above, the inclusion of social and economic impacts under CEQA is controversial. Many interpret the language in section 15064, subsection (e) to mean that the analysis of indirect adverse social and economic effects may be considered in an EIR but are not, strictly speaking, required.[40] According to the California Department of Transportation: "Many people in California, including some decision-makers, harbor the general belief that CEQA addresses only purely "environmental" issues, not social, demographic, or economic issues often raised by proposed projects. This is erroneous. The assumption however is understandable due to the complex linkage that must be demonstrated between the physical, social, and economic environment, and the determination of 'Significance'."[41]

Some case law has directly addressed this issue. In Citizen's Association for Sensible Development of Bishop Area v. County of Inyo,[42] the courts reconciled the ambiguity of section 15064, subsection (e) with subsections (d) and (f) which discussed evaluation of secondary or indirect consequences of a project. In the Bishop case, the Court ruled that subsection (f) gave the lead agency discretion to determine whether the consequences of social and economic changes were significant but did not give it discretion not to consider these consequences at all. In their ruling, the Court interpreted section 15064 as follows: "the lead agency shall consider the secondary or indirect environmental consequences of economic and social changes, but may find them to be insignificant."

Indirect Health Impacts

Environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly are considered mandatory findings of significance in accordance with CEQA Guidelines Section 15065.

A lead agency shall find that a project may have a significant effect on the environment and thereby require an EIR to be prepared for the project where any of the following conditions occur: (d) The environmental effects of a project will cause substantial adverse effects on human beings, either directly or indirectly.

As discussed in the evidence provided above, housing affordability and displacement affect health in numerous ways. Projects that have area or regional affects on the availability of affordable housing may be considered to have potential indirect adverse health consequences. Since displaced residents may not be relocated in adequate housing, the potential indirect health impacts of displacement also warrant consideration.

Environmental Justice Impacts

Environmental justice is rooted in the Equal Protection Clause of the U.S. Constitution and can be advanced using National Environmental

[40] Bass, RE., Herson, AI, Bogdan, KM. CEQA Deskbook A step-by-step guide on how to comply with the California Environmental Quality Act. Solano Press. Point Arena, 2001.
[41] Guidelines for Community Impact Assessment. California Department of Transportation. 1997
[42] Citizen's Association for Sensible Development v. County of Inyo, 172Cal.App.3d 151 (1985)

Policy Act (NEPA) as well as the Civil Rights Act of 1964. Environmental Justice provides another rationale for considering the effects on affordable housing or the displacement of low income residents under CEQA. California Law defines Environmental Justice as "... the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies."[43]

While environmental justice analysis and efforts in California have historically emphasized disproportionate health effects of toxic physical environmental agents, the concept of environmental justice is broader than the physical environment and human health. As stated in the 1997 President's Council of Economic Quality (CEQ) guidance adverse environmental justice effects can be also economic, social, cultural, and ecological impacts directly or indirectly related to physical environmental changes or impacts. 1997 CEQ Guidance states:

> When determining whether environmental effects are disproportionately high and adverse, agencies are to consider the following three factors to the extent practicable:
> (a) Whether there is or will be an impact on the natural or physical environment that significantly (as employed by NEPA) and adversely affects a minority population, low-income population, or Indian tribe. Such effects may include ecological, cultural, human health, economic, or social impacts on minority communities, low-income communities, or Indian tribes when those impacts are interrelated to impacts on the natural or physical environment; and
> (b) Whether environmental effects are significant (as employed by NEPA) and/or may be having an adverse impact on minority populations, low-income populations, or Indian tribes that appreciably exceeds or is likely to appreciably exceed those on the general population or other appropriate comparison group; and
> (c) Whether the environmental effects occur or would occur in a minority population, low-income population, or Indian tribe affected by cumulative or multiple adverse exposures from environmental hazards.

In California, Assembly Bill 1553 requires that the principles of environmental justice be incorporated into state guidelines for local general plans. As discussed below, this broader definition of environmental justice effects is consistent with adverse environmental effects under NEPA and CEQA as well as the 2003 State of California General Plan Guidelines Section on Environmental Justice and Sustainability and the 2003 Governor's Environmental Goals and Policy Report. The 2003 General Plan Guidelines include mixed-income housing development as a component of sustainability and environmental justice. Even from the standpoint of public health, inequitable social and economic effects can be equally if not more important that inequitable environment quality effects. An environmental justice analysis of projects that result in population or housing loss could focus on the potential for disproportionate impacts to low income and minority populations both living in the current units as well as effects on the market for affordable housing in the region.

[43] California Government Code Section 65040.12

Consistency with Local, Regional and State Land Use Policy

CEQA guidelines consider potential significant environmental impacts to include: "Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?" Local policies related to affordable housing can be found in the Housing Element of the General Plan, the HUD Consolidated Plan, and local ordinances related to rent and to eviction prevention.

California State law defines also a jurisdictions fair share housing goals in terms of four categories of affordability through the Regional Housing Needs Determination (RHND) process, devised to address the need for and planning of housing across a range of affordability and in all communities throughout California. Each jurisdiction within the Bay Area (101 cities, 9 counties) is given a share of the anticipated regional housing need. The Bay Area's regional housing need is specified by the California State Department of Housing and Community Development (HCD) and finalized through negotiations with Association of Bay Area Governments. The timeframe for this RHND process is January 1, 1999, through June 30, 2006, (a seven and a half year planning period). The current RHND requires 5244 units affordable to very low income residents, 2136 units affordable to low income residents, 5639 units affordable to moderate income residents, and 7363 units affordable to above moderate income residents. While San Francisco has met its market rate housing targets in recent years, it has not met moderate income, low income and very low income housing needs.

Total Need	Very Low	Low	Moderate	Above Moderate
20,372	5,244	2,126	5,639	7,363

The 2003 State of California General Plan Guidelines may also be viewed as applicable impacts on affordable housing.[44] The guideline's section on sustainability and environmental justice emphasize the need to carefully match employment potential, housing demand by income level and type, and new housing production.

The importance of ensuring adequate and affordable housing for every sector of the population to long term environmental quality and ecological sustainability is also emphasized in the 2003 Governor's Environmental Goals and Policy Report.[45] These State policies together with the emphasis on long term environmental goals in CEQA guidelines Section 15065 (b) suggests that impacts on housing affordability and adequacy are also potential mandatory findings of significance.

[44] 2003 State of California General Plan Guidelines. Office of Planning and Research. 2003

SECTION III IMPACT ASSESSMENT METHODS AND GUIDELINES FOR AFFORDABLE HOUSING AND DISPLACEMENT

A number of federal, state and local agencies consider displacement of low-income populations and loss affordable housing as potentially adverse impacts in the context of Environmental Impact Assessment. Examples of methods and guidelines are provided below:

Social Impact Assessment (SIA) The practice of SIA dates back to the construction of the trans-Alaska pipeline. At the time, critics argued that the Environmental Impact Statement (EIS) produced for that project failed to address potential social effects such as the influx of tens of thousands of non-native construction workers on the culture of the Inuit. In 1994, the U.S. Federal Government published a set of guidelines for SIA to support social assessment under NEPA.[46] Social impacts are defined as "…the consequences to human populations of any public or private actions-that alter the ways in which people live, work, play, relate to one another, organize to meet their needs and generally cope as members of society. The term also includes cultural impacts involving changes to the norms, values, and beliefs that guide and rationalize their cognition of themselves and their society." The guidelines categorized social impact variables as follows:

1. Population Characteristics mean present population and expected change, ethnic and racial diversity, and influxes and outflows of temporary residents as well as the arrival of seasonal or leisure residents.

2. Community and Institutional Structures mean the size, structure, and level of organization of local government including linkages to the larger political systems. They also include historical and present patterns of employment and industrial diversification, the size and level of activity of voluntary associations, religious organizations and interests groups, and finally, how these institutions relate to each other.

3. Political and Social Resources refer to the distribution of power authority, the interested and affected publics, and the leadership capability and capacity within the community or region.

4. Individual and Family Changes refer to factors which influence the daily life of the individuals and families, including attitudes, perceptions, family characteristics and friendship networks. These changes range from attitudes toward the policy to an alteration in family and friendship networks to perceptions of risk, health, and safety.

5. Community Resources: Resources include patterns of natural resource and land use; the availability of housing and community services to include health, police and fire protection and sanitation facilities. A key to the continuity and survival of human communities are their historical and cultural resources. Under this collection of variables we also consider possible

---

46 http://www.nmfs.noaa.gov/sfa/social_impact_guide.htm

changes for indigenous people and religious sub-cultures.

U.S. Department of Transportation Community Impact Assessment Guidance Among transportation agencies, changes in policies have included redefining the definition of "environment" to include "the natural environment, the built environment, the cultural and social fabric of our country and our neighborhoods, and the quality of life of the people who live here,' and considering project mediated effects on community cohesion; public facilities; employment; tax and property values; displacement of people, businesses, and farms; and adverse impacts on community and regional growth.

DOT guidelines for community impact assessment consider a number of social and economic factors.[47] They further recognize that while community impact assessment should not be exhaustive, it should focus on community goals and issues of community concern and controversy. The guidelines identify that displacement can involve, neighborhoods, businesses, and people. (www.ciatrans.net) Recommended analysis of impacts on residential displacement include the number and type (multi-family, single family) of residences displaced and the particular needs of vulnerable groups (disabled, minority, elderly).

Council on Environmental Quality Environmental Justice Guidance The Council on Environmental Quality, the federal agency tasked with oversight of NEPA and government compliance with Executive Order 12898 developed guidance to assist federal agencies with addressing environmental justice concerns in the context of NEPA procedures. This guidance suggests that agencies should 'determine whether minority populations, low-income populations, or Indian tribes are present in the affected area…consider data concerning the potential for multiple or cumulative exposure to human health or environmental hazards…recognize the interrelated cultural, social, occupational, historical, or economic factors that may multiply the natural and physical environmental effects…[and]…should assure meaningful community representation in the process.[48]

California Department of Transportation The California Department of Transportation (CalTrans) reference documents for CEQA provide specific guidance for the evaluation of impacts on population and on housing displacement. The 1997 Guidelines for Community Impact Assessment point out that the disproportionate displacement of vulnerable populations can have significant adverse human impacts:

> Certain population groups such as senior citizens, low income residents and non English speaking people often have strong community ties and depend on primary social relationships and important support networks that can be severed upon relocation. Households with school aged children may consider relocation especially disruptive if school transfers would be involved. Disabled people and those

[47] Federal Highway Administration Community Impact Assessment Website (Accessed at: www.ciatrans.net)

[48] Environmental Justice: Guidance under the National Environmental Policy Act. Council on Environmental Quality. 1997.

without automobile transportation often have special relocation problems.

The guidelines suggest investigating the demographics of the residents to determine if any vulnerable groups (Low income, minority, seniors, disabled, and children) would be impacted. The guidelines suggest evaluating the effects on the stock of affordable housing:

> A loss of a substantial number of houses affordable to people with low and moderate incomes may have an effect on the community stock of affordable housing. This could have the effect of increasing the demand for housing in a given sector of the market, bidding up the cost of that housing if the market supply is constrained and thereby disproportionately affecting certain income groups.

Similarly, the 2003 Desk Guide for Environmental Justice in Transportation Planning and Investments. The environmental justice guidelines categorize social and economic impacts into land use and development, population and housing, and fiscal and economic. These guidelines suggest analysis of population and housing impacts consider a number of variables. These include:

- Property acquisition and displacement
- Access to neighborhoods
- Community Cohesion
- Safety and security
- Visual and aesthetic quality
- Property values and gentrification

A particular concern emphasized by CalTrans is impacts of displacement and relocation on neighborhood or community cohesion. The decision tree for residential displacement includes assessment of the availability of relocation housing in the community where displacement is occurring. Social impacts considerations identified by CalTrans related to cohesion include:

- Is there evidence that community cohesion exists?
- Will the proposed project affect interaction among persons and groups?
- Will the proposed project cause redistribution of the population or an influx or loss of populations?
- Will certain people be separated or set apart from others?

City of Los Angeles Thresholds Guide In its *1998 CEQA Thresholds Guide*, the City of Los Angeles uses the following screening criteria for evaluating significant effects on population and housing displacement.[49]

- *Would the project result in the net loss of any existing housing units affordable to very low income or low income households (as defined by federal and/or City standards), through demolition, conversion, or other means.*

The Los Angeles guidelines evaluate the significance of population and housing impacts by considering the following factors:

- The net change in market rate and affordable units in the project area
- The current and anticipated supply of market rate and affordable units in the project area

[49] http://www.ci.la.ca.us/EAD/EADWeb-AQD/Thresholds_PDF/introceq.pdf

- The demographics of the project area
- The consistency with city and regional housing policies

The guidelines also suggest the following two mitigation measure for displacement of affordable housing:

- Exceed the statutory requirements for relocation assistance
- Increase the number of housing units affordable to lower income households

Tahoe Regional Planning Agency (TRPA) The TRPA Initial Environmental Checklist[50] requires a response to and evidence for the following questions relevant to the displacement of low income residents and the loss of affordable housing:

- Will the proposal include or result in the temporary or permanent displacement of residents?
- Will the proposal decrease the amount of housing in the Tahoe Region historically or currently being rented at rates affordable by lower and very-low-income households?
- Will the proposal result in the loss of housing for lower-income and very-low-income households?

Mitigation of affordable housing loss is required for project approval. According to planners at the TRPA any loss of affordable housing due to redevelopment has to be either rebuilt on site or offsite taking into account similar accessibility to transport resources. A recent example of such mitigation occurred with the proposed development of the 138 unit Round Hill Vacation Resort. The development of the time share condominium involved the removal of the 186 unit Lake Park Apartments. To mitigate displacement, the project included the construction of 67 new apartment units offsite prioritized for displaced tenants, affordable housing restrictions for the new apartments, phased demolition over 24 months with eviction of no more than 8 units per month, and relocation assistance.[51]

County of Santa Barbara Santa Barbara's 1993 Environmental Thresholds and Guideline Manual[52] provide a specific threshold for the loss of affordable housing. The rationale for establishing such a threshold comes from the county's affordable housing policies. The Santa Barbara County Housing Element documents a substantial shortfall in affordable housing opportunities and the preservation of the existing affordable housing stock is a stated goal of the Housing Element. According to the Element, "the loss or demolition of existing affordable units can displace very low to moderate income persons and further restricts the housing market." The threshold for Very Low to Moderate Income Housing Units is as follows:

- *The loss of four or more very low to moderate income housing opportunities through demolition, conversion, or other means represents a significant housing impact. Affordability is determined on the basis of the applicable definitions within the County's Comprehensive Plan and Coastal Plan.*

[50] http://www.trpa.org/Applications/new_applications2003/IECFINAL%20APRIL%202002%20Comp.pdf

[51] Lyn Barnett, Tahoe Regional Planning Association,. Personal Communication. and Balloffet and Associates. Round Hill Vacation Resort / Lake vista Apartments Environmental Assessment.

[52] http://ceres.ca.gov/planning/cega/thresholds.html

Mitigations to assist persons residing in those units shall be applied.

Santa Barbara's CEQA guidance also provides the following mitigation measures:

- *Mitigations would include extended length of notice to quit premises, relocation expenses, demolished or converted units through physical on or off-site replacement or by the payment of fees. Onsite replacement of low or moderate income housing is the preferable alternative. If onsite replacement is infeasible, the units shall be replaced offsite. Payment of an in-lieu fee shall occur only if on and off-site replacement are proven to be infeasible. Housing mitigation fees shall be sufficient to provide replacement of the demolished or converted units.*

Appendix I Model Housing Impacts Analysis

Screening Criteria

- Will the project result a decrease in the supply of housing?
- Will the project result in an increase in the demand for housing?
- Will the proposal result in the loss of housing affordability, availability or quality for low income or otherwise sensitive populations?
- Will low income or otherwise sensitive be displaced or relocated?

Setting Variables

- The demographics of the project area and locality
- The current and anticipated supply of housing units in the project area and locality disaggregated by affordability;
- Availability of vacant units in the project area and locality disaggregated by level of affordability;
- The quality (safety, environmental conditions…) of available housing units in the project area and locality (sources: census, local housing complaint data)
- Evidence of social cohesion in project area(e.g. organization, interactions, relationships, and support among residents)
- Access to public services in the project area (transportation, schools, childcare…)
- The number and type of employment opportunities in proximity to the project area

Analysis Variables

- The net change in market rate units historically or currently being rented at rates affordable by lower and very-low-income households in the project area
- The net change in affordable (including section 8, permanently affordable, and rent-controlled) units historically or currently being rented at rates affordable by lower and very-low-income households in the project area
- Existence within the displaced population of a higher than average proportion of ethnic minority, low income, medically vulnerable or health sensitive populations among displaced residents
- The location and comparability of replacement housing for displaced households;
- Effects on support (food, advice, childcare, elder care) provided to and by displaced residents
- Increased dependence on public assistance or public services
- Changes in accessibility to or utilization of public services
- Changes in the number of family or relatives living in close proximity
- Effects on crowding: changes in the number of individuals per room in the project area
- Changes in accessibility to public transportation
- Changes in the need for automobile ownership or use

Significance Criteria

- Net loss of housing supply relative to demand in the area, locality, or region;
- Net loss of affordable housing in the project area or locality;
- Significant reduction in housing quality or safety;
- Significant number of residents relocated to non-comparable housing;
- Any residents made temporarily or permanently homeless;
- Loss of community cohesion in project area;
- Increase of local residential segregation.

Mitigation Measures

- Change land use / zoning controls to enable increased housing density;
- Develop relocation plan consistent with California State Relocation Assistance and Property Acquisition Guidelines;
- Construct of replacement affordable housing onsite or offsite;
- Housing impact fees.

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project").[1] My review focused on the DEIR's treatment of:

- Population and Housing
- Growth Inducement
- Land Use and Planning
- Alternatives

In preparing these comments, I have reviewed the following information:

1. Draft Environmental Impact Report for the Plan and Appendices
2. 2014 LARDP
3. CPHP
4. 1976 Regents' Resolution
5. January 16, 2020 Letter from Mayor London Breed to Chancellor Sam Hawgood citing the 2007 MOU and 1987 and 2007 MOU's

After carefully reviewing the DEIR for the Project I have concluded the DEIR fails in numerous respects to comply with CEQA and to fulfill CEQA's fundamental mandate. As described below, the DEIR violates this law because it fails to analyze adequately the significant environmental impacts of the Project or propose sufficient mitigation measures. Where, as here, the EIR fails

[1] See Attachment 1 for Watt Qualifications

to fully and accurately inform decision-makers and the public of the environmental consequences of proposed actions, it does not satisfy the basic goals of the statute. Because of the DEIR's numerous and serious inadequacies, the Lead Agency must revise and recirculate the document to permit an adequate understanding of the environmental issues and potential solutions, including feasible mitigation measures and alternatives.

I. Context and Introduction

A. UCSF Should Honor the Space Ceiling and Other Commitments

UCSF should honor its commitment to the space ceiling and to development compatible with surrounding uses at the Parnassus Heights campus by selecting an alternative within the existing space ceiling. The Parnassus Heights campus site, the oldest and largest of the UCSF campuses, is located in among some of the oldest neighborhoods in San Francisco, which are characterized by a mix of unique residential areas ranging from single family to multi-family housing and neighborhood serving commercial districts such as located along Irving and Judah Streets and 9th Avenue. In addition to Mount Sutro Open Space Reserve, several park and open space areas are located near the campus. This area surrounding the Parnassus Heights campus is further characterized by local serving streets plagued with traffic, parking congestion and lack of transit. Approximately 43% of the main campus (exclusive of the Aldea area) borders the Reserve, breaking the City's normal grid pattern and limiting ingress and egress routes to the main campus. The surrounding neighborhoods, like all of San Francisco, also suffer from a lack of affordable housing and available sites to build new housing. Recognizing the unique and constrained location the Parnassus Heights campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part:

> "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." See Attachment 2.

The Regent's Resolution recognized the transportation problems in the area and committed funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit. Concern for the impacts of the Project on the neighborhood is an ongoing concern. In a letter to Chancellor Hawgood, dated January 16, 2020, Mayor London Breed, President of the Board of Supervisors Norman Yee and Supervisor Dean Preston note the need for a revised MOU to adopt and formalize arrangements for coordination and consideration of both our interests and inputs in the context of land use approvals, transportation needs and ongoing service provisions, noting the common challenges faced include housing supply, affordability and climate and seismic related risks. See Attachment 3. According to a June 4th Staff Report to the Planning Commission, the Planning Department and UCSF are engaged in ongoing conversations about how to structure a stakeholder process to achieve the Mayor and Supervisor's objectives, expected to culminate in an MOU.

While not part of the objectives or regulations in the UCSF 2014 LRDP, reference is made in the DEIR to the Community Planning Principles including:

- Land Use LU1. Plan for growth and renovations that are substantially consistent with use limitations and height and bulk limitations in the City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects. The University should consider City planning proposals that are underway. UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns.
- LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density, and that do not negatively affect surrounding land uses.
- LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights Campus site.

DEIR at page 4.10-3 to 4.10-4.

Although the University is constitutionally exempt from local land use regulation whenever using properties under its control in furtherance of its "educational mission," the University has committed to substantial consistency with local policies where feasible. This dual commitment – to the space ceiling and to adherence where feasible to local policy – is one UCSF should and can honor given the very real constraints to development in the area surrounding the Parnassus Heights campus. There are feasible alternatives to the Project, including a new hospital at Mount Zion, Mission Bay or Hunters Point, that should be fully considered in a revised and recirculated DEIR before the decision is made to break the space ceiling commitment and significantly impacting the surrounding neighborhoods.

B. The DEIR Should be Revised and Recirculated to Address the Outbreak in December 2019 of COVID 19

The outbreak of COVID 19 was first reported on December 31, 2019 in Wuhan China. The Notice of Preparation (NOP) for the UCSF Parnassus Heights campus was issued January 14, 2020. As described at page 4.0-6 of the DEIR, "[n]ormally, the baseline condition is the physical condition that exists when the Notice of Preparation ("NOP") is published. The NOP for the proposed CPHP was published in January 2020, and the baseline conditions contained in this CPHP EIR are generally taken from this time period. However, the CEQA Guidelines and applicable case law recognize that the date for establishing an environmental baseline cannot always be rigid." DEIR at 4.6-6. UCSF is a health based organization, therefore fully aware early on of the implications of the Wuhan outbreak. The DEIR itself acknowledged the potential implications of COVID 19, concluding that:

> "The net effect of the pandemic on the Parnassus Heights campus site development and operations cannot be predicted at this point in time without speculation." DEIR at page 1-9.

The DEIR concedes COVID 19 has implications for the Project. For example, the objectives for the New Hospital, objectives used in part to dismiss some alternatives, include an increase in beds to provide for inpatient health care in times of severe strain such as the current pandemic. DEIR at page 6-4. The brief discussion at page 1-9 also acknowledges that UCSF will likely consider operational changes such as increases in telehealth services and telework, among others.

COVID 19 was known or should have been known at the time of the issuance of the NOP and certainly, as reflected in Section 1.7 of the DEIR, was known prior to circulation of the DEIR for public comment. COVID 19 warrants changes and updates to existing environmental setting information, critical to complete an accurate impact analysis, as well as to the Project Description (e.g., space needs changes given a likely transition as noted in the discussion to telework and telehealth). Significant questions are raised by COVID 19 that have implications to the Project and related impacts – including but not limited to an acknowledgement that UCSF is likely to increase telework, telehealth consultations and remote learning. These are but a few of the changes warranting UCSF to hit pause both to revise the DEIR and to re-engage the public and experts, right-size the Project and evaluate other alternatives that would reduce or eliminate impacts while adhering to the existing space ceiling.

II. The Project Violates the California Environmental Quality Act

A. The Project Description is In Flux

A fundamental requirement of CEQA is that an EIR contain an accurate, complete and stable project description. Without a complete and stable project description, an agency and the public cannot be assured that all the project's environmental impacts have been revealed and mitigated. Further, CEQA and the CEQA Guidelines mandate that an EIR include a description of the "physical environmental conditions . . . from both a local and a regional perspective. . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines Section 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR – and thus the decision-makers, agencies and public who rely on the EIR – cannot accurately assess the potentially significant impacts of the proposed Project.

As discussed above, the Project is likely changing in fundamental ways due to COVID 19 – including adjustments to the Project due to a likely increase in telework and telehealth, among other adjustments:

> "UCSF will likely consider operational changes such as increases in telework and telehealth services, especially primary and secondary health care services." DEIR at 1-9.

In addition to telehealth and telework, distance learning also appears likely on the increase. The overall space needs and allocations for the Project should be revisited in light of COVID 19 and other rapidly changing conditions due to COVID. The emerging stakeholder process referenced in the June 2020 Staff Memo to the San Francisco Planning Commission provides another good reason to pause the proposed Project entitlement process and discuss an appropriately scaled Project for the Parnassus campus site.

B. The DEIR Includes Incomplete and Inadequate Baseline Information to Support the Analysis of Project Impacts

The DEIR fails to adequately describe baseline (environmental setting) conditions. Setting or environmental baseline information is as essential to adequately disclosing and analyzing project-related and cumulative impacts as a complete and consistent Project description. Without adequate and complete information about the environmental setting, it is not possible to determine whether the Project improves or makes worse existing environmental conditions or the extent of the Project-related and cumulative impacts. The Project NOP was issued January 14, 2020 after the COVID 19 pandemic was a known crisis. As such, the DEIR's baseline or existing environmental setting information must be updated to reflect conditions Pre-COVID 19 and Post emergence of COVID 19. Another option is to postpone the Project until more is known about the COVID crisis. Both pre- and post- emergence of COVID 19 information is critical if adequate analyses are to be completed for topics ranging from land use, housing and population to transportation.

Examples of baseline setting information that is missing from the DEIR includes but is not limited to the following.

1. Students, Faculty and Staff

The DEIR omits information essential to analysis of whether the Project will result in significant impacts to housing supply as well as related impacts of displacement due to increased demand for housing and gentrification. Such information includes at a minimum the general salary ranges of new students, faculty and staff. Such information was provided in the Mission Bay Hospital environmental documents and fiscal impact analysis, hereby incorporated by reference. . In addition, the DEIR should provide information about the current student, staff and faculty to inform analysis of new housing demand (e.g., where do current staff, faculty and students live? Etc.).

2. Demographics in the Surrounding Neighborhood and City

Basic demographic information must be part of the DEIR's revised baseline in order to support and inform analysis of Project impacts on housing. The DEIR includes no information about the surrounding area demographics or demographics in the City and study area, making adequate analysis of impacts impossible.

3. Affordable, Student, Workforce and Family Friendly Housing

The Project will significantly increase students, staff and faculty at the campus adding to the demand for scarce housing affordable to new students, staff and faculty in the areas surrounding the Project, the City and the region. In addition the Project will nearly double projected new job growth due to the multiplier effect. The DEIR must analyze the potential for the Project to raise housing prices, contribute to gentrification and displacement due to price increases and competition for scarce housing in the surrounding area, San Francisco and the region. Very little setting information is provided to support analysis in the short, 13 page section on Population and Housing and the even shorter, 8-page discussion of growth inducement.

To perform an adequate analysis of Project and cumulative impacts to population and housing and growth inducement, it is essential the DEIR include in the description of the Project baseline (setting) details concerning existing vacancy rates for affordable units, including deed restricted housing, family housing, and housing affordable to the workforce[2] in the surrounding neighborhoods[3], the City as well as the broader five-county study area. Little setting information is provided in support of the DEIR's across the board conclusions that impacts associated with project growth will be less than significant. The DEIR contains no information concerning affordable housing and workforce housing whatsoever.

Without current and complete information about the existing housing stock in the surrounding neighborhoods, the City and the study area, the DEIR cannot adequately analyze the Project's impact on affordable, workforce and family friendly housing and households, and the DEIR's conclusions concerning the insignificance of Project-related and cumulative impacts cannot be supported by facts and evidence. The DEIR must be revised to include this and other baseline information, including changes in housing stock and availability pre- and post- emergence of COVID 19. While long term effects of COVID 19 maybe speculative, some effects are known and should be disclosed where possible.

In addition to the above information, the DEIR must discuss and include in its revised analysis, the locations of disadvantaged communities. Such information is essential to support analysis of the extent to which the Project could further impact these DACs and exacerbate existing housing inequity. Sources of this information are readily available. See e.g., Urban Displacement Project www.urbandisplacement.org/map/sf. Project such as this one have a high potential to contribute to the gentrification and displacement of disadvantaged communities

[2] Workforce housing is housing at the lower end of market rate serving households with up to 200% of median income and often referred to as the "missing middle" or gap in affordable housing in San Francisco. Voters recently approved funding to build more housing, including for the SF workforce.

[3] Increasingly with the COVID 19 threat, workers and students choosing to avoid transit are increasingly putting pressure on nearby housing. This warrants adjustment of the DEIR's analysis of housing impacts in the surrounding neighborhoods.

due to the influx of additional students, staff and faculty who most likely will be seeking housing within walking and biking distance to the campus in a post COVID world.

4. Existing Jobs-Housing Balance and Fit within the Surrounding Neighborhood, City and Regional Study Area

The DEIR must analyze the potential for the Project to make worse the existing imbalance of jobs and housing. Little information is provided in the DEIR on jobs housing imbalance pre- or post-emergence of COVID 19. The DEIR fails to cite readily available information for San Francisco and Region concerning the growing imbalance. Specifically, San Francisco or more accurately in the SF-Oakland-Hayward census area, created only one new home per 6.8 new jobs between 2010 and 2015. Source: US Census Data. Looking just at San Francisco, it comes out to 8.2 jobs per new home during that same period, further increasing an enormous gap in the already out of balance housing to jobs ratio in the Bay Area. Not surprising rents increased by 43% over the same period due to housing scarcity and competition from new employees. Source: U.S. Census Data 2010 and 2015. This data is readily available and must be included in a revised DEIR to support a credible analysis of the Project's impacts on housing and growth.

C. Finding the right jobs-housing balance has long been an important concern for urban planners and an important policy consideration for general and area plans. More recently, attention has turned to jobs-housing fit – the extent to which housing price and rent is well matched to local job salary and quality. The DEIR are silent on the matter of jobs housing fit and fails to adequately address the issue of jobs housing balance. The DEIR should be revised to describe the existing job-housing balance and fit for the surrounding neighborhoods, the City and region. Updated baseline (environmental setting) information must include a description of changes in demand for housing in San Francisco Pre- and Post-Emergence of COVID 19. This information is not only necessary to adequately analyze environmental topics such as displacement and Project demand for new housing, but it is also essential to determining the extent to which the Project will increase commuting, traffic, transit demand, and vehicle miles traveled. Without this information, the full impacts associated with air quality and greenhouse gas emissions, among other impacts cannot be adequately analyzed and conclusions concerning the significance of Project-relation and cumulative impacts cannot be supported by facts and evidence. The DEIR must be revised to include this and other baseline information to inform revised impact analyses and conclusions. The DEIR's Analysis of, and Mitigation for, the Impacts of the Project Are Inadequate

The discussion of a project's environmental impacts is at the core of an EIR. See CEQA Guidelines Section 15126(a). As explained below, the DEIR's analysis of the Project's environmental impacts are deficient under CEQA because the DEIR fails to provide the necessary facts and analysis to support informed decisions about the Project, mitigation

measures and alternatives. An EIR must contain facts and analysis, not just bare conclusions. A conclusion regarding the significance of an environmental impact that is not based on analysis of the relevant facts fails to fulfill CEQA's information mandate.

Additionally, an EIR must identify feasible mitigation measures to mitigate significant environmental impacts. CEQA Guidelines Section 15126.4. Under CEQA, "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects. . . ." Pub. Res. Code Section 21002.

As explained below, the DEIR fails to provide detailed, accurate information about the full breadth of the Project's potentially significant impacts with respect to growth inducement, population and housing and land use and planning. The DEIR's cumulative analysis of these impacts is also deficient. Where the DEIR fails to adequately analyze the Project-related impacts, the cumulative analysis cannot be adequate. Further, the DEIR does not identify and analyze feasible mitigation measures that would reduce or avoid such impacts.

1. The DEIR's Analysis of the Project's Growth-Inducing and Population and Housing Impacts is Flawed

The DEIR's analysis of growth inducing and population and housing impacts is flawed and conclusions reached by the DEIR that all impacts are less than significant incorrect. These topics are closely related and the two sections contain multiple cross references. Therefore, these impact topics are discussed together in this section.

CEQA requires that an EIR include a detailed statement setting forth the growth-inducing impacts of a proposed project. Pub. Res. Code Section 21100(b)(5). A proposed project is either directly or indirectly growth inducing if it: (1) fosters economic or population growth or requires additional housing; (2) removes obstacles to growth; (3) taxes community services or facilities to such an extent that new services or facilities would be necessary; or (4) encourages or facilitates other activities that cause significant environmental effects. CEQA Guidelines Section 15126.2(d). While growth inducing impacts of a project need not be labeled as adverse, the secondary impacts of growth (e.g., gentrification and displacement, demand for additional housing and services, traffic, air pollution, etc.) may be significant and adverse. In such cases, the secondary impacts of growth inducement must be disclosed as significant secondary or indirect impacts of the project. The analysis required is similar in many respects to the analysis required to analyze impacts associated with population and housing.

a. Growth Inducement Analysis is Woefully Lacking

The DEIR contains a short, 3 and 1/2-page discussion of Growth Inducing Effects. The discussion acknowledges the Project will increase the campus population by approximately 4,100 persons by 2030 and an additional 1,080 persons by 2050, including students and faculty and staff. The DEIR also calculates the multiplier of 0.73 for an additional 3,420 jobs that could

be indirectly caused or induced by the Project. The Project includes construction of 142 net new housing units/beds within the Aldea housing complex and an additional 620 new residential units for a net total of 984 new units by 2050.

The DEIR concedes "[c]ampus population growth under the proposed CPHP would not be entirely accommodated by the existing and new housing on site, and therefore would result in indirect housing demand beyond the campus site." DEIR at 5-5. The discussion provides little real analysis of the Project's potential to induce growth in accordance with CEQA, nor does the discussion reach any conclusions as to the significance of growth inducing impacts instead relying on the assertion that the growth allowed by the Project is not substantial when "compared to the study area growth projections and to the extent that demand for new housing would exceed the capacity of the market area.[4]" DEIR at page 4.12-10. Yet, the discussion does not identify any potentially significant impacts associated with population growth as a result of the elimination of the existing space ceiling and implementation of the Plan.

The DEIR goes on to state:

> "Generally, the housing demand associated with employment growth under the proposed CPHP would be satisfied by the housing that could be added in San Francisco and in other parts of the region." DEIR at 4.12-8.

San Francisco and the region has been grossly underbuilding planned housing while generating significant new jobs; facts not disclosed by the DEIR. There is no information in the DEIR about the current housing crisis in San Francisco and region as summarized below. Nor does the DEIR contain any information about housing availability in the surrounding neighborhood and City, or information about housing affordability. Moreover, the DEIR fails to describe the breakdown of new students, faculty and staff in terms of numbers by typical jobs and salaries; information critical to estimating the percent of new staff, faculty and students who qualify as low income or very low income requiring lower cost housing options. Finally, the DEIR fails to acknowledge that UCSF is a major contributor to the affordable housing crisis, and will exacerbate that crisis by building out its expansion plan without building additional units affordable to new students, faculty, staff and employees of supporting services. See Jobs Housing Nexus Analysis SF, Kaiser Marston Associates, 2018 submitted under separate cover

Instead of the required analysis, the DEIR points to the Population and Housing Section conclusion to support its cursory overview of growth inducement impacts:

> "Implementation of the proposed CPHP would induce population growth in the Bay Area, but the population growth would not be substantial in comparison to growth that is projected and planned for San Francisco and the four study area counties in Plan Bay Area 2040 and the local general plans for the study area communities. Further, the population

[4] Five county study area.

growth would not result in a demand for new housing that would exceed the capacity of the five-county market area." DEIR at 4.12-9. Emphasis added.

By comparing the Project's growth to the entire City and region, the DEIR seeks to diminish the significance of housing demand generated by the Project. There is no question the Project will generate substantial additional growth in a highly constrained neighborhood[5], by increasing the daily average population by approximately 45%, nearly 5,200 students, faculty and staff. DEIR at page 4.12-1. In addition, the Project generates an additional 3,420 jobs based on a multiplier of 0.73%; jobs that will put additional demand on a tight housing market. No information is provided about the nature of these jobs or the associated salary ranges of employees. The Project will also increase likely increase the demand for housing in the immediately surrounding neighborhoods and City as people avoid transit in a COVID worried world and seek to walk and or bike to work.

The Project most certainly will induce growth that will in turn significantly impact housing. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, assuming all new students need housing and only 50% of faculty and staff need housing, at 4,000+ units, would still constitute a significant impact on a highly constrained housing market and could result in displacing local residents due to competition and gentrification. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis because under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing. Salaries disclosed for the Mission Bay Project for UCSF's workforce, suggest the majority of new students, staff and faculty will need housing affordable to low incomes. See www.payscale.com/research/USEmployer=UCSFMedicalCenter

Housing Demand Range			
Direct/Multiplier Growth at 2040 DEIR page 4.12-7	Students 504	Faculty and Staff 4,680	Multiplier/Indirect Employees: 3,420
Housing Demand Estimates	High Demand (worst case scenario 100 require housing): 504 units	High Demand: (worst case scenario 80% not housed, net new): 3,744 units	High Demand: 50% not housed, new demand):

[5] Constrained in terms of circulation and housing.

	Low Demand (50% not housed, new demand) 252 units	Low Demand (50% not housed, new demand) 2,340 units	1,760 units

These housing-related impacts are more than glossed over by a discussion that excludes any information about the dire housing crisis.

Substantial new non-residential and residential growth in San Francisco includes total population growth based on household size assumptions[6], in addition to new students, staff and faculty estimated in the DEIR to be as high as 12,220 people by 2050. DEIR at page 4.12-8. This estimate does not include indirect growth associated with the multiplier, but does assume all new growth is in San Francisco. This significant new growth will require additional public services, likely including expansion and therefore construction of facilities in the neighborhood or adjacent neighborhoods of a myriad of services. Yet the DEIR provide cursory information about these services and facilities and fails to analyze the associated impacts, including fiscal impacts. CEQA requires that if new construction of housing will occur to accommodate the Project's employees or services beyond that included in the Project, then the EIR must analyze the environmental impacts of that construction. The appropriate components for an adequate analysis include: (1) estimating the amount, location and time frame for growth that may result from the implementation of the Project (e.g., additional housing); (2) considering whether the new population would place additional demands on public services such as fire, police, recreation, emergency, health, childcare or schools; (3) applying impact assessment methodology to determine the significance of secondary or indirect impacts as a result of growth inducement; and (4) identifying mitigation measures or alternatives to address significant secondary or indirect impacts. CEQA Guidelines Appx. G Section XIII(a). The DEIR must be revised to provide this analysis and based on this analysis, to revise other environmental analyses including but not limited to population and housing, transportation, air quality, among other topics where impacts are derived in part from direct and indirect growth assumptions.

The DEIR dismissal of likely growth inducing impacts because the impacts are "impossible to determine" violates CEQA. Virtually the sum total of the discussion, below, lacks analysis and supporting facts and evidence while at the same time identifying the potential areas of significant impacts associated with significant growth:

> "While it is acknowledged above that the precise nature, location, and magnitude of effects of indirect and induced growth cannot be determined, the proposed CPHP

[6] 2.36 persons per HH; assumes only one student per HH. DEIR at page 4.12-8.

> would likely increase overall demand in the region for housing, commercial and industrial space, and associated infrastructure. Potential effects could include increased traffic congestion; increased air pollutant emissions; loss of agricultural land and open space; loss of habitat and associated flora and fauna; increased demand on public utilities and services, such as fire and police protection, water, recycled water, wastewater, solid waste, energy, and natural gas; and increased demand for housing. An increase in housing demand in the Bay Area region would also require governmental services including, but not limited to schools, libraries, and parks to serve new commercial and residential development." DEIR at 5-7.

The discussion also acknowledges that this growth could contribute to a loss of open space by converting those lands to housing, commercial space and infrastructure, but attempts to discount the many impacts associated with conversion of natural and working lands by pointing out without evidence that "most jurisdictions have adopted smart-growth policies that discourage or prohibit this type of development." DEIR at 5-7.

A revised growth inducing analysis must be included in a recirculated DEIR. The impacts of growth must also be considered in new analysis concerning the social equity impacts of the Project. See Attachment 4, Draft Planning Commission Resolution.

b. The DEIR's Analysis of and Mitigation for the Project's Population and Housing Impacts is Inadequate

The DEIR's approach to analysis of population and housing does not adequately analyze Project-related impacts associated with changes that would occur with Project implementation to the population, including employment and residential growth. Instead of actually analyzing the Project's impacts related to population and housing, the DEIR asserts that all impacts both direct and indirect will be less than significant. The DEIR lacks facts, analysis and evidence to support this conclusion. The result is a lack of information about the actual severity and extent of impacts associated with significant growth in population including students, faculty, staff and patients and visitors. For a Project that will guide development of the campus for 30+years and likely be the basis of streamlined permitting for project facilities and infrastructure, it is especially important that the DEIR comprehensively identify and analyze its impacts on growth, population, housing and employment.

In determining impact significance associated with growth in population, employment and housing, CEQA requires analysis of the following topics (substantially similar in DEIR at page 4.12-6):

- Would the project induce substantial population growth in the area, either directly (for example by proposing new homes and businesses) or indirectly (for example, through extension of roads and other infrastructure)?

- Would the project displace substantial number of existing housing units or create demand for additional housing, necessitating the construction of replacement housing?
- Would the project displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

In order to analyze the above significance thresholds, the DEIR must also address the following questions:

- Would the project result in the net loss of any existing housing units affordable to very low income or low income households through any means including gentrification?
- What is the net change in affordable versus market rate units in the surrounding neighborhoods as a result of the Project?
- Would the Project impact a disadvantaged community (DAC)?
- Would the project result in a greater imbalance between jobs and housing, including jobs housing fit?[7]

Finally, the DEIR fails to disclose the Project's inconsistency with the UCSF 2014 LRDP Community Planning Principle HI which calls for projects to make a positive contribution to San Francisco's affordable housing stock…in order to relieve housing demand in the local community. DEIR at page 4.12-4.

The DEIR's analysis of these potential impacts associated with population, employment and housing is inadequate starting with the lack of any credible environmental setting or context for the discussion including the following basic facts:

- San Francisco and the region added more jobs than housing over the last decade. Census data shows that San Francisco added 8.2 jobs per home since 2010. Overall, the Bay Area has added 2 jobs for every home built since 1990. See also Plan Bay Area Final Plan 2040, Attachment 5.
- Between 2011 and 2017, the region added 658,000 jobs and 140,000 housing units, or on average 4.7 jobs for every housing unit. SPUR Regional Strategy, Attachment 6.
- The shortfall of housing units is estimated by SPUR to be nearly 700,000 units including units to meet the needs of both middle income and lower income households. Id.

[7] Jobs-Housing fit means the extent to which housing prices or rents are matched to the local job salary ranges. Jobs-Housing balance provides a general sense of how in or out of balance housing to fit the local workforce may be. Jobs-Housing fit provides an essential and more granular sense of whether – even if in balance – local employees are able to reside locally or must commute long distances for housing affordable to them and their families. Without jobs-housing fit information, readily available using Census and other data, it is not possible for the DEIR to adequately analyze many Project-related and cumulative impacts including demand for new housing and vehicle miles traveled, among others.

- In order to meet the unmet past need plus future needs for housing, the Bay Area would need to build 45,000 units per year to produce an additional 2.2 millions units by 2070. Id.
- The production of affordable housing has lagged behind production of housing affordable to higher incomes, with significant shortfalls of housing production for moderate or middle income wage earners and lower income wage earners. From 1999 to 2014, the Bay area issued permits for only about 35% of the units to meet the needs of vulnerable populations such as low-income families. Id.
- Much of the older housing stock located in higher density areas such as San Francisco have experienced gentrification pressures due to competition from new and higher income wage earners. Id.

A revised DEIR must provide baseline information about the housing crisis and re-analyze housing-related impacts of the Project in light of that information. Based on accurate information about the pre-Covid SF and Bay Area housing crisis (summarize above), it can reasonably be concluded that the additional of 5,200 students, faculty and staff by 2050 and only 984 units produced, the housing need generated constitutes a significant impact. Demand for housing is further exacerbated by the job multiplier of 0.73 creating an additional 3,420 jobs induced by the Project. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, based on more new staff and faculty already housed, at an estimated 4,000+ units, would still constitute a significant impact. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis. Under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing.

The Project is also inconsistent with the Community Planning Principle HI directed at relieving housing demand on the local community. The DEIR's conclusion that "population growth would not result in a demand for new housing that would exceed the capacity of the five-county market area," and that "CPHP's impact related to population and housing would be less than significant" is clearly incorrect.

c. A Revised DEIR Must Include Feasible Mitigation Measures and Alternatives to Address Significant Impacts to Housing

The DEIR must identify feasible mitigation measures and alternatives capable of reducing or eliminating significant impacts. The DEIR fails to do so.

In reaction to the housing crisis, SF voters passed Measure E in March 2020, limiting construction of new office building unless affordable housing goals are met. Measure E is instructive as to the kinds of mitigation measures UCSF should consider in addressing the increased imbalance of housing and jobs the Project would foster.

Feasible mitigation measures that should be included in a revised DEIR include the following:

- Increase Project housing to provide sufficient and affordable housing for new students, faculty and staff as well as a portion of induced demand (multiplier) by increasing housing proposed by the Project and decreasing new jobs.
- Provide sufficient housing in advance of the development and occupation of non-residential buildings (in line with Measure E).
- Adopt a project that adheres to the existing space ceiling thereby reducing increased staff and faculty and associated housing demand.

These and other feasible mitigation measures must be identified in a revised DEIR to address the significant population and housing impacts of the Project and cumulative development on the Project area, the City and region. A Financial Analysis should accompany the revised Plan and DEIR setting forth costs associated with housing, services and other community benefits of the Project and laying out a revised approach to funding implementation of these Project elements.

- Would the project displace substantial number of existing housing units or create demand for additional housing, necessitating the construction of replacement housing?

2. The DEIR's Analysis of Land Use and Planning Is Incomplete and Inadequate, Thereby Failing to Disclose and Mitigate Significant Impacts

The DEIR incorrectly identifies as Less Than Significant the Project's Land Use and Planning impacts. At the heart of the analysis of land use and planning impacts is the question of the Project's consistency with applicable policies and other provisions including UC's as well as the City's. Contrary to the DEIR's conclusions, the Project is incompatible with the surrounding area and conflicts with numerous policies and provisions of San Francisco's General Plan and Planning Code, as well as UC policies. Due to UC's constitutional autonomy, development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local land use regulations. However, UCSF has indicated its intent to adhere to local policies and regulations to the extent practicable and to review policies germane to the analysis of land use impacts. DEIR at page 4.10-6. In the pertinent topical sections (e.g., Land Use and Planning, Noise, Aesthetics) the DEIR does describe pertinent policies and regulations, finding in each case that the Project is compatible with surrounding land uses and as such would not create any significant impacts. As described below, the analysis of land use and policy consistency is flawed and the conclusions

unsupported by evidence. Contrary to conclusions reached in the DEIR, there is evidence of policy and regulation inconsistency resulting in significant environmental impacts, only two of which – wind and cultural – are disclosed and acknowledged.

Planning and Land Use Context: The *San Francisco General Plan* provides policies and objectives to guide land use decisions and along with the San Francisco Planning Code prescribes the permitted uses and development standards to carry out the City's policies for the 107-acre Parnassus Campus site. In a 1987 Memorandum of Understanding (MOU), UCSF agree to advise and consult with the City of San Francisco on any proposed construction projects. The MOU states that the City Planning Commission will advise UCSF about the "conformance of such development with the Master Plan of San Francisco and Planning Code Section 304.5 (Institutional Master Plans) with recommendations, of any, for amendment to the proposal… Should the City Planning commission and UCSF disagree on any matter which is the subject of this MOU, either party may request the participation of the Mayor and the Chancellor in attempting to resolve the dispute." (MOU, para. IV). The DEIR must, include a complete and forthright analysis of the Project's consistency with the General Plan and other applicable planning documents, ordinances and regulations so that UCSF can honor its intent to adhere to the extent practicable, the City's policies and "zoning codes related to building use, height, and bulk limitations; floor areas; and parking requirements or restrictions for the purpose of ensuring compatibility with the surrounding uses." DEIR at page 4.10-6. Inconsistencies between the Project and the General Plan or other applicable planning documents that were enacted to protect the environment may constitute significant impacts in themselves and can also be evidence of other significant impacts that must be analyzed in the DEIR. Where elements of the Project are not part of its educational mission, and are inconsistent with the General Plan it may not be lawfully adopted or approved. Additional information is needed about the Project elements in order to describe and document how the entirety of the Project is in support of UCSF's educational mission. It is not possible to determine that without more details about how the new space will be used and occupied and for what specific purposes.

While not considered by UCSF objectives or regulations, reference is made in the UCSF 2014 LRDP, to the Community Planning Principles which were produced in collaboration with the UCSF Community Advisory Group. These Principles include the following:

- Land Use LU1. Plan for growth and renovations that are substantially consistent with use limitations and height and bulk limitations in the City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects. The University should consider City planning proposals that are underway. UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns.

- LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density, and that do not negatively affect surrounding land uses.
- LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights Campus site.

DEIR at page 4.10-3 to 4.10-4.

The Parnassus Heights campus site, the oldest and largest of the UCSF campuses, is located in among some of the oldest neighborhoods in San Francisco, characterized by unique physical characteristics and mix of land uses including residential areas ranging from single family to multi-family housing and charming neighborhood serving commercial districts such as located along Irving and Judah Streets and 9th Avenue. In addition to Mount Sutro Open Space Reserve, several park and open space areas are located near the campus. This area is characterized by local serving streets fraught with traffic, parking congestion and lack of transit.

Compliance with the City of San Francisco's adopted policies and regulations are a key indicator of whether the Project is or is not compatible with the surrounding neighborhood. UCSF clearly understood the breaking point for compatibility in its 1976 Regents' Resolution. Recognizing the unique and constrained location the Parnassus Heights campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part: "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." See Attachment 2.

In addition, the Resolution recognizes the transportation problems in the area and commits funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit.

In a letter to Chancellor Hawgood, dated January 16, 2020, Mayor London Breed, President of the Board of Supervisors Norman Yee and Supervisor Dean Preston note the need for a revised MOU to adopt and formalize arrangements for coordination and consideration of both our interests and inputs in the context of land use approvals, transportation needs and ongoing service provisions, noting the common challenges faced include housing supply, affordability and climate and seismic related risks. See Attachment 3.

In this case, after discussing only some of the applicable plans, the DEIR incorrectly concludes across the board that the Project would be compatible with adjacent lands uses and impacts would be insignificant. Some examples of the Project's glaring inconsistencies with the General Plan and Code include, but are not limited to, the following:

San Francisco General Plan and Zoning Code Excerpt	Inconsistency
Land Use and Urban Design Elements LU-2: Plan for growth and renovations that are substantially consistent with use limitations and bulk limitations in City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects…UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns. LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density and do not negatively affect surrounding land uses. LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights campus site. Policy 3.5: Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development. Policy 3.6: Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction. San Francisco Planning Code – Use Districts City's P (Public) Zoning District Housing along Third and Fifth Avenues – see also Residential House District, Two-Family (RH-2) Code sections Height and Bulk Districts: 25-X, 40-X, 65-D, 80-D, 130-D and 220-F. Floor areas rations are determined by allowable height and coverage.	The DEIR correctly concludes that the New Hospital, as well as Millberry Union, certain West Side development and the Aldea Housing densification project would not be consistent with City Planning Code height and/or bulk regulations for their respective building sites. DEIR at 4.10-16. The DEIR continues on to incorrectly conclude despite evidence to the contrary, that these conflicts would not result in significant incompatibility with adjacent land uses or impacts on surrounding uses. Taking just the New Hospital as an example, at about 955,000 gross square feet and up to 294 feet in height, the New Hospital clearly demonstrates the Project's incompatibility with the surrounding area resulting in significant adverse environmental impacts including but not limited to, wind, visual and environmental impacts associated with an inadequate supply of housing affordable to new students, faculty and staff. The New Hospital is patently inconsistent with SF Land Use and Design policies and height and bulk requirements in multiple ways. First, the New Hospital is within three height and bulk districts and exceeds height limits for portions of the site within two of these, the 65-D and 22-F Height and Bulk districts, by over 70 feet and X stories. Second, the New Hospital would require use of a portion of the Reserve and would be located even closer to the off-site residences on Edgewood. The DEIR concedes: Impact AES-2 finds that the New Hospital would be the most noticeable visual change under the CPHP program, and would contrast sharply both in height and scale with the nearby residential development…". DEIR at 4.10-17. In justifying the conclusion that the New Hospital is compatible with adjacent land uses, the DEIR points to the proposed amendments to the 2014 LRDP which increase the space ceiling. In addition, the DEIR (Impact AES-3) finds that with implementation of appropriate design standards and exterior materials light and glare and other impacts would be reduced to less than significant.

	Even so, the DEIR concedes that the New Hospital will still result in significant unavoidable wind hazards. Analysis by Jared Ikeda provides clear evidence the New Hospital with also result in significant and unavoidable visual impacts. See Attachment 7. There are clear inconsistencies between the New Hospital and the City's General Plan policies and Code resulting in documented significant and unavoidable impacts associated with wind hazard, visual and housing, among other impacts. <u>These inconsistencies and the associated physical environmental impacts are not resolved by the amendment to the LRDP to raise the space ceiling.</u> Combined with other Project elements – Millberry Union, West Side – and the Project scale and bulk overall, the Project is clearly incompatible with the surrounding area resulting in significant and unavoidable impacts including those omitted from the DEIR but disclosed (wind) and some revealed by expert analysis (e.g., visual, cultural, housing). A revised and recirculated DEIR must re-analyze Project consistency with these and other applicable provisions of the City's Plans and Codes and Impact LU-2 must be found to be a significant and unavoidable impact. In addition, the Project is clearly inconsistent with CPHP Policy 3.6, which states that the height of buildings should be related to the prevailing scale and character of existing development. The New Hospital at nearly 100 feet taller than the tallest existing building on the campus, Moffit Hospital, is clearly inconsistent with this Policy. A revised DEIR must include in a revised Land Use and Planning section a systematic and thorough analysis of inconsistencies with all applicable (City, UC, other) policies and regulations.
Urban Design Element Policy 1.1: Recognize and protect major views in the city, with particular attention to those of open space and water.	The DEIR incorrectly concludes the project will not conflict with these policies and specifically that "[d]evelopment under the CPHP would not have a substantial adverse effect on a scenic vista" (AES-1) or "conflict with the applicable zoning and other

Policy 3.4: Promote building forms that will respect and improve the integrity of open spaces and other public areas.	regulations governing scenic quality" (AES-2) and therefore no mitigation is required. In his analysis of visual impacts, Jared Ikeda concludes that the New 16-story Hospital would result in significant visual impacts including specifically that it would block views to Mt Sutro and the Reserve and would block views of the ocean and Golden Gate Park from trails and other public vantage points resulting in policy inconsistencies with direct significant environmental impacts. See Attachment 7. A revised DEIR must change the disposition of these impacts (AES-1 and 2) to significant and unavoidable and identify feasible mitigation measures including alternatives to the Project.
Shadow Proposition M, adopted by the voters in 1986, added section 101.1 to the SF Planning Code and established 8 priority policies. Priority Policy No. 8 calls for the protection of parks and open space and their access to sunlight and vistas.	The DEIR incorrectly states that the implementation of the Project would not create new shadow that substantially and adversely affects the use and enjoyment of publicly accessible open spaces. In his analysis of aesthetic impacts, Jared Ikeda reviewed the DEIR's analysis with respect to shadows and reached a different conclusion documented in his letter: "It appears though that certain areas along Parnassus Avenue and Irving Street will be subject to frequent shadows throughout the year." See Attachment 7. These more frequent shadows will clearly affect the use and enjoyment of these public spaces and as such should be called out as a Significant and Unavoidable impacts of the Project as proposed. Feasible mitigation measures must be identified.
Regents' Resolution: Space Ceiling of 3.55 Million Gross Square Feet	The DEIR conveniently concludes that the impacts associated with the Project's significant increase in gross square feet (an increase of approximately 1.5 million GSF about the existing space ceiling) and population increase from 18,500 to nearly 25,000, would be less than significant because the LRDP would be amended to increase both space and population. An amendment to the space and population ceiling does not eliminate the physical environmental impacts described in the table above associated with the increased scale of the Project. Such impacts include wind hazard (found SU by the DEIR), cultural (found SU by the DEIR) and additionally,

	aesthetic (visual and shadows) and housing, among others. A revised DEIR must identify this as an inconsistency, re-analyze the associated environmental impacts and identify feasible mitigation including alternatives to Project components such as the New Hospital.

A revised DEIR must include expanded and forthright analysis of the Project's potential inconsistencies with applicable plans and policies including the City of San Francisco's, and disclose the significant and significant and unavoidable, environmental impacts associated with those inconsistencies.

In addition, a revised DEIR must include feasible mitigation measures and alternatives to reduce or eliminate the significant impacts associated with those inconsistencies. Mitigation measures including, but not limited to the following should be considered:

- Retain the space ceiling and adopt an Alternative consistent with the space ceiling and other UCSF commitments.
- Seismically upgrade the existing hospital at Parnassus in combination with a New Hospital off-site (Mission Bay, Hunters Point, see other options in Alternatives discussion below).

3. The DEIR Alternatives Analysis is Legally Deficient

Alternatives are optional ways that the Project could achieve most of the objectives while also reducing or eliminating the environmental impacts of the Project. (California Public Resources Code Section 21002). Typically, alternatives to the Project involve changes to the location, scope, design, and intensity but can also include method of construction and/or operation. Where the Project includes a mix of land use types as in the case of this Project, alternatives may also include alterations in the mix of land uses proposed in order to reduce or eliminate impacts (e.g., increase Project housing to meet demand for growth within the space ceiling).

The fundamental mandate is that "public agencies should not approve projects if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of the project" (PRC Section 21002, 21081). Government agencies are required to consider alternatives to proposed actions affecting the environment. (PRC Section 21001 (g)).

The DEIR's alternatives analysis is legally deficient because it fails to describe a reasonable range of alternatives, or to the location of the Project, which would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the significant effects of the Project, and evaluate the merits of the alternatives. "An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision-making." (*Laurel*

Heights I, 47 Cal.3d at 404). An EIR must also include "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (*Id. At 405*.)

In developing a list of alternatives for analysis, both project objectives and known or likely significant impacts of the Project must be factored in. Alternatives need not meet all of the objectives and their fundamental purpose is to reduce or eliminate Project impacts. The Project setting can also influence the range and choice of alternatives. Offsite alternatives should be considered. Offsite alternatives must be feasible (e.g., site control by Project proponent or possible for the proponent to acquire the property).

Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)).

The DEIR's Alternatives Analysis is Legally Deficient Because it Improperly Rejects Feasible Off-Site Alternatives and Omits Others Feasible Off-Site Alternatives

Feasible alternatives to the Project that would reduce or eliminate significant Project impacts including those acknowledged by the DEIR briefly considered but dismissed include:

- No New Hospital at Parnassus Heights Campus Site/Implement Phase 2 of Medical Center at Mission Bay Campus Site
- New Hospital at Mount Zion Campus Site

Omitted from the list of feasible offsite options are:

- Seton Hall Hospital Facility, which stands empty
- New Hospital at Hunters Point, which would provide jobs in and health services to an underserved and disadvantaged community

The reasons provided in the short approximately one-page discussion dismissing the alternative of a new hospital at Mission Bay comes down to the alternatives' reported failure to meet very focused Project objectives and a purported conflict with the 2014 LRDP and CPHP. Specifically the DEIR states that the alternative would not meet some of the Project objectives (e.g., expansion of some services and other benefits from an interdisciplinary program) and would conflict with several 2014 LRDP and CPHPs objectives for Parnassus Heights campus including but not limited to adequate space to foster collaboration and to facility inter-dependence and connectivity for operational efficiency, adequate clinical and administrative support and aligned with other programs, increase in beds, and modern industry standards including seismic safety. Page 6-55 to 6-55. The discussion concedes that the alternative would reduce the significant

wind impacts, cultural and construction impacts, but that in so doing, it would likely also result in increased cross town traffic between the Parnassus and Mission Bay campus sites. Not analyzed was a combination of a smaller, new hospital at Parnassus in combination with Mission Bay; another feasible option that has the potential to address total need and allow phasing to accommodate patients and services.

Dismissal of these alternatives (New Hospital at Mission Bay and Combination of New Hospital at Mission Bay and Reduced Hospital at Parnassus) is not justified. First, the alternative would meet most of the Project objectives. If a New Hospital at Mission Bay is combined with a rebuilt smaller hospital at Parnassus, the alternative could meet the need for additional beds and services as well. The argument that this alternative would increase cross town traffic is not supported by any evidence or analysis. Finally, the conflicts with the 2014 LRDP are not persuasive since that document is being amended to break the space ceiling and this alternative would not require that significant amendment to the LRDP. In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus. These alternatives must be fully analyzed in a revised and recirculated DEIR, including additional facts and analysis to support the arguments concerning the alternatives conflicts.

The DEIR similarly dismisses the alternative of a new hospital at the Mount Zion Campus Site, stating that this alternative would result in UCSF hospitals operating at three different campus sites which would be "less than ideal and inefficient," would not help achieve the benefits realized through interdisciplinary collaboration and convergence between clinical care, research and education, land acquisition would be difficult and citing undisclosed conflicts with LRDP and CPHP objectives. The discussion concedes that the alternative would reduce the significant wind impacts, cultural and construction impacts, but that in so doing, it would likely also result in localized impacts at the Mt. Zion site and increased cross town traffic between the Parnassus and Mission Bay campus sites. This alternative also merits full analysis in a revised and recirculated DEIR because it would reduce or eliminate Project impacts and could be carried out in combination of seismic retrofits to the existing hospital at Parnassus to meet objectives and remain consistent with the space ceiling.

Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)). Rejection of the Mission Bay and Mt. Zion sites for a new hospital, either in lieu of or in combination with a smaller hospital at Parnassus, is not supported by the evidence and analysis provided and both require full analysis in a revised and recirculated DEIR.

In addition, the revised and recirculated DEIR should also fully analyze a new hospital at Hunters Point and reuse of Seton Hall. A new hospital at Hunters point would eliminate the

significant impacts associated with the Project and provide jobs and health care to a disadvantaged and underserved community.

Since the Mission Bay alternative reduces the Project's significant impacts, while achieving almost all Project objectives, the DEIR is arbitrary and capricious for dismissing this alternative in particular from full review and in rejecting this alternative. In addition, the Mission Bay Campus was justified by the cap at Parnassus, making this alternative essential for full review. In light of the development cap at Parnassus, each of these alternatives warrants review in a revised and recirculated DEIR with priority on Mission Bay and Hunters Point.

III. The DEIR Must be Revised and Recirculated

Decision makers and the public cannot possibly assess the Project's impacts through the present DEIR which is riddled with omissions, errors and inconsistencies. Among other fundamental deficiencies, the DEIR repeatedly understates the Project's significant environmental impacts and therefore fails to formulate feasible mitigation to reduce these impacts. To resolve these issues, a revised DEIR that would necessarily include substantial new information must be prepared and recirculated.

Sincerely,

Terry Watt

terryjwatt@gmail.com Cell: 415-377-6280

Terry Watt, AICP, owns Terry Watt Planning Consultants. Ms. Watt's firm specializes in planning and implementation projects with a focus on regionally-significant land use and conservation work that advances sustainable development patterns and practices. Prior to forming her own consulting group, she was the staff planning expert with the environmental and land use law firm Shute, Mihaly & Weinberger. She is an expert in general and specific planning and zoning, open space and agricultural land conservation strategies and approaches and environmental compliance, including CEQA and NEPA. Her skills also include facilitation and negotiation, public outreach and project management. Terry is a frequent presenter at regional, national and statewide workshops and symposiums. She holds a master's degree in City and Regional Planning from the University of Southern California and a multi-disciplinary bachelor's degree in Urban Studies from Stanford University.

Terry works with a wide variety of clients throughout California including non-profit organizations, government agencies and foundations. She volunteers up to half her professional time on select projects. Recent projects and roles include:

- Project Manager and Governor's Office Liaison for San Joaquin Valley: Least Conflict Lands for Solar PV project. Project funding came from the Hewlett and Energy Foundation's, matched by environmental organizations, the California Energy Commission and other private parties. The objective of the project was to identify areas in the Valley that had very low resource values for renewable energy to serve as an incentive for development of least conflict lands rather than valuable resource lands. Watt was responsible for overall project management and day to day coordination, multi-stakeholder (150 stakeholders) and agency (57 federal, local and agency advisors) outreach and participation, facilitation of meetings, Governor's Office convening's, all project logistics and project report. Link to Collaboration Platform – Data Basin San Joaquin Valley: http://sjvp.databasin.org/
- Governor's Office Liaison and Outreach Coordinator for the State's portion of the Desert Renewable Energy Conservation Plan (DRECP). As outreach coordinator, worked closely with local governments on DRECP related consistency issues with local general plans.
- Planning Consultant to California Attorney General's Office - Environment Section focusing on climate change, CEQA and general plans. (2007- 2010). While working with the Environment Section, assisted with settlements (Stockton General Plan, Pleasanton Housing Element and CEQA litigation); identified locally based best practices for local government planning to address climate change issues; and managed government outreach and consultation on general plans and climate action plans/energy elements/sustainability planning efforts. Post 2010 continue to provide periodic consulting services to the Environment Section related to select cases.
- Strategic Advisor and Planning Consultant to the Santa Clara Valley Open Space Authority, Greenbelt

Alliance and Committee for Green Foothills for the Coyote Valley Project focused on developing a conservation and development plan for the Valley. Watt was responsible for preparing the group's early CEQA comment letter on the negative declaration for a proposed Warehouse Project and assisting with scoping comments for the EIR.

- Measure M-2 Sales Tax and Environmental Mitigation Measure. (2009-). Terry was the Co-project manager/facilitator of a 30+-member environmental coalition that through a unique partnership with the Orange County Transportation Authority (OCTA) and state and federal wildlife agencies generated nearly $500 million in funding for programmatic environmental mitigation (conservation land acquisition and stewardship) in Measure M2, Orange County Transportation Sales Tax.
- State Office of Planning and Research Special Projects (2011 – 2017). Advisor to OPR on General Plan Guidelines, Infill and Renewable Energy Templates as part of the required update of the General Plan Guidelines. Expert panelist for workshops on SB 743.
- Marin Countywide General Plan and Environmental Impact Report (2004 to 2007). Project Manager for the award-winning Marin Countywide Plan Update and its Environmental Impact Report. The General Plan was among the first to incorporate leading edge climate change, greenhouse gas emissions reduction and sustainability policies as well as monitoring, tracking and implementation measures to measure success.
- Staff to the Martis Fund, a joint project of five environmental groups and a Business Group (Highlands Group and DMB Inc.). (2008 – ongoing). The Fund was created as a result of litigation settlement. The Fund has distributed over $15 million dollars since its inception to a range of conservation (acquisition of over 5,000 acres of open space), stewardship and restoration projects and workforce housing projects (emergency rental housing support, down payment assistance and low income apartments). Funding comes from a permanent transfer fee on all real estate sales at Martis Camp. http://www.martisfund.org/PDFs/Martis-Fund-Brochure.pdf
- Tejon Ranch Land Use and Conservation Agreement. (2006 – ongoing). Project coordinator for a dialogue process between environmental groups (Natural Resources Defense Council, Sierra Club, Endangered Habitats League, Planning and Conservation League, Audubon California) and The Tejon Ranch Company that resulted in a major Land Use and Conservation Agreement for the permanent protection of 240,000+ acres (90%) of the 270,000 acre Tejon Ranch. Secretary John Laird refers to the Agreement as a "miracle" agreement. In return for permanent conservation of 240,000+ acres, environmental groups agreed not to oppose projects within the development footprints; but can comment on regional planning efforts and the projects. Terry has an ongoing role overseeing implementation of the Agreement, including early role forming and managing the Conservancy formed by the Agreement. The Agreement provided the cornerstone of the Habitat Conservation Plan for a major portion of the Ranch; the Tejon Multi-Species Habitat Conservation Plan, TUMSHP, approved in April 2013. She recently joined the Board of the Tejon Ranch Conservancy created and funded by the Agreement.
- Orange County Wildlife Corridor. Project coordinator and architect for dialogue process between environmental and conservation organizations, City of Irvine and Lennar/Five Points development team that resulted in an 8 party Agreement, related general plan amendment and full funding to build an urban wildlife corridor to the specifications of the science team (6-member team jointly selected by all groups) connecting two high value conservation areas in central Orange County (Coastal and Eastern NCCP/HCP lands). Watt provides some ongoing implementation support. Recently (2017) coordinated DEIR comments letters on two Orange County Project proposals that could adversely impact the 5 Point/Irvine Wildlife Corridor.
- Ongoing assistance and authorship of expert comments on projects with recent letters on the proposed draft Amador County General Plan on behalf of the Foothill Conservancy and the proposed Squaw Valley Resort on behalf of a coalition of environmental and labor organizations.

- Facilitator to the Bolsa Chica Land Trust for recent agreement with Landowners to purchase remaining private acres of the Bolsa Chica uplands. Currently assisting with fundraising for the property.
- Advisor to the Nature Conservancy, the American Farmland Trust, Center for Law, Energy and Environment on numerous publications concerning urban infill and conservation.

APPENDIX F: 1976 REGENTS' RESOLUTION

"DESIGNATION OF OPEN SPACE RESERVE, ALTERATION OF CAMPUS BOUNDARIES, COMMITMENT OF HOUSES TO RESIDENTIAL USE, AUTHORIZATION TO NEGOTIATE SALE OF PROPERTIES AND COMMITMENT OF TRANSPORTATION STUDIES."

The following recommendations were approved by the Board of Regents on May 21, 1976:

1. That the reserve on Mount Sutro, which was designated as open space for a twenty-five year period by The Regents in October, 1975, be increased from fifty-two to approximately fifty-eight acres, and that the designation be made permanent.

2. That the boundaries of the San Francisco campus be altered to exclude properties on the west side of Third Avenue from 1309-11 Third Avenue to and including 1379 Third Avenue, and that the new boundaries be made permanent. The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent. These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the new campus boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton and Clarendon. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

3. That the Regents redefine their commitment, made as part of the October, 1975, approval of the Long Range Development Plan, to return certain existing houses to residential use as alternative campus space and funds for rehabilitation and relocation become available for the activities now housed therein, and that as part of this commitment: The ten houses on Third Avenue, outside the campus boundaries revised as recommended in 2. above, be sold subject to the provisions set forth in 4. below; the thirty-four houses on Third, Fifth, and Parnassus Avenues and on Irving and Kirkham Streets be rehabilitated as required and leased for residential purposes, with priority given to University students, faculty, and staff; and the seven houses on Fourth Avenue remaining after clearance of the site for the School of Dentistry Building project be retained for non-residential campus use.

4. That the Treasurer be authorized to negotiate the sale of the lots and structures, and other improvements thereon, located at 1309-11, 1319, 1325, 1337, 1343, 1355, 1361-63, 1367-69, 1373, and 1379 Third Avenue; the lot between 1355 and 1343 Third Avenue; and the lot between 1309-11 and 1319 Third Avenue, subject to the provisions listed in 4(a) through 4(e) below and that the results of said negotiations be presented to The Regents for final approval and authority to sell based on offers acceptable to The Regents:

    (a) The offer for sale of the two vacant lots shall commence within six months and the offer for sale of all remaining properties shall commence within thirty-six months, except that no relocation of University activities or tenants or conversion of houses for residential uses shall

be initiated until funds for such purpose are on hand as specified in 4(b) below and until space into which activities or tenants can be relocated is available;

(b) A special fund shall be established to fund projects within the Capital Improvement Program for the purpose of, first, providing accommodation for activities displaced by sale of houses, second, providing accommodation for campus activities displaced by conversion of the structures retained for residential use, and, third, converting and rehabilitating the structures retained for residential use, said fund to be funded from proceeds of the sale of the properties, except as noted in 4(c) below, and, if funds are not on hand from the sale of properties, from an advance, as needed, of not to exceed $50,000 from the University Opportunity Fund, such advance to be on a revolving basis and to be repaid with proceeds, as received, from subsequent sale of properties, it being understood that, at the completion of the sale of the properties, any part of the advance not repaid shall be converted to an appropriation;

(c) The portions of the proceeds of the sales of the lots between 1309-11 and 1319, and between 1343 and 1355 Third Avenue, attributable to the eighteen parking spaces currently located thereon, shall be deposited in the Net Revenue Account of the University of California Parking System;

(d) Funds not to exceed $10,000 shall be allocated by the President obtain an appraisal of market value of the properties for use as residences; and

(e) All properties shall be sold in the then existing condition, it being made clear to the buyer that he or she may be required to conform to all applicable State and City and County of San Francisco codes in converting the structures to residential use;

5. That funds not to exceed $25,000 be allocated to the San Francisco campus from the University Opportunity Fund for the purpose of retaining an independent consultant firm to develop additional plans for the alleviation of transportation problems such as traffic, parking congestion, and availability of public transit, it being the intent that such plans be implemented to the extend feasible within resources normally available to the campus for such purposes or within additional State appropriations that might be made available for such purposes;

6. That the Long Range Development Plan for the San Francisco campus, as approved by The Regents in October, 1975, be amended to reflect the described changes in designation of open space, boundaries, and use of housing;

7. That The Regents recognize the principle that the San Francisco campus will be administered so that the annual average of the daily campus population at the Parnassus site will remain substantially in accordance with the projections set forth in the Environmental Impact Report related to the Long Range Development Plan for the campus, approved by The Regents in October 1975.

OFFICE OF THE MAYOR
SAN FRANCISCO

LONDON N. BREED
MAYOR

January 16, 2020

Chancellor Sam Hawgood
University of California, San Francisco
513 Parnassus Avenue, Room 115 F, Box 0402
San Francisco, CA, 94143

Dear Chancellor Hawgood,

Happy New Year! As we begin this new year, this new decade, we look forward to continuing to work with you and the leadership of UCSF to help advance UCSF's mission of being the leading university dedicated to advancing health worldwide through preeminent biomedical research, graduate-level education in the life sciences and health professions, and excellence in patient care. We know UCSF is devoted at every level to serving the public, and the residents of San Francisco are fortunate to have your 22,500 employees serving them, as well as, to benefit from the nearly $6.5 billion you generate annually for the Bay Area economy.

Working collaboratively has been the hallmark of the City and County of San Francisco and UCSF's relationship over the years. As examples, we can proudly point to UCSF's partnership with our Department of Public Health in operating Zuckerberg General Hospital, or more recently, your assistance reviewing the methodology of the environmental testing surrounding the Shipyard at Hunter's Point. Indeed, both the City and UCSF tremendously benefit from working together.

To that end, and to further this collaborative spirit, as UCSF embarks on its rebuild and, truly, its reimaging of its Parnassus Height Campus, we propose that the City's Planning Department convene a City stakeholder process and directly engage with your planning team on the future design and uses of the campus. We are well aware of your growing needs and of the public's growing demands on your health care system and the services you provide. However, we want to ensure that as UCSF moves forward with its proposal, the input of the City's Planning Department and UCSF's surrounding neighborhoods are heard.

Moreover, as we discuss the growth at Parnassus Heights, the common challenges we both face – housing supply, affordability, transportation infrastructure, demand for more community and social services, and climate and seismic related risks – should be addressed in manners consistent with both UCSF's and the City's polices. By working with the City's Planning Department, the Mayor's office, District Supervisors, and neighborhood residents, we are confident such challenges can be met to address both of our short term and long-term needs.

OFFICE OF THE MAYOR
SAN FRANCISCO

LONDON N. BREED
MAYOR

In 2007, the City and County of San Francisco entered into a Memorandum of Understanding with San Francisco State University, as they embarked on their own campus redesign, which adopted and formalized arrangements for the coordination and consideration of both of our interests and inputs in the context of land use approvals, transportation needs, and ongoing service provisions. This is a model of collaboration that we recommend we pursue jointly as you move forward with the Parnassus project. As a first step in this process, we would like to meet with you and your team to outline a proposal for how such an MOU could be adopted by both of us. Should you have any initial questions or comments, please do not hesitate to contact any one of us. We look forward to discussing this further.

Sincerely,

London N. Breed
Mayor, City and County of San Francisco

Norman Yee
President, San Francisco Board of Supervisors

Dean Preston
Member, San Francisco Board of Supervisors, District 5

PROPOSED POLICY AND PLANNING AMENDMENT

In the context of the recent displays of institutional and structural racism and white supremacy, and the responding popular outcries for deep and lasting transformation, the Planning Department Staff prepared a Resolution requested by the Planning Commission to consider and adopt regarding the centering of the Planning Department's work program and resource allocation on racial and social equity. The Resolution acknowledges and apologizes for the history of inequitable Planning policies resulting in racial disparities; directs the Planning Department to implement its Racial and Social Equity Action Plan; directs the Planning Department to develop proactive strategies to address structural and institutional racism in collaboration with Black and American Indian communities and Communities of Color; directs the Planning Department to amend its hiring and promotion practices to ensure the Department's staff reflects the diversity and demographics of the community at all staff levels; recommends that the Board of Supervisors condemn discriminatory government actions; and directs the Planning Department to build accountability through metrics and reporting.

RESOLUTION CENTERING THE PLANNING DEPARTMENT'S WORK PROGRAM AND RESOURCE ALLOCATION ON RACIAL AND SOCIAL EQUITY; ACKNOWLEDGING AND APOLOGIZING FOR THE HISTORY OF INEQUITABLE PLANNING POLICIES THAT HAVE RESULTED IN RACIAL DISPARITIES; DIRECTING THE DEPARTMENT TO IMPLEMENT ITS RACIAL AND SOCIAL EQUITY ACTION PLAN; DIRECTING THE DEPARTMENT TO DEVELOP PROACTIVE STRATEGIES TO ADDRESS STRUCTURAL AND INSTITUTIONAL RACISM, IN COLLABORATION WITH BLACK, AMERICAN INDIAN AND COMMUNITIES OF COLOR; DIRECTING THE DEPARTMENT TO AMEND ITS HIRING AND PROMOTION PRACTICES TO ENSURE THAT THE DEPARTMENT'S STAFF REFLECTS THE DIVERSITY AND DEMOGRAPHICS OF THE COMMUNITY AT ALL STAFF LEVELS; RECOMMENDING THAT THE BOARD OF SUPERVISORS CONDEMN DISCRIMINATORY GOVERNMENT ACTIONS; AND, DIRECTING THE DEPARTMENT TO BUILD ACCOUNTABILITY THROUGH METRICS AND REPORTING.

