(3) For sewer overflows from the combined sewer system with volumes 50,000 gallons or greater that reach surface waters, the Discharger shall submit a technical report within 45 calendar days of the end date for such overflows that further explains the causes and circumstances, including the method and data used to calculate the volume, and lists response actions completed and planned.

(4) For sewer overflows from the combined sewer system with volumes less than 1,000 gallons, the Discharger shall submit certified reports to the CIWQS Online SSO database within 30 calendar days of the end of the month during which such overflows occur.

(5) For each month during which no sewer overflow from the combined sewer system occurs, the Discharger shall certify, within 30 calendar days of the end of the month during which no sewer overflow from the combined sewer system occurred, that no sewer overflow from the combined sewer system occurred.

Following the reporting requirements set forth above shall satisfy the reporting requirements for sewer overflows from the combined sewer system specified in Attachments D and G.

iii. Control No. 3: Review and Modify Pretreatment Program. The Discharger shall implement controls to minimize the impact of non-domestic discharges to its collection system. At three-year intervals, the Discharger shall re-evaluate whether additional modifications to its pretreatment program, such as requirements for

detention during wet weather, are feasible or practical. The Discharger shall document this re-evaluation in the annual report required by Provision VI.C.4.b and Attachment H.

iv. **Control No. 4: Maximize Flow to Treatment Plant.** During wet weather, the Discharger shall maximize the volume of wastewater that receives treatment at the Oceanside Water Pollution Control Plant (i.e., secondary treatment for 43 MGD and primary treatment for an additional 22 MGD) and is discharged at Discharge Point No. 001.

v. **Control No. 5: Prohibit Dry Weather Combined Sewer Overflows.** Dry weather discharges at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 are prohibited (see Discharge Prohibition III.D). During any dry weather discharge at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, or CSD-007, the Discharger shall inspect the associated outfall structure each day until the unauthorized discharge stops. For each prohibited dry weather discharge, the Discharger shall submit the information required by Attachment G section V.C.1.a (e.g., duration, cause, corrective actions taken or planned).

vi. **Control No. 6: Control Solid and Floatable Materials in Combined Sewer Discharges.** The Discharger shall implement measures to minimize the volume of solid and floatable materials in combined sewer discharges (e.g., equip Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 with baffles, screens, racks, or other means to reduce the volume of solid and floatable materials). The Discharger shall also remove and properly dispose of solid and floatable materials captured in the combined sewer system.

vii. **Control No. 7: Develop and Implement Pollution Prevention Program.** The Discharger shall implement a pollution prevention program focused on reducing the amount of pollutants that enter the combined sewer system. The Discharger shall develop and implement this program in accordance with Provision VI.C.3 (Pollutant Minimization Program). As part of this program, the Discharger shall implement a street sweeping program and clean catch basins at a frequency sufficient to minimize large accumulations of pollutants and debris.

viii. **Control No. 8: Notify Public of Combined Sewer Discharges.** The Discharger shall inform the public of the location of combined sewer discharge outfalls (i.e., Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007), the actual occurrences of combined sewer discharges, the possible health and environmental impacts of combined sewer discharges, and the recreational or commercial activities (e.g., swimming, shellfish harvesting) curtailed as a result of combined sewer discharges. Notification shall include the following, at a minimum:

(a) The Discharger shall maintain permanent identification signs at the locations of Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007, and at public access points. The Discharger shall inspect, and replace as necessary, all permanent signs at least once per calendar year to ensure

that the signs are visible and readable. New or replacement signs shall be visible and legible from a distance of 50 feet onshore and offshore, and contain the following information, at a minimum:

- Discharge Point No. (discharge identification number).
- Telephone number to report dry weather discharges.
- Description of discharge, including the words "sewage" and "pathogens that can cause illness."
- Warning, alert, caution, or other term to notify the public that caution is needed.

(b) The Discharger shall post warning signs, including "No Swimming" signs, at beach locations whenever a combined sewer discharge occurs to inform users that bacteria concentrations may be elevated. The Discharger shall post warning signs within four hours of the time the discharge commences unless the discharge begins after 4:00 p.m., in which case, the Discharger shall post warning signs by 8:00 a.m. the following day. Signs shall remain posted until analysis indicates that water quality meets bacteriological criteria for recreation.

(c) The Discharger shall post warning signs at public access points where shellfish may be harvested for human consumption whenever a combined sewer discharge occurs. The Discharger shall post warning signs within four hours of the time the discharge commences unless the discharge begins after 4:00 p.m., in which case, the Discharger shall post warning signs by 8:00 a.m. the following day. Signs shall be posted until the City and County Health Department indicates that posting is no longer required.

(d) The Discharger shall provide electronic notification of combined sewer discharges through a free-access website and telephone hotline. The electronic notification shall include information about the location and impacts of combined sewer discharges, and provide a telephone number for the public to report discharges.

ix. Control No. 9: Monitor to Characterize Combined Sewer Discharge Impacts and Efficacy of Controls. The Discharger shall monitor to determine the occurrence and apparent impacts of combined sewer discharges, and the efficacy of controls, as described in Provision VI.C.8 and the MRP.

b. Documentation of Nine Minimum Controls. The Discharger shall maintain records documenting implementation of the nine minimum controls described in Provision VI.C.5.a. By February 1 each year, the Discharger shall submit a report to the Regional Water Board and U.S. EPA covering the prior October 1 through September 30. The first such report shall be due February 1, 2021, and cover November 1, 2019, through September 30, 2020. The report shall summarize actions taken and planned to implement the nine minimum controls.

c. Long-Term Control Plan (LTCP). The Discharger shall implement its Long-Term Control Plan (LTCP) and shall comply with the following provisions:

i. The Discharger shall optimize system operations to minimize combined sewer discharges and maximize pollutant removal during wet weather.

ii. The Discharger shall use all facilities, including any inoperative or unused facilities, to store or treat wet weather flows to the maximum extent practicable.

iii. The Discharger shall capture for treatment, or storage and subsequent treatment, 100 percent of the combined wastewater and stormwater flow collected in the combined sewer system during precipitation events. Captured flows shall receive the minimum treatment specified in Table 2.

iv. The Discharger shall operate the facilities as set forth below and maintain records documenting implementation. If the Discharger demonstrates that changes to these operating parameters will result in additional storage or treatment, it shall implement such changes after receiving written concurrence from the Regional Water Board Executive Officer and U.S. EPA.

(a) The Oceanside Water Pollution Control Plant shall have an instantaneous influent flow rate of at least 43 MGD prior to discharging primary-treated effluent from the plant to Discharge Point No. 001.

(b) The Oceanside Water Pollution Control Plant shall have an instantaneous influent flow rate of at least 60 MGD prior to initiating discharge from the Westside Transport/Storage Structure to Discharge Point No. 001.

(c) The flow at Discharge Point No. 001 shall be at least 165 MGD within 2 hours of a discharge from Discharge Point No. CSD-002 or CSD-003.

(d) The Discharger shall ensure that two duty pumps at the Sea Cliff No. 1 Pump Station are operating at maximum capacity prior to discharging at Discharge Point No. CSD-005.

(e) The Discharger shall ensure that the Sea Cliff No. 2 Pump Station is operating at maximum capacity and at least 1,100 gallons per minute prior to discharging at Discharge Point Nos. CSD-006 and CSD-007.

(f) The Discharger shall comply with the following after rain and combined sewer discharges subside:

(1) If the National Weather Service predicts at least a 30 percent chance of rain within the next 24 hours, the Discharger shall maximize storage capacity for predicted rain by pumping down the Westside Transport/Storage Structure to dry weather levels (i.e., ten feet or less in the East Box).

(2) If the National Weather Service predicts less than a 30 percent chance of rain within the next 24 hours, the Discharger shall maximize secondary treatment

at the Oceanside Water Pollution Control Plant by ceasing the discharge of primary-treated plant effluent and Westside Transport/Storage Structure effluent to Discharge Point No. 001.

d. LTCP Update. The Discharger shall update its LTCP by implementing the following tasks based on the *Combined Sewer Overflow (CSO) Control Policy* and shall submit the required reports to the Regional Water Board and U.S. EPA as specified in the table below. In doing so, the Discharger may use previously completed studies to the extent that they accurately provide the required information.

Table 7. Tasks to Update Long-Term Control Plan (LTCP)

Task	Compliance Date
1. Post-Construction Characterization, Monitoring, and Modeling of Combined Sewer System The Discharger shall submit a System Characterization Report with a comprehensive characterization of the combined sewer system developed through records review, monitoring, modeling, and other means as appropriate to establish the existing conditions upon which the Consideration of Sensitive Areas Report (Task 3) will be based. At a minimum, the System Characterization Report shall include the following: **a.** Thorough description of the entire combined sewer system, including how it responds during a modeled typical year and various precipitation events (including 3-hour duration, 5-year and 10-year return frequency storms). This description will consider the volume and frequency of combined sewer system discharges and sewer overflows from the combined sewer system, and the impacts of climate change and sea level rise; **b.** Description of each model used, including a discussion of model calibration and validation; **c.** Location, frequency, and characteristics of actual combined sewer discharges and sewer overflows from the combined sewer system, and their locations relative to sensitive areas, for at least the last 10 years; **d.** Description of any temporal or spatial trends of sewer overflows from the combined sewer system; **e.** Based on available information, evaluation of how combined sewer discharges affect receiving water quality. At a minimum, the Discharger shall compare wet weather average and maximum discharge characteristics and receiving water monitoring data with Ocean Plan Table 1 water quality objectives; and **f.** Evaluation of combined sewer discharge control efficacy (e.g., using TSS as a proxy for pollutant removal efficiency), including a description of any method used.	Within 48 months of this Order's effective date
2. Public Participation The Discharger shall submit a description of its completed and planned public participation efforts to actively involve the affected public in its decision-making process related to capital planning, including implementation of any additional long-term combined sewer system controls based on the results of the Consideration of Sensitive Areas Report. The affected public includes rate-payers (including rate-payers in separate sanitary sewer system service areas), industrial users, persons who use the receiving waters, and any other interested persons. The public participation efforts may include outreach through methods such as public meetings, direct mailers, billing inserts, press releases, postings of information on the Discharger's website, and development of advisory committees.	Within 48 months of this Order's effective date

Task	Compliance Date
3. Consideration of Sensitive Areas Based on the findings of the System Characterization Report (Task 1), the Discharger shall submit a Consideration of Sensitive Areas Report that evaluates, prioritizes, and proposes control alternatives needed to eliminate, relocate, or reduce the magnitude or frequency of discharges to sensitive areas from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007. The Consideration of Sensitive Areas Report shall include the following, at a minimum: **a.** Provide updated water contact recreational use surveys, focusing particularly on recreational use following combined sewer discharges; **b.** Identify control alternatives for each combined sewer discharge structure and the combined sewer system as a whole, including but not limited to the following: **i.** Green infrastructure and low impact development; **ii.** Increased storage within the combined sewer system and at the Oceanside Water Pollution Control Plant; **iii.** Increased treatment capacity; **iv.** Operational changes; **v.** Increased pumping capacity at the Westside Pump Station; and **vi.** Use of high-rate treatment technologies and disinfection to minimize pollutant loads. **c.** Evaluate the practical and technical feasibility of the proposed alternatives; **d.** Using a model, simulate existing conditions and expected conditions after construction and operation of each proposed alternative, including how the alternative would be expected to affect water quality and combined sewer discharge volumes and frequencies at each combined sewer discharge outfall, and incorporating consideration of climate change and sea level rise; **e.** Evaluate the feasibility, costs, and benefits of the alternatives. Evaluate financial capabilities (e.g., using U.S. EPA's *Combined Sewer Overflows, Guidance for Financial Capability Assessment and Schedule Development* [EPA 832-B-97-004, February 1997] or other appropriate guidance); **f.** Consider costs relative to water quality and other public benefits, financial capabilities, other infrastructure needs, and integrated planning considerations, and prioritize and propose for implementation alternatives to eliminate, relocate, or reduce the magnitude or frequency of discharges from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007 based on Tasks 3.a through 3.e, above; and **g.** Provide an implementation schedule that includes interim milestones.	Within 48 months of this Order's effective date
4. Operational Plan **a.** The Discharger shall submit a Wet Weather Operations Report that proposes a set of operational parameters to be used as performance measures to ensure that wet weather operations maximize pollutant removal and minimize the frequency, volume, and duration of combined sewer discharges and sewer overflows from the combined sewer system. The performance measures may include all or a portion of those listed in Provision VI.C.5.c.iv and shall include measures to evaluate compliance. The Discharger shall provide the technical basis for proposing new performance measures or retaining the existing ones. **b.** Within 90 days of receiving written concurrence from the Regional Water Board Executive Officer and U.S. EPA, the Discharger shall update its Operation and Maintenance Manual, implement the proposed performance measures in lieu of those in Provision VI.C.5.c.iv, and demonstrate compliance.	Within 24 months of this Order's effective date Within 90 days of receiving written concurrence

Task	Compliance Date
5. Post-Construction Compliance Monitoring Program The MRP contains post-construction compliance monitoring requirements. The Discharger shall submit a Post-Construction Compliance Monitoring Plan proposing modifications, as appropriate, to the MRP for the next permit term to verify compliance with applicable water quality standards and protection of designated uses, as well as to ascertain the effectiveness of combined sewer system controls. At a minimum, the Post-Construction Compliance Monitoring Plan shall evaluate whether any reduction or increase in monitoring, or alternative monitoring, is appropriate.	With Report of Waste Discharge

6. Westside Recycled Water Project Operations Notification

The Discharger shall notify the Regional Water Board and U.S. EPA at least 30 days prior to commencing Westside Recycled Water Project operations. The notification shall include the following:

a. Date that operations will commence;

b. Description of the project as constructed, including a description and flow diagram of all treatment processes;

c. Description and line diagram of how and where the concentrate from the reverse osmosis process is to be discharged to Discharge Point No. 001;

d. Description of anticipated changes in the quality of effluent discharged to Discharge Point No. 001; and

e. Verification that effluent discharged to Discharge Point No. 001 will comply with this Order's requirements.

If pollutant concentrations are expected to increase by more than considered in the reasonable potential analysis based on future effluent quality with the Westside Recycled Water Project (see Fact Sheet § IV.C.4.b), the notification shall also summarize anticipated maximum receiving water concentrations and compare them to the water quality objectives listed in Fact Sheet Tables F-9 and F-10.

7. Flame Retardant Special Study

The Discharger shall propose a special study to evaluate Oceanside Water Pollution Control Plant effluent flame retardant concentrations and flame retardant mass loadings to the Pacific Ocean from Discharge Point No. 001. The Discharger shall submit a special study work plan to the U.S. EPA Water Division Director within one year of the effective date of this Order and shall submit the special study final report with the application for permit reissuance.

8. Efficacy of Combined Sewer System Controls Special Study

By August 1, 2023, the Discharger shall submit a report to the Regional Water Board and U.S. EPA evaluating the quality of the combined sewer discharges and the efficacy of the combined sewer discharge controls during wet weather (i.e., control of solid and floatable

material in combined sewer discharges) at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, and CSD-007. At a minimum, the Discharger shall monitor for TSS, copper, lead, and zinc. The Discharger shall also evaluate floatables removal.

ATTACHMENT A – DEFINITIONS

Areas of Special Biological Significance (ASBS)
Areas designated by the State Water Resources Control Board as ocean areas requiring protection of species or biological communities to the extent that maintenance of natural water quality is assured. All Areas of Special Biological Significance are also classified as a subset of State Water Quality Protection Areas.

Average Monthly Effluent Limitation (AMEL)
Highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)
Highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Bioaccumulative
Taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Chlordane
Sum of chlordane-alpha, chlordane-gamma, chlordene-alpha, chlordene-gamma, nonachlor-alpha, nonachlor-gamma, and oxychlordane.

Combined Sewer Discharge
Authorized combined sewer overflow during a wet weather day from an approved combined sewer discharge point. Table 2 of the Order lists approved combined sewer discharge points.

Combined Sewer Discharge Event
Discharge from one or more approved combined sewer discharge points during wet weather separated by at least six hours from any other combined sewer discharge event. Table 2 of the Order lists approved combined sewer discharge points.

Combined Sewer Overflow
The *Combined Sewer Overflow (CSO) Control Policy* defines a combined sewer overflow as the discharge from a combined sewer system at a point prior to the POTW's treatment plant.

Daily Discharge
Either: (1) total mass of the constituent discharged over a calendar day (12:00 a.m. through 11:59 p.m.) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit) for a constituent with limitations expressed in units of mass; or (2) unweighted arithmetic mean measurement of the constituent over a day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of a day.

For composite sampling, if a day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

DDT
Sum of 4,4'DDT, 2,4'DDT, 4,4'DDE, 2,4'DDE, 4,4'DDD, and 2,4'DDD.

Degrade
Degradation shall be determined by comparison of the waste field and reference site or sites for characteristic species diversity, population density, contamination, growth anomalies, debility, or supplanting of normal species by undesirable plant and animal species. Degradation occurs if there are significant differences in any of three major biotic groups, namely, demersal fish, benthic invertebrates, or attached algae. Other groups may be evaluated where benthic species are not affected, or are not the only ones affected.

Detected, but Not Quantified (DNQ)
Sample results that are less than the reported Minimum Level, but greater than or equal to the laboratory's method detection limit (MDL). Sample results reported as DNQ are estimated concentrations.

Dichlorobenzenes
Sum of 1,2-dichlorobenzene and 1,3-dichlorobenzene.

Dilution Credit
Amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation based on the allowance of a specified mixing zone. It is calculated from the dilution ratio, or determined by conducting a mixing zone study or modeling the discharge and receiving water.

Downstream Ocean Waters
Waters downstream with respect to ocean currents.

Dredged Material
Any material excavated or dredged from the navigable waters of the United States, including material otherwise referred to as "spoil."

Dry Weather
Any weather not defined as wet weather (determined on a day-by-day basis).

Effective Concentration (EC)
Point estimate of the toxicant concentration that would cause an adverse effect on a quantal, "all or nothing," response (such as death, immobilization, or serious incapacitation) in a given percent of the test organisms. If the effect is death or immobility, the term lethal concentration (LC) may be used. EC values may be calculated using point estimation techniques such as probit, logit, and Spearman-

Karber. EC_{25} is the concentration of toxicant (in percent effluent) that causes a response in 25 percent of the test organisms.

Enclosed Bays
Indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. This definition includes, but is not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drakes Estero, San Francisco Bay, Morro Bay, Los Angeles Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay.

Endosulfan
Sum of endosulfan-alpha, endosulfan-beta, and endosulfan sulfate.

Estuaries and Coastal Lagoons
Waters at the mouths of streams that serve as mixing zones for fresh and ocean waters during a major portion of the year. Mouths of streams that are temporarily separated from the ocean by sandbars shall be considered as estuaries. Estuarine waters will generally be considered to extend from a bay or the open ocean to the upstream limit of tidal action but may be considered to extend seaward if significant mixing of fresh and salt water occurs in the open coastal waters. The waters described by this definition include, but are not limited to, the Sacramento-San Joaquin Delta as defined by California Water Code section 12220, Suisun Bay, Carquinez Strait downstream to Carquinez Bridge, and appropriate areas of the Smith, Klamath, Mad, Eel, Noyo, and Russian Rivers.

Halomethanes
Sum of bromoform, bromomethane (methyl bromide), and chloromethane (methyl chloride).

HCH
Sum of the alpha, beta, gamma (lindane), and delta isomers of hexachlorocyclohexane.

Initial Dilution
Process that results in the rapid and irreversible turbulent mixing of wastewater with ocean water around the point of discharge.

For a submerged buoyant discharge, characteristic of most municipal and industrial wastes that are released from the submarine outfalls, the momentum of the discharge and its initial buoyancy act together to produce turbulent mixing. Initial dilution in this case is completed when the diluting wastewater ceases to rise in the water column and first begins to spread horizontally.

For shallow water submerged discharges, surface discharges, and non-buoyant discharges, characteristic of cooling water wastes and some individual discharges, turbulent mixing results primarily from the momentum of discharge. Initial dilution, in these cases, is considered to be completed when the momentum induced velocity of the discharge ceases to produce significant mixing of the waste, or the diluting plume reaches a fixed distance from the discharge to be specified by the Regional Water Board, whichever results in the lower estimate for initial dilution.

Instantaneous Maximum Effluent Limitation
Highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation
Lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

In-Stream Waste Concentration (IWC)
The concentration of a toxicant in the receiving water after mixing.

Kelp Beds
For purposes of the Ocean Plan bacteriological standards, significant aggregations of marine algae of the genera *Macrocystis* and *Nereocystis*. Kelp beds include the total foliage canopy of *Macrocystis* and *Nereocystis* plants throughout the water column.

Mariculture
Culture of plants and animals in marine waters independent of any pollution source.

Material
(a) In common usage: (1) the substance or substances of which a thing is made or composed, (2) substantial;

(b) For Ocean Plan purposes relating to waste disposal, dredging, and the disposal of dredged material and fill: matter of any kind or description that is subject to regulation as waste or any material dredged from the navigable waters of the United States. See “dredged material.”

Maximum Daily Effluent Limitation (MDEL)
Highest allowable daily discharge of a pollutant.

Method Detection Limit (MDL)
Minimum concentration of a substance that can be reported with 99 percent confidence that the measured concentration is distinguishable from method blank results, as defined in 40 C.F.R. part 136, Appendix B.

Minimum Level (ML)
Concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Natural Light
Reduction of natural light may be determined by measurement of light transmissivity or total irradiance, or both, according to the monitoring needs of the Regional Water Board or U.S. EPA.

No Observed Effect Concentration (NOEC)
Highest tested concentration of an effluent or a toxicant at which no adverse effects are observed on the aquatic test organisms at a specific time of observation. It is determined using hypothesis testing.

Not Detected (ND)
Sample results less than the laboratory's MDL.

PAHs (polynuclear aromatic hydrocarbons)
Sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,12-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[ah]anthracene, fluorene, indeno[1,2,3-cd]pyrene, phenanthrene, and pyrene.

PCBs (polychlorinated biphenyls)
Sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260.

Pollutant Minimization Program (PMP)
Waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The PMP goal shall be to reduce potential sources through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board and U.S. EPA may consider cost effectiveness when establishing PMP requirements. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), fulfill the PMP requirements.

Reporting Level (RL)
Minimum Level (ML) and its associated analytical method chosen by the Discharger for reporting and compliance determination from the MLs included in this Order, including an additional factor if applicable as discussed herein (also known as the "Reported Minimum Level"). The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected either from Ocean Plan Appendix II in accordance with Ocean Plan chapter III.C.5.a or established in accordance with Ocean Plan chapter III.C.5.b. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Sewer Overflow from the Combined Sewer System
Release or diversion of untreated or partially-treated wastewater or combined wastewater and stormwater from the combined sewer collection system. Sewer overflows from the combined sewer system can occur in public rights of way or on private property. Sewer overflows from the combined sewer system do not include releases due to failures in privately-owned sewer laterals or authorized combined sewer discharges at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, or CSD-007.

Shellfish
Organisms identified by the California Department of Public Health as shellfish for public health purposes (i.e., mussels, clams and oysters).

Significant Difference
Statistically significant difference in the means of two distributions of sampling results at the 95 percent confidence level.

Six-Month Median Effluent Limitation
Highest allowable moving median of all daily discharges for any 180-day period.

State Water Quality Protection Areas (SWQPAs)
Non-terrestrial marine or estuarine areas designated to protect marine species or biological communities from an undesirable alteration in natural water quality. All "Areas of Special Biological Significance" (ASBS) previously designated by the State Water Board in Resolutions 74-28, 74-32, and 75-61 are now also classified as a subset of SWQPAs and require the special protections the Ocean Plan affords.

TCDD Equivalents
Sum of the concentrations of chlorinated dibenzodioxins (2,3,7,8-CDDs) and chlorinated dibenzofurans (2,3,7,8-CDFs) multiplied by their respective Toxicity Equivalency Factors (TEFs) and Bioaccumulation Equivalency Factors (BEFs), as defined in Table A-1. When calculating TCDD Equivalents, the Discharger shall set congener concentrations below the minimum levels to zero. This approach is based on 40 C.F.R. part 132, Appendix F, Procedure 4, Tables 1 and 2, and TEFs listed in the Ocean Plan. This TCDD equivalents definition supersedes the dioxin-TEQ definition in Attachment G section V.C.1.d.iv.

Table A-1. Minimum Levels, Toxicity Equivalency Factors, and Bioaccumulation Equivalency Factors

Isomer Group	Minimum Level (pg/L)	Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factor (BEF)
2,3,7,8-TCDD	10	1.0	1.0
1,2,3,7,8-PeCDD	50	0.5	0.9
1,2,3,4,7,8-HxCDD	50	0.1	0.3
1,2,3,6,7,8-HxCDD	50	0.1	0.1
1,2,3,7,8,9-HxCDD	50	0.1	0.1
1,2,3,4,6,7,8-HpCDD	50	0.01	0.05
OCDD	100	0.001	0.01
2,3,7,8-TCDF	10	0.1	0.8
1,2,3,7,8-PeCDF	50	0.05	0.2
2,3,4,7,8-PeCDF	50	0.5	1.6
1,2,3,4,7,8-HxCDF	50	0.1	0.08
1,2,3,6,7,8-HxCDF	50	0.1	0.2
1,2,3,7,8,9-HxCDF	50	0.1	0.6
2,3,4,6,7,8-HxCDF	50	0.1	0.7
1,2,3,4,6,7,8-HpCDF	50	0.01	0.01
1,2,3,4,7,8,9-HpCDF	50	0.01	0.4
OCDF	100	0.001	0.02

Test of Significant Toxicity (TST)
A statistical approach used to analyze toxicity test data. The TST statistical approach is described in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010).

Toxicity Reduction Evaluation (TRE)
Study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical or chemicals responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.)

Waste
As used in the Ocean Plan, a Discharger's total discharge, of whatever origin (i.e., gross, not net, discharge).

Water Recycling
Treatment of wastewater to render it suitable for reuse, the transportation of treated wastewater to the place of use, and the actual use of treated wastewater for a direct beneficial use or controlled use that would not otherwise occur.

Wet Weather
Weather in which any one of the following conditions exists as a result of rain (determined on a day-by-day basis):

1. Instantaneous influent flow to the Oceanside Water Pollution Control Plant exceeds 43 MGD; or

2. Average daily influent concentration of TSS is less than 100 mg/L; or

3. Westside Transport/Storage Structure flow elevation exceeds 0 feet in the West Box or 18 feet in the East Box. (Flow from the East Box to the West Box occurs only when the East Box storage level exceeds 18 feet.)

ATTACHMENT B – FACILITY AND RECEIVING WATER MAPS

Figure B-1. Facility Overview Map

The Facility subject to this Order is shown in light red (western area) and includes the Oceanside Water Pollution Control Plant, wastewater collection system, and Westside Recycled Water Project. The Southeast Water Pollution Control Plant, North Point Wet Weather Facility, and Bayside Wet Weather Facilities are shown only for reference in light green (eastern area).

ATTACHMENT D – STANDARD PROVISIONS

I. STANDARD PROVISIONS—PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the terms, requirements, and conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application; or a combination thereof. (40 C.F.R. § 122.41(a); Wat. Code §§ 13261, 13263, 13265, 13268, 13000, 13001, 13304, 13350, 13385.)

2. The Discharger shall comply with effluent standards or prohibitions established under CWA section 307(a) for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i); Wat. Code, §§ 13267, 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(i); 40 C.F.R. § 122.41(i)(1); Wat. Code, §§ 13267, 13383);

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(2); Wat. Code, §§ 13267, 13383);

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(3); Wat. Code, §§ 13267, 13383); and

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i)(4); Wat. Code, §§ 13267, 13383.)

G. Bypass

1. Definitions

a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)

b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)

2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions—Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)

3. **Prohibition of bypass.** Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):

   a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));

   b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and

   c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions—Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)

4. **Approval.** The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions—Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)

5. **Notice**

   a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit prior notice, if possible at least 10 days before the date of the bypass. The notice shall be sent to the Regional Water Board. As of December 21, 2020, a notice shall also be submitted electronically to the initial recipient defined in Standard Provisions—Reporting V.J below. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(i).)

   b. Unanticipated bypass. The Discharger shall submit a notice of an unanticipated bypass as required in Standard Provisions—Reporting V.E below (24-hour notice). The notice shall be sent to the Regional Water Board. As of December 21, 2020, a notice shall also be submitted electronically to the initial recipient defined in Standard Provisions—Reporting V.J below. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology-based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. **Effect of an upset.** An upset constitutes an affirmative defense to an action brought for noncompliance with such technology-based permit effluent limitations if the requirements of Standard Provisions—Permit Compliance I.H.2 below are met. No determination made

during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).)

2. **Conditions necessary for a demonstration of upset.** A discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):

   a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));

   b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));

   c. The Discharger submitted notice of the upset as required in Standard Provisions—Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and

   d. The Discharger complied with any remedial measures required under Standard Provisions—Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)

3. **Burden of proof.** In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS—PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. §§ 122.41(l)(3), 122.61.)

III. STANDARD PROVISIONS—MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)

B. Monitoring must be conducted according to test procedures approved under 40 C.F.R. part 136 for the analyses of pollutants unless another method is required under 40 C.F.R. chapter 1, subchapter N. Monitoring must be conducted according to sufficiently sensitive test methods approved under 40 C.F.R. part 136 for the analysis of pollutants or pollutant parameters or required under 40 C.F.R. chapter 1, subchapter N . For the purposes of this paragraph, a method is sufficiently sensitive when:

1. The method minimum level (ML) is at or below the level of the effluent limitation established in the permit for the measured pollutant or pollutant parameter, and either (a) the method ML is at or below the level of the applicable water quality criterion for the measured pollutant or pollutant parameter, or (b) the method ML is above the applicable water quality criterion but the amount of the pollutant or pollutant parameter in a facility's discharge is high enough that the method detects and quantifies the level of the pollutant or pollutant parameter in the discharge; or

2. The method has the lowest ML of the analytical methods approved under 40 C.F.R. part 136 or required under 40 C.F.R. chapter 1, subchapter N, for the measured pollutant or pollutant parameter.

In the case of pollutants or pollutant parameters for which there are no approved methods under 40 C.F.R. part 136 or otherwise required under 40 C.F.R. chapter 1, subchapter N, monitoring must be conducted according to a test procedure specified in this Order for such pollutants or pollutant parameters. (40 C.F.R. §§ 122.21(e)(3), 122.41(j)(4), 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS—RECORDS

A. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

B. Records of monitoring information shall include the following:

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));

2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));

3. The date(s) the analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));

4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and

6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and

2. Permit applications and attachments, permits, and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS—REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or U.S. EPA within a reasonable time, any information which the Regional Water Board, State Water Board, or U.S. EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or U.S. EPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, §§ 13267, 13383.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Standard Provisions—Reporting V.B.2, V.B.3, V.B.4, V.B.5, and V.B.6 below. (40 C.F.R. § 122.41(k).)

2. For a corporation, all permit applications shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures. (40 C.F.R. § 122.22(a)(1).)

For a partnership or sole proprietorship, all permit applications shall be signed by a general partner or the proprietor, respectively. (40 C.F.R. § 122.22(a)(2).)

For a municipality, State, federal, or other public agency, all permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA). (40 C.F.R. § 122.22(a)(3).).

3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or U.S. EPA shall be signed by a person described in Standard Provisions—Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

a. The authorization is made in writing by a person described in Standard Provisions—Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));

b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)

4. If an authorization under Standard Provisions—Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions—Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)

5. Any person signing a document under Standard Provisions—Reporting V.B.2 or V.B.3 above shall make the following certification:

> "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." (40 C.F.R. § 122.22(d).)

6. Any person providing the electronic signature for documents described in Standard Provisions—V.B.1, V.B.2, or V.B.3 that are submitted electronically shall meet all relevant requirements of Standard Provisions—Reporting V.B, and shall ensure that all relevant requirements of 40 C.F.R. part 3 (Cross-Media Electronic Reporting) and 40 C.F.R. part 127 (NPDES Electronic Reporting Requirements) are met for that submission. (40 C.F.R § 122.22(e).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program in this Order. (40 C.F.R. § 122.22(l)(4).)

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board. As of December 21, 2016, all reports and forms must be submitted electronically to the initial recipient defined in Standard Provisions—Reporting V.J and comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(l)(4)(i).)

3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 C.F.R. part 136, or another method required for an industry-specific waste stream under 40 C.F.R. chapter 1, subchapter N, the results of such monitoring shall be included in the calculation and reporting of the data submitted in the DMR reporting form specified by the Regional Water Board or State Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written report shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written report shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

For noncompliance related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports must include the data described above (with the exception of time of discovery) as well as the type of event (i.e., combined sewer overflow, sanitary sewer overflow, or bypass event), type of overflow structure (e.g., manhole, combined sewer overflow outfall), discharge volume untreated by the treatment works treating domestic sewage, types of human health and environmental impacts of the event, and whether the noncompliance was related to wet weather.

As of December 21, 2020, all reports related to combined sewer overflows, sanitary sewer overflows, or bypass events must be submitted to the Regional Water Board and must be

submitted electronically to the initial recipient defined in Standard Provisions—Reporting V.J. The reports shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. The Regional Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours:

a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)

b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 C.F.R. section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (Alternatively, for an existing manufacturing, commercial, mining, or silvicultural discharge as referenced in 40 C.F.R. section 122.42(a), this notification applies to pollutants that are subject neither to effluent limitations in this Order nor to notification requirements under 40 C.F.R. section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1).) (40 C.F.R. § 122.41(l)(1)(ii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order's requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions—Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provisions—Reporting V.E above. For noncompliance related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports shall contain the information described in Standard Provisions—

Reporting V.E and the applicable required data in appendix A to 40 C.F.R. part 127. The Regional Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or U.S. EPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

J. Initial Recipient for Electronic Reporting Data

The owner, operator, or duly authorized representative is required to electronically submit NPDES information specified in appendix A to 40 C.F.R. part 127 to the initial recipient defined in 40 C.F.R. section 127.2(b). U.S. EPA will identify and publish the list of initial recipients on its website and in the Federal Register, by state and by NPDES data group (see 40 C.F.R. § 127.2(c)). U.S. EPA will update and maintain this list. (40 C.F.R. § 122.41(l)(9).)

VI. STANDARD PROVISIONS—ENFORCEMENT

A. The Regional Water Board is authorized to enforce the terms of this Order under several provisions of the Water Code, including, but not limited to, sections 13268, 13350, 13385, 13386, and 13387.

VII. ADDITIONAL PROVISIONS—NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural dischargers shall notify the Regional Water Board as soon as they know or have reason to believe (40 C.F.R. § 122.42(a)):

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(1)):

a. 100 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(1)(i));

b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(1)(ii));

c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(1)(iii)); or

d. The level established by the Regional Water Board in accordance with section 40 C.F.R. section 122.44(f). (40 C.F.R. § 122.42(a)(1)(iv).)

2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(2)):

a. 500 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(2)(i));

b. 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(2)(ii));

c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(2)(iii)); or

d. The level established by the Regional Water Board in accordance with 40 C.F.R. section 122.44(f). (40 C.F.R. § 122.42(a)(2)(iv).)

B. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 C.F.R. § 122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to CWA sections 301 or 306 if it were directly discharging those pollutants (40 C.F.R. § 122.42(b)(1)); and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of this Order. (40 C.F.R. § 122.42(b)(2).)

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 C.F.R. § 122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

Clean Water Act section 308 and 40 C.F.R. sections 122.41(h), 122.41(j)-(l), 122.44(i), and 122.48 require that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. This MRP establishes monitoring, reporting, and recordkeeping requirements that implement federal and State laws and regulations.

I. GENERAL MONITORING PROVISIONS

A. The Discharger shall comply with this MRP. The Regional Water Board Executive Officer and U.S. EPA may amend this MRP pursuant to 40 C.F.R. sections 122.62, 122.63, and 124.5. If any discrepancies exist between this MRP and the "Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits" (Attachment G), this MRP shall prevail.

B. The Discharger shall conduct all monitoring in accordance with Attachment D section III, as supplemented by Attachment G. Equivalent test methods must be more sensitive than those specified in 40 C.F.R. part 136 and must be specified in this permit.

C. The Discharger shall ensure that results of the Discharge Monitoring Report-Quality Assurance (DMR-QA) Study or most recent Water Pollution Performance Evaluation Study are submitted annually to the State Water Board at the following address or as otherwise directed:

State Water Resources Control Board
Quality Assurance Program Officer
Office of Information Management and Analysis
1001 I Street, Sacramento, CA 95814

D. The Discharger shall implement a Quality Assurance-Quality Control Program for any onsite field tests (e.g., turbidity, pH, temperature, dissolved oxygen, conductivity, disinfectant residual) analyzed by a noncertified laboratory. The Discharger shall keep a manual onsite containing the steps followed in this program and must demonstrate sufficient capability to adequately perform these field tests (e.g., qualified and trained employees, properly calibrated and maintained field instruments). The program shall conform to U.S. EPA guidelines or other approved procedures.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Locations

Monitoring Location Type	Monitoring Location Name	Monitoring Location Description [1]
Oceanside Water Pollution Control Plant Influent (dry weather)	INF-001A	During dry weather, any point in the plant headworks where all waste tributary to the plant is present and preceding any phase of treatment at the plant, exclusive of any return flows or process side streams.

Monitoring Location Type	Monitoring Location Name	Monitoring Location Description [1]
Oceanside Water Pollution Control Plant Influent (wet weather)	INF-001B	During wet weather, any point in the plant headworks where all waste tributary to the plant is present and preceding any phase of treatment at the plant, exclusive of any return flows or process side streams.
Oceanside Water Pollution Control Plant Effluent (dry weather)	EFF-001A	During dry weather, any point at the plant following all phases of treatment, prior to contact with Westside Recycled Water Project concentrate and the receiving water at Discharge Point No. 001.
Oceanside Water Pollution Control Plant Effluent (wet weather)	EFF-001B	During wet weather, any point at the plant following all phases of treatment, prior to contact with Westside Transport/Storage Structure effluent, Westside Recycled Water Project concentrate, and the receiving water at Discharge Point No. 001.
Oceanside Water Pollution Control Plant Effluent and Westside Recycled Water Project Concentrate (dry weather)	EFF-001C	During dry weather, any point at which all plant effluent and Westside Recycled Water Project concentrate tributary to Discharge Point No. 001 is present and after all phases of treatment. The Discharger may combine 24-hour composite samples from Monitoring Locations EFF-001A and EFF-001R to create a volumetrically flow-weighted representative sample for Monitoring Location EFF-001C.
Westside Transport/Storage Structure Effluent (wet weather) (identified in the previous order as "decant")	EFF-001D	During wet weather, any point following the Westside Pump Station wet weather pumps, prior to contact with treated plant effluent, Westside Recycled Water Project concentrate, and the receiving water at Discharge Point No. 001.
Westside Recycled Water Project Reverse Osmosis Concentrate	EFF-001R	Any point at the Westside Recycled Water Project following all phases of treatment, prior to contact with plant effluent, Westside Transport/Storage Structure effluent, and the receiving water at Discharge Point No. 001.
Combined Sewer Discharge Effluent	EFF-CSD	A monitoring location representative of combined sewer discharges from the Westside Transport/Storage Structure.
Shoreline Receiving Water	SRF-15	Nearshore receiving water along Baker Beach, in the surf at the terminus of Lobos Creek.
Shoreline Receiving Water	SRF-15 east	Nearshore receiving water along Baker Beach, in the surf east of Monitoring Location SRF-15.
Shoreline Receiving Water	SRF-16	Nearshore receiving water along Baker Beach, in the surf opposite the Sea Cliff No. 2 Pump Station.
Shoreline Receiving Water	SRF-17	Nearshore receiving water along China Beach, in the surf opposite the Sea Cliff No. 1 Pump Station.
Shoreline Receiving Water	SRF-18	Nearshore receiving water along Ocean Beach, in the surf at the foot of Balboa Street.
Shoreline Receiving Water	SRF-19	Nearshore receiving water along Ocean Beach, in the surf at the foot of Lincoln Way, opposite the Lincoln Combined Sewer Discharge Structure.
Shoreline Receiving Water	SRF-20	Nearshore receiving water along Ocean Beach, in the surf at the foot of Pacheco Street.
Shoreline Receiving Water	SRF-21	Nearshore receiving water along Ocean Beach, in the surf at the foot of Vicente Street, opposite the Vicente Combined Sewer Discharge Structure.
Shoreline Receiving Water	SRF-21.1	Nearshore receiving water along Ocean Beach, in the surf at the foot of Sloat Boulevard.

Monitoring Location Type	Monitoring Location Name	Monitoring Location Description [1]
Shoreline Receiving Water	SRF-22	Nearshore receiving water along Ocean Beach, in the surf at Fort Funston, opposite the Lake Merced Combined Sewer Discharge Structure.

Monitoring Location Type	Monitoring Location Name	Monitoring Location Description [1]
Biosolids	BIO-001	Biosolids (treated sludge)

Footnote:

[1] Latitude and longitude information is approximate.

III. INFLUENT MONITORING REQUIREMENTS

The Discharger shall monitor Oceanside Water Pollution Control Plant influent at Monitoring Location INF-001A during dry weather and Monitoring Location INF-001B during wet weather as follows:

Table E-2. Plant Influent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency [2]
Flow [1]	MG/MGD	Continuous	Continuous/D
Carbonaceous Biochemical Oxygen Demand (5-day @ 20°C)($CBOD_5$) [3]	mg/L	C-24	1/Week
Total Suspended Solids (TSS)	mg/L	C-24	5/Week

Abbreviations:

MG = million gallons
MGD = million gallons per day
mg/L = milligrams per liter

Sample Types and Frequencies:

Continuous = measured continuously
Continuous/D = measured continuously, and recorded and reported daily
C-24 = 24-hour composite
1/Week = once per week
5/Week = five times per week

Footnotes:

[1] The following information shall be reported in monthly self-monitoring reports:

- Daily average flow (MGD)
- Total monthly flow volume (MG)

[2] The minimum sampling frequency is the total number of influent samples to be collected during the specified sampling period, including samples collected during dry and wet weather at Monitoring Locations INF-001A and INF-001B.

[3] The Discharger may monitor Chemical Oxygen Demand at Monitoring Location INF-001B in lieu of $CBOD_5$ during wet weather.

IV. EFFLUENT MONITORING REQUIREMENTS

A. Oceanside Water Pollution Control Plant

1. **Dry and Wet Weather.** The Discharger shall monitor plant effluent at Monitoring Location EFF-001A during dry weather and at Monitoring Location EFF-001B during wet weather as follows:

Table E-3. Plant Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency [3]
Flow [1]	MG/MGD	Continuous	Continuous/D
$CBOD_5$ [2]	mg/L	C-24	1/Week
TSS	mg/L	C-24	5/Week
pH	standard units	Continuous or Grab	1/Week

Abbreviations:

MG = million gallons
MGD = million gallons per day
mg/L = milligrams per liter

Sample Types and Frequencies:

Continuous = measured continuously
Continuous/D = measured continuously, and recorded and reported daily
C-24 = 24-hour composite
Grab = grab sample
1/Week = once per week
5/Week = five times per week

Footnotes:

[1] The following information shall be reported in monthly self-monitoring reports:

- Daily average flow (MGD)
- Total monthly flow volume (MG)

[2] The Discharger may monitor Chemical Oxygen Demand at Monitoring Location EFF-001B in lieu of $CBOD_5$ during wet weather.

[3] The minimum sampling frequency is the total number of effluent samples to be collected during the specified sampling period, including samples collected during dry and wet weather at Monitoring Locations EFF-001A and EFF-001B.

2. **Dry Weather.** During dry weather, the Discharger shall monitor plant effluent at Monitoring Location EFF-001A as follows:

Table E-4. Dry Weather Plant Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Oil and Grease	mg/L	Grab	1/Quarter
Ammonia, total	mg/L as N	C-24	1/Quarter
Arsenic	µg/L	C-24	1/Quarter
Cadmium	µg/L	C-24	1/Quarter
Copper	µg/L	C-24	1/Quarter
Lead	µg/L	C-24	1/Quarter
Nickel	µg/L	C-24	1/Quarter
Selenium	µg/L	C-24	1/Quarter
Silver	µg/L	C-24	1/Quarter
Zinc	µg/L	C-24	1/Quarter
Remaining Ocean Plan Table 1 Pollutants [1]	µg/L	C-24 [2]	1/Year

Abbreviations:

mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
µg/L = micrograms per liter

Sample Types and Frequencies:

C-24 = 24-hour composite
Grab = grab sample
1/Quarter = once per quarter
1/Year = once per year

Footnotes:

[1] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, and chronic toxicity. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[2] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a 24-hour composite sample.

3. **Wet Weather.** During wet weather, the Discharger shall monitor plant effluent at Monitoring Location EFF-001B as follows:

Table E-5. Wet Weather Plant Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Duration of Blending [1]	minutes	Calculated	Continuous/D
Volume of Blended Wastewater Discharged [1]	MG	Calculated	Continuous/D
Ocean Plan Table 1 Pollutants [2]	µg/L	C-24 [3]	1/Year

Abbreviations:

MG = million gallons
µg/L = micrograms per liter

Sample Types and Frequencies:

Continuous/D = measured continuously, and recorded and reported daily
C-24 = 24-hour composite
1/Year = once per year

Footnotes:

[1] Blended wastewater is biologically-treated wastewater blended with wastewater diverted around biological treatment units at the Oceanside Water Pollution Control Plant. For each day on which blending occurs, the Discharger shall report the duration of blending and the volume of primary-only-treated wastewater blended.

[2] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, and chronic toxicity. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[3] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a 24-hour composite sample.

B. Combined Sewer System

1. **Westside Transport/Storage Structure Effluent.** During wet weather, the Discharger shall monitor Westside Transport/Storage Structure effluent at Monitoring Location EFF-001D as shown in Table E-6.

Table E-6. Westside Transport/Storage Structure Effluent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow Volume [1]	MG	Continuous	Continuous/D
TSS	mg/L	C-X [3]	3/Year
Ammonia, total	mg/L as N	C-X [3]	3/Year
Arsenic	µg/L	C-X [3]	3/Year

Parameter	Units	Sample Type	Minimum Sampling Frequency
Cadmium	µg/L	C-X [3]	3/Year
Copper	µg/L	C-X [3]	3/Year
Lead	µg/L	C-X [3]	3/Year
Nickel	µg/L	C-X [3]	3/Year
Selenium	µg/L	C-X [3]	3/Year
Silver	µg/L	C-X [3]	3/Year
Zinc	µg/L	C-X [3]	3/Year
Remaining Ocean Plan Table 1 Pollutants [2]	µg/L	C-X [3,4]	1/Year

Abbreviations:

MG = million gallons
mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
µg/L = micrograms per liter

Sample Types and Frequencies:

Continuous = measured continuously
Continuous/D = measured continuously, and recorded and reported daily
C-X = composite sample comprised of individual grab samples collected at equal intervals of no more than one hour at least until a sufficient sample volume for the required analyses is obtained.
1/Year = once per year
3/Year = three times per year

Footnotes:

[1] The following information shall be reported in monthly self-monitoring reports:
- Total daily flow volume from the Westside Transport/Storage Structure to Discharge Point No. 001
- Total monthly flow volume from the Westside Transport/Storage Structure to Discharge Point No. 001

[2] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, chronic toxicity, and volatile organic compounds. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[3] If the discharge lasts less than 24 hours, the Discharger shall sample at equal intervals for as long as possible and record the duration. The Discharger shall begin collecting aliquots or grab samples within two hours of commencing discharge from the Westside Transport/Storage Structure directly to Discharge Point No. 001.

[4] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a 24-hour composite sample.

2. Combined Sewer Discharges

a. During combined sewer discharge events, the Discharger shall monitor combined sewer discharge effluent at Monitoring Location EFF-CSD as follows:

Table E-7. Combined Sewer Discharge Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
TSS	mg/L	C-X [2]	1/Event
Ammonia, total	mg/L as N	C-X [2]	1/Event
Arsenic	µg/L	C-X [2]	1/Event
Cadmium	µg/L	C-X [2]	1/Event
Copper	µg/L	C-X [2]	1/Event
Lead	µg/L	C-X [2]	1/Event
Nickel	µg/L	C-X [2]	1/Event

Parameter	Units	Sample Type	Minimum Sampling Frequency
Selenium	µg/L	C-X [2]	1/Event
Silver	µg/L	C-X [2]	1/Event
Zinc	µg/L	C-X [2]	1/Event
Remaining Ocean Plan Table 1 Pollutants [1]	µg/L	C-X [2,3]	1/Year

Abbreviations:

mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
µg/L = micrograms per liter

Sample Types and Frequencies:

C-X = composite sample comprised of individual grab samples collected at equal intervals of no more than one hour at least until a sufficient sample volume for the required analysis is obtained.
Grab = grab sample
1/Event = once per combined sewer discharge event
1/Year = once per year

Footnotes:

[1] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, chronic toxicity, and volatile organic compounds. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[2] If the discharge lasts less than 24 hours, the Discharger shall sample for as long as possible at equal intervals and record the duration. If the discharge lasts less than one hour, the Discharger shall collect at least one grab sample.

[3] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a composite sample.

b. The Discharger shall record and report in each self-monitoring report the following information for each discharge at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007:

i. Date and time the combined sewer discharge started;

ii. Event duration (in minutes) and volume (in million gallons);

iii. Rainfall intensity and amount (in inches per day and peak hourly rainfall intensity per day) at representative locations where rainfall was measured;

iv. Information supporting discharge volume estimates (if estimated); and

v. Documentation of compliance or noncompliance with each wet weather operational requirement in Provision VI.C.5.c of the Order.

C. Westside Recycled Water Project

When the Westside Recycled Water Project is operating, the Discharger shall monitor reverse osmosis concentrate at Monitoring Location EFF-001R as follows:

Table E-8. Westside Recycled Water Project Concentrate Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MG/MGD	Continuous	Continuous/D

Parameter	Units	Sample Type	Minimum Sampling Frequency
TSS	mg/L	C-24	1/Month
pH	standard units	Continuous or Grab	1/Month
Settleable Solids	mL/L	Grab or C-24	1/Month
Turbidity	NTU	C-24	1/Month
Oil and Grease	mg/L	Grab	1/Quarter
Ocean Plan Table 1 Pollutants [2]	µg/L	C-24 [3]	1/Year

Abbreviations:

MG = million gallons
MGD = million gallons per day
mg/L = milligrams per liter
mL/L = milliliters per liter
µg/L = micrograms per liter
NTU = nephelometric turbidity units

Sample Types and Frequencies:

Continuous = measured continuously
Continuous/D = measured continuously, and recorded and reported daily
C-24 = 24-hour composite
Grab = grab sample
1/Month = once per month
1/Quarter = once per quarter
1/Year = once per year

Footnotes:

[1] The following information shall be reported in monthly self-monitoring reports:

- Daily average flow (MGD)
- Total monthly flow volume (MG)

[2] The Discharger shall monitor for the pollutants listed in Ocean Plan Table 1, except chlorine, tributyltin, radioactivity, acute toxicity, and chronic toxicity. The Discharger may monitor for total chromium in lieu of hexavalent chromium.

[3] For mercury and other parameters with analytical methods that require grab sampling, the Discharger may collect a grab sample instead of a 24-hour composite sample.

D. Discharge Point No. 001

During dry weather, the Discharger shall monitor discharges at Discharge Point No. 001 at Monitoring Location EFF-001C as specified in Table E-9, below. If during the year the discharge at Discharge Point No. 001 is ever entirely reverse osmosis concentrate, the Discharger shall collect at least one sample during that time, if feasible. Otherwise, the Discharger shall collect samples when the Recycled Water Project is operating, if possible.

Table E-9. Dry Weather Discharge Point No. 001 Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Chronic Toxicity [1]	Pass or Fail and Percent Effect	C-24	1/Quarter

Sample Type and Frequency:

C-24 = 24-hour composite
1/Quarter = once per quarter

Footnote:

[1] Chronic toxicity test samples shall be collected coincident with routine composite effluent samples and analyzed in accordance with MRP section V.

V. CHRONIC TOXICITY MONITORING REQUIREMENTS

A. Methodology

1. The Discharger shall conduct static non-renewal chronic toxicity tests with the purple sea urchin (*Strongylocentrotus purpuratus*) or the sand dollar (*Dendraster excentricus*) with the embryo-larval development test method. Bioassays shall be conducted in compliance with the most recently promulgated test methods, currently *Short-Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms* (EPA 600/R-95/136, 1995). If these protocols prove unworkable, the Regional Water Board and U.S. EPA may grant exceptions in writing upon the Discharger's request with justification.

2. The in-stream waste concentration (IWC) shall depend on the amount of recycled water being produced. When the Westside Recycled Water Project produces less than 1.0 MGD of recycled water for distribution, the IWC shall be 0.67 percent effluent. When the Westside Recycled Water Project produces at least 1.0 MGD of recycled water for distribution, the IWC shall be 0.37 percent effluent. Recycled water production for this purpose shall be determined based on the volume of recycled water produced during the 24-hour composite sampling period for the chronic toxicity test.

3. If an effluent toxicity test does not meet all test acceptability criteria in the test methods manual, the Discharger shall resample and retest within 14 days.

4. Dilution and control water, including brine controls, shall be 1-µm-filtered uncontaminated natural seawater, hypersaline brine prepared using uncontaminated natural seawater, or laboratory water prepared and used as specified in the test methods manual. If dilution water and control water are different from test organism culture water, the Discharger shall test a second control using culture water.

5. The Discharger shall conduct concurrent reference toxicant tests at least quarterly. The Discharger shall review and report all reference toxicant test results using the EC_{25} and EC_{50}.

B. Compliance Determination

Samples collected during routine and accelerated monitoring shall be used to evaluate compliance. Compliance with the chronic toxicity effluent limitation shall be evaluated using the TST statistical approach at the discharge IWC. The Discharger shall determine "Pass" or "Fail" and "percent effect" from a toxicity test at the discharge IWC using the TST statistical approach in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010), Appendix A, Figure A-1 and Table A-1. The TST null hypothesis shall be the following:

$$\text{mean discharge IWC response} \leq 0.75 \times \text{mean control response}$$

The Discharger shall report a test that rejects this null hypothesis as "Pass" and a test that does not reject this null hypothesis as "Fail." The relative "percent effect" at the discharge IWC shall be calculated and reported as:

([mean control response – mean discharge response] / mean control response) x 100%

C. Accelerated Monitoring

If a chronic bioassay test indicates a violation of the chronic toxicity effluent limitation, the Discharger shall retest within five days of receiving test results, or within seven days if the sample is contracted out to a commercial laboratory. Accelerated monitoring shall consist of four toxicity tests conducted at approximately two-week intervals. The Discharger shall return to routine monitoring if all four monitoring test results are "Pass."

If any accelerated monitoring test violates the chronic toxicity effluent limitation, the Discharger shall immediately initiate toxicity reduction evaluation (TRE) procedures in accordance with MRP section V.E. Accelerated monitoring is not required once the Discharger has initiated a TRE; however, the Discharger shall continue to conduct routine effluent monitoring for compliance determination purposes during the TRE.

D. Reporting Requirements

For each chronic toxicity test, whether identified as valid or not, the Discharger shall report the following, at a minimum, in monthly self-monitoring reports:

1. Sample date;

2. Test initiation date;

3. Test species;

4. TST statistical results (i.e., "Pass" or "Fail," and "percent effect" at the IWC);

5. Other biological and statistical endpoint values as appropriate (e.g., number of young, growth rate, NOEC, EC_{25});

6. Summary of water quality measurements for each toxicity test (e.g., pH, dissolved oxygen, temperature, conductivity, hardness, salinity, and ammonia);

7. Statistical program output results for each toxicity test, including tabular data and graphical plots;

8. Tabular data and graphical plots showing the laboratory's performance for (1) the reference toxicant for the previous 20 tests; and (2) the control mean, control standard deviation, and control coefficient of variation for the previous 12 months; and

9. Status of any ongoing TRE work, including completed and planned investigative activities.

E. Toxicity Reduction Evaluation (TRE)

1. Generic TRE Work Plan. The Discharger shall prepare and submit an initial investigation TRE work plan within 90 days of the effective date of this Order. The Discharger shall prepare the work plan based on *Toxicity Reduction Evaluation Guidance for Municipal*

Wastewater Treatment Plants (EPA/833/B-99/002, 1999), or the most current version. The work plan shall describe the steps the Discharger intends to follow if toxicity is detected. At a minimum, the work plan shall include a description of the following:

a. Investigation and evaluation techniques that will be used to identify potential causes and sources of toxicity, effluent variability, and treatment system efficiency;

b. Methods of maximizing in-house treatment efficiency and good housekeeping practices, and a list of all chemicals used in the operation of the Facility; and

c. Staff responsible for conducting TIEs (e.g., in-house expert, outside contractor).

2. **Specific TRE Work Plan.** If an accelerated monitoring test violates the chronic toxicity effluent limitation, the Discharger shall immediately initiate a TRE and submit a specific TRE work plan within 15 days. The specific work plan shall be the generic work plan revised as appropriate for this toxicity event. The Discharger shall implement the TRE in accordance with the work plan, incorporating any comments received from the Regional Water Board Executive Officer or U.S. EPA. The specific TRE work plan shall include the following:

   a. Actions to investigate, identify, and correct the causes of toxicity;

   b. Actions to mitigate the effects of the discharge and prevent the recurrence of toxicity; and

   c. Schedule for these actions, progress reports, and the final report.

3. **Toxicity Identification Evaluation (TIE).** The Discharger may initiate a TIE as part of a TRE to identify the cause of toxicity. The Discharger shall employ all reasonable efforts using currently available TIE methodologies (*Toxicity Identification Evaluation: Characterization of Chronically Toxic Effluents, Phase I* [EPA 600/6-91/005F, 1992]; *Methods for Aquatic Toxicity Identification Evaluations, Phase II Toxicity Identification Procedures for Samples Exhibiting Acute and Chronic Toxicity* [EPA 600/R-92/080, 1993]; *Methods for Aquatic Toxicity Identification Evaluations, Phase III Toxicity Confirmation Procedures for Samples Exhibiting Acute and Chronic Toxicity* [EPA 600/R-92/081, 1993]; and *Marine Toxicity Identification Evaluation [TIE]: Phase I Guidance Document* [EPA 600/R-96-054, 1996]).

F. Species Screening

1. The Discharger shall conduct a chronic toxicity screening test as described below (or as described in applicable State Water Board plan provisions that become effective after adoption of this Order) following any significant change in the nature of the effluent, except a change that reduces pollutant concentrations or a change resulting from operation of the Westside Recycled Water Project. If there is no significant change in the nature of the effluent, the Discharger shall conduct a screening test prior to submitting an application for permit reissuance.

2. Prior to undertaking a screening test, the Discharger shall submit a screening test proposal. The proposal shall address the elements below. If within 30 days the Regional Water Board

Executive Officer and U.S. EPA do not comment on the proposal, the Discharger shall commence the screening test.

3. The screening test shall use the protocols described in *Short-term Methods for Estimating the Chronic Toxicity of Effluent and Receiving Waters to West Coast Marine and Estuarine Organisms* (EPA 600/R-95/136, 1995) and test species specified in the table below:

Table E-10. Critical Life Stage Toxicity Tests

Species	Scientific Name	Effect	Test Duration
Giant kelp	*Macrocystis pyrifera*	Percent germination; germ tube length	48 hours
Abalone	*Haliotis rufescens*	Abnormal shell development	48 hours
Oyster Mussel	*Crassostrea gigas* *Mytilus edulis*	Abnormal shell development; percent survival	48 hours
Echinoderms - Urchins Sand dollar	*Strongylocentrotus purpuratus, Strongylocentrotus franciscanus, or Dendraster excentricus*	Percent fertilization or larval development	1 hour (fertilization) or 72 hours (development)
Shrimp	*Holmesimysis costata*	Percent survival; growth	7 days
Topsmelt	*Atherinops affinis*	Percent survival; growth	7 days

4. The Discharger shall conduct screening tests in two stages:

a. Stage 1 shall consist of a minimum of one battery of at least four tests conducted concurrently. Test species shall include at least one plant, one invertebrate, and one fish.

b. Stage 2 shall consist of a minimum of two test batteries initiated in different calendar months using the three most sensitive species determined based on the stage 1 test results.

5. The Discharger shall use appropriate controls and conduct concurrent reference toxicant tests.

6. The Discharger shall conduct screening tests at 75, 20, 0.67, 0.37, and 0.17 percent effluent.

VI. RECEIVING WATER MONITORING REQUIREMENTS

A. Shoreline Monitoring

1. The Discharger shall monitor shoreline receiving waters at Monitoring Locations SRF-15 east, SRF-15, SRF-17, SRF-18, SRF-19, and SRF-21.1 as follows:

Table E-11. Ambient Shoreline Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Enterococcus [1]	MPN/100 mL [2]	Grab	1/Week
Fecal coliform [3]	MPN/100 mL [2]	Grab	1/Week
Total coliform	MPN/100 mL [2]	Grab	1/Week

Abbreviation:

MPN/100 mL = most probable number per 100 milliliters

Sample Type and Frequency:

Grab = grab sample
1/Week = once per week

Footnotes:

[1] The Discharger shall monitor for enterococcus using U.S. EPA-approved methods, such as the IDEXX Enterolert method. When replicate analyses are made, the reported result shall be the geometric mean of the replicate results.

[2] Results may be reported as Colony Forming Units (CFU)/100 mL if the laboratory method used provides results in CFU/100 mL.

[3] The Discharger shall begin monitoring fecal coliform on October 1, 2020.

2. Following any combined sewer discharge at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-005, CSD-006, or CSD-007, the Discharger shall monitor shoreline receiving waters as indicated in the table below. Monitoring shall be conducted at each specified location for up to seven days or until the single-sample bacteriological standards of Cal. Code of Regs. tit. 17, section 7958(a)(1), are met (i.e., the enterococcus density is less than 104 most probable number (MPN)/100 mL, the fecal coliform density is less than 400 MPN/100 mL, and the total coliform density is less than 10,000 MPN/100 mL).

Table E-12. Post-CSD Event Shoreline Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Enterococcus [1]	MPN/100 mL [2]	Grab	1/Day [3]
Fecal coliform [4]	MPN/100 mL [2]	Grab	1/Day [3]
Total coliform	MPN/100 mL [2]	Grab	1/Day [3]
Standard observations [5]	---	---	1/Day [3]

Abbreviation:

MPN/100 mL = most probable number per 100 milliliters

Sample Type and Frequency:

Grab = grab sample
1/Day = once per day

Footnotes:

[1] The Discharger shall monitor for enterococcus using U.S. EPA-approved methods, such as the IDEXX Enterolert method. When replicate analyses are made, the reported result shall be the geometric mean of the replicate results.

[2] Results may be reported as Colony Forming Units (CFU)/100 mL if the laboratory method used provides results in CFU/100 mL.

[3] Sampling is only required at the monitoring locations indicated below when there is a combined sewer discharge at the discharge points indicated below:

Discharge Point	Monitoring Locations
CSD-001	SRF-22
CSD-002	SRF-20, SRF-21, and SRF-21.1
CSD-003	SRF-18, SRF-19, and SRF-20
CSD-005	SRF-17

CSD-006	SRF-15 east, SRF-15, and SRF-16
CSD-007	SRF-15 east, SRF-15, and SRF-16

[4] The Discharger shall begin monitoring fecal coliform on October 1, 2020.

[5] Standard observations are defined in Attachment G section III.B.3 and shall include any apparent fish kills. The estimated size of the affected area is not required.

B. Offshore Monitoring

The Discharger shall continue the Southwest Ocean Outfall Regional Monitoring Program, monitoring the area outside San Francisco Bay between Rocky Point in Marin County and Point San Pedro in San Mateo County, to identify any environmental effects of the discharge on receiving waters, sediment, or aquatic life.

1. **Sampling Frequency.** The Discharger shall sample annually in the fall when sediments are least disturbed and benthic infauna are most abundant.

2. **Sediment Chemistry Sampling**. The Discharger shall collect benthic samples from the seven historical monitoring locations (Stations 1, 2, 4, 6, 25, 28, and 31) to maintain time series data, and a minimum of 23 out of the 37 other monitoring locations (Stations 32 through 80). Samples shall be collected using a 0.1-square meter Smith-McIntyre grab sampler. The Discharger shall collect two grab samples at each station and composite the top 5 centimeters of sediment from each grab prior to analysis. The Discharger shall analyze the sediment samples for the following:

   - Total volatile solids
   - Total organic carbon
   - Kjeldahl nitrogen
   - Grain size
   - Inorganic toxic pollutants: aluminum, arsenic, cadmium, chromium, chromium (VI), copper, iron, lead, manganese, mercury, nickel, selenium, silver, and zinc. The Discharger may elect to report total chromium in lieu of chromium (VI).
   - DDT, PCBs, and PAHs

3. **Infaunal Sampling.** The Discharger shall analyze one benthic grab sample collected from each of the locations identified in the paragraph above for infaunal organisms. This sample shall be passed through 1.0- and 0.5-millimeter sieves. The Discharger shall relax organisms retained on each sieve and preserve them for later enumeration and taxonomic determination to the lowest taxon.

4. **Bioaccumulation Monitoring.** The Discharger shall conduct bioaccumulation monitoring to assess whether the concentrations of priority pollutants in marine life bioaccumulate to levels harmful to human health or the marine community. Tissue samples to assess bioaccumulation shall be collected at two locations: one at Station 1, 2, 25, or 28, and one at a reference location outside the influence of the discharge. At each location, three composite samples shall be collected of one macroinvertebrate species. Each composite sample shall consist of ten or more organisms of each species, with the preferred species being Dungeness crab (*Metacarcinus magister*). Muscle and hepatopancreas tissues shall be analyzed for inorganic

pollutants (i.e., arsenic, cadmium, chromium, copper, lead, mercury, selenium, silver, and zinc), DDT, PCBs, and PAHs.

5. **Reporting.** All offshore monitoring data shall be reported to the Regional Water Board and U.S. EPA in an Annual Report submitted by August 30 of the year following sampling. The report shall include raw data tables and summaries for each monitoring component. In addition to the annual reporting requirements, a comprehensive cumulative summary report shall be submitted with the application for permit reissuance.

VII. PRETREATMENT AND BIOSOLIDS MONITORING REQUIREMENTS

The Discharger shall comply with the following pretreatment monitoring requirements for influent at Monitoring Location INF-001A, effluent at Monitoring Location EFF-001A, and biosolids at Monitoring Location BIO-001. The Discharger shall report summaries of analytical results in pretreatment reports in accordance with Attachment H. If instructed to do so, the Discharger shall report biosolids analytical results with its electronic self-monitoring reports by manual entry, by EDF/CDF, or as an attached file.

Table E-13. Pretreatment and Biosolids Monitoring

Constituents	Influent INF-001A	Effluent EFF-001A [1]	Biosolids BIO-001	Sample Type	
				Influent and Effluent	Biosolids [7a]
VOC [2]	2/Year	2/Year	2/Year	Grab	Grab
BNA [3]	2/Year	2/Year	2/Year	Grab	Grab
Metals and Other Elements [4]	1/Month	1/Month	2/Year	C-24 [7b]	Grab
Hexavalent Chromium [5]	1/Month	1/Month	2/Year	Grab	Grab
Mercury	1/Month	1/Month [6]	2/Year	Grab	Grab
Cyanide	1/Month	1/Month	---	Grab	---
Molybdenum	---	---	2/Year	---	Grab
Organic Nitrogen	---	---	2/Year	---	Grab
Ammonia Nitrogen	---	---	2/Year	---	Grab
Total Solids	---	---	2/Year	---	Grab

Sample Types and Frequencies:

C-24 = 24-hour composite
Grab = grab sample
1/Month = once per month
2/Year = twice per year

Footnotes:

[1] Effluent monitoring conducted in accordance with Table E-4 may be used to satisfy these pretreatment monitoring requirements.

[2] VOC: volatile organic compounds.

[3] BNA: base/neutrals and acid extractable organic compounds.

[4] The metals and other elements are arsenic, cadmium, copper, lead, nickel, selenium, silver, and zinc.

[5] The Discharger may elect to monitor total chromium instead of hexavalent chromium and may elect to collect 24-hour composite samples instead of grab samples for total chromium.

[6] The Discharger shall use ultra-clean sampling (U.S. EPA Method 1669) and ultra-clean analytical methods (U.S. EPA Method 1631) for mercury monitoring, except when concentrations are expected to exceed 10 µg/L, in which case use of ultra-clean sampling and analysis methods is optional.

[7] Sample types:

a. The biosolids sample shall be a composite of the biosolids to be disposed. Biosolids sample collection and monitoring shall comply with the requirements in Attachment H, Appendix H-4. The Discharger shall also comply with the biosolids monitoring requirements in 40 C.F.R. part 503.

b. If an automatic compositor is used, the Discharger shall obtain 24-hour composite samples through flow-proportioned composite sampling. Alternatively, 24-hour composite samples may consist of discrete grab samples combined (volumetrically flow-weighted) prior to analysis or analyzed separately with the results mathematically flow-weighted.

VIII. RECYCLED WATER MONITORING REQUIREMENTS

A. Influent Monitoring

The Discharger shall monitor the monthly volume of influent to the Oceanside Water Pollution Control Plant.

B. Production Monitoring

The Discharger shall monitor the monthly volumes of effluent from the Oceanside Water Pollution Control Plant and Westside Recycled Water Project for each level of treatment.

C. Discharge Monitoring

The Discharger shall monitor the monthly volumes of effluent from the Oceanside Water Pollution Control Plant and Westside Recycled Water Project discharged to each of the following, for each level of treatment:

1. Inland surface waters, specifying volume required to maintain minimum instream flow;

2. Enclosed bays, estuaries and coastal lagoons, and ocean waters;

3. Natural systems, such as wetlands, wildlife habitats, and duck clubs, where augmentation or restoration has occurred, and that are not part of a wastewater treatment plant or water recycling treatment plant;

4. Underground injection wells, such as those classified by U.S. EPA's Underground Injection Control Program, excluding groundwater recharge via subsurface application intended to reduce seawater intrusion into a coastal aquifer with a seawater interface; and

5. Land, where beneficial use is not taking place, including evaporation or percolation ponds, overland flow, or spray irrigation disposal, excluding pasture or fields with harvested crops.

D. Reuse Monitoring

The Discharger shall monitor the following:

1. Monthly volume of recycled water distributed; and

2. Annual volumes of treated wastewater distributed for beneficial use in compliance with California Code of Regulations, title 22, in each of the use categories listed below:

a. Agricultural irrigation: pasture or crop irrigation;

b. Landscape irrigation: irrigation of parks, greenbelts, and playgrounds; school yards; athletic fields; cemeteries; residential landscaping, common areas; commercial landscaping; industrial landscaping; and freeway, highway, and street landscaping;

c. Golf course irrigation: irrigation of golf courses, including water used to maintain aesthetic impoundments within golf courses;

d. Commercial application: commercial facilities, business use (such as laundries and office buildings), car washes, retail nurseries, and appurtenant landscaping that is not separately metered;

e. Industrial application: manufacturing facilities, cooling towers, process water, and appurtenant landscaping that is not separately metered;

f. Geothermal energy production: augmentation of geothermal fields;

g. Other non-potable uses: including but not limited to dust control, flushing sewers, fire protection, fill stations, snow making, and recreational impoundments;

h. Groundwater recharge: the planned use of recycled water for replenishment of a groundwater basin or an aquifer that has been designated as a source of water supply for a public water system. Includes surface or subsurface application, except for seawater intrusion barrier use;

i. Seawater intrusion barrier: groundwater recharge via subsurface application intended to reduce seawater intrusion into a coastal aquifer with a seawater interface;

j. Reservoir water augmentation: the planned placement of recycled water into a raw surface water reservoir used as a source of domestic drinking water supply for a public water system, as defined in Health and Safety Code section 116275, or into a constructed system conveying water to such a reservoir (Wat. Code § 13561);

k. Raw water augmentation: the planned placement of recycled water into a system of pipelines or aqueducts that delivers raw water to a drinking water treatment plant that provides water to a public water system as defined in Health and Safety Code section 116275 (Wat. Code § 13561); and

l. Other potable uses: both indirect and direct potable reuse other than for groundwater recharge, seawater intrusion barrier, reservoir water augmentation, or raw water augmentation.

IX. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

The Discharger shall comply with all Standard Provisions (Attachments D, G, and H) related to monitoring, reporting, and recordkeeping.

B. Self-Monitoring Reports (SMRs)

1. **SMR Format.** The Discharger shall electronically submit SMRs using the State Water Board's California Integrated Water Quality System (CIWQS) Program website (http://www.waterboards.ca.gov/water_issues/programs/ciwqs). The CIWQS website will provide additional information for SMR submittal in the event of a service interruption for electronic submittal.

2. **SMR Due Dates and Contents.** The Discharger shall submit SMRs by the due dates, and with the contents, specified below:

   a. Monthly SMRs. Monthly SMRs shall be due 30 days after the end of each calendar month, covering that calendar month. The monthly SMR shall contain the applicable items described in sections V.B and V.C of both Attachments D and G of this Order.

   Monthly SMRs shall include all new monitoring results obtained since the last SMR was submitted. If the Discharger monitors any pollutant more frequently than required by this Order, the Discharger shall include the results of such monitoring in the calculations and reporting for the SMR.

   b. Annual SMR. Annual SMRs shall be due February 1 each year, covering the previous calendar year. The annual SMR shall contain the items described in Attachment G section V.C.1.f. See also Provision VI.C.2 (Effluent Characterization Study and Report) of the Order for requirements to submit reports with the annual SMR.

   c. Specifications for Submitting SMRs to CIWQS. The Discharger shall submit analytical results and other information using one of the following methods:

Table E-14. CIWQS Reporting

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	Attached File
All parameters identified in influent, effluent, and receiving water monitoring tables (except Dissolved Oxygen and Temperature)	Required for all results	
Dissolved Oxygen Temperature	Required for monthly maximum and minimum results only [1]	Discharger may use this method for all results or keep records

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	**Attached File**
Antimony, Arsenic, Beryllium, Cadmium, Chromium, Copper, Cyanide, Lead, Mercury, Nickel, Selenium, Silver, Thallium, Zinc, Dioxins &Furans (by U.S. EPA Method 1613), Other Pollutants (by U.S. EPA Methods 601, 602, 608, 610, 614, 624, and 625)	Required for all results [2]	
Volume and Duration of Blended Discharge [3]	Required for all blended effluent discharges	
Analytical Method	Not required (Discharger may select "data unavailable") [1]	
Collection Time Analysis Time	Not required (Discharger may select "0:00") [1]	

Footnotes:

[1] The Discharger shall continue to monitor at the minimum frequency specified in this MRP, keep records of the measurements, and make the records available upon request.

[2] These parameters require EDF/CDF data upload or manual entry regardless of whether monitoring is required by this MRP or other provisions of this Order (except for biosolids, sludge, or ash provisions).

[3] The requirement for volume and duration of blended discharge applies only if this Order authorizes the Discharger to discharge blended effluent.

The Discharger shall arrange all reported data in a tabular format and summarize the data to clearly illustrate whether the Facility is operating in compliance with effluent limitations. The Discharger is not required to duplicate the submittal of data entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format, the Discharger shall electronically submit the data in a tabular format as an attachment.

3. **Monitoring Periods.** Monitoring periods for all required monitoring shall be as set forth below unless otherwise specified:

Table E-15. Monitoring Periods

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
Continuous	Order effective date	All times
1/Day	Order effective date	Every 24-hour period, beginning at midnight and continuing through 11:59 p.m. (or any 24-hour period that reasonably represents a calendar day for purposes of sampling)
1/Week 5/Week	First Sunday following or on Order effective date	Sunday through Saturday

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
1/Month	First day of calendar month following or on Order effective date	First day of calendar month through last day of calendar month
1/Quarter	Closest of January 1, April 1, July 1, or October 1 following or on Order effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31
1/Year 3/Year	Closest January 1 following or on Order effective date	January 1 through December 31
2/Year	Closest January 1 or July 1 following or on Order effective date	January 1 through June 30 July 1 through December 31
1/Event	As soon as possible after combined sewer discharge event begins	Duration of the combined sewer discharge event

4. **RL and MDL Reporting.** The Discharger shall report with each sample result the Reporting Level (RL) and Method Detection Limit (MDL) as determined by the procedure in 40 C.F.R. part 136. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

   a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

   b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

   For purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ. The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (+/- a percentage of the reported value), numerical ranges (low to high), or any other means the laboratory considers appropriate.

   c. Sample results less than the laboratory's MDL shall be reported as "Not Detected", or ND.

   d. The Discharger shall instruct laboratories to establish calibration standards so that the minimum level (ML) value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.

5. **Compliance Determination.** Compliance with effluent limitations shall be determined using sample reporting protocols defined above and in the Fact Sheet and Attachments A, D, and G. For purposes of reporting and administrative enforcement by the Regional Water Board, State Water Board, or U.S. EPA, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the RL.

C. Discharge Monitoring Reports (DMRs)

DMRs are U.S. EPA reporting requirements. The Discharger shall electronically certify and submit DMRs together with SMRs using the Electronic Self-Monitoring Reports module eSMR 2.5 or the latest upgraded version. Electronic DMR submittal shall be in addition to electronic SMR submittal. Information about electronic DMR submittal is available at the DMR website at http://www.waterboards.ca.gov/water_issues/programs/discharge_monitoring.

D. Annual Recycled Water Reports

The Discharger shall electronically submit annual reports to the State Water Board by April 30 each year covering the previous calendar year using the State Water Board's GeoTracker website (http://geotracker.waterboards.ca.gov) under a site-specific global identification number. For the 2019 calendar year, the Discharger shall submit a report by April 30, 2020, covering January through December 2019. The annual report shall include the elements specified in Attachment E section VIII.

ATTACHMENT F – FACT SHEET

Contents

Tables

ATTACHMENT F – FACT SHEET

This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order. As described in section II.B of this Order, the Regional Water Board and U.S. EPA incorporate this Fact Sheet as findings supporting the issuance of this Order.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility.

Table F-1. Facility Information

WDID	2 386009001
CIWQS Place ID	256498
Discharger	City and County of San Francisco
Name of Facility	Oceanside Water Pollution Control Plant, Wastewater Collection System, and Westside Recycled Water Project
Facility Address	3500 Great Highway San Francisco, CA 94132 San Francisco County
Facility Contact, Title and Phone	Dale Miller, Operations Superintendent, Wastewater Enterprise, (415) 242-2225
Authorized Person to Sign and Submit Reports	Greg Norby, Assistant General Manager, Wastewater Enterprise, (415) 554-2465
Mailing Address	San Francisco Public Utilities Commission/Wastewater Enterprise 525 Golden Gate Ave., 13th Floor, San Francisco, CA 94102
Billing Address	Same
Type of Facility	Publicly-Owned Treatment Works (POTW) and Combined Sewer System
Major or Minor Facility	Major
Threat to Water Quality	2
Complexity	A
Pretreatment Program	Yes
Reclamation Requirements	State Water Board Order WQ 2016-0068-DDW
Facility Permitted Flow	43 million gallons per day (MGD), maximum dry weather flow
Facility Design Flow	Oceanside Water Pollution Control Plant 43 MGD maximum dry weather design flow (secondary treatment) 65 MGD maximum wet weather design flow (secondary treatment for 43 MGD and primary treatment for an additional 22 MGD) Westside Recycled Water Project 4 MGD maximum design flow (1.6 MGD annual average)
Watershed	San Mateo Coastal Basin
Receiving Water	Pacific Ocean
Receiving Water Type	Ocean waters

A. The City and County of San Francisco (Discharger) owns and operates the Oceanside Water Pollution Control Plant and its wastewater collection system. The Discharger plans to construct, own, and operate the Westside Recycled Water Project during this Order's term. Collectively, the Oceanside Water Pollution Control Plant, wastewater collection system, and Westside

Recycled Water Project are referred to as the Facility. The Facility discharges to the Pacific Ocean, a water of the United States.

For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. The Discharger is regulated pursuant to National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037681. It was previously subject to Order No. R2-2009-0062 (previous order). The Discharger filed a Report of Waste Discharge and submitted an application for reissuance of its waste discharge requirements (WDRs) and NPDES permit on April 3, 2014, and the previous order was administratively extended by operation of law. Order No. R2-2010-0054 amended the previous order to update the Regional Standard Provisions (Attachment G); Order No. R2-2011-0009 amended the previous order to update the pretreatment program requirements (Attachment H).

The Discharger is authorized to discharge subject to the WDRs and NPDES permit requirements in this Order at the discharge locations described in Table 2 of this Order. Regulations at 40 C.F.R. section 122.46 limit the duration of NPDES permits to a fixed term not to exceed five years. Accordingly, Table 3 of this Order limits the duration of the discharge authorization. Pursuant to California Code of Regulations, title 23, section 2235.4, the terms and conditions of an expired permit are automatically continued pending reissuance of the permit if the Discharger complies with all requirements for continuation of expired permits. (See 40 C.F.R § 122.6[d].)

II. FACILITY DESCRIPTION

A. Wastewater and Biosolids Treatment

1. **Location and Service Area.** The Oceanside Water Pollution Control Plant is located at 3500 Great Highway, San Francisco. The plant provides wastewater treatment for western San Francisco and a small portion of Daly City owned and operated by the North San Mateo County Sanitation District. The service area population is approximately 250,000. The Discharger is constructing a recycled water project at the plant site during this Order's term. The wastewater collection system is located throughout the western side of San Francisco. Attachment B shows maps of the Facility area.

2. **Collection System.** The Discharger's collection system is predominantly a combined sewer system with some limited separate sanitary sewers. The combined sewer system consists of approximately 250 miles of pipe, one major pump station (Westside Pump Station), six minor pump stations (four all-weather pump stations: Westside, Sea Cliff No. 1, Sea Cliff No. 2, and Pine Lake; and two wet weather pump stations: Sea Cliff No. 3 and Zoo Wet Weather Lift Station), and three large transport/storage structures (Westside Transport/Storage Structure, a 49.3-million-gallon box-like structure located beneath the Great Highway; Richmond Tunnel, a 12.0-million-gallon tunnel located to the north; and Lake Merced Tunnel, a 10.0-million-gallon tunnel located to the south). The separate sanitary sewer systems serve isolated areas and are also regulated under State Water Board

Order No. 2006-0003-DWQ as amended by State Water Board Order No. WQ 2013-0058-EXEC.

3. Wastewater Treatment

a. Oceanside Water Pollution Control Plant. During dry weather, the plant provides secondary treatment. The treatment processes include coarse screening at the Westside Pump Station, fine screening and grit removal at the plant headworks, primary sedimentation, activated sludge treatment by a high-purity oxygen process, and secondary clarification. The effluent is not disinfected. The plant has a maximum secondary treatment design capacity of about 43 million gallons per day (MGD). During wet weather, the plant can provide primary treatment for about 22 MGD more, which is combined with the secondary-treated effluent prior to discharge for a total treatment capacity of 65 MGD. Plant effluent flows to Discharge Point No. 001 by gravity.

b. Combined Sewer System. The combined storage capacity of the three transport/storage structures is about 71 million gallons. Collection system piping provides about 2 million gallons of additional storage. The transport/storage structures provide flow equalization and convey combined sewer system flows up to 65 MGD to the plant by way of the Westside Pump Station.

Flows above the plant's 65-MGD treatment capacity receive equivalent-to-primary treatment through solids settling, skimming of floatable solids, and in some cases screening within the combined sewer system. In addition to pumping up to 65 MGD to the plant, the Westside Pump Station can also pump flow from the Westside Transport/Storage Structure to Discharge Point No. 001 during wet weather (identified in the previous order as "decant"). The design capacity of the Westside Pump Station wet weather pumps ranges from 98 to 133 MGD depending on the number and model of pumps operating when there are high water levels in the West Box of the Westside Transport/Storage Structure (typically observed during wet weather operations). Flows that exceed the capacities of the Oceanside Water Pollution Control Plant and combined sewer system may discharge from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007. Four of these discharge points are directly connected to transport/storage structures (Discharge Point Nos. CSD-001, CSD-002, CSD-003, and CSD-004), and three are associated with pump station sumps (Discharge Point Nos. CSD-005, CSD-006, and CSD-007). After wet weather events, stored combined sewer system flows and accumulated solids remaining in the transport/storage structures are conveyed to the plant for treatment.

4. Sludge and Biosolids Management. The Discharger uses temperature-phased anaerobic digestion, which is capable of producing Class A biosolids. Primary sludge, waste activated sludge, and secondary scum are mixed and co-thickened using gravity belt thickeners prior to being fed to the anaerobic digestion system. The digestion system accepts hauled-in batches of primary and secondary sludge from the Treasure Island Wastewater Treatment Plant. Digested biosolids are dewatered using screw presses and stored in hoppers prior to being loaded into covered trucks for transport. During the wet season, the majority of biosolids are hauled to a landfill for storage and eventual use as interim cover, final cover, or landfill

building material; a small percentage is reused for agricultural land application. During the dry season, biosolids are hauled offsite for agricultural land application.

5. **Water Recycling and Reclamation**. The Discharger is constructing a recycled water project at the Oceanside Water Pollution Control Plant site during this Order's term. Secondary-treated effluent will be treated further with membrane filtration, reverse osmosis, and ultraviolet (UV) light disinfection to produce recycled water. The concentrate from the reverse osmosis process will be commingled with plant effluent prior to discharge at Discharge Point No. 001. Filter backwash water generated at the Westside Recycled Water Project will be directed to the plant headworks for treatment. The project is expected to produce and deliver an annual average flow of 1.6 MGD of recycled water for distribution in the western portion of San Francisco, with peak deliveries of up to 4 MGD during summer. Water recycling operations will not increase the mass of pollutants discharged at Discharge Point No. 001, but will increase the concentration of pollutants discharged. The requirements of this Order account for the discharge from this water recycling project. Reclamation requires waste discharge requirements beyond those specified here, such as those in State Water Board Order No. WQ 2016-0068-DDW (Water Reclamation Requirements for Recycled Water Use).

B. Discharge Points and Receiving Waters

1. **Discharge Point No. 001.** During dry weather, secondary-treated effluent is discharged at Discharge Point No. 001. During wet weather, the discharge at Discharge Point No. 001 comprises primary-treated and secondary-treated effluent from the Oceanside Water Pollution Control Plant and equivalent-to-primary-treated effluent from the Westside Transport/Storage Structure. When the Westside Recycled Water Project becomes operational, reverse osmosis concentrate will also be discharged at Discharge Point No. 001.

   Discharge Point No. 001 is a 4.5-mile-long (3.9 nautical mile-long) deepwater outfall that terminates with a diffuser that begins approximately 3.8 miles (3.3 nautical miles) from shore at a depth of 78 feet below mean lower low water (MLLW). The diffuser has 85 risers spread along a 3,000-foot outfall pipe. Each riser has eight ports. Discharge Point No. 001 discharges to the Pacific Ocean beyond the territorial waters of the State, which end three nautical miles from MLLW at shore.

2. **Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007.** During wet weather, equivalent-to-primary-treated wastewater is discharged to the Pacific Ocean at Discharge Point Nos. CSD-001, CSD-002, CSD-003, and CSD-004 when the Westside Pump Station capacity is exceeded, and at Discharge Point Nos. CSD-005, CSD-006, and CSD-007 when the capacities of the corresponding pump stations (i.e., Sea Cliff No. 1 and Sea Cliff No. 2 Pump Stations) are exceeded, including the capacity of the wet well connected to Discharge Point No. CSD-006. These discharge points are located within the territorial waters of the State.

C. Summary of Previous Requirements and Self-Monitoring Data

1. **Dry Weather.** Dry weather effluent limitations and representative monitoring data from the previous order term are presented below for discharges from the Oceanside Water Pollution Control Plant at Discharge Point No. 001:

Table F-2. Previous Dry Weather Effluent Limitations and Monitoring Data

Parameter	Units	Effluent Limitations				Monitoring Data (1/2011 – 12/2017)				
		6-Month Median	Monthly Average	Weekly Average	Daily Max.	Median	Highest 6-Month Median	Highest Monthly Average	Highest Weekly Average	Highest Daily Max.
Biochemical Oxygen Demand, 5-day @ 20°C (BOD_5)	mg/L	---	30	45	---	15	---	29	51 [1]	---
Total Suspended Solids (TSS)	mg/L	---	30	45	---	10	---	18	26	---
BOD_5 percent removal	%	---	85 (min.)	---	---	95	---	87 [2]	---	---
TSS percent removal	%	---	85 (min.)	---	---	96	---	92 [2]	---	---
pH	s.u.	Within a range of 6.0 – 9.0				Within a range of 6.0 – 8.3				
Chronic Toxicity	TU_c	---	---	---	150	50	---	---	---	149
Mercury	µg/L	5.9	---	---	24	0.0068	0.0093	---	---	0.071

Abbreviations:

Max. = maximum
min. = minimum
mg/L = milligrams per liter
µg/L = micrograms per liter
s.u. = standard units
TU_c = chronic toxicity units

Footnotes:

[1] The Discharger exceeded the weekly average effluent limitation three times during the previous order term, in October 2013, July 2014, and June 2017. The Discharger attributes these exceedances to the presence of nitrifying bacteria since carbonaceous biochemical oxygen demand ($CBOD_5$) concentrations were within the expected range. This Order allows $CBOD_5$ effluent limitations to be substituted for BOD_5 effluent limitations to address this concern, as described in Fact Sheet section IV.B.2, below.

[2] Lowest monthly average.

2. **Wet Weather.** Wet weather requirements from the previous order term included implementation of the nine minimum controls and the long-term control plan. The combined sewer system was designed to achieve a long-term average of eight combined sewer discharges per year. The following two tables summarize combined sewer discharges over a 20-year period and average combined sewer discharge durations for wet season 2012-2013.

Table F-3. Combined Sewer Discharge Frequency

Year (July 1 – June 30)	Rain (inches)	Number of Combined Sewer Discharges [1]						
		Lake Merced CSD-001	Vicente CSD-002	Lincoln CSD-003	Mile Rock CSD-004	Sea Cliff No. 1 CSD-005	Sea Cliff Sewer CSD-006	Sea Cliff No. 2 CSD-007
1997-1998	41.1	10	13	13	[2]	2	[3]	10

Year (July 1 – June 30)	Rain (inches)	Number of Combined Sewer Discharges [1]						
		Lake Merced CSD-001	Vicente CSD-002	Lincoln CSD-003	Mile Rock CSD-004	Sea Cliff No. 1 CSD-005	Sea Cliff Sewer CSD-006	Sea Cliff No. 2 CSD-007
1998-1999	18.9	6	7	7	[2]	0	[3]	0
1999-2000	23.2	5	6	6	[2]	1	[3]	1
2000-2001	13.8	2	0	0	[2]	2	[3]	2
2001-2002	24.4	6	6	6	[2]	1	[3]	1
2002-2003	22.3	5	6	6	[2]	1	[3]	7
2003-2004	18.8	4	4	4	[2]	2	[3]	8
2004-2005	26.2	7	7	6	[2]	5	[3]	8
2005-2006	31.8	11	9	9	[2]	3	[3]	9
2006-2007	14.8	2	1	1	[2]	0	[3]	2
2007-2008	18.4	4	4	4	[2]	0	[3]	1
2008-2009	18.3	4	4	4	[2]	0	[3]	1
2009-2010	25.8	4	3	3	[2]	6	[3]	7
2010-2011	30.1	5	4	4	[2]	0	0	3
2011-2012	17.0	3	3	2	[2]	2	0	3
2012-2013	19.7	6	6	6	[2]	3	1	3
2013-2014	12.0	3	2	2	[2]	0	1	3
2014-2015	17.7	6	6	6	[2]	3	0	4
2015-2016	18.6	9	8	6	[2]	1	0	4
2016-2017	32.4	13	13	13	[2]	1	0	14
2017-2018	18.0	3	3	3	[2]	0	0	5
Average	**22.1**	**5.6**	**5.5**	**5.3**	[2]	**1.5**	**0.3**	**4.6**

Footnotes:

[1] This table reflects rain and discharge frequencies reported in monthly self-monitoring reports.

[2] The previous order did not require monitoring at Discharge Point No. CSD-004.

[3] The Discharger did not monitor combined sewer discharge frequency at Discharge Point No. CSD-006 until it installed telemetry in 2010.

Table F-4. Combined Sewer Discharge Duration (July 1, 2012, through June 30, 2013)

	Lake Merced CSD-001	Vicente CSD-002	Lincoln CSD-003	Mile Rock CSD-004	Sea Cliff No. 1 CSD-005	Sea Cliff Sewer CSD-006	Sea Cliff No. 2 CSD-007
Days with Rainfall	53	53	53	[1]	53	53	53
Discharge Events	6	6	6 [2]	[1]	3	1	3
Average Duration (hours)	2.39	3.28	3 [2]	[1]	0.08	0.58	0.28
Average Volume/Event (million gallons)	2.75	3.16	[2]	[1]	0.002	0.08	0.01

Footnotes:

[1] The previous order did not require monitoring at Discharge Point No. CSD-004.

[2] Telemetry equipment for Discharge Point No. CSD-003 was not operational in December 2012. Due to similar weir heights and positions within the system, discharges likely occur simultaneously at Discharge Point Nos. CSD-002 and CSD-003. As such, about six discharges likely occurred from Discharge Point No. CSD-003 between July 1, 2012, and June 30, 2013, lasting an average duration of about 3 hours.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

A. Legal Authorities

This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260) for discharges to waters of the State. This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA, and Water Code chapter 5.5, division 7 (commencing with § 13370). It serves as an NPDES permit for point source discharges from the Facility to surface waters.

B. California Environmental Quality Act

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act, Public Resources Code division 13, chapter 3 (commencing with § 21100). On September 3, 2015, the San Francisco Planning Commission certified the Final Environmental Impact Report for the Westside Recycled Water Project, finding that the Discharger, acting through the San Francisco Planning Department, fulfilled all California Environmental Quality Act procedural requirements.

C. State and Federal Laws, Regulations, Policies, and Plans

1. **Water Quality Control Plan.** The Regional Water Board adopted the *Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan), which designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters in the San Francisco Bay Region. Requirements of this Order implement the Basin Plan. The table below lists the beneficial uses the Basin Plan attributes to the Pacific Ocean:

Table F-5. Basin Plan Beneficial Uses

Receiving Water	Beneficial Uses
Pacific Ocean	• Industrial Service Supply (IND) • Commercial and Sport Fishing (COMM) • Shellfish Harvesting (SHELL) • Marine Habitat (MAR) • Fish Migration (MIGR) • Preservation of Rare and Endangered Species (RARE) • Fish Spawning (SPWN) • Wildlife Habitat (WILD) • Water Contact Recreation (REC1) • Noncontact Water Recreation (REC2) • Navigation (NAV)

Basin Plan Table 4-1, Discharge Prohibition 1, prohibits wastewater discharges with particular characteristics of concern to beneficial uses at any point at which the wastewater does not receive a minimum initial dilution of at least 10:1. Basin Plan section 4.2 provides for exceptions under certain circumstances:

- An inordinate burden would be placed on the Discharger relative to the beneficial uses protected, and an equivalent level of environmental protection can be achieved by alternate means;
- A discharge is approved as part of a reclamation project;
- Net environmental benefits will be derived as a result of the discharge; or
- A discharge is approved as part of a groundwater cleanup project.

The Basin Plan further states:

> Significant factors to be considered by the Regional Water Board in reviewing requests for exceptions will be the reliability of the discharger's system in preventing inadequately treated wastewater from being discharged to the receiving water and the environmental consequence of such discharges.

During wet weather, this Order grants an exception to Basin Plan Discharge Prohibition 1 for discharges at Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 for the following reasons:

- Eliminating all wet weather combined sewer discharges or ensuring that these discharges receive a minimum initial dilution of 10:1 would be an inordinate burden disproportionate to the beneficial uses protected. The Discharger continues to invest in infrastructure to improve the combined sewer system (San Francisco Public Utilities Commission Wastewater Enterprise, *Report of Waste Discharge, Supplemental Information, Capital Improvements and Operational Changes*, April 3, 2014). This Order continues to require capture and treatment of all combined wastewater and stormwater. This Order also requires the Discharger to evaluate control alternatives to eliminate, relocate, or reduce the magnitude or frequency of combined sewer discharges.

- An equivalent level of environmental protection is provided because operating a combined sewer system, as opposed to a separate sewer system, removes many pollutants in urban runoff that elsewhere in the Region are discharged through stormwater outfalls with little or no treatment. This additional treatment comes at the cost of occasionally discharging partially-treated combined sewage and stormwater through Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007. The Monitoring and Reporting Program (MRP) (Attachment E) requires the Discharger to monitor combined sewer discharges and receiving waters to verify that an equivalent level of environmental protection is provided.

2. **California Ocean Plan.** The State Water Board adopted the *Water Quality Control Plan for Ocean Waters of California, California Ocean Plan* (Ocean Plan) in 1972 and has amended it several times, including in 1978 and most recently in 2018. The most recent changes became effective February 4, 2019. The Ocean Plan establishes water quality objectives and a program of implementation to protect beneficial uses of the Pacific Ocean within the territorial waters of the State.

   The territorial waters of the State end 3 nautical miles from shore. Discharge Point No. 001 is approximately 3.8 miles (3.3 nautical miles) offshore in federal waters. The Ocean Plan

(Appendix 1, Ocean Waters) states, "If a discharge outside the territorial waters of the State could affect the quality of the waters of the State, the discharge may be regulated to assure no violation of the Ocean Plan will occur in ocean waters." This Order contains discharge prohibitions, effluent limitations, receiving water limitations, and other provisions to ensure that discharges from Discharge Point No. 001 do not affect State waters. This Order's requirements related to Discharge Point No. 001 are based on U.S. EPA's federal authorities pursuant to the Clean Water Act.

a. Beneficial Uses. The table below lists the beneficial uses the Ocean Plan assigns to the Pacific Ocean:

Table F-6. Ocean Plan Beneficial Uses

Receiving Water	Beneficial Uses
Pacific Ocean	• Industrial Water Supply • Water Contact and Non-Contact Recreation, including Aesthetic Enjoyment • Navigation • Commercial and Sport Fishing • Mariculture • Preservation and Enhancement of Designated Areas of Special Biological Significance (ASBS) • Rare and Endangered Species • Marine Habitat • Fish Migration • Fish Spawning • Shellfish Harvesting

b. State Water Board Order No. WQ 79-16. During wet weather, State Water Board Order No. WQ 79-16 sets forth requirements for discharges from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007. Ocean Plan chapter III.J allows the State Water Board to grant exceptions to Ocean Plan requirements on a case-by-case basis if the public interest is served and the exception does not compromise beneficial uses (exceptions are listed in Ocean Plan Table VII-1). In 1979, the State Water Board granted the Discharger an exception from Ocean Plan requirements and imposed conditions, including but not limited to the following:

- Except for the bacteriological standards, to the greatest extent practical, the Discharger is to design, construct, and operate facilities to conform to the remaining standards set forth in chapter II of the 1978 Ocean Plan. These standards relate to physical characteristics (i.e., floating particulates, discoloration, natural light, and inert solids deposition), chemical characteristics (i.e., dissolved oxygen, pH, dissolved sulfide, toxic and organic chemicals in marine sediments, and nutrients), biological characteristics (i.e., marine communities and taste, odor, and color of marine resources used for human consumption), and radioactivity. Provisions V and VI.C.5 of this Order, and Attachments D and G sections I.C and I.D, require the Discharger to design, construct, and operate its facilities to conform to these standards to the greatest extent practical.

- To the greatest extent practical, the Discharger is to design, construct, and operate facilities to comply with the conditions controlled by the requirements set forth in chapter III, sections A and B, of the 1978 Ocean Plan. These requirements call for waste management systems to be designed and operated in a manner that will maintain indigenous marine life and a healthy and diverse marine community. They also call for waste discharges to be essentially free of floatable and settleable material, substances toxic to marine life due to increases in concentrations in water or sediments, substances that significantly decrease natural light, and materials that result in esthetically undesirable discoloration of the ocean surface. Provisions V and VI.C.5 of this Order and Attachments D and G sections I.C and I.D require the Discharger to design, construct, and operate its facilities to conform to these requirements to the greatest extent practical.

- The Discharger is to design and construct facilities to contain all stormwater runoff beyond that associated with an average of eight combined sewer discharges per year. Section III and Provision VI.C.5.c of this Order implement this condition.

- Beaches affected by combined sewer discharges are to be posted with warning signs beginning when the discharge commences until analysis indicates that water quality meets Ocean Plan bacteriological standards for recreation. Provision VI.C.5.a.viii of this Order implements this condition.

- Shellfish areas harvested for human consumption that may be affected by combined sewer discharges are to be posted with warning signs beginning when the discharge commences until the City and County Health Department indicates that no further posting is required. Provision VI.C.5.a.viii of this Order implements this condition.

- The Discharger is to comply with federal and State source control programs to minimize the entry of toxic substances into the waste collection system from industrial sources. Provisions VI.C.4.b and VI.C.5.a.iii of this Order and Attachment H implement this condition.

- The Discharger is to implement a self-monitoring program in accordance with Regional Water Board specifications. Provision VI.B of this Order and Attachment E implement this condition.

State Water Board Order No. WQ 79-16 explains the rationale for this exception and its conditions. It also states that the Regional Water Board or U.S. EPA may require construction of additional facilities or modification of existing Facility operations if it finds (1) changes in the location, intensity, or importance of affected beneficial uses, or (2) demonstrated unacceptable adverse impacts result from Facility operations as currently constructed.

3. **Combined Sewer Overflow (CSO) Control Policy.** On April 11, 1994, U.S. EPA adopted the *Combined Sewer Overflow (CSO) Control Policy* to establish a national approach for controlling combined sewer discharges and overflows (59 Fed. Reg. 18688-18698, April 19, 1994). The Wet Weather Water Quality Act of 2000 amended the CWA to require that

permits issued after December 21, 2000, for discharges from combined sewer systems conform to the *Combined Sewer Overflow (CSO) Control Policy* (33 U.S.C. § 1342[q][1]). Requirements of this Order implement the *Combined Sewer Overflow (CSO) Control Policy*, including the implementation of the nine minimum controls, a Long-Term Control Plan, and a post-construction monitoring program. (See Fact Sheet § VI.C.5.)

4. **Antidegradation Policy.** Federal regulations at 40 C.F.R. section 131.12 require that state water quality standards include an antidegradation policy consistent with stated requirements. The State Water Board established California's antidegradation policy through State Water Board Resolution No. 68-16, "*Statement of Policy with Respect to Maintaining High Quality of Waters in California*," which meets the federal antidegradation policy requirements. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, the antidegradation policy. Permitted discharges must be consistent with the antidegradation provisions of 40 C.F.R. section 131.12 and Resolution No. 68-16. (See Fact Sheet § IV.D.2.)

5. **Anti-Backsliding Requirements.** CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed. (See Fact Sheet § IV.D.1.)

6. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code §§ 2050 to 2097) or the federal Endangered Species Act (16 U.S.C. §§ 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other provisions to protect beneficial uses, including protecting rare and endangered species. The Discharger is responsible for meeting all Endangered Species Act requirements.

   U.S. EPA's reissuance of this NPDES permit is subject to certain requirements of the federal Endangered Species Act of 1973 and the Magnuson-Stevens Fishery Conservation and Management Act. In October 2017, U.S. EPA requested updated information from the National Marine Fisheries Service and the U.S. Fish and Wildlife Service (collectively, the Services) related to (1) essential fish habitat and managed and associated species, and (2) threatened and endangered species and their designated critical habitats near Discharge Point No. 001. U.S. EPA made a "may affect, not likely to adversely affect" determination for the southern California steelhead, Central California Coho salmon, Central Valley, spring-run chinook salmon, Sacramento River winter-run chinook salmon, humpback whale, leatherback turtle, green sea turtle, loggerhead turtle, white abalone, and olive ridley sea turtle; and a "no effect" determination for the remaining listed species under the Services' jurisdictions (*U.S. EPA Biological Evaluation*, September 2018). U.S. EPA provided a revised biological evaluation to the Services in April 2019. U.S. EPA may decide that changes to this Order are warranted based on the results of the completed consultation, and may modify or reopen it prior to the expiration date as described in Provision VI.C.1 of this Order.

7. **Sludge and Biosolids.** U.S. EPA administers 40 C.F.R. part 503, "Standards for the Use or Disposal of Sewage Sludge," which regulates the final use or disposal of sewage sludge generated during the treatment of domestic sewage in a municipal wastewater treatment facility. This Order does not authorize any act that violates those requirements. The Discharger is responsible for meeting all applicable requirements of 40 C.F.R. part 503.

8. **Ocean Discharge Criteria Evaluation.** CWA section 403(c) and implementing regulations at 40 C.F.R. part 125, subpart M, establish ocean discharge criteria for preventing unreasonable degradation of the marine environment of the territorial seas, contiguous zones, and oceans. The regulations at 40 C.F.R. section 125.122(b) allow a permitting authority to presume that a discharge will not cause unreasonable degradation for specific pollutants or conditions if the discharge complies with state water quality standards. This Order implements State water quality standards for discharges from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007. This Order also implements State water quality standards for discharges from Discharge Point No. 001, with the modifications described below.

   This Order's requirements for Discharge Point No. 001 are consistent with the Ocean Plan, except with respect to chronic toxicity and TCDD equivalents. In all other respects, therefore, U.S. EPA presumes that the discharge will not cause unreasonable degradation. With respect to chronic toxicity and TCDD equivalents, U.S. EPA is required to consider the site-specific factors listed in 40 C.F.R. section 125.122(a). U.S. EPA prepared an evaluation under CWA section 403(c) for chronic toxicity and TCDD equivalents and concluded that no unreasonable degradation of ocean waters will occur.

9. **Coastal Zone Management Act.** The California Coastal Commission has indicated that it is unnecessary to obtain a consistency certification pursuant to the Coastal Zone Management Act (16 U.S.C. § 1451 et seq.).

D. Impaired Waters on CWA 303(d) List

On April 6, 2018, U.S. EPA approved a revised list of California's impaired waters pursuant to CWA section 303(d), which requires identification of specific waters where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. Where it has not done so already, the Regional Water Board plans to adopt total maximum daily loads (TMDLs) for waters on the 303(d) list. TMDLs establish wasteload allocations for point sources and load allocations for nonpoint sources, and are established to achieve the water quality standards for the impaired waters. This Order does not authorize any discharge to receiving waters on California's list of impaired waters.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 C.F.R. section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 C.F.R.

section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

A. Discharge Prohibitions

1. **Prohibition III.A (Discharge different than described).** This prohibition is based on 40 C.F.R. section 122.21(a) and Water Code section 13260, which require filing an application and Report of Waste Discharge before a discharge can occur. Discharges not described in the application and Report of Waste Discharge, and subsequently in this Order, are prohibited.

2. **Prohibition III.B (Bypass of untreated or partially-treated wastewater).** This prohibition is based on the *Combined Sewer Overflow (CSO) Control Policy* and 40 C.F.R. section 122.41(m) (see Attachment D section I.G). Pursuant to 40 C.F.R. section 122.41(m)(4)(ii), the Regional Water Board and U.S. EPA approve bypass of the biological treatment units (i.e., blending primary-treated effluent with biologically-treated effluent) during wet weather, when treatment plant influent flow exceeds 43 MGD (the hydraulic capacity of the biological treatment units), because such bypass meets the criteria for approval set forth in 40 C.F.R. sections 122.41(m)(4)(i)(A)-(C):

   - When influent flow exceeds 43 MGD, bypass of biological treatment is unavoidable to prevent loss of life, personal injury, or severe property damage. Such bypass prevents the washout of solids and the microbial population from the biological treatment system and thus ensures treatment reliability. Moreover, such bypass prevents backups and flooding in the community that could cause personal injury or severe property damage.

   - There are no feasible alternatives to bypass when influent flow exceeds 43 MGD. Provisions VI.C.5.c and VI.C.5.d require the Discharger to implement all feasible measures to maximize treatment. As long as the Discharger complies with these provisions, it is implementing all feasible alternatives to avoid bypass during wet weather.

   - The Discharger provided notice at least ten days before any wet weather bypass in its *Report of Waste Discharge, Oceanside Water Pollution Control Plant and Westside Wet Weather Facilities* (April 3, 2014) and *Wastewater Enterprise Westside Operations Summary Baseline Report* (March 2014).

3. **Prohibition III.C (Discharge at Discharge Point No. 001 without minimum initial dilution of at least 148:1).** This prohibition is necessary to ensure that the assumptions used to derive the dilution credits established through this Order for Discharge Point No. 001 remain substantially the same so the effluent limitations at Discharge Point No. 001 remain protective of water quality. This Order considered a dilution credit of 148:1, as modeled assuming no currents, based on the Discharger's *Southwest Ocean Outfall Dilution Modeling Report, Final Report* (April 2014) to conduct the reasonable potential analysis described in Fact Sheet section IV.C.4. Moreover, the in-stream waste concentration (IWC) to be used to evaluate compliance with this Order's chronic toxicity effluent limitation is based on this dilution credit. When the Discharger produces 1.0 MGD of recycled water and discharges

reverse osmosis concentrate, the IWC for chronic toxicity testing reflects a dilution credit of 266:1, as modeled assuming currents. Both dilution credits correspond to the same outfall configuration, which this prohibition seeks to maintain.

4. **Prohibition III.D (Discharge from location other than Discharge Point No. 001, except during wet weather).** This prohibition clarifies that any discharges other than those to Discharge Point No. 001 are unauthorized, except those to Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 as explicitly authorized during wet weather in accordance with the *Combined Sewer Overflow (CSO) Control Policy*.

5. **Prohibition III.E (Discharge in excess of permitted flow).** This Order prohibits an average dry weather effluent flow greater than 43 MGD based on the plant's secondary treatment design capacity. Exceeding the secondary treatment design capacity could result in lowering the reliability of achieving this Order's treatment requirements.

B. Technology-Based Effluent Limitations

1. **Scope and Authority.** CWA section 301(b) and 40 C.F.R. section 122.44 require that permits include conditions meeting applicable technology-based requirements, at a minimum, and any more stringent effluent limitations necessary to meet water quality standards.

2. **Oceanside Water Pollution Control Plant.** During dry weather, the technology-based requirements for the Oceanside Water Pollution Control Plant are based on the Secondary Treatment Standards at 40 C.F.R. section 133.102, listed in the following table:

Table F-7. Secondary Treatment Requirements

Parameter	Monthly Average	Weekly Average
BOD_5 [1,2]	30 mg/L	45 mg/L
$CBOD_5$ [1,2]	25 mg/L	40 mg/L
TSS [2]	30 mg/L	45 mg/L
pH	6.0 – 9.0 standard units	

Abbreviation:

mg/L = milligrams per liter

Footnotes:

[1] $CBOD_5$ effluent limitations may be substituted for BOD_5 effluent limitations.

[2] The monthly average percent removal, by concentration, is not to be less than 85 percent.

This Order does not include the additional technology-based effluent limitations established in Ocean Plan chapter III.B.1 (i.e., oil and grease, turbidity, settleable solids) because the plant provides secondary treatment.

During wet weather, the *Combined Sewer Overflow (CSO) Control Policy* establishes the minimum technology-based requirements for combined sewer systems as the implementation of the nine minimum controls based on 40 C.F.R. section 125.3. Provision VI.C.5.a of this Order contains these requirements.

3. **Westside Recycled Water Project.** Ocean Plan chapter III.B.1 establishes technology-based effluent limitations for publicly-owned treatment works and industrial discharges for which effluent limitation guidelines have not been established pursuant to CWA sections 301, 302, 304, or 306. This Order requires Westside Recycled Water Project discharges to meet the minimum technology-based effluent limitations established in Ocean Plan Table 2, listed in the following table:

Table F-8. Ocean Plan Table 2 Effluent Limitations

Parameter	Units	Monthly Average	Weekly Average	Instantaneous
Oil and Grease	mg/L	25	40	75
TSS	mg/L	60 [1]	---	---
Settleable Solids	mL/L	1.0	1.5	3.0
Turbidity	NTU	75	100	225
pH	standard units	within 6.0 to 9.0 range (all times)		

Abbreviations:

mg/L = milligrams per liter
mL/L = milliliters per liter
NTU = nephelometric turbidity units

Footnote:

[1] Ocean Plan Table 2 notes state, "Suspended Solids: Dischargers shall, as a 30-day average, remove 75% of suspended solids from the influent stream before discharging wastewaters to the ocean, except that the effluent limitation to be met shall not be lower than 60 mg/L." Because the monthly average effluent limitation for suspended solids has been established as 60 mg/L, the Discharger is not required to remove 75% of influent suspended solids.

4. **Combined Sewer System.** The Westside Transport/Storage Structure and combined sewer discharge points discharge only during wet weather. As such, the *Combined Sewer Overflow (CSO) Control Policy* establishes the minimum technology-based requirements for combined sewer systems as the implementation of nine minimum controls based on 40 C.F.R. section 125.3. Provision VI.C.5.a of this Order contains these requirements.

C. Water Quality-Based Effluent Limitations (WQBELs)

1. Scope and Authority

CWA section 301(b) and 40 C.F.R. section 122.44(d) require that permits include limitations more stringent than federal technology-based requirements where necessary to achieve applicable water quality standards. According to 40 C.F.R. section 122.44(d)(1)(i), permits must include effluent limitations for all pollutants that are or may be discharged at levels that have a reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective, WQBELs must be established using (1) U.S. EPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, which may be derived using a proposed state criterion or policy interpreting a state narrative water quality criterion, supplemented with other relevant information (40 C.F.R. § 122.44[d][1][vi]). The process for determining reasonable potential and calculating WQBELs is intended to achieve applicable water quality objectives and criteria, protect the

designated uses of receiving waters as specified in the Basin Plan and Ocean Plan, and ensure no unreasonable degradation under CWA section 403(c) and 40 C.F.R. part 125, subpart M.

During dry weather, this Order imposes numeric effluent limitations at Discharge Point No. 001 for pollutants with reasonable potential to cause or contribute to exceedances of water quality standards.

During wet weather, this Order imposes narrative effluent limitations, not numeric limitations. In accordance with the *Combined Sewer Overflow (CSO) Control Policy*, this Order requires the Discharger to implement and update its Long-Term Control Plan. The *Combined Sewer Overflow (CSO) Control Policy* describes the presumption and demonstration approaches regarding water quality-based requirements and requires that a post-construction water quality monitoring program be in place to verify compliance with applicable water quality standards. This Order requires the combined sewer system to capture 100 percent of combined wastewater and stormwater and provide equivalent-to-primary treatment consisting of floatables and settleable solids removal. Provision VI.C.5.d (Task 3.b) of the Order requires the Discharger to assess the feasibility and necessity of disinfecting combined sewer discharges.

2. Beneficial Uses and Water Quality Objectives

Fact Sheet sections III.C.1 and III.C.2, above, identify the beneficial uses of the Pacific Ocean. Ocean Plan chapter II (including Table 1) lists water quality objectives for the Pacific Ocean.

3. Minimum Initial Dilution

In accordance with Ocean Plan chapter III.C, the minimum initial dilution at Discharge Point No. 001 can be estimated by experimental observation or computer simulation. The Discharger submitted an updated dilution study in April 2014, *Southwest Ocean Outfall (Discharge Point No. 001) Dilution Modeling Report – Final*, which estimated dilution based on NRFIELD and UM3 models and ambient water data measured from April 2012 through October 2013. Based on the more conservative estimate assuming no currents, the minimum initial dilution ratio is 148:1 (148 parts seawater per 1 part wastewater). This represents the minimum 30-day average dilution during the period of maximum stratification, observed from November 2012 through January 2013. The Discharger's dilution study also estimated dilution based on existing current velocity data measured at mid-depth of the water column. Accounting for ocean currents, the more conservative estimate of the minimum 30-day average dilution during the period of maximum stratification is 266:1.

A minimum initial dilution of 148:1 is used in the reasonable potential analysis described in Fact Sheet section III.C.4, below. The IWC to be used in chronic toxicity testing is also based on this minimum initial dilution, except when the Westside Recycled Water Project operates at full capacity to produce 1.0 MGD of recycled water, in which case the IWC is to be based on a minimum initial dilution of 266:1 as described in MRP section V.A.2. This increase in minimum initial dilution accounts for ocean currents, which move parallel to the coast, not

toward State waters (*Assessment of Effects on California State Waters from the Oceanside Southeast Ocean Outfall*, September 26, 2008).

4. Need for Water Quality-Based Effluent Limitations (Reasonable Potential Analysis)

a. Methodology

i. Dry Weather. Ocean Plan Appendix VI sets forth a procedure for reasonable potential analyses applicable to dry weather discharges from Discharge Point No. 001. The procedure assumes a lognormal distribution for the effluent data and compares the 95th percentile concentration at 95 percent confidence for each parameter listed in Ocean Plan Table 1, accounting for dilution, to the applicable water quality objective listed in Ocean Plan Table 1. The analysis results in one of three endpoints for each pollutant based on four triggers:

- Endpoint 1 – There is reasonable potential. WQBELs and monitoring are required.
- Endpoint 2 – There is no reasonable potential. WQBELs are not required, but monitoring may be required.
- Endpoint 3 – The analysis is inconclusive. Any existing WQBELs are retained and monitoring is required.

The four triggers are as follows:

(a) Trigger 1. If any detected value after adjustment for dilution (X) is greater than the applicable water quality objective (Co), then Endpoint 1 applies.

For Table 1 pollutants:	$X = (Ce + Dm\ Cs) / (Dm + 1)$
For acute toxicity:	$X = Ce / (0.1\ Dm + 1)$
Where:	Ce is the effluent concentration
	Dm is the minimum initial dilution expressed as parts seawater per part wastewater (148:1)
	Cs is the background seawater concentration from Ocean Plan Table 3.

(b) Trigger 2. If there are three or more detected values and the number of non-detected (ND) or detected but not quantified (DNQ) values (c) is less than or equal to 80 percent of the number of data points (n) (i.e., if $c/n \leq 80\%$), a parametric reasonable potential analysis is performed. If the calculated upper confidence bound is greater than Co, then Endpoint 1 is concluded; otherwise Endpoint 2 is concluded.

(c) Trigger 3. If there are less than three detected values or if there are more than three detected values but the percentage of non-detected (ND) or detected but not quantified (DNQ) values is more than 80 percent (i.e., if $c/n > 80\%$), a non-

parametric reasonable potential analysis is performed. Depending on the results, either Endpoint 2 or Endpoint 3 is concluded.

(d) Trigger 4. If any other information about the receiving water or the discharge supports a finding of reasonable potential, then the reasonable potential analysis may be based on best professional judgment. If data or other information is unavailable or insufficient to determine if a WQBEL is required, Endpoint 3 is concluded. Otherwise, either Endpoint 1 or Endpoint 2 is concluded.

ii. Wet Weather. For wet weather discharges from Discharge Point No. 001 and the combined sewer discharge points, the requirements described in Provision VI.C.5.c of the Order serve as narrative WQBELs.

b. Effluent Data. Since the Westside Recycled Water Project is expected to become operational during this permit term, two reasonable potential analyses were performed based on the Ocean Plan methodology: one based on current effluent quality and one based on potential future Westside Recycled Water Project effluent quality. In both cases, the analyses were based on dry weather effluent monitoring data the Discharger collected for Discharge Point No. 001 from January 2011 through December 2017. However, with full operation of the Westside Recycled Water Project, the Discharger anticipates that the discharge could potentially consist entirely of reverse osmosis concentrate approximately 1.4 percent of the time. Under these rare circumstances, the effluent could be as much as four times more concentrated when compared to existing conditions. For purposes of the Westside Recycled Water Project reasonable potential analysis, however, existing effluent data were multiplied by a concentration factor of 1.5, which reflects the foreseeable increase based on a 30-day averaging period. This concentration factor is sufficient to evaluate reasonable potential when the most stringent objectives (those with six-month averaging periods) apply.

c. Reasonable Potential Analysis Results. The following tables present the results of the two reasonable potential analyses performed (i.e., existing conditions and potential future Westside Recycled Water Project conditions). The analyses show reasonable potential for chronic toxicity based on Trigger 4. Chronic toxicity tests are intended to detect toxicity from a wide range of pollutants, and since the Facility has a municipal combined sewer system, there is a reasonable potential that unanticipated pollutants could be discharged into the system. Moreover, effluent monitoring data collected during the previous order term showed chronic toxicity at levels close to the previous order's effluent limit (see Table F-2) and similar toxicity could occur in the future.

Table F-9. Reasonable Potential Analysis No. 1 - Existing Conditions

Abbreviations:

WQO = water quality objective
µg/L = micrograms per liter
TUc = chronic toxicity units

Footnotes:

[1] The previous order did not require acute toxicity monitoring.

[2] The previous order did not require monitoring for radioactivity.

[3] Chlorine is not added for disinfection, and the previous order did not require monitoring for residual chlorine.

[4] The previous order did not require monitoring for chromium (III); however, the maximum detected concentration of total chromium (8.1 µg/L) is less than the water quality objective for chromium (III) of 190,000 µg/L.

Abbreviations:

WQO = water quality objective
µg/L = micrograms per liter

Footnotes:

[1] The previous order did not require monitoring for acute toxicity.

[2] The projection is particularly uncertain because chronic toxicity may occur as a result of various pollutants within the effluent and their toxic effects may not be linearly related to discharge concentrations.

[3] The previous order did not require monitoring for radioactivity.

[4] The previous order did not require monitoring for total residual chlorine.

[5] The previous order did not require monitoring for chromium (III); however, the maximum projected concentration of total chromium (12 µg/L) is less than the water quality objective for chromium (III) of 190,000 µg/L.

5. WQBELs

a. Dry Weather. For dry weather discharges from Discharge Point No. 001, the Ocean Plan calls for chronic toxicity WQBELs based on "toxic units" derived from multi-concentration toxicity tests. This Order introduces an updated approach. In 2010, U.S. EPA published the Test of Significant Toxicity (TST) statistical approach in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010). The TST statistical approach relies on the same U.S. EPA toxicity test methods. For example, section 9.4.1.2 of *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms* (EPA/600/R-95/0136, 1995) states, "the statistical methods recommended in this manual are not the only possible methods of statistical analysis."

To comply with the chronic toxicity WQBEL, effluent must "Pass" a single chronic toxicity test conducted at the IWC as defined in MRP section V.A.2 using the Test of Significant Toxicity (TST) statistical approach (Welch's t-test). The test result must reject the following null hypothesis:

H_0: mean discharge IWC response $\leq 0.75 \times$ mean control response.

In other words, the mean chronic toxicity response for a test sample must be statistically determined to be less than or equal to 75 percent of the response for a control sample. The 75 percent response level reflects a regulatory management decision intended to ensure that differences observed between test sample responses and control sample responses are meaningful. A test result that fails to reject the null hypothesis would not comply with the chronic toxicity WQBEL.

The chronic toxicity WQBEL is expressed as a single-sample maximum. For publicly-owned treatment works, 40 C.F.R. section 122.45(d) requires monthly and weekly effluent limitations unless impracticable. In this case, the single-sample WQBEL is necessary to protect against short-term effects. Limits expressed with monthly or weekly averaging periods could allow chronic toxicity to occur over shorter periods. This approach is comparable to that of the Ocean Plan, which calls for a daily maximum chronic toxicity limit. Single-sample and maximum daily chronic toxicity limits are comparable because chronic toxicity tests can take several days to complete, depending on the test species used. U.S. EPA recommends this approach in *EPA Regions 8, 9 and 10 Toxicity Training Tool* (January 2010).

b. Wet Weather. For wet weather discharges from Discharge Point No. 001 and the combined sewer discharge points, the Long-Term Control Plan required pursuant to the *Combined Sewer Overflow (CSO) Control Policy* and described in Provision VI.C.5.c of the Order serves as narrative WQBELs.

D. Discharge Requirement Considerations

1. Anti-Backsliding. This Order complies with the anti-backsliding provisions of CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l), which generally require

effluent limitations in a reissued permit to be as stringent as those in the previous permit. The requirements of this Order are at least as stringent as those in the previous order, with the exception of mercury. This Order does not contain dry weather mercury effluent limitations because there is no longer reasonable potential to exceed water quality objectives based on mercury effluent data. Removing the mercury WQBELs is consistent with State Water Board Order No. WQ 2001-16. Consistent with State Water Board Order No. WQ 2001-06, reliance on the TST statistical approach to evaluate chronic toxicity for dry weather discharges from the Oceanside Water Pollution Control Plant is not backsliding because this Order's effluent limitation is not comparable to the effluent limitation in the previous order.

2. **Antidegradation.** This Order complies with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution No. 68-16. It continues the status quo with respect to the level of discharge authorized in the previous order, which was adopted in accordance with antidegradation policies, and thus serves as the baseline by which to measure whether degradation will occur. This Order does not allow for a flow increase or a reduced level of treatment. The only potentially less stringent effluent limitation is the chronic toxicity WQBEL after Westside Recycled Water Project operations commence. The Westside Recycled Water Project is expected to concentrate, but not increase, existing pollutant loads; therefore, it will not degrade Pacific Ocean water quality.

3. **Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations. This Order's technology-based requirements implement minimum, applicable federal technology-based requirements. This Order also contains more stringent effluent limitations as necessary to meet water quality standards. These limitations are no more stringent than the CWA requires.

   This Order's WQBELs have been derived to implement water quality objectives that protect beneficial uses. The beneficial uses and water quality objectives set forth in the Ocean Plan and Basin Plan have been approved pursuant to federal law and are federal water quality standards. U.S. EPA approved the Ocean Plan on February 14, 2006, and also approved subsequent amendments. Most Basin Plan beneficial uses and water quality objectives were approved under State law and submitted to and approved by U.S. EPA prior to May 30, 2000. Beneficial uses and water quality objectives submitted to U.S. EPA prior to May 30, 2000, but not approved by U.S. EPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to 40 C.F.R. section 131.21(c)(1). U.S. EPA approved the remaining beneficial uses and water quality objectives implemented by this Order so they are applicable water quality standards pursuant to 40 C.F.R. section 131.21(c)(2).

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

This Order's receiving water limitations are based on Ocean Plan chapters II.C, II.D, and II.E, and State Water Board Order No. WQ 79-16. These limits are necessary to ensure compliance with applicable water quality standards in accordance with the CWA and regulations adopted thereunder.

VI. RATIONALE FOR PROVISIONS

A. Standard Provisions

Attachment D contains standard provisions that apply to all NPDES permits in accordance with 40 C.F.R. section 122.41 and additional conditions applicable to specific categories of permits in accordance with 40 C.F.R. section 122.42. The Discharger must comply with these provisions.

In accordance with 40 C.F.R. section 123.25(a)(12), permits may impose more stringent requirements. Attachment G contains standard provisions that supplement the federal standard provisions in Attachment D.

In addition to federal conditions that address enforcement authority specified in 40 C.F.R. sections 122.41(a)(2), 122.41(j)(5), and (k)(2), this Order incorporates Water Code section 13387(e) by reference.

B. Monitoring and Reporting Program (MRP) Requirements

CWA section 308 and 40 C.F.R. sections 122.41(h), 122.41(j)-(l), 122.44(i), and 122.48 require that NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. The Monitoring and Reporting Program (Attachment E) of this Order establishes monitoring, reporting, and recordkeeping requirements that implement federal and State requirements. For more background regarding these requirements, see Fact Sheet section VII.

C. Special Provisions

1. Reopener Provisions

These provisions are based on 40 C.F.R. sections 122.62 and 122.63 and allow modification of this Order and its effluent limitations as necessary in response to updated water quality objectives, regulations, or other new and relevant information that may become available in the future, and other circumstances as allowed by law. Provision VI.C.1.f is based on *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.g.

2. Effluent Characterization Study and Report

This Order does not include effluent limitations for Ocean Plan Table 1 pollutants that do not demonstrate reasonable potential, but this provision requires the Discharger to evaluate monitoring data to verify that the reasonable potential analysis conclusions of this Order remain valid. This requirement is authorized pursuant to 40 C.F.R. section 122.41(h) and Water Code section 13267, and is necessary to inform the next permit reissuance and to

ensure that the Discharger takes timely steps in response to any unanticipated change in effluent quality during the term of this Order.

3. Pollutant Minimization Program

This provision is based on *Combined Sewer Overflow (CSO) Control Policy* section II.B.7, Basin Plan section 4.13.2, Ocean Plan chapter III.C.9, State Water Board Order No. WQ 79-16, and Water Code section 13263. The provision requires the Discharger to include copper and zinc as pollutants of concern because concentrations are often elevated in combined sewer discharges.

4. Special Provisions for Publicly-Owned Treatment Works (POTWs)

a. Sludge and Biosolids Management. This provision is based on Basin Plan section 4.17. "Sludge" refers to the solid, semisolid, and liquid residue removed during primary, secondary, and advanced wastewater treatment processes. "Biosolids" refers to sludge that has been treated and may be beneficially reused.

b. Pretreatment Program. This provision is based on 40 C.F.R. part 403. The Discharger implements a pretreatment program due to the nature and volume of its industrial influent. This provision lists the Discharger's responsibilities regarding its pretreatment program and requires compliance with the provisions in Attachment H.

c. Anaerobically-Digestible Material. Standard Operating Procedures are required for dischargers that accept hauled waste food, fats, oil, and grease for injection into anaerobic digesters. The development and implementation of Standard Operating Procedures for management of these materials is intended to allow the California Department of Resources Recycling and Recovery to exempt operations from separate and redundant permitting programs. If the Discharger does not accept fats, oil, and grease for resource recovery purposes, it is not required to develop and implement Standard Operating Procedures.

Some publicly-owned treatment works choose to accept organic material, such as waste food, fats, oils, and grease, into their anaerobic digesters to increase production of methane and other biogases for energy production and to prevent such materials from being discharged into the collection system and potentially causing sanitary sewer overflows. The California Department of Resources Recycling and Recovery has proposed to exclude publicly-owned treatment works from Process Facility/Transfer Station permit requirements when the same activities are regulated under waste discharge requirements or NPDES permits. The proposed exclusion is restricted to anaerobically-digestible materials that have been prescreened, slurried, processed, and conveyed in a closed system for co-digestion with regular sewage sludge. The exclusion assumes that the facility has developed Standard Operating Procedures for proper handling, processing, tracking, and management.

d. Separate Sanitary Sewer System. This provision requires compliance with Attachments D and G and states that these requirements may be satisfied by complying

with State Water Board Order No. 2006-0003-DWQ, Statewide General Waste Discharge Requirements for Sanitary Sewer Systems, as amended by State Water Board Order No. WQ 2013-0058-EXEC and any subsequent order updating these requirements. These statewide WDRs require public agencies that own or operate sanitary sewer systems with greater than one mile of sewer lines to enroll for coverage and comply with requirements to develop sanitary sewer management plans and report sanitary sewer overflows, among other provisions and prohibitions. The statewide WDRs contain requirements for operation and maintenance of collection systems, and for reporting and mitigating sanitary sewer overflows, that are more extensive and, therefore, more stringent than the standard provisions in Attachments D and G.

5. Combined Sewer System Controls

a. Nine Minimum Controls. The *Combined Sewer Overflow (CSO) Control Policy* establishes nine minimum controls as the minimum technology-based requirements during wet weather for combined sewer systems based on 40 C.F.R. section 125.3:

- Conduct Proper Operations and Maintenance Program
- Maximize Use of Collection System for Storage
- Review and Modify Pretreatment Program
- Maximize Flow to Treatment Plant
- Prohibit Dry Weather Combined Sewer Overflows
- Control Solid and Floatable Materials in Combined Sewer Discharges
- Develop and Implement Pollution Prevention Program
- Notify Public of Combined Sewer Discharges
- Monitor to Characterize Combined Sewer Discharge Impacts and Efficacy of Controls

These nine minimum controls are the best conventional pollutant control technology (BCT) and the best available technology economically achievable (BAT). Provision VI.C.5.a of this Order requires implementation of these nine minimum controls and is consistent with U.S. EPA's guidance document, *Combined Sewer Overflows, Guidance for Nine Minimum Controls* (EPA 832-B-95-003, May 1995).

Provision VI.C.5.a.viii(a) contains specific signage and reporting requirements to inform the public of the location, occurrence, and possible health impacts of combined sewer discharges. The required signage language includes a telephone number so the public can report dry weather discharges to help ensure that corrective actions are taken and warning language to reduce public exposure to potential health risks. This provision contains requirements to protect the shellfish harvesting beneficial use in the Pacific Ocean (see Fact Sheet sections III.C.1 and III.C.2). This provision is consistent with State Water Board Order No. 79-16, U.S. EPA's *NPDES Compendium of Next Generation Compliance Examples* (September 2016), and 40 C.F.R. section 122.38 (*Public Notification Requirements for Combined Sewer Overflows to the Great Lakes Basin*, considered here as guidance).

For sewer overflows from the combined sewer system, Provision VI.C.5.a.ii(b) requires the Discharger to notify and report sewer overflows from the combined sewer system using the State's CIWQS database. Water Code sections 13267 and 13383, 40 C.F.R. section 122.41(h), and the *Combined Sewer Overflow (CSO) Control Policy* authorize the Regional Water Board and U.S. EPA to require information about releases of untreated or partially-treated wastewater. This information is necessary to evaluate combined sewer system performance, and operations and maintenance practices; to determine whether any diversions of untreated or partially-treated wastewater result in a discharge to surface waters; to satisfy public notification requirements; to identify whether the public could be affected; and to establish whether sewer overflows from the combined sewer system result in a nuisance as defined by Water Code section 13050.

b. Documentation of Nine Minimum Controls. Provision VI.C.5.b is based on section II.B of the *Combined Sewer Overflow (CSO) Control Policy*, which states that Dischargers should submit appropriate documentation demonstrating implementation of the nine minimum controls. Consistent with U.S. EPA's guidance document, *Combined Sewer Overflows, Guidance for Nine Minimum Controls* (EPA 832-B-95-003, May 1995), a community that has made substantial progress in implementing the nine minimum controls is still expected to provide documentation to the permitting authority to demonstrate how its program addresses each minimum control.

c. Long-Term Control Plan (LTCP). The *Combined Sewer Overflow (CSO) Control Policy* requires implementation of a Long-Term Control Plan (LTCP) to satisfy water quality-based requirements during wet weather. *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.f specifies that permits should contain requirements for maximizing the treatment of wet weather flows, as appropriate. The operational requirements in Provision VI.C.5.c of this Order are unchanged from the previous order, except that this Order requires the instantaneous influent flow rate to the Oceanside Water Pollution Control Plant prior to initiating discharge from the Westside Transport/Storage Structure to Discharge Point No. 001 to be 60 MGD to reflect the treatment capacity of the Oceanside Water Pollution Control Plant and operational considerations. This provision allows the Discharger to request changes to these operational parameters to ensure the Discharger's LTCP continues to minimize combined sewer discharges and maximize pollutant removal during wet weather.
Provision VI.C.5.d (Task 4) of this Order requires the Discharger to re-evaluate each operational requirement and propose additional performance measures within 24 months of this Order's effective date to ensure wet weather operations are optimized based on current information.

d. LTCP Update. The Discharger's report *San Francisco Wastewater Long Term Control Plan Synthesis* (March 30, 2018) summarizes the various documents that comprise the Discharger's historical planning process and LTCP. Provision VI.C.5.d requires the Discharger to update its LTCP with respect to the elements listed in *Combined Sewer Overflow (CSO) Control Policy* section II.C. *Combined Sewer Overflow (CSO) Control Policy* section IV.B describes the major elements that should be included in NPDES permits to implement the policy and ensure protection of water quality. This provision is consistent with U.S. EPA's guidance document *Combined Sewer Overflows, Guidance*

for Long-Term Control Plan (EPA 832-B-95-002, September 1995). This provision also implements State Water Board Order No. WQ 79-16, which sets forth specific conditions to be implemented during wet weather (see Fact Sheet § III.C.2.b).

This provision requires the Discharger to update its LTCP for the following reasons:

- *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.b specifies that the permit should contain narrative requirements to ensure that selected controls are implemented, operated, and maintained as described in the Discharger's LTCP.

- *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.d specifies that the permit should contain a requirement to monitor and collect sufficient information to demonstrate compliance with water quality standards and protect designated uses, as well as to determine the effectiveness of combined sewer system controls.

- *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.e specifies that the permit should contain a requirement to reassess combined sewer discharges to sensitive areas in those cases where elimination or relocation was previously found to be not physically possible and economically achievable.

- *Combined Sewer Overflow (CSO) Control Policy* section IV.B.2.f specifies that the permit should contain requirements for maximizing the treatment of wet weather flows at the treatment plant, as appropriate.

- State Water Board Order No. WQ 79-16 requires the Discharger to design, construct, and operate facilities to the greatest extent practical to conform to the standards set forth in chapter II of the 1978 Ocean Plan, except for the bacteriological standards (see Fact Sheet § III.C.2.b).

- State Water Board Order No. WQ 79-16 requires the Discharger to design, construct, and operate facilities to the greatest extent practical to comply with the conditions controlled by the requirements set forth in chapter III, sections A and B, of the 1978 Ocean Plan (see Fact Sheet § III.C.2.b).

- An updated LTCP is necessary to document that the Discharger's LTCP is based on the most current information to assess whether water quality standards are being met and that wet weather discharges are not causing unreasonable degradation of the marine environment (40 C.F.R. § 125.122).

6. Westside Recycled Water Project Operations Notification

The effluent limitations and specifications in this Order are based on information available during the permit reissuance process. Assumptions regarding how effluent quality could change after commencement of Westside Recycled Water Project operations were based on information the Discharger provided prior to completion of project planning and construction. This provision is necessary to evaluate whether the assumptions made during the permitting process remain valid and to ensure that the permit continues to be protective of water quality standards. Moreover, because some requirements of this Order are contingent

upon Westside Recycled Water Project operations, notification is necessary for the Regional Water Board and U.S. EPA to know when such requirements apply.

7. Flame Retardant Special Study

This special study is necessary to evaluate the potential impacts of flame retardants (i.e., polybrominated diphenyl ethers and chlorinated organophosphate flame retardants) in receiving waters. During U.S. EPA consultation with the National Marine Fisheries Service pursuant to the Endangered Species Act and Magnuson-Stevens Act, the National Marine Fisheries Service expressed concern about the presence of flame retardants in plant effluent and flame retardant mass loadings to the Pacific Ocean because organophosphates have been widely detected in San Francisco Bay water, sediment, and aquatic life tissue, and because polybrominated diphenyl ether (PBDE) and tris(1,3-dichloro-2-propyl)phosphate (TDCP) concentrations in San Francisco Bay water have regularly exceeded predicted no effect concentrations for marine settings (*U.S. EPA Biological Evaluation,* April 2019). This special study is consistent with other NPDES permits that authorize discharge to the Pacific Ocean.

8. Efficacy of Combined Sewer System Controls Special Study

This special study is necessary to characterize the quality of the combined sewer discharges and the efficacy of the combined sewer system controls during wet weather. It is based on the *Combined Sewer Overflow (CSO) Control Policy*, which requires "a post-construction water quality monitoring program adequate to verify compliance with water quality standards and protection of designated uses as well as to ascertain the effectiveness of CSO controls."

VII. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

CWA section 308 and 40 C.F.R. sections 122.41(h), 122.41(j)-(l), 122.44(i), and 122.48 require that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. The *Combined Sewer Overflow (CSO) Control Policy* requires monitoring to ascertain the effectiveness of controls and to verify compliance with water quality standards and protection of beneficial uses. The Monitoring and Reporting Program (MRP) in Attachment E of this Order establishes monitoring, reporting, and recordkeeping requirements that implement federal and State requirements. Specified monitoring frequencies take into account the quantity and variability of the discharge, past compliance, significance of pollutants, and cost of monitoring. The following provides the rationale for the monitoring and reporting requirements contained in the MRP.

A. Influent Monitoring. Influent flow monitoring is necessary to understand Facility operations and to evaluate compliance with Discharge Prohibition III.D. Influent $CBOD_5$ and TSS monitoring is necessary to evaluate compliance with this Order's 85 percent removal requirement. Influent monitoring is also necessary to identify wet weather days, as defined in Attachment A.

B. Effluent Monitoring. Dry weather monitoring is necessary to evaluate compliance with this Order's effluent limitations and to provide data for future reasonable potential analyses. Wet weather monitoring is necessary to characterize the efficacy of combined sewer system controls and assess receiving water impacts. Effluent flow monitoring is necessary to understand Facility operations and to assess impacts to receiving waters.

C. Toxicity Testing. Dry weather effluent chronic toxicity monitoring is necessary to evaluate compliance with this Order's chronic toxicity effluent limitation and to provide data for future reasonable potential analyses. Routine and accelerated chronic toxicity monitoring frequencies and Toxicity Reduction Evaluation requirements are based on the implementation provisions in Ocean Plan chapter III.C and the standard monitoring procedures guidance in section 7.1 of Ocean Plan Appendix III.

A tiered approach to determine the required effluent concentration in test samples removes impediments for the Discharger to construct and operate the Westside Recycled Water Project. When recycled water production exceeds 1.0 MGD, toxicity test samples are to contain an effluent concentration based on the dilution at Discharge Point No. 001 as modeled using observed ocean currents. This flexibility accounts for potential increases in pollutant concentrations as recycled water is removed from the discharge.

D. Receiving Water Monitoring. Receiving water monitoring is necessary to characterize the effects of the discharges authorized in this Order on the receiving water and species listed under the California Endangered Species Act or federal Endangered Species Act. The requirements are based on the monitoring guidance in Appendix III of the Ocean Plan. The MRP requires the Discharger to continue its Southwest Ocean Outfall Regional Monitoring Program to collect data on chemical and physical sediment quality, benthic infauna community structure, and physical anomalies and bioaccumulation of contaminants in organism tissues.

The MRP requires shoreline monitoring following combined sewer discharge events at beach locations where water contact recreation takes place. This monitoring is necessary to assess the possible effects of combined sewer discharges on the water contact recreation beneficial use and to establish when public notification is required pursuant to Provision VI.C.5.a.viii of this Order. The bacteria indicators, *Enterococcus* and fecal coliform, are consistent with the revised bacteria provisions approved by U.S. EPA on March 22, 2019. An additional bacteria indicator, total coliform, is required for shoreline monitoring following combined sewer discharges because monitoring for total coliform is consistent with the indicators identified by the California Department of Public Health.

The MRP no longer requires the Discharger to collect data on demersal fish and epibenthic invertebrate community structure because trawl sampling does not provide data that are useful in determining discharge effects (*Southwest Ocean Outfall Regional Monitoring Program 1997-2012 Summary Report,* April 2014). The MRP also no longer includes 12 offshore receiving water monitoring locations. Seven discontinued locations (Stations 73, 74, 75, 76, 77, 78, and 79) were part of a special study conducted from 2002 through 2016; the Discharger demonstrated that these locations are not significantly different from other reference monitoring locations (*A Review of Benthic Macrofaunal Assemblage and Sediment Conditions in the Reef-Effect Region of the SWOO-RMP,* August 2018). Sediment and infaunal sampling at the other

five discontinued locations (Stations 41, 42, 44, 46, 49) has historically provided very little information because of their location in a unique, high energy environment with little to no fine sediment or animals (Pang, Jennie, email communication, December 14, 2018).

E. Pretreatment and Biosolids Monitoring. The pretreatment and biosolids monitoring requirements for influent, effluent, and biosolids are necessary to evaluate compliance with the Discharger's U.S. EPA-approved pretreatment program. Biosolids monitoring is also required pursuant to 40 C.F.R. part 503.

F. Other Monitoring Requirements. Pursuant to CWA section 308, U.S. EPA requires dischargers to participate in a Discharge Monitoring Report-Quality Assurance (DMR-QA) Study Program. The program annually evaluates the analytical abilities of laboratories that perform or support NPDES permit-required monitoring. The program applies to discharger laboratories and contract laboratories. There are two options to comply: (1) dischargers can obtain and analyze DMR-QA samples, or (2) pursuant to a waiver U.S. EPA issued to the State Water Board, dischargers can submit results from the most recent Water Pollution Performance Evaluation Study. Dischargers must submit results annually to the State Water Board, which then forwards the results to U.S. EPA.

Recycled water monitoring and reporting requirements are required to be incorporated into this Order by State Water Board Order No. WQ 2019-0037-EXEC (Amending Monitoring and Reporting Programs for Waste Discharge Requirements, NPDES Permits, Water Reclamation Requirements, Master Recycling Permits, and General Waste Discharge Requirements) issued on July 24, 2019, pursuant to Water Code sections 13267 and 13383.

VIII. PUBLIC PARTICIPATION

The Regional Water Board and U.S. EPA considered the issuance of WDRs and an NPDES permit for the Facility. As a step this process, U.S. EPA and Regional Water Board staff developed a tentative order and encouraged public participation in the reissuance process.

A. Notification of Interested Parties. The Regional Water Board and U.S. EPA notified the Discharger and interested agencies and persons of their intent to adopt an order reissuing the NPDES permit for the Discharger's discharges and provided an opportunity to submit written comments and recommendations. Notification was provided through the *San Francisco Chronicle* and http://www.epa.gov/region9/water/npdes/pubnotices.html. The public had access to the Regional Water Board agenda and any changes in dates and locations through the Regional Water Board's website at http://www.waterboards.ca.gov/sanfranciscobay and U.S. EPA's website at http://www.epa.gov/region9/water/npdes/pubnotices.html.

B. Written Comments. Interested persons were invited to submit written comments concerning the tentative order as explained through the notification process. Comments to the Regional Water Board and U.S. EPA were to be submitted either in person or by mail to the U.S. EPA NPDES Permits Office (WTR 2-3) at 75 Hawthorne Street, San Francisco, California 94105, to the attention of Becky Mitschele, and to the Regional Water Board office at 1515 Clay Street, Suite 1400, Oakland, California 94612, to the attention of Jessica Watkins.

For full staff response and Regional Water Board and U.S. EPA consideration, the written comments were due by 5:00 p.m. on May 20, 2019.

C. Public Hearing. The Regional Water Board held a public hearing on the tentative order during its regular meeting at the following date and time, and at the following location:

Date:	Wednesday, September 11, 2019
Time:	9:00 a.m.
Location:	Elihu Harris State Office Building 1515 Clay Street, 1st Floor Auditorium Oakland, CA 94612
Contact:	Jessica Watkins, (510) 622-2349, jessica.watkins@waterboards.ca.gov

Interested persons were invited to attend. At the public hearing, the Regional Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony was requested to be in writing.

Dates and venues change. The Regional Water Board web address is http://www.waterboards.ca.gov/sanfranciscobay, where one could access the current agenda for changes in dates and locations.

D. Reconsideration of Waste Discharge Requirements. Any aggrieved person may petition the State Water Board to review the Regional Water Board decision regarding the final WDRs. The State Water Board must receive the petition at the following address within 30 calendar days of the Regional Water Board's action:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

For instructions on how to file a petition for review, see http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml.

E. Federal NPDES Permit Appeals. When U.S. EPA issues a final NPDES permit, it becomes effective on its effective date unless a request for review is filed. If a request for review is filed, only those permit conditions that are uncontested go into effect pending disposition of the request for review. Requests for review must be filed within 33 days following the date the final permit is mailed and must meet the requirements of 40 C.F.R. section 124.19. Requests for review should be addressed to the Environmental Appeals Board and sent through the U.S. Postal Service addressed to the Environmental Appeals Board's mailing address:

U.S. Environmental Protection Agency
Clerk of the Board
Environmental Appeals Board (MC 1103B)
Ariel Rios Building
1200 Pennsylvania Avenue, N.W.
Washington, D.C. 20460-0001

Alternatively, filings delivered by hand or courier, including Federal Express, UPS, and U.S. Postal Express Mail, should be directed to the following address:

Environmental Appeals Board
U.S. Environmental Protection Agency
Colorado Building
1341 G Street, N.W., Suite 600
Washington, D.C. 20460

Persons filing a request for review must have filed written comments on the draft permit. Otherwise, any such request for review may be filed only to the extent that the request pertains to changes from the draft to the final permit decision.

F. Information and Copying. The Report of Waste Discharge, related supporting documents, and comments received are on file and may be inspected at the Regional Water Board office at 1515 Clay Street, Suite 1400, Oakland, California at any time between 8:00 a.m. and 5:00 p.m. (except noon to 1:00 p.m.), Monday through Friday, and at the U.S. EPA Region IX office at 75 Hawthorne Street, San Francisco, California at any time between 9:00 a.m. and 5:00 p.m., Monday through Friday. Copying of documents may be arranged by calling the Regional Water Board at (510) 622-2300 or U.S. EPA at (415) 972-3524.

G. Register of Interested Persons. Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board and U.S. EPA, reference this Facility, and provide a name, address, and phone number.

H. Additional Information. Requests for additional information or questions regarding this Order should be directed to Jessica Watkins at (510) 622-2349 or jessica.watkins@waterboards.ca.gov, or Becky Mitschele at (415) 972-3492 or mitschele.becky@epa.gov.

ATTACHMENT G

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS (SUPPLEMENT TO ATTACHMENT D)

November 2017

Contents

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS

APPLICABILITY

This document supplements the requirements of Federal Standard Provisions (Attachment D). For clarity, these provisions are arranged using to the same headings as those used in Attachment D.

I. STANDARD PROVISIONS - PERMIT COMPLIANCE

A. Duty to Comply – Not Supplemented

B. Need to Halt or Reduce Activity Not a Defense – Not Supplemented

C. Duty to Mitigate – Supplement to Attachment D, Provision I.C.

1. **Contingency Plan**. The Discharger shall maintain a Contingency Plan as prudent in accordance with current facility emergency planning. The Contingency Plan shall describe procedures to ensure that existing facilities remain in, or are rapidly returned to, operation in the event of a process failure or emergency incident, such as employee strike, strike by suppliers of chemicals or maintenance services, power outage, vandalism, earthquake, or fire. The Discharger may combine the Contingency Plan and Spill Prevention Plan (see Provision I.C.2, below) into one document. In accordance with Regional Water Board Resolution No. 74-10, discharge in violation of the permit where the Discharger has failed to develop and implement a Contingency Plan as described below may be the basis for considering the discharge a willful and negligent violation of the permit pursuant to California Water Code section 13387. The Contingency Plan shall, at a minimum, provide for the following:

   a. Sufficient personnel for continued facility operation and maintenance during employee strikes or strikes against contractors providing services;

   b. Maintenance of adequate chemicals or other supplies, and spare parts necessary for continued facility operations;

   c. Emergency standby power;

   d. Protection against vandalism;

   e. Expeditious action to repair failures of, or damage to, equipment, including any sewer lines;

   f. Reporting of spills and discharges of untreated or inadequately treated wastes, including measures taken to clean up the effects of such discharges; and

   g. Maintenance, replacement, and surveillance of physical condition of equipment and facilities, including any sewer lines.

2. **Spill Prevention Plan.** The Discharger shall maintain a Spill Prevention Plan to prevent accidental discharges and to minimize the effects of any such discharges. The Spill Prevention Plan shall do the following:

   a. Identify the possible sources of accidental discharge, untreated or partially-treated waste bypass, and polluted drainage;

   b. State when current facilities and procedures became operational and evaluate their effectiveness; and

   c. Predict the effectiveness of any proposed facilities and procedures and provide an implementation schedule with interim and final dates when the proposed facilities and procedures will be constructed, implemented, or operational.

D. Proper Operation and Maintenance – Supplement to Attachment D, Provision I.D

1. **Operation and Maintenance Manual.** The Discharger shall maintain an Operation and Maintenance Manual to provide the plant and regulatory personnel with a source of information describing all equipment, recommended operational strategies, process control monitoring, and maintenance activities. To remain a useful and relevant document, the Operation and Maintenance Manual shall be kept updated to reflect significant changes in treatment facility equipment and operational practices. The Operation and Maintenance Manual shall be maintained in usable condition and be available for reference and use by all relevant personnel and Regional Water Board staff.

2. **Wastewater Facilities Status Report.** The Discharger shall maintain a Wastewater Facilities Status Report and regularly review, revise, or update it, as necessary. This report shall document how the Discharger operates and maintains its wastewater collection, treatment, and disposal facilities to ensure that all facilities are adequately staffed, supervised, financed, operated, maintained, repaired, and upgraded as necessary to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

3. **Proper Supervision and Operation of Publicly-Owned Treatment Works (POTWs).** POTWs shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Title 23, section 3680, of the California Code of Regulations.

E. Property Rights – Not Supplemented

F. Inspection and Entry – Not Supplemented

G. Bypass – Not Supplemented

H. Upset – Not Supplemented

I. Other – Addition to Attachment D

1. Neither the treatment nor the discharge of pollutants shall create pollution, contamination, or nuisance as defined by California Water Code section 13050.

2. Collection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater. If public contact with wastewater could reasonably occur on public property, warning signs shall be posted.

3. If the Discharger submits a timely and complete Report of Waste Discharge for permit reissuance, this permit shall continue in force and effect until the permit is reissued or the Regional Water Board rescinds the permit.

II. STANDARD PROVISIONS – PERMIT ACTION – Not Supplemented

III. STANDARD PROVISIONS – MONITORING

A. Sampling and Analyses – Supplement to Attachment D, Provisions III.A and III.B

1. Certified Laboratories. Water and waste analyses shall be performed by a laboratory certified for these analyses in accordance with California Water Code section 13176.

2. Minimum Levels. For the 126 priority pollutants, the Discharger should use the analytical methods listed in Table B unless the Monitoring and Reporting Program (MRP, Attachment E) requires a particular method or minimum level (ML). All monitoring instruments and equipment shall be properly calibrated and maintained to ensure accuracy of measurements.

3. Monitoring Frequency. The MRP specifies the minimum sampling and analysis schedule.

a. Sample Collection Timing

i. The Discharger shall collect influent samples on varying days selected at random and shall not include any plant recirculation or other sidestream wastes, unless otherwise stipulated in the MRP. The Executive Officer may approve an alternative influent sampling plan if it is representative of plant influent and complies with all other permit requirements.

ii. The Discharger shall collect effluent samples on days coincident with influent sampling, unless otherwise stipulated by the MRP. If influent sampling is not required, the Discharger shall collect effluent samples on varying days selected at random, unless otherwise stipulated in the MRP. The Executive Officer may approve an alternative effluent sampling plan if it is representative of plant discharge and in compliance with all other permit requirements.

iii. The Discharger shall collect effluent grab samples during periods of daytime maximum peak flows (or peak flows through secondary treatment units for facilities that recycle effluent).

iv. Effluent sampling for conventional pollutants shall occur on at least one day of any multiple-day bioassay the MRP requires. During the course of the bioassay, on at least one day, the Discharger shall collect and retain samples of the discharge. In the event that a bioassay result does not comply with effluent limitations, the Discharger

shall analyze the retained samples for pollutants that could be toxic to aquatic life and for which it has effluent limitations.

(a) The Discharger shall perform bioassays on final effluent samples; when chlorine is used for disinfection, bioassays shall be performed on effluent after chlorination and dechlorination; and

(b) The Discharger shall analyze for total ammonia nitrogen and calculate the amount of un-ionized ammonia whenever test results fail to meet effluent limitations.

b. Conditions Triggering Accelerated Monitoring

i. Average Monthly Effluent Limitation Exceedance. If the results from two consecutive samples of a constituent monitored in a particular month exceed the average monthly effluent limitation for any parameter (or if the required sampling frequency is once per month or less and the monthly sample exceeds the average monthly effluent limitation), the Discharger shall, within 24 hours after the results are received, increase its sampling frequency to daily until the results from the additional sampling show that the parameter complies with the average monthly effluent limitation.

ii. Maximum Daily Effluent Limitation Exceedance. If a sample result exceeds a maximum daily effluent limitation, the Discharger shall, within 24 hours after the result is received, increase its sampling frequency to daily until the results from two samples collected on consecutive days show compliance with the maximum daily effluent limitation.

iii. Acute Toxicity. If final or intermediate results of an acute bioassay indicate a violation or threatened violation (e.g., the percentage of surviving test organisms of any single acute bioassay is less than 70 percent), the Discharger shall initiate a new test as soon as practical or as described in applicable State Water Board plan provisions that become effective after adoption of these Regional Standard Provisions. The Discharger shall investigate the cause of the mortalities and report its findings in the next self-monitoring report.

iv. Chlorine. The Discharger shall calibrate chlorine residual analyzers against grab samples as frequently as necessary to maintain accurate control and reliable operation. If an effluent violation is detected, the Discharger shall collect grab samples at least every 30 minutes until compliance with the limitation is achieved, unless the Discharger monitors chlorine residual continuously. In such cases, the Discharger shall continue to conduct continuous monitoring.

v. Bypass. Except as indicated below, if a Discharger bypasses any portion of its treatment facility, it shall monitor flows and collect samples at affected discharge points and analyze samples for all constituents with effluent limitations on a daily basis for the duration of the bypass. The Discharger need not accelerate chronic toxicity monitoring. The Discharger also need not collect and analyze samples for mercury, dioxin-TEQ, and PCBs after the first day of the bypass. The Discharger may

satisfy the accelerated acute toxicity monitoring requirement by conducting a flow-through test or static renewal test that captures the duration of the bypass (regardless of the method specified in the MRP). If bypassing disinfection units only, the Discharger shall only monitor bacteria indicators daily.

(a) Bypass for Essential Maintenance. If a Discharger bypasses a treatment unit for essential maintenance pursuant to Attachment D section I.G.2, the Executive Officer may reduce the accelerated monitoring requirements above if the Discharger (i) monitors effluent at affected discharge points on the first day of the bypass for all constituents with effluent limitations, except chronic toxicity; and (ii) identifies and implements measures to ensure that the bypass will continue to comply with effluent limitations.

(b) Approved Wet Weather Bypasses. If a Discharger bypasses a treatment unit or permitted outfall during wet weather with Executive Officer approval pursuant to Attachment D section I.G.4, the Discharger shall monitor flows and collect and retain samples for affected discharge points on a daily basis for the duration of the bypass. The Discharger shall analyze daily for TSS using 24-hour composites (or more frequent increments) and for bacteria indicators with effluent limitations using grab samples. If TSS exceeds 45 mg/L in any composite sample, the Discharger shall also analyze daily the retained samples for all other constituents with effluent limitations, except oil and grease, mercury, PCBs, dioxin-TEQ, and acute and chronic toxicity. Additionally, at least once each year, the Discharger shall analyze the retained samples for one approved bypass for all other constituents with effluent limitations, except oil and grease, mercury, PCBs, dioxin-TEQ, and acute and chronic toxicity. This monitoring shall be in addition to the minimum monitoring specified in the MRP.

B. Standard Observations – Addition to Attachment D

1. **Receiving Water Observations.** The following requirements only apply when the MRP requires standard observations of receiving waters. Standard observations shall include the following:

   a. Floating and Suspended Materials (e.g., oil, grease, algae, and other macroscopic particulate matter) **—** presence or absence, source, and size of affected area.

   b. Discoloration and Turbidity — color, source, and size of affected area.

   c. Odor — presence or absence, characterization, source, and distance of travel.

   d. Beneficial Water Use — estimated number of water-associated waterfowl or wildlife, fisherpeople, and other recreational activities.

   e. Hydrographic Condition — time and height of high and low tides (corrected to nearest National Oceanic and Atmospheric Administration location for the sampling date and time).

f. Weather Conditions — wind direction, air temperature, and total precipitation during five days prior to observation.

2. **Wastewater Effluent Observations.** The following requirements only apply when the MRP requires standard observations of wastewater effluent. Standard observations shall include the following:

   a. Floating and Suspended Material of Wastewater Origin (e.g., oil, grease, algae, and other macroscopic particulate matter) **—** presence or absence.

   b. Odor — presence or absence, characterization, source, distance of travel, and wind direction.

3. **Beach and Shoreline Observations.** The following requirements only apply when the MRP requires standard observations of beaches or shorelines. Standard observations shall include the following:

   a. Material of Wastewater Origin — presence or absence, description of material, estimated size of affected area, and source.

   b. Beneficial Use — estimate of number of people participating in recreational water contact, non-water contact, and fishing activities.

4. **Waste Treatment and/or Disposal Facility Periphery Observations.** The following requirements only apply when the MRP requires standard observations of the periphery of waste treatment or disposal facilities. Standard observations shall include the following:

   a. Odor — presence or absence, characterization, source, and distance of travel.

   b. Weather Conditions — wind direction and estimated velocity.

IV. STANDARD PROVISIONS – RECORDS

A. Records to be Maintained – Supplement to Attachment D, Provision IV.A

The Discharger shall maintain records in a manner and at a location (e.g., the wastewater treatment plant or the Discharger's offices) such that the records are accessible to Regional Water Board staff. The minimum retention period specified in Attachment D, Provision IV, shall be extended during the course of any unresolved litigation regarding permit-related discharges, or when requested by Regional Water Board or U.S. EPA, Region IX, staff.

A copy of the permit shall be maintained at the discharge facility and be available at all times to operating personnel.

B. Records of Monitoring – Supplement to Attachment D, Provision IV.B

Monitoring records shall include the following:

1. **Analytical Information.** Records shall include analytical method detection limits, minimum levels, reporting levels, and related quantification parameters.

2. **Disinfection Process.** For the disinfection process, records shall include the following:
   a. For bacteriological analyses:
      i. Wastewater flow rate at the time of sample collection; and
      ii. Required statistical parameters for cumulative bacterial values (e.g., moving median or geometric mean for the number of samples or sampling period identified in the MRP).
   b. For the chlorination process (when chlorine is used for disinfection), at least daily average values for the following:
      i. Chlorine residual of treated wastewater as it enters the chlorine contact basin (mg/L);
      ii. Chlorine dosage (kg/day); and
      iii. Dechlorination chemical dosage (kg/day).
3. **Wastewater Treatment Process Solids.** For each treatment unit process that involves solids removal from the wastewater stream, records shall include the following:
   a. Total volume or mass of solids removed from each collection unit (e.g., grit, skimmings, undigested biosolids, or combination) for each calendar month or other time period as appropriate, but not to exceed annually; and
   b. Final disposition of such solids (e.g., landfill, other subsequent treatment unit).
4. **Treatment Process Bypasses.** For all treatment process bypasses, including wet weather blending, records shall include the following:
   a. Chronological log of treatment process bypasses;
   b. Identification of treatment processes bypassed;
   c. Beginning and ending dates and times of bypasses;
   d. Bypass durations;
   e. Estimated bypass volumes; and
   f. Description of, or reference to other reports describing, the bypasses, their cause, the corrective actions taken (except for wet weather blending explicitly approved within the permit and in compliance with any related permit conditions), and any additional monitoring conducted.
5. **Treatment Plant Overflows.** The Discharger shall retain a chronological log of overflows at the treatment plant, including the headworks and all units and appurtenances downstream, and records supporting the information provided in accordance with Provision V.E.2, below.

C. Claims of Confidentiality – Not Supplemented

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information – Not Supplemented

B. Signatory and Certification Requirements – Not Supplemented

C. Monitoring Reports – Supplement to Attachment D, Provision V.C

1. Self-Monitoring Reports. For each reporting period established in the MRP, the Discharger shall submit a self-monitoring report to the Regional Water Board in accordance with the requirements listed in the MRP and below:

a. Transmittal Letter. Each self-monitoring report shall be submitted with a transmittal letter that includes the following:

i. Identification of all violations of effluent limitations or other waste discharge requirements found during the reporting period;

ii. Details regarding the violations, such as parameters, magnitude, test results, frequency, and dates;

iii. Causes of the violations;

iv. Corrective actions taken or planned to resolve violations and prevent recurrences, and dates or time schedules for implementation (the Discharger may refer to previously submitted reports that address the corrective actions);

v. Explanation for any data invalidation. Data should not be submitted in a self-monitoring report if it does not meet quality assurance/quality control standards. However, if the Discharger wishes to invalidate a measurement after submitting it in a self-monitoring report, the Discharger shall identify the measurement suspected to be invalid and state the Discharger's intent to submit, within 60 days, a formal request to invalidate the measurement. The formal request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that supports invalidation (e.g., laboratory sheet, log entry, test results), and a discussion of the corrective actions taken or planned (with a time schedule for completion) to prevent recurrence of the sampling or measurement problem;

vi. Description of blending, if any. If the Discharger blends, it shall describe the duration of blending events and certify whether the blending complied with all conditions for blending;

vii. Description of other bypasses, if any. If the Discharger bypasses any treatment units (other than blending), it shall describe the duration of the bypasses and effluent quality during those times; and

viii. Signature. The transmittal letter shall be signed in accordance with Attachment D, Provision V.B.

b. Compliance Evaluation Summary. Each self-monitoring report shall include a compliance evaluation summary that addresses each parameter for which the permit specifies effluent limitations, the number of samples taken during the monitoring period, and the number of samples that exceed the effluent limitations.

c. More Frequent Monitoring. If the Discharger monitors any pollutant more frequently than required by the MRP, the Discharger shall include the results of such monitoring in the calculation and reporting of the data submitted in the self-monitoring report.

d. Analysis Results

i. Tabulation. Each self-monitoring report shall include tabulations of all required analyses and observations, including parameters, dates, times, sample stations, types of samples, test results, method detection limits, method minimum levels, and method reporting levels (if applicable), signed by the laboratory director or other responsible official.

ii. Multiple Samples. Unless the MRP specifies otherwise, when determining compliance with effluent limitations (other than instantaneous effluent limitations) and more than one sample result is available, the Discharger shall compute the arithmetic mean. If the data set contains one or more results that are "Detected, but Not Quantified (DNQ) or "Not Detected" (ND), the Discharger shall instead compute the median in accordance with the following procedure:

(a) The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

(b) The median of the data set shall be determined. If the data set has an odd number of data points, the median is the middle value. If the data set has an even number of data points, the median is the average of the two values around the middle, unless one or both of these values is ND or DNQ, in which case the median shall be the lower of the two results (where DNQ is lower than a quantified value and ND is lower than DNQ).

iii. Duplicate Samples. The Discharger shall report the average of duplicate sample analyses when reporting for a single sample result (or the median if one or more of the duplicates is DNQ or ND [see Provision V.C.1.d.ii, above]). For bacteria indicators, the Discharger shall report the geometric mean of the duplicate analyses.

iv. Dioxin-TEQ. The Discharger shall report for each dioxin and furan congener the analytical results of effluent monitoring, including the reporting level, the method detection limit, and the measured concentration. The Discharger shall report all measured values of individual congeners, including data qualifiers. When calculating dioxin-TEQ, the Discharger shall set congener concentrations below the minimum levels (MLs) to zero. The Discharger shall calculate and report dioxin-TEQ using the

following formula, where the MLs, toxicity equivalency factors (TEFs), and bioaccumulation equivalency factors (BEFs) are as provided in Table A:

$$\text{Dioxin-TEQ} = \Sigma\ (C_x \times TEF_x \times BEF_x)$$

where: C_x = measured or estimated concentration of congener *x*
TEF_x = toxicity equivalency factor for congener *x*
BEF_x = bioaccumulation equivalency factor for congener *x*

Table A

Minimum Levels, Toxicity Equivalency Factors,
and Bioaccumulation Equivalency Factors

Dioxin or Furan Congener	Minimum Level (pg/L)	2005 Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factor (BEF)
2,3,7,8-TCDD	10	1.0	1.0
1,2,3,7,8-PeCDD	50	1.0	0.9
1,2,3,4,7,8-HxCDD	50	0.1	0.3
1,2,3,6,7,8-HxCDD	50	0.1	0.1
1,2,3,7,8,9-HxCDD	50	0.1	0.1
1,2,3,4,6,7,8-HpCDD	50	0.01	0.05
OCDD	100	0.0003	0.01
2,3,7,8-TCDF	10	0.1	0.8

2,3,4,7,8-PeCDF	50	0.3	1.6
1,2,3,4,7,8-HxCDF	50	0.1	0.08
1,2,3,6,7,8-HxCDF	50	0.1	0.2
1,2,3,7,8,9-HxCDF	50	0.1	0.6
2,3,4,6,7,8-HxCDF	50	0.1	0.7
1,2,3,4,6,7,8-HpCDF	50	0.01	0.01
1,2,3,4,7,8,9-HpCDF	50	0.01	0.4
OCDF	100	0.0003	0.02

e. Results Not Yet Available. The Discharger shall make all reasonable efforts to obtain analytical data for required parameter sampling in a timely manner. Certain analyses may require additional time to complete analytical processes and report results. In these cases, the Discharger shall describe the circumstances in the self-monitoring report and include the data for these parameters and relevant discussions of any violations in the next self-monitoring report due after the results are available.

f. Annual Self-Monitoring Reports. By the date specified in the MRP, the Discharger shall submit an annual self-monitoring report covering the previous calendar year. The report shall contain the following:

i. Comprehensive discussion of treatment plant performance, including documentation of any blending or other bypass events, and compliance with the permit. This discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance,

and any other actions taken or planned that are intended to improve the performance and reliability of wastewater collection, treatment, or disposal practices;

ii. List of approved analyses, including the following:

(a) List of analyses for which the Discharger is certified;

(b) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory need not be submitted but shall be retained onsite); and

(c) List of "waived" analyses, as approved;

iii. Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations; and

iv. Results of facility report reviews. The Discharger shall regularly review, revise, and update, as necessary, the Operation and Maintenance Manual, Contingency Plan, Spill Prevention Plan, and Wastewater Facilities Status Report so these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall describe or summarize its review and evaluation procedures, recommended or planned actions, and estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure that they remain up-to-date.

D. Compliance Schedules – Not supplemented

E. Twenty-Four Hour Reporting – Supplement to Attachment D, Provision V.E

1. Oil or Other Hazardous Material Spills

a. Within 24 hours of becoming aware of a spill of oil or other hazardous material not contained onsite and completely cleaned up, the Discharger shall report as follows:

i. If the spill exceeds reportable quantities for hazardous materials listed in 40 C.F.R. part 302. The Discharger shall call the California Office of Emergency Services (800-852-7550).

ii. If the spill does not exceed reportable quantities for hazardous materials listed in 40 C.F.R., part 302, the Discharger shall call the Regional Water Board (510-622-2369).

b. The Discharger shall submit a written report to the Regional Water Board within five working days following either of the above telephone notifications unless directed otherwise by Regional Water Board staff. A report submitted electronically is acceptable. The written report shall include the following:

i. Date and time of spill, and duration if known;

ii. Location of spill (street address or description of location);

iii. Nature of material spilled;

iv. Quantity of material spilled;

v. Receiving water body affected, if any;

vi. Cause of spill;

vii. Estimated size of affected area;

viii. Observed impacts to receiving waters (e.g., oil sheen, fish kill, water discoloration);

ix. Corrective actions taken to contain, minimize, or clean up the spill;

x. Future corrective actions planned to prevent recurrence, and implementation schedule; and

xi. Persons or agencies notified.

2. Unauthorized Municipal Wastewater Treatment Plant Discharges[1]

a. Two-Hour Notification. For any unauthorized discharge that enters a drainage channel or surface water, the Discharger shall, as soon as possible, but not later than two hours after becoming aware of the discharge, notify the California Office of Emergency Services (800-852-7550) and the local health officer or director of environmental health with jurisdiction over the affected water body. Notification shall include the following:

i. Incident description and cause;

ii. Location of threatened or involved waterways or storm drains;

iii. Date and time that the unauthorized discharge started;

iv. Estimated quantity and duration of the unauthorized discharge (to the extent known), and estimated amount recovered;

v. Level of treatment prior to discharge (e.g., raw wastewater, primary-treated wastewater, or undisinfected secondary-treated wastewater); and

vi. Identity of person reporting the unauthorized discharge.

[1] California Code of Regulations, Title 23, section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially-treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment, or disposal system.

b. Five-Day Written Report. Within five business days following the two-hour notification, the Discharger shall submit a written report that includes, in addition to the information listed in Provision V.E.2.a, above, the following:

i. Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

ii. Efforts implemented to minimize public exposure to the unauthorized discharge;

iii. Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of receiving water) and extent of sampling if conducted;

iv. Corrective measures taken to minimize the impact of the unauthorized discharge;

v. Measures to be taken to minimize the potential for a similar unauthorized discharge in the future;

vi. Summary of Spill Prevention Plan or Operation and Maintenance Manual modifications to be made, if necessary, to minimize the potential for future unauthorized discharges; and

vii. Quantity and duration of the unauthorized discharge, and the amount recovered.

F. Planned Changes – Not supplemented

G. Anticipated Noncompliance – Not supplemented

H. Other Noncompliance – Not supplemented

I. Other Information – Not supplemented

VI. STANDARD PROVISION – ENFORCEMENT – Not Supplemented

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS – Not Supplemented

VIII. DEFINITIONS – Addition to Attachment D

More definitions can be found in Attachment A of this NPDES Permit.

A. Arithmetic Calculations

1. **Geometric Mean**. The antilog of the log mean or the back-transformed mean of the logarithmically transformed variables, which is equivalent to the multiplication of the antilogarithms. The geometric mean can be calculated with either of the following equations:

Geometric Mean $= Anti\log\left(\frac{1}{N}\sum_{i=1}^{N} Log(C_i)\right)$

or

Geometric Mean $= (C_1 \times C_2 \times \ldots \times C_N)^{1/N}$

Where "N" is the number of data points for the period analyzed and "C" is the concentration for each of the "N" data points.

2. **Mass Emission Rate.** The rate of discharge expressed in mass. The mass emission rate is obtained from the following calculation for any calendar day:

$$\text{Mass emission rate (lb/day)} = \frac{8.345}{N}\sum_{i=1}^{N} Q_i C_i$$

$$\text{Mass emission rate (kg/day)} = \frac{3.785}{N}\sum_{i=1}^{N} Q_i C_i$$

In which "N" is the number of samples analyzed in any calendar day and "Q_i" and "C_i" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" grab samples that may be taken in any calendar day. If a composite sample is taken, "C_i" is the concentration measured in the composite sample and "Q_i" is the average flow rate occurring during the period over which the samples are composited. The daily concentration of a constituent measured over any calendar day shall be determined from the flow-weighted average of the same constituent in the combined waste streams as follows:

$$C_d = \text{Average daily concentration} = \frac{1}{Q_t}\sum_{i=1}^{N} Q_i C_i$$

In which "N" is the number of component waste streams and "Q" and "C" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" waste streams. "Q_t" is the total flow rate of the combined waste streams.

3. **Removal Efficiency.** The ratio of pollutants removed by the treatment facilities to pollutants entering the treatment facilities (expressed as a percentage). The Discharger shall determine removal efficiencies using monthly averages (by calendar month unless otherwise specified) of pollutant concentration of influent and effluent samples collected at about the same time and using the following equation (or its equivalent):

   Removal Efficiency (%) = 100 × [1-(Effluent Concentration/Influent Concentration)]

B. Blending – the practice of bypassing biological treatment units and recombining the bypass wastewater with biologically-treated wastewater.

C. Composite Sample – a sample composed of individual grab samples collected manually or by an automatic sampling device on the basis of time or flow as specified in the MRP. For flow-based composites, the proportion of each grab sample included in the composite sample shall be within plus or minus five percent (+/-5%) of the representative flow of the waste stream being measured at the time of grab sample collection. Alternatively, equal volume grab samples may

be individually analyzed with the flow-weighted average calculated by averaging flow-weighted ratios of each grab sample analytical result. Grab samples comprising time-based composite samples shall be collected at intervals not greater than those specified in the MRP. The quantity of each grab sample comprising a time-based composite sample shall be a set of flow proportional volumes as specified in the MRP. If a particular time-based or flow-based composite sampling protocol is not specified in the MRP, the Discharger shall determine and implement the most representative protocol.

D. Duplicate Sample – a second sample taken from the same source and at the same time as an initial sample (such samples are typically analyzed identically to measure analytical variability).

E. Grab Sample – an individual sample collected during a short period not exceeding 15 minutes. Grab samples represent only the condition that exists at the time the sample is collected.

F. Overflow – the intentional or unintentional spilling or forcing out of untreated or partially-treated waste from a transport system (e.g., through manholes, at pump stations, or at collection points) upstream of the treatment plant headworks or from any part of a treatment plant.

G. Priority Pollutants – those constituents referred to in 40 C.F.R. part 122 as promulgated in the Federal Register, Vol. 65, No. 97, Thursday, May 18, 2000, also known as the California Toxics Rule.

H. Untreated waste – raw wastewater.

Table B

List of Monitoring Parameters and Analytical Methods

CTR No.	Pollutant/Parameter	Analytical Method[2]	Minimum Levels[3] (µg/l)											
			GC	GCMS	LC	Color	FAA	GFAA	ICP	ICP MS	SPGFAA	HYD RIDE	CVAA	DCP

33	Ethylbenzene	602	0.5	2										
39	Toluene	602	0.5	2										
20	Bromoform	601	0.5	2										
21	Carbon Tetrachloride	601	0.5	2										
22	Chlorobenzene	601	0.5	2										
23	Chlorodibromomethane	601	0.5	2										
24	Chloroethane	601	0.5	2										
25	2-Chloroethylvinyl Ether	601	1	1										
26	Chloroform	601	0.5	2										

[2] The suggested method is the U.S. EPA Method unless otherwise specified (SM = Standard Methods). The Discharger may use another U.S. EPA-approved or recognized method if that method has a level of quantification below the applicable water quality objective. Where no method is suggested, the Discharger has the discretion to use any standard method.

[3] Minimum levels are from the *State Implementation Policy*. They are the concentration of the lowest calibration standard for that technique based on a survey of contract laboratories. Laboratory techniques are defined as follows: GC = Gas Chromatography; GCMS = Gas Chromatography/Mass Spectrometry; LC = High Pressure Liquid Chromatography; Color = Colorimetric; FAA = Flame Atomic Absorption; GFAA = Graphite Furnace Atomic Absorption; ICP = Inductively Coupled Plasma; ICPMS = Inductively Coupled Plasma/Mass Spectrometry; SPGFAA = Stabilized Platform Graphite Furnace Atomic Absorption (i.e., U.S. EPA 200.9); Hydride = Gaseous Hydride Atomic Absorption; CVAA = Cold Vapor Atomic Absorption; DCP = Direct Current Plasma.

[4] Analysis for total chromium may be substituted for analysis of chromium (III) and chromium (VI) if the concentration measured is below the lowest hexavalent chromium criterion (11 ug/l).

[5] The Discharger shall use ultra-clean sampling (U.S. EPA Method 1669) and ultra-clean analytical methods (U.S. EPA Method 1631) for mercury monitoring. The minimum level for mercury is 2 ng/l (or 0.002 ug/l).

[6] MUN = Municipal and Domestic Supply. This designation, if applicable, is in the Findings of the permit.

[7] Determination of Asbestos Structures over 10 [micrometers] in Length in Drinking Water Using MCE Filters, U.S. EPA 600/R-94-134, June 1994.

CALIFORNIA REGIONAL WATER QUALITY CONTROL
BOARD
SAN FRANCISCO BAY REGION

ATTACHMENT H

PRETREATMENT PROGRAM PROVISIONS

For

NPDES POTW WASTEWATER DISCHARGE PERMITS

March 2011
(Corrected May 2011)

TABLE OF CONTENTS Page

Attachment H: Pretreatment Program Provisions

A. The Discharger shall be responsible and liable for the performance of all Control Authority pretreatment requirements contained in 40 C.F.R. 403, including any regulatory revisions to Part 403. Where a Part 403 revision is promulgated after the effective date of the Discharger's permit and places mandatory actions upon the Discharger as Control Authority but does not specify a timetable for completion of the actions, the Discharger shall complete the required actions within six months from the issuance date of this permit or six months from the effective date of the Part 403 revisions, whichever comes later.

(If the Discharger cannot complete the required actions within the above six-month period due to the need to process local adoption of sewer use ordinance modifications or other substantial pretreatment program modifications, the Discharger shall notify the Executive Officer in writing at least 60 days prior to the six-month deadline. The written notification shall include a summary of completed required actions, an explanation for why the six month deadline cannot be met, and a proposed timeframe to complete the rest of the required actions as soon as practical but not later than within twelve months of the issuance date of this permit or twelve months of the effective date of the Part 403 revisions, whichever comes later. The Executive Officer will notify the Discharger in writing within 30 days of receiving the request if the extension is not approved.)

The United States Environmental Protection Agency (U.S. EPA), the State and/or other appropriate parties may initiate enforcement action against a nondomestic user for noncompliance with applicable standards and requirements as provided in the Clean Water Act (Act).

B. The Discharger shall enforce the requirements promulgated under Sections 307(b), 307(c), 307(d) and 402(b) of the Act with timely, appropriate and effective enforcement actions. The Discharger shall cause nondomestic users subject to Federal Categorical Standards to achieve compliance no later than the date specified in those requirements or, in the case of a new nondomestic user, upon commencement of the discharge.

C. The Discharger shall perform the pretreatment functions as required in 40 C.F.R. 403 and amendments or modifications thereto including, but not limited to:

1. Implement the necessary legal authorities to fully implement the pretreatment regulations as provided in 40 C.F.R. 403.8(f)(1);

2. Implement the programmatic functions as provided in 40 C.F.R. 403.8(f)(2);

3. Publish an annual list of nondomestic users in significant noncompliance as provided per 40 C.F.R. 403.8(f)(2)(viii);

4. Provide for the requisite funding and personnel to implement the pretreatment program as provided in 40 C.F.R. 403.8(f)(3); and

5. Enforce the national pretreatment standards for prohibited discharges and categorical standards as provided in 40 C.F.R. 403.5 and 403.6, respectively.

D. The Discharger shall submit annually a report to U.S. EPA Region IX, the State Water Board and the Regional Water Board describing its pretreatment program activities over the previous calendar year. In the event that the Discharger is not in compliance with any conditions or requirements of the Pretreatment Program, the Discharger shall also include the reasons for noncompliance and a plan and schedule for achieving compliance. The report shall contain, but is not limited to, the information specified in Appendix H-1 entitled, "Requirements for Pretreatment Annual Reports." The annual report is due each year on February 28.

E. The Discharger shall submit a pretreatment semiannual report to U.S. EPA Region IX, the State Water Board and the Regional Water Board describing the status of its significant industrial users (SIUs). The report shall contain, but is not limited to, information specified in Appendix H-2 entitled, "Requirements for Pretreatment Semiannual Reports." The semiannual report is due July 31 for the period January through June. The information for the period July through December of each year shall be included in the Annual Report identified in Appendix H-1. The Executive Officer may exempt the Discharger from the semiannual reporting requirements on a case by case basis subject to State Water Board and U.S. EPA's comment and approval.

F. The Discharger shall conduct the monitoring of its treatment plant's influent, effluent, and sludge (biosolids) as described in Appendix H-4 entitled, "Requirements for Influent, Effluent and Sludge (Biosolids) Monitoring." (The term "biosolids," as used in this Attachment, shall have the same meaning as wastewater treatment plant "sludge" and will be used from this point forward.) The Discharger shall evaluate the results of the sampling and analysis during the preparation of the semiannual and annual reports to identify any trends. Signing the certification statement used to transmit the reports shall be deemed to certify the Discharger has completed this data evaluation. A tabulation of the data shall be included in the pretreatment annual report as specified in Appendix H-4. The Executive Officer may require more or less frequent monitoring on a case by case basis.

APPENDIX H-1

REQUIREMENTS FOR PRETREATMENT ANNUAL REPORTS

The Pretreatment Annual Report is due each year on February 28 and shall contain activities conducted during the previous calendar year. The purpose of the Annual Report is to:

- Describe the status of the Discharger's pretreatment program; and
- Report on the effectiveness of the program, as determined by comparing the results of the preceding year's program implementation.

The report shall contain, at a minimum, the following information:

A. Cover Sheet

The cover sheet shall include:

1. The name(s) and National Pollutant Discharge Elimination Discharge System (NPDES) permit number(s) of the Discharger(s) that is part of the Pretreatment Program;

2. The name, address and telephone number of a pretreatment contact person;

3. The period covered in the report;

4. A statement of truthfulness; and

5. The dated signature of a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for overall operation of the Publicly Owned Treatment Works (POTW) (40 C.F.R. 403.12(m)).

B. Introduction

This section shall include:

1. Any pertinent background information related to the Discharger and/or the nondomestic user base of the area;

2. List of applicable interagency agreements used to implement the Discharger's pretreatment program (e.g., Memoranda of Understanding (MOU) with satellite sanitary sewer collection systems); and

3. A status summary of the tasks required by a Pretreatment Compliance Inspection (PCI), Pretreatment Compliance Audit (PCA), Cleanup and Abatement Order (CAO), or other pretreatment-related enforcement actions required by the Regional Water Board or the U.S. EPA. A more detailed discussion can be referenced and included in the section entitled, "Program Changes," if needed.

C. Definitions

This section shall include a list of key terms and their definitions that the Discharger uses to describe or characterize elements of its pretreatment program, or the Discharger may provide a reference to its website if the applicable definitions are available on-line.

D. Discussion of Upset, Interference and Pass Through

This section shall include a discussion of Upset, Interference or Pass Through incidents, if any, at the Discharger's treatment plant(s) that the Discharger knows of or suspects were caused by nondomestic user discharges. Each incident shall be described, at a minimum, consisting of the following information:

1. A description of what occurred;

2. A description of what was done to identify the source;

3. The name and address of the nondomestic user responsible;

4. The reason(s) why the incident occurred;

5. A description of the corrective actions taken; and

6. An examination of the local and federal discharge limits and requirements for the purposes of determining whether any additional limits or changes to existing requirements may be necessary to prevent other Upset, Interference or Pass Through incidents.

E. Influent, Effluent and Biosolids Monitoring Results

The Discharger shall evaluate the influent, effluent and biosolids monitoring results as specified in Appendix H-4 in preparation of this report. The Discharger shall retain the analytical laboratory reports with the Quality Assurance and Quality Control (QA/QC) data validation and make these reports available upon request.

This section shall include:

1. Description of the sampling procedures and an analysis of the results (see Appendix H-4 for specific requirements);
2. Tabular summary of the compounds detected (compounds measured above the detection limit for the analytical method used) for the monitoring data generated during the reporting year as specified in Appendix H-4;
3. Discussion of the investigation findings into any contributing sources of the compounds that exceed NPDES limits; and
4. Graphical representation of the influent and effluent metal monitoring data for the past five years with a discussion of any trends.

F. Inspection, Sampling and Enforcement Programs

This section shall include at a minimum the following information:

1. Inspections: Summary of the inspection program (e.g., criteria for determining the frequency of inspections and inspection procedures);

2. Sampling Events: Summary of the sampling program (e.g., criteria for determining the frequency of sampling and chain of custody procedures); and

3. Enforcement: Summary of Enforcement Response Plan (ERP) implementation including dates for adoption, last revision and submission to the Regional Water Board.

G. Updated List of Regulated SIUs

This section shall contain a list of all of the federal categories that apply to SIUs regulated by the Discharger. The specific categories shall be listed including the applicable 40 C.F.R. subpart and section, and pretreatment standards (both maximum and average limits). Local limits developed by the Discharger shall be presented in a table including the applicability of the local limits to SIUs. If local limits do not apply uniformly to SIUs, specify the applicability in the tables listing the categorical industrial users (CIUs) and non-categorical SIUs. Tables developed in Sections 7A and 7B can be used to present or reference this information.

1. CIUs - Include a table that alphabetically lists the CIUs regulated by the Discharger as of the end of the reporting period. This list shall include:

   a. Name;

   b. Address;

   c. Applicable federal category(ies);

   d. Reference to the location where the applicable Federal Categorical Standards are presented in the report;

   e. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

   f. Information, calculations and data used to determine the limits for those CIUs for which a combined waste stream formula is applied.

2. Non-categorical SIUs - Include a table that alphabetically lists the SIUs not subject to any federal categorical standards that were regulated by the Discharger as of the end of the reporting period. This list shall include:

   a. Name;

b. Address;

c. A brief description of the type of business;

d. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

e. Indicate the applicable discharge limits (e.g., different from local limits) to which the SIUs are subject and reference to the location where the applicable limits (e.g., local discharge limits) are presented in the report.

H. SIU (categorical and non-categorical) Compliance Activities

The information required in this section may be combined in the table developed in Section 7 above.

1. **Inspection and Sampling Summary:** This section shall contain a summary of all the SIU inspections and sampling activities conducted by the Discharger and sampling activities conducted by the SIU over the reporting year to gather information and data regarding SIU compliance. The summary shall include:

   a. The number of inspections and sampling events conducted for each SIU by the Discharger;

   b. The number of sampling events conducted by the SIU. Identify SIUs that are operating under an approved Total Toxic Organic Management Plan;

   c. The quarters in which the above activities were conducted; and

   d. The compliance status of each SIU, delineated by quarter, and characterized using all applicable descriptions as given below:

      (1) Consistent compliance;

      (2) Inconsistent compliance;

      (3) Significant noncompliance;

      (4) On a compliance schedule to achieve compliance (include the date final compliance is required);

      (5) Not in compliance and not on a compliance schedule; and

      (6) Compliance status unknown, and why not.

2. **Enforcement Summary:** This section shall contain a summary of SIU compliance and enforcement activities during the reporting year. The summary may be included in the summary

table developed in section 8A and shall include the names and addresses of all SIUs affected by the actions identified below. For each notice specified in enforcement action "i" through "iv," indicate whether it was for an infraction of a federal or local standard/limit or requirement.

a. Warning letters or notices of violations regarding SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

b. Administrative Orders regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

c. Civil actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

d. Criminal actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

e. Assessment of monetary penalties. Identify the amount of penalty in each case and reason for assessing the penalty;

f. Order to restrict/suspend discharge to the Discharger; and

g. Order to disconnect the discharge from entering the Discharger.

3. July-December Semiannual Data: For SIU violations/noncompliance during the semiannual reporting period from July 1 through December 31, provide the following information:

a. Name and facility address of the SIU;

b. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

c. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

d. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

e. For violations/noncompliance identified in the reporting period, provide:

(1) The date(s) of violation(s);

(2) The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

(3) A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

I. Baseline Monitoring Report Update

This section shall provide a list of CIUs added to the pretreatment program since the last annual report. This list of new CIUs shall summarize the status of the respective Baseline Monitoring Reports (BMR). The BMR must contain the information specified in 40 C.F.R. 403.12(b). For each new CIU, the summary shall indicate when the BMR was due; when the CIU was notified by the Discharger of this requirement; when the CIU submitted the report; and/or when the report is due.

J. Pretreatment Program Changes

This section shall contain a description of any significant changes in the Pretreatment Program during the past year including, but not limited to:

1. Legal authority;
2. Local limits;
3. Monitoring/ inspection program and frequency;
4. Enforcement protocol;
5. Program's administrative structure;
6. Staffing level;
7. Resource requirements;
8. Funding mechanism;
9. If the manager of the Discharger's pretreatment program changed, a revised organizational chart shall be included; and
10. If any element(s) of the program is in the process of being modified, this intention shall also be indicated.

K. Pretreatment Program Budget

This section shall present the budget spent on the Pretreatment Program. The budget, either by the calendar or fiscal year, shall show the total expenses required to implement the pretreatment program. A brief discussion of the source(s) of funding shall be provided. In addition, the Discharger shall make available upon request specific details on its pretreatment program expense amounts such as for personnel, equipment, and chemical analyses.

L. Public Participation Summary

This section shall include a copy of the public notice as required in 40 C.F.R. 403.8(f)(2)(viii). If a notice was not published, the reason shall be stated.

M. Biosolids Storage and Disposal Practice

This section shall describe how treated biosolids are stored and ultimately disposed. If a biosolids storage area is used, it shall be described in detail including its location, containment features and biosolids handling procedures.

N. Other Pollutant Reduction Activities

This section shall include a brief description of any programs the Discharger implements to reduce pollutants from nondomestic users that are not classified as SIUs. If the Discharger submits any of this program information in an Annual Pollution Prevention Report, reference to this other report shall satisfy this reporting requirement.

O. Other Subjects

Other information related to the Pretreatment Program that does not fit into any of the above categories should be included in this section.

P. Permit Compliance System (PCS) Data Entry Form

The annual report shall include the PCS Data Entry Form. This form shall summarize the enforcement actions taken against SIUs in the past year. This form shall include the following information:

1. Discharger's name,
2. NPDES Permit number,
3. Period covered by the report,
4. Number of SIUs in significant noncompliance (SNC) that are on a pretreatment compliance schedule,
5. Number of notices of violation and administrative Orders issued against SIUs,
6. Number of civil and criminal judicial actions against SIUs,
7. Number of SIUs that have been published as a result of being in SNC, and
8. Number of SIUs from which penalties have been collected.

APPENDIX H-2

REQUIREMENTS FOR JANUARY-JUNE PRETREATMENT SEMIANNUAL REPORT

The pretreatment semiannual report is due on July 31 for pretreatment program activities conducted from January through June unless an exception has been granted by the Regional Water Board's Executive Officer (e.g., pretreatment programs without any SIUs may qualify for an exception to the pretreatment semiannual report). Pretreatment activities conducted from July through December of each year shall be included in the Pretreatment Annual Report as specified in Appendix H-1. The pretreatment semiannual report shall contain, at a minimum the following information:

A. Influent, Effluent and Biosolids Monitoring

The influent, effluent and biosolids monitoring results shall be evaluated in preparation of this report. The Discharger shall retain analytical laboratory reports with the QA/QC data validation and make these reports available upon request. The Discharger shall also make available upon request a description of its influent, effluent and biosolids sampling procedures. Violations of any parameter that exceed NPDES limits shall be identified and reported. The contributing source(s) of the parameters that exceed NPDES limits shall be investigated and discussed.

B. Significant Industrial User Compliance Status

This section shall contain a list of all SIUs that were not in consistent compliance with all pretreatment standards/limits or requirements for the reporting period. For the reported SIUs, the compliance status for the previous semiannual reporting period shall be included. Once the SIU has determined to be out of compliance, the SIU shall be included in subsequent reports until consistent compliance has been achieved. A brief description detailing the actions that the SIU undertook to come back into compliance shall be provided.

For each SIU on the list, the following information shall be provided:

1. Name and facility address of the SIU;

2. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

3. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

4. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

5. For violations/noncompliance identified in the reporting period, provide:

    a. The date(s) of violation(s);

    b. The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

c. A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

C. Discharger's Compliance with Pretreatment Program Requirements

This section shall contain a discussion of the Discharger's compliance status with the Pretreatment Program Requirements as indicated in the latest Pretreatment Compliance Audit (PCA) Report or Pretreatment Compliance Inspection (PCI) Report. It shall contain a summary of the following information:

1. Date of latest PCA or PCI report;

2. Date of the Discharger's response;

3. List of unresolved issues; and

4. Plan(s) and schedule for resolving the remaining issues.

APPENDIX H-3

SIGNATURE REQUIREMENTS FOR PRETREATMENT ANNUAL AND SEMIANNUAL REPORTS

The pretreatment annual and semiannual reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Discharger [POTW - 40 C.F.R. 403.12(m)]. Signed copies of the reports shall be submitted to the State Water Board and the Regional Water Board through the electronic self-monitoring report (eSMR) module of the California Integrated Water Quality System (CIWQS). Signed copies of the reports shall also be submitted electronically to U.S. EPA at R9Pretreatment@epa.gov or as instructed otherwise.

APPENDIX H-4

REQUIREMENTS FOR INFLUENT, EFFLUENT AND BIOSOLIDS MONITORING

The Discharger shall conduct sampling of its treatment plant's influent, effluent and biosolids at the frequency shown in **the pretreatment requirements table** of the Monitoring and Reporting Program (MRP, Attachment E). When sampling periods coincide, one set of test results, reported separately, may be used for those parameters that are required to be monitored by both the influent and effluent monitoring requirements of the MRP and the Pretreatment Program. The Pretreatment Program monitoring reports as required in Appendices H-1 and H-2 shall be transmitted to the Pretreatment Program Coordinator.

A. Reduction of Monitoring Frequency

The minimum frequency of Pretreatment Program influent, effluent, and biosolids monitoring shall be dependent on the number of SIUs identified in the Discharger's Pretreatment Program as indicated in Table H-1.

Table H-1: Minimum Frequency of Pretreatment Program Monitoring	
Number of SIUs	Minimum Frequency
< 5	Once every five years
> 5 and < 50	Once every year
> 50	Twice per year

If the Discharger's required monitoring frequency is greater than the minimum specified in Table H-1, the Discharger may request a reduced monitoring frequency for that constituent(s) as part of its application for permit reissuance if it meets the following criteria:

The monitoring data for the constituent(s) consistently show non-detect (ND) levels for the effluent monitoring and very low (i.e., near ND) levels for influent and biosolids monitoring for a minimum of eight previous years' worth of data.

The Discharger's request shall include tabular summaries of the data and a description of the trends in the industrial, commercial, and residential customers in the Discharger's service area that demonstrate control over the sources of the constituent(s). The Regional Water Board may grant a reduced monitoring frequency in the reissued permit after considering the information provided by the Discharger and any other relevant information.

B. Influent and Effluent Monitoring

The Discharger shall monitor for the parameters using the required sampling and test methods listed in **the pretreatment table** of the MRP. Any test method substitutions must have received prior written Executive Officer approval. Influent and effluent sampling locations shall be the same as those sites specified in the MRP.

The influent and effluent samples should be taken at staggered times to account for treatment plant detention time. Appropriately staggered sampling is considered consistent with the requirement for collection of effluent samples coincident with influent samples in Section III.A.3.a(2) of Attachment D. All samples must be representative of daily operations. Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 C.F.R. 136 and amendments thereto. For effluent monitoring, the reporting limits for the individual parameters shall be at or below the minimum levels (MLs) as stated in the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (2000) [also known as the State Implementation Policy (SIP)]; any revisions to the MLs shall be adhered to. If a parameter does not have a stated ML, then the Discharger shall conduct the analysis using the lowest commercially available and reasonably achievable detection levels.

The following report elements should be used to submit the influent and effluent monitoring results. A similarly structured format may be used but will be subject to Regional Water Board approval. The monitoring reports shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

1. Sampling Procedures, Sample Dechlorination, Sample Compositing, and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 C.F.R. 136 and amendments thereto. The Discharger shall make available upon request its sampling procedures including methods of dechlorination, compositing, and data validation.

2. A tabulation of the test results for the detected parameters shall be provided.

3. Discussion of Results – The report shall include a complete discussion of the test results for the detected parameters. If any pollutants are detected in sufficient concentration to upset, interfere or pass through plant operations, the type of pollutant(s) and potential source(s) shall be noted, along with a plan of action to control, eliminate, and/or monitor the pollutant(s). Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

C. Biosolids Monitoring

Biosolids should be sampled in a manner that will be representative of the biosolids generated from the influent and effluent monitoring events except as noted in (3. below. The same parameters required for influent and effluent analysis shall be included in the biosolids analysis. The biosolids analyzed shall be a composite sample of the biosolids for final disposal consisting of:

1. Biosolids lagoons – 20 grab samples collected at representative equidistant intervals (grid pattern) and composited as a single grab, or

2. Dried stockpile – 20 grab samples collected at various representative locations and depths and composited as a single grab, or

3. Dewatered biosolids - daily composite of 4 representative grab samples each day for 5 days taken at equal intervals during the daily operating shift taken from a) the dewatering units or b) each truckload, and shall be combined into a single 5- day composite.

The U.S. EPA manual, POTW Sludge Sampling and Analysis Guidance Document, August 1989, containing detailed sampling protocols specific to biosolids is recommended as a guidance for sampling procedures. The U.S. EPA manual Analytical Methods of the National Sewage Sludge Survey, September 1990, containing detailed analytical protocols specific to biosolids, is recommended as a guidance for analytical methods.

In determining if the biosolids are a hazardous waste, the Discharger shall adhere to Article 2, "Criteria for Identifying the Characteristics of Hazardous Waste," and Article 3, "Characteristics of Hazardous Waste," of Title 22, California Code of Regulations, sections 66261.10 to 66261.24 and all amendments thereto.

The following report elements should be used to submit the biosolids monitoring results. A similarly structured form may be used but will be subject to Regional Water Board approval. The results shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

- Sampling Procedures and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 C.F.R. 136 and amendments thereto. The Discharger shall make available upon request its biosolids sampling procedures and data validation methods.

- Test Results – Tabulate the test results for the detected parameters and include the percent solids.

- Discussion of Results – Include a complete discussion of test results for the detected parameters. If the detected pollutant(s) is reasonably deemed to have an adverse effect on biosolids disposal, a plan of action to control, eliminate, and/or monitor the pollutant(s) and the known or potential source(s) shall be included. Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

The Discharger shall also provide a summary table presenting any influent, effluent or biosolids monitoring data for non-priority pollutants that the Discharger believes may be causing or contributing to interference, pass through or adversely impacting biosolids quality.

EXHIBIT 6

ORDER No. R2-2013-0029
NPDES No. CA0037664

The following discharger is subject to waste discharge requirements (WDRs) set forth in this Order.

Table 1. Discharger Information

Discharger	City and County of San Francisco
Facility Name	Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System
Facility Address	San Francisco Public Utilities Commission / Wastewater Enterprise 750 Phelps Street San Francisco, CA 94124
CIWQS Place Number	256499

Table 2. Discharge Locations

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
Treatment Plant Discharge Points				
001 (Pier 80 Outfall)	Secondary-treated effluent (dry weather); Primary-treated and secondary-treated effluent (wet weathter)	37.749444	-122.372778	Lower San Francisco Bay
002 (Quint Street Outfall)	Secondary-treated effluent (wet weathter)	37.747222	-122.386944	Islais Creek
003 and 004 (Pier 33 Outfall)	Primary-treated effluent (wet weathter)	37.806944	-122.403056	Central San Francisco Bay
005 and 006 (Pier 35 Outfall)	Primary-treated effluent (wet weathter)	37.810000	-122.405556	Central San Francisco Bay
Combined Sewer Discharge Points				
009 (Baker Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.808056	-122.446667	Marina Beach North Shore Drainage Basin
010 (Pierce Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.806944	-122.440000	Marina Beach North Shore Drainage Basin
011 (Laguna Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.811667	-122.43189	Yacht Harbor #2 North Shore Drainage Basin

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
013 (Beach Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.808333	-122.406667	Pier 39 North Shore Drainage Basin
015 (Sansome Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.806667	-122.403056	Pier 31 North Shore Drainage Basin
017 (Jackson Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.798333	-122.39472	Pier 3 North Shore Drainage Basin
018 (Howard Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.793056	-122.390000	Pier 14 Central Drainage Basin
019 (Brannan Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.785278	-122.373333	Pier 32 Central Drainage Basin
022 (Third Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.777222	-122.389444	Mission Creek Central Drainage Basin
023 (Fourth Street North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.775556	-122.391389	Mission Creek Central Drainage Basin
024 (Fifth Street North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.773889	-122.393889	Mission Creek Central Drainage Basin
025 (Sixth Street North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.771944	-122.396111	Mission Creek Central Drainage Basin
026 (Division Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.770278	-122.397500	Mission Creek Central Drainage Basin
027 (Sixth Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.771389	-122.395000	Mission Creek Central Drainage Basin
028 (Fourth Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.775000	-122.391111	Mission Creek Central Drainage Basin
029 (Mariposa Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37764722	-122.385278	Central Basin Central Drainage Basin
030 (20th Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.761111	-122.380000	Central Basin Central Drainage Basin
030A (22nd Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.757778	-122.380278	Central Basin Central Drainage Basin
031 (Third Street North	Equivalent-to-primary-treated effluent (wet weathter)	37.747778	-122.386111	Islais Creek Central Drainage Basin

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
031A (Islais Creek North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747778	-122.387500	Islais Creek Central Drainage Basin
032 (Marin Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.748611	-122.390833	Islais Creek Central Drainage Basin
033 (Selby Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747778	-122.390833	Islais Creek Central Drainage Basin
035 Third Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747222	-122.386111	Islais Creek Central Drainage Basin
037 (Evans Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.735833	-122.373889	India Basin Southeast Drainage Basin
038 (Hudson Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.733333	-122.373839	India Basin Southeast Drainage Basin
040 (Griffith Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.723056	-122.382222	Yosemite Creek Southeast Drainage Basin
041 (Yosemite Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.723889	-122.385556	Yosemite Creek Southeast Drainage Basin
042 (Fitch Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.722222	-122.381944	South Basin Southeast Drainage Basin
043 (Sunnydale Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747222	-122.386944	Candlestick Cove Southeast Drainage Basin

Table 3. Administrative Information

This Order was adopted on:	August 14, 2013
This Order shall become effective on:	October 1, 2013
This Order shall expire on:	September 30, 2018
The Discharger shall file a Report of Waste Discharge as an application for reissuance of WDRs in accordance with California Code of Regulations, title 23, and an application for reissuance of a National Pollutant Discharge Elimination System (NPDES) permit no later than:	March 30, 2018
The U.S. Environmental Protection Agency (U.S. EPA) and the California Regional Water Quality Control Board, San Francisco Bay Region, have classified this discharge as follows:	Major

I, Bruce H. Wolfe, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of the Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on the date indicated above.

_____

Bruce H. Wolfe**,** Executive Officer

I. FACILITY INFORMATION

Information describing the Southeast Water Pollution Control Plant (Southeast Plant), North Point Wet Weather Facility (North Point Facility), Bayside Wet Weather Facilities, and Wastewater Collection System (collectively, the Facility) is summarized in Table 1 and in Fact Sheet (Attachment F) sections I and II.

II. FINDINGS

The California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board), finds:

A. Legal Authorities. This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA, and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as an NPDES permit for point source discharges from the Facility to surface waters.

B. Background and Rationale for Requirements. The Regional Water Board developed the requirements in this Order based on information the Discharger submitted as part of its application, information obtained through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F) contains background information and rationale for the requirements in this Order and is hereby incorporated into and constitutes findings for this Order. Attachments A through E, G, and H are also incorporated into this Order.

C. Provisions and Requirements Implementing State Law. No provisions and requirements in this Order are included to implement State law only.

D. Notification of Interested Parties. The Regional Water Board notified the Discharger and interested agencies and persons of its intent to prescribe these WDRs and provided an opportunity to submit written comments and recommendations. The Fact Sheet provides details regarding the notification.

E. Consideration of Public Comment. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. The Fact Sheet provides details regarding the public hearing.

THEREFORE, IT IS HEREBY ORDERED that Order No. R2-2008-0007 (previous order) is rescinded upon the effective date of this Order except for enforcement purposes, and, in order to meet the provisions of Water Code division 7 (commencing with § 13000) and regulations adopted thereunder, and the provisions of the CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order. This action in no way prevents the Regional Water Board from taking enforcement action for past violations of the previous order.

III. DISCHARGE PROHIBITIONS

A. Discharge of treated wastewater at a location or in a manner different from that described in this Order is prohibited.

B. Discharge at Discharge Point No. 001 is prohibited when treated wastewater does not receive a dilution of at least 231:1, as modeled. Compliance shall be achieved by proper operation and maintenance of the discharge outfall to ensure that it (or its replacement, in whole or part) is in good working order and is consistent with or can achieve better mixing than that described in Fact Sheet section IV.C.4.a. The Discharger shall address measures taken to ensure this in its application for permit reissuance.

C. The bypass of untreated or partially-treated wastewater to waters of the United States is prohibited, except during wet weather (as defined in Attachment A) and as provided for in the conditions stated in Attachment D section I.G.

D. Except during wet weather, discharges from Discharge Point Nos. 002 through 043 are prohibited.

E. Average dry weather effluent flow in excess of 85.4 MGD is prohibited at Discharge Point No. 001. Average dry weather effluent flow shall be determined from three consecutive dry weather months each year, with compliance measured at Monitoring Location EFF-001A as described in the Monitoring and Reporting Program (MRP).

F. Any sanitary or combined sewer discharge of untreated or partially-treated wastewater to waters of the United States not expressely authorized by this Order is prohibited.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent Limitations—Dry Weather

1. During dry weather, the Discharger shall comply with the following effluent limitations at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001A as described in the MRP.

Table 4. Effluent Limitations—Dry Weather

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Biochemical Oxygen Demand, 5-day @ 20°C (BOD_5)	mg/L	30	45	---	---	---
Total Suspended Solids (TSS)	mg/L	30	45	---	---	---
Oil and Grease	mg/L	10	---	20	---	---
pH [1]	s.u.	---	---	---	6.0	9.0
Total Residual Chlorine	mg/L	---	---	---	---	0.0 [2]
Copper, Total Recoverable	µg/L	53	---	76	---	---
Cyanide, Total	µg/L	20	---	43	---	---
Dioxin-TEQ	µg/L	1.4×10^{-8}	---	2.8×10^{-8}	---	---
1,2-Diphenylhydrazine	µg/L	5.4	---	11	---	---

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Total Ammonia, as N	mg/L	190	---	290	---	---

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter
s.u. = standard units
% = percent

Footnotes:

[1] If the Discharger monitors pH continuously, pursuant to 40 C.F.R. section 401.17 the Discharger shall be in compliance with this pH limitation provided that both of the following conditions are satisfied: (i) the total time during which the pH is outside the required range shall not exceed 7 hours and 26 minutes in any calendar month; and (ii) no individual excursion from the required pH range shall exceed 60 minutes.

[2] Effluent residual chlorine concentrations shall be monitored continuously or, at a minimum, every hour. The Discharger shall report for each day the maximum residual chlorine concentration observed following dechlorination using all values measured during that day. However, if monitoring continuously, for the purpose of mandatory minimum penalties required by Water Code section 13385(i), compliance shall be based only on discrete readings from the continuous monitoring every hour on the hour. The Discharger shall retain continuous monitoring readings for at least three years. The Regional Water Board reserves the right to use all continuous monitoring data for discretionary enforcement.

The Discharger may elect to use a continuous on-line monitoring system for measuring or determining that residual dechlorinating agent is present. This monitoring system may be used to prove that anomalous residual chlorine exceedances measured by on-line chlorine analyzers are false positives and are not violations of this total residual chlorine limit because it is chemically improbable to have chlorine present in the presence of sodium bisulfite.

2. **Percent Removal.** During dry weather, the average monthly percent removal of biochemical oxygen demand (BOD_5) and total suspended solids (TSS) at Discharge Point No. 001 shall not be less than 85 percent (i.e., in each calendar month, the arithmetic mean of BOD_5 and TSS, by concentration, for effluent samples collected at Monitoring Location EFF-001A as described in the MRP shall not exceed 15 percent of the arithmetic mean of the BOD_5 and TSS, by concentration, for influent samples collected at Monitoring Location INF-001 as described in the MRP at approximately the same times during the same period).

3. **Bacteria.** Dry weather discharges at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001A as described in the MRP, shall meet the following limitations:

   a. **Enterococcus.** The geometric mean enterococcus bacteria concentration of all samples in a calendar month shall not exceed 35 most probable number per 100 milliliters (MPN/100 mL).

   b. **Fecal Coliform.** The median fecal coliform density of all samples in any calendar month shall not exceed 500 MPN/100 mL, and no more than 10 percent of the samples in any calendar month shall contain a fecal coliform density equal to or greater than 1,100 MPN/100 mL.

4. **Whole Effluent Acute Toxicity.** During dry weather, discharges at Discharge Point No. 001 shall comply with the following limitations, with compliance measured at Monitoring Location EFF-001A as described in the MRP:

a. An 11-sample median value of not less than 90 percent survival; and

b. An 11-sample 90th percentile value of not less than 70 percent survival.

These acute toxicity limitations are defined as follows:

- **11-sample median.** A bioassay test showing survival of less than 90 percent represents a violation of this effluent limit if five or more of the past ten or fewer bioassay tests also show less than 90 percent survival.

- **11-sample 90th percentile.** A bioassay test showing survival of less than 70 percent represents a violation of this effluent limit if one or more of the past ten or fewer bioassay tests also show less than 70 percent survival.

Bioassays shall be performed using the most up-to-date U.S. EPA protocols and species as specified in the MRP. If these protocols prove unworkable, the Executive Officer and the Environmental Laboratory Accreditation Program may grant exceptions in writing upon the Discharger's request with justification.

If the Discharger can demonstrate that toxicity exceeding the levels cited above is caused by ammonia and that the ammonia in the discharge complies with the ammonia effluent limits in Section IV.A.1 of this Order, then such toxicity does not constitute a violation of this effluent limitation.

5. **Whole Effluent Chronic Toxicity.** During dry weather, discharges at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001A as described in the MRP, shall not contain chronic toxicity at a level that would cause or contribute to toxicity in the receiving water. Chronic toxicity is a detrimental biological effect on growth rate, reproduction, fertilization success, larval development, or any other relevant measure of the health of an organism population or community. Compliance with this limit shall be determined by analysis of indicator organisms and toxicity tests as described in the MRP.

B. Effluent Limitations—Wet Weather

During wet weather, the Discharger shall comply with the following effluent limitations at Discharge Point Nos. 001 through 006, with compliance measured at Monitoring Locations EFF-001B, EFF-002, and EFF-003 as described in the MRP. Provision VI.C.5 of this Order imposes additional technology-based and water quality-based wet weather requirements.

Table 5. Effluent Limitations—Wet Weather

		Effluent Limitations	
Parameter	**Units**	**Monthly Geometric Mean**	**Instantaneous Maximum**
Total Residual Chlorine	mg/L	---	0.0 [1]
Enterococcus	MPN/100 mL	35 [2]	---

Unit Abbreviation:

mg/L = milligrams per liter

Footnote:

[1] Effluent residual chlorine concentrations shall be monitored continuously or, at a minimum, every hour. The Discharger shall report for each day the maximum residual chlorine concentration observed following dechlorination using all values measured during that day. However, if monitoring continuously, for the purpose of mandatory minimum penalties required by Water Code section 13385(i),

compliance shall be based only on discrete readings from the continuous monitoring every hour on the hour. The Discharger shall retain continuous monitoring readings for at least three years. The Regional Water Board reserves the right to use all continuous monitoring data for discretionary enforcement.

The Discharger may elect to use a continuous on-line monitoring system for measuring or determining that residual dechlorinating agent is present. This monitoring system may be used to prove that anomalous residual chlorine exceedances measured by on-line chlorine analyzers are false positives and are not violations of this total residual chlorine limit because it is chemically improbable to have chlorine present in the presence of sodium bisulfite.

[2] Data from both wet and dry weather shall be included when calculating the geometric mean for compliance with this monthly wet weather limitation. For days with discharge but no sampling, the enterococcus densities shall be assumed to be the same as the densities of the most recent discharge samples. For days with no discharge, enterococcus densities shall be assumed to be 1 MPN/100 mL for calculational purposes.

V. RECEIVING WATER LIMITATIONS

A. The discharge shall not cause the following conditions to exist in receiving waters at any place outside the near-field mixing zone (i.e., where mixing is not controlled by effluent discharge momentum and buoyancy):

1. Floating, suspended, or deposited macroscopic particulate matter or foams;

2. Bottom deposits or aquatic growths to the extent that such deposits or growths cause nuisance or adversely affect beneficial uses;

3. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;

4. Visible, floating, suspended, or deposited oil or other products of petroleum origin; or

5. Toxic or other deleterious substances in concentrations or quantities that cause deleterious effects on wildlife, waterfowl, or other aquatic biota, or render any of these unfit for human consumption, either at levels created in the receiving waters or as a result of biological concentration.

B. The discharge shall not cause the following limits to be exceeded in receiving waters at any place within one foot of the water surface outside the near-field mixing zone (i.e., where mixing is not controlled by effluent discharge momentum and buoyancy):

1.	Dissolved Oxygen	5.0 mg/L, minimum The median dissolved oxygen concentration for any three consecutive months shall not be less than 80% of the dissolved oxygen content at saturation. When natural factors cause concentrations less than that specified above, the discharge shall not cause further reduction in ambient dissolved oxygen concentrations.
2.	Dissolved Sulfide	Natural background levels
3.	pH	The pH shall not be depressed below 6.5 or raised above 8.5. The discharge shall not cause changes greater than 0.5 pH units in normal ambient pH levels.

4. Nutrients — Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.

C. The discharge shall not cause a violation of any water quality standard for receiving waters adopted by the Regional Water Board or State Water Board as required by the CWA and regulations adopted thereunder (including the *Combined Sewer Overflow (CSO) Control Policy*) outside near-field mixing zones (i.e., where mixing is not controlled by effluent discharge momentum and buoyancy). If more stringent water quality standards are promulgated or approved pursuant to CWA section 303, or amendments thereto, the Regional Water Board may revise or modify this Order in accordance with the more stringent standards.

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all "Standard Provisions" in Attachment D.

2. The Discharger shall comply with all applicable provisions of the "Regional Standard Provisions, and Monitoring and Reporting Requirements for NPDES Wastewater Discharge Permits" (Attachment G). Attachment G provisions I.J (Storm Water) and III.A.3.c (Storm Water Monitoring) do not apply.

B. Monitoring and Reporting

The Discharger shall comply with the MRP (Attachment E), and future revisions thereto, and applicable sampling and reporting requirements in Attachments D and G.

C. Special Provisions

1. Reopener Provisions

The Regional Water Board may modify or reopen this Order prior to its expiration date in any of the following circumstances as allowed by law:

a. If present or future investigations demonstrate that the discharges governed by this Order have or will have a reasonable potential to cause or contribute to, or will cease to have, adverse impacts on water quality or beneficial uses of the receiving waters.

b. If new or revised water quality objectives or total maximum daily loads (TMDLs) come into effect for San Francisco Bay and contiguous water bodies (whether statewide, regional, or site-specific). In such cases, effluent limitations in this Order may be modified as necessary to reflect the updated water quality objectives and wasteload allocations in the TMDLs. Adoption of the effluent limitations in this Order is not intended to restrict in any way future modifications based on legally-adopted water quality objectives or TMDLs, or as otherwise permitted under federal regulations governing NPDES permit modifications.

c. If translator, dilution, or other water quality studies provide a basis for determining that a permit condition should be modified.

d. If State Water Board precedential decisions, new policies, new laws, or new regulations are adopted.

e. If an administrative or judicial decision on a separate NPDES permit or waste discharge requirements addresses requirements similar to this discharge.

f. Or as otherwise authorized by law.

The Discharger may request a permit modification based on any of the circumstances above. With any such request, the Discharger shall include antidegradation and anti-backsliding analyses.

With the consent of the Discharger, the Executive Officer may make minor modifications to this Order for the purposes set forth in 40 C.F.R. section 122.63.

2. Effluent Characterization Study and Report

a. Study Elements. The Discharger shall continue to characterize and evaluate the dry weather discharge from the following discharge point to verify that the "no" or "cannot determine" reasonable potential analysis conclusions of this Order remain valid and to inform the next permit reissuance. The Discharger shall collect representative samples at the monitoring stations set forth below, as defined in the MRP, at no less than the frequency specified below:

Discharge Point	Monitoring Station	Minimum Frequency
001	EFF-001A	Once per calendar year

The samples shall be analyzed for the priority pollutants listed in Attachment G, Table C, except for those priority pollutants with effluent limitations where the MRP already requires more frequent monitoring. Compliance with this requirement shall be achieved in accordance with the specifications of Attachment G, sections III.A.1 and III.A.2.

The Discharger shall evaluate on an annual basis if concentrations of any of these priority pollutants significantly increase over past performance. The Discharger shall investigate the cause of any such increase. The investigation may include, but need not be limited to, an increase in monitoring frequency, monitoring of internal process streams, and monitoring of influent sources. The Discharger shall establish remedial measures addressing any increase resulting in reasonable potential to cause or contribute to an exceedance of applicable water quality objectives during dry weather. This requirement may be satisfied through identification of the constituent as a "pollutant of concern" in the Discharger's Pollutant Minimization Program, described in Provision VI.C.3.

b. Reporting Requirements

i. Routine Reporting. The Discharger shall, within 30 days of receipt of analytical results, report the following in the transmittal letter for the appropriate self-monitoring report:

(a) Indication that a sample for this characterization study was collected; and

(b) Identity of priority pollutants detected at or above applicable water quality criteria (see Fact Sheet Table F-9 for the criteria), and the detected concentrations of those pollutants.

ii. Annual Reporting. The Discharger shall summarize the annual data evaluation and source investigation in the annual self-monitoring report.

iii. Final Report. The Discharger shall submit a final report that presents all these data with the application for permit reissuance.

3. Pollutant Minimization Program

a. The Discharger shall continue to improve its existing Pollutant Minimization Program to promote minimization of pollutant loadings to the treatment plant and therefore to the receiving waters.

b. The Discharger shall submit an annual report no later than February 28 each year. Each annual report shall include at least the following information:

i. Brief description of treatment plant. The description shall include the service area and treatment plant processes.

ii. Discussion of current pollutants of concern. Periodically, the Discharger shall analyze its circumstances to determine which pollutants are currently a problem and which pollutants may be potential future problems. This discussion shall include the reasons for choosing the pollutants.

iii. Identification of sources for pollutants of concern. This discussion shall include how the Discharger intends to estimate and identify pollutant sources. The Discharger shall include sources or potential sources not directly within the ability or authority of the Discharger to control, such as pollutants in the potable water supply and air deposition.

iv. Identification of tasks to reduce the sources of pollutants of concern. This discussion shall identify and prioritize tasks to address the Discharger's pollutants of concern. The Discharger may implement the tasks by itself or participate in group, regional, or national tasks that address its pollutants of concern. The Discharger is strongly encouraged to participate in group, regional, or national tasks that address its pollutants of concern whenever it is efficient and appropriate to do so. An implementation timeline shall be included for each task.

v. Outreach to employees. The Discharger shall inform employees about the pollutants of concern, potential sources, and how they might be able to help reduce the discharge of these pollutants of concern into the Facility. The Discharger may provide a forum for employees to provide input.

vi. Continuation of Public Outreach Program. The Discharger shall prepare a pollution prevention public outreach program for its service area. Outreach may

include participation in existing community events, such as county fairs; initiating new community events, such as displays and contests during Pollution Prevention Week; conducting school outreach programs; conducting plant tours; and providing public information in newspaper articles or advertisements, radio or television stories or spots, newsletters, utility bill inserts, or web sites. Information shall be specific to target audiences. The Discharger shall coordinate with other agencies as appropriate.

vii. **Discussion of criteria used to measure Pollutant Minimization Program and task effectiveness.** The Discharger shall establish criteria to evaluate the effectiveness of its Pollutant Minimization Program. This discussion shall idenify the specific criteria used to measure the effectiveness of each task in Provisions VI.C.3.b.iii, iv, v, and vi.

viii. **Documentation of efforts and progress.** This discussion shall detail all of the Discharger's Pollutant Minimization Program activities during the reporting year.

ix. **Evaluation of Pollutant Minimization Program and task effectiveness.** This Discharger shall use the criteria established in Provision VI.C.3.b.vii to evaluate the program and task effectiveness.

x. **Identification of specific tasks and timelines for future efforts.** Based on the evaluation, the Discharger shall explain how it intends to continue or change its tasks to more effectively reduce the amount of pollutants flowing to the Facility, and subsequently in its effluent.

c. The Discharger shall develop and conduct a Pollutant Minimization Program as further described below when there is evidence that a priority pollutant is present in the effluent above an effluent limitation (e.g., sample results reported as detected but not quantified [DNQ] when the effluent limitation is less than the method detection limit [MDL], sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, or results of benthic or aquatic organism tissue sampling) and either:

i. A sample result is reported as DNQ and the effluent limitation is less than the Reporting Level (RL); or

ii. A sample result is reported as not detected (ND) and the effluent limitation is less than the MDL using definitions in Attachment A and reporting protocols described in the MRP.

d. If triggered by the reasons set forth in Provision VI.C.3.c, above, the Discharger's Pollutant Minimization Program shall include, but not be limited to, the following actions and submittals:

i. Annual review and semi-annual monitoring of potential sources of the reportable priority pollutants, which may include fish tissue monitoring and other bio-uptake sampling, or alternative measures when source monitoring is unlikely to produce useful analytical data;

ii. Quarterly monitoring for the reportable priority pollutants in the influent to the Facility. The Executive Officer may approve alternative measures when influent monitoring is unlikely to produce useful analytical data;

iii. Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable priority pollutants in the effluent at or below the effluent limitation;

iv. Implementation of appropriate cost-effective control measures for the reportable priority pollutants, consistent with the control strategy; and

v. Inclusion of the following specific items within the annual report required by Provision VI.C.3.b above:

(a) All Pollutant Minimization Program monitoring results for the previous year;
(b) List of potential sources of the reportable priority pollutants;
(c) Summary of all actions undertaken pursuant to the control strategy; and
(d) Description of actions to be taken in the following year.