PREAMBLE

WHEREAS, the Planning Commission has reflected on the current events of COVID-19 and its disproportionate effects on American Indian communities, Black communities, and communities of color; the murders of George Floyd, Breonna Taylor, Ahmaud Arbery, Alex Nieto, Mario Woods, Luis Góngora Pat, and countless others as a result of police brutality and misconduct; and underlying government and economic structures that create the platform for these events; and

WHEREAS, the San Francisco Human Rights Commission states that racial equity means the systematic fair treatment of people of all Races that results in equal outcomes, while recognizing the historical context and systemic harm done to specific racial groups; and,

WHEREAS, San Francisco has a long history of creating and/or enforcing laws, policies, and institutions that have promoted white supremacy and perpetuated racial inequities in the City and County of San Francisco ("the City"), much of which is difficult to document due to historical erasure. The conditions that have created such racial inequities are also compounded by the intersection of race with class, gender,

sexuality, immigration status, disability, and other social identities and experiences that result in inequitable treatment or opportunities; and,

WHEREAS, using the power of zoning and land use, the City, its Planning Department ("Department") and other government agencies and private organizations have intentionally advanced policies aligned with white supremacy to segregate, displace, dispossess and extract wealth from Black communities, the American Indian community, and other communities of color. With the acknowledgement that this list is by no means exhaustive, examples include but are not limited to the following: Our history of state-sanctioned racism began with the genocide, exploitation, and dispossession of resources of the American Indian people on whose land our state and nation were founded. The City's 1870 Cubic Air Ordinance and 1880 Laundry Ordinance targeted the Chinese population using appeals of public safety to limit where they could live and work. Starting in the 1930s, Federal policies like redlining and local practices like racial covenants explicitly blocked American Indians, Black people and people of color from loans for homeownership and maintenance, as well as access to neighborhoods with good services and jobs; these policies led to cycles of disinvestment, segregation and poverty concentration among these communities. In 1942, in response to the bombing of Pearl Harbor, San Francisco aided the federal government in the forced eviction and internment of thousands of people of Japanese ancestry. In 1945, the Department identified neighborhoods that were predominately people of color as "blighted," including the Western Addition, South of Market, Chinatown, the Mission, and Bayview/Hunter's Point, and used this designation to justify the wholesale removal of Black communities and other communities of color through eminent domain. Furthermore, in the early 2000s, people of color were more likely to receive subprime housing loans than White borrowers. These predatory lending practices led to the foreclosure crisis starting in 2008, disproportionately impacting Black, Latinx, American Indian, and low-income people; during this period, middle-income Black and Latinx households lost nearly one-half of their wealth due to foreclosure. The cumulative impacts of these and other policies have resulted in the persistent outmigration and displacement of communities of color: the American Indian community in San Francisco experienced a decline from 0.5% of the population in 2006 to 0.1% today; while the Black community in San Francisco decreased from 11% of the City's population in 1990 to 5% in 2018; and,

WHEREAS, Although the City has taken steps to undo the damage caused by past policies and practices, the racial disparities caused continue to the present day. Despite progress in addressing explicit discrimination, racial inequities continue to be deep, pervasive, and persistent in San Francisco. In the 1950s and beyond, particularly in the context of a national Civil Rights Movement, systemic racism in San Francisco became much less explicit. Moving away from overtly race-based exclusionary policies regarding land or business ownership, the City's more recent and increasingly sophisticated racism has been defined by inaction or lack of intervention with regards to racial discrimination in employment, housing, neighborhood choice (through implicit exclusionary zoning), education, health care, or the criminal justice system; and,

WHEREAS, the legacy of these discriminatory policies is that San Francisco's American Indian, Black , and people of color have historically been, and many currently are, denied equal access to essential services and means of creating wealth, including affordable housing and homeownership opportunities, high-performing public schools, adequate transportation options, safe parks and open spaces, affordable health care, access to financial capital and entrepreneurship opportunities, and stores selling healthy food, among others; and,

WHEREAS, San Francisco's American Indian, Black, and people of color have historically been, and many currently are, disproportionately exposed to more environmental stressors including air and soil pollution, illegal dumping, industrial uses and transportation impacts, and are more likely to live in housing conditions where degraded indoor air quality contributes to the prevalence of asthma, other airborne diseases, and other health disparities; and,

WHEREAS, stark disparities continue to exist for City residents along racial lines. Race predicts worse outcomes for people of color across key indicators, including education, income, health, and incarceration, among others. For example, household income for White households is close to three times that of Black families and close to double that of American Indian and Latinx households, respectively. 53% of inmates in San Francisco County Jail are Black, while they only comprise about 5% of the City's total population. In 2018, American Indian and Black San Franciscans were more than three times more likely to be unemployed than Whites (11.9% and 12.5% versus 3.6%, respectively); and unemployment rates were similarly high for Native Hawaiian / Pacific Islanders (8.8%) and Latinxs (9.4%); and,

WHEREAS, The 2019 San Francisco Community Health Needs Assessment conducted by the San Francisco Health Improvement Partnership ("SFHIP") found that racial health inequities and poverty were foundational issues affecting the health of San Franciscans, impacting life expectancy, infant and maternal health, nutrition, stress, heart disease, and more. For example, in 2015-2017 the life expectancy in San Francisco was 72.1 years for Blacks, 76 years for Pacific Islanders, 81.7 years for White people, 85.1 years for Latinxs, and 87 years for Asians. (San Francisco data on American Indians was not included; such data is often unavailable in urban areas due to low population counts, which perpetuates disparities in documentation and policies that address their community needs.) The rates of asthma and COPD hospitalizations in the Black community are more than 10 times higher than for Asians; Pacific Islanders have the second highest rates. In San Francisco, Black women are twice as likely as White women to give birth prematurely, and Black and Pacific Islander women have the highest rates of prenatal morbidity. SFHIP also found that between 2007 and 2016, Black mothers had about 4% of births in San Francisco, but experienced 50% of maternal deaths, and 15% of infant deaths. While data on health outcomes in the American Indian population in San Francisco is limited, this community also faces persistent health disparities across a number of indicators. For instance, even though the overall rate of infant mortality in California has been declining since 2005, the American Indian/Alaska Native infant mortality rate in California remains high, averaging 6-7 infant deaths per 1,000 live births between 2005 and 2012; and,

WHEREAS, the impact of the redlining that went into effect in 1937 in San Francisco can still be seen today: 87% of redlined neighborhoods in San Francisco are neighborhoods currently undergoing displacement. The 2010 Census data showed a decline in the number of children of every racial group (including American Indian, Black, Latinx, and Asian and Pacific Islander) residing in San Francisco except white and multiracial children. Between 1990 and 2014-15, as housing prices rose, neighborhoods became more segregated, with the share of Black households in San Francisco living in high-poverty neighborhoods increasing from 41% in 2000 to 65% in 2015 (compared to Asian (27%), Latinx (19%), and White (12%) households). 50% of Black households, 31% of American Indian, and 30% of Latinx households are severely burdened by housing costs (spending more than 30% of their income on housing) while 16% of White households are similarly burdened. American Indian, Black, and Latinx residents have the lowest home ownership rates, at 0.3%, 4%, 9%, respectively. Latinxs reported the highest percentage of having been

threatened with eviction (24%), with 11% of those evictions having been raised with no cause, exceeding the percentage of no-cause evictions for other racial groups. 34% of Latinxs also reported having faced unstable living conditions in the last five years, with 36% stating they would have no other housing options if they were forced to move from their current residence.

WHEREAS, racial disparities in the rates of infection and death from COVID-19 have been documented, with American Indian, Black, and people of color disproportionately impacted by the disease. As of June 3rd, 2020 COVID-19 data for San Francisco, , indicate that Black communities in San Francisco comprised 9.3% of deaths, even though they comprise 5% of the population; Latinx communities comprised 47.8% of diagnosed cases (and comprise 15.2% of the population); American Indian communities comprised 0.4% of diagnosed cases (and comprise 0.1% of the population); and Asian communities comprised 46.5% of deaths (and comprise 34.1% of the population). In the April 2020 UCSF assessment in Mission District, 90% of the Latinx people tested for COVID-19 were positive, The health and economic impacts of the pandemic are exacerbating the existing disparities; and,

WHEREAS, Black and American Indian people are overrepresented among the homeless population. The 2019 San Francisco Homeless Count and Survey found that 37% of people experiencing homelessness were Black, while they represent only 5% of San Francisco's population. Overrepresentation in the homeless population was also high for American Indians (5% compared to 0.1%) and Pacific Islanders (2% compared to 0.2%). Of all people surveyed, 61% reported not being able to afford rent and 37% reported having no income. Discrimination and lack of access to opportunities for American Indian, Black and people of color put them at a higher risk of homelessness; and,

WHEREAS, San Francisco and other cities across the nation are part of a movement to eliminate institutional racism in partnership with the Government Alliance on Race and Equity (GARE), a national network dedicated to achieving racial equity and advancing opportunities for all. The Department's ongoing participation in GARE since January 2016 has given staff the training, tools, and support to build the Department's organizational capacity to advance racial equity in its programs, policies, and services; and,

WHEREAS, the Board of Supervisors, through Resolution No. 190547 on July 11, 2019, amended the Administrative Code to create an Office of Racial Equity as a Division of the Human Rights Commission, with authority to create a citywide Racial Equity Framework, analyze the impact of Board ordinances on racial equity, and create a racial reconciliation process; require City departments to create Racial Equity Action Plans and to provide annual updates on such Plans; require City departments to designate employees as racial equity leaders, and require the Department of Human Resources to produce an annual report concerning racial equity in the City workforce; and,

WHEREAS, in the coming years the Department will amend the General Plan through adoption of updated Housing and Transportation Elements, adoption of a Preservation Element, and updates to incorporate environmental justice, racial and social equity, and climate resilience across all relevant elements. On May 28, 2020, the Department launched the first of these updates: the Housing Element 2022 Update. The Housing Element policies will be grounded on the following values: racial and social equity, minimum displacement, more housing for all in all neighborhoods, and neighborhoods resilient to climate and health crises. The Transportation Element will be the next Element to undergo an update and will center its

policies in ConnectSF's goals of equity, economic vitality, environmental sustainability, safety and livability, and accountability and engagement; and,

WHEREAS, the Planning Commission (Commission) adopted the Racial & Social Equity Action Plan, Phase I on November 21, 2019 to guide the Department and Commission actions to strengthen our internal-facing processes and practices to address disparities in the Department's internal functions to advance organizational equity, through strategies that include: ongoing training for all staff; a biannual staff survey to assess Department attitudes and progress towards racial and social equity; and an interim Racial & Social Equity Assessment Tool to apply to relevant projects, policies, and practices; and,

WHEREAS, the Planning Commission adopted a Racial & Social Equity Vision on November 21, 2019, which envisions: inclusive neighborhoods that provide all with the opportunity to lead fulfilling, meaningful, and healthy lives; a city where public life and public spaces reflect the past, present and future of San Franciscans; a city where a person's race does not determine their lives' prospects and success; an inclusive Planning Department and Commissions that represent and engage the communities we serve; a Department that proactively infuses racial and social equity in both internal operations and external Planning work; and reimagines what the Planning field is and can be – inclusive, diverse and one that centers racial and social equity both as a practice and as an indicator of success; and

WHEREAS, the Planning Commission directed the Department to develop a Racial & Social Equity Action Plan, Phase II in collaboration with the new Office of Racial Equity, other City agencies, the Mayor's Office, the Board of Supervisors, and community stakeholders, to carefully examine and address legacy racial and social inequities and disparities in the Department's programs and policies and to develop Phase II with bold and forward-thinking strategies to advance racial and social equity in San Francisco; and,

MOVED, that the Commission considered public comment and reviewed the information before them and hereby adopts this Resolution.

FINDINGS

Having reviewed the materials identified in the preamble above, and having heard all testimony and arguments, this Commission finds, concludes, and determines as follows:

The Resolution directs the Planning Department to center its work program and resource allocation on racial and social equity; acknowledges and apologizes for the history of racist, discriminatory and inequitable planning policies that have resulted in racial disparities; directs the Department to develop proactive strategies to address and redress structural and institutional racism, in collaboration with Black and American Indian communities and communities of color; directs the Department to amend its hiring and promotion practices to ensure that the Department's staff reflects the diversity and demographics of the community at all staff levels; recommends that the Board of Supervisors condemn discriminatory government actions; and directs the Department to build accountability through metrics and reporting.

General Plan Compliance. The Resolution is in conformity with the General Plan's overall principles and discussion of preserving the cultural and economic diversity of our neighborhoods, although further changes to the General Plan may be needed to implement better the Planning Department's racial and social equity policies. While the current General Plan contains some discussion of equity as indicated in the

sections listed below, current objectives and policies across Elements do not adequately address disparities that are closely associated with race as well as other vulnerable populations.

I. HOUSING ELEMENT

POLICY 5.3. Prevent housing discrimination, particularly against immigrants and households with children.

POLICY 9.3. Maintain and improve the condition of the existing supply of public housing, through programs such as HOPE SF.

II. COMMERCE AND INDUSTRY ELEMENT

OBJECTIVE 3. PROVIDE EXPANDED EMPLOYMENT OPPORTUNITIES FOR RESIDENTS, PARTICULARLY THE UNEMPLOYED AND ECONOMICALLY DISADVANTAGED.

III. RECREATION AND OPEN SPACE ELEMENT

POLICY 1.2. Prioritize renovation in highly-utilized open spaces and recreational facilities and in high needs areas.

IV. TRANSPORTATION ELEMENT

POLICY 1.7. Assure expanded mobility for the disadvantaged.

V. COMMUNITY FACILITIES ELEMENT

POLICY 3.6 Base priority for the development of neighborhood centers on relative need.

VI. COMMUNITY SAFETY ELEMENT

OBJECTIVE 4. ASSURE THE SOUND, EQUITABLE AND EXPEDIENT RECONSTRUCTION OF SAN FRANCISCO FOLLOWING A MAJOR DISASTER.

VII. ARTS ELEMENT

OBJECTIVE II-2. SUPPORT ARTS AND CULTURAL PROGRAMS WHICH ADDRESS THE NEEDS OF DIVERSE POPULATIONS.

VIII. AIR QUALITY ELEMENT

POLICY 4.3. Minimize exposure of San Francisco's population, especially children and the elderly, to air pollutants.

IX. BAYVIEW HUNTERS POINT AREA PLAN

OBJECTIVE 15. COMBINE SOCIAL REVITALIZATION WITH PHYSICAL AND ECONOMIC REVITALIZATION EFFORTS.

POLICY 15.3. Make maximum use of Indigenous community resources to increase civic pride and support physical and economic revitalization.

X. CHINATOWN AREA PLAN
OBJECTIVE 1. PRESERVE THE DISTINCTIVE URBAN CHARACTER, PHYSICAL ENVIRONMENT AND CULTURAL HERITAGE OF CHINATOWN.

XI. EAST SOMA AREA PLAN
OBJECTIVE 7.3. REINFORCE THE IMPORTANCE OF THE SOUTH OF MARKET AS THE CENTER OF FILIPINO-AMERICAN LIFE IN SAN FRANCISCO.

XII. MISSION AREA PLAN
OBJECTIVE 7.3. REINFORCE THE IMPORTANCE OF THE MISSION AS THE CENTER OF LATINO LIFE IN SAN FRANCISCO .

XIII. WESTERN SOMA AREA PLAN
OBJECTIVE 9.4 REINFORCE THE IMPORTANCE OF THE SOUTH OF MARKET AS A CENTER FOR FILIPINO-AMERICAN AND LGBTQ LIFE IN SAN FRANCISCO.

POLICY 9.4.3. Protect and support Filipino, LGBTQ and other minority or culturally significant local business, structures, property and institutions in Western SoMa.

POLICY 9.4.6. Prioritize maintenance and support funding for cultural and service facilities that support Filipino-Americans, such as the Bayanihan Center, the Filipino Education Center, and the West Bay Pilipino Multi-Services Center.

THEREFORE, BE IT RESOLVED, that the Planning Commission condemns all forms of racism, sexism, homophobia, ableism, and other forms of discrimination; and affirms that all people – which explicitly includes American Indian people, Black and people of color – have a right to be in our City and have a right to safe and affordable housing, neighborhoods free from pollution and violence, opportunities for educational advancement and wealth creation, and access to essential services such as parks, transportation, health care, and places selling healthy food, among others; and,

BE IT FURTHER RESOLVED, that the Planning Commission stands in solidarity with the civil unrest and demands for justice of our fellow San Franciscans and communities across the nation, and affirms that Black Lives Matter; and,

BE IT FURTHER RESOLVED, that the Planning Commission must carry its responsibility for guiding the development of our city, streets, and open spaces with a central planning focus on racial and social equity; and,

BE IT FURTHER RESOLVED, that the Planning Commission condemns and apologizes for government practices that have resulted in and continue to have disproportionate impacts upon American Indian people, Black people, and people of color, including racist, discriminatory, and inequitable land use planning policies, programs and government actions, such as redlining, exclusionary zoning, racial covenants, urban renewal and discriminatory enforcement of land use policies; and,

BE IT FURTHER RESOLVED, that the Planning Commission recommends that the Board of Supervisors condemn all discriminatory government practices, including law enforcement practices that have resulted in a disproportionate number of American Indian people, Black people and people of color dying at the hands of law enforcement; and,

BE IT FURTHER RESOLVED, that the Planning Commission recommends that the Board of Supervisors reallocate resources towards expanding access to open space, housing, transportation, and services for American Indian, Black, and communities of color; and that it minimize the negative impacts of budget cuts due to the COVID-19 pandemic on these communities; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs all Department staff to move beyond acknowledgement of injustice and take concrete actions that are visible in the reallocation of resources and work program to (1) increase the American Indian and the Black population and provide stability to communities of color; (2) expand access to open space, housing, transportation, quality amenities and public services, and reduce exposure to environmental pollution in these communities, while ensuring that such investments do not lead to displacement or exacerbate inequities; and, (3) develop and expand participation for American Indian, Black and communities of color ; and

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to collaborate with the Office of Racial Equity (ORE) to align its work with ORE's framework to dismantle structural and institutional racism, which asserts that the City's work shall: (1) Affirmatively address racial and social inequities; (2) Assert that housing is a human right, and prioritize equitable housing development without displacement of American Indian, Black, and communities of color; (3) Develop public land strategies to meet affordable and inclusionary housing goals; (4) Support wealth-building through home ownership for American Indian, Black, and communities of color; (5) Champion housing choice by dismantling exclusionary zoning policies; (6) Promote environmental justice; and (7) Redress the consequences of government-sanctioned racial harm via meaningful City-supported, community-led processes; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs Department staff to expand the implementation of Phase I of the Racial & Social Equity Action Plan, to ensure that the Department's internal practices are thoughtfully examined and amended to advance racial and social equity across all of its core functions; and

BE IT FURTHER RESOLVED, that the Planning Commission directs Department staff to devote the resources necessary for the successful completion and implementation of Phase II of the Racial & Social Equity Action Plan to ensure that its plans, policies and programs actively address and redress structural and institutional racism; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs Department staff to address racial and social equity as it develops policies and programs to respond to the health, economic and housing crises resulting from the COVID-19 pandemic, prioritizing meeting the needs of Black communities, American Indian communities, and communities of color through its policies and programs to support the adaptive use and design of the public realm, community engagement and planning, protection of tenants and cultural resources, affordable housing preservation and production, streamlining and other support for small businesses, and funding for public services and infrastructure, among others; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to assess, strengthen and fund its outreach and engagement strategies to ensure that American Indian, Black and communities of color have true access to representation and participation in planning processes, as well as resources for participatory capacity building; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to amend the General Plan to incorporate policies that explicitly prioritize racial and social equity for American Indian communities, Black communities, and communities of color; that subsequent amendments to the General Plan utilize a racial and social equity lens; and

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to change hiring and promotion practices to correct the underrepresentation of American Indian people, Black people, and people of color across all staff levels and ensure the workforce reflects the needs of our communities; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to build accountability by identifying actions it will implement to advance racial and social equity, including developing performance measures, incorporating a racial and social equity lens in budgeting decisions, and reporting to the Commission on its progress at regular intervals; and,

BE IT FURTHER RESOLVED, that the Planning Commission asserts that the responsibility for implementing these structural and institutional changes falls upon all Department staff, across all levels and functions, and that it should not fall solely or disproportionately upon the American Indian, Black, or people of color staff who are already burdened with their lived experiences of racism; and,

NOW THEREFORE BE IT RESOLVED that the Commission hereby APPROVES the proposed Resolution on June 11, 2020.

The Regional Housing Crisis

No matter what, the future will bring major challenges. Overburdened infrastructure, climate change, disruptive technological innovation, and the changing regional and national economy are just some of the many issues that will call for coordinated and concerted regional action. One challenge above all, however, requires immediate attention: housing.

The Bay Area's housing affordability and neighborhood stability crisis has been decades in the making. Although the housing crisis has many components, its foundation is clear: there simply is not enough housing, whether market-rate or affordable, given the growing number of residents and jobs.

Instead of increasing housing supply to accommodate household and employment growth, for example, many local governments slowed permitting over time. Concurrently, the state and federal governments have pulled back financial support for affordable housing. Given a limited supply of both market-rate and affordable housing, combined with strong demand driven by exceptional regional economic performance, rents and home prices have risen rapidly. Today the Bay Area may have the most severe housing crisis of any of the nation's large metro areas and, at this time, there are limited policy tools to help address the problem at a regional level.

Supply, Demand and the Impacts of Income Inequality

The Bay Area's rate of housing construction first started to lag in the mid-1970s. Each subsequent decade has seen lower levels of overall housing permitting, as seen in Figure 1.2. Since 1990, other metropolitan regions with strong economies and growing populations, such as Washington, D.C., Seattle and Denver, have permitted housing units at significantly higher rates than the Bay Area. New housing construction in the Bay Area has been much more akin to slower growing, older metropolitan regions such as Philadelphia and New York.

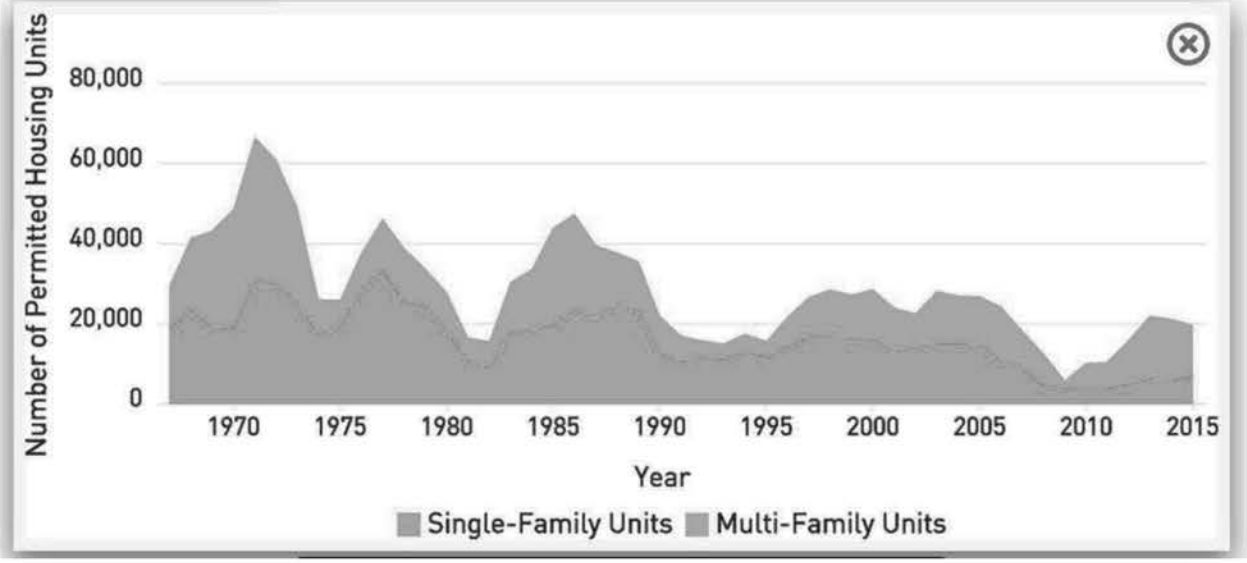

FIGURE 1.2 The historical trend for annual permitted housing units in the Bay Area. This graph shows the historical trend of permitted units for both single-family and multi-family units in the Bay Area, stretching back several decades. As can be seen, annual growth in permitted units stagnated even during the employment booms of the 1990s and 2010s.
Source: Vital Signs; Construction Industry Research Board, 1967–2010; California Homebuilding Foundation/Construction Industry Research Board, 2011–2015

There has been a particular mismatch between employment growth relative to the housing supply. Overall, the Bay Area has added nearly two jobs for every housing unit built since 1990. The deficit in housing production has been particularly severe in terms of housing affordable to lower- and middle-wage workers, especially in many of the jobs-rich, high-income communities along the Peninsula and in Silicon Valley. The booming regional economy combined with increased household formation among the millennial generation has further contributed to an evermore-acute housing crunch.

The widening income gap between high- and low-income households has further exacerbated the housing crisis. As seen in Table 1.1, the total number of households in the nine-county Bay Area increased by 20 percent from 1990 to 2015. The vast majority of this growth, however, was concentrated among households earning $150,000 or more annually, with the remaining growth among households earning less than $35,000 a year. Over a period spanning 25 years, there was a net decrease in the number of households earning between $35,000 and $149,999 in the Bay Area, as these households declined from 64 percent to 52 percent of total households in the region.

Bay Area Household Income*	1990		2015		Change from 1990 to 2015	
	Number of Households	Percent of 1990 Total**	Number of Households	Percent of 2015 Total**	Growth/ (Decline) in Households	Percent of Household Growth
Less than $35,000	446,000	20%	550,000	20%	104,000	+23%
$35,000 to $74,999	645,000	29%	625,000	23%	(20,000)	-4%
$75,000 to $149,999	785,000	35%	793,000	29%	8,000	+2%
$150,000 or more	375,000	17%	741,000	27%	366,000	+80%
Total Households	2,251,000		2,709,000		458,000	+20%

The Regional Housing Crisis
Legacy of Leadership
A Call to Action

These dynamics have had significant implications for the Bay Area housing market. With the increased number of higher income households and most income growth going to the top 20 percent, demand for housing has remained very strong at the upper end of the market. Conversely, it has become more difficult for low- and middle-wage households to compete for market-rate housing as a larger pool of high-wage workers bid up a limited housing supply. This has further intensified competition for scarce affordable housing opportunities.

Policy Contributors to the Housing Crisis

What led to such a mismatch between housing supply and demand? Why does the Bay Area today lack so much needed housing, especially housing affordable to low- and moderate-income households? The causes of this situation are complex and there are many competing interpretations of the available evidence, including a range of economic and demographic factors that extend beyond the Bay Area itself.

Generally, however, the policy drivers — things that local, regional and state governments have the power to address or alleviate — fall into a few interrelated categories: regulatory barriers and tax policy challenges that act to restrict the production of all types of housing, especially infill development; and insufficient support for affordable housing.

The Bay Area Today
The Regional Housing Crisis
Legacy of Leadership
A Call to Action

Regulatory Barriers and Tax Policy Challenges

Although the availability of developable land in the Bay Area is limited due to topography and protected conservation lands, state and local regulations often prevent instead of promote higher-density, mixed-use development in urban infill areas. Lengthy review processes in many communities stall transit-oriented projects long enough to make them infeasible, leading to the loss of grant funding and private investment that would otherwise flow into cities along with desperately needed new housing. The California Environmental Quality Act (CEQA) often acts as another obstacle to both affordable and market-rate housing. Although CEQA has been essential for improving air quality and protecting natural habitats, the law is sometimes used as a litigation tool for blocking projects that are otherwise designed to advance California's environmental policy objectives, such as reducing greenhouse gas (GHG) emissions.

In addition, the current approach to taxation creates incentives to attract development that maximizes sales tax revenues and minimizes costs for public services (such as schools, police and social services), rather than encouraging more balanced approaches to land use. This trend — the so-called "fiscalization of land use" — has discouraged housing development and small business growth in many communities. The tax revolt measures of 40 years ago, such as Proposition 13 and other restrictions on new funding sources, caused many jurisdictions to view housing as a "fiscal loser" because property tax rates were capped below the cost of delivering services compared to retail or commercial development. Commercial property owners also often lack the motivation to develop vacant parcels since the cost of holding these properties is relatively low and a potential windfall from rising land values over time is relatively high.

Legacy of Leadership

A Call to Action

Finally, as part of the 2011 Budget Act, the California Legislature approved the dissolution of the state's 400+ redevelopment agencies. California is now one of a small number of U.S. states without tax increment financing to support urban infill development.

Reduced Support and Insufficient Progress in Building Affordable Housing

In addition to the regulatory and tax policy challenges cited above, recent years have seen major reductions in funding for affordable housing programs at both the state and federal levels. There has also been insufficient progress in the production of "naturally occurring" affordable housing — unsubsidized rental units that are affordable to low- and moderate-income households. This has severely affected the region's low- and moderate-income households by further reducing the supply of new and existing affordable housing, whether government-subsidized or market-rate, especially given median wage deflation from 2000–2013.

Since 2000, for example, there have been cuts of over 50 percent to federal affordable housing programs, and most remaining federal funds go to rehabilitation rather than increasing supply. At the state level, the aforementioned dissolution of redevelopment agencies eliminated a large source of funding for affordable housing, including a loss of more than $200 million for the Bay Area in 2011 alone, according to Enterprise Community Partners and the Non-Profit Housing Association of Northern California.

The Regional Housing Crisis

Legacy of Leadership

A Call to Action

The production of housing affordable to low- and moderate-income households has lagged behind production of housing affordable to higher-income households, with the most significant shortfall occurring in the moderate or middle income category — housing that is typically produced by the market without subsidy in most metro regions. From 1999 to 2014, the Bay Area issued permits for only about 35 percent of the units required to meet the needs of vulnerable populations such as low-income families, seniors and the homeless. This left over 100,000 needed affordable housing units unbuilt.

At the same time, much of the older housing stock that typically forms the backbone of "naturally occurring" affordable housing is located in higher density, transit rich areas that have experienced gentrification pressures and the loss of affordable units, further exacerbating the challenges of sluggish affordable housing production. Moving forward, the annual funding needed to build an adequate supply of low- and moderate-income housing through cost-restricted units rather than through market mechanisms is estimated at $1.4 billion annually, according to the Association of Bay Area Governments (ABAG).

Impacts on the Region's Present and Future

The housing crisis raises major concerns about negative impacts to the region. Affordability, a primary concern of Bay Area residents, continues to be a major challenge. This in turn poses risks to the Bay Area's socioeconomic diversity, transportation system, environmental goals and robust economy.

The Bay Area Today
The Regional Housing Crisis
Legacy of Leadership
A Call to Action

Housing Affordability

Housing affordability has significantly worsened over time. Home prices are at record levels in some counties and near record levels in the rest. Rent payments have almost doubled in real dollars since the 1970s. While median wages are close to the top nationally, the Bay Area has by far the highest median home sale prices of any major metro region in the country, as shown in Figure 1.3. The region is now also home to three of the five most expensive rental markets in the nation, according to Zillow.

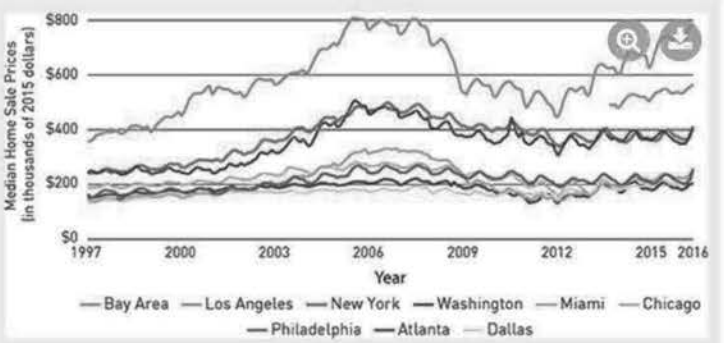

FIGURE 1.3 Median home sale prices by metro area from 1997 to 2016.
Over the last 20 years the Bay Area has seen one of the "spikiest" real estate markets in the country, with bigger booms and busts than other large metros. In particular, prices have risen much faster in the Bay Area coming out of the recent Great Recession.
Source: Vital Signs; Zillow, 1997–2016

The Regional Housing Crisis
Legacy of Leadership
A Call to Action

The prospects and benefits of home ownership are simply out of reach for many Bay Area households. Amid the affluence and new wealth generated in the post-recession era, approximately 24 percent of the Bay Area's population lives below 200 percent of the federal poverty level, and the vast majority of households with annual incomes below $50,000 experience an excessive housing cost burden, as shown in Figure 1.4.

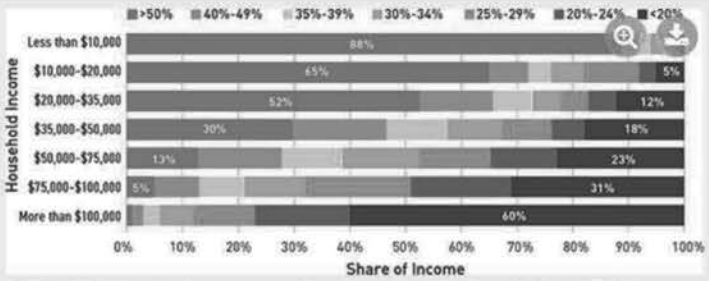

FIGURE 1.4 Share of income spent on housing by Bay Area households in 2015, segmented by income level.
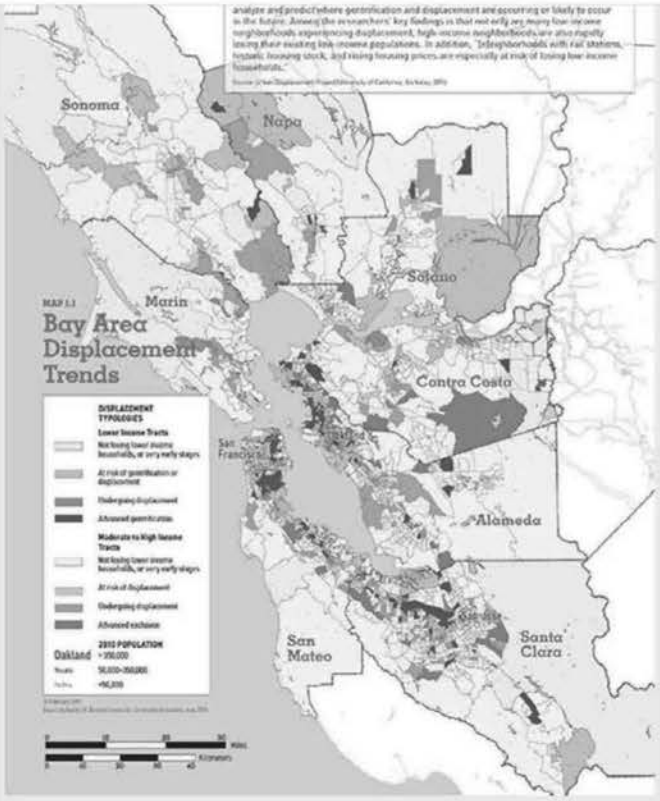
A significant majority of households earning less than $35,000 in the Bay Area spent more than 50 percent of their household income on housing in 2015.
Source: Vital Signs; U.S. Census Bureau/American Community Survey, 2015

Displacement and Quality of Life Concerns

While the cost of housing has increased significantly for both owner and renter households, renters are also at higher risk for displacement during periods of growth and expansion. Currently there are hundreds of thousands of lower-income households at risk of displacement in the Bay Area, with the majority of them living in San Francisco, Santa Clara and Alameda counties.

The lack of adequate tenant protections — or availability of subsidized or "naturally affordable" market-rate units in neighborhoods with quality transit service and other amenities — has accelerated the displacement of lower-income residents and even many businesses from the region's core urban areas. As shown in Map 1.1, displacement is no longer just a San Francisco problem, but a region-wide challenge.



MAP 1.1 Bay Area displacement trends.
Scholars at UC Berkeley looked at regional housing, income and other demographic data to analyze and predict where gentrification and displacement are occurring or likely to occur in the future. Among the researchers' key findings is that not only are many low-income neighborhoods experiencing displacement, high-income neighborhoods are also rapidly losing their existing low-income populations. In addition, "[n]eighborhoods with rail stations, historic housing stock, and rising housing prices are especially at risk of losing low-income households."
Source: Urban Displacement Project/University of California, Berkeley, 2016

Given insufficient support for affordable housing, many individuals who perform important but lower- paying jobs face either substandard or overcrowded and unhealthy housing; costly, long-distance work commutes; or sometimes even homelessness — the most severe expression of the region's housing shortage. Rising prices in the region's core have driven many lower-income households to outlying jurisdictions farther away from jobs, transit and amenities, even as low- and middle-wage job growth has been concentrated in three counties: San Francisco, San Mateo and Santa Clara. This shift contributes to increased development pressures on open space and agricultural lands, more pollution from passenger vehicles, adverse health impacts, higher transportation costs, and greater levels of highway and transit congestion.

SPUR REGIONAL STRATEGY

BRIEFING PAPER
MARCH 2020

What It Will Really Take to Create an Affordable Bay Area

How much housing does the region need to build to prevent income inequality from getting worse?

This report is one in a series of publications that lay the groundwork for the SPUR Regional Strategy.

Introduction

The San Francisco Bay Area continues to be one of the country's least affordable housing markets. The region's lack of housing and limited affordability have significant ramifications for the people who currently live here, the people who once lived here but have been forced to move elsewhere and the people who used to be housed but now live on the street.[1] These housing pressures are remaking the region's diversity,[2] culture, economy and environment. Limited housing affordability and its impacts across California have dominated the state legislative conversation, resulting in groundbreaking state legislation that has the potential, for the first time in decades, to move the needle on addressing the housing crisis.

And yet much more needs to be done if the Bay Area is going to become a region that builds enough housing for all of the people who want to live here — and for the children of those people to be able to stay here when they grow up.

SPUR is developing a Regional Strategy to envision what the Bay Area could be like 50 years from now if the region is successful in addressing the housing crisis, making great places that support a high quality of life, creating a transit system that works and combating climate change so that future generations can continue to comfortably inhabit this planet.

As part of this effort, we are delving into the causes, nature and sheer size of the housing crisis to make sure the solutions we propose are far-reaching enough to address the scale of the problem. We are testing our proposed solutions for "enough-ness" so that the region's policies don't just continue tinkering around the edges but, when taken together, actually solve the problem. It won't be easy to do. But it is SPUR's hope that by laying out the challenge in all of its complexity, we can help local, regional and state government adopt solutions that will ultimately have a chance of working.

1 Homelessness in San Francisco has risen 30% from 2017. Applied Survey Research, *San Francisco Homeless Count and Survey Comprehensive Report*, 2019, http://hsh.sfgov.org/wp-content/uploads/FINAL-PIT-Report-2019-San-Francisco.pdf

What caused the housing crisis?

Two interrelated factors drive the housing crisis: a failure to build enough housing for all of the people who live and work here, and increases in both incomes and the number of people with higher incomes. SPUR has been working with The Concord Group, a real estate economics firm, to understand both trends.

Driver 1:
The Bay Area has not built enough housing.

Although demand for housing has increased dramatically over the years — most notably due to a rapidly expanding regional economy — the amount of housing produced in the nine-county Bay Area has decreased in recent decades. Through the 1980s, the region produced a significant amount of housing on an annual basis, though much of it was built in lower-density development patterns, including single-family housing, master planned communities and garden-style apartments. In recent years, housing has increasingly been concentrated in fewer locations at higher densities,[3] and the number of units produced annually has decreased. This trend has multiple causes. The region has done a better job of protecting open space and seeking to concentrate growth in places that have already experienced development. Meanwhile, local governments have added more requirements to the development process, making it harder and harder to build housing in already-developed areas. More recently, real estate investors concerned by the Great Recession (and the subprime lending that exacerbated it) moved capital toward less risky investments in high-end urban development.

FIGURE 1

While housing production declined, the number of jobs rose significantly. From 2011 to 2017, the region added 658,000 jobs and 140,000 housing units, or 4.7 jobs for every housing unit. In many parts of the region, particularly those areas closest to the explosion in tech jobs, the ratio was significantly higher.

FIGURE 2

Ratio of Jobs to Housing in Bay Area Counties

COUNTY	JOBS TO HOUSING RATIO 2004–2008	JOBS TO HOUSING RATIO 2011–2017
San Francisco County	4.27	6.26
Alameda County	-0.05	3.86
Contra Costa County	0.66	3.04
San Mateo County	0.91	8.14
Santa Clara County	1.71	4.15
Marin County	0.27	4.82
Napa County	1.88	8.41
Sonoma County	-0.63	5.15
Solano County	0.55	4.27

The region's new jobs have attracted new residents. Since 2000, the Bay Area's population has increased by 15%, or roughly 1 million people. Adding more people without sufficiently expanding the amount of available housing has exacerbated the housing shortage and driven up the cost of housing.

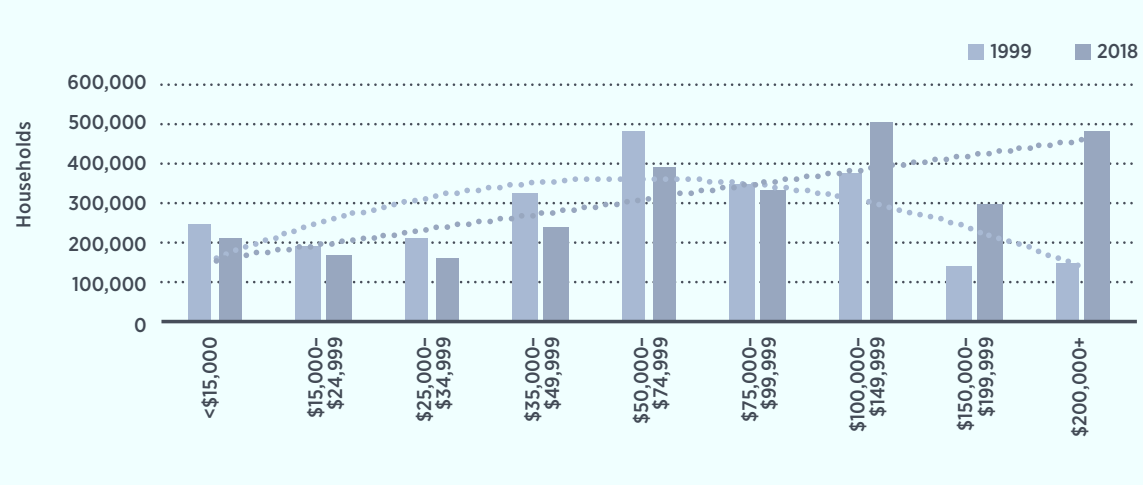
Driver 2:
The Bay Area is becoming richer.

The Bay Area is becoming increasingly wealthy. Just 20 years ago, incomes were distributed in a bell curve, meaning that more middle-income people lived in the region than either low-income people or wealthy people. Over the past two decades, that distribution has shifted to favor wealthier households. Since 1999, the Bay Area has seen a decrease of 300,000 households making under $100,000 and an increase of 625,000 households making over $100,000.[4]

FIGURE 3
Change in Bay Area Household Income Distribution, 1999–2018



Previous SPUR research provides two explanations for the shifts in household income.[5] The first is that wages in high-wage occupations have grown much faster than wages in low- and middle-wage occupations. The second reason is that middle-wage jobs did not grow during the past decade and are projected to grow more slowly than high- and low-wage jobs in the future. Some other reasons for shifts in income could include changes in household formation (when people marry or move in with roommates or family members) and wage increases over time as some people have moved up the job ladder. The net result is that as more higher-income households compete for a limited number of available homes on the market, they bid up rents and purchase prices across the board. This particularly affects new entrants into the housing market, making finding a first-time home expensive — if not impossible — for everyone but the high earners.

4 Analysis by the Concord Group. Note that income figures are not inflation-adjusted because typical inflation adjustments use housing as a major component of ongoing Consumer Price Index calculations. If income is inflation-adjusted to include housing costs, the enormous impact that housing has on income distribution would be eliminated from the analysis.

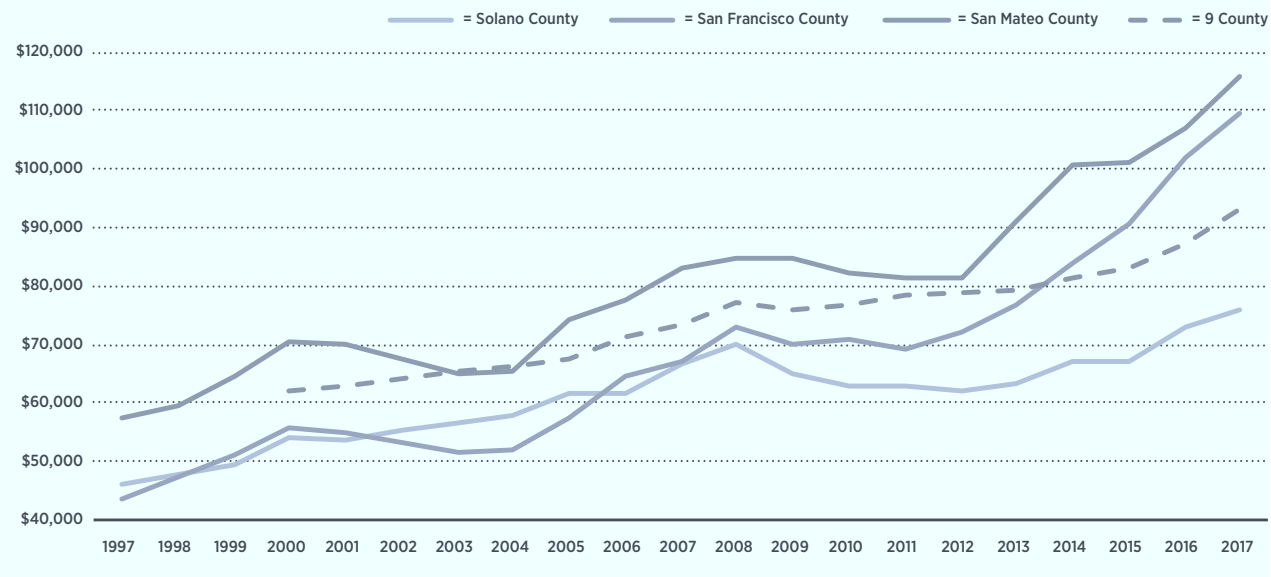
5 Levy, Stephen, "How the Retirement Wave Will Impact Bay Area Jobs and Workers," SPUR, 2019, https://www.spur.org/news/2019-01-17/how-retirement-wave-will-impact-bay-area-jobs-and-workers

Source: The Concord Group analysis of ArcGIS income distribution data and U.S. Census American Community Survey income distribution data, https://factfinder.census.gov (Note: This website will be taken off line on March 31, 2020, and will be replaced by https://data.census.gov/).

The change in the Bay Area's income distribution can be summarized by a significant shift in median income: The median Bay Area household became 50% wealthier over the last 20 years, with median income rising from $60,000 to $90,000.[6]

FIGURE 4
Change in Bay Area Median Household Income, 1997–2016

Median household income has grown significantly in the Bay Area over the last 20 years. San Mateo, San Francisco and Solano counties are included to show the range of distribution across the region.



These shifts have enormous implications not just for the Bay Area but for the 21-county Northern California megaregion, a geography that stretches from Santa Cruz to Sacramento. As more people move out of the Bay Area to seek affordable housing, the income distribution of the megaregion has also shifted, albeit less dramatically in the 12 outer-region counties than in the nine-county Bay Area.[7] The 12 outer counties — Mendocino, Lake, Colusa, Yolo, Sacramento, Placer, San Joaquin, Stanislaus, Merced, San Benito, Monterey and Santa Cruz — saw growth in households making $50,000 to $75,000 but still saw losses in households making under $50,000.

6 Analysis by the Concord Group. Note that income figures are not inflation-adjusted, as explained in footnote 4.

7 Analysis by the Concord Group. Note that income figures are not inflation-adjusted, as explained in footnote 4.

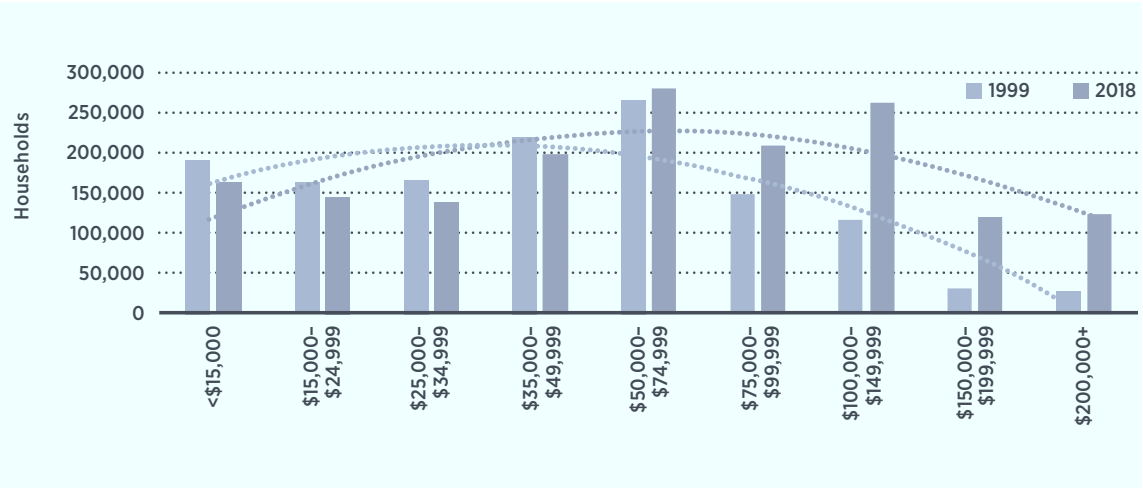
FIGURE 5

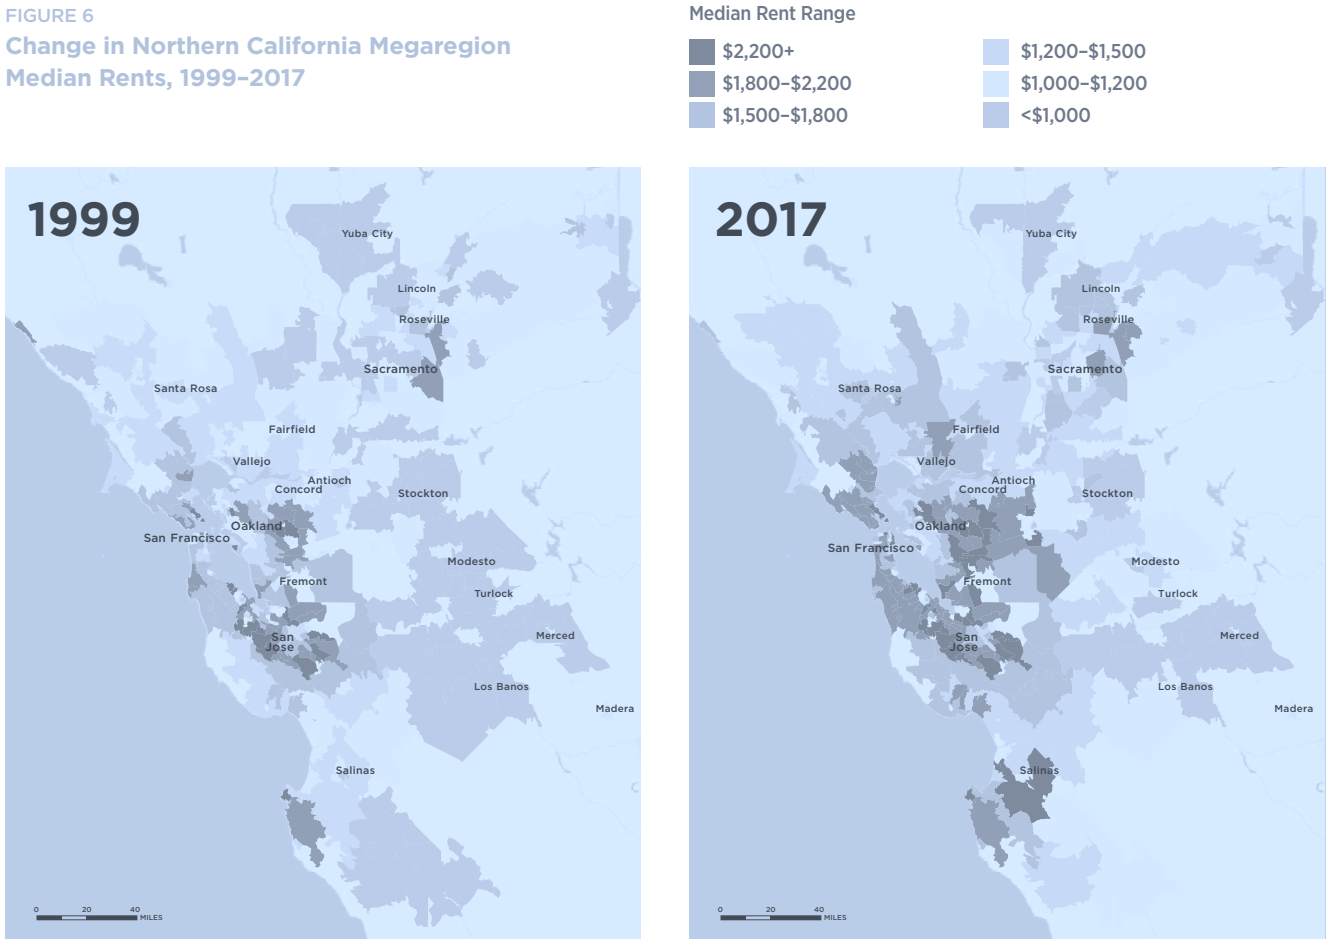
Change in Outer-Region Household Income Distribution, 1999–2018



Unsurprisingly, during this same time period, housing prices in the megaregion have increased as well, although the starkest increases have occurred mainly within the nine-county Bay Area.

FIGURE 6

Change in Northern California Megaregion Median Rents, 1999–2017



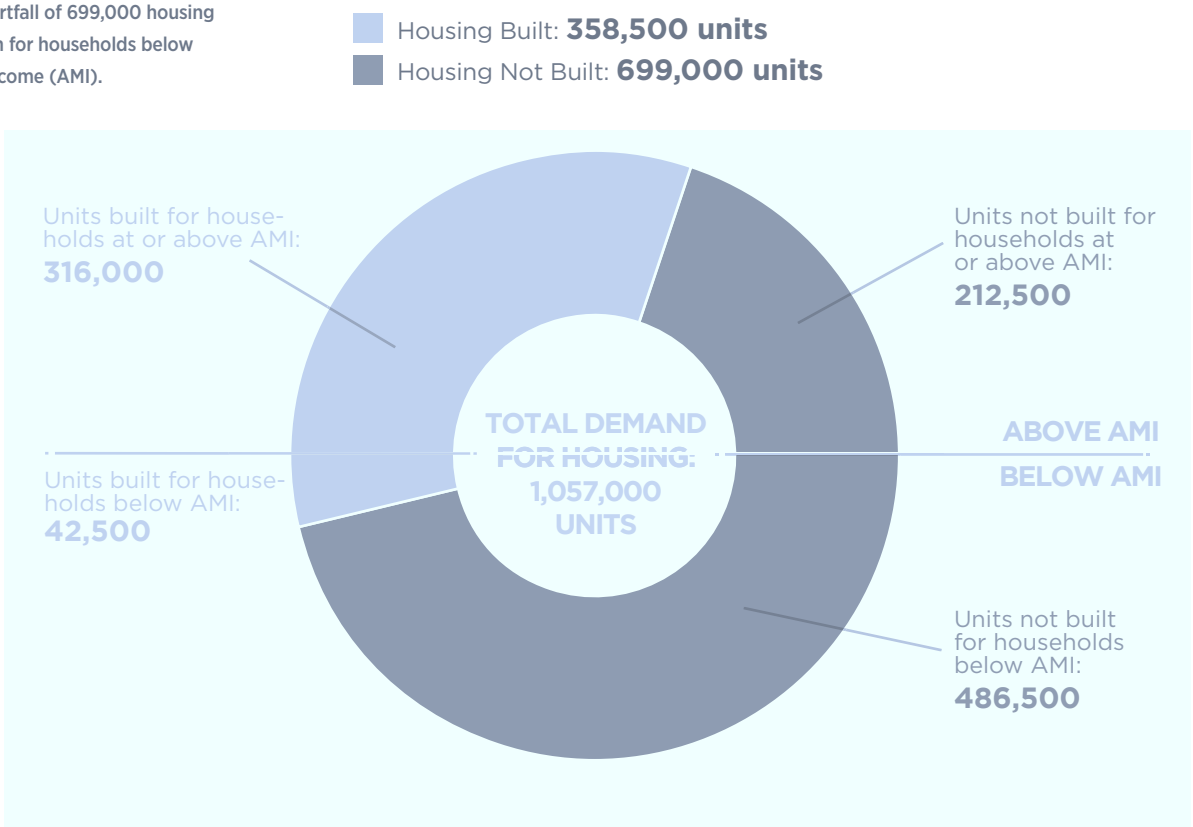
How much housing should the Bay Area have built?

Escalating housing unaffordability has been a contributing factor to massive income distribution changes since 1999, increasing the number of evictions, displacing historic residents of Bay Area communities and threatening the health and growth of the region. How much housing would the Bay Area have needed to build over the last 20 years to prevent income inequality from getting worse? Working with the Concord Group, SPUR sought to answer this question.

We found that the Bay Area saw the construction of 358,500 total housing units over a time period where typical long-term regional growth patterns would have called for a little over 1 million units. This created a shortfall of 699,000 housing units. The market largely served those able to pay the most for housing. Roughly 316,000 of the newly built units were rented or sold to those with higher incomes and/or higher levels of wealth, who were able to absorb the rapidly rising housing costs. At the same time, affordable housing developers built roughly 42,500 units of permanently affordable subsidized housing — not nearly enough to satisfy the demand for housing at the lowest end of the price spectrum. The missing 699,000 units fall into two categories: 486,500 units of housing needed for those below the median income and 212,500 units of housing needed for those above the median income, meaning that the demand for affordable and middle-income housing went largely unmet.

FIGURE 7
Historical Housing Shortfall
Bay Area Housing Demand, 2000–2018

How much housing would the Bay Area have needed to build over the last 20 years to prevent income inequality from getting worse? Analysis by SPUR and the Concord Group shows a shortfall of 699,000 housing units, most of them for households below the area median income (AMI).



Data visualization by Justin Fung. Source: See appendix for sources and methodology.

What was the impact of this failure to produce enough housing? Where did all of those people go? As SPUR has written about previously,[8] some moved to other places, some decided to stay and pay more of their income toward rent and others never showed up in the first place: Individuals who may have contemplated moving to the Bay Area decided to go elsewhere due to the region's high housing costs. Of those who have stayed, some live in overcrowded housing, doubling up with friends and family, or in units that are ill-suited to their family size. Others have not left their childhood homes, delaying adulthood. Of those who have left the Bay Area, some have moved to outer-county cities such as Sacramento in search of cheaper housing,[9] enduring lengthy super-commutes to keep their Bay Area jobs. Others have left Northern California altogether for more affordable metro areas, like Denver or Austin. Most distressing of all, many have lost all forms of housing, leading to the region's current homelessness crisis.

8 Terplan, Egon, "How Much Housing Should the Bay Area Have Built to Avoid the Current Housing Crisis?," SPUR, February 21, 2019, https://www.spur.org/news/2019-02-21/how-much-housing-should-bay-area-have-built-avoid-current-housing-crisis

9 Kneebone, Elizabeth and Issi Romem, "Disparity in Departure: Who Leaves the Bay Area and Where Do They Go?," Buildzoom and Terner Center for Housing Innovation, http://ternercenter.berkeley.edu/uploads/Disparity_in_Departure.pdf

How much housing does the Bay Area need to build for the future?

We also investigated how much and what type of housing the region should produce to keep up with future demand. More housing will be needed as the region's children grow up and create families of their own and as the economy continues to evolve, adding new workers in the decades to come. Accounting for growing demand is particularly important in stemming the flow of lower- and middle-income households from the region.

It's not possible to know how much the region's population will grow over the next 50 years, but data analysis can offer helpful projections. For this investigation, our partners at the Center for Continuing Study of the California Economy estimated a high population growth target and a low population growth target.[10] The Concord Group then modeled what those targets mean for housing demand. Using the high growth projection (one that includes more aggressive assumptions regarding levels of immigration and job growth), SPUR estimates that the Bay Area will need a minimum of 1.5 million new units between now and 2070 both to keep up with population growth and to stop the current trend of losing low- and moderate-income households as the region gains wealthier households.

If we include the existing housing shortfall — the 699,000 units the region should have built over the last 20 years but didn't — we estimate that the Bay Area needs to produce a minimum of 2.2 million units by 2070, or roughly 45,000 units per year (see Figure 9). We believe it is important to include the shortfall, as current residents of the Bay Area are already experiencing the impacts of the region's failure to deliver a sufficient amount of housing: high housing costs, overcrowding and homelessness. As we have shown, the region's inability to deliver a sufficient amount of housing at all income levels has led to a loss of lower-income households. By addressing the shortfall, the region could ameliorate some of these negative impacts.

SPUR's housing target of 2.2 million units (45,000 per year) is somewhat higher than the regional target developed by CASA (the Committee to House the Bay Area) of 35,000 units per year.[11] McKinsey estimates that California needs to produce a minimum of 3.5 million homes statewide to meet a backlog demand of 2 million homes plus a growth demand for 1.5 million homes by 2025.[12] The Bay Area's housing growth target from 2015 to 2023, set at the state level through the Regional Housing Needs Allocation (RHNA) process, shows a need for 188,000 housing units over an eight-year period, or roughly 23,500 units per year. SPUR is recommending housing growth targets that are almost double the RHNA estimates and slightly more than double the region's annual production from 2000 to 2018.

---

10 The Center for Continuing Study of the California Economy provided SPUR with population and job projections as detailed in its report *High and Low Projections of Jobs and Population for the Bay Area to 2070 — Projection Framework, Specific Assumptions and Results,* https://www.spur.org/sites/default/files/wysiwyg/CCSCE_High_and_Low_Projections_of_Jobs_and_Population_for_the_Bay_Area_to_2070-Projection_Framework_Assumptions_and_Results.pdf
The report included a high growth target and a low growth target based on national projections for jobs and population, as well as assumptions about immigration, growth in various economic sectors and the share of the population and job growth that the Bay Area will attract. SPUR chose to base its analysis on the high growth projection due to the following factors. First, it is unknown how rapidly the Bay Area's population will grow, but it most likely will reach both the low and the high targets eventually, if not within 50 years. Planning for the high growth target enables the region to fully meet future housing demand and plan for appropriate density. Second, if housing growth exceeds population growth targets, then housing prices might stabilize or decline for a period of time. Stabilizing prices would halt further displacement. While a period of declining prices might make existing owners worse off, it might help renters and assist many in the middle of the income distribution in buying a home for the first time. It is also easier to stop building when prices drop too quickly than it is to begin building rapidly when housing prices spike.

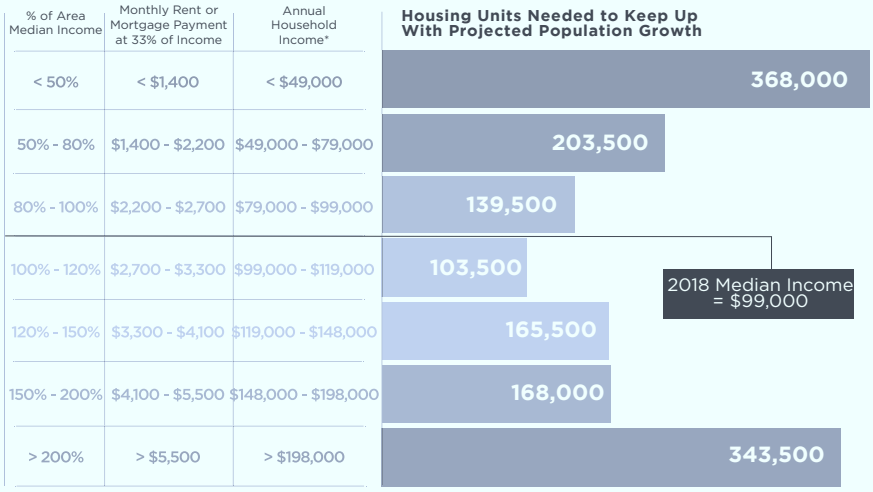
FIGURE 8

How Much Housing Does the Region Need to Build?

Projected Bay Area Housing Demand at All Income Levels, 2018–2070



The Concord Group's model (see Figure 8) looks at housing demand at various income levels based on population growth and seeks to answer the question: How much housing does the Bay Area need to add at different price levels to prevent income inequality from getting worse? It assumes that those who left the Bay Area over the last 20 years aren't coming back and focuses on making things better for the people who are here now and those who might come in the future.

It's important to note that the Concord Group's modeling doesn't answer the question: How much housing is needed to drive down housing prices? This question is notoriously challenging to answer accurately due to the confluence of many factors. To take just three issues: First, developers won't build new housing unless they are able to cover the costs of construction (labor, materials, land and financing). The ability to cover these costs is often dependent on rising housing prices. If housing prices drop below the level needed to build new units, private developers will stop building new housing and prices will rise. Second, if housing prices do decrease, then the Bay Area becomes a more desirable place to live for more people, which increases demand, and that increases prices. Lastly, driving housing prices down (rather than just flattening out price increases) can have negative impacts for homeowners, who can find themselves upside down on their mortgage if what they owe is more than the value of their home.

Because it's so hard to answer the question of how much housing the region would need to build to drive prices down, we are treating the answers that come from our modeling as minimum targets, knowing that the Bay Area would need to outproduce these numbers by some factor in order to reduce housing prices over time. It will be important to develop a housing delivery system that can change based on housing prices, allowing for more rapid housing production when prices spike. This system should also take into account the locations and types of housing needed to address demand.

The Bay Area will also need to adopt new policies to help develop housing for people at different incomes. The region will still need to produce a significant amount of market-rate housing — a minimum of 343,500 units for households making more than 200% of the area median income. For those at 80% of the area median income and below, the region will need to produce a minimum of 571,500 units. And for those between 80% and 200% of the area median income, another 576,500 units will be needed.

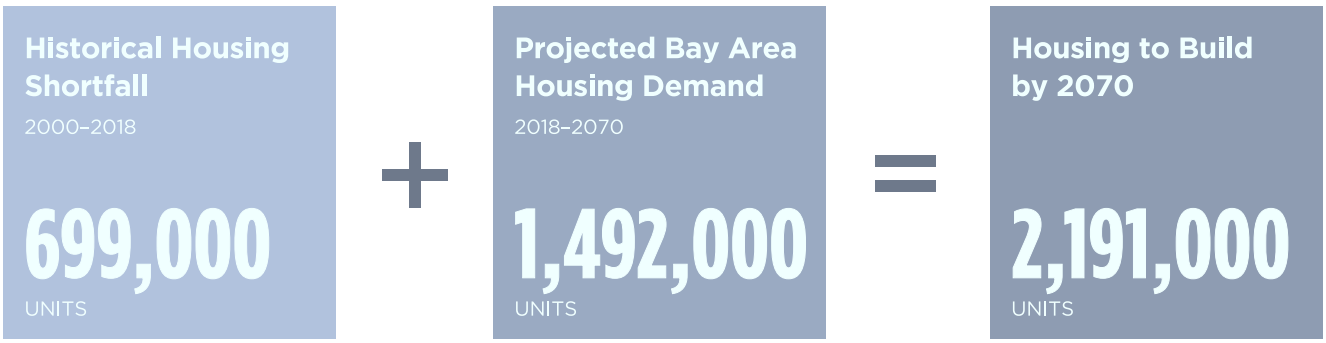
FIGURE 9

SPUR's 2070 Housing Target

Total Bay Area Housing Demand, 2000-2070

By adding the existing housing shortfall from Figure 7 to the projected housing need in Figure 8, SPUR estimates that the Bay Area needs to produce almost 2.2 million new housing units by 2070, or about 45,000 units per year.



Source: See appendix for sources and methodology.

What will it take to get there?

SPUR is deep in the process of developing an agenda to address the Bay Area's affordable housing challenge at the scale of the problem. While housing unaffordability may seem like an impossible problem to surmount, there are steps that those of us who live and work in the Bay Area can take. We can double the amount of housing our cities build, change our taxation and governance structures to fund the housing we need and adopt policies to protect the people who live here now. But to make all of this happen requires political will. The following are SPUR's initial thoughts about what it will take to create an affordable region.

Treat housing as infrastructure.

Housing is not something that's nice to have, like a new pair of shoes or a vacation. It is critical to human beings to have a place to live, just as it is critical to have food to eat, clean water to drink and power to provide heat in the winter. When we need new water pipes to ensure regional access to clean water, government doesn't just change the zoning code to allow for the new pipes and wait for the private sector to build them. Government develops the plan for the new water pipes, the public funds their construction and the government hires private contractors to build them.

If we treated housing as infrastructure, the same way we treat roads and water delivery as infrastructure, what in our housing delivery system would change? For starters, it might not be enough to rely solely on the private market to provide enough housing. Privately financed development in the Bay Area requires the careful alignment of a variety of factors: a local jurisdiction that will permit enough housing to be built, land prices low enough for the developer to recoup the cost over time, access to sufficient private lending at a low-enough rate to finance the construction, a workforce available to build the housing — and rising housing prices to pay for all of the above. This system of financing often means that housing can only be built when housing prices are escalating. When the market is down, housing production slows to a trickle — or sometimes stops altogether.

What if we rethought some aspects of this housing delivery system in order to achieve different objectives? For example, what if we could use public financing to build housing, particularly affordable and middle-income housing, at the bottom of the market (when land is cheaper and labor is more available) rather than at the top of the market? Being able to deliver housing at the low end of the market would have the added benefit of providing construction jobs throughout the market cycle, making them more secure over time.

What if there were other ways the public sector could provide readily available, lower-cost capital to finance the creation of middle-income housing — in ways that didn't cannibalize funding for more deeply affordable housing? And what if we were able to squeeze risk out of the development process by ensuring the faster, clearer permitting of housing so that developers functioned more like contractors? If their role was more focused on building the housing rather than negotiating a complicated and risky entitlement process, could they bring housing to market at more affordable price points?

It is not impossible to devise a different housing system than the one we have today. Other countries have made it a societal priority to build enough housing for everyone.[13] We can learn from them.

13 For example, in Vienna, roughly half of the city's housing stock is highly regulated, affordable "social housing." See: Holeywell, Ryan, "Vienna Offers Affordable *and* Luxurious Housing," *Governing*, February 2013, https://www.governing.com/topics/health-human-services/gov-affordable-luxurious-housing-in-vienna.html

Make it less expensive to build housing.

Regardless of how housing is financed, one thing is clear: We need to build significantly more of it — at all price points — if we're going to get ahead of the housing crisis. The region hasn't produced 45,000 units per year since the 1980s, when roughly half of new housing came in the form of sprawl-style single-family housing development, a less expensive building type to construct. Apartments, particularly those in taller buildings, are more complicated to build, so labor costs are higher; they take longer to build, so developers need to pay land costs, such as loan payments, property taxes, insurance and security, for a longer period of time before being able to rent or sell homes; and the construction materials, such as steel or mass timber, are more expensive. In order to produce housing at the scale needed, in denser development patterns that preserve the environment, all of the cost components of housing need to be examined: land prices, financing, construction, building permits, planning and building code requirements, taxes and fees. There can be no sacred cows: We need to examine every aspect of the housing delivery system to see how we can produce enough housing at the scale needed.

Change the governance structure to support housing construction.

Our current system of governance is not up to the challenge of solving our current housing crisis. Each city is responsible for deciding how much housing will be built within its boundaries and in which neighborhoods. The ability to determine zoning at the local level is called "home rule," a power enshrined in our state governance structure. Although the state sets a goal for how much housing each region should produce, and then regional agencies provide each city with a target, there is almost no consequence for failing to meet these goals. So each city has the power to engage in zoning practices that exclude middle- and low-income residents, such as allowing single-family homes only and requiring large lot sizes and plentiful parking. The requirements squeeze out apartment buildings, townhomes, duplexes and other more affordable housing types. Home rule creates a no-win situation for local politicians who support housing. They can approve the housing that is needed and face the anger of constituents who don't want more housing in their neighborhoods, or they can oppose the housing and make the housing crisis worse. The cumulative result of each city deciding how much housing to allow within its boundaries is the current statewide housing shortage.

State government has a very important role to play in addressing the housing crisis because it can create new rules around what gets built where. Senate Bill 50, a proposed bill that would have prevented cities from blocking housing near transit and in areas with good jobs and good schools, is one example of what state legislators can do. State government can also create new sticks and carrots to discourage or encourage certain behaviors. It can diminish local control for jurisdictions that don't help to address the housing crisis and offer new funding for jurisdictions that work to build the housing needed. It can also reform existing laws, like the California Environmental Quality Act, that make it harder to build housing in already-developed areas.

Regional institutions likewise can play an increased role. The newly created Bay Area Housing Finance Authority has certain powers to help create funding for affordable housing. Such an agency could eventually have other powers, including the power to land-bank parcels for future housing development and assemble land for housing construction.

Ensure that low-income people can stay in their current homes while new housing is being built.

If we are really to solve the housing crisis, we need to find ways to enable low-income Bay Area residents to remain in their homes. Roughly 282,000 low-income families in the Bay Area live in housing that is affordable to them but is currently at risk of cost escalation because those units are not subsidized or price-restricted.[14] And of course, many more housing units are occupied by low-income households at unaffordable rents, causing overcrowding and financial strain. As rents continue to rise, vulnerable families are displaced from the Bay Area.

Recent research has brought to light more information about the patterns and ramifications of displacement.[15] Long-standing theories that new housing development causes gentrification and displacement are giving way to a more nuanced understanding of this complicated dynamic. In most cases, new market-rate housing follows, rather than causes, gentrification. Developers seek to purchase land and build new units when and where prices are already on the upswing — that's when the odds are good that they can recoup their costs through higher rents or sale prices. In neighborhoods already experiencing gentrification, the development of new market-rate housing can speed up the process by further signaling that a neighborhood is a desirable place for investment. Once those new buildings are built and occupied, gentrification can intensify, adding to displacement pressures.

How do we address displacement? The solution to this problem is not to stop building market-rate housing. Without a sufficient amount of market-rate housing, high-income workers will continue to outcompete everyone else and shift housing prices for the entire region. Building more housing for market-rate buyers can reduce their impact on the housing market as a whole and help limit rapid increases in price.

But building more housing is only part of the solution. We also need to find ways to combat displacement by enabling low-income residents of the Bay Area to remain in their homes.

Finding ways to strengthen community ownership of land, taking existing housing out of the speculative market and making it permanently affordable, and developing other tools to stabilize neighborhoods are of critical importance in addressing the housing crisis. Helping low- and moderate-income families find a path to homeownership (without being swept up in the next foreclosure crisis) is another way to engage the problem. Thoughtful interventions that protect renters, like California's recent anti-price-gouging law,[16] are also needed.

---

14 Analysis completed by the California Housing Partnership and Enterprise Community Partners. This number represents an estimate of the total number of unrestricted units offered at rents affordable to low-income (< 80% Area Median Income [AMI)]) households *and* occupied by either an extremely low-income (< 30% AMI), very low-income (< 50% AMI) or low-income (< 80% AMI) household. While this number accounts for most deed-restricted affordable housing, due to data limitations the methodology does not incorporate public housing or locally restricted housing, such as units made affordable through inclusionary zoning. It also excludes housing occupied by tenants using a Housing Choice Voucher, since the units themselves are technically still subject to changes in the market and landlord participation is voluntary.

15 The Urban Displacement Project at UC Berkeley has developed substantial tools to understand displacement pressures in the Bay Area. See: https://www.urbandisplacement.org/

16 Chandler, Jenna, "Here's How California's Rent Control Law Works," *Curbed,* January 6, 2020, https://la.curbed.com/2019/9/24/20868937/california-rent-control-law-bill

Add significant new resources for affordable housing and find ways to build a lot more of it.

Stabilizing existing housing for low-income people and building the amount of affordable housing the Bay Area needs over the next 50 years will require a significant realignment of resources. It is important to note that the past 50 years of housing policy have predominately benefited one segment of the population: property owners, in particular white homeowners, who were not harmed by historic redlining policies. These laws systematically denied communities of color low-cost mortgages and other resources needed to build wealth. As a result of these disparities, white families have greater homeownership rates and have been able to transfer far more wealth over generations than families of color.[17] The largest housing program in the country has been the mortgage interest income tax deduction, which benefits only those homeowners with enough income to qualify for a deduction. In 2017, the cost of this program was $71 billion. While the Trump tax plan of 2017 has reduced the value of the mortgage interest income tax deduction to an estimated $41 billion,[18] none of the cost savings was redistributed to affordable housing programs.

California needs to consider significant new ways to fund affordable housing. It's time to reexamine Proposition 13, the 1978 law that caps property tax increases for both businesses and homeowners. Prop. 13 limits the taxable value of property to its last sale price, even if that sale was decades ago. This has dramatically curbed the amount of funding available for all public goods in California, including affordable housing. We need to find ways as a society to pay for affordable housing, not just through fees on new housing construction or large bond issues that require passage every few years, but through ongoing, stable, large-scale programs that are sized to address the need.

Affordable housing faces the same problems as market-rate housing. Construction costs are the same no matter if the housing is for low-income or high-income residents. The entitlements process is uncertain, as affordable housing must win approvals in jurisdictions that may not want housing for low-income families. And affordable housing often faces even more scrutiny than market-rate housing during the permitting process. There is also significant uncertainty in financing, as affordable housing developers must pull together a dizzying array of funding sources in order to make projects financially viable. This process has led to skyrocketing development costs. We need to find ways to reduce cost and risk in the affordable housing development process so we can build more housing more quickly at a reasonable cost.