4. Special Provisions for Municipal Facilities

a. Pretreatment Program. The Discharger shall implement and enforce its approved pretreatment program in accordance with federal pretreatment regulations (40 C.F.R. part 403); pretreatment standards promulgated under CWA sections 307(b), 307(c), and 307(d); pretreatment requirements specified under 40 C.F.R. section 122.44(j); and the requirements in Attachment H, "Pretreatment Requirements." The Discharger's responsibilities include, but are not limited to, the following:

i. Enforcement of the National Pretreatment Standards of 40 C.F.R. sections 403.5 and 403.6;

ii. Implementation of its pretreatment program in accordance with legal authorities, policies, procedures, and financial provisions described in the National Pretreatment Program (40 C.F.R. part 403).

iii. Submission of reports to the State Water Board and the Regional Water Board as described in Attachment H.

iv. Evaluation of the need to revise local limits under 40 C.F.R. section 403.5(c)(1) and, within 180 days following the effective date of this Order, submission of a report describing the changes, with a plan and schedule for implementation. To ensure no significant increase in copper discharges, and thus compliance with antidegradation requirements, the Discharger shall not consider eliminating or relaxing local limits for copper.

b. Sludge and Biosolids Management

i. All sludge and biosolids shall be disposed of, managed, or used in a municipal solid waste landfill; through land application; as a Class A compost; through a waste-to-

energy facility or another recognized and approved technology; in a sludge-only landfill; or in a sewage sludge incinerator in accordance with 40 C.F.R. part 503.

ii. Sludge and biosolids treatment, storage, and disposal, or use, shall not create a nuisance, such as objectionable odors or flies, or result in groundwater contamination.

iii. The sludge and biosolids treatment and storage site shall have facilities adequate to divert surface runoff from adjacent areas, to protect site boundaries from erosion and rising sea levels, and to prevent any conditions that would cause drainage from the materials in the storage site. Adequate protection is defined as protection from at least a 100-year storm and the highest possible tidal stage that may occur.

iv. Sludge or biosolids disposed in a municipal solid waste landfill shall meet the requirements of 40 C.F.R. part 258. In the annual self-monitoring report, the Discharger shall provide the amount of sludge or biosolids disposed and indicate the landfill to which it was sent.

v. This Order does not authorize permanent onsite sludge or biosolids storage or disposal. A Report of Waste Discharge shall be filed and the site brought into compliance with all applicable regulations prior to commencement of any such activity.

c. Collection System Management. The Discharger shall properly operate and maintain its entire collection system (see Provision VI.C.5 and Attachment D, section I.D). The Discharger shall report any noncompliance (see Attachment D, sections V.E.1 and V.E.2) and mitigate any discharge from its collection system that violates this Order (see Attachment D, section I.C).

i. Separate Sanitary Sewer System. The *General Waste Discharge Requirements for Wastewater Collection Agencies* (General Collection System WDRs), State Water Board Order 2006-0003 DWQ as amended by State Water Board Order WQ 2008-0002-EXEC, has requirements for operation and maintenance of separate sanitary sewer collection systems and for reporting and mitigating sanitary sewer overflows from the separate sanitary sewer portion of the Discharger's collection system. While the Discharger must comply with both the General Collection System WDRs and this Order, the General Collection System WDRs more clearly and specifically stipulate requirements for operation and maintenance and for reporting and mitigating sanitary sewer overflows. Implementation of the General Collection System WDRs for proper operation and maintenance and mitigation of sanitary sewer overflows will satisfy the corresponding federal NPDES requirements specified in Attachment D (as supplemented by Attachment G). Following the notification and reporting requirements in the General Collection System WDRs will satisfy NPDES the corresponding reporting requirements specified in Attachment D (as supplemented by Attachment G) for sanitary sewer overflows from the separate sanitary sewer portion of the collection system.

ii. Combined Sewer System. For purposes of this Order, a combined sewer system "excursion" is a release or diversion of untreated or partially-treated wastewater from

the combined sewer system that exits the system temporarily and then re-enters it. Excursions are caused by blockages or flow conditions within the publicly-owned portion of the combined sewer system and can occur in public rights of way or on private property. Excursions do not include releases from privately-owned sewer laterals or authorized combined sewer discharges from Discharge Point Nos. 009 through 043.

(a) Excursion Database. By January 1, 2014, the Discharger shall develop and maintain a database containing information about each excursion that occurs within the Southeast Plant's service area. The Discharger may limit these data to excursions occurring within the City and County of San Francisco. The Discharger may, at its option, include information concerning releases from private sewer laterals. The database shall contain the following information for each excursion:

(1) Location, including latitude and longitude, street address (if available), zip code, cross street, and asset number;

(2) Destination (if known), including whether the excursion was fully captured and returned to the combined sewer system and whether any portion of it entered a drainage channel or surface water;

(3) Estimated volume, in gallons, including volume that reached a surface water or drainage channel and volume recovered (all spills to drainage channels or surface waters are subject to MRP section IX.B, which modifies Attachment G section V.E.2);

(4) Date and time excursion was reported to the San Francisco Public Utilities Commission;

(5) Operator arrival date and time;

(6) End date and time of excursion, if known;

(7) Source (e.g., manhole, catch basin, vent trap);

(8) Cause (e.g., mainline blockage, roots, broken pipe);

(9) Corrective actions taken, including steps taken or planned to reduce, eliminate, and prevent reoccurrence;

(10) Parameters for which samples were analyzed and results (if applicable);

(11) Whether the County Health Officer was notified and health warnings were posted (if known);

(12) Whether a beach was affected and, if so, which one (if applicable);

(13) California Emergency Management Agency (CalEMA) control number, and date and time CalEMA was called (if applicable);

(14) Date and time County Health Officer was notified (if applicable).

If the Discharger chooses to include information regarding releases from private sewer laterals, it should also record responsible party contact information, if known.

(b) Routine Reporting. The Discharger shall report any excursion greater than 1,000 gallons, regardless of whether it enters a drainage channel or surface water, to the Regional Water Board and the San Francisco Department of Public Health not later than two hours after becoming aware of the discharge. The Discharger shall make this report as soon as (1) it has knowledge of the excursion, (2) reporting is possible, and (3) a report can be provided without impeding cleanup or other emergency measures. The Discharger shall report excursions by calling the Regional Water Board's spill hotline (currently 510-622-2369) and following standard procedures developed by the San Francisco Public Utilities Commission and the San Francisco Department of Public Health. (Spill to drainage channels or surface waters are subject to MRP section IX.B, which modifies Attachment G section V.E.2.)

(c) Annual Report. The Discharger shall submit a report no later than August 15 each year that compiles and summarizes information from the excursion database for the preceding 12 months ending June 30. Within the report, the Discharger shall review collection system performance, evaluate excursion trends in terms of time and location, summarize actions taken within the preceding year to minimize excursions, and identify specific tasks for the coming year to further minimize excursions.

(d) Record Keeping. The Discharger shall maintain documentation supporting the database records for at least three years following each excursion. The Executive Officer may extend this period if necessary. Documentation shall include, but need not be limited to, work orders and other maintenance records associated with responses and investigations. The Discharger shall make all excursion records available for review upon Regional Water Board staff request.

If the Discharger collects water quality samples for analysis, it shall maintain the following information:

- Date, exact place, and time of sampling or measurement;
- Individual who performed sampling or measurement;
- Date of analysis;
- Individual who performed analysis;
- Analytical technique or method used; and
- Analysis results.

5. Combined Sewer Sytem Controls

The Discharger shall maximize flows to the Southeast Plant and pollutant removal during wet weather in accordance with the Nine Minimum Controls and the Discharger's Long-Term Control Plan.

a. Combined Sewer Operations and Maintenance Plan. The Discharger shall revise and update its *Combined Sewer Operations and Maintenance Plan* as necessary to ensure compliance with the Nine Minimum Controls and the Long-Term Control Plan requirements of the *Combined Sewer Overflow Control Policy*. The Discharger shall submit the updated plan by August 15, 2015, and following any subsequent revision.

b. Nine Minimum Controls. The Discharger shall continue implementing the following controls:

i. Conduct Proper Operations and Maintenance Programs. The Discharger shall implement its *Combined Sewer Operations and Maintenance Plan*, which shall include the elements described below. The Discharger shall operate and maintain the system according to the plan and in accordance with Provision VI.C.4.c.ii of this Order. The Discharger shall maintain records to document plan implementation.

(a) Designate Manager for Combined Sewer Discharges and Overflows. The Discharger shall designate a person to be responsible for the wastewater collection system and serve as the contact person regarding the operation of the combined sewer system. The Discharger shall notify the Regional Water Board within 90 days of the designation of a new contact person.

(b) Inspect and Maintain Combined Sewer System. The Discharger shall properly operate and maintain the collection system and the combined sewer discharge outfalls to reduce the magnitude, frequency, and duration of combined sewer discharges. The Discharger shall perform the following:

- Regularly clean sewers and catch basins, and repair or replace, as necessary, sewers and related equipment;
- Disconnect any illegal connections;
- Inspect and maintain discharge structures, regulators, pumping stations, and tide gates to ensure that they are in good working condition and adjusted to minimize combined sewer discharges, prevent combined sewer overflows, and prevent tidal inflow;
- Inspect each combined sewer discharge outfall at least once per year. The inspection shall include, but not be limited to, entering the regulator structure, if accessible; determining the extent of any structural defect or debris and grit buildup; and removing any debris that may constrict flow, cause blockage, or result in a dry weather combined sewer overflow. For outfalls that are inaccessible, the Discharger may perform a visual check of the discharge pipe to determine whether combined sewer overflows have occurred or could potentially occur during dry weather; and

- Record all inspection results in a maintenance log.

(c) Provide Trained Staff. The Discharger shall provide adequate staff to carry out the operation, maintenance, repair, and testing required to ensure compliance with the terms and conditions of this Order. The Discharger shall provide appropriate training for each staff member.

(d) Allocate Funds for Operation and Maintenance. The Discharger shall allocate adequate funds for operation and maintenance activities.

ii. Maximize Use of Collection System for Storage. The Discharger shall continue to maximize the use of the collection system (i.e., collection system piping, not only the storage/transports) for in-line storage to reduce the magnitude, frequency, and duration of combined sewer discharges.

iii. Review and Modify Pretreatment Program. The Discharger shall continue to implement controls to minimize the impact of non-domestic discharges to its collection system. At three-year intervals, the Discharger shall re-evaluate whether additional modifications to its pretreatment program are feasible or practical. The Discharger shall maintain records to document this evaluation and implementation of controls.

iv. Maximize Flow to Southeast Plant and North Point Facility. The Discharger shall operate the Southeast Plant at maximum treatable flow during wet weather. The Discharger shall ensure that the *Combined Sewer Operation and Maintenance Plan* is implemented to maximize the volume of wastewater treated at the Southeast Plant and the North Point Facility and discharged via deep water outfalls, consistent with the hydraulic capacities of the storage, transport, treatment, and disposal facilities. The Discharger shall report rainfall with the self-monitoring reports the MRP requires.

v. Prohibit Dry Weather Combined Sewer Overflows. Dry weather combined sewer overflows from Discharge Point Nos. 002 through 043 are prohibited. The Discharger shall respond to dry weather combined sewer overflows in accordance with MRP section IX.B, which modifies Attachment G section V.E.2. During any dry weather combined sewer overflow, the Discharger shall inspect the overflow point each day until the overflow stops. The Discharger shall document in the inspection log each combined sewer overflow event, its duration, its cause, and the corrective measures taken.

vi. Control Solid and Floatable Materials in Combined Sewer Discharges. The Discharger shall continue to implement measures to control solid and floatable materials in combined sewer discharges, including the following:

(a) Ensuring that overflow structures are baffled or using other means to reduce the volume of floatable materials in combined sewer discharges, and

(b) Removing solid or floatable materials captured in the storage/transports prior to discharge.

vii. Develop and Implement Pollution Prevention Program. The Discharger shall continue to implement a Pollution Prevention Program focused on reducing the impact of combined sewer discharges and overflows on receiving waters. It shall develop and implement this program in accordance with Provision VI.C.3.

The Discharger shall also continue to implement a street sweeping program and clean catch basins at a frequency sufficient to prevent large accumulations of pollutants and debris.

viii. Notify Public of Combined Sewer Discharges. The Discharger shall continue to implement a public notification plan to inform citizens of when and where combined sewer discharges occur. The plan shall include the following:

(a) A mechanism to alert persons using receiving waters affected by combined sewer discharges for recreation; and

(b) A system to determine the nature and duration of conditions resulting from combined sewer discharges potentially harmful to receiving water users.

Warning signs shall be posted at beach locations where water contact recreation occurs whenever a combined sewer discharge occurs that could affect recreational users at that location. Warning signs shall be posted on the same day as the combined sewer discharge event unless the combined sewer discharge occurs after 4:00 p.m., in which case, signs shall be posted by 8:00 a.m. the next day. The Discharger shall maintain records documenting public notification.

ix. Monitor to Characterize Wet Weather Discharge Impacts and Efficacy of Controls. The Discharger shall continue monitoring wet weather discharges to characterize their impacts and the efficacy of wet weather discharge controls. The monitoring shall build upon the efforts and results the Discharger described in *Special Study: Overflow Impacts and Efficacy of Combined Sewer Overflow Controls for the San Francisco Bayside System, Southeast Water Pollution Control Plant, North Point Wet Weather Facility and Bayside Wet Weather Facilities* (June 29, 2012).

(a) Monitoring Requirements. Compliance with the following monitoring requirements shall be achieved in accordance with the specifications of Attachment D, section III, and Attachment G, sections III.A.1 and III.A.2. Samples shall be composites comprised of individual grab samples collected at equal intervals of no more than one hour for the duration of each discharge event, but not exceeding 24 hours. If an event does not last at least 24-hours, the Discharger shall sample for as long as possible and report the duration.

(1) Southeast Plant and North Point Facility Discharges. When Southeast Plant or North Point Facility discharges occur during wet weather, the Discharger shall collect effluent samples representing Discharge Point Nos. 001 through 006 at Monitoring Locations EFF-001B, EFF-002, and

EFF-003, as defined in the MRP. In addition to the monitoring required in MRP Table E-4, the Discharger shall monitor for the priority pollutants listed in Attachment G, Table C, at least once per year.

(2) Combined Sewer Discharges. The Discharger shall collect effluent samples representing Discharge Point Nos. 009 through 043 at Monitoring Locations CSD-010 through CSD-043, as defined in the MRP. The Discharger shall collect samples at a monitoring location whenever a combined sewer discharge event of at least one hour in duration occurs at that location (and may also collect samples representing shorter events). In addition to the monitoring required in MRP Table E-5, the Discharger shall monitor each sample for the following:

- total suspended solids
- settleable matter
- pH
- metals (arsenic, cadmium, copper, lead, nickel, selenium, silver, and zinc)
- cyanide
- ammonia (total)

The Discharger shall also monitor a combined sewer discharge at Monitoring Location CSD-41 for the remaining priority pollutants listed in Attachment G, Table C, at least once per year.

(3) Shoreline Monitoring. The Discharger shall collect shoreline receiving water grab samples at Monitoring Locations S-202.4, S-202.5, S-210, S-211, S-300.1, S-301.1, and S-301.2, as defined in the MRP. In addition to the monitoring required in MRP Table E-6, the Discharger shall monitor enterococcus and fecal coliform at a frequency sufficient to characterize ambient conditions (e.g., weekly).

(b) Reporting Requirements

(1) Routine Reporting. The Discharger shall, within 60 days of receipt of analytical results, indicate in the transmittal letter for the appropriate self-monitoring report that a sample for this study was collected.

(2) Final Report. The Discharger shall report its findings by September 30, 2017. The report shall include the following:

- All wet weather discharge monitoring data collected, including acute toxicity data (the Discharger shall include data that do not necessarily conform to the test procedures in 40 C.F.R. part 136 and explain these circumstances to provide context for data interpretation);

- All shoreline monitoring data collected and any discharge-related beach closures;

- Updated water contact recreational use surveys, focusing particularly on recreational use following combined sewer discharge events;

- Evaluation of combined sewer discharge control efficacy (e.g., using TSS as a proxy for pollutant removal efficiency); and

- Evaluation of combined sewer discharge impacts (e.g., comparing average and maximum discharge and receiving water monitoring data with water quality objectives, translated as appropriate using available metals translators and water effects ratios).

c. Long-Term Control Plan. The Discharger shall comply with the following provisions, consistent with implementation of its Long-Term Control Plan.

i. The Discharger shall optimize sytem operations to minimize combined sewer discharges and maximize pollutant removal during wet weather.

ii. The Discharger shall capture for treatment, or storage and subsequent treatment, 100 percent of the combined sewage flow collected in the combined sewage system during precipitation events. Captured combined sewage shall be directed to either the Southeast Plant, the North Point Facility, or the storage/transports. All combined sewage captured shall receive a minimum of the following treatment:

(a) Secondary treatment,
(b) Primary treatment, or
(c) Equivalent-to-primary treatment (in storage/transports).

iii. The Discharger shall operate the wet weather facilities as set forth below. If the Discharger can demonstrate (e.g., through modeling conducted as part of its Sewer System Improvement Program) that changes to these operating parameters will result in additional storage or treatment, it may implement such changes. Written acknowledgement that the Executive Officer concurs with the Discharger's demonstration must be obtained prior to implementation.

(a) North Shore Drainage Basin. Activation and operation of the North Point Facility shall depend on rainfall, forecasts, and storage conditions in the North Shore Drainage Basin and the Central Drainage Basin.

- The North Point Facility shall be activated when the level of combined sewage and stormwater in the North Shore Storage/Transport Box is at 200 inches.

- The North Point Facility shall be activated to treat 135 to 145 MGD of combined in-flow within 60 minutes of any combined sewer discharge through Discharge Point Nos. 013 to 017.

- The North Point Facility shall remain operational as long as necessary to minimize the likelihood of storage/transport combined sewer discharges in the Central or Southeast Drainage Basins.

(b) Central Drainage Basin. Activation and operation of the Channel Pump Station shall depend on rainfall, forecasts, and storage conditions in the Central Drainage Basin and the Southeast Drainage Basin.

- The Channel Pump Station shall pump 80 MGD to the Southeast Plant or Southeast Plant influent shall be at 250 MGD (from the Channel and Flynn Pump Stations and the Southeast Plant Lift Station) before there is any storage/transport combined sewer discharge to Mission Creek (Discharge Point Nos. 022 to 027).

- Flow from the Channel Pump Station to the Southeast Plant may be reduced to prevent a combined sewer discharge from the Southeast Drainage Basin storage/transport structures if the flows between the Central Drainage Basin structures and the Southeast Drainage Basin structures (Griffith Pump Station and/or Flynn Pump Station) become unbalanced, e.g., Griffith and/or Flynn storage levels continue to rise while the Southeast Plant is at maximum flow.

- The Mariposa Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point No. 029.

- The 20th St. Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point 030 or 030A.

(c) Southeast Drainage Basin. Southeast Plant operation shall depend on rainfall, forecasts, and storage conditions in the Central Drainage Basin and the Southeast Drainage Basin. The Southeast Plant shall have an influent flow of 240 to 250 MGD prior to any combined sewer discharge into Islais Creek from Discharge Point Nos. 031 through 035.

- The Griffith Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point Nos. 040 through 042. Flows from the Griffith Pump Station to the Southeast Plant may be reduced to maximize storage in the Southeast Drainage Basin if flows between the Central Drainage Basin and the Southeast Drainage Basin become unbalanced (e.g., if unused storage capacity exists in the Southeast Drainage Basin while the Southeast Plant is at maximum flow).

- The Sunnydale Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point No. 043. Flows from the Sunnydale Pump Station to the Griffith Pump Station may be reduced to maximize storage in the Southeast Drainage Basin if flows between the Central Drainage Basin and the Southeast Drainage Basin become unbalanced (e.g., if unused storage capacity exists in the Southeast Drainage Basin while the Southeast Plant is at maximum flow).

iv. The Discharger shall comply with the following after rains subside:

(a) Treatment at the Southeast Plant and North Point Facility shall continue until North Shore, Central, and Southeast Drainage Basin storage/transports are essentially empty of stormwater flows.

(b) If the National Weather Service predicts a 30 percent or greater chance of rain within the next 24 hours, the following provisions shall apply:

- Pumping shall occur until the wastewater level in the Channel Pump Station Box is between 100 to 150 inches,
- Pumping shall occur until the wastewater level in the North Shore Box is at 100 inches, and
- Pumping shall occur until the Islais Creek storage is essentially empty.

(c) If the National Weather Service predicts a less than 30 percent chance of rain within the next 24 hours, the following provisions shall apply:

- Pumping shall occur until the wastewater level in the Channel Pump Station Box is below 150 inches,
- Pumping shall occur until the wastewater level in the North Shore Box is below 150 inches, and
- Pumping shall occur until the Islais Creek storage is essentially empty.

v. By March 30, 2018, the Discharger shall synthesize and update its Long-Term Control Plan into one document that reflects current circumstances. The synthesis and update shall include the following elements.

(a) The Long-Term Control Plan shall continue to reflect the historical long-term average annual design goals for combined sewer discharges:

- Four combined sewer discharge events along the North Shore (Discharge Point Nos. 009 through 017);
- Ten combined sewer discharge events within the Central Basin (Discharge Point Nos. 018 through 036); and
- One combined sewer discharge event along the Southeast Sector (Discharge Point Nos. 037 through 043).

(b) The Discharger shall set forth operational requirements similar to those listed in Provisions VI.C.5.c.iii and VI.C.5.c.iv, above, to optimize system operations so as to maximize pollutant removal during wet weather and minimize combined sewer discharges.

(c) The Discharger shall set forth additional measures, to the extent technically and economically feasible, to maximize pollutant removal and minimize combined sewer discharges (e.g., implementing and promoting green infrastructure and low impact development that enhances stormwater detention and percolation).

(d) The Discharger shall develop and propose a metric to evaluate the performance of its wet weather disinfection systems for Discharge Point Nos. 001 through 006.

(e) The Discharger shall propose a plan for post-construction compliance monitoring of all wet weather discharges consistent with the *Combined Sewer Overflow Control Policy*.

vi. The Discharger shall submit a report implementing *Combined Sewer Overflow Control Policy* section II.C.3, "Consideration of Sensitive Areas." At a minimum, the Discharger shall explore how it could eliminate or relocate combined sewer discharges that discharge to sensitive areas. The Discharger shall base its assessment on any new or improved techniques (including but not limited to green infrastructure and low impact development) that can reduce, eliminate, or relocate combined sewer discharges from sensitive areas. The Discharger shall submit the report with its application for permit reissuance.

d. If the Executive Officer determines that the Discharger has caused a violation of any water quality standard for receiving waters, the Discharger shall evaluate its Long-Term Control Plan and its Combined Sewer Operations and Maintenance Plan, and submit a report identifying additional measures, considering its financial capabilities, to address the violation. The report shall include information on the technical and economic feasibility of the additional measures. The Discharger shall submit this report within 180 days after the Executive Officer provides notification of the violation, and the Discharger shall begin implementing the additional measures described in the report, as may be modified by the Executive Officer, within 60 days after report submittal.

6. Other Special Provisions

a. Copper Action Plan. The Discharger shall implement pretreatment, source control, and pollution prevention for copper in accordance with the following tasks and time schedule.

Table 6. Copper Action Plan

Task	Compliance Date
1. Review Potential Copper Sources The Discharger shall submit an inventory of potential copper sources to the treatment plant.	*Completed June 2009*
2. Implement Copper Control Program The Discharger shall submit a plan for and begin implementation of a program to reduce copper sources identified in Task 1. The plan shall consists, at a minimum, of the following elements: a. Provide education and outreach to the public (e.g., focus on proper pool and spa maintenance and plumbers' roles in reducing corrosion); b. If corrosion is determined to be a significant copper source, work cooperatively with local water purveyors to reduce and control water	*Completed February 2011*

Task	Compliance Date
corrosivity, as appropriate, and ensure that local plumbing contractors implement best management practices to reduce corrosion in pipes; and c. Educate plumbers, designers, and maintenance contractors for pools and spas to encourage best management practices that minimize copper discharges.	
3. Implement Additional Measures If the Regional Water Board notifies the Discharger that the three-year rolling mean copper concentration in Central or Lower San Francisco Bay exceeds 2.2 µg/L, then within 90 days of the notification, the Discharger shall evaluate the effluent copper concentration trend and, if it is increasing, develop and begin implementation of additional measures to control copper discharges. The Discharger shall report on the progress and effectiveness of actions taken, and provide a schedule for actions to be taken in the next 12 months.	With annual pollution prevention report due February 28 following 90 days after notification
4. Undertake Studies to Reduce Copper Pollutant Impact Uncertainties. The Discharger shall submit an updated study plan and schedule to conduct or cause to be conducted technical studies to investigate possible copper sediment toxicity and to investigate sub-lethal effects on salmonids. Specifically, the Discharger shall include the manner in which the above will be accomplished and describe the studies to be performed with an implementation schedule. To satisfy this requirement, the Discharger may collaborate and conduct these studies as a group.	*Completed January 2011*
5. Report Status of Copper Control Program. The Discharger shall submit an annual report documenting copper control program implementation and addressing the effectiveness of the actions taken, including any additional copper controls required by Task 3 above, and provide a schedule for actions to be taken in the next 12 months. Additionally, the Discharger shall report the findings and results of the studies completed, planned, or in progress under Task 4. Regarding Task 4 studies, dischargers may collaborate and provide this information in a single report to satisfy this requirement for an entire group.	With annual pollution prevention report due February 28 each year

b. Cyanide Action Plan. The Discharger shall implement monitoring and surveillance, pretreatment, source control and pollution prevention for cyanide in accordance with the following tasks and time schedule.

Table 7. Cyanide Action Plan

Task	Compliance Date
1. Review Potential Cyanide Sources The Discharger shall submit an inventory of potential cyanide sources to the treatment plant. If no cyanide sources are identified, Tasks 2 and 3 are not required, unless the Discharger receives a request to discharge detectable levels of cyanide to the sewer. If so, the Discharger shall notify the Executive Officer and implement Tasks 2 and 3.	*Completed June 2008*
2. Implement Cyanide Control Program The Discharger shall submit a plan and begin implementation of a program to minimize cyanide discharges to its treatment plant consisting, at a minimum, of the following elements: a. Inspect each potential source to assess the need to include that source in the control program. b. Inspect contributing sources included in the control program annually.	*Completed February 2011*

Task	Compliance Date
Inspection elements may be based on U.S. EPA guidance, such as Industrial User Inspection and Sampling Manual for POTWs (EPA 831-B-94-01). c. Develop and distribute educational materials to sources and potential sources regarding the need to prevent cyanide discharges. d. Prepare an emergency monitoring and response plan to be implemented if a significant cyanide discharge occurs. For purposes of this Order, a "significant cyanide discharge" is occurring if cyanide is found in the Southeast Plant's influent above 21 µg/L.	
3. Implement Additional Cyanide Control Measures If the Regional Water Board notifies the Discharger that ambient monitoring shows cyanide concentrations are 1.0 µg/L or higher in the main body of San Francisco Bay, then within 90 days of the notification, the Discharger shall commence actions to identify and abate cyanide sources responsible for the elevated ambient concentrations, and shall report on the progress and effectiveness of actions taken, and provide a schedule for actions to be taken in the next 12 months.	With next annual pollution prevention report due February 28 (at least 90 days following notification)
4. Report Status of Cyanide Control Program The Discharger shall submit an annual report documenting cyanide control program implementation and addressing the effectiveness of actions taken, including any additional cyanide controls required by Task 3, above, and provide a schedule for actions to be taken in the next 12 months.	With annual pollution prevention report due February 28 each year

c. Standard Operating Procedures for Resource Recovery. If the Discharger receives hauled-in anaerobically-digestible material for injection into an anaerobic digester, the Discharger shall notify the Regional Water Board and develop and implement Standard Operating Procedures for this activity. The Standard Operating Procedures shall be developed by February 1, 2014, or prior to initiation of hauling. The Standard Operating Procedures shall address material handling, including unloading, screening or other processing prior to anaerobic digestion, and transportation; spill prevention; spill response; avoidance of the introduction of materials that could cause interference, pass through, or upset of the treatment processes; avoidance of prohibited material; vector control; odor control; operation and maintenance; and the disposition of any solid waste segregated from introduction to the digester. The Discharger shall provide training to its staff on the Standard Operating Procedures and shall maintain records for a minimum of three years for each load received, describing the hauler, waste type, and quantity received. In addition, the Discharger shall maintain records for a minimum of three years for the disposition location and quantity of cumulative pre-digestion segregated solid waste hauled offsite.

ATTACHMENT A – DEFINITIONS

Arithmetic Mean (μ)
Also called the average, the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean = $\mu = \Sigma x / n$ where: Σx is the sum of the measured ambient water concentrations, and n is the number of samples.

Average Monthly Effluent Limitation (AMEL)
The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)
The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Bioaccumulative
Taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Carcinogenic
Known to cause cancer in living organisms.

Coefficient of Variation
Measure of data variability calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

Combined Sewer Discharge
Authorized discharge during a wet weather day from an approved combined sewer discharge point. Refer to Table 2 of the Order for a list of approved combined sewer discharge points.

Combined Sewer Discharge Event
Wet weather event that results in an authorized discharge from one or more approved combined sewer discharge points. A discrete combined sewer discharge event is separated by at least six hours from any other combined sewer discharge event. Refer to Table 2 of the Order for a list of approved combined sewer discharge points.

Combined Sewer System Excursion
Release or diversion of untreated or partially treated wastewater from the combined sewer system that exits the system temporarily and then re-enters it. Excursions do not include releases from privately owned sewer laterals, or authorized combined sewer discharges.

Daily Discharge
Either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit) for a constituent with limitations expressed in units of mass; or (2) the

unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period is considered the result for the calendar day in which the 24-hour period ends.

Detected, but Not Quantified (DNQ)
Sample result less than the RL, but greater than or equal to the laboratory's MDL. Sample results reported as DNQ are estimated concentrations.

Dilution Credit
Amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio or determined by conducting a mixing zone study or modeling the discharge and receiving water.

Dry Weather
Any weather not defined as wet weather (determined on a day-by-day basis).

Effluent Concentration Allowance (ECA)
Value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the CV for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in U.S. EPA guidance (*Technical Support Document For Water Quality-based Toxics Control*, March 1991, second printing, EPA/505/2-90-001).

Enclosed Bay
Indentation along the coast that encloses an area of oceanic water within a distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

Estimated Chemical Concentration
Concentration that results from the confirmed detection of the substance below the ML value by the analytical method.

Estuaries
Waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars are considered estuaries. Estuarine waters are considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater.

Estuarine waters include, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

Inland Surface Waters
All surface waters of the state that do not include the ocean, enclosed bays, or estuaries.

Instantaneous Maximum Effluent Limitation
Highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation
Lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Maximum Daily Effluent Limitation (MDEL)
Highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median
Middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between n/2 and n/2+1).

Method Detection Limit (MDL)
Minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in in 40 C.F.R. part 136, Attachment B, revised as of July 3, 1999.

Minimum Level (ML)
Concentration at which the entire analytical system gives a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Mixing Zone
Limited volume of receiving water allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

Not Detected (ND)
Sample results less than the laboratory's MDL.

Persistent Pollutants
Substances for which degradation or decomposition in the environment is nonexistent or very slow.

Pollutant Minimization Program
Program of waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the Pollutant Minimization Program is to reduce all potential sources of a priority pollutant through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. Cost effectiveness may be considered when establishing the requirements of a Pollutant Minimization Program. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), is considered to fulfill Pollutant Minimization Program requirements.

Pollution Prevention
Any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State Water Board or Regional Water Board.

Reporting Level (RL)
ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order, including an additional factor if applicable as discussed herein. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from SIP Appendix 4 in accordance with SIP section 2.4.2 or established in accordance with SIP section 2.4.3. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Source of Drinking Water
Any water designated as having a municipal or domestic supply (MUN) beneficial use.

Standard Deviation (σ)
Measure of variability calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;
μ is the arithmetic mean of the observed values; and
n is the number of samples.

Toxicity Reduction Evaluation (TRE)
Study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to

the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. A TIE is a set of procedures to identify the specific chemicals responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

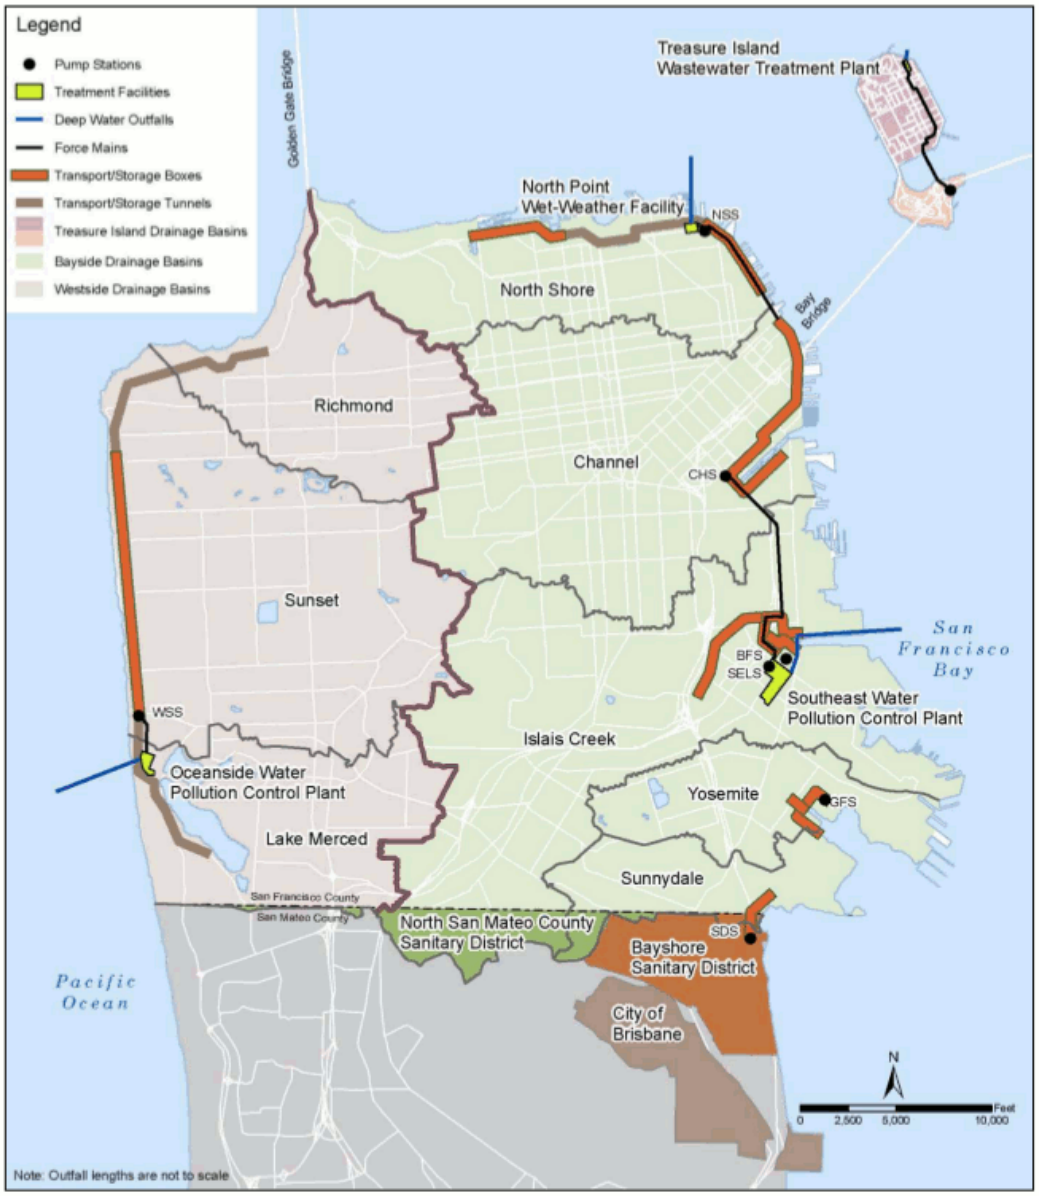
Wet Weather
Weather in which any one of the following conditions exists as a result of rain (determined on a day-by-day basis):

1. Instantaneous influent flow to the Southeast Plant (at Monitoring Location INF-001 as defined in the Monitoring and Reporting Program) exceeds 110 MGD and discharge occurs at Discharge Point No. 002;

2. Average influent biochemical oxygen demand (BOD_5) or total suspended solids (TSS) concentration at the Southeast Plant is less than 100 mg/L; or

3. North Shore storage/transport wastewater elevation exceeds 100 inches.

ATTACHMENT B – FACILITY MAP



The Facility subject to this Order is shown in the light green (eastern) area of the map and includes the Southeast Water Pollution Control Plant, the North Point Wet Weather Facility, and the Bayside Wet Weather Facilities. The remaining collection system subject to this Order is not shown. The Oceanside Water Pollution Control Plant, Westside Wet Weather Facilities, and Treasure Island Wastewater Treatment Plant are shown only for reference.

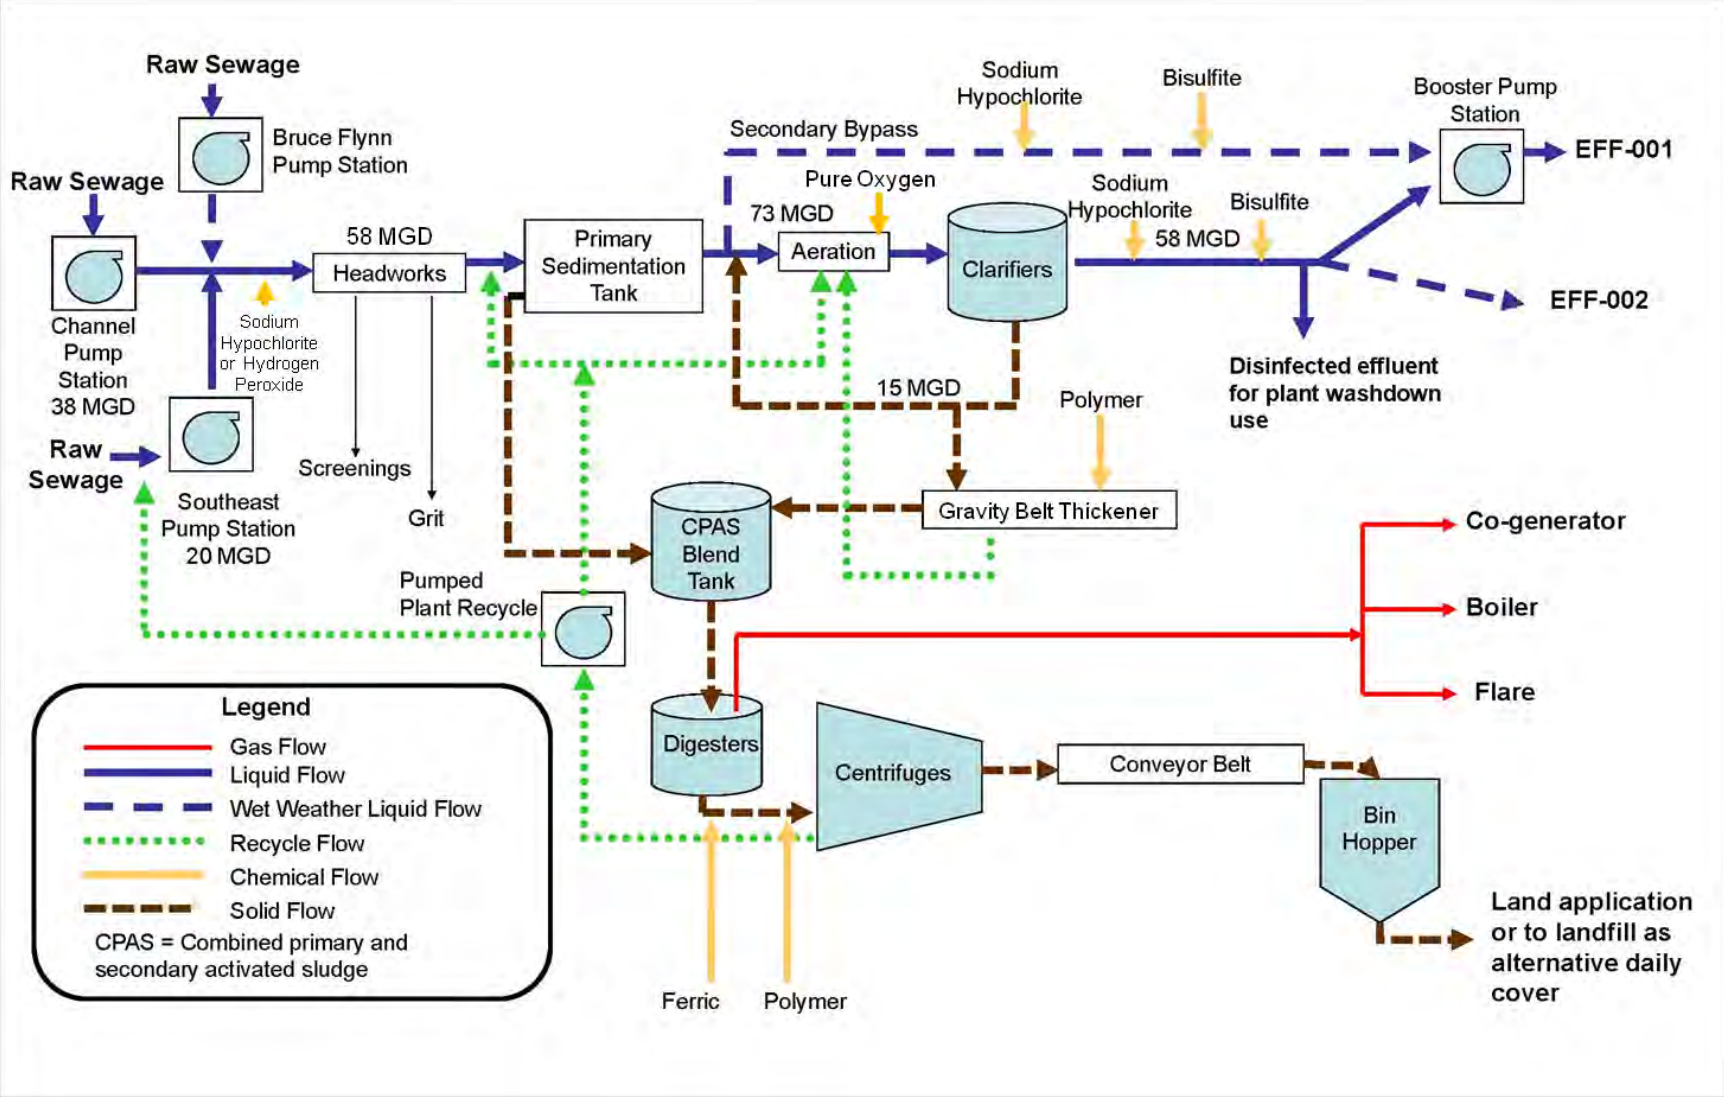
ATTACHMENT C – PROCESS FLOW DIAGRAM



ATTACHMENT D –STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 C.F.R. § 122.41(a).)

2. The Discharger shall comply with effluent standards or prohibitions established under CWA section 307(a) for toxic pollutants and with standards for sewage sludge use or disposal established under CWA section 405(d) within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 C.F.R. § 122.41(i); Wat. Code, § 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (40 C.F.R. § 122.41(i)(1));

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (40 C.F.R. § 122.41(i)(2));

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (40 C.F.R. § 122.41(i)(3)); and

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 C.F.R. § 122.41(i)(4).)

G. Bypass

1. Definitions

a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)

b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)

2. **Bypass not exceeding limitations.** The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)

3. **Prohibition of bypass.** Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):

a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));

b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of

equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and

c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)

4. Approval. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions—Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)

5. Notice

a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass. (40 C.F.R. § 122.41(m)(3)(i).)

b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). (40 C.F.R. § 122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).)

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):

a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));

b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));

c. The Discharger submitted notice of the upset as required in Standard Provisions—Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and

d. The Discharger complied with any remedial measures required under Standard Provisions—Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)

3. **Burden of proof.** In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS—PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. § 122.41(l)(3); § 122.61.)

III. STANDARD PROVISIONS – MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)

B. Monitoring results must be conducted according to test procedures under 40 C.F.R. part 136 or, in the case of sludge use or disposal, approved under 40 C.F.R. part 136 unless otherwise specified in 40 C.F.R. part 503 unless other test procedures have been specified in this Order. (40 C.F.R. § 122.41(j)(4); § 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS—RECORDS

A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 C.F.R. part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years

from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

B. Records of monitoring information shall include the following:

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));

2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));

3. The date(s) the analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));

4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and

6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and

2. Permit applications and attachments, permits, and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS—REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or U.S. EPA within a reasonable time, any information which the Regional Water Board, State Water Board, or U.S. EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or U.S. EPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, § 13267.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Standard Provisions—Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 C.F.R. § 122.41(k).)

2. For a corporation, all permit applications shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and

regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures. (40 C.F.R. § 122.22(a)(1).)

For a partnership or sole proprietorship, all permit applications shall be signed by a general partner or the proprietor, respectively. (40 C.F.R. § 122.22(a)(2).)

For a municipality, state, federal, or other public agency, all permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA). (40 C.F.R. § 122.22(a)(3).).

3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or U.S. EPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

a. The authorization is made in writing by a person described in Standard Provisions—Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));

b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)

4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions—Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)

5. Any person signing a document under Standard Provisions—Reporting V.B.2 or V.B.3 above shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly

responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." (40 C.F.R. § 122.22(d).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program in this Order. (40 C.F.R. § 122.22(l)(4).)

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 C.F.R. § 122.41(l)(4)(i).)

3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 C.F.R. part 136, or another method required for an industry-specific waste stream under 40 C.F.R. subchapters N or O, the results of such monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 C.F.R. § 122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 C.F.R. § 122.41(l)(6)(ii)):

a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)

b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 C.F.R. section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (Alternatively, for an existing manufacturing, commercial, mining, or silvicultural discharge as referenced in 40 C.F.R. section 122.42(a), this notification applies to pollutants that are subject neither to effluent limitations in this Order nor to notification requirements under 40 C.F.R. section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1).) (40 C.F.R. § 122.41(l)(1)(ii).)

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 C.F.R. § 122.41(l)(1)(iii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order's requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions—Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision—Reporting V.E above. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the

Regional Water Board, State Water Board, or U.S. EPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

VI. STANDARD PROVISIONS – ENFORCEMENT

A. The Regional Water Board is authorized to enforce the terms of this Order under several provisions of the Water Code, including, but not limited to, sections 13385, 13386, and 13387.

VII. ADDITIONAL PROVISIONS—NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural Dischargers shall notify the Regional Water Board as soon as they know or have reason to believe (40 C.F.R. § 122.42(a)):

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(1)):

a. 100 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(1)(i));

b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(1)(ii));

c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(1)(iii)); or

d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(1)(iv).)

2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(2)):

a. 500 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(2)(i));

b. 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(2)(ii));

c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(2)(iii)); or

d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(2)(iv).)

B. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 C.F.R. § 122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to CWA sections 301 or 306 if it were directly discharging those pollutants (40 C.F.R. § 122.42(b)(1)); and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of this Order. (40 C.F.R. § 122.42(b)(2).)

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 C.F.R. § 122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

Contents

Tables

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

The Code of Federal Regulations (40 C.F.R. § 122.48) requires that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements that implement federal and State regulations.

I. GENERAL MONITORING PROVISIONS

A. The Discharger shall comply with this MRP. The Executive Officer may amend this MRP pursuant to 40 C.F.R. sections 122.62, 122.63, and 124.5. If any discrepancies exist between this MRP and the "Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits" (Attachment G), this MRP shall prevail.

B. The Discharger shall conduct all monitoring in accordance with Attachment D, section III, as supplemented by Attachment G. Equivalent test methods must be more sensitive than those specified in 40 C.F.R. section 136 and must be specified in this permit.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Locations

Type of Sampling Location	Monitoring Location Name	Monitoring Location Description [1]
Influent	INF-001	Any point at the Southeast Plant upstream of the primary sedimentation basins at which all waste tributary to the treatment system is present, and preceding any phase of treatment. *Latitude 37.744611 Longitude -122.392111*
Influent	INF-002	Any point at the North Point Facility upstream of the primary sedimentation basins at which all waste tributary to the treatment system is present, and preceding any phase of treatment. *Latitude 37.806333 Longitude -122.409389*
Effluent	EFF-001A	During dry weather, any point at the Southeast Plant between the point at which all wastes have gone through complete secondary treatment, including disinfection, and Discharge Point No. 001 (deep water outfall). *Latitude 37.743611 Longitude -122.390000*
Effluent	EFF-001B	During wet weather, any point at the Southeast Plant at which adequate disinfection is assured and Discharge Point No. 001 (deep water outfall) (may be the same as Monitoring Location EFF-001A). *Latitude 37.743611 Longitude -122.390000*
Effluent	EFF-002	During wet weather, any point at the Southeast Plant between the point at which all wastes have gone through complete secondary treatment, including disinfection, and Discharge Point No. 002 (Islais Creek outfall). *Latitude 37.746944 Longitude -122.388056*

Type of Sampling Location	Monitoring Location Name	Monitoring Location Description [1]
Effluent	EFF-003	During wet weather, any point at the North Point Facility between Discharge Point Nos. 003 and 004 (Pier 33 outfalls) and 005 and 006 (Pier 35 outfalls) and the point at which all waste tributary to those outfalls is present and adequate disinfection is assured. *Latitude 37.806667 Longitude -122.407500*
Combined Sewer Discharge	CSD-010	During wet weather, any point between Discharge Point No. 010 (Pierce Street outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.806944 Longitude -122.440000*
Combined Sewer Discharge	CSD-025	During wet weather, any point between Discharge Point No. 025 (Sixth Street North outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.071944 Longitude -122.396111*
Combined Sewer Discharge	CSD-029	During wet weather, any point between Discharge Point No. 029 (Mariposa Street outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.764722 Longitude -122.385278*
Combined Sewer Discharge	CSD-031A	During wet weather, any point between Discharge Point No. 031A (North Islais North outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.747778 Longitude -122.387500*
Combined Sewer Discharge	CSD-041	During wet weather, any point between Discharge Point Nos. 041 or 042 (Yosemite Avenue or Fitch Street outfalls) and the point at which all waste tributary to the outfalls is present. *Latitude 37.723889 Longitude -122.381389* or *Latitude 37.722222 Longitude -122.381389*
Combined Sewer Discharge	CSD-043	During wet weather, any point between Discharge Point No. 043 (Sunnydale Avenue outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.747222 Longitude -122.386944*
Shoreline	S-202.5	Crissy Field West *Latitude 37.811667 Longitude -122.490000*
Shoreline	S-202.4	Crissy Field (east of Lagoon) *Latitude 37.810278 Longitude -122.452778*
Shoreline	S-210.1	Aquatic Park (Hyde St. Pier) *Latitude 37.8150DW00 Longitude -122.425833*
Shoreline	S-211	Aquatic Park Beach East End *Latitude 37.814722 Longitude -122.424167*
Shoreline	S-300.1	Candlestick Point SRA (Sunnydale Cove Beach) *Latitude 37.715833 Longitude -122.394167*
Shoreline	S-301.1	Candlestick Point SRA (Windsurfer Circle) *Latitude 37.715278 Longitude -122.366607*
Shoreline	S-301.2	Candlestick Point SRA (Jack Rabbit Beach) *Latitude 37.718611 Longitude -122.366667*
Biosolids	BIO-001	Biosolids (treated sludge)

Footnote:

[1] Latitude and longitude information is approximate for administrative purposes.

III. INFLUENT MONITORING REQUIREMENTS

The Discharger shall monitor Southeast Plant influent at Monitoring Location INF-001 as follows. Only flow monitoring is required during wet weather.

Table E-2. Influent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MGD	Continuous	Continuous/D [3]
Biochemical Oxygen Demand (5-day @ 20°C)(BOD_5)	mg/L	C-24	1/Week [3]
Total Suspended Solids (TSS)	mg/L	C-24	5/Week [3]
Cyanide, Total [2]	µg/L	Grab	1/Month [3]

Unit Abbreviations:

MGD = million gallons per day
MG = million gallons
mg/L = milligrams per liter
µg/L = micrograms per liter

Sample Type:

Continuous = measured continuously
C-24 = 24-hour composite sample
Grab = Grab sample

Sampling Frequency:

Continuous/D = measured continuously, and recorded and reported daily
1/Week = once per week
5/Week = five times per week
1/Month = once per month

Footnotes:

[1] Flow shall be monitored continuously and the following information shall be reported in monthly self-monitoring reports:
- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

[2] Influent cyanide monitoring may be used to satisfy the pretreatment monitoring requirements in Table E-7.

[3] BOD_5, TSS, and total cyanide monitoring is required only during dry weather.

IV. EFFLUENT MONITORING REQUIREMENTS

A. Dry Weather

During dry weather, the Discharger shall monitor Southeast Plant effluent at Monitoring Location EFF-001A as follows:

Table E-3. Effluent Monitoring — Dry Weather

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MGD	Continuous	Continuous/D
BOD_5	mg/L	C-24	1/Week [2]
TSS	mg/L	C-24	5/Week
Chemical Oxygen Demand (COD)	mg/L	C-24	5/Week [2]
Oil and Grease [3]	mg/L	Grab	1/Month

Parameter	Units	Sample Type	Minimum Sampling Frequency
pH [4]	standard units	Continuous or Grab	Continuous or 5/Week
Enterococcus [9]	MPN/100 mL	Grab	4/Year [8]
Fecal Coliform [9]	MPN/100 mL	Grab	1/Week
Total Residual Chlorine [5]	mg/L	Continuous or Grab	Continuous/H or 1/Hour
Acute Toxicity [6]	% Survival	Flow through	1/Month
Chronic Toxicity [7]	TUc	C-24	2/Year
Ammonia, Total	mg/L as N	Grab or C-24	1/Month
Copper, Total Recoverable	µg/L	C-24	1/Month
Cyanide, Total	µg/L	Grab	1/Month
Dioxin-TEQ	µg/L	Grab	2/Year
1,2-Diphenylhydrazine	µg/L	Grab	1/Month

Unit Abbreviations:

MGD = million gallons per day
mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
MPN/100 mL = most probable number per 100 milliliters
TUc = chronic toxicity units, equal to 100/NOEL, where NOEL = IC_{25}, EC_{25}, or NOEC
µg/L = micrograms per liter

Sample Type:

Continuous = measured continuously
C-24 = 24-hour composite sample
Grab = grab sample

Sampling Frequency:

Continuous/H = measured continuously, and recorded and reported hourly
Continuous/D = measured continuously, and recorded and reported daily
1/Hour = once per hour
1/Week = once per week
3/Week = three times per week
5/Week = five times per week
1/Month = once per month
5/Month = five times per month
2/Year = twice per year
4/Year = four times per year

Footnotes:

[1] Flow shall be monitored continuously and the following information shall be reported in monthly self-monitoring reports:
- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

[2] If the COD concentration exceeds 75 mg/L on two consecutive days, the Discharger shall increase the BOD_5 sampling frequency to daily until it demonstreates that the BOD_5 concentration is below 30 mg/L.

[3] Each oil and grease sampling and analysis event shall be conducted in accordance with U.S. EPA Method 1664.

[4] If pH is monitored continuously, the minimum and maximum pH values for each day shall be reported in self-monitoring reports.

[5] Effluent residual chlorine concentrations shall be monitored continuously or, at a minimum, every hour. The Discharger shall report for each day the maximum residual chlorine concentration observed following dechlorination. However, if monitoring continuously, the Discharger shall report for each day the maximum residual chlorine concentration based only on discrete readings from the continuous monitoring taken every hour on the hour. The Discharger shall retain continuous monitoring readings for at least three years. The Regional Water Board reserves the right to use all other continuous monitoring data for discretionary enforcement.

[6] Acute bioassay tests shall be performed in accordance with MRP section V.A.

[7] Critical life stage toxicity tests shall be performed in accordance with MRP section V.B.

[8] The four samples shall be collected in different calendar months during the higher recreational water contact season (June through October). If the enterococcus effluent limitation is exceeded, the Discharger shall conduct 5/Month accelerated sampling for at least three consecutive months. If full compliance is demonstrated after the three months, the Discharger may return to the 4/Year sampling.

[9] Results may be reported as Colony Forming Units/100 milliliters (CFU/100 mL) if the laboratory method used provides results in CFU/100 mL.

B. Wet Weather

1. **Southeast Plant and North Point Facility Outfalls.** During wet weather, when wet weather facilities are operating, the Discharger shall monitor Southeast Plant effluent at Monitoring Locations EFF-001B and EFF-002, and North Point Facility effluent at Monitoring Location EFF-003, as follows:

Table E-4. Effluent Monitoring — Wet Weather

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MGD	Continuous	Continuous/D
TSS	mg/L	C-X	1/Month
COD	mg/L	C-X	1/Month
Oil and Grease	mg/L	Grab	1/Month
pH	standard units	Continuous or Grab	Continuous or 1/Month
Enterococcus [5]	MPN/100 mL [2]	Grab	1/Day [4]
Fecal Coliform	MPN/100 mL [2]	Grab	1/Day [4]
Total Residual Chlorine	mg/L	Continuous or Grab	Continuous/H or 1/Hour
Acute Toxicity [3]	% Survival	Grab	1/Month
Copper, Total Recoverable	µg/L	C-X	1/Month
Cyanide, Total	µg/L	C-X	1/Month
Ammonia, Total	mg/L as N	Grab	1/Month

Unit Abbreviations:

MGD = million gallons per day
mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
µg/L = micrograms per liter
MPN/100 mL = most probable number per 100 milliliters

Sample Type:

Continuous = measured continuously
C-X = composite sample comprised of individual grab samples collected at equal intervals of no more than one hour for the duration of the discharge event but not exceeding 24 hours. If an event does not last at least 24-hours, the Discharger shall sample for as long as possible and note the duration in its self-monitoring report.
Grab = grab sample

Sampling Frequency:

Continuous/H = measured continuously, and recorded and reported hourly
Continuous/D = measured continuously, and recorded and reported daily
1/Hour = once per hour
1/Month = once per month
1/Day = once per wet weather day

Footnotes:

[1] Flow shall be monitored continuously and the following information shall be reported in monthly self-monitoring reports:
- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

[2] Results may be reported as colony forming units (CFU)/100 mL if the laboratory method used provides results in CFU/100 mL.

[3] Acute bioassay tests shall be performed only at Monitoring Location EFF-001B and EFF-003 in accordance with MRP section V.A.

[4] Wet weather effluent samples shall be collected within 4 hours after discharges start (when discharges start between 4:00 a.m. and 2:00 p.m.). If the wet weather facility begins operation after 2:00 p.m., samples shall be collected first thing the next morning during business hours (by 9:00 a.m.), provided that the discharge is still occurring.

[5] Data from both wet and dry weather shall be included when calculating the geometric mean for compliance with this monthly wet weather limitation. For days with discharge but no sampling, the enterococcus densities shall be assumed to be the same as the densities of the most recent discharge samples. For days with no discharge, enterococcus densities shall be assumed to be 1 MPN/100 mL for calculational purposes.

2. **Combined Sewer Discharge Outfalls.** During wet weather, when combined sewer discharges are occurring, the Discharger shall monitor combined sewer discharges at Monitoring Locations CSD-010 through CSD-043 as follows:

Table E-5. Combined Sewer Discharge Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Event Duration	minutes	---	1/Event
Flow Volume [1]	MG	Continuous	1/Event

Unit Abbreviations:

MG = million gallons

Sample Type:

Continuous = measured continuously

Sampling Frequency:

1/Event = once per combined sewer discharge event

Footnote:

[1] Flow volume may be estimated using models.

The Discharger shall also record and report in its self-monitoring reports the following information for each combined sewer discharge event at Monitoring Locations CSD-010 through CSD-043:

a. Date and time that combined sewer discharge started;

b. Rainfall intensity and amount (aggregated hourly data); and

c. Information supporting discharge volume estimate (if estimated).

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

The Discharger shall monitor whole effluent acute and chronic toxicity as follows.

A. Whole Effluent Acute Toxicity

1. During dry weather, acute toxicity at Discharge Point No. 001 (Monitoring Location EFF-001A) shall be evaluated by measuring survival of test organisms exposed to 96-hour continuous flow-through bioassays. The Discharger may stop a bioassay if wet weather occurs during a 96-hour test. If so, the Discharger shall initiate another test as soon as possible (i.e., as soon as approximately 96 hours of dry weather is forecasted). The Discharger may choose to continue a test during wet weather unless the instantaneous influent flow to the Southeast Plant (at Monitoring Location INF-001 as defined in the MRP) exceeds 110 MGD and discharge occurs at Discharge Point No. 002.

During wet weather, acute toxicity at Discharge Point Nos. 001 and 003 through 006 (Monitoring Locations EFF-001B and EFF-003) shall be evaluated by measuring survival of test organisms exposed to 96-hour static bioassays.

2. Test organisms shall be rainbow trout (*Oncorhynchus mykiss*) or fathead minnow (*Pimphales promelas*). The Executive Officer may specify a more sensitive organism or, if testing a particular organism proves unworkable, the most sensitive organism available.

3. All bioassays shall be performed according to the most up-to-date protocols in 40 C.F.R. part 136, currently *Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms,* 5th Edition (EPA-821-R-02-012).

4. If the Discharger demonstrates that specific identifiable substances in the discharge are rapidly rendered harmless upon discharge to the receiving water, compliance with the acute toxicity limit may be determined after test samples are adjusted to remove the influence of those substances. Written acknowledgement that the Executive Officer concurs with the Discharger's demonstration and that the adjustment will not remove the influence of other substances must be obtained prior to any such adjustment. The Discharger may manually adjust the pH of whole effluent acute toxicity samples prior to performing bioassays to minimize ammonia toxicity interference.

5. Bioassay water monitoring shall include, on a daily basis, pH, dissolved oxygen, ammonia (if toxicity is observed), temperature, hardness, and alkalinity. These results shall be reported. If a violation of an acute toxicity limit occurs, the bioassay test shall be repeated with new fish as soon as practical and shall be repeated until a test fish survival rate of 90 percent or greater is observed. If the control fish survival rate is less than 90 percent, the bioassay test shall be restarted with new fish and shall continue as soon as practical until an acceptable test is completed (i.e., control fish survival rate is 90 percent or greater).

B. Whole Effluent Chronic Toxicity

1. Monitoring Requirements

a. Sampling. During dry weather, the Discharger shall collect 24-hour composite effluent samples at Monitoring Location EFF-001A for critical life stage toxicity testing as indicated below. For toxicity tests requiring renewals, the Discharger shall collect 24-hour composite samples on consecutive days.

b. Test Species. The test species shall be purple sea urchin (*Strongylocentroltus purpuratus*) or, if gravid purple sea urchin are unavailable, sand dollar (*Dendraster excentricus*), unless a more sensitive species is identified.

The Discharger shall conduct a screening chronic toxicity test as described in Appendix E-1 following any significant change in the nature of the effluent. If there is no significant change in the nature of the effluent, the Discharger shall conduct a screening test and submit the results with its application for permit reissuance.

c. Frequency. Chronic toxicity monitoring shall be as specified below:

i. The Discharger shall monitor routinely twice per year.

ii. The Discharger shall accelerate monitoring to monthly after either exceeding a three-sample median of 10 TUC or a single-sample maximum of 20 TU_c. Based on the TUc results, the Executive Officer may specify a different frequency for accelerated monitoring to ensure that accelerated monitoring provides useful information.

iii. The Discharger shall return to routine monitoring if accelerated monitoring does not exceed either trigger in ii, above.

iv. If accelerated monitoring confirms consistent toxicity in excess of either trigger in ii, above, the Discharger shall continue accelerated monitoring and initiate toxicity reduction evaluation (TRE) procedures in accordance with section V.B.3, below.

v. The Discharger shall return to routine monitoring after implementing appropriate elements of the TRE, and either the toxicity drops below both triggers in ii, above, or, based on the TRE results, the Executive Officer determines that accelerated monitoring would no longer provide useful information.

Monitoring conducted pursuant to a TRE shall satisfy the requirements for routine and accelerated monitoring while the TRE is underway.

d. Methodology. Sample collection, handling, and preservation shall be in accordance with U.S. EPA protocols. In addition, bioassays shall be conducted in compliance with the most recently promulgated test methods, as shown in Appendix E-1. These are *Short-Term Methods for Estimating the Chronic Toxcicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms*, currently first edition (EPA/600/R-95-136). If these protocols prove unworkable, the Executive Officer and the Environmental Laboratory Accreditation Program may grant exceptions in writing upon the Discharger's request with justification. If the Discharger demonstrates that specific identifiable substances in the discharge are rapidly rendered harmless upon discharge to the receiving water, compliance with the chronic toxicity limit may be determined after test samples are adjusted to remove the influence of those substances. Written acknowledgement that the Executive Officer concurs with the Discharger's demonstration and that the adjustment will not remove the influence of other substances must be obtained prior to any such adjustment.

e. Dilution Series. The Discharger shall conduct tests at 20%, 15%, 10%, 5%, and 2.5%. The "%" represents percent effluent as discharged. Test sample pH may be controlled to the level of the effluent sample as received prior to being salted up.

2. Reporting Requirements

a. The Discharger shall provide toxicity test results for the current reporting period in the self-monitoring report and shall include the following, at a minimum, for each test.

i. Sample date

ii. Test initiation date

iii. Test species

iv. End point values for each dilution (e.g., number of young, growth rate, percent survival)

v. No Observable Effect Level (NOEL) values in percent effluent. The NOEL shall equal the IC_{25} or EC_{25} (see MRP Appendix E-1). If the IC_{25} or EC_{25} cannot be statistically determined, the NOEL shall equal to the No Observable Effect Concentration (NOEC) derived using hypothesis testing. The NOEC is the maximum percent effluent concentration that causes no observable effect on test organisms based on a critical life stage toxicity test.

vi. IC_{15}, IC_{25}, IC_{40}, and IC_{50} values (or EC_{15}, EC_{25}, EC_{40}, and EC_{50}) as percent effluent

vii. TUc values (100/NOEL, where NOEL = IC_{25}, EC_{25}, or NOEC

viii. Mean percent mortality (±s.d.) after 96 hours in 100% effluent (if applicable)

ix. IC_{50} or EC_{50} values for reference toxicant tests

x. Available water quality measurements for each test (e.g., pH, dissolved oxygen, temperature, conductivity, hardness, salinity, and ammonia)

b. The Discharger shall provide the results of the most recent three chronic toxicity tests and the 3-sample median in the self-monitoring report as TUc's.

3. Toxicity Reduction Evaluation (TRE)

a. The Discharger shall prepare a generic TRE work plan within 90 days of the effective date of this Order to be ready to respond to toxicity events. The Discharger shall review and update the work plan as necessary so that it remains current and applicable to the discharge and discharge facilities.

b. Within 30 days of exceeding either chronic toxicity trigger in section V.B.1.c.ii, above, the Discharger shall submit a TRE work plan, which shall be the generic work plan revised as appropriate for this toxicity event after consideration of available discharge data.

c. Within 30 days of completing an accelerated monitoring test observed to exceed either trigger in section V.B.1.c.ii, above, the Discharger shall initiate a TRE in accordance with a TRE work plan that incorporates any and all comments from the Executive Officer.

d. The TRE shall be specific to the discharge and be in accordance with current technical guidance and reference materials, including U.S. EPA guidance materials. The Discharger shall conduct the TRE as a tiered evaluation as summarized below.

i. Tier 1 shall consist of basic data collection (routine and accelerated monitoring).

ii. Tier 2 shall consist of evaluation of treatment process optimization, including operational practices and in-plant process chemicals.

iii. Tier 3 shall consist of a toxicity identification evaluation (TIE).

iv. Tier 4 shall consist of evaluation of options for additional effluent treatment processes.

v. Tier 5 shall consist of evaluation of options for modifications of in-plant treatment processes.

vi. Tier 6 shall consist of implementation of selected toxicity control measures, and followup monitoring and confirmation of implementation success.

e. The Discharger may end the TRE at any stage if monitoring finds there is no longer consistent toxicity (i.e., compliance with Provision IV.A.5 of the Order).

f. The objective of the TIE shall be to identify the substance or combination of substances causing the observed toxicity. The Discharger shall employ all reasonable efforts using currently available TIE methodologies.

g. As toxic substances are identified or characterized, the Discharger shall continue the TRE by determining the sources and evaluating alternative strategies for reducing or eliminating the toxic substances from the discharge. The Discharger shall take all reasonable steps to reduce toxicity to levels below the chronic toxicity limit.

h. Many recommended TRE elements parallel required or recommended efforts related to source control, pollution prevention, and stormwater control programs. TRE efforts should be coordinated with such efforts. To prevent duplication of efforts, evidence of complying with requirements or recommended efforts of such programs may be acceptable to demonstrate compliance with TRE requirements.

i. Chronic toxicity may be episodic and identification of causes of and reduction of sources of chronic toxicity may not be successful. Regional Water Board enforcement considerations will be based in part on the Discharger's actions and efforts to identify and control or reduce sources of consistent toxicity.

VI. RECEIVING WATER MONITORING REQUIREMENTS

A. Regional Monitoring. The Discharger shall continue to participate in the Regional Monitoring Program, which collects data on pollutants and toxicity in San Francisco Bay water, sediment, and biota.

B. Shoreline Monitoring. Following any combined sewer discharge event at Discharge Point Nos. 009, 010, 011, 013, or 015, the Discharger shall monitor shoreline receiving waters at Monitoring Locations S-202.4, S-202.5, S-210, and S-211. Following any combined sewer discharge event at Discharge Point Nos. 040, 041, or 042, the Discharger shall monitor at Monitoring Location S-301.2. Following any combined sewer discharge event at Discharge Point No. 043, the Discharger shall monitor at Monitoring Locations S-300.1 and S-301.1. Monitoring shall be conducted at each location as follows for up to seven days or until the single-sample bacteriological standards of Cal. Code of Regs. tit. 17, section 7958(a)(1), are met at that location (i.e., the enterococcus density is less than 104 most probable number (MPN)/100 mL and the fecal coliform density is less than 400 MPN/100 mL). Samples shall be collected between 8:00 a.m. and 4:00 p.m.

Table E-6. Shoreline Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Enterococcus [1]	MPN/100 mL [3]	Grab	1/Day
Fecal Coliform [2]	MPN/100 mL [3]	Grab	1/Day

Unit Abbreviations:

MPN/100 mL = most probable number per 100 milliliters

Sample Type:

Grab = Grab sample

Sampling Frequency:

1/Day = once per day

Footnotes:

[1] The Discharger shall monitor for enterococcus using U.S. EPA-approved methods, such as the IDEXX Enterolert method. When replicate analyses are made, the reported result shall be the geometric mean of the replicate results.

[2] Alternatively, the Discharger may measure *E. coli* as recommended for the U.S. EPA Beach Monitoring Program. *E. coli* may be measured using the IDEXX Colilert method.

[3] Results may be reported as CFU/100 mL if the test method used provides results in CFU/100 mL.

VII. PRETREATMENT AND BIOSOLIDS MONITORING REQUIREMENTS

The Discharger shall comply with the following pretreatment monitoring requirements for influent (at Monitoring Location INF-001), effluent (at Monitoring Location EFF-001A), and biosolids (at Monitoring Location BIO-001). The Discharger shall report summaries of analytical results in annual and semi-annual pretreatment reports in accordance with Attachment H. At its option, the Discharger may also report biosolids analytical results in its electronic self-monitoring reports by manual entry, by EDF/CDF, or as an attached file.

Table E-7. Pretreatment and Biosolids Monitoring

Constituents	Sampling Frequency			Sample Type	
	Influent INF-001 [1]	Effluent EFF-001A [1]	Biosolids BIO-001	Influent and Effluent	Biosolids
VOC [2]	2/Year	2/Year	2/Year	Grab	Grabs [6c]
BNA [3]	2/Year	2/Year	2/Year	Grab	Grabs [6c]
Metals [4]	1/Month	1/Month	2/Year	C-24 [6a]	Grabs [6c]
Hexavalent Chromium [5]	1/Month	1/Month	2/Year	Grab	Grabs [6c]
Mercury	1/Month	1/Month	2/Year	Grab or C-24 [6a][6b]	Grabs [6c]
Cyanide, Total	1/Month	1/Month	---	Grab	Grabs [6c]

Sample Type:

C-24 = 24-hour composite sample
Grab = Grab sample

Sampling Frequency:

1/Month = once per month
2/Year = twice per year

Footnotes:

[1] Influent and effluent monitoring conducted in accordance with Tables E-2 and E-3 may be used to satisfy these pretreatment monitoring requirements.

[2] VOC: volatile organic compounds

[3] BNA: base/neutrals and acids extractable organic compounds

[4] The metals are arsenic, cadmium, copper, lead, nickel, silver, zinc, and selenium.

[5] The Discharger may elect to report total chromium instead of hexavalent chromium. Samples collected for total chromium measurements shall be 24-hour composites.

[6] Sample types:

a. If an automatic compositor is used, the Discharger shall obtain 24-hour composite samples through flow-proportioned composite sampling. Alternatively, 24-hour composite samples may consist of discrete grab samples combined (volumetrically flow-weighted) prior to analysis or mathematically flow-weighted.

b. The Discharger may use automatic compositors for mercury if either (1) the compositing equipment (hoses and containers) complies with ultra-clean specifications, or (2) equipment blank samples demonstrate that the compositing equipment has not contaminated the sample.

c. The biosolids sample shall be a composite of the biosolids to be disposed. Biosolids collection and monitoring shall comply with the requirements specified in Attachment H, Appendix H-4. The Discharger shall also comply with the biosolids monitoring requirements of 40 C.F.R. part 503.

VIII. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

The Discharger shall comply with all Standard Provisions (Attachments D and G) related to monitoring, reporting, and recordkeeping, with modifications shown in section IX, below.

B. Self-Monitoring Reports (SMRs)

1. **SMR Format.** The Discharger shall electronically submit SMRs using the State Water Board's California Integrated Water Quality System (CIWQS) Web site (http://www.waterboards.ca.gov/ciwqs/index.html). The CIWQS website will provide additional information for SMR submittal in the event of a planned service interruption for electronic submittal.

2. **SMR Due Dates and Contents.** The Discharger shall submit SMRs by the due dates, and with the contents, specified below:

   a. **Monthly SMRs —** Monthly SMRs shall be due 30 days after the end of each calendar month, covering that calendar month. The monthly SMR shall contain the applicable items described in sections V.B and V.C of both Attachments D and G of this Order. See Provision VI.C.2 (Effluent Characterization Study and Report) of this Order for information that must also be reported with monthly SMRs.

   Monthly SMRs shall include all new monitoring results obtained since the last SMR was submitted. If the Discharger monitors any pollutant more frequently than required by this Order, the Discharger shall include the results of such monitoring in the calculations and reporting for the SMR.

   b. **Annual SMR —** Annual SMRs shall be due February 1 each year, covering the previous calendar year. The annual SMR shall contain the items described in sections V.C.1.f of Attachment G. See also Provisions VI.C.2 (Effluent Characterization Study and Report) and VI.C.5.b.ix (Monitor to Characterize Wet Weather Discharge Impacts and Efficacy of Controls) of the Order for requirements to submit reports with the annual SMR.

   c. **Specifications for Submitting SMRs to CIWQS —** The Discharger shall submit analytical results and other information using one of the following methods.

Table E-8. CIWQS Reporting

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	**Attached File**
All parameters identified in influent, effluent, and receiving water monitoring tables (except Dissolved Oxygen and Temperature)	Required for all results	
Dissolved Oxygen Temperature	Required for monthly maximum and minimum results only [1]	Discharger may use this method for all results or keep records
Cyanide Arsenic Cadmium Chromium Copper Lead Mercury Nickel Selenium Silver Zinc Dioxins and Furans (by U.S. EPA Method 1613)	Required for all results [2]	
Antimony Beryllium Thallium Other Pollutants (by U.S. EPA Methods 601, 602, 608, 610, 614, 624, and 625)	Not required (unless identified in influent, effluent, or receiving water monitoring tables), but encouraged [1]	Discharger may use this method and submit results with application for permit reissuance, unless data are submitted by CDF/EDF upload
Volume and Duration of Blended Discharge [3]	Required for all blended effluent discharges	

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	Attached File
Analytical Method	Not required (Discharger may select "data unavailable") [1]	
Collection Time Analysis Time	Not required (Discharger may select "0:00") [1]	

Footnotes:

[1] The Discharger shall continue to monitor at the minimum frequency specified in this MRP, keep records of the measurements, and make the records available upon request.

[2] These parameters require EDF/CDF data upload or manual entry regardless of whether monitoring is required by this MRP or other provisions of this Order (except for biosolids, sludge, or ash provisions).

[3] The requirement for volume and duration of blended discharge applies only if this Order authorizes the Discharger to discharge blended effluent.

The Discharger shall arrange all reported data in a tabular format and summarize data to clearly illustrate whether the Facility is operating in compliance with effluent limitations. The Discharger is not required to duplicate the submittal of data entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format, the Discharger shall electronically submit the data in a tabular format as an attachment.

3. **Monitoring Periods.** Monitoring periods for all required monitoring shall be as set forth below unless otherwise specified:

Table E-9. Monitoring Periods

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
Continuous	Permit effective date	All
1/Hour	Permit effective date	Hourly
1/Day	Permit effective date	Midnight through 11:59 p.m. or any 24-hour period that reasonably represents a calendar day for purposes of sampling.
1/Week or 2/Week or 5/Week	Sunday following permit effective date or on permit effective date if on Sunday	Sunday through Saturday
1/Month	First day of calendar month following permit effective date or on permit effective date if on first day of month	First day of calendar month through last day of calendar month
1/2 Months	First day of calendar month following permit effective date or on permit effective date if that date is first day of month	First day of calendar month through last day of next calendar month
1/Year	January 1	January 1 through December 31
2/Year	Closest January 1 or July 1 following (or on) permit effective date	November 1 through April 30 May 1 through October 31
4/Year	Closest January 1, April 1, July 1, or October 1 following (or on) permit effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
1/5 Years	Permit effective date	Once during the Order term no more than 12 months prior to applying for permit reissuance.

4. **RL and MDL Reporting.** The Discharger shall report with each sample result the Reporting Level (RL) and Method Detection Limit (MDL) as determined by the procedure in 40 C.F.R. part 136. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

   a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

   b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported. The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (+/- a percentage of the reported value), numerical ranges (low to high), or any other means the laboratory considers appropriate.

   c. Sample results less than the laboratory's MDL shall be reported as "Not Detected" or ND.

   d. The Discharger shall instruct laboratories to establish calibration standards so that the minimum level (ML) value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.

5. **Compliance Determination.** Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined above and in the Fact Sheet and Attachments A, D, and G. For purposes of reporting and administrative enforcement by the Regional Water Board and State Water Board, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL).

C. Discharge Monitoring Reports (DMRs)

1. At any time during the term of this Order, the State Water Board or Regional Water Board may notify the Discharger to electronically submit DMRs. Until such notification is given, the Discharger shall submit DMRs in accordance with the requirements described below.

2. Once notified by the State Water Board or Regional Water Board, the Discharger shall submit hard copy DMRs. The Discharger shall sign and certify DMRs as Attachment D requires. The Discharger shall submit original DMRs to one of the addresses listed below:

Standard Mail	FedEx/UPS/Other Private Carriers
State Water Resources Control Board Division of Water Quality c/o DMR Processing Center PO Box 100 Sacramento, CA 95812-1000	State Water Resources Control Board Division of Water Quality c/o DMR Processing Center 1001 I Street, 15th Floor Sacramento, CA 95814

3. All discharge monitoring results shall be reported on official U.S. EPA pre-printed DMR forms (EPA Form 3320-1) or self-generated forms that follow the exact same format as EPA Form 3320-1.

IX. MODIFICATIONS TO ATTACHMENT G

This MRP modifies Attachment G as indicated below:

A. Attachment G sections V.C.1.f and V.C.1.g are revised as follows, and section V.C.1.h (Reporting data in electronic format) is deleted.

f. Annual self-monitoring report requirements

By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

1) Annual compliance summary table of treatment plant performance (this summary table is not required if the Discharger has submitted the year's monitoring results to CIWQS in electronic reporting format by EDF/CDF upload or manual entry);

2) Comprehensive discussion of treatment plant performance and compliance with the permit (this discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater (this item is not required if the Discharger has submitted the year's monitoring results to CIWQS in electronic reporting format by EDF/CDF upload or manual entry);

4) List of approved analyses, including the following:

(i) List of analyses for which the Discharger is certified;

(ii) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory shall not be submitted but be retained onsite); and

(iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all stormwater to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs addressed as follows, unless the Discharger submits SMRs electronically to CIWQS:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format – *Deleted*

B. Attachment G sections V.E.2, V.E.2.a, and V.E.2.c are revised as follows, and sections V.E.2.b (24-hour Certification) and V.E.2.d (Communication Protocol) are deleted.

2. Unauthorized Discharges from Municipal Wastewater Treatment Plants[1]

The following requirements apply to municipal wastewater treatment plants that experience an unauthorized discharge at their treatment facilities and

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

supersede requirements imposed on the Discharger by the Executive Officer by letter of May 1, 2008.

a. Two (2)-Hour Notification

For any unauthorized discharges that enter a drainage channel or a surface water, the Discharger shall, as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the California Emergency Management Agency (CalEMA, currently 800-852-7550), the local health officers or directors of environmental health with jurisdiction over the affected water bodies, and the Regional Water Board. Timely notification by the Discharger to CalEMA also satisfies notification to the Regional Water Board. Notification shall include the following:

1) Incident description and cause;

2) Location of threatened or involved waterway(s) or storm drains;

3) Date and time the unauthorized discharge started;

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on); and

6) Identity of the person reporting the unauthorized discharge.

b. 24-hour Certification – *Deleted*

c. 5-day Written Report

Within five business days, the Discharger shall submit a written report that includes, in addition to the information required above, the following:

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

2) Efforts implemented to minimize public exposure to the unauthorized discharge;

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;

4) Corrective measures taken to minimize the impact of the unauthorized discharge;

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges; and

7) Quantity and duration of the unauthorized discharge, and the amount recovered.

d. Communication Protocol – *Deleted*

X. MODIFICATIONS TO ATTACHMENT H

This MRP modifies Attachment H as indicated below.

A. Attachment H, Appendix H-3, Signature Requirements for Pretreatment Annual and Semiannual Reports, is revised as follows.

The pretreatment annual and semiannual reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Discharger (POTW - 40 C.F.R. section 403.12[m]). Signed copies of the reports shall be submitted to the State Water Board and the Regional Water Board through the electronic self-monitoring report (eSMR) module of the California Integrated Water Quality System (CIWQS).

APPENDIX E-1
CHRONIC TOXICITY
DEFINITION OF TERMS AND SCREENING PHASE REQUIREMENTS

I. Definition of Terms

A. No observed effect level (NOEL) for compliance determination is equal to IC_{25} or EC_{25}. If the IC_{25} or EC_{25} cannot be statistically determined, the NOEL shall be equal to the NOEC derived using hypothesis testing.

B. Effective concentration (EC) is a point estimate of the toxicant concentration that would cause an adverse effect on a quantal, "all or nothing," response (such as death, immobilization, or serious incapacitation) in a given percent of the test organisms. If the effect is death or immobility, the term lethal concentration (LC) may be used. EC values may be calculated using point estimation techniques such as probit, logit, and Spearman-Karber. EC_{25} is the concentration of toxicant (in percent effluent) that causes a response in 25 percent of the test organisms.

C. Inhibition concentration (IC) is a point estimate of the toxicant concentration that would cause a given percent reduction in a nonlethal, nonquantal biological measurement, such as growth. For example, an IC_{25} is the estimated concentration of toxicant that would cause a 25 percent reduction in average young per female or growth. IC values may be calculated using a linear interpolation method such as U.S. EPA's Bootstrap Procedure.

D. No observed effect concentration (NOEC) is the highest tested concentration of an effluent or a toxicant at which no adverse effects are observed on the aquatic test organisms at a specific time of observation. It is determined using hypothesis testing.

II. Chronic Toxicity Screening Phase Requirements

A. The Discharger shall perform screening phase monitoring:

1. Subsequent to any significant change in the nature of the effluent discharged through changes in sources or treatment, except those changes resulting from reductions in pollutant concentrations attributable to source control efforts, or

2. Prior to permit reissuance. Screening phase monitoring data shall be included in the NPDES permit application for reissuance. The information shall be as recent as possible, but may be based on screening phase monitoring conducted within 5 years before the permit expiration date.

B. Design of the screening phase shall, at a minimum, consist of the following elements:

1. Use of test species specified in Appendix E-2, attached, and use of the protocols referenced in those tables.

2. Two stages:

a. Stage 1 shall consist of a minimum of one battery of tests conducted concurrently. Selection of the type of test species and minimum number of tests shall be based on Appendix E-2 (attached).

b. Stage 2 shall consist of a minimum of two test batteries conducted at a monthly frequency using the three most sensitive species based on the Stage 1 test results.

3. Appropriate controls.

4. Concurrent reference toxicant tests.

5. Dilution series of 100%, 50%, 25%, 12.5%, 6.25%, and 0%, where "%" is percent effluent as discharged, or as otherwise approved by the Executive Officer if different dilution ratios are needed to reflect discharge conditions.

C. The Discharger shall submit a screening phase proposal. The proposal shall address each of the elements listed above. If within 30 days, the Executive Officer does not comment, the Discharger shall commence with screening phase monitoring.

APPENDIX E-2
SUMMARY OF TOXICITY TEST SPECIES REQUIREMENTS

Table AE-1. Critical Life Stage Toxicity Tests for Estuarine Waters

Species	(Scientific Name)	Effect	Test Duration	Reference
Alga	*(Skeletonema costatum)* *(Thalassiosira pseudonana)*	Growth rate	4 days	1
Red alga	*(Champia parvula)*	Number of cystocarps	7–9 days	3
Giant kelp	*(Macrocystis pyrifera)*	Percent germination; germ tube length	48 hours	2
Abalone	*(Haliotis rufescens)*	Abnormal shell development	48 hours	2
Oyster Mussel	*(Crassostrea gigas)* *(Mytilus edulis)*	Abnormal shell development; percent survival	48 hours	2
Echinoderms - Urchins Sand dollar	*(Strongylocentrotus purpuratus, S. franciscanus)* *(Dendraster excentricus)*	Percent fertilization or larval development	1 hour (fertilization) or 72 hours (development)	2
Shrimp	*(Americamysis bahia)*	Percent survival; growth	7 days	3
Shrimp	*(Holmesimysis costata)*	Percent survival; growth	7 days	2
Topsmelt	*(Atherinops affinis)*	Percent survival; growth	7 days	2
Silversides	*(Menidia beryllina)*	Larval growth rate; percent survival	7 days	3

Toxicity Test References:

3. Short-term Methods for Estimating the Chronic Toxicity of Effluent and Receiving Waters to Marine and Estuarine Organisms. EPA/821/R-02/014. October 2002.

Table AE-2. Critical Life Stage Toxicity Tests for Fresh Waters

Species	(Scientific Name)	Effect	Test Duration	Reference
Fathead minnow	*(Pimephales promelas)*	Survival; growth rate	7 days	4
Water flea	*(Ceriodaphnia dubia)*	Survival; number of young	7 days	4
Alga	*(Selenastrum capricornutum)*	Final cell density	4 days	4

Toxicity Test Reference:

1. Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms, fourth Edition Chronic manual (EPA-821-R-02-013, October 2002).

Table AE-3. Toxicity Test Requirements for Stage One Screening Phase

Requirements	Receiving Water Characteristics		
	Discharges to Coast	Discharges to San Francisco Bay [1]	
	Ocean	Marine/Estuarine	Freshwater
Taxonomic diversity	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish
Number of tests of each salinity type: Freshwater [2] Marine/Estuarine	0 4	1 or 2 3 or 4	3 0
Total number of tests	4	5	3

[1] (a) Marine refers to receiving water salinities greater than 1 part per thousand (ppt) at least 95 percent of the time during a normal water year.

(b) Freshwater refers to receiving water with salinities less than 1 ppt at least 95 percent of the time during a normal water year.

(c) Estuarine refers to receiving water salinities that fall between those of marine and freshwater, as described above.

[2] The freshwater species may be substituted with marine species if:

(a) The salinity of the effluent is above 1 ppt greater than 95 percent of the time, or

(b) The ionic strength (TDS or conductivity) of the effluent at the test concentration used to determine compliance is documented to be toxic to the test species.

ATTACHMENT F - FACT SHEET

Contents

Tables

ATTACHMENT F – FACT SHEET

This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order. As described in section II.B of the Order, the Regional Water Board incorporates this Fact Sheet as its findings supporting the issuance of the Order.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility.

Table F-1. Facility Information

WDID	2 386010001
CIWQS Place ID	256499
Discharger	City and County of San Francisco
Facility Name	Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System
Facility Address	San Francisco Public Utilities Commission / Wastewater Enterprise 750 Phelps Street San Francisco, CA 94124
	San Francisco County
Facility Contact, Title, Phone	Tommy Moala, Assistant General Manager, Wastewater Enterprise, (415) 554-2465
Authorized Person to Sign and Submit Reports	Same as Facility Contact
Mailing Address	San Francisco Public Utilities Commission 525 Golden Gate Ave., 13th Floor San Francisco, CA 94102
Billing Address	Same as Mailing Address
Facility Type	Publicly Owned Treatment Works
Major or Minor Facility	Major
Threat to Water Quality	1
Complexity	A
Pretreatment Program	Yes
Reclamation Requirements	Not Applicable
Mercury and PCBs Requirements	NPDES Permit No. CA0038849
Permitted Flow	85.4 million gallons per day (MGD)
Design Flow	Southeast Water Pollution Control Plant: 85.4 MGD – Average dry weather design flow capacity; 250 MGD – Wet weather design flow capacity: 150 MGD receives primary and secondary treatment, and additional 100 MGD receives only primary treatment. North Point Wet Weather Facility: 150 MGD – Wet weather design flow capacity (only primary treatment).
Watershed	San Francisco Bay
Receiving Water	San Francisco Bay
Receiving Water Type	Marine

A. The City and County of San Francisco (Discharger) is the owner and operator of the Southeast Water Pollution Control Plant (Southeast Plant), North Point Wet Weather Facility (North Point Facility), Bayside Wet Weather Facilities, and wastewater collection system (collectively Facility).

For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. The Discharger is regulated pursuant to National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037664. It was previously subject to Order No. R2-2008-0007 (previous order), which was adopted on January 30, 2008, and expired on March 31, 2013. The Facility discharges wastewater to Central and Lower San Francisco Bay, waters of the United States within the San Francisco Bay watershed. Attachment B provides a map of the area around the Facility. Attachment C provides a Facility flow schematic.

The Discharger must file a petition with the State Water Resources Control Board (State Water Board), Division of Water Rights, and receive approval for any change in the point of discharge, place of use, or purpose of use of treated wastewater that decreases the flow in any portion of a watercourse. The State Water Board retains the jurisdictional authority to enforce such requirements under Water Code section 1211.

C. The Discharger filed a Report of Waste Discharge and submitted an application for reissuance of its WDRs and NPDES permit on October 2, 2012.

D. The discharge is also regulated under NPDES Permit No. CA0038849, which establishes requirements on mercury and polychlorinated biphenyls (PCBs) from wastewater discharges to San Francisco Bay. This Order does not affect the mercury and PCBs permit.

II. FACILITY DESCRIPTION

A. Wastewater and Biosolids Treatment and Controls

1. **Location and Service Area.** The Facility serves eastern San Francisco and portions of Brisbane and Daly City (served by the City of Brisbane, the Bayshore Sanitary District, and the North San Mateo County Sanitation District). The service area population is approximately 580,000.

   The Southeast Plant is located on Phelps Street at Jarrold Avenue near the Islais Creek Channel. It provides primary and secondary treatment of combined wastewater and stormwater. The North Point Facility is located on Bay Street near The Embarcadero. It provides primary treatment of combined wastewater and stormwater during wet weather. The Bayside Wet Weather Facilities are located throughout the eastern side of San Francisco, primarily near the shore. They provide equivalent-to-primary treatment during wet weather.

2. **Collection System.** The collection system is primarily a combined sewer system that conveys wastewater and stormwater to the Southeast Plant, North Point Facility, and Bayside Wet Weather Facilities. It consists of approximately 600 miles of pipe, and 7 major and 11 minor pump stations. Separate sanitary and storm drains serve isolated areas, including parts of Candlestick Point and Mission Bay. The Facility also receives wastewater from three satellite wastewater collection systems: the Bayshore Sanitary District (portions of Brisbane and Daly City), the City of Brisbane (residential sector), and the North San Mateo County Sanitation District (portions of Daly City). For the purposes of this Order, the Facility does not include the satellite collection systems.

3. **Wastewater Treatment.** The Discharger operates the Southeast Plant, North Point Facility, and Bayside Wet Weather Facilities to maximize treatment.

   a. **Southeast Plant.** During dry weather, the Southeast Plant provides secondary wastewater treatment. The treatment processes include a headworks (with coarse and fine bar screens, and grit removal), primary sedimentation tanks, pure oxygen aeration basins, secondary clarifiers, and chlorine contact basins (for chlorination using sodium hypochlorite and dechlorination using sodium bisulfite). These processes are shown in the diagram in Attachment C. The Southeast Plant has a dry weather design capacity of 85.4 MGD. From June 2010 through August 2012, its average dry weather flow was 58 MGD.

      During wet weather, the Southeast Plant processes up to 250 MGD of combined wastewater (i.e., sewage, industrial wastewater, and stormwater). Up to 150 MGD receives both primary and secondary treatment; the remaining flow (up to 100 MGD) receives only primary treatment. The entire volume is disinfected prior to discharge.

   b. **North Point Facility.** The North Point Facility discharges only during wet weather and provides primary treatment of combined wastewater. The treatment consists of bar screens, sedimentation tanks equipped with skimmers (clarification, removal of floatables), sodium hypochlorite injection, and dechlorination using sodium bisulfite addition. The North Point Facility can provide primary treatment for up to 150 MGD of combined wastewater. The entire volume of treated wastewater is disinfected and dechlorinated prior to discharge. Solids are directed to the Southeast Plant for digestion.

      The North Point Facility discharges under the following circumstances:

      - the North Shore Storage/Transport Box is at 200 inches;
      - within 60 minutes of any combined sewer discharge through Discharge Point Nos. 013 through 017; or
      - as necessary to minimize the likelihood of combined sewer discharges in the Central and Southeast Drainage Basins.

   c. **Bayside Wet Weather Facilities.** During dry weather, storage/transport structures transport wastewater to the Southeast Plant. During wet weather, these structures transfer combined wastewater to the Southeast Plant and, if necessary, the North Point Facility. They also provide storage for more than 120 million gallons of combined wastewater. In the event that the capacities of the Southeast Plant, North Point Facility, and storage/transport structures are exceeded, the combined wastewater receives the equivalent of primary treatment in the storage/transport structures and is discharged to San Francisco Bay through any one of 29 shoreline combined sewer discharge structures. The treatment in the storage/transport structures consists of settling solids with a series of baffles and weirs that also remove floatable materials prior to discharge. This process equates to the minimum treatment specified in U.S. EPA's *Combined Sewer Overflow Control Policy* (see Fact Sheet section III.C.8). After the wet weather is over, wastewater and accumulated solids remaining in the storage/transport structures are sent to the Southeast Plant for secondary treatment.

4. **Sludge and Biosolids Management.** Sludge from the primary and secondary clarification operations is processed using anaerobic digestion. The process consists of gravity belt thickeners for waste activated sludge thickening, mesophilic anaerobic digesters, and horizontal bowl centrifuges for dewatering. After digestion, the sludge is conditioned with ferric chloride and polymer, dewatered, and stored in cake hoppers for hauling. The digested and dewatered biosolids are beneficially used at a permitted landfill or land-applied at a permitted site. A portion of the biosolids is blended with green waste to create Class A compost. Class B biosolids are land-applied on farms in Solano and Sonoma counties or used at a landfill.

B. Discharge Points and Receiving Waters

1. **Dry Weather Discharges.** During dry weather, all flow receives secondary treatment and is discharged to Lower San Francisco Bay (a tidally-influenced, marine waterbody) through a deep water outfall (Discharge Point No. 001) at Pier 80, which is immediately north of the Islais Creek Channel. The outfall is approximately 810 feet east of Pier 80 at a depth of approximately 43 feet below mean lower low water. A diffuser at the outfall consists of 18 ports placed 15.9 feet apart on center along the terminal end of the outfall. The length of the diffuser is oriented approximately 90 degrees off north, perpendicular to the predominant current direction. The diffuser port openings are 8 inches in diameter, located at an elevation 42 inches above the sediment bed, and set at 0 degrees from horizontal.

   Following a September 2010 inspection that discovered that some fittings on the diffuser risers had broken off, the Discharger began replacing the discharge ports on the diffuser. The number of ports will remain the same, but the new ports will be equipped with duckbill valves to prevent rocks and debris from entering. The duckbill valves will likely increase dilution at the outfall.

2. **Wet Weather Discharges.** During wet weather, when secondary treatment capacity at the Southeast Plant has been exceeded, a portion of the primary-treated effluent bypasses aeration and secondary clarification. The bypassed primary effluent is chlorinated and dechlorinated, and then blended with disinfected secondary-treated wastewater and discharged through Discharge Point No. 001. The discharge from the Southeast Plant through Discharge Point No. 001 is maximized up to 110 MGD. Effluent flows in excess of 110 MGD are discharged via the Quint Street shallow water outfall into Islais Creek (Discharge Point No. 002). All effluent discharged through Discharge Point No. 002 receives secondary treatment, and all primary treated effluent is directed to the deep water outfall. Up to 140 MGD of secondary-treated wastewater may be discharged through Discharge Point No. 002. Under the most critical circumstances, up to 100 MGD of disinfected primary-treated effluent may be blended with 10 MGD of disinfected secondary-treated effluent and discharged through Discharge Point No. 001.

   When necessary, treated wastewater from the North Point Facility is discharged into San Francisco Bay through four deepwater outfalls, two of which discharge at the end of Pier 33 (Discharge Point Nos. 003 and 004) and two of which discharge at the end of Pier 35 (Discharge Point Nos. 005 and 006). If the capacities of the Southeast Plant, the North Point Facility, and the storage/transport structures are exceeded, wastewater in the storage/transport structures is discharged to San Francisco Bay through one or more of the 29 combined sewer discharge structures (Discharge Point Nos. 009 through 043).

C. Summary of Existing Requirements and Monitoring Data

Effluent limitations contained in the previous order and representative monitoring data from the previous order term are presented below:

Table F-2. Previous Effluent Limitations and Monitoring Data

Parameter	Units	Effluent Limitations					Monitoring Data (4/08–9/12)
		Monthly Average	Weekly Average	Daily Maximum	Instant-aneous Maximum	Instant-aneous Minimum	Highest Daily Discharge
Dry Weather (Discharge Point No. 001)							
Biochemical Oxygen Demand, 5-day @ 20°C (BOD_5)	mg/L	30	45	---	---	---	47 [6]
Total Suspended Solids (TSS)	mg/L	30	45	---	---	---	62 [6]
Oil and Grease	mg/L	10	---	20	---	---	17
pH	s.u.	---	---	---	9.0	6.0	6.1 – 7.7
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	35 [1]	---	---	---	---	16 [4]
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	270
Copper	µg/L	53 [3]	---	76 [3]	---	---	37
Lead	µg/L	36	---	89	---	---	1.6
Silver	µg/L	7	---	22	---	---	2.6
Zinc	µg/L	490	---	720	---	---	55
Cyanide	µg/L	20 [4]	---	43 [4]	---	---	9.5
Dioxin-TEQ	mg/yr	[5]					0 [5]
Tetrachloroethylene	µg/L	84	---	240	---	---	0.79
Bis (2-ethylhexyl) phthalate	µg/L	55	---	110	---	---	1.7
Ammonia	mg/L as N	190	---	290	---	---	42
Tributyltin	µg/L	0.032	---	0.065	---	---	< 0.0026
Wet Weather (Discharge Point No. 001)							
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	---	---	---	104	---	600
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	450
Wet Weather (Discharge Point No. 002)							
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	---	---	---	104	---	>24,000

Parameter	Units	Effluent Limitations					Monitoring Data (4/08–9/12)
		Monthly Average	Weekly Average	Daily Maximum	Instant-aneous Maximum	Instant-aneous Minimum	Highest Daily Discharge
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	680 [7]
Wet Weather (Discharge Point Nos. 004 through 006)							
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	---	---	---	104	---	5,800
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	>16,000 [7]

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter
s.u. = standard units
CFU/100 mL = colony forming units per 100 milliliters
MPN/100 mL = Most Probable Number per 100 milliliters
mg/L as N = milligrams per liter as nitrogen
mg/yr = milligrams per year

Footnotes:

[1] Monthly geometric mean.

[2] The 30-day moving median value was not to exceed 500 MPN/100 mL and no more than 10 percent of the samples in any 30-day period were to equal or exceed 1,100 MPN/100 mL.

[3] Final effluent limitations for copper became effective on the effective date of the copper site-specific objectives (January 6, 2009).

[4] Final effluent limitations for cyanide became effective on the effective date of the cyanide site specific objectives (July 22, 2008).

[5] Final effluent limitations for dioxin-TEQ became effective on June 30, 2012. The dioxin-TEQ limit was 1.6 mg/year. Compliance was to be based on the product of the average concentration in samples collected each year and the annual dry weather flow. No dioxin or furan congener was detected above the ML in Attachment G, Table A; therefore, in accordance with Attachment G section V.C.1.c.3, the 2012 dioxin-TEQ discharge was 0 mg/year.

[6] The monthly and weekly average BOD_5 and TSS concentrations at these times complied with BOD_5 and TSS effluent limitations.

[7] The 30-day median and 10th percentile fecal coliform densities at these times complied with fecal coliform effluent limitations.

Table F-3. Additional Wet Weather Monitoring Data

Parameter	Units	Discharge Point No. 001		Discharge Point No. 002		Discharge Point Nos. 003 through 006	
		Range	Median [1]	Range	Median [1]	Range	Median [1]
Chemical Oxygen Demand (COD)	mg/L	53 – 200	120	25 – 100	52	74 – 360	160
Oil and Grease	mg/L	--	--	--	--	<5 – 43	9.5
Total Residual Chlorine	mg/L	0	0	0	0	0	0
Enterococcus	MPN/ 100 mL	<10 – 600	<10	<10 – >24,000	31	<10 – 5,800	<10
Fecal Coliform	MPN/ 100 mL	<2 – 450	<10	<2 – 680	<10	<2 – >16,000	<10
Copper	µg/L	3 – 64	35	1 – 17	8	5 – 99	45
Lead	µg/L	1 – 43	12	0.1[2] – 2	1	1 – 31	13

Mercury	µg/L	<0.2 – 0.40	<0.2	<0.2	<0.2	<0.2 – 0.30[2]	<0.2
Silver	µg/L	0.04 – 2.6	0.28	0.03[2] – 0.51	0.14	0.04[2] – 0.75	0.32
Zinc	µg/L	12 – 230	100	4 – 64	32	14 – 290	130
Cyanide	µg/L	<3 – 3.3[2]	<3	<3	<3	1.9[2] – 12	<3
Ammonia	mg/L as N	3 – 29	5	7 – 41	32	2 – 14	5

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter
MPN/100 mL = Most Probable Number per 100 milliliters
mg/L as N = milligrams per liter as nitrogen

Footnotes:

[1] Median calculation reflects inclusion of estimated concentrations (i.e., detected but not quantified, DNQs) and nondetects (at the detection limit).

[2] Estimated concentration (i.e., detected but not quantified, DNQ)

D. Summary of Combined Sewer Discharge Events

The following tables summarize combined sewer discharge events over a 14-year period and estimated average combined sewer discharge event durations for wet season 2008-2009 through wet season 2012-2013:

Table F-4. Frequency of Combined Sewer Discharge Events

Year	Rainfall (inches)	Number of Combined Sewer Discharge Events		
		North Shore Basin [2]	Central Basin [3]	Southeast Basin [3]
1998-1999	17.0	1	13	0
1999-2000	20.9	3	12	1
2000-2001	15.8	0	8	0
2001-2002	19.3	2	9	2
2002-2003	21.1	3	14	4
2003-2004	16.9	4	8	2
2004-2005	28.2	4	15	1
2005-2006	28.9	3	16	2
2006-2007	15.1	1	5	1
2007-2008	17.4	3	7	2
2008-2009	15.6	3	4	1
2009-2010	22.4	5	11	3
2010-2011	26.3	6	21	0
2011-2012	15.9	2	8	1
14-Year Median	**18.4**	**3**	**10**	**1**
Design Criterion [1]		**4**	**10**	**1**

Footnotes:

[1] These criteria were based on 70 years of historic rainfall data and used to design the the Bayside Wet Weather Facilities. They are useful in evaluating system performance.

[2] North Shore Basin combined sewer discharges occur from Discharge Point Nos. 009 through 017.

[3] Central Basin combined sewer discharges occur from Discharge Point Nos. 018 through 035.

[4] Southeast Basin combined sewer discharges occur from Discharge Point Nos. 037 through 043.

Table F-5. Durations of Combined Sewer Discharge Events

Northshore Basin		Central Basin		Southeast Basin	
Discharge Point	Estimated Average Duration (Hours)	Discharge Point	Estimated Average Duration (Hours)	Discharge Point	Estimated Average Duration (Hours)
009	2	018	3	037	5
010	2	019	3	038	5
011	0	022	3	040	1
013	4	023	3	041	1
015	2	024	3	042	1
017	3	025	3	043	1

E. Compliance Summary

1. **Effluent Limitation Violations.** The Discharger violated its wet weather enterococcus limit ten times during the previous order term, as listed in the following table:

Table F-6. Wet Weather Enterococcus Effluent Limitation Violations

Violation Date	Monitoring Location	Unit	Effluent Limit	Reported Value
December 16, 2008	EFF-002	MPN/100mL	104	110
January 22, 2009	EFF-002	MPN/100mL	104	8,664 [1]
April 7, 2009	EFF-002	MPN/100mL	104	>24,196 [1]
January 29, 2010	EFF-002	MPN/100mL	104	11,199 [1]
December 5, 2010	EFF-001B	MPN/100mL	104	402
January 30, 2011	EFF-001B	MPN/100mL	104	598
March 19, 2011	EFF-001B	MPN/100mL	104	784 [1]
March 15, 2011	EFF-003	MPN/100mL	104	1,317 [2]
March 24, 2011	EFF-003	MPN/100mL	104	5,794 [2]
November 16, 2012	EFF-003	MPN/100mL	104	108

Footnotes:

[1] The Discharger asserts that these values may be false positives since simultaneous fecal coliform results were relatively low.

[2] These violations may be subject to minimum penalties of $3,000 each pursuant to California Water Code §13385(i).

The Discharger asserts that four reported values may be false positives due to matrix interference because, in each case, simultaneous fecal coliform results were relatively low.

However, the Discharger certified these results and, to date, has presented no corroborating information to invalidate them pursuant to MRP section XI.D.2 or Attachment G section V.C.1.a.5 of the previous order. The Discharger modified its sampling practices in early 2010 to test for interference before completing enterococcus analyses. As for the other violations, the Discharger points to the challenge of adding sufficient chlorine when operating at maximum hydraulic capacity, indicating that sudden stormwater surges make predicting the chlorine dose necessary for compliance difficult. The Discharger is considering options but has not proposed corrective actions.

The March 15 and 24, 2011, violations may be subject to minimum penalties of $3,000 each pursuant to California Water Code section 13385(i) because they are the fourth and fifth effluent limit violations within six months. Regional Water Board staff will evaluate relevant evidence and present the matter for Regional Water Board consideration as a separate action in the near future, as appropriate.

2. **Inspections.** The Facility is subject to annual compliance evaluation inspections. During the previous order term, there were five inspections, four of which focused on treatment plant operations at the Southeast Plant. The treatment plant inspections concluded with satisfactory ratings for compliance. An October 2010 inspection focused on the collection system.

   The collection system inspection addressed two main issues: (1) accumulation of grease and debris in the storage/transports; and (2) Discharger responsiveness to reports of collection system excursions onto sidewalks and streets. The Discharger responded to the inspection report by describing its routine collection system maintenance practices and programs addressing fats and grease and by pointing out that the number of apparent collection system problems reported was very high because all of its emergency hotline calls were included, whether or not they related to actual collection system problems. At the time, the Discharger was developing a new computer-based asset management system to allow it to better track and respond to calls.

   To follow up on the inspection and the Discharger's response, the Executive Officer issued an order requiring additional information pursuant to Water Code section 13267. This 13267 order required information on the extent and causes of excursions onto sidewalks and streets, and progress toward collection system improvements, asset management system development and implementation, and collection system cleaning and maintenance.

   In response, the Discharger submitted several reports, including a special study on combined sewer system excursions during the period from October 1, 2011, through September 30, 2012. Using its computer-based asset management system, it reported how many calls it received and how many of the calls related to collection system issues. Most (98 percent) of the reports related to private sewer laterals for which others were responsible. Nevertheless, the Discharger often resolved these problems on behalf of the other parties. The rest (about 70) related to the Discharger's collection system.

   The Discharger described specific maintenance activities, improvements, and repairs to its collections system; tracked the effectiveness of its fats, oil, and grease control program; and

described program improvements. Grease buildup is the main cause of the Discharger's sewer system blockages.

F. Planned Changes

The Discharger has started several infrastructure projects. In October 2012, the Discharger began the Southeast Plant Northside Facility Reliability Upgrade (Phase 2) project, which is an $11.5-million project to replace aging secondary sludge handlers and aeration-related electrical systems and to modify the secondary clarification process. The project is expected to be completed in August 2014. The Discharger began an Oxygen Generation Plant Replacement project in December 2012 and plans to complete this $12-million project in December 2013. The Discharger began dewatering facility corrosion repairs in August 2012, a $9.1-million project to address corrosion damage to concrete, the sludge piping network, and the electrical system at the sludge dewatering building. This project is expected to be completed in January 2014. The Discharger is also designing a project to begin in August 2013 to replace and relocate the sodium hypochlorite storage tanks for disinfection.

The Discharger's Sewer System Improvement Program is a three-phase, $6.9-billion effort over the next 20 years to address deficiencies, improve operational flexibility, provide seismic reliability, and ensure future compliance with anticipated environmental regulatory requirements. The program will address aging infrastructure and technologies at the treatment plants and increase the ability of the collection system to convey wastewater.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements in this Order are based on the requirements and authorities described below:

A. Legal Authorities

This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA, and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters.

B. California Environmental Quality Act

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act, Public Resources Code division 13, chapter 3 (commencing with § 21100).

C. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plan.** The Regional Water Board adopted the *Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan), which designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. Requirements in this Order implement the Basin Plan. In addition, this Order is consistent with State Water Board Resolution No. 88-63, which established State policy that all waters, with certain exceptions,

should be considered suitable or potentially suitable for municipal or domestic supply. Because of the marine influence on San Francisco Bay, total dissolved solids levels exceed 3,000 mg/L; therefore, San Francisco Bay meets an exception to State Water Board Resolution No. 88-63.

Beneficial uses for the receiving waters of each Facility discharge point are listed below:

Table F-7. Basin Plan Beneficial Uses

Discharge Points	Receiving Water	Beneficial Uses
001, 002, 019, 043	Lower San Francisco Bay	Industrial Service Supply (IND) Ocean, Commercial, and Sport Fishing (COMM) Shellfish Harvesting (SHELL) Estuarine Habitat (EST) Fish Migration (MIGR) Preservation of Rare and Endangered Species (RARE) Fish Spawning (SPWN) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
003, 004, 005, 006, 009, 010, 011, 013, 015, 017, 018	Central San Francisco Bay	Industrial Service Supply (IND) Industrial Process Supply (PROC) Ocean, Commercial, and Sport Fishing (COMM) Shellfish Harvesting (SHELL) Estuarine Habitat (EST) Fish Migration (MIGR) Preservation of Rare and Endangered Species (RARE) Fish Spawning (SPWN) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
022, 023, 024, 025, 026, 027, 028	Mission Creek	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
029, 030, 030A	Central Basin	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
031, 031A, 032, 033, 035	Islais Creek	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)

037, 038	India Basin	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
040, 042	South Basin	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
041	Yosemite Creek	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2)

2. **Sediment Quality.** The State Water Board adopted the *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality* on September 16, 2008, and it became effective on August 25, 2009. This plan supersedes other narrative sediment quality objectives, and establishes new sediment quality objectives and related implementation provisions for specifically defined sediments in most bays and estuaries. This Order implements the sediment quality objectives of this plan.

3. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** U.S. EPA adopted the NTR on December 22, 1992, and amended it on May 4, 1995 and November 9, 1999. About 40 criteria in the NTR apply in California. On May 18, 2000, U.S. EPA adopted the CTR. The CTR promulgated new toxics criteria for California and incorporated the previously adopted NTR criteria that applied in the State. U.S. EPA amended the CTR on February 13, 2001. These rules contain water quality criteria for priority pollutants.

4. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated for California through the NTR and the priority pollutant objectives the Regional Water Board established in the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives, and provisions for chronic toxicity control. Requirements of this Order implement the SIP for dry weather discharges.

5. **Antidegradation Policy.** Federal regulations at 40 C.F.R. section 131.12 requires that state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy through State Water Board Resolution 68-16, which is deemed to incorporate the federal antidegradation policy where the federal policy applies under federal law. Resolution 68-16 requires that existing

water quality be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. Permitted discharges must be consistent with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution 68-16.

6. **Anti-Backsliding Requirements.** CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.

7. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code §§ 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. §§ 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the State, including protecting rare, threatened, or endangered species. The Discharger is responsible for meeting all applicable Endangered Species Act requirements.

8. **Combined Sewer Overflow Control Policy.** U.S. EPA's *Combined Sewer Overflow Control Policy* (59 Fed. Reg. 18688-18698, April 19, 1994). The policy establishes a national approach for controlling combined sewer discharges and overflows and calls for a two-phased process. During the first phase, dischargers operating combined sewer systems were required to implement the Nine Minimum Controls, which were to constitute CWA technology-based requirements as applied to combined sewer systems (best conventional pollutant control technology [BCT] and best available control technology economically achievable [BAT]). Dischargers were also required to develop Long-Term Control Plans based on their financial capabilities. During the second phase, dischargers were required to implement the Long-Term Control Plans, thus providing a basis for demonstrating or presuming attainment of water quality objectives protective of beneficial uses. This Order requires the Discharger to continue operating its combined sewer system in accordance with the Nine Minimum Controls and its Long-Term Control Plan.

D. Impaired Waters on CWA 303(d) List

In October 2011, U.S. EPA approved a revised list of impaired waters prepared pursuant to CWA section 303(d), which requires identification of specific water bodies where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. Where it has not done so already, the Regional Water Board plans to adopt Total Maximum Daily Loads (TMDLs) for pollutants on the 303(d) list. TMDLs establish wasteload allocations for point sources and load allocations for non-point sources, and are established to achieve the water quality standards for the impaired waters.

Central and Lower San Francisco Bay are listed as impaired waters. The pollutants impairing Central San Francisco Bay are chlordane, DDT, dieldrin, dioxins and furans, exotic species, mercury, dioxin-like PCBs and PCBs, selenium, and trash. The pollutants impairing Lower San Francisco Bay are chlordane, DDT, dieldrin, exotic species, dioxins and furans, mercury, trash, and dioxin-like PCBs and PCBs. On February 12, 2008, U.S. EPA approved a TMDL for

mercury in San Francisco Bay. On March 29, 2010, U.S. EPA approved a TMDL for PCBs in San Francisco Bay. The TMDLs for mercury and PCBs are incorporated into the Basin Plan and apply to this discharge; however, mercury and PCBs discharges are not covered by this Order. Instead, they are regulated under NPDES Permit No. CA0038849.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants discharged into waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 C.F.R. section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 C.F.R. section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of receiving waters.

A. Discharge Prohibitions

1. Prohibitions in this Order

a. Discharge Prohibition III.A (No discharge other than as described in this Order): This prohibition is based on 40 C.F.R. section 122.21(a) and Water Code section 13260, which require filing an application and Report of Waste Discharge before a discharge can occur. Discharges not described in the application and Report of Waste Discharge, and subsequently in this Order, are prohibited.

b. Discharge Prohibition III.B (Minimum initial dilution of 231:1): This Order is based on a modeled dilution ratio of 231:1 for the calculation of one or more effluent limitations reflecting available information regarding the dilution achieved at Discharge Point No. 001 (see section IV.C.4.a of this Fact Sheet). Therefore, this prohibition is necessary to ensure that the assumptions used to derive the dilution credit remain substantially the same so the limitations remain protective of water quality.

c. Discharge Prohibition III.C (No bypass of secondary treatment): This prohibition is based on 40 C.F.R. section 122.41(m) and U.S. EPA's *Combined Sewer Overflow Control Policy*. Bypass of secondary treatment is prohibited except during wet weather as defined in Attachment A or in accordance with 40 C.F.R. section §122.41(m) (see Attachment D section I.G.)

d. Discharge Prohibition III.D (No dry weather discharges at Discharge Point Nos. 002 through 043): This prohibition reflects the principle objective of U.S. EPA's *Combined Sewer overflow Control Policy* (i.e., to ensure that combined sewer discharges only result from wet weather and that such discharges only occur at specified locations). Dry weather discharges must receive full secondary treatment prior to discharge through Discharge Point No. 001.

e. Discharge Prohibition III.E (Average dry weather effluent flow not to exceed dry weather design capacity): This prohibition is based on the Southeast Plant's design

treatment capacity (i.e., the historic and tested reliability of the treatment plant). Exceeding the average dry weather flow design capacity could result in lowering the reliability of achieving compliance with water quality requirements.

This Order prohibits an average dry weather effluent flow greater than 85.4 MGD. The previous order prohibited an average dry weather flow greater than 84.5 MGD. That value was a typographical error. The prohibitions in earlier orders (e.g., Order No. R2-2002-0073) specified 85.4 MGD. Federal regulations allow correction of this error (40 C.F.R. § 122.63).

f. Discharge Prohibition III.F (No sewer overflows): Basin Plan Table 4-1, Discharge Prohibition 15, and the CWA prohibit the discharge of wastewater to surface waters except as authorized under an NPDES permit. Publicly owned treatment works must achieve secondary treatment at a minimum and any more stringent limitations necessary to meet water quality standards (33 U.S.C. § 1311[b][1][B and C]). A sanitary sewer or combined sewer overflow that results in the discharge of raw sewage or wastewater not meeting this Order's effluent limitations to surface waters is therefore prohibited under the CWA and the Basin Plan. This prohibition does not apply to combined sewer discharges explicitly authorized in this Order pursuant to U.S. EPA's *Combined Sewer Overflow Control Policy*.

2. Exception to Shallow Water and Dead-End Slough Discharge Prohibition

Basin Plan Table 4-1, Discharge Prohibition 1, prohibits discharges not receiving a minimum of 10:1 initial dilution and discharges to dead-end sloughs. Basin Plan section 4.2 provides for exceptions under certain circumstances:

- An inordinate burden would be placed on the Discharger relative to the beneficial uses protected, and an equivalent level of environmental protection can be achieved by alternate means;
- A discharge is approved as part of a reclamation project;
- Net environmental benefits will be derived as a result of the discharge; or
- A discharge is approved as part of a groundwater cleanup project.

Discharges to Discharge Point Nos. 001 and 003 through 006 receive a minimum of at least 10:1 dilution[1]; therefore, they are not subject this discharge prohibition. During wet weather, this Order grants an exception for discharges to Discharge Point Nos. 002 and 009 through 043 for the following reasons:

a. Wet weather discharges to Discharge Point Nos. 002 and 009 through 043 occur as a result of the Discharger's efforts to maximize treatment of sanitary and industrial wastewater *and* stormwater. To eliminate all combined sewer discharges would place an inordinate burden on the Discharger, which has invested heavily in infrastructure that

[1] Dilution at Discharge Point No. 001 is discussed in section IV.C.4.a of this Fact Sheet. Discharge Point Nos. 003 through 006 are located off of Piers 33 and 35 and discharge at a depth of about 10 feet below mean low low water (MLLW). In August 1973, the Discharger completed a study that estimated dilution ratios to be at least 10:1 at each outfall when discharging at a maximum flow of 170 MGD.

captures and treats most combined wastewater and stormwater. Providing additional deepwater discharge capacity is unwarranted for the relatively small portion of the combined wastewater not discharged to deep water. Such a burden would be wholly disproportional relative to the beneficial uses protected because this Order's requirements are sufficient to protect beneficial uses.

b. An equivalent level of environmental protection has been achieved because Provision VI.C.5 specifies controls that ensure the reliability of the Discharger's system in maximizing treatment and minimizing discharges not receiving at least 10:1 initial dilution. Combined sewer discharges at Discharge Point Nos. 009 through 043 receive equivalent-to-primary treatment, but before any combined sewer discharges occur, the Discharger optimizes discharges at Discharge Point Nos. 001 through 006. Discharges to Discharge Point Nos. 001 and 003 through 006 receive at least 10:1 dilution. When Discharge Point No. 001 (the Pier 80 deepwater outfall) is at capacity, the Discharger redirects only its highest quality effluent (secondary-treated wastewater) to Discharge Point No. 002.

Furthermore, in 1999 the Discharger took steps to enhance San Francisco Bay's beneficial uses by contributing $1 million to the Port of San Francisco to restore a 25-acre wetland at Heron's Head Park (Pier 98). Enhancing beneficial uses in this way provides environmental protection equivalent to providing at least 10:1 dilution for additional flows.

c. Net environmental benefits result from the operation of a combined sewer system. The system removes many pollutants in urban runoff, which elsewhere in the Region are discharged through stormwater outfalls with little or no treatment. For example, the system removes almost 2,000 tons, or 84 percent, of suspended sediment from the stormwater component of its influent each year (*Special Study Overflow Impacts and Efficacy of Combined Sewer Overflow Controls for the San Francisco Bayside System, Southeast Water Pollution Control Plant, North Point Wet Weather Facility and Bayside Wet Weather Facilities*, June 29, 2012).

B. Conventional and Non-Conventional Pollutant Effluent Limitations

1. Scope and Authority

a. Dry Weather Discharges. CWA section 301(b) and 40 C.F.R. section 122.44 require that permits include conditions meeting technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet water quality standards. The dry weather discharges authorized by this Order must meet minimum federal technology-based requirements based on Secondary Treatment Standards at 40 C.F.R. section 133 as summarized below. In addition, the 30-day average percent removal for biochemical oxygen demand (BOD_5) (or carbonaceous biochemical oxygen demand, $CBOD_5$) and total suspended solids (TSS), by concentration, is not to be less than 85 percent. The Basin Plan contains additional requirements for certain pollutants.

Table F-8. Secondary Treatment Requirements

Parameter	Monthly Average	Weekly Average
BOD_5	30 mg/L	45 mg/L
$CBOD_5$ [1]	25 mg/L	40 mg/L
TSS	30 mg/L	45 mg/L
pH	6.0 – 9.0 standard units [2]	

Footnotes:

[1] $CBOD_5$ effluent limitations may be substituted for BOD_5 limitations.

[2] The pH is to be between 6.0 and 9.0 unless inorganic chemicals are added during treatment or industrial sources cause the pH to be less than 6.0 or greater than 9.0.

b. Wet Weather Discharges. Discharges from combined sewer systems are point sources subject to NPDES permit requirements; however, such wet weather discharges are not subject to the Secondary Treatment Standards. The *Combined Sewer Overflow Control Policy* establishes technology-based requirements for combined sewer systems based on 40 C.F.R. section 125.3. The Policy requires the Discharger to implement Nine Minimum Controls, which represent the best conventional technology and best available technology economically achievable. Provision VI.C.5.b of this Order contains these requirements. This Order contains total residual chlorine and enterococcus limits for disinfected effluent from Discharge Point Nos. 001 through 006 to ensure proper operations and maintenance consistent with the Nine Minimum Controls.

2. Effluent Limitations

a. Dry Weather Discharges (Discharge Point No. 001)

i. BOD_5 and TSS. The dry weather BOD_5 and TSS effluent limitations, including the 85 percent removal requirements, are based on the Secondary Treatment Standards and Basin Plan Table 4-2.

ii. Oil and Grease. The oil and grease effluent limitations are based on Basin Plan Table 4-2.

iii. pH. The pH effluent limitations are based on the Secondary Treatment Standards and Basin Plan Table 4-2.

iv. Total Residual Chlorine. The total residual chlorine effluent limitation is based on Basin Plan Table 4-2. The allowance for determining false positives when using continuous devices is based on the fact that continuous instruments occasionally have anomalous spikes, and it is chemically improbable to have free chlorine present in the presence of sodium bisulfite.

v. Enterococcus. Basin Plan Table 4-2A requires the enterococcus effluent limitation for discharges to receiving waters with the water contact recreation beneficial use.

vi. Fecal Coliform. Basin Plan Table 4-2A requires total coliform effluent limitations for discharges to receiving waters with the shellfish harvesting beneficial use, but Basin Plan Table 4-2A, footnote c, allows substituting fecal coliform limitations for

total coliform limitations provided that the substitution will not result in unacceptable adverse impacts on beneficial uses. This Order contains the following fecal coliform effluent limits:

- The median fecal coliform density in any calendar month is not to exceed 500 MPN/100 mL); and
- no more than 10 percent of the samples in any calendar month may contain a fecal coliform density equal to or greater than 1,100 MPN/100 mL.

The Fact Sheet for Regional Water Board Order No. 94-149 attributes these limits to "recommendations for the Department of Health Services (Memorandum from Don Womeldorf, Chief Environmental Management Branch to James Baetge SWRCB dated Octover 24, 1990) and the initial dilution achieved at the Pier 80 Outfall."

These limits will not result in unacceptable adverse impacts on beneficial uses, including water contact recreation and shellfish harvesting. The enterococcus limit discussed above adequately protects water contact recreation. As for shellfish harvesting, Southeast Plant effluent is diluted at least 50:1 at the Pier 80 outfall (*Dilution Model for the San Francisco Southeast Treatment Plant Bay Outfall [Pier 80]*, December 6, 2007) and the nearest shellfish beds are near Candlestick Point, more than three miles away (*San Francisco Bay Subtidal Habitat Goals Report*, 2010). Basin Plan Table 3-1 contains a 30-day median fecal coliform objective of 14 MPN/100 mL and a 90th percentile fecal coliform objective of 43 MPN/100 mL to protect shellfish harvesting. Therefore, accounting for mixing and dilution, the fecal coliform limits in this Order will protect shellfish harvesting. Moreover, in April 1993, the Discharger decreased its chlorine residual for a time and observed that total coliform and fecal coliform levels near Candlestick Point remained equal to San Francisco Bay background levels ("NPDES Limits for Bacteria," *Water Environment & Technology*, Vol. 8, August 1996, pp 69-73). Other Lower San Francisco Bay dischargers have conducted similar receiving water impact studies and found no relationship between effluent and shoreline fecal coliform densities (City of San Mateo, November 1997; South Bayside System Authority, January 1998). Apparently, other fecal coliform sources (e.g., birds, wildlife, urban runoff) more directly affect shoreline fecal coliform levels. The studies evaluated a range of effluent discharges that included fecal coliform densities considerably higher than those allowed by this Order.

The Monitoring and Reporting Program requires weekly monitoring, but samples may be collected more frequently. The 10 percent requirement will be interpreted as follows. If up to nine samples are collected in a calendar month, a single sample with a fecal coliform density equal to or greater than 1,100 MPN/100 mL would violate the 10 percent limit; if 10 to 19 samples are collected, two samples at or above 1,100 MPN/100 mL would violate the limit; if 20 to 29 samples are collected, three samples at or above 1,100 MPN/100 mL would violate the limit; and if 30 or 31 samples are collected, four samples at or above 1,100 MPN/100 mL would violate the limit.

b. Wet Weather Discharges (Discharge Point Nos. 001 through 006)

i. Total Residual Chlorine. The total residual chlorine effluent limitation is based on Basin Plan Table 4-2, as guidance, to ensure that Southeast Plant and North Point Facility treatment, including disinfection, is conducted in a manner consistent with proper operations and maintenance as required by the Nine Minimum Controls. The allowance for determining false positives when using continuous devices accounts for the fact that continuous instruments occasionally have anomalous spikes, and it is chemically improbable to have free chlorine present in the presence of sodium bisulfite.

ii. Enterococcus. To ensure that Southeast Plant and North Point Facility disinfection is conducted in a manner consistent with proper operations and maintenance, as required by the Nine Minimum Controls, this Order contains an enterococcus effluent limitation. Disinfection performance is to be evaluated using a monthly geometric mean enterococcus limit of 35 MPN/100 mL, chosen based on the receiving water quality objective for water contact recreation in Basin Plan Table 3-1.

This Order does not retain the previous order's single-sample maximum enterococcus limit because, in the context of using single-sample maxima for enterococcus, U.S. EPA states in part:

> Other than in the beach notification and closure decision context, the geometrice mean is the more relevant value for ensuring that appropriate actions are taken to protect and improve water quality because it is a more reliable measure, being less subject to random variation, and more directly linked to the underlying studies on which the 1986 bacteria criteria were based. (69 Fed. Reg. 67224, November 16, 2004.)

This change is not subject to anti-backsliding requirements because the two limits reflect different averaging periods and both are consistent with Basin Plan Table 3-1 water quality objectives.

This Order also does not retain the previous order's fecal coliform limits. The enterococcus limit is sufficient to evaluate treatment performance. Anti-backsliding requirements do not apply because this Order replaces the fecal coliform limits with a new enterococcus limit; therefore, a direct comparison is impossible.

C. Toxic Pollutant Effluent Limitations

1. Scope and Authority

For toxic pollutants, this Order contains water quality-based effluent limitations (WQBELs) that implement water quality objectives that protect beneficial uses. CWA section 301(b) and 40 C.F.R. section 122.44(d) require that permits include limitations more stringent than federal technology-based requirements where necessary to achieve applicable water quality standards. According to 40 C.F.R. section 122.44(d)(1)(i), permits must include effluent limitations for all pollutants that are or may be discharged at levels that have a reasonable potential to cause or

contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective, WQBELs must be established using (1) U.S. EPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting a narrative criterion, supplemented with relevant information (40 C.F.R. § 122.44[d][1][vi]). The process for determining reasonable potential and calculating WQBELs is intended to achieve applicable water quality objectives and criteria and protect designated uses of receiving waters as specified in the Basin Plan.

During dry weather, this Order imposes numeric effluent limitations at Discharge Point No. 001 for toxic pollutants with reasonable potential to cause or contribute to exceedances of water quality standards. During wet weather, this Order imposes narrative effluent limitations for toxic pollutants, not numeric limitations. In accordance with the *Combined Sewer Overflow Control Policy*, this Order requires the Discharger to implement its Long-Term Control Plan to control combined sewer discharges and overflows. The plan calls for meeting CWA water quality-based requirements by providing a minimum level of treatment. The *Combined Sewer Overflow Control Policy* presumes that CWA water quality-based requirements will be met if the Discharger implements at least primary clarification of at least 85 percent of collected wastewater (unless data indicate otherwise). U.S. EPA describes this "presumption approach" as follows:

> A program that meets any of the criteria listed below would be presumed to provide an adequate level of control to meet the water quality-based requirements of the CWA, provided the permitting authority determines that such presumption is reasonable in light of the data and analysis conducted in the characterization, monitoring, and modeling of the system and the consideration of sensitive areas described above. These criteria are provided because data and modeling of wet weather events often do not give a clear picture of the level of [combined sewer overflow] controls necessary to protect [water quality standards].
>
> i. No more than an average of four overflow events per year, provided that the permitting authority may allow up to two additional overflow events per year. For the purpose of this criterion, an overflow event is one or more overflows from a CSS (Combined Sewer System) as the result of a precipitation event that does not receive the minimum treatment specified below; or
>
> ii. The elimination or the capture for treatment of no less than 85% by volume of the combined sewage collected in the Combined Sewer System during precipitation events on a system-wide annual average basis; or
>
> iii. The elimination or removal of no less than the mass of the pollutants, identified as causing water quality impairment through the sewer system characterization, monitoring, and modeling effort, for the volumes that would be eliminated or captured for treatment under paragraph ii above.

> Combined sewer overflows remaining after implementation of the nine minimum controls and within the criteria specified at [i or ii], should receive a minimum of:
>
> - Primary clarification (Removal of floatables and settleable solids may be achieved by any combination of treatment technologies or methods that are shown to be equivalent to primary clarification.);
>
> - Solids and floatables disposal; and
>
> - Disinfection of effluent, if necessary, to meet [water quality standards], protect designated uses and protect human health, including removal of harmful disinfection chemical residuals, where necessary."

The Discharger's Long-Term Control Plan exceeds the specifications for the presumption approach. The Discharger's system is designed to capture 100 percent of combined wastewater within the storage/transport boxes and to provide treatment consisting of floatables and settleable solids removal. Therefore, no untreated combined sewer overflows occur (combined sewer discharges receive equivalent-to-primary treatment). Provision VI.C.5.c of this Order requires the Discharger to continue implementing its Long-Term Control Plan.

2. Beneficial Uses and Water Quality Criteria and Objectives

Discharge Point No. 001 discharges to Lower San Francisco Bay. Section III.C.1, above, identifies the beneficial uses of Lower San Francisco Bay. Water quality criteria and objectives to protect these beneficial uses are described below:

a. Basin Plan Objectives. The Basin Plan specifies numeric water quality objectives for 10 priority pollutants and narrative water quality objectives for toxicity and bioaccumulation. The narrative toxicity objective states, "All waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce other detrimental responses in aquatic organisms." The narrative bioaccumulation objective states, "Controllable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered."

b. CTR Criteria. The CTR specifies numeric aquatic life and human health criteria for numerous priority pollutants. These criteria apply to inland surface waters and enclosed bays and estuaries. Some human health criteria are for consumption of "water and organisms" and others are for consumption of "organisms only." The criteria applicable to "organisms only" apply to Lower San Francisco Bay because it is not a source of drinking water.

c. NTR Criteria. The NTR establishes numeric aquatic life and human health criteria for a number of toxic pollutants for San Francisco Bay waters upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. The NTR criteria apply to Lower San Francisco Bay.

d. Sediment Quality Objectives. The *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality* contains a narrative water quality objective: "Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities in bays and estuaries of California." This objective is to be implemented by integrating three lines of evidence: sediment toxicity, benthic community condition, and sediment chemistry. The policy requires that if the Regional Water Board determines that a discharge has reasonable potential to cause or contribute to an exceedance of this objective, it is to impose the objective as a receiving water limit.

e. Receiving Water Salinity. Basin Plan section 4.6.2 (like the CTR and NTR) states that the salinity characteristics (i.e., freshwater vs. saltwater) of the receiving water are to be considered in determining the applicable water quality objectives. Freshwater criteria apply to discharges to waters with salinities equal to or less than one part per thousand (ppt) at least 95 percent of the time. Saltwater criteria apply to discharges to waters with salinities equal to or greater than 10 ppt at least 95 percent of the time in a normal water year. For discharges to waters with salinities between these two categories, or tidally-influenced freshwaters that support estuarine beneficial uses, the water quality objectives are the lower of the salt or freshwater objectives (the latter calculated based on ambient hardness) for each substance.

Lower San Francisco Bay is a salt water environment based on salinity data generated through the Regional Monitoring Program (RMP). Salinity data collected at the Alameda (BB70) sampling location between 1993 and 2001 indicate that the salinity was greater than 10 ppt in 100 percent of the samples. Lower San Francisco Bay is therefore classified as saltwater, and the reasonable potential analysis and WQBELs are based on saltwater water quality criteria and objectives.

f. Site-Specific Metals Translators. Effluent limitations for metals must be expressed as total recoverable metal (40 C.F.R. § 122.45[c]). Since the water quality objectives for metals are typically expressed as dissolved metal, translators must be used to convert metals concentrations from dissolved to total recoverable and vice versa. The CTR contains default translators; however, site-specific conditions, such as water temperature, pH, suspended solids, and organic carbon may affect the form of metal (dissolved, non-filterable, or otherwise) present and therefore available to cause toxicity. In general, dissolved metals are more available and more toxic to aquatic life than other forms. Site-specific translators can account for site-specific conditions, thereby preventing overly stringent or under-protective water quality objectives. For copper, Basin Plan Table 7.2.1-2 contains site-specific translators for deep water discharges to Lower San Francisco Bay: 0.73 and 0.87 (monthly and daily). For nickel, this Order uses site-specific translators the Clean Estuary Partnership developed, as set forth in *North of Dumbarton Bridge Copper and Nickel Development and Selection of Final Translators* report (March 2005): 0.65 and 0.85 (monthly and daily). For silver, this Order uses a site-specific translator based on RMP data collected from 1993 through 2001 at the Alameda sampling station (BB70): 0.66.

3. Need for Water Quality-Based Effluent Limitations (Reasonable Potential Analysis)

Assessing whether a pollutant has reasonable potential to exceed a water quality objective is the fundamental step in determining whether a WQBEL is required.

a. Methodology. For dry weather discharges, SIP section 1.3 sets forth the methodogy used for this Order for assessing whether a pollutant has reasonable potential to exceed a water quality objective. The analysis begins with identifying the maximum effluent concentration (MEC) observed for each pollutant based on available effluent concentration data and the ambient background concentration (B). SIP section 1.4.3 states that ambient background concentrations are either the maximum ambient concentration observed or, for water quality objectives intended to protect human health, the arithmetic mean of observed concentrations.There are three triggers in determining reasonable potential:

i. Trigger 1 is activated if the maximum effluent concentration is greater than or equal to the lowest applicable water quality objective (MEC $\geq$ water quality objective).

ii. Trigger 2 is activated if the ambient background concentration observed in the receiving water is greater than the water quality objective (B > water quality objective) *and* the pollutant is detected in any effluent sample.

iii. Trigger 3 is activated if a review of other information indicates that a WQBEL is needed to protect beneficial uses.

b. Effluent Data. The reasonable potential analysis for this Order is based on effluent monitoring data the Discharger collected from April 2008 through September 2012. The copper data were collected from October 2009 through September 2012 because these more recent three years of data better represent current discharge conditions.

c. Ambient Background Data. The reasonable potential analysis for this Order is based on RMP data collected at the Yerba Buena Island station (BC10) from 1993 through 2011, and additional Bay Area Clean Water Agencies data from *San Francisco Bay Ambient Water Monitoring Interim Report* (2003) and *Ambient Water Monitoring: Final CTR Sampling Update* (2004). These reports contain monitoring results from 2002 and 2003 for priority pollutants the RMP did not monitor at the time. For ammonia, the ambient concentration at the RMP station nearest to the discharge point, the Alameda RMP station (BB70), was used because, as described in section IV.C.4.a.iii of this Fact Sheet, this Order grants full dilution credit for ammonia.

d. Reasonable Potential Analysis for Toxic Pollutants. The maximum effluent concentrations, most stringent applicable water quality criteria and objectives, and ambient background concentrations used in the analysis are presented in the following table, along with the reasonable potential analysis results (yes or no) for each pollutant. Reasonable potential was not determined for all pollutants because there are not water quality objectives for all pollutants, and monitoring data are unavailable for others. The pollutants that exhibit reasonable potential are copper, cyanide, dioxin-TEQ, 1,2-diphenylhydrazine, and total ammonia.

Table F-9. Reasonable Potential Analysis

CTR #	Priority Pollutants	Governing criterion or objective (µg/L)	MEC or Minimum DL [1][2] (µg/L)	B or Minimum DL [1][2] (µg/L)	Results [3]

Footnotes:

[1] The maximum effluent concentration and ambient background concentration are the actual detected concentrations unless preceded by a "<" sign, in which case the value shown is the minimum detection level (DL).

[2] The maximum effluent concentration or ambient background concentration is "Unavailable" when there are no monitoring data for the constituent.

[3] RPA Results = Yes, if MEC ≥ WQC, B > WQC and MEC is detected, or Trigger 3
= No, if MEC and B are < WQC or all effluent data are undetected
= Undetermined (Ud), if no criteria have been promulgated or data are insufficient.

[4] SIP section 1.3 excludes from its reasonable potential analysis procedure priority pollutants for which a TMDL has been developed. TMDLs have been developed for mercury and PCBs in San Francisco Bay. Mercury and PCBs from wastewater discharges are regulated by NPDES Permit No. CA0038849, which implements the San Francisco Bay Mercury and PCBs TMDLs.

[5] Units for total ammonia are milligrams per liter as nitrogen.

e. Reasonable Potential Analysis for Sediment Quality. Pollutants in some receiving water sediments may be present in quantities that alone or in combination are toxic to benthic communities. Efforts are underway to identify stressors causing such conditions. However, to date there is no evidence directly linking compromised sediment conditions to the discharges subject to this Order; therefore, the Regional Water Board cannot draw a conclusion about reasonable potential for these discharges to cause or contribute to exceedances of the sediment quality objectives. Nevertheless, the Discharger continues to participate in the RMP, which monitors San Francisco Bay sediment and seeks to identify stressors responsible for degraded sediment quality. Thus far, the monitoring has provided only limited information about potential stressors and sediment transport. The Regional Water Board is exploring options for obtaining additional information that may inform future analyses.

f. Constituents with limited data. In some cases, reasonable potential cannot be determined because effluent data are limited or ambient background concentrations are unavailable. Provision VI.C.2 of the Order requires the Discharger to continue monitoring for these constituents in its effluent using analytical methods that provide the best feasible detection limits. When additional data become available, further analysis will be conducted to determine whether numeric effluent limitations are necessary.

g. Pollutants with No Reasonable Potential. This Order does not contain WQBELs for constituents that do not demonstrate reasonable potential; however, Provision VI.C.2 of the Order still requires monitoring for those pollutants. If concentrations are found to have increased significantly, Provision VI.C.2 of the Order requires the Discharger to investigate the sources of the increases and implement remedial measures if the increases pose a threat to receiving water quality.

4. Water Quality-Based Effluent Limitations

For dry weather discharges, WQBELs were developed for the pollutants determined to have reasonable potential to cause or contribute to exceedances of water quality objectives. The WQBELs are based on the procedures specified in SIP section 1.4.

a. Dilution Credits. SIP section 1.4.2 allows dilution credits under certain circumstances. The Discharger submitted a dilution study titled *Dilution Model for the San Francisco Southeast Treatment Plant Bay Outfall (Pier 80)*, dated December 6, 2007. The study contains estimates of initial dilution based on the UM3 model as implemented with the U.S. EPA-supported Visual PLUMES modeling package. The study used the average dry weather flow, 62 MGD, to estmate the initial dilution representing chronic (long-term average) conditions, and the 95th percentile of dry weather flows, 72 MGD, to calculate the initial dilution representing acute (short-term) conditions. Estimated initial dilution ratios are 231:1 (230 parts ambient water to one part effluent) at 62 MGD and 51:1 at 72 MGD.

i. Bioaccumulative Pollutants. For certain bioaccumulative pollutants, dilution credit is significantly restricted or denied. Specifically, these pollutants include dioxin and furan compounds, which appear on the CWA section 303(d) list for Lower San Francisco Bay because, based on available data on the concentrations of these pollutants in aquatic organisms, sediment, and the water column, they impair San Francisco Bay beneficial uses. The following factors suggest insufficient assimilative capacity in San Francisco Bay for these pollutants.

Tissue samples taken from San Francisco Bay fish show the presence of these pollutants at concentrations greater than screening levels (*Contaminant Concentrations in Fish from San Francisco Bay*, May 1997). The results of a 1994 San Francisco Bay pilot study, presented in *Contaminated Levels in Fish Tissue from San Francisco Bay* (Regional Water Board, 1994) also show elevated levels of chemical contaminants in fish tissues. The Office of Environmental Health and Hazard Assessment (OEHHA) completed a preliminary review of the data in the 1994 report and in December 1994 issued an interim consumption advisory covering certain fish species in San Francisco Bay due to the levels of some of these pollutants.

OEHHA updated this advisory in a May 2011 report, *Health Advisory and Safe Eating Guidelines for San Francisco Bay Fish and Shellfish*, which still suggests insufficient assimilative capacity in San Francisco Bay for 303(d)-listed pollutants. Therefore, dilution credits are denied for bioaccumulative pollutants on the 303(d) list for which data are lacking on sources and significant uncertainty exists about how different sources contribute to bioaccumulation.

ii. Non-Bioaccumulative Pollutants (except ammonia). For non-bioaccumulative pollutants (except ammonia), a conservative dilution credit of 10:1 (D = 9) has been assigned. The 10:1 dilution credit is based, in part, on Basin Plan Prohibition 1 (Table 4-1), which prohibits discharges with less than 10:1 dilution. SIP section 1.4.2 allows for limiting the dilution credit. The dilution credit is limited for the following reasons:

(a) San Francisco Bay is a complex estuarine system with highly variable and seasonal upstream freshwater inflows and diurnal tidal saltwater inputs. SIP section 1.4.3 allows background conditions to be determined on a discharge-by-discharge or water body-by-water body basis. A water body-by-water body approach is taken here due to inherent uncertainties in characterizing ambient background conditions in a complex estuarine system on a discharge-by-discharge basis.

(b) Because of the complex hydrology of San Francisco Bay, there are uncertainties in accurately determining an appropriate mixing zone. The models used to predict dilution do not consider the three dimensional nature of San Francisco Bay currents resulting from the interaction of tidal flushes and seasonal fresh water outflows. Being heavier and colder than fresh water, ocean salt water enters San Francisco Bay on a twice-daily tidal cycle, generally beneath the warmer fresh water that flows seaward. When these waters mix and interact, complex circulation patterns occur due to the varying densities of the fresh and ocean waters. The complex patterns occur throughout San Francisco Bay, but are most prevalent in San Pablo Bay, Carquinez Strait, and Suisun Bay. The locations of this mixing and interaction change, depending on the strength of each tide. Additionally, sediment loads from the Central Valley change on a long-term basis, affecting the depth of different parts of San Francisco Bay, resulting in alteration of flow patterns, mixing, and dilution at the outfall.

For non-bioaccumultive pollutants (except ammonia), the Yerba Buena Island RMP monitoring station (BC10), relative to other RMP stations, fits SIP guidance for establishing background conditions. SIP section 1.4.3 requires that background water quality data be representative of the ambient receiving water that will mix with the discharge. Because the WQBELs for non-bioaccumultive pollutants (except ammonia) are based on a restricted dilution credit, water quality data from the Yerba Buena Island monitoring station best represents the water that will mix with the discharge.

iii. Ammonia. For ammonia, a conservative estimate of actual initial dilution was used to calculate the effluent limitations. This is justified because ammonia, a non-

persistent pollutant, quickly disperses and degrades to a non-toxic state, and cumulative toxicity is unlikely. The 231:1 dilution ratio is appropriate for calculating limits based on the chronic water quality objective because that objective is an annual median; the dilution ratio associtated with the long-term average flow best represents long-term (chronic) conditions. The 51:1 dilution ratio is appropriate for calculating limits based on the acute water quality objective because that objective is an absolute maximum; the dilution associated with the maximum flow best represents short-term (acute) conditions.

For ammonia, the Alameda RMP monitoring station (BB70), relative to other RMP stations, fits SIP guidance for establishing background conditions. SIP section 1.4.3 requires that background water quality data be representative of the ambient receiving water that will mix with the discharge. Because the ammonia WQBELs are based on actual dilution at the edge of the initial mixing zone, data from the Alameda RMP station best represents the water at the edge of the initial mixing zone.

b. WQBEL Development. For those pollutants with reasonable potential, average monthly effluent limitations (AMELs) and maximum daily effluent limitations (MDELs) were developed as explained below:

i. Copper

(a) Water Quality Objectives. Basin Plan Table 3-3A contains chronic and acute marine water quality objectives for copper of 6.0 and 9.4 µg/L (site-specific objectives for San Francisco Bay), expressed as dissolved metal and accounting for a Water Effects Ratio of 2.4. Converting these water quality objectives to total recoverable metal using the site-specific translators of 0.73 (chronic) and 0.87 (acute) results in water quality criteria of 8.2 µg/L (chronic) and 10.8 µg/L (acute).

(b) Reasonable Potential Analysis. This Order establishes copper WQBELs because the maximum effluent concentration (13 µg/L) exceeds the governing water quality objective (8.2 µg/L), demonstrating reasonable potential by Trigger 1, and because Basin Plan section 7.2.1.2 requires that individual NPDES permits for municipal and industrial wastewater treatment facilities include copper WQBELs.

(c) WQBELs. Copper WQBELs, calculated according to SIP procedures with an effluent data coefficient of variation of 0.28 and a dilution credit of D = 9 (dilution ratio = 10:1), are an AMEL of 53 µg/L and an MDEL of 76 µg/L.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because this Order's copper WQBELs are the same as those in the previous order.

ii. Cyanide

(a) Water Quality Objectives. Basin Plan Table 3-3C contains chronic and acute marine water quality objectives for cyanide of 2.9 µg/L and 9.4 µg/L (site-specific objectives for San Francisco Bay).

(b) Reasonable Potential Analysis. This Order establishes cyanide WQBELs because the maximum effluent concentration (9.5 µg/L) exceeds the governing water quality objective (2.9 µg/L), demonstrating reasonable potential by Trigger 1.

(c) WQBELs. Cyanide WQBELs, calculated according to SIP procedures with an effluent data coefficient of variation of 0.80 and a dilution credit of D = 9, are an AMEL of 20 µg/L and an MDEL of 45 µg/L. This MDEL is less stringent than the one in the previous order (43 µg/L); therefore, this Order retains the previous MDEL to avoid backsliding.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because this Order's cyanide WQBELs are at least as stringent as those in the previous order.

iii. Dioxin-TEQ

(a) Water Quality Objective. The Basin Plan narrative water quality objective for bioaccumulative substances states, "Many pollutants can accumulate on particulates, in sediments, or bioaccumulate in fish and other aquatic organisms. Controllable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered."

Because it is the consensus of the scientific community that dioxins and furans associate with particulates, accumulate in sediments, and bioaccumulate in the fatty tissue of fish and other organisms, the Basin Plan's narrative bioaccumulation water quality objective applies to these pollutants. Elevated levels of dioxins and furans in San Francisco Bay fish tissue demonstrate that the narrative bioaccumulation water quality objective is not being met. U.S. EPA has therefore placed Lower San Francisco Bay on its 303(d)-list of receiving waters where water quality objectives are not being met after imposition of applicable technology-based requirements.

When the CTR was promulgated, U.S. EPA stated its support of the regulation of dioxin and dioxin-like compounds through the use of toxicity equivalencies (TEQs). U.S. EPA stated, "For California waters, if the discharge of dioxin or dioxin-like compounds has reasonable potential to cause or contribute to a violation of a narrative criterion, numeric WQBELs for dioxin or dioxin-like compounds should be included in NPDES permits and should be expressed using a TEQ scheme" (65 Fed. Reg. 31695-31696, May 18, 2000). This Order uses a TEQ scheme based on a set of toxicity equivalency factors (TEFs) the World Health Organization developed in 1998, and a set of bioaccumulation equivalency factors (BEFs) U.S. EPA developed for the Great Lakes region (40 C.F.R. part 132, Appendix F) to convert the concentration of any congener of dioxin or furan into an equivalent concentration of 2,3,7,8-tetrachlorinated dibenzo-p-dioxin (2,3,7,8-TCDD). Although the 1998 World Health Organization scheme includes TEFs for dioxin-like PCBs, they are not included in this Order's TEQ scheme.

The CTR has established a specific water quality criterion for PCBs, and dioxin-like PCBs are included in the analysis of total PCBs.

The CTR establishes a numeric water quality objective for 2,3,7,8-TCDD of 1.4×10^{-8} µg/L for the protection of human health when aquatic organisms are consumed. The CTR criterion is used as a criterion for dioxin-TEQ because dioxin-TEQ represents a toxicity weighted concentration equivalent to 2,3,7,8-TCDD, thus translating the narrative bioaccumulation objective into a numeric criterion.

(b) Reasonable Potential Analysis. TEFs and BEFs were used to express measured concentrations of 16 dioxin congeners in effluent and background samples as equivalent 2,3,7,8-TCDD concentrations. For each sample, the sum of these equivalent concentrations is the dioxin-TEQ concentration. This Order establishes dioxin-TEQ WQBELs because the ambient background receiving water dioxin-TEQ concentration (5.3×10^{-8} µg/L) exceeds the CTR numeric criterion for 2,3,7,8-TCDD (1.4×10^{8} µg/L) and dioxin-TEQ was detected in the effluent, demonstrating reasonable potential by Trigger 2.

(c) WQBELs. Dioxin-TEQ WQBELs, calculated according to SIP procedures with a default coefficient of variation of 0.60 and no dilution credit, are an AMEL of 1.4×10^{-8} µg/L and an MDEL of 2.8×10^{-8} µg/L.

(d) Anti-backsliding. The previous order contained an annual mass-based dioxin-TEQ effluent limit based on a dry weather flow of 85.4 MGD and a monthly average effluent concentration of 1.4×10^{-8} µg/L. Anti-backsliding requirements are satisfied because this Order's dioxin-TEQ WQBELs are as stringent as the previous mass-based limitation (the new AMEL is the same as the concentration used to derive the prevous mass-based limit).

iv. 1,2-Diphenylhydrazine

(a) Water Quality Objectives. The CTR contains a human health water quality criterion for 1,2-diphenylhydrazine of 0.54 µg/L when organisms only (not water) are consumed from the receiving water.

(b) Reasonable Potential Analysis. This Order establishes WQBELs for 1,2-diphenylhydrazine because the maximum effluent concentration (1.1 µg/L) exceeds the governing water quality objective (0.54 µg/L), demonstrating reasonable potential by Trigger 1.

(c) WQBELs. WQBELs for 1,2-diphenylhydrazine, calculated according to SIP procedures with a default coefficient of variation of 0.60 and a dilution credit of D = 9, are an AMEL of 5.4 µg/L and an MDEL of 11 µg/L.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because the previous order did not contain 1,2-diphenylhydrazine limitations.

v. Ammonia

(a) Water Quality Objectives. The discharge into Lower San Francisco Bay occurs south of the San Francisco Bay Bridge. For these waters, Basin Plan section 3.3.20 contains water quality objectives for un-ionized ammonia of 0.025 mg/L as an annual median and 0.4 mg/L as a maximum. These objectives were translated from un-ionized ammonia concentrations to equivalent total ammonia concentrations (as nitrogen) since (1) sampling and laboratory methods are unavailable to analyze for un-ionized ammonia, and (2) the fraction of total ammonia that exists in the toxic un-ionized form depends on the pH, salinity, and temperature of the receiving water.

To translate the un-ionized ammonia objectives, pH, salinity, and temperature data were obtained from the RMP station nearest to the outfall (Alameda station, BB70). The un-ionized fraction of total ammonia was calculated as follows:

$$\text{For salinity} > 10 \text{ ppt: fraction of } NH_3 = \frac{1}{1+10^{(pK-pH)}}$$

Where:

$$pK = 9.245 + 0.116(I) + 0.0324\,(298 - T) + \frac{0.0415(P)}{(T)}$$

$$I = \text{Molal ionic strength of saltwater} = \frac{19.9273(S)}{(1{,}000 - 1.005109(S))}$$

S = Salinity (parts per thousand)

T = Temperature (degrees Kelvin)

P = Pressure (one atmosphere)

The median and 90th percentile un-ionized ammonia fractions were then used to express the daily maximum and the annual average un-ionized objectives as chronic and acute total ammonia criteria. This approach is consistent with U.S. EPA guidance on translating dissolved metal water quality objectives to total recoverable metal water quality objectives (U.S. EPA, 1996, *The Metals Translator: Guidance for Calculating a Total Recoverable Limit from a Dissolved Criterion*, EPA Publication 823-B-96-007).

The equivalent total ammonia chronic and acute criteria are 1.1 mg/L and 8.5 mg/L as nitrogen.

(b) Reasonable Potential Analysis. This Order relies on the SIP methodology as guidance to perform the reasonable potential analysis. This Order establishes total ammonia WQBELs because the maximum effluent concentration (42 mg/L as nitrogen) exceeds the governing water quality criterion (1.1 mg/L as nitrogen), demonstrating reasonable potential by Trigger 1.

(c) WQBELs. This Order relies on the SIP methodology as guidance to calculate the total ammonia WQBELs. The WQBELs are the more stringent AMEL and MDEL based on independent calculations using the chronic and acute objectives. To calculate an AMEL and MDEL based on the chronic objective, the median background concentration at the Alameda RMP station (BB70) (0.11 mg/L) and the minimum dilution based on the average flow (231:1) were used. To calculate an AMEL and MDEL based on the acute objective, the maximum background concentration (0.22 mg/L) and the minimum dilution based on the maximum flow (51:1) were used. Because the Basin Plan's chronic un-ionized ammonia objective is an annual median, the median background concentration and long-term average dilution represent ambient conditions better than a daily maximum concentration and minimum dilution.

The total ammonia WQBELs in this Order are based on the chronic objective. Calculated using an effluent data coefficient of variation of 0.15 and a dilution credit of D = 230, they are an AMEL of 220 mg/L and an MDEL of 300 mg/L.

Statistical adjustments were made to the total ammonia WQBEL calculations. The SIP assumes a 4-day average concentration and a monthly sampling frequency of 4 days per month to calculate effluent limitations based on chronic criteria, but the Basin Plan's chronic water quality objective for un-ionized ammonia is based on an annual median instead of the typical 4-day average. Therefore, a 365-day average and a monitoring frequency of 30 days per month (the maximum daily sampling frequency in a month since the averaging period for the chronic criteria is longer than 30 days) were used. These statistical adjustments are supported by U.S. EPA's *Water Quality Criteria; Notice of Availability; 1999 Update of Ambient Water Quality Criteria for Ammonia* (64 Fed. Reg. 71974-71980, December 22, 1999).

The newly calculated AMEL and MDEL are less stringent than those in the previous order (190 µg/L and 290 µg/L); therefore, this Order retains the previous AMEL and MDEL to avoid backsliding.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because this Order's total ammonia WQBELs are the same as those in the previous order.

(e) Growing Regional Concern with Nutrients. As described above and in section IV.C.4.a.iii of this Fact Sheet, a translated Basin Plan un-ionized ammonia objective and a conservative estimate of actual initial dilution were used to calculate the total ammonia effluent limitations. In the future, the Regional Water Board may grant less dilution credit or change the ammonia limitations in other ways to address growing concerns about nutrients in the receiving water. Currently, a region-wide effort is underway to study and evaluate potential effects. This effort, which is referred to as the San Francisco Bay Nutrient Strategy, includes developing a nutrient assessment framework that can be used to calculate WQBELs for nutrients. The Regional Water Board, through its Executive Officer, has also required wastewater dischargers, including this Discharger, to monitor nutrients, including ammonia, in their influent and

effluent. This information will be used to compare nutrient loads from wastewater discharges to loads from other sources, to support modeling and evaluation of load reduction scenarios, and to determine the need for additional wastewater treatment to address nutrients.

c. Effluent Limit Calculations. The following table shows the WQBEL calculations:

Table F-10. WQBEL Calculations

PRIORITY POLLUTANTS	Copper	Cyanide	Dioxin TEQ	1,2-Diphenyl-hydrazine	Total Ammonia (acute)	Total Ammonia (chronic)

5. Whole Effluent Acute Toxicity

This Order includes dry weather effluent limitations for whole effluent acute toxicity based on Basin Plan Table 4-3. All bioassays are to be performed according to the U.S. EPA approved method in 40 C.F.R. section 136, currently *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, 5th Edition (EPA-821-R-02-012). The approved test species specified in the MRP are rainbow trout (*Oncorhynchus mykiss*) and fathead minnow (*Pimephales promelas*).

Based on Basin Plan section 3.3.20, if the Discharger can demonstrate that ammonia causes acute toxicity in excess of the acute toxicity limitations in this Order, and that the ammonia in the discharge complies with the ammonia effluent limitations in this Order, then such toxicity does not constitute a violation of the effluent limitations for whole effluent acute toxicity.

6. Whole Effluent Chronic Toxicity

a. Water Quality Objective. Basin Plan section 3.3.18 states, "There shall be no chronic toxicity in ambient waters. Chronic toxicity is a detrimental biological effect on growth rate, reproduction, fertilization success, larval development, population abundance, community composition, or any other relevant measure of the health of an organism, population, or community."

b. Reasonable Potential Analysis. The Discharger conducted semiannual chronic toxicity tests during the previous order term using the echinoderm larval development test. The previous order contained chronic toxicity triggers (three-sample median of 10 TUc or single-sample maximum of 20 TUc) for accelerated chronic toxicity testing. The maximum single-sample chronic toxicity result during the previous order term was 10 TUc in July 2009. The relatively low toxicity indicates low reasonable potential for

chronic toxicity so this Order contains only a narrative chronic toxicity limit. A numeric limit is unwarranted.

c. **Requirements.** The Order contains a narrative chronic toxicity effluent limitation based on the Basin Plan's narrative toxicity water quality objective. The Order also includes requirements for chronic toxicity monitoring to ensure attainment of the narrative toxicity objective and a monitoring "trigger" for initiation of accelerated monitoring requirements when exceeded. The Discharger is required to implement a chronic toxicity reduction evaluation in some circumstances. These requirements are consistent with CTR and SIP requirements.

d. **Screening Phase Study and Monitoring Requirement**. The MRP requires the Discharger to conduct a chronic toxicity screening phase study, as described in MRP Appendix E-1, prior to permit reissuance. The Discharger's April 2012 chronic toxicity screening study did not indicate the presence of toxicity effects in the effluent for the test species examined. Therefore, the Discharger will continue to using the echinoderm larval development test (i.e., purple sea urchin [*Strongylocentroltus purpuratus*] or sand dollar [*Dendraster excentricus*]. The accelerated monitoring triggers are based on Basin Plan Table 4-5.

D. Effluent Limitation Considerations

1. **Anti-backsliding.** This Order complies with the anti-backsliding provisions of CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l), which generally require effluent limitations in a reissued permit to be as stringent as those in the previous permit. Most requirements of this Order are at least as stringent as those in the previous order, with some exceptions:

   - This Order does not retain silver, lead, zinc, tetrachloroethylene, tributyltin, and bis(2-ethylhexyl)phthalate limits from the previous order because data no longer indicate that these pollutants have reasonable potential to exceed water quality objectives. This is consistent with State Water Board Order WQ 2001-16.

   - This Order replaces the previous order's wet weather enterococcus and fecal coliform limits with a new wet weather enterococcus limit. The change from an instantaneous maximum enterococcus limit to a geometric mean is not subject to anti-backsliding requirements because the two limits reflect different averaging periods, both are consistent with Basin Plan Table 3-1 water quality objectives, and a direct comparison between the two types of limits is impossible. Likewise, the change from fecal coliform limits to an enterococcus limit is not subject to anti-backsliding requirements because a direct comparison between these two types of limits is also impossible.

   - This Order does not retain mercury limits from the previous order because NPDES Permit No. CA0038849 now covers mercury discharges.

2. **Antidegradation.** This Order complies with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution No. 68-16. It continues the status quo with respect to the level of discharge authorized in the previous order, which is the baseline by

which to measure whether degradation will occur. This Order does not allow for a reduced level of treatment relative to the previous order.

This Order corrects a typographical error in the previous order. Discharge Prohibition III.E allows the average dry weather flow to increase from 84.5 MGD to 85.4 MGD. Earlier orders (e.g., Order No. R2-2002-0073) allowed this slightly higher flow. This change will not affect water quality, particularly since the effluent limitations and other provisions of this Order require the Discharger to maintain its existing treatment performance. Therefore, discharges subject to this Order will not degrade water quality, and findings authorizing degradation are unnecessary.

This Order replaces the previous order's wet weather enterococcus and fecal coliform limits with a new wet weather enterococcus limit. This change will not degrade receiving water quality because the old and new limits are all consistent with Basin Plan Table 3-1 water quality objectives, and any difference in effects would be temporally limited and would not result in any long-term deleterious effect on water quality (e.g., they would cease after wet weather is over).

3. **Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. This Order's technology-based requirements implement minimum, applicable federal technology-based requirements. In addition, this Order contains more stringent effluent limitations as necessary to meet water quality standards. Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement CWA requirements.

   This Order's WQBELs have been derived to implement water quality objectives that protect beneficial uses. The beneficial uses and water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that WQBELs were derived from the CTR, the CTR is the applicable standard pursuant to 40 C.F.R. section 131.38. The procedures for calculating these WQBELs are based on the CTR, as implemented in accordance with the SIP, which U.S. EPA approved on May 18, 2000. U.S. EPA approved most Basin Plan beneficial uses and water quality objectives prior to May 30, 2000. Beneficial uses and water quality objectives submitted to U.S. EPA prior to May 30, 2000, but not approved by U.S. EPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to 40 C.F.R. section 131.21(c)(1). U.S. EPA approved the remaining beneficial uses and water quality objectives so they are applicable water quality standards pursuant to 40 C.F.R. section 131.21(c)(2).

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

The receiving water limitations in sections V.A.1 and V.A.2 of the Order are based on Basin Plan narrative and numeric water quality objectives. The receiving water limitation in section V.A.3 of the Order requires compliance with federal and State water quality standards in accordance with the CWA and regulations adopted thereunder.

VI. RATIONALE FOR PROVISIONS

A. Standard Provisions

Attachment D contains standard provisions that apply to all NPDES permits in accordance with 40 C.F.R. section 122.41 and additional conditions applicable to specific categories of permits in accordance with 40 C.F.R. section 122.42. The Discharger must comply with these provisions. The conditions set forth in 40 C.F.R. sections 122.41(a)(1) and (b) through (n) apply to all state-issued NPDES permits and must be incorporated into the permits either expressly or by reference.

In accordance with 40 C.F.R. section 123.25(a)(12), states may omit or modify conditions to impose more stringent requirements. Attachment G contains standard provisions that supplement the federal standard provisions in Attachment D.

This Order omits federal conditions that address enforcement authority specified in 40 C.F.R. sections 122.41(j)(5) and (k)(2) because the State's enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates Water Code section 13387(e) by reference.

B. Monitoring and Reporting

Pursuant to 40 C.F.R. section 122.48, NPDES permits must specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383, and 40 C.F.R. sections 122.41(h) and (j), authorize the Regional Water Board to require technical and monitoring reports. This Order establishes monitoring and reporting requirements, contained in the Monitoring and Reporting Program (Attachment E), that implement federal and State requirements. For more background regarding these requirements, see section VII of this Fact Sheet.

C. Special Provisions

1. Reopener Provisions

These provisions are based on 40 C.F.R. sections 122.62 and 122.63 and allow modification of this Order and its effluent limitations as necessary in response to updated water quality objectives, regulations, or other new and relevant information that may become available in the future, and other circumstances as allowed by law.

2. Effluent Characterization Study and Report

This Order does not include effluent limitations for priority pollutants that do not demonstrate reasonable potential, but this provision requires the Discharger to continue monitoring for these pollutants during dry weather as described in the MRP and Attachment G. Dry weather monitoring data are necessary to verify that the "no" and "cannot determine" reasonable potential analysis conclusions of this Order remain valid. This requirement is authorized pursuant to CWC section 13267, and is necessary to inform the

next permit reissuance and to ensure that the Discharger takes timely action in response to any unanticipated change in effluent quality during the term of this Order.

3. Pollutant Minimization Program

This provision is based on Basin Plan section 4.13.2 and SIP section 2.4.5.

4. Special Provisions for Municipal Facilities

a. Pretreatment Program. This provision is based on 40 C.F.R. part 403. The Discharger implements a pretreatment program due to the nature and volume of industrial influent to the Southeast Plant. Two significant industrial users discharge to the Facility and are subject to the Discharger's pretreatment program. This provision lists the Discharger's responsibilities regarding its pretreatment program and requires compliance with the provisions in Attachment H, "Pretreatment Requirements."

b. Sludge and Biosolids Management. "Sludge" refers to the solid, semisolid, and liquid residue removed during primary, secondary, and advanced wastewater treatment processes. "Biosolids" refers to sludge that has been treated and may be beneficially used. This provision is based on Basin Plan section 4.17 and 40 C.F.R. parts 257 and 503.

c. Collection System Management. The Discharger's collection system is predominantly a combined sewer system with some limited separate sanitary sewers. It is part of the Facility regulated through this Order. This provision explains this Order's requirements as they relate to the Discharger's collection system and promotes consistency with the State Water Board's *Statewide General Waste Discharge Requirements for Sanitary Sewer Systems* (General Collection System WDRs), Order 2006-0003-DWQ as amended by WQ 2008-0002-EXEC.

i. Separate Sanitary Sewer System. The General Collection System WDRs require public agencies that own or operate sanitary sewer systems with greater than one mile of pipes or sewer lines to enroll for coverage under the General Collection System WDRs. The General Collection System WDRs contain requirements for collection system operation and maintenance and for reporting and mitigating sanitary sewer overflows. They also require agencies to develop sanitary sewer management plans and report all sanitary sewer overflows. The Discharger must comply with both the General Collection System WDRs and this Order. To the extent that the Discharger's separate sanitary sewer collection system is part of the Facility subject to this Order, certain provisions apply, as specified in Provision VI.C.4.c.i.

ii. Combined Sewer System. For purposes of this Order, an "excursion" is a release or diversion of untreated or partially treated wastewater from the combined sewer system that exits the system temporarily and then re-enters it. The Discharger and U.S. EPA developed the collection system excursion reporting requirement in this Order so the information would be available.

5. Combined Sewer Overflow Controls

The *Combined Sewer Overflow Control Policy* addresses combined sewer system operations. Its requirements are summarized below as they relate to this Order. The Discharger has designed, constructed, and implemented control strategies that address wet weather flows. This provision specifies performance criteria for wet weather combined sewer system operations.

a. Combined Sewer Operations and Maintenance Plan. This provision is necessary to ensure that combined sewer system operations and maintenance comply with the Nine Minimum Controls and the Long-Term Control Plan requirements of the *Combined Sewer Overflow Control Policy*.

b. Nine Minimum Controls. The *Combined Sewer Overflow Control Policy* requires these "Nine Minimum Controls" to satisfy CWA technology-based requirements:

- Conduct proper operations and maintenance programs,
- Maximize use of collection system for storage,
- Review and modify pretreatment program,
- Maximize flow to Southeast Plant and North Point Facility,
- Prohibit dry weather combined sewer overflows,
- Control solid and floatable materials in combined sewer discharges,
- Develop and implement pollution prevention program,
- Notify public of combined sewer discharges, and
- Monitor to characterize wet weather discharge impacts and efficacy of controls.

The *Combined Sewer Overflow Control Policy* requires monitoring to ascertain the effectiveness of controls and to verify compliance with water quality standards and protection of beneficial uses. If implemented controls do not result in attainment of water quality standards, including beneficial uses, a discharger must evaluate its operating practices. If monitoring indicates that water quality standards are not met, the data may be used to identify additional controls necessary to achieve water quality standards.

Over the previous order term, the Discharger monitored combined sewer discharges (*Special Study: Overflow Impacts and Efficacy of Combined Sewer Overflow Controls for the San Francisco Bayside System, Southeast Water Pollution Control Plant, North Point Wet Weather Facility and Bayside Wet Weather Facilities*, June 29, 2012). It found that average combined sewer discharge pollutant concentrations are below acute water quality objectives for metals and other priority pollutants, with the exceptions of copper and zinc. The average dissolved zinc concentration was 91 µg/L (based on the default CTR acute translator), compared to the water quality objective of 90 µg/L. The average dissolved copper concentration was 19 µg/L (based on the Basin Plan Table 7.2.1-2 acute translator), compared to the water quality objective of 10.8 µg/L. Water quality objectives apply in the receiving water, not combined sewer discharges *per se*. Therefore, given the relatively short duration of combined sewer discharges (i.e., just a few hours each time), and accounting for the inevitable dilution within the receiving waters during wet weather, water quality standards appear to be maintained.

The Order requires the Discharger to continue monitoring wet weather discharges to characterize their impacts and evaluate the efficacy of its wet weather controls. The Order also requires receiving water monitoring for enterococcus and fecal coliform at recreational use locations to determine the impacts of wet weather discharges on water contact recreation. The data collected may be used to document current conditions and evaluate whether beneficial uses are protected.

Among other requirements, the Nine Minimum Controls require the Discharger to notify the public when combined sewer discharges occur. The Discharger's current notification process fulfills these requirements. It includes posting permanent signs at San Francisco beaches that inform the public in English, Spanish, and Chinese that international "No Swimming" signs will be posted when it is unsafe to enter the water and to warn users that bacteria concentrations may be elevated during heavy rain. The Discharger posts "No Swimming" signs at beaches whenever a combined sewer discharge occurs in the area. These signs remain posted until water sampling indicates that bacteria concentrations have dropped below levels of concern for water contact recreation (i.e., the single-sample bacteriological standards of Cal. Code of Regs. tit. 17, § 7958[a][1]). Both types of signs provide the Discharger's toll-free water quality hotline (1-877-SFBEACH) that the Discharger updates weekly and whenever new bacteria results are available. The Discharger also provides color-coded indicators (green/open; red/posted) of beach water quality conditions on the Internet (http://beaches.sfwater.org).

The Discharger has designated Lewis Harrison as the contact person responsible for the wastewater collection system. The Order allows the Discharger to designate a different contact person as long as the Discharger notifies the Regional Water Board within 90 days.

c. Long-Term Control Plan. The *Combined Sewer Overflow Control Policy* requires implementation of a Long-Term Control Plan to to satisfy CWA water quality-based requirements (see section IV.C.1 of this Fact Sheet). The Discharger designed and built a combined sewer system that provides for long-term control and treatment. This provision specifies how the combined sewer system is to be operated, consistent with implementation of the Long-Term Control Plan. The Discharger designed the system based on historical rainfall to achieve the following long-term average annual goals:

- Four combined sewer discharge events along the North Shore (Discharge Point Nos. 009 through 017);
- Ten combined sewer discharge events within the Central Basin (Discharge Point Nos. 018 through 036); and
- One combined sewer discharge event along the Southeast Sector (Discharge Point Nos. 037 through 043).

Some years are wetter than others and may contribute more or less flow than anticipated by these design goals; therefore, these goals are not intended for determining compliance.

This provision requires the Discharger to synthesize and update its Long-Term Control Plan into one document that reflects current circumstances. The updated plan is necessary to optimize system operations so as to maximize pollutant removal during wet weather

and minimize combined sewer discharges. This requirement recognizes that circumstances have changed since the plan was first developed and implemented. However, the Order maintains the historical long-term average annual design goals for combined sewer discharges.

In addition to the system design elements of the plan, the Discharger is to describe additional measures, to the extent technically and economically feasible, to minimize combined sewer discharges (e.g., implementing and promoting low-impact development measures that enhance stormwater percolation and slow stormwater runoff to the combined sewer system).

The Discharger is also to develop and propose a mechanism to evaluate the performance of its wet weather disinfection system for Discharge Point Nos. 001 through 006. Based on the proposal, the Regional Water Board may consider replacing the wet weather enterococcus limits in this Order when it next takes up this permit for reissuance.

This provision also requires the Discharger to review its approach to protecting sensitive areas, which include waters with threatened or endangered species and their habitat, waters with primary contact recreation, and waters with shellfish beds, among others. This provision implements *Combined Sewer Overflow Control Policy* section II.C.3, "Consideration of Sensitive Areas," which requires the following with each permit reissuance:

i. Prohibit new or significantly increased combined sewer discharges;

ii. Eliminate and relocate combined sewer discharges that discharge to sensitive areas wherever physically possible and economically achievable, except where elimination or relocation would provide less environmental protection than additional treatment (where elimination or relocation is not physically possible and economically achievable, or would provide less environmental protection than additional treatment, treatment for remaining combined sewer discharges must be sufficient to protect beneficial uses); and

iii. Where elimination or relocation is not physically possible and economically achievable, reassess the situation, based on new or improved techniques to eliminate or relocate the combined sewer discharges, or based on changed circumstances that influence economic achievability, with each subsequent permit term.

d. This provision sets forth steps the Discharger must take if the Executive Offer finds that its discharges cause violations of water quality standards in receiving waters.

6. Other Special Provisions

a. Copper Action Plan. This provision is based on Basin Plan section 7.2.1.2 and is necessary to ensure that use of copper site-specific objectives is consistent with antidegradation policies. Data the San Francisco Estuary Institute compiled for 2008-2010 indicate no degradation of San Francisco Bay water quality with respect to copper (http://www.sfei.org/content/copper-site-specific-objective-3-year-rolling-averages).

b. Cyanide Action Plan. This provision is based on Basin Plan section 4.7.2.2 and is necessary to ensure that use of cyanide site-specific objectives is consistent with antidegradation policies. The threshold for considering influent cyanide concentrations to indicate a possible "significant cyanide discharge" in the Discharger's service area is set at 21 µg/L. This concentration is about 1.5 times the maximum cyanide concentration (14 µg/L) found in the facility's influent during the previous order term. Because the Discharger has not observed influent cyanide concentrations greater than 14 µg/L, if influent concentrations 1.5 times this level were observed, there could be a significant cyanide source.

c. Standard Operating Procedures Requirement for Resource Recovery. Standard Operating Procedures are required for dischargers that accept hauled waste fats, oil, and grease for injection into anaerobic digesters. The development and implementations of Standard Operating Procedures for management of these materials is intended to allow the California Deparment of Resources Recycling and Recovery to exempt operations from separate and redundant permitting programs. If the Discharger does not accept fats, oil, and grease for resource recovery purposes, it is not required to develop and implement Standard Operating Procedures.

VII. RATIONALE FOR MONITORING AND REPORTING PROGRAM (MRP)

Attachment E contains the MRP for this Order. It specifies sampling stations, pollutants to be monitored (including all parameters for which effluent limitations are specified), monitoring frequencies, and reporting requirements. The following provides the rationale for the MRP requirements.

A. MRP Requirements Rationale

1. **Influent Monitoring.** Influent flow monitoring is necessary to identify wet weather as defined in Attachment A and to evaluate implementation of Long-Term Control Plan requirements. BOD_5 and TSS monitoring is necessary to evaluate compliance with this Order's 85 percent removal requirement. Basin Plan section 4.7.2.2 requires cyanide monitoring because this Order is based on site-specific cyanide water quality objectives.

2. **Effluent Monitoring.** Effluent flow monitoring is necessary to evaluate compliance with Prohibition III.E (average dry weather flow) and to understand Facility operations. During dry weather, monitoring for the other parameters in Table E-3 is necessary to evaluate compliance with this Order's effluent limitations applicable to Discharge Point No. 001. During wet weather, enterococcus and total residual chlorine monitoring is necessary to evaluate compliance with this Order's effluent limitations applicable to Discharge Point Nos. 001 through 006. Fecal coliform monitoring will provide additional information regarding the efficacy of controls. During combined sewer discharge events, duration and flow volume monitoring is necessary to characterize combined sewer discharges. Provision VI.C.2 of the Order requires monitoring for additional priority pollutants for which there are no effluent limits to inform the next permit reissuance and to ensure that the Discharger takes timely steps in response to any unanticipated change in effluent quality.

Provision VI.C.5.b.ix(a) of the Order requires monitoring to characterize combined sewer discharge impacts and efficacy of controls.

3. **Whole Effluent Toxicity Testing**. Acute and chronic whole effluent toxicity tests are necessary to evaluate compliance with acute and chronic toxicity effluent limitations during dry weather. Chronic toxicity tests during dry weather are also necessary to evaluate whether chronic toxicity triggers the need for a Toxicity Reduction Evaluation. Acute toxicity tests during wet weather are necessary to evaluate the efficacy of wet weather controls.

4. **Receiving Water Monitoring.** The Discharger is required to continue participating in the RMP, which involves collecting data on pollutants and toxicity in San Francisco Bay water, sediment, and biota. This monitoring is necessary to characterize the receiving water and the effects of the discharges authorized in this Order. The Discharger is also required to monitor shoreline locations where water contact recreation takes place. This monitoring is necessary to assess the possible effects of combined sewer discharges and to comply with Provisions VI.C.5.b.viii, "Notify Public of Combined Sewer Discharges," and VI.C.5.b.ix, "Monitor to Characterize Combined Sewer Discharge Impacts and Efficacy of Controls."

5. **Pretreatment and Biosolids Monitoring.** The pretreatment and biosolids monitoring requirements for influent, effluent, and biosolids are necessary to evaluate compliance with the Discharger's U.S. EPA-approved pretreatment program. Biosolids monitoring is also required pursuant to 40 C.F.R. part 503.

B. Monitoring Requirements Summary. The table below summarizes routine monitoring requirements. This table is for informational purposes only. The actual requirements are specified in the MRP and elsewhere in this Order.

Table F-11. Monitoring Requirements Summary

Parameter	Influent INF-001	Effluent EFF-001A	Effluent EFF-001B, EFF-002, and EFF-003	Effluent CSD-010 through CSD-043	Biosolids BIO-001	Receiving Water
Flow	Continuous[1]	Continuous[1]	Continuous[1]	1/Event[1]		
BOD_5	1/Week[2]	1/Week[3]				
TSS	5/Week[2]	5/Week	1/Month	1/Event		
Chemical Oxygen Demand (COD)		5/Week[3]	1/Month			
Oil and Grease		1/Month	1/Month			
pH		Continuous or 5/Week	Continuous or 1/Month	1/Event		Support RMP
Total Residual Chlorine		Continuous or 1/Hour	Continuous or 1/Hour			
Acute Toxicity		1/Month	1/Month[8]			Support RMP
Chronic Toxicity		2/Year				Support RMP
Enterococcus		4/Year[4]	1/Day			1/Day[6]
Fecal Coliform		1/Week	1/Day			1/Day[6]
Dissolved Oxygen						Support RMP
Sulfides						Support RMP
Temperature						Support RMP
Copper, Total Recoverable		1/Month	1/Month			Support RMP
Cyanide, Total	1/Month[2]	1/Month	1/Month	1/Event		Support RMP

Parameter	Influent INF-001	Effluent EFF-001A	Effluent EFF-001B, EFF-002, and EFF-003	Effluent CSD-010 through CSD-043	Biosolids BIO-001	Receiving Water
Ammonia, Total		1/Month	1/Month	1/Event		Support RMP
Dioxin-TEQ		2/Year				Support RMP
1,2-Diphenylhydrazine		1/Month				Support RMP
Settleable Matter				1/Event		
All other priority pollutants		1/Year	1/Year	1/Year[7]		Support RMP
Volatile Organic Compounds	2/Year	2/Year			2/Year	
Base/Neutrals Acid Extractable Organic Compounds	2/Year	2/Year			2/Year	
Metals[2]	1/Month	1/Month		1/Event	2/Year	Support RMP
Hexavalent Chromium	1/Month	1/Month			2/Year	Support RMP
Mercury	1/Month	1/Month			2/Year	Support RMP
Metric tons/year					See Attach. G, § III.B.1	
Paint filter test					See Attach. G, § III.B.2	

Footnotes:

[1] The following flow information is to be reported:

- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

For Monitoring Locations CSD-010 through CSD-043, only total flow volume (MG) and event duration are to be reported.

[2] The metals are arsenic, cadmium, copper, lead, nickel, selenium, silver, and zinc.

[3] If the COD_5 concentration exceeds 75 mg/L on two consecutive days, the Discharger is to increase the BOD_5 sampling frequency to daily until it demonstreates that the BOD_5 concentration is below 30 mg/L.

[4] If the enterococcus effluent limitation is exceeded, the Discharger is to conduct 5/Month accelerated sampling for at least three consecutive months. If full compliance is demonstrated after the three months, the Discharger may return to the 4/Year sampling.

[5] Influent monitoring is only required during dry weather.

[6] Monitoring is to be once per day following nearby combined sewer discharges. Otherwise, monitoring is to be sufficient to characterize ambient background conditions (e.g., weekly).

[7] Monitoring is only required at Monitoring Location CSD-041.

[8] Monitoring is only required at Monitoring Locations EFF-001B and EFF-003.

VIII. PUBLIC PARTICIPATION

The Regional Water Board considered the issuance of WDRs that will serve as an NPDES permit for the Facility. As a step in the WDR adoption process, Regional Water Board staff developed tentative WDRs and encouraged public participation in the WDR adoption process.

A. Notification of Interested Parties. The Regional Water Board notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and provided an opportunity to submit written comments and recommendations. Notification was provided through *The Recorder*. The public had access to the agenda and any changes in dates and locations through the Regional Water Board's website at http://www.waterboards.ca.gov/sanfranciscobay.

B. Written Comments. Interested persons were invited to submit written comments concerning the tentative WDRs as explained through the notification process. Comments were due either in person or by mail at the Regional Water Board office at 1515 Clay Street, Suite 1400, Oakland, California 94612, to the attention of Derek Whitworth.

For full staff response and Regional Water Board consideration, the written comments were due at the Regional Water Board office by 5:00 p.m. on July 1, 2013.

C. Public Hearing. The Regional Water Board held a public hearing on the tentative WDRs during its regular meeting at the following date and time, and at the following location:

Date: Wednesday, August 14, 2013
Time: 9:00 a.m.
Location: Elihu Harris State Office Building
1515 Clay Street, 1st Floor Auditorium
Oakland, CA 94612

Contact: Derek Whitworth, (510) 622-2349, DWhitworth@waterboards.ca.gov

Interested persons were invited to attend. At the public hearing, the Regional Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony wasrequested to be in writing.

Dates and venues change. The Regional Water Board web address is http://www.waterboards.ca.gov/sanfranciscobay, where one could access the current agenda for changes in dates and locations.

D. Reconsideration of Waste Discharge Requirements. Any aggrieved person may petition the State Water Board to review the Regional Water Board decision regarding the final WDRs. The State Water Board must receive the petition at the following address within 30 calendar days of the Regional Water Board action:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

For instructions on how to file a petition for review, see http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml.

E. Information and Copying. The Report of Waste Discharge, related supporting documents, and comments received are on file and may be inspected at the address above at any time between 9:00 a.m. and 5:00 p.m., Monday through Friday. Copying of documents may be arranged by calling (510) 622-2300.

F. Register of Interested Persons. Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference the Facility, and provide a name, address, and phone number.

G. Additional Information. Requests for additional information or questions regarding this Order should be directed to Derek Whitworth at (510) 622-2349 or DWhitworth@waterboards.ca.gov.

AND REPORTING REQUIREMENTS
(SUPPLEMENT TO ATTACHMENT D)

For

NPDES WASTEWATER DISCHARGE PERMITS

March 2010

Contents

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS (SUPPLEMENT TO ATTACHMENT D)

FOR

NPDES WASTEWATER DISCHARGE PERMITS

APPLICABILITY

This document applies to dischargers covered by a National Pollutant Discharge Elimination System (NPDES) permit. This document does not apply to Municipal Separate Storm Sewer System (MS4) NPDES permits.

The purpose of this document is to supplement the requirements of Attachment D, Standard Provisions. The requirements in this supplemental document are designed to ensure permit compliance through preventative planning, monitoring, recordkeeping, and reporting. In addition, this document requires proper characterization of issues as they arise, and timely and full responses to problems encountered. To provide clarity on which sections of Attachment D this document supplements, this document is arranged in the same format as Attachment D.

I. STANDARD PROVISIONS - PERMIT COMPLIANCE

A. Duty to Comply – Not Supplemented

B. Need to Halt or Reduce Activity Not a Defense – Not Supplemented

C. Duty to Mitigate – This supplements I.C. of Standard Provisions (Attachment D)

1. Contingency Plan - The Discharger shall maintain a Contingency Plan as originally required by Regional Water Board Resolution 74-10 and as prudent in accordance with current municipal facility emergency planning. The Contingency Plan shall describe procedures to ensure that existing facilities remain in, or are rapidly returned to, operation in the event of a process failure or emergency incident, such as employee strike, strike by suppliers of chemicals or maintenance services, power outage, vandalism, earthquake, or fire. The Discharger may combine the Contingency Plan and Spill Prevention Plan into one document. Discharge in violation of the permit where the Discharger has failed to develop and implement a Contingency Plan as described below will be the basis for considering the discharge a willful and negligent violation of the permit pursuant to California Water Code Section 13387. The Contingency Plan shall, at a minimum, contain the provisions of a. through g. below.

a. Provision of personnel for continued operation and maintenance of sewerage facilities during employee strikes or strikes against contractors providing services.

b. Maintenance of adequate chemicals or other supplies and spare parts necessary for continued operations of sewerage facilities.

c. Provisions of emergency standby power.

d. Protection against vandalism.

e. Expeditious action to repair failures of, or damage to, equipment and sewer lines.

f. Report of spills and discharges of untreated or inadequately treated wastes, including measures taken to clean up the effects of such discharges.

g. Programs for maintenance, replacement, and surveillance of physical condition of equipment, facilities, and sewer lines.

2. Spill Prevention Plan - The Discharger shall maintain a Spill Prevention Plan to prevent accidental discharges and minimize the effects of such events. The Spill Prevention Plan shall:

a. Identify the possible sources of accidental discharge, untreated or partially treated waste bypass, and polluted drainage;

b. Evaluate the effectiveness of present facilities and procedures, and state when they became operational; and

c. Predict the effectiveness of the proposed facilities and procedures, and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational.

This Regional Water Board, after review of the Contingency and Spill Prevention Plans or their updated revisions, may establish conditions it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of the permit upon notice to the Discharger.

D. Proper Operation & Maintenance – This supplements I.D of Standard Provisions (Attachment D)

1. Operation and Maintenance (O&M) Manual - The Discharger shall maintain an O&M Manual to provide the plant and regulatory personnel with a source of information describing all equipment, recommended operational strategies, process control monitoring, and maintenance activities. To remain a useful and relevant document, the O&M Manual shall be kept updated to reflect significant changes in treatment facility equipment and operational practices. The O&M Manual shall be maintained in usable condition and be available for reference and use by all relevant personnel and Regional Water Board staff.

2. Wastewater Facilities Status Report - The Discharger shall regularly review, revise, or update, as necessary, its Wastewater Facilities Status Report. This report shall document how the Discharger operates and maintains its wastewater collection, treatment, and disposal facilities to ensure that all facilities are adequately staffed, supervised, financed, operated, maintained, repaired, and upgraded as necessary to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

3. Proper Supervision and Operation of Publicly Owned Treatment Works (POTWs) - POTWs shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Division 4, Chapter 14, Title 23 of the California Code of Regulations.

E. Property Rights – Not Supplemented

F. Inspection and Entry – Not Supplemented

G. Bypass – Not Supplemented

H. Upset – Not Supplemented

I. Other – This section is an addition to Standard Provisions (Attachment D)

1. Neither the treatment nor the discharge of pollutants shall create pollution, contamination, or nuisance as defined by California Water Code Section 13050.

2. Collection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater, except in cases where excluding the public is infeasible, such as private property. If public contact with wastewater could reasonably occur on public property, warning signs shall be posted.

3. If the Discharger submits a timely and complete Report of Waste Discharge for permit reissuance, this permit continues in force and effect until a new permit is issued or the Regional Water Board rescinds the permit.

J. Storm Water – This section is an addition to Standard Provisions (Attachment D)

These provisions apply to facilities that do not direct all storm water flows from the facility to the wastewater treatment plant headworks.

1. Storm Water Pollution Prevention Plan (SWPP Plan)

The SWPP Plan shall be designed in accordance with good engineering practices and shall address the following objectives:

a. To identify pollutant sources that may affect the quality of storm water discharges; and

b. To identify, assign, and implement control measures and management practices to reduce pollutants in storm water discharges.

The SWPP Plan may be combined with the existing Spill Prevention Plan as required in accordance with Section C.2. The SWPP Plan shall be retained on-site and made available upon request of a representative of the Regional Water Board.

2. Source Identification

The SWPP Plan shall provide a description of potential sources that may be expected to add significant quantities of pollutants to storm water discharges, or may result in non-storm water discharges from the facility. The SWPP Plan shall include, at a minimum, the following items:

a. A topographical map (or other acceptable map if a topographical map is unavailable), extending one-quarter mile beyond the property boundaries of the facility, showing the wastewater treatment facility process areas, surface water bodies (including springs and wells), and discharge point(s) where the facility's storm water discharges to a municipal storm drain system or other points of discharge to waters of the State. The requirements of this paragraph may be included in the site map required under the following paragraph if appropriate.

b. A site map showing the following:

   1) Storm water conveyance, drainage, and discharge structures;

   2) An outline of the storm water drainage areas for each storm water discharge point;

   3) Paved areas and buildings;

   4) Areas of actual or potential pollutant contact with storm water or release to storm water, including but not limited to outdoor storage and process areas; material loading, unloading, and access areas; and waste treatment, storage, and disposal areas;

   5) Location of existing storm water structural control measures (i.e., berms, coverings, etc.);

   6) Surface water locations, including springs and wetlands; and

   7) Vehicle service areas.

c. A narrative description of the following:

   1) Wastewater treatment process activity areas;

   2) Materials, equipment, and vehicle management practices employed to minimize contact of significant materials of concern with storm water discharges;

   3) Material storage, loading, unloading, and access areas;

   4) Existing structural and non-structural control measures (if any) to reduce pollutants in storm water discharges; and

   5) Methods of on-site storage and disposal of significant materials.

d. A list of pollutants that have a reasonable potential to be present in storm water discharges in significant quantities.

3. Storm Water Management Controls

The SWPP Plan shall describe the storm water management controls appropriate for the facility and a time schedule for fully implementing such controls. The appropriateness and priorities of controls in the SWPP Plan shall reflect identified potential sources of pollutants. The description of storm water management controls to be implemented shall include, as appropriate:

a. Storm water pollution prevention personnel

Identify specific individuals (and job titles) that are responsible for developing, implementing, and reviewing the SWPP Plan.

b. Good housekeeping

Good housekeeping requires the maintenance of clean, orderly facility areas that discharge storm water. Material handling areas shall be inspected and cleaned to reduce the potential for pollutants to enter the storm drain conveyance system.

c. Spill prevention and response

Identify areas where significant materials can spill into or otherwise enter storm water conveyance systems and their accompanying drainage points. Specific material handling procedures, storage requirements, and cleanup equipment and procedures shall be identified, as appropriate. The necessary equipment to implement a cleanup shall be available, and personnel shall be trained in proper response, containment, and cleanup of spills. Internal reporting procedures for spills of significant materials shall be established.

d. Source control

Source controls include, for example, elimination or reduction of the use of toxic pollutants, covering of pollutant source areas, sweeping of paved areas, containment of potential pollutants, labeling of all storm drain inlets with “No Dumping” signs, isolation or separation of industrial and non-industrial pollutant sources so that runoff from these areas does not mix, etc.

e. Storm water management practices

Storm water management practices are practices other than those that control the sources of pollutants. Such practices include treatment or conveyance structures, such as drop inlets, channels, retention and detention basins, treatment vaults, infiltration galleries, filters, oil/water separators, etc. Based on assessment of the potential of various sources to contribute pollutants to storm water discharges in significant quantities, additional storm water management practices to remove pollutants from storm water discharges shall be implemented and design criteria shall be described.

f. Sediment and erosion control

Measures to minimize erosion around the storm water drainage and discharge points, such as riprap, revegetation, slope stabilization, etc., shall be described.

g. Employee training

Employee training programs shall inform all personnel responsible for implementing the SWPP Plan. Training shall address spill response, good housekeeping, and material management practices. New employee and refresher training schedules shall be identified.

h. Inspections

All inspections shall be done by trained personnel. Material handling areas shall be inspected for evidence of, or the potential for, pollutants entering storm water discharges. A tracking or follow up procedure shall be used to ensure appropriate response has been taken in response to an inspection. Inspections and maintenance activities shall be documented and recorded. Inspection records shall be retained for five years.

i. Records

A tracking and follow-up procedure shall be described to ensure that adequate response and corrective actions have been taken in response to inspections.

4. Annual Verification of SWPP Plan

An annual facility inspection shall be conducted to verify that all elements of the SWPP Plan are accurate and up-to-date. The results of this review shall be reported in the Annual Report to the Regional Water Board described in Section V.C.f.

K. Biosolids Management – This section is an addition to Standard Provisions (Attachment D)

Biosolids must meet the following requirements prior to land application. The Discharger must either demonstrate compliance or, if it sends the biosolids to another party for further treatment or distribution, must give the recipient the information necessary to ensure compliance.

1. Exceptional quality biosolids meet the pollutant concentration limits in Table III of 40 CFR Part 503.13, Class A pathogen limits, and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8). Such biosolids do not have to be tracked further for compliance with general requirements (503.12) and management practices (503.14).

2. Biosolids used for agricultural land, forest, or reclamation shall meet the pollutant limits in Table I (ceiling concentrations) and Table II or Table III (cumulative loadings or pollutant concentration limits) of 503.13. They shall also meet the general requirements (503.12) and management practices (503.14) (if not exceptional quality biosolids) for Class A or Class B pathogen levels with associated access restrictions (503.32) and one of the 10 vector attraction reduction requirements in 503.33(b)(1)-(b)(10).

3. Biosolids used for lawn or home gardens must meet exceptional quality biosolids limits.

4. Biosolids sold or given away in a bag or other container must meet the pollutant limits in either Table III or Table IV (pollutant concentration limits or annual pollutant loading rate limits) of 503.13. If Table IV is used, a label or information sheet must be attached to the biosolids packing that explains Table IV (see 503.14). The biosolids must also meet the Class A pathogen limits and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8).

II. STANDARD PROVISIONS – PERMIT ACTION – Not Supplemented

III. STANDARD PROVISIONS – MONITORING

A. Sampling and Analyses – This section is a supplement to III.A and III.B of Standard Provisions (Attachment D)

1. Use of Certified Laboratories

Water and waste analyses shall be performed by a laboratory certified for these analyses in accordance with California Water Code Section 13176.

2. Use of Appropriate Minimum Levels

Table C lists the suggested analytical methods for the 126 priority pollutants and other toxic pollutants that should be used, unless a particular method or minimum level (ML) is required in the MRP.

For priority pollutant monitoring, when there is more than one ML value for a given substance, the Discharger may select any one of the analytical methods cited in Table C for compliance determination, or any other method described in 40 CFR part 136 or approved by U.S. EPA (such as the 1600 series) if authorized by the Regional Water Board. However, the ML must be below the effluent limitation and water quality objective. If no ML value is below the effluent limitation and water quality objective, then the method must achieve an ML no greater than the lowest ML value indicated in Table C. All monitoring instruments and equipment shall be properly calibrated and maintained to ensure accuracy of measurements.

3. Frequency of Monitoring

The minimum schedule of sampling analysis is specified in the MRP portion of the permit.

a. Timing of Sample Collection

1) The Discharger shall collect samples of influent on varying days selected at random and shall not include any plant recirculation or other sidestream wastes, unless otherwise stipulated by the MRP.

2) The Discharger shall collect samples of effluent on days coincident with influent sampling unless otherwise stipulated by the MRP or the Executive Officer. The Executive Officer may approve an alternative sampling plan if it is demonstrated to be representative of plant discharge flow and in compliance with all other permit requirements.

3) The Discharger shall collect grab samples of effluent during periods of day-time maximum peak effluent flows (or peak flows through secondary treatment units for facilities that recycle effluent flows).

4) Effluent sampling for conventional pollutants shall occur on at least one day of any multiple-day bioassay test the MRP requires. During the course of the test, on at least one day, the Discharger shall collect and retain samples of the discharge. In the event a bioassay test does

not comply with permit limits, the Discharger shall analyze these retained samples for pollutants that could be toxic to aquatic life and for which it has effluent limits.

i. The Discharger shall perform bioassay tests on final effluent samples; when chlorine is used for disinfection, bioassay tests shall be performed on effluent after chlorination-dechlorination; and

ii. The Discharger shall analyze for total ammonia nitrogen and calculate the amount of un-ionized ammonia whenever test results fail to meet the percent survival specified in the permit.

b. Conditions Triggering Accelerated Monitoring

1) If the results from two consecutive samples of a constituent monitored in a 30-day period exceed the monthly average limit for any parameter (or if the required sampling frequency is once per month and the monthly sample exceeds the monthly average limit), the Discharger shall, within 24 hours after the results are received, increase its sampling frequency to daily until the results from the additional sampling show that the parameter is in compliance with the monthly average limit.

2) If any maximum daily limit is exceeded, the Discharger shall increase its sampling frequency to daily within 24 hours after the results are received that indicate the exceedance of the maximum daily limit until two samples collected on consecutive days show compliance with the maximum daily limit.

3) If final or intermediate results of an acute bioassay test indicate a violation or threatened violation (e.g., the percentage of surviving test organisms of any single acute bioassay test is less than 70 percent), the Discharger shall initiate a new test as soon as practical, and the Discharger shall investigate the cause of the mortalities and report its findings in the next self monitoring report (SMR).

4) The Discharger shall calibrate chlorine residual analyzers against grab samples as frequently as necessary to maintain accurate control and reliable operation. If an effluent violation is detected, the Discharger shall collect grab samples at least every 30 minutes until compliance with the limit is achieved, unless the Discharger monitors chlorine residual continuously. In such cases, the Discharger shall continue to conduct continuous monitoring as required by its permit.

5) When a bypass occurs (except one subject to provision III.A.3.b.6 below), the Discharger shall monitor flows and collect samples on a daily basis for all constituents at affected discharge points that have effluent limits for the duration of the bypass (including acute toxicity using static renewals), except chronic toxicity, unless otherwise stipulated by the MRP.

6) Unless otherwise stipulated by the MRP, when a bypass approved pursuant to Attachment D, Standard Provisions, Sections I.G.2 or I.G.4, occurs, the Discharger shall monitor flows and, using appropriate procedures as specified in the MRP, collect and retain samples for affected discharge points on a daily basis for the duration of the bypass. The Discharger shall analyze for total suspended solids (TSS) using 24-hour composites (or more frequent increments) and for bacteria indicators with effluent limits using grab samples. If TSS exceeds 45 mg/L in any composite sample, the Discharger shall also analyze the retained samples for that discharge

for all other constituents that have effluent limits, except oil and grease, mercury, dioxin-TEQ, and acute and chronic toxicity. Additionally, at least once each year, the Discharger shall analyze the retained samples for one approved bypass discharge event for all other constituents that have effluent limits, except oil and grease, mercury, dioxin-TEQ, and acute and chronic toxicity. This monitoring shall be in addition to the minimum monitoring specified in the MRP.

c. Storm Water Monitoring

The requirements of this section only apply to facilities that are not covered by an NPDES permit for storm water discharges and where not all site storm drainage from process areas (i.e., areas of the treatment facility where chemicals or wastewater could come in contact with storm water) is directed to the headworks. For storm water not directed to the headworks during the wet season (October 1 to April 30), the Discharger shall:

1) Conduct visual observations of the storm water discharge locations during daylight hours at least once per month during a storm event that produces significant storm water discharge to observe the presence of floating and suspended materials, oil and grease, discoloration, turbidity, and odor, etc.

2) Measure (or estimate) the total volume of storm water discharge, collect grab samples of storm water discharge from at least two storm events that produce significant storm water discharge, and analyze the samples for oil and grease, pH, TSS, and specific conductance.

   The grab samples shall be taken during the first 30 minutes of the discharge. If collection of the grab samples during the first 30 minutes is impracticable, grab samples may be taken during the first hour of the discharge, and the Discharger shall explain in the Annual Report why the grab sample(s) could not be taken in the first 30 minutes.

3) Testing for the presence of non-storm water discharges shall be conducted no less than twice during the dry season (May 1 to September 30) at all storm water discharge locations. Tests may include visual observations of flows, stains, sludges, odors, and other abnormal conditions; dye tests; TV line surveys; or analysis and validation of accurate piping schematics. Records shall be maintained describing the method used, date of testing, locations observed, and test results.

4) Samples shall be collected from all locations where storm water is discharged. Samples shall represent the quality and quantity of storm water discharged from the facility. If a facility discharges storm water at multiple locations, the Discharger may sample a reduced number of locations if it establishes and documents through the monitoring program that storm water discharges from different locations are substantially identical.

5) Records of all storm water monitoring information and copies of all reports required by the permit shall be retained for a period of at least three years from the date of sample, observation, or report.

d. Receiving Water Monitoring

The requirements of this section only apply when the MRP requires receiving water sampling.

1) Receiving water samples shall be collected on days coincident with effluent sampling for conventional pollutants.

2) Receiving water samples shall be collected at each station on each sampling day during the period within one hour following low slack water. Where sampling during lower slack water is impractical, sampling shall be performed during higher slack water. Samples shall be collected within the discharge plume and down current of the discharge point so as to be representative, unless otherwise stipulated in the MRP.

3) Samples shall be collected within one foot of the surface of the receiving water, unless otherwise stipulated in the MRP.

B. Biosolids Monitoring – This section supplements III.B of Standard Provisions (Attachment D)

When biosolids are sent to a landfill, sent to a surface disposal site, or applied to land as a soil amendment, they must be monitored as follows:

1. Biosolids Monitoring Frequency

Biosolids disposal must be monitored at the following frequency:

Metric tons biosolids/365 days	Frequency
0-290	Once per year
290-1500	Quarterly
1500-15,000	Six times per year
Over 15,000	Once per month

(Metric tons are on a dry weight basis)

2. Biosolids Pollutants to Monitor

Biosolids shall be monitored for the following constituents:

- Land Application: Arsenic, cadmium, copper, mercury, molybdenum, nickel, lead, selenium, and zinc
- Municipal Landfill: Paint filter test (pursuant to 40 CFR 258)
- Biosolids-only Landfill or Surface Disposal Site (if no liner and leachate system): arsenic, chromium, and nickel

C. Standard Observations – This section is an addition to III of Standard Provisions (AttachmentD)

1. Receiving Water Observations

The requirements of this section only apply when the MRP requires standard observations of the receiving water. Standard observations shall include the following:

a. *Floating and suspended materials* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence, source, and size of affected area.

b. *Discoloration and turbidity*: description of color, source, and size of affected area.

c. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

d. *Beneficial water use*: presence of water-associated waterfowl or wildlife, fisherpeople, and other recreational activities in the vicinity of each sampling station.

e. *Hydrographic condition*: time and height of corrected high and low tides (corrected to nearest National Oceanic and Atmospheric Administration location for the sampling date and time of sample collection).

f. *Weather conditions*:

1) Air temperature; and

2) Total precipitation during the five days prior to observation.

2. Wastewater Effluent Observations

The requirements of this section only apply when the MRP requires wastewater effluent standard observations. Standard observations shall include the following:

a. *Floating and suspended material of wastewater origin* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence.

b. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

3. Beach and Shoreline Observations

The requirements of this section only apply when the MRP requires beach and shoreline standard observations. Standard observations shall include the following:

a. *Material of wastewater origin*: presence or absence, description of material, estimated size of affected area, and source.

b. *Beneficial use*: estimate number of people participating in recreational water contact, non-water contact, or fishing activities.

4. Land Retention or Disposal Area Observations

The requirements of this section only apply to facilities with on-site surface impoundments or disposal areas that are in use. This section applies to both liquid and solid wastes, whether confined or unconfined. The Discharger shall conduct the following for each impoundment:

a. Determine the amount of freeboard at the lowest point of dikes confining liquid wastes.

b. Report evidence of leaching liquid from area of confinement and estimated size of affected area. Show affected area on a sketch and volume of flow (e.g., gallons per minute [gpm]).

c. Regarding odor, describe presence or absence, characterization, source, distance of travel, and wind direction.

d. Estimate number of waterfowl and other water-associated birds in the disposal area and vicinity.

5. Periphery of Waste Treatment and/or Disposal Facilities Observations

The requirements of this section only apply when the MRP specifies periphery standard observations. Standard observations shall include the following:

a. *Odor*: presence or absence, characterization, source, and distance of travel.

b. *Weather conditions*: wind direction and estimated velocity.

IV. STANDARD PROVISIONS – RECORDS

A. Records to be Maintained – This supplements IV.A of Standard Provisions (Attachment D)

The Discharger shall maintain records in a manner and at a location (e.g., wastewater treatment plant or Discharger offices) such that the records are accessible to Regional Water Board staff. The minimum period of retention specified in Section IV, Records, of the Federal Standard Provisions shall be extended during the course of any unresolved litigation regarding the subject discharge, or when requested by the Regional Water Board or Regional Administrator of U.S. EPA, Region IX.

A copy of the permit shall be maintained at the discharge facility and be available at all times to operating personnel.

B. Records of monitoring information shall include – This supplements IV.B of Standard Provision (Attachment D)

1. Analytical Information

Records shall include analytical method detection limits, minimum levels, reporting levels, and related quantification parameters.

2. Flow Monitoring Data

For all required flow monitoring (e.g., influent and effluent flows), the additional records shall include the following, unless otherwise stipulated by the MRP:

a. Total volume for each day; and

b. Maximum, minimum, and average daily flows for each calendar month.

3. Wastewater Treatment Process Solids

a. For each treatment unit process that involves solids removal from the wastewater stream, records shall include the following:

1) Total volume or mass of solids removed from each collection unit (e.g., grit, skimmings, undigested biosolids, or combination) for each calendar month or other time period as appropriate, but not to exceed annually; and

2) Final disposition of such solids (e.g., landfill, other subsequent treatment unit).

b. For final dewatered biosolids from the treatment plant as a whole, records shall include the following:

1) Total volume or mass of dewatered biosolids for each calendar month;

2) Solids content of the dewatered biosolids; and

3) Final disposition of dewatered biosolids (disposal location and disposal method).

4. Disinfection Process

For the disinfection process, these additional records shall be maintained documenting process operation and performance:

a. For bacteriological analyses:

1) Wastewater flow rate at the time of sample collection; and

2) Required statistical parameters for cumulative bacterial values (e.g., moving median or geometric mean for the number of samples or sampling period identified in this Order).

b. For the chlorination process, when chlorine is used for disinfection, at least daily average values for the following:

1) Chlorine residual of treated wastewater as it enters the contact basin (mg/L);

2) Chlorine dosage (kg/day); and

3) Dechlorination chemical dosage (kg/day).

5. Treatment Process Bypasses

A chronological log of all treatment process bypasses, including wet weather blending, shall include the following:

a. Identification of the treatment process bypassed;

b. Dates and times of bypass beginning and end;

c. Total bypass duration;

d. Estimated total bypass volume; and

e. Description of, or reference to other reports describing, the bypass event, the cause, the corrective actions taken (except for wet weather blending that is in compliance with permit conditions), and any additional monitoring conducted.

6. Treatment Facility Overflows

This section applies to records for overflows at the treatment facility. This includes the headworks and all units and appurtenances downstream. The Discharger shall retain a chronological log of overflows at the treatment facility and records supporting the information provided in section V.E.2.

C. Claims of Confidentiality – Not Supplemented

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information – Not Supplemented

B. Signatory and Certification Requirements – Not Supplemented

C. Monitoring Reports – This section supplements V.C of Standard Provisions (Attachment D)

1. Self Monitoring Reports

For each reporting period established in the MRP, the Discharger shall submit an SMR to the Regional Water Board in accordance with the requirements listed in this document and at the frequency the MRP specifies. The purpose of the SMR is to document treatment performance, effluent quality, and compliance with the waste discharge requirements of this Order.

a. Transmittal letter

Each SMR shall be submitted with a transmittal letter. This letter shall include the following:

1) Identification of all violations of effluent limits or other waste discharge requirements found during the reporting period;

2) Details regarding violations: parameters, magnitude, test results, frequency, and dates;

3) Causes of violations;

4) Discussion of corrective actions taken or planned to resolve violations and prevent recurrences, and dates or time schedule of action implementation (if previous reports have been submitted that address corrective actions, reference to the earlier reports is satisfactory);

5) Data invalidation (Data should not be submitted in an SMR if it does not meet quality assurance/quality control standards. However, if the Discharger wishes to invalidate any measurement after it was submitted in an SMR, a letter shall identify the measurement suspected to be invalid and state the Discharger's intent to submit, within 60 days, a formal request to invalidate the measurement. This request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that

supports invalidation [e.g., laboratory sheet, log entry, test results, etc.], and discussion of the corrective actions taken or planned [with a time schedule for completion] to prevent recurrence of the sampling or measurement problem.);

6) If the Discharger blends, the letter shall describe the duration of blending events and certify whether blended effluent was in compliance with the conditions for blending; and

7) Signature (The transmittal letter shall be signed according to Section V.B of this Order, Attachment D – Standard Provisions.).

b. Compliance evaluation summary

Each report shall include a compliance evaluation summary. This summary shall include each parameter for which the permit specifies effluent limits, the number of samples taken during the monitoring period, and the number of samples that exceed applicable effluent limits.

c. Results of analyses and observations

1) Tabulations of all required analyses and observations, including parameter, date, time, sample station, type of sample, test result, method detection limit, method minimum level, and method reporting level, if applicable, signed by the laboratory director or other responsible official.

2) When determining compliance with an average monthly effluent limitation and more than one sample result is available in a month, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of detected but not quantified (DNQ) or nondetect (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

i. The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

ii. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

If a sample result, or the arithmetic mean or median of multiple sample results, is below the reporting limit, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation and the Discharger conducts a Pollutant Minimization Program, the Discharger shall not be deemed out of compliance.

3) Dioxin-TEQ Reporting: The Discharger shall report for each dioxin and furan congener the analytical results of effluent monitoring, including the quantifiable limit (reporting level), the method detection limit, and the measured concentration. The Discharger shall report all measured values of individual congeners, including data qualifiers. When calculating dioxin-TEQ, the Discharger shall set congener concentrations below the minimum levels (ML) to zero. The Discharger shall calculate and report dioxin-TEQs using the following formula,

where the MLs, toxicity equivalency factors (TEFs), and bioaccumulation equivalency factors (BEFs) are as provided in Table A:

$$\text{Dioxin-TEQ} = \Sigma (C_x \times TEF_x \times BEF_x)$$

where: C_x = measured or estimated concentration of congener *x*
TEF_x = toxicity equivalency factor for congener x
BEFx = bioaccumulation equivalency factor for congener *x*

Table A

Minimum Levels, Toxicity Equivalency Factors,
and Bioaccumulation Equivalency Factors

Dioxin or Furan Congener	Minimum Level (pg/L)	1998 Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factor (BEF)
2,3,7,8-TCDD	10	1.0	1.0
1,2,3,7,8-PeCDD	50	1.0	0.9
1,2,3,4,7,8-HxCDD	50	0.1	0.3
1,2,3,6,7,8-HxCDD	50	0.1	0.1
1,2,3,7,8,9-HxCDD	50	0.1	0.1
1,2,3,4,6,7,8-HpCDD	50	0.01	0.05
OCDD	100	0.0001	0.01
2,3,7,8-TCDF	10	0.1	0.8
1,2,3,7,8-PeCDF	50	0.05	0.2
2,3,4,7,8-PeCDF	50	0.5	1.6
1,2,3,4,7,8-HxCDF	50	0.1	0.08
1,2,3,6,7,8-HxCDF	50	0.1	0.2
1,2,3,7,8,9-HxCDF	50	0.1	0.6
2,3,4,6,7,8-HxCDF	50	0.1	0.7
1,2,3,4,6,7,8-HpCDF	50	0.01	0.01
1,2,3,4,7,8,9-HpCDF	50	0.01	0.4
OCDF	100	0.0001	0.02

d. Data reporting for results not yet available

The Discharger shall make all reasonable efforts to obtain analytical data for required parameter sampling in a timely manner. Certain analyses require additional time to complete analytical processes and report results. For cases where required monitoring parameters require additional time to complete analytical processes and reports, and results are not available in time to be included in the SMR for the subject monitoring period, the Discharger shall describe such circumstances in the SMR and include the data for these parameters and relevant discussions of any observed exceedances in the next SMR due after the results are available.

e. Flow data

The Discharger shall provide flow data tabulation pursuant to Section IV.B.2.

f. Annual self monitoring report requirements

By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

1) Annual compliance summary table of treatment plant performance, including documentation of any blending events;

2) Comprehensive discussion of treatment plant performance and compliance with the permit (This discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices.);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater;

4) List of approved analyses, including the following:

(i) List of analyses for which the Discharger is certified;

(ii) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory shall not be submitted but be retained onsite); and

(iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all storm water to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs to:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format

The Discharger has the option to submit all monitoring results in an electronic reporting format approved by the Executive Officer. If the Discharger chooses to submit SMRs electronically, the following shall apply:

1) *Reporting Method*: The Discharger shall submit SMRs electronically via a process approved by the Executive Officer (see, for example, the letter dated December 17, 1999, "Official Implementation of Electronic Reporting System [ERS]" and the progress report letter dated December 17, 2000).

2) *Monthly or Quarterly Reporting Requirements*: For each reporting period (monthly or quarterly as specified in the MRP), the Discharger shall submit an electronic SMR to the Regional Water Board in accordance with the provisions of Section V.C.1.a-e, except for requirements under Section V.C.1.c(1) where ERS does not have fields for dischargers to input certain information (e.g., sample time). However, until U.S. EPA approves the electronic signature or other signature technologies, Dischargers that use ERS shall submit a hard copy of the original transmittal letter, an ERS printout of the data sheet, and a violation report (a receipt of the electronic transmittal shall be retained by the Discharger). This electronic SMR submittal suffices for the signed tabulations specified under Section V.C.1.c(1).

3) *Annual Reporting Requirements*: Dischargers who have submitted data using the ERS for at least one calendar year are exempt from submitting the portion of the annual report required under Section V.C.1.f(1) and (3).

D. Compliance Schedules – Not supplemented

E. Twenty-Four Hour Reporting – This section supplements V.E of Standard Provision (Attachment D)

1. Spill of Oil or Other Hazardous Material Reports

a. Within 24 hours of becoming aware of a spill of oil or other hazardous material that is not contained onsite and completely cleaned up, the Discharger shall report by telephone to the Regional Water Board at (510) 622-2369.

b. The Discharger shall also report such spills to the State Office of Emergency Services [telephone (800) 852-7550] only when the spills are in accordance with applicable reporting quantities for hazardous materials.

c. The Discharger shall submit a written report to the Regional Water Board within five working days following telephone notification unless directed otherwise by Regional Water Board staff. A report submitted electronically is acceptable. The written report shall include the following:

1) Date and time of spill, and duration if known;

2) Location of spill (street address or description of location);

3) Nature of material spilled;

4) Quantity of material involved;

5) Receiving water body affected, if any;

6) Cause of spill;

7) Estimated size of affected area;

8) Observed impacts to receiving waters (e.g., oil sheen, fish kill, water discoloration);

9) Corrective actions taken to contain, minimize, or clean up the spill;

10) Future corrective actions planned to be taken to prevent recurrence, and schedule of implementation; and

11) Persons or agencies notified.

2. Unauthorized Discharges from Municipal Wastewater Treatment Plants[1]

The following requirements apply to municipal wastewater treatment plants that experience an unauthorized discharge at their treatment facilities and are consistent with and supercede requirements imposed on the Discharger by the Executive Officer by letter of May 1, 2008, issued pursuant to California Water Code Section 13383.

a. Two (2)-Hour Notification

For any unauthorized discharges that result in a discharge to a drainage channel or a surface water, the Discharger shall, as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the State Office of Emergency Services (telephone 800-852-7550), the local health officers or directors of environmental health with jurisdiction over the affected water bodies, and the Regional Water Board. The notification to the Regional Water Board shall be via the Regional Water Board's online reporting system at www.wbers.net, and shall include the following:

1) Incident description and cause;

2) Location of threatened or involved waterway(s) or storm drains;

3) Date and time the unauthorized discharge started;

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on); and

6) Identity of the person reporting the unauthorized discharge.

b. 24-hour Certification

Within 24 hours, the Discharger shall certify to the Regional Water Board, at www.wbers.net, that the State Office of Emergency Services and the local health officers or directors of environmental health with jurisdiction over the affected water bodies have been notified of the unauthorized discharge.

c. 5-Day Written Report

Within five business days, the Discharger shall submit a written report, via the Regional Water Board's online reporting system at www.wbers.net, that includes, in addition to the information required above, the following:

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

2) Efforts implemented to minimize public exposure to the unauthorized discharge;

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;

4) Corrective measures taken to minimize the impact of the unauthorized discharge;

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges; and

7) Quantity and duration of the unauthorized discharge, and the amount recovered.

d. Communication Protocol

To clarify the multiple levels of notification, certification, and reporting, the current communication requirements for unauthorized discharges from municipal wastewater treatment plants are summarized in Table B that follows.

Table B

Summary of Communication Requirements for Unauthorized Discharges[1] from Municipal Wastewater Treatment Plants

Discharger is required to:	Agency Receiving Information	Time frame	Method for Contact
1. Notify	California Emergency Management Agency (Cal EMA)	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Telephone – (800) 852-7550 (obtain a control number from Cal EMA)
	Local health department	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Depends on local health department
	Regional Water Board	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Electronic[2] www.wbers.net
2. Certify	Regional Water Board	As soon as possible, but not later than **24 hours** after becoming aware of the unauthorized discharge.	Electronic[3] www.wbers.net
3. Report	Regional Water Board	Within **5 business days** of becoming aware of the unauthorized discharge.	Electronic[4] www.wbers.net

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

[2] In the event that the Discharger is unable to provide online notification within 2 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the notification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the notification information into the Regional Water Board's online system in electronic format.

[3] In most instances, the 2-hour notification will also satisfy 24-hour certification requirements. This is because the notification form includes fields for documenting that OES and the local health department have been contacted. In other words, if the Discharger is able to complete all the fields in the notification form within 2 hours, certification requirements are also satisfied. In the event that the Discharger is unable to provide online certification within 24 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the certification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the certification information into the Regional Water Board's online system in electronic format.

[4] If the Discharger cannot satisfy the 5-day reporting requirements via the Regional Water Board's online reporting system, it shall submit a written report (preferably electronically in pdf) to the appropriate Regional Water Board case manager. In cases where the Discharger cannot satisfy the 5-day reporting requirements via the online reporting system, it must still complete the Regional Water Board's online reporting requirements within 15 calendar days of becoming aware of the unauthorized discharge.

F. Planned Changes – Not supplemented

G. Anticipated Noncompliance – Not supplemented

H. Other Noncompliance – Not supplemented

I. Other Information – Not supplemented

VI. STANDARD PROVISION – ENFORCEMENT – Not Supplemented

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS – Not Supplemented

VIII. DEFINITIONS – This section is an addition to Standard Provisions (Attachment D)

More definitions can be found in Attachment A of this NPDES Permit.