Build housing for the "missing middle."

SPUR's research has found that the private real estate market addresses the needs of the highest-income households. These households outcompete and set prices for everyone else due to the limited supply of housing. And while the prices they pay are at record highs, households in this category are not in fact paying a higher percentage of their income now than they have historically. At the same time, affordable housing developers, subsidized by public funding, have made a valiant effort to build permanently affordable housing for the region's

17 Traub, Amy et al., *The Racial Wealth Gap: Why Policy Matters,* Demos, June 21, 2016, https://www.demos.org/research/racial-wealth-gap-why-policy-matters

18 Tax Policy Center, "Key Elements of the U.S. Tax System," *The Tax Policy Center's Briefing Book,* https://www.taxpolicycenter.org/briefing-book/what-are-tax-benefits-homeownership

lowest-income households. But there is a significant part of the population that is not served by either the existing market or subsidized affordable housing programs: the "missing middle."

As mentioned above, SPUR estimates that over the next 50 years, in order to accommodate future growth, the Bay Area will need to build 576,500 units that are affordable to people making between 80% and 200% of the area median income. One part of the solution is to allow enough market-rate housing to be built to lower prices enough that eventually a larger percentage of middle-income people can participate in the housing market. But another part of the solution involves developing new programs and interventions that can reach middle-income households. Secondary units, smaller units that come without a parking space, mixed-income housing that uses the proceeds from market-rate units to subsidize middle-income units, and co-housing (where households collectively finance housing and some common spaces are shared)[19] all need to be examined as tools to address this portion of the market.

Change the cultural assumptions about housing.

Lastly and perhaps most importantly, we need to change the way we think about housing. The American Dream has always involved land ownership, from the Jeffersonian agrarian ideal[20] to the cultural elevation of the single-family home and the white picket fence. Yet other countries and cultures do not place homeownership on such a pedestal. Part of the cultural value of homeownership has to do with the role it plays in the United States as a primary mechanism of wealth generation and wealth transfer from one generation to the next. Another part has to do with our country's extraordinary lack of a social safety net relative to other developed countries. One's ability to retire and enjoy old age often hinges on property ownership. But the American conception of property rights has deeply negative consequences for renters. Unlike homeowners, most renters can't rely on being able to stay in their homes for the long term and aren't guaranteed stable housing costs.

If we are going to change our housing system in any meaningful way, we need to change our collective dream. What if we dreamed of a future where all families could afford housing and go to great schools? Where no one had to live in fear that the next illness or change of job could result in losing their home? Where commutes were short and pleasant and it was easy to get around by train, bus, biking or walking? What if there were ways to build assets for future generations that didn't involve owning a home? What if asset building were not a matter of life and death because our society took care of its people? What if homelessness were not tolerated and we found a way to house our most vulnerable populations?

Dreaming a new dream is the prerequisite for a better future. It's time for us to rise to the challenge.

Appendix

Methodology to Determine "A Historical Housing Shortfall" (Figure 7) and "How Much Housing Does the Region Need to Build?" (Figure 8)

Figures 7 and 8 in this paper, "A Historical Housing Shortfall" and "How Much Housing Does the Region Need to Build?" were developed by The Concord Group (TCG) to illustrate demand for housing at each whole dollar of income and monthly housing cost, which means that the model reflects true demand for each individual income. For the model, TCG used data from Claritas's Spotlight, a syndicated data source that provides yearly demographic data for the United States. This model specifically used the household income distribution from the year 2018. Spotlight, like the U.S. Census, presents its household income distribution in ranges ($25,000 to $50,000, $50,000 to $75,000, etc.). In total, there are 10 delineated income ranges.

TCG made a set of assumptions that informed the model. First, that "housing affordability" would be defined as a household spending no more than 33% of its income on housing costs and that every household would demand housing at that percentage of their yearly income. TCG then quantified the units demanded at each household income range based on each household in that income range spending 33% of its income on housing. For example, households making under $49,000, or under 50% of the area median income, would have a maximum affordable housing cost of $1,400 per month. The equation to reach this figure is (Annual Income x Housing Burden [33%]) / 12 (months in a year).

Second, TCG assumed that households in the nine-county Bay Area would grow at a rate determined by the Center for the Continuing Study of the California Economy (CCSCE). CCSCE used two different growth scenarios: a high growth potential and a low growth potential for the nine-county Bay Area. The maximum growth scenario projected 1% growth through 2040, 1% growth from 2040 to 2050, 0.5% growth from 2050 to 2060, and 0.5% growth from 2060 to 2070. In total, the maximum growth scenario projected a need for roughly 1,492,000 units of housing in the nine-county Bay Area from 2018 to 2070. The low growth scenario projected 0.6% growth through 2040, 0.4% growth from 2040 to 2050, 0.3% growth from 2050 to 2060, and 0.3% growth from 2060 to 2070. In total, the low growth scenario projected a need for roughly 748,000 units of housing in the nine-county Bay Area from 2018 to 2070.

Third, TCG assumed that the 2018 income distribution would remain constant. While TCG and SPUR do not expect income distribution to remain constant over the next 50 years due to a variety of factors, including wage growth, inflation, employment trends and other major economic events, TCG and SPUR wanted to look at the equitable housing needs independent of those factors and give a broad understanding, in today's dollars, of how much new housing would be needed at which income levels to ensure that housing would be at least as affordable as it is today.

Additional Methodology to Determine "A Historical Housing Shortfall" (Figure 7)

TGC developed a second model to quantify the total housing need for the nine-county Bay Area from 2000 to 2018 as a way to identify the unmet housing needs. In this model, TCG used a household annual growth rate of 2% (the average employment growth per year during this period for the nine-county Bay Area) to reflect what growth could have been for households in this period if sufficient housing had been available. TCG also used the original income distribution of the year 2000. Overall, TCG believes that about 1,057,000 units of housing should have been built during this time period. However, only 358,000 units were built.

The blue number at the lower left represents the affordable housing built in the nine-county Bay Area from 2000 to 2018. The data for affordable units came from the Department of Housing and Urban Development's (HUD's) Low Income Housing Tax Credits Database (https://lihtc.huduser.gov/), which tracks all affordable housing projects, including all projects funded through HUD, state service, local government, for-profit or nonprofit sponsors or any housing project with an income limit. TCG has assumed that, while affordable units can affect households making up to 80% of the area median income, these units served the lowest-earning households within the nine-county Bay Area. This blue number at the lower left represents the units built that are affordable to those making under 100% of the area median income.

The blue number at the top left of the figure represents the total market-rate units built in the nine-county Bay Area from 2000 to 2018. The data for built housing was taken from HUD's building permit website (https://socds.huduser.gov/permits/), with the assumption that all units from the years of 2000 through 2018 were built and operated at an occupancy of 93%. TCG has assumed that, while market-rate units can affect households making any level of income, these units most likely served the highest-wage earners in the nine-county Bay Area. This blue number at the top left represents the units built that are affordable to those making over 100% of the area median income.

The red number at the bottom of the figure represents the units that should have been built for households below the area median income but were not built. The red number at the upper right of the figure represents the units that should have been built for households above the median income but were not built. Overall, TCG has determined that the housing shortfall for the nine-county Bay Area from 2000 to 2018 was roughly 699,000 units.

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project")[1]. My review focused on the DEIR's treatment of visual and shadow impacts. My comments are attached as follows:

[1] See appendix for Jared Ikeda qualifications

VISUAL IMPACT

As described in the Comprehensive Parnassus Heights Plan Draft Environmental Impact Report, the proposed plan would provide 2.9 million gross square feet (gsf) of new building space. Currently, there is approximately 3.92 million gsf of building space. With full implementation of the CPHP, the total gross square feet would be approximately 5.97 million, including instruction, research, clinical and support space, housing and structured parking. This is a substantial increase in building area, mass and height, and will undoubtedly create significant visual impacts.

Within this plan a new 16 story hospital is to be constructed at the far east end of the campus and rise to 294 feet in height. As stated in the Draft EIR, this new hospital will be subject to a subsequent project specific environmental review as more details of this project becomes available. However, the Draft EIR states (*pg 4.1-23*) that development under the CPHP would not have a substantial adverse effect on scenic vistas. A significant effect on a scenic vista as defined in the DEIR, is a substantial block or degrade of scenic view from public vantage points. In review of this plan and DEIR, it is apparent that the proposed building plan and particularly the new 16 story hospital would have significant visual impacts. (*see figure 1 and 2*)

Fig 1 Existing view west from adjacent neighborhood

Fig 2 View west with proposed new hospital

By including this new hospital plan within this DEIR and concluding that it would not have a substantial adverse impact on a scenic vista, avoids discussion and possible mitigation measures in subsequent environmental review. This is not the intent of CEQA. Environmental review is a means to avoid or lessen adverse environmental effects at the outset, and by dismissing this issue at this time implies that it will not be address at a project level EIR in the future.

The topography of Mount Sutro and the green of the forested reserve are major elements that visually shape the adjacent neighborhoods as well as the overall city scape as seen from a distance. The views from publically accessible areas in and around the proposed UCSF Parnussus campus to these landmarks are of importance in establishing the quality of the environment here. One particularly significant local view point is the trail head near the intersection of Farnsworth Lane and Edgewood.

Public Trail Head at the end of Farnsworth Lane

The proximity and mass of the proposed new hospital will substantially impact this viewpoint. The 294 ft height and form of the proposed building will be seen and will block views to the west. The existing tree masses in this area and subsequently along the trail leading down, may tend to screen and filter the vistas but, the new proposed hospital will entirely block scenic vistas and dominate the view. This is a significant change to the public view and the inherent quality of the trail head and experience of accessing and walking this trail. This impact to the environmental quality of this publically accessible trail is significant and should be taken into account in considering mitigation measures or alternatives.

Furthermore the entire neighborhoods to the east, and views from streets such as Edgewood and Belmont and Willard and areas to the north of Parnassus Ave such as Hill Point Way will also be visually impacted by the large dominant mass of the new hospital. The size and height of the new hospital will also block views to Mt Sutro and the forest reserve from areas north of Parnassus Ave and Irving Street, and the visual experience of seeing a natural setting of a forested hillside from the local sidewalks and streets will be changed to one of a large urban building.

The visual simulations shown here have been constructed within Google Earth and incorporate scale models of the building masses and heights identified in the DEIR.

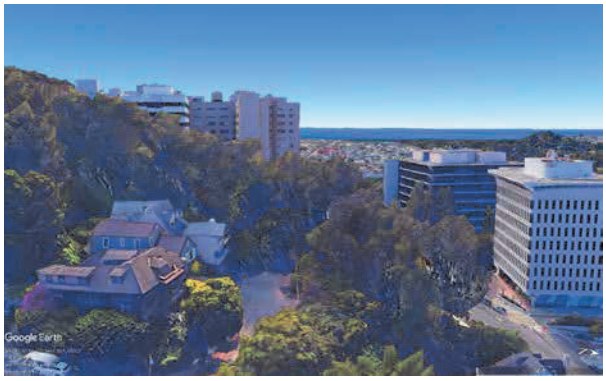

Figure 3 View west from end of Farnsworth

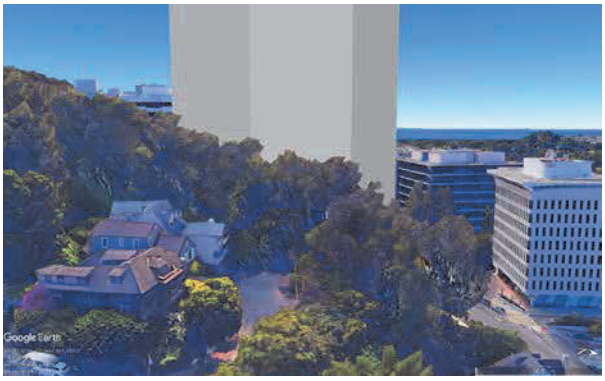

Figure 4 View west from end of Farnsworth with new hospital

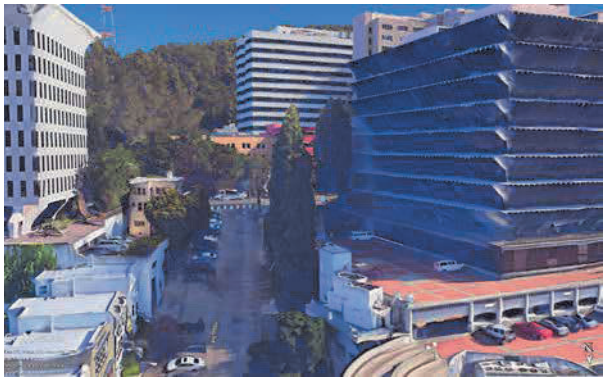

Figure 5 View south from Hill Point Way

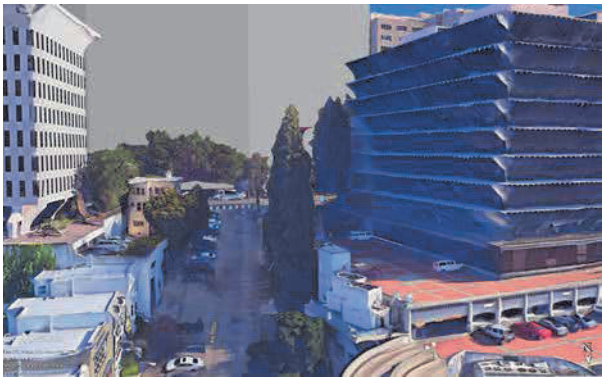

Figure 6 view south from Hill Point Way with new hospital

The views from the trailhead at the end of Farnsworth and adjacent residential neighborhood will become dominated by the mass of the new proposed hospital.

By stating that impacts to publically available scenic vistas are less than significant, the DEIR does not provide any possible mitigation measures or alternatives. This precludes further discussion and possible mitigation measures in future specific project environmental review and essentially allows development of the height and massing of the proposed buildings at this stage of the review process.

Views from other Prominent Vantage Points

The DEIR also identifies several other prominent publically accessible vantage points. These include Tank Hill natural area, Buena Vista Park, and Corona Heights Park. These are all located to the east of the Parnassus Heights campus. The DEIR states that the implementation of the CPHP would not result in a substantial adverse impact to scenic vistas from these publically accessible vantage points. However, in review it is again apparent that the new proposed hospital would change the skyline. (*see figures 7 through 12)*

Fig 7 view westward from Tank Hill natural area

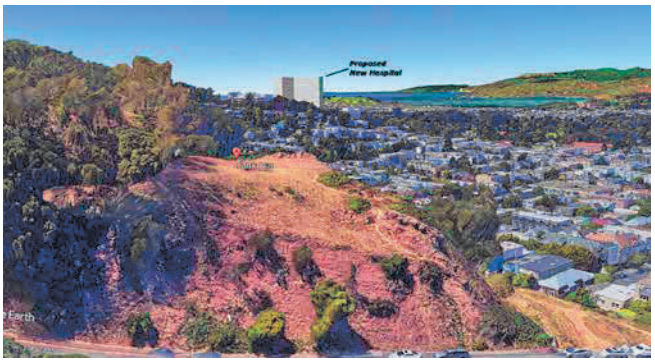

Fig 8 view from Tank Hill natural area with proposed new hospital

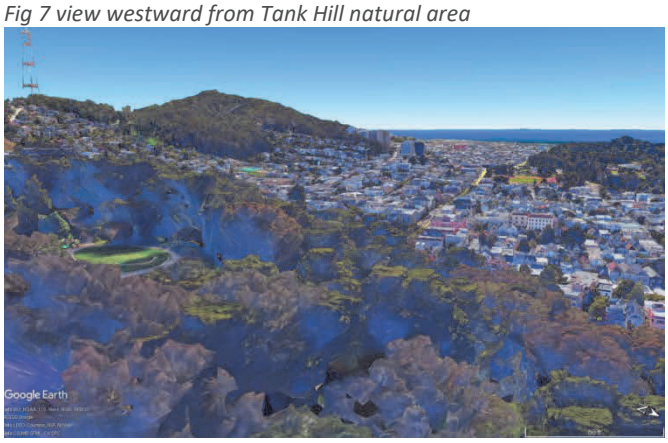

Figure 3 view from Buena Vista Park

Figure 5 view from Buena Vista Park with proposed hospital

Figure 4 View from Corona Heights Park

Figure 6 View from Corona Heights Park with proposed hospital

The development of the CPHP will undoubtedly change the visible skyline by addition of the new 294 foot high hospital. This is a noticeable change and should be addressed in the context of the Urban Design

Element of the San Francisco General Plan. The height and mass of the proposed new hospital will be highly visible as a new feature in the skyline from these public parks as well as from various other locations and streets within the surrounding neighborhoods. The Urban Design Element includes a policy to: "*Recognize and protect major views in the city, with particular attention to those of open space and water. Views contribute immeasurably to the quality of the city and to the lives of its residents. Protection should be given to major views whenever it is feasible, with special attention to the characteristic views of open space and water that reflect the natural setting of the city and give a colorful and refreshing contrast to man's development."*

The Urban Design Element of the city's General Plan states that shape, height and bulk of tall building with respect to views from important vantage points around the city should contribute to the beauty of the skyline. While views from private property are not protected in city regulations, the General Plan does protect specific view corridors from the public realm.

It is not clear in the DEIR whether the CPHP has undergone an initial Preliminary Project Assessment by the city's Urban Design Advisory Team (UDAT) to determine consistency with Urban Design Guidelines and other relevant design regulations, the Planning Code, and other policies in the General Plan. Is this review to come at a later environmental review as the project evolves? If so, does this mean that the height and mass of the new hospital is a given if this plan is approved. Since the proposed new hospital will be seen from several publically accessible view points and parks, it seems that such a major feature that will change the visible skyline should be reviewed and assessed by UDAT prior to further project level environmental review.

Overall Impact on Shadow

The DEIR states that implementation of the CPHP would not create new shadows in a manner that would substantially and adversely affect the use and enjoyment of publically accessible open spaces. The DEIR provides description and diagrams of shadow impacts onto various public locations during different seasons and times of day. These public locations include parks and schools which are some distance away and will receive "occasional shadow". The DEIR states that these areas would not be adversely affected and the impact is considered less than significant.

It appears though that certain areas along Parnassus Ave and Irving St. will be subject to "frequent shadows" throughout the year. (*Fan 1 of the Shadow Study Appendix within the DEIR*) Although these are not officially called out as "publically accessible open spaces" needing to be addressed within the city's Urban Design Element guidelines, they are public sidewalk and streets that are frequented by pedestrians and passerbys. These areas currently receive shadows from existing structures but, it can be expected that the increased height of the proposed new hospital and Milberry Terrace and Irving St Gateway projects will further increase the time and frequency of the shadows along Irving St and Parnassus Ave.
Although shadows do not directly affect change in air temperature, they do affect the direct exposure to sun radiation and the resulting feeling of warmth to a person's body. Further, sun radiation can affect the temperature of a surface struck by sunlight and increase that temperature and it's surroundings. The comfort and attractiveness of these particular areas to pedestrians and passerbys may be adversely affected and should be addressed in the EIR. The city's Urban Design Guidelines state that plazas or parks located in the shadows cast by large buildings can be unpleasant for the user and large buildings can be oriented to minimize shadows falling on public or semi-public open space. The guidelines state that the height and mass of tall, closely packed buildings can be shaped to permit sunlight to reach open spaces.

The CPHP does provide new open pedestrian areas within the campus and that is welcomed and appreciated and is a positive. But, discussion of the impact to the existing local areas and circulation patterns should still be noted and made aware to the public. There should be a discussion of how impact to these public areas might be mitigated.

Conclusion

The existing features of Mt Sutro and the Forest Reserve provide form and a sense of place and living within the environment to the UCSF campus and adjacent neighborhoods. The new CPHP with its heights and mass of proposed buildings would alter and change that sense. As noted in the city's Urban Design Element:

"The uses and benefits of the city pattern are many and profound. This pattern is, first of all, bound up in the image and character of the city. To weaken or destroy the pattern would make San Francisco a vastly different place. Second, the city pattern has important psychological effects upon residents of the city. It provides organization and measured relationships that give a sense of place and purpose and reduce the degree of stress in urban life. Outlooks upon a pleasant and varied pattern provide for an extension of individual consciousness and personality, and give a comforting sense of living with the environment."

The visual change from the implementation of the CPHP will be seen from many locations throughout the adjacent neighborhoods as well as other areas and parks within the city including areas of Golden Gate Park. The impact of the shadow patterns to the adjacent neighborhoods will also affect the quality experiences of spaces and pedestrian walkways by the public. These should be considered in the approval process and given recognition in the EIR.

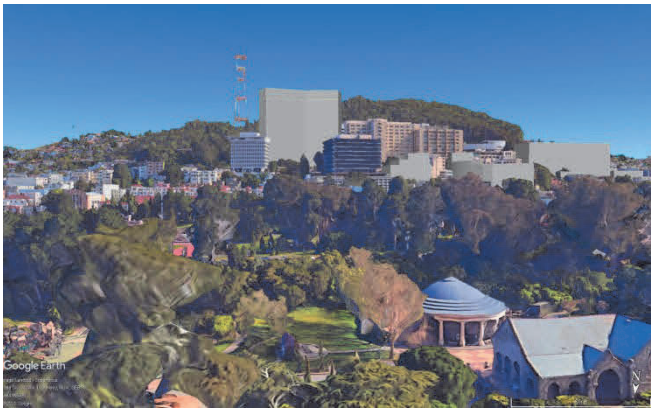

Figure 17 view south from Golden Gate Park with implementation of CPHP

Appendix:

Jared M. Ikeda

Jared Ikeda is a retired Landscape Architect and environmental planner with experience in preparation of land use planning studies, community planning, environmental impact studies, urban site planning, landscape development plans, and recreation planning. He has been involved in a wide range of studies and projects for both public and private sector clients and has participated in and directed all phases of land planning, investigative studies and landscape development. He has served on the board of directors of a major international landscape architectural firm, and Landwatch Monterey County, and served as a lecturer in the Department of Landscape Architecture at California State Polytechnic University, Pomona. His teaching activities focuses upon advanced landscape design and stressed use of computer technology including AutoCAD and ArcMap GIS software. He has prepared a number of visual impact and simulation studies using a variety of computer software including Sketchup and Google Earth. He has been involved in the preparation of the Monterey County General Plan Update from 1999 to 2004 and was responsible for studies and preparation of the Environmental Resource Management Element and the Circulation Element. He also directed consultant work on the Environmental Impact Report.

Project Experience
A selected list of relevant project experience includes:

Granite Chief Wilderness Area – Visual simulation of a proposed gondola
Client: Mountain Area Preservation Foundation

Preparation of a visual simulation of a proposed gondola system connecting the Squaw Valley Resort with Alpine Meadows village. The gondola system crosses an area adjacent to the Granite Chief Wilderness area and impacts the visual quality within the wilderness area.

Donner Summit Development Impact Study

Client: Sierra Watch and the Sierra Club

As part of a consulting team charged with review and comment upon a potential new development of an environmentally sensitive area of the Donner Summit, Mr Ikeda prepared GIS mapping and visual simulation of the proposed plan utilizing Google Earth software.

Dyer Mountain Visual Simulations

Client: Shute Mihaly Weinberger, llc

Mr Ikeda prepared 3 dimensional visual simulations of a proposed forest management plan and ski resort development in Lassen County. The work was utilized to demonstrate the visual impact of the proposed plan.

Colosseum Gold Mine – Visual Impact Analysis
Client: Bureau of Land Management

Prepared a visual impact analysis and land restoration plan for the Colosseum Gold Mine, an open pit gold mine near the California/Nevada border. The project utilized computer generated visual simulations.

Professional Experience
Principal: Ikeda Consulting, 2005 to Present
Monterey County Redevelopment Agency, 2004-2005
Senior Admin Analyst: County of Monterey, Environmental Resource Policy, 1999-2004
Lecturer: Cal Poly Pomona, Dept of Landscape Architecture 1997-1999
Vice-President/Officer-in-Charge EDAW Inc., Irvine Office: 1980 to 1987

EDAW, Inc. 1969 to 1989

Education

Bachelor of Science in Environmental Design, California State Polytechnic University, Pomona, 1968.

Honors

Best Comprehensive Plan, Orange Co. Section, American Planning Association, San Juan Capistrano Master Open Space Plan, 1992
Distinguished Alumnus Award, 1983, School of Environmental Design, California State Polytechnic University, Pomona.
Merit Award, American Society of Landscape Architects, Santa Ana River Open Space Study, 1973

Lectures & Publications

Mr. Ikeda has served as a guest lecturer at UCLA, UC Irvine, and Cal Poly Pomona. Mr. Ikeda has also served as Chairman of a panel on Computers and Landscape Architecture for the Southern California Chapter of the American Society of Landscape Architecture.
Contributor to *"Design with Digital Tools"* McGraw Hill, 2000

Re: Comment on Final Environmental Impact Report, UCSF Comprehensive Parnassus Heights Plan (SCH 2020010175)

"The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent."

-Resolution of the Board of Regents of the University of California, May 21, 1976 (Exhibit A)

Dear Chair Pérez, Vice Chair Estolano, and Honorable Regents:

This letter is submitted on behalf of the Parnassus Neighborhood Coalition ("PNC"), a group of residents living near the University of California, San Francisco ("UCSF") Parnassus Heights campus, regarding the Final Environmental Impact Report ("FEIR") prepared for the Comprehensive Parnassus Heights Plan ("CPHP") (SCH 2020010175) (the "Project"). After reviewing the FEIR, we conclude that the FEIR fails as an informational document, fails to adequate respond to comments on the DEIR, and fails to impose all feasible mitigation measures and alternatives to reduce the Project's impacts. PNC requests that the University address these shortcomings in a revised draft environmental impact report ("RDEIR") and recirculate the RDEIR prior to considering approvals for the Project.

I. REQUEST OF EXTENSION OF COMMENT PERIOD.

On January 11, 2021, staff released the FEIR, for a bare minimum 10-day comment period. Pub. Res. Code 21092.5. However, the Regents' rules require comments to be submitted 24 hours prior to the start of the 3-day meeting, which is Monday, Feb. 18, which is a state and federal holiday (Martin Luther King, Jr. Day). This provides an unlawfully short and patently inadequate opportunity for the public to review and comment on the FEIR, which totals over 5000 pages. On January 12, 2021, the San Francisco Board of Supervisor adopted a resolution asking the Regents to continue consideration of the FEIR to March, 2021, to allow the public and the City two months to review the FEIR. https://sfbos.org/sites/default/files/bag011221_minutes.pdf. We urge the Regents to honor this reasonable request from the governing body of UCSF's host city. In addition, we submit herewith a petition signed by 896 local residents asking the Regents to extend the public review period on the FEIR and to abide by the Regents' own resolution establishing a Space Ceiling. (Exhibit A).

We therefore request an extension of the comment period and submit this letter under protest. Furthermore, we reserve the right to file additional comments up to and including the date of the final decision and hearing by the Regents, as allowed by state law. Pub. Res. Code section 21177; *Bakersfield Citizens for Local Control v. City of Bakersfield,* 124 Cal.App.4th 1184 (2004).

Despite the short timeline, it is apparent that the FEIR fails to comply with the requirements of CEQA. The FEIR fails to provide adequate or substantive responses to many of the comments submitted on the Draft EIR, fails to impose feasible mitigation measures, changes the project description dramatically, identifies new significant impacts that require new mitigation measures, and contains other defects. A RDEIR is required to address these defects.

II. PROJECT DESCRIPTION

In 2014, the University of California prepared a Long Range Development Plan ("LRDP") setting forth concepts, principles, and plans to guide future growth for the UCSF campus, outlining projected development levels and patterns for UCSF at all of its main campus sites through 2035. The Regents certified the FEIR for the LRDP in November 2014, which included an analysis of the potential environmental impacts from the then-envisioned development at the Parnassus Heights campus site. However, at some point after this, UCSF undertook an entirely new planning process to dramatically expand the Parnassus Heights campus, resulting in the development of the CPHP, which provides a long-term development framework for the "revitalization" of the Parnassus Heights campus.

This Project proposes to develop approximately 2.9 million gross square feet ("gsf") of new building space at Parnassus Heights. The CPHP includes an "Initial

Phase" that comprises of: 1) Irving Street Arrival improvements, 2) Research and Academic Building ("RAB"), 3) initial Aldea Housing Densification, and 4) New Hospital. This Initial Phase is anticipated to be completed by approximately 2030. Beyond the Initial Phase, the "Future Phase" encompasses the remaining development described in the CPHP envisioned for completion by the horizon year of 2050. However, when accounting for existing campus site development, demolition that was approved under the UCSF 2014 LRDP but not yet implemented, and potential additional building demolition that would occur under the CPHP, the total amount of campus space upon full implementation of the CPHP would be 6.0 million gsf.

The CPHP for the first time reneges on the promise made by the UC Regents in 1976 to the City of San Francisco and the community of Parnassus Heights to resolve a CEQA lawsuit that the Parnassus campus would never exceed 3.55 million square feet – which has generally been referred to as the "Space Ceiling." The CPHP would exceed this Space Ceiling by over 2 million square feet, making a mockery of this false promise.

II. LEGAL BACKGROUND

The lead agency must evaluate comment on the draft EIR and prepare written responses in the final EIR. (PRC §21091(d)) The FEIR must include a "detailed" written response to all "significant environmental issues" raised by commenters. As the court stated in *City of Long Beach v. LA USD* (2009) 176 Cal.App.4th 889, 904:
The requirement of a detailed written response to comments helps to ensure that the lead agency will fully consider the environmental consequences of a decision before it is made, that the decision is well informed and open to public scrutiny, and that public participation in the environmental review process is meaningful.

The FEIR's responses to comments must be detailed and must provide a reasoned, good faith analysis. (14 CCR §15088(c)) Failure to provide a substantive response to comment render the EIR legally inadequate. (*Rural Land Owners Assoc. v. City Council* (1983) 143 Cal.App.3d 1013, 1020). If the public suggests a feasible mitigation measure or alternative, the agency may only decline to implement it if it provides substantial evidence that the mitigation measure or alternative is infeasible. (*Covington v. Great Basin Unified Air Pollution Control Dist*., 43 Cal. App. 5th 867, 256 Cal. Rptr. 3d 902 (2019)).

The responses to comments on a draft EIR must state reasons for rejecting suggested mitigation measures and comments on significant environmental issues. "Conclusory statements unsupported by factual information" are not an adequate response. (14 CCR §15088(b, c*); Cleary v. County of Stanislaus* (1981) 118 Cal.App.3rd 348) The need for substantive, detailed response is particularly appropriate when comments have been raised by experts or other agencies. (*Berkeley Keep Jets v. Bd. of Port Comm'rs* (2001) 91 Cal.App.4th 1344, 1367; *People v. Kern*

(1976) 72 Cal.app.3d 761) A reasoned analysis of the issue and references to supporting evidence are required for substantive comments raised. (*Calif. Oak Found. v. Santa Clarita* (2005) 133 Cal.App.4th 1219).

If significant new information is added to an Environmental Impact Report (EIR) after notice of public review has occurred, but before final certification of the EIR, the lead agency must issue a new notice and recirculate the EIR for comments and consultation. (Pub. Res. Code § 21092.1; 14 CCR § 15088.5.) "Significant new information" triggering the need for EIR recirculation includes information showing that (1) a new or more severe environmental impact would result from the project, (2) a feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of a project but the project proponent declines to adopt it, or (3) the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. (14 CCR § 15088.5(a)(1)-(4).) A decision not to recirculate an EIR must be supported by substantial evidence in the administrative record. (14 CCR § 15088.5(e).)

The FEIR abjectly fails to meet these legal standards, as it is riddled with conclusory statements lacking any factual support or analysis.

IV. DISCUSSION

A. Space Ceiling.

The most glaring shortcoming of the CPHP is that it reneges on the Regents' promise to the City of San Francisco and the community of Parnassus Heights never to exceed 3.55 square feet of development at the Parnassus Heights campus. This promise was made by the Regents themselves to resolve a lawsuit in 1976, and has been reaffirmed countless times thereafter, most recently in the 2014 LRDP. In May 21, 1976, the Regents adopted a resolution stating the following:

> The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and ***this limit shall be permanent.*** These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the new campus boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton and Clarendon. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

1976 Resolution, ¶ 2 (emphasis added). The Regents directed that these commitments be amended into the 1975 Long Range Development Plan. Id., ¶ 6 ("That the Long Range Development Plan for the San Francisco campus, as approved by The Regents in October, 1975, be amended to reflect the described changes in designation of open space, boundaries, and use of housing").

Retired San Francisco Superior Court Judge James Robertson submitted additional evidence during the public comment period that the Space Ceiling was intended to be permanent, just as it says in black and white. Residents filed a CEQA suit in 1976 and dismissed that suit only because the Regents agreed to the "permanent" space ceiling. The minutes of the 1976 Regents meeting at which the Space Ceiling was adopted make clear that the Regents were well-aware that this was a "permanent" commitment that would bind the Regents in the future. Regent Morris stated that the 3.55 million square foot limitation would be "permanent." "He did not construe the word 'permanent' as implying flexibility." He believed the cap would "commit future Boards to this extent 100 years hence." Despite these concerns, the Regents adopted the Space Ceiling without amendment. (Id.).

UC has repeatedly relied on the Space Ceiling to justify other expansions. As the former Chancellor of UCS stated to justify the UCSF Mission Bay Campus:

> As Chancellor of The University of California, San Francisco, I am pleased to present UCSF's 1996 Long Range Development Plan (LRDP), which was approved by The Regents on January 17, 1997. The 1996 LRDP will guide the physical development of UCSF over the next fifteen years, into the second decade of the 21st century. This LRDP has been prepared not only with close attention to the needs of the UCSF campus community, but also to the concerns of the wider community, which joined with us to establish the goals and objectives that guided the development of the LRDP. We are most grateful for this participation and encouragement. This LRDP reaffirms the principles of the 1976 Regents' resolution which has limited development at the Parnassus Heights site. Recognizing constraints to future development at Parnassus Heights, the LRDP has been prepared, in part, to help UCSF and The Regents acquire and develop a major new campus site. A major new site is desirable for several reasons. First, there is the need to relieve our extremely crowded conditions, particularly at the Parnassus Heights site where we are, without question, the most crowded campus among comparable institutions. Second, we need to provide additional space to support UCSF's research into the causes and treatment of illnesses, some of which are undoubtedly unknown to us today, just as the impending HIV crisis was unforeseen at the time of the 1982 LRDP. Finally, we must find a way to consolidate UCSF units currently scattered throughout San Francisco.

The FEIR ignore entirely our arguments that the Space Ceiling is a binding commitment and enforceable under the doctrines of equitable estoppel and promissory estoppel. The FEIR merely makes a conclusory statement that since the Space Ceiling was created by the Regents, it may also be destroyed by the Regents. This argument ignores entirely the estoppel arguments and the fact that the Regents made the Space Ceiling "permanent." In short, the FEIR begs the question, "what does the word 'permanent' mean?"

B. Zakheim Murals.

The DEIR proposed to destroy priceless murals painted by Bernard Zakheim as part of the WPA program. The DEIR also admits that the Project as proposed would result in a significance and unavoidable adverse change in the significance of known historical resources, in particular the UC Hall which includes the Bernard Zakheim murals. DEIR, p. 4.4-12. During the 1930s, Zakheim, a student of Diego Rivera, was one of the leading artists in the area who were creating major public art under the auspices of the New Deal art programs. The ten murals that make up Zakheim's *History of Medicine* (1936-39) constitute one of this region's largest New Deal art projects by a single artist. Despite housing such important artwork, the Project proposes to demolish UC Hall. *Id*.

After criticism from the New York Times, Los Angeles Times, San Francisco Chronicle and others, UC relented and stated that they would preserve the murals by safely removing them and storing them, with possible plans to relocate them. This promise was relayed to the media, the San Francisco Board of Supervisors and others, and was formalized in a Memorandum of Understanding between UCSF and the City of San Francisco Planning Commission. This raises several problems.

First, UCSF admitted in the hearing of the San Francisco Board of Supervisors Land Use Committee that the MOU is unenforceable. (https://sanfrancisco.granicus.com/TranscriptViewer.php?view_id=177&clip_id=37480). Supervisor Peskin asked UCSF Chancellor Sam Hawgood to incorporate the commitment to preserve the murals into the EIR so that it would be enforceable. Chancellor Hawgood refused and insisted that the MOU be separate from the EIR. Id.

By contrast, the FEIR continues to state that UC reserves the right to destroy the priceless Zakheim Murals. The FEIR states:

> The University is currently assessing how best to relocate the large 10-panel set of murals, the "History of Medicine in California," painted on the walls of Toland Hall auditorium in the century-old UC Hall. UC Hall is seismically deficient and functionally obsolescent, and is proposed to be replaced by a new facility that meets California's seismic codes.

> UCSF has determined that it may be infeasible to remove and relocate the murals as there is no guarantee that any effort to remove them would be successful.
>
> (FEIR 8.3-38).

Thus, despite assurances in the unenforceable MOU that UC will preserve the murals, the enforceable EIR states that "there is no guarantee" that UC will preserve the murals. UCSF's commitments are inconsistent and contradictory.

CEQA requires that mitigation measures must be fully enforceable through permit conditions, agreements or other legally binding instruments. 14 CCR § 15126.4(a)(2). See *Woodward Park Homeowners Assn., Inc. v. City of Fresno* (2007) 150 Cal. App. 4th 683, 730 (project proponent's agreement to a mitigation by itself is insufficient; mitigation measure must be an enforceable requirement). The mitigation measures to preserve the Zakheim murals is not enforceable because its is contained in the unenforceable MOU, and excluded from the enforceable EIR.

CEQA requires that all feasible mitigation measures must be implemented. The mitigation measure to preserve the Zakheim murals is clearly feasible since UC has included it in the MOU. However, UC has failed to include the measure in the EIR. The failure to include a feasible mitigation measure in the FEIR renders the document legally inadequate, and the UC therefore is precluded from adopting a statement of overriding considerations. *Covington v. Great Basin*, 43 Cal.App.5th 867.

Furthermore, even if the measure were included in the FEIR, it is not adequate the mitigate the impact. The MOU proposes merely to remove the murals and store them. Placing the murals in storage for all eternity does not mitigate the impact. Art has no value if cannot be seen. Even the MOU fails to commit to display the murals prominently in the new building or anywhere else. The FEIR and MOU both merely state that "UCSF continues to assess how best to safety relocate the murals." (FEIR 8.3-20). The FEIR states, "Assuming removal of the murals to a temporary storage facility is successful, UCSF will explore options to either return the murals to the Parnassus Heights campus site to be incorporated in a future new building that can accommodate them, or to relocate them to a museum or other institution where they can be maintained by experts and made accessible to a broad public audience." (FEIR 8.3-39). Thus, even if the murals are not destroyed, there is no commitment to display the murals. This is inadequate mitigation. It is clearly feasible to display the murals at a prominent location at the University or elsewhere. The EIR must be revised to include an enforceable requirement to preserve the murals and display them publicly.

C. SIGNIFICANT NEW IMPACTS REQUIRE RECIRCULATION

The FEIR identified six (6) new significant impacts that were not identified in the draft EIR. While the FEIR proposes mitigation measures that will allegedly reduce these impacts to a level of less than significant (LTS), as a matter of law a revised draft EIR is required to analyze these impacts, to consider whether the proposed mitigation measures are adequate, and to consider additional mitigation measures and alternatives.

CEQA Guidelines Section 15088.5 and CEQA section 21092.1 set the standard requiring recirculation prior to final project approval. Recirculation of an EIR is required when "significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification [of the Final EIR]." New information added to an EIR is significant when "the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement." The Guidelines require recirculation when:

> (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
> (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
> (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.
> (4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. (*Mountain Lion Coalition v. Fish and Game Com*. (1989) 214 Cal.App.3d 1043)

Recirculation is also required when the FEIR identifies new mitigation measures. Recirculation is required because the public was denied the opportunity for comment and response on this "ostensibly feasible way to mitigate" the Project's cumulative impacts. *Spring Valley*, *supra*, 248 Cal. App. 4th at 108 [FEIR proposes entirely new mitigation proposal]. *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1120 also holds that an EIR's failure to evaluate water supply mitigation requires recirculation. Recirculation is warranted where the agency's ultimate rational for its significance conclusion does not appear in the draft EIR. (Pesticide Action Network North America v. Department of Pesticide Regulation (2017) 16 Cal.App.5th 224, 252 [DEIR "provided no analysis or explanation to show how it reached that conclusion"]; Save Our Peninsula, supra, 87 Cal.App.4th at 128-131 [belated identification of mitigation offset parcel without analysis in DEIR], 131-134 [belated claim of riparian rights as basis for adequacy of water supply].)

The FEIR report shows that Project will have new significant impacts that were not analyzed in the DEIR, that there will be an increase in severity of impacts over the level analyzed in the DEIR, and that the DEIR is so fundamentally and basically inadequate conclusory in nature that meaningful public review and comment were precluded. The FEIR proposes new mitigation measures for these impacts, but these measures were not presented in the DEIR and the public had no adequate opportunity to review and comment on these measures. Therefore a recirculated draft EIR is required pursuant to CEQA Guidelines section 15088.5.

For example, the FEIR for the first time states that the Project may have significant cumulative particulate matter (PM-10) impacts. (FEIR 2-13). This is contradicts the DEIR's conclusion that there would be no such impacts. As mitigation, the FEIR proposes to require Tier 4 Final construction equipment rather than Tier 4 Interim. However, this makes no sense. Tier 4 Final construction equipment reduce nitrogen oxides (NOx) emissions, not PM-10 as compared to Tier 4 Interim. Thus, the proposed measure does not even address the new impact. This points out exactly why this new impact should have been analyzed in a RDEIR rather than hidden away in the FEIR.

The FEIR discloses a new geotechnical impact, GEO-3. (FEIR 2-25). The mitigation measure is that UC will hire a geotechnical expert to submit a report. This is plainly inadequate deferred mitigation. CEQA prohibits the agency from deferring the development of mitigation until after project approval. "[M]itigation measure[s] [that do] no more than require a report be prepared and followed" do not provide adequate information for informed decisionmaking under CEQA. *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 794; Guidelines § 15126.4(a)(1)(B).

The FEIR discloses four new hydrological impacts, HYD-1, (FEIR 4.9-10 to 4.9-13); HYD-2, C-HYD-1 and C-HYD-2. The FEIR states, "Construction and operation of campus development under the CPHP would have the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade surface or groundwater quality." This is exactly the opposite of the DEIR's conclusion: "Construction and operation of campus development under the CPHP would **not** have the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade surface or groundwater quality." (emphasis added) The FEIR thus identifies a potentially significant impact that the DEIR did not disclose, analyze or seek to mitigate. The FEIR discloses for the first time that the Project may overwhelm San Francisco's stormwater system, which is already releasing untreated raw sewage into the Pacific Ocean during rain events. The Project will only make this situation worse. This impact was not disclosed at all in the DEIR. As mitigation, the FEIR proposes that UCSF will "Avoid increasing the likelihood of surcharges by exceeding the capacity of the City's CSS." Id. However, this "mitigation" does not ensure that the impact will be rendered less than significant. It imposes no enforceable

standard or numerical threshold. This impact must be analyzed and specific mitigation measures proposed in a RDEIR.

D. PROJECT CHANGES REQUIRE NEW EIR.

UC promises in the MOU with the City of San Francisco to increase the amount of housing provided as part of the Project. The MOU promises to add 1,263 housing units above the 762 units analyzed in the DEIR, bringing the total amount of housing to 2025 units. While the PNC fully supports the additional housing, the new housing will have new impacts on public services (schools, police, fire, sewer), traffic, greenhouses gases, air quality, energy use, and almost every other factor. These impacts must be analyzed and mitigated in a RDEIR. UCSF cannot shield these impacts from review by placing the commitment in an MOU and excluding it from the EIR. The EIR must accurately describe the project that will actually be constructed. It simply fails to do this. Even if UCSF were proposing only to construct 1263 units of housing, this alone would require CEQA review. UC cannot simply add what would itself be massive residential development to an existing EIR and pretend that it has no impacts.

For example, under the Bay Area Air Quality Management District ("BAAQMD") standards, an apartment building with more than 494 units would be expected to have significant emissions of reactive organic gases (ROGs) (Exhibit B). UCSF is proposing to construct over double this amount of new apartments. This must be analyzed in a RDEIR. Urban planner Terrell Watt provides expert comments that the revised Project will have additional impacts on schools, traffic, police services, fire services, and many other elements that must be analyzed and mitigated in a RDEIR.

In *Washoe Meadows Community v. Dept. of Parks & Recreation* (2017) 17 Cal.App.5th 277 ("*Washoe"*), the court held, "***[F]or a project to be stable, the DEIR, the FEIR, and the final approval must describe substantially the same project***." As our Supreme Court explained, "[t]he defined project ***and not some different project*** must be the EIR's bona fide subject." (*Concerned Citizens of Costa Mesa v. 32nd Dist. Agric. Ass'n* (1986) 42 Cal.3d 929, 934 ("*Costa Mesa*") [emphasis added].) Whether an EIR correctly describes a project is a question of law, subject to *de novo* review." (*South of Market Cmty. Action Network v. City & Cnty. of San Francisco* (2019) 33 Cal.App.5th 321, 332 ("*SoMa*").) By adding 1263 residential units to the project, the DEIR and FEIR do not describe the same project.

For over forty years the courts have consistently held that an accurate and stable project description is a bedrock requirement of CEQA—the *sine qua non* (that without which there is nothing) of an adequate CEQA document:

> Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage

> of terminating the proposal (i.e., the "no project" alternative) and weigh other alternatives in the balance. An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR.

(*County of Inyo v. City of Los Angeles*, 71 Cal. App. 3d 185, 192 (1977).)

The ability of informed citizens to participate in environmental review is a key component of CEQA. (*Washoe*, *supra*, 17 Cal.App.5th at 285 ["Informed public participation is essential to environmental review under CEQA."]; *Inyo*, *supra*, 71 Cal.App.3d at 192 ["The EIR process facilitates CEQA's policy of supplying citizen input."].) Through the EIR process, CEQA "provide[s] public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment." (*Washoe*, *supra*, 17 Cal.App.5th at 286 [quoting Pub. Res. Code § 21061].)

In *Inyo*, the court first articulated that "[a] curtailed or distorted project description may stultify the objectives of the [CEQA] process." (*Inyo*, *supra*, 71 Cal.App.3d at 192.) This court recently noted that the requirement for an accurate, stable, and finite project description has been "reiterated in a number of cases since *County of Inyo*." (*Millennium*, *supra*, 39 Cal.App.5th at 17 [citing *Treasure Island*, *supra*, 227 Cal.App.4th at 1052; *Communities for a Better Envt. v. City of Richmond* (2010) 184 Cal.App.4th 70, 85-89; *San Joaquin Raptor Rescue Ctr. v. County of Merced* (2007) 149 Cal.App.4th 645, 653 ("*San Joaquin Raptor*")].)

As discussed below, in *Inyo* and the subsequent cases applying its accurate project description requirement, the courts have found that an unstable project description runs afoul of the informational requirements of CEQA which facilitate informed decision-making and public participation. (see, e.g., *Millennium*, *supra*, 39 Cal.App.5th at 17-18; *Washoe*, *supra*, 17 Cal.App.5th at 288-89; *Inyo*, *supra*, 71 Cal.App.3d at 197.)

In *Millennium*, this court evaluated the project description for a large mixed-use development, which described three conceptual development scenarios that would satisfy the project's Development Agreement (*Millennium*, *supra*, 39 Cal.App.5th at 9-10.) The scenarios presented in the DEIR only depicted potential massing options that might have been developed and, thus, "the public had no idea how many buildings or towers would be built and where they would be located on the project site." (*Id.* at 11.)

This Court held that the DEIR did not meet CEQA's requirement for an accurate, stable or finite proposed project because "it fails to describe the siting, size, mass, or appearance of any building proposed to be built at the project site" and "presents different conceptual scenarios that Millennium or future developers may follow for the development of this site." (*Millennium*, *supra*, 39 Cal.App.5th at 18.) Notably, this court noted that the failure to include an accurate, stable, and finite project description "***was***

an obstacle to informed public participation 'even if we cannot say such input would have changed the project ultimately selected and approved.'" (*Id*. at 20 [quoting *Washoe*, *supra*, 17 Cal.App.5th at 290] [emphasis added].)

In *Washoe*, the court evaluated a DEIR prepared by the California Department of Parks and Recreation which described five different alternatives for a project, including an existing 18-hole golf course, to reduce sediment discharge from the Upper Truckee River into Lake Tahoe. (*Washoe*, *supra*, 17 Cal.App.5th at 283.) The DEIR did not identify a preferred alternative but instead proposed that, after comments had been received on the DEIR, the Department would identify the preferred alternative in the FEIR to "determine which alternative or combinations of features from multiple alternatives will become the preferred alternative." (*Id*. at 283.) In the FEIR, the Department identified "[a] refined version of Alternative 2" as the preferred alternative. The Department subsequently certified the FEIR. (*Id.* at 283-84.) The petitioners sought to set aside the approval of the project because, *inter alia*, the DEIR did not contain an "accurate, stable and finite" project description. (*Id*. at 287.)

The *Washoe* court upheld the lower court's ruling in favor of the petitioners, agreeing with the lower court that "***for a project to be stable, the DEIR, the FEIR, and the final approval must describe substantially the same project***." (*Washoe*, *supra*, 17 Cal.App.5th at 288 [emphasis added].) Notably, the fact that the DEIR had a thorough analysis of the environmental impacts of Alternative 2 did not alter the court's analysis because the revised version of Alternative 2 ultimately described in the FEIR and adopted by the agency was different than the Alternative 2 in the DEIR. The court held, "an agency's failure to propose a stable project is not confined to 'the informative quality of the EIR's environmental forecasts.'" (*Id.* [quoting *Inyo*, *supra*, 71 Cal.App.3d at 197].) The court further explained:

> Rather, ***inconsistencies in a project's description***, or (as here) the failure to identify or select any project at all, ***impairs the public's right and ability to participate in the environmental review process***. A description of a broad range of possible projects, rather than a preferred or actual project, presents the public with a moving target and requires a commenter to offer input on a wide range of alternatives that may not be in any way germane to the project ultimately approved.

(*Id*. [emphasis added].)

In *Inyo*, the court of appeal reached a similar conclusion. There, the court addressed whether the description of a project related to the extraction of subsurface water satisfied the requirements of CEQA. The EIR had described the project as a 51 cubic feet per second increase in the water extraction rate. (*Inyo*, *supra*, 71 Cal.App.3d at 189.) However, the court noted, "the project concept expands and contracts from place to place within the EIR." (*Id*. at 190.) Some sections of the EIR analyzed a

"recommended project" with higher rates of groundwater extraction as well as the development of infrastructure to export water to Los Angeles even though those aspects of the project were not included in the EIR's initial project description. (*Id*.) As the court explained, "The small-scale groundwater project described at the outset was dwarfed by the 'recommended project' ultimately endorsed by the final EIR and approved by the board of commissioners." (*Id*. at 199.)

The court in *Inyo* concluded that "an accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR." (*Inyo*, *supra*, 71 Cal.App.3d at 199.) Even though "the informative quality of the EIR environmental forecasts [were] not affected by the ill-conceived, initial project description," the court underscored that "[t]he defined project *and not some other project* must be the EIR's bona fide subject." (*Id*. at 197, 199 [emphasis added].) The failure to accurately describe the project, regardless of the environmental analysis in the CEQA document, violated CEQA because "the selection of a narrow project as the launching pad for a vastly different wider proposal **frustrated CEQA's pubic information aims**." (*Id*. at 199-200 [emphasis added].)

The DEIR described a Project with 763 dwelling units. UCSF is now proposing 2025 units – almost triple the amount. This renders the EIR legally inadequate. There is no way the public could have been expected to comment on the 2025 unit project since it was not included in the DEIR. The DEIR's inaccurate project description interfered with the public's ability to meaningfully participate and comment on the Project. A RDEIR is required to accurately describe the Project that will actually be built. While PNC fully supports additional housing, it cannot be denied that this housing will itself have significant impacts that must be analyzed and mitigated in a RDEIR.

E. The FEIR's Alternatives Analysis is Legally Deficient.

The FEIR refuses to analyze the several feasible alternatives proposed by public commenters. This renders the response to comments and the alternatives analysis legally inadequate. Urban Planner Terrell Watt explains that the FEIR fails to adequately respond to feasible alternatives proposed in the comments on the DEIR, in violation of CEQA.

In particular, commenters suggested alternatives including constructing the new hospital at a large vacant parcel in Hunters Point, thereby preserving the Space Ceiling, while providing medical services to San Francisco's most under-served community. Other options including building the new hospital at Mount Zion, or Mission Bay. The FEIR rejects all of these options. However, it provides no substantial evidence that these alternatives are infeasible.

An EIR must describe a range of reasonable alternatives to the Project, or to the location of the Project, which would feasibly attain most of the basic objectives of the

project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. "An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision making." *Laurel Heights I*, 47 Cal.3d at 404. An EIR must also include "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." *Id*. at 405.

CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring "environmentally superior" alternatives and all feasible mitigation measures. CEQA Guidelines § 15002(a)(2) and (3); *See also*, *Berkeley Jets*, 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564. The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines § 15002(a)(2). If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns." Pub. Res. Code § 21081; CEQA Guidelines § 15092(b)(2)(A) & (B). A "feasible" alternative is one that is capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors. Pub. Res. Code § 21061.1; CEQA Guidelines § 15364.

The lead agency is required to select the environmentally preferable alternative unless it is infeasible. As explained by the Supreme Court, an environmentally superior alternative may not be rejected simply because it is more expensive or less profitable:

> The fact that an alternative may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible. What is required is evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.

Citizens of Goleta Valley v. Bd. of Supervisors (1988) 197 Cal.App.3d 1167, 1180-81; *see also*, *Burger v. County of Mendocino* (1975) 45 Cal.App.3d 322; *County of El Dorado v. Dept. of Transp*. (2005) 133 Cal.App.4th 1376 (agency must consider small alternative to casino project); *Preservation Action Counsel v. San Jose* (2006) 141 Cal. App. 4th 1336.

In addition, an environmentally superior alternative may not be rejected because it does not meet all of the Project's objectives. Inconsistency with only some of the Project Objectives is not necessarily an appropriate basis to eliminate impact-reducing project alternatives from analysis in an EIR. CEQA Guidelines § 15126.6(c), (f); *see also Watsonville Pilots Assn. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1089.

Here, the FEIR fails to adopt the environmentally superior alternatives and fails to describe a reasonable range of alternatives.

First, the FEIR identifies several significant environmental impacts the Project will have, as well as project alternatives that may alleviate some of these impacts. However, UCSF failed to adopt the environmentally superior alternative, or any other alternative, that would reduce the Project's impacts and failed to include and analyze several feasible alternatives that are available and would reduce some of the Project's significant impacts. The FEIR refuses to adopt the environmentally superior alternative, Alternative 2: the Reduced Project Alternative, because it would "fail to fully achieve certain Project objectives, and in particular, would not fully meet the CPHP project objectives, for space, urban design and mobility, or for the New Hospital, RAB or Aldea Housing Densification." DEIR, p. 6-71. This justification is insufficient and does not constitute substantial evidence that the environmentally superior alternative is infeasible.

Second, the FEIR fails to select the 2014 LRDP Alternative. The environmental impacts of the 2014 LRDP Alternative were already analyzed in the 2014 LRDP EIR, and this alternative would result in less significant impacts than the proposed Project. However, UCSF did not select this alternative because it "would not achieve the proposed CPHP objectives." FEIR, p. 6-20. Numerous objectives from the 2014 LRDP FEIR remain valid with respect to the proposed Project. *See id*. at 3-13. Dismissing this alternative for this reason fails to demonstrate how this alternative is not feasible.

Additionally, Urban Planner Terrell Watt, a member of the American Institute of Certified Planners, reviewed the DEIR, including the alternatives analysis, and concluded that the DEIR is legally deficient because it "fails to describe a reasonable range of alternatives, or to the location of the Project, which would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the significant effects of the Project, and evaluate the merits of the alternatives." Specifically, the DEIR improperly rejected feasible off-site alternatives and omits other feasible off-site alternatives. For example, feasible alternatives to the Project that would reduce or eliminate the Project's significant impacts that the DEIR briefly considered but dismissed include the following: (1) No New Hospital at Parnassus Heights Campus Site/Implement Phase 2 of Medical Center at Mission Bay Campus Site; and (2) New Hospital at Mount Zion Campus Site. *Id*.

The reasons provided for dismissing the alternative of a new hospital at Mission Bay comes down to the alternative's purported failure to meet every focused Project objective and a purported conflict with the 2014 LRDP and CPHP. Specifically, the FEIR, like the DEIR states that the alternative would not meet some of the Project objectives and would conflict with several 2014 LRDP and CPHP objectives including but not limited to adequate space to foster collaboration and to facilitate inter-dependence and connectivity for operational efficiency, adequate clinical and

administrative support and alignment with other programs, increase in beds, and modern industry standards including seismic activity. *See* DEIR, p. 6-55. The discussion concedes that the alternative would reduce significant wind, cultural, and construction impacts, but that in doing so, it would likely also result in increased cross town traffic between the Parnassus and Mission Bay campus sites. However, the discussion failed to analyze a combination of a smaller, new hospital at Parnassus in combination with Mission Bay, which is a feasible option that has the potential to address total need and allow phasing to accommodate patients and services. The EIR's justification for dismissing this alternative is not justified. First, the alternative would meet most of the Project's objectives. Second, the argument that the alternative would increase cross-town traffic is not supported by any evidence or analysis. Lastly, the conflicts with the 2014 LRDP are not persuasive since that document is being amended to break the space ceiling and this alternative would not require that significant amendment to the LRDP. "In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus." This alternative must be fully analyzed in a revised and recirculated DEIR, including additional facts and analysis to support the arguments concerning the alternatives analysis.

The FEIR, like the DEIR also dismisses the alternative of a new hospital at the Mount Zion Campus Site without actually analyzing the alternative, stating that it "would be less than ideal and inefficient" to have UCSF hospitals at three different sites, and that it would not help achieve the benefits realized through interdisciplinary collaboration and convergence between clinical care, research and education, land acquisition would be difficult, and citing undisclosed conflicts with the 2014 LRDP and CPHP objectives. DEIR, p. 6-57. Locating the proposed hospital at the Mount Zion campus would "reduce the significant wind impact . . ., avoid demolition of the LPPI (individually eligible for listing in the National and California Registers), and avoid a number of temporary construction and operational impacts associated with the New Hospital at the Parnassus Heights campus site." *Id*. The Mount Zion campus site is 2 miles from the Parnassus campus site and several of the existing buildings, including the hospital, must be retrofitted or demolished due to seismic issues. *See* UCSF 2014 LRDP, p. 89. The 2014 LRDP even states that the demolition of outdated and seismically compromised buildings would allow for the construction of new space to accommodate clinical programs at the Parnassus site. *Id*. at 91. The FEIR must analyze the feasibility of this alternative due and compare it with the other identified alternatives.

Rejection of the Mission Bay and Mount Zion sites for a new hospital, either in lieu of or in combination with a smaller hospital at the Parnassus campus, is not supported by the evidence and analysis provided and both require full analyses in a revised and recirculated DEIR.

Lastly, the FEIR and DEIR also fail to mention their Hunters Point site. UCSF owns 3.8 acres in Hunters Point with two single story buildings used for an animal care facility. UCSF 2014 LRDP, p. 117. At the time the 2014 LRDP was published, the City

had approved the Candlestick-Hunters Point Shipyard Development Plan, an extensive mixed-use redevelopment plan for the area that would include housing, retail, office, commercial, industrial, and open use spaces. *See id*. Because UCSF's facilities at this site are in relatively poor condition, UCSF was exploring the possible relocation of those functions and occupants and potential relinquishment of the site. *Id*. However, healthcare, a hospital, and economic development would be greatly needed in this community, especially with the progression of the Candlestick-Hunters Point Shipyard Development Plan. Since UCSF does not have future plans for this site, it should consider the feasibility of locating a portion of the proposed Project at this location.

The FEIR rejects many of the off-site alternatives because they are off-site. This makes a mockery of CEQA's requirement for consideration of off-site alternatives. The courts have held that if environmentally superior alternative sites are available for a project, it would be inconsistent with CEQA's purposes to ignore off-site alternatives simply because on-site alternatives have been considered. In *Citizens of Goleta Valley v Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1179 (*Goleta I*), the court held that the EIR for a proposed resort hotel should have considered alternative locations for the project. Observing that the public need for the hotel should be served at minimal environmental expense, the court concluded that "[r]eason requires that the agency charged with the duty to protect the environment compare impacts at feasible alternative locations." 197 Cal.App.3d at 1180. If off-site alternatives can be rejected simply because they are off-site, then the CEQA requirement for analysis of off-site alternatives becomes meaningless. A revised draft EIR is required to analyze and consider the above alternatives and to select the environmentally superior alternative unless it is truly infeasible.

F. The FEIR Fails to Adequately Respond to Expert Comments.

Commenters submitted extensive expert comments on the DEIR. The FEIR largely ignores these comments, or simply provides inadequate, perfunctory, of false and inaccurate responses to these expert comments. As such, the FEIR fails to comply with CEQA, which requires that the FEIR must include a "detailed" written response to all "significant environmental issues" raised by commenters. *City of Long Beach v. LA USD* (2009) 176 Cal.App.4th 889, 904.

1. FEIR Fails to Adequately Respond to Biological Resources Comments of Dr. Shawn Smallwood, Ph.D.

Wildlife biologist, Dr. Shawn Smallwood, Ph.D, submitted extensive comment on the DEIR, concluding that the Project site contains 47 species of special status species, and concluding that the Project would adversely affect these species by posing risks of window collisions, and destroying habitat. Dr. Smallwood has provided supplemental comments explaining that the FEIR ignores or mischaracterizes or fails to adequately respond to most of his comments.

In particular, the FEIR only analyzes six of the 47 species identified by Dr. Smallwood. Thus, for the remaining 41 species there is no response at all. Dr. Smallwood proposed a very feasible mitigation measure that UCSF should implement San Francisco's bird-safe window treatments. UCSF refuses, arguing that it is not legally required to comply with San Francisco's requirements. This misses the point. The measures are clearly "feasible" since they are required throughout San Francisco. CEQA requires the agency to implement all feasible mitigation measures, regardless of whether those measures are legally required. See, *Covington v. Great Basin Unified Air Pollution Control Dist*., 43 Cal. App. 5th 867 (2019). UCSF seems to misunderstand the most basic requirements of CEQA.

Dr. Smallwood's attached comment letter discusses in detail the inadequacy of the FEIR's response to his comments on the DEIR. (Exhibit C). Dr. Smallwood's comments are incorporated herein in their entirety.

2. FEIR Fails to Adequately Respond to Comments of Urban Planner Terrell Watt.

Certified Urban Planner Terrell Watt submits comments concluding that the FEIR fails to adequately respond to her comments on the DEIR. Most obviously, the FEIR contends that the Project will have no significant aesthetic impacts despite detailed visual and shadow analysis provided by Watt showing that the Project will block views or Mount Sutro from many public places, will cast shadows deep into Golden Gate Park and other public spaces, and will tower over the neighboring residential community of one and two story homes. In short, it simply does not pass the "straight-face-test" for the FEIR to contend that placing a 300-foot-tall skyscraper in the middle of a two-story residential neighborhood has absolutely no aesthetic impacts. In legal parlance, the FEIR provides no substantial evidence to rebut the expert evidence presented on the Project's significant aesthetic impacts.

Watt pointed out in her DEIR comments that the Project exceeds otherwise applicable height limits imposed by the General Plan and Zoning code, violates shadow CEQA significance thresholds, and violates CEQA guidance concerning public views. The FEIR primarily argues that the Project will not have significant aesthetic impacts because UCSF is constitutionally not required to comply with the local zoning and general plan. This argument misses the point entirely. The exceedance of these objective standards indicates a significant impact under CEQA, regardless or whether UC is legally required to comply with those standards. CEQA significance thresholds are indications of significant impacts, not binding legal requirements. For example, exceedance Air District air quality thresholds indicate a significant impacts, despite the fact that it is perfectly legal to emit levels of pollution in excess of those thresholds. The exceedance means that the impact must be disclosed and analyzed as a significant impact in a CEQA document – even if the project ultimately emits pollution in excess of

those thresholds. (See, *Schenck v. County of Sonoma* (2011) 198 Cal.App.4th 949, 960 (County applies BAAQMD's "published CEQA quantitative criteria" and "threshold level of cumulative significance"); *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 110-111 ("A 'threshold of significance' for a given environmental effect is simply that level at which the lead agency finds the effects of the project to be significant"); *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 327 ("As the [South Coast Air Quality Management] District's established significance threshold for NOx is 55 pounds per day, these estimates [of NOx emissions of 201 to 456 pounds per day] constitute substantial evidence supporting a fair argument for a significant adverse impact"). The General Plan and Zoning codes provide object standards, the exceedance of which indicates a significant impact that must be disclosed, analyzed and mitigated in an RDEIR – regardless of whether UC is legally required to comply with those objective standards.

Furthermore, the FEIR misses the point that aesthetic impacts may be significant even if there are no objective standards and no binding legal requirements. "We further conclude it is inherent in the meaning of the word 'aesthetic [sic] 'that any substantial, negative effect of a project on view and other features of beauty could constitute a 'significant' environmental impact under CEQA." *Quail Botanical Gardens v. Encinitas*, 35 Cal. Rptr.2d 470, 475 (1994). In Quail, a residential project was found to have significant aesthetic impacts because it was visible from a public botanical garden. In *Ocean View Estates Homeowners Assn., Inc. v. Montecito Water Dist.,* 116 Cal. App. 4th 396, (2004) a proposed cover for a water reservoir had significant visual impacts because it was visible from a public hiking trail. Neither of these cases involved any objective standards or legally binding requirements. Thus, the FEIR's argument that the Project has no significant aesthetic impacts because the City's land use and zoning requirements are not binding on UC has no merit. By refusing to analyze aesthetic impacts based on this species and legally erroneous argument UCSF has failed to proceed in a manner required by law.

3. FEIR Fails to Adequately Respond to Comments of Soil Water Air Protection Enterprise.

Dr. Paul Rosenfeld, Ph.D., and hydrogeologist Matthew Hagemann, C.Hg., of environmental consulting firm Soil, Water, Air Protection Enterprise (SWAPE), submitted extensive comments on the DEIR. As explained below and in SWAPE's forthcoming written comments, the FEIR fails to adequately respond to SWAPE's comments on the DEIR.

- Unsubstantiated Utility Company and Intensity Factors: As discussed in SWAPE's September 10, 2020 comment letter, the DEIR's CalEEMod model included incorrect operational land use types and sizes. Review of the FEIR demonstrates that the Project still fails to justify or correct these modeling errors.

As such, SWAPE reiterates the September 10th comment that the Project's air quality analysis should not be relied upon.

- Failure to Include All Proposed Land Uses: As discussed in SWAPE's September 10th comment letter, the DEIR failed to evaluate emissions associated with the proposed temporary construction office. Review of the FEIR demonstrates that the Project still fails to justify or correct this error. As such, SWAPE reiterates the September 10th comment that the Project's air quality analysis should not be relied upon.

- Incorrect Operational Land Use Types & Sizes: As discussed in SWAPE's September 10th comment letter, the DEIR's CalEEMod model included incorrect operational land use types and sizes. Review of the FEIR demonstrates that the Project still fails to justify or correct these modeling errors. As such, SWAPE reiterates the September 10th comment that the Project's air quality analysis should not be relied upon.

- Unsubstantiated Changes to Construction Phase Lengths: As discussed in SWAPE's September 10th comment letter, the DEIR's CalEEMod model included unsubstantiated changes to the Project's individual construction phase lengths. Review of the FEIR demonstrates that the Project still fails to justify or correct this modeling error. As such, SWAPE reiterates the September 10th comment that the Project's air quality analysis should not be relied upon.

- Unsubstantiated Changes to Consumer Product Emission Factors: As discussed in SWAPE's September 10th comment letter, the DEIR's CalEEMod model included unsubstantiated changes to the consumer product emission factors. Review of the FEIR demonstrates that the Project still fails to justify or correct this modeling error. As such, SWAPE reiterates the September 10th comment that the Project's air quality analysis should not be relied upon.

- Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated: As discussed in SWAPE's September 10th comment letter, the DEIR conducted multiple HRAs for each component of the Project and evaluated them based on the BAAQMD threshold of 10 in one million ***separately***. Furthermore, the DEIR's operational HRA only evaluated TAC emissions associated with emergency generators required for RAB operation. The FEIR fails to justify this incorrect analysis, and as a result, SWAPE reiterates the September 10th comment that the DEIR failed to adequately evaluate the Project's DPM emissions.

- Incorrect and Unsubstantiated Analysis of Emissions: As discussed in SWAPE's September 10th comment letter, the DEIR's quantitative GHG analysis relies upon an incorrect and unsubstantiated air model. As discussed above, SWAPE reiterates the September 10th comments regarding the unsubstantiated input

parameters used to model the Project's GHG emissions. As such, we will reiterate our September 10th comment regarding the Project's underestimated GHG emissions estimates.

- Incorrect Reliance upon CARB's 2017 Scoping Plan: As discussed in SWAPE's September 10th comment letter, the DEIR failed to demonstrate that the Project would be consistent with CARB's 2017 Scoping Plan. SWAPE reiterates this comment, as well as evaluate the Project's consistency with CARB's 2017 Scoping Plan based on the performance-based standards under CARB's 2017 Scoping Plan.

- Failure to Implement All Feasible Mitigation Measures: SWAPE proposes numerous feasible mitigation measures to reduce the Project's air pollution impacts. The FEIR fails to require implementation of these feasible measures, and fails to provide substantial evidence that the measures are infeasible. Therefore, the EIR fails to meet the requirements of CEQA, and the Regents are legally precluded from adopting a statement of overriding considerations. A statement of overriding considerations may only be adopted after the agency imposes all feasible mitigation measures. Since the Regents have failed to impose all feasible mitigation meausres, they may not adopt a statement of overriding considerations, may not certify the EIR, and may not approve the Project. *Covington v. Great Basin Unified Air Pollution Control Dist*., 43 Cal. App. 5th 867, 256 Cal. Rptr. 3d 902 (2019).

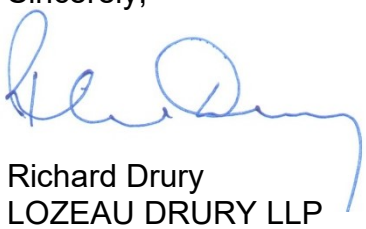
V. UCSF SHOULD PREPARE AND RECIRCULATE A REVISED DEIR

A RDEIR should be prepared and circulated for full public review to address the impacts identified above and to propose feasible mitigation measures. CEQA requires re-circulation of an EIR when significant new information is added to the EIR following public review but before certification. (Pub. Res. Code § 21092.1.) The CEQA Guidelines clarify that new information is significant if "the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project" including, for example, "a disclosure showing that . . . [a] new significant environmental impact would result from the project." (14 CCR § 15088.5.) The above significant environmental impacts have not been analyzed in the EIR and must be addressed in an RDEIR that is re-circulated for public review.

VI. CONCLUSION

For the foregoing reasons, PNC believes that the FEIR for the UCSF Comprehensive Parnassus Heights Plan is wholly inadequate and urges the Regents to require a Revised Draft EIR to be prepared to address the concerns raised herein. Thank you for considering our comments and please include this letter in the record of proceedings for this project.

Sincerely,



Richard Drury
LOZEAU DRURY LLP

EXHIBIT A

Massive Expansion at UCSF: Don't break the promise at Parnassus

Published by Parnassus Neighborhood Coalition on 2nd Jan 2021

Don't let UCSF break its promise and rush through a MASSIVE EXPANSION of its UCSF Parnassus campus as soon as January 21!

They want a 300-foot tower, 8,000 new employees and 2 million additional square feet of new space -- SalesForce Tower and Transamerica Pyramid combined!

Studies show it will overload transit, skyrocket housing costs, reduce open space, shadow our parks and neighborhoods, and increase the risk of cancer.

The plan breaks their own promise -- since 1976 -- establishing a permanent space cap of 3.55 million square feet at the Parnassus campus.

Despite the pandemic which has limited community input, UCSF is attempting to rush approval of its plans without all San Franciscans being heard.

We, the undersigned, call on the UC Board of Regents to delay approval of their expansion plan to allow meaningful community input, negotiate a fair Memorandum of Understanding with San Francisco to ensure adequate community benefits, and adhere to the 3.55 million permanent space cap as promised to the neighborhood for over 44 years.

EXHIBIT B

3. SCREENING CRITERIA

The screening criteria identified in this section are **not thresholds of significance**. The Air District developed screening criteria to provide lead agencies and project applicants with a conservative indication of whether the proposed project could result in potentially significant air quality impacts. If all of the screening criteria are met by a proposed project, then the lead agency or applicant would not need to perform a detailed air quality assessment of their project's air pollutant emissions. These screening levels are generally representative of new development on greenfield sites without any form of mitigation measures taken into consideration. In addition, the screening criteria in this section do not account for project design features, attributes, or local development requirements that could also result in lower emissions. For projects that are mixed-use, infill, and/or proximate to transit service and local services, emissions would be less than the greenfield type project that these screening criteria are based on.

If a project includes emissions from stationary source engines (e.g., back-up generators) and industrial sources subject to Air District Rules and Regulations, the screening criteria should not be used. The project's stationary source emissions should be analyzed separately from the land use-related indirect mobile- and area-source emissions. Stationary-source emissions are not included in the screening estimates given below and, for criteria pollutants, must be added to the indirect mobile- and area-source emissions generated by the land use development and compared to the appropriate Thresholds of Significance. Greenhouse gas emissions from permitted stationary sources should not be combined with operational emissions, but compared to a separate stationary source greenhouse gas threshold.

3.1. OPERATIONAL-RELATED IMPACTS

3.1.1. Criteria Air Pollutants and Precursors

The screening criteria developed for criteria pollutants and precursors were derived using the default assumptions used by the Urban Land Use Emissions Model (URBEMIS). If the project has sources of emissions not evaluated in the URBEMIS program the screening criteria should not be used. If the project meets the screening criteria in Table 3-1, the project would not result in the generation of operational-related criteria air pollutants and/or precursors that exceed the *Thresholds of Significance* shown in Table 2-2. Operation of the proposed project would therefore result in a less-than-significant cumulative impact to air quality from criteria air pollutant and precursor emissions.

3.1.2. Greenhouse Gases

The screening criteria developed for greenhouse gases were derived using the default emission assumptions in URBEMIS and using off-model GHG estimates for indirect emissions from electrical generation, solid waste and water conveyance. If the project has other significant sources of GHG emissions not accounted for in the methodology described above, then the screening criteria should not be used. Projects below the applicable screening criteria shown in Table 3-1 would not exceed the 1,100 MT of CO_2e/yr GHG threshold of significance for projects other than permitted stationary sources.

If a project, including stationary sources, is located in a community with an adopted qualified GHG Reduction Strategy, the project may be considered less than significant if it is consistent with the GHG Reduction Strategy. A project must demonstrate its consistency by identifying and implementing all applicable feasible measures and policies from the GHG Reduction Strategy into the project.

Table 3-1
Operational-Related Criteria Air Pollutant and Precursor Screening Level Sizes

Notes: du = dwelling units; ksf = thousand square feet; NO_X = oxides of nitrogen; ROG = reactive organic gases. Screening levels include indirect and area source emissions. Emissions from engines (e.g., back-up generators) and industrial sources subject to Air District Rules and Regulations embedded in the land uses are not included in the screening estimates and must be added to the above land uses.
Refer to Appendix D for support documentation.
Source: Modeled by EDAW 2009.

3.2. COMMUNITY RISK AND HAZARD IMPACTS

Please refer to Chapter 5 for discussion of screening criteria for local community risk and hazard impacts.

3.3. CARBON MONOXIDE IMPACTS

This preliminary screening methodology provides the Lead Agency with a conservative indication of whether the implementation of the proposed project would result in CO emissions that exceed the *Thresholds of Significance* shown in Table 2-3.

The proposed project would result in a less-than-significant impact to localized CO concentrations if the following screening criteria is met:

1. Project is consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, regional transportation plan, and local congestion management agency plans.

2. The project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour.
3. The project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway).

3.4. ODOR IMPACTS

Table 3-3 presents odor screening distances recommended by BAAQMD for a variety of land uses. Projects that would site a new odor source or a new receptor farther than the applicable screening distance shown in Table 3-3 from an existing receptor or odor source, respectively, would not likely result in a significant odor impact. The odor screening distances in Table 3-3 should not be used as absolute screening criteria, rather as information to consider along with the odor parameters and complaint history. Refer to *Chapter 7 Assessing and Mitigating Odor Impacts* for comprehensive guidance on significance determination.

Table 3-3
Odor Screening Distances

Land Use/Type of Operation	Project Screening Distance
Wastewater Treatment Plant	2 miles
Wastewater Pumping Facilities	1 mile
Sanitary Landfill	2 miles
Transfer Station	1 mile
Composting Facility	1 mile
Petroleum Refinery	2 miles
Asphalt Batch Plant	2 miles
Chemical Manufacturing	2 miles
Fiberglass Manufacturing	1 mile
Painting/Coating Operations	1 mile
Rendering Plant	2 miles
Coffee Roaster	1 mile
Food Processing Facility	1 mile
Confined Animal Facility/Feed Lot/Dairy	1 mile
Green Waste and Recycling Operations	1 mile
Metal Smelting Plants	2 miles
Refer to Appendix D for support documentation.	

Facilities that are regulated by CalRecycle (e.g. landfill, composting, etc.) are required to have Odor Impact Minimization Plans (OIMP) in place and have procedures that establish fence line odor detection thresholds. The Air District recognizes a Lead Agency's discretion under CEQA to use established odor detection thresholds as thresholds of significance for CEQA review for CalRecycle regulated facilities with an adopted OIMP.

3.5. CONSTRUCTION-RELATED IMPACTS

3.5.1. Criteria Air Pollutants and Precursors

This preliminary screening provides the Lead Agency with a conservative indication of whether the proposed project would result in the generation of construction-related criteria air pollutants and/or precursors that exceed the *Thresholds of Significance* shown in Table 2-4.

If all of the following *Screening Criteria* are met, the construction of the proposed project would result in a less-than-significant impact from criteria air pollutant and precursor emissions.

1. The project is below the applicable screening level size shown in Table 3-1; and
2. All *Basic Construction Mitigation Measures* would be included in the project design and implemented during construction; and
3. Construction-related activities would not include any of the following:
    a. Demolition;
    b. Simultaneous occurrence of more than two construction phases (e.g., paving and building construction would occur simultaneously);
    c. Simultaneous construction of more than one land use type (e.g., project would develop residential and commercial uses on the same site) (not applicable to high density infill development);
    d. Extensive site preparation (i.e., greater than default assumptions used by the Urban Land Use Emissions Model [URBEMIS] for grading, cut/fill, or earth movement); or
    e. Extensive material transport (e.g., greater than 10,000 cubic yards of soil import/export) requiring a considerable amount of haul truck activity.

3.5.2. Community Risk and Hazards

Chapter 5, *Assessing and Mitigating Local Community Risk and Hazard Impacts*, contains information on screening criteria for local risk and hazards.

RE: Comprehensive Parnassus Heights Plan

Dear Ms. Wong,

I write to reply to responses to my comments on UCSF's (2020) Draft Environmental Impact Report ("DEIR") prepared for the Parnassus Heights Plan. My qualifications for doing so as an expert were summarized in my original comment letter of 1 September 2020, along with my CV.

My replies follow the numbered the responses in the FEIR.

O-LD2-84. The response refers me to response O-LD2-31.

Response O-LD2-31 says I detected 23 bird species, but I detected 22 bird species. The response neglects to address my interpretation of the species detection rate. A logistic model fit to my rate of detections predicts many more species occur on the site than the number of species I detected.

Response O-LD2-31 also mischaracterizes my comments, "The commenter states that the Draft EIR includes only 6 birds; that is incorrect as the Draft EIR mentions 20 species of birds." I commented that of the 40 special-status species of birds I addressed, the EIR addresses only 6 of them. In my Table 2, I did not bother to list bird species that I knew would not occur at the site, but which the DEIR briefly addressed. Unlike the DEIR, my Table 2 did not include burrowing owl, western snowy plover, yellow rail, California black rail, Alameda song sparrow, San Pablo song sparrow, Ridgeway's rail, California least tern, yellow-headed blackbird, nor northern spotted owl. Most of the species of birds mentioned in the DEIR are irrelevant to the project's potential impacts. The species I listed in my Table 2 are relevant.

Response O-LD2-31 implies that birds documented in the Mount Sutro Open Space Reserve stay within the Reserve. It says, "The commenter states that the Draft EIR neglects to include birds known to occur in the Reserve. The Draft EIR project area includes bordering areas of the Reserve, but does not include the entire Reserve; birds such as northern harrier (*Circus hudsonicus*) which have been observed in the Reserve, are unlikely in the areas of the campus site where CPHP development is proposed." However, none of the birds documented in the Reserve are flightless; all are volant. Birds documented in the Reserve must have flown to the Reserve, and they must also fly out of the Reserve to migrate, disperse, and patrol home ranges. As I commented in my

letter of 1 September 2020 (pages 7 and 17), birds and bats using the Reserve fly to and from the Reserve.

According to response O-LD2-31, "Special-status birds were identified as such in the Draft EIR if they were federal or State listed species, or state species of special concern in California." However, §15380 of the CEQA Guidelines defines special-status species as Endangered, Rare, or Threatened. The CEQA definition is consistent with how I identified them in Table 2 of my comment letter. I relied on the status assigned each species in California's Special Animal List (California Department of Fish and Wildlife, Natural Diversity Database. November 2019. Special Animals List. Periodic publication.) – a list that is often relied upon for CEQA reviews. It would be helpful for the EIR to apply the definition of special-status species in CEQA Guidelines §15380.

The last portion of the Response O-LD2-31 seems disingenuous, arguing that because all native migratory bird species are protected under the Migratory Bird Treaty Act, all bird species identified by me and others "...are included in the environmental baseline and will be protected from impacts to active nests, consistent with State and federal regulations, as provided under CPHP Mitigation Measure BIO-1c in the Draft EIR." The response is disingenuous because it implies that a take-avoidance salvage survey somehow also serves as the analysis of project impacts to these birds. My comment addressed the inadequacy of the EIR's analysis of impacts, whereas the response claims that a mitigation measure of low effect also doubles as the analysis of impacts. It cannot.

O-LD2-85. The response reaffirms my characterization of the net effect of redesignating an already-forested area as mitigation for taking 0.15 acres from the Mount Sutro Open Space Reserve. As I commented, "From the perspective of wildlife, the swap in land designations results in a 0.15-acre habitat loss." Wildlife residing on the land to be redesignated will experience no change in their existence, where wildlife residing on the 0.15 acres to be taken from the Reserve will be destroyed. Hence, there would be a net loss of 0.15 acres of habitat on what is already a desperately isolated patch of habitat in the City of San Francisco.

O-LD2-86. The response refers me to Master Response 10.

Referring to comments on bird-window collision mortality, Master Response 10 defends the EIR's deficient impact analysis by claiming such an analysis would be premature: "Because the specific materials, size and massing of the buildings that would be built under the CPHP are not known at this time, it is not possible to quantify this impact." However, a range of possible impacts can be predicted quantitatively based on a range of assumptions for how much glass would extend across the façades of buildings. I made one prediction based on one assumption on the use of glass. Other predictions can be made from other assumptions. The decision-makers and the public should be informed of the range of possible impacts that would be caused by bird-window collisions.

Master Response 10 defends its level of analysis as adequate because it consists of the mere mention of the Pacific Flyway and the mere mention of potential bird-window collision mortality. Simply mentioning types of impacts is not an analysis. As I

demonstrated in my comments, one can analyze the potential impact quantitatively. Even a qualitative analysis would be more helpful than mere mentions of the existence of the Pacific Flyway and of the bird-window collision issue.

Master Response 10 defers mitigation of bird-window collision impacts to project-level EIRs, arguing that this programmatic EIR cannot do so because building details remain unknown. However, the EIR can and should adopt the City of San Francisco's (2011) bird-safe guidelines as well as the specific mitigation measures that I recommend to programmatically mitigate building impacts going forward. Based on my experience, the risk of not adopting sufficient bird-safe guidelines at this stage would be that each project-specific EIR would refer back to the programmatic EIR in support of its claim that the bird-window collision issue had already been analyzed and mitigated.

Master Response 10 deflects from the issues I raised about the large numbers of birds that annually migrate through the project area and the need for study of bird flight patterns in the area to strategically design the project to minimize impacts. It also deflects from my comment that the situational context of a building can contribute more to collision mortality than can the building's height (I provided an infamous example in the Morgan Mail Building of New York). According to Master Response 10, "It is acknowledged that taller buildings are more likely to cause collisions with migrating birds and bats, however, this potential impact is highly localized within the context of the Pacific Flyway, which encompasses the whole western United States." Acknowledging that taller buildings are more likely to cause collisions implies that I asserted such a relationship. But again, I pointed out the increased risk from the project's location next to Mount Sutro Open Space Reserve. Even a low-rise building could be more hazardous depending on the types and extent of glass used in the building's façades, how far from the Reserve it is located and how it is oriented relative to bird traffic. Rather than throwing up its hands at the vastness of the Pacific Flyway, the University ought to perform surveys to learn how birds use the local airspace of the project.

Master Response 10 further deflects from the issues I raised by claiming, "...UCSF will consider potential impacts to migratory birds in siting proposed buildings as part of CPHP Mitigation Measure BIO-2b." It adds, "The recommendation for more detailed flight pattern studies is noted, however, CPHP Mitigation Measures BIO-2a and -2b will reduce the potential bird strikes to occur under the CPHP to a less than significant level by siting buildings to limit collision and by designing buildings to limit light and reflectivity, thus minimizing bird strikes." In fact, mitigation measures BIO-2a and -2b do not involve strategic siting of buildings to minimize impacts to birds. These measures address the locations of construction areas, the lighting of construction areas, installations of exterior lights in the project, and the use of building materials to minimize reflectance and glare. The closest these measures get toward my recommendation is to orient buildings to minimize light and glare. However, it is unclear how this last measure has anything to do with minimizing bird-window collision mortality or energetic impacts to birds that would have to negotiate their ways through or around the project.

Rather than making unfounded claims that certain mitigation measures will effectively minimize impacts, the University ought to perform the simple surveys that could inform decision-making. Learn how birds use their aerohabitat of the project area. This is the approach I used to help reduce bird mortality among wind turbines in the Altamont Pass Wind Resource Area ("APWRA"). The original wind turbines installed in the early 1980s were sited to maximize wind energy generation but without any thought to their potential impacts to birds. Following surveys to quantify relative abundance of birds across the APWRA, I developed map-based models to guide turbine siting when the old turbines were repowered with modern turbines (Smallwood et al. 2017). A before-after, control-impact experiment measured a 75% to 82% reduction of golden eagle collision mortality and a 65% reduction of bird collision mortality at the first repowered project for which the model was applied for turbine siting (Brown et al. 2016). Repowering since that time benefitted from improved models based on flight behavior surveys and GPS telemetry of golden eagles. Similar surveys can and should be initiated in the project area to characterize which species are flying through during which seasons and times of day, their heights above ground, and how they react to existing buildings. The University would be much better informed about collision risks after only the first year of surveys.

O-LD2-87. The response refers me to response O-LD2-31.

Response O-LD2-31 dodges my comments about how the EIR pigeon-holes species into unrealistically narrow portions of the environment. Worse, it claims that wildlife living in Mount Sutro Open Space Reserve are constrained to the Reserve. None of the birds are so-constrained, and neither are the bats. Otherwise, see my earlier replies to Response O-LD2-31.

O-LD2-88. The response refers me to Master Response 10. However, Master Response 10 does not address the list of species I presented in Table 2 of my 1 September 2020 comments. This list of species was of special-status species and other species known to have been killed by windows. With the release of a new study since my comments of 1 September 2020 (Basilio et al. 2020: Supplemental Material), we know of 9 more special-status species that have been documented as window collision fatalities and are therefore susceptible to new structural glass installations (Table 1, which is a revised version of Table 2 in my comments of 1 September 2020).

In revising the Table, I checked eBird records for any updates. In the process, I identified another 7 special-status species of birds recently documented in the project area. My total increased from the 40 that I reported in my comment letter to 47 herein (Table 1). Of these 47 special-status species, 25 (53%) have now been documented as collision fatalities, which is a substantial increase over the 40% documented as of 1 September 2020. Additional research of this issue will undoubtedly expand the documentation of species represented by collision mortality caused by window traps that new projects add to avian aerohabitat. The EIR needs to seriously address this issue.

Table 1. eBird (https://eBird.org) reports of special-status species near the project site and species reported as window-collision victims at the nearby California Academy of Sciences (CAS) buildings (Kahle et al. 2016).

Species	Scientific name	Status[1]	Occurrences			Number counted at CAS study		Known window deaths

O-LD2-89. The response refers me to Master Response 10. See my replies to O-LD2-86. Otherwise, Master Response 10 does not dispute my prediction of annual collision mortality. At the same time, it claims that the lack of foreknowledge of building design details prevents quantitative predictions of collision mortality. However, as I pointed out earlier, one need not know the design details of future buildings to predict bird-window collision mortality so long as one assumes that trends in building design would apply to this project. If the University was to build windowless buildings, then my assumptions would be erroneous and my predicted mortality inaccurate. If the University builds according to current trends, then my predictions would prove more accurate. The studies I relied upon to predict annual bird-window collision mortality reflected the types of buildings constructed recently, including a disproportionately larger representation of university buildings in the studies. The latter trend resulted from the popularity of bird-window collision studies by graduate students on university campuses across the USA over the last 15 years or so. The foundation of my prediction is robust, and is representative of the types of buildings universities prefer to build. That the response does not dispute the accuracy of my assumptions nor of my mortality prediction suggests that the project's building designs are anticipated to be consistent with my assumptions. The EIR should be revised to include a more appropriate analysis of bird-window collision mortality.

O-LD2-90. The response refers me to Master Response 10. However, Master Response 10 does not address my comment about the EIR's application of a false CEQA standard related to the project's potential impacts to wildlife movement in the region. A wildlife movement corridor need not be identified and shown to be disrupted for a project to have significant impacts to wildlife movement in the region. Inserting tall structures into the aerohabitat of birds on either side of Mount Sutro Open Space Reserve is likely to disrupt the movement patterns of volant wildlife regardless of whether they are flying along an imagined or real corridor.

Nor does Master Response 10 address my comments on the project's impacts to wildlife movement in terms of energetic costs and potential increased risk of predation. Imposing tall structures into the airspace used by volant wildlife forces changes to flight patterns and exposes many species to the hazards of predation by animals known to exploit such settings. The EIR needs to be revised to address these issues.

O-LD2-91. The response refers me to response O-LD2-34.

Regarding the issue of bird-window collisions, which I raised in my comment letter of 1 September 2020, the response O-LD2-34 claims, "...no federal or State law protects birds from strike impacts." Wildlife protection laws generally do not specify modes of take; they specify that take is not allowed without an incidental take permit or an exemption granted by the designated enforcement authority. I have participated with prosecutions of those who killed birds by striking them with their wind turbine blades, and I have participated with lawsuits directed at those who contaminated birds with plutonium and oil. In my experience, wildlife protection laws are enforced in situations where violations are of large magnitude and could have been largely prevented through appropriate analysis and mitigation. In my experience, the question of whether due

diligence was applied has factored into prosecutions and lawsuits over impacts to wildlife.

In this case, CEQA's purpose and its primary objectives can lay the foundation of due diligence that an enforcement authority can use to determine whether to prosecute violations of wildlife protection laws. CEQA's purpose is to maximize environmental protection by requiring that project impacts be avoided or mitigated to the greatest extent reasonably possible. A primary objective is for the lead agency to publicly disclose potential environmental impacts of a proposed project so that decision-makers and the public can make more informed decisions over whether and how to proceed with a proposed project. Another objective is to consider public comment for the purpose of identifying issues and feasible alternative mitigation measures. With my comments, I have identified issues, predicted the magnitude of a potentially significant impact, and identified feasible alternative mitigation measures. A foundation has been laid for later determination of whether the project egregiously vi0lated wildlife protection laws.

Response O-LD2-34 adds, "UCSF is not subject to local land use regulation whenever using land under its control in furtherance of its educational mission." Again, I refer to CEQA's purpose to maximize environmental protection by requiring that project impacts be avoided or mitigated to the greatest extent reasonably possible. The City of San Francisco's (2011) bird-safe guidance was designed, essentially, to achieve CEQA's purpose. The guidelines are not unreasonable, and their full implementation would protect birds to the maximum extent based on what was known about the bird-window collision issue at the time. According to CEQA Public Resources Code § 21002, "...public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects."

Response O-LD2-34 claims that its mitigation measures would protect birds from window collisions to the maximum extent feasible. It further characterizes its mitigation measures as magnanimous of the University because the University is not obliged to abide by local land-use regulations. However, the proposed mitigation cannot possibly avoid impacts to birds to the maximum extent feasible, because the University's mitigation is much lesser than that of City of San Francisco's (2011) bird-safe guidance, which was itself essentially formulated to avoid impacts to the maximum extent feasible. The response is akin to a runner claiming to have won the marathon after finishing the first mile of the race. The EIR needs to be revised to implement all of City of San Francisco's (2011) bird-safe guidance as a starting point, and then it should add the measures I recommend.

Response O-LD2-34 concludes "While buildout of the CPHP would increase the likelihood of bird strikes from the larger structures, in the context of the Pacific Flyway, used by an estimated billion birds per year, these impacts are minor, and not cumulatively considerable." It is just this type of reasoning that has contributed to the 29% loss of birds over the last 48 years in North America (Rosenberg et al. 2019). Comparison of collision fatalities caused by the project to the numbers of birds using the

Pacific Flyway skips over the impacts to demographic units that matter, such as to the family unit, deme, and population (Smallwood 2001). To be consistent and appropriate, the scope of the cumulative effects analysis needs to match the scope of the cumulative impacts. If the Pacific Flyway is to be scope of the analysis as the response establishes, then the estimate of bird-window collision mortality across the entire Pacific Flyway must be compared to the number of birds using the Pacific Flyway. Alternatively, and more appropriately, the scope would be City of San Francisco, so the comparison would be the cumulative number of birds killed by the City's windows to the numbers of birds moving through the City annually. The EIR's error is in comparing the scope of the project's window-caused mortality to the scope of the Pacific Flyway.

Response O-LD2-34 also concludes, "A study estimating fatality rates for birds for all San Francisco buildings recently built, planned, or foreseeable, is not required for this EIR." I did not suggest that such a study is required, but I did assert that it would appropriately inform decision-makers and the public of potential cumulative impacts to birds caused by window collisions. Bird-window collisions is one of the principal impacts to biological resources from the proposed project, so it is reasonable to estimate cumulative fatalities of birds that collide with windows across San Francisco. Such a study would not be difficult, and could be performed through sampling to estimate the extent of windows in the City now and in the foreseeable future. The alternative adopted by the University to this point is to acknowledge that many birds collide with windows but otherwise to offer absolutely no estimate of the magnitude of the impact. This alternative falls far short of due diligence.

O-LD2-92. The response refers me to response O-LD2-35.

According to response O-LD2-35, "While the commenter is correct regarding the difficulty of identifying bird nests and bat roosts in dense vegetation, however, CPHP Mitigation Measures BIO-1c and BIO-1d require a qualified biologist to perform the survey, who is experienced in identification of active nests and roosts." My comment about the difficulty of locating bird nests and bat roosts applies to all biologists, including those experienced with such surveys. But in my experience, the biologists who are deployed by consulting firms to perform these frustratingly unproductive surveys are typically the newest biologists to the firm and those with the least experience with searching for bird nests or bat roosts. Mitigation Measures BIO-1c and -1d could be improved by explicitly detailing the minimum qualifications of biologists who would perform these surveys. If recently-degreed biologists are to be deployed, then they should be accompanied by senior biologists with demonstrated experience in searching for bird nests or bat roosts.

Response O-LD2-35 also states, "The preconstruction bat surveys identified in CPHP Mitigation Measure BIO-1d will detect signs of current or recent bat use, or potential for bat presence, and are based on survey methodologies that meet California Department of Fish and Wildlife guidance." It would help to identify the CDFW guidance.

The response did not address my comment about the need for detection surveys. Detection surveys are needed to inform readers of the EIR of potential impacts and appropriate mitigation. They are also needed to inform preconstruction surveys.

O-LD2-93. The response refers me to Master Response 10. However, Master Response 10 does not address my comments on mitigation efficacy associated with measures outlined in City of San Francisco's (2011) bird-safe guidance document nor with recent actions to reduce bird mortality at existing buildings. It ignores my comments on the mitigation efficacy and cost at New York's Javits Center. Since my comments of 1 September 2020, City of Portland Bureau of Environmental Services and Portland Audubon (2020) reduced bird collision fatalities 94% by affixing marked Solyx window film to existing glass panels of Portland's Columbia Building. This and other measures have been developed since City of San Francisco (2011), and ought to be included as candidate mitigation measures in the EIR. Otherwise, see my earlier replies to Master Response 10.

O-LD2-94. The response refers me to Master Response 10. Master Response 10, however, does not address my comments on macro- and micro-siting of project buildings to minimize impacts to wildlife. The current stage of planning is the stage when the most important decisions can be made to minimize project impacts to wildlife. Decisions over where buildings should be constructed, and of what size and orientation, and including what types and extents of glass are the most critical for minimizing impacts to wildlife. At minimum, the EIR needs to include a decision-making framework to guide where buildings would be constructed and their heights and management of glass. This framework should be responsive to flight behavior surveys of birds and bats within the project area. At least three years of flight behavior surveys would be preferable because three years would be more likely to capture inter-annual variation in relative abundance and flight patterns of bird and bat species.

Thank you for your attention,

Shawn Smallwood

Born May 3, 1963 in
Sacramento, California.
Married, father of two.

Ecologist

Expertise

- Finding solutions to controversial problems related to wildlife interactions with human industry, infrastructure, and activities;
- Wildlife monitoring and field study using GPS, thermal imaging, behavior surveys;
- Using systems analysis and experimental design principles to identify meaningful ecological patterns that inform management decisions.

Education

Ph.D. Ecology, University of California, Davis. September 1990.
M.S. Ecology, University of California, Davis. June 1987.
B.S. Anthropology, University of California, Davis. June 1985.
Corcoran High School, Corcoran, California. June 1981.

Experience

- 665 professional publications, including:
- 88 peer reviewed publications
- 24 in non-reviewed proceedings
- 551 reports, declarations, posters and book reviews
- 8 in mass media outlets
- 87 public presentations of research results

Editing for scientific journals: Guest Editor, *Wildlife Society Bulletin*, 2012-2013, of invited papers representing international views on the impacts of wind energy on wildlife and how to mitigate the impacts. Associate Editor, *Journal of Wildlife Management*, March 2004 to 30 June 2007. Editorial Board Member, *Environmental Management*, 10/1999 to 8/2004. Associate Editor, *Biological Conservation*, 9/1994 to 9/1995.

Member, Alameda County Scientific Review Committee (SRC), August 2006 to April 2011. The five-member committee investigated causes of bird and bat collisions in the Altamont Pass Wind Resource Area, and recommended mitigation and monitoring measures. The SRC reviewed the science underlying the Alameda County Avian Protection Program, and advised

the County on how to reduce wildlife fatalities.

Consulting Ecologist, 2004-2007, California Energy Commission (CEC). Provided consulting services as needed to the CEC on renewable energy impacts, monitoring and research, and produced several reports. Also collaborated with Lawrence-Livermore National Lab on research to understand and reduce wind turbine impacts on wildlife.

Consulting Ecologist, 1999-2013, U.S. Navy. Performed endangered species surveys, hazardous waste site monitoring, and habitat restoration for the endangered San Joaquin kangaroo rat, California tiger salamander, California red-legged frog, California clapper rail, western burrowing owl, salt marsh harvest mouse, and other species at Naval Air Station Lemoore; Naval Weapons Station, Seal Beach, Detachment Concord; Naval Security Group Activity, Skaggs Island; National Radio Transmitter Facility, Dixon; and, Naval Outlying Landing Field Imperial Beach.

Part-time Lecturer, 1998-2005, California State University, Sacramento. Instructed Mammalogy, Behavioral Ecology, and Ornithology Lab, Contemporary Environmental Issues, Natural Resources Conservation.

Senior Ecologist, 1999-2005, BioResource Consultants. Designed and implemented research and monitoring studies related to avian fatalities at wind turbines, avian electrocutions on electric distribution poles across California, and avian fatalities at transmission lines.

Chairman, Conservation Affairs Committee, The Wildlife Society--Western Section, 1999-2001. Prepared position statements and led efforts directed toward conservation issues, including travel to Washington, D.C. to lobby Congress for more wildlife conservation funding.

Systems Ecologist, 1995-2000, Institute for Sustainable Development. Headed ISD's program on integrated resources management. Developed indicators of ecological integrity for large areas, using remotely sensed data, local community involvement and GIS.

Associate, 1997-1998, Department of Agronomy and Range Science, University of California, Davis. Worked with Shu Geng and Mingua Zhang on several studies related to wildlife interactions with agriculture and patterns of fertilizer and pesticide residues in groundwater across a large landscape.

Lead Scientist, 1996-1999, National Endangered Species Network. Informed academic scientists and environmental activists about emerging issues regarding the Endangered Species Act and other environmental laws. Testified at public hearings on endangered species issues.

Ecologist, 1997-1998, Western Foundation of Vertebrate Zoology. Conducted field research to determine the impact of past mercury mining on the status of California red-legged frogs in Santa Clara County, California.

Senior Systems Ecologist, 1994-1995, EIP Associates, Sacramento, California. Provided consulting services in environmental planning, and quantitative assessment of land units for their conservation and restoration opportunities basedon ecological resource requirements of 29 special-status species. Developed ecological indicators for prioritizing areas within Yolo County

to receive mitigation funds for habitat easements and restoration.

Post-Graduate Researcher, 1990-1994, Department of Agronomy and Range Science*, U.C. Davis*. Under Dr. Shu Geng's mentorship, studied landscape and management effects on temporal and spatial patterns of abundance among pocket gophers and species of Falconiformes and Carnivora in the Sacramento Valley. Managed and analyzed a data base of energy use in California agriculture. Assisted with landscape (GIS) study of groundwater contamination across Tulare County, California.

Work experience in graduate school: Co-taught Conservation Biology with Dr. Christine Schonewald, 1991 & 1993, UC Davis Graduate Group in Ecology; Reader for Dr. Richard Coss's course on Psychobiology in 1990, UC Davis Department of Psychology; Research Assistant to Dr. Walter E. Howard, 1988-1990, UC Davis Department of Wildlife and Fisheries Biology, testing durable baits for pocket gopher management in forest clearcuts; Research Assistant to Dr. Terrell P. Salmon, 1987-1988, UC Wildlife Extension, Department of Wildlife and Fisheries Biology, developing empirical models of mammal and bird invasions in North America, and a rating system for priority research and control of exotic species based on economic, environmental and human health hazards in California. Student Assistant to Dr. E. Lee Fitzhugh, 1985-1987, UC Cooperative Extension, Department of Wildlife and Fisheries Biology, developing and implementing statewide mountain lion track count for long-term monitoring.

Fulbright Research Fellow, Indonesia, 1988. Tested use of new sampling methods for numerical monitoring of Sumatran tiger and six other species of endemic felids, and evaluated methods used by other researchers.

Projects

Repowering wind energy projects through careful siting of new wind turbines using map-based collision hazard models to minimize impacts to volant wildlife. Funded by wind companies (principally NextEra Renewable Energy, Inc.), California Energy Commission and East Bay Regional Park District, I have collaborated with a GIS analyst and managed a crew of five field biologists performing golden eagle behavior surveys and nocturnal surveys on bats and owls. The goal is to quantify flight patterns for development of predictive models to more carefully site new wind turbines in repowering projects. Focused behavior surveys began May 2012 and continue. Collision hazard models have been prepared for seven wind projects, three of which were built. Planning for additional repowering projects is underway.

Test avian safety of new mixer-ejector wind turbine (MEWT). Designed and implemented a before-after, control-impact experimental design to test the avian safety of a new, shrouded wind turbine developed by Ogin Inc. (formerly known as FloDesign Wind Turbine Corporation). Supported by a $718,000 grant from the California Energy Commission's Public Interest Energy Research program and a 20% match share contribution from Ogin, I managed a crew of seven field biologists who performed periodic fatality searches and behavior surveys, carcass detection trials, nocturnal behavior surveys using a thermal camera, and spatial analyses with the collaboration of a GIS analyst. Field work began 1 April 2012 and ended 30 March 2015 without Ogin installing its MEWTs, but we still achieved multiple important scientific advances.

Reduce avian mortality due to wind turbines at Altamont Pass. Studied wildlife impacts caused by 5,400 wind turbines at the world's most notorious wind resource area. Studied how impacts are perceived by monitoring and how they are affected by terrain, wind patterns, food resources, range management practices, wind turbine operations, seasonal patterns, population cycles, infrastructure management such as electric distribution, animal behavior and social interactions.

Reduce avian mortality on electric distribution poles. Directed research toward reducing bird electrocutions on electric distribution poles, 2000-2007. Oversaw 5 founds of fatality searches at 10,000 poles from Orange County to Glenn County, California, and produced two large reports.

Cook *et al*. v. Rockwell International *et al*., No. 90-K-181 (D. Colorado). Provided expert testimony on the role of burrowing animals in affecting the fate of buried and surface-deposited radioactive and hazardous chemical wastes at the Rocky Flats Plant, Colorado. Provided expert reports based on four site visits and an extensive document review of burrowing animals. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals. I testified in federal court in November 2005, and my clients were subsequently awarded a $553,000,000 judgment by a jury. After appeals the award was increased to two billion dollars.

Hanford Nuclear Reservation Litigation. Provided expert testimony on the role of burrowing animals in affecting the fate of buried radioactive wastes at the Hanford Nuclear Reservation, Washington. Provided three expert reports based on three site visits and extensive document review. Predicted and verified a certain population density of pocket gophers on buried waste structures, as well as incidence of radionuclide contamination in body tissue. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals.

Expert testimony and declarations on proposed residential and commercial developments, gas-fired power plants, wind, solar and geothermal projects, water transfers and water transfer delivery systems, endangered species recovery plans, Habitat Conservation Plans and Natural Communities Conservation Programs. Testified before multiple government agencies, Tribunals, Boards of Supervisors and City Councils, and participated with press conferences and depositions. Prepared expert witness reports and court declarations, which are summarized under Reports (below).

Protocol-level surveys for special-status species. Used California Department of Fish and Wildlife and US Fish and Wildlife Service protocols to search for California red-legged frog, California tiger salamander, arroyo southwestern toad, blunt-nosed leopard lizard, western pond turtle, giant kangaroo rat, San Joaquin kangaroo rat, San Joaquin kit fox, western burrowing owl, Swainson's hawk, Valley elderberry longhorn beetle and other special-status species.

Conservation of San Joaquin kangaroo rat. Performed research to identify factors responsible for the decline of this endangered species at Lemoore Naval Air Station, 2000-2013, and implemented habitat enhancements designed to reverse the trend and expand the population.

Impact of West Nile Virus on yellow-billed magpies. Funded by Sacramento-Yolo Mosquito and Vector Control District, 2005-2008, compared survey results pre- and post-West Nile Virus epidemic for multiple bird species in the Sacramento Valley, particularly on yellow-billed magpie and American crow due to susceptibility to WNV.

Workshops on HCPs. Assisted Dr. Michael Morrison with organizing and conducting a 2-day workshop on Habitat Conservation Plans, sponsored by Southern California Edison, and another 1-day workshop sponsored by PG&E. These Workshops were attended by academics, attorneys, and consultants with HCP experience. We guest-edited a Proceedings published in Environmental Management.

Mapping of biological resources along Highways 101, 46 and 41. Used GPS and GIS to delineate vegetation complexes and locations of special-status species along 26 miles of highway in San Luis Obispo County, 14 miles of highway and roadway in Monterey County, and in a large area north of Fresno, including within reclaimed gravel mining pits.

GPS mapping and monitoring at restoration sites and at Caltrans mitigation sites. Monitored the success of elderberry shrubs at one location, the success of willows at another location, and the response of wildlife to the succession of vegetation at both sites. Also used GPS to monitor the response of fossorial animals to yellow star-thistle eradication and natural grassland restoration efforts at Bear Valley in Colusa County and at the decommissioned Mather Air Force Base in Sacramento County.

Mercury effects on Red-legged Frog. Assisted Dr. Michael Morrison and US Fish and Wildlife Service in assessing the possible impacts of historical mercury mining on the federally listed California red-legged frog in Santa Clara County. Also measured habitat variables in streams.

Opposition to proposed No Surprises rule. Wrote a white paper and summary letter explaining scientific grounds for opposing the incidental take permit (ITP) rules providing ITP applicants and holders with general assurances they will be free of compliance with the Endangered Species Act once they adhere to the terms of a "properly functioning HCP." Submitted 188 signatures of scientists and environmental professionals concerned about No Surprises rule US Fish and Wildlife Service, National Marine Fisheries Service, all US Senators.

Natomas Basin Habitat Conservation Plan alternative. Designed narrow channel marsh to increase the likelihood of survival and recovery in the wild of giant garter snake, Swainson's hawk and Valley Elderberry Longhorn Beetle. The design included replication and interspersion of treatments for experimental testing of critical habitat elements. I provided a report to Northern Territories, Inc.

Assessments of agricultural production system and environmental technology transfer to China. Twice visited China and interviewed scientists, industrialists, agriculturalists, and the Directors of the Chinese Environmental Protection Agency and the Department of Agriculture to assess the need and possible pathways for environmental clean-up technologies and trade opportunities between the US and China.

Yolo County Habitat Conservation Plan. Conducted landscape ecology study of Yolo County to spatially prioritize allocation of mitigation efforts to improve ecosystem functionality within the County from the perspective of 29 special-status species of wildlife and plants. Used a hierarchically structured indicators approach to apply principles of landscape and ecosystem ecology, conservation biology, and local values in rating land units. Derived GIS maps to help guide the conservation area design, and then developed implementation strategies.

Mountain lion track count. Developed and conducted a carnivore monitoring program throughout California since 1985. Species counted include mountain lion, bobcat, black bear, coyote, red and gray fox, raccoon, striped skunk, badger, and black-tailed deer. Vegetation and land use are also monitored. Track survey transect was established on dusty, dirt roads within randomly selected quadrats.

Sumatran tiger and other felids. Upon award of Fulbright Research Fellowship, I designed and initiated track counts for seven species of wild cats in Sumatra, including Sumatran tiger, fishing cat, and golden cat. Spent four months on Sumatra and Java in 1988, and learned Bahasa Indonesia, the official Indonesian language.

Wildlife in agriculture. Beginning as post-graduate research, I studied pocket gophers and other wildlife in 40 alfalfa fields throughout the Sacramento Valley, and I surveyed for wildlife along a 200 mile road transect since 1989 with a hiatus of 1996-2004. The data are analyzed using GIS and methods from landscape ecology, and the results published and presented orally to farming groups in California and elsewhere. I also conducted the first study of wildlife in cover crops used on vineyards and orchards.

Agricultural energy use and Tulare County groundwater study. Developed and analyzed a data base of energy use in California agriculture, and collaborated on a landscape (GIS) study of groundwater contamination across Tulare County, California.

Pocket gopher damage in forest clear-cuts. Developed gopher sampling methods and tested various poison baits and baiting regimes in the largest-ever field study of pocket gopher management in forest plantations, involving 68 research plots in 55 clear-cuts among 6 National Forests in northern California.

Risk assessment of exotic species in North America. Developed empirical models of mammal and bird species invasions in North America, as well as a rating system for assigning priority research and control to exotic species in California, based on economic, environmental, and human health hazards.

Smallwood, S. March 8, 2007. Estimated Effects of Proposed Measures to be Applied to 2,500 Wind Turbines in the APWRA Fatality Monitoring Plan. SRC Document S15.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, J. Burger, and J. Yee). February 7, 2007. Analysis of Monitoring Program in Context of 1/1//2007 Settlement Agreement.

Smallwood, S. January 8, 2007. Smallwood's Concerns over the Agreement to Settle the CEQA Challenges. SRC Document S5.

Alameda County SRC (Smallwood, K. S., S. Orloff, J. Estep, J. Burger, and J. Yee). December 19, 2006. Altamont Scientific Review Committee (SRC) Recommendations to the County on the Avian Monitoring Team Consultants' Budget and Organization.

Reports to Clients

Smallwood, K. S. 2020. Comparison of bird and bat fatality rates among utility-scale solar projects in California. Report to undisclosed client.

Smallwood, K. S., D. Bell, and S. Standish. 2018. Skilled dog detections of bat and small bird carcasses in wind turbine fatality monitoring. Report to East Bay Regional Park District, Oakland, California.

Smallwood, K. S. 2018. Addendum to Comparison of Wind Turbine Collision Hazard Model Performance: One-year Post-construction Assessment of Golden Eagle Fatalities at Golden Hills. Report to Audubon Society, NextEra Energy, and the California Attorney General.

Smallwood, K. S., and L. Neher. 2018. Siting wind turbines to minimize raptor collisions at Rooney Ranch and Sand Hill Repowering Project, Altamont Pass Wind Resource Area. Report to S-Power, Salt Lake City, Utah.

Smallwood, K. S. 2017. Summary of a burrowing owl conservation workshop. Report to Santa Clara Valley Habitat Agency, Morgan Hill, California.

Smallwood, K. S., and L. Neher. 2018. Comparison of wind turbine collision hazard model performance prepared for repowering projects in the Altamont Pass Wind Resources Area. Report to NextEra Energy Resources, Inc., Office of the California Attorney General, Audubon Society, East Bay Regional Park District.

Smallwood, K. S., and L. Neher. 2016. Siting wind turbines to minimize raptor collisions at Summit Winds Repowering Project, Altamont Pass Wind Resource Area. Report to Salka, Inc., Washington, D.C.

Smallwood, K. S., L. Neher, and D. A. Bell. 2017. Mitigating golden eagle impacts from repowering Altamont Pass Wind Resource Area and expanding Los Vaqueros Reservoir. Report to East Contra Costa County Habitat Conservation Plan Conservancy and Contra Costa Water District.

Smallwood, K. S. 2016. Review of avian-solar science plan. Report to Center for Biological Diversity. 28 pp

Smallwood, K. S. 2016. Report of Altamont Pass research as Vasco Winds mitigation. Report to NextEra Energy Resources, Inc., Office of the California Attorney General, Audubon Society, East Bay Regional Park District.

Smallwood, K. S., and L. Neher. 2016. Siting Wind Turbines to Minimize Raptor collisions at Sand Hill Repowering Project, Altamont Pass Wind Resource Area. Report to Ogin, Inc., Waltham, Massachusetts.

Smallwood, K. S., and L. Neher. 2015a. Siting wind turbines to minimize raptor collisions at Golden Hills Repowering Project, Altamont Pass Wind Resource Area. Report to NextEra Energy Resources, Livermore, California.

Smallwood, K. S., and L. Neher. 2015b. Siting wind turbines to minimize raptor collisions at Golden Hills North Repowering Project, Altamont Pass Wind Resource Area. Report to NextEra Energy Resources, Livermore, California.

Smallwood, K. S., and L. Neher. 2015c. Siting wind turbines to minimize raptor collisions at the Patterson Pass Repowering Project, Altamont Pass Wind Resource Area. Report to EDF Renewable Energy, Oakland, California.

Smallwood, K. S., and L. Neher. 2014. Early assessment of wind turbine layout in Summit Wind Project. Report to Altamont Winds LLC, Tracy, California.

Smallwood, K. S. 2015. Review of avian use survey report for the Longboat Solar Project. Report to EDF Renewable Energy, Oakland, California.

Smallwood, K. S. 2014. Information needed for solar project impacts assessment and mitigation planning. Report to Panorama Environmental, Inc., San Francisco, California.

Smallwood, K. S. 2014. Monitoring fossorial mammals in Vasco Caves Regional Preserve, California: Report of Progress for the period 2006-2014. Report to East Bay Regional Park District, Oakland, California.

Smallwood, K. S. 2013. First-year estimates of bird and bat fatality rates at old wind turbines, Forebay areas of Altamont Pass Wind Resource Area. Report to FloDesign in support of EIR.

Smallwood, K. S. and W. Pearson. 2013. Neotropical bird monitoring of burrowing owls (*Athene cunicularia*), Naval Air Station Lemoore, California. Tierra Data, Inc. report to Naval Air Station Lemoore.

Smallwood, K. S. 2013. Winter surveys for San Joaquin kangaroo rat (*Dipodomys nitratoides*) and burrowing owls (*Athene cunicularia*) within Air Operations at Naval Air Station, Lemoore. Report to Tierra Data, Inc. and Naval Air Station Lemoore.

Smallwood, K. S. and M. L. Morrison. 2013. San Joaquin kangaroo rat (*Dipodomys n. nitratoides*) conservation research in Resource Management Area 5, Lemoore Naval Air Station: 2012 Progress Report (Inclusive of work during 2000-2012). Naval Facilities Engineering Command, Southwest, Desert Integrated Products Team, San Diego, California.

Smallwood, K. S. 2012. Fatality rate estimates at the Vantage Wind Energy Project, year one. Report to Ventus Environmental, Portland, Oregon.

Smallwood, K. S. and L. Neher. 2012. Siting wind turbines to minimize raptor collisions at North Sky River. Report to NextEra Energy Resources, LLC.

Smallwood, K. S. 2011. Monitoring Fossorial Mammals in Vasco Caves Regional Preserve, California: Report of Progress for the Period 2006-2011. Report to East Bay Regional Park District.

Smallwood, K. S. and M. L. Morrison. 2011. San Joaquin kangaroo rat (*Dipodomys n. nitratoides*) Conservation Research in Resource Management Area 5, Lemoore Naval Air Station: 2011 Progress Report (Inclusive of work during 2000-2011). Naval Facilities Engineering Command, Southwest, Desert Integrated Products Team, San Diego, California.

Smallwood, K. S. 2011. Draft study design for testing collision risk of FloDesign Wind Turbine in Patterson Pass, Santa Clara, and Former AES Seawest Wind Projects in the Altamont Pass Wind Resource Area (APWRA). Report to FloDesign, Inc.

Smallwood, K. S. 2011. Comments on Marbled Murrelet collision model for the Radar Ridge Wind Resource Area. Report to EcoStat, Inc., and ultimately to US Fish and Wildlife Service.

Smallwood, K. S. 2011. Avian fatality rates at Buena Vista Wind Energy Project, 2008-2011. Report to Pattern Energy.

Smallwood, K. S. and L. Neher. 2011. Siting repowered wind turbines to minimize raptor collisions at Tres Vaqueros, Contra Costa County, California. Report to Pattern Energy.

Smallwood, K. S. and M. L. Morrison. 2011. San Joaquin kangaroo rat (*Dipodomys n. nitratoides*) Conservation Research in Resource Management Area 5, Lemoore Naval Air Station: 2010 Progress Report (Inclusive of work during 2000-2010). Naval Facilities Engineering Command, Southwest, Desert Integrated Products Team, San Diego, California.

Smallwood, K. S. 2010. Wind Energy Development and avian issues in the Altamont Pass, California. Report to Black & Veatch.

Smallwood, K. S. and L. Neher. 2010. Siting repowered wind turbines to minimize raptor collisions at the Tres Vaqueros Wind Project, Contra Costa County, California. Report to the East Bay Regional Park District, Oakland, California.

Smallwood, K. S. and L. Neher. 2010. Siting repowered wind turbines to minimize raptor collisions at Vasco Winds. Report to NextEra Energy Resources, LLC, Livermore, California.

Smallwood, K. S. 2010. Baseline avian and bat fatality rates at the Tres Vaqueros Wind Project, Contra Costa County, California. Report to the East Bay Regional Park District, Oakland, California.

Smallwood, K. S. and M. L. Morrison. 2010. San Joaquin kangaroo rat (*Dipodomys n. nitratoides*) Conservation Research in Resource Management Area 5, Lemoore Naval Air Station: 2009 Progress Report (Inclusive of work during 2000-2009). Naval Facilities Engineering Command, Southwest, Desert Integrated Products Team, San Diego, California. 86 pp.

Smallwood, K. S. 2009. Mammal surveys at naval outlying landing field Imperial Beach, California, August 2009. Report to Tierra Data, Inc. 5 pp

Smallwood, K. S. 2009. Mammals and other Wildlife Observed at Proposed Site of Amargosa Solar Power Project, Spring 2009. Report to Tierra Data, Inc. 13 pp

Smallwood, K. S. 2009. Avian Fatality Rates at Buena Vista Wind Energy Project, 2008-2009. Report to members of the Contra Costa County Technical Advisory Committee on the Buena Vista Wind Energy Project. 8 pp.

Morrison, M.L., and K.S. Smallwood. 1999. NTI plan evaluation and comments. Exhibit C in W.D. Carrier, M.L. Morrison, K.S. Smallwood, and Vail Engineering. Recommendations for NBHCP land acquisition and enhancement strategies. Northern Territories, Inc., Sacramento.

Smallwood, K. S. 1999. Estimation of impacts due to dredging of a shipping channel through Humboldt Bay, California. Court Declaration prepared on behalf of EPIC.

Smallwood, K. S. 1998. 1998 California Mountain Lion Track Count. Report to the Defenders of Wildlife, Washington, D.C. 5 pages.

Smallwood, K.S. 1998. Draft report of a visit to a paint sludge dump site near Ridgewood, New Jersey, February 26th, 1998. Unpublished report to Consulting in the Public Interest.

Smallwood, K.S. 1997. Science missing in the "no surprises" policy. Commissioned by National Endangered Species Network and Spirit of the Sage Council, Pasadena, California.

Smallwood, K.S. and M.L. Morrison. 1997. Alternate mitigation strategy for incidental take of giant garter snake and Swainson's hawk as part of the Natomas Basin Habitat Conservation Plan. Pages 6-9 and *iii* illustrations in W.D. Carrier, K.S. Smallwood and M.L. Morrison, Natomas Basin Habitat Conservation Plan: Narrow channel marsh alternative wetland mitigation. Northern Territories, Inc., Sacramento.

Smallwood, K.S. 1996. Assessment of the BIOPORT model's parameter values for pocket gopher burrowing characteristics. Report to Berger & Montague, P.C. and Roy S. Haber, P.C., Philadelphia. (peer reviewed).

Smallwood, K.S. 1997. Assessment of plutonium releases from Hanford buried waste sites. Report Number 9, Consulting in the Public Interest, 53 Clinton Street, Lambertville, New Jersey, 08530.

Smallwood, K.S. 1996. Soil Bioturbation and Wind Affect Fate of Hazardous Materials that were Released at the Rocky Flats Plant, Colorado. Report to Berger & Montague, P.C., Philadelphia.

Smallwood, K.S. 1996. Second assessment of the BIOPORT model's parameter values for pocket gopher burrowing characteristics and other relevant wildlife observations. Report to Berger & Montague, P.C. and Roy S. Haber, P.C., Philadelphia.

Smallwood, K.S., and R. Leidy. 1996. Wildlife and Their Management Under the Martell SYP. Report to Georgia Pacific, Corporation, Martel, CA. 30 pp.

EIP Associates. 1995. Yolo County Habitat Conservation Plan Biological Resources Report. Yolo County Planning and Development Department, Woodland, California.

Smallwood, K.S. and S. Geng. 1995. Analysis of the 1987 California Farm Cost Survey and recommendations for future survey. Program on Workable Energy Regulation, University-wide Energy Research Group, University of California.

Smallwood, K.S., S. Geng, and W. Idzerda. 1992. Final report to PG&E: Analysis of the 1987 California Farm Cost Survey and recommendations for future survey. Pacific Gas & Electric Company, San Ramon, California. 24 pp.

Fitzhugh, E.L. and K.S. Smallwood. 1987. Methods Manual – A statewide mountain lion population index technique. California Department of Fish and Game, Sacramento.

Salmon, T.P. and K.S. Smallwood. 1989. Final Report – Evaluating exotic vertebrates as pests to California agriculture. California Department of Food and Agriculture, Sacramento.

Smallwood, K.S. and W. A. Erickson (written under supervision of W.E. Howard, R.E. Marsh, and R.J. Laacke). 1990. Environmental exposure and fate of multi-kill strychnine gopher baits. Final Report to USDA Forest Service –NAPIAP, Cooperative Agreement PSW-89-0010CA.

Fitzhugh, E.L., K.S. Smallwood, and R. Gross. 1985. Mountain lion track count, Marin County, 1985. Report on file at Wildlife Extension, University of California, Davis.

Comments on Environmental Documents (Year; pages)

I was retained or commissioned to comment on environmental planning and review documents, including:

- Mulqueeney Ranch Wind Repowering Project DSEIR (2021; 98);
- Clawiter Road Industrial Project IS/MND, Hayward (2021; 18);
- Garnet Energy Center Stipulations, New York (2020);
- Heritage Wind Energy Project, New York (2020: 71);
- Ameresco Keller Canyon RNG Project IS/MND, Martinez (2020; 11);
- Cambria Hotel Project Staff Report, Dublin (2020; 19);
- Central Pointe Mixed-Use Staff Report, Santa Ana (2020; 20);
- Oak Valley Town Center EIR Addendum, Calimesa (2020; 23);

- Coachillin Specific Plan MND Amendment, Desert Hot Springs (2020; 26);

- Merced County General Plan Revision, notice of Negative Declaration (2001: 2.);
- Notice of Preparation of Campus Parkway EIR/EIS (2001: 7.);
- Draft Recovery Plan for the bighorn sheep in the Peninsular Range (*Ovis candensis*) (2000);
- Draft Recovery Plan for the California Red-legged Frog (*Rana aurora draytonii*), on behalf of The Wildlife Society—Western Section (2000: 10.);
- Sierra Nevada Forest Plan Amendment Draft Environmental Impact Statement, on behalf of The Wildlife Society—Western Section (2000: 7.);
- State Water Project Supplemental Water Purchase Program, Draft Program EIR (1997);
- Davis General Plan Update EIR (2000);
- Turn of the Century EIR (1999: 10);
- Proposed termination of Critical Habitat Designation under the Endangered Species Act (Fed. Reg. 64(113): 31871-31874) (1999);
- NOA Draft Addendum to the Final Handbook for Habitat Conservation Planning and Incidental Take Permitting Process, termed the HCP 5-Point Policy Plan (Fed. Reg. 64(45): 11485 - 11490) (1999; 2 + attachments);
- Covell Center Project EIR and EIR Supplement (1997).

Position Statements I prepared the following position statements for the Western Section of The Wildlife Society, and one for nearly 200 scientists:

- Recommended that the California Department of Fish and Game prioritize the extermination of the introduced southern water snake in northern California. The Wildlife Society--Western Section (2001);
- Recommended that The Wildlife Society—Western Section appoint or recommend members of the independent scientific review panel for the UC Merced environmental review process (2001);
- Opposed the siting of the University of California's 10th campus on a sensitive vernal pool/grassland complex east of Merced. The Wildlife Society--Western Section (2000);
- Opposed the legalization of ferret ownership in California. The Wildlife Society--Western Section (2000);
- Opposed the Proposed "No Surprises," "Safe Harbor," and "Candidate Conservation Agreement" rules, including permit-shield protection provisions (Fed. Reg. Vol. 62, No. 103, pp. 29091-29098 and No. 113, pp. 32189-32194). This statement was signed by 188 scientists and went to the responsible federal agencies, as well as to the U.S. Senate and House of Representatives.

Posters at Professional Meetings

Leyvas, E. and K. S. Smallwood. 2015. Rehabilitating injured animals to offset and rectify wind project impacts. Conference on Wind Energy and Wildlife Impacts, Berlin, Germany, 9-12 March 2015.

Smallwood, K. S., J. Mount, S. Standish, E. Leyvas, D. Bell, E. Walther, B. Karas. 2015. Integrated detection trials to improve the accuracy of fatality rate estimates at wind projects. Conference on Wind Energy and Wildlife Impacts, Berlin, Germany, 9-12 March 2015.

Smallwood, K. S. and C. G. Thelander. 2005. Lessons learned from five years of avian mortality research in the Altamont Pass WRA. AWEA conference, Denver, May 2005.

Neher, L., L. Wilder, J. Woo, L. Spiegel, D. Yen-Nakafugi, and K.S. Smallwood. 2005. Bird's eye view on California wind. AWEA conference, Denver, May 2005.

Smallwood, K. S., C. G. Thelander and L. Spiegel. 2003. Toward a predictive model of avian fatalities in the Altamont Pass Wind Resource Area. Windpower 2003 Conference and Convention, Austin, Texas.

Smallwood, K.S. and Eva Butler. 2002. Pocket Gopher Response to Yellow Star-thistle Eradication as part of Grassland Restoration at Decommissioned Mather Air Force Base, Sacramento County, California. White Mountain Research Station Open House, Barcroft Station.

Smallwood, K.S. and Michael L. Morrison. 2002. Fresno kangaroo rat (*Dipodomys nitratoides*) Conservation Research at Resources Management Area 5, Lemoore Naval Air Station. White Mountain Research Station Open House, Barcroft Station.

Smallwood, K.S. and E.L. Fitzhugh. 1989. Differentiating mountain lion and dog tracks. Third Mountain Lion Workshop, Prescott, AZ.

Smith, T. R. and K. S. Smallwood. 2000. Effects of study area size, location, season, and allometry on reported *Sorex* shrew densities. Annual Meeting of the Western Section of The Wildlife Society.

Presentations at Professional Meetings and Seminars

Dog detections of bat and bird fatalities at wind farms in the Altamont Pass Wind Resource Area. East Bay Regional Park District 2019 Stewardship Seminar, Oakland, California, 13 November 2019.

Repowering the Altamont Pass. Altamont Symposium, The Wildlife Society – Western Section, 5 February 2017.

Developing methods to reduce bird mortality in the Altamont Pass Wind Resource Area, 1999-2007. Altamont Symposium, The Wildlife Society – Western Section, 5 February 2017.

Conservation and recovery of burrowing owls in Santa Clara Valley. Santa Clara Valley Habitat

Agency, Newark, California, 3 February 2017.

Mitigation of Raptor Fatalities in the Altamont Pass Wind Resource Area. Raptor Research Foundation Meeting, Sacramento, California, 6 November 2015.

From burrows to behavior: Research and management for burrowing owls in a diverse landscape. California Burrowing Owl Consortium meeting, 24 October 2015, San Jose, California.

The Challenges of repowering. Keynote presentation at Conference on Wind Energy and Wildlife Impacts, Berlin, Germany, 10 March 2015.

Research Highlights Altamont Pass 2011-2015. Scientific Review Committee, Oakland, California, 8 July 2015.

Siting wind turbines to minimize raptor collisions: Altamont Pass Wind Resource Area. US Fish and Wildlife Service Golden Eagle Working Group, Sacramento, California, 8 January 2015.

Evaluation of nest boxes as a burrowing owl conservation strategy. Sacramento Chapter of the Western Section, The Wildlife Society. Sacramento, California, 26 August 2013.

Predicting collision hazard zones to guide repowering of the Altamont Pass. Conference on wind power and environmental impacts. Stockholm, Sweden, 5-7 February 2013.

Impacts of Wind Turbines on Wildlife. California Council for Wildlife Rehabilitators, Yosemite, California, 12 November 2012.

Impacts of Wind Turbines on Birds and Bats. Madrone Audubon Society, Santa Rosa, California, 20 February 2012.

Comparing Wind Turbine Impacts across North America. California Energy Commission Staff Workshop: Reducing the Impacts of Energy Infrastructure on Wildlife, 20 July 2011.

Siting Repowered Wind Turbines to Minimize Raptor Collisions. California Energy Commission Staff Workshop: Reducing the Impacts of Energy Infrastructure on Wildlife, 20 July 2011.

Siting Repowered Wind Turbines to Minimize Raptor Collisions. Alameda County Scientific Review Committee meeting, 17 February 2011

Comparing Wind Turbine Impacts across North America. Conference on Wind energy and Wildlife impacts, Trondheim, Norway, 3 May 2011.

Update on Wildlife Impacts in the Altamont Pass Wind Resource Area. Raptor Symposium, The Wildlife Society—Western Section, Riverside, California, February 2011.

Siting Repowered Wind Turbines to Minimize Raptor Collisions. Raptor Symposium, The Wildlife Society - Western Section, Riverside, California, February 2011.

Wildlife mortality caused by wind turbine collisions. Ecological Society of America, Pittsburgh,

Pennsylvania, 6 August 2010.

Map-based repowering and reorganization of a wind farm to minimize burrowing owl fatalities. California burrowing Owl Consortium Meeting, Livermore, California, 6 February 2010.

Environmental barriers to wind power. Getting Real About Renewables: Economic and Environmental Barriers to Biofuels and Wind Energy. A symposium sponsored by the Environmental & Energy Law & Policy Journal, University of Houston Law Center, Houston, 23 February 2007.

Lessons learned about bird collisions with wind turbines in the Altamont Pass and other US wind farms. Meeting with Japan Ministry of the Environment and Japan Ministry of the Economy, Wild Bird Society of Japan, and other NGOs Tokyo, Japan, 9 November 2006.

Lessons learned about bird collisions with wind turbines in the Altamont Pass and other US wind farms. Symposium on bird collisions with wind turbines. Wild Bird Society of Japan, Tokyo, Japan, 4 November 2006.

Responses of Fresno kangaroo rats to habitat improvements in an adaptive management framework. California Society for Ecological Restoration (SERCAL) 13th Annual Conference, UC Santa Barbara, 27 October 2006.

Fatality associations as the basis for predictive models of fatalities in the Altamont Pass Wind Resource Area. EEI/APLIC/PIER Workshop, 2006 Biologist Task Force and Avian Interaction with Electric Facilities Meeting, Pleasanton, California, 28 April 2006.

Burrowing owl burrows and wind turbine collisions in the Altamont Pass Wind Resource Area. The Wildlife Society - Western Section Annual Meeting, Sacramento, California, February 8, 2006.

Mitigation at wind farms. Workshop: Understanding and resolving bird and bat impacts. American Wind Energy Association and Audubon Society. Los Angeles, CA. January 10 and 11, 2006.

Incorporating data from the California Wildlife Habitat Relationships (CWHR) system into an impact assessment tool for birds near wind farms. Shawn Smallwood, Kevin Hunting, Marcus Yee, Linda Spiegel, Monica Parisi. Workshop: Understanding and resolving bird and bat impacts. American Wind Energy Association and Audubon Society. Los Angeles, CA. January 10 and 11, 2006.

Toward indicating threats to birds by California's new wind farms. California Energy Commission, Sacramento, May 26, 2005.

Avian collisions in the Altamont Pass. California Energy Commission, Sacramento, May 26, 2005.

Ecological solutions for avian collisions with wind turbines in the Altamont Pass Wind Resource Area. EPRI Environmental Sector Council, Monterey, California, February 17, 2005.

Ecological solutions for avian collisions with wind turbines in the Altamont Pass Wind Resource Area. The Wildlife Society—Western Section Annual Meeting, Sacramento, California, January 19,

2005.

Associations between avian fatalities and attributes of electric distribution poles in California. The Wildlife Society - Western Section Annual Meeting, Sacramento, California, January 19, 2005.

Minimizing avian mortality in the Altamont Pass Wind Resources Area. UC Davis Wind Energy Collaborative Forum, Palm Springs, California, December 14, 2004.

Selecting electric distribution poles for priority retrofitting to reduce raptor mortality. Raptor Research Foundation Meeting, Bakersfield, California, November 10, 2004.

Responses of Fresno kangaroo rats to habitat improvements in an adaptive management framework. Annual Meeting of the Society for Ecological Restoration, South Lake Tahoe, California, October 16, 2004.

Lessons learned from five years of avian mortality research at the Altamont Pass Wind Resources Area in California. The Wildlife Society Annual Meeting, Calgary, Canada, September 2004.

The ecology and impacts of power generation at Altamont Pass. Sacramento Petroleum Association, Sacramento, California, August 18, 2004.

Burrowing owl mortality in the Altamont Pass Wind Resource Area. California Burrowing Owl Consortium meeting, Hayward, California, February 7, 2004.

Burrowing owl mortality in the Altamont Pass Wind Resource Area. California Burrowing Owl Symposium, Sacramento, November 2, 2003.

Raptor Mortality at the Altamont Pass Wind Resource Area. National Wind Coordinating Committee, Washington, D.C., November 17, 2003.

Raptor Behavior at the Altamont Pass Wind Resource Area. Annual Meeting of the Raptor Research Foundation, Anchorage, Alaska, September, 2003.

Raptor Mortality at the Altamont Pass Wind Resource Area. Annual Meeting of the Raptor Research Foundation, Anchorage, Alaska, September, 2003.

California mountain lions. Ecological & Environmental Issues Seminar, Department of Biology, California State University, Sacramento, November, 2000.

Intra- and inter-turbine string comparison of fatalities to animal burrow densities at Altamont Pass. National Wind Coordinating Committee, Carmel, California, May, 2000.

Using a Geographic Positioning System (GPS) to map wildlife and habitat. Annual Meeting of the Western Section of The Wildlife Society, Riverside, CA, January, 2000.

Suggested standards for science applied to conservation issues. Annual Meeting of the Western Section of The Wildlife Society, Riverside, CA, January, 2000.

The indicators framework applied to ecological restoration in Yolo County, California. Society for Ecological Restoration, September 25, 1999.

Ecological restoration in the context of animal social units and their habitat areas. Society for Ecological Restoration, September 24, 1999.

Relating Indicators of Ecological Health and Integrity to Assess Risks to Sustainable Agriculture and Native Biota. International Conference on Ecosystem Health, August 16, 1999.

A crosswalk from the Endangered Species Act to the HCP Handbook and real HCPs. Southern California Edison, Co. and California Energy Commission, March 4-5, 1999.

Mountain lion track counts in California: Implications for Management. Ecological & Environmental Issues Seminar, Department of Biological Sciences, California State University, Sacramento, November 4, 1998.

"No Surprises" -- Lack of science in the HCP process. California Native Plant Society Annual Conservation Conference, The Presidio, San Francisco, September 7, 1997.

In Your Interest. A half hour weekly show aired on Channel 10 Television, Sacramento. In this episode, I served on a panel of experts discussing problems with the implementation of the Endangered Species Act. Aired August 31, 1997.

Spatial scaling of pocket gopher (*Geomyidae*) density. Southwestern Association of Naturalists 44th Meeting, Fayetteville, Arkansas, April 10, 1997.

Estimating prairie dog and pocket gopher burrow volume. Southwestern Association of Naturalists 44th Meeting, Fayetteville, Arkansas, April 10, 1997.

Ten years of mountain lion track survey. Fifth Mountain Lion Workshop, San Diego, February 27, 1996.

Study and interpretive design effects on mountain lion density estimates. Fifth Mountain Lion Workshop, San Diego, February 27, 1996.

Small animal control. Session moderator and speaker at the California Farm Conference, Sacramento, California, Feb. 28, 1995.

Small animal control. Ecological Farming Conference, Asylomar, California, Jan. 28, 1995.

Habitat associations of the Swainson's Hawk in the Sacramento Valley's agricultural landscape. 1994 Raptor Research Foundation Meeting, Flagstaff, Arizona.

Alfalfa as wildlife habitat. Seed Industry Conference, Woodland, California, May 4, 1994.

Habitats and vertebrate pests: impacts and management. Managing Farmland to Bring Back Game Birds and Wildlife to the Central Valley. Yolo County Resource Conservation District, U.C. Davis, February 19, 1994.

Management of gophers and alfalfa as wildlife habitat. Orland Alfalfa Production Meeting and Sacramento Valley Alfalfa Production Meeting, February 1 and 2, 1994.

Patterns of wildlife movement in a farming landscape. Wildlife and Fisheries Biology Seminar Series: Recent Advances in Wildlife, Fish, and Conservation Biology, U.C. Davis, Dec. 6, 1993.

Alfalfa as wildlife habitat. California Alfalfa Symposium, Fresno, California, Dec. 9, 1993.

Management of pocket gophers in Sacramento Valley alfalfa. California Alfalfa Symposium, Fresno, California, Dec. 8, 1993.

Association analysis of raptors in a farming landscape. Plenary speaker at Raptor Research Foundation Meeting, Charlotte, North Carolina, Nov. 6, 1993.

Landscape strategies for biological control and IPM. Plenary speaker, International Conference on Integrated Resource Management and Sustainable Agriculture, Beijing, China, Sept. 11, 1993.

Landscape Ecology Study of Pocket Gophers in Alfalfa. Alfalfa Field Day, U.C. Davis, July 1993.

Patterns of wildlife movement in a farming landscape. Spatial Data Analysis Colloquium, U.C. Davis, August 6, 1993.

Sound stewardship of wildlife. Veterinary Medicine Seminar: Ethics of Animal Use, U.C. Davis. May 1993.

Landscape ecology study of pocket gophers in alfalfa. Five County Grower's Meeting, Tracy, California. February 1993.

Turbulence and the community organizers: The role of invading species in ordering a turbulent system, and the factors for invasion success. Ecology Graduate Student Association Colloquium, U.C. Davis. May 1990.

Evaluation of exotic vertebrate pests. Fourteenth Vertebrate Pest Conference, Sacramento, California. March 1990.

Analytical methods for predicting success of mammal introductions to North America. The Western Section of the Wildlife Society, Hilo, Hawaii. February 1988.

A state-wide mountain lion track survey. Sacramento County Dept Parks and Recreation. April 1986.

The mountain lion in California. Davis Chapter of the Audubon Society. October 1985.

Ecology Graduate Student Seminars, U.C. Davis, 1985-1990: Social behavior of the mountain lion; Mountain lion control; Political status of the mountain lion in California.

Other forms of Participation at Professional Meetings

- Scientific Committee, Conference on Wind energy and Wildlife impacts, Berlin, Germany, March 2015.

- Scientific Committee, Conference on Wind energy and Wildlife impacts, Stockholm, Sweden, February 2013.

- Workshop co-presenter at Birds & Wind Energy Specialist Group (BAWESG) Information sharing week, Bird specialist studies for proposed wind energy facilities in South Africa, Endangered Wildlife Trust, Darling, South Africa, 3-7 October 2011.

- Scientific Committee, Conference on Wind energy and Wildlife impacts, Trondheim, Norway, 2-5 May 2011.

- Chair of Animal Damage Management Session, The Wildlife Society, Annual Meeting, Reno, Nevada, September 26, 2001.

- Chair of Technical Session: Human communities and ecosystem health: Comparing perspectives and making connection. Managing for Ecosystem Health, International Congress on Ecosystem Health, Sacramento, CA August 15-20, 1999.

- Student Awards Committee, Annual Meeting of the Western Section of The Wildlife Society, Riverside, CA, January, 2000.

- Student Mentor, Annual Meeting of the Western Section of The Wildlife Society, Riverside, CA, January, 2000.

- Ph.D. Thesis Committee, Steve Anderson, University of California, Davis
- MS Thesis Committee, Marcus Yee, California State University, Sacramento

Other Professional Activities or Products

Testified in Federal Court in Denver during 2005 over the fate of radio-nuclides in the soil at Rocky Flats Plant after exposure to burrowing animals. My clients won a judgment of $553,000,000. I have also testified in many other cases of litigation under CEQA, NEPA, the Warren-Alquist Act, and other environmental laws. My clients won most of the cases for which I testified.

Testified before Environmental Review Tribunals in Ontario, Canada regarding proposed White Pines, Amherst Island, and Fairview Wind Energy projects.

Testified in Skamania County Hearing in 2009 on the potential impacts of zoning the County for development of wind farms and hazardous waste facilities.

Testified in deposition in 2007 in the case of O'Dell et al. vs. FPL Energy in Houston, Texas.

Testified in Klickitat County Hearing in 2006 on the potential impacts of the Windy Point Wind Farm.

Memberships in Professional Societies

The Wildlife Society
Raptor Research Foundation

Honors and Awards

Fulbright Research Fellowship to Indonesia, 1987
J.G. Boswell Full Academic Scholarship, 1981 college of choice
Certificate of Appreciation, The Wildlife Society—Western Section, 2000, 2001
Northern California Athletic Association Most Valuable Cross Country Runner, 1984
American Legion Award, Corcoran High School, 1981, and John Muir Junior High, 1977
CIF Section Champion, Cross Country in 1978
CIF Section Champion, Track & Field 2 mile run in 1981
National Junior Record, 20 kilometer run, 1982
National Age Group Record, 1500 meter run, 1978

Community Activities

District 64 Little League Umpire, 2003-2007
Dixon Little League Umpire, 2006-07
Davis Little League Chief Umpire and Board member, 2004-2005
Davis Little League Safety Officer, 2004-2005
Davis Little League Certified Umpire, 2002-2004
Davis Little League Scorekeeper, 2002
Davis Visioning Group member
Petitioner for Writ of Mandate under the California Environmental Quality Act against City of Woodland decision to approve the Spring Lake Specific Plan, 2002
Served on campaign committees for City Council candidates

Representative special-status species experience

Common name	Species name	Description
Field experience		
California red-legged frog	*Rana aurora draytonii*	Protocol searches; Many detections
Foothill yellow-legged frog	*Rana boylii*	Presence surveys; Many detections
Western spadefoot	*Spea hammondii*	Presence surveys; Few detections
California tiger salamander	*Ambystoma californiense*	Protocol searches; Many detections
Coast range newt	*Taricha torosa torosa*	Searches and multiple detections
Blunt-nosed leopard lizard	*Gambelia sila*	Detected in San Luis Obispo County
California horned lizard	*Phrynosoma coronatum frontale*	Searches; Many detections
Western pond turtle	*Clemmys marmorata*	Searches; Many detections
San Joaquin kit fox	*Vulpes macrotis mutica*	Protocol searches; detections
Sumatran tiger	*Panthera tigris*	Track surveys in Sumatra
Mountain lion	*Puma concolor californicus*	Research and publications
Point Arena mountain beaver	*Aplodontia rufa nigra*	Remote camera operation
Giant kangaroo rat	*Dipodomys ingens*	Detected in Cholame Valley
San Joaquin kangaroo rat	*Dipodomys nitratoides*	Monitoring & habitat restoration
Monterey dusky-footed woodrat	*Neotoma fuscipes luciana*	Non-target captures and mapping of dens
Salt marsh harvest mouse	*Reithrodontomys raviventris*	Habitat assessment, monitoring
Salinas harvest mouse	*Reithrodontomys megalotus distichlus*	Captures; habitat assessment
Bats		Thermal imaging surveys
California clapper rail	*Rallus longirostris*	Surveys and detections
Golden eagle	*Aquila chrysaetos*	Numerical & behavioral surveys
Swainson's hawk	*Buteo swainsoni*	Numerical & behavioral surveys
Northern harrier	*Circus cyaeneus*	Numerical & behavioral surveys
White-tailed kite	*Elanus leucurus*	Numerical & behavioral surveys
Loggerhead shrike	*Lanius ludovicianus*	Large area surveys
Least Bell's vireo	*Vireo bellii pusillus*	Detected in Monterey County
Willow flycatcher	*Empidonax traillii extimus*	Research at Sierra Nevada breeding sites
Burrowing owl	*Athene cunicularia hypugia*	Numerical & behavioral surveys
Valley elderberry longhorn beetle	*Desmocerus californicus dimorphus*	Monitored success of relocation and habitat restoration
Analytical		
Arroyo southwestern toad	*Bufo microscaphus californicus*	Research and report.
Giant garter snake	*Thamnophis gigas*	Research and publication
Northern goshawk	*Accipiter gentilis*	Research and publication
Northern spotted owl	*Strix occidentalis*	Research and reports
Alameda whipsnake	*Masticophis lateralis euryxanthus*	Expert testimony

RE: Comments on Final Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Final Environmental Impact Report ("FEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project") as well as the terms of a recent Agreement entered into by UCSF and the City of San Francisco. This comment letter includes comments by Jared Ikeda, who submitted comments on the DEIR and who has also reviewed the FEIR. Our review focused on the new Agreement as well as the adequacy of the FEIR's Master and comment letter-specific responses directed at our comments on the Draft EIR.

After carefully reviewing the FEIR for the Project we have concluded the FEIR fails in numerous respects to comply with CEQA and to fulfill CEQA's fundamental mandate. As described below, the FEIR violates this law because it fundamentally fails to adequately respond to our comments. The purpose of each response to a comment on the Draft EIR is to address the significant environmental issue(s) raised by each comment. Specifically, Section 15088(b) of the CEQA Guidelines requires that the written response describe the nature of the significant environmental issues raised. When the lead agency's position conflicts with recommendations and objections raised in the comments, the environmental issues must be addressed in detail giving reason why specific comments and suggestions were not accepted. Here, the Final EIR summarily dismisses many comments without addressing their merits.

In addition to the Final EIR's failure to adequately address numerous comments on the Draft EIR, a recent agreement between UCSF and the City of San Francisco fundamentally changes the Project Description. Specifically, the agreement commits UCSF to build 1,263 additional new units for faculty, students and staff, for a Project total of 2,025 new housing units. While

increasing the number of housing units in the Project may have beneficial implications, the fact is the numerous, potentially significant impacts associated with more than doubling the housing in the Project have not been analyzed. Potentially significant impacts caused by this substantial increase in housing units include, but are not limited to impacts to public services and facilities, impacts to parking, traffic and transit, aesthetic impacts and other impacts associated with a significant increase in population in the neighborhood. Moreover, as described below, the addition of these units to the Project destabilizes the Project as described in both the DEIR and FEIR, requiring recirculation of a Draft EIR that adequately analyzes the impacts associated with the changed Project.

I. The Final EIR Fails to Adequately Respond to Comments

As stated above, the fundamental purpose of each response to a comment on the Draft EIR is to address the significant environmental issue(s) raised by each comment. Specifically, Section 15088(b) of the CEQA Guidelines requires that the written response describe the nature of the significant environmental issues raised. When the lead agency's position conflicts with recommendations and objections raised in the comments, the environmental issues must be addressed in detail giving reason why specific comments and suggestions were not accepted. Here, the Final EIR summarily dismisses many comments without addressing their merits.

There is no better example of the FEIR's failure to adequately respond to comments than the Final EIR's response to comments on the Project's aesthetic impacts. Responses to comments documenting significant impacts associated with the Project contend that placing a 294 foot tower in a residential neighborhood has no aesthetic impacts whatsoever. Comments are disregarded based on UC's argument that it need not comply with local planning, zoning and other regulations. This massive non-conformity – a nearly 300 foot tower – clearly causes a significant impact as documented in comments submitted by Jared Ikeda, me and many other commentors.

Comments concerning the significance of visual impacts are further dismissed based on the following responses:

- Visual simulations submitted in comments by Jared Ikeda are not the same as a ground-level observer would see.

- Simulations misrepresent the effect of the proposed new hospital. The new hospital would certainly be visible from these locations, but it would take up a small portion of the horizon and only from Tank Hill would the new building obscure any ocean view at all from publicly accessible viewpoints.

- The trailhead at Farnsworth would be partially obscured by vegetation and narrow field of view and is not a high quality viewpoint and visual change is not considered significant.

- UCSF is constitutionally exempt from local land use regulations and therefore not required to undergo review by City of San Francisco Planning Dept Urban Design Advisory Team or conform to policies, principles and other provisions concerning land use and aesthetics.

None of these responses address the pure fact that the Project's nearly 300 foot tower will result in significant visual impacts. Specifically, the preparation of visual simulations using Google Earth was intended to provide context to the visual impacts from the proposed building height and mass of the new hospital. The proposed new hospital at 16 stories and 294 feet in height is clearly shown by the before and after figures to radically alter the scenic quality from different nearby viewpoints. Simulations submitted by Jared Ikeda in comments on the DEIR illustrate that the proposed building mass changes the view scenery significantly. While not ground-level simulations, the simulations illustrate the expected change in scenery and provide the visual context from these locations. The fact that the views will be changed is irrefutable and cannot be denied or put aside as insignificant. In certain locations within the neighborhood as illustrated by the simulations submitted in comments on the DEIR, the view is blocked by the new structure in some cases and radically altered in others. The different simulations that were provided in comments demonstrate these conditions. The notion that vegetation and other features may partially obscure the view of the new hospital does not change the fact that there will be a change to the view and scenic qualities at the Farnworth Trail as well as other publicly accessible viewpoints and the neighborhood.

The argument that the proposed plan is constitutionally exempt from local land use regulations does nothing to the address the fact that the Project significantly impacts the view from publicly accessible viewpoints and the general neighborhood. It is a specious argument to say that because University is not required to undergo a review with the City's Urban Design Advisory Team or comply with the City's rules, that there are no significant impacts associated with this massive tower. The Final EIR simply fails to adequately respond.

The Final EIR states that the new hospital would be visible from various publicly accessible viewpoints but concludes that these scenic vistas would not be substantially or adversely impacted. Clearly the massive new hospital structure will significantly alter views and is out of scale with the neighborhood, but because the Final EIR does not agree, feasible mitigation measures and alternative capable of reducing or eliminating these impacts are also disregarded (e.g., reducing the height of the new hospital, off-site options for the new hospital component of the Project).

Moreover, compliance with the City of San Francisco's adopted policies and regulations remains a key indicator of whether the Project is or is not compatible with the surrounding neighborhood. UCSF clearly understood the breaking point for compatibility in its 1976 Regents' Resolution. Recognizing the unique and constrained location the Parnassus Heights

campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part:

- "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent."

In addition, the Resolution recognizes the transportation problems in the area and commits funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit. The Final EIR cannot dismiss significant impacts based on UCSF's disregard for City policy and regulations. The additional housing units will further strain this constrained neighborhood by increasing population and in turn putting additional demands on the transportation system and other support systems. The demands from additional housing can feasibly be offset by a reduced or relocated hospital so that the overall Project stays within the constraints and limitations of this unique neighborhood.

II. The DEIR Should be Revised and Recirculated to Address UCSF's Commitment to Build 1,263 New Housing Units

A fundamental requirement of CEQA is that an EIR contain an accurate, complete and stable project description. Without a complete and stable project description, an agency and the public cannot be assured that all the project's environmental impacts have been revealed and mitigated. Further, CEQA and the CEQA Guidelines mandate that an EIR include a description of the "physical environmental conditions . . . from both a local and a regional perspective. . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines Section 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR – and thus the decision-makers, agencies and public who rely on the EIR – cannot accurately assess the potentially significant impacts of the proposed Project.

Although the Final EIR responses summarily and improperly dismissed the argument that the Project Description is in flux due to COVID-19, there is no mistaking the significant change to the Project the addition of 1,263 new housing units for students, faculty and staff means. More than doubling housing constitutes a huge change in the Project as well as its overall impacts. As a result of this Agreement between UCSF and San Francisco, a revised and recirculated DEIR is required to address among other likely significant impacts, impacts to public services and facilities (including schools), traffic, parking and transit, as well as aesthetic and other impacts associated with such a massive increase in the scale of the project. This change in the Project also changes the analysis in the Draft and Final EIR's of the projects growth inducing effects since the new housing fundamentally changes the prior analysis. For example, 1,263 new units will have a multiplier effect in terms of public services and facilities needed in the neighborhood, including but not limited to parks and open space, schools and essential

services. This and other impacts must be analyzed in an environmental document, preferably a revised DEIR, that is circulated for public review and comment. A revised DEIR presents the opportunity to include an adequate growth inducing analysis and analysis of population and housing, missing from the DEIR and dismissed in the FEIR as too speculative. For a Project that will guide development of the campus for 30+years and likely be the basis of streamlined permitting for project facilities and infrastructure, it is especially important that the DEIR comprehensively identify and analyze its impacts on growth, population, housing and employment.

III. The FEIR Improperly Dismisses Feasible Alternatives

Alternatives are optional ways that the Project could achieve most of the objectives while also reducing or eliminating the environmental impacts of the Project. (California Public Resources Code Section 21002). The Final EIR improperly dismisses numerous alternatives as infeasible based on objectives alone, including off-site alternatives -- such as building the hospital at the Hunter's Point Candlestick Park site -- that reduce significant impacts associated with the Project.

The fundamental mandate is that "public agencies should not approve projects if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of the project" (PRC Section 21002, 21081). Government agencies are required to consider alternatives to proposed actions affecting the environment. (PRC Section 21001 (g)). Alternatives need not meet all of the objectives and their fundamental purpose is to reduce or eliminate Project impacts.

Alternatives may not be rejected merely because they fail to meet some of the project objectives, are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)).