1. Arithmetic Calculations

   a. Geometric mean is the antilog of the log mean or the back-transformed mean of the logarithmically transformed variables, which is equivalent to the multiplication of the antilogarithms. The geometric mean can be calculated with either of the following equations:

   $$\text{Geometric Mean} = Anti\log\left(\frac{1}{N}\sum_{i=1}^{N} Log(C_i)\right)$$

   or

   $$\text{Geometric Mean} = (C_1 * C_2 * \ldots * C_N)^{1/N}$$

   Where "N" is the number of data points for the period analyzed and "C" is the concentration for each of the "N" data points.

   b. Mass emission rate is obtained from the following calculation for any calendar day:

   $$\text{Mass emission rate (lb/day)} = \frac{8.345}{N}\sum_{i=1}^{N} Q_i C_i$$

   $$\text{Mass emission rate (kg/day)} = \frac{3.785}{N}\sum_{i=1}^{N} Q_i C_i$$

   In which "N" is the number of samples analyzed in any calendar day and "Q_i" and "C_i" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" grab samples that may be taken in any calendar day. If a composite sample is taken, "C_i" is the concentration measured in the composite sample and "Q_i" is the average flow rate occurring during the period over which the samples are composited. The daily concentration of a constituent measured over any calendar day shall be determined from the flow-weighted average of the same constituent in the combined waste streams as follows:

Cd = Average daily concentration = $\frac{1}{Q_t}\sum_{i=1}^{N} Q_i C_i$

In which "N" is the number of component waste streams and "Q" and "C" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" waste streams. "Q_t" is the total flow rate of the combined waste streams.

c. Maximum allowable mass emission rate, whether for a 24-hour, weekly 7-day, monthly 30-day, or 6-month period, is a limitation expressed as a daily rate determined with the formulas in the paragraph above, using the effluent concentration limit specified in the permit for the period and the specified allowable flow.

d. POTW removal efficiency is the ratio of pollutants removed by the treatment facilities to pollutants entering the treatment facilities (expressed as a percentage). The Discharger shall determine removal efficiencies using monthly averages (by calendar month unless otherwise specified) of pollutant concentration of influent and effluent samples collected at about the same time and using the following equation (or its equivalent):

Removal Efficiency (%) = 100 × [1-(Effluent Concentration/Influent Concentration)]

2. Biosolids means the solids, semi-liquid suspensions of solids, residues, screenings, grit, scum, and precipitates separated from or created in wastewater by the unit processes of a treatment system. It also includes, but is not limited to, all supernatant, filtrate, centrate, decantate, and thickener overflow and underflow in the solids handling parts of the wastewater treatment system.

3. Blending is the practice of recombining wastewater that has been biologically treated with wastewater that has bypassed around biological treatment units.

4. Bottom sediment sample is (1) a separate grab sample taken at each sampling station for the determination of selected physical-chemical parameters, or (2) four grab samples collected from different locations in the immediate vicinity of a sampling station while the boat is anchored and analyzed separately for macroinvertebrates.

5. Composite sample is a sample composed of individual grab samples collected manually or by an automatic sampling device on the basis of time or flow as specified in the MRP. For flow-based composites, the proportion of each grab sample included in the composite sample shall be within plus or minus five percent (+/-5%) of the representative flow rate of the waste stream being measured at the time of grab sample collection. Alternatively, equal volume grab samples may be individually analyzed with the flow-weighted average calculated by averaging flow-weighted ratios of each grab sample analytical result. Grab samples comprising time-based composite samples shall be collected at intervals not greater than those specified in the MRP. The quantity of each grab sample comprising a time-based composite sample shall be a set of flow proportional volumes as specified in the MRP. If a particular time-based or flow-based composite sampling protocol is not specified in the MRP, the Discharger shall determine and implement the most representative sampling protocol for the given parameter subject to Executive Officer approval.

6. Depth-integrated sample is defined as a water or waste sample collected by allowing a sampling device to fill during a vertical traverse in the waste or receiving water body being sampled. The Discharger shall collect depth-integrated samples in such a manner that the collected sample will be representative of the waste or water body at that sampling point.

7. Flow sample is an accurate measurement of the average daily flow volume using a properly calibrated and maintained flow measuring device.

8. Grab sample is an individual sample collected in a short period of time not exceeding 15 minutes. Grab samples represent only the condition that exists at the time the wastewater is collected.

9. Initial dilution is the process that results in the rapid and irreversible turbulent mixing of wastewater with receiving water around the point of discharge.

10. Overflow is the intentional or unintentional spilling or forcing out of untreated or partially treated wastes from a transport system (e.g., through manholes, at pump stations, and at collection points) upstream from the treatment plant headworks or from any part of a treatment plant facility.

11. Priority pollutants are those constituents referred to in 40 CFR Part 122 as promulgated in the Federal Register, Vol. 65, No. 97, Thursday, May 18, 2000, also known as the California Toxics Rule, the presence or discharge of which could reasonably be expected to interfere with maintaining designated uses.

12. Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.

13. Toxic pollutant means any pollutant listed as toxic under federal Clean Water Act section 307(a)(1) or under 40 CFR 401.15.

14. Untreated waste is raw wastewater.

15. Waste, waste discharge, discharge of waste, and discharge are used interchangeably in the permit. The requirements of the permit apply to the entire volume of water, and the material therein, that is disposed of to surface and ground waters of the State of California.

14.	Cyanide	SM 4500 CN^- C or I				5								
15.	Asbestos (only required for dischargers to MUN waters)[5]	0100.2 [6]												
16.	2,3,7,8-TCDD and 17 congeners (Dioxin)	1613												
17.	Acrolein	603	2.0	5										
18.	Acrylonitrile	603	2.0	2										
19.	Benzene	602	0.5	2										
33.	Ethylbenzene	602	0.5	2										
39.	Toluene	602	0.5	2										
20.	Bromoform	601	0.5	2										
21.	Carbon Tetrachloride	601	0.5	2										
22.	Chlorobenzene	601	0.5	2										
23.	Chlorodibromomethane	601	0.5	2										
24.	Chloroethane	601	0.5	2										

[1] The suggested method is the U.S. EPA Method unless otherwise specified (SM = Standard Methods). The Discharger may use another U.S. EPA-approved or recognized method if that method has a level of quantification below the applicable water quality objective. Where no method is suggested, the Discharger has the discretion to use any standard method.

[2] Minimum levels are from the *State Implementation Policy*. They are the concentration of the lowest calibration standard for that technique based on a survey of contract laboratories. Laboratory techniques are defined as follows: GC = Gas Chromatography; GCMS = Gas Chromatography/Mass Spectrometry; LC = High Pressure Liquid Chromatography; Color = Colorimetric; FAA = Flame Atomic Absorption; GFAA = Graphite Furnace Atomic Absorption; ICP = Inductively Coupled Plasma; ICPMS = Inductively Coupled Plasma/Mass Spectrometry; SPGFAA = Stabilized Platform Graphite Furnace Atomic Absorption (i.e., U.S. EPA 200.9); Hydride = Gaseous Hydride Atomic Absorption; CVAA = Cold Vapor Atomic Absorption; DCP = Direct Current Plasma.

[3] Analysis for total chromium may be substituted for analysis of chromium (III) and chromium (VI) if the concentration measured is below the lowest hexavalent chromium criterion (11 ug/l).

[4] The Discharger shall use ultra-clean sampling (U.S. EPA Method 1669) and ultra-clean analytical methods (U.S. EPA Method 1631) for mercury monitoring. The minimum level for mercury is 2 ng/l (or 0.002 ug/l).

[5] MUN = Municipal and Domestic Supply. This designation, if applicable, is in the Findings of the permit.

[6] Determination of Asbestos Structures over 10 [micrometers] in Length in Drinking Water Using MCE Filters, U.S. EPA 600/R-94-134, June 1994.

ATTACHMENT H – PRETREATMENT REQUIREMENTS

CALIFORNIA REGIONAL WATER QUALITY CONTROL
BOARD
SAN FRANCISCO BAY REGION

ATTACHMENT H
PRETREATMENT PROGRAM PROVISIONS

For

NPDES POTW WASTEWATER DISCHARGE PERMITS

March 2011
(Corrected May 2011)

TABLE OF CONTENTS Page

Attachment H: Pretreatment Program Provisions

A. The Discharger shall be responsible and liable for the performance of all Control Authority pretreatment requirements contained in 40 CFR 403, including any regulatory revisions to Part 403. Where a Part 403 revision is promulgated after the effective date of the Discharger's permit and places mandatory actions upon the Discharger as Control Authority but does not specify a timetable for completion of the actions, the Discharger shall complete the required actions within six months from the issuance date of this permit or six months from the effective date of the Part 403 revisions, whichever comes later.

(If the Discharger cannot complete the required actions within the above six-month period due to the need to process local adoption of sewer use ordinance modifications or other substantial pretreatment program modifications, the Discharger shall notify the Executive Officer in writing at least 60 days prior to the six-month deadline. The written notification shall include a summary of completed required actions, an explanation for why the six month deadline cannot be met, and a proposed timeframe to complete the rest of the required actions as soon as practical but not later than within twelve months of the issuance date of this permit or twelve months of the effective date of the Part 403 revisions, whichever comes later. The Executive Officer will notify the Discharger in writing within 30 days of receiving the request if the extension is not approved.)

The United States Environmental Protection Agency (U.S. EPA), the State and/or other appropriate parties may initiate enforcement action against a nondomestic user for noncompliance with applicable standards and requirements as provided in the Clean Water Act (Act).

B. The Discharger shall enforce the requirements promulgated under Sections 307(b), 307(c), 307(d) and 402(b) of the Act with timely, appropriate and effective enforcement actions. The Discharger shall cause nondomestic users subject to Federal Categorical Standards to achieve compliance no later than the date specified in those requirements or, in the case of a new nondomestic user, upon commencement of the discharge.

C. The Discharger shall perform the pretreatment functions as required in 40 CFR 403 and amendments or modifications thereto including, but not limited to:

1. Implement the necessary legal authorities to fully implement the pretreatment regulations as provided in 40 CFR 403.8(f)(1);

2. Implement the programmatic functions as provided in 40 CFR 403.8(f)(2);

3. Publish an annual list of nondomestic users in significant noncompliance as provided per 40 CFR 403.8(f)(2)(viii);

4. Provide for the requisite funding and personnel to implement the pretreatment program as provided in 40 CFR 403.8(f)(3); and

5. Enforce the national pretreatment standards for prohibited discharges and categorical standards as provided in 40 CFR 403.5 and 403.6, respectively.

D. The Discharger shall submit annually a report to U.S. EPA Region 9, the State Water Board and the Regional Water Board describing its pretreatment program activities over the previous calendar year. In the event that the Discharger is not in compliance with any conditions or requirements of the Pretreatment Program, the Discharger shall also include the reasons for noncompliance and a plan and schedule for achieving compliance. The report shall contain, but is not limited to, the information specified in Appendix H-1 entitled, "Requirements for Pretreatment Annual Reports." The annual report is due each year on February 28.

E. The Discharger shall submit a pretreatment semiannual report to U.S. EPA Region 9, the State Water Board and the Regional Water Board describing the status of its significant industrial users (SIUs). The report shall contain, but is not limited to, information specified in Appendix H-2 entitled, "Requirements for Pretreatment Semiannual Reports." The semiannual report is due July 31 for the period January through June. The information for the period July through December of each year shall be included in the Annual Report identified in Appendix H-1. The Executive Officer may exempt the Discharger from the semiannual reporting requirements on a case by case basis subject to State Water Board and U.S. EPA's comment and approval.

F. The Discharger shall conduct the monitoring of its treatment plant's influent, effluent, and sludge (biosolids) as described in Appendix H-4 entitled, "Requirements for Influent, Effluent and Sludge (Biosolids) Monitoring." (The term "biosolids," as used in this Attachment, shall have the same meaning as wastewater treatment plant "sludge" and will be used from this point forward.) The Discharger shall evaluate the results of the sampling and analysis during the preparation of the semiannual and annual reports to identify any trends. Signing the certification statement used to transmit the reports shall be deemed to certify the Discharger has completed this data evaluation. A tabulation of the data shall be included in the pretreatment annual report as specified in Appendix H-4. The Executive Officer may require more or less frequent monitoring on a case by case basis.

APPENDIX H-1

REQUIREMENTS FOR PRETREATMENT ANNUAL REPORTS

The Pretreatment Annual Report is due each year on February 28 and shall contain activities conducted during the previous calendar year. The purpose of the Annual Report is to:

- Describe the status of the Discharger's pretreatment program; and
- Report on the effectiveness of the program, as determined by comparing the results of the preceding year's program implementation.

The report shall contain, at a minimum, the following information:

A. Cover Sheet

The cover sheet shall include:

1. The name(s) and National Pollutant Discharge Elimination Discharge System (NPDES) permit number(s) of the Discharger(s) that is part of the Pretreatment Program;

2. The name, address and telephone number of a pretreatment contact person;

3. The period covered in the report;

4. A statement of truthfulness; and

5. The dated signature of a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for overall operation of the Publicly Owned Treatment Works (POTW) (40 CFR 403.12(m)).

B. Introduction

This section shall include:

1. Any pertinent background information related to the Discharger and/or the nondomestic user base of the area;

2. List of applicable interagency agreements used to implement the Discharger's pretreatment program (e.g., Memoranda of Understanding (MOU) with satellite sanitary sewer collection systems); and

3. A status summary of the tasks required by a Pretreatment Compliance Inspection (PCI), Pretreatment Compliance Audit (PCA), Cleanup and Abatement Order (CAO), or other pretreatment-related enforcement actions required by the Regional Water Board or the U.S. EPA. A more detailed discussion can be referenced and included in the section entitled, "Program Changes," if needed.

C. Definitions

This section shall include a list of key terms and their definitions that the Discharger uses to describe or characterize elements of its pretreatment program, or the Discharger may provide a reference to its website if the applicable definitions are available on-line.

D. Discussion of Upset, Interference and Pass Through

This section shall include a discussion of Upset, Interference or Pass Through incidents, if any, at the Discharger's treatment plant(s) that the Discharger knows of or suspects were caused by nondomestic user discharges. Each incident shall be described, at a minimum, consisting of the following information:

1. A description of what occurred;

2. A description of what was done to identify the source;

3. The name and address of the nondomestic user responsible;

4. The reason(s) why the incident occurred;

5. A description of the corrective actions taken; and

6. An examination of the local and federal discharge limits and requirements for the purposes of determining whether any additional limits or changes to existing requirements may be necessary to prevent other Upset, Interference or Pass Through incidents.

E. Influent, Effluent and Biosolids Monitoring Results

The Discharger shall evaluate the influent, effluent and biosolids monitoring results as specified in Appendix H-4 in preparation of this report. The Discharger shall retain the analytical laboratory reports with the Quality Assurance and Quality Control (QA/QC) data validation and make these reports available upon request.

This section shall include:

1. Description of the sampling procedures and an analysis of the results (see Appendix H-4 for specific requirements);
2. Tabular summary of the compounds detected (compounds measured above the detection limit for the analytical method used) for the monitoring data generated during the reporting year as specified in Appendix H-4;
3. Discussion of the investigation findings into any contributing sources of the compounds that exceed NPDES limits; and
4. Graphical representation of the influent and effluent metal monitoring data for the past five years with a discussion of any trends.

F. Inspection, Sampling and Enforcement Programs

This section shall include at a minimum the following information:

1. Inspections: Summary of the inspection program (e.g., criteria for determining the frequency of inspections and inspection procedures);

2. Sampling Events: Summary of the sampling program (e.g., criteria for determining the frequency of sampling and chain of custody procedures); and

3. Enforcement: Summary of Enforcement Response Plan (ERP) implementation including dates for adoption, last revision and submission to the Regional Water Board.

G. Updated List of Regulated SIUs

This section shall contain a list of all of the federal categories that apply to SIUs regulated by the Discharger. The specific categories shall be listed including the applicable 40 CFR subpart and section, and pretreatment standards (both maximum and average limits). Local limits developed by the Discharger shall be presented in a table including the applicability of the local limits to SIUs. If local limits do not apply uniformly to SIUs, specify the applicability in the tables listing the categorical industrial users (CIUs) and non-categorical SIUs. Tables developed in Sections 7A and 7B can be used to present or reference this information.

1. CIUs - Include a table that alphabetically lists the CIUs regulated by the Discharger as of the end of the reporting period. This list shall include:

   a. Name;

   b. Address;

   c. Applicable federal category(ies);

   d. Reference to the location where the applicable Federal Categorical Standards are presented in the report;

   e. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

   f. Information, calculations and data used to determine the limits for those CIUs for which a combined waste stream formula is applied.

2. Non-categorical SIUs - Include a table that alphabetically lists the SIUs not subject to any federal categorical standards that were regulated by the Discharger as of the end of the reporting period. This list shall include:

   a. Name;

b. Address;

c. A brief description of the type of business;

d. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

e. Indicate the applicable discharge limits (e.g., different from local limits) to which the SIUs are subject and reference to the location where the applicable limits (e.g., local discharge limits) are presented in the report.

H. SIU (categorical and non-categorical) Compliance Activities

The information required in this section may be combined in the table developed in Section 7 above.

1. **Inspection and Sampling Summary:** This section shall contain a summary of all the SIU inspections and sampling activities conducted by the Discharger and sampling activities conducted by the SIU over the reporting year to gather information and data regarding SIU compliance. The summary shall include:

   a. The number of inspections and sampling events conducted for each SIU by the Discharger;

   b. The number of sampling events conducted by the SIU. Identify SIUs that are operating under an approved Total Toxic Organic Management Plan;

   c. The quarters in which the above activities were conducted; and

   d. The compliance status of each SIU, delineated by quarter, and characterized using all applicable descriptions as given below:

      (1) Consistent compliance;

      (2) Inconsistent compliance;

      (3) Significant noncompliance;

      (4) On a compliance schedule to achieve compliance (include the date final compliance is required);

      (5) Not in compliance and not on a compliance schedule; and

      (6) Compliance status unknown, and why not.

2. **Enforcement Summary:** This section shall contain a summary of SIU compliance and enforcement activities during the reporting year. The summary may be included in the summary

table developed in section 8A and shall include the names and addresses of all SIUs affected by the actions identified below. For each notice specified in enforcement action "i" through "iv," indicate whether it was for an infraction of a federal or local standard/limit or requirement.

a. Warning letters or notices of violations regarding SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

b. Administrative Orders regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

c. Civil actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

d. Criminal actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

e. Assessment of monetary penalties. Identify the amount of penalty in each case and reason for assessing the penalty;

f. Order to restrict/suspend discharge to the Discharger; and

g. Order to disconnect the discharge from entering the Discharger.

3. July-December Semiannual Data: For SIU violations/noncompliance during the semiannual reporting period from July 1 through December 31, provide the following information:

a. Name and facility address of the SIU;

b. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

c. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

d. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

e. For violations/noncompliance identified in the reporting period, provide:

(1) The date(s) of violation(s);

(2) The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

(3) A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

I. Baseline Monitoring Report Update

This section shall provide a list of CIUs added to the pretreatment program since the last annual report. This list of new CIUs shall summarize the status of the respective Baseline Monitoring Reports (BMR). The BMR must contain the information specified in 40 CFR 403.12(b). For each new CIU, the summary shall indicate when the BMR was due; when the CIU was notified by the Discharger of this requirement; when the CIU submitted the report; and/or when the report is due.

J. Pretreatment Program Changes

This section shall contain a description of any significant changes in the Pretreatment Program during the past year including, but not limited to:

1. Legal authority;
2. Local limits;
3. Monitoring/ inspection program and frequency;
4. Enforcement protocol;
5. Program's administrative structure;
6. Staffing level;
7. Resource requirements;
8. Funding mechanism;
9. If the manager of the Discharger's pretreatment program changed, a revised organizational chart shall be included; and
10. If any element(s) of the program is in the process of being modified, this intention shall also be indicated.

K. Pretreatment Program Budget

This section shall present the budget spent on the Pretreatment Program. The budget, either by the calendar or fiscal year, shall show the total expenses required to implement the pretreatment program. A brief discussion of the source(s) of funding shall be provided. In addition, the Discharger shall make available upon request specific details on its pretreatment program expense amounts such as for personnel, equipment, and chemical analyses.

L. Public Participation Summary

This section shall include a copy of the public notice as required in 40 CFR 403.8(f)(2)(viii). If a notice was not published, the reason shall be stated.

M. Biosolids Storage and Disposal Practice

This section shall describe how treated biosolids are stored and ultimately disposed. If a biosolids storage area is used, it shall be described in detail including its location, containment features and biosolids handling procedures.

N. Other Pollutant Reduction Activities

This section shall include a brief description of any programs the Discharger implements to reduce pollutants from nondomestic users that are not classified as SIUs. If the Discharger submits any of this program information in an Annual Pollution Prevention Report, reference to this other report shall satisfy this reporting requirement.

O. Other Subjects

Other information related to the Pretreatment Program that does not fit into any of the above categories should be included in this section.

P. Permit Compliance System (PCS) Data Entry Form

The annual report shall include the PCS Data Entry Form. This form shall summarize the enforcement actions taken against SIUs in the past year. This form shall include the following information:

1. Discharger's name,

2. NPDES Permit number,

3. Period covered by the report,

4. Number of SIUs in significant noncompliance (SNC) that are on a pretreatment compliance schedule,

5. Number of notices of violation and administrative orders issued against SIUs,

6. Number of civil and criminal judicial actions against SIUs,

7. Number of SIUs that have been published as a result of being in SNC, and

8. Number of SIUs from which penalties have been collected.

APPENDIX H-2

REQUIREMENTS FOR JANUARY-JUNE PRETREATMENT SEMIANNUAL REPORT

The pretreatment semiannual report is due on July 31 for pretreatment program activities conducted from January through June unless an exception has been granted by the Regional Water Board's Executive Officer (e.g., pretreatment programs without any SIUs may qualify for an exception to the pretreatment semiannual report). Pretreatment activities conducted from July through December of each year shall be included in the Pretreatment Annual Report as specified in Appendix H-1. The pretreatment semiannual report shall contain, at a minimum the following information:

A. Influent, Effluent and Biosolids Monitoring

The influent, effluent and biosolids monitoring results shall be evaluated in preparation of this report. The Discharger shall retain analytical laboratory reports with the QA/QC data validation and make these reports available upon request. The Discharger shall also make available upon request a description of its influent, effluent and biosolids sampling procedures. Violations of any parameter that exceed NPDES limits shall be identified and reported. The contributing source(s) of the parameters that exceed NPDES limits shall be investigated and discussed.

B. Significant Industrial User Compliance Status

This section shall contain a list of all SIUs that were not in consistent compliance with all pretreatment standards/limits or requirements for the reporting period. For the reported SIUs, the compliance status for the previous semiannual reporting period shall be included. Once the SIU has determined to be out of compliance, the SIU shall be included in subsequent reports until consistent compliance has been achieved. A brief description detailing the actions that the SIU undertook to come back into compliance shall be provided.

For each SIU on the list, the following information shall be provided:

1. Name and facility address of the SIU;

2. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

3. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

4. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

5. For violations/noncompliance identified in the reporting period, provide:

    a. The date(s) of violation(s);

    b. The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

c. A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

C. Discharger's Compliance with Pretreatment Program Requirements

This section shall contain a discussion of the Discharger's compliance status with the Pretreatment Program Requirements as indicated in the latest Pretreatment Compliance Audit (PCA) Report or Pretreatment Compliance Inspection (PCI) Report. It shall contain a summary of the following information:

1. Date of latest PCA or PCI report;

2. Date of the Discharger's response;

3. List of unresolved issues; and

4. Plan(s) and schedule for resolving the remaining issues.

APPENDIX H-3

SIGNATURE REQUIREMENTS FOR PRETREATMENT ANNUAL AND SEMIANNUAL REPORTS

The pretreatment annual and semiannual reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Discharger [POTW - 40 CFR 403.12(m)]. Signed copies of the reports shall be submitted to the U.S. EPA, the State Water Board, and the Regional Water Board at the following addresses unless the Discharger is instructed by any of these agencies to submit electronic copies of the required reports:

Pretreatment Program Reports
Clean Water Act Compliance Office (WTR-7)
Water Division
Pacific Southwest Region
U.S. Environmental Protection Agency
75 Hawthorne Street
San Francisco, CA 94105-3901

Submit electronic copies only to State and Regional Water Boards:
Pretreatment Program Manager
Regulatory Unit
State Water Resources Control Board
Division of Water Quality-15th Floor
1001 I Street
Sacramento, CA 95814
DMR@waterboards.ca.gov
NPDES_Wastewater@waterboards.ca.gov

Pretreatment Coordinator
NPDES Wastewater Division
SF Bay Regional Water Quality Control Board
1515 Clay Street, Suite 1400
Oakland, CA 94612
(Submit the report as a single Portable Document Format (PDF) file to the Pretreatment Coordinator's folder in the Regional Water Board's File Transfer Protocol (FTP) site. The instructions for using the FTP site can be found at the following internet address:
http://www.waterboards.ca.gov/sanfranciscobay/publications_forms/documents/FTP_Discharger_Guide-12-2010.pdf.)

APPENDIX H-4

REQUIREMENTS FOR INFLUENT, EFFLUENT AND BIOSOLIDS MONITORING

The Discharger shall conduct sampling of its treatment plant's influent, effluent and biosolids at the frequency shown in **the pretreatment requirements table** of the Monitoring and Reporting Program (MRP, Attachment E). When sampling periods coincide, one set of test results, reported separately, may be used for those parameters that are required to be monitored by both the influent and effluent monitoring requirements of the MRP and the Pretreatment Program. The Pretreatment Program monitoring reports as required in Appendices H-1 and H-2 shall be transmitted to the Pretreatment Program Coordinator.

A. Reduction of Monitoring Frequency

The minimum frequency of Pretreatment Program influent, effluent, and biosolids monitoring shall be dependent on the number of SIUs identified in the Discharger's Pretreatment Program as indicated in Table H-1.

Table H-1: Minimum Frequency of Pretreatment Program Monitoring	
Number of SIUs	Minimum Frequency
< 5	Once every five years
> 5 and < 50	Once every year
> 50	Twice per year

If the Discharger's required monitoring frequency is greater than the minimum specified in Table H-1, the Discharger may request a reduced monitoring frequency for that constituent(s) as part of its application for permit reissuance if it meets the following criteria:

The monitoring data for the constituent(s) consistently show non-detect (ND) levels for the effluent monitoring and very low (i.e., near ND) levels for influent and biosolids monitoring for a minimum of eight previous years' worth of data.

The Discharger's request shall include tabular summaries of the data and a description of the trends in the industrial, commercial, and residential customers in the Discharger's service area that demonstrate control over the sources of the constituent(s). The Regional Water Board may grant a reduced monitoring frequency in the reissued permit after considering the information provided by the Discharger and any other relevant information.

B. Influent and Effluent Monitoring

The Discharger shall monitor for the parameters using the required sampling and test methods listed in **the pretreatment table** of the MRP. Any test method substitutions must have received prior written Executive Officer approval. Influent and effluent sampling locations shall be the same as those sites specified in the MRP.

The influent and effluent samples should be taken at staggered times to account for treatment plant detention time. Appropriately staggered sampling is considered consistent with the requirement for

collection of effluent samples coincident with influent samples in Section III.A.3.a(2) of Attachment G. All samples must be representative of daily operations. Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto. For effluent monitoring, the reporting limits for the individual parameters shall be at or below the minimum levels (MLs) as stated in the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (2000) [also known as the State Implementation Policy (SIP)]; any revisions to the MLs shall be adhered to. If a parameter does not have a stated ML, then the Discharger shall conduct the analysis using the lowest commercially available and reasonably achievable detection levels.

The following report elements should be used to submit the influent and effluent monitoring results. A similarly structured format may be used but will be subject to Regional Water Board approval. The monitoring reports shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

1. Sampling Procedures, Sample Dechlorination, Sample Compositing, and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto. The Discharger shall make available upon request its sampling procedures including methods of dechlorination, compositing, and data validation.

2. A tabulation of the test results for the detected parameters shall be provided.

3. Discussion of Results – The report shall include a complete discussion of the test results for the detected parameters. If any pollutants are detected in sufficient concentration to upset, interfere or pass through plant operations, the type of pollutant(s) and potential source(s) shall be noted, along with a plan of action to control, eliminate, and/or monitor the pollutant(s). Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

C. Biosolids Monitoring

Biosolids should be sampled in a manner that will be representative of the biosolids generated from the influent and effluent monitoring events except as noted in (3. below. The same parameters required for influent and effluent analysis shall be included in the biosolids analysis. The biosolids analyzed shall be a composite sample of the biosolids for final disposal consisting of:

1. Biosolids lagoons – 20 grab samples collected at representative equidistant intervals (grid pattern) and composited as a single grab, or

2. Dried stockpile – 20 grab samples collected at various representative locations and depths and composited as a single grab, or

3. Dewatered biosolids - daily composite of 4 representative grab samples each day for 5 days taken at equal intervals during the daily operating shift taken from a) the dewatering units or b) each truckload, and shall be combined into a single 5- day composite.

The U.S. EPA manual, POTW Sludge Sampling and Analysis Guidance Document, August 1989, containing detailed sampling protocols specific to biosolids is recommended as a guidance for sampling procedures. The U.S. EPA manual Analytical Methods of the National Sewage Sludge Survey, September 1990, containing detailed analytical protocols specific to biosolids, is recommended as a guidance for analytical methods.

In determining if the biosolids are a hazardous waste, the Discharger shall adhere to Article 2, "Criteria for Identifying the Characteristics of Hazardous Waste," and Article 3, "Characteristics of Hazardous Waste," of Title 22, California Code of Regulations, sections 66261.10 to 66261.24 and all amendments thereto.

The following report elements should be used to submit the biosolids monitoring results. A similarly structured form may be used but will be subject to Regional Water Board approval. The results shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

- Sampling Procedures and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto. The Discharger shall make available upon request its biosolids sampling procedures and data validation methods.

- Test Results – Tabulate the test results for the detected parameters and include the percent solids.

- Discussion of Results – Include a complete discussion of test results for the detected parameters. If the detected pollutant(s) is reasonably deemed to have an adverse effect on biosolids disposal, a plan of action to control, eliminate, and/or monitor the pollutant(s) and the known or potential source(s) shall be included. Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

The Discharger shall also provide a summary table presenting any influent, effluent or biosolids monitoring data for non-priority pollutants that the Discharger believes may be causing or contributing to interference, pass through or adversely impacting biosolids quality.

CERTIFIED MAIL
RETURN RECEIPT REQUESTED

Mr. Harlan Kelly, Jr.
General Manager
San Francisco Public Utilities Commission
525 Golden Gate Avenue
San Francisco, CA 94102

Re: Notice of Violation of National Pollutant Discharge Elimination System permits

Dear Mr. Kelly:

This letter serves to notify you that the EPA has identified Clean Water Act (CWA) violations of the City and County of San Francisco's (City's) National Pollutant Discharge Elimination System (NPDES) permits regulating discharges from the City's wastewater treatment plants, 36 combined sewer discharge (CSD) facilities and its combined sewer system. The permits in question are: (1) Waste Discharge Requirements for the City and County of San Francisco Oceanside Water Pollution Control Plant (Southwest Ocean Outfall) and Collection System, Including the Westside Wet Weather Facilities Order No. R2-2009-0062/NPDES No. CA0037681 (Oceanside Permit); and (2) Waste Discharge Requirements for the City and County of San Francisco Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System Order No. R2-2013-0029/NPDES No. CA0037664 (Southeast Permit).

Historically, the City's data, which we also note are materially incomplete in numerous ways that likely masks the true nature and scope of certain violations, show it is discharging approximately one and a half billion gallons of combined sewage annually onto beaches and other sensitive areas, including areas where recreation takes place. Recent data show that the annual combined sewer discharges are closer to two billion gallons. The failure to properly operate and maintain the City's sewage collection and treatment facilities creates public health risks. For example, lack of proper operation and maintenance has caused force main and pump station failures that have diverted substantial volumes of raw and partially-treated sewage to flow across beaches and into the San Francisco Bay and the Pacific Ocean. There have been instances of sewage flowing in the streets and entering people's homes. Moreover, the City's data also show other pollutants of significant concern such as copper, zinc, lead, cyanide and ammonia that can threaten the water quality of the Bay and the ocean.

The City has violated and in many cases continues to violate the terms of its NPDES permits, including but not limited to the following:

1. Failure to properly operate and maintain its facilities including the associated collection systems as required by sections VI.C.4.c, VI.C.5.b.i.b, and Attachment D.I.D. of the

Southeast Permit and sections VI.C.4.a.1, VI.C.6.b.1.ii, and Attachment D.I.D. of the Oceanside Permit. For example, the City has not cleaned, repaired and replaced sewer pipes on a schedule to ensure they remain in proper working order, the City does not inspect all accessible CSD outfalls every year, and the City has not provided adequate back-up power at critical facilities. Also, Attachment G.I.I.2 of the Southeast and Oceanside Permits requires that "[c]ollection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater, except in cases where excluding the public is infeasible, such as private property," and EPA has documented several incidents when public contact with wastewater occurred, evidencing that the systems are not being properly operated and maintained.

2. Failure to comply with wet weather operational requirements to maximize use of the collection system for storage and to maximize flows to treatment plants pursuant to sections VI.C.5.b.ii, VI.C.5.b.iv, and VI.C.5.c.iii of the Southeast Permit and sections VI.C.6.b.(2), VI.C.6.b.(4), and VI.C.6.c.(3) of the Oceanside Permit. For example, critical pumps were not activated in order to maximize storage and treatment that could have avoided or reduced sewage discharges, and which resulted in unpermitted discharges.

3. Failure to post warning signs when public contact with wastewater could reasonably occur as required by Attachment G.I.I.2 of both the Southeast and Oceanside permits. For example, the City has failed to post warning signs when excursions have occurred on public property.

4. Failure to comply with reporting and recordkeeping requirements related to releases or diversions of untreated or partially-treated sewage from the combined sewer system pursuant to sections VI.C.4.c.ii.(a), VI.C.4.c.ii.(b), and VI.C.4.c.ii.(c) of the Southeast Permit. For example, the City has not collected or provided all required information about such releases or diversions in the Excursion Annual Report and has not reported all applicable releases and diversions that have occurred. The City has also failed to report all applicable releases and diversions greater than 1,000 gallons to the Regional Water Board and Department of Public Health.

5. Failure to comply with CSD monitoring and reporting as required by section VI.B of both the Southeast and Oceanside permits. For example, the City failed to monitor for all required parameters, did not monitor at the required frequency and failed to use a data-driven analysis of the pollutant removal efficacy of CSD structures.

6. Failure to notify the public of CSDs as required by section VI.C.5.b.viii of the Southeast Permit and section VI.C.6.b.(8) of the Oceanside Permit. For example, signs have been obscured, posted in inconspicuous areas, or unreadable from a reasonable distance, and warning signs have not been posted as required.

7. Failure to comply with water quality standards as required by section V.C of the Southeast Permit. For example, combined sewer discharges have exceeded water quality standards for pH, heavy metals, and bacteria

The City must operate in full compliance with the requirements of the CWA, including its NPDES permits. The violations identified in this letter may result in liability for appropriate

injunctive relief pursuant to CWA Section 309(b), 33 U.S.C. § 1319(b), and statutory civil penalties under CWA Section 309(d), 33 U.S.C. § 1319(d), as modified by 40 C.F.R. Part 19. Please note that the EPA is coordinating with the California Regional Water Quality Control Board, San Francisco Bay Region, to ensure that timely and appropriate enforcement action is taken and compliance with the permits is achieved.

The EPA takes CWA violations at municipal treatment plants very seriously and has pursued vigorous enforcement actions against other municipalities within California as well as elsewhere in the nation. The EPA expects the City to share its concern for the protection of public health and surface water resources and expects the City to address its ongoing CWA violations with significant and meaningful measures to ensure a prompt return to full compliance.

The notice provided in this letter is not an election by the EPA to forgo any remedies available to it under the law, including without limit any administrative, civil or criminal action to seek penalties, fines, or other appropriate injunctive relief under the CWA, and specifically any authority under CWA sections 309 and 504, 33 U.S.C. §§ 1319 and 1364. The EPA reserves all available legal and equitable rights and remedies to enforce any violations identified in this letter, as well as any other violations not specifically identified herein.

Sincerely,

Michael Stoker
Regional Administrator

cc: Michael Montgomery
Executive Officer SFRWQCB

EXHIBIT 8

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

NOV 21 2019

Harlan L. Kelly, Jr.
General Manager
San Francisco Public Utilities Commission
525 Golden Gate Avenue, 13th Floor
San Francisco, California 94102

Dear Mr. Kelly:

Your Deputy General Manager, Michael Carlin, copied the U.S. Environmental Protection Agency's Office of Water on his September 9, 2019 letter to Michael Stoker, Region 9 Regional Administrator, on behalf of the San Francisco Public Utilities Commission (SFPUC) regarding the reissuance of the SFPUC Oceanside NPDES permit. The Oceanside permit was issued on October 1, 2009 and expired on September 30, 2014. It has been continued administratively since that date. In his letter, Mr. Carlin requested a delay in the adoption of the renewed permit to allow a path forward "that is consistent with the intent of the Combined Sewer Overflow (CSO) Policy, protects receiving water quality, and creates improved regulatory certainty for the benefit of all parties." Given the national policy and consistency issues raised in his letter, we are responding on behalf of Mr. Stoker. EPA Administrator Andrew Wheeler also has asked us to respond on his behalf to the October 1, 2019, letter that you sent to him. The analysis set forth below applies not only to the Oceanside Publicly Owned Treatment Plant (POTW), but also to the Southeast (Bayside) POTW, which similarly is operating under an expired permit that has been continued administratively.

In summary, the interpretation of the CSO Policy set forth in the SFPUC letters, as well as the objection to permit terms that require compliance with water quality standards (WQS), have been reviewed by the EPA at the Headquarters level because they raise national issues. As articulated below, your asserted positions are inconsistent with the approach taken with respect to CSO and water quality issues across the country. If adopted, the EPA would be holding the City and County of San Francisco to a different and much lower standard than other communities that are addressing CSO issues.

In the September 9 letter, the SFPUC objects to permit conditions that require compliance with WQS and states that such permit conditions would impose "unlimited liability risk." According to that letter, the SFPUC does not need to comply with WQS because, following implementation of a Long-Term Control Plan (LTCP), "all parties should be assured that water quality standards and beneficial uses are being protected." Such an assertion is a complete misstatement of the CSO Policy, which was incorporated by reference into the Clean Water Act (CWA) in 2000. *See* 59 Fed. Reg. 18,688 (Apr. 19, 1994); CWA section 402(q), 33 U.S.C. 1342(q).

The CSO Policy does not waive any CWA requirements. Rather, the CSO Policy provides guidance on the planning, selection, and implementation of CSO controls "that meet the requirements of the CWA." 59 Fed. Reg. at 18,688. The Policy establishes nine minimum controls that are the minimum technology-based requirements for CSO discharges. 59 Fed Reg. at 18,695. Water quality-based requirements "are to be established based on applicable water quality standards." *Id.*

To develop a LTCP to meet WQS, the Policy lays out two alternative approaches to evaluate CSO controls: the "presumption" approach and the "demonstration" approach. The City and County of San Francisco began constructing CSO controls before the issuance of the CSO Policy and completed those controls in 1997. However, the CSO Policy still applies. As stated in the Policy, "[i]f, after monitoring, it is determined that WQS are not being attained, the permittee should be required to submit a revised CSO control plan that, once implemented, will attain WQS." *Id.* at 18,690. Moreover, the Policy specifically states that preexisting CSO controls "should be reviewed and modified to be consistent with the sensitive area, financial capability, and post-construction monitoring provisions of this Policy." *Id.* For example, far from waiving WQS, the CSO Policy specifies that a permit must include a post-construction monitoring program that is sufficient "to demonstrate compliance with WQS and protection of designated uses as well as to determine the effectiveness of CSO controls." *Id.* at 18,696. Permits also must include "[a] reopener clause authorizing the NPDES authority to reopen and modify the permit upon determination that the CSO controls fail to meet WQS or protect designated uses." *Id.* The Policy also specifies that "[t]he selected controls should be designed to allow cost effective expansion or cost-effective retrofitting if additional controls are subsequently determined to be necessary to meet WQS, including existing and designated uses." 59 Fed. Reg. at 18,691.

The SFPUC's September 9 letter states that the collection system exceeds its "design objectives" and that SFPUC believes that the discharges are "consistent with applicable water quality standards." "Consistent with" standards is not the same as meeting standards and the CWA requires compliance with WQS. WQS, their applicability, and policies generally affecting their application and implementation (such as mixing zones) are all established by state law, subject to EPA approval. The EPA is well aware that since 1979, California has provided San Francisco with a variance from the bacteria standards applicable to the Oceanside POTW and even allows "floatables" (i.e., fecal matter and other organic and inorganic substances) in the water that can directly impact beaches with recreation impacts. The CWA requires that states review applicable WQS, including variances, at least every three years. 33 U.S.C. 1313(c)(1); 40 CFR 131.20(a). The EPA's WQS regulations also require that a variance longer than five years be reevaluated at least every five years. *See* 40 CFR 131.14(b)(v). EPA Headquarters' review of the history of the variance seems to indicate that there have been no attempts to update this variance since its initial implementation in 1979. The EPA notified California in writing on August 14, 2017 and again on August 12, 2019 that the variance must be reviewed to ensure compliance with the CWA and the EPA's WQS regulations. That review must take place and if California cannot demonstrate that this variance meets the requirements set forth in 40 CFR 131.14, it should remove the variance.

The September 9 letter also argues that the Pacific Ocean is not impaired, including for bacteria, and that the Basin Plan and the San Francisco Bay Bacteria Total Maximum Daily Load (TMDL) found that combined sewer discharges are not a significant source of bacteria to the receiving waters. The attainment status of the receiving water does not obviate the need for a CSO discharge to meet WQS. The CWA is designed to protect receiving waters that already meet WQS, as well as to restore waters that are impaired. Further, reliance on the San Francisco Bay Bacteria TMDL to create a presumption that the Oceanside plant is not a significant source of bacteria is inapposite. First, the Oceanside plant discharges were not analyzed under the San Francisco Bay Bacteria TMDL. Second, the State of California has given the Oceanside POTW a variance from bacteria and must comply with other WQS to the extent practical. Third, the prior Oceanside permits had even given SFPUC an exemption from monitoring for bacteria in effluent so the utility has no factual basis for quantifying its bacteria loading. Finally, as applied to the Southeast plant, the TMDL assumes compliance with the existing permit. That assumption has been seriously called into question by the October 2, 2019 Notice of Violation issued to the SFPUC by EPA Region 9.

In addition to requiring discharges to meet WQS, the CSO Policy requires that permits must include "[a] requirement to reassess overflows to sensitive areas in those cases where elimination or relocation of the overflows is not physically possible and economically achievable. The reassessment should be based on consideration of new or improved techniques to eliminate or relocate overflows or changed circumstances that influence economic achievability." 59 Fed. Reg. at 18,696. The SFPUC has combined sewer overflow outfalls that discharge into the Pacific Ocean at Ocean Beach (Discharge Point Nos. CSD-001, CSD-002, and CSD-003), China Beach (Discharge Point No. CSD-005), and Baker Beach (Discharge Point Nos. CSD-006 and CSD-007). These are popular recreation areas used by the community and tourists throughout the year. As noted in Region 9's comments on the draft Oceanside permit, SFPUC has conducted a study that suggests that elimination of CSOs in the typical year at Baker Beach and China Beach is achievable. *See Westside Drainage Basin Urban Watershed Technical Opportunities Technical Memorandum* (Feb. 2015). However, the SFPUC's permit would continue to authorize those outfalls as well as other outfalls that are near other beaches. Like most beaches, these sites are used for primary contact recreation and thus are considered sensitive areas under the CSO Policy. 59 Fed. Reg. at 18,692. To comply with the CSO Policy, the physical possibility and economic achievability of the elimination or relocation of CSOs that discharge to primary contact recreation beaches must be addressed. The fact that Baker Beach was formerly impaired and may now be meeting WQS, as noted in your October 1, 2019 letter, does not obviate the need to determine if these combined sewer discharges can be eliminated or relocated. The revised Oceanside permit appropriately requires SFPUC to evaluate that elimination or relocation. Further, the beaches on the Bayside remain impaired.

The October 1, 2019 SFPUC letter argues in favor of continuing to use the same controls developed in the 1970s to addressing combined sewer discharges. Upgrading publicly owned treatment works from primary to secondary treatment was a significant impetus for the 1972 amendments to the CWA. Since that time, the vast majority of cities have made enormous investments to meet the secondary treatment standard. While secondary treatment standards do not apply to CSOs, the CSO Policy, technology-based limits based on best available technology economically achievable and best conventional technology, and WQS do.[1] We all might agree that in 1994 San Francisco was ahead of the curve in addressing CSOs. However, after 25 years of implementing the CSO Policy, San Francisco is now far behind.

As discussed above, the CSO Policy requires compliance with water quality standards. The EPA's concerns regarding WQS exceedances are clearly identified in the October 2, 2019 Notice of Violation. The EPA is also concerned that the approach adopted by San Francisco in the 1970s, with its continued reliance on primary treatment, does not even meet the "presumption" approach under the CSO Policy.[2] Under the presumption approach a city may initially presume compliance with WQS by either reducing the number of CSO overflows each year to no more than four to six, by eliminating or capturing for treatment no less than 85% of the volume of the combined sewage collected, or by eliminating or removing the mass of pollutants causing water quality impairments. 59 Fed. Reg. at 18,692-93. SFPUC's system is designed to route 100% of the sewage that does not receive treatment at a POTW to storage/transport and diversion structures that are intended to provide equivalent to primary treatment before sending the sewage to the combined sewer discharge outfalls. These structures are equipped with baffles that are intended to retain "floatables" instead of flowing through the outfall. However, if the structures fill with water it is unclear whether they operate as designed. Further, after a rainfall event, it

---

[1] *Montgomery Environmental Coalition v. Costle*, 646 F.2d 568, 592 (D.C. Cir. 1980).

[2] Under CSO Control Policy I.C.1 and 2, communities such as San Francisco that were already constructing or operating controls as of the date of the policy are not subject to the initial planning and construction provisions in the policy. "Such programs, however, should be reviewed and modified to be consistent with the sensitive area, financial capability, and post-construction monitoring provisions of this Policy." 59 Fed. Reg. at 18,690.

is unclear whether SFPUC cleans out the storage/transport structures to prevent "floatables" from the last storm from being discharged during the next storm. These operation and maintenance issues are among the subjects raised by the October 2, 2019 Notice of Violation.

Even if operated as designed, these structures do not constitute 85% "capture for treatment" that the CSO Policy identifies as an option for initially presuming WQS are met. Under the CSO Policy, capture for treatment means capture for *secondary* treatment. This is clear from the text of the Policy that requires that any combined sewer overflows *remaining after 85% is captured for treatment* receive at least *primary* clarification, i.e., treatment. 59 Fed. Reg. at 18,693. If "capture for treatment" meant primary treatment, this additional condition would have no meaning. Thus, the SFPUC's design for CSO treatment does not even warrant a presumption that WQS are met because it only achieves primary treatment. Of course, even if applicable, any presumption may be rebutted and the October 2, 2019 Notice of Violation rebuts that presumption.

The October 1, 2019 letter further argues that the SFPUC's combined sewer outfalls each discharge between one and 10 times a year. According to SFPUC's September 2017 Bayside System Efficacy Report, CSOs have occurred from discharge points CSD 009-043 an average of 17.6 times per year between 2012 and 2017, and according to SFPUC's September 2013 Monitoring Study to Effectively Characterize Overflow Impacts and Efficacy of CSD Controls for Oceanside, CSOs occurred from discharge points CSD 001-007 25 times in 2012-2013. SFPUC's own data show that the design and actual performance of San Francisco's combined sewer system exceed the four to six overflow events per year contemplated under the approach for presuming an adequate level of control to meet WQS under the CSO Policy. 59 Fed. Reg. at 18,692.

Finally, we need to address the claim in your October 1, 2019 letter that operational deficiencies by SFPUC "do not result in routine exposure to raw sewage." We would certainly hope that even when flooding occurs, basement backups are not "routine" for the residents of San Francisco. However, the fact that they exist may well be an indication that the City is not properly operating and maintaining its system. This issue also is a subject of the October 2, 2019 Notice of Violation.

These issues do not preclude reissuance of the Oceanside permit. However, they may prevent the SFPUC from being able to demonstrate compliance with the terms of both the Oceanside and Southeast permits immediately. Indeed, the October 2, 2019 Notice of Violation issued to the SFPUC by EPA Region 9 alleges that you are currently in violation of the terms of your expired 2009 Oceanside permit. The CSO Policy states that "[i]f compliance with the Phase II permit is not possible, an enforceable schedule, consistent with the Enforcement and Compliance Section of this policy, should be issued in conjunction with the Phase II permit which specifies the schedule and implementation of the long-term CSO control plan." *Id.* at 18,696. At present, we do not see how SFPUC can demonstrate compliance with WQS, its NPDES permits, or the CSO Policy in the near term. Accordingly, we strongly urge you to enter into such an enforceable agreement with the EPA.

Sincerely,

David P. Ross

SUMMARY OF RECENT CITY OF SAN FRANCISCO NPDES PERMIT VIOLATIONS

1. SOUTHEAST - Current Permit # ORDER No. R2-2013-0029

NPDES No. CA0037664

A	B	C	D
Date of Violation	**Description of Violation**	**Permit Term Violated**	**Date and Type of Document / Exhibit #**
2/8/14	Discharging un-dechlorinated treated water from southeast WPCP (Violation #1)	Section 3. a & c	2/13/14 5D (Ex. 1) 4/9/14 5DSup (Ex. 2) 4/15/14 CCSF (Ex. 2A) 6/10/14 VN (Ex. 3) 6/30/14 CCSF (Ex. 4) 10/22/14 CCSF (Ex. 5) 1 - Folder 001
2/8/14	Discharging untreated wastewater (Violation #2)	Section 3. a & c	2/13/14 5D (Ex. 1) 4/9/14 5DSup (Ex. 2) 6/10/14 VN (Ex. 3 above) 6/30/14 CCSF (Ex. 4 above) 10/22/14 CCSF (Ex. 5) 1 - Folder 001
2/28/14	Discharge of un-dechlorinated treated wastewater at discharge point No. 003 through No. 006	Section 3. a & c	3/5/14 5D (Ex. 6) 4/9/14 5DSup (Ex. 7) 6/10/14 VN (Ex. 3 above) 6/30/14 CCSF (Ex. 4 above) 2 - Folder 002
3/10/14	Discharge primary treated wastewater at discharge point No.001	Section 3. a & c	3/14/14 5D (Ex. 8) 4/09/14 5D (Ex. 8A) 6/10/14 VN (Ex. 3 above) 6/30/14 CCSF (Ex. 4 above) 3 - Folder 003
4/28/14	Unauthorized discharge due to grease blocking manhole water way		5/06/15 5D (Ex. 9) 5/06/15 CCSF (Ex. 10) 4 - Folder 004

EXHIBIT 9

5/14/14	Discharge secondary treated wastewater during dry weather to Islais creek discharge point.	Section 3. a & d	5/19/145D (Ex. 11) 5/15/14 CCSF (Ex. 11A) 6/10/14 VN (Ex. 3 above) 6/30/14 CCSF (Ex. 4 above) 5 - Folder 005
7/19/14	Unauthorized discharge with a positive chlorine residual	Section IV. A. 1. Table 6	7/24/14 5D (Ex. 12) 6 - Folder 027
10/17/14	Coliform bacterial counts not calculated as required. 1 permit violation since the last inspection. Not sufficiently dechlorinating discharge water		10/17/14 CEI (Ex. 13) 7 - Folder 006

2. SOUTHEAST - Previous Permit # ORDER No. R2-2002-0073 and

ORDER No. R2-2008-0007

NPDES No. CA0037664

Date of Violation	**Description of Violation**	**Permit Term Violated**	**Date and Type of Document / Exhibit #**
8/10/04	Unauthorized dry weather discharge due to power outage, insecure back-up power source, refrigeration of effluent not right temp	ORDER NO. R2-2002-0073 NPDES PERMIT NO. CAOO37664 Condition 10.e	9/14/04 CEI (Ex. 14) 1/14/05 CCSF (Ex. 15) 1 - Folder 009
12/6/14 and 12/7/14	Numerous deficiencies in CCSF's POTW pre-treatment program	Various Pretreatment Compliance Inspection Summary Report, see Sections 5.1, 5.2, 5.3, 6, 7,.1, 7.3, 7.4, 7.5, 8, 9, pp. (47)	2/16/05 PCI (Ex. 16) 3/04/05 CCSF (Ex. 17) 2 - Folder 033

11/17/05	CCSF facility using incorrect BOD (biochemical oxygen demand) values in their reporting. Three prohibited dry weather discharges to Islais creek noted since last inspection.		1/30/06 CEI (Ex. 18) 3/14/06 CCSF (Ex. 19) 3 - Folder 034
8/09/07	CCSF was not regulating SIU's and inspecting private companies before reissuing them a permit, not citing SIU's if they did violate their permit, many instances of non compliance	40 CFR 403.8(f)(l)(iii)(B)(4) 40 CFR 403.8(f)(2)(v) 40 CFR 403.8(f)(2)(iv)	8/09/07 PCA (Ex. 20) 9/20/07 CCSF (Ex. 21) 4 - Folder 014
5/8/08	Effluent exceedance of chlorine residual in the effluent reported since the last inspection.	Part B of Order No. R2-2002-0073	7/29/08 CEI (Ex. 22) 5 - Folder 035
6/26/2008	PCI report conducted indicates in the cover letter that the CCSF was not compliant. Water board specifically asks CCSF for a response regarding how they "plan to achieve compliance".		6/26/08 PCI cover (Ex. 23) 7/24/08 CCSF (Ex. 24) 6 - Folder 015
7/11/08	Discharge spill into Islais Creek as a result of PG&E power outage		7/14/08 5D (Ex. 25) 7/14/08 CCSF (Ex. 26) 7/14/08 CCSF H (Ex. 27) 7 - Folder 013
9/11/2008	Fecal coliform concentration exceedance caused five permit violations		1/28/09 AR (Ex. 28) 8 - Folder 037

12/16/08	Bacterial concentrations in the effluent was higher than the permit allowed.	Order No. R2-2008-0007, Provision IV.B.1.c,	11/5/2009 IP (Ex. 29) 1/28/09 AR (Ex. 28 above) 9 - Folder 012
1/15/09	The southeast WPCP was not adequately recording and reporting their data to the water board. The plant also discharged effluent that exceeded the permits concentration of fecal coliform bacteria. Lab work was not performed adequately with permit standards.	Order No. R2-2008-0007. Section 3a Section 3c. Section 2.d. Section 4g. Section 5a. Section 7.i. 40 CFR Part 136.	2/23/09 IP (Ex. 30) 4/8/09 CCSF (Ex. 31) 4/9/09 CCSF (Ex. 32) 10 - Folder 011
2/02/09	PCI cover letter from 2009 indicates CCSF no compliance due to inadequately regulating SIU's – 18 out of 30 SIU's were not inspected at all by CCSF.		7/29/09 PCI cover (Ex. 33) 11 - Folder 016
2/23/09	High copper concentrations in the influent to southeast WPCP	Section 8 Special Provisions Copper Action Plan	6/23/09 CCSF (Ex. 34) 12 - Folder 008
9/21/09	Enterococcus bacterial concentration exceedance in the effluent at discharge point 002.	Order No. R2-2008-0007, Provision IV.B.1.c,	11/05/09 CEI (Ex. 35) 13 - Folder 036
2/26/10	SIU's significant noncompliance on page 46 of 2009 AR. Summary of report also indicates 5 notices of violations against SUI's and 1 SUI with published noncompliance		3/26/10 AR (Ex. 36) 14 - Folder 038

10/13/10	CCSF not correctly reporting all overflow events or reporting them at all, not maintaining overflow structures as required by their permit and not keeping-up with general plant maintenance, not removing solids and floating materials prior to discharge	Order No. R2-2008-0007, Attachment D, Section D Order No. R2-2008-0007, Section V-Receiving Water Limitations, Item 7, (I) No. R2-2008-0007, V. Receiving Water	10/13/10 CEI (Ex. 37) 6/6/11 CCSF (Ex. 38) 12/20/11 CCSF (Ex. 39) 15 - Folder 017
12/14/11	The effluent from southeast WPCP did not pass the fish/organism test of 90 percent or more survival	No. R2-2008-0007, Section IV.A.1.f	2/8/12 CEI (Ex. 40) 16 - Folder 010
11/16/12	Enterococcus violation		5/30/14 CEI (Ex. 41) 17 - Folder 031
12/08 thru 12/12	Ten counts of Enterococcus bacterial concentration exceedances in the effluent at southeast WPCP between 2008-2012	Sections 13385(h) and 13385(i)	1/25/10 AR (Ex. 42) 1/31/11 AR (Ex. 43) 6/18/13 CCSF (Ex. 44) 7/23/13VN (Ex. 45) 7/23/13 W (Ex. 46) 18 - Folder 007

3. OCEANSIDE - Current Permit # ORDER No. R2-2009-0062

NPDES No. CA0037681

Date of Violation	Description of Violation	Permit Term Violated	Date and Type of Document / Exhibit #
7/21/14	Unauthorized discharge and operator error on 2 hour reporting requirement		7/30/14 5D (Ex. 47) 9/23/14 PP (Ex. 48) 1 - Folder 024
8/27/14	Unauthorized discharge		9/4/14 5D (Ex. 49) 9/23/14 PP (Ex. 50) 2- Folder 025
12/11/14	Unauthorized discharge		1/26/13 CCSF (Ex. 51) 12/11/14 2HR (Ex. 52) 12/18/14 5D (Ex. 53) 1/7/15 CCSF (Ex. 54) 1/13/15 CCSF (Ex. 55) 1/23/15 5D Sup (Ex. 56) 1/26/15 CCSF (Ex. 57) 1/28/15 CCSF (Ex. 58) 2/24/15 PP (Ex. 59) 3/30/15 CCSF (Ex. 60) 4/27/15 CCSF (Ex. 61) PP (Ex. 62) 3 - Folder 026

Previous Permit # CA0037681 (R2-2009-0062)

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
03/13/2019	BOD_5 results for INF-001A and EFF-001A samples did not meet the BOD method SM5210B specification of a minimum dissolved oxygen depletion of 2.0 mg/L for the seed banks. This violation is 1 of 2 QA/QC specifications that were not met for these samples on this day	Section VI.B. MRP Section V.C.3.	OSP0246 OSP0288, 291
03/13/2019	BOD_5 results for INF-001A and EFF-001A samples did not meet the BOD method SM5210B specification of a maximum dissolved oxygen depletion of .20 mg/L for the dilution water blanks. This violation is 2 of 2 QA/QC specifications that were not met for these samples on this day	Section VI.B. MRP Section V.C.3.	OSP0246 OSP0288, 291
07/07/2019 – 07/13/2019	BOD_5 results for INF-001 and EFF-001A samples did not meet the BOD method SM5210B specification of a maximum dissolved oxygen depletion of .20 mg/L for the dilution water blanks.	Section VI.B. MRP Section III. & Section VI.B. MRP Section IV.	OSP0253 OSP0288, 291
07/28/2019 – 08/03/2019	Only four INF-001 samples were collected this week for pH due to unplanned plant shutdown on July 29-30, necessitated by a PG&E issue, prevented the collection of grab samples on those days. The permit requires 5/week minimum monitoring	Section VI.B. MRP Section III.	OSP0253, 254 OSP0288, 291

Exhibit 10

All Instances of Non-Compliance of the Relevant NPDES Permits for the OSP

Previous Permit # CA0037681 (R2-2009-0062)

Date of Violation	Description of Violation	Permit Term Violated	Page Number of Exhibit 13
07/28/2019 – 08/03/2019	Only four INF-001 samples were collected this week for TSS due to unplanned plant shutdown on July 29-30, necessitated by a PG&E issue, prevented the collection of composite samples on those days, and a sampler setup issue prevented collection of a sample on July 31st. The permit requires 5/week minimum monitoring frequency.	Section VI.B. MRP Section III.	OSP0253, 254 OSP0288, 291
08/02/2019	For dry weather compliance monitoring, incomplete composite samples were collected for monitoring locations INF-001A and EFF-001Adue to plant shutdowns. Only TSS could be calculated.	Section IV.A. & Section VI.B. MRP Section III	OSP0258
08/17/2019	Unauthorized discharge of an estimate 1.8 MG of primary treated wastewater bypassed secondary treatment facilities and discharged through Discharge Point 001 for 13 hours due to equipment and programming failure.	Section III.A. Order conditions	OSP0251 OSP0258, 259 OSP0288, 290
08/17/2019	For dry weather compliance monitoring, incomplete composite samples were collected for monitoring locations INF-001A and EFF-001Adue to plant shutdowns. Only TSS could be calculated.	Section IV.A. & Section VI.B. MRP Section III	OSP0258

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Air Quality.

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents. I write on its behalf to comment on the Draft Environmental Impact Report (DEIR) for the Comprehensive Parnassus Heights Plan (CPHP) with respect to its analysis of Project impacts on air quality.

San Franciscans objects to the approval of this Project. The DEIR fails to comply with the California Environmental Quality Act (CEQA) for the reasons described below and in my previous letters dated yesterday and today and submitted today.

1. The DEIR's Cancer Risk Impact Assessment Is Based on Legal Errors and Not Supported by Substantial Evidence.

a. The DEIR's thresholds of significance for cancer risk.

The DEIR establishes a threshold of significance for toxic air contaminant (TAC) related cancer risk as follows: "Exceed the LRDP EIR standard of significance by exposing receptors to toxic air contaminant emissions that (1) result in a cancer risk greater than 10 cancer cases per 1 million people exposed in a lifetime...." The DEIR also establishes more general threshold of significance, as follows: "Expose sensitive receptors to substantial pollutant concentrations." (DEIR 4.2-19 [pdf 233].)

The DEIR elaborates on the TAC-caused cancer risk as follows:

> In addition to criteria air pollutants, individual projects may emit TACs during construction and operation. As part of assessment of Initial Phase projects, a HRA [Health Risk Assessment] was conducted to provide quantitative estimates of health risks from exposures to TACs.

CEQA provides the lead agency with discretion in selecting significance

> thresholds for the purposes of assessing impacts. For the analysis of health risk and localized impacts, UCSF uses quantitative significance thresholds adopted by BAAQMD [Bay Area Air Quality Management District]. These thresholds are based on substantial evidence identified in Appendix D of the 2017 BAAQMD CEQA Guidelines and its 2009 Justification Report. These thresholds were applied for the analysis of health risk and localized impacts in the Final EIR for the 2014 UCSF Long Range Development Plan and are also applied in this document. Specifically, if a proposed project would result in increased cancer risks exceeding 10 in one million or, a hazard index exceeding 1.0 or a localized PM2.5 concentration exceeding 0.3 ìg/m3 then it would be considered to result in a significant impact with regard to exposure of sensitive receptors to substantial pollutant concentrations. The 0.3 ìg/m3 PM2.5 concentration and the excess cancer risk of 10.0 per million persons exposed are the levels below which BAAQMD considers new sources not to make a considerable contribution to cumulative health risks (BAAQMD, 2017a).
>
> As described by BAAQMD, USEPA considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cancer risk. A cumulative cancer risk of 100 in one million is also used by the City of San Francisco for projects within its jurisdiction to determine the location of APEZ's. Therefore, a *cumulative increase* in cancer risk from all sources would occur if the total of all risks exceeds in one million [sic].

(DEIR 4.2-24 [pdf 238] (italics added).)

The last sentence of this passage appears to have a missing word. Presumably it is supposed to read "the total of all risks exceeds ***100*** in one million." It is also not clear what the DEIR means when it states that "a cumulative increase" in cancer risk would occur. Presumably it means that "cumulatively ***considerable*** increase in cancer risk from all sources would occur if the total of all risks exceeds ***100*** in one million."

For the Project's cumulative cancer risk impact, the DEIR confirms that it uses a threshold of 100 per one million, stating:

> As discussed above, cumulative health risks are analyzed in accordance with BAAQMD's threshold and guidance. As described by BAAQMD considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cancer risk.

(DEIR 4.2-24 [pdf 238] (italics added).)

b. The DEIR's description of the existing conditions (i.e., baseline) for cancer risk.

The DEIR describes the existing conditions (i.e., baseline) for TAC related cancer risk from ambient concentrations of carcinogenic toxic air contaminants as 248.3 cases per million. (DEIR 4.2-10 [pdf 224].)

The DEIR describes the existing conditions (i.e., baseline) for TAC related cancer risk from diesel particulates (DPM) as 480 in one million in the year 2000 in the Bay Area; and 520 in one million in the year 2012 statewide. (DEIR 4.2-11 [pdf 225].) The DEIR indicates that in 2000, CARB approved a Diesel Risk Reduction Plan that it anticipated would result in an 80 percent decrease in statewide diesel health risk in 2020 as compared with the diesel risk in 2000. The DEIR does not disclose what the statewide diesel risk was in 2000, so it is not possible to calculate what an 80% reduction would look like in 2020. The DEIR also does not disclose what the statewide diesel risk is in 2020.

The EIR's description of the DPM baseline risk is insufficient because it is not current as of the date of the Notice of Preparation of the EIR.

c. The DEIR's impact assessment for cancer risk is based on legal error and not supported by substantial evidence.

(1) The DEIR's assessment of the Project's incremental increased cancer risk is based on legal error and not supported by substantial evidence.

The DEIR's impacts analysis concludes that the Project's incremental and cumulative increased cancer risk impacts are less than significant. These conclusions are based on errors of law and are not supported by substantial evidence.

The DEIR's threshold of significance for the Project's incremental cancer risk impact is any increase in cancer risk over 10 cases per million. The DEIR borrows this threshold from the BAAQMD CEQA Guidelines and then deploys it without regard for the extreme baseline cancer risk in San Francisco. The DEIR thereby commits the fundamental error of failing to add the Project's effects to the baseline for purposes of determining significance. (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 722-723; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 881-882.)

In addition to this fundamental legal error, the DEIR's use of this threshold regardless of baseline cancer risk is not supported by substantial evidence. The baseline cancer risk in San Francisco is 248.3 cases per million plus the unquantified DPM related risk. The DEIR's uncritical use of the 10 cases per million BAAQMD threshold implies that an increase of less than 10 cases per million is always less than significant, regardless of the baseline risk, which

presumably is very different in rural suburban parts of the Bay Area (e.g., Blackhawk) than it is in San Francisco. There is no substantial evidence to support this implicit factual finding.

There is no substantial evidence to support this implicit factual finding because the BAAQMD threshold is a policy, based on a value judgment, not a finding of fact based on evidence. This violates CEQA. Determinations of significance must be based on evidence, not value judgments and policy. (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108–1109 (*Amador Waterways*) ["such thresholds cannot be used to determine automatically whether a given effect will or will not be significant"].)

Here, other than pointing to the BAAQMD threshold, the DEIR fails to explain why the Project's admitted incremental increase in cancer risk is not significant given that it is being added to a severe baseline cancer risk. "[I]n preparing an EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project, irrespective of whether an established threshold of significance has been met with respect to any given effect." (*Amador Waterways, supra,* 116 Cal.App.4th at 1109.)

(2) The DEIR's assessment of the Project's cumulative increased cancer risk is based on legal error and not supported by substantial evidence.

As discussed above, for the Project's cumulative increased cancer risk, the DEIR uses threshold of any exceedance of 100 cases per one million because "BAAQMD considers a cancer risk of 100 cases per one million or less to be within the 'acceptable' range of cancer risk." (DEIR 4.2-24 [pdf 238],) The DEIR also confirms this on page 4.2-27, stating:

> As discussed above, cumulative health risks are analyzed in accordance with BAAQMD's threshold and guidance. As described by BAAQMD considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cancer risk.

Assuming *arguendo* that this is an appropriate threshold for assessing whether the Project's cumulative cancer risk impact is significant, the DEIR fails to apply it. After stating this threshold on DEIR pages 4.2-24 and page 4.2-27, the DEIR shiftily alters the threshold on page 4.2-70, stating:

> Because the cumulative increase in cancer risk from all sources would be well below 100 in one million ... the CPHP's cumulative impact to local health risk and hazards would be reduced to less than significant with identified mitigation.

Thus, instead of considering any resulting cancer risk above 100 cases per one million to be significant, the DEIR shifts to requiring that the cumulative "increase" in cancer risk contributed by the Project in combination with other projects exceed 100 cases per one million to

be found significant. This shift reflects several legal errors.

First, the DEIR is just plain confusing as to what the cumulative threshold is, which frustrates meaningful public comment. Therefore, the DEIR must be revised and recirculated using a clear and stable cumulative threshold.

Second, the threshold as employed on page 4.2-70 (for both construction and operation) suffers the same legal defect as the incremental standard, i.e., it is employed without regard to the baseline cancer risk. The baseline cancer risk in San Francisco is 248.3 cases per million plus the unquantified DPM caused risk. According BAAQMD and this DEIR, this baseline risk is "unacceptable." The cumulative increase in cancer risk contributed by the Project in combination with other projects will make this existing severe condition worse. Other than pointing to the BAAQMD threshold, the DEIR fails to explain why the Project's admitted cumulative increase in cancer risk is not significant given that it is being added to a severe baseline cancer risk. (*Communities For a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 718.)[1]

This legal error is illustrated by considering the math. According the DEIR, the threshold of a cumulative *increase* of 100 cases per million applies regardless of baseline risk. Thus, a project with a baseline cancer risk of 50 cases per million would need a post-project cancer risk of 150 cases per million for the cumulative impact to be deemed significant, while a project with a baseline cancer risk of 100 cases per million would need a post-project cancer risk of 200 cases per million for the cumulative impact to be deemed significant. Thus, a project with the higher baseline risk (100 per million) *would not be deemed* to have a significant cumulative impact with a post-project cancer risk of 150 cases per million, but a project with the lower baseline risk (50 per million) *would be deemed* to have a significant cumulative impact with a post-project cancer

---

[1] The decision in *Kings County* repudiates the "ratio theory," stating:

> The [ ] EIR concludes the project's contributions to ozone levels in the area would be immeasurable and, therefore, insignificant because the [cogeneration] plant would emit relatively minor amounts of [ozone] precursors compared to the total volume of [ozone] precursors emitted in Kings County. The EIR's analysis uses the magnitude of the current ozone problem in the air basin in order to trivialize the project's impact ... The relevant question to be addressed in the EIR is not the relative amount of precursors emitted by the project when compared with preexisting emissions, but whether any additional amount of precursor emissions should be considered significant in light of the serious nature of the ozone problems in this air basin.

(*Kings County, supra*, 221 Cal.App.3d at 718).

risk of 150 cases per million.

In short, the widely repudiated "ratio theory" in which "the greater the overall problem, the less significance a project has in a cumulative impacts analysis" is embedded in the threshold of significance applied by the DEIR to the Project's cumulative cancer risk impact. (*Kings County, supra*, 221 Cal.App.3d 692, 721 ["We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's "ratio" theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis"].)

Needless to day, the environmental justice implications of the DEIR's use of this threshold are dire.

Third, like the incremental threshold, the cumulative threshold, represents a value judgement, not a threshold for making a factual findings based on evidence. And this is true for both the DEIR's initial formulation of the threshold as a post-project condition in which cancer risk exceeds 100 cases per one million, and its later formulation of the threshold as the cumulative increase in cancer risk contributed by the Project in combination with other projects exceeds 100 cases per one million.

CEQA neither requires nor allows the DEIR to use the BAAQMD's or EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts. UCSF's discretion to decide that significant environmental harm is "acceptable" in light of the project's benefits arises at the end of the CEQA analysis, in the context of a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant.

> A statement of overriding considerations is required, and offers a proper basis for approving a project despite the existence of unmitigated environmental effects, only when the measures necessary to mitigate or avoid those effects have properly been found to be infeasible. (Pub. Resources Code, § 21081, subd. (b).) Given our conclusion the Trustees have abused their discretion in determining that CSUMB's remaining effects cannot feasibly be mitigated, that the Trustees' statement of overriding circumstances is invalid necessarily follows. CEQA does not authorize an agency to proceed with a project that will have significant, unmitigated effects on the environment, based simply on a weighing of those effects against the project's benefits, unless the measures necessary to mitigate those effects are truly infeasible. Such a rule, even were it not wholly inconsistent with the relevant statute (id., § 21081, subd. (b)), would tend to displace the fundamental obligation of "each public agency [to] mitigate or avoid the significant effects on the environment of projects that it carries out or approves

whenever it is feasible to do so" (id., § 21002.1, subd. (b)).

City of Marina v. Board of Trustees of the California State University (2006) 39 Cal.4th 341, 368-69.

This is a critical distinction, because where the Project does not exceed thresholds of significance that are erroneously inflated by the concept of "acceptable risk," UCSF is absolved of further legal obligation to mitigate the impact. As a result, the public cannot know whether UCSF will allow an unknown number of cancer cases to occur that it could have feasibly avoided had it scrupulously followed CEQA. Nor does the public know, had the EIR determined the Project's additional cancer risk is significant, whether or not UCSF would have found the Project's benefits outweigh its environmental and adverse human health effects.

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

(2) January 21, 2021, Board of Regents of the University of California meeting, Agenda Item entitled "Committee Reports Including Approvals of Recommendations from Committees: ... Finance and Capital Strategies Committee."

PROJECT IMPACTS ON AIR QUALITY

Dear Members of the Board of Regents of the University of California and Ms. Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents. I write on its behalf to object to the Board's approval of Amendment #7 to the UC San Francisco 2014 Long Range Development Plan for the Comprehensive Parnassus Heights Plan and Amendment #2 to the Physical Design Framework, San Francisco Campus (referred to herein as "Project").

The Board should not and cannot legally approve this Project because the Project Environmental Impact Report ("EIR") does not comply with the California Environmental Quality Act ("CEQA"). This letter discusses the EIR's failure to lawfully analyze and disclose the Project's impacts on air quality and human health.

As discussed in my September 11, 2020, letter regarding the Draft EIR's air quality analysis, to evaluate the significance of the Project's cancer risk effects, the EIR uses thresholds of significance developed by the Bay Area Air Quality Management District ("BAAQMD"). BAAQMD [Bay Area Air Quality Management District].

For the Project's incremental effects, BAAQMD's threshold is any increase in cancer risk at or above 10 new cases of cancer per one million people. For the Project's cumulative effects, BAAQMD's threshold is 100 cases of cancer per one million people.

My September 11, 2020, letter commented that the EIR is unclear as to how the cumulative threshold is applied. Is it deemed significant if the Project contributes to an increase in cancer risk where total post-project cancer risk exceeds 100 cases of cancer per one million. Or is it only deemed significant if the Project contributes an increase in cancer risk at least 100 in one million above baseline risk. The Final EIR and it response to comments fail to respond to this point or to clarify how the threshold was applied.

The Final EIR responds to my comment regarding the Draft EIR's failure to describe the baseline cancer risk from diesel particulates ("DPM) by calculating this risk using projections the California Air Resources Board ("CARB") made in the year 2000 regarding reductions in DPM caused cancer risk that could be expected by the year 2020. The response to comments provides, for the first time, an estimate the statewide diesel risk in 2000, which it uses to calculate a current basin wide cancer risk of 96 cases of cancer per 1 million people, stating:

> The California Air Resources Board (CARB) has published projected trends of DPM emissions for the San Francisco Bay Area Air Basin. Based on this latest trends document, basin-wide emissions of DPM are predicted to decrease from 10 tons per day in 2000 to 2 tons per day in 2020, an 80 percent reduction. As stated on page 4.2-11 of the Draft EIR, as of 2000, the average Bay Area cancer risk from exposure to DPM based on a population-weighted average ambient DPM concentration was approximately 480 in one million. Consequently, one may expect that the current (2020) basin-wide risk solely from DPM to be on the order of 96 in one million.

(FEIR Vol. 2, p. 8.4.2.2-240 (pdf 352).)

This response to comments is too little, too late. It is too little because it is an estimate based on 20 year old projections, not a current analysis at a time close to issuance of the Notice of Preparation. It is too late because an accurate and complete description of baseline conditions is essential information for a Draft EIR to present. The omission of this information from the Draft EIR requires recirculating a revised Draft EIR for public and agency comment.

The Draft EIR represents that baseline cancer risk from toxic air contaminants ("TAC") is 248 cases per one million people. As noted, the Final EIR suggests the DPM baseline cancer risk is 96 cases per 1 million. The Final EIR also states these two baseline risks are additive, stating: "Other toxic air contaminant emissions within the basin will further contribute to this estimated risk." (FEIR Vol. 2, p. 8.4.2.2-240 (pdf 352).) Thus, baseline cancer risk is at least either 248 cases per one million people or 344 cases per one million people. The Final EIR responds to my comment regarding the invalidity of the EIR's use of the cumulative threshold by referencing the fact that the BAAQMD considers any cancer risk below 100 cases of cancer in one million

people to be "acceptable" and cancer risk above 100 cases of cancer in one million people to be unacceptable. Thus, EIR must explain why any Project induced increase in cancer risk above this severe existing condition is not significant. (*Communities For a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 718.)[1] The EIR fails to do so. This is a failure to proceed in the manner required by law.

My September 11, 2020, letter commented that the Draft EIR employs these thresholds in a manner that fails to account for the severity of existing baseline conditions. The FEIR's response to comments argues that these thresholds of significance are supported by "substantial evidence." (FEIR Vol. 2, p. 8.4.2.2-240-242 (pdf 352-354).) This is not responsive to my comment that the EIR commits a procedural/informational error by "failing to add the Project's effects to the baseline for purposes of determining significance."

The FEIR's response to comments argues that because BAAQMD, San Francisco and other agencies agree that these thresholds of significance are appropriate, this somehow provides "substantial evidence" supporting their use. (FEIR Vol. 2, p. 8.4.2.2-240-242 (pdf 352-354).) This and a number of other points purport to explain why the BAAQMD thresholds are supported by substantial evidence *in general*. The FEIR misconceives the task at hand, because the points made in the response to comments in this regard are entirely abstract, untethered to the fact of this Project. (See e.g., *Golden Door Properties, LLC v. County of San Diego* (2018) 27 Cal.App.5th 892, 903–905 (*Golden Door*) ["the Efficiency Metric 'allows the threshold to be applied evenly to most project types,' but it does not account for variations between different types of development; nor does it explain why the per person limit would be appropriately evenly

---

[1] The decision in *Kings County* repudiates the "ratio theory," stating:

> The [ ] EIR concludes the project's contributions to ozone levels in the area would be immeasurable and, therefore, insignificant because the [cogeneration] plant would emit relatively minor amounts of [ozone] precursors compared to the total volume of [ozone] precursors emitted in Kings County. The EIR's analysis uses the magnitude of the current ozone problem in the air basin in order to trivialize the project's impact ... The relevant question to be addressed in the EIR is not the relative amount of precursors emitted by the project when compared with preexisting emissions, but whether any additional amount of precursor emissions should be considered significant in light of the serious nature of the ozone problems in this air basin.

(*Kings County, supra*, 221 Cal.App.3d at 718).

applied despite project differences. Without substantial evidence explaining why statewide GHG reduction levels would be properly used in this context, the County fails to comply with CEQA Guidelines"].)

The response to comments argues that the 100 in one million cancer risk threshold is based on guidance developed by the United States Environmental Protection Agency for "acceptable" risk. The announced basis of that threshold for toxic air pollutants is identified as the 1989 preamble to the benzene National Emissions Standards for Hazardous Air Pollutants (NESHAP) rulemaking, which is focused on providing the "maximum feasible protection against risks to health ..." (*Id.,* emphasis added.)

The EIR presents a simplistic misrepresentation of actual EPA policy. The EPA's actual policy is to assess increased cancer risk based on a host of site-specific factors within a range of values from 1 in one million to 100 in one million. This policy reflects the agency's attempt to balance the costs and benefits of protecting public health in its implementation of a host of federal environmental laws, including the Clean Air Act, Clean Water Act, Resource Conservation and Recovery Act, CERCLA (Superfund), etc. (See Exhibit [Starfield, L.E., "The 1990 National Contingency Plan: More Detail and More Structure, But Still a Balancing Act;" Environmental Law Reporter, June 1990].)[2]

---

[2]"In the proposed NCP [Superfund National Contingency Plan], the Agency [EPA] had defined the acceptable risk range as being from 10^{-4} to 10^{-7}, meaning that when the excess risk to an individual of contracting cancer due to a lifetime exposure to a certain concentration of a carcinogen falls between approximately 1 in 10,000 [100 in one million] and 1 in 10 million, it is judged to be an acceptable exposure. As a measure of additional protection, the proposal provided that there should be a "point of departure" of 10^{-6}, toward the more protective end of the scale, that should be used in setting preliminary remediation goals; if conditions warranted, the final remedy could achieve a level elsewhere within the range. ¶ The final rule maintained the point of departure of 10^{-6}, but narrowed the risk range to 10^{-4} through 10^{-6}. This action was taken in response to public comment and concerns that the Superfund range went below the accepted de minimis level used by other EPA programs and those of other federal agencies. ... the Agency has retained the discretion to select a cleanup level outside the range in appropriate circumstances (e.g., where concerns about sensitive populations, synergistic effects among chemical mixtures, etc., suggest that the remedy should attain a level below 10^{-6}. The use of a range of acceptable risk is general practice for most government programs. As discussed below in the section on role of cost, it affords the Agency the flexibility to take into account different situations, different kinds of threats, and different kinds of technical remedies. If a single risk level had been adopted, (e.g., at the more stringent end of the risk range), fewer alternatives would be expected to pass the protectiveness threshold and qualify for consideration in the

Instead of following this analytic approach, the EIR selects one value at the least environmentally protective end of the EPA's "acceptable risk" range and uses it to determine the significance of the Project's impacts, but without regard to the Project's site-specific considerations.

The EIR's reliance on the 100 excess cancer threshold to determine cumulative significance is legally flawed because it improperly imports considerations of the cost and feasibility of mitigation into a determination of significance, whereas CEQA requires that these two determinations be made in distinct steps. The EPA standard was designed to support a different regulatory scheme, not to support determinations of significance under CEQA. The EPA is permitted and required to consider factors of cost and feasibility in its regulation of toxics under the Clean Air Act. However, CEQA neither requires nor allows the EIR to use EPA's judgment of "acceptable" cancer risk to determine the significance of cumulative impacts. The determination of "acceptable" environmental harm arises at the end of the CEQA analysis in the context of a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant. (*See, e.g., City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341, 368-369.)

This is a critical distinction, because where the Project does not exceed thresholds of significance that are erroneously inflated by the concept of "acceptable risk," UCSF is absolved of further legal obligation to mitigate the impact. As a result, the public cannot know whether UCSF will allow an unknown number of cancer cases to occur that it could have feasibly avoided had it scrupulously followed CEQA. Nor does the public know, had the EIR determined that 46 additional child cancer cases per one million persons is significant, whether or not UCSF would have found the Project's benefits outweigh its environmental and adverse human health effects.

The Alliance also objected that the DSEIR's purported justification of the 100 excess cancer threshold as representative of "pristine" conditions was not coherent or explained by the DSEIR or the 2009 BAAQMD reports cited by the DSEIR.

The SEIR's use of the BAAQMD cancer risk thresholds is legally flawed because "a threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant." (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109.) Also, the EIR uncritically relies on an appeal to another agency's standards without justification, even though it is well-settled that mere compliance with

---

balancing phase of the remedy selection process." (Id., 20 ELR 10237 [footnotes omitted].)

another agency's regulatory standards cannot be used under CEQA as a sufficient basis for determining that a project's effects are insignificant. (*Ebbetts Pass Forest Watch v. California Department of Forestry & Fire Protection* (2008) 43 Cal4th 936, 957 (err to conclude that compliance with pesticide restrictions precludes significant impact); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718 (improper to conclude that compliance with air quality regulations precludes significant impact); *Oro Fino Gold Mining Corporation v County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (meeting general plan noise standard does not preclude significant impact).) An agency must conduct its own fact-based analysis of project impacts, regardless of compliance with other regulatory standards. (*Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16; C*itizens for Non-Toxic Pest Control v. Department of Food & Agriculture* (1986) 187 Cal.App.3d 1575, 1587-1588.)

The response to comments also purports to find substantial evidence support for using these thresholds in the fact that BAAQMD developed its 100 in one million cumulative criterion because it is reflective of air quality in a 'pristine' portion of the Bay area. It is difficult to see how this supports the EIR's use of the cumulative threshold to find this Project's cumulative cancer risk impacts to be less than significant.

If the EIR uses the cumulative threshold to conclude that if the Project contributes to an increase in cancer risk where total post-project cancer risk exceeds 100 cases of cancer per one million, then the fact that cancer risk in pristine areas is 100 in one million supports finding this Project's cumulative contribution to be "considerable" because it will increase cancer risk above the baseline cancer risk of at least 248 or cases per one million people or 344 cases per one million people

Alternatively, if the EIR uses the cumulative threshold to deem the impact significant only if the Project contributes an increase in cancer risk at least 100 in one million above baseline risk, then the fact that cancer risk in pristine areas is 100 in one million is irrelevant to the determination of significance.

The response to comments also refers several times to a 1000 foot distance from sources of cancer risk. The response does not explain how this distance supports the EIR's application of these thresholds to the facts of this Project and its setting. If this distance limit is used to exclude the contribution of regionally or globally transported TACs to this Project's cumulative excess cancer risk, the EIR commits an error of law. Baseline risk cannot be arbitrarily reduced by this artifice. Also, the fact that DPM or TACs from a <u>particular</u> source may attenuate with distance does not explain why the cumulative background DPM and TACs from <u>all</u> sources, including more distant sources, should be ignored in a cumulative analysis. CEQA requires consideration of all related sources of risk in cumulative analysis.

Finally, BAAQMD adopted these cancer risk thresholds of significance for general use and the EIR uses them without adapting them or how they are applied to reflect anything unique about this project or its environmental setting. CEQA requires that before the Regents use such generalized thresholds of significance, it must adopt the thresholds by a public rule-making process, and must show in that process that the thresholds are supported by substantial evidence.

> Having determined the Efficiency Metric is a threshold of significance, we conclude the 2016 Guidance Document "must be adopted by ordinance, resolution, rule, or regulation, [be] developed through a public review process[,] and be supported by substantial evidence." (§ 15064.7, subd. (b).) The County's reliance on *Save Cuyama, supra*, 213 Cal.App.4th 1059, 153 Cal.Rptr.3d 534 to argue CEQA compliance is unnecessary because the threshold of significance is evaluated on a case-by-case basis does not persuade us otherwise. *Save Cuyama* acknowledges a threshold for general use is subject to CEQA public adoption guidelines. (Id. at p. 1068, 153 Cal.Rptr.3d 534.) ... The County acknowledges the Efficiency Metric was not formally adopted by ordinance, rule, resolution, or regulation and was not developed through a public review process. Accordingly, the 2016 Guidance Document is out of compliance with state CEQA requirements.

Golden Door Properties, LLC v. County of San Diego (2018) 27 Cal.App.5th 892, 903.

The 1990 National Contingency Plan — More Detail And More Structure, But Still a Balancing Act

Lawrence E. Starfield

Editors' Summary: The 1986 Superfund Amendments required EPA to make substantial changes in the national contingency plan, EPA's principal rulemaking under the Superfund program. Congress imposed potentially conflicting mandates on EPA, such as requirements to maximize treatment and to ensure cost-effective remedies. EPA's proposed NCP revisions, issued in December 1988, were analyzed in ELR's March 1989 issue by the EPA attorney who played a principal role in drafting the proposed revisions. In this Article, the final NCP revisions, which took effect on April 9, 1990, are analyzed by the EPA attorney primarily responsible for the legal issues in the final rule. The rule and preamble, which together cover 200 pages in the Federal Register*, include EPA's response to the 1986 amendments and revisions that reflect EPA's experience with the first decade of Superfund. The author provides an overview of the framework of the final NCP, analyzes the major issues addressed by the final rule, and discusses the prinicipal changes from the 1988 proposed rule. The author observes that the true test of the NCP's success will be in the field, and that Congress should give the new regulatory framework some time to be implemented before imposing another set of mandates and deadlines.*

Mr. Starfield is an attorney-adviser in the U.S. Environmental Protection Agency's Office of General Counsel. He has worked on Superfund issues at EPA since 1987, and in the private sector from 1981-87. He is the attorney principally responsible for legal issues in the National Contingency Plan's 1990 revisions, which are the subject of this Article. The views expressed are those of the author and do not necessarily represent the views of the U.S. Environmental Protection Agency.

List of Acronyms

The following abbreviations are used in this Article:

ACLs—alternate concentration limits

ARARs—applicable or relevant and appropriate requirements

BDAT—best demonstrated available technology

CERCLA—Comprehensive Environmental Response, Compensation, and Liability Act of 1980

CRP—community relations plan

EPA—Environmental Protection Agency

ESD—explanation of significant difference

FS—feasibility study

HRS—hazard ranking system

HSWA—Hazard and Solid Waste Amendments of 1984

LDR—land disposal restrictions

MCL—maximum contaminant level

MCLG—maximum contaminant level goal

NCP—national priorities list

O&M—operation and maintenance

PA—preliminary assessment

PRPs—potentially responsible parties

RCRA—Resource Conservation and Recovery Act

RD/RA—remedial design/remedial action

RI—remedial investigation

RI/FS—remedial investigation/feasibility study

ROD—record of decision

SARA—Superfund Amendments and Reauthorization Act of 1986

SDWA—Safe Drinking Water Act

SI—site investigation

SMOA—Superfund memorandum of agreement

TAG—technical assistance grant

TBC—to be considered

WQC—water quality criteria

[20 ELR 10225]

DATELINE: Washington, D.C. February 2, 1990. EPA Administrator William K. Reilly today signed the long-awaited rule to put into place a revised structure for the operation of EPA's Superfund program for cleaning up hazardous waste sites.

While this is not the type of sensational headline to grab the attention of the average reader, it is big news to those who are potentially responsible for, who regulate, or who live near Superfund sites.[1] The lack of a catchy headline is due in part to the fact that although the rule has been long-awaited (and court-ordered), its general content has been known or surmised for some time. The 1990 national contingency plan (NCP)[2] implements requirements in the Superfund Amendments and Reauthorization Act of 1986 (SARA),[3] and thus many aspects of the rule were pre-ordained. Further, the final rule is not dramatically different from the 1988 proposed NCP, which the Environmental Protection Agency (EPA) has been using as guidance since its publication.[4] Thus, to a large degree, the process for achieving Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA)[5] remedies under the final rule should not be very different from the process that has been followed for the last year or two.

At the same time, the rule contains many highly significant changes and formalizes what were only proposed positions on how EPA will run the Superfund program. The onerous length of the NCP (the rule and preamble covered 978 double-spaced pages prior to its condensed 200 pages in the *Federal Register*) is due to the need to cover the many issues raised by SARA, plus EPA's desire to revise the program to reflect the experience of the first decade of

Superfund.[6]

The most notable changes from the 1988 proposal include the following: a more flexible standard against which private cleanup actions will be measured for determing "consistency with the NCP" for cost recovery purposes; a commitment for CERCLA cleanups to generally attain maximum contaminant level goals (MCLGs), where the MCLGs are above zero; a more limited risk range for cleanups involving carcinogenic constituents; and a presumption that variances under the Resource Conservation and Recovery Act (RCRA)[7] are appropriate for the treatment, prior to land disposal, of soils at CERCLA sites that are contaminated with restricted hazardouswastes.

The final rule also takes steps to provide greater structure to the CERCLA process, and thereby to promote consistency of process and result in remedy selection. This is accomplished through an organization of the nine remedy selection criteria into three functional categories, statements concerning the types of remedies that are "expected" to result from the process, and the placement of increased emphasis on protecting health and the environment through the use of treatment at sites. Significant revisions have also been made in the process of defining how CERCLA actions are to comply with the applicable or relevant and appropriate requirements (ARARs) of other laws, in the opportunities afforded for public participation (e.g., longer public comment periods, community interviews, and an administrative record process), and in the increased role of states as partners to EPA throughout the response action process.

However, *despite increases in detail and structure, the revised NCP remains a highly discretionary document, under which decisionmakers have the flexibility to balance relevant factors and to design remedies to meet the unique needs of specific sites.* Accordingly, many of the changes in the final rule may go further toward achieving "consistency in process" rather than "consistency in result."

This Article discusses the major changes from the 1988 proposed NCP and other significant issues in the final rule. However, to provide a clear context for the revisions, the Article first provides background on Superfund and the NCP, a summary of the major sections of the NCP, and a "road map" through the hazardous site response section of the NCP.

Background

Superfund

In 1980, Congress enacted CERCLA to provide authority for the cleanup of serious threats to public health and the environment resulting from releases of hazardous substances, pollutants, and contaminants into the environment.[8] CERCLA § 104[9] empowers EPA[10] to take response **[20 ELR 10226]** measures "consistent with the national contingency plan" to address such threats through direct funding under the Superfund (the Fund). EPA also has the authority, independent of Fund-financed response actions, to issue orders or seek judicial relief under CERCLA § 106[11] to require the abatement of releases that may be an imminent and substantial endangerment to public health, welfare, or the environment.

EPA response actions may consist of either "removal" or "remedial" actions.[12] Removal actions are generally immediate or interim measures taken to assess, evaluate, minimize, or mitigate danger to the public health or the environment.[13] In addition to including the actual removal of hazardous substance wastes, a removal action may consist of providing a temporary alternative water supply, building a fence, or conducting an investigation under § 104(b) (including a remedial investigation (RI)[14]). A remedial action is an action consistent with a long-term or "permanent" remedy at a site, such as the excavation or destruction of hazardous substances, or provision of a permanent alternative water supply.[15] The decision as to whether an action is a removal or a remedial action is not always obvious, because the definitions overlap to a significant degree. Removal and remedial actions must, "to the greatest extent possible, be in accordance with the provisions of the [NCP]."[16]

Where EPA determines that a state, political subdivision thereof, or Indian tribe has the capability to carry out a removal or remedial action under CERCLA § 104 (in accordance with the NCP) and adequate enforcement authority (under state/tribal law), the Agency may enter into a cooperative agreement or contract with the state, subdivision; or tribe to carry out specified actions at CERCLA sites.[17] The governmental entity with primary responsibility for carrying out the response action at a site is termed the "lead agency."[18]

The statute imposes liability for the costs of response actions on four classes of "responsible parties" described in

CERCLA § 107[19] — past owners and operators of the release site, present site owners/operators, certain generators of the released hazardous substances, and transporters of the hazardous substances. Pursuant to § 107(a)(4)(A),[20] the United States, states, and Indian tribes may recover all costs of removal or remedial action incurred in a manner "not inconsistent with the [NCP]." Similarly, "other necessary costs of response incurred by any other person consistent with the [NCP]" may be recovered from the four categories of liable parties.[21] The courts have generally found that liability under CERCLA is joint and several (if harm is indivisible).[22]

In addition to this basic structure, Congress added a substantial number of requirements and directions in SARA. For instance, new CERCLA § 121 sets out requirements for how remedial actions should be selected; a new § 117 provides specific opportunities for public participation in remedy selection; and subsections (h), (j), and (k) of Section 113 have been added concerning the timing and scope of judicial review and the requirement for an administrative record for all response actions.

The NCP

As noted above, many of CERCLA's requirements are tied to "compliance" or "consistency" with the NCP. The NCP has been the blueprint for governmental response actions since 1968, when it focused almost exclusively on responses to oil spills. With the enactment of CERCLA in 1980, Congress prescribed a greatly expanded role for the NCP, extending its applicability to releases of hazardous substances, pollutants, and contaminants.[23] The NCP has been revised several times, with the last major revision occurring in November 1985.[24]

With the passage of SARA in October 1986, EPA set about drafting revisions to the NCP.SARA § 105(b)[25] specifically required EPA to revise the NCP "to reflect the requirements" of SARA, and specifically to provide procedures and standards for remedial actions "which are consistent with the [SARA amendments] relating to the selection of remedial actions." The following are the major SARA requirements relating to remedy selection that the NCP was intended to incorporate:

* protect human health and the environment;[26]

* comply with ARARs under federal environmental or state environmental or facility siting laws (or justify a waiver);[27]

* select *cost-effective* remedies;[28]

[20 ELR 10227]

* utilize *permanent* solutions and alternative treatment technologies or resource recovery technologies *to the maximum extent practicable;*[29]

* address the preference for remedies in which *treatment* that tht *permanently* and significantly reduces the volume, toxicity, or mobility of hazardous substances, pollutants, and contaminants is a principal element;

* consider the short- and long-term potential for adverse human health effects from exposure in assessing the effectiveness of alternative remedial actions;[30]

* provide significant opportunities for *public participation;*[31] and

* provide for substantial and meaningful *state involvement* in the initiation and development of remedial actions.[32]

These diverse statutory requirements provided a complicated mandate for the Superfund program, due in large part to the inherent tension among some of the SARA requirements. EPA was directed to maximize treatment, yet ensure cost-effective remedies.[33] The Agency was also directed to take into account the preferences of both states and the public before selecting remedies, yet those preferences could lead to a departure from other statutory requirements (e.g., some communities might oppose an incineration alternative due to concerns over air emissions). In short, SARA pushed the Agency in several directions at one time, resulting in some difficulty in prescribing hard rules that should apply at all sites. As discussed in more detail below, EPA attempted to implement the multiple directions in the statute by incorporating a set of nine remedy selection criteria into the final NCP, which are to be applied on a site-specific basis.

The Agency's efforts to achieve consensus on how best to reconcile SARA directives were a major cause of the delay in the promulgation of the rule. In addition, the Agency took the opportunity provided by SARA to completely revise the 1985 NCP, and thus initiated many more changes than may have been contemplated by Congress when it set the statutory deadlines. In effect, the 1985 NCP is largely overhauled (especially the subparts dealing with hazardous substance response). Also, many provisions were added to reflect programmatic experience gained over the 10 years Superfund has been in operation, and other changes were made to clarify the response process and to make the NCP easier to follow. For instance, the sequence in which response activities is discussed was changed to better reflect the order in which they occur. Also, public participation requirements were integrated throughout the rule to be discussed with the activity to which they relate.

Due to these factors, the promulgation of the NCP was repeatedly delayed, and the statutory deadline[34] to promulgate a revised NCP by April 17, 1988, was not met. In the autumn of 1988, several environmental groups sued the Agency for failure to meet the statutory deadline, resulting in a timetable for final promulgation, enforceable by the U.S. District Court for the District of Columbia.[35] The revisions were proposed in the *Federal Register* on December 21, 1988,[36] and as agreed, the final revisions were delivered to the *Federal Register* on February 5, 1990, for publication. They appear in the March 8, 1990 issue of the *Federal Register.*[37]

Effective Date/Retroactivity

The 1990 revisions took effect on April 9, 1990. The rule will not be applied to actions completed before the effective date, but it will be applied to on-going actions.[38]

Ninety-Day Study of CERCLA

Several months after the proposal of the NCP in the *Federal Register,* EPA Administrator Reilly took office and began a 90-day review of the Superfund program.[39] This study was designed as an internal agency review, with a focus on the management of the Superfund program and implementation issues; it was not a review of the NCP or of the then-pending NCP rulemaking proposal. Although the two initiatives proceeded on separate tracks, they are generally consistent and do overlap (e.g., both emphasize treatment, public participation, and expedited response).

Overall Framework of the Final NCP

The 10 Subparts

The NCP is broken down into 10 subparts (and an 11th will be proposed). The following four subparts were substantially revised or added by the final rule and are critical to an understanding of the Superfund response process:

Subpart E (subpart F in the 1985 NCP), entitled "Hazardous Substance Response," is the key subpart of the NCP for Superfund responses. It sets out the elements for response to hazardous substance releases and describes the CERCLA process from site discovery through final cleanup. It is within this section that the procedure for remedy selection is discussed.[40]

Subpart F is a new subpart added to explain the role and responsibilities of states in CERCLA actions. CERCLA § 121(f)(1), added by SARA, directed EPA to promulgate regulations to provide for substantial and meaningful state involvement during response actions.[41]

Subpart H is a new subpart on participation by other persons in response actions and on the recovery of costs **[20 ELR 10228]** under CERCLA § 107(a)(4)(B). It consolidates and expands into a separate subpart the discussion of private party actions under CERCLA.[42]

Subpart I is a new subpart, added to implement the requirement in SARA (CERCLA § 113(k)) for the establishment of an administrative record.[43]

The remaining subparts relate either to oil discharges (which are generally exempt from response under CERCLA by statute[44]) or to administrative interactions among cooperating federal agencies; they are not discussed in detail in this article:

Subpart A is a general introductory section, although it also includes important definitions.[45]

Subpart B combines, without major change, Subparts B and C from the 1985 NCP and describes the interaction of executive branch agencies in responding to releases of hazardous substances or oil.[46]

Subpart C addresses preparedness activities, federal and regional contingency plans, and planning responsibilities of state and local agencies.[47]

Subpart D sets forth the phases of response to discharges of oil, and is substantially unchanged from the 1985 NCP; however, the subpart may take on increasing importance in light of the recent oil spills in Alaska and elsewhere.[48]

Subpart G designates,and sets out the responsibilities of, federal trustees who may act on behalf of the President to assess and restore damaged natural resources.[49]

Subpart J discusses the use of dispersants for oil spills; it is largely unchanged from Subpart K in the 1985 NCP.[50]

Subpart K has been reserved for a new subpart of regulations concerning federal facilities. EPA intends to propose, as an amendment to the NCP, a subpart that would act as a road map to the NCP requirements that apply to CERCLA response actions at federal facilities and would codify certain provisions of CERCLA § 120 that relate to federal facilities only.

Road Map to the CERCLA Site Response Process (Subpart E)

Site Discovery. The process begins with the discovery of a release by one of several possible mechanisms (e.g., notification requirements under CERCLA § 103(a) or (b) or under other laws, a petition from a citizen,[51] etc.)[52] In the case of an emergency (e.g., fire, explosion), a removal action will be taken to stabilize the site.

Removal Assessment. In nonemergency situations, the release is evaluated to determine if a removal action is appropriate based on a removal preliminary assessment (PA) and, if appropriate, a removal site inspection (SI).[53]

Removal Action. Where necessary to protect human health and the environment, the Agency may initiate a removal action to prevent, mitigate, or minimize the threat posed by the release. This may involve removal of surface drums, fencing of the site, the provision of temporary drinking water supplies, etc.[54] Removals may be emergency actions (taken within hours of discovery), time-critical actions, or non-time-critical actions.[55]

Remedial Site Evaluation. A remedial PA (and SI, where appropriate) is conducted on all sites in the CERCLA Information System database, CERCLIS, to see if the site is a priority for long-term remedial response.[56] These evaluations involve the collection of data for scoring the site under the hazard ranking system (HRS) model;[57] sites scoring above the threshold in the HRS[58] are placed on the national priorities list (NPL)[59] for further evaluation and possible remedial action.[60]

Remedial Priorities. The Agency evaluates releases for inclusion on the NPL based on the HRS score or one of the other methods for listing outlined in the NCP.[61] The Agency may spend Fund monies for *remedial* action only at those sites that are on the NPL. ("Fund-financed remedial action" does not include removal action or enforcement action.[62])

Remedial Investigation/Feasibilty Study. The Agency will undertake a remedial investigation and feasibility study (RI/FS) at sites that are, or appear to be, priorities for action (i.e., that are on, or are proposed for listing on, the NPL). The RI/FS, like any other investigation conducted pursuant to CERCLA § 104(b), is a removal action under CERCLA § 101(23), despite the word remedial in its name.

During the RI, the nature and extent of the threat posed by the contamination is studied; concurrently, alternative **[20 ELR 10229]** approaches are developed as part of the FS for responding to and managing the site problem.[63]

Preliminary Remediation Goal. The first step in developing alternatives during the FS is the establishment of a preliminary goal for the remediation of the site.[64] This goal is initially based on readily available information, such as a chemical-specific ARAR, or the "point of departure" in the range of acceptable risk.[65] Alternatives are then developed that are capable of attaining the preliminary remediation goal. (The goal may be modified as additional information is

developed).

Screening of Remedial Alternatives. A broad list of alternatives is then reviewed and screened, with the more extreme, impracticable options being eliminated before the detailed analysis of alternatives begins. Alternatives may be eliminated during screening based on effectiveness, implementability, or "grossly excessive" cost.[66]

Analysis of Alternatives Using the Nine Criteria. The Agency then conducts a detailed analysis of the remaining alternatives (usually three-nine, depending on the complexity of the problem). The advantages and disadvantages of the alternatives are studied and compared using the following nine remedy selection criteria:[67]

* overall protection of human health and the environment;

* compliance with (or waiver of) the ARARs of other laws;

* long-term effectiveness and permanence;

* reduction of toxicity, mobility, or volume through treatment;

* short-term effectiveness;

* implementability;

* cost;

* state acceptance; and

* community acceptance.

Selection of Remedy.[68] Thenine criteria are then used to select the remedy by evaluating them in three functional categories (threshold, balancing, and modifying criteria), in order to reflect the nature and/or timing of their application. The first two criteria — protectiveness and compliance with ARARs — are identified as threshold criteria; only the alternatives that meet those criteria may be carried forward.[69]

Protective, ARAR-compliant alternatives are then "balanced" (i.e., used to evaluate tradeoffs) based on the middle five criteria (and the two modifying criteria, to the extent they are known). The Agency then attempts to select *the* remedial alternative that "utilizes permanent solutions and treatment . . . to the maximum extent practicable" and is "cost-effective" based on a comparison of the appropriate balancing or modifying criteria.[70] Alternatives are judged cost-effective if their costs are "in proportion" to their overall effectiveness; an alternative is found to achieve the maximum permanence and treatment practicable based on a balancing of the seven nonthreshold criteria, with an emphasis on the factors of "long-term effectiveness and permanence" and "reduction in mobility, toxicity or volume through treatment."[71]

EPA and the state then discuss the remedial options and issue a proposed plan, which sets out the lead agency's recommended alternative.[72] Consistent with CERCLA § 117, the public is afforded an opportunity to review and comment on the alternatives studied in the FS and the proposed plan.[73] After review of and response to public comments, and formal consideration of the two modifying criteria (state and community acceptance), the final remedy selection is documented in a record of decision (ROD).[74]

Remedial Design/Remedial Action and Operation and Maintenance. The lead agency then sets about designing, constructing, and implementing the selected remedy.[75] Often, the remedial action plan set out in the ROD will need to be modified in light of information developed during the design phase (e.g., the Agency may learn that more soil is contaminated and needs to excavated). If the remedial action to be taken differs "significantly" from the remedy selected in the ROD with respect to scope, performance, or cost, the lead agency will issue an explanation of significant differences (ESD).[76] If the action to be taken "fundamentally alters" the basic features of the remedy selected in the ROD, the lead agency will propose and take comment on a ROD amendment.[77]

Once the remedy is operational and functional (or later, for groundwater restoration remedies[78]), the state undertakes

responsibility for funding and carrying out operation and maintenance (O&M) of the remedy.[79]

Deletion From the NPL, Five-Year Review. Once EPA has determined that no further response action is appropriate, the site may be proposed for deletion, or recategorized on the NPL,[80] even where O&M is continuing. Sites at which hazardous substances remain above levels that allow for unlimited use and unrestricted exposure must be reviewed at least every five years after the initiation of the remedy (not merely after completion), consistent with CERCLA § 121(c).[81] As discussed in more detail below, the NCP discusses EPA's general policy not to delete a site at which hazardous substances remain until at least one five-year review has been performed after completion of the remedial action.

[20 ELR 10230]

Major Issues/Changes in the 1990 NCP

ARARs Issues

There were several major changes and statements in the final NCP revisions relating to ARARs, the "applicable" or "relevant and appropriate" requirements of other environmental laws. How CERCLA actions comply with ARARs often determines the cleanup standard at a site or certain parameters that the remedial approach must fulfill. Thus, a discussion of major ARARs issues is an important starting point in a review of the final NCP.

* *Background.* As defined in the final rule, "applicable" requirements are cleanup standards, standards of control, and other substantive environmental protection requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting laws that specifically address a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance found at a CERCLA site.[82]

A "relevant and appropriate" requirement is a *promulgated* standard that, while not applicable to the substance, location, or action, addresses problems or situations sufficiently similar to those encountered at a CERCLA site that its use is well suited to the particular site. One example is where a federal requirement has not been adopted by a state authorized to run the federal program. Such requirement may not be applicable in the state, but it could nevertheless be relevant and appropriate to management of the CERCLA waste at issue. In another example, RCRA waste management requirements may be relevant and appropriate to a CERCLA waste that is similar to a RCRA-listed hazardous waste but is not specifically listed in the RCRA regulations[83] (and thus to which RCRA would not independently "apply").

The concept of requiring remedies to attain relevant and appropriate standards (i.e., standards that do not independently apply as a matter of law) is unique to CERCLA and has generated controversy and confusion. (Indeed, it is somewhat counter-intuitive to be required to comply with requirements that do not apply as a matter of law.) To add some consistency to the process, the final rule offers several factors to consider in determining if a requirement is relevant and appropriate under the circumstances of the release (both findings must be made).[84] However, the notion of what standards are appropriate is, almost by definition, a matter of judgment, subject to case-by-case variations. Thus, the Agency retains considerable discretion in making the ultimate decision of what standards a CERCLA remedy should attain based on potential relevance and appropriateness. (Of course, the decision that a remedy must attain a certain standard may be questioned during the comment period of the ROD.) This discretion is even broader in that the Agency may decide that only certain portions of a requirement are relevant and appropriate.[85] The ability to find that a nonapplicable requirement is not appropriate has limited the instances in which statutory waivers[86] are necessary for relevant and appropriate requirements.

There are four conditions that must be met for a requirement to be considered a potential ARAR, based either on applicability or relevance and appropriateness. First, the requirement must be promulgated (i.e., "of general applicability and enforceable").[87] Second, it must be a substantive — rather than administrative — requirement; CERCLA actions are required to meet only the procedures set out in the NCP (additional procedures of other laws are met where appropriate, as a matter of policy).[88] Third, it must be a requirement of an "environmental" law, as provided in CERCLA § 121(d)(2)(A)(i) and (ii);[89] the requirements and procedures of nonenvironmental laws are simply complied with to the extent they apply — they are not considered as part of the ARARs review process under CERCLA.[90] Fourth, ARARs are limited to on-site actions, consistent with CERCLA § 121(d)(2)(A);[91] where EPA

sends wastes off site, that waste transfer must comply with the substantive and administrative requirements of *applicable* law (there would be no relevant and appropriate determination, and no waiver option).[92]

Only those requirements that pertain to a specific action are ARARs for that action.[93] The clearest case for the application of this principle is where contaminated soil is being removed from the surface at a site as part of a removal action or a first operable unit ROD; groundwater cleanup standards for the contaminants found in the soil would not pertain to the surface cleanup action, and thus would not be ARARs for that action.

ARARs may be chemical-specific (e.g., an established level for a specific chemical in groundwater), action-specific (e.g., a land disposal restriction for RCRA hazardous wastes), or location-specific (e.g., a restriction on actions that adversely affect wetlands). Thus, the concept is much broader than that of a specific cleanup level for a site.

The idea of applying the ARARs of other *federal* laws to CERCLA actions was first introduced by the 1985 **[20 ELR 10231]** NCP.[94] SARA generally incorporated the idea into CERCLA § 121(d)(2) for remedial actions, and added the requirement to meet certain ARARs of *state* law, which the final rule picks up.[95] Although not required by SARA, the final NCP also continues the 1985 policy of requiring removal actions to comply with ARARs "to the extent practicable."[96]

* *Maximum Contaminant Levels and Maximum Contaminant Level Goals as ARARs.* In the preamble to the proposed NCP, the Agency had stated that the ARAR for the cleanup of groundwater that was an actual or potential source of drinking water would generally be the maximum contaminant level (MCL).[97] This approach was based largely on the view that MCLs, as the enforceable drinking water standards under the Safe Drinking Water Act (SDWA), are relevant and appropriate to the cleanup of CERCLA sites.[98] The option of generally requiring cleanup to health-based maximum contaminant level goals (MCLGs) was rejected, based on a determination that MCLs are protective of human health, and that it would not be appropriate to require groundwater at CERCLA sites to be cleaner than the levels required for the nation's water supply. Further, MCLGs are, by definition, unenforceable, aspirational goals under the SDWA.[99] According to the proposal, MCLGs would have been attained only in unusual cases (e.g., cases involving multiple contaminants or pathways where the attainment of enforceable MCLs would result in a risk greater than the acceptable risk range).[100]

A number of commenters criticized this approach, focusing on the direction in the statute to attain MCLGs "where relevant and appropriate." These commenters argued that EPA should attain even zero-level MCLGs because MCLGs are health-based standards — not standards based on what is feasible for drinking water systems (the case for MCLs) — and thus are the appropriate standard for CERCLA cleanups. They suggested that where such levels could not be physically attained, waivers should be used.

Although EPA continues to believe that the language in the statute gives the Agency considerable discretion to decide whether it is "appropriate" to apply standards more stringent than drinking water standards to groundwater, the Agency reevaluated the MCL/MCLG question during the comment review period and sought to give greater deference to the words of the statute while not requiring attainment of standards that would be generically inappropriate.

The preamble to the final rule notes, as a threshold matter, that in addition to giving the Agency discretion as to when compliance with MCLGs might be appropriate, the first sentence in CERCLA § 121(d)(2) sets out a somewhat competing mandate: It requires on-site CERCLA remedies to attain promulgated standards or levels of control established under the SDWA (i.e., MCLs), where they are applicable or relevant and appropriate.[101]

The final NCP deals with the potential applicability of both MCLs and MCLGs by providing that MCLGs that are greater than zero shall be attained where "relevant and appropriate under the circumstance of the release." (Thus, it is expected that MCLG's above zero will generally be the cleanup level for actual and potential drinking water sources.) However, where the MCLG is set at zero (as it is for carcinogens), the relevant MCL would be used as the cleanup standard, where relevant and appropriate.[102]

This revised approach is believed to better reflect the statutory intent of CERCLA § 121, while also recognizing the practical difficulties inherent in attaining MCLGs set at zero (indeed, the Agency concluded that it is not scientifically possible to detect whether a level of zero contamination has been attained). The NCP explains that the use of an unattainable, unmeasurably zero level is not appropriate in setting actual cleanup levels to be attained under

Superfund.[103] Further, CERCLA requires protective remedies, not the complete elimination of risk.[103]

The approach adopted in the final rule also recognizes the realities of present groundwater treatment technology. While some commenters may believe that zero levels are attainable, or that EPA should require cleanup down to the levels of detection, the empirical evidence suggests that such results are far from practical. Experience with the Superfund program has shown that groundwater treatment is very difficult.[104] While groundwater remediation is proving effective in containing plumes to prevent further migration and in achieving significant mass reduction of chemicals, it may not be possible in many cases to achieve MCLs throughout the aquifers, not to mention levels of zero.

The practical impact of the change from "generally MCLs" to "generally non-zero MCLGs" is small at present, because for noncarcinogens (the body of chemicals with MCLGs above zero), the MCLs are set at the same level as the corresponding MCLGs. However, in the future, the Agency may consider setting MCLGs that are more stringent than MCLs for certain noncarcinogens. Although such an action would have no legal effect on compliance under the SDWA, it would have a potential impact on CERCLA remedies; in effect, groundwater at some **[20 ELR 10232]** CERCLA sites may be driven to be cleaner than U.S. drinking water. Of course, where a more stringent MCLG level cannot be achieved, site-specific waivers would likely be used at CERCLA sites.

It is important to note that the preamble to the final rule strongly emphasizes the importance of MCLs/nonzero MCLGs as the primary standards for the cleanup of groundwater at CERCLA sites. Alternate concentration limits (ACLs)[105] are discussed as being appropriate only where it is not practicable to meet the MCL/nonzero MCLG;[106] similarly, water quality criteria (WQC)[107] are discussed as being generally appropriate only in limited cases involving surface water.[108]

* *Freezing ARARs.* A frequent ARARs issue is whether a requirement that is made part of a selected remedy (or that drives the choice of that remedy) must be revised when a new requirement is promulgated. In the preamble to the proposed NCP, EPA took the position that requirements promulgated after the initiation of the remedial action will not be attained unless necessary to ensure protectiveness.[109] This was intended to avoid the requirement to restart work already begun.

In the final rule, the Agency reconsidered and expanded this interpretation by providing that requirements promulgated or modified after the signing of the ROD — an earlier point in the process — must be attained (or waived) only when determined to be applicable or relevant and appropriate *and* necessary to ensure protectiveness.[110] That is to say, ARARs generally freeze at the time of ROD signature.

The Agency explained that this approach is both necessary and appropriate under the statute. A contrary requirement, to reexamine potential ARARs throughout the design and implementation phases of CERCLA remedies, would threaten to subject remedial actions to constant interruption and reevaluation, significantly disrupting the cleanup process. This would be inconsistent with Congress' intent that EPA conduct cleanups expeditiously[111] and would prevent the Agency from achieving finality in the remedy selection process.

This ARARs freezing policy will not compromise protection of human health and the environment. EPA will continue to review CERCLA remedies where hazardous substances are left on site at least every five years to ensure that the remedy remains protective.[112] Further, the Agency will evaluate standards promulgated after ROD signature, as appropriate, to ensure that the selected remedy is adequately protective.

The determination of whether a remedy remains protective is a complicated issue, and guidance is expected on the matter in the near future. However, it is likely that a five-year review of protectiveness would, at a minimum, include an assessment of whether the measures put in place by the ROD continue to provide effective management, within acceptable risk levels, of the hazardous substances remaining on site. Obviously, if monitoring wells showed new contamination, additional measures might be necessary. The more difficult issue during the five-year review — or earlier, if appropriate — will be whether the protectiveness of a remedy is called into question by the promulgation of a new standard since the time of ROD signature.

For example, a substance that had been considered nonhazardous at the time of remedy selection might subsequently be listed as a hazardous waste under RCRA. If the ROD had allowed that substance to be left in place without treatment or engineering controls, the newly applicable RCRA requirements might well result in a finding that the remedy is no longer protective and that additional response action (preceded by a ROD amendment or ESD) is

required. By contrast, if the newly regulated substance had been contained using engineering controls along with other hazardous substances, the additional information concerning the substance's RCRA status might not result in a finding that the remedy is no longer protective. (Such a finding might need to reflect a reexamination of the risk assessment for the site in conjunction with the new information; if the risk posed by the site continued to be within acceptable levels, no modification of the remedy would be necessary.)

As for new remedial decisions made after ROD signature, the freezing ARARs policy applies as follows: Components of a remedy not described in the ROD must attain (or waive) requirements that are identified as applicable or relevant and appropriate *at the time* the ROD amendment or explanation of significant differences (ESD) describing the component is signed.[113]

* *Definition of Placement: Application of RCRA Land Disposal Restrictions.* One of the most controversial ARARs issues is the debate over how RCRA applies to CERCLA actions; the preambles to both the proposed and final NCP spend a significant amount of time on the question.[114] Perhaps the most contentious issue within that debate is how to apply the land disposal restrictions (LDR) that were added to RCRA § 3004[115] by the Hazardous and Solid Waste Amendments of 1984 (HSWA).[116]

[20 ELR 10233]

According to RCRA § 3004(k), "land disposal" is defined for the purposes of § 3004 and LDR as including the "placement" of a specified hazardous waste in a landfill, surface impoundment, waste pile, etc.[117] Thus, where a specified waste has been "placed" in a hazardous waste management unit, land disposal has occurred and the LDR requirements are triggered. The LDR requirements ban the disposal of most hazardous wastes after a given point in time, unless EPA promulgates treatment standards for those wastes. The Agency has promulgated (or plans to promulgate) regulations for all categories of LDR wastes,[118] and it has in general required treatment using the best demonstrated available technology (BDAT) prior to lawful land disposal. Although Congress appears to have contemplated that LDR standards would apply to wastes from CERCLA cleanups (even if not immediately),[119] many in the Agency and in the regulated community have found the standards difficult to implement in the context of CERCLA cleanup actions.

A number of parties have argued that BDAT standards were designed for specific chemicals or waste streams, and that such standards are poorly suited to CERCLA cleanup actions that typically involve complex mixtures of chemicals. Further, contamination at CERCLA sites generally involves contaminated soils that are difficult and costly to treat (especially by incineration, a common BDAT technology). Indeed, many inside and outside the Agency suggest that applying the LDR requirement to CERCLA cleanups has the perverse effect of encouraging no treatment at sites because it results in a choice of extremes: either treat the material to expensive BDAT levels (which in the case of combustion technologies results in large volumes of ash remaining for disposal) or leave the material in place, thereby avoiding LDR. Interim options, such as treating the contaminated soil to safe levels that are above BDAT and then placing it back in the unit of origin, would seem to be unavailable. The preamble to the proposed rule set out EPA's interpretation that LDR-restricted waste may not be placed in a unit without treatment to BDAT, even if the waste has been partially treated and is being re-placed in the unit.[120]

In response to the numerous comments on this point, the Agency issued a supplemental notice in October 1989, requesting comment on a possible reinterpretation of RCRA § 3004(k) to the effect that if soil were excavated, treated, and "re-placed" in the unit of origin, that unit would be improved and no new "placement" of waste would be said to have occurred (and the LDR requirements would not be triggered).[121]

The preamble to the final NCP retains the 1988 interpretation that placing waste back into the unit of origin constitutes "placement" for the purposes of RCRA § 3004 (and specifically, LDR), unless the waste was treated to BDAT (or to an approved variance level).[122] However, the preamble discussion recognizes the practical problem posed by the applicability of BDAT to contaminated soil at cleanup sites and sets out a series of actions to address this issue.

First, the Agency pledges to promulgate specific BDAT standards that would be appropriate for contaminated soil and debris (the existing BDAT standards are generally developed with defined waste streams in mind). Second, to give more immediate relief, the preamble sets out the Agency's view that the BDAT standards established for certain wastestreams are generally inappropriate for contaminated soil and debris, and thus decisionmakers can "presume" that a RCRA

treatability variance is available for such materials.[123] Because on-site CERCLA actions are not subject to permitting or administrative determination requirements of other laws,[124] a variance level may be set at CERCLA sites by the regional administrator as part of the ROD process. However, the variance level will still need to be justified in the ROD, and the presumption that a variance is appropriate may be rebutted on a site-specific basis, such as where the soil is saturated with high levels of combustible organic chemicals (as discussed in the preamble to the final rule).[125]

Finally, EPA is not taking final action at this time on the supplemental proposal to reinterpret "placement."[126]

* *Point of Compliance With ARARs in Groundwater.* In discussing ARARs, it is critical to define the physical point at which protective levels must be achieved. This is especially problematic in groundwater where no fixed contaminant boundaries exist. For instance, should compliance be required at the vertical line extending from the site owner's property boundary, at the existing boundary of the contamination itself, or at all points of contamination? In the preamble to the proposed rule, EPA stated that its general policy will be to clean up contaminated groundwater (that is being used, or is reasonably likely to be used, as drinking water) throughout the contaminated plume, or where waste is left in place on the surface, up to and beyond the edge of the waste unit boundary.[127]

The preamble to the final rule reaffirms this general policy of achieving an area of attainment but also discusses the possibility of setting alternative points of compliance in certain limited cases.[128] First, where a plume of groundwater contamination is caused by releases from several distinct sources that are in close geographical proximity, the preamble contemplates that the problem may appropriately **[20 ELR 10234]** be addressed as a whole rather than source by source. Thus, the point of compliance could be drawn to encompass the proximate sources, and the contaminated plume stemming from these sources could be pulled back to that line. This option is based on an assessment that it would be impracticable to, in effect, divide a contaminant plume such that it could be drawn back to sources at several different but nearby points. Drawing the plume back to the line surrounding those sources would make more practical sense, without a loss in protection.

Second, the preamble notes that where there is little likelihood of exposure due to the remoteness of the site, it may also be appropriate to consider an alternate point of compliance, provided that contamination in the aquifer is controlled from further migration.[129] The Agency did not give guidance on when a site is sufficiently "remote" to justify such an alternate point of compliance, but the limitation in the preamble to remote areas where there is little chance of exposure suggests that this possibility will be rarely used.

Any use of an alternate point of compliance would need to be justified on a case-by-case basis, considering the statutory requirements for remedies to be protective and to prefer treatment technologies, and the general goal of the statute to clean up — rather than to maintain the status quo — at contaminated sites.[130]

* *TBCs* (criteria or guidance "to be considered"). The issue of whether government policy statements or guidance documents are ARARs has frequently arisen at CERCLA sites. To address this point, the Agency developed the concept of "TBCs," nonbinding criteria, guidance, advisories, and the like that — unlike ARARs — are not required to be attained. TBCs may, however, contain information that may be helpful in the establishment of a cleanup standard.

The proposed rule suggested that TBCs, as well as ARARs, *must* be identified in the early stages of remedy selection.[131] A number of commenters were concerned that the rule, as proposed, would require the time-consuming identification of an undefined array of advisories and policy statements. In response, the final rule makes clear that the use and identification of TBCs are discretionary, not mandatory.[132]

The significance of this change is that the identification and use of TBCs are not routinely required during the remedial development process. At the same time, the Agency may still use TBCs to assist in determining what is protective or to otherwise help in designing Superfund remedies, where appropriate, as a complement to ARARs. For instance, where there is no binding requirement as to the safe level of a contaminant, but a health advisory or guidance document exists on the point, the Agency may refer to that document to support its decision on a cleanup standard. Such a decision would have to be justified on a site-specific basis, and the public (and potentially responsible parties (PRPs)) would have an opportunity during the comment period to comment on the appropriateness of using the levels in that TBC.

* *Substantive, Not Administrative, Requirements.* The Agency has consistently interpreted the concept of ARARs as including only the substantive, not administrative, requirements of other laws.[133] The preamble to the final rule

continues this interpretation and includes the concept in the definitions of "applicable" and "relevant and appropriate" requirements.[134] This interpretation was historically based on the position that CERCLA actions must be allowed to proceed expeditiously and that compliance with administrative and procedural provisions would slow down CERCLA actions.[135] Moreover, the NCP sets out a detailed set of procedures of its own that CERCLA actions must follow; these render unnecessary the procedures of other environmental programs.

In enacting SARA, Congress codified elements of this policy. CERCLA § 121(e)(1) expressly relieves EPA of any permitting requirement for on-site CERCLA actions. In addition, Congress crafted a new § 121(d)(2), which requires CERCLA actions to attain the "standards" and "levels of control" set by other environmental laws. This section too supports the position that CERCLA actions need not follow the procedures of other laws. The substantive/administrative distinction is also consistent with the Agency's view that the provisions of other environmental laws were impliedly repealed or preempted by CERCLA for on-site CERCLA actions.[136]

Although administrative provisions, such as those calling for consultation with other agencies or the reporting of certain information, are not required, it is EPA policy to generally engage in such consultation and provide needed information (e.g., discharge monitoring reports).[137]

[20 ELR 10235]

* *Compliance With ARARs During Response Actions.* The final rule requires CERCLA remedies to comply with ARARs *during* the design and implementation of the remedial action, as well as at its conclusion.[138] This point was the subject of significant comment, as several noted that the statute merely requires CERCLA remedies to attain ARARs "at the completion of the remedial action."[139] However, as the preamble to the final rule explains, compliance with ARARs during the remedial action makes sense for many of the same reasons that compliance with ARARs makes sense at completion: The requirements of other laws help define how the activity can be carried out in a manner that is protective of health and the environment.[140] For instance, if the conduct of a remedy involves the storage of hazardous waste pending construction of a final treatment unit, it would be short-sighted at best and irresponsible at worst to be concerned with applicable waste management standards only at the end of the project. Waste managed during the remedial action should also meet the substantive standards of other applicable or relevant and appropriate laws.

Similarly, EPA is continuing its policy of attaining ARARs *during* removal actions[141] (to the extent practicable, as discussed below in the section on Removal ARARs). This policy would apply to fieldwork conducted as part of an RI/FS, which comes within the definition of a removal action.[142] EPA has issued extensive guidance on how it will comply with the ARARs of the resource protection statutes — such as the Endangered Species Act[143] and the National Historic Preservation Act[144] — during the investigative and cleanup phases of CERCLA response.[145]

The policy of attaining ARARs during remedial and removal actions does not apply to chemical-specific ARARs, such as soil cleanup levels, which can only be met at the completion of the action.[146] In addition, a statutory waiver is available for interim actions that will attain the ARAR upon completion of the total response.[147]

* *Removal Actions — Compliance With ARARs.* Most of the foregoing discussion has focused on compliance with ARARs for CERCLA *remedial* actions; the rules for short-term actions, "removals," are different based on both the statute and long-standing practice. The 1985 NCP provided that because of their time-sensitive nature, removals need meet ARARs only to the "greatest extent practicable, considering the exigencies of the situation."[148] In SARA, the ARARs concept was applied only to remedial actions.[149] To some, the omission represented an implied finding that removals need not meet the requirements of other laws (although it could also be argued that the language of SARA impliedly affirmed the existing requirement that removals should meet ARARs to the extent practicable).

In the final rule, the Agency decided that it was sound policy for removal actions to attain ARARs "to the extent practicable," while at the same time recognizing that ARARs should not interfere with the mission of removals to quickly respond to and stabilize dangerous sites.[150] The preamble to the final rule explains in greater detail how and when removal actions should meet the requirements of other laws and still fulfill their statutory mission.[151]

First, the preamble makes clear that only requirements that pertain to the specific response actions being conducted are potential ARARs. For instance, if a removal action consisted of removing leaking drums, requirements relating to potential groundwater cleanup would not be ARAR for that removal action.

Second, once requirements are said to be potential ARARs for a removal, they must be complied with "to the extent practicable considering the exigencies of the situation."[152] The preamble attempts to give greater precision to this phrase. The notion of practicability is based on two factors: the urgency of the situation and the scope of the removal action.[153] The urgency factor is rather obvious — where the time-sensitive nature of the removal is such that compliance with (or even identification of) all potential ARARs is not possible, those requirements need not be met. This will often be the case where the Agency responds to fires, explosions, or serious spills.

The "scope of the removal action" factor is more complex. It reflects the narrow purpose of removals to mitigate or minimize harm, rather than to accomplish a permanent remedy. For example, where contaminated soil is discovered near a school yard, a removal action may be taken to fence off the contaminated area, remove the top two feet of contaminated soil, and cover the area with clean topsoil. This action would address the immediate problem of preventing exposure of the school children to the contamination. However, the removal would not attempt to address all contaminated soil on site (i.e., the contamination below two feet), and thus might arguably not meet a soil cleanup level for that contaminant.

One option for addressing this problem might have been to require the removal action to continue excavation until the soil cleanup ARAR was met. However, such an approach, if applied broadly, could substantially increase the cost and time required to perform the removal action, thereby exceeding the action's intended scope.[154] In effect, **[20 ELR 10236]** a policy of requiring removals to attain ultimate cleanup standards would convert removals into remedial actions, without the additional procedures required in the NCP.[155] It would also limit the number of removals that can be performed and would greatly reduce the ability of removals to respond quickly to site problems. To date, removals have been one part of the Superfund program that has been an unqualified success, due in large part to the ability of the program to function quickly.

An alternative approach, adopted by the Agency, is to recognize that a final cleanup standard would not be practicable to meet, given the limited scope and duration of a removal. Of course, the permanent remedy of attaining soil cleanup standards may be met by subsequent *remedial* actions carried out at the site.

The preamble also notes that the six statutory waivers[156] available for CERCLA remedial actions may also be used to waive ARARs during removals.[157]

* *State ARARs Issues.* The SARA amendments added the requirement that CERCLA remedial actions must comply with applicable or relevant and appropriate requirements of state environmental and facility siting laws (as well as federal environmental laws) where those requirements are promulgated, identified in a timely manner, and more stringent than those under federal law.[158] The final NCP extends this concept of attaining more stringent state ARARs to removal actions as a policy matter. (EPA has further stated, as a matter of policy, that promulgated Indian tribal requirements may be potential ARARs.[159])

From the beginning, there have been problems in the identification of ARARs from the support agency (most often, the states). Some states have provided mere "laundry lists" of state laws and/or regulations, without specific discussion of how, if at all, they relate to the site. This has resulted in delays and wasted resources. To avoid this problem in the future, the preamble to the final NCP directs states to provide "a list of requirements with specific citations to the section of law identified as a potential ARAR, and *a brief explanation of why that requirement is considered to be applicable or relevant and appropriate to the site."*[160] In addition, the final rule requires the identification of state ARARs no later than the detailed analysis stage of the FS.[161] These new requirements may force agencies to make key decisions on cleanup standards earlier in the process.

One of the most difficult state ARARs issues is the determination of whether legislated goals (e.g., nondegradation standards under state law) constitute substantive requirements such that they should be considered ARARs. State laws setting general goals may be considered substantive ARARs if they are promulgated and enforceable, and "directive in intent," either on their face or through regulations.[162] For example, if a state statute prohibits the degradation of surface water below a defined level, it is directive in nature and may be an ARAR. If a state law sets forth an anti-degradation goal without regulations or direction as to how to achieve it, the Agency must decide whether the goal constitutes an ARAR (e.g., is it enforceable), and then may exercise flexibility in determining how to comply with the goal. In any case, even if a remedial response is found not to comply with a state anti-degradation ARAR during the response, an interim action waiver of the state standard may be appropriate if the ARAR will be satisfied upon completion of the

total remedy for the site.[163]

Risk Assessment and Risk Range

The NCP contemplates the use of risk assessments as an integral part of the process for developing remedial alternatives that are protective of human health and the environment.

Risk analysis begins during the early stages of the RI, when a "baseline risk assessment" is performed to evaluate the risk posed by a site in the absence of any remedial action.[164] It is based on a comparison with this no-action risk level that the lead agency will target levels of risk that will be adequately protective of human health for a particular site. The baseline risk assessment also helps to provide justification for performing remedial action at the site.

Concurrently, the lead agency would begin to set a "preliminary remediation goal" as part of the FS. The preliminary remediation goal is an initial statement of the desired endpoint concentration or risk level, and alternatives are developed that are capable of meeting that goal.[166] It is based on readily available information, such as chemical-specific ARARs (e.g., a drinking water standard), concentrations associated with the reference doses or cancer potency factors, or the point of departure for the Agency's acceptable risk range, discussed below.[167] The preliminary remediation goal is modified during the site evaluation process as site-specific data (including information from the baseline risk assessment or newly identified ARARs) become available.[168]

[20 ELR 10237]

Where there is only one contaminant of concern and a chemical-specific ARAR (e.g., a drinking water standard) exists for that contaminant, the remediation goal will be set at the ARAR level, and achievement of that standard will generally be deemed to be protective.[169] However, an ARAR may not be available for the contaminant of concern (or for all of several contaminants at a site), or compliance with available ARARs may not be sufficiently protective due to additive or synergistic effects from multiple pathways of exposure or multiple contaminants.[170] Thus, risk assessments will often be necessary to determine the appropriate cleanup goal. (Compliance with the available ARARs would, of course, still be required, consistent with NCP § 300.430(f)(1)(i)(A).)

Where ARARs are not available or are not sufficiently protective, EPA sets remediation goals for noncarcinogens such that the cumulative risks from exposure will not result in adverse effects to human populations (including sensitive subgroups such as children) during a lifetime or part of a lifetime, incorporating an adequate margin of safety.[171] The risks associated with potential alternatives are assessed based on the "reasonable maximum exposure scenario," which is designed to include all exposures that can be *reasonably* expected to occur.[172] The analysis considers exposures under both current use conditions as well as potential future conditions,[173] but does not focus on worst-case exposure assumptions.[174]

Where environmental effects are observed, EPAsets remediation goals based on environmental ARARs (where they exist) and levels based on a site-specific assessment of what is protective of the environment. For carcinogens, the establishment of an acceptable level of risk in cases where ARARs do not exist (or are not sufficiently protective) is especially sensitive, because such contaminants arguably pose a risk at almost any level of exposure (although that risk may be large or small depending on the amount and duration of the exposure and the type of carcinogen involved). Under the NCP, when remedies cannot entirely eliminate potential exposure to a carcinogen, the Agency may achieve protection of human health by selecting remedies that pose very small risks, (i.e., that are within an acceptable range of risk) based on a review of reliable cancer potency information such as EPA's cancer potency factors.[175]

In the proposed NCP, the Agency had defined the acceptable risk range as being from 10<-4> to 10<-7>, meaning that when the excess risk to an individual of contracting cancer due to a lifetime exposure to a certain concentration of a carcinogen falls between approximately 1 in 10,000 and 1 in 10 million, it is judged to be an acceptable exposure.[176] As a measure of additional protection, the proposal provided that there should be a "point of departure" of 10<-6>, toward the more protective end of the scale, that should be used in setting preliminary remediation goals; if conditions warranted, the final remedy could achieve a level elsewhere within the range.[177]

The final rule maintained the point of departure of 10<-6>, but narrowed the risk range to 10<-4> through 10<-6>.[178] This action was taken in response to public comment and concerns that the Superfund range went below the accepted

de minimis level used by other EPA programs and those of other federal agencies. It also reflects the limits of available analytical techniques, which cannot effectively verify for many contaminants that concentration levels corresponding to a risk of 10<-7> have actually been attained.[179]

Although this change might appear to be a lessening of protection or a lessening of the Agency's commitment to protect, it is in fact likely to have minimal if any impact on the selection of remedies at Superfund sites for two reasons. First, no CERCLA remedies have selected 10<-7> as a cleanup level to date (although one or two may have achieved it due to the efficacy of the technology). Second, the Agency has retained the discretion to select a cleanup level outside the range in appropriate circumstances (e.g., where concerns about sensitive populations, synergistic effects among chemical mixtures, etc., suggest that the remedy should attain a level below 10<-6>).

The use of a *range* of acceptable risk is general practice for most government programs.[180] As discussed below in the section on role of cost, it affords the Agency the flexibility to take into account different situations, different kinds of threats, and different kinds of technical remedies. If a single risk level had been adopted, (e.g., at the more stringent end of the risk range), fewer alternatives would be expected to pass the protectiveness threshold and qualify for consideration in the balancing phase of the remedy selection process.

Remedy Selection — Added Structure

One of the major changes between the proposed and final NCP is the attempt in the final rule to build greater structure into the remedy selection process. The Superfund program has been criticized for having a process that was too vague and incapable of quality control or review; rather, remedies were said to be selected by an arbitrary assessment of any of the nine remedy selection criteria. The process was equated with juggling nine balls and picking one out of the air.

By making a number of structural modifications in the remedy selection process, EPA seeks to accomplish two goals: first, to increase consistency in both process and result during remedy selection, and second, to improve **[20 ELR 10238]** understanding of the process on the part of the public and PRPs.

* *Categorizing the Nine Criteria During Final Remedy Selection.* The first initiative was to group the nine criteria into three functional categories and to place those categories in the text of the rule.[181]

First, the rule establishes a category of two "threshold" criteria that all remedial alternatives must meet to be considered in the final balancing: (1) "overall protection of human health and the environment" and (2) "compliance with applicable or relevant and appropriate requirements of other environmental laws (unless a waiver is justified)." These requirements cannot be compromised.

Next, the rule establishes a category of five "balancing criteria" that are used to weigh the tradeoffs among the protective, ARAR-compliant[182] remedial alternatives:

* long-term effectiveness and permanence;

* reduction of toxicity, mobility, or volume through treatment;

* short-term effectiveness (e.g., environmental impacts during the cleanup itself);

* implementability (e.g., whether the technology being considered is available within the necessary timeframe); and

* cost.

Finally, two "modifying criteria" — state acceptance and community acceptance — are considered in altering otherwise viable approaches. These criteria are listed for consideration at the end of the process because they are generally not fully known until after the public comment period on the proposed plan; however, they may be considered part of the balancing process as soon as they are known.

These categories of criteria were discussed in the preamble to the proposed NCP, but they were intended to be used during the detailed analysis stage.[183] The final rule moves the criteria into the text of the rule itself and makes them applicable to the remedy selection decision itself, thereby assuring that the final decision gives the appropriate

consideration to each factor.

Although the nine criteria do afford the Agency considerable flexibility, the remedy selection process is not as wide open as it may seem. In practice, most alternatives will not show dramatic differences in all nine criteria (remember that all must be protective and ARAR-compliant to get into the balancing stage). Tradeoffs on a site-specific basis are likely to focus on one or two criteria. For instance, where alternatives are similar in cost, the balancing will focus on differences in effectiveness or implementability; where two alternatives both accomplish treatment, the key factor may be cost or short-term effects. It is highly unlikely that all of the balancing and modifying factors will be at issue in the comparison of two alternatives.

Further, during the final balancing stage, when the Agency selects the alternative that "utilizes permanent solutions and treatment to the maximum extent practicable," the final rule places special emphasis on the factors of "long-term effectiveness and permanance" and "reduction in mobility, toxicity, or volume through treatment;"[184] these two criteria will be decisive when the alternatives perform similarly with respect to other balancing criteria.[185] Thus, where Alternative A is protective at a lower cost than Alternative B, but Alternative B would result in a greater reduction in the mobility of the waste, the rule would assign added "points" to the treatment alternative. Where alternatives provide similar long-term effectiveness and permanence and a similar reduction in mobility, toxicity, or volume, the other balancing criteria will serve to distinguish among the alternatives. This prioritizing of criteria adds some greater predictability to the process.

Thus, although the nine criteria have been retained, the discretion in evaluating them has been somewhat limited by structural changes in the final rule. Those changes should also help the decisionmakers — and the reviewing public — to better understand the process of selecting a remedy from among unequal options.

* *Emphasis on Treatment.* Another major change in the remedy selection process under the 1990 NCP is the increased emphasis on treatment in CERCLA remedies. EPA sets this tone at the outset by establishing a new program goal that EPA shall select remedies that are protective over time and "minimize untreated waste."[186] The rule then goes on to set out the "expectation" that the Agency will "use treatment to address the principal threats posed by a site, wherever practicable."[187] Treatment may represent the sole remedy, or it may be part of a combination of responses, as where "hot spot" areas are treated and immobile wastes and treatment residues are controlled using engineering controls. The preamble further establishes, as a guideline, that treatment as part of CERCLA remedies should generally achieve reductions of 90 to 99 percent in the concentration or mobility of contaminants of concern.[188]

Also, as noted above, the final rule emphasizes treatment during final remedy selection by requiring that the factors of long-term effectiveness and permanence and reduction in mobility, toxicity, or volume through treatment be emphasized in the final balancing process to determine which alternative offers the maximum permanence and treatment practicable.[189]

Another way in which the final rule has been revised to encourage the selection of more treatment remedies is through the addition of an expectation that innovative treatment technology alternatives should be developed where such technologies offer the potential for "comparable" performance;[190] an innovative technology need not be shown to be superior to more proven technologies to be chosen as part of a remedy.

These factors, taken together, suggest that more treatment **[20 ELR 10239]** remedies will be selected under the 1990 NCP than was the case previously.

* *"Expectations" in the Final Rule.* A third important change in the structure of the remedy selection process is the addition of remedial expectations into the rule section of the final NCP. EPA discussed in the preamble to the proposed rule the type of remedies that were "expected" to result from the remedy selection process;[191] to highlight this important guidance, the expectations were moved into the text of the final rule.[192] These statements are not intended to *require* the selection of any particular remedy at specific sites, or to substitute for the site-specific balancing of the nine criteria during remedy selection. Rather, they are intended to educate decisionmakers and the public as to the type of remedies that EPA has selected in certain situations, so that learning will not be unnecessarily repeated and an appropriate range of alternatives may be considered.[193]

For example, it is the Agency's experience and expectation that highly mobile wastes need to be treated, and that where

highly mobile contaminants exist, the lead agency should focus on the development of treatment alternatives. Thus, the rule states that "EPA expects to use treatment to address the principal threats posed by a site, wherever practicable."[194] Similarly, it is the Agency's experience and expectation that large volumes of low contamination wastes (e.g., large municipal landfills) are most appropriately contained; thus, a focus on the development of engineering control alternatives is recommended for such cases.[195]

The expectations also recognize that in many cases, the appropriate remedy may include a combination of treatment and containment, such as where the levels of contamination vary over a site. The Agency would expect in such cases to treat hot spots of high level, mobile contaminants, and certain areas oflow contamination.[196]

There may also be sites where the expectations will not prove useful under the circumstances of the release. In any case, as noted above,the expectations are not intended to avoid the full remedy selection analysis; each remedy must still be explained and justified in a proposed plan. The preamble to the final NCP makes clear that reliance on an expectation alone is not reason enough to select a particular remedy.

Similar to expectations in the final rule are a number of "management principles" to offer programmatic guidance for the remedy selection process.[197] One of the most frequently discussed is the principle that there should be a "bias for action" at Superfund sites. This means that actions should be taken as early as possible when necessary or appropriate to achieve significant risk reduction quickly.[198] This policy may be implemented by the initiation of operable units in phases or the use of removal actions to address immediate threats at NPL sites.[199]

A second fundamental management principle is that of "streamlining" the Superfund process. The site response program has been criticized for performing unnecessarily long studies and data collection. Streamlining is a concept of tailoring the data-collection needs, the evaluation of alternatives, and the documentation of the selected remedy to reflect the scope and complexity of the site-specific problems.[200] For example, the preamble to the final rule discusses the use of a focused or streamlined FS where site problems are straightforward such that it would be inappropriate to develop a full range of alternatives (or where a removal action has limited the amount of additional work necessary).[201]

The Agency believes that the addition of these expectations and principles to the remedy selection framework will help to expedite action and lead to similar remedies at similar sites. Here, as with much of the final rule, the test will be in the implementation.

* *Fund-Balancing Waiver.* EPA also sought to add structure to the remedy selection process by identifying a threshold at which a waiver of ARARs based on a balancing of demands on the Fund would be "routinely considered." Comment was specifically solicited on this issue.[202]

As noted above, CERCLA § 121(d)(4) sets out six limited circumstances in which an environmental standard that is applicable or relevant and appropriate may be waived by EPA foran on-site action. The sixth waiver, called the Fund-balancing waiver, is available only for remedial actions undertaken using Fund monies and only where the attainment of the standard "will not provide a balance" between the need for protection of public health and the environment and the availability of amounts from the Fund to respond to other seriously contaminated sites.[203] This waiver has been used sparingly to date.[204] After a review of the public comments submitted, the preamble to the final rule provides that the Agency will routinely consider the Fund-balancing waiver in cases where the cost of an operable unit is more than four times the average operable unit cost (the average operable unit cost is now approximately $ 15 million, resulting in a trigger of approximately $ 60 million for routine consideration of this waiver).[205]

It is difficult to predict the impact or significance of this change. Certainly, it means that the Fund-balancing waiver will be considered more often. However, this is only a policy, and the policy merely states that the regions should **[20 ELR 10240]** "consider" the waiver when the cost of an operable unit exceeds the threshold.

* *Role of Cost.* The role of cost in remedy selection has been one of the most hotly disputed issues in the Superfund program. Many PRP groups argue that cost must be a major factor in deciding on an appropriate remedy and note that the requirement to select "cost-effective" remedies appears in CERCLA § 121(a) and (b). Many environmentalists and some legislators have argued that cost is given too much emphasis in remedy selection and have posited that cost should be considered only in determining the cost-efficient method for implementing a selected remedy. In effect, they argue that the proper cleanup level for a site should be set, and then a remedy should be selected to attain that level,

without consideration of cost.[206]

In the preamble to the final rule, EPA discussed the role of cost at great length.[207] The Agency stated that it agrees that cost should not be considered in setting the protective level in situations where a specific ARAR defines the cleanup level that must be achieved at the site (e.g., where an MCLG above zero is available for contaminants in drinkable groundwater). However, where ARARs are not available for the specific contaminants of concern (or where ARARs are not sufficiently protective[208]), the Agency defines protectiveness in terms of the risk range, and several alternative remedial technologies may be capable of achieving protection within that range. Under such circumstances, cost may be one of the factors to consider in choosing among the available technologies.

It is important to note, however, that cost and other factors may be considered only to distinguish among alternatives that have been found to be protective of human health and the environment and in compliance with ARARs (or to have justified a waiver).

Cost is specifically considered during the final balancing process, as the Agency attempts to satisfy two statutory mandates of CERCLA § 121(b)(1) by identifying *the* remedial alternative that utilizes "permanent solutions and treatment . . . to the maximum extent practicable" while being cost-effective. These determinations are intended to be made simultaneously; however, for ease of analysis, they are discussed separately in the NCP.

Cost-Effectiveness. The determination whether a proposed remedial alternative is cost-effective is based on an evaluation of several of the nine criteria. First, overall effectiveness is assessed based on: long-term effectiveness and permanence; reduction of mobility, toxicity, or volume through treatment; and short-term effectiveness. The overall effectiveness is then compared to the cost of the alternative to determine if they are "in proportion" to one another[209] (i.e., does the approach represent a reasonable value for the money?[210]). In making this comparison, the decisionmaker is not directed by the NCP to place special emphasis on the factors of "reduction of toxicity, mobility or volume through treatment" and "long-term effectiveness and permanence," as is required during the assessment of permanence and treatment to the maximum extent practicable (as provided in NCP § 300.430(f)(1)(ii)(E)). However, because "effectiveness" is measured based on those two factors (plus short-term effectiveness), an alternative that is high in treatment and permanence will be considered more effective and thus can justify a relatively higher cost (high effectiveness and high cost would be in proportion). The comparison of cost to effectiveness is performed for each alternative individually and for all the alternatives in relation to one another.[211] This latter analysis allows the Agency to identify alternatives that produce an incremental increase in effectiveness for a reasonable increase in cost, based on a comparison of corresponding increases for other alternatives. Several alternatives may be found to be cost-effective.[212]

Although the statute requires EPA to select cost-effective remedies, EPA has decided not to consider cost-effectiveness as a threshold criterion on a par with protectiveness and compliance with ARARs. This is based in part on the fact that unlike the "protectiveness" and "compliance with ARARs" determinations, which can be reached for each alternative individually, the cost-effectiveness finding requires a comparison of each alternative in relation to other alternatives and the consideration of several factors during a balancing phase. (The same comment is true of the statutory mandate to utilize permanent solutions and treatment to the maximum extent practicable.) In addition, the preamble to the final rule suggests that reliable information on cost will not be generally available as early in the process as is information on a remedial technology's protectiveness, and thus cost should not be used too early in the final balancing process to eliminate viable alternatives.[213]

Cost and Practicability. The statutory requirement to select *the* alternative (there is only one) that utilizes permanence and treatment to the maximum extent practicable[214] is fulfilled by selecting the protective, ARAR-compliant alternative that provides the best balance of tradeoffs among alternatives based on a review of all the balancing and modifying criteria (if the latter are known).[215] It is a subjective judgment, but the NCP sets out some parameters to help assure consistency in its application. Specifically, the NCP requires that during the balancing process, the factors of long-term effectiveness and permanence and reduction in toxicity, mobility, or volume should be emphasized, and that the "preference for treatment as a principal element" and the "bias against off-site land disposal of untreated wastes" must be considered.[216] **[20 ELR 10241]** This statutory determination is the final step in the process before a remedy is recommended in the proposed plan.

Although cost, as one of the nine criteria, is considered in making this determination, it is not expected to play a major role. The importance of almost every other criterion to this determination is emphasized by the NCP. First, the two

threshold criteria must already have been met for any alternative considered during the final balancing. Second, the rule places special emphasis on the treatment and effectiveness factors during this determination; those criteria will be "the most important, decisive factors in remedy selection when the alternatives perform similarly with respect to other balancing criteria."[217] Third, the NCP highlights the two modifying criteria[218] and "implementability"[219] as important considerations in fulfilling this statutory requirement. Thus, cost is one of only two of the nine criteria the use of which is not stressed for this determination. It is also noteworthy that cost will not always be a differentiating factor between remedial alternatives; the final remedy selection will generally focus on tradeoffs based on only one or two criteria.

Cost as a Screen. Cost may also be considered during one other aspect of the remedy selection process: screening, when alternatives that are deemed not to be viable are eliminated from more thorough consideration. The use of cost at this early stage has also been the subject of considerable comment. Many were concerned that cost would be used to screen out appropriate remedial technologies early in the process before they were given a fair evaluation and without the benefit of public review and comment.

The final NCP has been revised to narrow the circumstances under which cost may be considered when screening alternatives at the start of the evaluation process. Specifically, the final rule provides that a given alternative may be eliminated during screening if it is determined that the cost of the alternative is "grossly excessive" compared with its effectiveness.[220] This provision will allow the Agency to avoid the need to conduct resource-intensive analyses of extreme and unrealistic options, while at the same time not allowing cost to compromise consideration of viable options that may simply be more expensive than other alternatives.[221]

* *Definition of "On-site" and Application to Noncontiguous facilities.* Critical to both the type and extent of remedies that may be selected is the definition of the CERCLA site. The site definition is important because "[n]o Federal, State, or local permit shall be required for the portion of any removal or remedial action conducted *entirely onsite* . . . ."[222] Further, the process of meeting ARARs — and the substantive versus administrative distinction — only applies to on-site actions.[223] However, the term "on-site" is undefined in the statute.

In the proposed NCP, EPA took comment on several possible interpretations of "on-site" and suggested defining the term in a manner consistent with statutory intent and the practical realities of site response.[224] Specifically, the Agency sought to address situations in which a treatment plant needs to be located on uncontaminated property over a plume of contamination, or a sludge stabilization tank needs to be located next to, but not in, a sludge pit; thus, the proposal suggested defining "on-site" as the actual contamination plus limited surrounding areas.

After reviewing public comments, the Agency adopted the approach recommended in the proposal and defined "on-site" as consisting of "the areal extent of contamination and all suitable areas in very close proximity to the contamination necessary for implementation of the response action."[225] By defining the site to include contaminated areas plus those areas in "very close proximity" and "necessary" to implementation of the response, the Agency sought to give pragmatic effect to the statutory provision that on-site CERCLA remedies should not be required to obtain a permit, while not unduly expanding the commonsense concept of what actions are "entirely onsite."[226]

The exemption from permit requirements for on-site actions has even greater implications when considered in conjunction with EPA's power to address releases at noncontiguous facilities. CERCLA § 104(d)(4) allows the Agency broad discretion to treat noncontiguous facilities as one site for the purpose of taking response action.[227] The only limitations prescribed by the statute are that the facilities be reasonably related either "on the basis of geography" *or* "on the basis of the threat, or potential threat to the public health or welfare or the environment." Once the decision is made to treat two or more facilities as one site, no permit will be required for the management of waste transferred from one part of the aggregated site to the other.

[20 ELR 10242]

The preamble to the final rule recognizes the significant impact such aggregations could have, because in theory one Superfund site could come to be treated as the disposal site for many Superfund sites. Such a result could be of concern to communities, affected states, and PRPs. Thus, the Agency set out a number of factors that should be considered in deciding whether it makes sense under CERCLA to treat two or more contamination problems as one.[228]

First, the decisionmaker would look into whether the wastes from the noncontiguous facilities are appropriate for

similar treatment or disposal. Second, the possible transportation risks would be evaluated (e.g., the risks might be significant where the wastes are highly volatile or the transfer would take place through heavily populated areas). Third, the views and consent of the affected state(s) and public should be solicited. And fourth, the cost-effectiveness of the aggregated response should be evaluated (including the incremental cost of transportation).[229] The Agency rejected the idea that a specific distance could be defined for saying when aggregation would or would not be appropriate. Rather, the final rule contemplates a case-by-case evaluation of all factors as part of the ROD process, with opportunity for comment by all interested parties.

During the NCP comment period, a number of PRPs raised the concern that they could face increased liability if two or more Superfund sites were treated as one.[230] Such issues could be raised during comments on the site-specific aggregation decision. Of course, liability issues potentially arise from every response action, whether waste is left on site, sent to an off-site disposal facility, or sent to a treatment or disposal facility that is part of a remedy at a noncontiguous Superfund facility. It is not obvious that the third option, with its inherent EPA oversight, poses a greater risk of liability than the first two.

State Issues

* *NPL Deferral.* Of all the issues in the proposed NCP, the one that received the most public comments was whether EPA should defer the listing of sites on the NPL based on the availability of "some" response authority under other federal or state laws. (A deferral policy already existed, and continues, for most private sites that are subject to federal or state-authorized RCRA programs, and for sites that are regulated under licenses issued by the Nuclear Regulatory Commission.[231]) Although many states argued that they have the capability to clean up sites as well as or better than the federal government, the idea of state deferral was "deferred" in the final rule.[232] Congressional staff have indicated that the concept of deferring sites from the NPL may be reviewed by Congress during CERCLA reauthorization; a possibly limited deferral for "CERCLA-quality" state programs may be considered at that time.[233]

* *Role of States in Response Actions.* The role of states in the CERCLA response process was a major part of the NCP revisions. In line with the mandate of CERCLA § 121(f), the Agency sought to spell out the opportunities and methods for state involvement throughout the site evaluation and response process; this initiative resulted in a new Subpart F to the NCP. It is meant to establish a "partnership" between the federal and state governments at CERCLA sites.

Perhaps most significantly, the final revisions set out an expanded role for states in the remedy selection portion of the process. For Fund-financed sites, a state may be designated as the lead agency where it demonstrates certain capabilities, and thereby performs the RI/FS, drafts the proposed plan and ROD, and conducts the remedial design/remedial action (RD/RA) phases of the response. This affords the states a major role over remedy selection: by drafting recommended alternatives and proposing the remedy, the state recommendations can be expected to strongly influence the final decision in many cases. (The deference accorded to a state recommendation will likely be greatest where the state has a proven track record of cleaning up sites.) At the same time, the final rule provides that for Fund-financed actions, a state may not publish a proposed plan that EPA has not approved,[234] and where the state does prepare the ROD, it must seek EPA's concurrence and adoption of the remedy specified therein.[235]

For EPA-lead sites, the states also have considerable power. First, the NCP specifically requires EPA to seek state concurrence on its remedies,[236] and in extreme cases where the state disagrees with a proposed Fund-financed remedy, it may withhold the required state assurances under CERCLA § 104(c)(3). (At EPA-lead enforcement sites, the states may challenge the waiver of ARARs under CERCLA § 121(f)(2).) The final rule also discusses dispute resolution procedures to work out state/federal conflicts.[237]

Alternatively, the state may take a non-Fund-financed, state-lead enforcement action at a site under state law (this is likely where a solvent PRP is available). EPA concurrence is not required for such actions, although it may be requested.[238] The availability of EPA concurrence on state-lead enforcement sites is significant in that it may help states to achieve settlements with PRPs.[239]

Some states — those that have implemented aggressive cleanup programs — may argue that EPA has not gone far **[20 ELR 10243]** enough in turning over remedy selection authority to the states, and indeed, this sentiment was reflected in several comments on the NCP. However, EPA specifically declined to delegate the ultimate CERCLA remedy selection power to states in the final rule.[240] The preamble explains the Agency's view that delegation of final decisionmaking

authority on remedy selection is not appropriate, and that although an expanded state role is required under CERCLA § 121(f), EPA should retainprimary responsibility for the federal Superfund program. (Indeed, the role carved out for states in § 121(f) may be argued to imply that EPA should retain final decisionmaking authority.) There is also a general concern about the propriety of allowing states to commit Fund dollars without EPA oversight. The issue of state remedy selection, like the issue of deferral to states of potential NPL sites, may be the subject of congressional attention during the reauthorization of CERCLA.[241]

* *Enhancement of Remedies.* The issue of whether a state may "enhance" an EPA-selected remedy, and under what conditions, has generated a significant amount of interest and controversy. Different people mean different things when they discuss "enhancement," and in fact, the term is often misused. Historically, the term has been used to include diverse types of potential state actions, from seeking to increase the level of cleanup, to building a larger treatment plant that may be used by the state after the CERCLA action is completed, to insisting on requirements that EPA believes are inappropriate or that could conflict with the EPA-selected remedy.

The final rule separates consideration of state-proposed actions that are (1) necessary to the selected action (those would be handled by ROD amendment or ESD); (2) not necessary to the selected action, but not inconsistent with the CERCLA remedy (these would be allowed in the Agency's discretion if the state assumed financial and oversight responsibility for the change); and (3) in conflict with EPA decisions.[242]

The preamble notes, as a threshold matter, that states already have significant opportunities during the RI/FS process leading up to remedy selection to suggest to EPA that state standards should be considered ARARs and thus attained, or that the proposed remedy should be expanded in scope. In most cases, these issues should be worked out prior to remedy selection and they are more properly viewed as remedy selection issues, not enhancement.[243] The issue of enhancing or supplementing the selected remedy is more often an issue in the context of post-ROD suggestions for change.

Where, after the ROD, the state asks EPA to change or expand the selected remedy and EPA agrees that the state's suggestions are appropriate and necessary to protect human health and the environment, the Agency may include the changes in the Fund-financed remedy through a ROD amendment or ESD (consistent with final rule § 300.435(c)(2)), in which case the Agency would share in the costs of the modified or additional activity. If the Agency concludes that the state-suggested changes or expansions are not necessary to the selected remedial action, the Agency will not modify the ROD or pay for the additional action; however, the Agency may still decide to allow the additional action to proceed concurrent with the EPA-selected remedy.

Where EPA finds that the proposed change[244] or expansion is not necessary to the EPA-selected remedy, but would not conflict or be inconsistent with it, the Agency may agree to integrate the proposed change or expansion into the planned CERCLA remedial work, but only if the state agrees to fund and oversee the necessary changes or additions. For example, the state may want a groundwater system to run longer than planned in order to attain water quality levels beyond those required under CERCLA, or the state may want to extend a water line outside the Superfund site in anticipation of expected residential or industrial development in the area. Such changes or expansions that would not conflict or be inconsistent with the EPA-selected remedy would generally be accommodated, on the condition that the state fund and supervise the change or expansion.

In instances where the state requests, and pays for, an incremental increase in the cleanup level, a lively debate can be expected between the state and any PRPs over whether the costs of such enhancements may be recovered in a cost recovery action. The state would be expected to argue that even if the cleanup is more than the minimum required under the NCP, it is "not inconsistent with the NCP" for purposes of cost recovery under CERCLA § 107(a)(4)(A). Interestingly, while CERCLA § 107(a)(4)(B) allows private parties to recover only "necessary" costs consistent with the NCP, the word "necessary" is absent from the cost recovery provision of CERCLA § 107(a)(4)(A), which applies to states.

Finally, where a state-proposed change or expansion would conflict or be inconsistent with the EPA-selected remedy, it would not be appropriate to allow the state to proceed without EPA approval.[245] Indeed, to do so would be tantamount to giving the states a veto power over EPA remedial action decisions.

* *Superfund Memorandum of Agreement.* A major step in facilitating an EPA/state partnership under the NCP is

expected to be the development of the Superfund **[20 ELR 10244]** Memorandum of Agreement (SMOA). SMOAs are voluntary, general agreements (not site-specific) that may be used to establish the general framework for the EPA/state working relationship, to define the roles of the lead and support agencies, and to provide for EPA oversight. They are the recommended method for working out the interrelationship between state and federal authorities.

In the proposed rule, EPA had suggested making SMOAs prerequisites to certain actions under CERCLA (e.g., the designation of a state as lead agency for a non-Fund financed action).[246] However, a number of states strongly opposed a "requirement" to enter into a SMOA, and the final rule makes clear that SMOAs are not required as a condition for the state acting as lead agency. Instead, the final NCP provides that a number of issues — including annual EPA/state consultations, review by the support agency, timetables for the identification of ARARs, and dispute resolution — "may" be agreed to by the state and region in a SMOA. Where there is no SMOA, the rule sets out minimum requirements that would apply.[247]

* *State Cost Share for O&M.* One of the most sensitive issues for states in the final NCP has been the extent of state responsibility to pay O&M costs for CERCLA remedial actions. For remedial actions, the federal and state governments share costs according to the formula in CERCLA § 104(c)(3), generally 90 percent federal, 10 percent state.[248] Once the remedy has been constructed and is operational, the costs and responsibility for operating and maintaining the remedy transfer to the state. The final rule provides that states are responsible for assuring the "operation and maintenance of implemented remedial actions for the expected life of those actions."[249] The preamble explains that this position is consistent with the statute and long-standing EPA policy.[250]

SARA added to CERCLA a new § 104(c)(6), providing that for the purposes of CERCLA § 104(c)(3) — which includes the cost share provision — treatment or other measures necessary to restore ground or surface water quality would be considered remedial action as compared with O&M until protective levels are attained or for 10 years, whichever is earlier. By virtue of being included in the term "remedial action," restoration measures would qualify for the federal cost share.

A number of states commented that this section should be read expansively to include any measures that contribute to full restoration (e.g., the maintenance of caps and leachate collection systems). They argued that if such measures are not maintained, water quality could degrade and restoration would not occur. The final NCP takes the position that "treatment or other measures *necessary* to restore ground and surface water" do not include source control maintenance measures (like landfill cap maintenance or leachate collection systems) or measures whose primary purpose is to provide drinking water.[251] Although EPA recognized that a failure to maintain source control maintenance measures could result in some additional contamination of ground or surface water, those measures are not appropriately considered "necessary for restoration" and therefore "remedial actions" under CERCLA § 104(c)(6). Rather, they fall within the category of normal operation and maintenance activities.

The legislative history cited in the preamble to the final rule suggests that Congress sought, through § 104(c)(6), to correct an imbalance in the manner in which water body contamination was treated as compared with surface contamination.[252] In the case of surface cleanup, an action would be considered remedial — and subject to a cost share — throughout construction of engineering controls, excavation of the contaminated area, or until protective levels were otherwise achieved. However, for ground and surface water, actions were considered remedial only up to the point where the treatment plant was built and operational, regardless of remaining contaminant levels in the water. The solution adopted was to include within the definition of "remedial action" those ground and surface water restoration efforts taken up to the point that protective levels were achieved, or for 10 years, if earlier. The 10-year time limitation was added out of the recognition that groundwater remedies will generally take many years to complete and would be a major drain on the Superfund program if EPA were required to fund them.[253]

In the preamble to the final rule, EPA explained that the states' view would lead to results that are inconsistent with the intent of Congress and with common sense. If source control maintenance and other O&M activities are necessary for restoration, restoration can never be considered complete as long as O&M is required. This is clearly not the intent of Congress, since § 104(c)(6) contemplates that restoration may be considered complete when protective levels are achieved if in less than 10 years, even if O&M continues. The states' interpretation would also lead to a situation where virtually all on-site O&M activities could be characterized as remedial action under § 104(c)(6), on the theory that if they were not maintained, they might degrade the ground/surface water; such a result would appear to exceed the limited intent of Congress.

The final NCP also takes notice of the fact that groundwater pump-and-treat technologies may reach a point at which restoration activities no longer result in significant reductions in contaminant concentrations. Thus, the rule provides that restoration may be considered complete for the purposes of CERCLA § 104(c)(6) when protective levels are achieved, in 10 years, *or* when such a steady-state situation is reached.[254]

Finally, the preamble to the final rule states that EPA will consider funding O&M for "temporary or interim measures" to control or prevent further releases, where no final remedy for a unit has yet been selected (e.g., maintenanceof a *temporary* landfill cap).[255] The rationale **[20 ELR 10245]** behind this policy is that interim measures may be necessary to stabilize a site while EPA is deciding on a final remedy; such measures are, in effect, part of the remedy. However, if EPA selects a final solution for an operable unit (e.g., a final cap on a contaminant source), the maintenance of that unit would be considered normal O&M for which the state would be responsible.

Administrative Record Issues (Subpart I)

This subpart implements CERCLA § 113(k) by setting out the rules for establishing an administrative record file and by explaining what material may be included in, or excluded from, the administrative record.

* *Purposes of a Record.* The administrative record for a site serves two basic purposes. First, it constitutes the record for judicial review. CERCLA § 113(j) specifically provides that judicial review of the adequacy of any CERCLA response will generally be limited to the record assembled by the Agency (rather than allowing for *de novo* review), although courts may go beyond the record and allow for the introduction of supplementary materials in limited cases. The public and PRPs have opportunities throughout the process to add materials to the administrative record file, particularly during the formal public comment period. All response decisions not dictated by CERCLA or the NCP should be justified in the administrative record.

The second fundamental purpose of establishing a record (and file) is to provide interested parties an opportunity to review the response actions proposed for a site, so that they may meaningfully participate in the response selection process.

* *Administrative Record File vs. Administrative Record.* The rule makes a distinction between the administrative record "file" and the administrative record. This is because typically, the formal record for judicial review is not compiled until after EPA selects a response action;[256] the administrative record file is the mechanism for compiling the formal record, and making it publicly available, as early in the process as possible. Further, the Agency encourages the placement of even potentially relevant materials into the administrative record file, leaving the process of reviewing documents for relevance until the later compilation of the formal record.

The administrative record file should not be confused with the information repository for a site. Although some of the same documents may be contained in both files, and both provide the public with relevant information, they are fundamentally different. The information repository contains *general* documents that relate to a Superfund site and to the Superfund program, including background information and policy guides. By contrast, the administrative record file contains site-specific data, comments, and other documents used in the selection of a *particular* response action.[257]

For remedial actions, the administrative record file will be established after the start of the RI;[258] for removal actions with a planning period of at least six months, the record file will be established when the engineering evaluation/cost analysis is made available;[259] and for removals with a planning period of less than six months, the administrative record file will be made available no later than 60 days after initiation of the action.[260] Except for emergency removals completed within 30 days of initiation, the administrative record file must be located at or near the site and at another central location for public review.[261]

* *What Is In/Out of the Administrative Record.* The formal administrative record is compiled based on a review of the administrative record file and will include those documents that "form the basis for the selection of a response action,"[262] consistent with the mandate in CERCLA § 113(k) for the establishment of "an administrative record upon which the President [or his delegate, EPA] shall base the selection of a response action." The record will typically include factual information/data; analyses of factual information; policy and guidance documents; public participation documents, including public comments; decision documents throughout the process; orders; and responses to comments.[263]

At the same time, irrelevant, duplicative, and certain predecisional documents (e.g., staff-level options papers and drafts of final documents) would not necessarily be included in the administrative record, unless such documents contain information that forms the basis of selection of the response action and the information is not otherwise included in the administrative record.[264] A contrary policy of including deliberative and predecisional documents in the record could have a chilling effect on the free exchange of ideas within EPA. Privileged information that formed the basis for a response action decision will be included in a confidential section of the administrative record.[265]

Although some commenters expressed the concern during the rulemaking that the final administrative record may not include all appropriate materials, the preamble to the final rule emphasizes that the record will include appropriate information even if it does not support the selected remedy. For example, comments submitted during the formal public comment period must be considered by the Agency and will be included in the record, even if they are ultimately rejected.[266] In addition, as a matter of policy, EPA will attempt to consider significant comment submitted prior to the comment period. However, to the extent a party wishes to ensure that its comments will be considered by the Agency and made part of the record, **[20 ELR 10246]** those comments should be submitted (or resubmitted during the formal public comment period on the proposed plan).[267]

Interested persons may also submit technical studies or other information to EPA throughout the process leading up to final remedy selection,[268] and the Agency will generally consider such information, if relevant and timely submitted. Such studies would then be placed in the administrative record file. Agency consideration of such studies will usually be reflected in subsequent documents or analyses performed by the Agency and included in the record file. Subject to the qualifications discussed above, information placed in the record file for a proposed response action and relevant to the selection of that response action, whether in support of or in opposition to the selected response action, will become part of the final administrative record for the response selection decision.[269] Again, if there are questions as to whether all or part of a study was considered by the Agency or whether it will be a part of the final record, parties may wish to refer to the studies during the public comment period.

* *Adding Documents Post-ROD.* After the ROD is signed, certain classes of documents may be added to the administrative record files, including documents relating to remedy selection issues that the ROD reserves or does not address; ESD notices; documents relating to ROD amendments; and certain public comments that substantially support the need to significantly alter the response action.[270] EPA may also establish separate comment periods on issues or documents of concern, and such documents — and the comments on them — will be made a part of the administrative record.[271]

The need to add documents to the record after remedy selection is a logical reflection of the fact that the ROD does not resolve or even contemplate all issues concerning the response action; indeed, as noted above, the ROD may specifically reserve certain issues. In addition, it is common, if not inevitable, for issues to arise during the design and implementation phases of the remedy, requiring the Agency to refine, modify, or clarify aspects of the response action. Documents relating to these activities are necessary components of the record for reviewing the Agency's action.

Public Participation

The new administrative record provisions are an important component of the Agency's efforts to increase public involvement and awareness of CERCLA actions. In addition to those provisions, the final NCP also incorporates new community relations requirements, in response to the mandate in CERCLA § 117. Unlike the 1985 NCP, in which community relations requirements were addressed separately in one section,[272] the 1990 revisions incorporate community relations requirements into each of the sections relating to the different phases of response (i.e., removal actions, RI/FSs, selection of remedy, and RD/RA).[273]

During Removal Actions. The amount of public participation required by the NCP during removal actions has been greatly expanded from the simple requirements in the 1985 NCP to designate a spokesman and to develop a formal community relations plan for removal actions extending beyond 45 days. The NCP now includes requirements regarding the preparation and availability of an administrative record file, a comment period, and interviews with local officials and interested persons.[274] However, the timing and extent of the public participation required vary depending on whether the removal is considered an emergency, time-critical, or non-time-critical action.[275] The extent of public participation also depends, to a large degree, on the needs and wishes of the public. NCP sets out the basic community relations requirements that EPA has found through experience to be necessary and allows for greater involvement

where public interest is high.[276] For example, the final rule allows for an extended comment period upon request.[277]

During the RI/FS. The final rule also increased the opportunities for public participation during the investigatory and alternatives assessment stages of the process. The revisions expand the use of the community relations plan (CRP) to provide greater opportunities for public participation in decisionmaking, require information repositories as well as administrative record files, more prominently discuss the availability of technical assistance grants (TAGs),[278] and provide for interviews of members of the local community to better assess the views of affected residents, officials and other interested parties.[279]

During Remedial Actions. Similarly, the 1990 NCP revisions increase community relations and participation efforts during remedial actions. The revisions implement CERCLA § 117 by requiring the preparation and publication of a proposed plan, describing the remedial alternatives analyzed, and proposing a recommended alternative.[280] In a change from the proposed rule, the final revisions allow the public 30 days to comment on the proposed plan, plus at least an additional 30 days upon simple request.[281]

Under the final rule, the Agency will respond to significant comments received during the formal public comment period on the proposed plan for remedial response, as required under CERCLA § 117. In addition, the final rule **[20 ELR 10247]** "encourages" the lead agency to respond to significant comments submitted *prior* to the public comment period.[282]

Post-ROD. After the ROD has been signed and the design phase begins, the CRP will be reviewed and, where appropriate, revised to describe public involvement opportunities during RD/RA.[284]

There are several possible opportunities for public comment and involvement during implementation of the remedy. If the Agency decides to amend the ROD, a new proposed plan/public comment period will be established.[285] This would generally occur where the Agency changes the remedy in a fundamental way, such as deciding that incineration instead of containment should be performed due to new information on the levels of organic constituents in the waste. In effect, such a change constitutes a new remedy selection, and the public would have a strong interest in providing views to the Agency. On the other hand, if the Agency changes the remedy in a significant but nonfundamental fashion, an ESD notice may be issued, consistent with CERCLA § 117(c).[286]

Neither the statute nor the NCP revisions require a new public comment period in the event that an ESD notice is issued. This is based in large part on the recognition that design and implementation will, in almost all cases, result in some refinements or modifications of the selected remedy. It would be very disruptive to require a new formal public comment and response to comment for alterations in the scope or cost of an already reviewed remedy (e.g., where 25 percent more soil needs to be excavated and treated, or where several more monitoring wells need to be installed). Further, additional comment is arguably unnecessary because the Agency will already have received the public's views of the basic remedial approach. Again, if the changes rise to the level of a *fundamental* change in the remedy, a formal ROD amendment would be required. (In any case, the Agency has the ability to provide additional public comment periods in appropriate cases,[287] and may well do so where ESDs relate to contentious issues.)

Moreover, the public is not without an avenue to voice concerns where EPA issues an ESD notice. The ESD will be made available to the public, and concerned parties may submit comments to the Agency. The final rule specifically provides that the lead agency "is required" to consider comments submitted by interested persons after the close of the public comment period if the comments contain "significant" new information that could not have been submitted during the public comment period and which "substantially support the need to significantly alter the response action."[288]

Admittedly, this is not an invitation to frequent public comment after the remedy has started, but it is consistent with the need for the Agency to get on with the business of accomplishing cleanups. If public comments — including PRP comments — could, by right, require formal response and a halt in Agency action, the program would be subject to endless delays. Such a result would be inconsistent with both the intent in CERCLA to accomplish cleanups expeditiously and the express provision in CERCLA § 113(h) that no judicial review of CERCLA response actions may be obtained prior to enforcement or completion of the response action. The provision does, however, give the public (and PRPs) the opportunity to raise significant issues to EPA at any point in the RD/RA process.

PRP Issues

Several specific issues not already discussed may hold special interest for PRPs.

Private Party Cost Recovery Actions ("Consistency With the NCP"). One of the most important issues to private parties is the ability to recover their cleanup costs under CERCLA's cost recovery provision (§ 107). CERCLA § 107(a)(4)(B) provides that parties other than the federal government, states, or Indian tribes may recover necessary costs of response that are incurred consistent with the NCP.[289] The issue of when a private party action is "consistent with the NCP" has long been a contentious one, both in and out of the courts.[290] EPA addressed this issue in a new Subpart H;[291] the approach taken in the final rule represents a dramatic change from both the proposed rule and from the 1985 NCP.

The proposed rule provided that any person may undertake a response action to reduce or eliminate a release of a hazardous substance. It also set out a list of those NCP provisions for which compliance would be required for a private party response action to be considered consistent with the NCP for purposes of cost recovery actions under CERCLA § 107.[292]

In the final rule, EPA defines "consistency with the NCP" as whether a private party cleanup has, *when evaluated as a whole,* achieved "substantial compliance" with potentially applicable NCP requirements and resulted in a CERCLA-quality cleanup.[293] (CERCLA § 107(a)(4)(B) **[20 ELR 10248]** also requires that the private party show that the costs incurred were "necessary" cleanup costs.)

This is a major change. The 1985 and the proposed NCP had required provision-by-provision comparisons between the elements of private actions and specific requirements in the NCP. This approach had allowed (if not encouraged) the parties that were responsible for the pollution to attempt to pick apart basically sound remedies, and thereby avoid paying their share of the cleanup costs. The revised approach calls for a less technical determination of whether a cleanup, when evaluated as a whole, appears to be along the lines contemplated by CERCLA (i.e., whether it is in "substantial compliance" with specified NCP requirements and has resulted in a CERCLA-quality cleanup). The rule specifically states that cost recovery actions should not be defeated based on immaterial or insubstantial deviations from the detailed set of NCP provisions (whether federal or private).[294]

The final rule does retain the list of potentially relevant NCP provisions that has appeared in prior rules,[295] but as guidance, not as a list of fixed requirements.[296] The retention of this list is intended to help parties who are uncertain as to what portions of the NCP might apply to them.[297] It also provides some standard against which the substantial compliance test can be applied. (A private party can eliminate any uncertainty about achieving substantial compliance by meeting the full set of requirements identified by EPA as potentially relevant to private actions.)

A new element in the rule is the requirements for "CERCLA-quality cleanups." This determination is to be made based on a comparison of the action with the principal mandates of SARA: the basic remedy selection requirements of CERCLA § 121(b)(1) (i.e., the remedial action must be "protective of human health and the environment," utilize "permanent solutions and alternative treatment technologies or resource recovery technologies to the maximum extent practicable," and be "cost-effective"); the requirement to attain ARARs in § 121(d)(2); and the requirement to provide for meaningful public participation in § 117.[298]

EPA set this less restrictive test for cost recovery actions based on a belief that it is important to encourage private parties to perform voluntary cleanups of sites, and to remove unnecessary obstacles to their ability to recover their costs from the parties that are liable for the contamination. As noted above, many voluntary cleanups are being contested based on allegations that cleanups failed to meet the letter of the NCP, even if the spirit of the regulation was satisfied. The Agency concluded that such hyper-technical challenges were not in the best interest of environmental protection. At the same time, the new standard reflects the Agency's view that it is also important to encourage only environmentally sound cleanups, not any cleanup. The requirement for "CERCLA-quality cleanups" was intended to achieve this goal.

The NCP recognizes that in the final analysis, the courts will decide, on a case-by-case basis, whether cleanup actions are consistent with the NCP.[299] However, the establishment of which requirements apply to private actions and to what extent they must be met (literally or substantially) appear to be within the Agency's authority (CERCLA § 105(a) and

(b) authorize EPA to develop NCP procedures and requirements). Thus, the final rule attempts to set out a more lenient standard for review than that contained in previous rules.

* *Enforcement Issues.* The NCP sets out few enforcement-specific requirements. This is largely because of the need to maintain discretion in CERCLA's enforcement program. However, there are a number of enforcement issues addressed in the NCP that will be of interest to PRPs.

Perhaps the foremost enforcement issue is the perceived problem of dual enforcement under federal and state law. In effect, responsible parties want greater certainty that when they carry out a remedy under CERCLA, or under state law (in a non-Fund-financed, state-lead enforcement action), the cleanup will not be second-guessed by the other authority. The NCP has attempted to address this concern in part through the provisions of Subpart F.[300]

The major thrust of Subpart F is to set up a partnership between EPA and the states from the beginning to the end of a CERCLA action. The rule describes a formal process for concurrence between EPA and the states on remedies, and even provides for the availability of EPA concurrence on a non-Fund-financed, state-lead enforcement remedy.[301] (This latter possibility may help the states in concluding consent agreements with PRPs.) At EPA-lead enforcement sites, the NCP specifically requires EPA to notify the state of negotiations and to allow the state to participate.[302] When disagreements arise, the NCP contemplates the use of a dispute resolution process, preferably set out in a SMOA.[303] (The SMOA is hoped to be an important tool in minimizing inconsistencies between EPA and the state.) Thus, the new procedures and policies outlined in the NCP are intended to result in greater coordination of EPA and state efforts and enforcement strategies. Where irreconcilable conflicts occur despite these procedures, issues of federal preemption and interpretations of CERCLA § 122(e)(6) may become important.[304]

A related question raised by some commenters is whether **[20 ELR 10249]** a state may require a PRP to do more than EPA has ordered. To a large extent, the coordination steps outlined above are intended to avoid such a situation. However, the state may in some cases want EPA to go beyond its selected remedy; that issue is addressed above in the discussion on state issues and enhancement of remedies.

Another enforcement-related point is the Agency's position on whether a PRP may obtain access to a site to perform its own sampling as a basis for commenting on the EPA (or state-lead) action. The NCP preamble states that EPA opposes "unrestricted" access to a site by PRPs, on the grounds that unrestricted access, sampling, and testing could present a health threat to those residing on or near the site;[305] it could also jeopardize the efficient completion of the CERCLA action. PRPs do have the opportunity to perform the RI/FS under CERCLA § 104(a)(1);[306] if they decline, they may be deemed to have given up the right to be on-site at all times. (This may serve as an incentive for PRPs to get involved in the CERCLA process at the earliest stages.)

This is not to say that the PRPs have no opportunity for access where they decline to perform the RI/FS. The lead agency may be receptive, in appropriate cases, to PRP requests for limited access under supervision, to the same extent that the agency would allow access to community groups that are monitoring CERCLA actions under TAGs. Even where the PRPs do not have physical access to the site, they do have the opportunity to review government data and studies through the administrative record file, and the lead agency has a significant interest in assuring that the file is complete. EPA and the state will ultimately be able to recover their investigative and cleanup costs only if their actions are adequately justified in the administrative record. PRPs will have the opportunity to comment on information in the administrative record file during the comment period on the proposed plan.

* *Effect of Final Rule on Ongoing Actions.* Also of interest to PRPs will be the effect of the new revisions on ongoing actions. It is important to note that, starting on the effective date (April 9, 1990), the NCP applies to all CERCLA actions, even those that commenced prior to that date under the 1985 NCP.[307] (The exception is made for administrative record requirements, which apply to ongoingactions only "to the extent practicable."[308]) The preamble explains that this should not pose a hardship to ongoing actions, because most of the revisions were already common practice or are easily accommodated. Specifically, the final rule does not differ dramatically from the December 1988 proposed rule, which has been treated as guidance by the Agency. Further, the major changes from the 1985 NCP were those mandated by SARA, and those changes are (or should be) already reflected in ongoing actions. In addition, some of the more obvious problems of changing from an old system to a new one have been avoided by the provision on freezing ARARs — only standards that were identified as applicable or relevant and appropriate at the time of ROD signature must be attained even if new requirements are promulgated, except to the extent the new requirements call into

question the protectiveness of the selected remedy.[309]

A contrary decision — to grandfather ongoing actions — could inappropriately open the way for many actions to avoid important requirements. The preamble notes that many Superfund actions, especially groundwater restoration efforts, are long-term in nature (generally taking from 10 to 30 years), and even RI/FSs can take from one to two years to complete;[310] the mere fact that such actions have already been started does not justify a permanent waiver of new requirements.

* *Deletion From the NPL.* Historically, the first question asked by parties when they learn that their site has become a target of attention under CERCLA is, "How do we get off the National Priorities List?" The answer has always been limited: finish the cleanup of the site or show that no cleanup is necessary. The final NCP gives some indication that the process may be even more difficult in the future, or at least, slower.

EPA has indicated that the number of sites deleted from the NPL should not be viewed as the measure of success of the Superfund program. This is due in large part to the fact that although many NPL sites have been substantially cleaned up, they require long periods of time before remediation can be formally completed (such that deletion is appropriate). This is typically the case for sites where groundwater contamination is involved: The sources of the contamination (e.g., drums, lagoons, waste piles) have been removed or controlled, but groundwater treatment continues. NPL deletion is also an inappropriate barometer of the program's success because it ignores the success of the removal program, which has resulted in addressing immediate threats at hundreds of sites.

To better communicate the information on the number of sites that have been "substantially" cleaned up, the final rule establishes a new "Construction Completion" category for remedies that have been implemented and are operating properly, including sites awaiting deletion; sites awaiting five-year review and/or deletion; and sites undergoing long-term remedial action to achieve cleanup levels identified in the ROD (e.g., pumping and treating of groundwater).[311]

The language in the preamble to the final rule suggests that PRPs should not look for rapid deletion of sites subject to five-year review (i.e., sites where hazardous substances remain as part of the remedy).[312] EPA has stated through policy, and now has reaffirmed in the preamble to the NCP, that the Agency does not intend to delete sites from the NPL where hazardous substances remain until at least one five-year review has been conducted **[20 ELR 10250]** under CERCLA § 121(c) after completion of the remedial action.[313] The Administrator's Management Review of Superfund specifically suggested this approach.[314]

Although it may appear to be a major shift in the rules of the game (i.e., how to get out of Superfund) it is too early to evaluate the effect of this policy. First, the regulations, even in 1985, gave EPA the discretion to delete *or recategorize* NPL sites "where no further response is appropriate,"[315] and in that sense the new policy was always a potential approach. Second, it is unclear that the policy will be used to severely delay the deletion of sites that have been cleaned up to EPA's specifications. For instance, the requirement that a "five-year review" be conducted before deletion does not necessarily mean that five years must go by after remedy completion before a site may be deleted under the policy. The statute requires a review "no less often than each 5 years," and thus in appropriate cases, a review may follow the previous one by less than five-years (note that the first five-year review at a site must begin after the "initiation" — not completion — of the remedial action).[316]

Even after a site is deleted from the NPL, the Agency has authority to take further action at the site in appropriate cases, without the need to go through a new HRS scoring.[317]

* *No Expanded NPL Deferral Policy.* The issue of an expanded deferral policy is also of considerable interest to private parties. To some, the option of deferring NPL sites to states offered PRPs the possibility of working out reasonable cleanups with state officials in a less public, less expensive, and often less cumbersome, process than under CERCLA. Similarly, deferral to other federal programs could have allowed PRPs to work out cleanups under the standards and procedures of other laws.[318]

As discussed above, the Administrator decided to "defer" the idea of expanding the NPL deferral policy to include deferral to other federal authorities, state authorities, and enforcement orders.[319] It is expected that the concept will be reviewed by Congress during CERCLA reauthorization, and there are some indications that a limited deferral for

"CERCLA-quality" programs may be considered at that time.

Federal Agency Issues

Federal agencies wear several hats under CERCLA. They can be the lead agency for cleanup, acting as the delegate of the President; they can be the designated trustee for certain natural resources; and they can serve as an expert agency, providing guidance to the lead agency on appropriate ways to handle specific waste types.[320] The NCP discusses each of these roles.

* *Applicability of the NCP.* Facilities owned or operated by federal agencies or departments are subject to the requirements of the NCP in the same manner and to the extent they are applicable to private parties, except for those requirements that apply only to Fund-financed activities.[321]

In addition, there are certain requirements imposed by statute that apply specifically and separately to federal facility sites. For instance, the final NCP specifically codifies the provision in CERCLA § 120(e)(4) that remedies for federal facility sites that are on the NPL should be selected jointly by EPA and the federal agency that owns or operates the facility, except that in the case of disagreement, the EPA Administrator selects the remedy.[322] However, most requirements that are specific to federal sites will be discussed in a new Subpart K to the NCP, discussed below.

* *Subpart K Proposal.* The Agency plans to propose a new subpart to the NCP to create a "road map" for how the requirements of the NCP apply to federal agencies, which may be both the PRP and the cleanup authority (as the delegate of the President) at their own sites. Subpart K may also codify certain provisions of CERCLA § 120 that apply uniquely to federal facilities.

The issue that is expected to be of most concern in Subpart K is how cleanup requirements will apply at federal facility sites that are not on the NPL (at which EPA has no formal role in the selection of remedial actions[323]). The role of the states at non-NPL federal facilities could, if addressed in Subpart K, be a contentious issue.[324] Of course, the public will be afforded an opportunity to comment on Subpart K when it is proposed in the *Federal Register.*

* *Natural Resource Trustees.* Subpart G to the NCP discusses the role of certain federal agencies as trustees for natural resources.[325] Upon notification of actual or **[20 ELR 10251]** threatened injury to natural resources, the trustee may conduct resource surveys and assessments, seek the restoration of the resource, or take other actions.[326]

CERCLA authorizes the use of the Fund to clean up releases, but SARA § 517 restricts the use of Fund monies for the *restoration* or rehabilitation of natural resources. The task of restoring resources is left to the natural resource trustee, who under CERCLA § 107(f) has the authority to sue PRPs for such damages and to restore affected resources with such monies. However, the statute and the NCP do provide for extensive coordination between the primary CERCLA cleanup action and any restoration activity that may be deemed necessary by the trustee.[327]

* *Expertise and Support for EPA Cleanups.* Finally, the NCP provides a major role for other federal agencies in providing expertise to the lead agency to facilitate response actions under CERCLA.[328] Subpart B of the NCP also groups certain federal agencies into a National Response Team, which is responsible for national response and preparedness planning,[329] and the NCP establishes Regional Response Teams of federal, state, and local agencies, which are responsible for regional preparedness and planning as well as for providing advice and support to response site managers.[330]

Separate NCP Rulemakings

There are several rulemakings that are planned or in progress to further revise the NCP.

Revised Hazard Ranking System

On December 23, 1988, EPA proposed to revise the HRS, Appendix A to the NCP. The HRS is the model by which releases are assigned a numerical score for use in placing priority releases on the CERCLA NPL.[331] CERCLA § 105(c) had called for revisions by April 17, 1988.

CERCLA "Off-site" Transfer Rule

On November 29, 1988, EPA proposed to add § 300.440 to the NCP setting out requirements for the transfer of wastes from CERCLA sites.[332] The proposed rule would implement the requirements of CERCLA § 121(d)(3) and the "revised off-site policy," which currently provides that wastes from CERCLA-funded or authorized actions may only be transferred to properly permitted off-site facilities that are in compliance with applicable law and do not have uncontrolled releases of hazardous substances.[333] Regulations on this issue were suggested in the Conference Report on SARA, but not by the language of the statute.

Subpart K to the NCP

As discussed above, the Agency intends to propose a new Subpart K to the NCP relating to CERCLA actions at federal facility sites.

Conclusions

The task of revising the rules of operation for the nation's Superfund program has been a formidable one for EPA. The Agency has had to reconcile competing mandates in fulfilling its responsibilities. For instance, the statute calls for the accomplishment of expeditious remedies, yet it requires substantial involvement of the public and the states, detailed administrative records, and a long study and alternatives-assessment process prior to remedy selection. The statute also calls for a maximum use of costly treatment technologies, while at the same time requiring selected remedies to be cost-effective.

By one measure, the NCP is an unqualified success: It contains "something for everyone." States can be expected to be happy with an expanded partnership role throughout the process; PRPs can be happy with the less restrictive private cost recovery standard, and with some more realistic expectations and principles for more streamlined decisionmaking; environmentalists should be heartened by the increased emphasis placed on selecting treatment-oriented remedies under this rule; community groups should be encouraged by the increased opportunities for participation in the process; and the interested public overall should be pleased by efforts to add some structure and predictability to a process that has historically been viewed as wide open.

At the same time, each of these constituencies is likely to be dissatisfied with parts of the final rule (indeed, in some cases precisely the part that pleased some other interest group). Such a reaction would not be unexpected from a process that seeks consensus, and a statute that includes a separate provision for each of several competing constituencies; indeed, such a reaction may be an indication that the Agency has charted a proper middle course.

However, the real measure of the NCP's success, and of the success of the Superfund program more broadly, will be in the implementation — not the words — of the final rule. Implementation is especially critical in this program because so many issues are addressed in guidance, rather than in binding rules. As noted earlier, although detail and structure have been added to the remedy selection process, the NCP remains a highly discretionary document, affording significant flexibility to the site-specific decision-maker. It is too early to tell how consistently those rules and policy statements will be applied.

Whether the new NCP is given a fair test in the field may depend, to a large degree, on Congress. The shadow on the horizon is the up-coming reauthorization of CERCLA. It would be unfortunate if Congress sought too quickly to try to remedy perceived problems before giving the new NCP regulatory framework some time to be understood and put to work. Perhaps the last thing the Superfund needs is another ambitious set of mandates and deadlines, like those in SARA, that would again turn Agency energies to rewriting the rules, rather than applying them in the field.

The final NCP has been long in coming. Only time will tell if it was worth the wait.

1. "Superfund" (the Fund) is the commonly used name for the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), 42 U.S.C. §§ 9601-9675, ELR STAT. CERCLA 001-075. The name stems from the fund established by CERCLA that may be used to directly finance cleanup actions. The Fund was originally established under CERCLA § 221, 42 U.S.C. § 9631 (1982), but was modified in 1986 by SARA § 517, and recodified at § 9507 Chapter 98 of the Internal Revenue Code.

2. 55 Fed. Reg. 8666-8865 (Mar. 8, 1990) (to be codified at 40 C.F.R. § 300).

3. Pub. L. No. 99-499, 100 Stat. 1613 (Oct. 17, 1986). On the 1986 amendments generally, see Atkeson et al., *An Annotated Legislative History of the Superfund Amendments and Reauthorization Act of 1986 (SARA)*, 16 ELR 10360 (Dec. 1986).

4. 53 Fed. Reg. 51394 (Dec. 21, 1988). Virtually every section of the 1985 NCP relating to hazardous site response was revised or reorganized in the proposed NCP revisions, and most of those changes have been finalized in the 1990 revisions.

5. 42 U.S.C. §§ 9601-9675, ELR STAT. CERCLA 001-075.

6. Courageous readers will note that the bulk of the preamble consists of responses to public comment or lengthy discussions of policy issues that are not necessarily included in the rule. This reflects the practice of the Superfund program to give guidance in the preamble to its rulemakings; the Agency believed that most of the responses to comment were important enough to be included in the published package (which can then be easily cited), rather than included in a support document that is available only from the Superfund docket.

7. 42 U.S.C. §§ 6901-6992K, ELR STAT. RCRA 001-050.

8. The term "hazardous substance" is defined in CERCLA § 101(14), 42 U.S.C. § 9601(14), ELR STAT. CERCLA 007, to include any substance listed as hazardous under a number of other environmental statutes, including the Clean Air Act, the Clean Water Act, and RCRA. The term "pollutant or contaminant" is defined in § 101(33), 42 U.S.C. § 9601(33), ELR STAT. CERCLA 009, and generally includes any substance capable of endangering the health of humans or other organisms.

9. 42 U.S.C. § 9604, ELR STAT. CERCLA 012.

10. Although Congress placed the authority for administering CERCLA with the President, most of that authority was delegated to the Administrator of EPA (for nonfederal sites). Exec. Order No. 12580, 52 Fed. Reg. 2923, ELR ADMIN. MATERIALS 45031 (Jan. 29, 1987).

11. 42 U.S.C. § 9606, ELR STAT. CERCLA 024.

12. CERCLA § 101(25), 42 U.S.C. § 9601(25), ELR STAT. CERCLA 009.

13. *Id.* § 101(23), 42 U.S.C. § 9601(23), ELR STAT. CERCLA 008.

14. 55 Fed. Reg. at 8698 (Mar. 8, 1990); 54 Fed. Reg. 13298 (Mar. 31, 1989); 52 Fed. Reg. 27622 (July 22, 1987).

15. CERCLA § 101(24), 42 U.S.C. § 9601(24), ELR STAT. CERCLA 009.

16. *Id.* § 105(a), 42 U.S.C. § 9605(a), ELR STAT. CERCLA 021.

17. *Id.* § 104(d)(1)(A), 42 U.S.C. § 9604(d)(1)(A), ELR STAT. CERCLA 052.

18. NCP § 300.5; 40 C.F.R. § 300.6 (1985). Under the NCP, states cannot be the lead agency for all purposes. For example, only EPA may make the final remedy selection decision for a Fund-financed cleanup. *See* NCP § 300.515(e)(1); note 72 *infra*. For purposes of this Article, references will generally be to "EPA" action under CERCLA, even though in many cases, the state may assume the lead for actions at particular sites.

19. 42 U.S.C. § 9607, ELR STAT. CERCLA 024.

20. *Id.* § 9607(a)(4)(A), ELR STAT. CERCLA 024.

21. CERCLA § 107(a)(4)(B), 42 U.S.C. § 9607(a)(4)(B), ELR STAT. CERCLA 024.

22. *See, e.g.*, O'Neil v. Picillo, 883 F.2d 176, 20 ELR 20115 (1st Cir. 1989); United States v. Chem-Dyne Corp., 572 F. Supp. 802, 13 ELR 20986 (S.D. Ohio 1983).

23. The history and development of the NCP is discussed in detail in Freedman, *Proposed Amendments to the National Contingency Plan: Explanation and Analysis*, 19 ELR 10103 (Mar. 1989).

24. 50 Fed. Reg. 47912 (Nov. 20, 1985).

25. Codified at CERCLA § 105(b), 42 U.S.C. § 9605(b), ELR STAT. CERCLA 022.

26. *Id.* § 121(b), 42 U.S.C. § 9621(b), ELR STAT. CERCLA 051.

27. *Id.* § 121(d)(2), (d)(4), 42 U.S.C. § 9621(d)(2), (d)(4), ELR STAT. CERCLA 052. The statute provides for the waiver of an ARAR under six limited circumstances: (1) where the action is an *interim* measure, and the ARAR will be met upon completion; (2) where compliance with the ARAR would pose a *greater risk* to health and the environment than noncompliance; (3) where it is *technically impracticable* to meet the ARAR; (4) where the standard of performance of an ARAR can be met by an *equivalent method;* (5) where a state standard has *not been consistently applied* elsewhere; and (6) where compliance would not provide a balance between the protection achieved and *demands on the Fund* for other sites.

28. *Id.* § 121(a), (b)(1), 42 U.S.C. § 9621(a),(b)(1), ELR STAT. CERCLA 051.

29. *Id.* § 121(b)(1), 42 U.S.C. § 9621(b)(1), ELR STAT. CERCLA 051.

30. *Id.*

31. *Id.* §§ 117, 113(k), 42 U.S.C. §§ 9617, 9613(k), ELR STAT. CERCLA 042, 040.

32. *Id.* § 121(f), 42 U.S.C. § 9621(f), ELR STAT. CERCLA 053.

33. The requirement to select cost-effective remedies is stated in § 121(a) and (b)(1).

34. CERCLA § 105(b), 42 U.S.C. § 9605(b), ELR STAT. CERCLA 022.

35. Natural Resources Defense Council v. Reilly, No. 88-3199 (D.D.C. consent decree filed June 14, 1989).

36. 53 Fed. Reg. 51394 (Dec. 21, 1988).

37. 55 Fed. Reg. 8666-8865 (Mar. 8, 1990).

38. *Id.* at 8795. CERCLA's administrative record requirements apply to ongoing actions "to the extent practicable." CERCLA § 113(k)(2)(C), 42 U.S.C. § 9613(k)(2)(C), ELR STAT. CERCLA 040; *see also* NCP § 300.800(d),.800(e). This issue is discussed in more detail *infra* at text accompanying notes 307-10.

39. Reilly, *A Management Review of the Superfund Program* (June 1989).

40. 55 Fed. Reg. at 8839 (to be codified at 40 C.F.R. § 300.400-.440). Hereinafter sections of the final rule will be referred to as "NCP § 300. "; finalrule sections from the 1985 NCP will be referred to as "40 C.F.R. § 300. (1985)."

41. NCP § 300.500-.525.

42. NCP § 300.700-.825.

43. NCP § 300.800-.825.

44. CERCLA § 101(14) defines a "hazardous substance" to generally exclude "petroleum, including crude oil or any fraction thereof," as well as natural gas and natural gas liquids. However, where a hazardous substance is intermingled with a petroleum product, or where a petroleum product is specifically listed under one of the statutes in § 101(14), response authority under CERCLA is available. *See* Memorandum from Francis S. Blake, General Counsel, to J. Winston Porter, Assistant Administrator for Solid Waste and Emergency Response, Scope of the CERCLA Petroleum Exclusion Under Sections 101(14) and 104(a)(2) (July 31, 1987).

45. NCP § 300.1-.7.

46. NCP § 300.100-.185. This subpart deals with federal agencies as arms of the executive branch, offering their expertise on matters relevant to releases (e.g., the Nuclear Regulatory Commission with respect to waste containing radioactive elements, or the Fish and Wildlife Service regarding threatened species). This should be distinguished from planned Subpart K, which will set out the responsibilities of federal agencies when taking cleanup actions at their own facilities.

47. NCP § 300.200-.220.

48. NCP § 300.300-.335.

49. NCP § 300.600-.615.

50. NCP § 300.900-.920.

51. CERCLA § 105(d), 42 U.S.C. § 9605(d), ELR STAT. CERCLA 023.

52. NCP § 300.405.

53. NCP § 300.410.

54. NCP § 300.415.

55. Time-critical removal actions commence in fewer than six months after discovery of the release, while non-time-critical removal actions commence after a planning period of more than six months. 53 Fed. Reg. at 51409. Very few CERCLA removal actions fall into the non-time-critical category.

56. NCP § 300.420.

57. 40 C.F.R. pt. 300, app. A.

58. A rulemaking is presently under way to revise the HRS, consistent with CERCLA § 105(c), 42 U.S.C. § 9605(c), ELR STAT. CERCLA 023. *See* 53 Fed. Reg. 51962 (Dec. 23, 1988).

59. 40 C.F.R. pt. 300,app. B.

60. Monies from the Fund may be spent only for remedial actions at those releases listed on the NPL. *See* 40 C.F.R. § 300.66(c)(2), .68(a) (1985); NCP § 300.425(b)(1).

61. NCP § 300.425.

62. *See* NCP § 300.425(b)(1), .425(b)(2); 55 Fed. Reg. 8698 (Mar. 8, 1990); 54 Fed. Reg. 13298 (Mar. 31, 1989); 54 Fed. Reg. 10522 (Mar. 13, 1989).

63. NCP § 300.430(a)(2), .430(d), .430(e).

64. NCP § 300.430(e)(2)(i).

65. 55 Fed. Reg. 8712-13 (Mar. 8, 1990); *see infra* text accompanying notes 164-80.

66. NCP § 300.430(e)(7).

67. NCP § 300.430(e)(9).

68. NCP § 300.430(f).

69. NCP § 300.430(f)(1)(i).

70. CERCLA § 121(b)(1), NCP § 300.430(f)(1)(ii)(D) and (E).

71. NCP § 300.430(f)(1)(ii)(E).

72. If the state is the lead agency but EPA does not agree with the proposed plan, EPA may take back the lead on the project. *See* NCP § 300.515(e)(1).

73. NCP § 300.430(f)(2).

74. NCP § 300.430(f)(5). For a list of all CERCLA RODs, see ELR ADMIN. MATERIALS 30003:3.

75. NCP § 300.435.

76. CERCLA § 117(c), 42 U.S.C. § 9617(c), ELR STAT. CERCLA 043; NCP § 300.435(c)(2)(i).

77. NCP § 300.435(c)(2)(ii). The different circumstances warranting an ESD as compared with a ROD amendment are discussed below at text accompanying notes 284-88.

78. *See* NCP § 300.435(f)(3), and discussion below on state cost share for O&M.

79. CERCLA § 104(c)(3), 42 U.S.C. § 9604(c)(3), ELR STAT. CERCLA 013; NCP § 300.510(c)(1).

80. NCP § 300.425.

81. NCP § 300.430(f)(4)(ii).

82. NCP § 300.5.

83. 40 C.F.R. § 261.31-.33.

84. NCP § 300.400(g)(2)(i)-.400(g)(2)(viii).

85. The Agency has specifically discussed this interpretation with respect to the standards for closure of hazardous waste management units under RCRA. *See* 53 Fed. Reg. 51445-46 (Dec. 21, 1988).

86. CERCLA § 121(d)(4), 42 U.S.C. § 9621(d)(4), ELR STAT. CERCLA 052. There are six limited circumstances under which an ARAR may be waived. *See supra* note 27, and 55 Fed. Reg. 8747-50 (Mar. 8, 1990). Although waivers have been used rarely to date, the Agency is considering their more frequent application in the future. *See, e.g.*, the discussion below in the section "Remedy Selection — Fund Balancing Waiver."

87. NCP § 300.400(g)(4).

88. 55 Fed. Reg. 8756-57 (Mar. 8, 1990). This issue is discussed in more detail below, in the section "ARARs Issues — Substantive, Not Administrative, Requirements."

89. 42 U.S.C. § 9621(d)(2)(A)(i) and (ii), ELR STAT. CERCLA 052.

90. Thus, they will not be considered potentially relevant and appropriate requirements, and they cannot be waived under CERCLA § 121(d)(4), 42 U.S.C. § 9621(d)(4), ELR STAT. CERCLA 052. One advantage of being considered a potential ARAR is that the requirement is on a list that is routinely considered by site managers (*see* 55 Fed. Reg. at 8764-66). Thus, the likelihood of early attention to the requirement is high.

91. 42 U.S.C. § 9621(d)(2)(A), ELR STAT. CERCLA 052.

92. Off-site transfers must also comply with EPA's off-site policy (EPA/OSWER Directive No. 9834.11, Nov. 13, 1987) and CERCLA § 121(d)(3), 42 U.S.C. § 9621(d)(3), ELR STAT. CERCLA 052. A new section of the NCP has been proposed to codify the off-site requirements in that policy and section of the statute. *See* 53 Fed. Reg. 48218 (Nov. 29, 1988).

93. 55 Fed. Reg. 8695-96 (Mar. 21, 1990).

94. 40 C.F.R. § 300.68(i)(1) (1985). Note, however, that under 40 C.F.R. § 300.65(f) and .68(i) (1985), remedies were required to meet the ARARs of federal environmental and public health laws; the statute and the final NCP limit ARARs to environmental laws.

95. NCP § 300.400(g)(4); *see* discussion below in "State ARARs Issues."

96. NCP § 300.415(i); *see also* 40 C.F.R. § 300.65(f) (1985).

97. 53 Fed. Reg. at 51441.

98. MCLs are independently applicable only to public drinking water systems. SDWA § 1401(1), 42 U.S.C. § 300f(1), ELR STAT. SDWA 002; 50 Fed. Reg. 46880 (Nov. 13, 1985). Hence, their use as potential ARARs for contaminated groundwater is based on an analysis that under CERCLA § 121(d)(2)(A)(i), they may be relevant and appropriate requirements in determining groundwater restoration levels. Similarly, MCLGs are not independently applicable (they are unenforceable goals). However, the statute requires the attainment of MCLGs where "relevant and appropriate under the circumstances of the release." CERCLA § 121(d)(2)(A), 42 U.S.C. § 9621(d)(2)(A), ELR STAT. CERCLA 052.

99. *See* NRDC v. EPA, 812 F.2d 721, 723, 17 ELR 20418 (D.C. Cir. 1987); SDWA § 1412, 42 U.S.C. § 300g-1, ELR STAT. SDWA 002; 50 Fed. Reg. 46880-81 (Nov. 13, 1985); 49 Fed. Reg. 2437 (June 12, 1984).

100. 53 Fed. Reg. 51441 (Dec. 21, 1988).

101. 55 Fed. Reg. 8751-52 (Mar. 8, 1990). ARARs are defined as the "promulgated" (i.e., enforceable) requirements of other laws. NCP § 300.400(g)(4). MCLs are the enforceable requirements of the SDWA. 50 Fed. Reg. 46881 (Nov. 13, 1985).

102. NCP § 300.430(e)(2)(i)(B), (C).

103. 55 Fed. Reg. 8751-52 (Mar. 8, 1990).

104. *See* Memorandum of Jonathan Z. Cannon, Acting Assistant Administrator for Solid Waste and Emergency Response, *Considerations in Ground Water Remediation at Superfund Sites*, EPA/OSWER Directive No. 9355.4-03 (Oct. 18, 1989).

105. CERCLA § 121(d)(2)(B)(ii), 42 U.S.C. § 9621(d)(2)(B)(ii), ELR STAT. CERCLA 052.

106. 55 Fed. Reg. 8754 (Mar. 8, 1990).

107. CERCLA § 121(d)(2)(B)(i), 42 U.S.C. § 9621(d)(2)(B)(i), ELR STAT. CERCLA 052.

108. 55 Fed. Reg. 8754-55 (Mar. 8, 1990).

109. 53 Fed. Reg. 51440 (Dec. 21, 1988).

110. NCP § 300.430(f)(1)(ii)(B); 55 Fed. Reg. 8757 (Mar. 8, 1990).

111. *See* S. REP. NO. 848, 96th Cong., 2d Sess. 56 (1980), *reprinted in* 1 SENATE COMM. ON ENVIRONMENT & PUBLIC WORKS, 97th Cong. 2d Sess., *A Legislative History of the Comprehensive Environmental Response, Compensation and Liability Act of 1980*, at 363 (Comm. Print 1983):

The paramount purpose of this section [104] is the protection of public health, welfare and the environment. It is recognized that government response will often be necessary prior to receipt of evidence which conclusively establishes the substances or materials released or the origin of their release, discharge or disposal. Because delay will often exacerbate an already serious situation, the bill authorizes the President to respond when a substantial threat of release

may exist.

Courts have also recognized the congressional intent to promote the "prompt cleanup of hazardous waste sites." Dickerson v. EPA, 834 F.2d 974, 978, 18 ELR 20305, 20306 (11th Cir. 1987); J. V. Peters & Co. v. EPA, 767 F.2d 263, 264, 15 ELR 20646 (6th Cir. 1985).

112. CERCLA § 121(c), 42 U.S.C. § 9621(c), ELR STAT. CERCLA 051; 40 C.F.R. § 300.430(f)(4)(ii); 53 Fed. Reg. 51430, 51507 (Dec. 21, 1988).

113. NCP § 300.430(f)(1)(ii)(B)(2).

114. *See* 53 Fed. Reg. 51443-47 (Dec. 21, 1988); 55 Fed. Reg. 8759-62 (Mar. 8, 1990).

115. 42 U.S.C. § 6924, ELR STAT. RCRA 012.

116. Pub. L. No. 98-616, 88 Stat. 3221.

117. 42 U.S.C. § 6924(k), ELR STAT. RCRA 013.

118. *See, e.g.*, 53 Fed. Reg. 31138 (Aug. 17, 1988) (standards for first-third wastes issued); 54 Fed. Reg. 26594 (June 23, 1989) (standards for second-third wastes issued); 54 Fed. Reg. 48372 (Nov. 11, 1989) (standards for third-third wastes proposed).

119. *See, e.g.*, RCRA § 3004(d)(3), which provides that for four years after the effective date of the HSWA, the restrictions in subsection (d) would not apply to "any disposal of contaminated soil or debris resulting from a response action taken under § 104 or 106 of [CERCLA] or a corrective action under this title." 42 U.S.C. § 6924(d)(3), ELR STAT. RCRA 013.

120. 53 Fed. Reg. 51444 (Dec. 21, 1988). However, movement of hazardous waste entirely within a unit would not constitute placement or "land disposal" under RCRA Subtitle C. *Id.*

121. 54 Fed. Reg. 41566 (Oct. 10, 1989).

122. 55 Fed. Reg. 8759-60 (Mar. 8, 1990).

123. *Id.* at 8760-61. Variances from BDAT are available under RCRA where the treatment technology is deemed not to be "appropriate" to the waste. 40 C.F.R. § 268.44.

124. *See* CERCLA § 121(e)(1), (d)(2); discussion at 53 Fed. Reg. 51443 (Dec. 21, 1988).

125. 55 Fed. Reg. 8762 (Mar. 8, 1990). EPA has issued detailed guidance on treatability variance levels for specific types of contaminants. *See* Superfund LDR Guidance No. 6A, *Obtaining a Soil and Debris Treatability Variance for Remedial Actions*, EPA/OSWER Directive No. 9347.3-06FS (July 1989).

126. 55 Fed. Reg. 8762 (Mar. 8, 1990).

127. 53 Fed. Reg. 51426 (Dec. 21, 1988).

128. 55 Fed. Reg. 8753 (Mar. 8, 1990).

129. *Id.* at 8734.

130. CERCLA § 121(b), 42 U.S.C. § 9621(b), ELR STAT. CERCLA 051. CERCLA also appears to contemplate the restoration of groundwater. CERCLA § 104(c)(6), 42 U.S.C. § 9604(c)(6), ELR STAT. CERCLA 013.

131. *See, e.g.*, proposed § 300.430(b)(7), 53 Fed. Reg. 51504 (Dec. 21, 1988).

132. *See, e.g.*, NCP § 300.400(g)(3), .415(i), .430(b)(9); 55 Fed. Reg. 8744-45 (Mar. 8, 1990).

133. *See* discussion in the preamble to the proposed rule at 53 Fed. Reg. 51443 (Dec. 21, 1988), and in *CERCLA Compliance With Other Laws Manual*, EPA/OSWER Directive No. 9234.1-01, at p. 1-11 (Interim Final Guidance, Aug. 8, 1988).

134. NCP § 300.5; 55 Fed. Reg. 8756 (Mar. 8, 1990).

135. *See supra* note 111. In addition to enacting an express permit waiver in CERCLA § 121(e)(1), discussed below, Congress recognized the need to allow cleanups to move forward without delay by enacting § 113(h), which delays judicial review of CERCLA response actions until EPA takes an enforcement or cost recovery action, until the action has been completed, or until an action has been filed under CERCLA § 106(b).

136. *See* 50 Fed. Reg. 47910-18 (Nov. 20, 1985); 50 Fed. Reg. 5865 (Feb. 12, 1985); Memorandum of Francis S. Blake, General Counsel, to Lee M. Thomas, Administrator, "CERCLA Compliance With Other Environmental Laws" Opinion (Nov. 22, 1985). The implied repeal theory is based in large part on the existence of the ARARs process under CERCLA § 121(d)(2) and (d)(4), which defines how and to what extent the requirements of federal and state environmental laws should apply to on-site CERCLA remedial actions. Based on these provisions, CERCLA remedies will incorporate (or waive) the standards of other environmental laws, as appropriate under CERCLA. Thus, although other environmental laws do not independently apply to CERCLA response actions, the substantive requirements of such laws will be applied to such actions, consistent with CERCLA § 121(d) and NCP § 300.400(g).

137. *See, e.g., CERCLA Compliance With Other Laws Manual: Part II*, EPA/OSWER Directive No. 9234.1-02, at p. 4-1 (Interim Final Guidance, Aug. 1989):

While EPA interprets CERCLA § 121(e) to exempt lead agencies . . . from complying with the administrative requirements for on-site remedial activities, it is strongly recommended that lead agencies, nonetheless, consult as specified with administering agencies for on-site actions. The administering agencies have the expertise to determine the impacts of a remedial action on particular aspects of the environment and what steps should be taken to avoid and mitigate adverse impacts.

138. NCP § 300.435(b)(2).

139. CERCLA § 121(d)(2)(A), 42 U.S.C. § 9621(d)(2)(A), ELR STAT. CERCLA 052.

140. 55 Fed. Reg. 8755 (Mar. 8, 1990).

141. *Id.* at 8695.

142. CERCLA §§ 101(23), 104(b); 42 U.S.C. §§ 9601(23), 9604(b); ELR STAT. CERCLA 052.

146. 55 Fed. Reg. 8755 (Mar. 8, 1990).

147. CERCLA § 121(d)(4)(A), 42 U.S.C. § 9621(d)(4)(A), ELR STAT. CERCLA 052; NCP § 300.430(f)(1)(ii)(C)*(1).*

148. 40 C.F.R. § 300.65(f) (1985).

149. *See* CERCLA § 121(d)(2), 42 U.S.C. § 9621(d)(2), ELR STAT. CERCLA 052.

150. NCP § 300.415(i).

151. 55 Fed. Reg. 8695-96 (Mar. 8, 1990).

152. NCP § 300.415(i).

153. NCP § 300.415(i)(A) and (B).

154. "Removal" actions are defined in CERCLA § 101(23) as actions to "prevent, minimize or mitigate damage" or to conduct investigations, whereas "remedial" actions are defined in CERCLA § 101(24) as actions consistent with a "permanent" remedy at the site. Further, CERCLA § 104(c)(1) provides that Fund-financed removal actions may not continue after $ 2 million have been obligated or 12 months have elapsed, except under limited circumstances spelled out in that section. Both sections of the statute suggest that removals are generally intended to be short-term, nonpermanent actions. (Although in some cases, a removal action may result in a permanent solution to a contamination problem.)

155. For instance, as discussed below, there are additional public participation requirements associated with remedial actions.

156. CERCLA § 121(d)(4), 42 U.S.C. § 9621(d)(4), ELR STAT. CERCLA 052; NCP § 300.430(f)(1)(ii)(C).

157. 55 Fed. Reg. 8695; 8747 (Mar. 8, 1990).

158. CERCLA § 121(d)(2)(A)(ii), 42 U.S.C. § 9621(d)(2)(A)(ii), ELR STAT. CERCLA 052; NCP § 300.400(g)(4). (Note that "promulgated" is defined in the rule as being "of general applicability and legally enforceable." *Id.*) Under the 1985 NCP, state requirements were merely considered TBCs. 40 C.F.R. § 300.68(i)(4) (1985).

159. 55 Fed. Reg. 8741-42 (Mar. 8, 1990).

160. *Id.* at 8746; *see* NCP § 300.400(g)(5).

161. NCP § 300.515(d)(1).

162. *See* discussion at 53 Fed. Reg. 51438 (Dec. 21, 1988); 55 Fed. Reg. 8746 (Mar. 8, 1990).

163. CERCLA § 121(d)(4)(A), 42 U.S.C. § 9621(d)(4)(A), ELR STAT. CERCLA 052; NCP § 300.430(f)(1)(ii)(C)(*1*).

164. NCP § 300.430(d)(1).

165. 55 Fed. Reg. 8709 (Mar. 8, 1990). The baseline risk assessment consists of an exposure assessment component and a toxicity assessment component. It has superseded the "endangerment assessment," because the two have the same goal, function, and methodology. *Id.*

166. *Id.* at 8713.

167. NCP § 300.430(e)(2)(i), .430(e)(2)(i)(A)(2); 55 Fed. Reg. 8713 (Mar. 8, 1990).

168. 55 Fed. Reg. 8712 (Mar. 8, 1990).

169. This is in deference to the determination of another environmental protection program that the ARAR level is protective. (Cleanup to a level more stringent than the single ARAR might be appropriate to assure protectiveness where the Agency finds, for example, on a site-specific basis, that the contaminant poses a risk over more than one pathway of exposure. *Id.* at 8713.)

170. *Id.*

171. *Id.* at 8712-13. These levels are set based on reliable toxicity information, such as EPA's reference doses.

172. *Id.* at 8712.

173. NCP § 300.430(d)(4); 55 Fed. Reg. 8709-11 (Mar. 8, 1990). In effect, cleanups will be based on "likely" residential, industrial, or other uses. The Superfund program is in the process of developing generic exposure assumptions for such use categories.

174. 55 Fed. Reg. 8713 (Mar. 8, 1990).

175. *Id.*

176. 53 Fed. Reg. 51425-26 (Dec. 21, 1988).

177. Exposure factors, uncertainty factors, and technical factors may determine where to set remedial action goals within the risk range. *See* 55 Fed. Reg. 51426 (Mar. 8, 1990).

178. NCP § 300.430(e)(2)(i)(A)(*2*).

179. 55 Fed. Reg. 8716-17 (Mar. 8, 1990).

180. *See, e.g. id.* at 8717 n.9.

181. NCP § 300.420(f)(1)(i)(A)-(C); 55 Fed. Reg. 8724 (Mar. 8, 1990).

182. The analysis of compliance with ARARs does not necessarily resolve the issue of how stringent the remedy must be. As discussed below in the section on the "role of cost," where chemical-specific ARARs are not available to define the protective cleanup level for the relevant contaminants, the Agency will select among the alternative technologies that will result in remedies within the acceptable risk range; the balancing criteria aid in selecting among such viable, protective alternatives.

183. *See* 53 Fed. Reg. 51428-29 (Dec. 21, 1988).

184. NCP § 300.430(f)(1)(ii)(E).

194. NCP § 300.430(f)(1)(iii)(A). "Principal threats" include liquids as well as highly toxic or highly mobile contamination.

195. NCP § 300.430(f)(1)(iii)(B).

196. NCP § 300.430(a)(1)(iii)(C). The rule also sets out expectations concerning the development of innovative technologies; the use of institutional controls, primarily a supplement to more active measures; and the restoration of groundwater to its beneficial uses, wherever practicable. NCP § 300.430(a)(1)(iii)(D)-(F).

197. NCP § 300.430(a)(1)(ii); 55 Fed. Reg. 8703 (Mar. 8, 1990).

198. NCP § 30.430(a)(1)(ii)(A).

199. *See, e.g.*, Memorandum from Don R. Clay, Assistant Administrator for Solid Waste and Emergency Response, *Interim Guidance on Addressing Immediate Threats at NPL Sites* (Superfund Management Review: Recommendation No. 22), EPA/OSWER Directive No. 9200.2-03 (Jan. 30, 1990).

200. NCP § 30.430(a)(1)(ii)(C).

201. 55 Fed. Reg. 8712, 8714 (Mar. 8, 1990).

202. 53 Fed. Reg. 51440 (Dec. 21, 1988).

203. CERCLA § 121(d)(4)(f); NCP § 300.430(f)(1)(ii)(C)(*6*).

204. The Fund-balancing waiver has been invoked in only one case and considered in another. *See* Freedman, *supra* note 23, at 10132 n.261.

205. 55 Fed. Reg. 8749-50 (Mar. 8, 1990).

206. *See, e.g.*, Senate Subcomm. on Superfund, Ocean, and Water Protection, *Lautenberg-Durenberger Report on Superfund Implementation: Cleaning Up the Nation's Cleanup Program*, 57-64 (May 1989).