Feasible alternatives to the Project, improperly dismissed by the Final EIR, that would reduce or eliminate significant Project impacts should be reinstated for consideration including the following:

- No New Hospital at Parnassus Heights Campus Site and instead one of the following:
    - Implement Phase 2 of Medical Center at Mission Bay Campus Site.
    - New Hospital at Mount Zion Campus Site.
    - Seton Hall Hospital Facility, which stands empty.

- New Hospital at Hunters Point at the Candlestick site formerly slated for a new shopping mall. Locating the new hospital here would avoid many of the impacts associated with the Parnassus site, and would have may co-benefits such as providing jobs in and health services to an underserved and disadvantaged community.

The reasons provided in the Final EIR for dismissing these alternatives largely come down to whether or not the alternative met narrowly drafted Project objectives. The opportunity to revise and recirculate the DEIR to include 1,263 units of additional new housing, also provides an opportunity to address the shortcomings in the alternatives analysis. The DEIR Must be Revised and Recirculated.

Decision makers and the public cannot possibly assess the Project's impacts through the present DEIR and FEIR, both riddled with omissions, errors and inconsistencies. Among other fundamental deficiencies, both DEIR and FEIR repeatedly understate the Project's significant environmental impacts and therefore fail to formulate feasible mitigation to reduce these impacts. To resolve these issues, a revised DEIR that would necessarily include substantial new information must be prepared and recirculated.

Sincerely,

Terry Watt

Sixteen-story, 995,000 Square-Foot New Hospital Proposed in Parnassus Heights

(Administrative Record (AR) 3667, 5914.)

Introduction

UCSF's Parnassus Heights campus lies in a beautiful but constrained location within a residential community on the slopes of Mount Sutro. This action challenges the Comprehensive Parnassus Heights Plan ("CPHP" or "Project") approved by the respondent University of California. The CPHP is wildly out of scale in Parnassus Heights. It envisions about six million square feet of construction, including a hospital of almost a million square feet. Decades ago, UC committed not to expand the campus in such impactful manner. Instead, it repeatedly leveraged its space cap promise to justify locating medical facilities that it now it operates successfully in other parts of the City — including at Mission Bay.

The CPHP EIR fails to analyze or mitigate many significant Project impacts and refused to study alternate sites for a new hospital at any other of UC's City properties. Petitioners thus seek enforcement of mandates of the California Environmental Quality Act via this Court's judgment and writ.[1]

Statement of Facts

UCSF's Parnassus Heights Campus in San Francisco includes 107 acres in the Inner Sunset. The sixty-acre Mount Sutro Open Space Reserve lies within the central and southern portion of the campus.

In response to neighborhood concerns, in 1976 UCSF permanently committed to limit buildings on the Parnassus campus to 3.55 million gross square feet (the "space ceiling"). (AR 43029-31; 43046-47.) UC reaffirmed this commitment in 2014 in the UCSF Long Range Development Plan ("2014 LRDP"). (AR 13483.) UC's space ceiling resolution designated the Mount Sutro Open Space Reserve as permanent open space and altered campus boundaries to permanently exclude certain properties and prohibit further expansion within a defined surrounding area. (AR 43029-31; 43046-47.)

The 2014 LRDP established strategies to reduce a space ceiling "overage" that existed at that time by "1) converting some existing office space (UC Hall and Millberry Union towers) to residential use; 2) demolishing a number of buildings and either moving occupants and programs to other campus sites or absorbing them into other buildings at Parnassus Heights; and 3) excluding all residential space from the space ceiling calculation." (AR 13523.) The 2014 LRDP also limited new construction "to the need to comply with state seismic legislation and to better meet campus housing goals" (AR 13519) and to build a "New Hospital Addition." (AR 13523.)

The CPHP would gut and exceed the 3.55 million gross square foot permanent space ceiling by 1.44 million gross square feet. Housing was excluded from the calculation, and so the resulting development would be approximately six million gross square feet, exceeding the promised space

[1] CEQA is codified at Public Resources Code sections 21000, *et seq*. All statutory citations *post* are to the Public Resources Code unless otherwise noted.

ceiling by nearly 100%. (AR 3684.) The CPHP proposes several projects to be completed by 2030, the largest being a sixteen-story, 294 foot-tall New Hospital and a new research and academic building. Other phases would be constructed through 2050. The CPHP calls for 2.9 million gross square feet of new buildings at the campus and amends the 2014 LRDP. (AR 3684 [Table3-2].)

The 2014 LRDP required retaining, and in some cases re-purposing, several historic campus buildings, including UC Hall and Milberry Union. (AR 13523.) The CPHP reverses course. It proposes to demolish buildings that are historically significant and eligible for or already listed in the California Register of Historical Resources. Their loss would cause significant environmental impact. These buildings include UC Hall, Millberry Union, School of Dentistry, Langley Porter Psychiatric Institute, Aldea San Miguel Housing Buildings 8, 10, and 12, and Saunders Court. (AR 238-43; 1738-49; 1755-56; 3890-3906; 3912-13; 6621-22.)

Standard of Review

"The foremost principle under CEQA is that the Legislature intended the act 'to be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language.'" (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 511 [Citations] (*County of Fresno*).) An EIR must reflect a good faith effort at full disclosure, with "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (*Laurel Heights Improvement Association v. Regents of University of California* (1988) 47 Cal.3d 376, 405 (*Laurel Heights I*); Cal. Code Regs., tit.14 ("Guidelines"), § 15151.)

In reviewing an EIR, courts determine whether the agency prejudicially abused its discretion by: (1) failing to proceed in the manner required by law, or (2) reaching a decision or determination that is not supported by substantial evidence. (*Laurel Heights I*, *supra*, 47 Cal.3d at 392.) "A reviewing court must adjust its scrutiny to the nature of the alleged defect, depending on whether the claim is predominantly one of improper procedure or a dispute over the facts." (*Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 435 (*Vineyard*).)

If an EIR fails to address an issue or omits essential information, courts employ de novo review to determine whether the agency violated the statute's disclosure requirements. (*Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal.5th 918, 935 (*Banning Ranch*).) Similarly, the sufficiency of an EIR's discussion of environmental impacts is reviewed de novo. (*County of Fresno*, *supra*, 6 Cal.5th at 514 ["whether a description of an environmental impact is insufficient because it lacks analysis or omits the magnitude of the impact is not a substantial evidence question."].) An EIR must analyze every issue for which the record contains substantial evidence supporting a "fair

argument" of significant impact. (*Visalia Retail*, *LP v. City of Visalia* (2018) 20 Cal.App.5th 1, 13 (*Visalia Retail*); *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 (*Amador Waterways*).)

Courts use the "substantial evidence" test to review an agency's factual conclusions. (*Vineyard*, *supra,* 40 Cal.4th at 435.) But "the existence of substantial evidence supporting the agency's ultimate decision . . . *is not relevant* when one is assessing a violation of [CEQA's] information disclosure provisions." (*Communities v. Richmond*, *supra*, 184 Cal.App.4th at 82 (italics added).) While substantial evidence review defers to an agency's role as fact-finder, such deference does not abdicate vigorous judicial review. (*Laurel Heights I*, *supra*, 47 Cal.3d at 409, fn. 12 ["We do not suggest that a court must uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference."].)

Argument

A. The EIR's Analyses of Growth Inducement and Population and Housing Impacts are Inadequate[2]

1. Facts Regarding Growth Inducing and Population/Housing Impacts

The campus population of students, faculty, staff, patients, and visitors is currently almost 18,000 and would increase due to the Project by almost 8,000 people by 2050, for a total campus population of over 25,000. (AR 4143; 4262; 1979.) The EIR explains that CPHP-induced population growth by 2050 in San Francisco would be about 7,300 and in the surrounding four counties about 5,500 persons. (AR 4262; 1979.) The EIR does not disclose campus-related employment, but indicates the Project would add over 4500 staff and faculty positions and 3400 related jobs by 2050; a total creation of about 8,100 new jobs. (AR 4143; 4264.)

The CPHP as proposed and evaluated in the EIR would develop 762 units of on-campus housing for students, faculty, and staff by 2050. (AR 13; 3670; 3675-76; 4262; 4145). At the eleventh hour before approving the CPHP, UC decided to build another 1,263 off-campus housing units. (AR 13; 262.) These off-campus units are not included in the EIR's project description, analysis of growth inducing impacts, analysis of population and housing impacts, or Mitigation Monitoring and Reporting Program ("MMRP"). (AR 3643-86; 4262-65; 4142-49; 6577-6607).

2. Introduction to Growth Inducement and Population/Housing Impacts

The EIR commits several legal errors in its analysis of off-campus housing displacement effects. It uses thresholds of significance that exclude consideration of substantial evidence that such impacts

[2] The issues in this section are "exhausted" in comments at AR 5822; 5878-84; 5894-5901; 758-59; SAR 63067-68. "SAR" refers to the proposed Supplemental Administrative Record attached to Petitioner's Motion to Augment Administrative Record.

may be significant. (*Visalia Retail*, *supra*, 20 Cal.App.5th at 13 [EIRs must analyze every issue for which the record provides a "fair argument" of significant impact]; *Amador Waterways*, *supra*, 116 Cal.App.4th at 1108-1109 ["thresholds cannot be used to determine automatically whether a given effect will or will not be significant"].)

As the Project would create many more jobs than houses, it would contribute to the severe existing "jobs/housing imbalance" in San Francisco and the Bay Area. When the people employed in an area greatly exceed available affordable housing, economic and social consequences lead to adverse impacts on the physical environment — within the purview of CEQA. Housing costs increase, driven by high demand and low supply, resulting in population displacement by "gentrification," as people with lower income are forced to seek lower housing costs elsewhere. The EIR omits analysis of such impacts, erroneously dismissing them as "social and economic."

CEQA recognizes a "significant effect on the environment" where "effects of a project will cause substantial adverse effects on human beings, either directly or indirectly." (§ 21083 (b)(3).) The San Francisco Department of Public Health has published guidance for assessing the effects of housing displacement caused by development projects, finding that physical effects include stress, unsafe housing, crowding, homelessness, unmet transport needs, and increased service needs. (AR 6867, 6869-70 ["Inadequate or unaffordable housing forces San Francisco residents into crowded or substandard conditions; requires them to compromise access to jobs and services, and quality education; and requires them to work multiple jobs to make ends meet"].)

CEQA requires that an EIR include a detailed statement of the growth-inducing impact of a proposed project. (§ 21100 (b)(5); Guidelines, § 15126.2 (e) [an EIR must "[d]iscuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment"].) A project has significant impacts if it would "induce substantial population growth in an area, either directly . . . or indirectly . . . ," or if it would "[d]isplace substantial numbers of people, necessitating the construction of replacement housing elsewhere." (Guidelines, Appendix G, §§ XIV(a), (b)).) The interplay between a project's economic and social effects is explained in the Guidelines at section 15064 subdivision (e):

> Economic or social changes may be used to determine that a physical change shall be regarded as a significant effect on the environment. Where a physical change is caused by economic or social effects of a project, the physical change may be regarded as a significant effect in the same manner as any other physical change resulting from the project. . . . If the physical change causes adverse economic or social effects on people, those adverse effects may be used as a factor in determining whether the physical change is significant. For example, if a project would cause overcrowding of a public facility and the overcrowding causes an adverse effect on people, the overcrowding would be regarded as a significant effect.

(*Citizen's Association for Sensible Development v. County of Inyo* (1985) 172 Cal.App.3d 151, 170-71 (*County of Inyo*) ["the lead agency shall consider the secondary or indirect environmental consequences of economic and social changes"].)

3. The EIR Omits Analysis of the CPHP's Off-Campus Housing Displacement Effects

The EIR analyzes "growth inducing" and "population and housing" impacts in separate chapters (AR 4262 [Ch 5.4]; 4137 [Ch 4.12]) but acknowledges that they are closely related. (AR 2097-99, 4262-64.) The EIR recognizes "the pressing need for affordable housing in San Francisco." (AR 3675-76.) The EIR concedes that "[c]ampus population growth under the proposed CPHP would not be entirely accommodated by the existing and new housing on site, and therefore would result in indirect housing demand beyond the campus site." (AR 4262.) Despite these facts, the EIR fails to analyze the off-campus housing displacement effects of CPHP-induced increases in student, faculty, and staff populations, new jobs, and housing demand.

For "population and housing" impacts, the EIR establishes three "significance criteria," querying whether the CPHP would:

> a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?
> b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?
> c) Exceed the LRDP EIR standard of significance by creating a demand for housing outside the market area where the facilities or site are located?

(AR 4142.) The EIR explains that criteria a) and c) are addressed in Impact POP-1 and criterion b) is addressed in Impact POP-2. (AR 4142.)

Impact POP-I relates to "unplanned population growth" and the creation of "demand for housing outside the market area." (AR 1979-83.) Impact POP-2 ostensibly relates to whether the CPHP would "displace substantial numbers of existing people or housing" that would "necessitate the construction of replacement housing elsewhere." (AR 1983, 4147.) The EIR admits that the project would draw thousands of new residents to the area; Impact POP-1 acknowledges "the housing demand associated with employment growth under the proposed CPHP." (AR 1982; 4146.) But while the EIR acknowledges that the CPHP-induced increase in population growth and associated demand for housing in the City's housing-short environment might indirectly displace residents and increase housing demand, its analyses of Impacts POP-1 and POP-2 do not analyze Project "housing displacement" effects in San Francisco or in the campus environs. The EIR discusses Impact POP-2 only as to temporary displacement of tenants in the Aldea housing complex on campus. (AR 1983-84, 4147.)

The EIR erroneously contends that gentrification is merely a social impact that need not be analyzed. (AR 5797-5800.) The EIR deploys thresholds of significance that artificially confine analysis to on-campus effects. It then fails to assess the indirect physical effects of gentrification/displacement as outlined by the Department of Public Health. (AR 5879, 5989; 6867-85.) The ignored effects include the CPHP-induced need for building new housing, which is a significant environmental impact. (*Ante*; Guidelines, Appendix G, § XIV (b).) The EIR's analysis of Impacts POP-1 and POP-2 and the FEIR's responses to comments as to those impacts are thus either irrelevant to the claimed legal error or not supported by substantial evidence.

Urban planner Terry Watt, ACIP [American Institute of Certified Planners], provided substantial evidence supporting a fair argument that the CPHP may cause a significant impact on housing demand in San Francisco; to wit: (1) the City is suffering a severe shortage of housing as well as a severe shortage of affordable housing; (2) for well over a decade, new jobs in the City far outstrip the rate of construction of new housing; and (3) the Project would exacerbate both of these existing conditions. (AR 5894-5901; 6711-13.) The EIR was thus required to analyze and mitigate the impact, and did not. (*Visalia Retail*, *supra*, 20 Cal.App.5th at 13.)

As Ms. Watt explained, the EIR fails to disclose that while Project-generated demand for housing would vastly outstrip construction of Project-related housing, San Francisco and the region have been grossly under-building while generating significant new jobs. In fact, the EIR provides no information about the current local and regional housing crisis, housing availability in the surrounding neighborhood and City, or affordability. The EIR fails to describe typical anticipated jobs and salaries of new faculty and staff, critical to estimating the percent that may qualify — along with students — as low income or very low income and likely require new low-cost housing. The EIR fails to acknowledge or offer mitigation for the fact that UCSF is a major contributor to the affordable housing crisis and would exacerbate that crisis by building out the CPHP without providing additional units affordable to new students, faculty, staff, and employees of supporting services. (AR 5894-5901.)

Since the record contains a fair argument that impacts may be significant, the EIR's omission of these analyses is prejudicial legal error. The standard for whether information omitted from an EIR is "essential" is similar to whether any procedural violation of CEQA is prejudicial. For the omission of essential information, "[t]he ultimate inquiry . . . is whether the EIR includes "enough detail 'to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'" (*County of Fresno*, *supra*, 6 Cal.5th at 516.) Similarly, "omission in an EIR's significant impacts analysis is deemed prejudicial if it deprived the public and decision makers of

substantial relevant information about . . . likely adverse impacts." (*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 463.)[3]

In addition to failing to assess physical effects of displacement and gentrification, the EIR erred by limiting analysis to on-campus effects. CEQA requires that an EIR evaluate, and that public agencies mitigate or avoid, significant effects of projects in the "area which will be affected." (*City of San Diego v. Board of Trustees of California State University* (2015) 61 Cal.4th 945, 957 (*City of San Diego*); *City of Marina*, *supra*, 39 Cal.4th at 367 ["CEQA does not . . . limit a public agency's obligation to mitigate or avoid significant effects to effects occurring on the agency's own property"]; Guidelines, § 15360.)

This rule applies to UCSF with particularity because CEQA and the Education Code require that UC analyze and mitigate off-campus impacts. (§ 21080.09 (b); Ed. Code, § 67504 (b)(1) ["the expansion of campus *enrollment and facilities* may negatively affect the surrounding environment. Consistent with . . . CEQA, it is the intent of the Legislature that the University of California sufficiently mitigate significant off-campus impacts related to campus growth and development" (italics added)]; *Save Berkeley's Neighborhoods v. Regents of University of California* (2020) 51 Cal.App.5th 226, 231 ("[G]rowth includes student enrollment increases, which the Legislature has acknowledged 'may negatively affect the surrounding environment'" [citing Ed. Code, § 67504 (b)(1)]).) The EIR's narrow focus on the Project's growth-inducing potential and tenant relocation impacts *on campus* ignores the physical impacts of CPHP-induced growth that would occur in the surrounding area.

The FEIR's response to comments raising concerns about housing are non-responsive or reflect legal errors discussed in the next section. Master Response 14 simply restates what the DEIR said about growth-inducing and population/housing impacts. (AR 5792-96.) It provides no new analysis in response to the comments. For example, it states that the Draft EIR "finds that the new households would create a demand for housing that would not be entirely accommodated by the existing and new housing on the Parnassus Heights campus site; that the result would be housing demand (and associated population growth) beyond the campus site;" and that while San Francisco

> . . . is the primary area that would be affected directly by CPHP-related population and housing effects, effects would extend beyond San Francisco to neighboring counties in the Bay Area. The Draft EIR explains that it would be speculative to characterize the site-specific environmental effects resulting from the development of such off-site housing as the development would occur over a large five-county area and over a period of time (note that the CPHP covers a period of 30 years).

[3] See also *San Joaquin Raptor I*, *supra*, 27 Cal.App.4th at 721-722 ["error is prejudicial 'if the failure to include relevant information precludes informed decisionmaking and informed public participation, thereby thwarting the statutory goals of the EIR process,'"], quoting *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712 (*Kings County*)].

(AR 6796.) The response artfully evades the question presented by the comments regarding the nature and extent of impacts on the community and the environment of additional affordable housing demand in a city with a dire shortage.

Master Response 14 also contends that the comments "conflate the conclusions of the population and housing analysis . . . with the CPHP's growth inducing effects . . . to assert that the Draft EIR is seeking to diminish the significance of the effects of the project on housing" and that "the two analyses are distinctly different in the impacts that they address." (AR 5796.) This response is immaterial. The EIR is required to analyze and identify mitigation for the CPHP's housing displacement impact; it fails to do so as described above, and the response fails to explain how or why any purported differences between population/housing and growth-inducing impacts under CEQA are relevant.

Master Response 15 makes two legal arguments, *i.e.*, that gentrification need not be studied because it is *only* a social and economic effect *and* that analyzing the indirect effect on the physical environment of the gentrification caused by the CPHP would be "speculative." (AR 5797-5800.) Both arguments constitute legal error.

The response cites appellate decisions for the proposition that gentrification is a social and economic effect. (AR 5798-800.) It fails to explain that the cases recognize that where substantial evidence supports a fair argument that a project's social and economic effects may indirectly lead to significant impacts on the physical environment, they must be studied in an EIR. (*E.g.*, *Joshua Tree Downtown Business Alliance v. County of San Bernardino* (2016) 1 Cal.App.5th 677, 685 ["only if the loss of businesses affects the physical environment — for example, by causing or increasing urban decay — will CEQA be engaged"]; *Maintain Our Desert Environment v. Town of Apple Valley* (2004) 124 Cal.App.4th 430, 446 ["social, economic and business competition concerns are not relevant to CEQA analysis unless it is demonstrated that those concerns will have a significant effect on the physical environment"]; *Goleta Union School Dist. v. Regents of University of California* (1995) 37 Cal.App.4th 1025, 1030-31 ["An EIR may trace a chain of cause and effect from a proposed decision on a project through anticipated economic or social changes resulting from the project to physical changes caused in turn by the economic or social changes"].)

As noted above, Ms. Watt's expert opinion provides substantial evidence supporting a fair argument. (*E.g.*, AR 5900 ["Based on accurate information about the pre-Covid SF and Bay Area housing crisis (summarized above), it can reasonably be concluded that the addition of 5,200 students, faculty and staff by 2050 and only 984 units produced, the housing need generated constitutes a significant impact"].) The EIR cannot lawfully omit any analysis of the issue.

The EIR's conclusion that the analysis would be "speculative" is unsupported by fact. (*Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The EIR must contain facts and analysis, not just the bare conclusions of a public agency"].) Ms. Watt details many types of information the EIR could and should have developed to conduct the required analysis. (AR 5894-5901.) UC failed to "use its best efforts to find out and disclose all that it reasonably can." (Guidelines, § 15144.) In *Stanislaus Audubon Society*, *Inc. v. County of Stanislaus* (1995) 33 Cal.App.4th 144, for example, the Court found substantial evidence that a proposed country club could induce housing development. As a result, it was inappropriate for the County to postpone review of the likely environmental effects until such effects had manifested. (*Id*. at158-59; see also *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal.App.4th 342, 370-71 (*Napa Citizens*) [an agency may not defer analysis of housing effects simply because the nature and extent of such development is unknown]; *City of Antioch v. City Council* (1986) 187 Cal.App.3d 1325, 1338.)

In sum, the EIR fails to include mandatory analysis of whether CPHP-induced increases in population and demand for housing would indirectly cause significant impacts on the physical environment and people off-campus by displacing people from their homes and creating a need for construction of new housing.

4. The EIR Incorrectly Applies "Ratio Theory" and Improper Baseline to Growth Inducement and Population and Housing Impacts [4]

The EIR's conclusion that CPHP growth inducement and population/housing impacts would be less than significant is based on additional errors of law. The EIR states:

> Implementation of the proposed CPHP would induce population growth in the Bay Area, but the population growth would *not be substantial in comparison* to growth that is projected and planned for San Francisco and the four study area counties in Plan Bay Area 2040 and the local general plans for the study area communities. Further, the population growth would not result in a demand for new housing that would exceed the capacity of the five-county market area.

(AR 1981; 4145 (italics added).) The EIR's rationale that the CPHP's growth is "not substantial in comparison" to growth projected for San Francisco and the four-county study area invokes the discredited "ratio theory."

CEQA prohibits such "drop in the bucket" analysis. (*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 515 (*Cleveland I*) ["SANDAG's conclusory statement that its role in achieving the Executive Order's 2050 emission reduction target is 'likely small' is not a valid reason for rejecting the target as a measure of significance"]; *San Francisco Baykeeper, Inc. v. State Lands Commission* (2015) 242 Cal.App.4th 202, 223 ["this approach 'avoids analyzing the

[4] These issues are "exhausted" in comments at AR 5880.

severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling.'"]; *Friends of Oroville v. City of Oroville* (2013) 219 Cal.App.4th 832, 841-42; *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 (*CBE v. Resources*) ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County*, *supra*, 221 Cal.App.3d at 718.)

Also, by comparing CPHP-induced growth to *planned* growth in the entire City and region, the EIR improperly compares the impact to what is allowed in planning documents rather than what exists in the environment. (*Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 321, n.6 (*South Coast*); *Environmental Planning and Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 358-59.)

5. The EIR Piecemeals Analysis of the New Housing Initiative[5]

Only days before approval of the CPHP, UC and the City and County of San Francisco agreed to a Memorandum of Understanding in which UC agreed to build 1,263 off-campus housing units. (AR 13; 262; 1302; 1314-15; 1355.) As noted above, this construction was *not* included in the EIR's project description, analysis of growth inducing or population and housing impacts, or the MMRP. But this new housing became part of the Project. Therefore, the EIR was required to study and mitigate its impacts.

CEQA's conception of the term "project" remains broad to maximize protection of the environment. (*Friends of the Sierra Railroad v. Tuolumne Park & Recreation Dist.* (2007) 147 Cal.App.4th 643, 653; *San Joaquin Raptor I*, *supra*, 27 Cal.App.4th at 730). "This big picture approach to the definition of a project (*i.e.*, including "the whole of an action") prevents a proponent or a public agency from avoiding CEQA requirements by dividing a project into smaller components which, when considered separately, may not have a significant environmental effect." (*Nelson v. County of Kern* (2010) 190 Cal.App.4th 252, 270-271.) Lead agencies must also evaluate the environmental impacts of reasonably foreseeable future activities associated with a CEQA project that may contribute to significant environmental effects. (*Laurel Heights I*, *supra*, 47 Cal.3d at 395-396.) This obligation attaches whether the new housing is considered part of the Project, a foreseeable future activity, or a separate project subject to cumulative effects analysis; one way or the other the EIR must conduct the analysis. (*San Joaquin Raptor I*, *supra*, 27 Cal.App.4th at 733.) Construction of off-campus housing is a reasonably foreseeable future activity associated with implementation of the CPHP.

Moreover, CEQA does not permit last minute changes to the project description. (*Washoe Meadows Community v. Dept. of Parks & Recreation* (2017) 17 Cal.App.5th 277 ["[F]or a project to be

[5] These issues are "exhausted" in comments at AR 750-753; SAR 3067-68.

stable, the DEIR, the FEIR, and the final approval must describe substantially the same project."]) "The defined project and not some different project must be the EIR's bona fide subject." (*Concerned Citizens of Costa Mesa v. 32nd Dist. Agricultural Assn*. (1986) 42 Cal.3d 929, 934.)[6] After adding 1,263 residential units, the DEIR, FEIR, and Findings do not describe the Project.

The EIR's omission of any analysis of whether CPHP-induced housing demand would cause significant environmental effects by displacing people from their homes and construction of new housing is a prejudicial legal error warranting issuance of a peremptory writ. Its absence precludes "those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'" (*County of Fresno*, *supra*, 6 Cal.5th at 516).

B. The EIR Fails to Lawfully Assess Impacts on Beach Water Quality[7]

1. Introduction and Standard of Review for Beach Water Quality Claims

CEQA requires that an EIR evaluate, and that agencies mitigate or avoid, significant effects of projects in the "area which will be affected by a proposed project." (*City of San Diego*, *supra*, 61 Cal.4th at 957; Guidelines, § 15360.) The project description is the activity the EIR evaluates for environmental impact (*Nelson v. County of Kern* (2010) 190 Cal.App.4th 252, 271-272; § 21065), while the environmental setting (i.e., baseline) is the condition of the environment against which the EIR will evaluate project changes for environmental harm (*South Coast*, *supra*, 48 Cal.4th at 315). Therefore, CEQA requires that an EIR describe the environmental setting. (*Ibid*; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 874 (*Eel River*); Guidelines, § 15125.) An EIR's description of the environmental setting must also describe relevant regulatory actions by other agencies that affect the setting. (*Eel River*, *supra*, 108 Cal.App.4th at 874 ["the EIR's description of the Project's environmental setting is deficient because it does not disclose . . . the fact that FERC is considering proposals to curtail these diversions in order to prevent harm to these species"].)

Here, the DEIR fails to describe either physical or regulatory components of the environmental setting as they relate to potential significant impacts on beach water quality. The DEIR then fails to assess Project impact on that water quality, which is severely degraded. The whole issue is ignored. (AR 1895-1911 [DEIR, Ch.4.9].) Extensive comments, including data showing current water quality conditions, explained how the Project's admitted increases in waste and storm water discharges would exacerbate this pollution. (AR 6052-65, 7461-8889.) Because substantial evidence supports a "fair argument" that the Project may cause a significant impact on beach water quality, the EIR was required

---

[6] Whether an EIR correctly describes a project is a question of law, subject to de novo review. (*South of Market Community Action Network v. City & County of San Francisco* (2019) 33 Cal.App.5th 321, 332.)

[7] The issues in this section were "exhausted" at AR 6052-65; 856-862; 7461-8889.

to analyze the issue. (*Visalia Retail*, *supra.)* The claim that the EIR omitted essential information is reviewed de novo. (*County of Fresno*, 6 Cal.5th at 516.)

2. The DEIR's Analysis of Impacts on Water Quality

The DEIR discloses that the project would add about 2.0 million square feet of new space and generate about 0.18 mgd (million gallons per day) of new wastewater/sewage. (AR 2084.) The EIR assesses this impact solely in terms of whether it may require construction of new wastewater treatment capacity, which construction might cause secondary environmental impacts. (AR 2063-91.) The DEIR concludes that such new construction would not be needed because "[w]astewater flows from the Parnassus Heights campus site would be directed to the OSP [Oceanside Treatment Plant]" that "has about 26 mgd of excess dry weather treatment capacity, which is adequate to accommodate the increase in flow generated by the net new development envisioned under the proposed CPHP." (AR 2084.)

With respect to stormwater discharges, the DEIR discloses that the campus drains both west to the OSP and east to the Southeast Treatment Plant (SEP) and that San Francisco operates a combined sewer system (CSS) that combines stormwater with sewage for treatment at these plants. The EIR concludes that impacts on surface water quality would be less than significant because the Project-induced increase in the acreage of impervious surfaces is only 4% compared to the current acreage of impervious surfaces on campus, and because operation of the CSS, the OSP, and the SEP is regulated by the San Francisco Regional Water Quality Control Board (Water Board) through permits issued pursuant to the National Pollutant Discharge Elimination System (NPDES) established by the federal Clean Water Act and the state Porter-Cologne Water Quality Control Act. (AR 1905-06.) The DEIR reaches this conclusion without quantifying the increase in stormwater discharge associated with the increase in impervious surface, without mentioning beach water quality or its severely degraded condition, and without a single word devoted to how combined Project-induced increases in sewage and stormwater discharges might exacerbate these conditions.

In addition to the increase in impervious surfaces and unquantified stormwater runoff from the "campus core," the DEIR discloses additional increases in impervious surfaces outside the campus core. (AR 1906.) The DEIR concludes these increases would also not cause significant impacts because of the "same or similar regulatory requirements as those described" for the campus core and because improvements constructed outside the campus boundary would be subject to "construction site runoff requirements and post-construction stormwater controls in accordance with the City Public Works Code and in compliance with the City's Stormwater Management Ordinance." (AR 1906.)

This portion of the DEIR is singularly uninformative. As it did with the increases in runoff from the campus core area, the DEIR provides no clues regarding the degree of increased stormwater runoff

associated with the increase in impervious surfaces outside the core. Also, while the DEIR intimates that off-campus facilities would be subject to San Francisco's "post-construction stormwater controls," it provides no information on the extent to which these controls might reduce CPHP-caused increases in runoff. As it does with Project-generated increases in sewage, the DEIR also relies on "the relatively small change" in Project-generated increases in stormwater discharge to conclude the impact on "stormwater drainage capacity, or additional sources of polluted runoff would be less than significant." (AR 1908.) In sum, the DEIR fails to assess whether increases in sewage and stormwater discharges, which are combined in the city's CSS, may cause significant impacts on beach water quality.

a. The DEIR Fails to Describe San Francisco's Degraded Beach Water Quality

Comments documented the degraded condition of San Francisco's beach water quality. (AR 6055-57.) The San Francisco Public Utilities Commission (SFPUC) monitors shoreline bacteria (*i.e.*, total coliform, e. coli and enterococcus) at sixteen stations around the perimeter of San Francisco where water contact recreation occurs, including additional monitoring whenever a treated discharge from the City's combined sewer system affects a recreational beach. When monitoring shows that bacterial contamination exceeds state health standards, the affected beach is "posted" to discourage water contact recreation. This database shows that between January of 2016 and June of 2020, there were 131 days on which at least one ocean side beach was posted for exceeding state health standards for any of the three types of bacteria tested; 333 days on which at least one bay side beach was posted, and 464 days on which at least one beach was posted.[8] (AR 6056; 7461-75 [Figures 1 through 15 summarizing beach water quality monitoring data January 1, 2016, though June 30, 2020].)[9] These results are in Table 2.[10]

Table 2 [Summary of Figures 1-15]

January 1, 2016, through June 30, 2020	# of days when at least one beach was posted for at least one exceedance of a state health standard [Blue Bars]	# of beach postings for exceedances of state health standards or due to combined sewer system (CSS) overflow [Yellow Bars]	# of exceedances of any state health standard at any beach [Red Bars]
Ocean Side beaches	131	210	298
Bay Side beaches	333	546	936
Ocean and Bay beaches	464	756	1,234

[8] Ocean side beaches are: Baker, China, Ocean, and Fort Funston. Bay side beaches are: Crissy Field, Aquatic Park, Mission Creek, Candlestick Point State Recreation Area, and Islais Creek.

[9] Figures 1 through 15 present monthly totals of days on which San Francisco ocean side and bay side beaches exceeded state health standards for any of the three types of bacteria tested.

[10] For January 1, 2016, though June 30, 2020, these figures show monthly totals for ocean side beaches (Figures 1-5), bay side beaches (Figures 6-10), and ocean and bay side beaches (Figures 11-15.) The SFPUC's raw water quality monitoring data for this time period is at AR 8047-8172.

The DEIR fails to disclose this information. Remarkably, the DEIR also fails to disclose that the waters of San Francisco Bay are listed as impaired for bacterial contamination under section 303(d) of the Clean Water Act ("CWA"), or that in 2016, the State Water Resources Control Board adopted a Total Maximum Daily Load for bacterial contamination for the bay. (AR 6056-57; 7484-86 [Ex 2]; 7488-7502 [Ex 3].)[11] Thus, any discharge exceeding the City's bacterial load allocation violates the CWA. In short, the current environmental setting/baseline at San Francisco's ocean side and bay side beaches is one of severe water quality degradation and the DEIR ignores this elephant in the room.

b. The DEIR Fails to Describe the Dysfunctional Regulatory System Governing San Francisco's Sewage Treatment Plants

As noted above, the Water Board regulates San Francisco's operation of the OSP and SEP through NPDES permits.[12] These permits require the SFPUC to submit monthly and annual self-monitoring reports (SMRs) to the Water Board, by online upload to the California Integrative Water Quality System database (CIWQS). The SMRs include raw data regarding water quality and narrative cover letters. The cover letters describe instances of permit non-compliance. The CIWQS database also includes notices of violations issued by the Water Board.

All instances of NPDES permit non-compliance at the OSP and SEP recorded from January 2016, to June 2020, are presented at AR 8004-22 [Ex 10] and AR 8024-45 [Ex 11], respectively. There were 171 instances of non-compliance and 44 Notices of Violation.[13] All instances of permit non-compliance at the OSP and SEP for the years 2008 through 2014 are presented at AR 7994-8002 [Ex 9]. The OSP and SEP have consistently failed to comply with their NPDES permits, including permit terms limiting bacterial contamination in their effluent discharges to the ocean and bay. Indeed, in 2019 the U.S. Environmental Protection Agency sent two Notice of Violation letters to the City detailing many of the worst violations of federal and state water pollution control laws due to bacterial contamination. (AR 7984-86 [Ex 7]; 7988-91 [Ex 8].) The DEIR ignores all of this.

c. The DEIR's Omission of Essential Information and Analysis Regarding Beach Water Quality Impacts Is Prejudicial

The DEIR's handling of impacts on beach water quality precluded meaningful consideration of the issue. The DEIR fails to describe the most important components of the environmental and regulatory settings relating to beach water quality, including severely degraded water quality conditions

---

[11] The Water Board's Order and Basin Plan Amendment to establish a Total Maximum Daily Load for bacteria at San Francisco bay beaches are AR 7484-86 [Ex 2] and 7488-7502 [Ex 3], respectively.

[12] The OSP is governed by NPDES Permit No. CA0037681, by way of Water Board Orders R2-2009-0062 (AR 7504-7663 [Ex 4]) and R2-2019-0028 (AR 7665-7814 [Ex 5]). The SEP is governed by is NPDES Permit No. CA0037664; Order No. R2-2013-0029. (AR 7816-7982 [Ex 6].)

[13] See AR 8177- 8501 [Ex 13], for the OSP, and AR 8503-8720 [Ex 14], for the SEP.

and the demonstrated inability of San Francisco's CSS to prevent these conditions. (*San Joaquin Raptor I*, *supra*, 27 Cal.App.4th at 722-30; *Eel River*, *supra*, 108 Cal.App.4th at 874.) Establishing the baseline environmental setting at the beginning of the CEQA process is a fundamental requirement so that project changes can be seen in context and significant effects accurately identified. (*Communities v. Richmond*, *supra*, 184 Cal.App.4th at 89.) Here, the DEIR ignores not only the baseline but the entire issue. Readers of the DEIR would have no idea that beach water quality is degraded, that regulatory efforts have failed to clean it up, or that the project may make it worse.

The DEIR also fails to describe the Project in enough detail to inform any analysis of water quality impacts, most egregiously with respect to increases in impervious surfaces outside the campus core. In addition, discussion of water quality impacts fails to account for stormwater and sewage being combined in the same pipes for conveyance to the OSP and SEP. Instead, the DEIR describes these waste streams in separate chapters, minimizing their combined impact. (AR 1895-1911; 2063-91.)

d. The DEIR's Reliance on the "Ratio Theory" and Another Agency's Regulatory Program are Errors of Law

The DEIR concludes that water quality impacts would be less than significant based on the relatively small increases in Project-generated sewage to be conveyed to the OSP and the relatively small increases in impervious surfaces that would increase stormwater runoff to the OSP and SEP. These are errors of law. As discussed *ante*, the "ratio" approach is a legal error.

The DEIR also bases its conclusion that water quality impacts would be less than significant on its unlawful reliance on other agencies' regulatory programs. As discussed, regardless of the DEIR's assertion that the OSP has sufficient *dry weather capacity* to meet current and projected demand, and regardless of the fact that San Francsico's CSS is regulated by NPDES permits enforced by the Water Board, the waters at San Francisco beaches frequently exceed state bacterial health standards. This error is especially prejudicial where, as here, the relied-upon regulatory program is failing to prevent severe beach water pollution. (*Ebbetts Pass Forest Watch v. California Dept. of Forestry and Fire Protection* (2008) 43 Cal.4th 936, 957 (*Ebbetts Pass*) [error to conclude that compliance with pesticide restrictions precludes significant impact]; *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16.)

3. The FEIR Fails to Cure the DEIR's Omission of Essential Information Regarding Beach Water Quality Impacts and the FEIR's Response to Comments Is Legally Inadequate

Lead agencies must meaningfully respond to significant environmental comments on a Draft EIR. (*Santa Clarita Organization for Planning the Environment v. County of Los Angeles* (2003) 106 Cal.App.4th 715, 723 ["It is not enough for the EIR simply to contain information submitted by the

public and experts. Problems raised by the public and responsible experts require a good faith reasoned analysis in response"]; *Environmental Protection Information Center v. Johnson* (1985) 170 Cal.App.3d 604, 628 ["Non-specific, general, or conclusory responses unsupported by empirical information, scientific authorities or explanatory information "fail to crystallize issues"]; *People v. County of Kern* (1974) 39 Cal.App.3d 830, 841 [Responses to comments must "set forth in detail the reasons why the particular comments and objections were rejected."].)

a. The FEIR's Responses Confirm the DEIR's Omission of Essential Information

Extensive comments on the DEIR, including data showing current beach water conditions, explained how the Project's admitted increases in waste and storm water discharges would exacerbate pollution. (AR 6052-65, 7461-8889.)[14] The DEIR failed to discuss beach water quality but generally found that Project-related water quality impacts would be less than significant. (AR 1904.) In response to comments, the FEIR and Findings reversed field and found that beach water quality impacts could be significant. (AR 4062; 222-226; 5783-5788 [Master Response 12].) The FEIR concedes that comments on the DEIR made "the valid point that existing water quality in the Bay and the Ocean is negatively affected by wet weather discharges, and that condition is part of the CEQA baseline for evaluation of impacts." (AR 5784.) The FEIR, does not however, remedy the DEIR's failure to describe "existing water quality in the Bay and the Ocean," nor how it is "negatively affected by wet weather discharges," nor provide this missing information as "part of the CEQA baseline for evaluation of impacts." The FEIR does not analyze the extent of use of the waters at San Francisco beaches for water contact recreation like swimming, kayaking, surfing, kite boarding, wind-surfing, and fishing, nor the extent to which degraded water quality and the SFPUC's beach water quality postings dissuade people from engaging in water recreation. The Draft EIR's omission of essential information is unremedied.

The change from the DEIR's finding that the impact is *not* potentially significant to the FEIR's finding that it *is* potentially significant is also not accompanied by any new information regarding the nature and severity of the potentially significant impact. As a result, the DEIR omits essential information. (*County of Fresno*, *supra*, 6 Cal.5th at 519 ["a sufficient discussion of significant impacts requires not merely a determination of whether an impact is significant, but some effort to explain the nature and magnitude of the impact"]; *accord*, *Cleveland I*, *supra*, 3 Cal.5th at 514–15, 529.)

[14] The Draft EIR comment letter is at AR 6052-6065. The Figures and Exhibits submitted with the comment are at AR 7461-8889.

b. The FEIR's Responses Improperly Compress Analyzing the Significance of Impacts with Identifying Mitigation Measures

Instead of analyzing the significance of the beach water quality impact, the FEIR proposes mitigation by expanding Mitigation HYD-1. (AR 5786-88; 6544-50.) Substituting mitigation for impact analysis violates CEQA. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 658 (*Lotus*) ["The failure of the EIR to separately identify and analyze the significance of the impacts . . . before proposing mitigation measures . . . precludes both identification of potential environmental consequences arising from the project and also thoughtful analysis of the sufficiency of measures to mitigate"]; *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 663 (*San Joaquin Raptor II*) ["A mitigation measure cannot be used as a device to avoid disclosing project impacts"].)

c. The FEIR's Responses Require Recirculation of a Revised Draft EIR

Amendment of Mitigation HYD-1 to reduce a newly-identified potentially significant effect requires recirculation of a revised Draft EIR. (*Pesticide Action Network North America v. Department of Pesticide Regulation* (2017)16 Cal.App.5th 224, 252 (*Pesticide Action*); *Spring Valley Lake Assn. v. City of Victorville* (2016) 248 Cal.App.4th 91, 108 [recirculation required where EIR proposes "ostensibly feasible way to mitigate" impacts and "a complete redesign of the project's stormwater management system"]; *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1120 [EIR's failure to evaluate or discuss feasibility of water supply mitigation requires recirculation]; Guidelines, § 15088.5 (a).)

The new terms in Mitigation HYD-1 include applying San Francisco's regulatory program for stormwater control and modeling stormwater flows from the Parnassus campus to "demonstrate that future incremental increases in stormwater and/or wastewater from the campus site under the CPHP would not cause or contribute to any increase in overflow volumes from the City's CSS discharge structures." (AR 4064-65.) While this is an improvement over ignoring the problem, the FEIR simply assumes that HYD-1 would be effective in reducing the newly-identified significant impact to less-than-significant. This is insufficient. The FEIR's supporting evidence raises more questions than it answers. (AR 5787-88.) For example, would it be physically feasible to impound enough stormwater during the rainy season to reduce the campus contribution to the CSS and avoid contributing to CSS overflows?

Thus, recirculating a revised Draft EIR with the new mitigation and supporting evidence is required to provide opportunity for the public and other agencies to review and comment.

d. The FEIR's Responses Improperly Defer the Formulation of Mitigation Measures

Mitigation HYD-1 includes the post-approval deferral of formulation of mitigation based on future analyses outside of the EIR's public review process. Even if the DEIR had first analyzed the problem, which did not occur here, CEQA would not allow such deferral unless the EIR satisfied several criteria. The EIR would have to show that it was impracticable to develop mitigation during the CEQA process and that there is evidence that future mitigation is feasible and will be subject to specific performance standards. (Guidelines, § 15126.4 (a)(1)(B); *Golden Door Properties, LLC. v. County of San Diego* (2020) 50 Cal.App.5th 467, 518-525 (*Golden Door II*); *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 858; *Cleveland II*, *supra*, 17 Cal.App.5th at 440-443 ["[i]mpermissible deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR"]; *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173 (*CCEC*) , 195 [a mitigation that does not commit the agency to specific action or standards is inadequate]; *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 740 (*POET I*) ["The deferral of the formulation of mitigation measures requires the agency to commit itself to specific performance criteria for evaluating the efficacy of the measures implemented."].)

Mitigation HYD-1 is a classic example of improperly deferred mitigation because it proposes a future process ungoverned by objective performance standards. An air pollution standard of "no increase in nitrogen oxide (NOx)" was held insufficient because the EIR established "no objective performance criteria for measuring whether the stated goal [*i.e.,* no net increase] will be achieved." (*POET I*, *supra*, 218 Cal.App.4th at 739-740.) Another case rejected a mitigation measure that proposed a "bilateral negotiation between a project proponent and the lead agency after project approval." (*Communities v. Richmond*, 184 Cal.App.4th at 92-6.) Here, MM HYD-1 is worse; it proposes a *unilateral* decision by the lead agency *after* project approval and *outside* of CEQA's public comment process.

Mitigation HYD-1 is also unenforceable. It includes no objective benchmarks, milestones, or reporting processes providing a basis for enforcement review or enforcement action by anyone outside of UCSF. CEQA requires that mitigations be enforceable. (*Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491; *Federation of Hillside & Canyon v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261.) The lack of enforceability is illustrated by the Integrated Catchment Model (ICM) component of Mitigation Measure HYD-1, which includes many layers of contingency: establishing a baseline, conducting modeling, determining if new infrastructure is needed, determining UCSF's fair share, paying fair share cost, etc. (AR 5787.)

Mitigation HYD-1 contemplates that UCSF would pay "its proportional share of the costs of expanding the CSS." This measure is illusory because there is no adopted fair share fee program to turn the dollars into infrastructure. The EIR cannot find the impact less than significant based on UCSF's intention to pay a fair share of construction costs where there is no assured plan to build the infrastructure. (*Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 1186-87.)

The FEIR admits that UCSF's contribution to combined sewer system overflows is potentially significant, but does not establish a threshold of significance for judging what degree of reduction of the contribution would reduce its contribution to less than "cumulatively considerable" in violation of CEQA. (*Lotus*, *supra*, 223 Cal.App.4th at 655 ["the EIR fails to identify any standard of significance, much less to apply one to an analysis of predictable impacts from the project"].)

UC was required — but failed — to revise the DEIR to analyze beach water quality impacts and to recirculate the revised DEIR for public and agency comment. The new information provided in the Final EIR triggers recirculation because it demonstrates that the DEIR circulated for comment on an issue of environmental import "was so fundamentally and basically inadequate or conclusory in nature that public comment was in effect meaningless." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1123, 1130 (*Laurel Heights II*); see also *Mountain Lion Coalition v. Fish & Game Com.* (1989) 214 Cal.App.3d 1043, 1052 ["If we were to allow the deficient analysis in the [DEIR] to be bolstered by a document that was never circulated for public comment . . . we would be subverting the important public purposes of CEQA"]; Guidelines, § 15088.5 (a)(4).)

C. The EIR Fails as an Informational Document Regarding Impacts to Transit Capacity

Three Muni lines run at the edge of the UCSF campus. These include the "N-Judah" line, which is the busiest in the Muni system. (AR 6097.) UC's findings acknowledge that the Project would have an impact on transit service: "The plan would increase traffic and demand for parking and public transit service." (AR 12.) Despite this, the DEIR failed to analyze the Project's impact on transit capacity:

> *Consistent with the CEQA Guidelines and the SF Guidelines*, the transportation impact analysis in this EIR analyzes the change to VMT [vehicle miles traveled] that would result from the implementation of the CPHP at the Parnassus Heights campus site. Changes to traffic operations in the study area (i.e., the level of service of project area intersections) and *transit operations (e.g. project generated transit ridership and effect on capacity utilization, potential delay to transit vehicles) is outside the scope of the CEQA analysis* and are not discussed below.

(AR 2035, italics added.)

The EIR further explains that impacts to transit are analyzed "for informational purposes only" in an appendix to the DEIR that "is provided for decision-makers' consideration, independent of the

environmental review process." (AR 2036.) The only purported analysis of transit impacts is contained in two Appendix paragraphs disclosing that the CPHP's generated vehicle trips and passenger loading activities "may periodically:

- Result in transit delay on Parnassus Avenue (6 Haight/Parnassus, 43 Masonic) and Irving Street (N Judah)
- Reduce accessibility by blocking multimodal transportation facilities, such as crosswalks, bicycle lanes, and/or transit stops."

(AR 3516.) The EIR Appendix further notes that "[T]here may be peak passenger travel periods where demand, either for the campus site overall, or for specific locations is greater than supply. During these periods there would be a higher chance of delay to transit or a reduction in access to transportation facilities." (AR 3517.) Relative to the inadequacy of this analysis, one expert traffic engineer noted that "[N]o feasibility study has been conducted on how much capacity is available to serve the UCSF expansion or how additional transit capacity can be provided to decrease solo vehicle trips." (AR 6097.) The DEIR applies no significance standard for impacts to transit capacity, makes no significance determination, and discussed no mitigation. The EIR's failure to analyze CPHP impacts on transit delay, and indirect increase to VMT is error that renders the EIR insufficient as an informational document.

1. Transit Delay Is a Cognizable Impact Under CEQA

While the DEIR is correct that automobile delay ("level of service" aka LOS) is no longer a CEQA measure of transportation impact, the same is not true for impacts to transit facilities. Impact to transit capacity is a relevant consideration under both the CEQA Guidelines and City Guidelines, with which the EIR purports to comply. (Guidelines, § 15064.3 (a)["[o]ther relevant consideration may include the effects of the project on transit"]; AR 991 [significance criteria include "[s]ubstantially delay public transit"]; 999 ["The department uses a quantitative threshold of significance and qualitative criteria to determine whether the project would substantially delay public transit"]; 1002 [required analysis for "public transit delay"]; 1005 [required cumulative analysis for "public transit delay"].) Guidelines Appendix G asks whether a project would "conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadways, bicycle and pedestrian facilities." (Guidelines, Appendix G, § XVII (a).) OPR's *Technical Advisory on Evaluating Transportation Impacts in CEQA* ("OPR Technical Advisory"), another document that the EIR purports to follow, includes a section entitled "Impacts to Transit" that provides in relevant part:

> Because criteria for determining the significance of transportation impacts must promote "the development of multimodal transportation networks" pursuant to Public Resources Code section 21099, subd. (b)(1), lead agencies should consider project impacts to transit systems and bicycle and pedestrian networks.

(AR 34406.) Rather than provide the required analysis, the FEIR doubles down on UC's position that

overcrowding a transit system is "not a CEQA concern." (AR 6120.) Incredibly, UC squarely points its finger at Muni to analyze the CPHP's impact on transit: "The CPHP is not responsible for analyzing the potential effects of Muni operational issues or changes, and Muni is expected to adjust operations accordingly." (AR 6113.) This is legal error. CEQA requires analysis of whether a project would overwhelm the existing transit system. (*Mission Bay Alliance v. Office of Community Investment & Infrastructure* (2016) 6 Cal.App.5th 160, 191 ["substantial evidence supports the conclusion that the Warriors can be expected to work with the transit agencies 'to provide additional . . . service' sufficient to mitigate the project's impacts on regional transit"].)

The FEIR asserts that UC's cramped view of its duties under CEQA is based "on the CEQA Guidelines and OPR Technical Advisory ["Advisory"]." (AR 6113.) As established above, Guidelines section 15064.3, subdivision (a) in no way supports omitting consideration of transit delay impacts. Similarly, the Advisory explains that "lead agencies should consider project impacts to transit systems and bicycle and pedestrian networks." (AR 34406.) While the Advisory also states that agencies "generally should not treat the addition of new transit users as an adverse impact," the "addition of new transit users" is not the same as overwhelming transit capacity. (AR 34406.) Further, the Advisory provides that impacts to transit capacity should be analyzed, at minimum, as a cumulative impact: "Increased demand throughout a region may, however, cause a cumulative impact by requiring new or additional transit infrastructure." (*Ibid*.)

2. Increased Transit Delay May Increase Vehicle Miles Traveled ("VMT")

Analysis of impacts to transit capacity is also required because overwhelming the transit system may have an indirect impact by increasing the Project's VMT. (AR 6096.) Transportation engineer Tom Brohard explained that "the table assigns relatively high percentages for transit use for faculty/staff/ students as well as residents. The higher transit percentages will likely go down if the transit system is overwhelmed and automobile use goes up." (AR 6096.) The CEQA Guidelines are in accord, noting that even a purely qualitative analysis of VMT "would evaluate factors such as the availability of transit." (Guidelines, § 15064.3 (b)(3).) A bare qualitative analysis is only allowed "if existing models or methods are not available." (*Ibid*.) Quantitative modeling is readily available for estimating VMT and transit impacts, and so must be utilized here. (AR 991-1003; *Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners* (2001) 91 Cal.App.4th 1344, 1381 (*Berkeley Keep Jets*).)

In response, the FEIR inaccurately pronounced that "there is no evidence to suggest that transit crowding *alone* leads to an increase in VMT that would result in a significant impact under CPHP." (AR 6113-14, italics added.) This mischaracterization does not justify ignoring the issue. First, engineer Brohard's comment provides evidentiary support for the uncontroversial fact that overwhelming transit

would lead more people to choose automobiles. (AR 6096.) The City — which operates the transit system — agrees that "transit delay greater than one-half headway . . . might result in a significant impact . . . due to a substantial number of people riding transit switching to riding in private or for-hire vehicles." (AR 999].) Second, UC cannot justify ignoring transit overcrowding simply based on speculation that such overcrowding "alone" may not push VMT above the relevant significance standard. (Guidelines, § 15358 (a)(2) [requiring an EIR to analyze "indirect or secondary effects"].)

Moreover, even without transit overcrowding, the Project would increase VMT. (AR 6099 ["Here, VMT is shown to increase by 23% and 15% for the CPHP"].) Engineer Brohard explains that the existing transit system in the Project area may already be overwhelmed, so that the Project may result in higher VMT than disclosed in the DEIR. (AR 6096-97.) The EIR therefore fails as an informational document by lacking analysis as to whether the Project's predicted impact on transit overcrowding (AR 3516) would indirectly exacerbate the Project's acknowledged increase in VMT.

In summary, no authority supports UC's claim that transit overcrowding is "not a CEQA concern." (AR 6120.) The Guidelines, OPR Guidance, and San Francisco guidance demonstrate that it is a relevant consideration, and even provide methodology for analyzing the impact. Further, overcrowding transit may indirectly contribute to increased VMT. Finally, even if UC is correct that no significance standard is directly "applicable" due to its Constitutional status, that does not obviate the need for analysis where, as here, the record supports a fair argument of a significant impact.

D. The EIR Fails to Properly Analyze and Mitigate Construction Noise Impacts

Although construction-related impacts are sometimes trivialized because of their typically "short" duration compared to potentially indefinite operational impacts, that is not the case here — where the Project will be ongoing for nearly 30 years. The CPHP's "*Initial"* Phase projects would be under construction until 2030. (AR 1951.) The "*Future*" Phase of construction would go on for another twenty years — between 2030 and 2050. (*Id*.) This means that if UC starts construction in 2022 (as it says it will), "sensitive receptors" — people who live and work adjacent to and surrounding the Parnassus Heights campus would be exposed to nearly three decades worth of construction noise, activity and emissions. During that time, residences on all sides of the campus, some as close as 70 feet from active construction, would be menaced by sustained noise levels over 75 dBA. (AR 1956-57.)

The EIR attempts to minimize the extraordinary amount of expected noise, at times 27 dBA above ambient levels, by stating that they "would only occur a short percentage of the overall construction period." (AR 1955.) Considering the nearly three-decades of construction, this vague assertion is not reassuring. Potential health impacts of exposure should have been analyzed and effective mitigation identified, but were not. These failures violate CEQA and require revision of the EIR.

1. Predicted Noise Levels are Not Correlated to Identified Human Health Impacts

The EIR finds that construction activities implementing the CPHP would generate noise levels in excess of applicable standards, identified as a significant impact. However, the EIR must take the analysis a step further by correlating significant noise to potential health effects. (*County of Fresno*, *supra*, 6 Cal.5th at 520 [EIR failed to correlate significant emissions to human health impacts.].) The EIR violates CEQA because it fails to correlate significant construction noise impacts and resulting human health effects to neighbors.

CEQA requires an EIR to "identify and focus on the significant environmental effects of the proposed project…examin[ing] changes in the existing physical condition in the affected area," including "health and safety problems caused by the physical changes." (Guidelines, § 15126.2 (a).) This section "also suggests that a connection be drawn between . . . potential project emissions and human health impacts. Such a connection would meet CEQA's requirements." (*County of Fresno*, *supra*, 6 Cal.5th at 520.) If it is not scientifically possible to determine potential human health impacts, "the EIR itself must explain why, in a manner reasonably calculated to inform the public of the scope of what is and is not yet known about the Project's impacts." (*Ibid*.) Although *County of Fresno* addressed the need to correlate air emissions to human health, *Sierra Watch v. County of Placer* (2021) 69 Cal.App.5th 86 recently applied similar analysis to the effects of noise emissions on human health.

"CEQA requires that the EIR have made a reasonable effort to discuss relevant specifics regarding the connection between two segments of information already contained in the EIR, the general health effects associated with a particular pollutant and the estimated amount of that pollutant the project will likely produce." (*County of Fresno*, *supra*, 6 Cal.5th at 521.) As in *County of Fresno*, the Project EIR fails to correlate the Project's environmental effects with impacts to human health.

While the EIR contains a section titled "Health Effects of Environmental Noise" that identifies a list of "other potential health effects" from "high noise levels" (AR 1937), the EIR fails to identify the noise levels at which these health effects may occur, much less whether the Project's noise levels would trigger impacts. For example, the EIR generally states that noise results in "decreased performance for complex cognitive tasks, such as reading, attention span, problem solving, and memorization," but fails to identify whether and to what extent CPHP noise levels may cause these health impacts. (AR 1937.)

One commentor explained, "While the DEIR briefly mentions some of these 'other potential heath effects' from noise emissions, the DEIR does not correlate these various health effects (and others as reflected in WHO 2018) to noise emissions." (AR 6091.) UC responded that the discussion of health effects on DEIR pages 4.11-3 – 4 is provided as introductory information. (AR 6118.) The "introductory information" states that "noise can cause annoyance and can trigger emotional reactions like anger,

depression, and anxiety. WHO reports that, during daytime hours, few people are seriously annoyed by activities with noise levels below 55 dBA or moderately annoyed with noise levels below 50 dBA." (AR 1937.) Rather than address the health impacts identified by WHO, the noise section states:

> Construction equipment would comply with the City's Noise Ordinance restriction (noise level of 80 dBA or less at a distance of 100 feet), and the resultant predicted noise levels at the nearest receptors would be below this level. Therefore, project construction noise would not result in adverse health effects related to pain, the onset of hearing loss or other significant health effects.

(AR 1960.) This significance determination fails to correlate the level of noise that nearby residents would be exposed to for up to thirty years and whether those levels would produce health impacts described in the "introductory information." (AR 1937; see *County of Fresno*, *supra*, 6 Cal.5th at 520.)

Further, the EIR fails to connect large increases in dBA to potential health impacts. The EIR states that "analysis provided . . . indicates that noise levels from proposed peak demolition and construction activities at the closest receptors could exceed existing noise levels by as much as 27 dBA at receptors approximately 70 feet away." (AR 1951.) The EIR provides a table describing noise levels of normal construction equipment at 100 feet, and none lower than 70 dBA. (AR 1951.) Therefore, any residence within 100 feet would potentially be exposed to all-day noise levels of at least 70 dBA and as high as 80 dBA. (AR 1956.) The EIR fails to describe how this level of long-term noise would affect the health of neighbors or why that impact cannot yet be described. Our Supreme Court has identified this flaw: "Because the EIR as written makes it impossible for the public to translate the bare numbers provided into adverse health impacts or to understand why such translation is not possible at this time . . . the EIR's discussion of air quality" was inadequate." (*County of Fresno*, *supra*, 6 Cal.5th at 521.)

UC thus glosses over the health impacts that would result from CPHP construction noise. (AR 1959.) As held in *Berkeley Keep Jets*, *supra*, 91 Cal.App.4th at 1371 the "EIR's approach of simply labeling the effect 'significant' without accompanying analysis of the project's impact on the health of [] employees and nearby residents is inadequate to meet the environmental assessment requirements of CEQA"].) The EIR fails as an informational document because it does not correlate the admittedly high and long-lasting construction noise emissions to human health impacts on the surrounding community.

2. Noise Mitigation Measure NOI-1b Is Both Unenforceable and Impermissibly Deferred Mitigation

As discussed *ante*, the Guidelines allow deferral of some details of mitigation measures, to be developed after project approval. (Guidelines, § 15126.4, subd. (a)(1)(B).) However, CEQA requires that "the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that

performance standard." (*Ibid.*) The CPHP EIR does not meet these requirements. Mitigation measure NOI-1b suffers from a myriad of flaws that renders it ineffective. It states:

> **CPHP Mitigation Measure NOI-1b: Construction Hours**
>
> Construction hours *shall be restricted* to the hours listed in the table below. In rare circumstances, *work may need to occur* outside of these work hour limits. In such cases, UCSF Community and Government Relations will receive advance notice from the project manager, at least one week in advance as feasible, and will engage the community to identify measures to minimize potential impacts. These measures may include, but not be limited to, restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers to shield the short-term nighttime activity.

Construction Hours

	"Not Noisy" Work[1]		Noisy Work	
	Regular hours	**Extended hours[2]**	**Regular hours**	**Extended hours**
Monday - Friday	7:00 a.m. to 5:00 p.m.	5:00 p.m. to 8:00 p.m.	8:00 a.m. to 5:00 p.m.	
Saturday		8:00 a.m. to 5:00 p.m.		9:00 a.m. to 4:00 p.m.
Sunday		8:00 a.m. to 5:00 p.m.		

1 "Not Noisy" work = 80 decibels or less at 100 feet; "Noisy" work = more than 80 decibels at 100 feet.
2 Extended hours to be considered by UCSF Community and Government Relations with advance notice from the project manager.

(AR 1953, italics added.) The first sentence states that the construction hours "shall be restricted" as listed on the table; the next sentence states that work "may need to occur outside of these work hour limits." (*Ibid.*) NOI-1b does not impose finite restrictions as construction may proceed 24 hours a day when "need[ed.]" The mitigation is therefore not effective or enforceable.[15]

In the event of after-hours construction work, NOI-1b provides a short list of measures that "may" be imposed to reduce resultant noise impacts. (*Ibid.*) "These measures *may* include . . . restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers to shield the short-term nighttime activity." (*Ibid.*) The first problem is that "smaller time windows" and "condensing the overall duration" are not performance standards, as required. As held in *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 858, "[t]he terms 'increase' and 'reduce'— even though preceded by the mandatory term 'shall' and modified by the phrase 'to the extent feasible'— are not specific performance standards." The EIR provides no

[15] The EIR misrepresents that NOI-1b would prevent nighttime construction noise. (AR 1959 ["Implementation of CPHP Mitigation Measure NOI-1b would ensure that nighttime noise impacts from construction activities would be avoided"]; 1960 ["Because construction would be restricted by CPHP Mitigation Measure NOI-1b to only occur during daytime hours, health effects associated with the potential for nighttime awakenings would be avoided"].)

noise level threshold, measurement, or performance standard for after-hours work. Finally, there is no analysis of what the referenced "temporary barriers" would consist of or whether they would be effective to mitigate noise to an [unstated] standard. Ambient "nighttime noise levels should be 45 dBA or below, and short-term events should not generate noise in excess of 60 dBA." (AR 1937.) NOI-1b fails to address how after-hours work would relate to these levels and fails to impose any type of performance standard that would be used to enforce this mitigation measure.

Rather than prohibit construction outside of regular working hours to protect the health of neighbors, the adopted mitigation measure for noise is ineffective and impermissibly deferred without performance standards. The mitigation does not support a finding that the Project's construction noise would be less than significant. The EIR is inadequate on this issue and must be revised.

E. The EIR Fails to Lawfully Assess Impacts on Historic Buildings[16]

1. The EIR's Conclusion That It Is Infeasible to Avoid Demolishing Historically Significant Buildings, Including UC Hall, Is Based on Errors of Law and Is Not supported by Substantial Evidence

The Project proposes to demolish many buildings that it concedes are historically and culturally significant, are eligible for listing in the California Register of Historic Resources or are already so listed, and as to which the demolition represents a significant environmental impact. These buildings include UC Hall, Millberry Union, School of Dentistry, Langley Porter Psychiatric Institute, Aldea San Miguel Housing Buildings 8, 10, and 12, and Saunders Court. (AR 1738-49; 1755-56; 3890-3906; 3912-13; AR 6621-22; 238-243.)

The DEIR finds these significant impacts unavoidable because — according to UCSF — it is infeasible to continue to use these buildings. Just six years ago, however, UCSF's 2014 LRDP did not propose to demolish UC Hall, Millberry Union, School of Dentistry, Aldea San Miguel Housing Buildings 8, 10, and 12, and Saunders Court. Therefore, it was presumptively feasible to continue to use these buildings in 2014. In fact, the 2014 LRDP proposed to re-purpose UC Hall and Milberry Union for student housing (AR 13472; 13523-24); to renovate Saunders Court "to improve its functionality for general use and special events" (AR 13526); and to continue to use the School of Dentistry building (AR 13483; 13484-85) and Aldea housing buildings (AR 13520).

The record contains no evidence that anything has changed to make it infeasible to continue the 2014 LRDP's plans for one of more of these buildings rather than to demolish all of them. "[T]he deference provided to governing bodies with respect to land use planning decisions must be tempered by the presumption that the governing body adopted the mitigation measure in the first place only after due

[16] These issues are "exhausted" in comments at AR 6027-29; 6031-39; 888-89.

investigation and consideration." (*Napa Citizens*, *supra*, 91 Cal.App.4th at 359.) One of CEQA's core purposes is to avoid unnecessary environmental harm. The lead agency "may not . . . approve the project as proposed if there are feasible alternatives or mitigation measures that would avoid or substantially lessen the adverse environmental effects." (*Stockton Citizens for Sensible Planning v. City of Stockton* (2010) 48 Cal.4th 481, 498; see also *County of Fresno*, *supra,* 6 Cal.5th at 524-25 ["Even when a project's benefits outweigh its unmitigated effects, agencies are still required to implement all mitigation measures unless those measures are truly infeasible"]; *City of San Diego*, *supra*, 61 Cal.4th at 967; *Newhall Ranch I*, *supra*, 62 Cal.4th at 231 ["the lead agency must adopt feasible mitigation measures or project alternatives to reduce the effect to insignificance"].)

Mitigations or alternatives are not infeasible unless they make it impractical to proceed with the project. (*Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1181 (*Goleta I*); *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 599 (*Uphold Our Heritage*); *Preservation Action Council v. City of San Jose* (2006) 141 Cal.App.4th 1336 (*Preservation Action*) [city's finding that reduced-size alternative was infeasible due to competitive disadvantage was not supported by substantial evidence where record contained no data about competing stores].)

Here, neither the EIR nor UCSF's CEQA Findings present any evidence that it is infeasible to avoid demolishing each or any of these buildings. (AR 3878-3915; 238-43.) Given the contrast between the CPHP and the 2014 LRDP, this represents a significant omission of essential information and a failure to support an environmental conclusion with substantial evidence. (*County of Fresno*, *supra*, 6 Cal.5th at 527 [EIR must evaluate whether a mitigation measure is infeasible.].)

The FEIR's response to comments is also inadequate. The response and the Board's Findings say, in essence, that UCSF prefers to demolish all of these buildings so it is infeasible not to demolish them. (AR 6042; AR 238-42.) That preference does not equate to infeasibility. Neither the FEIR nor the Findings analyze ways to modernize the campus without demolishing every historically significant buildings. As the San Francisco Historic Preservation Commission commented, "the DEIR did not adequately consider alternatives that focused on the preservation of historic resources. Specifically, the DEIR did not analyze an alternative that retained just UC Hall, the building where the Zakheim murals are located, or just Toland Hall, the part of UC Hall where the Zakheim murals are located." (AR 5812.) This is an error of law because, as noted above, mitigation measures or alternatives are not infeasible unless they make it impractical to proceed with the project. (*City of Marina*, *supra*, 39 Cal.4th 341 at 368-69 ["CEQA does not authorize an agency to proceed with a project that will have significant, unmitigated effects on the environment, based simply on weighing of those effects against the project's benefits, unless the measures necessary to mitigate those effects are truly infeasible"].)

2. The DEIR Fails to Evaluate UCSF's Parnassus Campus as a Historic Resource or Historic District

The DEIR and the two *Carey & Company* reports upon which its analysis of historic buildings is based address one building at a time and fail to evaluate UCSF's Parnassus campus as a "historic resource" or "historic district" (defined in Public Resources Code section 5020.1, subdivisions (j) and (h), respectively) in its own right. (AR 1738-56; 3890-3913; 40072-130 [Carey 2011]; 40131-393 [Carey 2003].) Indeed, of the many "Form 523s" prepared for the many historic buildings on the campus and attached to the 2003 and 2011 Carey reports, not one describes the "Resource Present" as a "District" (AR 40106-121 [Carey 2003], including 40106 [UC Hall]; 40109; 40111 [Langley-Porter]; 40144; 40116; 40118; 40120]; 40131-40393 [Carey 2011], including 40283 [Aldea San Miguel 8]; 40287 [Aldea San Miguel 10]; 40291 [Aldea San Miguel 12]; 40295 [Ambulatory Care Center]; 40299 [Community Dental Clinic Building]; 40303 [Environmental Health and Safety (EH&S) Building]; 40305 [Faculty Alumni House]; 40309 [HSIR East]; 40313 [HSIR West]; 40317; 40319; 40351 [Milberry Student Union Building].)

Architectural historian Kara Brunzell explains this point:

> Preparers of the DEIR were clearly aware of the importance of looking at the campus as a whole. The document acknowledges districts as one of the important categories of historical resources . . . and divides the campus into six districts "based in part on existing land use patterns." ¶ An adequate cultural resources DEIR section would bring a similar intellectual rigor to the investigation of the potential historical significance of the campus as an entity in its own right, using a district (or districts) to organize the discussion of the built environment's significance. This would allow the cultural resources section to reflect the spatial and historical relationships between buildings, the street grid, open spaces, and other features of the site. . . . The attempt to evaluate each building individually without considering context, setting, or the site as whole means that the DEIR has not considered a potential historical resource: the Parnassus Heights Campus.

(AR 6037.)[17] CEQA requires that in preparing an EIR a lead agency must "use its best efforts to find out and disclose all that it reasonably can." (Guidelines, § 15144.) CEQA defines three categories of historic resources: mandatory, presumptive, and discretionary. (*Valley Advocates v. City of Fresno* (2008) 160 Cal.App.4th 1039, 1051 (*Valley Advocates*); § 21084.1; Guidelines, § 15064.5 (a).)

Mandatory historic resources are those "listed in, or determined to be eligible for listing in, the California Register of Historical Resources." (*Valley Advocates*, *supra*, 160 Cal.App.4th at 1051; § 21084.1, first sentence; Guidelines, § 15064.5 (a)(1).) Presumptive historical resources are those listed in a local historic register or identified as significant in a qualified historical resource survey. (*Valley Advocates*, *supra*, 160 Cal.App.4th at 1054; § 21084.1, third sentence; Guidelines, § 15064.5 (a)(2).)

[17] The EIR's analysis of visual impacts divides the campus into several "districts." (AR 1552; 3700.) It is inarguable that the site is more than a collection of unrelated buildings.

Lead agencies also have a mandatory duty to exercise their discretion to determine if a resource is historic. (Guidelines, § 15064.5(a)(3).) Discretionary historic resources are those a lead agency has discretion to designate even if not listed in a state or local register or identified in a qualified survey. (*Friends of Willow Glen Trestle v. City of San Jose* (2016) 2 Cal.App.5th 457, 467 ["final sentence of section 21084.1 clearly permits a lead agency to make a determination as to whether a resource that is neither deemed nor presumed to be a historical resource is nevertheless a historical resource for CEQA purposes"]; *Valley Advocates*, *supra*, 160 Cal.App.4th at 1059-60; § 21084.1, final sentence; Guidelines, §§ 15064.5(a)(3), (a)(4) .)

Lead agencies have a mandatory duty to exercise their discretion to determine if a resource is historic. (Guidelines, § 15064.5(a)(3) ["Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources . . ."].) The word "shall" identifies "a mandatory element which all public agencies are required to follow." (Guidelines, § 15005 (a); see *Valley Advocates*, *supra*, 160 Cal.App.4th at 1060, 1063 ["a prejudicial abuse of discretion occurs when a public agency is misinformed regarding its discretionary authority and, as a result, does not actually choose whether to exercise that discretionary authority"].) Where, as here, the agency fails to exercise its discretionary authority to determine if a resource is a "discretionary" historic resource, the error is reviewed de novo as a failure to proceed in the manner required by law. (*Valley Advocates*, *supra*, 160 Cal.App.4th at 1063.)

UC failed to proceed in the manner required by law because it failed to exercise its discretion to determine if the campus as a whole is a "discretionary" historic resource. (§ 21084.1; Guidelines, § 15064.5 (a), citing §§ 5020.1 and 5024.1.) "'Historic district' means a definable unified geographic entity that possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development." and "'Historical resource' includes, but is not limited to, any . . . area, which is historically . . . significant." (§§ 5020.1 (h), (j).) The EIR gives this no consideration.

The FEIR's response to comments (AR 6040-41) points to only two sentences in the DEIR or its supporting materials where the concept of a "historic district" is mentioned, as if this shows the concept was evaluated and rejected. It fails to reference any other information in the DEIR — because there is none — that explains why the DEIR or FEIR declined to evaluate the campus for qualification as a historic district. The response also refers to the new evaluation in FEIR Appendix HR (AR 6609-29) as if this provides the missing analysis. It does not. In fact, the new memorandum in Appendix HR says nothing about the campus as a "historic district" and never uses the word "district."

Instead, the response to comments offers an entirely new rationale for not evaluating the campus as a historic district: "Given the wide range of architectural styles and uses of the buildings, the long period of development (1917-2010), and a lack of overall thematic context or initial master plan guiding development from the beginning, it was determined that the campus as a whole did not constitute a historic district." (AR 6041.) This rationale is not in the DEIR; it is significant new information requiring recirculation of a revised Draft EIR for public and agency comment. A change in EIR reasoning supporting a significance conclusion warrants recirculation. (*Sutter Sensible Planning, Inc. v. Board of Supervisors* (1981) 122 Cal.App.3d 813, 817 (*Sutter*) [recirculation required because the FEIR provided 'a more elaborate discussion of ground water availability and the projected impact of the plant on the water table']; *Pesticide Action*, *supra*, 16 Cal.App.5th at 252 [recirculation required for new rationale for significance conclusion in FEIR].)

Also, the new evaluation in the FEIR's Appendix HR presents aerial photos/maps showing all historic resources that would be demolished or altered. (AR 6621-22.) This aerial photo/map is a revelation. The DEIR failed to provide a visual aid showing the radical transformation of the entire campus from the loss of many historically significant buildings. This omission prevented a reader of the DEIR — even a careful reader — from understanding the wide geographic scale and intensity of the transformation the CPHP proposes for the campus as a whole.

Thus, the EIR omits essential information regarding the environmental setting and fails to assess the CPHP's potentially significant effects on all potential historic resources in the affected environment.

F. The EIR Fails to Adequately Assess Impacts from Air Emissions[18]

1. The EIR Impermissibly Piecemeals the Project's Human Health Impacts from Toxic Air Contaminant Emissions

The EIR fails as an informational document by not disclosing the human health risk resulting from the Project's combined emissions of toxic air contaminants ("TAC"). The EIR acknowledges that the Project "would result in development that would generate operational emissions of TACs and result in localized contributions to PM2.5 concentrations from a variety of sources." (AR 1684.) The EIR also acknowledges that Project construction over 30 years would generate TAC emissions. (AR 1671.) While the EIR utilizes a significance threshold of ten increased cancer risks, its analysis of the Project's impacts against this standard is defective because it piecemeals various emission sources and thereby fails to identify the overall health risk resulting from the combined emissions from all Project emissions.

Specifically, the EIR concludes that the Project's construction emissions for the Irving Street Arrival, RAB, New Hospital, and Aldea Housing Densification would result in a combined 9.47

[18] The issues in this section were exhausted in public comments at AR 6069-6075; 890-896.

increased cancer risks (AR 5962-63), very close to the applicable significance standard of ten. (AR 1642.) UC keeps the health impact below the threshold by arbitrarily omitting key elements of the Project's TAC emissions. (AR 5964.) The expert retained by petitioner Parnassus Neighborhood Coalition ("PNC") explained that state guidance requires an overall health risk assessment to account for both construction and operational TAC emissions, stating in relevant part:

> According to OEHHA guidance, as referenced by the DEIR, "the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location." However, the HRAs conducted in the DEIR fail to sum each age bin to evaluate the total cancer risk over the course of the Project's construction and operation, as is required by the guidance. This is incorrect and thus, an updated analysis should quantify the Project's construction and operational health risks and then sum them to compare to the BAAQMD threshold of 10 in one million, as referenced by the DEIR (p. 4.2-16).

(AR 5964.) The most significant sources for the omitted operational TAC emissions include mobile-source emissions and emissions from the New Hospital. The mobile-source TAC emissions omitted from the EIR's analysis are not insignificant, as PNC's expert further explains:

> [W]hile DEIR includes an HRA assessing the health risk impacts associated with the emergency generators associated with the operation of the RAB component of the Initial Phase of the Project, the DEIR fails to evaluate the health risk impacts resulting from the Project's entire operation. This is incorrect, as the DEIR indicates that the CPHP would result in 52,200 daily vehicle trips throughout operation, which will result in additional exhaust (p. 4.15-29, Table 4.15-7).

(*Ibid*., italics added.) TAC emissions from the New Hospital are also not insignificant. "Fume hood emissions also contribute to exposure to TACs." (AR 11049.) UC revealed in the 2014 LRDP EIR that "Risks associated with fume hood emissions were estimated at 4.46 in one million at the maximally exposed individual . . ." (AR 10936.)

The FEIR does not supply this missing analysis of mobile-source or Hospital TAC emissions nor provide any expert testimony demonstrating that California Office of Health Hazard Assessment ("OEHHA") does not require it. (AR 6012.) Instead, the FEIR relies upon the "plan-level" nature of its review as to these Project components to conclude that health risks from the New Hospital and future phase projects will undergo separate subsequent CEQA review. (*Ibid*.)