207. 55 Fed. Reg. 8726-30 (Mar. 8, 1990).

208. *See* discussion above in "Risk Assessment and Risk Range."

209. NCP § 300.430(f)(1)(ii)(D); 55 Fed. Reg. 8728 (Mar. 8, 1990).

210. 55 Fed. Reg. 8728 (Mar. 8, 1990); *see also* 53 Fed. Reg. 51422 (Dec. 21, 1988).

211. 55 Fed. Reg. 8728 (Mar. 8, 1990); 53 Fed. Reg. 51427-28 (Dec. 21, 1988).

212. Alternatives with grossly excessive costs will be eliminated during screening, as discussed below.

213. 55 Fed. Reg. 8728 (Mar. 8, 1990). This decision not to use cost as a major factor in eliminating "viable" options prior to balancing is not necessarily inconsistent with the Agency's use of cost during screening, discussed below, to eliminate extreme (nonviable) options with "grossly" excessive cost.

214. CERCLA § 121(b)(1), 42 U.S.C. § 9621(b)(1), ELR STAT. CERCLA 052.

215. NCP § 300.430(f)(1)(ii)(e); 55 Fed. Reg. 8729 (Mar. 8, 1990).

216. The "permanence" offered by a remedy is an important element of this determination. The preamble to the final NCP notes that the maximum permanence practicable is judged along a continuum, based on the degree of long-term effectiveness and permanence afforded by a remedy. 55 Fed. Reg. 8720 (Mar. 8, 1990).

217. *Id.* at 8725.

218. *Id.*

219. *Id.* at 8729.

220. NCP § 300.430(e)(7)(iii); 55 Fed. Reg. 8714-15 (Mar. 8, 1990).

221. Cost may also be used to screen out an alternative that uses a similar technology and provides similar effectiveness and implementability to another alternative, but at a greater cost. In effect, this avoids the need to carry variations of the same technology through the detailed analysis phase.

222. CERCLA § 121(e)(1), 42 U.S.C. § 9621(e)(1), ELR STAT. CERCLA 053.

223. CERCLA § 121(d)(2)(A), 42 U.S.C. § 9621(d)(2)(A), ELR STAT. CERCLA 052 ("With respect to any hazardous substance, pollutant or contaminant that will remain onsite . . .").

224. 53 Fed. Reg. 51406-08 (Dec. 21, 1988); *see also* discussion in Freedman, *supra* note 23, at 10125-26.

225. NCP § 300.400(e).

226. 55 Fed. Reg. 8688-89 (Mar. 8, 1990). This definition of "on-site" in the NCP is also significant in that it defines, by extension, the term "off-site," and thus affects the scope of CERCLA policy on the transfer of CERCLA wastes off site. Currently, such transfers are regulated under the revised off-site policy, EPA/OSWER Directive No. 9834.11 (Nov. 13, 1987), and CERCLA § 121(d)(3), which provide generally that wastes from CERCLA-funded or authorized actions may only be transferred to properly permitted off-site facilities that are in compliance with applicable law, and do not have uncontrolled releases of hazardous substances. Regulations to implement the off-site policy and § 121(d)(3) have been proposed (53 Fed. Reg. 48219 (Nov. 29, 1988)).

227. As noted in CERCLA § 104(d)(4), "where two or more noncontiguous facilities are reasonably related on the basis of geography, or on the basis of the threat, or potential threat to the public health or welfare or the environment, the President may, in his discretion, treat these related facilities as one for the purposes of this section." 42 U.S.C. § 9604(d)(4), ELR STAT. CERCLA 015.

228. 55 Fed. Reg. 8690 (Mar. 8, 1990).

229. As a matter of policy, and as part of the hazard ranking system process for site evaluation, EPA applies more restrictive criteria to potential site aggregations at the NPL listing stage than it does at the remedial response stage. *See* 48 Fed. Reg. 40663 (Sept. 8, 1983).

230. 55 Fed. Reg. 8691 (Mar. 8, 1990).

231. *See, e.g.*, 53 Fed. Reg. 51416 (Dec. 21, 1988) (proposed NCP); 53 Fed. Reg. 23978 (June 24, 1988); 48 Fed. Reg. 40658 (Sept. 8, 1983).

232. 55 Fed. Reg. 8667 (Dec. 21, 1988).

233. A recent report by GAO on the capability of State response programs revealed disparities in the abilities of states to clean up sites, but recognized that many states have well-developed response programs. *See* GAO REP. NO. GAO/RCED-89-164, HAZARDOUS WASTE SITES: STATE CLEANUP STATUS AND ITS IMPLICATIONS FOR FEDERAL POLICY (Aug. 1989).

234. NCP § 300.515(e)(1).

235. NCP § 300.515(e)(2)(i); 55 Fed. Reg. 8782 (Mar. 8, 1990).

236. NCP § 300.515(e)(2)(i).

237. 55 Fed. Reg. 8781-82 (Mar. 8, 1990).

238. NCP § 300.515(e)(2)(ii).

239. However, there are limitations on the ability of a state to take independent actions. If EPA undertakes (or has already begun) an RI/FS at a site, CERCLA § 122(e)(6) would not allow a PRP to take remedial action at the site without the prior authorization of EPA, and on its face, that section would also appear to proscribe PRP remedial actions ordered by a state. Further, where EPA does not concur on a state remedy, EPA will not be deemed to have approved the state decision, resulting in less certainty for the PRPs. NCP § 300.515(e)(2)(ii). A state may also be limited in its ability to carry out an independent state-ordered action if that action physically conflicts with an action ordered by EPA, under general principles of federal supremacy.

240. 55 Fed. Reg. 8783 (Mar. 8, 1990). Several commenters suggested that CERCLA § 104(d)(1) may be read in

conjunction with CERCLA § 104(c)(4) (relating to the selection of remedial actions) to allow EPA to authorize states to select remedies at specific sites through cooperative agreements or Superfund contracts.

241. During the original passage of CERCLA in 1980, Congress rejected the idea of establishing a program of federal grants to states as the means of cleaning up hazardous waste sites. *See* Freedman, *supra* note 23, at 10134 & n.274.

242. NCP § 300.515(f); 55 Fed. Reg. 8783-85 (Mar. 8, 1990).

243. As noted above, where EPA and the state disagree on a remedy selection, a state has the option of withholding its CERCLA § 104 assurances,thereby preventing the remedy from proceeding as a Fund-financed action (although EPA could initiate an enforcement action), and for EPA enforcement actions, a process is available for states to challenge a decision by EPA to waive an ARAR (CERCLA § 121(f)(2)(B)). These are, however, extreme measures, and the Agency's goal is to reach agreement with states through the normal remedy selection process. The final rule specifically sets out a procedure for dispute resolution with the states in order to foster agreement on ARARs. NCP § 300.515(d)(3), .515(d)(4); 55 Fed. Reg. 8781-82 (Mar. 8, 1990).

244. These proposed "changes" could include the attainment of a particular state standard that EPA found not to be an ARAR, or waived.

245. As noted above, a state's ability to proceed unilaterally where EPA is undertaking a CERCLA response action may be limited. *See supra* note 239.

246. Proposed NCP § 300.515(a)(3), 53 Fed. Reg. 51511 (Dec 21, 1988).

247. *E.g.*, NCP § 300.505(d)(4); *see* 55 Fed. Reg. 8776-77 (Mar. 8, 1990).

248. The exception to this formula is where the State operated the site, at the time of disposal, in which case the state's cost share may be 50 percent or greater. CERCLA § 104(c)(3)(C)(ii), 42 U.S.C. § 9604(c)(3)(C)(ii), ELR STAT. CERCLA 013.

280. NCP § 300.430(f)(3).

281. NCP §§ 300.430(f)(3)(i)(C); 55 Fed. Reg. 8770 (Mar. 8, 1990).

282. NCP § 300.820(b)(2).

If EPAdecides to adopt a final ROD that differs significantly from the proposed plan and those changes could not have been reasonably anticipated based on existing information, additional comment will be solicited on a revised proposed plan.[283]

283. NCP § 300.430(f)(3)(ii)(B).

284. NCP § 300.435(c)(1).

285. NCP § 300.435(c)(2)(ii).

286. NCP § 300.435(c)(2)(i). Both the preamble to the final rule and the preamble to the proposed rule discuss when an ESD, as compared with a ROD amendment, would be appropriate. *See* 55 Fed. Reg. 8772-73 (Mar. 8, 1990); 53 Fed. Reg. 51451-52 (Dec. 21, 1988); *see also Interim Final Guidance on preparing Superfund Decision Documents,* EPA/OSWER Directive No. 9355.3-02 (May 1989).

287. NCP § 300.825(b).

288. NCP § 300.825(c); 55 Fed. Reg. 8773 (Mar. 8, 1990).

289. The issue of whether a local government comes within CERCLA § 107(a)(4)(A) or (B) was not decided by the NCP, but rather was left to the courts. *See 55* Fed. Reg. 8799 (Mar. 8, 1990).

290. District courts have issued interpretations at both ends of the spectrum on this issue. *Compare* General Elec. Co. v. Litton Bus. Sys., 715 F. Supp. 949, 962, 19 ELR 21433, 21438 (W.D. Mo. 1989) (holding that consistency with the NCP "does not necessitate strict compliance with its provisions") *and* Amland Properties Corp. v. Aluminum Co. of Am., 711 F. Supp. 784, 796, 19 ELR 21180, 21184 (D.N.J. 1989) (rejecting arguments that "substantial compliance" with the NCP is sufficient). The split in the courts on this issue was also discussed in the preamble to the proposed rule; 53 Fed. Reg. 51462 (Dec. 21, 1988).

291. NCP § 300.700.

292. 53 Fed. Reg. 51461 (Dec. 21, 1988).

293. NCP § 300.700(c)(3).

294. NCP § 300.700(c)(4).

295. NCP § 300.700(c)(5)-.700(c)(7).

296. 55 Fed. Reg. 8792-93 (Mar. 8, 1990).

297. There are a number of NCP requirements that do not make sense for private parties, such as the requirements for state assurances (§ 300.510), or other provisions related to use of the Fund. Similarly, there are self-imposed restrictions on governmental actions that are not relevant to private actions, such as the requirement that a site be listed on the NPL before Fund-financed remedial action may be taken (300.425(b)(1)).

298. 55 Fed. Reg. 8793 (Mar. 8, 1990). Note that compliance with these mandates was already necessary under the proposed rule, which required private parties to strictly comply with the detailed provisions of the NCP, including provisions codifying these statutory mandates. *See* proposed rule § 300.430(f)(3)(ii) (protectiveness and ARARs); .430(f)(3)(iii) (cost-effectiveness and permanence/treatment); and .430(f)(2) (public participation).

299. 55 Fed. Reg. 8794 (Mar. 8, 1990).

300. *See id.* at 8785-86.

301. NCP § 300.515(e)(2)(i) and (ii). However, the rule maintains the Agency's long-standing position that EPA silence on a state-conducted remedy cannot be construed as EPA concurrence. 55 Fed. Reg. 8786 (Mar. 8, 1990); 53 Fed. Reg. 51458 (Dec. 21, 1988).

302. NCP § 300.520.

303. NCP § 300.515(d)(3)-.515(d)(4); 55 Fed. Reg. 8781-82 (Mar. 8, 1990).

304. 42 U.S.C. § 9622(e)(6); ELR STAT. CERCLA 052; *see* 55 Fed. Reg. 8783 (Mar. 8, 1990); 54 Fed. Reg. at 10523-24 (Mar. 13, 1989).

305. 55 Fed. Reg. 8688 (Mar. 8, 1990). The rule states that a PRP may be designated as EPA's representative for the purpose of access only where that PRP has agreed to conduct response activities pursuant to an administrative order or consent decree. NCP § 300.400(d)(3).

306. 42 U.S.C. § 9604(a)(1); ELR STAT. CERCLA 052; *see* 55 Fed. Reg. 8688 (Mar. 8, 1990). CERCLA § 104(a)(1) sets out certain preconditions before a PRP may conduct an RI/FS. The PRP must show that it will carry out the work

promptly and properly, and it must agree to reimburse the Fund for any oversight costs.

307. 55 Fed. Reg. 8795 (Mar. 8, 1990).

308. CERCLA § 113(k)(2)(C), 42 U.S.C. § 9613(k)(2)(C), ELR STAT. CERCLA 052; NCP § 300.800(d), (e).

Subject:	RE: 995 GHG requirements

Have we completed a similar analysis for the new hospital?

Yes. It is a chapter in the draft EIR. Specifically the Climate Action Plan Appendix. (Pages 1483 to 1548 https://ucsf.app.box.com/v/CPHP-Draft-EIR)

We analyzed the cost of meeting the greenhouse gas on the entire CPHP project – including NHPH - for both engineering design features into the project and also for buying requisite offsets. The most cost effective path for meeting the requirements of SB 995 will involve some of both some design features and offsets We thoroughly vetted our strategy with the Office of General Counsel at UCOP.

We currently buy offsets. We have a UCSF committee on purchasing future offsets. Purchase of offsets currently comes out of operational funds. The source of future expenditures of funds for project associated offsets not caused by utility usage is still under discussion. We plan to have a recommendation to management in 2021. The soonest that purchase would start is in 2024.

Jackie's figures assume $9/ton. We assume $11 NPV to be conservative. We have actually paid as low as $6. We look at the technology and the cost curves annually.

Paul,

See below – it's a long email string, but the portion pertaining to you is right on top.

We are going to set up a meeting on Monday from 2-3, but I see that you have a conflict. Is there any way that you could provide some input before Monday? Sorry for the short notice – this came from Brian Newman via our donor, so there is a level of urgency to respond.

Thanks,
Dan

Hi Dan,

Both of the suggested times work for me.

Could I ask as well that we seek any information regarding the current status and scope of the campus EIR process as information for the conversation? That also factors into the SB 995 portion of any conversation. Would be good to know how far along that is and how they are treating NHPH. Paul Franke might be the right person to talk with in advance to understand status.

Thanks,
Rob

All,

I'm adding Anna into the conversation.

Rob and Raj – Thanks for the thorough explanation – that makes sense. It sounds like there are a lot of variables to consider. I think it makes sense to set up a conversation for next week. Can we do Monday 8/24 from 2-3 or Wednesday 8/26 from 4-5? Let me know if those times work and I'll send out an invite.

I'll see if I can better define the request so we know what level of detail is appropriate for this analysis.

Thanks,
Dan

Thanks Rob, great summary.

We did not get into a detailed GHG analysis during masterplanning as Rob mentioned below. However, if we wanted to take a step towards this direction and/or discuss Rob's points in more detail – can I suggest setting up a conversation with Anna Levitt. We can then take the next step based on the outcome of that conversation.

We have had similar conversations with Anna on carbon accounting and calculations on other ongoing Parnassus projects (unrelated to SB995) and that would be the best first step. Arup/Mazzetti can follow through based on our agreed next steps. Let me know if you have additional thoughts.

Subject: RE: 995 GHG requirements

Dan,

My understanding of SB 995 is that it is an extension of AB 900, which allows projects that so choose to be streamlined under CEQA if they commit to offsetting any additional greenhouse gas emissions the project would incur compared to the existing use (I'll caveat that I'm getting up to speed a bit on it—this is the first project of mine where SB 995 has come up, and SB 995 is not yet passed into law, I don't believe). If my read is correct that it is functionally an extension of AB 900 for non-housing projects, then we are currently pursuing two projects with this pathway as well (under AB 900). In both of those cases, offsets were the way to go because the site prevented us from achieving the requirement of no net new GHGs any other way.

For NHPH, to answer your question, we have not done any cost analysis. However, we have reasonably observed that the project cannot get offset a significant portion of its emissions on-site with PV or other means due to the use, height, and the general lack of sun at Parnassus. So as an early assumption, we would assume that offsets would be required to meet an SB 995 target for NHPH.

In our experience working through projects with AB 900, it is comprehensive in the offsets required. While UCSF will be purchasing green power that would take care of the electrical and gas use at limited additional cost (and as part of the UC purchasing pool hopefully would meet the requirements CARB sets for emissions offsets or green power under AB 900), the transportation emissions offset might be harder. AB 900 (and I believe SB 995 as well) requires that VMT be reduced 15% as part of the project from a baseline condition, and that traffic generated by the project be offset. This has been the largest category on projects we've worked on, including a different hospital project (though there it was closer to energy than on mixed use projects that applied). Currently, some of the transportation emissions are outside the UC goals (Scope 3 are not required to be carbon neutral until 2050). So the offset cost would be higher than what the project might incur without pursuing SB 995.

One other wrinkle—since the NHPH project will be under a master EIR for the campus, for the streamlining benefit to kick in, the entire campus EIR might have to pursue SB 995, which would further increase the analysis and cost to purchase offsets. I'm less sure about that portion, and a CEQA consultant may need to weigh in on the pathways allowable, but wanted to flag that may be one issue to consider.

I hope this is helpful, and let me know if there are points that we want to discuss further or seek to understand a bit more to determine relevance to NHPH.

-Rob

Stuart – see the email below from Jackie. The GHA reduction requirements in the streamlining legislation has a material impact on the cost of the Berkeley housing project. Have we completed a similar analysis for the new hospital?

Brian Newman
Senior Associate Vice Chancellor, UCSF Real Estate
Vice President, UCSF Health

From: "Safier, Jackie" <JSafier@prometheusreg.com>
Date: Wednesday, August 19, 2020 at 1:03 PM
To: Brian Newman <Brian.Newman@ucsf.edu>
Subject: RE: 995 GHG requirements

Brian: We did analyze the cost of meeting the greenhouse gas requirements of SB 995 on our Berkeley project with Ramboll. Sharing this as it applies to UCSF if going this route. Here is what we found preliminarily as it applies to our project in Berkeley.

- Basically our 300 million project, we need 32,000 tons – to buy carbon credits it would cost about $300K. To engineer it into the project would be $20 million (so buying the offsets is the route to go)
- Issue is the A's need 531K tons (so 15 times more than us) so about $4.8 million in carbon offset credits to purchase.
- If in Berkeley we decide to apply come January or February 20202 , we would need to buy the credits then. Issue with there being a supply available given the A's purchases and pricing.

Geologic and Hydrogeologic Characterization
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
Industrial Stormwater Compliance
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring. For the past 15 years, as a founding partner with SWAPE, Matt has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality and greenhouse gas emissions.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2104, 2017;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 300 environmental impact reports and negative declarations since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at more than 100 industrial facilities.
- Expert witness on numerous cases including, for example, perfluorooctanoic acid (PFOA) contamination of groundwater, MTBE litigation, air toxins at hazards at a school, CERCLA compliance in assessment and remediation, and industrial stormwater contamination.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.
- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted

public hearings, and responded to public comments from residents who were very concerned about the impact of designation.
- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:
- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:
- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9.

Activities included the following:
- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific

principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt is currently a part time geology instructor at Golden West College in Huntington Beach, California where he taught from 2010 to 2014 and in 2017.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, industrial, military and agricultural sources, unconventional oil drilling operations, and locomotive and construction engines. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities. Dr. Rosenfeld has also successfully modeled exposure to contaminants distributed by water systems and via vapor intrusion.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, creosote, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at sites and has testified as an expert witness on numerous cases involving exposure to soil, water and air contaminants from industrial, railroad, agricultural, and military sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 5-14-2021
Trial, October 8-4-2021

In the Circuit Court of Cook County Illinois
Joseph Rafferty, Plaintiff vs. Consolidated Rail Corporation and National Railroad Passenger Corporation d/b/a AMTRAK,
Case No.: No. 18-L-6845
Rosenfeld Deposition, 6-28-2021

In the United States District Court For the Northern District of Illinois
Theresa Romcoe, Plaintiff vs. Northeast Illinois Regional Commuter Railroad Corporation d/b/a METRA Rail, Defendants
Case No.: No. 17-cv-8517
Rosenfeld Deposition, 5-25-2021

In the Superior Court of the State of Arizona In and For the Cunty of Maricopa
Mary Tryon et al., Plaintiff vs. The City of Pheonix v. Cox Cactus Farm, L.L.C., Utah Shelter Systems, Inc.
Case Number CV20127-094749
Rosenfeld Deposition: 5-7-2021

In the United States District Court for the Eastern District of Texas Beaumont Division
Robinson, Jeremy et al *Plaintiffs*, vs. CNA Insurance Company et al.
Case Number 1:17-cv-000508
Rosenfeld Deposition: 3-25-2021

In the Superior Court of the State of California, County of San Bernardino
Gary Garner, Personal Representative for the Estate of Melvin Garner vs. BNSF Railway Company.
Case No. 1720288
Rosenfeld Deposition 2-23-2021

In the Superior Court of the State of California, County of Los Angeles, Spring Street Courthouse
Benny M Rodriguez vs. Union Pacific Railroad, A Corporation, et al.
Case No. 18STCV01162
Rosenfeld Deposition 12-23-2020

In the Circuit Court of Jackson County, Missouri
Karen Cornwell, *Plaintiff,* vs. Marathon Petroleum, LP, *Defendant.*
Case No.: 1716-CV10006
Rosenfeld Deposition. 8-30-2019

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case No.: 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No.: 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In United States District Court For The Southern District of Mississippi
Guy Manuel vs. The BP Exploration et al., Defendants
Case: No 1:19-cv-00315-RHW
Rosenfeld Deposition, 4-22-2020

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division

ANDREW JAY COLEMAN, PH.D., P.G. – Executive Level Technical Leadership in Science and Engineering, R&D, and Remediation Services

ELECTRIC POWER RESEARCH INSTITUTE, Palo Alto, CA
Executive Director, Member and Technical Services, December 2015-Present
Sr. Technical Executive, Environment, Geothermal, December 2014- December 2015
Sr. Program Manager, Environment, Research Strategy December 2013 to December 2014
Marketing Manager, Environment & Renewable Energy Sector, September 2010 to December 2013

LEHIGH UNIVERSITY – Bethlehem, PA, P.C. Rossin College of Engineering and Applied Science
Professor of Practice and Director of the Energy Systems Engineering Institute , April 2009 to September 2010, and adjunct appointment through 2022. By university consent, created, led and created succession plan for its place in the College. Responsibilities included teaching several courses and developing research for ESEI, coordinating industrial sponsorship and collaboration. U.S. DOE/NETL FOA 152– Keystone Smart Grid Fellowship Program

ELECTRIC POWER RESEARCH INSTITUTE, Palo Alto, CA
Account Executive, Technical Advisory Services, Environment Sector, May 2008 to April 2009

Program Manager, Manufactured Gas Plant Remediation Program, May 2000 to May 2008
Developed collaborative research projects and publications for more than 35 companies in the US and the European Union. Provided innovative, remediation and construction solutions on an individual and collaborative basis. Interfaced with regulators on land redevelopment scopes.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY, Newark, NJ
Senior Project Scientist, Manufactured Gas Plant Site Remediation, December 1994 to May 2000
Special consultant to PSE&G's Director of Environmental Affairs

ENSR Consulting and Engineering, Piscataway, NJ
Project Manager, Geologist, June 1991 to Dec 1994 Confidential Clients Site Management, Environmental remediation and construction work.

Action Filed: February 19, 2021 Merits Hearing/Trial: January 14, 2022 Case No. RG21090517 [Related Case Nos. RG21089332 and RG21088939] ASSIGNED FOR ALL PRE-TRIAL PURPOSES TO JUDGE FRANK ROESCH, DEPT. 17 Action Filed: February 19, 2021 Merits Hearing/Trial: January 14, 2022

DECLARATION OF BRIAN NEWMAN

I, Brian Newman, declare as follows:

1. I am the Senior Associate Vice Chancellor, UCSF Real Estate, at the University of California, San Francisco ("UCSF" or the "University"). I have held this position since August 2018. Prior to that, I was the Vice President of Campus Development at Oregon Health and Science University. My responsibilities in my current position include executive-level strategy and oversight of campus planning, real estate transactions, lease portfolio management, the campus architect, building permits and inspections, and design and construction for UCSF, including both the University and UCSF Health.

2. I have personal knowledge of all of the matters stated herein, and, if called as a witness in this action, I could and would competently testify to those matters.

3. Since August 2018, one of my primary responsibilities has been to work with and coordinate the efforts of the UCSF leadership, Campus Planning, and the UCSF Medical Center on the development and future implementation of the Comprehensive Parnassus Heights Plan ("CPHP"). The CPHP contains a master plan-level guidance for the modernization of the Parnassus Heights campus site, which is UCSF's oldest campus site, ensuring that a modernized Parnassus Heights enhances UCSF's status as a leading academic medical center in the region, state, and nation and as an anchor institution in San Francisco. It focuses on the configuration of

buildings and open space areas and the major types of uses within buildings (e.g., inpatient, outpatient, research, instruction, support, housing, and parking), with special attention paid to the adjacency of uses especially at the intersection of clinical, research, and instruction uses.

4. Other than the pressing need to modernize the Parnassus Heights facilities, a primary driver of the CPHP was the need to replace the aging Moffitt Hospital by 2030 because of SB 1953. SB 1953 became effective on September 21, 1994, and established a seismic safety buildings program under the California Office of Statewide Health Planning and Development's jurisdiction. SB 1953 required that all general acute care hospital facilities in California meet stringent seismic safety requirements by 2013 or 2030, depending on the physical condition of the hospital, in order to function as emergency centers following a major seismic event. Buildings that could not meet the deadlines needed to be decommissioned as in-patient hospital facilities.

5. In total, the CPHP provides for development of approximately 2.90 million gross square feet ("gsf") of new building space at Parnassus Heights. When accounting for existing campus site development (approximately 3.92 million gsf); demolition that was approved under the 2014 LRDP but not yet implemented (approximately 187,000 gsf); and potential additional building demolition that would occur under the CPHP (approximately 688,000 gsf), the total amount of campus building space upon full implementation of the CPHP would be approximately 5.97 million gsf, including instruction, research, clinical, and support space, housing, and structured parking.

6. Not only is Moffitt Hospital seismically deficient and outdated for modern hospital purposes, Parnassus Heights' two hospitals (Long and Moffitt) do not contain sufficient beds to meet the demand for the type of highly sophisticated medical cases that are referred to UCSF. Parnassus Heights is UCSF's primary site for adult clinical care and provides tertiary and quaternary care. Over the past three years, Long and Moffitt hospitals have turned away between 2,500-3,000 referrals annually because of inadequate bed capacity.

7. In order to meet SB 1953's 2030 deadline to decommission Moffitt Hospital as an inpatient facility and to address the immediate need for modern research space and more student and faculty housing at Parnassus Heights, the CPHP identified four major projects referred to as

the Initial Phase projects in the CPHP and the CPHP EIR that would be implemented by 2030. These include the New Hospital to replace Moffitt Hospital, the Research and Academic Building ("RAB"), the Initial Aldea Housing Densification, and the Irving Street Arrival project. There are also a number of smaller, mostly infrastructure-related projects referred to as the Initial Phase Improvements that would be completed by 2030, including the Parnassus Avenue Streetscape improvements, service corridor and utility line extensions, fuel tank replacement, ammonia tank replacement, among others.

8. Because 61 acres of the approximately 107 acres at the Parnassus Heights campus site are dedicated open space located in the Mount Sutro Open Space Reserve, UCSF's built space at Parnassus Heights is concentrated in the north end of the campus site in a dense pattern. As implementation of the CPHP will require demolition of some large existing structures to create building areas for new structures such as the RAB and New Hospital, and because the RAB will require almost four years for construction and occupancy and because the New Hospital will require approximately five years for construction and one year of testing prior to opening for patients in 2030, the timing and sequencing of construction projects implementing the CPHP is both very tight and very crucial. The first CPHP project, the Integrated Center for Design and Construction ("ICDC"), would provide temporary space for UCSF's design and construction teams to work and meet during the construction of the CPHP Initial Phase projects. It is currently being constructed in two floors of the Kalmanovitz Library Garage and is anticipated to be completed and occupied by the end of 2021.

9. The planning and space needs assessment leading up to the preparation of the CPHP identified a glaring need for expanded and state of the art research facilities at Parnassus Heights to support UCSF's health care mission. As the new RAB will be constructed on the site of the existing UC Hall, UC Hall will need to be demolished prior to commencement of RAB construction. Demolition of UC Hall must be preceded by abatement of hazardous building materials as the building was constructed in 1917. And as UC Hall contains Toland Hall, home of the WPA-era Zakheim Murals, the effort to remove and store the murals must occur prior to the start of hard demolition of UC Hall. Abatement work on UC Hall is scheduled to commence in

the fourth quarter of 2021 and be completed by the end of the second quarter of 2022. Mural removal efforts began with design, conservation and planning in the first quarter of 2021, with removal and storage of the murals scheduled to be completed by the fourth quarter of 2021. The Court's issuance of a Temporary Restraining Order on August 23, 2021, has potentially altered that schedule. Hard demolition of UC Hall would commence in the fourth quarter of 2022 and be completed by the second quarter of 2023. RAB construction would commence in the summer of 2023 and be completed in the summer of 2026.

10. The New Hospital, which was analyzed at a program-level in the CPHP EIR and which will be the subject of a project-specific EIR anticipated to be certified by the Regents in 2022, will be built on the site of the existing Langley Porter Psychiatric Institute ("LPPI"). Abatement of hazardous building materials and demolition of the interior of LPPI is scheduled to begin in the first quarter of 2022 and be completed in the summer of 2023. Exterior demolition of LPPI will be completed in the first three quarters of 2023. Early site work and OSHPD review of the New Hospital will commence in September 2023 and be completed in the summer of 2024. Construction of the New Hospital is scheduled to commence in summer of 2024 and be completed in 2029.

11. While abatement and demolition activities are conducted on UC Hall and LPPI, work will also be commencing on the Irving Street Arrival project and some of the Initial Phase Improvements.

12. If any of the actions implementing the CPHP Initial Phase projects described above is delayed, it will cause a chain reaction that leads to delays in other projects, and ultimately threaten UCSF's ability to comply with SB 1953 by 2030 and meet the currently unmet demand for patient beds as Parnassus Heights. If demolition of UC Hall is delayed, it will result in delays in construction and operation of the RAB, denying UCSF faculty and staff access to modern research facilities essential to their cutting edge efforts to address the most complex medical problems facing humanity. Delays also will inevitably result in increased construction costs. Construction costs in the Bay Area for major projects such as the RAB have been escalating on average 4-5%. For a project like the RAB, with an estimated construction cost of $470M, every

month of delay could increase construction costs by an additional $1.96M.

13. All of the CPHP projects described above will result in 1,000's of construction jobs and even more permanent jobs in these new facilities, providing a needed jolt to the San Francisco economy as it emerges from the pandemic shut downs.

14. In connection with the CPHP, UCSF and the City and County of San Francisco entered into a Memorandum of Understanding ("MOU") regarding various community benefits. I was one of the lead UCSF negotiators in reaching agreement on the MOU. Pursuant to the MOU, UCSF agreed to deliver a total of 1,263 net new housing units in San Francisco by 2050 (inclusive of the 762 units already included in the CPHP and analyzed in the CPHP EIR), pay approximately $20,000,000 to SFMTA to improve transit service to Parnassus Heights, implement certain agreed upon workforce development proposals, including 30% local hire for construction jobs, expand its partnerships with the City for the provision of psychiatric services, pediatric and mental health support services for youth, among other benefits to the City and the community.

15. In connection with the WPA-era Zakheim Murals described above, I took the lead on behalf of UCSF related to the disposition of the Zakheim Murals. Based on preliminary cost estimates and technical assessments UCSF received from Architectural Resources Group ("ARG") and Page & Turnbull early in 2020, and the likelihood that the Zakheim Murals would be substantially damaged or destroyed in the event of removal and relocation from Toland Hall, UCSF initially determined that the estimated cost of physical preservation, removal and relocation of the Zakheim Murals would be prohibitive in light of UCSF's primary responsibility to support its academic health care mission when allocating public funds to its various projects. Given this preliminary decision, UCSF notified the U.S. General Services Administration ("GSA") of the potential destruction of the Zakheim Murals on May 22, 2020. A true and correct copy of the letter to the GSA is attached hereto as Exhibit A. UCSF also extended a written notice of UCSF's intent to demolish UC Hall and the Zakheim Murals contained therein as a courtesy to the family of Bernard Zakheim on June 4, 2020. A true and correct copy of the letter to the Zakheim family is attached hereto as Exhibit B. In the written notice to the Zakheim family, UCSF offered the Zakheim family an opportunity to preserve, remove and relocate the Zakheim Murals at their own

cost, and also described the procedures of notifying the public and existing organizations with an art-related purpose should a third-party be able to preserve, remove and relocate the Zakheim Murals. Both GSA and the Zakheim family indicated that neither had the financial resources to pay for the removal, storage and reinstallation of the Zakheim Murals; however, both parties expressed desire to work with UCSF to preserve the Zakheim Murals and to determine a solution that would allow UCSF to move forward with its work on UC Hall while preserving the public interest in keeping the Zakheim Murals accessible to members of the community.

16. After receiving feedback from GSA, the Zakheim family, the City's Historic Preservation Commission and Board of Supervisors, and the community on UCSF's initial plans for the Zakheim Murals, UCSF decided to issue a request for proposals for the removal, conservation, and transportation of the Zakheim Murals to a temporary off-site storage facility. A true and correct copy of the issued Request for Proposals dated September 21, 2020, is attached hereto as Exhibit C. The request for proposals process concluded in October 2020, and UCSF selected ARG Conservation Services to conduct the work. This process was a public process, and one of the respondent teams included Nathan Zakheim, the son of the deceased mural artist.

17. The proposal to preserve the murals by removing them from Toland Hall and storing them until they can be reinstalled for public display either at Parnassus Heights or another UCSF location or another publicly accessible setting such as a museum has widespread public support, including from the purported owners of the murals (the GSA), Zakheim family members, preservationists, the City and County of San Francisco, acting through its Historic Preservation Commission and Board of Supervisors, and the greater community. As it is not feasible to preserve the murals in situ at Toland Hall, it is difficult to understand why anyone would oppose the effort to remove and preserve the murals.

18. As stated above, the Zakheim Mural removal began with design, conservation and planning in the first quarter of 2021 with removal and storage of the murals to be completed by the fourth quarter of 2021. Provided that the Zakheim Murals are successfully removed from Toland Hall and stored, UCSF will assemble a task force by the end of 2021, which will include a City representative, to advise on options for the display of the Zakheim Murals in a publicly accessible

setting, either on a UCSF campus or at a museum or other institution. Membership in the task force was recently announced to the public.

19. As indicated above, removal of the murals must precede demolition of UC Hall which must precede construction of the RAB. Any delay in removing the murals will have a ripple effect on these subsequent projects, delaying the ultimate completion of much needed state of the art research space at Parnassus Heights as well as causing substantial increases in construction costs for the RAB. In addition to these obvious harms to the University, any delay in completing the mural removal project which is currently underway would likely cause UCSF to lose the services of the world class team of conservators working on this project who would likely move on to other projects if this project is suspended because of an injunction, and there is no way of determining when UCSF would be able to finish the project with the selected expert team.

20. If the mural removal is enjoined until a hearing in January 2022, the work would effectively be delayed until April 2022 or later to ensure the end of the rainy season. An eight month delay in removing the murals and commencing demolition of UC Hall would delay the construction and opening of the RAB by this same period and likely result in increased RAB construction costs of at least $15M.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed on this _1_ day of September, 2021, at __San Francisco__, California.

DECLARATION OF KEVIN BEAUCHAMP

I, Kevin Beauchamp, declare:

1. I am the Executive Director of Physical Planning at University of California, San Francisco ("UCSF"). I have held this position since January 2020; prior to that I was Director of Physical Planning. I have worked for UCSF in these capacities since 2002, although I began my career at UCSF as a planner in 1994. Prior to my time at UCSF, I was a planner at Environmental Science Associates.

2. I have personal knowledge of all of the matters stated herein, and, if called as a witness in this action, I could and would competently testify to those matters.

3. In my current position, I manage all physical planning for most of UCSF's campus sites (including Parnassus Heights) with the exception of San Francisco VA Medical Center, UCSF Fresno and UCSF Benioff Children's Hospital Oakland. UCSF owns approximately 9 million gross square feet ("gsf") of instruction, clinical, research, support, and housing space at approximately 12 sites in San Francisco and surrounding communities, and leases approximately 1.7 million gsf of additional space. UCSF is the City of San Francisco's second largest employer after the City itself, with over 26,000 employees.

4. I have worked on and/or supervised the preparation and implementation of UCSF's two most recent Long Range Development Plans ("LRDPs"), the 1996 LRDP and the 2014

LRDP. I was also directly involved in the planning and space needs assessments that led to the preparation of the Comprehensive Parnassus Heights Plan ("CPHP") at issue in this litigation.

5. The Parnassus Heights campus site is the oldest of the UCSF campus sites comprising approximately 107 acres of land in the mature Inner Sunset mixed-use neighborhood and adjacent to the Haight Ashbury and Cole Valley neighborhoods. UCSF's facilities are concentrated at the north end of the campus site. The 61-acre Mount Sutro Open Space Reserve occupies the central and southern portion of the campus site. Aldea Housing is surrounded by (but is not a part of) the Mount Sutro Reserve. Parnassus Heights houses five professional degree programs, wet and dry biomedical research laboratories and offices, instructional facilities, impatient and outpatient clinical facilities, housing, and other campus support space. UCSF's tertiary and quaternary adult acute care hospital, Moffitt (built in 1955) and Long Hospitals (built in 1982) are also located at Parnassus Heights. The facilities at Parnassus Heights are aging and the campus site as a whole lacks a cohesive identity. UCSF's investment in Parnassus Heights has not kept pace with its aging facilities or changes in programmatic need, resulting in infrastructure, buildings, and interior spaces that require substantial renewal and investment. Over the past approximately 15-20 years, most of UCSF's development efforts have focused solely on its Mission Bay campus site, to the detriment of Parnassus Heights. The goal of the CPHP is to address this situation and modernize Parnassus Heights.

6. Following the Regents of the University of California (the "Regents") approval of the 2014 LRDP, UCSF commenced and completed the CPHP, which provides a more detailed vision for the future of the Parnassus Heights campus site. An internal process for the CPHP included two years of stakeholder engagement, led by the Parnassus Master Plan Steering Committee, which was convened to oversee the preparation of the CPHP and met monthly to provide feedback and guidance. The steering committee included representatives with diverse perspectives from the professional schools, the Graduate Division, Academic Senate, UCSF Health, UCSF Real Estate, and University Relations, among others. Working Groups were also formed to look more closely at space for a Central Research Lab, research space more generally, educational space, and space for digital health/informatics. Other than the need to construct the

New Hospital by 2030, these planning efforts identified the need for expanded, modern research space as a primary need. In addition, in September 2018, UCSF released a survey to all UCSF employees for feedback and received over 1,800 responses and a research faculty survey focused on the programmatic needs of the research community garnered approximately 1,200 responses. Both of these surveys provided valuable input to the plan.

7. The CPHP contains master plan-level guidance for the overall physical environment at Parnassus Heights. It focuses on the configuration of building and open space areas and the major types of uses within buildings (e.g., inpatient, outpatient, research, instruction, support, housing, and parking), with special consideration of the adjacency of clinical, research, and instruction uses. Following the completion of this planning effort, it became apparent that UCSF could not meet the projected clinical and program needs at Parnassus Heights operating within the confines of the space ceiling imposed on the campus site in the 1976 Regents' Resolution.

8. Because the CPHP proposed to modify the Parnassus Heights development plan identified in the 2014 LRDP, an amendment of the 2014 LRDP ("LRDP Amendment No. 7") was proposed. This amendment would incorporate the CPHP's concepts and proposals into the 2014 LRDP, replacing portions of the Parnassus Heights chapter in the 2014 LRDP and making other necessary conforming changes. These proposed changes would include:

a. Revisions to functional zones;

b. Revisions to the space program;

c. Updates to the projected average daily population;

d. Revisions to the Regents' Resolution to increase the amount of space in non-residential buildings (known as the "space ceiling") to 5.05 million gsf and to modify the boundary of the Mount Sutro Open Space Reserve to accommodate the New Hospital while maintaining a minimum of 61 acres in the Reserve; and

e. Updates to the UCSF Greenhouse Gas Reduction Strategy.

The proposed 2014 LRDP, as amended by the CPHP, would become the primary planning document for Parnassus Heights and would guide the development of the Parnassus Heights

campus site through the next 30 years, or an approximate horizon year of 2050. All other UCSF campus sites addressed by the 2014 LRDP would continue to have an approximate horizon year of 2035.

9. LRDP Amendment No. 7 would increase the projected future space program at Parnassus Heights from 3.61 million gsf (excluding housing) in horizon year 2035 to approximately 5.05 million gsf (excluding housing) in horizon year 2050, a net increase of approximately 1.44 million gsf. When compared to the existing (2019) space developed at the campus site (approximately 3.68 million gsf, excluding housing), the LRDP amendment would result in a net increase in the space program by approximately 1.37 million gsf (excluding housing) by 2050. LRDP Amendment No. 7 would also result in an increase in the estimated average daily population from approximately 18,500 in horizon year 2035 to about 25,300 in horizon year 2050, a net increase of approximately 6,800. When compared to the existing (2018) average daily population at the campus site (approximately 17,400), the proposed LRDP amendment would result in a net increase in the average daily population by approximately 7,900 by 2050.

10. Planning for new and updated clinical facilities at UCSF began following the passage of SB 1953, which became effective on September 21, 1994. SB 1953 established a seismic safety buildings program under the California Office of Statewide Health Planning and Development's jurisdiction. SB 1953 required that all general acute care hospital facilities in California meet stringent seismic safety requirements by 2013 or 2030, depending on the physical condition of the hospital, in order to function as emergency centers following a major seismic event. Buildings that could not meet the deadlines needed to be decommissioned as in-patient hospital facilities.

11. In response to SB 1953, UCSF prepared a long term planning document as part of Amendment No. 2 to the 1996 LRDP, and prepared the 2005 Hospital Replacement EIR ("2005 EIR"). The 2005 EIR looked at replacing Moffitt Hospital at Parnassus Heights and the UCSF/Mount Zion Hospital by upgrading either hospital to meet the 2013 (for Mount Zion) and 2030 (for Moffit) seismic safety standards; however, neither hospital upgrade was deemed

feasible. The 2005 EIR analyzed the demolition of Moffitt Hospital and the development of up to 400 new hospital beds at two different locations on the Parnassus Heights campus site, including one site adjacent to Moffitt Hospital where the Langley Porter Psychiatric Institute ("LPPI") resides.

12. The 2005 planning effort was further refined in the 2008 LRDP Amendment No. 3 and 2008 Medical Center at Mission Bay EIR, which provided an update to the two-hospital plan and analyzed details regarding the plans for the new hospital at Mission Bay. The 2008 LRDP Amendment No. 3 summarized, "The Initial Phase ('LRDP Phase') of those recommendations, which were adopted in LRDP Amendment #2, are to: 1) develop three integrated specialty hospitals with about 210 beds at Mission Bay by 2012; 2) maintain tertiary and quaternary care with about 600 beds at Parnassus Heights for a total of about 810 beds during the LRDP phase; 3) provide ambulatory care facilities at both Parnassus Heights and Mission Bay; and 4) populate both sites with basic and translational disease oriented research programs."

13. Subsequently, the 2014 LRDP and 2014 LRDP EIR proposed and analyzed various changes at the Parnassus Heights campus site, including decommissioning Moffitt Hospital, and building a new Hospital of approximately 308,000 gsf with 140 beds at the LPPI site.

14. A community process to support the development of the CPHP began in mid-2018 by engaging thousands of neighbors, community leaders, merchants, city representatives, and staff through a multilingual survey, as well as working group meetings and three open houses. The re-envisioning comprehensively evaluated improvements to building design and functionality, public spaces and pedestrian connectivity, as well as vehicular traffic flow. The Community Working Group, comprising 24 members included community leaders, neighbors, merchants, city representatives, and UCSF staff and their process was organized in three phases;

a. "Discovery" Phase (May - September 2018) This phase focused on introducing the community to the CPHP concept and educating them on the process, as well as soliciting initial feedback from neighbors on potential campus improvements.

b. "Alternatives" Phase (October 2018-February 2019) During this phase, neighbors were presented with three plan options and gave feedback on the alternatives.

c. "Future Direction" Phase (March - June 2019) This phase focused on refining the plan and finalizing the Community Ideas Report, a document memorializing the community feedback received on the plan. The report identifies the six focus areas of housing, campus design, connectivity with nature, multi-modal mobility, public realm, and programs and amenities that benefit the neighborhood.

After concluding the first phase of the community engagement process, key stakeholders were identified to discuss potential impacts of the CPHP and neighborhood concerns. To facilitate this effort, the Advisory Committee on the Future of Parnassus Heights was formed, which comprises community leaders, neighbors, merchants, and city and non-profit representatives who live or work near the UCSF Parnassus Heights Campus.

15. The two major nonresidential projects implementing the CPHP are the 870,000 gsf New Hospital and the 271,000 gsf RAB. Both are proposed to be developed on sites with extant buildings, UC Hall for the RAB and LPPI for the New Hospital. As the buildings to be demolished for these CPHP projects are very old, 1917 for UC Hall and 1941 for LPPI, actual hard demolition of these structures must be preceded by extensive abatement of hazardous materials and soft demolition, which is scheduled to take approximately 12 to 16 months. Abatement of hazardous materials and soft demolition work would be needed for both UC Hall and LPPI even under the prior 2014 LRDP proposals (which contemplated that UC Hall was to be retrofitted and repurposed for housing, and that LPPI would be demolished to make way for a smaller hospital on that site). Due to the dense development pattern on the 46-acre portion of the Parnassus Heights campus site that is not dedicated to the Mount Sutro Reserve and to Parnassus Heights' location surrounded by residential development, it is essential that demolition and construction projects at Parnassus Heights are coordinated and synchronized to ensure that they can be completed on schedule and on budget. This is particularly so with the unmet need for state of the art research space at Parnassus Heights to support the clinical activities and with the need to complete and open the New Hospital by 2030 because of SB 1953. Any delay in commencing the demolition of LPPI will have ripple effects on the subsequent construction projects, jeopardizing UCSF's ability to meet the statutory deadlines of SB 1953. In addition, as demolition of UC Hall

and commencement of construction of the RAB are scheduled to precede construction of the New Hospital, any delay in demolishing UC Hall will result in a much more substantial overlap of construction activities at Parnassus Heights than currently anticipated, which our CPHP planning efforts have been designed to minimize to the extent possible.

16. Other than the UC Hall Zakheim Murals removal project, the Integrated Center for Design and Construction at Parnassus Heights ("ICDC"), and abatement and soft demolition of UC Hall, no other projects would be underway by January 14, 2022, that rely on the CPHP EIR.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed on this 1st day of September, 2021, at San Francisco, California.

Environmental Science Associates, Inc.

University of California
San Francisco

II. PROJECT DESCRIPTION

A. PROJECT OBJECTIVES

GENERAL MISSION

To maintain UCSF's role as one of the leading academic health science institutions in the United States, UCSF must continue to have the physical facilities necessary to:

- recruit and retain highly qualified faculty members for teaching, research and patient care;
- continue to generate growth in basic science research programs, whose discoveries advance medical knowledge generally and allow UCSF health care providers to offer patients the most advanced techniques available for diagnosis and treatment; and
- provide the research experiences necessary to offer the highest quality of training to health science graduate and professional students.

The public benefits generally from UCSF's role in advancing the current understanding of human health, aging, and disease. Californians and others, nationally and internationally, benefit directly from the application of the expertise of UCSF's faculty to research and patient care and the education of students. As a regional referral center for the western United States, the UCSF Medical Center offers its patients access to care that incorporates the latest research developments. The availability of such state-of-the art patient care is made possible by the high level of research productivity and on-going discoveries continually being made by UCSF researcher and their staff and students. The research programs at UCSF also provide an exemplary setting for the education of graduate professional students, medical students and residents, many of whom will later practice in California.

PROJECT PLANNING BACKGROUND

Evolution of Space Constraints

In 1976, The Regents responded to community concerns over UCSF success and corresponding growth at Parnassus Heights by enacting an amendment to the

1976 Long Range Development Plan (*LRDP*) that established floor area and population limitations for Parnassus Heights. The *LRDP* amendment set a ceiling of 3.55 million gross square feet for development at Parnassus Heights, limited the daily campus population at Parnassus Heights to 13,427 persons, and precluded campus boundary expansion into the Parnassus Heights neighborhood. As a result of these Parnassus Heights space constraints, UCSF must seek locations off Parnassus Heights to fulfill any unmet needs for additional academic space. For further discussion of the 1976 *LRDP* amendment and it effects on UCSF academic planning and programs, see Chapter III, Section A, University Plans and Policies.

Functional Needs for Space

While the requirements for office and classroom teaching space per faculty member have remained stable over time, changes in research methods in the biomedical sciences have escalated the space needs of faculty members. For example, space intensive computerized equipment is now frequently used for examining molecular structures in order to design potential new drugs.

Additional space is essential both to recruit new faculty who are pioneering new techniques and to retain faculty who have created research programs that now need room for reasonable growth. Further, to capitalize on the new understandings and possibilities created by current research, additional faculty must be recruited in fields that have not previously existed. In 1980, for example, no one could have foreseen the explosion in both research and patient care in response to the AIDS epidemic.

Adequate space must be developed to support academic programs and related faculty recruitments that cannot be predicted today, but are likely to flow from rapid advances in molecular biology, genetics, and immunology. UCSF's leadership role in the biochemical sciences gives UCSF both the opportunity and the obligation to apply its expertise to advances in research and to the education of graduate students in the health science fields. With that obligation goes the need to marshal the necessary physical facilities to support those teaching and research activities.

Periodically, UCSF prepares a *Long Range Development Plan (LRDP)*, which is a general land use plan based upon the academic goals and objectives of UCSF. The 1982 *LRDP* confirmed the physical space constraints associated with further

development at Parnassus Heights. Parnassus Heights is currently the most densely developed of the University of California campuses, and is operating within the space and population constraints discussed above that were established in 1976 (following adoption of the 1976 *LRDP*) and confirmed in the 1982 *LRDP* (both *LRDP*s, as well as their accompanying EIRs, are incorporated herein by reference). With the completion of the new medical library, UCSF will be close to the limitation on total square footage adopted for Parnassus Heights by The Regents in 1976. UCSF cannot undertake construction of new biomedical research facilities and related teaching and administration and support service space at Parnassus Heights without demolishing other facilities that are essential to its overall academic programs.

The 1982 *LRDP* noted that research space limitations would be one of the primary challenges that UCSF would face during the 1980s: The present era of unparalleled program growth in both basic and applied research, with discoveries multiplying and feeding one another, has produced breakthroughs of fundamental importance for human health and well-being. These breakthroughs require expanded research facilities and significant curricular revisions. Current space constraints limit campus ability to respond to research opportunities and curricular changes. The very success of our multidisciplinary efforts triggers a multiplier impact upon needs. New technologies, such as those involving computer systems, radiation applications and germ-free rooms, demand configurations of facilities never imagined a few years ago.

In sum, the *LRDP* concluded that the combination of inadequate existing space, space limitations at Parnassus Heights, and the need for space to accommodate expansion and new programs requires that UCSF expand its research capacity to maintain the quality of research at UCSF.

Decentralization

Both the 1976 and 1982 *LRDP*s recognized the problems created by space constraints on the Parnassus Heights site, and included the policy of relocating those programs that could operate effectively at some distance from the Parnassus Heights site to other sites (not within the Parnassus Heights area or the Parnassus Heights site space constraint described above). Pursuant to this policy of decentralization, the space released by relocation of Parnassus Heights activities can then be reallocated for programs that, by their nature, should remain on the Parnassus site.

Decentralization has disadvantages in that it requires duplication of certain services and equipment, increases the costs of transportation, and interferes with academic interaction necessary due to the links between research programs, patient care activities, instructional activities and student and administrative/support services. For these reasons, both the 1976 and 1982 *LRDP*s contemplated that the primary candidates for relocation to other sites would be those administrative and support activities that could feasibly be separated from the main site. Since the 1976 *LRDP* was adopted, the goal of decentralization has been largely realized for administrative uses. As a result of the University's implementation of the policy of decentralization established in the 1976 *LRDP*, there remain only approximately 50,000 gross square feet of space devoted to what may generally be described as campus administration remaining on the Parnassus Heights site. As these administrative uses provide essential campuswide services (for example, student financial aid), they could not operate effectively at a distance from the main Parnassus Heights site.

Programmatic Needs

Concurrent with space limitations at the Parnassus Heights site, the University is experiencing a need for research expansion space because of medical technological advances and health care crises such as those mentioned above. As examples, over 200 investigators at UCSF are working on different aspects of AIDS research and treatment; advances in neurobiology give new information on the molecular and cellular structures and operation of the brain, and this research shows potential for finding the genetic and chemical bases for Alzheimer's disease, depression, schizophrenia, and multiple sclerosis; other research shows promise in work on Tay-Sachs disease and sickle cell anemia.

The 1982 *LRDP* recognized that the "rapid growth of new technology and newly developed drug distribution systems has demanded an expansion" of the School of Pharmacy and its role in health care developments. The *LRPD* noted several areas in which the basic research efforts of the School of Pharmacy have been active, including the following:

- quantifying changes in drug activity caused by altered disease states;
- designing new, more powerful drugs that lack unwanted side effects;
- studying drugs used in kidney transplants and problems affecting arthritis patients; and

- investigating drugs that could effectively fight cancer while leaving healthy cells free of toxic impact.

Indeed, the UCSF School of Pharmacy receives the highest level of federal medical and health care research funding of any such school, and new research opportunities are continuously presented. The School of Pharmacy is the number one ranked such school with respect to the quality of its pharmaceutically related research efforts in the United States (Pharmaceutical Chemistry Program Review Committee, 1982)[1].

The 1982 *LRDP* concluded that the combination of inadequate existing space, space limitations at Parnassus Heights, and the need for space to accommodate expanding and new research programs means that new space must be found in order to maintain the quality of faculty and research at UCSF.

PROJECT OBJECTIVES

UCSF has proposed the Laurel Heights project in order to accomplish a number of objectives that stem from both Parnassus Heights space limitations and escalating research needs. These objectives are as follows:

1. Expand biomedical research facilities.
2. Release critically needed space for research at the Parnassus Heights site.
3. Consolidate and reduce congestion experienced by the School of Pharmacy and its basic science programs to promote a more effective use of space and research resources.

Performance Criteria

The Academic Planning Board, UCSF's primary academic planning body, developed and adopted a list of criteria for evaluating the ability of the Laurel Heights project and the various alternatives to meet the project objectives. These criteria, with a brief explanation of each one, are listed below.

Cases

INTRODUCTION AND SUMMARY OF ARGUMENT

When a public agency or private developer responds to comments on a draft EIR by providing any new information or making any revisions to the text, it must address the issue of whether it is necessary to recirculate for a new round of public comment. The issue is one of considerable consequence, for recirculation inevitably will add cost and significantly delay the project. It is critical that there be a comprehensible, clear standard that agencies, parties and their advisors acting in good faith can understand and apply.

Nowhere in its fifty-page brief does the Association articulate a workable legal standard that would allow this Court—or the numerous public agencies and courts that will face the issue in the future—to determine when the statutory threshold of "significant new information" warranting recirculation has been met. Instead, the Association maintains that the determination of whether significant new information is not susceptible to an articulable standard, but can only be made on a case-by-case basis. Appellant's Answer Brief on the Merits ("Assoc. Br.") at 28. Alternatively, it contends that significant new information should include *any* information that "relates to" a project's potentially significant impacts, alternatives or mitigation measures. *Id.* It even asserts that recirculation is required whenever there is evidence to support "an argument that there *could* be *potentially* significant effects not already considered." *Id.* at 41 (emphasis added). In short, to the Association "significant new information" means virtually any information at all.

The Association's vague, standardless approach is inconsistent with the legislative history of Section 21092.1 and the body of case law applying a closely analogous statute, Section 21166; it fails to provide any guidance to public agencies and courts that will be faced with recirculation claims in the future; and it will encourage additional litigation by project opponents, resulting in costly project delays. The statute was meant to impose the clear and workable standard articulated in Guidelines §15162: recirculation is required where the final EIR reveals (1) a new adverse impact; (2) a more severe adverse impact; (3) a change in the project that will require important revisions to the EIR because of significant adverse impacts not previously considered; or (4) mitigation measures or alternatives not previously considered (or previously found infeasible) which would substantially reduce a significant adverse effect. Unlike the position advanced by the Association, this interpretation is based directly on the detailed Guideline promulgated by the Secretary of Resources under an analogous statute and the cases applying that Guideline; it is consistent with the legislative history of Section 21092.1 and with analogous federal law; it would provide a measure of certainty and predictability for public agencies attempting to comply with CEQA;

and, most importantly, is the *only* interpretation suggested by any party that makes sense and is workable. *See* Part I, *infra*.

The Association similarly fails to propose any sensible standard of review to govern judicial review of an agency's determination that the statutory threshold has not been met. Instead, it suggests that an EIR *must* be recirculated any time there is a "fair argument" that there is new information regarding a *potentially* adverse impact. Assoc. Br. at 17, 33, 47. That proposed standard is inconsistent with the substantial evidence rule, which courts routinely apply in CEQA cases in reviewing agency decisions not to prepare subsequent or supplemental EIRs—decisions that are directly comparable to the decision not to recirculate involved here. Even more importantly, it would make recirculation the rule, rather than the exception. For these reasons, a reviewing court must uphold an agency's decision not to require recirculation if there is substantial evidence to support a determination that any new information in the final EIR was not significant. *See* Part II, *infra*.

The Association's argument that even under the standard urged by the Regents, the Final EIR in this case contained "significant new information" that required it to be recirculated cannot be sustained. The Association makes two contentions: that the Final EIR worked a "fundamental revision of the analysis of the significant noise impact"; and that it contained changes in the project that "significantly increased adverse impacts." Assoc. Br. at 1. The Association's claims are, quite simply, false. The Final EIR merely added some additional information requested by the public regarding noise impacts, but without disturbing either the structure of the Draft EIR or altering its overall conclusion—adopted by the Board of Regents—that those impacts would be *insignificant*. A virtually identical treatment of noise impacts in the first Laurel Heights EIR, based on far less detailed information, was expressly upheld by this Court in *Laurel Heights I*. *See* Part III(A), *infra*. Moreover, no information in the Final EIR "increased" *any* impact, much less a significant one. To the contrary, as to each of the subjects addressed in the Association's brief, the information in the Final EIR merely confirmed, clarified or amplified the information contained and conclusions reached in the Draft EIR. *See* Parts III(B)-(E), *infra*.

Pervading the Association's discussion are the claims that the Draft EIR's discussion of key environmental issues was somehow inadequate to alert the public to the environmental issues raised by the project, and that the University deliberately "withheld" the new information from the public until the Final EIR was published. No such conclusion was reached by the Court of Appeal, and nothing could be further from the truth. The Draft EIR contained an extraordinarily lengthy and detailed discussion of each of the issues about which

the Association now professes concern; in virtually every instance, the additional information was generated and added to the Final EIR in response to requests by the Association and the public; and *none of that information changed the conclusions that had been reached in the Draft EIR*. Under any standard of review, the Association's claim that the Final EIR contained significant new information requiring recirculation must be rejected.

ARGUMENT

I.

APPELLANT HAS FAILED TO OFFER A WORKABLE STANDARD THAT WOULD ALLOW PUBLIC AGENCIES AND THE COURTS TO DETERMINE WHETHER AN ENVIRONMENTAL IMPACT REPORT CONTAINS "SIGNIFICANT NEW INFORMATION" WARRANTING RECIRCULATION.

Section 21092.1 of the Public Resources Code provides that an EIR should be recirculated for additional public comment if it contains "significant new information." Neither the statute nor the State CEQA Guidelines, which implement CEQA and are entitled to great weight, directly defines the quoted terms, thereby giving rise to the central issue on this appeal. As shown in our opening brief, Section 21092.1 should be construed in harmony with a directly comparable section of CEQA, which requires that a subsequent or supplemental EIR be prepared if "new information," unknown at the time the EIR was certified, becomes available thereafter. Respondent's Opening Brief ("Regents' Op. Br.") at 12-16. The requirement as originally enacted by the Legislature was somewhat ambiguous, for "new information" was undefined in CEQA. However, the State CEQA Guidelines clarified the situation by defining "new information" as that which shows either that "[t]he project will have one or more significant [*i.e.*, adverse] effects not discussed previously in the EIR," or that "[s]ignificant effects previously examined will be substantially more severe than shown in the [draft] EIR." GUIDELINES §15162(a)(3)(B)(1), (2); *see* Regents' Op. Br. at 12-13.[1]

---

[1]The Guidelines also provide that a supplemental or subsequent ~~EIR~~ should be prepared if changes are proposed in the project or "[s]ubstantial changes occur with respect to the circumstances under which the project is undertaken" which will require "important revisions" of the previous EIR "due to the involvement of new significant environmental impacts" not considered in the previous EIR (GUIDELINES §15162(a)(2)); or if the "new information" shows either that:

"Mitigation measures or alternatives previously found not to be feasible would in fact be feasible and would substantially reduce one or more significant effects of the

(continued...)

As was the case in the Superior Court and the Court of Appeal, the Association has again failed to offer any articulable standard that could feasibly replace the clear language of this directly analogous Guideline.[2] To the contrary, the Association goes so far as to actually question this Court's authority to construe the statutory language, suggesting that task is more appropriately undertaken by the Secretary for Resources. *See* Assoc. Br. at 3-4.[3] The Association overlooks the fundamental principle that statutory construction is ultimately the responsibility of the judiciary, not the executive branch. *E.g., Oakland Raiders v. City of Berkeley*, 65 Cal. App. 3d 623, 629 (1976). While the contemporaneous administrative construction of a statute is entitled to substantial weight in determining legislative intent (*e.g., Department of Health Services v. Superior Court*, 232 Cal. App. 3d 776, 782 (1991)), the courts must construe a statute in a proper case—particularly where the administrative agency responsible for implementing the statute has failed to clarify ambiguous statutory language.[4]

---

[1](...continued)
project; or

> "Mitigation measures or alternatives which were not previously considered in the EIR would substantially lessen one or more significant effects on the environment." (*Id.* §15162(a)(3)(B)(3), (4))

None of these categories is remotely applicable here.

[2]Although the recirculation issue has been the central issue in this case since the Association challenged the adequacy of the new EIR, the Association also failed in both lower courts to offer any coherent formulation of the legal standard that it would have had those courts apply.

The Court of Appeal did no better at defining the standard for measuring "significant new information," holding only that the Final EIR should have been recirculated because it believed that certain information in that document was "significant enough to be revealed and commented on by the public." Slip op. at 11; *see also id.* at 12 ("on balance the FEIR contained new information of such significance as to warrant recirculation for the proper public role of commenting on the environmental impact of the project"). This is singularly unhelpful: it provides no standard at all that could be applied, with any reasonable degree of confidence, by agencies, private parties or reviewing courts.

[3]The Association challenges the Court's authority to construe the statute even more explicitly in its Response to Amicus Curiae Brief of Pacific Legal Foundation ("PLF Resp."). There, the Association notes correctly that "the Legislature did not heed the recommendation of the bar committee that an attempt be made to clarify what is significant new information." PLF Resp. at 15. The Association strongly implies that for this reason, this Court may not do so either:

> "Thus, in requesting further clarification of the §21092.1 standard, [amicus] asks the Court to do what the Legislature declined to do. Also, the adoption of guidelines further explicating statutory requirements is the function of the Secretary for Resources." (*Id.*)

[4]The most recent comprehensive version of the State CEQA Guidelines was promulgated by the Secretary for Resources in June 1986, two years after the enactment of Section 21092.1. There is no Guideline expressly defining the term "significant new information" as used in that statute. It may well be, of course, that the Resources Agency believed that Guidelines §15162 provided all
(continued...)

Rather than propose an alternative standard, the Association insists that "[t]he determination of whether new information is significant . . . is not subject to an 'iron clad' definition, but must be determined on a case by case basis." Assoc. Br. at 28. Despite this disclaimer, the Association goes on to offer a veritable laundry list of examples that, in its view, *would* fall within the statute. Thus, the Association would find "significant new information," and hence require recirculation, if the information is "highly pertinent to the Draft EIR's conclusions." *Id.* at 3. Further, in its view recirculation would be required if *any* of the following were contained in a final EIR:

> "a fundamentally reorganized analysis of a potentially significant effect; information which *significantly* changes a project or increases its adverse impacts; information effecting *substantial* revisions in an EIR; *important* additional details, *more elaborate* discussions or *important* new or updated figures concerning potentially significant effects; and a discussion of a new alternative which meets basic project criteria." (*Id.* at 4 (emphasis added))

Elsewhere, the Association offers an even broader formulation, suggesting that "[n]ew information can be significant because it *relates to potentially* significant impacts, alternatives or mitigation measures, . . . or raises *important new issues* about the analyses or conclusions presented in the Draft EIR." *Id.* at 28 (emphasis added). Finally, it claims that recirculation is compelled if a project opponent offers any evidence to support a claim that there "could be" potentially significant effects not already discussed. *Id.* at 41, 46, 47.

The Association's proposed "standard" amounts to no standard at all. As the emphasized language indicates, it hardly advances the analysis to merely repeat the word "significant," or to substitute for it "important," "substantial" or "more elaborate." More importantly, the Association apparently would set the threshold so low that recirculation would be required any time new information "relates to potentially significant impacts, alternatives or mitigation measures," or a "fair argument" can be made that there "could be" such impacts. *Id.* at 28. Since, by definition, virtually *any* new information concerning a project would "relate to" one or more of these principal elements of an EIR, the Association thus would make recirculation the rule, rather than the exception. As shown in the following sections, that broad a reading of CEQA would be inconsistent with the statutory scheme as a whole, and with the legislative history of Section 21092.1 in

[4](...continued)
the guidance necessary in light of the several judicial decisions which looked to Section 21166 and Guidelines §15162 in applying Section 21092. *See* Regents' Op. Br. at 13-14.

particular; would depart dramatically from the standard under analogous federal law; and would impose serious costs on public projects subject to environmental review, with no offsetting public benefit.

A. Section 21092.1 Should Be Construed In Harmony With Section 21166 Of The Public Resources Code.

The Association insists that by suggesting that the Court look to Section 21166 for guidance in construing Section 21092.1, the University is asking the Court "to amend §21092.1 by judicial fiat." Assoc. Br. at 3. That worn-out cliche is the last refuge of those who will not understand that the proper role of courts is to interpret statutes. The Association's argument ignores basic principles of statutory construction that require the two statutes to be construed in harmony with each other; it is also inconsistent with the substantial body of cases that have looked to Section 21166 and the implementing Guideline in determining whether recirculation is warranted and with the legislative history of Section 21092.1. *See* Regents' Op. Br. at 13-19. Finally, the Association does not offer any persuasive reason to construe Section 21092.1, which applies when "significant new information" arises before certification of an EIR, any differently than Section 21166, which applies when "new information" arises *after* certification of an EIR.

First, as the Association itself recognizes (Assoc. Br. at 4), Section 21092.1 should be construed with reference to CEQA, of which it forms a part, so that the entire statutory scheme may be harmonized. Both Section 21092.1 and Section 21166 address the same issue, in virtually the same language: when "new information" should warrant reopening (or extending) the environmental review process for further public comment. They therefore should be construed in harmony with each other.

Second, the legislative history of Section 21092.1 directly supports a consistent reading of the two statutes. As the Association concedes (Assoc. Br. at 18, 35-36), in enacting Section 21092.1, the Legislature intended to codify the holding in *Sutter Sensible Planning, Inc. v. Board of Supervisors*, 122 Cal. App. 3d 813 (1981). As the majority below correctly observed (slip op. at 8) and as the Association concedes (Assoc. Br. at 18), the court in that case explicitly looked to the three Section 21166 standards in determining the recirculation issue presented by that case. *See Sutter Sensible Planning*, 122 Cal. App. 3d at 821-22. As we showed in our opening brief (Regents' Op. Br. at 16-18), the State Bar Committee explicitly recommended that the Legislature codify the holding of *Sutter Sensible Planning*, and the Legislature adopted that recommendation. It follows that the

Legislature must have approved of the *Sutter Sensible Planning* court's reliance on the standards set forth in Section 21166.[5]

Third, despite the Association's attempt to distinguish these cases on their facts (Assoc. Br. at 24-25), numerous other appellate courts since *Sutter Sensible Planning* have looked to the standards set forth in Section 21166 and its implementing Guideline to determine whether recirculation of a final EIR is warranted, even where the new information arose before certification. For example, in *Mira Monte Homeowners Ass'n v. County of Ventura,* 165 Cal. App. 3d 357 (1985), four days prior to a hearing on an EIR for a proposed subdivision it was discovered that one of the streets in the development would encroach into a fragile wetland area containing rare plant species. *Id.* at 360-61. The EIR had been prepared on the assumption that the development would *not* invade the wetlands. *Id.* at 360. Nevertheless, the county's board of supervisors certified the EIR as complete and imposed additional conditions of tentative map approval, which had been developed since the discovery of the encroachment. *Id.* at 361.

The Court of Appeal treated the issue presented by the case as whether the board of supervisors had abused its discretion by certifying the EIR as complete without first preparing a subsequent or supplemental EIR. *Id.* at 362. Even though the new information had been discovered *before* certification of the EIR, the court looked to Section 21166 and its implementing Guideline to evaluate

---

[5]A recent amendment to CEQA provides further support for this conclusion. During 1992, the Legislature enacted Assembly Bill 3078 (Sher), which amended Section 21083.3 of the Public Resources Code. Before its amendment, that statute provided that once an EIR had been prepared and certified for a general plan, CEQA review of a residential development project consistent with such a plan "shall be limited to effects on the environment which are peculiar to the parcel or to the project and which were not addressed as significant effects in the prior environmental impact report." §21083.3(b) (1991).

Assembly Bill 3078 broadened Section 21083.3 to apply to all development projects, rather than only residential development projects. At the same time, the Legislature added language to the statute that essentially codifies the Guidelines standard for preparation of subsequent or supplemental EIRs:

> "If a development project is consistent with the general plan of a local agency and an environmental impact report was certified with respect to that general plan, the application of this division to the approval of that development project shall be limited to effects on the environment which are peculiar to the parcel or to the project and which were not addressed as significant effects in the prior environmental impact report, *or which substantial new information shows will be more significant than described in the prior environmental impact report.*" (*Id.* §21083.3(b) (emphasis added))

Thus, unless substantial new information shows that a project will have new or more significant environmental effects than previously recognized, no project-specific EIR need be prepared once a general plan EIR has been certified. That is precisely parallel to the standard established by Section 21166 and Guidelines §15162.

that issue. *Id.* at 362-63. The court held that the newly discovered encroachment involved a "substantial change in circumstances" within the meaning of Section 21166, both because it "meant that the significant impact upon the wetlands would be more severe than previously recognized by the EIR," and because it involved a "new significant effect." *Id.* at 363-64. In light of that conclusion, the court concluded the proper procedure upon discovery of the encroachment should have been "further environmental evaluation by way of a subsequent or supplemental report prior to any project approval." *Id.* at 364-65. The court relied particularly on Section 21068, which defines "significant effect on the environment" as "a substantial, or potentially substantial, *adverse* change in the environment." §21068 (emphasis added).[6] *See also, e.g., Marin Mun. Water Dist. v. KG Land California Corp.*, 235 Cal. App. 3d 1652, 1666-68 (1991) (after the preparation of a draft EIR regarding a water district's proposed moratorium on new service connections pending the development of new water supplies, the district's water supply master plan, which made it clear that probable duration of the moratorium would be 10 years or more, was completed and made available to the public; recirculation was not required, since the draft EIR stated that the moratorium was for an extended but indefinite period and considered the potential impacts if the moratorium lasted for more than 5 or 6 years); *Sierra Club v. Gilroy City Council*, 222 Cal. App. 3d 30 (1990) (after publication of a draft EIR for a residential development project, the California Tiger Salamander was discovered on the site, and the city commissioned a written report containing the salamander that proposed additional mitigation measures; preparation of a new EIR was not required, since the public had an opportunity to comment on the final EIR before it was certified).

Fourth, by the time the Legislature enacted Section 21092.1, the phrase "new information" in Section 21166 had been construed both judicially and administratively to mean new information revealing new or more severe adverse impacts. *See* Regents' Op. Br. at 12-16. This creates a strong presumption—which the Association fails even to discuss, let alone refute—that the comparable words of Section 21092.1 were intended by the Legislature to have the same meaning.[7]

---

[6]The Association attempts to distinguish *Mira Monte* on the ground that "the original EIR had not already been revised to include the new analysis." Assoc. Br. at 24. That does not change the fact that the *Mira Monte* court looked to Section 21166 even though the new information arose *before* certification, and even though the court could have ordered the board of supervisors to recirculate the final EIR together with the testimony regarding the encroachment and the newly developed conditions.

[7]The only material difference in terminology between the two statutes is that Section 21092.1 further qualifies "new information" by requiring it to be "significant." That hardly suggests that (continued...)

B. The University's Proposed Standard Is Consistent With The Federal Standard Under NEPA For Supplementation Of Environmental Impact Statements.

As shown in our opening brief, the *Sutter Sensible Planning* court explicitly relied on federal cases under the National Environmental Policy Act ("NEPA") in its discussion of the circumstances under which recirculation is appropriate, and the State Bar Committee expressly approved that reliance in recommending that the Legislature codify the court's holding in Section 21092.1. Regents' Op. Br. at 17-20. The NEPA standard, like the parallel standard embodied in Section 21092.1, requires the preparation of a supplement to either a draft or final environmental impact statement if there are "significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts." 40 C.F.R. §1502.9(c). As the Association acknowledges (Assoc. Br. at 35), under this standard, as incorporated into CEQA, "recirculation is not required where the supplement merely *clarifies or amplifies*, or makes insignificant modifications in, *an adequate EIR*." *Sutter Sensible Planning*, 122 Cal. App. 3d at 822-23 (citation omitted; emphasis added).

Relying on a number of district court and Court of Appeals decisions, the Association argues that NEPA requires recirculation (in the form of preparation of supplements to EIS's) whenever new information "effects a fundamental reorganization of the analysis used in the draft EIR, indicates that the prior analysis was inadequate, or discloses the true nature of the proposed project." Assoc. Br. at 40. As shown in Part III, *infra*, however, none of these categories applies here. Moreover, all of the cases upon which the Association relies were decided well in advance of the United States Supreme Court's 1989 decision in *Marsh v. Oregon Natural Resources Council*, 490 U.S. 360 (1989), which upheld an agency's decision not to require a supplemental environmental impact statement to address new information developed after the completion of the original EIR. In reaching that conclusion, the Court held that "if the new information is sufficient to show that the remaining action will 'affec[t] the quality of the human environment' *in a significant manner or to a significant extent not already considered*, a supplemental EIS must be prepared." *Id.* at 374 (footnote

---

[7](...continued)
it was intended to have a *broader* meaning than "new information" as used in Section 21166. But that is necessarily what the Association now claims–*i.e.*, that the term "*significant* new information" is a broader, more inclusive term of art than "new information." If the difference in terminology had any meaning at all, it could be the opposite, with "significant new information" being a *narrower*, not broader, category than "new information."

omitted; emphasis added). The Court's overall approach to the issue under NEPA thus is entirely consistent with the standard proposed by the University here.

C. Appellant's Vague "Standard" Would Make Recirculation The Rule Rather Than The Exception, And Would Impose Substantial Costs On Public Projects Without Any Corresponding Public Benefit.

If the Court were to adopt the Association's view that "significant new information" means any information that "relates to" a project's "potentially significant" impacts, alternatives or mitigation measures (Assoc. Br. at 28), recirculation would become the rule rather than the exception. By definition, nearly *any* information would fall within one or more of those extremely broad categories. As a result, virtually every public (or private) project could be delayed, and made more costly, by project opponents who could readily force responsible agencies to recirculate a final EIR merely by the expedient of requesting additional information—whether or not that information showed that the project would have more severe impacts than those previously disclosed in draft —or by claiming that there were feasible project alternatives or mitigation measures not previously considered that could reduce the project's environmental impacts. The recirculated "final" EIR which responded to such comments, in turn, would itself become vulnerable to the very same tactic, with the ultimate result that agencies' consideration of public projects and the projects themselves would be delayed, and the costs of the environmental review process, and of financing and constructing development projects, would soar.

In short, the Association's standard would insure the very outcome that even the Court of Appeal majority below foresaw:

> "[S]uch a low standard would posit a cycle of recirculation, new comment, and new circulation, leading to endless delay. . . . The raison d'etre of an FEIR is to provide additional information in response to public comment on the draft. *If any new information is 'significant information,' virtually any FEIR would have to be recirculated;* to thus require recirculation for reconsideration of any new information would punish a project proponent for being environmentally responsible. If a proponent responded with new information, a challenger would cry foul and seek recirculation; if a proponent sensed this hurdle and said little, the challenger would again cry foul and complain of incompleteness." (Slip op. at 9-10 (emphasis added))

As Justice Low observed in his separate opinion, such a standard would "render environmental litigation an endless chess match, a cycle of move and

countermove, with no conceivable end in sight." *Id.*, slip op. at 3 (Low, Acting P.J., dissenting).

These observations are particularly apropos to this litigation. Over the past six years, the Association's unalterable opposition to the University's use of its Laurel Heights property has led it to file three separate lawsuits, giving rise to a full trial, countless pretrial motions and petitions for writ of mandate before the Superior Court and the Court of Appeal, multiple Court of Appeal opinions, several petitions for review, and two full appeals on the merits before this Court.[8] In light of this background, the Association's contention that this case could have been long since resolved had the University simply agreed to recirculate the Final EIR is preposterous. Assoc. Br. at 29. Had the University recirculated the Final EIR, the Association undoubtedly would have responded with a new round of voluminous comments and requests for information; and, when the University responded to those comments in good faith before certifying the Final EIR, the Association would have been in a position to make the same claim it has advanced here—namely, that the responses constituted "significant new information" requiring yet another recirculation and opportunity for further comment.

II.

THE COURTS SHOULD DEFER TO AN AGENCY'S DECISION NOT TO REQUIRE RECIRCULATION IF THERE IS SUBSTANTIAL EVIDENCE TO SUPPORT A DETERMINATION THAT ANY NEW INFORMATION IN THE FINAL EIR WAS NOT SIGNIFICANT.

Once an agency has decided not to recirculate a final EIR, its determination should be upheld if there is substantial evidence to support its determination that the Final EIR did not contain "significant new information." That standard is entirely consistent with the substantial evidence standard applied by courts in reviewing agency determinations not to require subsequent EIRs. *See* Regents' Op. Br. at 24 and authorities cited.[9]

---

[8]Most recently, this Court denied the Association's petition for review of the Court of Appeal's unpublished decision rejecting its claims for "estoppel" against the University in connection with its acquisition of the Laurel Heights property in 1985. No. S029099. In that decision, which is now res judicata, the Court of Appeal rejected various claims that the Association now attempts to reargue in its brief to this Court. For example, the Association's heavy reliance on local zoning ordinances (Assoc. Br. at 5) ignores the Court of Appeal's conclusion in that case—citing its own opinion in a previous case brought by the Association, which is also final—that such local ordinances do not apply to the University of California.

[9]The Association erroneously implies that *Mira Monte*, 165 Cal. App. 3d 357, rejects the substantial evidence standard, arguing that it is "better reasoned than those decisions in which (continued...)

The Association offers no justification for a different standard of review depending on whether the "new information" was developed before or after certification of the EIR. In either case, the agency must examine the existing environmental document and consider the significance of the additional information in that context. There may be conflicting opinions or information regarding the consequences of the additional information which in either case the agency must evaluate. There are no intrinsic differences between the agency's process and evaluation when undertaken before as opposed to following certification. All of the reasons justifying use of the substantial evidence standard in the post-certification context apply with equal force to the case where additional information is developed after circulation of the draft EIR and prior to certification. *See id.* at 24-25.

The Association argues for extension of the "fair argument" standard applicable to review of an agency's decision that a negative declaration may be prepared rather than an EIR. Assoc. Br. at 17, 33, 47. But it makes no attempt to explain why that standard would be required for purported "new information" that arises pre-certification when that same standard already has been rejected in the post-certification context. *E.g., Fund for Envtl. Defense v. County of Orange,* 204 Cal. App. 3d 1538, 1544 (1988). In either case, the "fair argument" standard would place too heavy a hand on the scale. That standard is appropriately applied to review of a decision against preparing an EIR in light of the perceived policy of CEQA in favor of preparation of an EIR; all doubts are resolved against a negative declaration. *See Bowman v. City of Petaluma,* 185 Cal. App. 3d 1065, 1073 (1986). But there is no comparable policy in favor of preparing seriatim supplements to, or recirculations of, an EIR.[10]

---

[9](...continued)
courts have reviewed an agency determination not to require a subsequent EIR based on whether the record contains substantial evidence to support [that] determination . . . ." Assoc. Br. at 33. *Mira Monte* does not address, let alone reject, the substantial evidence standard. *Bowman v. City of Petaluma,* 185 Cal. App. 3d 1065, 1075 (1986) (*Mira Monte* was decided "[w]ithout discussing the effects of the substantial evidence standard of review"). Indeed, there was no occasion for the court to do so since it was undisputed that the project would encroach upon wetlands to a degree not previously recognized. Thus the only courts to consider the issue have held that a reviewing court must uphold a decision not to prepare a supplemental or subsequent EIR if that decision is supported by substantial evidence. *See* Regents' Op. Br. at 24.

[10]Under CEQA, the substantial evidence test is expressly incorporated into the statute and Guidelines themselves. *E.g.,* PUB. RES. CODE §§21168, 21168.5; GUIDELINES §15384; *see Laurel Heights I,* 47 Cal. 3d 376, 392-93, 407 (1988). This substantial evidence standard is equivalent to "the standard of review used by courts in reviewing agency decisions"; the fair argument standard, by contrast, applies only when a court is reviewing an agency's decision whether or not to prepare an EIR. Comment foll. GUIDELINES §15384. Accordingly, the substantial evidence standard should apply to an agency's decision not to require recirculation.

The Association's own arguments make the University's point. The Association contends that this Court *cannot* determine whether the new information contained in the Final EIR was significant or not, because that would require it to "pass upon the correctness of the EIR's conclusions" or to "engage in fact-finding in the first instance." Assoc. Br. at 2, 12. Those arguments are silly. Of course, the question whether a given piece of information is "significant" and requires recirculation depends on some initial evaluation of the factual content and importance of the information. Ultimately, however, whether new information is "significant" or not is a legal conclusion for the courts to make, applying the appropriate legal standard and the appropriate standard of review. As explained below (*see* Part III, *infra*), the EIR, the Board of Regents, and both lower courts all found that the new information in the Final EIR was not "significant" in the sense that it did not show that the project would have any new or more adverse impacts not previously discussed in the Draft EIR.[11] As we show in Part III below, there is ample evidence in the record to support those findings; no other conclusion by this Court would be appropriate.

III.

THE SUPERIOR COURT CORRECTLY FOUND THAT THE FINAL EIR DID NOT CONTAIN "SIGNIFICANT NEW INFORMATION" REQUIRING RECIRCULATION.

The Board of Regents approved the Final EIR, and with it that document's conclusion that the Final EIR did "not include significant new information about environmental impacts and [did] not require a fundamental reorganization of the DEIR" and that, accordingly, "there [was] no need to recirculate the Final EIR for an additional public review period." FEIR 75. The University argued below, as

---

[11]The Association denies that the Regents found that the additional information in the Final EIR did not require recirculation. Assoc. Br. at 34, 41. It is mistaken. As shown below, the Final EIR expressly found that recirculation was not required because the document did not contain significant new information or represent a fundamental reorganization. *See* p.13, *infra*. The Regents thereupon found that the Final EIR "has been completed in compliance with the California Environmental Quality Act." A.15 at 448-49.

The Association also claims that "the public was prejudiced because it was unable to inform the decisionmaking Regents of errors in the new analyses and to present requests and suggestions for mitigation . . . ." Assoc. Br. at 35. This is also untrue. The public had an opportunity to communicate in writing and in person with the Board of Regents prior to certification of the EIR and approval of the project. Indeed, the Association sent a 13-page letter opposing the project to the Board of Regents (R. 6634-47) *and*, through its representative, personally addressed the Board prior to its approval of the project. R. 6525. The facts of this case vividly demonstrate that recirculation is not required to protect the public's opportunity to communicate with the decisionmaker.

it has here, that this finding should be upheld because the Final EIR revealed no new or more severe adverse environmental impacts. The Superior Court agreed: its denial of the petition for writ of mandate necessarily upheld the Board of Regents' finding. The Court of Appeal majority disagreed as to the applicable legal standard, but it expressly found that the Final EIR "demonstrated no new *adverse* environmental impact" (slip op. at 11 (emphasis added)) regarding air toxics, and impliedly made the same finding as to the other potential impacts.[12]

Thus two reviewing courts, and the Board of Regents in the first instance, have concluded that the Final EIR revealed no new or more severe adverse impacts. In such circumstances, this Court, as a court of discretionary jurisdiction "rather than a court for correction of errors in fact finding, cannot undertake to review concurrent findings of fact by two courts below in the absence of a very obvious and exceptional showing of error." *Graver Tank & Mfg. Co. v. Linde Air Prod. Co.*, 336 U.S. 271, 275 (1949) and cases cited; *accord, Goodman v. Lukens Steel Co.*, 482 U.S. 656, 665 (1987); *Rogers v. Lodge*, 458 U.S. 613, 623 (1982); *Berenyi v. Dist. Director, INS*, 385 U.S. 630, 635 (1967).[13] The "two court-concurrent findings" principle is particularly applicable here, where the Superior Court and the Court of Appeal reviewed the findings of an administrative body:

> "[T]he responsibility of assessing a record to determine whether agency findings are supported by substantial evidence 'is not [the Supreme Court's] but 'primarily' that of the court of appeals. 'This Court will intervene only in what ought to be the rare instance where the standard [of review] appears to have been misapprehended or grossly misapplied.' *Mobil Oil Corp. v. FPC*, 417 U.S. 283, 310 (1974)." (STERN, GRESSMAN & SHAPIRO, SUPREME COURT PRACTICE (6th ed. 1986))

In any event, whatever degree of scrutiny is given, the record will reveal that the Board of Regents correctly found that the Final EIR revealed no new or more

---

[12]It was because the Court of Appeal majority agreed that the Final EIR did not disclose new or more significant adverse impacts that it was necessary for it to reach the issue on which review was granted, holding that Section 21092.1 "does *not* trigger recirculation only when the new information shows a new or more severe significant impact." Slip op. at 10 (emphasis deleted). Thus nowhere did the majority reject the conclusion of the dissent that "the new information included in the EIR merely amplifies or confirms the draft EIR's conclusions" and "does not show a significant impact." *Id.* at 3 (dissenting opinion).

[13]The authorities cited above describe the settled practice of the United States Supreme Court. *See* STERN, GRESSMAN & SHAPIRO, SUPREME COURT PRACTICE 218 (6th ed. 1986). In light of the 1984 amendment to Article VI, Section 12 of the California Constitution revising this Court's discretionary jurisdiction in a fashion which closely resembles the United States Supreme Court's discretionary jurisdiction, the principle should be equally applicable to this Court.

significant adverse impacts, and thus that recirculation was not required. This is so whether the Court applies the substantial evidence test urged in Part II, *supra*, or reviews the issue de novo.

A. The Final EIR Did Not Disclose Any New Or More Significant Impacts Relating To Project Noise.

The Association makes a simple issue needlessly complex. In *Laurel Heights I*, this Court held that the 1986 EIR's treatment of noise impacts was sufficient and valid. That EIR, like the current one, adopted as the "daytime performance standard" for the building's mechanical systems "the limits allowable by city ordinance," stated that noise from the fans would be calculated once the systems were designed and the fans selected, and represented that specific noise control treatments would then be evaluated if predicted noise levels exceeded the performance standards. 47 Cal. 3d at 418. This Court held this treatment of the noise impacts valid. *Id.; accord, Sacramento Old City Ass'n v. City Council*, 229 Cal. App. 3d 1011 (1991).

With the current EIR, the University took the same approach to noise impacts this Court upheld in *Laurel Heights I*, committing the University to whatever noise abatement design and equipment modifications are necessary to reduce project noise to below the voluntarily adopted limit prescribed by the San Francisco Noise Ordinance. DEIR 163; FEIR 334. The Board of Regents adopted this mitigation measure (and procedures to implement and monitor it) and found that this would reduce the noise impact to insignificance. A. 15 at 468-469; *id.* at 524-526.[14] Under *Laurel Heights I*, both the Draft and Final EIR, and the Board's ultimate action, fully comply with CEQA.

---

[14]In light of this commitment, the Association's claim that recirculation of the Final EIR was required to allow further public comment on certain noise data rings particularly hollow. In *Holy Cross Wilderness Fund v. Madigan*, 960 F.2d 1515 (10th Cir. 1992), for example, the court upheld, under NEPA, a decision by the U.S. Army Corps of Engineers not to supplement a final environmental impact statement after learning that additional data were needed to fully evaluate the impact of a water diversion project on wetlands, since the Corps had issued the permit with the specific condition that there be no wetlands losses, which "essentially guaranteed that the Cities mitigate those impacts." *Id.* at 1526. The court concluded that guarantee made supplementation of the EIS unnecessary:

> "When the Corps determined that there would be no adverse impacts on wetlands, and developed a plan to ensure that result, the need for publication of studies relating to possible effects on wetlands disappeared." (*Id.* at 1527)

Here, the University similarly made it an express condition of the project that any noise impacts be mitigated to insignificance, and developed a mitigation monitoring program to ensure that result. As a result, precisely the same conclusion follows.

The Association argues that because in the Final EIR the University voluntarily provided additional noise data responding to public comments on the Draft EIR, recirculation was required. Assoc. Br. at 42-46. The claim is utterly meritless. In the first place, it ignores the fact that the fundamental basis for the Board of Regents' finding that noise was not a significant adverse impact was the mitigation measure committing the University to incorporating whatever noise abatement design and equipment features are necessary to reduce project noise to below 50 dBA, *not* the informational data provided in the EIR. With or without the additional data provided in the Final EIR, the EIR was sufficient under *Laurel Heights I.*[15]

Moreover, the additional noise data provided in the Final EIR, including certain preliminary noise calculations based on noise generated by typical mechanical equipment of a type likely to be used in the project, merely confirmed the conclusion in the Draft EIR that project noise could be mitigated to an insignificant level. FEIR 335, 343-46 & App. D, pp.3-4; App. E (project noise would be below 50 dBA, and would increase noise levels in neighborhood by no more than 3 dBA, even in nighttime or early morning hours). Nothing in that additional noise data undermines the conclusion of the EIR that project noise would be an insignificant impact.[16]

---

[15]The Association asserts that the Draft EIR's discussion of noise impacts was "superficial" and "inadequate." Assoc. Br. at 6, 42. It chastises the University for failing to present measurements of nighttime noise levels (as opposed to 24-hour average noise levels) or information on the amount of noise emitted from "typical laboratory exhaust equipment." *Id.* at 6. But as this Court reminded the Association in *Laurel Heights I,* an EIR need not contain every possible study:

> "A project opponent or reviewing court can always imagine some additional study or analysis that might provide helpful information. It is not for them to design the EIR." (47 Cal. 3d at 415)

[16]The Association says that the EIR's conclusion that project noise would be reduced by no more than 3 dBA is "ambiguous" and that in fact nighttime project noise would increase by more than that amount. Assoc. Br. at 44-45. In fact, the EIR is unambiguous on this point: referring to the very data which the Association purports to cite, it concludes that "overall noise increase in the area as a result of project mechanical equipment operation would be 0 to 3 dBA." FEIR 344; *see also* App. D at p.4.

The Association's erroneous argument to the contrary is discussed in our opening brief at 27 n.20. In addition to demonstrating that its analysis of the noise data is erroneous, we showed that the Association had failed to raise its contention (that recirculation was required because, assertedly, the new data showed that noise would increase by more than 5 dBA) either administratively *or* in the trial court, and could not raise the claim for the first time on appeal. The Association responds that this point was not raised by the University in its Petition For Review. Assoc. Br. at 45 n.10. There was no occasion to do so. The Court of Appeal's opinion did not discuss, let alone reject, the Association's untimely claim that recirculation was required for this reason; *a fortiori,* it did not reject the University's position that the issue could not be raised for

(continued...)

The Association indulges in rhetoric but not analysis when it characterizes the additional noise data in the Final EIR as a "fundamental reorganization" of the EIR. Assoc. Br. at 1, 43. It is no such thing. The Final EIR merely made minor corrections to the text of the Draft EIR, and referenced the additional, confirmatory data. *See* FEIR 343-47.

B. The Final EIR Did Not Disclose Any New Or More Significant Cumulative Impacts Relating To Toxic Air Emissions.

As explained in the opening brief, the Draft EIR found that there were no accepted methodologies for measuring cumulative toxic air emissions from the project and other potential sources; accordingly, it rated the impact as "unknown." The Final EIR did so as well.[17] Regents' Op. Br. at 28-29. By definition, these conclusions did not disclose a new or more significant adverse impact.

In addition, the Final EIR included an experimental study attempting to assess the impacts of cumulative toxic air emissions. *Id.* As our opening brief showed, that experimental study provided comforting news: the maximum estimated cumulative cancer risk increase would be below the standard of significance for the project, and no non-carcinogenic cumulative health effects would be expected. Thus nothing in the additional, albeit experimental, data revealed a new or more significant adverse impact requiring recirculation. *Id.*

The Association makes no argument to the contrary. *See* Assoc. Br. at 10, 47-48.[18]

---

[16](...continued)
the first time on appeal. In any event, the Association is just plain wrong on the merits of this tardily raised contention, as the noise data in the Final EIR fully supports the EIR's express finding that noise would increase by no more than 3 dBA as a result of the project.

Finally, the Association repeats the accusation that "the Final EIR revealed that the laboratory exhaust stacks . . . would be up to four feet wide rather than one foot wide" and that this could have unexamined noise impacts requiring recirculation. Assoc. Br. at 45-46. This issue was not raised during the administrative process, and cannot be raised now. In any event, the contention is false: the dimensions of the stacks did *not* change and the Final EIR does not say otherwise. *See* Regents' Op. Br. at 27-28 n.20 and authorities cited.

[17]The Board of Regents conservatively treated this "unknown" impact as if it were an unavoidable significant adverse impact, and found that "if the impacts were significant, specific economic, social or other considerations make infeasible project alternatives in the FEIR." A.15 477-78; *see* Regents' Op. Br. at 29.

[18]Instead, the Association argues that the experimental study could be wrong. Assoc. Br. at 10. But that is precisely why the Final EIR did not claim that the cumulative air toxics impact was insignificant (even though the data from the experimental study supported such a conclusion), and why neither the EIR nor the Board of Regents based any findings on that study. Whether the experimental study is "right" or "wrong" is irrelevant to the issue of recirculation.

C. The Final EIR Did Not Disclose New Or More Significant Impacts Relating To "Night Lighting Glare."

The Final EIR added a new impact for "night lighting glare." However, the Final EIR found that the impact was not significant; in addition, it added a mitigation measure. FEIR 231. The Association's only response is that *its* expert said that the glare "*could potentially* create a significant adverse aesthetic impact . . . ." Assoc. Br. at 9, 47 (emphasis added). But it does not claim–and could not possibly say–that the Final EIR revealed a new or more severe *adverse* impact, and the tentative speculation of its expert is insufficient to overcome the contrary findings of the EIR and the Board of Regents on this issue.

D. The Final EIR Did Not Disclose A New Or More Significant Adverse Impact Relating To Truck Traffic.

As explained in our opening brief, the Final EIR corrected a minor error in the Draft EIR that there would be three on-site truck loading points; in fact, there is to be one. Regents' Op. Br. at 29-30. However, the Final EIR adhered to the conclusion of the Draft EIR that truck trips would not cause a significant environmental impact. *See* DEIR 134; FEIR 228, 256-58. This correction of a minor design detail did not change the project description, and did not identify a new or more severe environmental impact.

E. The Final EIR Did Not Add A New, Environmentally Superior Project Alternative.

The Parnassus alternative was discussed in the Draft EIR. *See* Regents' Op. Br. at 30. It was also discussed in greater detail in the Final EIR. *Id.* Both documents found, as did the Regents, that the Parnassus alternative would be infeasible. DEIR 19-23, 67-70; FEIR 735; Findings, A.15 at 491. If that were not enough, the Final EIR also found that the Parnassus alternative would result in *greater* adverse environmental impacts than the proposed project. FEIR 728-35 (greater adverse impacts relating to University plans and policies, land use and planning, parking, air quality, construction noise); in no respect was the Parnassus alternative superior to the proposed project.[19] Accordingly, the Final EIR's additional discussion of that alternative did not require recirculation.[20]

---

[19]The Association's statement that the Final EIR "indicates that [the Parnassus alternative] would cause impacts similar to those at Laurel Heights" (Assoc. Br. at 11) is therefore false. The Association makes no attempt to demonstrate that these findings are erroneous, let alone that they are not supported by substantial evidence.

[20]As explained in the opening brief, recirculation would be required where the Final EIR (continued...)

CONCLUSION

The judgment of the Court of Appeal should be reversed, and the case should be remanded to that court with instructions to place the case back on calendar for argument and disposition of the remaining issues not reached by that court in its prior opinion.

DATED: January 25, 1993.

disclosed an *environmentally superior* (and feasible) alternative not considered in the Draft EIR. *See* GUIDELINES §15162(a)(3)(B)(4). Since the Final EIR finds that the Parnassus alternative is neither feasible nor environmentally superior, this recirculation "trigger" was not applicable.

Subject: RE: 995 GHG requirements

Have we completed a similar analysis for the new hospital?

Yes. It is a chapter in the draft EIR. Specifically the Climate Action Plan Appendix. (Pages 1483 to 1548 https://ucsf.app.box.com/v/CPHP-Draft-EIR)

We analyzed the cost of meeting the greenhouse gas on the entire CPHP project – including NHPH - for both engineering design features into the project and also for buying requisite offsets. The most cost effective path for meeting the requirements of SB 995 will involve some of both some design features and offsets We thoroughly vetted our strategy with the Office of General Counsel at UCOP.

We currently buy offsets. We have a UCSF committee on purchasing future offsets. Purchase of offsets currently comes out of operational funds. The source of future expenditures of funds for project associated offsets not caused by utility usage is still under discussion. We plan to have a recommendation to management in 2021. The soonest that purchase would start is in 2024.

Jackie's figures assume $9/ton. We assume $11 NPV to be conservative. We have actually paid as low as $6. We look at the technology and the cost curves annually.

Paul,

See below – it's a long email string, but the portion pertaining to you is right on top.

We are going to set up a meeting on Monday from 2-3, but I see that you have a conflict. Is there any way that you could provide some input before Monday? Sorry for the short notice – this came from Brian Newman via our donor, so there is a level of urgency to respond.

Thanks,
Dan

Hi Dan,

Both of the suggested times work for me.

Could I ask as well that we seek any information regarding the current status and scope of the campus EIR process as information for the conversation? That also factors into the SB 995 portion of any conversation. Would be good to know how far along that is and how they are treating NHPH. Paul Franke might be the right person to talk with in advance to understand status.

Thanks,
Rob

All,

I'm adding Anna into the conversation.

Rob and Raj – Thanks for the thorough explanation – that makes sense. It sounds like there are a lot of variables to consider. I think it makes sense to set up a conversation for next week. Can we do Monday 8/24 from 2-3 or Wednesday 8/26 from 4-5? Let me know if those times work and I'll send out an invite.

I'll see if I can better define the request so we know what level of detail is appropriate for this analysis.

Thanks,
Dan

Thanks Rob, great summary.

We did not get into a detailed GHG analysis during masterplanning as Rob mentioned below. However, if we wanted to take a step towards this direction and/or discuss Rob's points in more detail – can I suggest setting up a conversation with Anna Levitt. We can then take the next step based on the outcome of that conversation.

We have had similar conversations with Anna on carbon accounting and calculations on other ongoing Parnassus projects (unrelated to SB995) and that would be the best first step. Arup/Mazzetti can follow through based on our agreed next steps. Let me know if you have additional thoughts.

Subject: RE: 995 GHG requirements

Dan,

My understanding of SB 995 is that it is an extension of AB 900, which allows projects that so choose to be streamlined under CEQA if they commit to offsetting any additional greenhouse gas emissions the project would incur compared to the existing use (I'll caveat that I'm getting up to speed a bit on it—this is the first project of mine where SB 995 has come up, and SB 995 is not yet passed into law, I don't believe). If my read is correct that it is functionally an extension of AB 900 for non-housing projects, then we are currently pursuing two projects with this pathway as well (under AB 900). In both of those cases, offsets were the way to go because the site prevented us from achieving the requirement of no net new GHGs any other way.

For NHPH, to answer your question, we have not done any cost analysis. However, we have reasonably observed that the project cannot get offset a significant portion of its emissions on-site with PV or other means due to the use, height, and the general lack of sun at Parnassus. So as an early assumption, we would assume that offsets would be required to meet an SB 995 target for NHPH.

In our experience working through projects with AB 900, it is comprehensive in the offsets required. While UCSF will be purchasing green power that would take care of the electrical and gas use at limited additional cost (and as part of the UC purchasing pool hopefully would meet the requirements CARB sets for emissions offsets or green power under AB 900), the transportation emissions offset might be harder. AB 900 (and I believe SB 995 as well) requires that VMT be reduced 15% as part of the project from a baseline condition, and that traffic generated by the project be offset. This has been the largest category on projects we've worked on, including a different hospital project (though there it was closer to energy than on mixed use projects that applied). Currently, some of the transportation emissions are outside the UC goals (Scope 3 are not required to be carbon neutral until 2050). So the offset cost would be higher than what the project might incur without pursuing SB 995.

One other wrinkle—since the NHPH project will be under a master EIR for the campus, for the streamlining benefit to kick in, the entire campus EIR might have to pursue SB 995, which would further increase the analysis and cost to purchase offsets. I'm less sure about that portion, and a CEQA consultant may need to weigh in on the pathways allowable, but wanted to flag that may be one issue to consider.

I hope this is helpful, and let me know if there are points that we want to discuss further or seek to understand a bit more to determine relevance to NHPH.

To: Brian Newman <Brian.Newman@ucsf.edu>
Subject: RE: 995 GHG requirements

Brian: We did analyze the cost of meeting the greenhouse gas requirements of SB 995 on our Berkeley project with Ramboll. Sharing this as it applies to UCSF if going this route. Here is what we found preliminarily as it applies to our project in Berkeley.

- Basically our 300 million project, we need 32,000 tons – to buy carbon credits it would cost about $300K. To engineer it into the project would be $20 million (so buying the offsets is the route to go)
- Issue is the A's need 531K tons (so 15 times more than us) so about $4.8 million in carbon offset credits to purchase.
- If in Berkeley we decide to apply come January or February 20202 , we would need to buy the credits then. Issue with there being a supply available given the A's purchases and pricing.

Cc: Yamauchi, Lori <Lori.Yamauchi@ucsf.edu>
Subject: CPHP next steps

Kevin and Sharon - In response to the committee feedback, please work with the PE team to determine how we can accommodate more housing on the west end and Aldea with larger massing and potentially taller buildings. This would be just a scenario that we can evaluate internally with Paul and Sam. With the UC Hall demo scenario and a larger replacement building, maybe some of those opportunity sites in the west end can become housing rather additional than program space.

I am hopeful that the next phase of renderings will address some of Jackie's concerns about the quality of the architecture. From my conversations with her after the meeting she was reacting to the incomplete state of the images we showed yesterday and specific elements like how the garages were skinned.

As far as Alex's comment, I don't think he truly grasped how many buildings we propose to demo. We can produce a graphic that illustrates all of the buildings proposed for demo and the total square footage: LPPI, UHC, SON, SOD, MUE, Koret, Kirkham. I realize these demos were outlined on one of the slides but I think we need a specific graphic that shows demos and nothing else.

Thanks.

Re: Comment on Draft Environmental Impact Report, UCSF Comprehensive Parnassus Heights Plan (SCH 2020010175)

"The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent."

-Resolution of the Board of Regents of the University of California, May 21, 1976 (Exhibit A)

Dear Chair Pérez, Vice Chair Estolano, and Honorable Regents:

This letter is submitted on behalf of the Parnassus Neighborhood Coalition ("PNC"), a group of residents living near the University of California, San Francisco ("UCSF") Parnassus Heights campus, regarding the Draft Environmental Impact Report ("DEIR") prepared for the Comprehensive Parnassus Heights Plan ("CPHP") (SCH 2020010175) (the "Project"). After reviewing the DEIR, we conclude that the EIR fails as an informational document and fails to impose all feasible mitigation measures to reduce the Project's impacts. PNC requests that the University address these shortcomings in a revised draft environmental impact report ("RDEIR") and recirculate the RDEIR prior to considering approvals for the Project. We reserve the right to supplement these comments during review of the Final EIR for the Project and at public hearings concerning the Project. *Galante Vineyards v. Monterey Peninsula Water Management Dist*. (2007) 60 Cal.App.4th 1109, 1121.

I. PROJECT DESCRIPTION

In 2014, the University of California prepared a Long Range Development Plan ("2014 LRDP") setting forth concepts, principles, and plans to guide future growth for the UCSF campus, outlining projected development levels and patterns for UCSF at all of its main campus sites through 2035. Available at https://ucsf.app.box.com/s/h6f3cfzsznl1bl3kk0am5k9gtc5lila8/file/701727549327. The Regents certified the FEIR for the LRDP in November 2014, which included an analysis of the potential environmental impacts from then-envisioned development at the Parnassus Heights campus site. However, at some point after this, UCSF undertook a planning process to re-envision and revitalize the Parnassus Heights campus as a whole, resulting in the development of the CPHP, which provides a long-term development framework for the "revitalization" of the Parnassus Heights campus.

This Project proposes to develop approximately 2.9 million gross square feet ("gsf") of new building space at Parnassus Heights. The CPHP includes an "Initial Phase" that comprises of: 1) Irving Street Arrival improvements, 2) Research and Academic Building ("RAB"), 3) initial Aldea Housing Densification, and 4) New Hospital. This Initial Phase is anticipated to be completed by approximately 2030. Beyond the Initial Phase, the "Future Phase" encompasses the remaining development described in the CPHP envisioned for completion by the horizon year of 2050. However, when accounting for existing campus site development, demolition that was approved under the UCSF 2014 LRDP but not yet implemented, and potential additional building demolition that would occur under the CPHP, the total amount of campus space upon full implementation of the CPHP would be 6.0 million gsf. The Project will add over 2 million square feet of additional space. To put this in perspective, this is equivalent to placing both the Salesforce Tower and the Transamerica Pyramid on this highly congested site in a residential neighborhood.

The CPHP for the first time reneges on the promise made by the UC Regents in 1976 to the City of San Francisco and the community of Parnassus Heights to resolve a CEQA lawsuit that the Parnassus campus would never exceed 3.55 million square feet. The CPHP would exceed this Space Ceiling by over 2 million square feet, making a mockery of this false promise.

II. LEGAL BACKGROUND

CEQA requires that an agency analyze the potential environmental impacts of its proposed actions in an environmental impact report ("EIR") (except in certain limited circumstances). *See, e.g.*, Pub. Res. Code § 21100. The EIR is the very heart of CEQA. *Dunn-Edwards v. BAAQMD* (1992) 9 Cal.App.4th 644, 652. "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the

statutory language." *Communities for a Better Environment v. Calif. Resources Agency* (2002) 103 Cal. App. 4th 98, 109.

CEQA has two primary purposes. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project. 14 Cal. Code Regs. ("CEQA Guidelines") § 15002(a)(1). "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.'" *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564. The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." *Berkeley Keep Jets Over the Bay v. Bd. of Port Comm'rs*. (2001) 91 Cal. App. 4th 1344, 1354 ("Berkeley Jets"); *County of Inyo v. Yorty* (1973) 32 Cal.App.3d 795, 810.

Second, CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring "environmentally superior" alternatives and all feasible mitigation measures. CEQA Guidelines § 15002(a)(2) and (3); see also, *Berkeley Jets*, 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564. The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines §15002(a)(2). If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns." Pub. Res. Code § 21081; CEQA Guidelines § 15092(b)(2)(A) & (B). The lead agency may deem a particular impact to be insignificant only if it produces rigorous analysis and concrete substantial evidence justifying the finding. *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 732 (Cal. App. 5th Dist. 1990).

The EIR is the very heart of CEQA "and the integrity of the process is dependent on the adequacy of the EIR." *Berkeley Jets*, 91 Cal. App. 4th 1109, 1355. CEQA requires that a lead agency analyze all potentially significant environmental impacts of its proposed actions in an EIR. Pub. Res. Code § 21100(b)(1); Guidelines § 15126(a); *Berkeley Jets*, 91 Cal.App.4th 1344, 1354. The EIR must not only identify the impacts, but must also provide "information about how adverse the impacts will be." *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831. The lead agency may deem a particular impact to be insignificant only if it produces rigorous analysis and concrete substantial evidence justifying the finding. *Kings County Farm Bureau*, 221 Cal.App.3d 692, 732. "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." *Communities for a Better Env't*, 103 Cal.App.4th 98, 109.

The California Supreme Court has noted that "the adequacy of an EIR's discussion of environmental impacts is an issue distinct from the extent to which an agency is correct in its determination whether the impacts are significant" and, as such, "adequacy of discussion claims are not typically amenable to substantial evidence review." *Sierra Club v. Co. of Fresno* (2018) 6 Cal. 5th 502, at 514-15. Rather, such claims are reviewed de novo to determine "whether the discussion sufficiently performs the function of facilitating 'informed agency decisionmaking and informed public participation.'" *Id*. at 513 [quoting *California Native Plant Soc'y v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 988].

"[T]he reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A 'clearly inadequate or unsupported study is entitled to no judicial deference.'" *Berkeley Jets*, 91 Cal. App. 4th 1344, 1355 (emphasis added), quoting, *Laurel Heights Improvement Assn. v. Regents of University of California*, 47 Cal. 3d 376, 391 409, fn. 12 (1988). A prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decisionmaking and informed public participation, thereby thwarting the statutory goals of the EIR process." *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal. App. 4th 713, 722; *Galante Vineyards v. Monterey Peninsula Water Management Dist*. (1997) 60 Cal. App. 4th 1109, 1117; *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal. App. 4th 931, 946. As discussed below, and in the attached expert comment letters of expert Dr. Smallwood, expert consulting firm SWAPE, Mr. Ikeda, and Ms. Watt, the EIR for this Project fails to adequately analyze and mitigate the Project's impacts.

In general, mitigation measures must be designed to minimize, reduce or avoid an identified environmental impact or to rectify or compensate for that impact. CEQA Guidelines § 15370. Where several mitigation measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be identified. *Id.* at § 15126.4(a)(1)(B). A lead agency may not make the required CEQA findings unless the administrative record clearly shows that all uncertainties regarding the mitigation of significant environmental impacts have been resolved.

III. DISCUSSION

A. Space Ceiling.

The most glaring shortcoming of the CPHP is that it reneges on the Regents' promise to the City of San Francisco and the community of Parnassus Heights never to exceed 3.55 million square feet of development at the Parnassus Heights campus. This promise was made by the Regents themselves to resolve a lawsuit in 1976, and has been reaffirmed countless times thereafter, most recently in the 2014 LRDP. In May 21, 1976, the Regents adopted a resolution stating the following:

> The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and ***this limit shall be permanent.*** These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the new campus boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton and Clarendon. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

1976 Resolution, ¶ 2 (emphasis added) (Exhibit A). The Regents directed that these commitments be amended into the 1975 Long Range Development Plan. Id., ¶ 6 ("That the Long Range Development Plan for the San Francisco campus, as approved by The Regents in October, 1975, be amended to reflect the described changes in designation of open space, boundaries, and use of housing").