This is a legal error. First, the FEIR does not explain why it is too speculative to include these emission sources in the overall health risk as required by Guidelines section 15145. "The fact more precise information may be available during the next tier of environmental review does not excuse [an agency] from providing what information it reasonably can now." (*Cleveland II*, *supra*, 17 Cal.App.5th at 440; *San Joaquin Raptor II*, *supra*, 149 Cal.App.4th at 660 [EIR was required to analyze "an aspect of the Project itself, as well as a reasonably foreseeable use"].) Readily available information about the

Project's operational TAC emissions includes the acknowledged 28,800 daily vehicle trips, a major source of diesel particulate emissions (AR 4204), as well as the Project's increase in mobile-source diesel consumption by 505,297 gallons per year. (AR 1779.) Additionally, conservative estimates of the number of hood fumes required for the New Hospital are available. (AR 10936 ["At present, there are approximately 208 active fume hoods in operation at the Parnassus Heights campus site"].)

Thus, ample information regarding the Project's mobile-source and Hospital TAC emissions was available to estimate the Project's combined health risk. Either emission source alone, when added to the Project's acknowledged 9.47 increased cancer risks, would overcome the relevant significance standard of ten increased cancer risks. The addition of both emission sources together would put the Project's combined health risk well beyond that standard.

UC alternatively asserted in the FEIR that the health risks from the various components of the Project should not be measured against the project-level threshold of ten increased cancers, but rather the cumulative threshold of 100 increased cancers. (AR 6012-13.) This position ignores that these different aspects of the CPHP are nowhere else identified in the EIR as separate projects for purposes of CEQA. Indeed, nowhere does UC claim that these various construction activities have independent utility. In fact, the EIR combined the emissions from these various construction activities for purposes of assessing the Project's impact from criteria air emissions. (Compare AR 1658 [combining criteria air emissions for different construction activities] with 1679-1682 [dividing human health impacts according to construction activity].) UC's argument that the Project's various emission sources should be measured against a cumulative threshold constitutes impermissible piecemealing.

In short, the EIR fails as an informational document by piecemealing the Project's TAC emissions for purposes of minimizing the resulting health risk to nearby residents.

2. The EIR's Use of Thresholds of Significance for the CPHP's Cancer Risk Impact Is Based on Legal Errors and Not Supported by Substantial Evidence

The EIR errs by using thresholds of significance for both project-level and cumulative cancer risk that fail to take into consideration the severity of existing cancer risk conditions.

a. The EIR's Thresholds of Significance for Cancer Risk

The DEIR explains that "[a]s part of assessment of Initial Phase projects, a HRA [Health Risk Assessment] was conducted to provide quantitative estimates of health risks from exposures to TACs" and that the EIR "uses quantitative significance thresholds adopted by BAAQMD [Bay Area Air Quality Management District]." (AR 1650.)[19] For "project level" TAC related cancer risk, this threshold is

[19] The DEIR states: "These thresholds are based on substantial evidence identified in Appendix D

"exposing receptors to toxic air contaminant emissions that (1) result in a cancer risk greater than 10 cancer cases per 1 million people exposed in a lifetime . . ." (AR 1645.)[20] For "cumulative" TAC-related cancer risk, the EIR uses a threshold of 100 per one million, stating: "BAAQMD considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cancer risk. (AR 1650.)

b. UC Failed to Adopt Its Cancer Risk Thresholds of Significance in a Public Rule-Making Process[21]

The EIR uses cancer risk thresholds of significance adopted by BAAQMD for general use without adapting them or how they are applied to reflect anything unique about this project or its environmental setting. CEQA requires that before UCSF uses such generalized thresholds of significance, it must adopt the thresholds by a public rule-making process, and must show in that process that the thresholds are supported by substantial evidence. (*Golden Door Properties, LLC v. County of San Diego* (2018) 27 Cal.App.5th 892, 903 (*Golden Door I*).) By failing to undertake this process, UCSF failed to proceed in the manner required by law.

c. The EIR Fails to Adequately Describe Existing Cancer Risk Conditions

The DEIR describes existing conditions (*i.e.*, baseline) for TAC-related cancer risk from ambient TAC concentrations as 248.3 cases per million. (AR 1636.) The DEIR describes the existing conditions for cancer risk from diesel particulates (DPM) as 480 in one million in the year 2000 in the Bay Area; and 520 in one million in the year 2012 statewide. (AR 1637.) The DEIR indicates that in 2000, the California Air Resources Board (CARB) approved a Diesel Risk Reduction Plan that it anticipated would result in an 80 percent decrease in statewide diesel health risk in 2020 compared with the diesel risk in 2000. The DEIR does not disclose what the statewide diesel risk was in 2000, so the reader cannot calculate what an 80% reduction would be in 2020. The DEIR also does not disclose what the statewide diesel risk is in 2020.

The EIR's description of the overall cancer risk is insufficient because the DPM baseline risk is not current as of the date of the Notice of Preparation of the EIR.[22] The FEIR responds to this comment by calculating this risk using projections CARB made in the year 2000 regarding reductions in DPM cancer risk that could be expected by the year 2020. The response provides, for the first time, an

---

of the 2017 BAAQMD CEQA Guidelines and its 2009 Justification Report." (AR 1650 [DEIR 4.2-24].) The 2017 BAAQMD CEQA Guidelines is at AR 15672. Appendix D thereof is at 15832. The purported "justification" and "substantial evidence" for these thresholds is at AR 15860-15876.

[20] The DEIR also uses a threshold of "localized PM2.5 concentration exceeding 0.3 ìg/m3" (AR 1650.) The DEIR also establishes more general threshold of significance, as follows: "Expose sensitive receptors to substantial pollutant concentrations." (AR 1645.)

[21] This claim is exhausted at AR 896.

[22] This claim is exhausted at AR 6071.

estimate of the statewide diesel risk in 2000, which it uses to calculate a current basin wide cancer risk of 96 cases of cancer per 1 million people. (AR 6076.)

This response is too little, too late. It is an estimate based on 20 year-old projections, not a current analysis when the Notice of Preparation issued. (*South Coast*, *supra*, 48 Cal.4th at 327, citing Guidelines, § 15125 (a).) Also, the FEIR suggests the TAC and DPM risks are additive, stating: "Other toxic air contaminant emissions within the basin will further contribute to this estimated risk." (AR 6076.) Thus, baseline cancer risk from TAC and DPM may be 344 cases per one million people (*i.e.*, 248 cases per one million people for TAC plus 96 cases per 1 million for DPM). (AR 6076.) The omission of this information from the DEIR precludes informed public comment.

d. The DEIR's Assessment of the "Project-Level" Cancer Risk Impact Is Based on Legal Error and Not Supported by Substantial Evidence

The DEIR concludes that the Project's "project-level" or incremental increase in cancer risk is less than significant because the project would increase cancer risk by 9.8 new cases per one million people, which is below the DEIR's threshold of significance of any increase in risk over 10 cases per million. (AR 1671-84 [Impact AIR-3: Construction]; 1684- 89 [Impact AIR-4: Operations].) The DEIR borrows this threshold from BAAQMD's CEQA Guidelines and then deploys it without regard to the extreme baseline cancer risk in San Francisco. In doing so, the DEIR commits the fundamental error of failing to add the Project's effects to the baseline for purposes of determining significance because it applies the threshold without regard to the magnitude of the baseline cancer risk. Under CEQA, an EIR analyzes the environmental impacts of the proposed project on the environmental setting (or "baseline"). (*South Coast*, *supra*, 48 Cal.4th at 315; *San Joaquin Raptor I*, *supra*, 27 Cal.App.4th at 722-23; *Eel River*, *supra*, 108 Cal.App.4th at 881-82; Guidelines, §§ 15125 (a)(1), 15126.2 (a).)

The baseline cancer risk in San Francisco is 248 cases per million from TAC plus at least 96 cases per million from DPM. The DEIR's uncritical use of the ten cases per million BAAQMD threshold implies that an increase of less than ten cases per million is always less than significant, regardless of the baseline risk. This is a legal error, because the severity of existing conditions is always a factor in determining significance of project impacts. (*CBE v. Resources*, *supra*, 103 Cal.App.4th at 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County*, *supra*, 221 Cal.App.3d at 718.) The EIR's unevaluated assumption that an increase of less than ten cases per million is always less than significant is a policy judgment, not a finding of fact based on evidence. This violates CEQA because determinations of significance must be based on evidence. (*Amador Waterways*, *supra*, 116 Cal.App.4th at 1108-1109 ["thresholds cannot be used to determine

automatically whether a given effect will or will not be significant"].)

Moreover, while "the existence of substantial evidence supporting the agency's ultimate decision . . . is not relevant when one is assessing a violation of [CEQA's] information disclosure provisions,"[23] the EIR's use of this threshold is not supported by substantial evidence. Other than pointing to the BAAQMD threshold, the DEIR fails to explain why the Project's admitted incremental increase in cancer risk is not significant given that it is being added to a severe baseline cancer risk.

Instead, the FEIR's responses to comments states that "The 10.0 in one million cancer risk criterion. . . is also the level set by the Project Risk Requirement in the Air District's Regulation 2, Rule 5 new and modified stationary sources of TAC, which states that the Air Pollution Control Officer shall deny an Authority to Construct or Permit to Operate for any new or modified source of TACs if the project risk exceeds a cancer risk of 10.0 in one million." (AR 6077.) Neither the response to comments or the BAAQMD CEQA Guidelines (at AR 15866) explain why a threshold used in a different regulatory program to deny permission to operate a stationary source of TAC represents an appropriate threshold for determining significance under CEQA, where such a determination does not require denial of the project. Indeed, BAAQMD's Regulation 2, Rule 5 process for new and modified stationary sources of TAC may require the project to "implement Best Available Control Technology for Toxics (T-BACT), as determined by BAAQMD." (AR 15730.) According to BAAQMD, "Regulation 2-5 dictates that the cancer risk is acceptable if it is below one in a million, or if T-BACT is applied and the cancer risk is below 10 in a million." (AR 16163.) Thus, for UC to accurately use BAAQMD's Regulation 2-5 criterion for issuing stationary source permits as its threshold of significance, it would have to use the "one in a million" threshold instead of the "ten in a million" threshold because BAAQMD has not required that the CPHP implement T-BACT.[24]

e. The DEIR's Assessment of the Project's Cumulative Increased Cancer Risk Is Based on Legal Error and Not Supported by Substantial Evidence

The DEIR concludes that the Project's "cumulative" increase in cancer risk when considered in combination with other sources of risk is less than significant (AR 1695-97; 3846-48 [Impact C-AIR-2: Construction and Operation].) For cumulative increased risk, the DEIR uses a threshold of any exceedance of 100 cases per one million because "BAAQMD considers a cancer risk of 100 cases per one million or less to be within the 'acceptable' range of cancer risk." (AR 1650; 1653; 3800; 3803.)

Assuming arguendo that this is an appropriate threshold for assessing whether the Project's cumulative cancer risk impact is significant, the DEIR fails to apply it. After stating this threshold, the

[23] *Communities v. Richmond*, *supra*, 184 Cal.App.4th at 82.

[24] Also, as discussed in the next section, "acceptable" under CEQA is not the same as "significant."

DEIR changes it, stating: "Because the cumulative increase in cancer risk from all sources would be well below 100 in one million . . . the CPHP's cumulative impact to local health risk and hazards would be reduced to less than significant with identified mitigation." (AR 1696, 3847.)

Thus, instead of considering a post-project cumulative cancer risk above 100 cases per one million to be significant, the DEIR shifts to requiring that the cumulative "increase" in cancer risk contributed by the Project in combination with other projects exceed 100 cases per one million to be found significant. This shift reflects several legal errors.

First, the DEIR is confusing as to what the cumulative threshold is, which frustrates meaningful public comment. Therefore, the DEIR must be revised and recirculated using a clear and stable cumulative threshold.

Second, both thresholds, as described at AR 1650 and employed at AR 1696 for both construction and operation, suffer the same legal defect as the incremental standard: they are applied without regard to the baseline cancer risk. That risk in San Francisco is 248 cases per million from TAC plus at least 96 cases per million from DPM. According BAAQMD and the DEIR, this baseline risk is "unacceptable." The cumulative increase in cancer risk contributed by the Project in combination with other projects would make this existing "unacceptable" condition worse. The EIR fails to explain why the Project's admitted cumulative increase in cancer risk above an already unacceptable baseline level is not significant given that it is being added to a severe cancer baseline. (*CBE v. Resources*, *supra*, 103 Cal.App.4th at 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County*, *supra*, 221 Cal.App.3d at 718.)

This legal error is illustrated by a simple example. According to the DEIR, the threshold of a cumulative increase of 100 cases per million applies regardless of baseline risk. Thus, a project with a baseline cancer risk of 50 cases per million would need a post-project cancer risk of 150 cases per million for the cumulative impact to be deemed significant, while a project with a baseline cancer risk of 75 cases per million would need a post-project cancer risk of 175 cases per million for the cumulative impact to be deemed significant. Thus, a project with the higher baseline risk (75 per million) would not be deemed to have a significant cumulative impact with a post-project cancer risk of 150 cases per million, but a project with the lower baseline risk (50 per million) would be deemed to have a significant cumulative impact with a post-project cancer risk of 150 cases per million. In short, the widely repudiated "ratio theory" in which "the greater the overall problem, the less significance a project has in

a cumulative impacts analysis" is improperly embedded in the EIR's threshold of significance for the Project's cumulative cancer risk impact. (*Kings County*, *supra*, 221 Cal.App.3d at 721.)[25]

The Final EIR responds to comments regarding the invalidity of the EIR's use of the cumulative threshold by noting that the BAAQMD considers any cancer risk below 100 cases of cancer in one million people to be "acceptable" and cancer risk above 100 cases of cancer in one million people to be unacceptable. (AR 6082-83.) Thus, the EIR must explain why any CPHP-induced increase in cancer risk above the severe existing condition (which clearly exceeds 100 in one million) is not significant. The EIR fails to do so. This is a failure to proceed in the manner required by law.

The FEIR responds to the comment that the DEIR employs the TAC cancer risk thresholds in a manner that fails to account for the severity of existing baseline conditions by arguing that these thresholds are supported by "substantial evidence." (AR 6076-78.) This is not responsive to the comment that the EIR commits a procedural/informational error by "failing to add the Project's effects to the baseline for purposes of determining significance."

The FEIR's response to comments argues that because BAAQMD, San Francisco and other agencies agree that these thresholds are appropriate, this somehow provides "substantial evidence" supporting their use. (AR 6076-78.) The FEIR misconceives the task at hand, because the response is entirely abstract, untethered to the facts of this Project or its setting. (*Golden Door I*, *supra*, 27 Cal.App.5th at 903-905 ["the Efficiency Metric 'allows the threshold to be applied evenly to most project types,' but it does not account for variations between different types of development; nor does it explain why the per person limit would be appropriately evenly applied despite project differences. Without substantial evidence explaining why statewide GHG reduction levels would be properly used in this context, the County fails to comply with CEQA Guidelines"].)

CEQA neither requires nor allows the DEIR to use the BAAQMD's or EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts. (*Ebbetts Pass*, *supra*, 43 Cal.4th at 957 (error to conclude that compliance with pesticide restrictions precludes significant impact).) The EIR's reliance on the increase over 100 in one million threshold to determine cumulative significance improperly imports considerations of cost and feasibility of mitigation into a determination of significance, whereas CEQA requires that these determinations be made in distinct steps.[26] UC's discretion to decide that significant harm is "acceptable" in light of Project benefits arises at the end of

[25] The environmental justice implications of the DEIR's use of this threshold are dire.

[26] The EPA standard was designed to support a different regulatory scheme, not to support determinations of significance under CEQA. The EPA is permitted and required to consider factors of cost and feasibility in its regulation of toxics under the Clean Air Act.

the CEQA analysis, in a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant. (*City of Marina*, *supra*, 39 Cal.4th 341 at 368-369.)

The FEIR argues that the 100 in one million cancer risk threshold is based on guidance developed by the United States EPA for "acceptable" risk. (AR 6077.) The response misrepresents actual EPA policy, which is to assess increased cancer risk based on a host of site-specific factors within a range of values from one in one million to 100 in one million. This policy reflects the agency's attempt to balance the costs and benefits of protecting public health in its implementation of a host of federal environmental laws, including the Clean Air Act, Clean Water Act, Resource Conservation and Recovery Act, CERCLA (Superfund), etc. (AR 898 [Starfield, L.E., "The 1990 National Contingency Plan: More Detail and More Structure, But Still a Balancing Act;" *Environmental Law Reporter*, June 1990].) Instead of following this analytic approach, the EIR selects one value at the least environmentally protective end of the EPA's "acceptable risk" range and uses it to determine the significance of the Project's impacts, but without regard to the Project's site-specific considerations.

The distinction is important, because where the impact does not exceed a threshold of significance erroneously inflated by the concept of "acceptable risk," UC is absolved of further legal obligation to mitigate the impact. As a result, the public cannot know whether UC would allow an unknown number of cancer cases to occur that it could have feasibly avoided had it scrupulously followed CEQA. Nor does the public know, had the EIR found the Project's additional cancer risk insignificant, whether UC would have found the Project's benefits outweigh its environmental and adverse human health effects. (*County of Fresno*, *supra*, 6 Cal.5th at 512 ["the EIR . . . is a document of accountability"].)

3. Additional Responses to a Comment Regarding the EIR's Method for Determining the Significance of Cumulative Cancer Risk are Inadequate

Commentors noted that the DEIR is confusing because it is unclear if it considers any resulting post-project cumulative cancer risk above 100 cases per one million to be a significant project impact, or if it requires that the cumulative "increase" in cancer risk contributed by the Project in combination with other projects exceed 100 cases per one million be found significant. (AR 6072-73.) The FEIR fails to respond to this comment or clarify how the threshold was applied.

The response also purports to find substantial evidence support for using these thresholds in the fact that BAAQMD developed its 100 in one million cumulative criterion because it is reflective of air quality in a 'pristine' portion of the Bay Area. (AR 6079.) It is difficult to see how this supports the EIR's use of the cumulative threshold to find this Project's cumulative cancer risk impacts to be less than significant. If the EIR uses the cumulative threshold to conclude that if the Project contributes to an

increase in cancer risk where total post-project cancer risk exceeds 100 cases of cancer per one million, then the fact that cancer risk in pristine areas is 100 in one million supports finding this Project's cumulative contribution to be "considerable" because it would increase cancer risk above the baseline cancer risk of at least 248 or 344 cases per one million people. Alternatively, if the EIR requires that the cumulative "increase" in cancer risk contributed by the Project in combination with other projects exceed 100 cases per one million to be found significant, then the fact that cancer risk in pristine areas is 100 in one million is irrelevant to the determination of significance.

The response to comments also refers to a 1,000-foot distance from sources of cancer risk. (AR 7078; 6080.) The response does not explain how this distance supports the EIR's application of its thresholds to this Project and its setting. If this distance limit is used to exclude the contribution of regionally or globally transported TACs to this Project's cumulative excess cancer risk, the EIR commits an error of law. Baseline risk cannot be arbitrarily reduced by this artifice. Also, the fact that pollutants from a particular source may attenuate with distance does not explain why the cumulative background cancer risk pollutants from all sources, including more distant sources, can be ignored in a cumulative analysis. CEQA requires consideration of all existing conditions in cumulative analysis. (*CBE v. Resources*, *supra*, 103 Cal.App.4th at 114; *Kings County*, *supra*, 221 Cal.App.3d at 718.)

G. The EIR's Visual Impacts Analysis Is Based on Errors of Law and Improperly Defers the Formulation of Mitigation Measures for Significant Visual Impacts[27]

1. The EIR's Analysis of Impacts AES-1 and AES-2 Omits Essential Information

The EIR divides its analysis of the CPHP's visual impacts into three types of impacts using three separate thresholds of significance: physical impacts on scenic vistas (AR 3719 [Impact AES-1]), "conflict with applicable zoning and other regulations governing scenic quality" (AR 3726 [Impact AES-2]), and "new sources of substantial light or glare which would adversely affect daytime or nighttime views" (AR 3741 [Impact AES-3].)

The EIR deploys these thresholds in a manner that excludes consideration of substantial evidence supporting a fair argument that visual impacts as perceived from surrounding neighborhoods may be significant. The EIR achieves this result by (1) artificially limiting its analysis of *physical* changes to the visual character of the area to impacts on scenic vistas (i.e., Impact AES-1) and (2) measuring the CPHP's conflict with applicable regulations governing visual impact against a legally erroneous baseline of future regulations.

[27] The issues in this section are exhausted at AR 5862-64; 5903-06; 5913-18; 6137-43.

Regarding Impact AES-2, the EIR identifies the "applicable regulations governing scenic quality" as UC's 2014 LRDP sub-objectives 1B and 1C, which provide, respectively, that the campus: "Acknowledge and respond to local zoning and height and bulk limitations to the extent possible" and "Design new buildings to be sensitive to the surrounding neighborhood and landscape, taking into account use, scale, potential noise generation, and density." (AR 3726.)

The EIR finds that the New Hospital, at 955,000 gross square feet, 16 stories tall, and 294 feet in height (AR 3668), would:

> contrast sharply both in height and scale with the existing residential development to the east, which is limited to 40 feet in height. The proposed New Hospital would also be nearly 100 feet taller than other existing buildings on the campus site (adjacent Moffitt Hospital is currently the tallest building at 197 feet). In addition, the proposed New Hospital would be a prominent newly visible feature in the viewsheds from nearby neighborhoods . . . . As such . . . the height and scale of the proposed New Hospital would be inconsistent with 2014 LRDP sub-objective 1C.

(AR 3731.) Having shown that the impact is significant, the EIR performs a neat trick by finding the impact less than significant because the CPHP would do away with the 2014 LRDP's regulations governing scenic quality with which it conflicts. The EIR states:

> To the extent the CPHP would be inconsistent with applicable 2014 LRDP objectives as described above, UCSF would seek amendments to the 2014 LRDP to bring the CPHP and 2014 LRDP into conformity. In particular, the 2014 LRDP would be amended clarify (sic) that sub-objectives 1B and 1C would not apply to the New Hospital project . . . ."

(AR 3737; see also AR 3727.) By this artifice, the EIR improperly considers the baseline to be the future project under the amended LRDP policy, rather than comparing the CPHP's environmental impact to current conditions. (*South Coast*, *supra*, 48 Cal.4th at 320-21; *Environmental Planning and Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 355.)

When this error is combined with the EIR's self-selected limitation on Impact AES-1 to only consider impacts on scenic vistas, the EIR commits the additional legal error of deploying its thresholds of significance to foreclose consideration of substantial evidence supporting a fair argument of significant impact. (*Ante*, *Visalia Retail*, *supra*, 20 Cal.App.5th at 13; *Amador Waterways*, *supra*, 116 Cal.App.4th at 1108–09.)

Here, a fair argument of significant impact is provided, not only by the EIR's analysis of Impact AES-2 (AR 3726-41), but by public comments from expert planners Terry Watt (AR 5903-06) and Jared Ikeda of Ikeda Consulting. (AR 5913-14). Mr. Ikeda opined that the proposed building under the CPHP, and particularly the sixteen-story New Hospital "would have significant visual impacts," providing visual simulations to show the extreme inconsistency with surrounding development. (AR 5913-14.) Mr. Ikeda described the New Hospital as the "dominant mass" in the neighborhood, that will "block views"

to Mount Sutro. (AR 5915.) He concluded that "the height and mass of the proposed new hospital will be highly visible as a new feature in the skyline from . . . public parks as well as from various other locations and streets within the surrounding neighborhoods." (AR 5917.) The New Hospital would also be visible from Golden Gate Park. (AR 5918.) Golden Gate Park is one block (400 feet) from campus. (AR 3644, 3699.)

In short, the EIR's analysis of Impacts AES-1 and AES-2 reveal a rabbit warren of legal errors that combine to omit an essential analysis of the CPHP's physical impacts on the area's visual quality as seen from the surrounding neighborhood, requiring revision of the DEIR.

2. UC Erroneously Claims That It Is Exempt from Considering Visual Impacts Pursuant to Public Resources Code Section 21099

The EIR claims, based on section 21099 subdivision (d), that it need not analyze visual impacts and that the analysis that is provided is solely for informational purposes. (AR 3715-16; 3691-92; 5766.) That is incorrect. The CPHP does not qualify for exemption from CEQA's requirements to assess visual impacts. "The scope of an exemption may be analyzed as a question of statutory interpretation and thus subject to independent review." (*Covina Residents for Responsible Development v. City of Covina* (2018) 21 Cal.App.5th 712, 724.) Courts review exemptions narrowly. (*San Lorenzo Valley Community Advocates for Responsible Education v. San Lorenzo Valley Unified School Dist.* (2006) 139 Cal.App. 4th 1356, 1382; *Mountain Lion Foundation v. Fish and Game Commission* (1997) 16 Cal.4th 105, 125 (*Mountain Lion Foundation*.)

Section 21099, subdivision (d)(1) states that "[a]esthetic and parking impacts of a residential, mixed use-residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." The EIR contends the CPHP "substantially meets the definition of an employment center as the campus site includes a variety of commercial uses." (AR 3692.) But the exemption narrowly defines an "employment center project" as "a project located on property zoned for commercial uses." (§ 21099 (a)(1).) To the extent the campus has any zoning classification, it is partially zoned by the City as "(Public) Zoning District" and "Residential House District, Two-Family (RH-2)." (AR 4082.) It is not zoned for "commercial use."

In responses to comments, the FEIR argues that pursuant to its "constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation, including those of the City of San Francisco." (AR 5765.) Assuming this is true, it is not relevant to whether the campus meets the statutory requirement of being zoned for commercial uses. It is either zoned for "(Public) Zoning

District" and "Residential House District, Two-Family (RH-2)" or it is not zoned at all.[28]

The FEIR also presents a new argument that the CPHP is a "residential" or "mixed-use residential" project because it "proposes substantial new on-campus housing, consisting of 772 net new housing units." (AR 5765-66.) These characterizations are incorrect as a matter of law. While section 21099 does not define "residential" or "mixed-use residential" projects, another closely-related section of CEQA does. Section 21159.28 subdivision (d) defines a "residential or mixed-use residential project" as one "where at least 75 percent of the total building square footage . . . consists of residential use or a . . . transit priority project as defined in Section 21155." "Transit priority projects" are defined as containing "at least 50 percent residential use, based on total building square footage." (§ 21155.)

The CPHP proposes 915,300 square feet of housing out of total proposed development of over five million square feet. (AR 3684.) Thus, housing represents less than 20% of the CPHP development footprint, not nearly enough to qualify it as a "residential" or "mixed-use residential" project under CEQA's limited exemptions for housing projects. (*Berkeley Hillside Preservation v. City of Berkeley* (2015) 60 Cal.4th 1086, 1099-1100 ["statutes must be read in the context of "the entire scheme of law of which it is part so that the whole may be harmonized and retain effectiveness"].)

The CPHP is not within the scope of section 21099 and requires EIR analysis of visual impacts.

H. The EIR Improperly Defers the Formulation of Mitigation Measures for Significant Biological and Visual Impacts

In its analysis of biological Impact BIO-2, the EIR finds significant wildlife impacts from increased bird strikes due to light and glare associated with higher buildings, particularly the New Hospital adjacent to the Mount Sutro Reserve; and that the adoption of Mitigation Measure BIO-2b (MM BIO-2b) would reduce this impact to less than significant. (AR 3870-71.) In its analysis of aesthetic Impact AES-3, the EIR finds the CPHP would create new sources of substantial light or glare which would significantly and adversely affect daytime or nighttime views in the area, and that the adoption of Mitigation Measure AES-3 (MM AES-3) would reduce this impact to less than significant.

Both MM BIO-2b and MM AES-3 improperly defer the formulation of specific mitigation measures until after project approval. MM BIO-2b provides:

> ***Minimize*** light and glare resulting from new buildings through the orientation of the building, use of landscaping materials and choice of primary façade materials. Design standards and guidelines to minimize light and glare shall be adopted for the new buildings, including: reflective metal walls and mirrored glass walls shall not be used as primary building materials for facades.

(AR 3871.) As biologist Dr. Shawn Smallwood stated in his comments on the DEIR, the proposed

[28] UC does not dispute that it must comply with CEQA before approving the CPHP.

mitigation does not reduce the impact to a less-than-significant level, the choice of materials has been deferred, and the measure does not establish "performance standards." (AR 5938-39; 5868-69.) The "design standards and guidelines to minimize light and glare" are also deferred and are not linked to any performance standards.

MM AES-3 provides:

> Light and glare from buildings ***shall be minimized*** through the orientation of the building, use of landscaping materials and choice of primary facade materials. Design standards and ***guidelines to minimize light and glare shall be adopted*** for new buildings, including:
>
> - Reflective metal walls and mirrored glass walls shall not be used as ***primary*** building materials for facades.
> - Installation of illuminated building signage ***shall strive*** to be consistent with UCSF design guidelines and/or City Planning Code sign standards for illumination. . ..
> - Design parking structure lighting to ***minimize*** off-site glare.

(AR 3742) This measure improperly defers the formulation of actual mitigations because it does not establish performance standards against which future planners or the public can judge whether the impact is reduced to less than significant. The terms "minimize," "primary," and "strive" are too vague to be enforceable. (See case law discussion *ante*).

I. The EIR Fails to Assess the Project's Shadow Impacts on Surrounding Neighborhoods

Shadow impacts from the huge CPHP buildings are of major concern. UC prejudicially abused its discretion because the EIR was required, but failed, to analyze the impact of new shadows on the surrounding neighborhood. The EIR restricted its analysis of new shadows to three city parks; to wit, Golden Gate, Richard Gamble Memorial, and Gratton. (AR 1597-1624; 3759, 3771.) The FEIR's Master Response concedes that new shadow is considered significant only if it "substantially and adversely affect[s] the use and enjoyment of publicly accessible open spaces. (AR 5779.) Commentors objected to the Draft EIR's failure to analyze the significance of new shadows on surrounding neighborhoods, including those created by the proposed 16-story New Hospital. Comments presented substantial evidence supporting a fair argument that such new shadows may have significant impacts. (AR 5775; 5864; 5906; 5917-18; 6311, 6313, 6401, 6443, 6509-10.)[29]

[29] "As currently envisioned, the proposed New Hospital would be 16 stories and up to 294 feet in height. Although the building has not yet been designed, the 16-story building would exceed the City's height limits for the portions of the project site within the 65-D and 220-F Height and Bulk Districts. As for any portion of the New Hospital that would be located within the Open Space Height and Bulk District, although General Plan policies discourage the placement of buildings or additions within this district." (AR 4091.) UC is "exempt from local zoning whenever using property under its control in furtherance of its educational mission." (*Ibid*.)

Planner Jared Ikeda commented on the lack of analysis of shadow impacts on public places outside of parklands. (AR 5863, 5912, 5917-18.) Based on the DEIR's Shadow Study Appendix (AR 3749-63.), Mr. Ikeda observed that the increased height of the proposed New Hospital, Milberry Terrace, and Irving Street Gateway projects "will further increase the time and frequency" of shadows cast throughout the year on public sidewalks and streets along Parnassus Avenue and Irving Street frequented by pedestrians. (AR 5917.) Mr. Ikeda also observed that shadows "affect the direct exposure to sun radiation and the resulting feeling of warmth to a person's body;" that "sun radiation can affect the temperature of a surface struck by sunlight and increase that temperature and its surroundings;" and that "[t]he comfort and attractiveness of these particular areas to pedestrians and passersby may be adversely affected and should be addressed in the EIR." (AR 5917.)

The EIR's refusal to analyze the significance of shadow impacts on neighborhood life outside of city parks, when presented with substantial evidence supporting a fair argument that such impacts may be significant, renders it inadequate. (See *ante*.) The EIR cannot use a self-selected threshold of significance to ignore a fair argument of significant impact. (*Amador Waterways*, *supra*, 116 Cal.App.4th at 1109 ["a threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant."].)

The FEIR's response to comments also summarizes what the DEIR's shadow study shows regarding the timing and extent of new shadows. (AR 5779 [2nd full ¶].) But, like the DEIR, the FEIR fails to determine the significance of this impact. (*Amador Waterways*, *supra*, 116 Cal.App.4th at 1111-12 ["The question the Agency had to answer was whether the reduction of the surface flow in the streams constituted a significant environmental effect."].)

The CPHP EIR failed to adequately address shadow impacts, in multiple respects.

J. The EIR Improperly Deferred the Formulation of Mitigation for Significant Wind Impacts[30]

The New Hospital, sixteen stories tall and over 294 feet high, would be the tallest building in the vicinity of the Parnassus campus. (AR 3731, 3668.) The EIR concludes that wind is already "uncomfortable" on Parnassus Avenue near the existing Moffitt-Long Hospital and Medical Building 1: "Winds that approach the campus from the southwest through the northwest tend to be accelerated as they flow between Mount Sutro and the taller campus buildings along the south side of Parnassus Avenue, as well as along Parnassus Avenue between taller campus buildings to either side of the street." (AR 3708.) The EIR concluded that wind impacts in the vicinity of the proposed New Hospital and

[30] This issue was exhausted in public comments at AR 1014-1016; 1021-1112.

other buildings would exceed the comfort criterion for pedestrians and would be "significant and unavoidable with mitigation." (AR 3743-46.)

The EIR identifies (and the Findings adopt) Mitigation Measure AES-4 to reduce the significant impact. However, MM AES-4 defers the formulation of specific mitigation measures to future analyses when specific building designs become available:

> CPHP Mitigation Measure AES-4 would require that wind-tunnel testing of specific building designs for structures 80 feet tall or greater be implemented to reduce wind impacts as feasible. However, in the absence of wind tunnel testing of specific building designs, it cannot be concluded that effects would be reduced to a less than significant level. Therefore, this impact would be significant and unavoidable with mitigation.

(AR 3744; see also 145-146, 3743, 4092.)

As discussed, to defer mitigation until after project approval it must be impracticable to achieve in the present and the agency must adopt performance standards. UC violates both criteria for deferral.

1. The EIR's Implied Finding That It Is Impractical to Formulate Specific Mitigation Measures Before Approval Is Not Supported by Substantial Evidence

The EIR states that wind impacts require computational analysis, which it includes, and an "individual point-based analysis undertaken in a wind tunnel," which it asserts cannot occur without final building designs:

> The computational analysis provides information regarding wind flows over the entire site, unlike the individual point-based analysis undertaken in a wind tunnel, and thus is able to reliably predict wind comfort conditions across a relatively wide area, such as the Parnassus Heights campus site. Computational wind engineering does not, however, account for turbulence (variation in wind speed and direction) in the same manner as does wind-tunnel testing, which is more appropriate for evaluation of actual specific designs of tall buildings. Moreover, computational analysis cannot identify exceedances of the wind hazard criterion due to its inability to reliably simulate turbulence using currently accepted methods.

(AR 3717.) On such basis, the EIR defers final analysis of the significance of wind impacts caused by the New Hospital, the Irving Street Arrival, Research and Academic Building ("RAB") and the Initial Aldea Housing Densification. (AR 3774, 3745.) It also defers the formulation of specific mitigation measures for those buildings until final designs are completed and subjected to wind-tunnel testing. (AR 3744, 3746.) The FEIR comment response is that "precise evaluation of a building's wind effects can only be undertaken in a wind-tunnel analysis, and because such an analysis provides useful information only when an actual specific building design is evaluated, *it is not possible* to provide more detail regarding potential wind impacts and potential mitigation measures . . . (AR 5773, italics added.)

Assuming, *arguendo*, that the absence of final designs precludes final wind-tunnel testing, the FEIR fails to explain or provide substantial evidence that it is impractical to complete final designs

before approval of the CPHP and to conduct the necessary wind tunnel testing to enable this EIR to analyze wind impacts and evaluate mitigations or alternative designs *before approval*.[31]

Moreover, relevant EIR evidence points in the opposite direction. The approximate mass and size of the buildings, including the New Hospital, are already known and modeled. (AR 3663.)[32] UC designed the New Hospital during the preparation of the EIR and consideration of the CPHP, noting that "sufficient detail will be available to publish a project-level Draft EIR for the New Hospital in the summer of 2021." (AR 3585.) An architectural firm prepared the CPHP and produced a visual rendering of the new buildings, after which UC hired another architect for the New Hospital in July 2020. (AR 1133; 1137-43; 1154-59.)[33] There is no substantial evidence that it would be impractical to complete building designs and conduct wind tunnel testing before EIR certification and project approval. UC's deferral of formulation of specific mitigation measures was a prejudicial abuse of discretion.

2. UC's Mitigation Fails to Require Compliance with Specific Performance Standards

MM AES-4 identifies a specific performance criterion: new exceedance(s) of the City's 26-mph pedestrian wind hazard criterion, *but it does not require that it be met*. (AR 3744.) UC merely promises that "UCSF shall work with the wind consultant to identify feasible mitigation strategies, including design changes (e.g., setbacks, rounded/chamfered building corners, stepped facades, etc.), to eliminate or reduce wind hazards to the maximum feasible extent." (AR 3744.) It does not set a performance standard by which these mitigation measures would be measured nor commit UCSF to a course of action. This does not satisfy the mandates of CEQA. (*Ante*; Guidelines, § 15126.4 (a)(1)(B).)

The error is prejudicial because UC finds the CPHP's future wind impacts to be "significant and unavoidable." (AR 144-47.) This finding requires that UC impose feasible mitigation measures that would substantially reduce the impact or reduce it to less than significant. (§ 21081 (a)(3); Guidelines, § 15091 (a)(3).) UC chose to defer design-specific analysis of wind impacts until after approval, and thus it is also its choice that no mitigation measure is ready to approve.

Also, UC's refusal to conduct design-specific analysis before approval means that its statement of overriding considerations based on Project benefits outweighing significant environmental effects

---

[31] "Where there are impacts that cannot be alleviated without imposing an alternative design, their implications and the reasons why the project is being proposed, notwithstanding their effect, should be described." (Guidelines, § 15126.2(c).)

[32] "The preliminary concept for the New Hospital consists of a 5-story podium, above which an 11-story tower would rise." (AR 3668.)

[33] SF submitted additional detailed literature regarding specific design features to reduce pedestrian wind impacts, including the use of building features, massing, rounded corners, orientation of building in relation to wind, and consideration of terrain, and including information about how "podium designs" affect wind. (AR 1021-1112; 1095-1098; 1105-1111.)

was adopted without adequate basis, because neither UC nor the public know the severity of the significant effect. (*County of Fresno*, *supra*, 6 Cal.5th at 519 ["a sufficient discussion of significant impacts requires not merely a determination of whether an impact is significant, but some effort to explain the nature and magnitude of the impact"].)

Finally, MM AES-4 requires the use of an incorrect baseline to determine the success of the mitigations. The mitigation requires comparison of the "wind hazard exceedance or the number of test points subject to hazardous winds, compared to then-existing conditions . . . ." (AR 3744.) The proper baseline is the present, not future environmental conditions. (*South Coast*, *supra*, 48 Cal.4th at 320-321.)

K. The EIR Fails to Lawfully Analyze and Mitigate GHG Emissions

Implementation of the CPHP would increase electricity consumption at the Parnassus Heights campus by 116 percent, natural gas would be increased by 61 percent, diesel would be increased by 71 percent, and gasoline would be increased by 22 percent. (AR 1779.) These drastic increases in energy consumption would, in turn, significantly increase GHG emissions at the Parnassus campus. The EIR's analysis and mitigation for these GHG emission violates CEQA. UC's strategy to primarily rely on purchasing voluntary market offsets results in both unenforceable and improperly deferred mitigation. UC also improperly relies on the inapplicable 2017 Scoping Plan to establish a significance standard.

1. The EIR Relies on Unenforceable Mitigation

CEQA requires a lead agency to consider the "extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions[.]" (Guidelines, § 15064.4 (b)(3).) One of the EIR's significance criteria for GHG emissions is whether the CPHP would "generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment." (AR 1851.) The DEIR stated that the criterion would be potentially surpassed, because "the CPHP would result in a significant impact on the environment if GHG emissions from construction and operations of the Parnassus Heights campus site would exceed a threshold of zero net additional GHG emissions compared to the existing conditions, currently estimated below to be 125,426 MT CO2e annually for all Scope 1, Scope 2, and Scope 3 sources[.]" (AR 1852.)

To decrease the GHG emissions to less than significant (i.e., less than net-zero), the EIR relies on Mitigation GHG-1c. (AR 1855.) GHG-1c is divided into two parts, "Compliance with CARB's Cap and Trade Program" and "Compliance with UC Policy." (AR 1858.) There are two critical distinctions between the parts. Compliance with CARB's cap and trade program requires offset credits to be registered and retired by an Offset Project Registry pursuant to 17 California Code of Regulations section 95802 subdivision (a). However, these offsets may only be applied to UCSF's Central Utility

Plant ("CUP") because it is the only aspect of the CPHP that is a "Covered Entity" (AR 1834) – and then only up to a maximum of eight percent of UC's cap and trade program compliance obligation (AR 6128.) For the remainder of its compliance obligation, UC proposes to "utilize *the voluntary carbon market* to offset the remainder of the emissions from the CPHP that are above the project significance criterion." (AR 6128, italics added; 1858.)

The EIR concedes the eight percent maximum decrease under the cap-and-trade program is insufficient to meet its net-zero increase standard. (AR 1854.) In 2018, UCSF Parnassus produced 125,426 MT CO_2e of emissions. (*Ibid*.) Implementing the CPHP would increase emissions to 187,241 MT CO_2e, which is an increase of 61,815 MT CO_2e. (*Ibid*.) An eight percent decrease from the CUP would be insufficient to cover this increase and so, to avoid a significant impact determination, UC relies on the purchase of offsets *in a voluntary market* for all other CPHP emissions (equal to roughly 59,000 MT CO_2e a year). (AR 1855.)

The legal problem, however, is that these voluntary market offsets do not meet the same enforceability standard as CARB's cap and trade program (i.e., "real, permanent, verifiable, additional, and enforceable") and, therefore, are not "fully enforceable through permit conditions, agreements, or other legally binding instruments" as required by CEQA. (Guidelines, § 15126.4 (a)(2); see *Golden Door II*, *supra*, 50 Cal.App.5th at 506-514 [offset-based GHG mitigation violated CEQA because unenforceable].) In *Golden Door II,* as here, the agency's proposed offsets did not meet the protocols of the CARB cap-and-trade program designed to ensure that they are "real, permanent, verifiable, additional, and enforceable." (*Id*., *supra*, 50 Cal.App.5th at 511.) The CPHP's mitigation here, M-GHG-1c, uses nearly identical language as the mitigation in *Golden Door II*. (Compare AR 1859 to 50 Cal.App.5th at 511.) *Golden Door II* held that voluntary market offsets did not meet CEQA's enforceability requirement for mitigation because "M-GHG- does not require the protocol itself to be consistent with CARB requirements." (*Golden Door II*, *supra*, 50 Cal.App.5th at 506, 512.) The same is true here. (AR 1859 ["The protocols of each registry . . . shall be used"].)

2. The EIR Impermissibly Defers Mitigation for GHG Emissions

As discussed above, "Deferred mitigation violates CEQA if it lacks performance standards to ensure the mitigation goal will be achieved." (*Golden Door II*, *supra*, 50 Cal.App.5th at 520; Guidelines, § 15126.4 (a)(1)(B).) In *Golden Door II*, the court found the relevant offset mitigation impermissibly deferred because the county's planning and development director determined whether to approve offsets, without applying objective criteria. (*Golden Door II*, *supra*, 50 Cal.App.5th at 519.) UC's mitigation strategy is analogous and therefore dictates the same outcome here. *Golden Door II* determined that "M-GHG-1 sets a generalized goal — no net increase or net zero GHG emissions . . .

achieving that goal depends on implementing undefined offset protocols, occurring in unspecified locations (including foreign countries), the specifics of which are deferred to those meeting one person's subjective satisfaction." (*Id*., *supra*, 50 Cal.App.5th at 520.) The only differences here are that (1) UC limits offsets to unspecified locations within the United States and (2) instead of a single person's subjective satisfaction it is UC's unspecified "internal guidelines" and "internal screens" that must be satisfied. (AR 1858.) Neither difference compels a different outcome.

With respect to the location of offsets, *Golden Door II* held that M-GHG-1 did not contain objective standards as to whether any specific offset project would be "available" or "financially feasible" in one location or another. (*Golden Door II*, *supra*, 50 Cal.App.5th at 520-21.) UC follows the same approach here by allowing a large portion of CPHP emissions to be "mitigated" by purchasing offsets. (AR 1854.) Rather than determine the locations and protocols of these offsets at the time of the EIR, UC has deferred these determinations.

Further, *Golden Door II* found the agency's criteria for determining whether an offset would be "real, permanent, verifiable and enforceable," was not sufficiently objective. (*Golden Door II*, *supra*, 50 Cal.App.5th at 521.) UC's mitigation also lacks the objective criteria, as the "protocols of each registry, and *UC own internal screens*, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols." (AR 1859, italics added.) The EIR provides no information about what these "internal screens" are, who is responsible for defining them, or whether the screens would provide offsets that are real, permanent, additional, and independently verified. (*Ibid*.) Without additional information, decision-makers and the public are left in the dark as to whether GHG-1c contains adequate, or any, performance standards. As in *Golden Door II*, GHG-1c is impermissibly deferred.

3. CARB's 2017 Scoping Plan Is Inapplicable by Its Own Terms to UC and Cannot Be Used to Reduce UC's Duty to Mitigate GHG Impacts

One of the EIR's thresholds of significance for GHG emissions asks: "Would implementation of the CPHP . . . Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases." (AR 1851.) In 2017, UCSF developed a combined Climate Action Plan and GHG Reduction Strategy ("GHGRS") "to provide streamlined analysis under CEQA for future development projects" (AR 1845-46) and to ensure that UCSF can answer 'no' to the above-stated questions (AR 1851). The GHGRS is also intended to ensure that UCSF is consistent with the state's GHG emission reduction targets for 2030 and 2050. (AR 1846; 1851.) Through legislation and executive orders, California has set the following emissions targets: by 2030, reduce GHG missions to 40 percent below 1990 levels; and by 2050, reduce GHG emissions to 80 percent below 1990 levels.

(AR 1830-31.) (See e.g., (*Cleveland I;* 3 Cal.5th at 428; *Newhall Ranch I*, *supra*, 62 Cal.4th at 221; *Spring Valley Lake*, *supra*, 248 Cal.App.4th at 101; *Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, 1168; *Citizens for Responsible Equitable Environmental Development v. City of Chula Vista* (2011) 197 Cal.App.4th 327, 335-36.)

The EIR, however, in selecting the standard for determining whether its "conflict with applicable plan" threshold is triggered, abandons UCSF's own "applicable" GHGRS and instead uses the "inapplicable" CARB 2017 Scoping Plan Update, which guides cities and counties to use a "zero net increase" significance standard for GHG emissions. (AR 1852, 26981.) But UCSF is not a city or county, and so the CARB 2017 Scoping Plan guidance is inapplicable by its own terms, and the EIR fails to substantively explain how such guidance is applicable to a statewide entity like UC. As the EIR explains, "UCSF is a constitutionally created state entity," and therefore not a city, county or local government. (AR 1741.) As such, guidance to cities and counties regarding review and approval of private development projects within their respective jurisdictions simply has no application to UC's management of its own development proposals on its own property, over which UC has plenary authority.

In short, the EIR says it will use "conflict with an applicable plan, policy, or regulation" as a threshold of significance, but then selects a patently inapplicable plan to use in the analysis. This is a legal error. Further, this error is prejudicial because using a "net zero" significance standard reduces UC's mitigation obligation as compared to using a significance standard tied to the state's 2030 and 2050 GHG reduction goals.

L. The EIR Fails to Adequately Assess Whether Significant Increases in Energy Consumption are Wasteful, Inefficient or Unnecessary

1. UC May Not Uncritical Rely on Title 24 and LEED Certification

The CEQA Guidelines require lead agencies to prepare a substantive analysis of a project's energy impacts and provides in relevant part:

> Energy Impacts. If analysis of the project's energy use reveals that the project may result in significant environmental effects due to *wasteful, inefficient, or unnecessary use of energy, or wasteful use of energy resources, the EIR shall mitigate that energy use*. This analysis should include the project's energy use for all project phases and components, including transportation-related energy, during construction and operation. *In addition to building code compliance, other relevant considerations may include, among others, the project's size, location, orientation, equipment use and any renewable energy features* that could be incorporated into the project.

(Guidelines, § 15126.2 (b), italics added.)

An EIR must affirmatively analyze a project's use and efficiency to determine whether there is "wasteful, inefficient, or unnecessary use of energy." Here, the EIR's perfunctory analysis of energy

falls well short of these mandates. There are two interrelated but distinct defects in the EIR's analysis of energy impacts. First, the EIR disregards Appendix F energy conservation factors. Second, the analysis relies heavily on compliance with Title 24 and LEED standards but otherwise fails to consider other relevant considerations of Guidelines section 15126.2, subdivision (b).

The EIR purports to analyze the considerations set forth in CEQA Guidelines, Appendix F, yet completely overlooks the introduction of Appendix F, which states:

> The goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include:
> a. decreasing overall per capita energy consumption,
> b. decreasing reliance on fossil fuels such as coal, natural gas and oil, and
> c. increasing reliance on renewable energy resources.

(Guidelines, Appendix F.)

The EIR makes no effort to demonstrate that the CPHP employs these specifically-identified "means" to achieve the stated goal of conserving energy. The most glaring conflict comes from a paragraph titled "Appendix F.II.C.1: Energy Requirements and Energy Use Efficiencies" of the EIR, which points the reader to Tables 4.5-2 and 4.5-3 for estimated energy usage. (AR 1779.) Table 4.5-2 discloses that electricity use would increase from 5,091 to 10,976 MWh/year, natural gas use would increase from 1,044,485 to 1,686,549 MMBtu/year, diesel use would increase from 681,823 to 1,198,763 gallons per year, and even gasoline use would increase from 4,246,449 to 5,178,022 gallons per year. (*Ibid*.) These numbers translate to a 116 percent increase in electricity use, 61 percent increase in natural gas use, 76 percent increase in diesel use and 22 percent increase in gasoline use. (*Ibid*.)

With respect to the three different "means" of achieving energy conservation, the EIR discloses that UCSF would dramatically increase its reliance on fossil fuels rather than "decreasing reliance." Further, the EIR's energy chapter does not break down energy use per capita so there is no evidence whether this is met. Last, the EIR is unclear whether renewable energy sources would be implemented into the CPHP, and this is particularly troublesome given "[t]he CUP currently supplies a substantial majority (98 percent) of the electricity service to the Parnassus Heights campus site by means of gas and steam turbine generators." (AR 1767.) Therefore, there is no indication that any of the identified means to achieve the goal of energy conservation are being met other than through reliance on compliance with Title 24 and LEED standards.

Though the EIR provides energy consumption data, the dramatic increases easily overcome the low threshold of whether the Project "may" result in wasteful, inefficient, or unnecessary use of energy, or wasteful use of energy resources. (Guidelines, § 15126.2 (b).) Put simply, the Project's proposed

increases in energy consumption imposes upon UC the duty to analyze in the EIR whether such consumption is "wasteful, inefficient or unnecessary." The EIR fails at this task.

The EIR's determination that energy impacts would be less than significant is based entirely on the Project's compliance with UC's Sustainable Practices Policy provisions "that are designed to conserve and reduce energy consumption," which in turn are premised on Title 24 and LEED compliance. (AR 1774, 1777.) However, both the CEQA Guidelines and applicable case law require more. Guidelines section 15126.2, subdivision (b) expressly requires, "In addition to building code compliance, other relevant considerations may include, among others, the project's size, location, orientation, equipment use and any renewable energy features that could be incorporated into the project." In *CCEC*, *supra*, 225 Cal.App.4th at 211, the court determined that requiring "compliance with Title 24 of the California Code of Regulations and other California green building codes did not meet the requirements of appendix F of the CEQA Guidelines." The court explains that such compliance

> . . . does not address many of the considerations required under appendix F of the CEQA Guidelines. These considerations include whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope. Here, a requirement that [the project] comply with the Building Code does not, by itself, constitute an adequate assessment of mitigation measures that can be taken to address the energy impacts during construction and operation of the project.

(*Ibid*.) In *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 Cal.App.4th 256, 265, the court relied on the *CCEC* court's analysis to conclude that the respondent city's EIR "improperly relies on compliance with the building code to mitigate operational and construction energy impacts, without further discussion of the CEQA Guidelines, Appendix F criteria."

Here, the EIR states that all "[i]ndividual projects under the proposed CPHP would be required to comply with the UC Policy on Sustainable Practices, which requires new construction of facilities to meet a minimum standard of LEED-NC Silver and strive for LEED-NC Gold when possible and requires 20 percent better energy performance than Title 24[.]" (AR 1786.) UC asserts, "UCSF has committed to implement the energy reduction measures within its GHGRS as part of the LRDP and the CPHP to improve efficiency of existing buildings, including the requirement that new buildings be designed to surpass Title 24 energy efficiency standards and . . . attain LEED 'Silver' certification or equivalent." (AR 5988.) Based on this conclusory analysis, the EIR determined the CPHP would not result in wasteful, inefficient, or unnecessary consumption of fuel or energy. (AR 5988.)

UC's reliance on LEED certification fails because, as in *CCEC*, it fails to consider "whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope."

(*CCEC*, *supra*, 225 Cal.App.4th at 21.) The EIR never explains whether the scope of LEED certification includes consideration of these issues.[34] Even if LEED certification accounted for such considerations, reliance on LEED certification also fails because the UC's Policy on Sustainable Practices, which the EIR identifies as the ultimate legal authority imposing the requirement for LEED Silver certification,[35] includes an express waiver procedure for LEED certification. (AR 33958 ["Any proposed waiver from section III.A of the Policy may be requested administratively from the UCOP Executive Director of Capital Programs prior to first project approval"].)

The EIR fails to analyze whether the Project's significant increase in energy consumption is wasteful, inefficient or unnecessary. Further, UC may not sidestep this required analysis by pointing to Title 24 or LEED certification.

2. UC Relies on the Ratio Theory to Avoid Adequate Analysis of Cumulative Energy Impacts

The EIR finds the CPHP would not result in cumulatively considerable impacts from wasteful, inefficient, or unnecessary energy consumption. (AR 1788.) To arrive at this conclusion, the EIR impermissibly relies on the long-repudiated "ratio theory." (See *ante*.) The EIR repeatedly emphasizes that the CPHP would account for a miniscule amount of energy use across the state or the City (AR 1781-83), however, this "drop in the bucket" analysis is being used to circumvent analysis of whether the project's energy consumption is cumulatively "wasteful, inefficient, or unnecessary." (Guidelines, § 15126.2 (b); AR 1787 ["Given the relatively small percentage of the CPHP's other fuel and energy uses compared to existing fuel and energy use in the region"].) Reliance on the "ratio theory" is improper.

Setting aside the EIR's reliance on the ratio theory, the cumulative analysis is defective also because it identifies no significance criteria for the cumulative impacts. (AR 1787.) The EIR's analysis relies heavily on Title 24 and LEED to show "efficiencies," but does not analyze the cumulative impact against any identifiable significance standard. (AR 1787; *Lotus*, *supra*, 223 Cal.App.4th 645, 657 ["Simply stating that there will be no significant impacts because the project incorporates 'special construction techniques' is not adequate or permissible" to meet CEQA requirements.].) Rather than analyze how the Project's large increase in energy consumption could contribute to a cumulative impact, the EIR instead concludes, "[O]perational electricity requirements of the CPHP would not be cumulatively considerable and the estimated consumption rate would not be substantial compared to the 2018 citywide consumption." (AR 1787.) What this fails to determine, for example, is whether doubling

[34] The most detailed description of LEED certification is buried in the administrative record, and characterizes LEED as "a green building rating system" and identifies four levels: Certified, Silver, Gold and Platinum. (AR 33941.)

[35] The revised LRDP accommodating the CPHP states, "The Sustainable Practices Policy sets the following additional requirements and goals relevant to GHG emissions reduction." (AR 48.)

the site's use of electricity would affect the local grid or whether an additional 642,064 MMBTU of natural gas a year would be cumulatively considerable. (AR 1779.)

In summary, the EIR fails as an informational document with respect to the Project's project-level and cumulative analysis as to whether the proposed dramatic increases in energy consumption are inefficient, wasteful or unnecessary.

M. The EIR Fails to Analyze Off-Site Alternatives

CEQA's mandates are enforced vis-à-vis project alternatives and mitigation measures. The Supreme Court set aside the EIR certified in *Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal.5th 918, 937 based on the city's failure to "meaningfully address feasible alternatives or mitigation measures." The Court rejected a flawed EIR for the expansive Newhall Ranch project following multiple EIRs spanning a decade. (*Newhall Ranch I*, *supra*, 62 Cal.4th 204.) Justice Kathryn Werdegar's majority opinion, noting Justice Ming Chin's dissent warning of "inordinate delay" attending an additional CEQA process, underscored that judicial review of an EIR cannot turn on

> ... independent assessment of the project's environmental merits. Even if Newhall Ranch offered the environmentally best means of housing this part of California's growing population, CEQA's requirements for informing the public and decision makers of adverse impacts, *and for imposition of valid, feasible mitigation measures*, would still have to be enforced.

(*Id.* at 240, italics added.)

1. Alternatives Enforce CEQA's Substantive Mandate

Public Resources Code section 21002 lays out the state policy that "agencies should not approve projects as proposed if there are feasible alternatives . . . that would substantially lessen their significant environmental effects." The same code section explains that environmental processes — in this case, an EIR — are practical: they are "*intended to assist public agencies*" in evaluating impacts and identifying alternatives. (§ 21002, italics added; *see* § 21002.1 (a).)

Consistent with this premise, the Supreme Court held in *City of Marina* that CEQA requires agencies "to avoid or mitigate, if feasible, the significant environmental effects of their project." (*City of Marina*, *supra*, 39 Cal.4th at 369; see also *Preservation Action*, *supra*, 141 Cal.App.4th at 1350 ["agencies should not approve projects as proposed if there are feasible alternatives . . . which would substantially lessen the significant environmental effects . . . ")

CEQA's "substantive mandate" is further implemented in section 21081, and *does not allow an agency to approve a project with significant impacts for which there are feasible alternatives.* (*Mountain Lion Foundation*, *supra*, 16 Cal.4th at 123, 134.) A further relevant mandate, applicable only *after* feasible mitigations and alternatives have been adopted, is that projects can be approved despite

significant impacts when specific "economic, social, or other conditions" — factors *external* to the project itself — make mitigation infeasible. (§§ 21002, 21002.1.)

To approve a project with significant environmental impacts, UC therefore must first impose project alternatives and mitigation measures found to be feasible — enforcing CEQA's substantive mandate — and then, if significant impacts remain, adopt a supportable finding of overriding public benefit. (§ 21081; *City of Marina*, *supra*, 39 Cal.4th at 350.) The findings must be made in order, and while both must be fact-based, the Legislature reserved policy considerations for the latter. (*Ibid.*)

2. EIRs Must Analyze Potentially Feasible Alternatives that Reduce Project Impacts

CEQA requires that lead agencies consider alternatives at two stages in the EIR process. First, a draft EIR must analyze a range of reasonable alternatives. (Guidelines, § 15126.6.) Later, when the agency considers whether to approve or carry out the project as proposed, it cannot do so if a feasible alternative would substantially reduce significant effects. (Guidelines, § 15092 (b)(2)(A).)

To explore ways to meet as many goals as possible while protecting the environment, EIRs thus must evaluate alternatives that accomplish "most" basic objectives. (Guidelines, § 15126.6 (a); *Preservation Action*, *supra*, 141 Cal.App.4th at 1353.) Alternatives warrant study in the EIR process if they can reduce or avoid impacts and are "potentially feasible." (Guidelines, §§ 15126.6 (a), (c) , (f); *Watsonville Pilots Association v City of Watsonville* (2010) 183 Cal.App.4th 1059, 1087 (*Watsonville Pilots*).) As to whether an EIR has evaluated a range of reasonable alternatives, "[e]ach case must be evaluated on its facts ... in light of the statutory purpose." (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1086, citing *Citizens of Goleta v. Board of Supervisors of Santa Barbara County et al*. (1990) 52 Cal.3d 553, 566 (*Goleta II*).) The nature and scope of the alternatives to be studied are governed by the rule of reason. (Guidelines, § 15126.6 (a); *In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* (2008) 43 Cal. 4th 1143, 1163 (*In re Bay-Delta*).)

CEQA defines feasible: "capable of being accomplished in a successful manner within a reasonable . . . time, taking into account economic, environmental, social, and technological factors." (§ 21061.) External factors — "legal, social, . . . or other considerations, including considerations for the employment opportunities for highly-trained workers" — may also be relevant. (§ 21081 (a)(3).) Feasible alternatives are allowed to "impede to some degree the attainment of the project objectives, or . . . be more costly." (Guidelines, § 15126.6 (b).)

Finally, an "alternative that is potentially feasible should not be excluded from an EIR simply because it may not further all of the agency's policy objectives." (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1087.) *Watsonville Pilots* found legal error when a draft EIR failed to evaluate a reduced

development that failed to meet two of twelve objectives: "The City's argument on this issue is premised on its claim that no discussion of an alternative is required if that alternative would not meet a project objective. This premise is mistaken." (*Ibid*.)

3. The EIR Fails to Analyze Alternate Locations for Expansion

The CPHP DEIR identified several alternatives suitable for analysis, as follows: "No Project Alternative, consisting of No Development and Development under the 2014 LRDP;" "Reduced Project;" CPHP including New Hospital: 19-Story Option;" and CPHP including New Hospital - Phased Option." (AR 2106, 4271, 5754.) The DEIR formulated but dismissed from analysis the off-site alternatives of building the new hospital at UCSF's Mission Bay or Mount Zion properties. (AR 2154; 2157; 4319; 4322.) UC prejudicially abused its discretion by refusing to analyze these off-site alternatives within the EIR process as well as rejecting the Hunters Point/Candlestick location.

a. The Mission Bay Location

The EIR admits that the Mission Bay alternative would reduce the CPHP's significant wind impact in the vicinity of the new hospital, avoid the significant adverse impact of demolishing the historic Langley Porter Psychiatric Institute, and would also avoid construction and operational impacts associated with the new hospital. (AR 2155, 4320.) The EIR also finds that the Mission Bay alternative would result in "an estimated 284 fewer overall [hospital] beds at Parnassus Heights;" that "there are bed shortages for critical and acute care" in the City and the greater Bay Area, and the Mission Bay site thus "would not meet this growing demand, or allow for an expansion of emergency, surgical, interventional radiology, and imaging services, at this campus site." (AR 2104, 2164; 4269, 4319.)

However, increasing beds "*at Parnassus Heights*" is an unduly and self-servingly narrow EIR objective, precluding consideration of *any* off-site alternative. The DEIR fails to explain why the Mission Bay alternative could not be configured to increase available beds and why it is not "potentially feasible," which is the applicable legal standard, and led to a later unsupported finding that all alternatives were infeasible and eliminated from further consideration in the Draft EIR. (AR 247.)

The DEIR also finds, without support or fact-based analysis, that the Mission Bay alternative would "conflict with several 2014 LRDP objectives for the Parnassus Heights campus site" including the preference to locate instruction, clinical, research, and support uses in proximity "to foster collaboration and to facilitate the inter-dependence and connectivity for operational efficiency and effectiveness of instruction, clinical, research and support uses in close physical proximity to each other;" and "(e)nsure that Long Hospital and the New Hospital Addition have adequate clinical and administrative support and are aligned with education, research and specialized care programs and support that remain at the campus site." (AR 2155, 4320.)

The purported conflict is unsupported to the point of absurdity, rendering the EIR analysis inadequate. The EIR fails to explain that the 2014 LRDP contemplated meeting the same objectives without the vast expansion proposed in the CPHP. Moving some new facilities to Mission Bay would not conflict LRDP objectives, nor fundamental EIR objectives for the "New Hospital." (AR 1449.)

The DEIR pronounces that "by not developing a New Hospital at the Parnassus Heights campus site, and focusing future new clinical uses at the Mission Bay campus site, this potential alternative would also result in decreased efficiency for UCSF staff and students." (AR 2155, 4320.) "Decreased efficiency" is subjective, is not a fundamental objective á la *In re Bay-Delta*, and is a trumped-up reason *not to analyze* this alternative. Meeting all conceived objectives is not the standard at the EIR stage for an alternative that can reduce significant impacts. (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1087.)

Goleta I, *supra*, 197 Cal.App.3d at 1179-80 held that an EIR for a resort hotel should have considered an alternate site: "Reason requires that the agency charged with the duty to protect the environment compare impacts at feasible alternative locations." As discussed ante, off-site alternatives cannot be rejected for analysis because a project proponent *does not want* an off-site project, any more than a reduced-size project can be rejected for that reason. (*Uphold Our Heritage*, *supra*, 147 Cal.App.4th at 602; *Preservation Action*, *supra*, 141 Cal.App.4th at 1355-56.) Otherwise, CEQA's requirement for consideration and analysis of off-site alternatives is meaningless.

Petitioner Yerba Buena Neighborhood Consortium submitted comments on the Draft EIR that explain that Mission Bay could

> ... fully accommodate expanded UCSF development of this scale and meet fundamental project objectives (*In re Bay-Delta* (2008) 43 Cal.4th 1143.) That of course is exactly what happened once before in 1996 with the decision to locate a new UCSF research campus in the already-approved Mission Bay Redevelopment Project.

(AR 6178.) Mission Bay is a logical, beneficial site at which to achieve project benefits without significant impacts, as is a promising hybrid alternative rejected from consideration: "No New Hospital at Parnassus Heights Campus Site/Implement Phase 2 of Medical Center at Mission Bay Campus." "In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus." (AR 5855.) The claim of increased crosstown traffic is not supported by evidence or analysis.

Failure to address alternatives utilizing the Mission Bay site in the DEIR was error warranting issuance of a peremptory writ. As pointed out in comments by the Consortium, "[t]he now almost-finished Mission Bay Project has conclusively proved that a UCSF campus can be a catalyst project that makes master-planned projects like these financially feasible for development. In particular, associated bio-med commercial development remains potentially viable."

b. The Mount Zion Location

The Mount Zion alternative location, two miles from the Parnassus Heights project site, reduces or avoids the same significant environmental impacts as the Mission Bay location. It was rejected for EIR analysis for failing to meet the same non-fundamental project objectives and creating the same purported "inefficiencies." The DEIR objects to Mount Zion as "less than ideal." (AR 2157, 4322.) This is not a CEQA standard. (*Laurel Heights I*, *supra*, 47 Cal.3d at 400.) Like Mission Bay, there is a rejected reasonable partial alternative that should also be considered; locating the new hospital at Mount Zion would remove significant impacts at Parnassus and meet fundamental objectives. (AR 255-57.)

c. The Hunters Point Location

The Draft and Final EIRs also fail to mention the Hunters Point off-site alternative that the Yerba Buena Neighborhood Consortium urged for consideration. UC owns 3.8 acres in Hunters Point with two single-story buildings used for an animal care facility. (AR 13583.) The City submitted EIR comments that included a draft "Racial & Social Equity Initiative" planning approach referencing Bayview/Hunters Point. (AR 6718, 6721-23, 6727-28.) When the 2014 LRDP was published, San Francisco had approved the Candlestick-Hunters Point Shipyard Development Plan, an extensive mixed-use redevelopment plan that did not proceed. (*Ibid.*) As pointed out by planner Terry Watt, the EIR fails to properly analyze project alternatives, including locating a new hospital at Hunters Point:

> Feasible alternatives to the Project, improperly dismissed by the Final EIR, that would reduce or eliminate significant Project impacts should be reinstated for consideration including . . . No New Hospital at Parnassus Heights Campus Site and instead one of the following: Implement Phase 2 of Medical Center at Mission Bay Campus Site; New Hospital at Mount Zion Campus Site; . . .New Hospital at Hunters Point at the Candlestick site formerly slated for a new shopping mall. Locating the new hospital here would avoid many of the impacts associated with the Parnassus site, and would have many co-benefits such as providing jobs in and health services to an underserved and disadvantaged community.

(SAR 63068-69.)

4. The FEIR Failed to Respond to Comments Regarding Off-site Alternatives

Petitioners have discussed the importance of adequate responses to EIR comments relative to EIR analysis, *ante*. As in many CEQA cases, especially those involving projects of regional importance and impact, the legal problem is both that the EIR failed to analyze the off-site alternatives *and*, as a separate violation of CEQA, that it failed to respond to public comments that requested the analysis.

The FEIR's "Master Response 5: EIR Alternatives" restates the DEIR's reasons for not analyzing the Mission Bay and Mount Zion alternatives and concludes that

> an alternative that would adopt and implement the CPHP without construction of a New Hospital at Parnassus Heights . . . would not address one specific need . . . which is the need for co-location of instructional, research, and clinical spaces, and would not achieve most of the basic project objectives as shown in Table 8.3-1 below.

(AR 5757 [Mission Bay]; 5759 [Mount Zion].) The master response points out that objectives "for the Parnassus Heights campus site... appropriately focus on UCSF's goals for the campus site, *since the proposed project is a plan for that campus site*." (AR 5754, italics added.) Under such circular logic, no project/plan EIR would need to consider off-site alternatives. Instead, CEQA requires consideration of "alternative locations" for a project based on the answer to a "key question":

> The key question and first step in analysis is whether any of the significant effects of the project would be avoided or substantially lessened by putting the project in another location. Only locations that would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR.

(Guidelines, § 15126.6 (f)(2)(A).) There is a caveat; if "no feasible alternative locations exist" of course a non-existent alternate site cannot be considered; "for example, . . . a geothermal plant or mining project must be in close proximity to natural resources at a given location." (*Id*. at (f)(2)(B).) The FEIR references *California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, which dealt with needs of a public park that could only be resolved in that location. (AR 5755.)

The FEIR master response conflates the "potentially feasible" standard for including an alternative for analysis in a draft EIR with the "actually feasible" standard applicable to an agency's decision to *adopt* an alternative instead of the proposed project. But neither standard requires that every listed project objective be met. (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1087.) The response never considers whether alternatives are "potentially feasible" and provides no substantial evidence to the contrary. Importantly, the omission of off-site alternatives for EIR discussion deprived the public and decision-makers of essential information.

Inadequate responses to individual comments regarding off-site alternatives include:

- **Comment Letter O-YNBC: Yerba Buena Neighborhood Consortium**. The Consortium urged EIR consideration of alternate off-site locations "to meet fundamental project objectives," noting "that is exactly what happened in 1996 with the decision to locate a new UCSF research campus in the already-approved Mission Bay Redevelopment Project." (AR 6178; see also Comment Letter I-Goodman (AR 23, 6316, 6326-27).) The FEIR relied on its inadequate Master Response 5, discussed *ante*, providing no comment-specific analysis. (AR 6179.)

- **Comment Letter I-Leonard: Edward Leonard**. The Leonard letter reiterates the need for the EIR to analyze alternate sites, especially in light of the space ceiling that UC committed to because "expansion at the Parnassus Campus was not feasible." (AR 6380, 6383-84.) "There are

several suitable, if not superior, alternatives to accomplishing UCSF's objectives, not requiring the building of an elephantine structure, completely unsuitable for the space it will occupy, in a residential neighborhood. If UCSF really requires a hospital as big as it claims, it should find an appropriately scaled new site." (AR 6379-84.) The FEIR again simply refers the commentor to its master response. (AR 6389.)

- **Comment Letter O-LD2: Lozeau Drury**. The 46-page letter written by attorney Richard Drury on behalf of the Parnassus Neighborhood Coalition addressed off-site alternatives in depth, including the need for analysis of the reasonable and potentially-feasible sites. (AR 5853-56.) Mr. Drury's analysis is reflected in the arguments presented *ante* regarding the DEIR's inadequate analysis of alternatives. The response again relies on Master Response 5. (AR 5978.)

The FEIR did not adequately respond to comments regarding the three off-site alternatives.

5. Approval Findings are Premature

In assessing feasibility of an alternative to reduce or avoid significant environmental impacts, an agency must consider whether external conditions stand in the way of its successful accomplishment rather than whether non-basic project objectives are met. UC's findings certifying the EIR and approving a project with many significant impacts and without locating any portion at an alternate site based on claimed infeasibility are both unsupported and premature. (AR 247-59.) As in the *Uphold Our Heritage* and *Preservation Action* cases, to name a few, an adequate EIR is prerequisite for considering CEQA approval findings. (*Ante*.) The UC Regents do not yet have sufficient information to determine feasibility of alternate sites for any or all Project purposes.

Conclusion

Petitioners request this Court's judgment and issuance of a peremptory writ of mandamus in the public interest, ordering the University of California to fully comply with CEQA. UC must first set aside approvals of the Comprehensive Parnassus Heights Plan and void its certification of the EIR.

Respectfully submitted.[36]

[36] This brief is co-written and is signed by counsel for Petitioners in three related cases (Case Nos. RG21088939, RG21089332, and RG21090517). By executing this brief, the undersigned counsel do not appear for or undertake representation of any petitioner other than as identified in the signature lines.

Treatise

Introduction

The merits of this public interest action are not refuted by the University of California. The CPHP EIR fails to achieve its purpose. As always, the standard of review plays a critical role in assessing CEQA compliance. The Supreme Court has in recent years reiterated that if an EIR process fails to comply with mandated procedures, or if the EIR omits essential information or insufficiently analyzes impacts, judicial review is de novo, while the substantial evidence standard applies to factual findings. UC's repeated, incorrect assertions of broader substantial evidence review invite error.

The context of UC efforts to overbuild the Parnassus Heights campus warrant mention as remarkable and relevant. The campus is beautiful, historic, and constrained. Indeed, in the 1990's UC developed a facility a few miles away at Laurel Heights justified by the claimed infeasibility of expansion at Parnassus. The constraints remain, and the CPHP EIR's failure to analyze *any* potentially feasible off-site alternatives at *sites owned by UC* — which it has long admitted are essential to avoid overbuilding Parnassus — violates CEQA.[1]

Petitioners in the related cases respectfully request this Court's judgment and peremptory writ.

Discussion

A. The EIR Fails to Analyze Any Off-Site Alternatives

The CPHP EIR failed to study — and therefore, the UC Regents had no opportunity to review or adopt — potentially feasible off-site alternatives. UC *owns multiple properties* in San Francisco that were acquired specifically to address space constraints at Parnassus, and so can meet fundamental plan objectives and avoid or reduce significant impacts at Parnassus. The error is prejudicial because identifying and adopting feasible alternatives is the primary goal of CEQA.

In arguing that it sufficiently studied and rejected off-site alternatives, UC's brief misstates the law. First, it posits that as the lead agency, it — instead of "a project's critics" — has sole responsibility for formulating a range of alternatives for the EIR to study (Respondents' Opening Brief (ROB) 67:11), citing *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 396, 406 (*Laurel Heights I*). In *Laurel Heights I*, the Regents had argued that "CEQA places the

[1] If UC is ordered to produce the relevant record documents that it has withheld to date, including, for example, documents that it describes as addressing its decision not to pursue EIR analysis of alternative UC-owned sites, petitioners will seek to supplement their merits briefing as appropriate.

burden of identifying alternatives" on environmental petitioners. The Supreme Court ruled their position was "not supported" because the *responsibility for EIR adequacy* lies with the lead agency. (*Ibid*.)

The take-away is that concerned citizens are *not required to* — but may — point out deficiencies in an EIR process so that a lead agency will meet its responsibilities to certify an adequate EIR. "'It is not limited to alternatives proposed and justified by objectors [to an EIR].' (*Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1178.)" (*Laurel Heights I, supra*, 47 Cal.3d at 406.)

It is ironic that UC relies on *Laurel Heights I,* in which the Supreme Court reviewed the inadequate EIR prepared when UC expanded its San Francisco properties to a new campus two miles away from Parnassus in Laurel Heights *because* "there were serious space constraints at the Parnassus campus and ... a need to develop off-campus locations for academic and support activities. (*Laurel Heights I, supra*, 47 Cal.3d at 388.) To be clear, UC justified acquisition of the Laurel Heights site to avoid new construction that otherwise would have caused significant impacts at Parnassus. (*Ibid.*)

The revised EIR for Laurel Heights was again at issue in *Laurel Heights Improvement Association v. Regents of the University of California* (1993) 6 Cal.4th 1112, 1141 (*Laurel Heights II*):

> [The Parnassus Heights] campus .... *is the most densely developed* of all [UC] facilities. The draft EIR ... explains that, because the necessary space at the Parnassus Heights campus can only be created by demolition of existing buildings fully in use or by violating the limits adopted in the long-range development plan, the alternative of *expansion at this site is infeasible*.

(Italics added.) UC lacks credibility when it now contends that it is not even *potentially* feasible to construct new facilities at its other City campuses, that the CPDP EIR thus need not study any off-site alternatives, and that it is *only* feasible to build new facilities at Parnassus. (ROB 67-69.) The Parnassus campus site has not grown since UC took the position that it could not feasibly accommodate a 370,000 square-foot research facility. (*Laurel Heights II, supra*, 6 Cal.4th at 1120.) The CPHP, including the proposed 995,000 square-foot New Hospital (Petitioners' Opening Brief (POB) 12), would cause significant environmental impacts and the demolition of buildings of even more historic importance today than in 1982. UC has to date protected its historic resources and avoided significant impacts by development at Laurel Heights, Mt. Zion, and Mission Bay, *away from* Parnassus.

UC argues, based on inaccurate references to CEQA Guidelines [14 Cal.Code Regs.], sections 15151 and 15384, that courts review an EIR's range of project alternatives for substantial evidence.[2]

[2] Guideline 15151 describes standards for EIR adequacy; 15384 defines substantial evidence. Neither directs that the range of alternatives for study in an EIR is reviewed for substantial evidence.

(ROB 67:12-13.) Instead, "[e]ach case must be evaluated on its facts ... in light of the statutory purpose." (*Watsonville Pilots Association v. City of Watsonville* (2010) Cal.App.4th 1059, 1086 (*Watsonville Pilots*) [Citation].) The nature and scope of the alternatives to be studied in an EIR is governed by the rule of reason. (Guidelines, § 15126.6 (a); *In re Bay-Delta* (2008) 43 Cal.4th 1143, 1163.) Further, "the fact that agency decision-makers may ultimately find an alternative infeasible does not necessarily preclude it from being discussed in the EIR. An alternative that is potentially feasible should not be excluded from an EIR simply because it may not further all of the agency's policy objectives." (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1087.)

Of course, an EIR need not study "each and every conceivable variation" of a proposed project. (ROB 67:14-15.) And that is not what petitioners seek, any more than they pursue *any* trivial or "gotcha" CEQA violation. UC pronounces that no off-site alternative would meet its objective to "revitalize the aging Parnassus Heights campus." (ROB 67-68.) But three suggested off-site locations *already owned by UC* can accommodate the New Hospital *while revitalization of the Parnassus campus proceeds with other important, long-planned project components*. As the alternate sites can "attain most of the basic objectives" of the plan and reduce significant impacts, EIR review will "foster meaningful public participation and informed decision making." (ROB 67:17; Guidelines, § 15126.6 (f).)

UC unlawfully excluded study of *any and all* off-site alternatives based on an unduly narrow definition of "revitalizing the Parnassus campus." Analysis of alternate sites in the EIR is critical to inform the Regents' consideration of the feasibility of locating some new facilities — *e.g.*, the New Hospital — off-site to reduce or avoid significant impacts. "While a lead agency may not give a project's purpose an artificially narrow definition, [it] may structure its EIR alternative analysis around a reasonable definition of underlying purpose." (*In re Bay-Delta*, *supra*, 43 Cal.4th 1143, 1166.)

UC attempts to distinguish this case from *Watsonville Pilots, supra,*183 Cal.App.4th at 1087, arguing that the record proves that alternate sites *cannot* accomplish "most" project objectives. But UC focuses on only 5 out of 42 objectives, not "most;" further, the cites do not prove what UC says they do:

AR 247-48: UC's CEQA findings "screen out" EIR review of a New Hospital at Mission Bay or Mt. Zion. Any large project has environmental consequences. UC's omission of alternate sites from analysis relate to unstudied impacts of differences between the current and *any* revised project — fewer beds *at Parnassus*, theoretical increase in some cross-town traffic between Mission Bay and Parnassus, decreased benefits of interdisciplinary collaboration *at Parnassus.* The findings assume but do not show infeasibility, greater impacts than the current project, or failure to accomplish fundamental objectives.

AR 255-57: UC's CEQA findings address responses to EIR comments requesting analysis of off-site alternatives. The findings refuse to study the alternatives, but acknowledge that locating the New Hospital at the Mission Bay or Mt. Zion campuses would reduce conceded impacts at Parnassus, while other impacts will shift from Parnassus to the new hospital sites.

AR 2154-57; AR 4319-22: The Draft EIR provides a conclusory discussion as to why alternatives were "dismissed from further evaluation," later mirrored in the findings addressed at AR 247-48, above, without underlying analysis, *e.g*. "increase potential cross town traffic."

AR 5756-57: The EIR responds to comments requesting analysis of off-site alternatives, particularly for the New Hospital, and provides a conclusory discussion as to why *no* off-site alternatives could satisfy objectives relating to the Parnassus site, later mirrored in the findings addressed at AR 255-57, above. The conclusory response is not adequate.

Finally, UC argues that it had sufficient information as to whether alternate sites were feasible "including multiple prior EIRs addressing the issue." (ROB 71:17-19.) UC then repeats the AR citations to the findings and EIR pages discussed above regarding alternatives rejected from study in the EIR; adds a cite to the Draft EIR Alternatives section that contains the four (*on*-site) alternatives that the EIR did study, and ends with cites to a 5000-page block at AR 8981-13658 [documents from 2005-2014]. The citations are not probative or even helpful.

Absent analysis of *any* off-site alternatives *in the EIR*, UC's violation of CEQA is blatant.

B. EIR Analysis of Growth Inducing and Population/Housing Impacts is Inadequate

Contrary to UC's argument (ROB 25:9-16), petitioners do not confuse the EIR's growth inducement and population/housing analyses. Read together, both chapters fail to assess off-campus housing displacement impacts of increasing campus population or the physical impacts of building housing to meet increased demand. (POB 17:4-26.)

1. The EIR Omits Analysis of Off-Campus Housing Displacement Effects

Petitioners claim that the EIR's analyses of Impacts POP-1 and POP-2 improperly exclude consideration of housing displacement effects in the surrounding community. The EIR's analysis of Impact POP-1 relates to "unplanned population growth" and the creation of "demand for housing outside the market area" while its analysis of Impact POP-2 only considers temporary displacement of on-campus tenants. (POB 17-21.) UC fails to address the fact that the POP-2 analysis is improperly limited geographically and fails to assess displacement as opposed to mere growth in housing demand.

UC's argument that "the CPHP is adding housing for some of the population growth related to CPHP" (ROB 25:5-6, citing AR 1983) ignores the EIR's failure to analyze off-campus displacement. (POB 19:3-16; *American Canyon Community v. City of American Canyon* (2006) 145 Cal.App.4th 1062, 1066-1067, 1081-1082 [failure to consider extraterritorial effects]; *Lotus v. Dept. of Transportation* (2014) 223 Cal.App.4th 645, 658 (*Lotus*) [substituting mitigation for impact analysis violates CEQA].)

UC pronounces the EIR's characterization of population growth not off-set by new campus housing as "insubstantial" when compared to regional growth as "satisfied by housing that could be added" in the study area; and "within the capacity" of the five-county market area. (ROB 24:13-21; citing AR 1980-81, 1984-85.) But capacity to meet housing demand growth is not relevant under the threshold of significance: which is whether a project would "displace substantial numbers of existing people or housing" and create need for replacement housing. (POB at 18:4-7.) EIR review is needed.

While UC's new population might theoretically be housed without displacement if housed only in new units, that is not UC's plan. UC committed to provide over 1200 housing units for its population from existing units, so significant displacement of residents will certainly occur. (AR 1314-15.) What is missing from the EIR is analysis that relates the CPHP's 4,000 to 6,000-unit increased housing demand to baseline and cumulative conditions. Such analysis would allow a prediction of the extent to which the CPHP may cause off-campus displacement or require construction of housing.

Planner Terry Watt presented a fair argument that project demand would outstrip local supply and identified information that the EIR should have but fails to provide, including housing availability in the surrounding neighborhood, affordability, local and new population incomes, and rents. (POB 18:14-22.) Watt provided uncontroverted evidence that San Francisco has been creating 8.2 jobs per housing unit since 2010; that there is a regional housing shortfall of 700,000 units; that the Bay Area has produced only 35% of the units required for moderate and lower income workers since 1999; and that the City is experiencing gentrification. (AR 5989-5990.) Watt cites salary data that the new UCSF population would compete for housing affordable to lower income families. (AR 5896.) Watt reasonably concludes that housing demand would cause a significant impact. (AR 5900.)

2. The EIR Erroneously Treats Displacement as a Speculative Social Effect

Petitioners claim that the EIR fails to proceed as required by CEQA due to informational inadequacy; UC's argument that substantial evidence supports the EIR's conclusion regarding population and housing impacts is irrelevant. (ROB 23:9-24:21; POB 15:26-16:1.) Since the EIR fails to

assess the significance of project-induced off-campus displacement or need for replacement housing, whether substantial evidence could support a finding to that effect is premature. (POB 18:4-7.),

Contrary to UC's false flag argument, petitioners do not rely on *Stanislaus Audubon Society, Inc. v. County of Stanislaus* (1995) 33 Cal.App.4th 144, a negative declaration case, to support application of the fair argument standard here. (ROB 26:18-27:6; POB 14:27; 16:1, citing *Visalia Retail, LP v. City of Visalia* (2018) 20 Cal.App.5th 1, 13; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 (*Amador Waterways*) [EIR must analyze every issue for which the record contains substantial evidence supporting a fair argument of significant impact].)[3]

UC does not point to any evidence that the EIR addresses the substance of Watt's fair argument or that its experts considered or reached a different conclusion regarding the indirect physical effects associated with displacement. Instead, while conceding that "new off-site housing would be constructed," UC argues that "it would be speculative to characterize the site-specific environmental effects." (ROB 26:10-11, citing AR 2098.) The EIR's assertion on this point is conclusory, without factual support. An agency "cannot divest itself of its analytical and informational obligations by summarily dismissing the possibility" of indirect effects. (*Bakersfield, supra,* 124 Cal.App.4th at 1207.) CEQA does not permit deferral of analysis of housing-related impacts simply because the precise nature and extent of development are unknown. (POB at 21:1-10). Both Watt and the City's public health guidance identify the elements of the required analysis, and Watt followed that guidance to provide an unrebutted fair argument that displacement effects would be significant. (AR 5879, 5989; 5894-5901 [Watt]; AR 6867-85 [SFDPH] 4-15.)

UC's argument that it was entitled to disagree with Watt regarding the potential significance of the displacement impact is irrelevant because the EIR did not evaluate the issue. UC's argument that it was entitled to ignore the City guidance because it is "not subject to City policies" (ROB 26:26) misses the point that this guidance provides part of the basis for fair argument that the impact may be significant, even if it is not directly enforceable against UC.

3. The EIR Incorrectly Applies "Ratio Theory" and an Improper Baseline

UC argues that the EIR does not rely on a ratio theory because its definition of "substantial

---

[3] See also, *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1207 (*Bakersfield*) [EIR must evaluate indirect physical effects of economic and social effects where fair argument standard is met]; 1208 [standard of review for whether EIR fails to analyze potentially significant indirect physical impact is whether agency failed to proceed as required by law].)

unplanned population growth" is growth "inconsistent with growth anticipated in adopted planning documents." (ROB 27:17.) UC also argues that the EIR establishes "an appropriate baseline" (AR 1973-74) and that the EIR shows that projected growth is consistent with "growth anticipated in adopted planning documents." (ROB 27:19-21.) These defenses fail.

Neither the EIR nor UC dispute the existence of the regional housing shortage documented by Watt. (POB 18:12.) CEQA does not permit a "ratio" analysis in which a project's contribution to a cumulative impact is deemed less than significant based "upon the individual project's relative effects…" (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 721.) The EIR cannot dismiss the significance of the project's contribution to the regional housing shortage simply because it "would not be substantial in comparison to growth that is projected and planned" for the region. (POB 21:24-22:5.) UC fails to address petitioners' authorities on this point.

The EIR fails to provide a legally adequate non-comparative, non-ratio cumulative analysis. An adequate analysis requires that the EIR first assess whether there is a significant cumulative impact from all projects taken together; if so, the EIR must separately determine if the project's contribution is considerable. (Guidelines, §§ 15065(a)(3); 15130(a); 15355; *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 (*CBE v. Resources*) ["... the lead agency shall consider whether the cumulative impact is significant and whether the proposed project's incremental effects are cumulatively considerable"]; Kostka and Zischke, "Practice Under the California Environmental Quality Act" (2nd Ed., 2019 Update), § 13.39.) In that second determination, the EIR may not rely on a comparison or a ratio because "the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant." (*CBE v. Resources, supra,* 103 Cal.App.4th at 120.)

Regarding the EIR's improper application of a future planning baseline, the EIR's error lies in using this baseline to exclude consideration of substantial evidence tending to show the physical impact may be significant. (POB 16:1, citing *Amador Waterways*, *supra*, 116 Cal.App.4th at 1108-1109.) UC also fails to address authority that comparison to planned growth improperly compares a project's impact to a plan for the future rather than to existing conditions. (POB 22:6-10.) Here, the relevant comparison must be to the existing conditions, not to future conditions, because the project will contribute to a significant existing housing shortage. Further, the EIR fails to demonstrate that the use of an existing conditions baseline would result in an inadequate or misleading analysis (*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 457 (*Smart Rail*).)

4. The EIR Piecemeals Analysis of the New Housing Initiative

The EIR omits any analysis of UC's last-minute commitment to provide off-campus housing units in the City; therefore, it fails to evaluate the whole of the project. (POB 22:10-23:8.) UC does not dispute that its commitment to provide these units was not disclosed until issuance of the Final EIR.

The MOU commits UC to provide over 2500 rental units in the City for the UC population, of which about 1200 would be diverted from existing units and about 1200 would be new units. (AR 1314-15.) Of these units, 1,000 must be "UC Affordable Units" that are "comprised of new and existing units." (AR1315.) Thus, the MOU commits UC to displace non-UC tenants from at least 1,200 existing units and potentially to displace additional tenants as necessary to construct new units on existing residential sites. Omission of the MOU's housing unit commitment from the EIR's impact analysis understates the potential for displacing existing City residents.

Focusing on the 200 new units for which locations have not yet been identified, UC argues that there is "no proposal and no discretionary action yet to implement the additional 200 units." (ROB 28:7) This is incorrect. UC's commitment to provide these units is a discretionary action. (*Save Tara v. City of West Hollywood* (2008) 45 Cal.4th 116, 139 (*Save Tara*).)

UC argues that the new units include two projects that completed CEQA review years ago, plus 200 additional units for which City would conduct CEQA review in the future, thereby obviating the need for CEQA review now. (ROB 27:22-28:9.) These arguments fail. The EIR failed to "tier" to such past review as required by CEQA. (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 443 (*Vineyard Area Citizens*), quoting Guidelines, §§ 15150(c) [when an EIR incorporates an earlier environmental document by reference, "the incorporated part of the referenced document shall be briefly summarized" and "[t]he relationship between the incorporated part of the referenced document and the EIR shall be described"]; see § 15152 (g).) UC's brief cannot cure the EIR's failure to tier to an earlier CEQA document.

Regarding the promise of future CEQA review for the rest of the units, UC cites nothing in the MOU requiring such review. Even if it did, future "CEQA review" could result in an exemption from CEQA, perfecting the piecemealing violation that began with this EIR's failure to analyze the impact of providing the new units. Also, the EIR cannot tier *from* a future environmental document. (*Vineyard Area Citizens, supra,* 40 Cal.4th at 440 [Court rejected this "approach as legally improper"].) Also, UC's pre-commitment may improperly "preclude any alternatives or mitigation measures that CEQA

would otherwise require to be considered, including the alternative of not going forward with the project." (*Save Tara, supra,* 45 Cal.4th at 139.)

C. The EIR Inadequately Analyzes Beach Water Quality Impacts

1. Standard of Review

UC asserts that an EIR's description of the environmental baseline is reviewed for substantial evidence. (ROB 28, citing *Smart Rail, supra,* 57 Cal.4th at 447-49; *Communities for a Better Environment v. South Coast Air Quality Management Dist*. (2010) 48 Cal.4th 310, 328 (*Communities*).) These cases are inapposite. *Smart Rail* involved a claim that an EIR's description of future conditions as its environmental baseline, rather than existing conditions, was improper. *Communities* challenged an agency's choice of methodology to measure changing baseline conditions. Here, the challenge is to the EIR's failure to describe the physical and regulatory components of the environmental setting as they relate to beach water quality. (AR 1895-1911.) The Court reviews de novo whether the EIR omitted this essential information as a failure to proceed in the manner required by law. (POB 14.)

2. The EIR Fails to Adequately Describe the Environmental Baseline

Petitioners' opening brief details the EIR's failure to describe severely-degraded existing beach water quality conditions and the ineffectiveness of existing regulatory controls. (POB 25-26.) In response, UC argues it is "not in a position to verify observed non-compliance or opine on potential future enforcement actions by regulatory agencies" nor to "compel regulatory agencies governing San Francisco's sewage treatment plants to enforce compliance with their own regulations." (ROB 29:6.) This argument misconceives the claim. The issue is not what actions UC must take to clean up water pollution in San Francisco; the issue is whether the EIR properly analyzes and discloses the significance of the CPHP's contribution to worsening existing water quality conditions. This legal obligation exists regardless of whether UC can single-handedly solve the problem.

UC argues that "[a]n EIR need not resolve existing environmental problems that will not be exacerbated by the project, which is the case here." (ROB 29:6.) The problem for UC is that the EIR admits the CPHP will *exacerbate* this environmental problem, generating about 0.18 million gallons per day (mgd) of new wastewater/sewage. (AR 2084.) The FEIR admits that the CPHP's beach water quality impacts could be significant. (AR 4062; 222-226; 5783-5788 [Master Response 12].) UC's lawyers cannot disavow these record facts in their brief.

> The audience to whom an EIR must communicate is not the reviewing court but the public and the government officials deciding on the project. That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR, for example, is irrelevant, because the public and decision makers did not have the briefs available at the time the project was reviewed and approved.

(*Vineyard Area Citizens, supra,* 40 Cal.4th at 443.)

UC argues that the DEIR's description of the City plumbing system satisfies its obligation under CEQA to describe existing degraded beach water quality conditions. (ROB 29:23-30:12.) But the description provides no clue to the reader that beach water quality is routinely unhealthy for humans.

UC also relies on the FEIR's addition of new provisions to MM-HYD-1, "to control where it makes sewer connections for the campus site to the City's CSS system, and therefore, control the flows it would send to either the OSP or the SEP." (ROB 30:1.) This information was first provided in the FEIR's response to comments, too late in the process. (AR 5783-88.) It is critical to provide accurate setting information in the DEIR as a basis for impact analysis, so that the public can comment on impacts, the FEIR can respond, and the agency has the benefit of the process in making decisions. (POB 24-2; *San Joaquin Raptor/Wildlife Rescue Center. v. County. of Stanislaus* (1994) 27 Cal. App. 4th 713, 727; *Communities for a Better Env't v. City of Richmond* (2010) 184 Cal.App.4th 70, 89 [baseline required "at the beginning of the CEQA process"]; *Galante Vineyards v. Monterey Peninsula Water Mgmt. Dist*. (1997) 60 Cal.App.4th 1109, 1124 [tardy baseline disclosure not cured by later analysis].)

UC's citation to information in the FEIR supports the claim that the EIR must be recirculated in revised form. (POB 29-30). Also, the information that UC cites is part of an illegally deferred and unenforceable new mitigation measure. (POB 30-31.)

Regarding the Draft and Final EIRs' failures to describe the ineffective regulatory system for protecting beach water quality, UC argues that "the EIR extensively discusses the environmental and regulatory settings of beach water quality and analyzes Project impacts on beach water." (ROB 30:23.) This bald legal conclusion is unsupported by any record cites.

3. The EIR Relies on Ratio Theory and Other Regulatory Programs

UC argues, without citing any record evidence, that the EIR did not rely on the small ratio of the CPHP's incremental contribution to beach water pollution to conclude that the impact is less than significant. (ROB 31:3-18.) UC ignores the opening brief's point that the EIR concludes the CPHP's impact would be less than significant because the increase in the acreage of impervious surfaces *is only*

4% compared to the current acreage of impervious surfaces on campus. (POB 24:13, citing AR 1905-06.) UC's unsupported defense should be rejected.

UC also argues, again without citing record evidence, that the EIR did not rely on another agency's regulatory program to conclude that the CPHP's impact would be less than significant. (ROB 31:19-27.) UC argues that the case cites offered in the opening brief are inapposite because in those cases the agencies "skipped" environmental analysis. (ROB 31:19-27.) UC (i) does not contest the legal rule that an agency cannot rely on another agency's regulatory program to conclude that an impact is less than significant; (ii) does not cite record evidence that the CPHP EIR did not do so; and (iii) does not rebut the evidence cited in the opening brief that this EIR does, in fact, "skip" environmental analysis. UC's defense is thus unavailing.

4. The FEIR's Responses Require Recirculation of a Revised Draft EIR

UC incorrectly argues that the Court reviews all "recirculation claims" for substantial evidence. In fact, the petitioners' recirculation claim regarding water quality is reviewed de novo.

Recirculation is required when "significant new information" is omitted from a Draft EIR and added to a Final EIR. (Pub. Resources Code, § 21092.1[4]; Guidelines, § 15088.5(a).) In its seminal recirculation case, the California Supreme Court explained the central role of public participation through comment and response, holding that "public participation is an 'essential part of the CEQA process.'" (*Laurel Heights II, supra,* 6 Cal.4th 1112, 1123.) Recirculation is intended to permit public comment on new information and require agency responses. (Guidelines, § 15088.5 (f).) *Laurel Heights II* enumerated four categories of "significant new information" that require recirculation, now identified in Guidelines section 15088.5 (a)(1)-(4). (*Laurel Heights II, supra,* 6 Cal.4th at 1130 and n.15.) Petitioners seek recirculation under the fourth category, alleging significant new information disclosed after the DEIR was published "that the draft EIR was so fundamentally and basically inadequate and conclusory in nature that public comment on the draft was in effect meaningless." (*Id*. at 1130.)

Laurel Heights II recognizes that the fourth recirculation criterion is different from the first three:

> With the addition of the fourth category of 'triggering information' to the list, we recognize that 'significance' for purposes of section 21092.1 cannot be defined exclusively in terms of the grounds for recirculation found in section 21166, from which the first three categories are drawn. The different circumstances governed by these statutes mandate this conclusion.

[4] All cites to statutory authority are to the Public Resources Code unless otherwise stated.

(*Laurel Heights II*, 6 Cal.4th at 1130.) The fourth criterion is similar to whether an EIR's omission of essential information precludes informed decisionmaking and public participation. Supreme Court decisions hold that this question is reviewed de novo. (POB 14-15.) Reviewing a fourth criterion recirculation claim for substantial evidence as urged by UC is inconsistent with these decisions.

Moreover, *Laurel Heights II* held that determining the standard of review for a recirculation claim is case-specific: "We conclude that the substantial evidence standard set forth in section 21168.5 governs the Regents' decision not to recirculate the EIR in this case." (*Laurel Heights II*, 6 Cal.4th at 1135.) The recirculation dispute involved five sources of new information that clarified or confirmed matters already fully disclosed and analyzed in the Regent's informationally adequate EIR. (*Id*. at 1136.) *Laurel Heights II* addressed whether that information constituted "significant new information" under the first three criteria of Guideline section 15088.5. (*Id*. at 1137-1141.) Again, the claim here addresses omission of essential information regarding beach water, implicating the fourth criterion.

UC's reliance on *South County Citizens for Smart Growth v. County of Nevada* (2013) 221 Cal.App.4th 316, 330, is similarly misplaced, as it addresses a mitigation measure adding "significant new information" under the third criterion, at Guideline section 15088.5(a)(3) and does not address the arguments above. Appellate decisions are not authority for propositions not expressly considered. (*People ex rel. City of Santa Monica v. Gabriel* (2010) 186 Cal.App.4th 882, 891.)

Save Our Peninsula v. Monterey County Board of Supervisors (2001) 87 Cal.App.4th 99, 111, 114, 122-128 [water quantity], 112, 131-134 [water source] required recirculation of an EIR that belatedly disclosed baseline water use and recharacterized the water source as riparian. The Final EIR in *Sutter Sensible Planning, Inc. v. Board of Supervisors* (1981) 122 Cal.App.3d 813, 817-18 required recirculation as it included "a more elaborate discussion of groundwater availability and the projected impact of the plant on the water table" and substituted new "estimates of evapo-transpiration potentials ... for figures used in the previous EIR which were repudiated by their purported author." (*Id.,* at 817-18.) Here, the FEIR makes analogous setting description changes because it reverses field and admits that the CPHP could make degraded beach water quality worse.

5. The EIR Improperly Defers the Formulation of Mitigation Measures

UC defends the "deferred" mitigation claim by arguing that MM-HYD-1 will be "implemented before final design approval to reduce the Project's potentially significant impacts on beach water quality." (ROB 33:9.) This is irrelevant, because "[t]he delayed implementation of mitigation measures is a type of delay distinct from deferred formulation," (*King & Gardiner Farms, LLC v. County of Kern*

(2020) 45 Cal.App.5th 814, 860 (*King & Gardiner Farms*); *POET v. State Air Resources* Board (2013) 218 Cal.App.4th 681, 738.)

> UC argues that MM-HYD-1 includes these enforceable performance standards:
>
> (a) the stormwater runoff rate and volume from the CPHP shall not exceed predevelopment conditions for the 1- and 2-year, 24-hour design storm; and
>
> (b) that the total volume of stormwater discharges from Parnassus Heights in wet weather is decreased by an amount sufficient to offset flows from any increase in impervious surfaces and any increases in wastewater discharges as a result of the CPHP. (AR 6599-601; AR 222-24.)

(ROB 33:20.) UC is incorrect because both measures require additional analyses, *post-approval*, to determine "predevelopment conditions for the 1- and 2-year, 24-hour design storm" and the magnitude of the decrease in "total volume of stormwater discharges" required to fully offset increases in stormwater *and* wastewater discharges. The analyses may lead to enforceable performance standards at some point, but to defer the formulation of mitigation the EIR must provide enforceable performance standards before approval. This EIR fails that test. Moreover, MM-HYD-1 fails to meet the other requirements for deferring the formulation of mitigation, *i.e*., whether it is impracticable to develop mitigation during the CEQA process and there is evidence that future mitigation is feasible. (POB 30:2.)

D. The EIR Fails to Analyze Transit Delay Impacts

Petitioners explained that the EIR fails as an informational document because it does not analyze transit capacity impacts. (POB 31-34.) UC now asserts: "Substantial evidence supports UC's less than significant determination, and Petitioners have not met their burden to prove otherwise." (ROB 35.) This response is nonsensical because the EIR contends that transit capacity is not a CEQA issue and never made a significance determination that could be reviewed for substantial evidence. (AR 6120.) Whether transit capacity is within the scope of CEQA analysis is a question of law reviewed de novo. (*City of Marina v. Board of Trustees of California State University* (2006) 39 Cal.4th 341, 355 (*City of Marina*.)

1. The EIR was Required to Analyze Transit Delay

UC asserts that petitioners failed to address how delay in transit would conflict with other programs, plans, ordinances, or policies that address transit. (ROB 35:16-17.) That is untrue. Petitioners provided several citations to both San Francisco's Transportation Impact Analysis Guidelines and OPR's Technical Advisory on Evaluating Transportation Impacts in CEQA (OPR Technical Advisory). (POB 32-34.) Both provide directives that should be considered in the EIR. (Guidelines, § 15064.3 (a).)

When a lead agency is evaluating a project's transportation impacts, "Other relevant considerations may include the effects of the project on transit and non-motorized travel." (*Ibid*.)

UC misquotes the OPR Technical Advisory to argue that transit capacity is not a CEQA issue: "...that document states: 'increased ridership should not be considered an adverse effect, *even if it results in increased travel times*...' (ROB 36:10-12, italics added.) The Technical Advisory, however, does *not* include the above-italicized language. (AR 34406.) UC's attempt to insert this language into the quote falsifies OPR's guidance because the referenced paragraph is silent on whether increased transit delay is a project-level impact, and the next paragraph indicates that increased delay should be addressed as cumulative impact. (POB 33:11-15.) UC does not address OPR's assertion that increased transit delay may "cause a cumulative impact by requiring new or additional transit infrastructure." (AR 34406.)

The opening brief recites evidence in the record that demonstrates the need for additional analysis regarding transit. (POB 32:1-10.) UC responds by quoting the EIR Appendix: "With implementation of the CPHP, the campus site would have both more locations and capacity for passenger loading to occur," and that "loading supply for the campus site is expected to be greater than [transit loading] demand for most of the day." (ROB 35:13-16.) UC omits the remainder of the quote:

> [A]lthough passenger loading supply for the campus site is expected to be greater than demand for most of the day, there may be peak passenger travel periods where demand, either for the campus site overall, or for specific locations is greater than supply. During these periods there would be a higher chance of delay to transit or a reduction in access to transportation facilities.

(AR 3517.) The EIR Appendix does not refute that the CPHP would increase transit delay, much less that transit delay itself falls outside the scope of CEQA.

UC next cites Guidelines section 15064.3(b)(1) to argue that CPHP effects on transportation are presumed less than significant because it is within a half mile of "several major transit stops." (ROB 35:22-25.) This is irrelevant to whether transit capacity is within the scope of CEQA review. Also, any presumption provided by subdivision (b)(1) pertains to vehicle miles travelled (VMT), not the "effects of the project on transit," which is the issue here addressed in subdivision (a)(1). Finally, the Guideline provides only that this is "generally" the case. (Guidelines, § 15064.3 (b)(1).) If this presumption is applied uniformly, there would seldom be a need to address transportation impacts in the City, served extensively by public transit. City guidelines for analyzing transportation impacts under CEQA confirm this is not the case. (AR 980-1008.) They include impacts to transit delay as a CEQA issue. (AR 999.)

UC dismisses the import of the City's CEQA transportation guidelines, calling them "immaterial because the City is not the lead agency and UC is not subject to its thresholds." (ROB 36:6-7.) The statement is directly contrary to the EIR's representation that its transportation analysis is "[c]onsistent with the CEQA Guidelines and the SF Guidelines." (AR 4199.) Regardless, UC's refusal to establish a significance threshold for transit capacity impacts cannot allow its EIR process to ignore substantial evidence of an environmental impact. (*Amador Waterways, supra*, 116 Cal.App.4th at 1109.)

2. Transit Delay may Indirectly Impact Vehicle Miles Traveled

UC mischaracterizes petitioners' argument that impacts to transit capacity could create indirect impacts to VMT that remain unanalyzed. (POB 34:9-10.) UC provides several citations to the effect that the EIR analyzed VMT and substantial evidence supports the analysis. (ROB 37:2-3.) However, the EIR did not analyze transit capacity impacts, including potential increased transit capacity that would indirectly contribute to VMT. (AR 6120.) In fact, UC acknowledges that the EIR "assumed that 'the share of travel by public transit [would] remain the same or be slightly reduced from current levels.'" (ROB 37: 6-7.) Actual analysis of impacts on transit capacity could have required the EIR to abandon this assumption. (POB 33:26-34:10 [fair argument that transit delay from the CPHP may, in turn, increase VMT].) Thus, the EIR fails to analyze indirect impacts on VMT. (Guidelines, § 15126.2 (a).

E. The EIR Fails to Adequately Analyze and Mitigate Construction Noise Impacts

1. The EIR Fails to Adequately Address Potential Health Impacts

While construction of the CPHP would last three decades, UC argues that "occasional noise level of up to 76 dBA" would occur only "over several months of activity." (ROB 38:17-18.) UC's single-page AR citation provides no explanation. (AR 1960.) It is belied by UC's CalEEMod inputs, which assume 4.5 years of construction for the New Hospital (AR 2530), 3 years/10 months for the RAB (AR 2589-90), 11 months for Aldea Housing (AR 2502), and 9 months for the Irving Street Arrival (AR 2562). This translates to about ten years of construction for the "first phase" projected from March 2022 (AR 2562) to December 2029 (AR 2530). The EIR explains that "generally comparable" noise levels would occur for the next 20 years. (AR 1951-52). UC's claimed "several months of activity" is false.

UC claims that the EIR analyzed impacts of construction noise as "significant and unavoidable ..." (ROB 39:13-14.) But the four pages relied on do not discuss related human health impacts. (AR 1950-53.) Although the EIR was certified after the Supreme Court ruled in *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502 (*Sierra Club*) in 2018, discussion of health risks from construction noise is

in one paragraph that is detached from and plays no role in the significance determination for NOI-1. (AR 1960.) As in *Sierra Club*, the EIR provides a discussion of the human health impacts from noise levels, but fails to correlate those noise levels to project emissions for purposes of public disclosure or assessment of significance. UC's statement that its "EIR identifies the health impacts associated with noise caused by construction activities, the noise levels at which those health impacts may occur, and describes the noise levels associated with CPHP construction activities" is false. (ROB 40: 9-11.)

The EIR's failure to correlate noise to health impacts is demonstrated by two simple questions:

(i) What noise levels and exposure periods are associated with "decreased performance of cognitive tasks" or "physiological effects such as hypertension and heart disease"? (ROB 39:20-23.)

(ii) If "few people are seriously annoyed by activities with noise level below 55 dBA," (ROB 39:25-26), what level causes most people to be annoyed?

These questions are critical since residents would be exposed to many years of construction noise at levels up to 80 dBA. (AR 1956.) The EIR fails to provide answers. (*Laurel Heights I, supra,* 47 Cal.3d at 405 [requiring "detail sufficient to enable those who did not participate in its preparation to understand"].) Rather than addressing likely health impacts at lower noise levels, the EIR focuses on "pain and hearing damage" that result at "120dB and 140 dB respectively." (AR 1960.) The EIR also fails to consider if hypertension, heart disease, decreased performance of cognitive tasks, and serious annoyance would constitute significant impacts. (*Amador Waterways, supra*, Cal.App.4th at 1108–09.)

UC argues that the EIR's analysis is saved as it "applies the standards established in the City's Police Code and General Plan...and the daytime construction noise criteria of the Federal Transit Administration." (ROB 38:19-21.) However, neither the City's noise ordinance (AR 31234-82) nor the FTA manual (AR 32212-27) indicate that their respective standards consider health impacts or correlate noise levels to health risks. Further, as explained below, the EIR does not apply these standards.

2. Mitigation for Construction Noise is Inadequate

UC first argues that MM NOI-1b "commits UC to restricted hours," and then acknowledges that MM NOI-1b allows exceptions. (ROB 40:24-27.) While it would minimize the exceptions to "rare circumstances ... such as large concrete pours," NOI-1c provides no limitation. (AR 1476, 1953.) "Rare circumstances" are defined neither as to their nature or the frequency of occurrence. (*Ibid*.)

UC next argues that "there is nothing vague about 'restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers

to shield the short-term nighttime activity.'" (ROB 41:2-4.) Although quoted in the opening brief, UC ignores *King & Gardiner Farms, supra*, 45 Cal.App.5th at 858, which explains that the "terms 'increase' and 'reduce'— even though preceded by the mandatory term 'shall' and modified by the phrase 'to the extent feasible'— are not specific performance standards." UC provides no definition or performance standard for "smaller time windows" or "condensing the overall duration" of nighttime construction. Similarly, MM NOI-1b provides no standard for either the design of the "temporary barriers" or the performance of their noise shield.

Finally, UC points to "a *program*-level analysis and mitigation measures," requiring preparation of a future "Noise Control Plan." (ROB, 41:10-15.) This does not cure the defective *project*-level analysis and mitigation for the CPHP's "initial phase" construction. (AR 1948.) Further, any future "noise control plans" are to be approved "by UCSF" and not a regulatory agency, if construction noise "is consistent with the standards set forth in the City's Noise Ordinance." (AR1952.) The EIR's conspicuous use of the phrase "consistent with" appears shorthand for disclaiming commitment to comply with the City's standard, as the EIR explains: "Although UCSF is not subject to the noise ordinance, it *strives* to be consistent with it to the extent feasible." (AR 1530, italics added.) Generalized admonitions to operate more quietly "where feasible" or "wherever possible" are inadequate mitigation. (*Sierra Watch v. County of Placer* (2021) 69 Cal.App.5th 86, 110.) "This language, in effect, only tells construction contractors to be quieter than normal when they can. Although that may be good neighborly advice, it is not sufficient as a mitigation measure." (*Ibid*.) The same is true here, where neighbors would be exposed to significant construction noise over decades.

F. The EIR Fails to Adequately Analyze Historic Resource Impacts

1. UC Cannot Approve Demolition Based on a 'Policy Decision'

UC argues that it has discretion to find that retaining one or more historic buildings is infeasible based solely on a "policy decision." (ROB 41:20-42:26.) UC relies on *Sacramento Old City Association v. City Council* (1991) 229 Cal.App.3d 1011, 1018 (*SOCA*) for the proposition that courts must not "substitute their own opinions as to what constitutes wise public policy." Yet *SOCA* was generally discussing the substantial evidence standard for agency findings, not whether otherwise-feasible mitigations or alternatives to reduce significant impacts can be ignored based on declared 'public policy." (*Ibid*.) Under UC's view, any agency could approve demolition of historic resources by stating a policy preference for new versus historic buildings. That is assuredly not a proper CEQA interpretation

of "feasibility," and it is inappropriate here where UC has substantial properties in the City, unsupported verification of space needs, and great flexibility as to where to locate research and hospital facilities.

Feasibility is a question of fact, not "policy." UC's finding that avoidance of demolition is infeasible is not supported by substantial evidence. The finding must turn on facts as to whether the project could be accomplished with the identified mitigations or alternatives. (POB 19:8.) The historic resources at Parnassus are capable of being rehabilitated, as UC conceded in its 2014 Plan and EIR.

CEQA's "substantive mandate" requires that an agency not approve a project "as proposed if there are feasible alternatives or mitigation measures that would avoid or substantially lessen the adverse environmental effects." (*Stockton Citizens for Sensible Planning v. City of Stockton* (2010), 48 Cal.4th 481, 498; Guidelines, § 15092(b)(2)(A); POB 66:17.) UC unlawfully ignores the substantive mandate, contending that its policy decision to change land uses at Parnassus led it to consider and reject several alternatives that would have retained one or more historic buildings, and that is enough. (ROB, 42:2-21.)

As the California Supreme Court held in *City of Marina*, *supra*, 39 Cal.4th at 368-69, an agency cannot "proceed with a project that will have significant, unmitigated effects on the environment, based simply on a weighing of those effects against the project's benefits, unless the measures necessary to mitigate those effects are truly infeasible." Policy and public benefit considerations do not arise in determinations of feasibility, but only when an agency approves a project because its overriding benefits render *unavoidable* significant impacts "acceptable." (Guidelines, § 15093.)

2. The DEIR Fails to Evaluate the Campus as a Historic District or Area

UC contends that "the EIR has sufficient detail to provide an informed reader with the background necessary to understand (1) the *historic resources* that were evaluated, (2) those that may be present and were not evaluated before publication of the EIR, and (3) potential impacts of the CPHP." (ROB 19, italics added.) However, the only *historic resources* that the Draft EIR evaluated were individual buildings, plazas, and murals. The campus was not evaluated as a unified *historic resource* in its own right as a "historic district" or "historic area." (POB 41:16-21.) This is important because a substantial alteration to a historic district as a whole has a separate significant impact for which mitigations and alternatives must be identified and applied.

In response to comments, the FEIR contends but provides no supporting facts that the EIR adequately evaluates the campus as a historic district. (POB 41:22-27.) UC points to a sentence in Carey & Co.'s 2011 report suggesting that the possibility of a historic district at the Parnassus campus was considered but that the researchers "*did not find sufficient evidence* to identify an historic district." (ROB

43:24-44:5, italics in original.) Yet the only relevant reference in the report is a "negative pregnant" — an inference — because Carey & Co. surveyed all UCSF campuses for historic resources and *reported* only one potential historic district at Third Avenue. (AR 40134.)

Carey & Co. does not offer a word of explanation as to whether the Parnassus campus is or is not a potential "historic district" or "historic area." An inference that the issue was evaluated does not meet CEQA's requirements for public disclosure. Even where an EIR's environmental conclusion is correct, "there must be a disclosure of the 'analytic route the ... agency traveled from evidence to action.'" (*Sierra Club, supra,* 6 Cal.5th at 513, quoting *Laurel Heights I, supra*, 47 Cal.3d at 404 and *Topanga Assn. for a Scenic Community v. County of Los Angeles* (1974) 11 Cal.3d 506, 515.)

Moreover, while the 2011 Carey & Co. report is cited in the DEIR (AR 1757), it is not part of the EIR or attached as an appendix. "The data in an EIR must not only be sufficient in quantity, it must be presented in a manner calculated to adequately inform the public and decision makers... '[I]nformation scattered here and there in EIR appendices' or a report 'buried in an appendix,' is not a substitute for 'a good faith reasoned analysis.'" (*Vineyard Area Citizens, supra*, 40 Cal.4th at 442.) The EIR's failure to evaluate the whole campus as a potential historic resource fails to satisfy CEQA mandates for public disclosure and evaluation of impacts and feasible mitigation.

G. The EIR Fails to Adequately Assess Impacts from Air Emissions

1. The EIR Piecemeals Analysis of Health Impacts from TAC Emissions

The EIR piecemeals its analysis of human health impacts from TAC emissions to minimize significant impacts on neighbors' cancer risk. The critical issues are: (i) whether construction and operational TAC emissions should be segregated for EIR analysis, and (ii) whether the project-level significance threshold of 10 increased cancer risks applies rather than a cumulative threshold of 100.

(a) The EIR Fails to Address Cancer Risks from all TAC Emissions

In response to expert testimony and guidance from the California Office of Environmental Health Hazard Assessment (OEHHA) stating that a health risk assessment should include both construction and operational TAC emissions, UC pronounces a "disagreement among experts" as if that allows it to freely rely on its own methodology to determine whether cancer risks are significant. (ROB 47: 22-28.) UC fails, however, to identify any expert support for the EIR's methodology of segregating

health risks from TAC emissions. (ROB 47:26.)[5] BAAQMD's guidance is in accord with OEHHA, and provides in that "Some proposed projects would include both permitted and non-permitted TAC sources. For instance, a manufacturing facility may include some permitted stationary sources and also attract a high volume of diesel trucks and/or include a rail yard. *All sources should be accounted for* in the analysis." (AR 15733, italics added.) UC's failure to identify any expert support for its competing "methodology" is fatal to its defense.

This is not an issue of "competing experts" that entitles UC to deference. The EIR's failure to account for mobile-source TAC emissions for the entire CPHP, or any operational emissions from the New Hospital, is based on a legal posture that "future projects…will undergo separate review" rather than any identifiable expert evidence. (POB 43:19-23.) The opening brief responds directly[6] to UC's legal position, explaining that EIR analysis cannot be deferred where, as here, the record includes sufficient information allowing study of an impact. (POB, 43:24-44:9.) UC ignores this argument, including the opening brief's discussion of mobile-source diesel emissions and New Hospital operational emissions that were available for calculation of resulting TAC emissions. (ROB 5-48.)

(b) The CPHP is a Single Project for Purposes of CEQA Analysis

The opening brief explains that the EIR minimized TAC health risks by treating each infrastructure element of the CPHP as a separate CEQA project, and even purported to distinguish construction and operational TAC emissions. (POB 44:9-19.) UC's only discernible response is that "the only overlap between construction emissions and operational emissions would be cumulative ... because emissions from operations (generators and vehicles) cannot occur until construction of a building is complete." (ROB 47:8-11.)[7]

That operational emissions occur later than construction emissions means that they are "serial" or "consecutive," but not that they are "cumulative." It is absurd to suggest that construction of a building somehow has independent utility from operation of the same building. (*Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1223.) While UC now ignores this

---

[5] UC cites a single page from the record supporting its assertion, and that page is unrelated to TAC emissions. (AR 6979.) The FEIR's response to PNC's expert references no expert analysis or evidence supporting UC's methodology. (AR 6012-13.)

[6] UC falsely asserts that "Petitioners . . . ignore that the EIR indicates that the New Hospital and Future Phase Projects will undergo separate environmental review." (ROB 47:18- 19)

[7] UC concedes that these different buildings have no independent utility in its recitation of the "interrelated sequence of projects." (ROB 16:2-13.)

point, the record is replete with evidence that the EIR consistently treated the CPHP as a single project. (See, e.g. AR 1647, 1659 [criteria air emissions], 1786-1787 [energy], 2050 [transportation].) In any event, the scope of a project under CEQA is a legal question for the Court without deference to the lead agency. (*Stopthemillenniumhollywood.com v. City of Los Angele*s (2019) 39 Cal.App.5th 1, 15.) The EIR's unique approach to piecemeal the CPHP's various TAC emission sources in this manner unlawfully minimizes the CPHP's significant cancer risk impacts on UC's neighbors.

2. The EIR Incorrectly Applies Cancer Risk Thresholds of Significance

UC first argues, incorrectly, that the claims arising from the EIR's erroneous use of cancer risk thresholds of significance were not exhausted in the administrative process. (ROB 48:16.) They were exhausted by comments (POB, 45:28; 51:28, citing AR 890-96, 898-944, 6069-74, 5862-64; 5903-06; 5913-18; 6137-43) and the Final EIR responded. (AR 6076-6083.)

UC argues that it and other agencies have used the same cancer risk thresholds for years. (ROB 48:21.) This is irrelevant. The EIR failed to apply these thresholds to the environmental baseline established in the EIR to determine significance. Instead, it applies the thresholds without regard to the magnitude of baseline cancer risk. Also, there is no record evidence that UC and other agencies in fact have applied the thresholds in this manner for years. Even if they had, repeating a legal error would not make it legally correct. The emperor repeatedly parading without clothes remains naked.

(a) UC Failed to Adopt Its Thresholds in a Public Rule-Making Process

UC fails to defend this claim argued at POB 45:4. Judgment and a writ should issue.

(b) The EIR Fails to Adequately Describe Existing Cancer Risk Conditions

UC defends the EIR's use of the 100 in one million cancer risk criterion by arguing that "the predicted existing risk levels attributable solely to diesel particulate matter (DPM) are not a factor in the impact assessment of the EIR." (ROB 49:8.) This argument has three flaws. First, the idea that "existing risk levels are not a factor in the impact assessment" is contrary to CEQA case law requiring that the project-caused impact (increased risk) be added to existing conditions (existing risk). (POB 46:17-27.) Second, UC's argument implies that the EIR is exempt from CEQA's requirement to describe baseline conditions as of the Notice of Preparation date. UC cites no authority, and there is none. Third, UC's assertion that existing risks "attributable solely to DPM are not a factor in the impact assessment of the EIR" is a red herring. The claim is that existing risks attributable to both DPM and TAC are a factor in the impact assessment and need to be described in the EIR.

(c) The EIR inadequately analyzes Project and Cumulative Cancer Risk

The EIR's rationale for applying BAQMD's project-level and cumulative cancer risks thresholds were addressed in the opening brief. (ROB 49:14-50:25; POB 46:9-51:14.) UC now pronounces that "Petitioners' argument that the significance threshold should account for the existing baseline cancer risk would require virtually every CEQA project to prepare an EIR ... because the ambient risk exceeds the standard of significance; it would be absurd for CEQA to require this result." (ROB 50:25-28.)

UC thus concedes the gravamen of petitioners' claim, that in finding the CPHP's project-level and cumulative cancer risk to be less-than-significant, the EIR applied BAAQMD's thresholds in a manner that ignores the baseline's severely adverse cancer risk conditions. UC argues that "BAAQMD's threshold ... also does not require that existing background emissions be considered in evaluating the significance of a project's incremental emissions." (ROB 50:21.) Assuming arguendo that this is correct, it is unavailing since BAAQMD has no more license to ignore CEQA's requirements than does UC.

Moreover, under UC's approach there is no upper limit to air pollution that would require an agency to find that a project's impact is significant, because as long as each project stays under the 10 per million threshold, air could become unbreathable without a finding that any project would have a significant impact. CEQA does not allow such "creeping incrementalism" to remain undisclosed.

Instead of explaining why this approach does not violate CEQA, which it does (POB 46:9-51:14), UC makes a policy argument that courts should recognize an exception, implying that otherwise every project that would increase cancer risk above a preexisting severely degraded baseline would have a significant adverse effect, thereby necessitating the preparation of an EIR. UC's parade of horribles is incorrect and addressed to the wrong branch of government. It is incorrect because a lead agency's legal obligation is to determine if an increase in cancer risk is individually significant or "cumulatively considerable." (Guidelines, §§ 15065(a)(3); 15130(a); 15355; *CBE v. Resources, supra*, 103 Cal.App.4th at 120 [the 'one [additional] molecule rule' is not the law"].) The EIR *must explain*, based on facts rather than policy and what other agencies say, why worsening severely degraded conditions is individually significant or "cumulatively considerable." The EIR fails to do so.

UC's policy argument is overblown because CEQA has many exemptions for projects in urban areas even if they may worsen poor air quality. (§§ 21080.42; 21081.2; 21155.1; 21155.11; 21159.21; Guidelines, §§ 15301-15304; 15322.) UC's policy argument is addressed to the wrong branch of government because the Court may not rewrite a statute to suit UC's desire.

UC also generally argues that a 47-page technical document (AR 16491-537) not included in the EIR finds that the Parnassus campus is not in an Air Pollutant Exposure Zone (APEZ.) (ROB 51:1-9.) UC does not explain why this is relevant. Regardless, the EIR fails to disclose why worsening severely degraded ambient risk (conceded as above 100 in one million) is not individually significant or cumulatively considerable. (*Vineyard Area Citizens, supra*, 40 Cal.4th at 442 ["[I]nformation 'scattered here and there in EIR appendices' or a report 'buried in an appendix,' is not a substitute for 'a good faith reasoned analysis'"]; 443 ["That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR, for example, is irrelevant"].)

Regarding cumulative cancer risk, UC relies on the FEIR's response, that BAAQMD directs that a project would have a cumulatively considerable impact if all sources within a 1,000-foot radius plus the project exceeds an excess cancer risk level of more than 100 in one million. (ROB 51:20.) The response is inadequate. (POB 51:7-14.) The math is simple. Baseline risk in the area studied is above 100 in one million. The project would make that worse regardless of how far receptors are from sources of pollution or whether the CPHP "excess risk" exceeds another 100 in one million. Whether other agencies find that "acceptable" is not a relevant or legal basis to find the impact less than significant.

H. The EIR Inadequately Analyzes Visual Impacts

1. The EIR's Analysis of Impacts AES-1 and -2 Omits Essential Information

With two caveats, the opening brief fully anticipates UC's opposition regarding the validity of the EIR's analysis of Impacts AES-1 and AES-2. Those arguments are not repeated here. (POB 51-54.) UC repeats the EIR's unfounded assertion that it can reduce significant impacts by changing the baseline, in this case by amending the LRDP's regulations that minimize such impacts. (POB 52:1-19.)

UC's only new argument is to claim disagreement that "the threshold of significance should be changed to 'visual impacts as perceived from surrounding neighborhoods' rather than the selected criterion listed in Appendix G." (ROB 53:25, n.16.) UC misconceives the claim. It is not that a threshold of significance should be "changed," but that the EIR must assess the impact because otherwise it commits legal error by deploying its thresholds of significance to foreclose consideration of substantial evidence supporting a fair argument of significant impact. (POB 52:20.)

2. UC Erroneously Relies on Public Resources Code Section 21099

UC's discussion of the section 21099 exemption for aesthetic impacts fails to interpret CEQA "in such manner as to afford the fullest possible protection to the environment within the reasonable

scope of the statutory language.'" (*Laurel Heights I, supra,* 47 Cal.3d at 390.) Also, exemptions from CEQA "are narrowly construed." (*San Lorenzo Valley Community Advocates for Responsible Education v. San Lorenzo Valley Unified School Dist.* (2006) 139 Cal.App.4th 1356, 1382.)

UC's argument that the definition of "residential or mixed-use residential project" in section 21159.28 (d) does not provide guidance for defining these terms in section 21099 ignores their common parentage. Section 21099 was enacted to encourage transit-oriented, infill development to reduce greenhouse gases announced in Senate Bill No. 375, "one in a series of executive, legislative and administrative measures enacted to reduce greenhouse gas emissions ..." (*Covina Residents for Responsible Development v. City of Covina* (2018) 21 Cal.App.5th 712, 725) Section 21159.28 was enacted pursuant to Senate Bill 375. Since both statutes were enacted to further goals of SB 375, the provisions should be read *in pari materia*. (*Smith v. LoanMe, Inc.* (2021) 11 Cal.5th 183, 190.) Thus, section 21099's CEQA exemption for aesthetic impacts attributable to a residential or mixed-use project cannot reasonably be interpreted to apply to this EIR.

I. The EIR Defers Formulating Mitigation for Biological and Visual Impacts

UC denies that the EIR improperly defers formulation of mitigation measures MM BIO-2b and MM AES-3, treating it as a challenge to whether the EIR's conclusion that impacts will be less than significant is supported by substantial evidence. UC misconceives the nature of the claim, which is a procedural challenge to the EIR's assumption that it meets criteria for deferral. "The existence of substantial evidence ... is not relevant when one is assessing a violation of [CEQA's] information disclosure provisions." (*Communities for a Better Env't v. Richmond, supra*, 184 Cal.App.4th at 82.

J. The EIR Fails to Assess Shadow Impacts on Surrounding Neighborhoods

UC incorrectly argues that "[a]nalysis of shadow impacts is not required under CEQA." (ROB 57:18, citing Guidelines, Appendix G.) This argument is incorrect because CEQA requires analysis of all project-caused physical changes to the environment (§§ 21100, 21002.1, 21065) and loss of sunlight is unquestionably a physical change. Also, the fact that Appendix G does not mention "shadow" is irrelevant; its preamble expressly provides that "[s]ubstantial evidence of impacts not listed on this form must also be considered."

As with visual impacts, UC misconceives the issue. It is not that a threshold of significance should be "changed" but that the EIR unlawfully fails to analyze the significance of shadow impacts on

neighborhood life outside of city parks despite substantial evidence supporting a fair argument that such impacts may be significant. (*Amador Waterways, supra*, 116 Cal.App.4th at 1109.)

K. Deferral of Formulation of Mitigation for Significant Wind Impacts is Unlawful

UC implies that labeling the CPHP EIR a "program" EIR gives it a free pass to defer the formulation of mitigation for significant wind impacts. This is incorrect. The level of specificity for a program EIR is determined by the nature of the project and the 'rule of reason' and not by semantic labels. (*Citizens for a Sustainable Treasure Island v. City and County of San* Francisco (2014) 227 Cal.App.4th 1036, 1052.) A program EIR must provide "decision makers with sufficient analysis to intelligently consider the environmental consequences of [the] project." (*Ibid*; *Cleveland National Forest Foundation v. San Diego Ass'n of Governments* (2017) 17 Cal.App.5th 413, 426 (*Cleveland*).)

UC ignores extensive authority in the opening brief addressing the EIR's improper deferral of the formulation of mitigation for significant wind impacts. (POB 30; 36:25; 57:9 ["As discussed, to defer mitigation until after project approval it must be impracticable to achieve in the present and the agency must adopt performance standards. UC violates both criteria for deferral."].) The opening brief did not repeat these citations for each mitigation deferral claim.

UC's defense consists mostly of undisputed points. For example, the parties assume that wind tunnel testing is required for accurate prediction of wind speeds and that final building designs are necessary for accurate wind tunnel tests. Petitioners' claim is that the EIR presents no evidence that it is impractical for UC to develop final building designs before approving the CPHP; thus allowing wind tunnel testing. UC ignores this claim and cites to no such evidence.

Similarly, UC argues that MM AES-4 includes a specific performance criterion, *i.e*., San Francisco's wind hazard threshold of 26 mph. Petitioners do not dispute that MM AES-4 references this criterion. The legal problem is that MM AES-4 does not mandate compliance with this criterion. (POB 58:12; *Cleveland, supra*, 17 Cal.App.5th at 440-443 ["[i]mpermissible deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR"]. UC fails to defend this claim.

UC argues that MM AES-4 does not use an incorrect, post-project baseline to determine the success of wind mitigation, contending that the "baseline" under CEQA has nothing to do with measuring the success of mitigation. (ROB, 60:15; POB 59:6.) This reflects a deep misunderstanding of how CEQA works. The environmental setting (i.e., pre-project baseline) is the condition of the

environment against which an EIR evaluates project changes for environmental harm. (*Communities, supra*, 48 Cal.4th at 315). For purposes of measuring the success of mitigation, changing the baseline to reflect conditions after portions of the project are built could partially or completely obscure the magnitude of the change caused by the project. The updated baseline would reflect more degraded environmental conditions than the pre-project baseline. The Court should reject UC's absurd argument.

L. GHG Emissions must be Analyzed and Mitigated

UC relies heavily on the purchase of voluntary carbon offsets to support the EIR's determination that greenhouse gas (GHG) emissions would be less than significant. (AR 1854-55 [UC to purchase roughly 59,000 metric tons of CO_{2e} a year, approximately 95 percent of the increased emissions from the buildout of the CPHP].) UC relies on this strategy because it is less expensive than lowering emissions. (AR 42215.) But UC's proposed voluntary offsets fail to meet CEQA's requirements that mitigation measures be "fully enforceable through permit conditions, agreements, or other legally binding instruments." (Guidelines, § 15126.4 (a)(2).)

UC first argues that *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467 (*Golden Door*) is limited to its facts and should not be relied upon. (ROB 62:1-4, 14-15.) *Golden Door* states, "Our decision is not intended to be, and should not be construed as blanket prohibition on using carbon offsets — even those originating outside of California — to mitigate GHG emissions under CEQA." (*Id*. at 483.) UC overreaches, as *Golden Door*'s limiting language reflects adherence to the principle of judicial restraint. The practice of distinguishing one case from another is based on the assumption that appellate rulings are limited to the facts of each case. But petitioners' claim is not premised, as UC states, on a "blanket prohibition on using offsets." Far from it, the material facts in *Golden Door* are substantively identical to the instant case and compel the same outcome.

UC argues that *Golden Door* is distinguishable because "MM GHG-1c commits UC to monitoring emissions annually and acquiring carbon offset credits in conformance with CARB guidance." (ROB 62:16-19.) UC fails to explain what is meant by "offset credits in conformance with CARB guidance." It cites only three pages from the EIR to support this assertion, and the only possible interpretation from them is that "Offset credits shall be third-party verified by a major registry recognized by CARB ... UCSF will purchase CARB conforming national offset credits registered with an approved registry." (AR 1858.) UC fails to acknowledge that CARB approval is rejected as a basis for enforceability. (*Golden Door, supra,* 50 Cal.App.5th at 511.) Further, UC relies on the same

registries as the agency in *Golden Door*. (Compare AR1858-1859 [discussion of CPHP's voluntary carbon offset registries] with *Golden Door*, *supra*, 50 Cal.App.5th at 570-571 [discussion of registries].)

UC next argues that MM-GHG-1c is distinguishable from *Golden Door* because the EIR mentions the use of protocols whereas the mitigation measure in *Golden Door* does not. (ROB 62:23-27.) This simplistic argument is unavailing because UC *fails to require CARB approval for the protocols*, which is necessary for enforceability. (AR 1859.) MM-GHG-1c only requires that "protocols of each registry, and UC's own internal screens, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols." (*Ibid*.) This is inadequate, as *Golden Door* explains:

> [R]egardless of how the voluntary protocols are developed, [C]ARB staff must determine whether the voluntary protocol should be developed for use in the Cap-and-Trade Program and if so, to conduct its own rulemaking process.... *This process ensures that any voluntary protocol ... demonstrates the resulting reductions meet the offset criteria in [Assem. Bill No. 32] ...* Protocols developed by the voluntary programs are not Compliance Offset Protocols." (Italics added.)

(*Golden Door*, *supra*, 50 Cal.App.5th at 511-12.)

As in *Golden Door*, UC fails to require CARB approval for these protocols, or information regarding the protocols. (AR 1859.) Without additional requirements, MM-GHG-1c is unenforceable. The similarities to *Golden Door* are striking and compel the same result.

1. MM-GHG-1c is Impermissibly Deferred

There are two ways in which MM-GHG-1 is impermissibly deferred. First, offset protocols are undefined. (POB 61:1-5.) Second, offset locations are unspecified. (*Ibid*.) UC states that voluntary offsets would "prioritize" local and in-state offsets and, if no such offsets are "available," UC would purchase out-of-state offsets. (ROB 63:3-11.) *Golden Door* found the mitigation measure impermissibly deferred where it "contains no objective standards for determining whether any particular offset project is 'available' and 'financially feasible' in one location or another." (*Golden Door, supra*, 50 Cal.App.5th at 520.) As in *Golden Door*, UC fails to identify any objective standard for when local or in-state offsets are "available." (ROB 63:4–11.) Apparently attempting to distinguish *Golden Door*, UC states in a footnote that "it is not possible or feasible to specify exactly where future credits will be obtained." (ROB 63:27 fn. 22.) UC fails to explain, however, why requiring an objective standard for "availability" would be equivalent to "specify[ing] exactly where future credits will be obtained." Again, the facts here are substantively identical to *Golden Door*, and compel the same finding of improper deferral.

2. The EIR Relies on the CARB 2017 Scoping Plan to Analyze GHG Impacts

There are two flaws in the CPHP's use of the CARB's 2017 Scoping Plan. First, the 2017 Scoping Plan standard relied upon is not applicable to the UC. (POB 62:10-13.) Second, the CPHP's reliance on "zero net increase" conflicts with UC's own policies. (POB 61:21-62:6.)

In lieu of properly analyzing this conflict as required by CEQA, UC provides a handful of excerpts from the EIR that purport to show that the CPHP is consistent with "UC plans and policies, 2040 Plan Bay Area, CARB's 2017 Scoping Plan Updated, and Executive Order S-3-05." (ROB 63:16-18.) However, UC provides no explanation as to how the CPHP's goal of "no net increase" is consistent with state mandates for emission decreases.

UC's opposition concludes by stating "Petitioners ignore that UC's CNI [Carbon Neutrality Initiative] is more stringent than all state requirements for reduction of GHG emissions, including AB 32, SB 32, and 2017 Scoping Plan." (ROB 64:3-4.) UC's claim is false. The CNI is a carbon neutrality goal that is only half-heartedly entered into by the UC, and bears no relationship to state goals. (AR 41069 [noting that UC is not on track to meet its carbon neutrality goals by 2025].) Further, UC's opposition does not even attempt to argue how the 2017 Scoping Plan's guidance to cities and counties is applicable to UC as a state entity. UC has failed to adequately analyze how implementation of the CPHP is consistent with an applicable plan, policy, or regulation.

M. The EIR fails to Adequately Analyze Energy Conservation

1. Project Level Analysis Fails to Comply with Informational Mandates

A main focus of UC's arguments is to avoid applicable language in the CEQA Guidelines' Appendix F. UC attempts to brush aside a critical element of Appendix F by stating that "Petitioners' argument weakly relies on the aspirational goals listed in the introduction to Appendix F, all of which are still met by the EIR." (ROB 64:15-16.) First, this ignores "the fundamental rule of statutory construction which states that the court should ascertain the intent of the Legislature to best effectuate the purpose of the law. [Citation.] Legislative intent should be gathered from the whole act and applied reasonably to carry out the policy of the legislation. [Citation.]" (*Estate of Coudures* (1984) 151 Cal.App.3d 741, 746.)

The task is eased because Appendix F's policy is expressly stated: "The goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include: [¶] (1) decreasing overall per capita energy consumption, [¶] (2) decreasing reliance on fossil fuels such as

coal, natural gas and oil, and [¶] (3) increasing reliance on renewable energy sources." (Guidelines, App. F, § I.) *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 213 (*CCEC*) quoted this Appendix F language to invalidate an EIR that did "not indicate any investigation into renewable energy options that might be available or appropriate for the project." Here, the EIR fails to describe how the CPHP complies with any of the prescribed means to achieve energy conservation: the UC is increasing its reliance on fossil fuels, fails to assess whether its per capita energy consumption is increasing, and fails to require any increased renewable energy in favor of purchasing offsets.

Dismissing these fundamental issues, UC asserts that "CPHP will add about 2.90 million gsf of new building space and thus has to use more energy than the existing 3.92 million gsf of building space." (ROB 64:18-19.) UC fails to explain why this 74 percent increase in building space requires a 116 percent increase in electricity use, 76 percent increase in diesel use, and 61 percent increase in natural gas use. (AR 1779.) These increases suggest that CPHP development would be less energy efficient than the existing campus. (*Ibid*.) While it is possible that a per-capita energy consumption analysis pursuant to Appendix F, section I ("decreasing overall per capita energy consumption") might help explain this troublesome lack of energy efficiency, UC defiantly refuses to perform such analysis. (ROB, 65:11.) This is an informational failure under Guidelines section 15126.2 and Appendix F.

In an attempt to pivot from its excessive unexplained increases in energy consumption, UC points to Title 24 and LEED certifications to posit that "fossil fuel consumption would be reduced." (ROB 65:13.) However, the assumed "reduction" is illusory — both in terms of absolute numbers and in relation to the proposed increased building space. (AR 1779.)

UC expends much effort explaining how "UC is increasing renewable energy sources at all of its locations, including Parnassus Heights," referencing prior actions and contemplated future strategies actions that are neither elements of nor mitigation for the CPHP. (ROB 65:16-26.) Impacts from such unrelated projects are irrelevant, and information scattered about the record does not satisfy the EIR's informational disclosure requirements. (*Vineyard Area Citizens, supra,* 40 Cal.4th 412, 442.)

UC boasts that "the campus is developing *strategies* for adding new renewable generation including rooftop solar systems, and microgrid districts with battery storage." (ROB 65:24-25.) First, developing strategies to apply at some undefined date does not show a "decreas[ed] reliance on fossil fuels." (Guidelines, App. F, § I; AR 35130 ["Renovations and upgrades are recommended across many existing electrical facilities in the next 15 years to maintain business-as-usual operations"].) Second, the

CUP is scheduled "to remain in good operation until 2030-2035." (AR 35131.) UC fails to provide any performance standards to reduce reliance on fossil fuels, a primary path to achieve energy conservation.

UC's brief relies heavily on its goal to meet Title 24 and strive to achieve LEED Silver for new buildings, but does not dispute that these goals may be waived. (POB 65:1-6; ROB 64:21-24; 64:27-65:2 [claiming waivers would be limited to "exceptional circumstances"].) UC also relies on *Tracy First v. City of Tracy* (2009) 177 Cal.App.4th 912*,* to argue that reliance on building codes is sufficient to address energy impact concerns. (ROB 65:27-28, 66:1-4.) However, as in *CCEC*, UC here fails to provide any analysis regarding the other factors CEQA requires in addition to building code compliance. (*CCEC, supra*, 225 Cal.App.4th at 211; Guidelines, § 15126.2 (b).) It is thus impossible to determine whether changing certain aspects of the project would create a more efficient or less wasteful CPHP.

2. Cumulative Energy Impacts Analysis is Fatally Flawed

CEQA prohibits "drop in the bucket" or "ratio theory" analysis. (*San Francisco Baykeeper v. State Lands Comm.* (2015) 242 Cal.App.4th 202, 223.) UC argues that it only provides comparison to "statewide and regional energy use to provide a frame of reference." (ROB 66:21-23.) This attempted whitewash fails. The EIR dismisses cumulative energy impacts because "given the relatively small percentage of the CPHP's other fuel and energy uses compared to existing fuel and energy use in the region," there would be no adverse cumulative impacts. (AR 3944.) The EIR found a less than cumulatively considerable impact because electricity use would not be "substantial compared to 2018 citywide consumption." (AR 3944.) This is the hallmark of ineffective "drop in the bucket" analysis.

Additionally, the EIR determines that cumulative energy impacts would be less than significant — without reference to a significance standard. (AR 3944.) UC attempts to distinguish *Lotus, supra*, 223 Cal.App.4th 645 because it "does not discuss cumulative impacts" (ROB 65:66:24-27), but then fails to explain how that makes a difference since CEQA requires standards of significance for both types of impacts. (Guidelines, § 15064.) Alternatively, UC purports to create its own standard: "whether 'the collective effect of the project would be to use fuel or energy in a wasteful or inefficient manner.'" (ROB 66:27-67:1.) UC fails to explain how the "collective effect of the project" is comprehensible or provides a meaningful standard for either the cumulative impact or the CPHP's incremental contribution. Further, this confused statement is set forth in a response to comment and not the Draft or Final EIR's analysis of energy impacts. (Compare AR 6114 [response to comment] with 1787-1788 [DEIR] and 3944-3945 [FEIR].) The EIR's failure to identify a significance standard for its cumulative impact analysis of energy is uncorrected.

Conclusion

Petitioners in the three related cases respectfully request this Court's judgment and peremptory writ in the public interest, ordering UC to set aside the CPHP approvals including certification of the EIR, and to revise and recirculate the EIR in compliance with CEQA before reconsideration.

Respectfully submitted,

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project")[1]. My review focused on the DEIR's treatment of visual and shadow impacts. My comments are attached as follows:

[1] See appendix for Jared Ikeda qualifications

VISUAL IMPACT

As described in the Comprehensive Parnassus Heights Plan Draft Environmental Impact Report, the proposed plan would provide 2.9 million gross square feet (gsf) of new building space. Currently, there is approximately 3.92 million gsf of building space. With full implementation of the CPHP, the total gross square feet would be approximately 5.97 million, including instruction, research, clinical and support space, housing and structured parking. This is a substantial increase in building area, mass and height, and will undoubtedly create significant visual impacts.

Within this plan a new 16 story hospital is to be constructed at the far east end of the campus and rise to 294 feet in height. As stated in the Draft EIR, this new hospital will be subject to a subsequent project specific environmental review as more details of this project becomes available. However, the Draft EIR states (*pg 4.1-23*) that development under the CPHP would not have a substantial adverse effect on scenic vistas. A significant effect on a scenic vista as defined in the DEIR, is a substantial block or degrade of scenic view from public vantage points. In review of this plan and DEIR, it is apparent that the proposed building plan and particularly the new 16 story hospital would have significant visual impacts. (*see figure 1 and 2*)

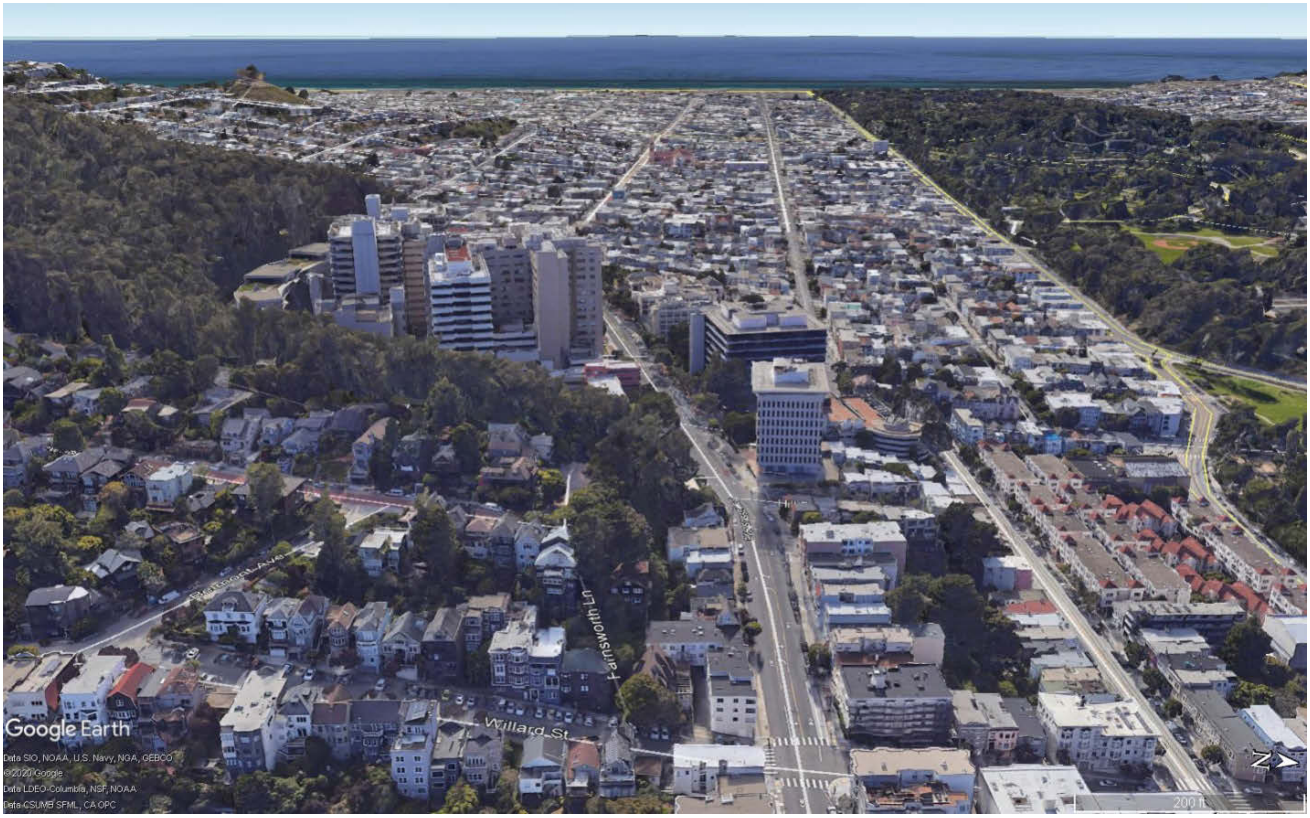

Fig 1 Existing view west from adjacent neighborhood

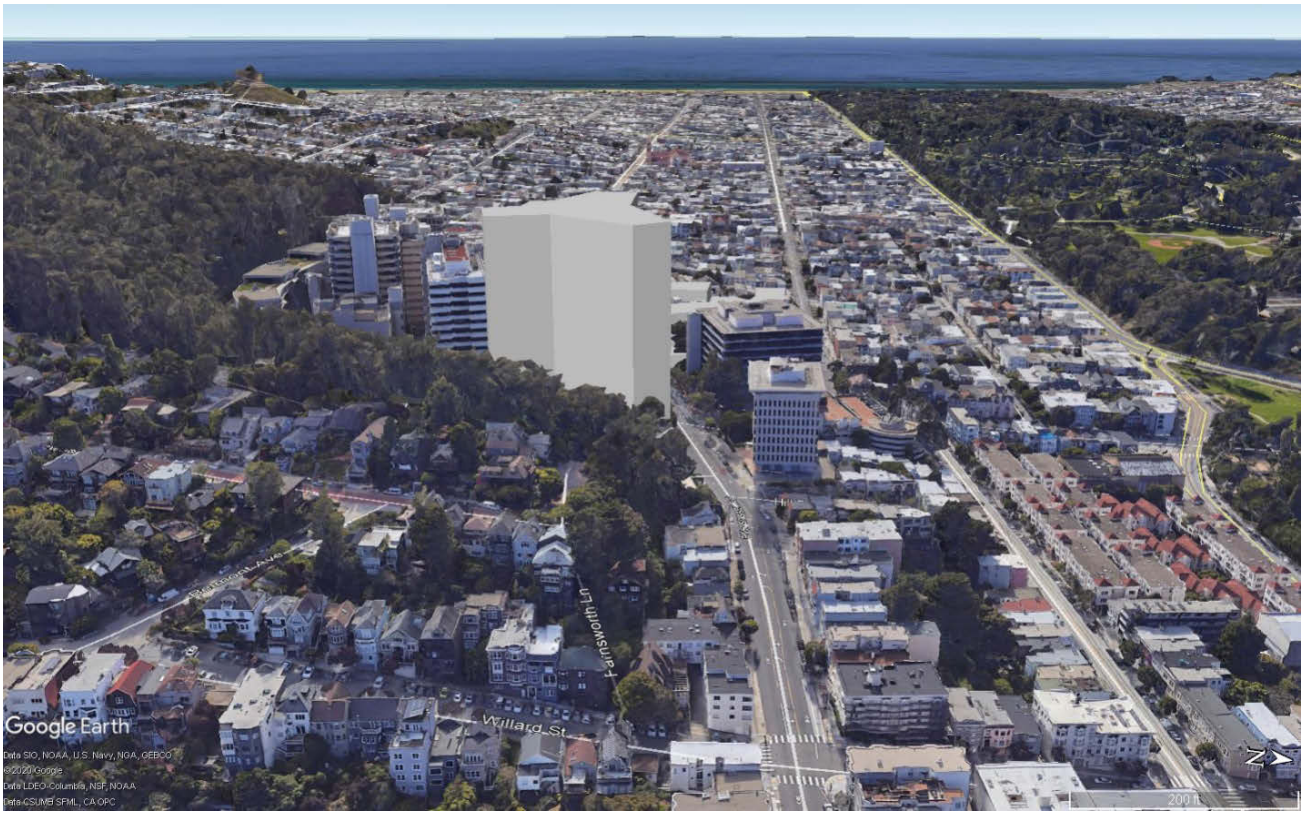

Fig 2 View west with proposed new hospital

By including this new hospital plan within this DEIR and concluding that it would not have a substantial adverse impact on a scenic vista, avoids discussion and possible mitigation measures in subsequent environmental review. This is not the intent of CEQA. Environmental review is a means to avoid or lessen adverse environmental effects at the outset, and by dismissing this issue at this time implies that it will not be address at a project level EIR in the future.

The topography of Mount Sutro and the green of the forested reserve are major elements that visually shape the adjacent neighborhoods as well as the overall city scape as seen from a distance. The views from publically accessible areas in and around the proposed UCSF Parnussus campus to these landmarks are of importance in establishing the quality of the environment here. One particularly significant local view point is the trail head near the intersection of Farnsworth Lane and Edgewood.

Public Trail Head at the end of Farnsworth Lane

The proximity and mass of the proposed new hospital will substantially impact this viewpoint. The 294 ft height and form of the proposed building will be seen and will block views to the west. The existing tree masses in this area and subsequently along the trail leading down, may tend to screen and filter the vistas but, the new proposed hospital will entirely block scenic vistas and dominate the view. This is a significant change to the public view and the inherent quality of the trail head and experience of accessing and walking this trail. This impact to the environmental quality of this publically accessible trail is significant and should be taken into account in considering mitigation measures or alternatives.

Furthermore the entire neighborhoods to the east, and views from streets such as Edgewood and Belmont and Willard and areas to the north of Parnassus Ave such as Hill Point Way will also be visually impacted by the large dominant mass of the new hospital. The size and height of the new hospital will also block views to Mt Sutro and the forest reserve from areas north of Parnassus Ave and Irving Street, and the visual experience of seeing a natural setting of a forested hillside from the local sidewalks and streets will be changed to one of a large urban building.

The visual simulations shown here have been constructed within Google Earth and incorporate scale models of the building masses and heights identified in the DEIR.

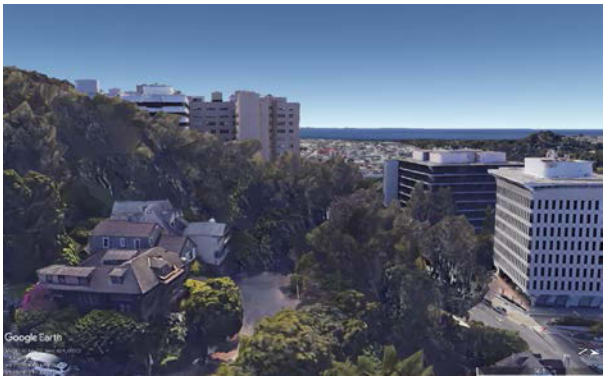

Figure 3 View west from end of Farnsworth

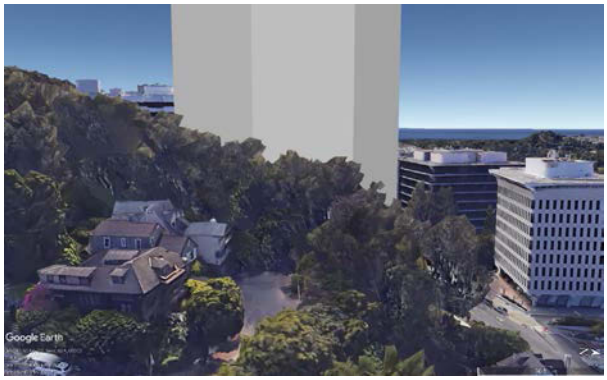

Figure 4 View west from end of Farnsworth with new hospital

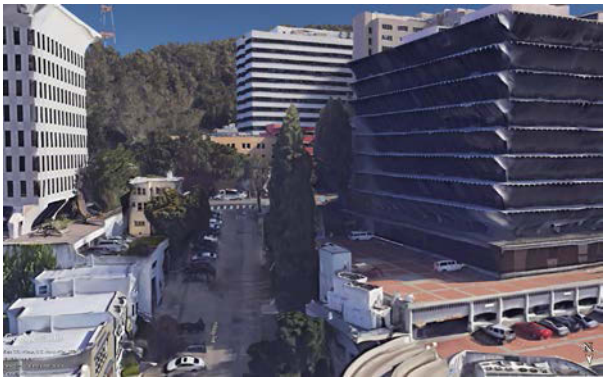

Figure 5 View south from Hill Point Way

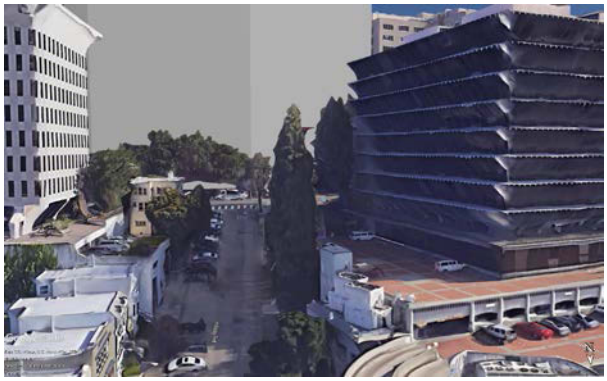

Figure 6 view south from Hill Point Way with new hospital

The views from the trailhead at the end of Farnsworth and adjacent residential neighborhood will become dominated by the mass of the new proposed hospital.

By stating that impacts to publically available scenic vistas are less than significant, the DEIR does not provide any possible mitigation measures or alternatives. This precludes further discussion and possible mitigation measures in future specific project environmental review and essentially allows development of the height and massing of the proposed buildings at this stage of the review process.

Views from other Prominent Vantage Points

The DEIR also identifies several other prominent publically accessible vantage points. These include Tank Hill natural area, Buena Vista Park, and Corona Heights Park. These are all located to the east of the Parnassus Heights campus. The DEIR states that the implementation of the CPHP would not result in a substantial adverse impact to scenic vistas from these publically accessible vantage points. However, in review it is again apparent that the new proposed hospital would change the skyline. (*see figures 7 through 12)*

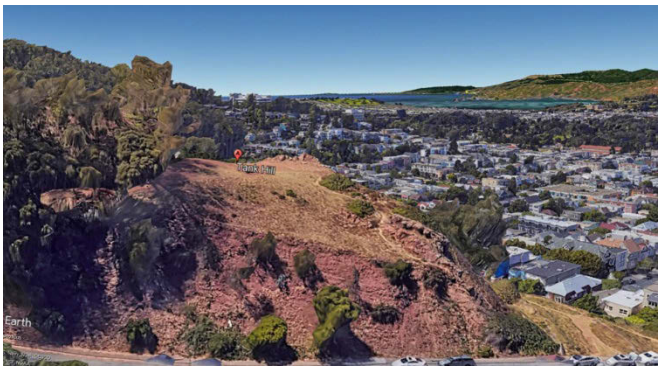

Fig 7 view westward from Tank Hill natural area

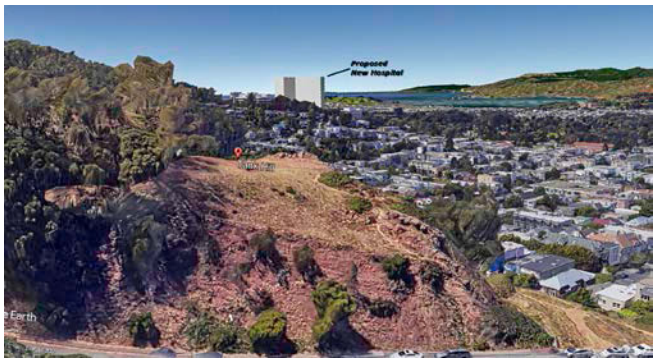

Fig 8 view from Tank Hill natural area with proposed new hospital

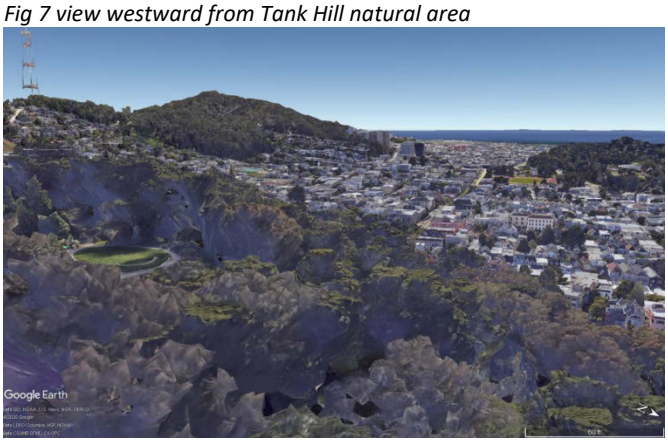

Figure 3 view from Buena Vista Park

Figure 5 view from Buena Vista Park with proposed hospital

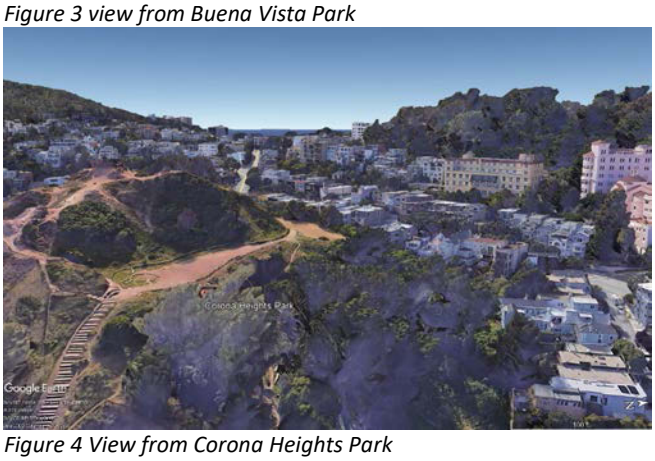

Figure 4 View from Corona Heights Park

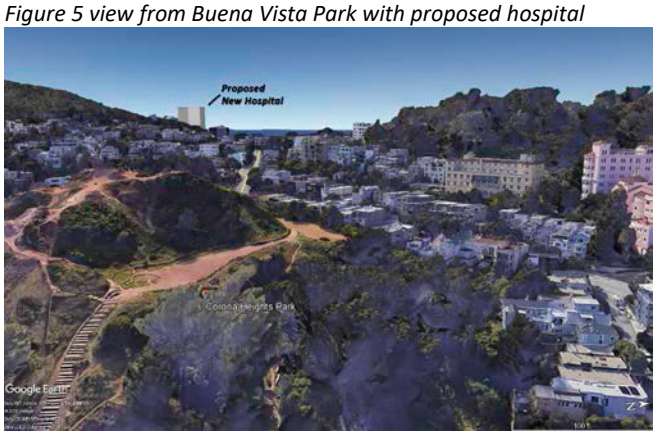

Figure 6 View from Corona Heights Park with proposed hospital

The development of the CPHP will undoubtedly change the visible skyline by addition of the new 294 foot high hospital. This is a noticeable change and should be addressed in the context of the Urban Design

Element of the San Francisco General Plan. The height and mass of the proposed new hospital will be highly visible as a new feature in the skyline from these public parks as well as from various other locations and streets within the surrounding neighborhoods. The Urban Design Element includes a policy to: "*Recognize and protect major views in the city, with particular attention to those of open space and water. Views contribute immeasurably to the quality of the city and to the lives of its residents. Protection should be given to major views whenever it is feasible, with special attention to the characteristic views of open space and water that reflect the natural setting of the city and give a colorful and refreshing contrast to man's development."*

The Urban Design Element of the city's General Plan states that shape, height and bulk of tall building with respect to views from important vantage points around the city should contribute to the beauty of the skyline. While views from private property are not protected in city regulations, the General Plan does protect specific view corridors from the public realm.

It is not clear in the DEIR whether the CPHP has undergone an initial Preliminary Project Assessment by the city's Urban Design Advisory Team (UDAT) to determine consistency with Urban Design Guidelines and other relevant design regulations, the Planning Code, and other policies in the General Plan. Is this review to come at a later environmental review as the project evolves? If so, does this mean that the height and mass of the new hospital is a given if this plan is approved. Since the proposed new hospital will be seen from several publically accessible view points and parks, it seems that such a major feature that will change the visible skyline should be reviewed and assessed by UDAT prior to further project level environmental review.

Overall Impact on Shadow

The DEIR states that implementation of the CPHP would not create new shadows in a manner that would substantially and adversely affect the use and enjoyment of publically accessible open spaces. The DEIR provides description and diagrams of shadow impacts onto various public locations during different seasons and times of day. These public locations include parks and schools which are some distance away and will receive "occasional shadow". The DEIR states that these areas would not be adversely affected and the impact is considered less than significant.

It appears though that certain areas along Parnassus Ave and Irving St. will be subject to "frequent shadows" throughout the year. (*Fan 1 of the Shadow Study Appendix within the DEIR*) Although these are not officially called out as "publically accessible open spaces" needing to be addressed within the city's Urban Design Element guidelines, they are public sidewalk and streets that are frequented by pedestrians and passerbys. These areas currently receive shadows from existing structures but, it can be expected that the increased height of the proposed new hospital and Milberry Terrace and Irving St Gateway projects will further increase the time and frequency of the shadows along Irving St and Parnassus Ave.
Although shadows do not directly affect change in air temperature, they do affect the direct exposure to sun radiation and the resulting feeling of warmth to a person's body. Further, sun radiation can affect the temperature of a surface struck by sunlight and increase that temperature and it's surroundings. The comfort and attractiveness of these particular areas to pedestrians and passerbys may be adversely affected and should be addressed in the EIR. The city's Urban Design Guidelines state that plazas or parks located in the shadows cast by large buildings can be unpleasant for the user and large buildings can be oriented to minimize shadows falling on public or semi-public open space. The guidelines state that the height and mass of tall, closely packed buildings can be shaped to permit sunlight to reach open spaces.

The CPHP does provide new open pedestrian areas within the campus and that is welcomed and appreciated and is a positive. But, discussion of the impact to the existing local areas and circulation patterns should still be noted and made aware to the public. There should be a discussion of how impact to these public areas might be mitigated.

Conclusion

The existing features of Mt Sutro and the Forest Reserve provide form and a sense of place and living within the environment to the UCSF campus and adjacent neighborhoods. The new CPHP with its heights and mass of proposed buildings would alter and change that sense. As noted in the city's Urban Design Element:

"The uses and benefits of the city pattern are many and profound. This pattern is, first of all, bound up in the image and character of the city. To weaken or destroy the pattern would make San Francisco a vastly different place. Second, the city pattern has important psychological effects upon residents of the city. It provides organization and measured relationships that give a sense of place and purpose and reduce the degree of stress in urban life. Outlooks upon a pleasant and varied pattern provide for an extension of individual consciousness and personality, and give a comforting sense of living with the environment."

The visual change from the implementation of the CPHP will be seen from many locations throughout the adjacent neighborhoods as well as other areas and parks within the city including areas of Golden Gate Park. The impact of the shadow patterns to the adjacent neighborhoods will also affect the quality experiences of spaces and pedestrian walkways by the public. These should be considered in the approval process and given recognition in the EIR.

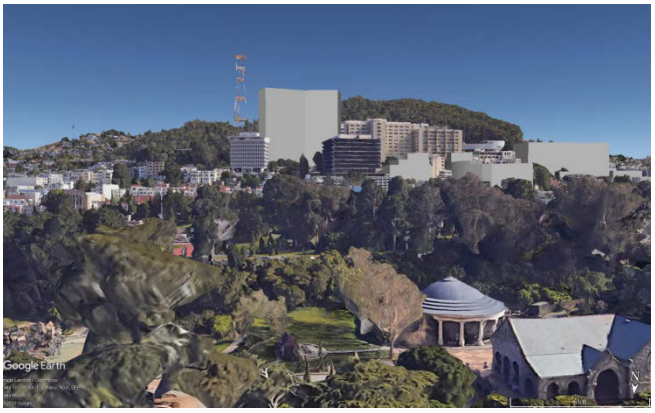

Figure 17 view south from Golden Gate Park with implementation of CPHP

Appendix:

Jared M. Ikeda

Jared Ikeda is a retired Landscape Architect and environmental planner with experience in preparation of land use planning studies, community planning, environmental impact studies, urban site planning, landscape development plans, and recreation planning. He has been involved in a wide range of studies and projects for both public and private sector clients and has participated in and directed all phases of land planning, investigative studies and landscape development. He has served on the board of directors of a major international landscape architectural firm, and Landwatch Monterey County, and served as a lecturer in the Department of Landscape Architecture at California State Polytechnic University, Pomona. His teaching activities focuses upon advanced landscape design and stressed use of computer technology including AutoCAD and ArcMap GIS software. He has prepared a number of visual impact and simulation studies using a variety of computer software including Sketchup and Google Earth. He has been involved in the preparation of the Monterey County General Plan Update from 1999 to 2004 and was responsible for studies and preparation of the Environmental Resource Management Element and the Circulation Element. He also directed consultant work on the Environmental Impact Report.

Project Experience
A selected list of relevant project experience includes:

Granite Chief Wilderness Area – Visual simulation of a proposed gondola
Client: Mountain Area Preservation Foundation

Preparation of a visual simulation of a proposed gondola system connecting the Squaw Valley Resort with Alpine Meadows village. The gondola system crosses an area adjacent to the Granite Chief Wilderness area and impacts the visual quality within the wilderness area.

Donner Summit Development Impact Study

Client: Sierra Watch and the Sierra Club

As part of a consulting team charged with review and comment upon a potential new development of an environmentally sensitive area of the Donner Summit, Mr Ikeda prepared GIS mapping and visual simulation of the proposed plan utilizing Google Earth software.

Dyer Mountain Visual Simulations

Client: Shute Mihaly Weinberger, llc

Mr Ikeda prepared 3 dimensional visual simulations of a proposed forest management plan and ski resort development in Lassen County. The work was utilized to demonstrate the visual impact of the proposed plan.

Colosseum Gold Mine – Visual Impact Analysis
Client: Bureau of Land Management

Prepared a visual impact analysis and land restoration plan for the Colosseum Gold Mine, an open pit gold mine near the California/Nevada border. The project utilized computer generated visual simulations.

Professional Experience
Principal: Ikeda Consulting, 2005 to Present
Monterey County Redevelopment Agency, 2004-2005
Senior Admin Analyst: County of Monterey, Environmental Resource Policy, 1999-2004
Lecturer: Cal Poly Pomona, Dept of Landscape Architecture 1997-1999
Vice-President/Officer-in-Charge EDAW Inc., Irvine Office: 1980 to 1987

EDAW, Inc. 1969 to 1989

Education

Bachelor of Science in Environmental Design, California State Polytechnic University, Pomona, 1968.

Honors

Best Comprehensive Plan, Orange Co. Section, American Planning Association, San Juan Capistrano Master Open Space Plan, 1992
Distinguished Alumnus Award, 1983, School of Environmental Design, California State Polytechnic University, Pomona.
Merit Award, American Society of Landscape Architects, Santa Ana River Open Space Study, 1973

Lectures & Publications

Mr. Ikeda has served as a guest lecturer at UCLA, UC Irvine, and Cal Poly Pomona. Mr. Ikeda has also served as Chairman of a panel on Computers and Landscape Architecture for the Southern California Chapter of the American Society of Landscape Architecture.
Contributor to *"Design with Digital Tools"* McGraw Hill, 2000

Subject: File Request re: New Hospital DEIR
Date: Friday, January 28, 2022 4:43:13 PM

This Message Is From an External Sender
This message came from outside your organization.

Good afternoon Ms. Wong,

My firm is currently working on comments to the Draft Environmental Impact Report for the New Hospital at Parnassus Heights. The DEIR relies on several visual simulations in its analysis of aesthetic impacts. In order to adequately respond to this information, are requesting the 3D AutoCAD files for the proposed new hospital (or whatever native format used). For your convenience, we created a link to transfer the files electronically: https://www.dropbox.com/request/uSxsepFY6uXRJCP4fgQ1

Please let me know if you have any questions regarding this request. Thank you for your assistance.

Best regards,

James Crowder

Appendix AIR-A
NHPH Construction Data

Attachment A

UCSF New Hospital – Construction Data Needs for Air Quality, GHG, and Noise Analysis – Project-Level

Instructions: Please provide the information listed below. This data request is grouped into two major categories:

1. **Required data needs** – this information is required to perform the analysis
2. **Preferred data needs** – this information is not required, but will improve the accuracy of the modeling

REQUIRED DATA NEEDS

Note: This information is required to perform the analysis.

UCSF Project Name: New Hospital at Parnassus Heights (NHPH)

1. Project Construction Schedule (approximate start date – approximate end date)

From: January 2023 to**:** January 2033

2. What are the durations of each Construction Phase?
***Note for days per week enter either 5 (M-F); 6 (M-Sa); or 7 (M-Su).*

Phases (if applicable)	Number of Workers (Max.)	Start (month/date/year)	Finish (month/date/year)	Months	Total Duration (work days)	Days per week
LPPI Demolition		Included in the 2014 LRDP EIR submitted for the demolition of the Langley Porter Institute and its auxiliary buildings. No construction resources allocated to demolition				
Site Preparation / MCWUtilities	75	9/1/2022	10/1/2023	14 Months	313	5
Grading / Shoring / Mass	75	3/1/2024	10/1/2024	6 Months	134	5
Drainage / Utilities / Subgrade	75	2/1/2023	6/1/2024	16 Months	358	5
Foundations	75	6/1/2024	3/1/2025	10 Months	224	5
Structure	125	5/1/2025	11/1/2026	17 Months	380	5
Exteriors Building Construction	125	2/1/2026	2/1/2028	24 Months	739	5
Interiors Building Construction	250	2/1/2026	11/1/2028	33 Months	551	5
Final Site Improvements	50	1/1/2029	11/1/2029	11 Months	246	5
Other 1: Commissioning		TBD, 1 Year duration Post Completion of NHPH				
Other 2: ML Renovations/Bridge Tunnel Connection	TBD	01/05/2030	01/05/2033		746	5

Note: Construction phases may overlap; for example, Architectural Coating (interior and/or exterior painting) may begin on some floors when structural work continues above.

3. What are the daily hours of construction?
(What time will construction start, what time will construction end on each day)

Monday through Friday:	From: 7 a.m.	To: 5 p.m.
Saturday:	From: 8 a.m.	To: 5 p.m.
Sunday:	From: 8 a.m.	To: 5 p.m.

Is a Continuous Concrete Pour planned (e.g., concrete pouring over an extended duration, such as a 24-hour concrete pour)?
If yes, indicate the number of hours for Continuous Concrete Pouring: **N/A Hours**

Additional construction timing notes: Typical construction hours as designated by community guidelines to be from 7 AM to 5 PM. Due to the structural requirements of concrete pour size, concrete construction times may vary from 5 AM to 10 PM. When necessary, for construction, the Project Manager will get special approval from all parties to continue work past 5 PM. Tower Crane erection/dismantle and other special construction activities may require weekend work, only with approval of any impacted groups. Any work to be done during the extended work hours from 5 PM – 8 PM will need advance notice from the Project Manager. Noisy work will not be allowed on Sundays.

4. Total Construction Site Area? 2.3 acres.

Additional site area notes: The total site acreage includes, Medical Center Way (MCW), Moffitt-Long Hospitals, NHPH Footprint, and the Loading Dock.

5. Moffitt-Long Renovations Demolition

A. What is the anticipated total volume to be demolished? (Building square footage or tons of debris)? 85 tons of debris; 114,000 bldg. square feet.

B. Maximum number of haul trucks during demolition: 15 Total 3 Daily

C. What are the anticipated demolition truck haul routes?

(see schedule for estimated construction durations)

6. Haul Trucks

D. What is the volume of excavated material to be removed? 110,700 cu. yds.

E. What is the volume of excavated material to be imported? 5,400 cu. yds.

F. Maximum number of haul trucks: 664 Total 10 Daily

G. What are the anticipated truck haul routes?

Anticipated Soil Truck Hauling Routes will be. (See attached truck route document) dictated by campus.

See excavation diagram below.

H. When would soil hauling occur in the construction schedule?

From: 01/01/2023 to**:** 09/23/2024 | Excavation
Total Number of Days: 431

From: 04/01/2027 to: 07/02/2027 | Landscaping
Total Number of Days: 65

From: 01/06/2025 to**:** 7/30/2025 | Parnassus Tunnel Excavation
Total Number of Days: 186

From: Dates TBD Project Stil Under Design Review| Diesel Fuel Tank Project Excavation
Total Number of Days: TBD

7. Other Heavy-Duty Trucks

I. Maximum number of other heavy-duty trucks needed for equipment mobilization/demobilization, removal of demolition material, delivery of building materials (e.g. utilities, concrete/cement, wood, steel, fuel), and any other activities during construction: 1000 Total 20 Daily

J. When would this trucking activity occur in the construction schedule?

From: 01/01/2023 to**:** 01/05/2033
Total number of Days: 2493

8. Building Construction Phase:

Please Provide estimated project construction by phase based on land use type (please add additional phases or non-residential land uses as appropriate):

A. Phase 1:

i. **Educational Facilities:** _____(type); _____square footage
ii. **Research Facilities:** _____(type); _____square footage
iii. **Medical Facilities:** X (type); 834,000 square footage
iv. **Open Space:** _____(type); _____square footage

9. Paving Phase:

Would Asphalt Paving be required? X Yes ____No

If so:

a. How much of the site is anticipated to be asphalt paved? 1 acres

Additional Paving Notes: Repaving Medical Center Way and Parnassus Avenue adjacent to the site during utility relocation work. This work will occur during the Site Improvements/Utilities phase, as MCW will be trenched for the sub-grade utilidor work. Parnassus Avenue will be repaved during the Site Utilities phase as well.

PREFERRED DATA NEEDS

Note: this information is not required, but will improve the accuracy of the modeling. For areas that are left blank, we will use model defaults and/or conservative/worst-case assumptions. The more data that is provided, the more realistic the modeling will be for the project, and the lower emissions are likely to be (because we will have to use fewer conservative assumptions).

10. What construction equipment pieces are anticipated for each phase, and how many of each during an <u>average*</u> construction day? Please use table below to indicate quantity of each piece of equipment.

* Please provide the total inventory of all the construction equipment that would be used for the construction of the project for each applicable phase of construction (i.e., demolition, grading, building, etc.). If unknown, the modeling equipment default value for each construction phase coupled with professional experience will be used to determine the appropriate equipment lists.

Please indicate in <u>Column 2</u> if any of this equipment would be electrically powered and, if so, whether electricity would come from the utility power grid or from diesel-powered on-site generator(s).

		CONSTRUCTION PHASES

11. Site Preparation Phase (e.g., vegetation removal and minor earthwork prior to mass grading and excavation):

Would site preparation be required? X Yes ____ No ____ Unknown
Would material export be required? X Yes ____ No ____ Unknown

If "yes" for material export, complete as much of the following as possible:

Information	Amount	Units
Material Export (if applicable): Total Amount of vegetation and earthwork removal	2,600	Total Export Cubic Yards
	50	Daily Export Cubic Yards
Maximum Number of Haul Trucks	52	Total Export
	5	Daily Export
Capacity of Haul Trucks	10	Cubic Yards (typically 10 to 20 cubic yards; Default is 16 cubic yards/20 tons)
Distance to Disposal Site (if known)	20	Miles (default assumption is 20 mi.)
Describe Haul Truck Route (entrance/exit points, streets, nearest freeways, etc.). If material is hazardous, specify the location of the hazardous waste receiver (e.g., Kettleman). Material Export assumes all of the existing landscaping sections of the Parnassus Campus that will need to be removed for the New Hospital project.		

12. Grading and Excavation Phase:

Would grading and excavation be required? X Yes ____ No ____ Unknown
Would material export be required? X Yes ____ No ____ Unknown
Would material import be required? X Yes ____ No ____ Unknown

Acres disturbed during grading on a maximum (worst-case) construction day: **- Acres**

Will there be equipment a staging area and a materials lay-down area: **X Yes** ____ **No**
If yes, and staging area is offsite please provide a map of the location(s).
If yes, what size? ____

If "yes" for **material export**, complete as much of the following as possible:

Information	Amount	Units
Material Export (if applicable): Total Amount of earthwork removal	108,100	Total Export Cubic Yards

	200	Daily Export Cubic Yards
Maximum Number of Haul Trucks	540	Total Export
	10	Daily Export
Capacity of Haul Trucks	20	Cubic Yards (typically 10 to 20 cubic yards; Default is 16 cubic yards/20 tons)
When would soil hauling occur in the construction schedule?	06/05/2024	Start Date
	01/05/2033	End Date
	140	Total number of days
Distance to Disposal Site (if known)	**TBD**	Miles (default assumption is 20 mi.)
Describe Haul Truck Route (entrance/exit points, streets, nearest freeways, etc.). If material is hazardous, specify the location of the hazardous waste receiver (e.g., Kettleman).		

If “yes” for **material import**, complete as much of the following as possible:

Information	Amount	Units
Material Import (if applicable): Total Amount of vegetation and earthwork removal	5,400	Total Import Cubic Yards
	75	Daily Import Cubic Yards
Maximum Number of Haul Trucks	72	Total Import
	5	Daily Import
Capacity of Haul Trucks	15	Cubic Yards (typically 10 to 20 cubic yards; Default is 16 cubic yards/20 tons)
When would soil hauling occur in the construction schedule?	04/01/2027	Start Date
	07/02/2027	End Date
	65	Total number of days
Distance to Import Site (if known)	TBD	Miles (default assumption is 20 mi.)
Describe Haul Truck Route (entrance/exit points, streets, nearest freeways, etc.). See Truck Route Map		

13. Drainage/Utilities/Trenching CIVIL

Would a separate drainage/utilities/trenching phase be required?
X Yes ____ No ____ Unknown

14. Foundation/Concrete Pour

Would a separate foundation/concrete pour phase be required?
X Yes ____ No ____ Unknown

If "yes", complete as much of the following as possible:

Information	Amount	Units
Concrete Pouring Amount	18,170	Total Cubic Yards of Concrete
	100	Daily Cubic Yards of Concrete
Maximum Number of Concrete Trucks	181	Total Trucks
	10	Daily Trucks
Capacity of Concrete Trucks	10	Cubic Yards (typically 10 cubic yards)
When would concrete pouring occur in the construction schedule?	12/17/2024	Start Date
	09/30/2025	End Date
	120	Total number of days
Distance to concrete production site (if known)	N/A	Miles (default assumption is 20 mi.)
Describe Concrete Truck Route (entrance/exit points, streets, nearest freeways, etc.). The concrete truck may follow the truck route when near the site in San Francisco. For travel from the North, use US-101 N for all truck routes and travel from the south use US-101 S.		

15. Core and Shell/SOMD Concrete Pour

Would a separate foundation/concrete pour phase be required?
X Yes ____ No ____ Unknown

If "yes", complete as much of the following as possible:

Information	Amount	Units
Concrete Pouring Amount	20,000	Total Cubic Yards of Concrete
	100	Daily Cubic Yards of Concrete
Maximum Number of Concrete Trucks	200	Total Trucks
	10	Daily Trucks

Capacity of Concrete Trucks	10	Cubic Yards (typically 10 cubic yards)
When would concrete pouring occur in the construction schedule?	01/052025	Start Date
	01/05/2026	End Date
	260	Total number of days
Distance to concrete production site (if known)	N/A	Miles (default assumption is 20 mi.)
Describe Concrete Truck Route (entrance/exit points, streets, nearest freeways, etc.). The concrete truck may follow the truck route when near the site in San Francisco. For travel from the North, use US-101 N for all truck routes and travel from the south will travel through US-101 S		

16. Paving Phase

Would Asphalt Paving be required? X Yes ____No

If "yes" complete as much of the following as possible:

Information	Amount	Units
Total Area of Asphalt Paving	1	Total Acres
Describe Areas to be Asphalt Paved (e.g., parking areas, adjacent streets, etc.). Pavement of Parnassus Avenue and Medical Center Way for all utility relocation going along these roads. The paving will occur during various phases, primarily the MCW widening for utilities and the		

17. Architectural Coating Phase:

Would Architectural Coating (e.g., paint) be required? X Yes ____No

If "yes" complete as much of the following as possible (if unknown program defaults/air district requirements will be used):

Information	Amount	Units
Residential Interior Area Coated	N/A	Square feet coated
	N/A	Paint VOC (grams/liter)
Residential Exterior Area Coated	N/A	Square feet coated
	N/A	Paint VOC (grams/liter)
Non-Residential Interior Area Coated	735,700	Square feet coated

	TBD	Paint VOC (grams/liter)
Non-Residential Exterior Area Coated	190,000	Square feet coated
	TBD	Paint VOC (grams/liter)
Architectural Coating Notes: *(e.g., please note if exterior cladding will be pre-finished)*:		

18. Other 1: Phase Name: Moffitt-Long Hospital Renovations

(Please include all pertinent information to help use accurately model this phase. Insert sections from pervious phases that are relevant to this phase).

Additional Phase Notes: After the completion of NHPH, the adjacent hospital buildings will be renovated as a part of the New Hospital projects. Additional construction resources have been allocated to this phase, but any specified quantities can be provided after scope of work is decided upon.

19. If known, what is the anticipated make and horsepower of each of the construction equipment pieces?

Please add extra rows as appropriate for different makes of the same type of equipment. If unknown, model default information for each type of equipment will be used. If equipment is not included specifically in the table, please be sure to provide, at a minimum, the anticipated horsepower.

Equipment	Make/Model	Electrically Powered?	Horsepower (HP)
Air Compressors	TBD	No	150
Backhoes	TBD	No	350
Bore/Drill Rigs	TBD	No	700
Cement and Mortar Mixers	TBD	No	6
Concrete/ Industrial Saws	TBD	No	33
Compactor	TBD	No	TBD
Cranes (Mobile)	TBD	No	350
Cranes (Tower)	TBD	Yes	150
Crawler Tractors	TBD	No	410
Crushing/ Proc. Equipment	TBD	No	
Dumpers/ Tenders	TBD	No	325
Excavator	TBD	No	385
Forklifts	TBD	No	210
Generator Sets	TBD	No	10
Graders	TBD	No	185
Loaders	TBD	No	120
Off-Highway Tractors	TBD	No	
Off-Highway Trucks	TBD	No	

Equipment	Make/Model	Electrically Powered?	Horsepower (HP)
Pavers	TBD	No	74
Paving Equipment	TBD	No	
Pumps	TBD	No	73
Rollers	TBD	No	40
Rough Terrain Forklifts	TBD	No	
Rubber Tired Dozers	TBD	No	
Rubber Tired Loaders	TBD	No	
Scraper	TBD	No	330
Signal Boards	TBD	No	
Skid Steer Loaders	TBD	No	
Surfacing Equipment	TBD	No	
Sweepers/ Scrubbers	TBD	No	
Tractors/Loaders/Backhoes	TBD	No	
Trenchers	TBD	No	41
Welders	TBD	No	
Other (Specify)			
Concrete Truck	TBD	No	
Pile Hammer	TBD	No	

Additional equipment Notes:

20. Will pile-drivers or other high-impact equipment be required during project construction? If so, when in the construction schedule would it occur?

a. When would high-impact equipment bee required during the project?

From: 01/01/2023_ to: 05/09/2025
Total number of days: 742

Additional high-impact equipment notes: Duration includes the demolition phase of the existing structure and the construction of the foundations for the new hospital. The foundation consists of a combination of pile caps and a thick mat foundation.

21. Worker commuting:

What is the approximate *average* one-way trip distance that workers will travel when commuting to the construction site? 30 Miles

22. Cleaner Construction Equipment: Projects requiring a construction health risk assessment typically need to utilize cleaner equipment to meet health risk standards. HBW

Can the Project specify the use of heavy-duty diesel equipment over 50 HP certified to the U.S. EPA/CARB Tier 3 and/or Tier 4 emissions standards in construction bid documents?

____ No ____ Tier 3 ____ Tier 4 Interim ____ Tier 4 Final X Unknown

23. Electric or Alternative-Fueled Construction Equipment

Identify heavy-duty equipment that would be electric or alternative-fueled rather than diesel-fueled (typically Tower Cranes, Pumps, Welders, etc., be sure to identify the type of fuel for each).

List Electric or Alternative Fueled Equipment: Forklift (propane), Tower Crane (Electric)

Would electric pole power be available on the Project Site?

____ Yes X No ____ Unknown

24. Dust Control

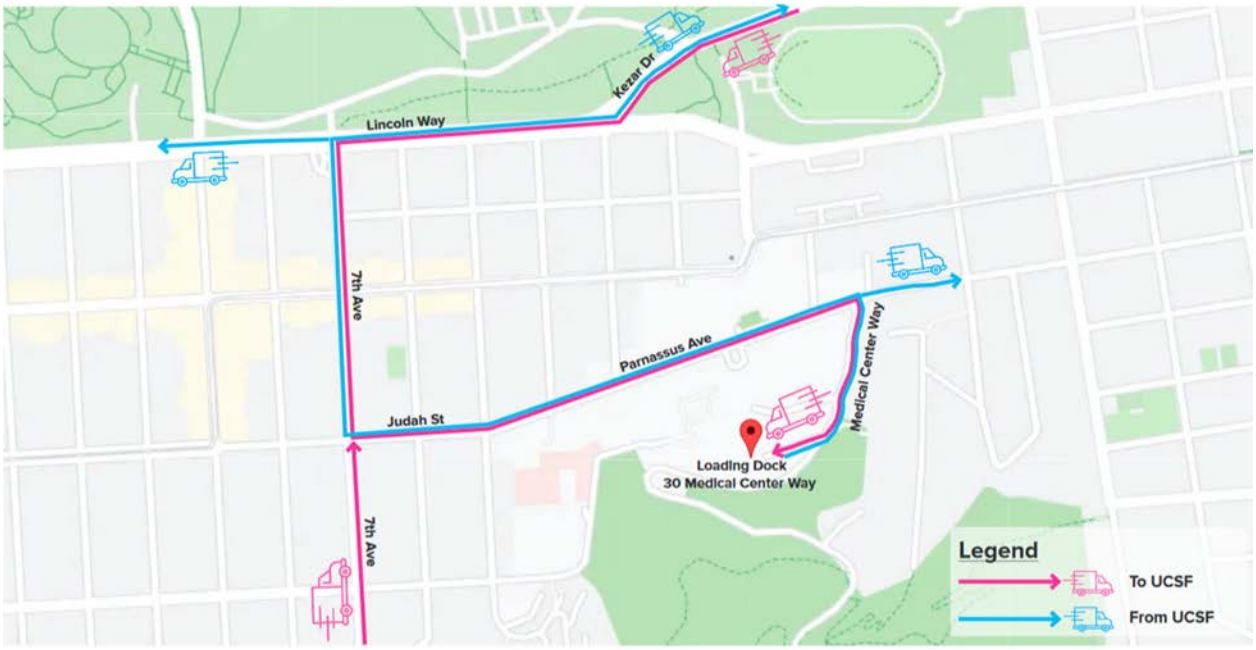
The analysis will assume standard dust control (such as watering three times daily).

List any additional dust control measures (e.g., soil stabilizers, tarps covering stockpiles, additional watering, rumble strips/watering strips at haul truck entrances/exits, use of street sweepers):

Additional Dust Control Measures: Scaffolding with netting will be placed between the existing hospital and the construction site.

Additional Construction Details

I) Delivery Truck Route along Parnassus Avenue.



A. Trucks will be using the East exit to the Parnassus Site and will be exiting South towards the lower Bay Area.

B. Blue Route Leaving East on Parnassus: 100%

C. Blue Route Leaving West on Parnassus: 0%

1 Executive Summary

University of California, San Francisco (UCSF) plans to construct a New Hospital and related improvements, collectively referred to as the New Hospital Parnassus Heights (NHPH) project. The NHPH project will include development of a 900,000 gross square foot (gsf) New Hospital, renovation of Moffitt and Long Hospitals; widening of Medical Center Way (MCW) in the vicinity of the New Hospital; replacement of diesel fuel tanks and medical gas storage tanks; vegetation management and slope stabilization improvements; and construction of a proposed pedestrian bridge and tunnel across Parnassus Avenue.

The proposed NHPH project would increase the daily population on the campus site and the daily diurnal wastewater flows from the campus site. Although the New Hospital site is already largely impervious, the project would increase the total impervious area and stormwater flows from the Parnassus Heights campus site would be expected to increase due to the NHPH. Both the increased wastewater and stormwater would be added to the existing combined flows that are currently discharged from the campus site to the San Francisco Public Utilities Commission's (the "SFPUC"") combined sewer system (CSS). To avoid an increase in CSS discharges from the campus site that could result in capacity issues, downstream flooding or water quality impacts, UCSF has established the following requirements for the proposed NHPH. The proposed project shall:

- Avoid increasing the likelihood of surcharges by exceeding the capacity of the City's Combined Storm and Sewer System (CSS),
- Avoid increasing the extent or duration of ponding or overland flow by exceeding the capacity of the City's CSS, and
- Avoid discharges to the City's CSS that increase frequency, duration, or volume of combined sewer discharges to the receiving waters.

An InfoWorks ICM hydraulic model was developed to study existing and future conditions of the NHPH site and determine storage volumes for storm and sewer flows required to meet the conditions listed above. Results of the modeling indicate that a storage volume of 150,000 gallons is required to detain stormwater on the campus site to meet these requirements.

2 Introduction

University of California, San Francisco (UCSF) plans to construct a New Hospital and related improvements, collectively known as the New Hospital Parnassus Heights (NHPH) project. The NHPH project components would have the potential to affect stormwater and/or wastewater conditions include:

- Development of a 900,000 gross square foot (gsf) New Hospital,
- Widening of a section of the existing Medical Center Way (MCW) from approximately 28’ to 36’ to include 5’ sidewalks on both sides and 13’ drive lanes,
- Relocation of existing drainage system and other utilities, and
- Provision of a new Medical Gas Storage facility to the east of MCW adjacent to the New Hospital loading dock.

The Langley Porter Psychiatric Institute (LPPI) building, and three small support structures are located on the site of the New Hospital. The demolition and removal of these buildings were previously planned under the 2014 Long Range Development Plan. Accordingly, the demolition and removal of these buildings are not included in the NHPH project and will be completed separately from and ahead of the NHPH project.

Refer to Figure 1 for the future layout of the New Hospital, MCW, and the Medical Gas Storage facility site. The areas that include the New Hospital, the portion of the MCW that will be widened, and the medical gas storage site are collectively referred to as the “Project Site” in this report.

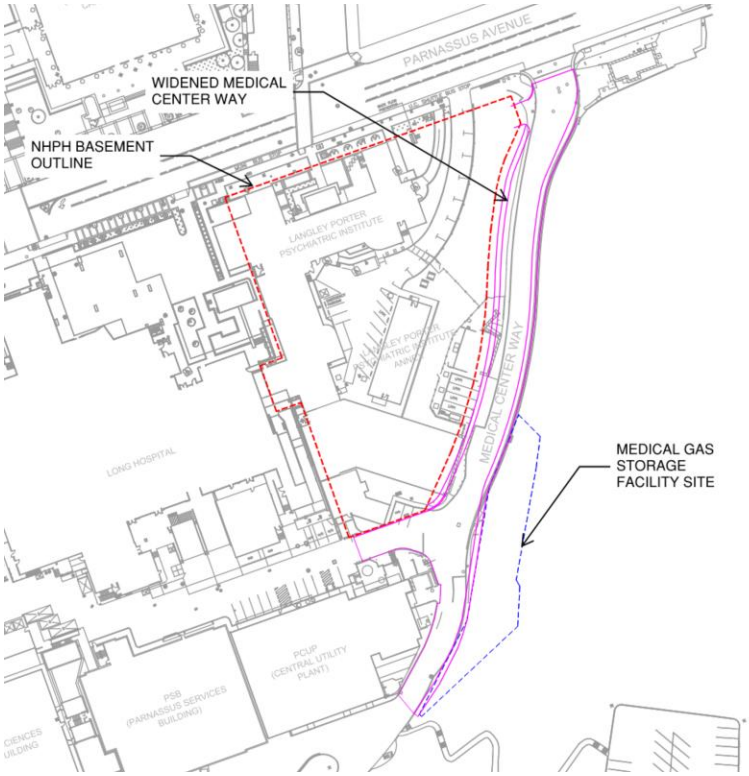

Figure 1 Future Layout of New Hospital, MCW and the Medical Gas Storage Facility Site Approximate Boundaries

Arup is coordinating and designing utilities and infrastructure for the future New Hospital building, including the stormwater system.

Arup completed the preliminary study assessing the existing and future conditions of the Project Site and analyzed potential storage tanks and their parameters to meet several stormwater management requirements.

Arup analyzed the Project Site by developing InfoWorks ICM hydraulic models representing existing and future conditions.

3 Combined Sewer Management Criteria

The mitigation design criteria for stormwater are that the NHPH will:

- Avoid increasing the likelihood of surcharges by exceeding the capacity of the City's Combined Storm and Sewer System (CSS).
- Avoid increasing the extent or duration of ponding or overland flow by exceeding the capacity of the City's CSS.
- Avoid discharges to the City's CSS that increase frequency, duration, or volume of combined sewer discharges to the receiving waters.

These requirements are interpreted as meaning that combined stormwater and sewer runoff peak flow and volume post development will not exceed pre-development conditions for the 1- and 2-year 24-hour design storms. This is also consistent with the San Francisco Public Utility Commission's (SFPUC) stormwater management criteria, which requires that the peak flows and volume not exceed pre-development conditions for these design storms where the existing project site has an existing imperviousness of less than fifty (50) percent. The project site, as viewed by SFPUC, is the entire campus, which has an existing imperviousness of less than fifty (50) percent.

To meet these requirements, modeling must prove that future CSS peak flows and volume discharged do not exceed existing conditions. The results from this modeling effort will also be incorporated into SFPUC CSS model to see if there are any increase in discharges to receiving water.

Arup modeled and assessed the New Hospital, MCW, and medical gas storage facility sites together in one comprehensive model under:

- Existing conditions
- Future conditions without stormwater storage
- Future conditions with stormwater storage to meet peak flow and volume reduction requirements

We assume that because there are limited opportunities to reduce the runoff volume through infiltration or irrigation, UCSF will be permitted to store runoff during the storm to meet the total volume reduction requirement and then discharge the stored water after 24 hours.

4 Existing Site Conditions

4.1 Existing CSS Infrastructure

The existing site condition is analyzed based on information provided through previous studies and as-built drawings to determine the existing drainage and sewer infrastructure at the Project Site. Arup reviewed the UCSF Parnassus Heights Utilities Condition Assessment Report completed by BKF[1] and the following record drawings obtained from UCSF:

- Sheets C-4.1 to C-4.4 of UCSF Project M3444 Bridging Document by Sandis (2008).
- Sheet P-1 of the Parnassus Campus Sewer Site Plan drawn by J. Hughes (1999).

- Sheets C4 and C5 of the Central Utilities Pant Parnassus Avenue Campus San Francisco, California, New Site Utilities As-Built by Walsh Construction Company (1995).
- Fuel Oil Storage Facility, Project 926002, by Sysku & Hennessy Engineers (1980).

The existing drainage system within the Parnassus Heights campus site carries combined flow as it collects storm runoff during rainfall events as well as sanitary flows from buildings. There are two (2) main combined storm sewer (CSS) lines running through the New Hospital site: west of LPPI and along MCW. Both sewer lines comprise up to 15" diameter pipes. Pipe materials include vitrified clay (VC), polyvinyl chloride (PVC), cast iron (CI) and steel.

The CSS line running west of LPPI mainly conveys storm and sanitary flows collected north of MCW. The CSS line running along Medical Center Way collects and conveys flows from south of MCW, including from the hillside.

The combined flows are discharged to the existing 30" SFPUC CSS main running east along Parnassus Avenue. There are two (2) additional smaller connections from the Site to SFPUC CSS main that mostly contain sanitary flows. The layout of the existing drainage infrastructure is depicted on Figure 2.

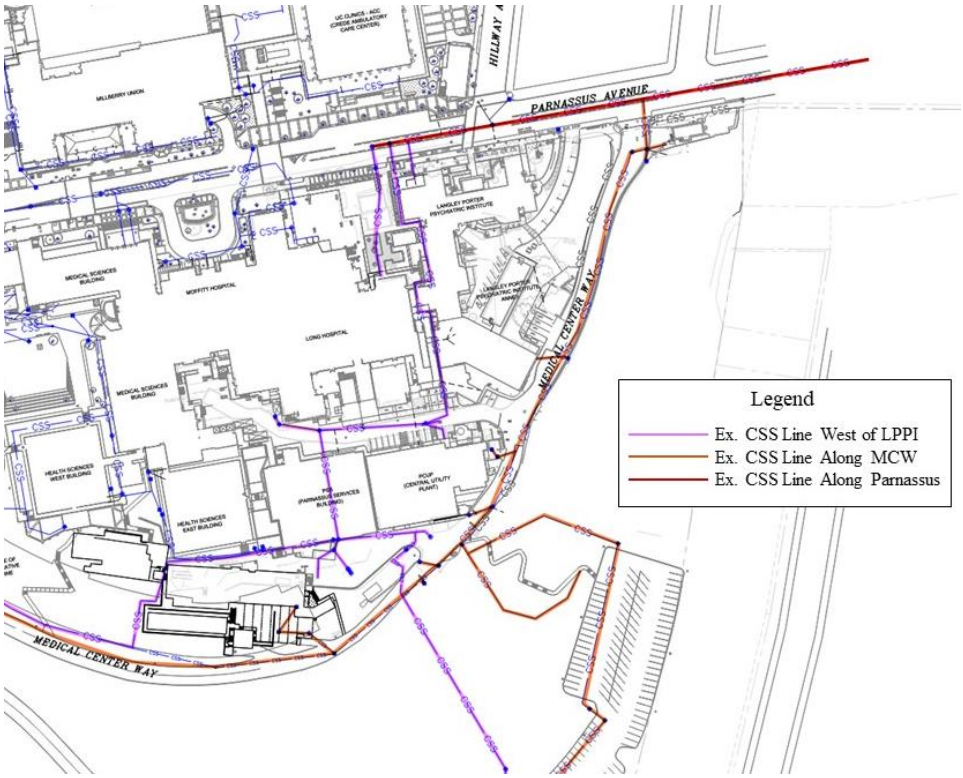

Figure 2 Existing CSS Pipe Network

The elevation data shown in the record drawings was converted from the old City Datum to CCSF-VD13 vertical datum by adding 11.195'.

4.2 Existing Watershed

The Project Site is part of and at the downstream end of a larger watershed that discharges into the SFPUC CSS main on Parnassus Avenue. The campus site CSS network that conveys stormwater from this watershed to the SFPUC CSS main is shown in Figure 3. This watershed is delineated based on the City of San Francisco five (5) foot contours downloaded from DataSF and information gathered from site walks[2]. The total area of this watershed is approximately 21.6 acres.

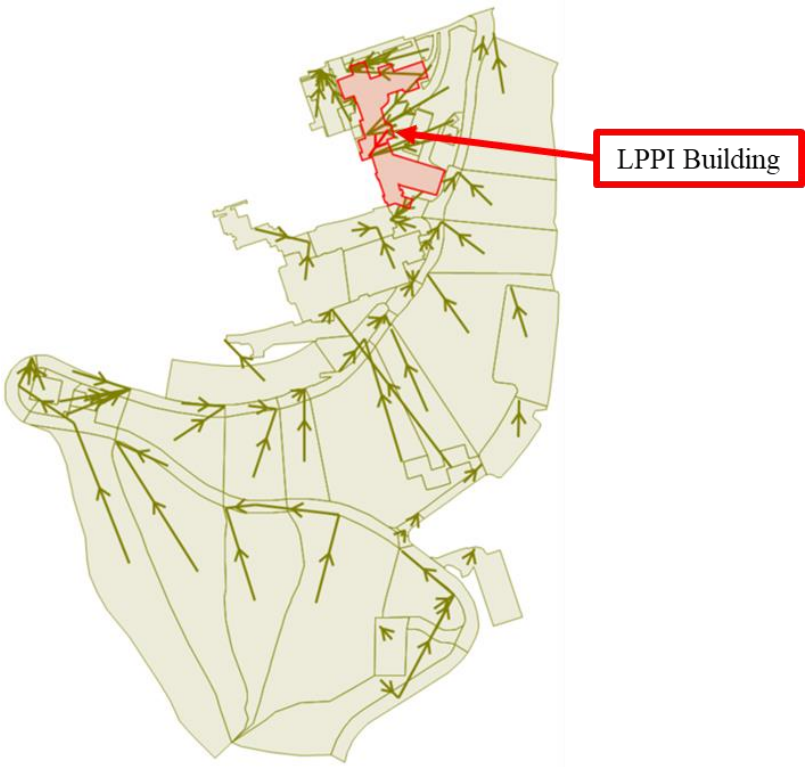

Figure 3 Existing Watershed

4.2.1 Existing Land Cover

The existing land cover assessment uses the aerial imagery and topographical survey provided to Arup.

Most of the existing New Hospital site consists of impermeable roadways, pavements, and roofs. Permeable open spaces comprise approximately 18% of the project area.

The assumed existing land cover at LPPI is shown in Figure 4.

EXISTING AREAS			
PERVIOUS	ROW TREE WELLS	1,783	SF
	LANDSCAPING	13,948	SF
IMPERVIOUS	ROOF	33,510	SF
	PAVEMENT	36,866	SF
TOTAL		86,107	SF

Figure 4 Existing Land Cover at LPPI/New Hospital Site

The existing MCW is completely impervious and the bordering area of Mount Sutro where the future road will be expanded into has head tree and underbrush cover. The existing area where the Medical Gas Storage Facility will be place is located on a currently completely pervious area of Mount Sutro as well.

5 Future Site Conditions

5.1 Future CSS Infrastructure

The existing CSS infrastructure will need to be reconfigured to accommodate construction of the New Hospital building.

Arup recommends that the existing 15” CSS that runs along the western side of LPPI be rerouted to run along MCW and connect directly to the existing 30” SFPUC CSS main in Parnassus Avenue. The existing connections to the 15” CSS pipe from LPPI will be demolished with the existing LLPI building. Two (2) new sanitary sewer laterals from the New Hospital will be connected to a new CSS pipe section on the east side of the New Hospital.

The routing and connections of the existing 15” CSS line that runs down the east side of MCW will mostly remain unchanged except for one (1) short section of aging pipe that will be replaced. Figure 5 shows the future CSS layout.

5.1.1 Future Stormwater Storage

To achieve project requirements to reduce peak flow and runoff volume, Best Management Practices (BMP) are proposed to be utilized within the design.

Detention storage using the existing fuel tanks located along MCW and a new detention storage tank at the existing ammonia tank site are proposed. These locations were selected because of the limited space on the New Hospital site and the Department of Health Care Access and Information (HCAI) regulations that prevent stormwater from being reused inside the hospital.

The New Hospital basement was initially identified as a preliminary location for the future storage tank(s). This location is restricted by limited space in the basement and the inherent risk from storing large volumes of water within an operating building, so alternative sites were explored. The UCSF / design team has identified potential cost and space saving opportunities by identifying detention opportunities by reusing the existing diesel fuel tanks and space at the ammonia tank site to construct a new stormwater holding tank (Figure 5).

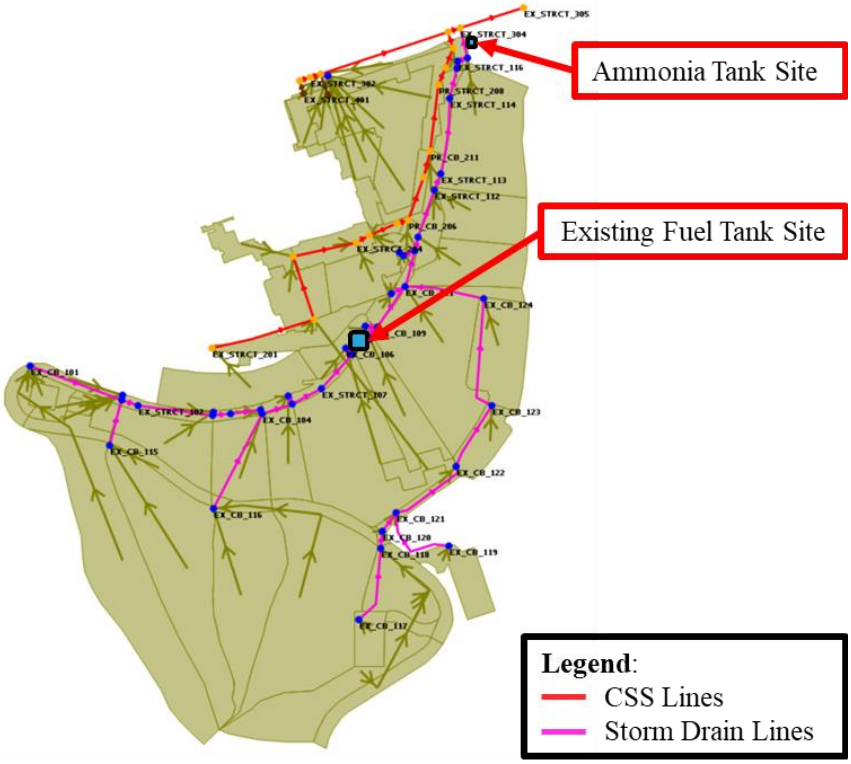

Figure 5 Future Pipe Network and Watershed

There are five (5) 30,000-gallon fuel tanks underneath MCW, adjacent to the Dolby building that are available for stormwater management. Conservatively, it is assumed only four (4) of these tanks will be useable for storage, giving 120,000 gallons of storage. Based on the existing CSS and fuel tank elevations, this storage would be a gravity system, and no pumping would be needed.

A storage tank is proposed at the existing ammonia tank site as well. The existing ammonia tank and building on the eastern side of the intersection of MCW and Parnassus Avenue will be demolished, and about 600 ft^2 of space will be set aside for future stormwater storage. The volume and depth required for this tank is determined with InfoWorks ICM modeling effort. The existing CSS elevations will not allow for gravity flow and stored water will need to be pumped to the City's sewer main after the storm.

5.2 Future Watershed

The watershed boundary under the future conditions will be the same as that under the existing condition. With the proposed NHPH project, the land cover in the watershed will change at the future New Hospital building site, Medical Gas Storage Facility site, and along MCW. Proposed green roofs offset any increase in impervious area, resulting in an overall reduction of 0.1-acres of impervious area. Table 1 compares the existing and future watershed land cover.

Table 1 Watershed Land Cover Comparison

Land Cover	Existing Conditions (acres)	Future Conditions (acres)
Forest	13.8	13.6
Landscaping / Green Roof	0.4	0.7
Road / Roof	7.4	7.3
Total	21.6	21.6

5.2.1 New Hospital Site

The land cover under future conditions was assessed based on the proposed roof extent for the New Hospital. The future roof will be impervious with portions constructed as green roofs on levels 6, 8 and 10.

5.2.2 Medical Gas Storage Facility Site

The new Medical Gas Storage Facility site will be located south of the New Hospital along MCW. The total area of the site is approximately 6,000 ft^2. Under the existing condition, the site area is completely pervious. Under the future condition, the site is proposed to be fully impervious.

5.2.3 Medical Center Way

MCW will be widened by approximately 8' between the intersection with Parnassus Avenue and the New Hospital loading dock. Additional catch basins are planned to be added along the western side of the road to handle increased flows from the widening of MCW.

6 Sewer Flow and Rainfall Event Data

6.1 Sewer Flow Data

Two datasets were used to determine the existing sewer flows in the study area, a flow monitoring dataset and historical monthly water demand data. The flow monitoring dataset was used for all existing sewer flows besides LPPI. The LPPI sewer flow could not be separated out from the flow monitoring data, so monthly historical water demand data was used to determine sewer flows demands for LPPI

Flow monitoring was performed at the Project Site from November 9, 2020, to March 7, 2021. The rainfall and sewer depth were monitored at ten (10) different locations within the Project Site. Figure 6 depicts locations where sewer flows and rainfall depth were monitored.

The monitoring data was reviewed and used to determine existing sanitary flows coming from buildings within the Parnassus Heights campus site. This data was also used to calibrate the "existing conditions" hydraulic model. See Table 2 for the existing conditions sewer flows.

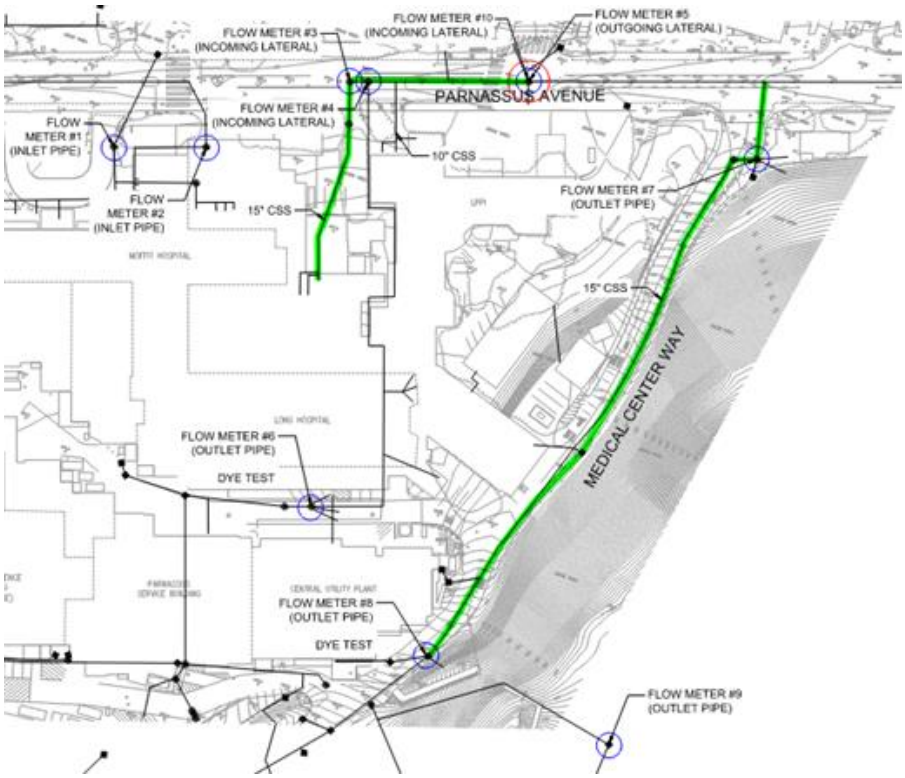

Figure 6 Rainfall and Sewer Depth Monitoring Locations

Table 2 Sewer Flows within Study Area

Sewer Flow Location	Sewer Flow from Flow Monitoring Data (cfs / gpm)	Projected Sewer Flow from Water Demand Data (cfs / gpm)
Moffit	0.054 / 69	N/A
South of LPPI	0.055 / 25	N/A
LPPI	N/A	0.008 / 3.4
New Hospital (Replaces LPPI in Future Conditions)	N/A	0.193 / 87

The historical monthly water demand data from 2018 was used to determine sewer flows for LPPI. It was assumed ninety (90) percent of water used is returned to sewers (Ref: SFPUC website). This yielded similar values for average daily flow per bed for LPPI as the flow monitoring data for the Moffit building. This per bed sewer flow was also used to estimate the future New Hospital sewer flow.

In future conditions, the LPPI building sewer flow is removed and the New Hospital flow is added. It should be noted that the New Hospital sewer flow is much larger than the LPPI building (0.193 vs. 0.008 cfs).

6.2 Design Rainfall Events

The existing and future conditions with the proposed project were analyzed based on two (2) design storm events:

- SFPUC 1-year 24-hour storm event, and
- SFPUC 2-year 24-hour storm event.

The 1- and 2-year 24-hour rainfall depths and distributions were obtained from SFPUC[3]. The data came with a temporal distribution predefined by SFPUC. The 1-year peak rainfall intensity provided by SFPUC is 2.65 inches/hour and the total rainfall depth is 1.96 inches. The 2-year peak rainfall intensity provided by SFPUC is 1.96 inches/hour and the total rainfall depth is 2.36 inches.

7 Analysis

InfoWorks ICM 9.5 was used to model and analyze the existing and future conditions throughout the Project Site. This software was selected and utilized in this study as SFPUC uses InfoWorks ICM 9.5 for modeling of the overall City's CSS systems.

7.1 Baseline Model

7.1.1 Existing CSS Infrastructure

The existing conditions model was developed as a baseline model for this study using the CSS information available. At locations where no information existed, interpolations were done from available information or assumptions were made with engineering judgment. It should be noted that not all lateral connections to the main CSS lines were incorporated due to lack of available information.

The stormwater drainage areas (subcatchments) were delineated according to the locations of existing catch basins, 5 (five) foot contours from DataSF, and information gathered from site walks.

The hydraulic model representing existing site conditions is shown on Figure 7.

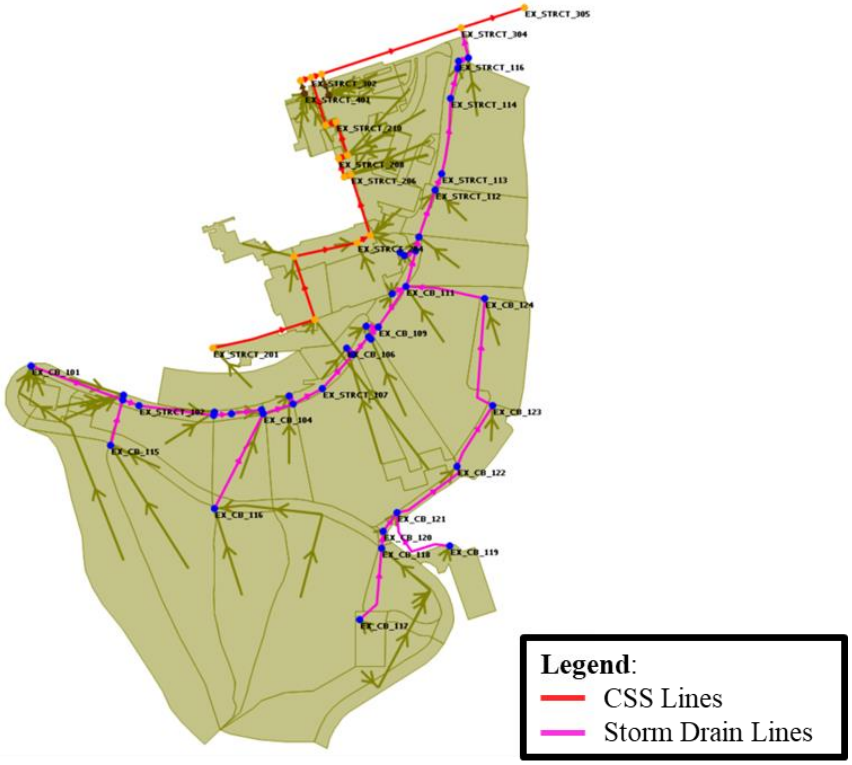

Figure 7 Modeled Existing Conditions with Watershed and Infrastructure

The Curve Number (CN) runoff volume type and Soil Conservation Service (SCS) Unit routing methods were used to estimate runoff hydrographs from each subcatchment.

Based on the Final Geotechnical Data Report produced on January 15, 2021, by Rutherford + Chekene, the following soil layers are found within the Parnassus Heights campus site:

- Artificial fill
- Dune sand
- Colma Formation

The Dune Sand and Colma Formation consist of predominantly fine sand that correspond to Hydrological Soil Group (HSG) C.

Arup reviewed information available on the United States Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey that suggests that the hillside located south of the Project Site consists of Candlestick-Kron-Buriburi complex, which is also categorized under HSG C. Taking into consideration both these data references, HSG C was used for selection of CN's.

USDA NRCS Technical Release 55 (TR-55) Urban Hydrology for Small Watersheds Manual was used to determine CN's for each delineated subcatchment taking into consideration applicable land cover and selected HSG.

Time of concentrations for all subcatchments were calculated with a minimum value of 5 minutes[4].

7.1.2 Model Calibration

Following the development of InfoWorks ICM hydraulic model representing existing site conditions, Arup calibrated the model by utilizing the rainfall and sewer depth data obtained during the flow survey.

The model calibration was undertaken based on the following metered locations:

- Flow Meter #3 (incoming lateral)
- Flow Meter #4 (incoming lateral)
- Flow Meter #5 (outgoing pipe)
- Flow Meter #6 (outlet pipe)
- Flow Meter #7 (outlet pipe)
- Flow Meter #8 (outlet pipe)

The subcatchments time of concentration values were calibrated, with a minimum of five (5) min, to match the model flow depths to the flow survey data. After calibration, the baseline model represents the existing site conditions reasonably well based on the available information (Figure 8).

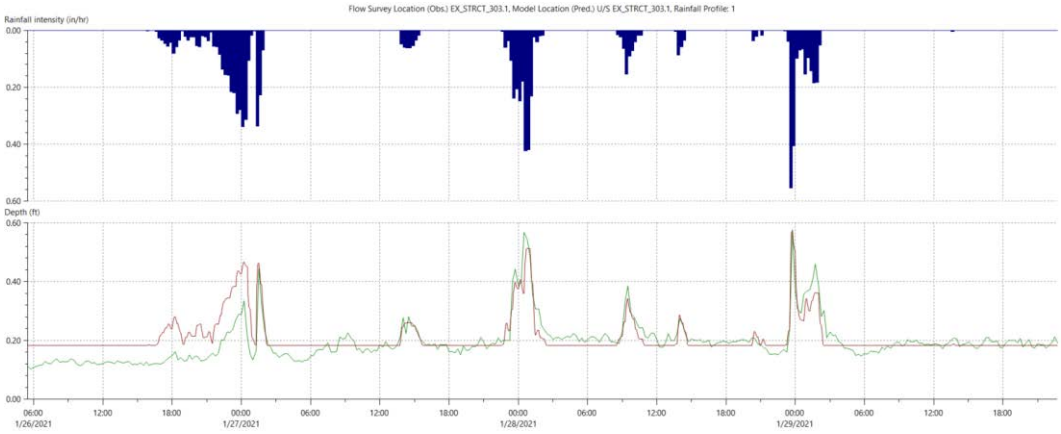

Figure 8 Example of the Model Calibration Plot (Flow Meter #5) (comparing observed [green] and predicted [red] flow depth in 30" CSS main along Parnassus Avenue)

7.2 Future Model

The future hydraulic model was developed from the calibrated existing hydraulic model and revised with proposed changes. Based on the future design information available, the following has been incorporated within the future hydraulic model:

- The existing 15" CSS pipe section along the west side of LPPI is removed.
- A new 15" CSS pipe is added to relocate flow along the west side of LPPI to MCW.
- All subcatchments located within the New Hospital extents are designated as impervious or vegetated roofs and are routed to the Parnassus Avenue CSS main.
- The LPPI sewer flow (0.008 cfs) is removed from the model, and
- The new sanitary sewer flow from NHPH is set to be 0.193 cfs.

The hydraulic model representing the future site conditions is shown on Figure 9.

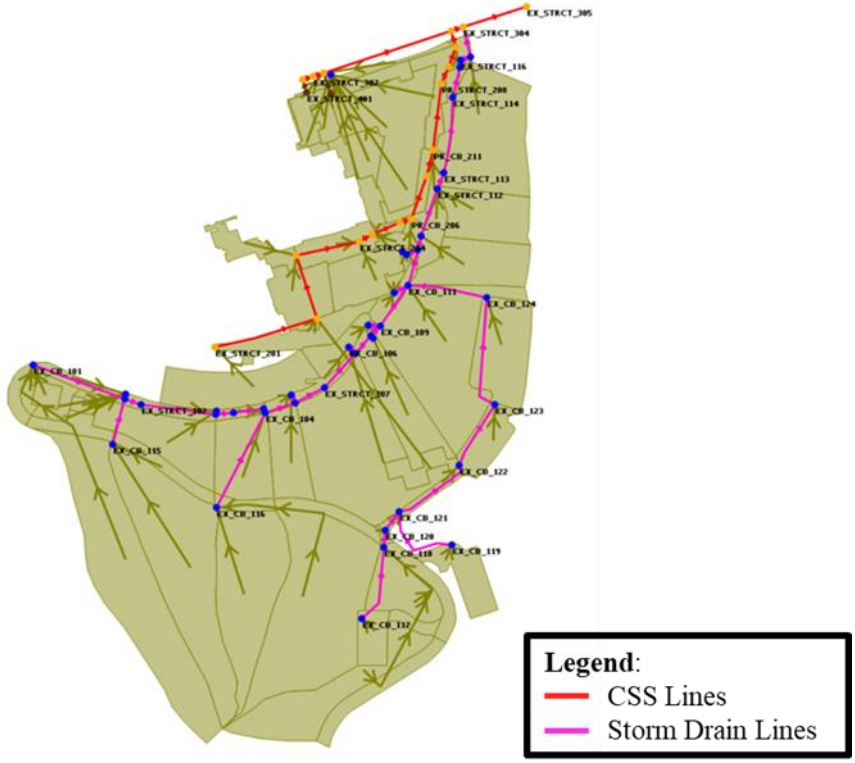

Figure 9 Future Modeled Pipe Network and Watershed

Several scenarios of the future model were developed to represent different compliance scenarios, including 1- and 2-year 24-hour stormwater events, with and without proposed stormwater storages.

7.3 Results

The existing and future hydraulic models were simulated for two (2) design storm events: SFPUC 1- and 2-year 24-hour rainfall events.

SFPUC 1- and 2-year 24-hour storm events were analyzed to determine the size and type of storage needed to meet the project's stormwater management criteria.

7.3.1 SFPUC 1- and 2-year 24-hour Storm Events

The objective of these simulations is to determine the future storage capacity to meet the project's stormwater management requirements.

The future model with no storage was used to determine the amount of storage required to match existing conditions. For the 1- and 2-year 24-hour storm events, 143,290 and 144,790 gallons are needed, respectively. The impervious area within the project site slightly decreased, however the sewer flow form the New Hospital greatly increased over the LPPI building, resulting in a net CSS flow increase. The CSS flow increase will be offset by future stormwater storage.

The required storage volume was rounded up to 150,000 gallons, and then detention storage was added to the future conditions model, splitting between the fuel tank site (120,000 gallons) and the ammonia tank site (30,000 gallons). The peak flow and volume discharged requirements are met with 150,000 gallons of storage. See Table 3 and Table 4 which show the peak flows and runoff values for the existing and future conditions hydraulic models with the 1- and 2-year 24-hour storm events.

Table 3 InfoWorks ICM Modeling Output: 1-year 24-hour storm event

Model scenario	Scenario Requirements	Peak Flowrate (cfs)	Total Runoff Volume (gal)	Storage Required (gal)	Conformance with project requirements?
Existing Condition	n.a	13.5	828,420	n.a	n.a
Future Conditions (no storage)	n.a	14.6	971,710	143,290	No
Future Conditions (with storage)	Peak flow and total volume reduction to meet existing condition	11.9	819,680 (120,000-gal storage at fuel tank site, 30,000-gal at ammonia tank site)	150,000	Yes

Table 4 InfoWorks ICM Modeling Output: 2-year 24-hour storm event

Model scenario	Scenario Requirements	Peak Flowrate (cfs)	Total Runoff Volume (gal)	Storage Required (gal)	Conformance with project requirements?
Existing Condition	n.a	16.7	908,870	n.a	n.a
Future Conditions (no storage)	n.a	17.8	1,053,660	144,790	No
Future Conditions (with storage)	Peak flow and total volume reduction to meet existing condition	14.6	902,220 (120,000-gal storage at fuel tank site, 30,000-gal at ammonia tank site)	150,000	Yes

8 Conclusion

Arup conducted an assessment to determine potential stormwater management design options for the NHPH project to conform with the project's stormwater management requirements.

The assessment included sizing and analysis of the proposed storage tank capacity under both the 1- and 2-year 24-hour storm events to meet the peak flow and volume reduction requirements set forth for the NHPH project.

The proposed storage tank capacities were analyzed with InfoWorks ICM hydraulic models. The model estimated peak flow and runoff volumes under the existing and future (no storage provided) conditions, and future conditions with the proposed storage. To meet the peak flow and volume reduction requirements set forth for the NHPH project, the following is needed:

- 150,000 gallons of total storage which includes,
    - 120,000 gallons at the existing fuel tank site, and
    - 30,000 gallons at the redeveloped ammonia tank site.

Combined Sewer System Modeling Updates

Meeting with UCSF
11/1/2021

ARUP

Updates since Oct 22, 2021

1. Expanded existing watershed
2. Maximized storage at Fuel Tanks
3. Assessed feasibility of removing NHPH storage tank
4. Added storage at Ammonia Tank Site to offset removing NHPH storage

CSS Conformance per CPHP EIR

Appendix HYD-B

Requirement	Interpretation	Modeling Tasks
1. Avoid increasing likelihood of surcharges by exceeding capacities of City's CSS	Stormwater runoff rate and volume post development will not exceed pre-development conditions for the 1- and 2-yr 24-hr design storms	Prove that Future CSS peak runoff and volume do not exceed existing conditions *-Completed by Arup*
2. Avoid increasing extent & duration of ponding or overland flow by exceeding capacities of City's CSS		
3. Avoid discharges to City's CSS that could increase frequency, duration, or volume of combined sewer discharges to receiving waters	Total volume of stormwater discharge during wet weather is decreased to offset flows from any increase in impervious surfaces and any increases in wastewater	Outputs from NHPH model to be incorporated into SFPUC's CSS model to see if any increase in discharges to receiving waters *-In Progress by Hydroconsult Engineers*

ARUP

CSS Conformance Scenario

Scenario	Design Storms	Peak Flow Reduction	Total Volume Reduction
CPHP EIR Conformance	1- and 2-yr 24-hr	**Combined sewer and stormwater** not to exceed existing condition	**Combined sewer and stormwater** not to exceed existing condition

- Assuming that we will be allowed to store flow during the storm to meet the total volume reduction requirement and then discharge after 24 hours

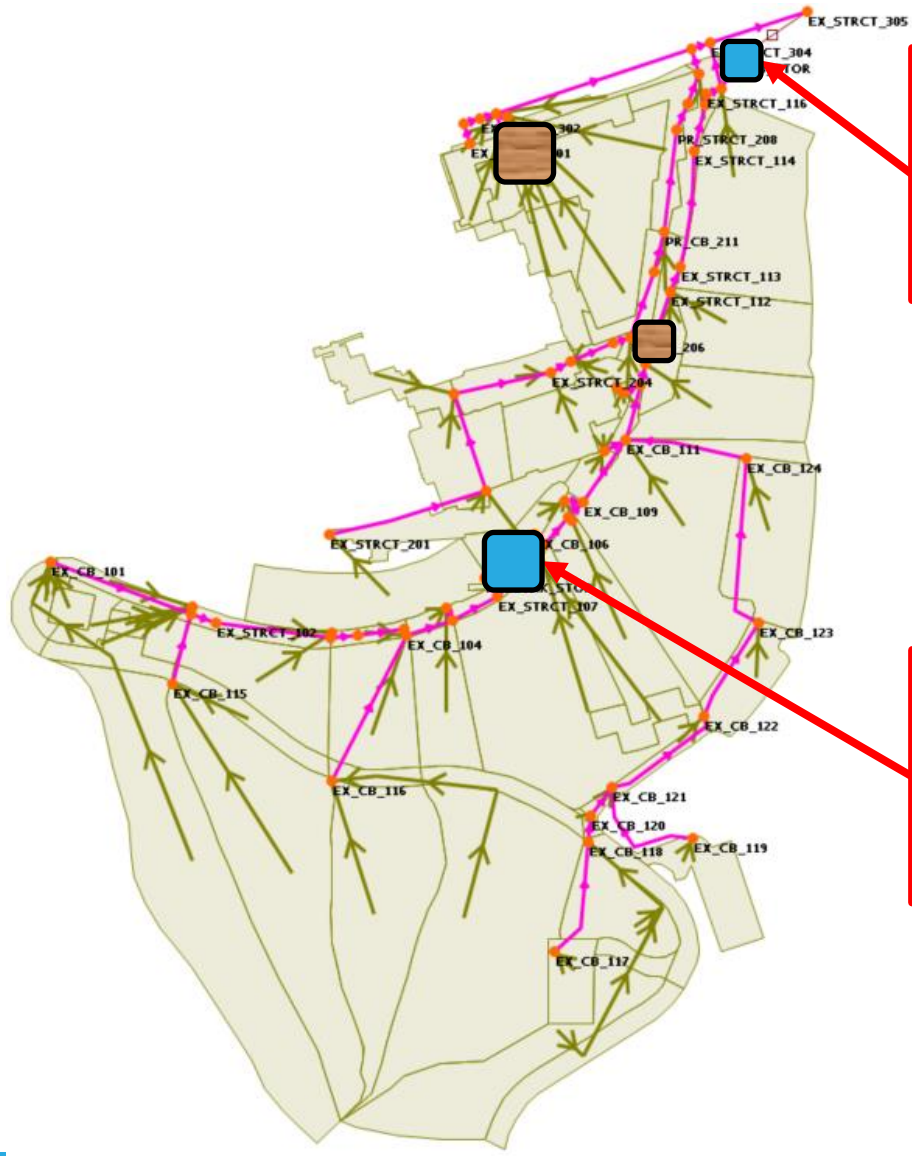
Future Storage Locations



Ammonia Site:
30,000 gal Future Storage Required
- Pump to SFPUC Main

Existing Fuel Tanks:
120,000 gal Existing Available Storage
- Use all 120,000 gal
- Gravity flow back to Ex. CSS line

- Additional potential storage not required for EIR Requirements:
  - NHPH Basement: 200,000 gal set aside for tank
  - Medical Gas Replacement Tank Site: 6,000 gal

Fuel Tank Storage – 120,000 gal

- Assuming 4 tanks out of 5 are available for storage (4 x 30,000 gal = 120,000 gal)
- If 5th tank can be used, total storage utilized = 150,000 gal
  - Potential to remove need for any additional storage