The Space Ceiling was reaffirmed by the Regents in the Long Range Development Plans (LRDPs) of 1982 and 1994. It was reaffirmed in 2014, though amended to exclude certain residential properties from the calculation of the Campus' gross square feet. UC has relied on the Space Ceiling as a justification to develop other sites throughout the City. In *Laurel Heights II*, the Regents represented to the Supreme Court that the expansion to Laurel Heights was necessary since the Space Ceiling prohibited any further development at the Parnassus Campus. *Laurel Heights Impr. Assoc. v. Regents of Univ. of Calif.* (1993) 6 Cal.4th at 1120 (*Laurel Heights II*). The Supreme Court noted in the *Laurel Heights I and II* cases that development of the new Laurel Heights campus was necessary due to the Regents' representation of "serious space constraints at the Parnassus campus and concluded there was a need to develop off-campus locations." *Laurel Heights II,* 6 Cal.4th at 1120; *Laurel Heights Impr. Assoc. v. Regents of Univ. of Calif*. (1988) 47 Cal.3d at 388 (*Laurel Heights I*). Having benefitted by relying on the Space Ceiling to develop other locations, the Regents now want to disregard the Space Ceiling and its prior declaration to the Court, notwithstanding the reliance of the community on the commitment. The Space Ceiling was negotiated because the campus was too small to accommodate future growth, and that remains even more pressing today.

In 2014, the Regents adopted a Long Range Development Plan ("LRDP") that recognized the need to comply with the Space Ceiling, and to "decompress" the Parnassus Campus by moving certain functions to other locations. However, in order to more readily comply with the Space Ceiling, the Regents amended the 1976 Resolution's development ceiling to exclude specific residential development at Aldea Housing and University House from the ceiling calculation. The 1976 Resolution had not excluded these specific residential buildings from the development ceiling calculation, although other residential areas were excluded. See 2014 LRDP, p. 51 ("The total

amount of structured space within the campus boundaries is not to exceed 3.55 million gsf, excluding space committed to residential use on Third, Fourth, Fifth, and Parnassus avenues and Kirkham and Irving streets.") The 2014 LRDP "identifies strategies to reduce the space ceiling overage over the life of the LRDP by: 1) converting some existing office space (UC Hall and Millberry Union towers) to residential use; 2) demolishing a number of buildings and either moving occupants and programs to other campus sites or absorbing them into other buildings at Parnassus Heights; and 3) excluding all residential space from the space ceiling calculation." 2014 LRDP, p. 57 (emphasis added). The 2014 LRDP included an amendment to the 1976 Resolution which stated, "3. The space ceiling for the Parnassus Heights campus site is 3.55 million gross square feet. The space ceiling includes space in non-residential buildings within the boundary of the Parnassus Heights campus site." 2014 LRDP, p. 64. Although the 2014 LRDP was intended to guide the University's growth through 2035, the University is now proposing to abandon the 2014 LDRP at the Parnassus Campus to allow dramatic expansion of development approved in 2014 and proposed as the UCSF Comprehensive Parnassus Heights Plan. The Plan proposes to further amend the 1976 Resolution to "Increase the space ceiling limit from the current 3.55 million gsf to a proposed 5.05 million gsf, excluding housing (an increase of approximately 1.5 million gsf above the current space ceiling limit) in recognition of the tremendous need for program space at the campus site in order for UCSF to retain its leadership position in patient care, research, and education." Plan DEIR, p. 3-44.

As discussed below, under the doctrine of promissory estoppel, the Regents cannot abandon their solemn promise to the community to adopt a "permanent" Space Ceiling of 3.55 million square feet.

1. The Space Ceiling is Enforceable Under the Doctrine of Promissory Estoppel

a. Elements of Promissory Estoppel

Promissory estoppel involves "'[a] promise which the promisor should reasonably expect to induce action or forbearance of a definite and substantial character on the part of the promisee and which does induce such action or forbearance is binding if injustice can be avoided only by enforcement of the promise.' This rule is applicable in California." *Hilltop Properties, Inc. v. State* (1965) 233 Cal.App.2d 349, 362. "The elements of promissory estoppel are (1) a promise, (2) the promisor should reasonably expect the promise to induce action or forbearance on the part of the promisee or a third person, (3) the promise induces action or forbearance by the promisee or a third person, and (4) injustice can be avoided only by enforcement of the promise." *Kajima/Ray Wilson v. Los Angeles County Metropolitan Transportation Authority* (2000) 23 Cal.4th 305, 310.

The purpose of promissory estoppel is “to make a promise binding even though there was no consideration in the sense of something that is bargained for and given in exchange. Reasonable reliance serves to hold the offeror in lieu of the consideration ordinarily required to make the offer binding." *Id*. “Promissory estoppel is a theory of recovery which is allowed where injustice can be avoided only by enforcement of the promise, this usually occurring where the plaintiff has made a complete and substantial change of position in reliance upon the promise.” *Id*. The doctrine only applies where there was no bargained for reliance by the promissee. *Id*. at 363.

“[E]stoppel has been applied with some reluctance insofar as its application against a governmental body is concerned, since it is the general rule that a governmental agency may not be estopped by the conduct of its officers and employees.” *Id*. at 364. Here, however, the Regents adopted the resolution at issue, so there would not be a problem regarding a promise of an employee or officer. The promise at issue was made by the University’s ultimate decision-making body, not by a subordinate employee. There was a written promise, especially given the emphatic statement that the development ceiling of 1976 was “permanent.”

The Space Ceiling Resolution meets all of the elements of promissory estoppel:

(1) There is no dispute that the Space Ceiling Resolution was a promise never to build more than 3.55 million square feet at the campus;
(2) The Regents reasonably expected the promise to induce action or forbearance on the part of the promisee or a third person -- namely the dismissal of the 1976 CEQA lawsuit;
(3) The promise induced action or forbearance by the promisee or a third person -- namely the Petitioners did in fact dismiss their lawsuit; and
(4) Injustice can be avoided only by enforcement of the promise. There is no way for the Petitioners or anyone else to revive the 1976 lawsuit at this point since the limitations period is long expired. The only way avoid injustice is to enforce the promise.

The adoption of the Space Ceiling induced a forbearance “of a definite and substantial character” by any neighbors or organizations. In particular, the neighbors forbore from prosecuting their CEQA lawsuit challenging the 1975 LRDP.

First, there can be no question that the Space Ceiling Resolution was a “promise.” Second, the Regents clearly reasonably expected the petitioners in the 1975 LRDP case to drop their lawsuit in exchange for the promise of a “permanent” Space Ceiling. There is no way to avoid the injustice other than to enforce the Regents’ solemn promise, since the 1976 CEQA petitioners cannot now reinstitute their action. All of the elements of promissory estoppel are satisfied. The Regents therefore cannot simply disregard the promise made to the City and the neighborhood in 1976 simply because they find it no longer convenient to keep their promise.

b. The 1976 Space Ceiling Does Not Impair the Police Power.

The Regents may contend that the 1976 Resolution improperly surrenders or impairs the Regents' delegated governmental power sitting as a legislative body. As a general rule, "a local government may not contract away its right to exercise its police power in the future, and land use regulations involve the exercise of police power." See *Alameda Cty. Land Use Assn. v. City of Hayward* (1995) 38 Cal.App.4th 1716, 1724. Courts '"will not read into the contract[ ] an abrogation of the potential future exercise of the sovereign police power." *Richeson v. Helal* (2007) 158 Cal.App.4th 268, 280 (involving effort to enforce covenants to remove nonconforming use despite issuance of use permit), and will construe a contract, if possible, in a manner that preserves the police power. *Id*. at p. 281, citing *Delucchi v. County of Santa Cruz* (1986) 179 Cal.App.3d 814, 823-824 (rejecting interpretation of Williamson Act contract which sought "wholesale freeze of zoning" changes). "A contract that purports to do so is invalid as contrary to public policy if the contract amounts to a municipality's 'surrender' or 'abnegation' of its control of a municipal function." *108 Holdings, Ltd. v. City of Rohnert Park* (2006) 136 Cal.App.4th 186, 195.

First, it is unclear whether the Regents even possess police powers. There is no case law discussing whether the University wields any police powers. "The definition of 'police power' is broad and rather nebulous." *Goldbaum v. Regents of Univ. of California* (2011) 191 Cal.App.4th 703, 712. "The police power is the authority to enact laws to promote the public health, safety, morals and general welfare. [Citation.] Legislation is within the police power if it is reasonably related to a proper legislative goal." *Id*., quoting C*ommunity Memorial Hospital v. County of Ventura* (1996) 50 Cal.App.4th 199, 206, 56 Cal.Rptr.2d 732. "As noted in Witkin's Summary of California Law, 'It has been said that the police power is simply the power of sovereignty or power to govern—the inherent reserved power of the state to subject individual rights to reasonable regulation for the general welfare.'" *Churchill v. Parnell* (1985) 170 Cal.App.3d 1094, 1098 (quoting 5 Witkin, Summary of Cal. Law (8th ed. 1974) Constitutional Law, § 435, p. 3734). Most of the cases touching on police power and the Regents involves whether statutes enacted by the Legislature pursuant to its police powers are applicable to the Regents.

Second, even if the Regents possess police powers, they were not exercising police powers in adopting the Space Ceiling, but merely limiting their own use of their own property as a market participant. The Space Ceiling is an act of the Regents placing limitations on themselves. It limits the Regents use of their own property. It does not restrict the general public or anyone else in any manner, as would a general plan or zoning ordinance. A governmental entity's role in regulating the use of its own property is not an exercise of its police power or its power as a government per se, but as a market participant engaged in what were historically called proprietary activities. *City of Oakland v Burns* (1956) 46 C2d 401, 407 ("When a governmental entity is authorized to exercise a power purely proprietary, the law leans to the theory that it has

full power to perform it in the same efficient manner as a private person would"). Governmental entities have broad discretion over the use of their own property. *Laura Vincent Co. v City of Selma* (1941) 43 CA2d 473. 43 CA2d at 476; see also *Irwin v City of Manhattan Beach* (1966) 65 C2d 13.

The courts have recognized the validity of permanent deed restrictions on public property donated to the public by private entities. Thus, when land is donated to the city with a restriction on its use, the city usually cannot divert the use of the property to purposes inconsistent with the terms of the grant, including transferring an interest in the donated land to private parties for nonpublic uses. *Big Sur Props. v Mott* (1976) 62 CA3d 99. Thus, a public entity should be equally in its right to impose permanent restrictions on its own property.

The Space Ceiling was not an attempt to "subject individual rights to reasonable regulation for the general welfare." Instead, it was simply the Regents' decision regarding how to use its own property. Instead of exercising any non-delegable police powers, the Regents used their "virtual plenary power" to manage and dispose of their property by entering into a "permanent" commitment to maintain a Space Ceiling of 3.55 million square feet. There is no reason that this promise should not be enforceable.

2. The Space Ceiling is Enforceable Under the Doctrine of Equitable Estoppel.

The California Supreme Court has articulated the doctrine of equitable estoppel as follows: "[o]ne cannot justly or equitably lull his adversary into a false sense of security, and thereby cause his adversary to subject his claim to the bar of the statute of limitations, and then be permitted to plead the very delay caused by his course of conduct as a defense to the action when brought. [Citations]" *Lantzy v. Centrex Homes* (2003) 31 Cal.4th 363, 383. The Court further noted: "[a]n estoppel may arise although there was no designed fraud on the part of the person sought to be estopped. [Citation.] To create an equitable estoppel, 'it is enough if the party has been induced to refrain from using such means or taking such action as lay in his power, by which he might have retrieved his position and saved himself from loss.' ... Where the delay in commencing action is induced by the conduct of the defendant it cannot be availed of by him as a defense. [Citations]" *Id*. at 384.

In this case, the elements of equitable estoppel are present. To establish equitable estoppel, a Plaintiff must show: 1) the Defendant knew the relevant facts; 2) the Defendant made a misrepresentation bearing on the necessity of bringing a timely suit; 3) the Defendant intended its words or conduct would be acted upon or led Plaintiff to believe it was so intended; 4) Plaintiff was ignorant of the true state of facts; and 5) Plaintiff reasonably relied thereon in delaying commencement of the action. *Doheny Park Terrace Homeowners Ass'n, Inc. v. Truck Ins. Exch.* (2005) 132 Cal.App.4th 1076,

1099. Finally, 6) the exception applies here to the rule that estoppel is not ordinarily applied against a city for the conduct of its officials.

a. The Regents knew the relevant facts.

The Regents were aware that they had been sued under CEQA over the 1975 LRDP. To settle that case, the Regents adopted a resolution imposing a permanent space ceiling on the Parnassus Campus. The Regents knew that this would induce the petitioners to drop their lawsuit, which they did. As the court held in *Lantzy v. Centrex Homes* (2003) 31 Cal.4th 363, 383, "[a]n estoppel may arise although there was no designed fraud on the part of the person sought to be estopped. [Citation.] To create an equitable estoppel, 'it is enough if the party has been induced to refrain from using such means or taking such action as lay in his power, by which he might have retrieved his position and saved himself from loss.' ... Where the delay in commencing action is induced by the conduct of the defendant it cannot be availed of by him as a defense. [Citations]" *Id*. at 384.

b. Regents made a misrepresentation bearing on the necessity of bringing a timely suit

The Regents made their promise to settle a lawsuit, but reneged on the promise long after the time had passed to refile or revive the lawsuit. The Petitioners are not able to bring a timely suit at this point since the statute of limitation has expired.

c. Regents intended their words or conduct would be acted upon or led Petitioners to believe it was so intended.

The Regents obviously intended the adoption of the Space Ceiling Resolution to induce the petitioners to dismiss their CEQA lawsuit challenging the 1975 LRDP.

d. Petitioners were ignorant of the true state of facts.

The petitioners in the 1975 lawsuit were ignorant of the fact that the Regents would renege upon their commitment to a "permanent" space ceiling of 3.55 million square feet.

e. Petitioners reasonably relied upon the commitment.

The petitioners in the 1975 lawsuit reasonably believed that when the Regents adopted a Resolution stating that development would never exceed 3.55 million square feet, and that this commitment would be "permanent," that the Resolution meant what it said.

f. The Regents may not rely on the rule relating to the conduct of government officials because its application would work a grave injustice in this case.

As the California Supreme Court has stated, there is a general rule that a "government agency may not be estopped by the conduct of its officers or employees." *Farrell v. Co. of Placer* (1944) 23 Cal.2d 624, 627 ("*Farrell*"). However, the Court held in that same case that "there are many instances in which an equitable estoppel in fact will run against the government where justice and right require it. [Citations]" Id. at 627-628; see also *California Cigarette Concessions, Inc. v. City of Los Angeles* (1960) 53 Cal.2d 865, 869 ("estoppel against a city is appropriate "when the facts clearly establish that a grave injustice would be done if an equitable estoppel were not applied. [Citation]"). The court noted that the government should be held to a similar standard as ordinary citizens in the conduct of its business, quoting Justice Holmes thus: "…[i]t has been aptly said: 'If we say with Mr. Justice Holmes, 'Men must turn square corners when they deal with the Government', it is hard to see why the government should not be held to a like standard of rectangular rectitude when dealing with its citizens. (48 Harv.L.Rev. 1299.)" *Farrell* at 628.

Here, there is no issue of the University being bound by promises made by their officers of employees. The promise at issue was made at the highest level by the Regents themselves.

In *Farrell*, counsel for two defendant Counties in a personal injury case advised the plaintiff suing for defective condition of a bridge that she need not bring an action until after she had ascertained the amount of her damages. Plaintiff then waited until after the relevant statute of limitations had expired to file her claim. The Defendants demurred on the grounds that the statutory period to file a claim had run. In reversing the trial court's sustaining of the demurrer, the court emphasized that the Plaintiff's reasonable reliance on the representations of the Defendants worked an injustice which a court of equity was empowered to correct.

Moreover, courts have held that "strong considerations of policy" are needed to deny the application of estoppel where government entities have misled the public. *Co. of San Diego v. Cal. Water and Telephone Co.* (1947) 30 Cal.2d 817. Here, failure to estop the Regents from rescinding their Space Ceiling Resolution will result a manifest injustice. The time has long passed for reviving the lawsuit that was dismissed in exchange for the Space Ceiling. Also, countless neighbors have purchased homes and businesses in the area in reasonable reliance on the permanent Space Ceiling. The permanent commitment made in 1976 should be enforced exactly as it was written - permanent.

3. The Violation of the Space Ceiling Policy is a Significant Impact Under CEQA.

Where a local or regional policy of general applicability, is adopted in order to avoid or mitigate environmental effects, a conflict with that policy in itself indicates a potentially significant impact on the environment. *Pocket Protectors v. Sacramento* (2005) 124 Cal.App.4th 903. Indeed, any inconsistencies between a proposed project and applicable plans must be discussed in an EIR. CEQA Guidelines § 15125(d); *City of Long Beach v. Los Angeles Unif. School Dist.* (2009) 176 Cal. App. 4th 889, 918; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal. App. 4th 859, 874 (EIR inadequate when Lead Agency failed to identify relationship of project to relevant local plans). A Project's inconsistencies with local plans and policies constitute significant impacts under CEQA. *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 783-4. The recent *Georgetown Preservation Society v. County of El Dorado* (2018) 30 Cal.App.5th 358 follows *Pocket Protectors* in holding that the fair argument standard applies to a potential inconsistency with a plan adopted for environmental protection.

The Space Ceiling is a policy adopted by the Regents to address the campus' environmental impacts in almost every area: traffic, population, growth inducement, air pollution, noise, etc. The violation of the Space Ceiling is therefore a significant impact that must be analyzed and mitigated under CEQA. The most obvious alternative is for the University to continue to abide by the Space Ceiling. This is a feasible alternative since it was deemed feasible only a few short years ago in the 2014 LRDP.

B. The EIR Fails to Consider Impacts of COVID-19 In the Baseline.

The DEIR dismisses the impacts of COVID-19 on the Project. A revised draft EIR is required to analyze whether and how COVID-19 will impact the need for this massive expansion Project. COVID-19 has dramatically impacted our work practices, increasing the use of telecommuting from home, telemedicine, and remote learning. All of these developments have the potential to reduce the need for office, classroom and clinical space as people are increasingly inclined to work and learn from home. These developments may dramatically and permanently change the nature and need for the Project.

Every CEQA document must start from a "baseline" assumption. The CEQA "baseline" is the set of environmental conditions against which to compare a project's anticipated impacts. Section 15125(a) of the CEQA Guidelines states in pertinent part that a lead agency's environmental review under CEQA:

> "…must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time [environmental analysis] is commenced, from both a local and regional perspective. This environmental

> setting will normally constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant." (Emphasis added.)

CEQA Guidelines § 15125(a); see, *Save Our Peninsula Committee v. County of Monterey* (2001) 87 Cal.App.4th 99, 124-125 ("*Save Our Peninsula"*). As the court of appeal has explained, "the impacts of the project must be measured against the 'real conditions on the ground,'" and not against hypothetical permitted levels. *Save Our Peninsula, supra*, 87 Cal.App.4th 99, 121-123.

The outbreak of COVID 19 was first reported on December 31, 2019 in Wuhan China. The Notice of Preparation (NOP) for the UCSF Parnassus Heights campus was issued January 14, 2020. The NOP for the proposed CPHP was published in January 2020, and the baseline conditions contained in this CPHP EIR are generally taken from this time period. However, the CEQA Guidelines and applicable case law recognize that the date for establishing an environmental baseline cannot always be rigid." DEIR at 4.6-6. UCSF is a health based organization, therefore fully aware early on of the implications of the Wuhan outbreak. The DEIR itself acknowledged the potential implications of COVID 19, concluding that:

> "The net effect of the pandemic on the Parnassus Heights campus site development and operations cannot be predicted at this point in time without speculation." DEIR, p. 1-9.

The DEIR concedes COVID 19 has implications for the Project. For example, the objectives for the New Hospital, objectives used in part to dismiss some alternatives, include an increase in beds to provide for inpatient health care in times of severe strain such as the current pandemic. DEIR, p. 6-4. The brief discussion at page 1-9 also acknowledges that UCSF will likely consider operational changes such as increases in telehealth services and telework, among others.

COVID 19 was known at the time of the issuance of the NOP and certainly, as reflected in Section 1.7 of the DEIR, was known prior to circulation of the DEIR for public comment. COVID 19 warrants changes and updates to existing environmental setting information, critical to complete an accurate impact analysis, as well as to the Project Description (e.g., space needs changes given a likely transition as noted in the discussion to telework and telehealth). Significant questions are raised by COVID 19 that have implications to the Project and related impacts – including but not limited to an acknowledgement that UCSF is likely to increase telework, telehealth consultations and remote learning. These are but a few of the changes warranting UCSF to hit pause both to revise the DEIR and to re-engage the public and experts, right-size the Project and evaluate other alternatives that would reduce or eliminate impacts while adhering to the existing space ceiling.

C. The EIR's Alternatives Analysis is Legally Deficient.

An EIR must describe a range of reasonable alternatives to the Project, or to the location of the Project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. "An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision making." *Laurel Heights I*, 47 Cal.3d at 404. An EIR must also include "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." *Id*. at 405.

CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring "environmentally superior" alternatives and all feasible mitigation measures. CEQA Guidelines § 15002(a)(2) and (3); *see also*, *Berkeley Jets*, 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564. The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines § 15002(a)(2). If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns." Pub. Res. Code § 21081; CEQA Guidelines § 15092(b)(2)(A) & (B). A "feasible" alternative is one that is capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors. Pub. Res. Code § 21061.1; CEQA Guidelines § 15364.

The lead agency is required to select the environmentally preferable alternative unless it is infeasible. As explained by the Supreme Court, an environmentally superior alternative may not be rejected simply because it is more expensive or less profitable:

> The fact that an alternative may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible. What is required is evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.

Citizens of Goleta Valley v. Bd. of Supervisors (1988) 197 Cal.App.3d 1167, 1180-81; *see also*, *Burger v. County of Mendocino* (1975) 45 Cal.App.3d 322; *County of El Dorado v. Dept. of Transp*. (2005) 133 Cal.App.4th 1376 (agency must consider small alternative to casino project); *Preservation Action Counsel v. San Jose* (2006) 141 Cal. App. 4th 1336.

In addition, an environmentally superior alternative may not be rejected because it does not meet all of the Project's objectives. Inconsistency with only some of the

Project Objectives is not necessarily an appropriate basis to eliminate impact-reducing project alternatives from analysis in an EIR. CEQA Guidelines § 15126.6(c), (f); *see also Watsonville Pilots Assn. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1089. Here, the DEIR fails to adopt the environmentally superior alternatives and fails to describe a reasonable range of alternatives.

First, the EIR identifies several significant environmental impacts the Project will have, as well as the project alternatives that may alleviate some of these impacts. However, UCSF failed to adopt the environmentally superior alternative, or any other alternative, that would reduce the Project's impacts and failed to include and analyze several feasible alternatives that are available and would reduce some of the Project's significant impacts. The DEIR refuses to adopt the environmentally superior alternative, Alternative 2: the Reduced Project Alternative, because it would "fail to fully achieve certain Project objectives, and in particular, would not fully meet the CPHP project objectives, for space, urban design and mobility, or for the New Hospital, RAB or Aldea Housing Densification." DEIR, p. 6-71. This justification is insufficient and does not constitute substantial evidence that the environmentally superior alternative is infeasible.

Second, the DEIR fails to select the 2014 LRDP Alternative. The environmental impacts of the 2014 LRDP Alternative were already analyzed in the 2014 LRDP EIR, and this alternative would result in less significant impacts than the proposed Project. However, UCSF did not select this alternative because it "would not achieve the proposed CPHP objectives." DEIR, p. 6-20. Numerous objectives from the 2014 LRDP FEIR remain valid with respect to the proposed Project. *See id*. at 3-13. Dismissing this alternative for this reason fails to demonstrate how this alternative is not feasible.

Additionally, Urban Planner Terrell Watt, a member of the American Institute of Certified Planners, reviewed the DEIR, including the alternatives analysis, and concluded that the DEIR is legally deficient because it "fails to describe a reasonable range of alternatives, or to the location of the Project, which would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the significant effects of the Project, and evaluate the merits of the alternatives." Exhibit B,,p. 21. Specifically, the DEIR improperly rejected feasible off-site alternatives and omits other feasible off-site alternatives. *Id*. at 22. For example, feasible alternatives to the Project that would reduce or eliminate the Project's significant impacts that the DEIR briefly considered but dismissed include the following: (1) No New Hospital at Parnassus Heights Campus Site/Implement Phase 2 of Medical Center at Mission Bay Campus Site; and (2) New Hospital at Mount Zion Campus Site. *Id*.

The reasons provided for dismissing the alternative of a new hospital at Mission Bay comes down to the alternative's reported failure to meet every focused Project objective and a purported conflict with the 2014 LRDP and CPHP. *Id*. Specifically, the DEIR states that the alternative would not meet some of the Project objectives and

would conflict with several 2014 LRDP and CPHP objectives including but not limited to adequate space to foster collaboration and to facilitate inter-dependence and connectivity for operational efficiency, adequate clinical and administrative support and alignment with other programs, increase in beds, and modern industry standards including seismic activity. *See* DEIR, p. 6-55. The discussion concedes that the alternative would reduce significant wind, cultural, and construction impacts, but that in doing so, it would likely also result in increased cross-town traffic between the Parnassus and Mission Bay campus sites. However, the discussion failed to analyze a combination of a smaller, new hospital at Parnassus in combination with Mission Bay, which is a feasible option that has the potential to address total need and allow phasing to accommodate patients and services. Exhibit B, p. 22. The DEIR's justification for dismissing this alternative is not justified. First, the alternative would meet most of the Project's objectives. *Id*. Second, the argument that the alternative would increase cross-town traffic is not supported by any evidence or analysis. *Id*. at 22-23. Lastly, the conflicts with the 2014 LRDP are not persuasive since that document is being amended to break the space ceiling and this alternative would not require that significant amendment to the LRDP. *Id*. at 23. "In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus." *Id*. This alternative must be fully analyzed in a revised and recirculated DEIR, including additional facts and analysis to support the arguments concerning the alternatives analysis.

The DEIR also dismisses the alternative of a new hospital at the Mount Zion Campus Site without actually analyzing the alternative, stating that it "would be less than ideal and inefficient" to have UCSF hospitals at three different sites, and that it would not help achieve the benefits realized through interdisciplinary collaboration and convergence between clinical care, research and education, land acquisition would be difficult, and citing undisclosed conflicts with the 2014 LRDP and CPHP objectives. DEIR, p. 6-57. Locating the proposed hospital at the Mount Zion campus would "reduce the significant wind impact . . ., avoid demolition of the LPPI (individually eligible for listing in the National and California Registers), and avoid a number of temporary construction and operational impacts associated with the New Hospital at the Parnassus Heights campus site." *Id*. The Mount Zion campus site is 2 miles from the Parnassus campus site and several of the existing buildings, including the hospital, must be retrofitted or demolished due to seismic issues. *See* UCSF 2014 LRDP, p. 89. The 2014 LRDP even states that the demolition of outdated and seismically compromised buildings would allow for the construction of new space to accommodate clinical programs at the Parnassus site. *Id*. at 91. The DEIR must analyze the feasibility of this alternative due and compare it with the other identified alternatives.

Rejection of the Mission Bay and Mount Zion sites for a new hospital, either in lieu of or in combination with a smaller hospital at the Parnassus campus, is not supported by the evidence and analysis provided and both require full analyses in a revised and recirculated DEIR.

Lastly, the DEIR also fails to mention their Hunters Point site. UCSF owns 3.8 acres in Hunters Point with two single story buildings used for an animal care facility. UCSF 2014 LRDP, p. 117. At the time the 2014 LRDP was published, the City had approved the Candlestick-Hunters Point Shipyard Development Plan, an extensive mixed-use redevelopment plan for the area that would include housing, retail, office, commercial, industrial, and open use spaces. *See id*. Due to UCSF's facilities at this site being in relatively poor condition, UCSF was exploring the possible relocation of those functions and occupants and potential relinquishment of the site. *Id*. However, healthcare, a hospital, and economic development would be greatly needed in this community, especially with the progression of the Candlestick-Hunters Point Shipyard Development Plan. Since UCSF does not have future plans for this site, it should consider the feasibility of locating a portion of the proposed Project at this location.

The DEIR rejects many of the off-site alternatives because they are off-site. This makes a mockery of CEQA's requirement for consideration of off-site alternatives. The courts have held that if environmentally superior alternative sites are available for a project, it would be inconsistent with CEQA's purposes to ignore off-site alternatives simply because on-site alternatives have been considered. In *Citizens of Goleta Valley v Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1179 (*Goleta I*), the court held that the EIR for a proposed resort hotel should have considered alternative locations for the project. Observing that the public need for the hotel should be served at minimal environmental expense, the court concluded that "[r]eason requires that the agency charged with the duty to protect the environment compare impacts at feasible alternative locations." *Id*. at 1180. If off-site alternatives can be rejected simply because they are off-site, then the CEQA requirement for analysis of off-site alternatives becomes meaningless. A revised draft EIR is required to analyze and consider the above alternatives and to select the environmentally superior alternative unless it is truly infeasible.

D. The EIR Improperly Delays the Analysis of the Hospital.

The DEIR fails to describe details of several elements of the hospital, contending that sufficient details are not known to allow a detailed analysis of impacts such as wind. However, the DEIR reveals that the University of aware of many of the details of the Project, including the specific height and sizes of buildings - the extent that it was possible to create visual representations of all of the buildings. Since the University is aware of these details, a more detailed analysis must be provided in the DEIR.

The courts have consistently held that an "accurate and stable project description" is a bedrock requirement of CEQA—the *sine qua non* (that without which there is nothing) of an adequate CEQA document:

> Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost,

> consider mitigation measures, assess the advantage of terminating the proposal (i.e., the "no project" alternative) and weigh other alternatives in the balance. An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR.

Inyo v. Los Angeles (1977) 71 Cal.App.3d 185, 192-93. The ability of informed citizens to participate in environmental review is a key component of CEQA. *Washoe Meadows v. Dept. of Parks and Rec*. (2017) 17 Cal.App.5th 277, 285 ["Informed public participation is essential to environmental review under CEQA."]; *Inyo*, 71 Cal.App.3d at 192 ["The EIR process facilitates CEQA's policy of supplying citizen input."]. Through the EIR process, CEQA "provide[s] public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment." *Washoe, supra*, 17 Cal.App.5th at 286 [quoting Pub. Res. Code § 21061].

The court recently noted that the requirement for an accurate, stable, and finite project description has been "reiterated in a number of cases since *County of Inyo*." *Stop the Millenium Hollywood v. Los Angeles* (2019) 39 Cal.App.5th 1, 17. In *Millennium*, the court evaluated the project description for a large mixed-use development, which described three conceptual development scenarios that would satisfy the project's Development Agreement. *Id*. at 9-10. The scenarios presented in the DEIR only depicted potential massing options that might have been developed and, thus, "the public had no idea how many buildings or towers would be built and where they would be located on the project site." *Id*. at 11. The court held that the DEIR did not meet CEQA's requirement for an accurate, stable or finite proposed project because "it fails to describe the siting, size, mass, or appearance of any building proposed to be built at the project site" and "presents different conceptual scenarios that Millennium or future developers may follow for the development of this site." *Id*. at 18. Notably, the court noted that the failure to include an accurate, stable, and finite project description "was an obstacle to informed public participation 'even if we cannot say such input would have changed the project ultimately selected and approved.'" *Id*. at 20 [quoting Washoe, supra, 17 Cal.App.5th at 290] [emphasis added].

The DEIR for CPHP is similar to the one rejected in *Millenium*. It fails to provide detail of the project, hampering informed public comment. A revised draft EIR is required to provide requisite details of the Project and its impacts.

E. The EIR Impermissibly Defers Mitigation.

Feasible mitigation measures for significant environmental effects must be set forth in a CEQA document for consideration by the lead agency's decision makers and the public before certification of the CEQA document and approval of a project. The formulation of mitigation measures generally cannot be deferred until after certification and approval of a project. CEQA Guidelines, section 15126.4(a)(1)(B) states: "Formulation of mitigation measures should not be deferred until some future time.

However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way."

"A study conducted after approval of a project will inevitably have a diminished influence on decisionmaking. Even if the study is subject to administrative approval, it is analogous to the sort of post hoc rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA." *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 307. "[R]eliance on tentative plans for future mitigation after completion of the CEQA process significantly undermines CEQA's goals of full disclosure and informed decisionmaking; and[,] consequently, these mitigation plans have been overturned on judicial review as constituting improper deferral of environmental assessment." *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 92. Moreover, by deferring the development of specific mitigation measures, UCSF is effectively precluding public input into the development of those measures. CEQA prohibits this approach.

Here, The DEIR is rife with impermissible deferred mitigation for several of the Project's environmental impacts.

1. The EIR defers mitigation of the Project's wind impacts.

The DEIR admits the Project's wind impacts will be significant and unavoidable with mitigation. DEIR, p. 4.1-46. However, the DEIR defers the formation of actual mitigation measures to lessen the Project's wind impacts to an undetermined future time. *See id*. at 4.1-47. Specifically, mitigation measure AES-4 requires UCSF to engage a qualified wind consultant to conduct wind tunnel testing of the proposed buildings with facades 80 feet high or over to determine whether the buildings would result in exceedances of San Francisco's 26-mph pedestrian wind hazard criterion. *Id*. If the consultant does find an exceedance, UCSF shall work with the consultant to identify feasible mitigation strategies such as design changes. *Id*. UCSF's delay in mitigating the Project's potential wind impacts undermines CEQA's goals of full disclosure and informed decisionmaking. Moreover, UCSF is preventing the public from providing input on the development of these measures and leaving them up to the sole discretion of UCSF and the wind consultant it hires, violating CEQA.

2. The EIR defers mitigation of the Project's impacts on cultural resources.

The DEIR also admits that the Project as proposed would result in a significance and unavoidable adverse change in the significance of known historical resources, in particular the UC Hall which includes the Bernard Zakheim murals. DEIR, p. 4.4-12. During the 1930s, Zakheim, a student of Diego Rivera, was one of the leading artists in the area who were creating major public art under the auspices of the New Deal art

programs. *See* Exhibit C. The ten murals that make up Zakheim's *History of Medicine* (1936-39) constitute one of this region's largest New Deal art projects by a single artist. *See id*. Despite housing such important artwork, the Project proposes to demolish UC Hall. DEIR, p. 4.4-12.

The DEIR contains several mitigation measures for the project's impacts to cultural resources, but all of them are improperly deferred to an uncertain time. For example, mitigation measure CUL-1a requires, at some point prior to any demolition work or significant alterations initiated at the known historical resources, "UCSF shall ensure that a qualified architectural historian who meets the Secretary of the Interior's Professional Qualification Standards identifies character-defining features of each historical resource." *Id*. at 4.4-19. The DEIR provides no justification for delaying this mitigation measure until after the EIR has been certified. The identification of character-defining features for historical resources on the Project site can and must be done prior to the approval of the Project so decision-makers and the public have sufficient information to determine the Project's impacts on cultural resources.

Mitigation measure CUL-1b also improperly defers mitigation by requiring a qualified architectural historian to thoroughly document each building and associated landscaping setting, which will include photography and a written documentary record of the buildings, at some point "[p]rior to any demolition work or significant alterations initiated at the known historical resources." *Id*. This measure suffers the same fatal flaws as CUL-1a – the DEIR does not provide any justification why this measure must be performed at some uncertain time, and should in fact be performed prior to the approval of the Project.

Mitigation measure CUL-1c requires UCSF to determine whether any character defining features of an individual historic resource may be salvaged "[p]rior to the demolition or significant alteration activities." *Id*. at 4.4-20. If features can be salvaged, "a Salvage Plan shall be prepared by a qualified architectural historian or historic architect." *Id*. The identification of historic resources on the Project site that can be salvaged must be done prior to the preparation of an EIR. The DEIR's conclusion that the Project will have significant and unavoidable impacts on cultural resources cannot be supported without such an analysis. Further, by deferring this analysis and the preparation of Salvage Plans for such resources, UCSF is undermining the full disclosure of the Project's impacts to decision-makers and the public, and preventing them from commenting on or analyzing the substantive mitigation measures for such impacts.

Lastly, mitigation measure CUL-1d requires UCSF Planning staff to work with a conservator to develop and implement a digital imaging and virtual preservation proposal for the Zakheim murals at some point "[p]rior to the commencement of demolition activities at UC Hall." *Id*. Not only does this measure suffer the same deferred mitigation flaws as identified for the other measures above, but it is attempting

to stand in place of feasible mitigation that would in fact preserve the murals. The DEIR states that the cost to physically preserve the murals by removing and relocating them, $7.6 million, "is prohibitive in light of UCSF's primary responsibility to support its academic health care mission." *Id*. at 4.4-15. UCSF instead is threatening to destroy the murals unless another third party, including Zakheim's family, will pay to preserve the murals. *Id*. $7.6 million is a drop in the bucket for the cost of the Project and the many measures UCSF proposes to implement for the Project that have nothing to do with its "primary responsibility to support its academic health care mission." UCSF has failed to otherwise explain why preserving the murals is not feasible.

3. The EIR defers mitigation of the Project's hazards and hazardous materials impacts.

The DEIR states that the Project may have impacts due to naturally occurring asbestos but any impact will be mitigated to less than significant due to the implementation of mitigation measure HAZ-1. DEIR, p. 4.8-16. However, HAZ-1 requires an Excavation Management Plan to be prepared at a later time. *See id*. at 4.8-18. This Excavation Management Plan is to be prepared to determine the absence or presence of naturally occurring asbestos in materials to be excavated yet the DEIR fails to provide a justification or explanation for why this Excavation Management Plan has not already been conducted in order to inform the decision-makers and the public reviewing the DEIR. UCSF should prepare the Excavation Management Plan prior to the approval of the Project so that the Project's potential hazardous impacts are known and fully analyzed in the DEIR, and so decision-makers and the public can propose mitigation measures and comment on the analysis.

The DEIR also proposes mitigation measure HAZ-4, which requires an environmental consulting firm to prepare a Soil Management Plan to include measures to address protocols for identifying, handling, and characterizing suspect contaminated soils at some point "[p]rior to development of the [Project]." *Id*. at 4.8-23. Again, this mitigation measure is improperly deferred and UCSF fails to provide an explanation why this Soil Management Plan could not be prepared prior to the DEIR. By deferring the development of this plan, UCSF is precluding the decision-makers and the public from reviewing the plan and commenting on its adequacy.

4. The EIR defers mitigation of the Project's noise impacts.

The DEIR includes mitigation measures NOI-1a, NOI-1b, and NOI-1c to reduce the Project's construction noise impacts. DEIR, p. 4.11-18. However, NOI-1a and NOI-1b are improperly deferred. For example, NOI-1a requires UCSF contractors to employ site-specific noise attenuation measures during construction of the Project, which will be included in a Noise Control Plan "that shall be submitted for review and approval by UCSF to ensure that construction noise is consistent with the standards set forth in the City's Noise Ordinance." *Id*. The DIER goes on to list several noise control strategies

that must be included in the Noise Control Plan. *Id*. UCSF again improperly excludes decision-makers and the public from participating in the review of this plan, and fails to explain why this plan could not be prepared prior to the DEIR. In deferring the formation of the mitigation measure to an unknown future time, UCSF cannot conclude that NOI-1a will in fact mitigate construction noise.

Further, NOI-1b suffers from similar flaws in that measures to minimize potential impacts of construction noise occurring outside the established work hour limits will be determined at a later time. *See id*. at 4.11-19. Additionally, NOI-1b lists several mitigation measures that *may be* included to reduce these impacts, but fails to include any concrete measures to show this impact will be mitigated. *Id*.

The DEIR also concludes that the Project's operational noise impacts will be less than significant with mitigation. *Id*. at 4.11-26. However, NOI-2 also improperly defers mitigation. For example, an acoustical consultant will be retained to review mechanical noise to determine specific noise reduction measures to reduce noise to comply with the City's Police Code. *Id*. at 4.11-28. NOI-2 also contains a list of possible noise reduction measures but fails to make them requirements. *Id*. Again, the deferment of the analysis of the operational noise and selection of mitigation measures prevents the disclosure of the Project's impacts and potential mitigation measures to decision-makers and the public. Without concrete and required mitigation, this measure cannot be relied upon to conclude that the Project will have less than significant operational noise impacts.

Lastly, the DEIR concludes that the Project's groundborne vibration and noise levels due to construction activities will be less than significant with mitigation. DEIR, p. 4.11-30. However, measure NOI-3b improperly defers this mitigation. NOI-3b requires UCSF to evaluate the presence of vibration-sensitive equipment within 150 feet of construction and demolition areas, and any sensitive equipment shall be evaluated for the existing extent of vibration isolation and relocated or further embellish isolation, as it is warranted. *Id*. The Project already lays out where construction will take place, even on future projects within the CPHP, so there is no reason why the evaluation of vibration-sensitive equipment is deferred to an unknown future time. Again, UCSF is preventing decision-makers and the public the opportunity to evaluate the Project's impacts and commenting on the proposed mitigation measures. Without this analysis and the deferred mitigation, this measure cannot be relied upon to conclude the Project will have less than significant groundborne vibration and noise levels.

5. The EIR defers mitigation of the Project's travel condition impacts.

The DEIR states that the Project's construction activities will have a less than significant impact with mitigation on the travel conditions along sidewalks and roadways serving the Project site. DEIR, p. 4.15-49. The DEIR relies on mitigation measure TRANS-5 to reduce this to a less than significant impact. *Id*. TRANS-5 requires construction contractors to prepare a traffic control plan for major phases of the

Project's construction, as well as meet with City agencies to coordinate feasible measures to reduce traffic congestion. *Id*. at 4.15-49. UCSF fails to provide an explanation for why the traffic control plan could not be prepared prior to the DEIR and why decision-makers and the public are excluded from reviewing and commenting on the mitigation measures that will be selected for the traffic control plan. By deferring this mitigation and excluding decision-makers and the public from reviewing and commenting on such measures, UCSF cannot rely on TRANS-5 to conclude the Project will have less than significant impact on the travel conditions along sidewalks and roadways serving the Project site during construction.

F. The EIR Impermissibly Relies on CEQA Section 21099.

The DEIR states that under CEQA section 21099, aesthetics and parking impacts do not need to be considered because this is an "employment center project" on an "infill site." DEIR, p. 4.0-3. The DEIR's conclusions are erroneous, and a revised EIR is required to analyze aesthetic and parking impacts. PRC 21099(d)(1) defines "employment center project" as follows:

> (a) For purposes of this section, the following terms mean the following:
> 1. 'Employment center project' means a project located on property **zoned for commercial uses** with a floor area ratio of no less than 0.75 and that is located within a transit priority area.

The Project area is not zoned for commercial uses. The DEIR at 4.10-7 states that the "campus site is primarily located in the City's P (Public) Zoning District…. Housing located along Third and Fifth Avenues is designated by the City as Residential House District, Two-Family (RH-2)." Since the Project site is not zoned commercial, 21099 does not apply at all.

Furthermore, 21099(e) states, "This section does not affect the authority of a public agency to establish or adopt thresholds of significance that are more protective of the environment." San Francisco has adopted thresholds that are more protective of the environment. The voters adopted Measure M, adding Planning Code section 101.1, which protects public open space vistas. General Plan Urban Design Element Policy 1.1 protects public views of open space and water. Since the City and voters of San Francisco have adopted more protective thresholds, those thresholds apply and must be considered.

The DEIR is therefore misleading as an informational document since it falsely states that 21099 applies to the Project and that aesthetic and parking impacts need not be considered. A revised draft EIR is required to correct this misinformation and to fully analyze and mitigate the Project's significant aesthetic and parking impacts.

G. The EIR Fails to Adequately Analyze the Project's Aesthetic Impacts.

If a project has any substantial negative effect on views and other features of beauty, it may have a significant environmental impact under CEQA. *See Ocean View Estates Homeowners Association, Inc. v. Montecito Water District* (2004) 116 Cal.App.4th 396, 401; *see also Quail Botanical Gardens Foundation, Inc. v. City of Encinitas* (1994) 29 Cal.App.4th 1597, 1604. If a project has a substantial adverse effect on a scenic vista, will substantially damage scenic resources, including scenic highways, or substantially degrade the existing visual character or quality of the site and its surroundings, it may have a significant aesthetic impact. *See* CEQA Guidelines, Appendix G.

The DEIR states that the Project would have a less than significant impact on scenic vistas. DEIR, p. 4.1-27. However, land use planner and Principal of Ikeda Consulting Jared Ikeda reviewed the DEIR and the Project's visual impacts and concluded that the Project will result in a significant change to public views and will change the visible skyline. *See* Exhibit D.

Specifically, a "particularly significant local view point is the trail head near the intersection of Farnsworth Lane and Edgewood." *Id*. at 3. The addition of a 294 foot high hospital will be seen from this vantage point and blocks views to the west, which "is a significant change to the public view and the inherent quality of the trail head and experience of accessing and walking this trail." *Id*. at 4. While the existing trees in this area and along the trail leading down screen and filter the vistas, the new hospital will entirely block scenic vistas and dominate the view. *Id*. This is a significant impact that must be analyzed and mitigated in the DEIR.

Additionally, the neighborhoods to the east, and views from streets such as Edgewood and Belmont and Willard will also be visually impacted by the new hospital. *Id*. The hospital will also "block views to Mt Sutro and the forest reserve from areas north of Parnassus Ave and Irving Street, and the visual experience of seeing a natural setting of a forested hillside from the local sidewalks and streets will be changed to one of a large urban building." *Id*. Furthermore, the addition of the new hospital "will undoubtedly change the visible skyline." *Id*. at 5. This is a noticeable chance and should be addressed in the context of the San Francisco General Plan Urban Design Element. *Id*. at 5-6.

San Francisco's General Plan Urban Design Element first policy is to "recognize and protect major views in the city, with particular attention to those of open space and water." San Francisco General Plan, Urban Design Element, Policy 1.1. Specifically, "[p]rotection should be given to major views whenever it is feasible, with special attention to the characteristic views of open space and water that reflect the natural setting of the city and give a colorful and refreshing contrast to man's development." *Id*.

However, the DEIR ignores this policy and fails to acknowledge the proposed hospital's impact on views of the Pacific Ocean. *See* Exhibit D, pp. 4-5.

A revised and recirculated draft EIR is required to analyze and mitigate the Project's significant aesthetic impacts. Feasible mitigation would include reducing the height or moving the 297 foot proposed hospital since it is responsible for most of the Project's adverse aesthetic impacts.

H. The EIR Fails to Adequately Analyze the Project's Impacts on Shadows.

The DEIR states that implementation of the Project would not create new shadows in a manner that would substantially and adversely affect the use and enjoyment of publicly accessible open spaces. DEIR, p. 4.1-74. However, as Mr. Ikeda points out, shadows affect the direct exposure to sun radiation, which can affect the temperature of the surface that is struck by sunlight. Exhibit D, p. 6. The comfort and attractiveness of these areas to pedestrians may be adversely affected yet are not addressed in the EIR. *Id*. Further, the city's Urban Design Guidelines state that plazas or parks located in the shadows cast by large buildings are unpleasant for users and large buildings can be oriented to minimize shadows falling on public or semi-public open space. *See id*. The EIR should take this into account and mitigate the Project's shadows in such a way as to minimize them on public or semi-public open spaces. Also, the DEIR clearly shows that the massive new hospital will cast shadows deep into Golden Gate Park. *See* DEIR, pp. 4.1-62, 4.1-68). The shadow renderings show shadows extending far into Golden Gate Park, near the baseball diamonds known as "Big Rec." The DEIR dismisses this impact arguing that the impact is on baseball fields that are rarely used in the morning. But this area is used for many things other than baseball. It is heavily used for soccer, tai-chi, frisbee, running and other activities at all hours of the day and at all times of the year. The shadowed area includes hiking/jogging trails which are very popular for dog walking, running, hiking and other activities at all hours. This is one of the most heavily used areas of the popular park.

San Francisco's Shadow Policy states that a project over 40 feet in height has a significant impact if it will cause shadows on a property under the jurisdiction of San Francisco's Department of Recreation and Parks. San Francisco Planning Department Shadow Analysis Procedure, July 2014; San Francisco Planning Code section 295.

Since the DEIR's own analysis shows that the massive 300- foot hospital casts shadows deep into Golden Gate Park, this is a significant impact that must be analyzed and mitigated in a revised DEIR. An obvious mitigation that should be analyzed in the revised DEIR is to relocate the hospital or make it much shorter to reduce its shadow impacts.

I. The DEIR Fails to Adequately Analyze the Project's Impacts on Biological Resources and Fails to Mitigate Impacts of the Project on Numerous Sensitive Species.

Expert biologist Shawn Smallwood, Ph.D. has reviewed the DEIR's discussion of biological resources. *See* Exhibit E. Drawing on his familiarity with the project area and decades of studying and surveying many of the species encountered at the site, Dr. Smallwood has prepared a critique of the DEIR, pointing out numerous shortcomings in the baseline assessment of the presence of species at the site, failures to evaluate impacts that will result from the Project, and numerous instances where the DEIR's assertions are insufficient or not supported by substantial evidence.

1. The DEIR provides an inadequate baseline and fails to adequately analyze the Project's impacts on biological resources.

In visiting the Project site, Dr. Smallwood observed at least 23 species of vertebrate wildlife, including 5 special-status species. Exhibit E, p. 2. The Golden Gate Audubon Society ("GGAS") tallied 47 species of birds on Mount Sutro Open Space Reserve in 2020. *See id*. at 5. eBird records further indicate a long list of species use Mount Sutro Open Space Reserve, the Parnassus Campus, and Aldea Housing. *Id*. While these sources documented 40 special-status species of birds, the EIR only addresses 6 special-status species. *Id*. at 9. Of these 6 special-status species, the EIR dismisses the likelihood of occurrence of two of them, assigns low likelihood of occurrence to another three, and assigns only a moderate likelihood of another, despite all of these species being documented on the site or surrounding area. *Id*. Furthermore, in a report prepared for UCSF, GGAS reported sighting 7 special-status species of birds that are not addressed in the EIR. *Id*. at 9-10. The EIR's attempts to justify this by claiming the Project site and surrounding area lacks the habitats necessary to support special-status species. *See* DEIR, pp. 4.3-14-4.3-15. However, as Dr. Smallwood notes, the EIR describes artificially narrow habitat needs for these species. *See* Exhibit E, p. 10. By narrowing down the species the EIR states is found at the Project site, the EIR also narrows its analysis of the Project's impacts to biological resources. In failing to establish an adequate baseline of biological resources, the EIR fails to adequately analyze the Project's impacts to biological resources.

The EIR also states that 0.15 acres of the Mount Sutro Open Space Reserve would be removed to facilitate the tallest of the proposed buildings on the campus, but would redesignate 0.4 acres to Open Space Reserve from Support. DEIR, p. 3-39. However, this 0.4 acres is already forested and otherwise indistinguishable from the forested landscape of the surrounding areas of Mount Sutro Open Space Reserve. Exhibit E, p. 7. "From the perspective of wildlife, the swap in land designations results in a 0.15-acre habitat loss," which the EIR fails to analyze. *Id*. Although "[m]uch more substantial impacts than mere acreage loss would result from the heights, extent, and structural attributes of the proposed new buildings." *Id*. Erecting tall structures into the

aerohabitat of volant wildlife results in collision mortality and interference with wildlife movement, as further described below.

2. The DEIR fails to adequately address the Project's impacts on wildlife resulting from bird strikes.

Migratory or dispersing birds attempting to stop over at the habitat island that Mount Sutro represents in San Francisco, and most birds leaving Mount Sutro to continue their migration or dispersal, "would expend extra energy – energy needed for long-distance flights – negotiating their way around the [Project's] buildings, but some would collide with the buildings after becoming disoriented or misled by the buildings' nighttime lights and by transparent and reflective glass windows." Exhibit E, p. 8. The DEIR acknowledges that the Project could result in an increase in bird collisions with buildings on the campus site, but concludes that by implementing mitigation measures BIO-2a, Prevention of Harm to Migrating Birds during Construction, and BIO-2b, Bird-Safe Building Treatments, the potential impacts to birds will be less than significant. Specifically, "[i]mplementation of these measures would reduce the potential adverse effect on resident and migrating birds to a less than significant level by reducing injuries associated with night lighting during construction and operation of the new facilities, and requiring design features be incorporated into new structures that would make buildings more visible to birds." DEIR, p. 4.3-19. This discussion of the Project is not sufficient to describe the Project's impacts on birds colliding with the building's windows. By failing to adequately quantify the Project's impacts due to bird collisions, the DEIR misrepresents the Project's potential impacts and fails to give any sense of the magnitude of this potential impact.

Full disclosure of the potential impact on wildlife of window collisions is especially important because "[w]indow collisions are often characterized as either the second or third largest source of human-caused bird mortality." Exhibit E, p. 17. Dr. Smallwood reviewed the DEIR, and even though it lacking details about the design of the proposed buildings, including the amount of glass, types of glass, and structural contexts of glass, predicted the Project will result in 6,176 bird deaths per year as a result of bird collisions. *Id*. at 16. The vast majority of these deaths are protected under Fish and Game Code section 3513. *Id*. If the Project moves forward as proposed, the Project will cause significant impacts on birds as a result of window collisions, despite the proposed mitigation measures. *Id*.

3. The DEIR fails to adequately analyze the Project's impacts on wildlife movement.

The DEIR asserts that since the Mount Sutro Open Space Reserve "does not provide contiguous habitat for any terrestrial species," the Project's "activities would have overall minimal impact on the Reserve's function as a migratory stopover," and implementation of several mitigation measures designed to address window collisions

would result in a less than significant impact on wildlife movement. DEIR, p. 4.3-19. However, the primary phrase of the CEQA wildlife corridor standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. Exhibit E, p. 17. Sites such as the Project site "is critically important for wildlife movement because it composes a diminishing patch of natural cover within an expanse of anthropogenic land uses, forcing more volant wildlife to use the site as a stopover and staging habitat during migration, dispersal, and home range patrol." *Id*.

Further, even if mitigation measures do succeed in lessening bird-window collision mortality, "it will have no effect on the project's impacts to movement of wildlife that survive their encounters with the buildings." *Id*. Beyond window collisions, the Project's tall buildings would pose an additional barrier. "Many birds and bats attempting to fly to or from Mount Sutro would have to detour around the buildings, risking predation by peregrine falcons which exploit these types of situations, and costing valuable energy needed for long-distance travel. Inserting multiple tall buildings into the aerohabitat of birds and bats would cause significant adverse impacts to those birds and bats." *Id*.UCSF must therefore go back and adequately analyze the Project's impacts on wildlife movement.

4. No meaningful discussion of the Project's cumulative effects on wildlife is included in the DEIR.

Recognizing that several projects may together have a considerable impact, CEQA requires an agency to consider the "cumulative impacts" of a project along with other projects in the area. Pub. Res. Code § 21083(b); CEQA Guidelines § 15355(b). If a project may have cumulative impacts, the agency must prepare an EIR, since "a project may have a significant effect on the environment if '[t]he possible side effects of a project are individually limited but cumulatively considerable.'" *CBE*, 103, Cal.App.4th at 98; *Kings County Farm Bur*., 221 Cal.App.3d at 721. It is vital that an agency assess "'the environmental damage [that] often occurs incrementally from a variety of small sources . . . .'" *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1214 ("*Bakersfield Citizens*").

Rather than assess the cumulative wildlife impacts of the Project, the DEIR states that due to the urban setting, implementation of the Mount Sutro Open Space Vegetation Management Plan, and the 2014 LRDP EIR mitigation measures, the Project would have a less than significant cumulative impact on biological resources. *See* DEIR, pp. 4.3-23-4.3-24. As Dr. Smallwood points out, "[i]f cumulative effects were indeed merely residual impacts of inadequately mitigation, then CEQA would require an inadequate mitigation analysis instead of a cumulative impact analysis." Exhibit E, p. 18.

Redevelopment of existing structures in already developed areas does in fact pose potentially severe bird-window collision impacts despite the assertion that redeveloped areas have already removed all biological resources. *Id*. As Dr. Smallwood

points out, "[j]ust as the project proposes potentially severe bird-window collision impacts, so too do new buildings going up in place of older buildings. New buildings in San Francisco are glass-covered." *Id*. An adequate cumulative impacts analysis would therefore "include a tally of predicted or estimated fatality rates of birds colliding with glass facades of recently built, planned, and foreseeable buildings in San Francisco." *Id*. Due to the Project's impacts, and those of other buildings in San Francisco, a serious cumulative impacts analysis is warranted. Bird abundance across North America has declined 29% over the last 48 years, which will result in substantial ecological and economic consequences. *See id*. Since windows are recognized as one of the principal anthropogenic sources of bird mortality, their cumulative effects among San Francisco's new buildings must be analyzed and mitigated. As a result, the DEIR's discussion of cumulative wildlife impacts is entirely deficient.

5. The DEIR's proposed mitigation measures will not reduce impacts to biological resources to less-than-significant levels.

The EIR proposes to mitigate potentially significant impacts to birds and bats through mitigation measures BIO-1c and BIO-1d, in which a biologist will conduct pre-construction surveys for nesting birds within 250 feet of the construction area and for roosting bats within 50 feet of the construction area within 7 days prior to initiation of construction activities. *See* DEIR, pp. 4.3-15-4.3-16. However, Dr. Smallwood disagrees that these measures would reduce the Project's impacts to less than significant because preconstruction surveys are limited in their mitigation effect as they detect only small fractions of bird nests and roosting bats occurring on a project site. Exhibit E, p. 18.

"Preconstruction surveys alone fail to prevent the deaths of most of the animals at risk, nor do they do anything to prevent habitat destruction and lost reproductive capacity." *Id*. at 19. Instead, detection surveys should be performed, and early enough to not only inform preconstruction surveys but also the public and decision-makers about potential project impacts. *Id*. "Take avoidance surveys cannot lessen impacts to nesting birds and roosting bats without first informing the public and decision-makers of the magnitude of potential impacts, nor without informing survey personnel where to look." *Id*.

The EIR also proposes to mitigate the Project's potentially significant impacts to birds due to collisions with the Project's windows through mitigation measure BIO-2b. BIO-2b includes the following measures: (1) minimizing unnecessary light emissions from interior and exterior portions of buildings; (2) exploring and adopting window glazing options such as marked glass or UV-reflective glass; and (3) minimizing light and glare of facades through orientation of the building, choice of materials, and landscaping. *See* DEIR, p. 4.3-20. However, Dr. Smallwood does not believe this mitigation measure will reduce the Project's impacts to birds due to window collisions to less than significant. San Francisco's 2011 standards for bird-safe buildings included glass and façade treatments and lighting treatment measures that were often of

uncertain efficacy and much has been learned by research performed since 2011. Exhibit E, p. 19. As for the third of the proposed measures in the EIR, minimizing light and glare of facades through orientation of buildings, etc., the EIR fails to identify the materials to be used and is unclear about whether and how building orientation would be decided to minimize collision risk, nor does it indicate the structural materials to be used on any particular portions of buildings. *See id*. at 19-20. While the building orientations are already decided, the decision of materials to be used are deferred to an unspecified later date. *Id*. at 20. In order to inform this measure, behavioral ecologists need to survey the project area to adequately characterize flight patterns and reactions to existing buildings, and surveys are needed to learn how many of each bird species fly through the area and at what times of day and night. *Id*.

6. The DEIR fails to analyze all potential feasible mitigation measures to reduce the project's impacts to biological resources.

As Dr. Smallwood points out, the most effective measure to minimize collision fatalities is careful siting. *Id*., at 21.

> There are two types of siting: Macro and micro. Macro-siting refers to selection of a project site, whereas micro-siting refers to selection of locations for project components within the boundary of a project site. Both levels of siting can substantially mitigate impacts to wildlife, but macro-siting usually offers the greatest opportunity for minimizing impacts. Applying macro-siting to the proposed project would consider impacts to wildlife if the new square footage was located at the site of UCSF's Medical Center at Mount Zion, or in Bayview at the Hunters Point shipyard, as examples. Of course, macro-siting must also consider project objectives but can also consider collateral opportunities for students and host communities. Other factors considered, siting the project farther from Mount Sutro Open Space Reserve would vastly lessen impacts to birds.

Id. Micro-siting at the Project site to reduce the Project's impacts to birds would require reducing the size of the Project and minimizing the extent of windows on building facades, reducing building heights, and siting the taller buildings farther from the steep, forested slopes of Mount Sutro. *Id*. UCSF should investigate these siting measures and implement them if determined to be feasible.

J. Air Quality.

We submit herewith the expert comments of Dr. Paul Rosenfeld, Ph.D., and Matthew Hagemann, C.Hg., of the consulting firm, Soil Water Air Protection Enterprise (SWAPE). *See* Exhibit F. SWAPE demonstrates that the air quality analysis in the DEIR is patently inadequate. The SWAPE comments show that the air modelling supporting the DEIR was manually manipulated and altered in many respects to make

the modelling fundamentally inaccurate and misleading. This renders the DEIR inadequate as an informational document. A revised draft EIR is required to include accurate air modelling and analysis.

In this letter we highlight just some of the more egregious examples of "tinkering" that were performed on the air models in the DEIR.

- The energy-generating utilities for the Project were manually adjusted to show a CH4 (methane) and N2O (nitrous oxide) intensity factor of zero. Exhibit F, p. 2. Of course, this is impossible, and vastly understates the greenhouse gas (GHG) emissions of the Project.
- The DEIR's model fails to include all of the 25,000 to 45,000 square feet of construction offices, again understating Project emissions of many types, particularly volatile organic compounds (VOCs).
- The Aldea Housing Densification will include 184 parking spaces (DEIR, p. 3-28), yet the DEIR's air model assumes zero parking for these units. Exhibit F, p. 3.
- The Project involves demolition of 42 existing student housing structures in order to construct 184 new housing structures. But the DEIR calculated the demolished housing as "Research and Development," which overstates the baseline emissions. *Id*. at 4.
- The DEIR models all 3.9 million square feet of existing land use space as "hospital." However, much of that space is housing, lecture halls, commercial space, library, parking and other functions that generate lower levels of emissions. This results in an overstatement of baseline emissions. *Id*. at 5.
- The DEIR vastly undercounts the emissions from Phase I of the Project. The Initial Phase calculation assumes 412,000 square feet of only research and development and residential space. But Phase I will actually include 1.43 million square feet of new building development. Thus, the DEIR undercounts the Phase I land use space by over 1 million square feet, and fails to include any hospital or parking space and related emissions. *Id*. at 6.
- The DEIR makes massive manual manipulations to the CalEEMod default construction schedule - extending the construction schedule out dramatically. The longer construction schedule results in lower emission numbers since emissions are calculated on a maximum daily basis. For example, the architectural coating (painting) phase was increased by over 5100% from the default value of 10 days to 521 days. The building construction phase was increased by over 400% from 200 to 1043 days. The grading phase was increased by 3700% from the default value of 4 to 152 days. The site preparation phase was increased by 7500% from the default value of 2 to 152 days. *Id*. at 7. SWAPE lists many other manipulations that were made to the air model, all resulting in lower daily emission rates by spreading out construction emissions over a longer time period.
- The DEIR underestimated the total amount of demolition emission and hauling trips. *Id*. at 8.

- The DEIR calculated emission assuming the use of Tier 4 Final Construction equipment, which is the cleanest construction equipment currently available. However, the DEIR does not require Tier 4 Final Construction equipment. It only required Tier 4 Construction equipment. There are two types of Tier 4 construction equipment: Tier 4 Interim and Tier 4 Final. These are actually quite different. Tier 4 Final equipment is up to 80% cleaner than Tier 4 Interim equipment. Therefore, by assuming the use of Tier 4 Final equipment, when only Tier 4 Interim is required, the DEIR underestimates Project construction emissions by up to 5 times. *Id*. at 11. SWAPE points out the there is very little Tier 4 Final equipment available in the market, so assuming that a contractor will voluntarily use it when it is not required is unrealistic. *Id*. at 12.
- The DEIR air model was manually manipulated to reduce vehicle emissions, thereby underestimating emissions from cars and trucks. *Id*. at 13.
- The DEIR was manually manipulated to reduce emission from consumer products, such as hair sprays, deodorants, air fresheners and other products that may be used by future residents. *Id*. at 14.
- The DEIR reduced the "silt-loading factor" for road dust by more than half. The DEIR states that it is using a San Francisco-specific silt loading factor. However SWAPE determined that the EIR relied on a San Diego factor, not a San Francisco factor. *Id*. at 15.
- The DEIR underestimates operations vehicle emissions by manually adjusting the default vehicle trip rates. *Id*.
- The DEIR underestimates the Project energy use. Operational energy use values were manually reduced to ZERO kilowatt hours. The DEIR justifies this by citing to UCSF's zero net electricity goal for 2025. However, the zero electricity goal is simply a goal, it is not a requirement of commitment. 2025 is less than five years away. It is preposterous to assume that the Project will use zero electricity in just five years from now. *Id*. at 16.
- The DEIRs cancer risk assessment is inaccurate for several reasons: First, it assumes the use of Tier 4 Final construction equipment, which is not required; second, it fails to consider the cumulative impacts of the various construction projects; third, it fails to consider the health risk impacts from the entire operation, which includes 52,200 daily vehicle trips and related diesel particulate matter emissions and other pollutants.

K. Greenhouse Gas Impacts.

The Project will have significant greenhouse gas ("GHG") emissions of 61,815 metric tons of carbon dioxide equivalents per year (MT CO2/yr), which indicates a significant impact. DEIR, p. 4.7-36. To mitigate this impact, the DEIR proposes mitigation measure GHG-1c, requiring offsets for emissions above the existing inventory of 125,426 MT CO2/year. However, the Court of Appeal recently held that emission offsets alone cannot justify a finding of a less than significant impact. *Golden Door v. San Diego* (2018) 27 Cal.App.5th 892. The Golden Door court held that offset credits

may not adequately mitigate GHG emissions since they may be generated out of state or even out of country and may not represent real, verifiable and quantifiable emission reductions.

The DEIR also relies on alleged consistency with the 2017 California Air Resources Board ("CARB") Scoping Plan to determine GHG significance. However, SWAPE demonstrates that the Project does not demonstrate compliance with the 2017 Scoping Plan and appears to violate numerous provisions of the Plan. Exhibit F, pp. 21-25.

The DEIR relies on the Project's alleged compliance with Plan Bay Area 2040. CEQA Guidelines section 15064.4(b)(3) and 15183(b) allow lead agencies to consider a project's consistency with regional plans for mitigation of GHG emissions. However, Plan Bay Area 2040 is not a GHG reduction plan or a Climate Action Plan at all. It includes none of the required elements of such as plan as set forth in 15183.5(b)(1). *Id*. at 26.

L. Energy Impacts.

Lead agencies are required to analyze a project's energy impacts, and relying on existing energy-reduction requirements in buildings codes, and on the beneficial side effects of reducing greenhouse gases, to demonstrate a project's energy impacts will not be significant is not sufficient under CEQA. In *Spring Valley Lake Association v. City of Victorville* (2016) 248 Cal.App.4th 91, 103, the court determined that an EIR could not demonstrate greenhouse gas reductions from increasing Title 24 energy efficiency by 15 perfect if it could not show that the project "will, in fact, exceed Title 24 standards by 15 percent." While this case involves claimed greenhouse gas reductions, the result is applicable to the type of analysis required for energy reductions.

Here, the DEIR concludes that the Project will have less than significant energy impacts. DEIR, pp. 4.5-19, 4.5-28. This conclusion is in part based on the Project's compliance with UC's Sustainable Practices Policy provisions "that are designed to conserve and reduce energy consumption." *Id*. at 4.5-28. The DEIR states that all individual projects under the proposed CPHP would be required to comply with the UC Policy on Sustainable Practices, which requires new construction of facilities to meet a minimum standard of LEED-NC Silver and strive for LEED-NC Gold when possible and requires 20 percent better energy performance than Title 24. *See id*. However, the UC Policy on Sustainable Practices establishes goals, not requirements. *See* University of California - Policy on Sustainable Practices, p. 2. By solely relying on these goals, the DEIR's explanation fails to demonstrate how an increase in Title 24 efficiency and implementation of LEED-NC Silver or Gold will in fact reduce the Project's energy impacts. The DEIR also fails to calculate the reductions such measures would provide and whether they are sufficient to conclude the Project will in fact have a less than significant energy impact. Failure to provide such information renders the DEIR's

energy impacts analysis legally inadequate because it is not based on substantial evidence.

M. The EIR Fails to Adequately Analyze the Project's Land Use Impacts.

The DEIR concludes that the Project will result in a less than significant impact to Land Use and Planning. DEIR, pp. 4.10-9, 4.10-15. However, this ignores the fact that the Project is flatly inconsistent with a vast array of land use and general plan policies - most obviously the Project vastly exceeds applicable height limits. The DEIR justifies ignoring these policies by arguing that the University is not required to comply with local land use and zoning. Even if this were true, this does not mean that there is no impact resulting from the plan inconsistencies. CEQA is concerned with environmental impacts, not with legal requirements. The environmental impacts exist regardless of whether the University is bound to comply with the land use requirements at issue.

Also, in a 1987 Memorandum of Understanding ("MOU"), UCSF agreed to advise and consult with the City of San Francisco on any proposed construction projects. *See* Exhibit G. The MOU states that the City Planning Commission will advise UCSF about the "conformance of such development with the Master Plan of San Francisco and Planning Code Section 304.5 (Institutional Master Plans) with recommendations, of any, for amendment to the proposal… Should the City Planning commission and UCSF disagree on any matter which is the subject of this MOU, either party may request the participation of the Mayor and the Chancellor in attempting to resolve the dispute." *Id*. ¶ IV. Thus, UCSF has agreed to attempt to resolve any inconsistencies with the City's land use and zoning requirements. Also, UCSF has indicated that it intends to adhere to local policies and regulations to the extent practicable and to review policies germane to the analysis of land use impacts. DEIR, p. 4.10-6.

Where a local or regional policy of general applicability is adopted in order to avoid or mitigate environmental effects, a conflict with that policy in itself indicates a potentially significant impact on the environment. *Pocket Protectors v. Sacramento* (2005) 124 Cal.App.4th 903; *Georgetown Preservation Society v. County of El Dorado* (2018) 30 Cal.App.5th 358.

The San Francisco General Plan provides policies and objectives to guide land use decisions and, along with the San Francisco Planning Code, prescribes the permitted uses and development standards to carry out the City's policies for the 107-acre Parnassus Campus site. The DEIR must therefore include a complete and forthright analysis of the Project's consistency with the General Plan and other applicable planning documents, ordinances and regulations so that UCSF can honor its intent to adhere to the extent practicable, the City's policies and "zoning codes related to building use, height, and bulk limitations; floor areas; and parking requirements or restrictions for the purpose of ensuring compatibility with the surrounding uses." DEIR, p. 4.10-6.

Compliance with the City's adopted policies and regulations are a key indicator of whether the Project is or is not compatible with the surrounding neighborhood. Here, after discussing only some of the applicable plans, the DEIR incorrectly concludes that the Project would be compatible with the adjacent land uses and impacts would be insignificant. Urban Planner Terrell Watt lists numerous inconsistencies with the General Plan and Planning Code. *See* Exhibit B, pp. 15-21.

GENERAL PLAN/ZONGING PROVISION	INCONSISTENCY
Land Use and Urban Design Elements LU-2: Plan for growth and renovations that are substantially consistent with use limitations and bulk limitations in City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects…UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns. LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density and do not negatively affect surrounding land uses. LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights campus site. Policy 3.5: Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development. Policy 3.6: Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction. San Francisco Planning Code – Use Districts City's P (Public) Zoning District Housing along Third and Fifth Avenues – see also Residential House District, Two-Family (RH-2) Code sections Height and Bulk Districts: 25-X, 40-X, 65-D, 80-D, 130-D and 220-F. Floor areas rations are determined by allowable height and coverage.	The DEIR correctly concludes that the New Hospital, as well as Millberry Union, certain West Side development and the Aldea Housing densification project would not be consistent with City Planning Code height and/or bulk regulations for their respective building sites. DEIR at 4.10-16. The DEIR continues on to incorrectly conclude despite evidence to the contrary, that these conflicts would not result in significant incompatibility with adjacent land uses or impacts on surrounding uses. Taking just the New Hospital as an example, at about 955,000 gross square feet and up to 294 feet in height, the New Hospital clearly demonstrates the Project's incompatibility with the surrounding area resulting in significant adverse environmental impacts including but not limited to, wind, visual and environmental impacts associated with an inadequate supply of housing affordable to new students, faculty and staff. The New Hospital is patently inconsistent with SF Land Use and Design policies and height and bulk requirements in multiple ways. First, the New Hospital is within three height and bulk districts and exceeds height limits for portions of the site within two of these, the 65-D and 22-F Height and Bulk districts, by over 70 feet and X stories. Second, the New Hospital would require use of a portion of the Reserve and would be located even closer to the off-site residences on Edgewood. The DEIR concedes: Impact AES-2 finds that the New Hospital would be the most noticeable visual change under the CPHP program, and would contrast sharply both in height and scale with the nearby residential development…". DEIR at 4.10-17. In justifying the conclusion that the New Hospital is compatible with adjacent land uses, the DEIR points to the proposed amendments to the 2014 LRDP which increase the space ceiling. In addition, the DEIR (Impact AES-3) finds that with implementation of appropriate design standards and exterior materials light and glare and other impacts would be reduced to less than significant. Even so, the DEIR concedes that the New Hospital will still result in significant unavoidable wind

	hazards. Analysis by Jared Ikeda provides clear evidence the New Hospital with also result in significant and unavoidable visual impacts. See Attachment 7. There are clear inconsistencies between the New Hospital and the City's General Plan policies and Code resulting in documented significant and unavoidable impacts associated with wind hazard, visual and housing, among other impacts. <u>These inconsistencies and the associated physical environmental impacts are not resolved by the amendment to the LRDP to raise the space ceiling</u>. Combined with other Project elements – Millberry Union, West Side – and the Project scale and bulk overall, the Project is clearly incompatible with the surrounding area resulting in significant and unavoidable impacts including those omitted from the DEIR but disclosed (wind) and some revealed by expert analysis (e.g., visual, cultural, housing). A revised and recirculated DEIR must re-analyze Project consistency with these and other applicable provisions of the City's Plans and Codes and Impact LU-2 must be found to be a significant and unavoidable impact. In addition, the Project is clearly inconsistent with CPHP Policy 3.6, which states that the height of buildings should be related to the prevailing scale and character of existing development. The New Hospital at nearly 100 feet taller than the tallest existing building on the campus, Moffit Hospital, is clearly inconsistent with this Policy. A revised DEIR must include in a revised Land Use and Planning section a systematic and thorough analysis of inconsistencies with all applicable (City, UC, other) policies and regulations.

Urban Design Element Policy 1.1: Recognize and protect major views in the city, with particular attention to those of open space and water. Policy 3.4: Promote building forms that will respect and improve the integrity of open spaces and other public areas.	The DEIR incorrectly concludes the project will not conflict with these policies and specifically that "[d]evelopment under the CPHP would not have a substantial adverse effect on a scenic vista" (AES-1) or "conflict with the applicable zoning and other regulations governing scenic quality" (AES-2) and therefore no mitigation is required. In his analysis of visual impacts, Jared Ikeda concludes that the New 16-story Hospital would result in significant visual impacts including specifically that it would block views to Mt Sutro and the Reserve and would block views of the ocean and Golden Gate Park from trails and other public vantage points resulting in policy inconsistencies with direct significant environmental impacts. See Attachment 7. A revised DEIR must change the disposition of these impacts (AES-1 and 2) to significant and unavoidable and identify feasible mitigation measures including alternatives to the Project.
Shadow Proposition M, adopted by the voters in 1986, added section 101.1 to the SF Planning Code and established 8 priority policies. Priority Policy No. 8 calls for the protection of parks and open space and their access to sunlight and vistas.	The DEIR incorrectly states that the implementation of the Project would not create new shadow that substantially and adversely affects the use and enjoyment of publicly accessible open spaces. In his analysis of aesthetic impacts, Jared Ikeda reviewed the DEIR's analysis with respect to shadows and reached a different conclusion documented in his letter: "It appears though that certain areas along Parnassus Avenue and Irving Street will be subject to frequent shadows throughout the year." See Attachment 7. These more frequent shadows will clearly affect the use and enjoyment of these public spaces and as such should be called out as a Significant and Unavoidable impacts of the Project as proposed. Feasible mitigation measures must be identified.

Regents' Resolution: Space Ceiling of 3.55 Million Gross Square Feet	The DEIR conveniently concludes that the impacts associated with the Project's significant increase in gross square feet (an increase of approximately 1.5 million GSF about the existing space ceiling) and population increase from 18,500 to nearly 25,000, would be less than significant because the LRDP would be amended to increase both space and population. An amendment to the space and population ceiling does not eliminate the physical environmental impacts described in the table above associated with the increased scale of the Project. Such impacts include wind hazard (found SU by the DEIR), cultural (found SU by the DEIR) and additionally, aesthetic (visual and shadows) and housing, among others. A revised DEIR must identify this as an inconsistency, re-analyze the associated environmental impacts and identify feasible mitigation including alternatives to Project components such as the New Hospital.

All of these inconsistencies are significant impacts under CEQA. A revised DEIR must include an expanded and forthright analysis of the Project's potential inconsistencies with applicable plans and policies, including the City's, and disclose the significant unavoidable environmental impacts associated with those inconsistencies. The revised DEIR must also include feasible mitigation measures and alternatives to reduce or eliminate these impacts. Alternatives should include alternative project proposals to conform to land use and zoning requirements to the maximum extent feasible, including height limitations.

N. Growth Inducing Impacts, Population and Housing Impacts.

CEQA requires the lead agency to determine whether the "environmental effects of a project will cause substantial adverse effects on human beings, either directly or indirectly," Pub. Res. Code § 21083(b)(3), (d)), and to "take immediate steps to identify any critical thresholds for the health and safety of the people of the state and take all coordinated actions necessary to prevent such thresholds being reached." *See* Pub. Res. Code § 21000 et seq. CEQA requires that an EIR include a detailed statement setting forth the growth-inducing impacts of a proposed project. *Id*. § 21100(b)(5). A proposed project is either directly or indirectly growth inducing if it: (1) **fosters economic or population growth or requires additional housing;** (2) removes obstacles to growth; (3) taxes community services or facilities to such an extent that new services or facilities would be necessary; or (4) encourages or facilitates other activities that cause significant environmental effects. CEQA Guidelines § 15126.2(d).

While growth inducing impacts of a project need not be labeled as adverse, the secondary impacts of growth (e.g., gentrification and displacement, demand for additional housing and services, traffic, air pollution, etc.) may be significant and adverse. In such cases, the secondary impacts of growth inducement must be disclosed as significant secondary or indirect impacts of the project. The analysis required is similar in many respects to the analysis required to analyze impacts associated with population and housing. CEQA Guidelines Appendix G, Section XII provides that a project will have significant impacts where it will:

> • **Induce substantial population growth or concentration of population in an area, either directly (for example, by proposing new housing or businesses), or indirectly (for example, through extension of roads or other infrastructure);**
> • Displace substantial numbers of existing housing necessitating the construction of replacement housing elsewhere; or
> • **Displace substantial numbers of people**, necessitating the construction of replacement housing elsewhere.

The City of San Francisco Department of Public Health has issued a policy paper concluding that a Housing Impact Assessment should be conducted under CEQA. San Francisco Dept. of Public Health, *The Case of Housing Impacts Assessment: The Human Health and Social Impacts of Inadequate Housing and Their Consideration in CEQA Policy and Practice* (PHES Technical Research Report) (May 2004), Exhibit H. The Housing Impact Report grounds its conclusion in CEQA's requirement that an agency must consider reasonably foreseeable "environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly." Pub. Res. Code § 210983(b)(3).

Urban Planner Terrell Watt explains that the DEIR contains a short, 3 and 1/2-page discussion of Growth Inducing Effects. Exhibit B, pp. 8-12. Ms. Watt concludes that the Project will generate demand for housing that will vastly outstrip the amount of housing that will be constructed as part of the Project. The DEIR's discussion acknowledges the Project will increase the campus population by approximately 4,100 persons by 2030 and an additional 1,080 persons by 2050, including students and faculty and staff. The DEIR also calculates the multiplier of 0.73 for an additional 3,420 jobs that could be indirectly caused or induced by the Project. The Project includes construction of 142 net new housing units/beds within the Aldea housing complex and an additional 620 new residential units for a net total of 984 new units by 2050.

The DEIR concedes "[c]ampus population growth under the proposed CPHP would not be entirely accommodated by the existing and new housing on site, and therefore would result in indirect housing demand beyond the campus site." DEIR, p. 5-5. The discussion provides little real analysis of the Project's potential to induce

growth in accordance with CEQA, nor does the discussion reach any conclusions as to the significance of growth inducing impacts instead relying on the assertion that the growth allowed by the Project is not substantial when "compared to the study area growth projections and to the extent that demand for new housing would exceed the capacity of the market area." DEIR, p. 4.12-10. Yet, the discussion does not identify any potentially significant impacts associated with population growth as a result of the elimination of the existing space ceiling and implementation of the Plan.

The DEIR goes on to state:

> "Generally, the housing demand associated with employment growth under the proposed CPHP would be satisfied by the housing that could be added in San Francisco and in other parts of the region." DEIR at 4.12-8.

Ms. Watt points out that the San Francisco and the region has been grossly underbuilding planned housing while generating significant new jobs; facts not disclosed by the DEIR. There is no information in the DEIR about the current housing crisis in San Francisco and region as summarized below. Nor does the DEIR contain any information about housing availability in the surrounding neighborhood and City, or information about housing affordability. Moreover, the DEIR fails to describe the breakdown of new students, faculty and staff in terms of numbers by typical jobs and salaries; information critical to estimating the percent of new staff, faculty and students who qualify as low income or very low income requiring lower cost housing options. Finally, the DEIR fails to acknowledge that UCSF is a major contributor to the affordable housing crisis, and will exacerbate that crisis by building out its expansion plan without building additional units affordable to new students, faculty, staff and employees of supporting services. *See* Jobs Housing Nexus Analysis SF, Kaiser Marston Associates, 2018.

Instead of the required analysis, the DEIR points to the Population and Housing Section conclusion to support its cursory overview of growth inducement impacts:

> "Implementation of the proposed CPHP would induce population growth in the Bay Area, but the population growth would **not be** substantial in comparison to growth that is projected and planned for San Francisco and the four study area counties in Plan Bay Area 2040 and the local general plans for the study area communities. Further, the population growth would not result in a demand for new housing that would exceed the capacity of the five-county market area." DEIR, p. 4.12-9. Emphasis added.

By comparing the Project's growth to the entire City and region, the DEIR seeks to diminish the significance of housing demand generated by the Project. CEQA prohibits this type of "drop in the bucket" analysis. No single project would ever have a significant impact if its effects were compared to an entire region. In *Friends of Oroville*

v. City of Oroville, 219 Cal. App. 4th 832 (2013), the Court of Appeal held that the agency failed to adequately analyze a project's cumulative contribution to significant GHG impacts by concluding, without adequate analysis, that the project's "miniscule" emissions were insignificant in light of the state's cumulative, state-wide GHG emissions, thus "applying a meaningless, relative number to determine insignificant impact." 219 Cal. App. 4th at 841-842. The Regents make the same error here by comparing the Project's impacts on housing to the entire Bay Area. In fact, given that the entire Bay Area is facing an extreme housing shortage, the cumulative impacts of this Project are worse, not better.

There is no question the Project will generate substantial additional growth in a highly constrained neighborhood, by increasing the daily average population by approximately 45%, nearly 5,200 students, faculty and staff. DEIR, p. 4.12-1. In addition, the Project generates an additional 3,420 jobs based on a multiplier of 0.73%; jobs that will put additional demand on a tight housing market. No information is provided about the nature of these jobs or the associated salary ranges of employees. The Project will also increase likely increase the demand for housing in the immediately surrounding neighborhoods and City as people avoid transit in a COVID worried world and seek to walk and or bike to work.

According to Urban Planner Ms. Watt, the Project most certainly will induce growth that will in turn significantly impact housing. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, assuming all new students need housing and only 50% of faculty and staff need housing, at 4,000+ units, would still constitute a significant impact on a highly constrained housing market and could result in displacing local residents due to competition and gentrification. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis because under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing. Salaries disclosed for the Mission Bay Project for UCSF's workforce, suggest the majority of new students, staff and faculty will need housing affordable to low incomes. See www.payscale.com/research/USEmployer=UCSFMedicalCenter.

Housing Demand Range			
Direct/Multiplier Growth at 2040 DEIR page 4.12-7	Students 504	Faculty and Staff 4,680	Multiplier/Indirect Employees: 3,420
Housing Demand Estimates	High Demand (worst case scenario 100 require housing): 504 units Low Demand (50% not housed, new demand) 252 units	High Demand: (worst case scenario 80% not housed, net new): 3,744 units Low Demand (50% not housed, new demand) 2,340 units	High Demand: 50% not housed, new demand): 1,760 units

These housing-related impacts are more than glossed over by a discussion that excludes any information about the dire housing crisis.

Substantial new non-residential and residential growth in San Francisco includes total population growth based on household size assumptions, in addition to new students, staff and faculty estimated in the DEIR to be as high as 12,220 people by 2050. DEIR, p. 4.12-8. This estimate does not include indirect growth associated with the multiplier, but does assume all new growth is in San Francisco. This significant new growth will require additional public services, likely including expansion and therefore construction of facilities in the neighborhood or adjacent neighborhoods of a myriad of services. Yet the DEIR provides cursory information about these services and facilities and fails to analyze the associated impacts, including fiscal impacts. CEQA requires that if new construction of housing will occur to accommodate the Project's employees or services beyond that included in the Project, then the EIR must analyze the environmental impacts of that construction. The appropriate components for an adequate analysis include: (1) estimating the amount, location and time frame for growth that may result from the implementation of the Project (e.g., additional housing); (2) considering whether the new population would place additional demands on public services such as fire, police, recreation, emergency, health, childcare or schools; (3) applying impact assessment methodology to determine the significance of secondary or indirect impacts as a result of growth inducement; and (4) identifying mitigation measures or alternatives to address significant secondary or indirect impacts. CEQA Guidelines Appx. G § XIII(a).

The DEIR must be revised to provide this analysis and based on this analysis, to revise other environmental analyses including but not limited to population and housing, transportation, air quality, among other topics where impacts are derived in part from direct and indirect growth assumptions.

The DEIR's dismissal of likely growth inducing impacts because the impacts are "impossible to determine" violates CEQA. Virtually the sum total of the discussion, below, lacks analysis and supporting facts and evidence while at the same time identifying the potential areas of significant impacts associated with significant growth:

> "While it is acknowledged above that the precise nature, location, and magnitude of effects of indirect and induced growth cannot be determined, the proposed CPHP would likely increase overall demand in the region for housing, commercial and industrial space, and associated infrastructure. Potential effects could include increased traffic congestion; increased air pollutant emissions; loss of agricultural land and open space; loss of habitat and associated flora and fauna; increased demand on public utilities and services, such as fire and police protection, water, recycled water, wastewater, solid waste, energy, and natural gas; and increased demand for housing. An increase in housing demand in the Bay Area region would also require governmental services including, but not limited to schools, libraries, and parks to serve new commercial and residential development." DEIR, p. 5-7.

The discussion also acknowledges that this growth could contribute to a loss of open space by converting those lands to housing, commercial space and infrastructure, but attempts to discount the many impacts associated with conversion of natural and working lands by pointing out without evidence that "most jurisdictions have adopted smart-growth policies that discourage or prohibit this type of development." DEIR, p. 5-7.

Given that human beings must live somewhere, the increased demand for housing created by the Project will result in either displacement of local residents, who will in turn be forced to move elsewhere where additional housing will be required, or construction of additional housing in San Francisco. In either case, this will have significant impacts that must be analyzed in a revised EIR.

Ms. Watt concludes, "Based on accurate information about the pre-Covid SF and Bay Area housing crisis (summarize above), it can reasonably be concluded that the addition of 5,200 students, faculty and staff by 2050 and only 984 units produced, the housing need generated constitutes a significant impact. Demand for housing is further exacerbated by the job multiplier of 0.73 creating an additional 3,420 jobs induced by the Project. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need

housing. Lower demand for new housing, based on more new staff and faculty already housed, at an estimated 4,000+ units, would still constitute a significant impact. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis. Under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing.

A revised growth inducing analysis must be included in a revised and recirculated DEIR. The analysis must analyze the Project's likely impacts on generating housing demand and causing displacement of existing residents. The EIR must analyze feasible mitigation measures, such as the construction of additional affordable housing units to meet the additional demand generated by the Project, or contribution to a fund to facilitate construction of such new housing. Such measures are clearly feasible and therefore must be required. Since these measures will have environmental impacts of their own, this requires a recirculated draft EIR. CEQA Guidelines § 15088.5; *Mountain Lion Coalition v. Fish and Game Com*. (1989) 214 Cal.App.3d 1043.

O. The EIR Fails to Adequately Analyze the Project's Impacts on Public Services.

The DEIR concludes that the Project will result in a less than significant impact on public services. DEIR, pp. 4.13-7, 4.13-19. The DEIR makes this conclusion despite the fact that the total population at the Parnassus Heights campus will increase by nearly 7,500 by 2050. *Id*. at 4.13-7. Additionally, the DEIR limits its public services analyses to impacts on fire protection facilities and public school facilities. The DEIR states that since the increase in population at the Project site will increase over time, the Project "would result in an incremental increase in demand for fire protection." *Id*. at 4.13-8. Additionally, the DEIR only analyzed the impacts to schools based on the number of children anticipated to live in campus housing, and not the impact to school from children of students or employees not living on campus. *Id*. at 4.13-10. These analyses fail to provide substantial evidence that these impacts would be less than significant because the analyses are limited in scope and fail to include evidence supporting the conclusions. Lastly, with regards to other public facilities, with the exception to police facilities, the DEIR merely states "campus development under the proposed CPHP would not affect any other public facilities . . . and therefore, will not be evaluated further in this section." *Id*. at 4.13-6. The DEIR provides no further explanation for this omission, and the justification provided fails to support the DEIR's conclusion that the Project will have less than significant impacts on public services.

P. The EIR Fails to Adequately Analyze the Project's Transportation Impacts.

The DEIR concludes that the Project will have a less than significant transportation impact because the Project would "be consistent with the transportation-related goals and policies set forth in the *UC Sustainable Practices Policy* and the 2014 LRDP," and "would not conflict with San Francisco's Transit First Policy, Better Streets Plan, or the San Francisco Bicycle Strategy." DEIR, p. 4.15-38, 4.15-40. However, this analysis ignores the practical implications of the Project on transportation impacts. The Project will increase the campus' daily population by 5,790 by the year 2030 and by 7,850 by the year 2050. *Id*. at 4.12-7. The DEIR also anticipates an increase in public transportation use and a decrease in personal vehicle travel to the Project site, and promotes the use of the N Judah by UCSF personnel and visitors yet fails to discuss the impacts this increase in daily population will have on public transit. The N Judah is the busiest line in the Muni Metro System and adding thousands of daily users will result in a significant impact. A revised EIR is required to analyze and mitigate this impact.

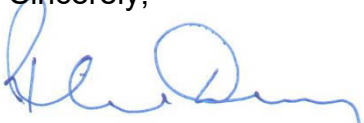
IV. UCSF SHOULD PREPARE AND RECIRCULATE A REVISED DEIR

A revised draft environmental impact report ("RDEIR") should be prepared and circulated for full public review to address the impacts identified above and to propose feasible mitigation measures. CEQA requires re-circulation of an EIR when significant new information is added to the EIR following public review but before certification. Pub. Res. Code § 21092.1. The CEQA Guidelines clarify that new information is significant if "the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project" including, for example, "a disclosure showing that . . . [a] new significant environmental impact would result from the project." CEQA Guidelines § 15088.5. The above significant environmental impacts have not been analyzed in the EIR and must be addressed in an RDEIR that is re-circulated for public review.

V. CONCLUSION

For the foregoing reasons, PNC believes that the Draft EIR for the UCSF Comprehensive Parnassus Heights Plan is wholly inadequate and urges the Regents to require a Revised Draft EIR to be prepared to address the concerns raised herein. Thank you for considering our comments and please include this letter in the record of proceedings for this project.

Sincerely,



Richard Drury
LOZEAU DRURY LLP

Exhibit A

APPENDIX F: 1976 REGENTS' RESOLUTION

"DESIGNATION OF OPEN SPACE RESERVE, ALTERATION OF CAMPUS BOUNDARIES, COMMITMENT OF HOUSES TO RESIDENTIAL USE, AUTHORIZATION TO NEGOTIATE SALE OF PROPERTIES AND COMMITMENT OF TRANSPORTATION STUDIES."

The following recommendations were approved by the Board of Regents on May 21, 1976:

1. That the reserve on Mount Sutro, which was designated as open space for a twenty-five year period by The Regents in October, 1975, be increased from fifty-two to approximately fifty-eight acres, and that the designation be made permanent.

2. That the boundaries of the San Francisco campus be altered to exclude properties on the west side of Third Avenue from 1309-11 Third Avenue to and including 1379 Third Avenue, and that the new boundaries be made permanent. The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent. These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the new campus boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton and Clarendon. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

3. That the Regents redefine their commitment, made as part of the October, 1975, approval of the Long Range Development Plan, to return certain existing houses to residential use as alternative campus space and funds for rehabilitation and relocation become available for the activities now housed therein, and that as part of this commitment: The ten houses on Third Avenue, outside the campus boundaries revised as recommended in 2. above, be sold subject to the provisions set forth in 4. below; the thirty-four houses on Third, Fifth, and Parnassus Avenues and on Irving and Kirkham Streets be rehabilitated as required and leased for residential purposes, with priority given to University students, faculty, and staff; and the seven houses on Fourth Avenue remaining after clearance of the site for the School of Dentistry Building project be retained for non-residential campus use.

4. That the Treasurer be authorized to negotiate the sale of the lots and structures, and other improvements thereon, located at 1309-11, 1319, 1325, 1337, 1343, 1355, 1361-63, 1367-69, 1373, and 1379 Third Avenue; the lot between 1355 and 1343 Third Avenue; and the lot between 1309-11 and 1319 Third Avenue, subject to the provisions listed in 4(a) through 4(e) below and that the results of said negotiations be presented to The Regents for final approval and authority to sell based on offers acceptable to The Regents:

    (a) The offer for sale of the two vacant lots shall commence within six months and the offer for sale of all remaining properties shall commence within thirty-six months, except that no relocation of University activities or tenants or conversion of houses for residential uses shall

be initiated until funds for such purpose are on hand as specified in 4(b) below and until space into which activities or tenants can be relocated is available;

(b) A special fund shall be established to fund projects within the Capital Improvement Program for the purpose of, first, providing accommodation for activities displaced by sale of houses, second, providing accommodation for campus activities displaced by conversion of the structures retained for residential use, and, third, converting and rehabilitating the structures retained for residential use, said fund to be funded from proceeds of the sale of the properties, except as noted in 4(c) below, and, if funds are not on hand from the sale of properties, from an advance, as needed, of not to exceed $50,000 from the University Opportunity Fund, such advance to be on a revolving basis and to be repaid with proceeds, as received, from subsequent sale of properties, it being understood that, at the completion of the sale of the properties, any part of the advance not repaid shall be converted to an appropriation;

(c) The portions of the proceeds of the sales of the lots between 1309-11 and 1319, and between 1343 and 1355 Third Avenue, attributable to the eighteen parking spaces currently located thereon, shall be deposited in the Net Revenue Account of the University of California Parking System;

(d) Funds not to exceed $10,000 shall be allocated by the President obtain an appraisal of market value of the properties for use as residences; and

(e) All properties shall be sold in the then existing condition, it being made clear to the buyer that he or she may be required to conform to all applicable State and City and County of San Francisco codes in converting the structures to residential use;

5. That funds not to exceed $25,000 be allocated to the San Francisco campus from the University Opportunity Fund for the purpose of retaining an independent consultant firm to develop additional plans for the alleviation of transportation problems such as traffic, parking congestion, and availability of public transit, it being the intent that such plans be implemented to the extend feasible within resources normally available to the campus for such purposes or within additional State appropriations that might be made available for such purposes;

6. That the Long Range Development Plan for the San Francisco campus, as approved by The Regents in October, 1975, be amended to reflect the described changes in designation of open space, boundaries, and use of housing;

7. That The Regents recognize the principle that the San Francisco campus will be administered so that the annual average of the daily campus population at the Parnassus site will remain substantially in accordance with the projections set forth in the Environmental Impact Report related to the Long Range Development Plan for the campus, approved by The Regents in October 1975.

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project").[1] My review focused on the DEIR's treatment of:

- Population and Housing
- Growth Inducement
- Land Use and Planning
- Alternatives

In preparing these comments, I have reviewed the following information:

1. Draft Environmental Impact Report for the Plan and Appendices
2. 2014 LARDP
3. CPHP
4. 1976 Regents' Resolution
5. January 16, 2020 Letter from Mayor London Breed to Chancellor Sam Hawgood citing the 2007 MOU and 1987 and 2007 MOU's

After carefully reviewing the DEIR for the Project I have concluded the DEIR fails in numerous respects to comply with CEQA and to fulfill CEQA's fundamental mandate. As described below, the DEIR violates this law because it fails to analyze adequately the significant environmental impacts of the Project or propose sufficient mitigation measures. Where, as here, the EIR fails

[1] See Attachment 1 for Watt Qualifications

to fully and accurately inform decision-makers and the public of the environmental consequences of proposed actions, it does not satisfy the basic goals of the statute. Because of the DEIR's numerous and serious inadequacies, the Lead Agency must revise and recirculate the document to permit an adequate understanding of the environmental issues and potential solutions, including feasible mitigation measures and alternatives.

I. Context and Introduction

A. UCSF Should Honor the Space Ceiling and Other Commitments

UCSF should honor its commitment to the space ceiling and to development compatible with surrounding uses at the Parnassus Heights campus by selecting an alternative within the existing space ceiling. The Parnassus Heights campus site, the oldest and largest of the UCSF campuses, is located in among some of the oldest neighborhoods in San Francisco, which are characterized by a mix of unique residential areas ranging from single family to multi-family housing and neighborhood serving commercial districts such as located along Irving and Judah Streets and 9th Avenue. In addition to Mount Sutro Open Space Reserve, several park and open space areas are located near the campus. This area surrounding the Parnassus Heights campus is further characterized by local serving streets plagued with traffic, parking congestion and lack of transit. Approximately 43% of the main campus (exclusive of the Aldea area) borders the Reserve, breaking the City's normal grid pattern and limiting ingress and egress routes to the main campus. The surrounding neighborhoods, like all of San Francisco, also suffer from a lack of affordable housing and available sites to build new housing. Recognizing the unique and constrained location the Parnassus Heights campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part:

> "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." See Attachment 2.

The Regent's Resolution recognized the transportation problems in the area and committed funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit. Concern for the impacts of the Project on the neighborhood is an ongoing concern. In a letter to Chancellor Hawgood, dated January 16, 2020, Mayor London Breed, President of the Board of Supervisors Norman Yee and Supervisor Dean Preston note the need for a revised MOU to adopt and formalize arrangements for coordination and consideration of both our interests and inputs in the context of land use approvals, transportation needs and ongoing service provisions, noting the common challenges faced include housing supply, affordability and climate and seismic related risks. See Attachment 3. According to a June 4th Staff Report to the Planning Commission, the Planning Department and UCSF are engaged in ongoing conversations about how to structure a stakeholder process to achieve the Mayor and Supervisor's objectives, expected to culminate in an MOU.

While not part of the objectives or regulations in the UCSF 2014 LRDP, reference is made in the DEIR to the Community Planning Principles including:

- Land Use LU1. Plan for growth and renovations that are substantially consistent with use limitations and height and bulk limitations in the City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects. The University should consider City planning proposals that are underway. UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns.
- LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density, and that do not negatively affect surrounding land uses.
- LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights Campus site.

DEIR at page 4.10-3 to 4.10-4.

Although the University is constitutionally exempt from local land use regulation whenever using properties under its control in furtherance of its "educational mission," the University has committed to substantial consistency with local policies where feasible. This dual commitment – to the space ceiling and to adherence where feasible to local policy – is one UCSF should and can honor given the very real constraints to development in the area surrounding the Parnassus Heights campus. There are feasible alternatives to the Project, including a new hospital at Mount Zion, Mission Bay or Hunters Point, that should be fully considered in a revised and recirculated DEIR before the decision is made to break the space ceiling commitment and significantly impacting the surrounding neighborhoods.

B. The DEIR Should be Revised and Recirculated to Address the Outbreak in December 2019 of COVID 19

The outbreak of COVID 19 was first reported on December 31, 2019 in Wuhan China. The Notice of Preparation (NOP) for the UCSF Parnassus Heights campus was issued January 14, 2020. As described at page 4.0-6 of the DEIR, "[n]ormally, the baseline condition is the physical condition that exists when the Notice of Preparation ("NOP") is published. The NOP for the proposed CPHP was published in January 2020, and the baseline conditions contained in this CPHP EIR are generally taken from this time period. However, the CEQA Guidelines and applicable case law recognize that the date for establishing an environmental baseline cannot always be rigid." DEIR at 4.6-6. UCSF is a health based organization, therefore fully aware early on of the implications of the Wuhan outbreak. The DEIR itself acknowledged the potential implications of COVID 19, concluding that:

> "The net effect of the pandemic on the Parnassus Heights campus site development and operations cannot be predicted at this point in time without speculation." DEIR at page 1-9.

The DEIR concedes COVID 19 has implications for the Project. For example, the objectives for the New Hospital, objectives used in part to dismiss some alternatives, include an increase in beds to provide for inpatient health care in times of severe strain such as the current pandemic. DEIR at page 6-4. The brief discussion at page 1-9 also acknowledges that UCSF will likely consider operational changes such as increases in telehealth services and telework, among others.

COVID 19 was known or should have been known at the time of the issuance of the NOP and certainly, as reflected in Section 1.7 of the DEIR, was known prior to circulation of the DEIR for public comment. COVID 19 warrants changes and updates to existing environmental setting information, critical to complete an accurate impact analysis, as well as to the Project Description (e.g., space needs changes given a likely transition as noted in the discussion to telework and telehealth). Significant questions are raised by COVID 19 that have implications to the Project and related impacts – including but not limited to an acknowledgement that UCSF is likely to increase telework, telehealth consultations and remote learning. These are but a few of the changes warranting UCSF to hit pause both to revise the DEIR and to re-engage the public and experts, right-size the Project and evaluate other alternatives that would reduce or eliminate impacts while adhering to the existing space ceiling.

II. The Project Violates the California Environmental Quality Act

A. The Project Description is In Flux

A fundamental requirement of CEQA is that an EIR contain an accurate, complete and stable project description. Without a complete and stable project description, an agency and the public cannot be assured that all the project's environmental impacts have been revealed and mitigated. Further, CEQA and the CEQA Guidelines mandate that an EIR include a description of the "physical environmental conditions . . . from both a local and a regional perspective. . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines Section 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR – and thus the decision-makers, agencies and public who rely on the EIR – cannot accurately assess the potentially significant impacts of the proposed Project.

As discussed above, the Project is likely changing in fundamental ways due to COVID 19 – including adjustments to the Project due to a likely increase in telework and telehealth, among other adjustments:

> "UCSF will likely consider operational changes such as increases in telework and telehealth services, especially primary and secondary health care services." DEIR at 1-9.

In addition to telehealth and telework, distance learning also appears likely on the increase. The overall space needs and allocations for the Project should be revisited in light of COVID 19 and other rapidly changing conditions due to COVID. The emerging stakeholder process referenced in the June 2020 Staff Memo to the San Francisco Planning Commission provides another good reason to pause the proposed Project entitlement process and discuss an appropriately scaled Project for the Parnassus campus site.

B. The DEIR Includes Incomplete and Inadequate Baseline Information to Support the Analysis of Project Impacts

The DEIR fails to adequately describe baseline (environmental setting) conditions. Setting or environmental baseline information is as essential to adequately disclosing and analyzing project-related and cumulative impacts as a complete and consistent Project description. Without adequate and complete information about the environmental setting, it is not possible to determine whether the Project improves or makes worse existing environmental conditions or the extent of the Project-related and cumulative impacts. The Project NOP was issued January 14, 2020 after the COVID 19 pandemic was a known crisis. As such, the DEIR's baseline or existing environmental setting information must be updated to reflect conditions Pre-COVID 19 and Post emergence of COVID 19. Another option is to postpone the Project until more is known about the COVID crisis. Both pre- and post- emergence of COVID 19 information is critical if adequate analyses are to be completed for topics ranging from land use, housing and population to transportation.

Examples of baseline setting information that is missing from the DEIR includes but is not limited to the following.

1. Students, Faculty and Staff

The DEIR omits information essential to analysis of whether the Project will result in significant impacts to housing supply as well as related impacts of displacement due to increased demand for housing and gentrification. Such information includes at a minimum the general salary ranges of new students, faculty and staff. Such information was provided in the Mission Bay Hospital environmental documents and fiscal impact analysis, hereby incorporated by reference. . In addition, the DEIR should provide information about the current student, staff and faculty to inform analysis of new housing demand (e.g., where do current staff, faculty and students live? Etc.).

2. Demographics in the Surrounding Neighborhood and City

Basic demographic information must be part of the DEIR's revised baseline in order to support and inform analysis of Project impacts on housing. The DEIR includes no information about the surrounding area demographics or demographics in the City and study area, making adequate analysis of impacts impossible.

3. Affordable, Student, Workforce and Family Friendly Housing

The Project will significantly increase students, staff and faculty at the campus adding to the demand for scarce housing affordable to new students, staff and faculty in the areas surrounding the Project, the City and the region. In addition the Project will nearly double projected new job growth due to the multiplier effect. The DEIR must analyze the potential for the Project to raise housing prices, contribute to gentrification and displacement due to price increases and competition for scarce housing in the surrounding area, San Francisco and the region. Very little setting information is provided to support analysis in the short, 13 page section on Population and Housing and the even shorter, 8-page discussion of growth inducement.

To perform an adequate analysis of Project and cumulative impacts to population and housing and growth inducement, it is essential the DEIR include in the description of the Project baseline (setting) details concerning existing vacancy rates for affordable units, including deed restricted housing, family housing, and housing affordable to the workforce[2] in the surrounding neighborhoods[3], the City as well as the broader five-county study area. Little setting information is provided in support of the DEIR's across the board conclusions that impacts associated with project growth will be less than significant. The DEIR contains no information concerning affordable housing and workforce housing whatsoever.

Without current and complete information about the existing housing stock in the surrounding neighborhoods, the City and the study area, the DEIR cannot adequately analyze the Project's impact on affordable, workforce and family friendly housing and households, and the DEIR's conclusions concerning the insignificance of Project-related and cumulative impacts cannot be supported by facts and evidence. The DEIR must be revised to include this and other baseline information, including changes in housing stock and availability pre- and post- emergence of COVID 19. While long term effects of COVID 19 maybe speculative, some effects are known and should be disclosed where possible.

In addition to the above information, the DEIR must discuss and include in its revised analysis, the locations of disadvantaged communities. Such information is essential to support analysis of the extent to which the Project could further impact these DACs and exacerbate existing housing inequity. Sources of this information are readily available. See e.g., Urban Displacement Project www.urbandisplacement.org/map/sf. Project such as this one have a high potential to contribute to the gentrification and displacement of disadvantaged communities

[2] Workforce housing is housing at the lower end of market rate serving households with up to 200% of median income and often referred to as the "missing middle" or gap in affordable housing in San Francisco. Voters recently approved funding to build more housing, including for the SF workforce.

[3] Increasingly with the COVID 19 threat, workers and students choosing to avoid transit are increasingly putting pressure on nearby housing. This warrants adjustment of the DEIR's analysis of housing impacts in the surrounding neighborhoods.

due to the influx of additional students, staff and faculty who most likely will be seeking housing within walking and biking distance to the campus in a post COVID world.

4. Existing Jobs-Housing Balance and Fit within the Surrounding Neighborhood, City and Regional Study Area

The DEIR must analyze the potential for the Project to make worse the existing imbalance of jobs and housing. Little information is provided in the DEIR on jobs housing imbalance pre- or post-emergence of COVID 19. The DEIR fails to cite readily available information for San Francisco and Region concerning the growing imbalance. Specifically, San Francisco or more accurately in the SF-Oakland-Hayward census area, created only one new home per 6.8 new jobs between 2010 and 2015. Source: US Census Data. Looking just at San Francisco, it comes out to 8.2 jobs per new home during that same period, further increasing an enormous gap in the already out of balance housing to jobs ratio in the Bay Area. Not surprising rents increased by 43% over the same period due to housing scarcity and competition from new employees. Source: U.S. Census Data 2010 and 2015. This data is readily available and must be included in a revised DEIR to support a credible analysis of the Project's impacts on housing and growth.

C. Finding the right jobs-housing balance has long been an important concern for urban planners and an important policy consideration for general and area plans. More recently, attention has turned to jobs-housing fit – the extent to which housing price and rent is well matched to local job salary and quality. The DEIR are silent on the matter of jobs housing fit and fails to adequately address the issue of jobs housing balance. The DEIR should be revised to describe the existing job-housing balance and fit for the surrounding neighborhoods, the City and region. Updated baseline (environmental setting) information must include a description of changes in demand for housing in San Francisco Pre- and Post-Emergence of COVID 19. This information is not only necessary to adequately analyze environmental topics such as displacement and Project demand for new housing, but it is also essential to determining the extent to which the Project will increase commuting, traffic, transit demand, and vehicle miles traveled. Without this information, the full impacts associated with air quality and greenhouse gas emissions, among other impacts cannot be adequately analyzed and conclusions concerning the significance of Project-relation and cumulative impacts cannot be supported by facts and evidence. The DEIR must be revised to include this and other baseline information to inform revised impact analyses and conclusions. The DEIR's Analysis of, and Mitigation for, the Impacts of the Project Are Inadequate

The discussion of a project's environmental impacts is at the core of an EIR. See CEQA Guidelines Section 15126(a). As explained below, the DEIR's analysis of the Project's environmental impacts are deficient under CEQA because the DEIR fails to provide the necessary facts and analysis to support informed decisions about the Project, mitigation

measures and alternatives. An EIR must contain facts and analysis, not just bare conclusions. A conclusion regarding the significance of an environmental impact that is not based on analysis of the relevant facts fails to fulfill CEQA's information mandate.

Additionally, an EIR must identify feasible mitigation measures to mitigate significant environmental impacts. CEQA Guidelines Section 15126.4. Under CEQA, "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects. . . ." Pub. Res. Code Section 21002.

As explained below, the DEIR fails to provide detailed, accurate information about the full breadth of the Project's potentially significant impacts with respect to growth inducement, population and housing and land use and planning. The DEIR's cumulative analysis of these impacts is also deficient. Where the DEIR fails to adequately analyze the Project-related impacts, the cumulative analysis cannot be adequate. Further, the DEIR does not identify and analyze feasible mitigation measures that would reduce or avoid such impacts.

1. The DEIR's Analysis of the Project's Growth-Inducing and Population and Housing Impacts is Flawed

The DEIR's analysis of growth inducing and population and housing impacts is flawed and conclusions reached by the DEIR that all impacts are less than significant incorrect. These topics are closely related and the two sections contain multiple cross references. Therefore, these impact topics are discussed together in this section.

CEQA requires that an EIR include a detailed statement setting forth the growth-inducing impacts of a proposed project. Pub. Res. Code Section 21100(b)(5). A proposed project is either directly or indirectly growth inducing if it: (1) fosters economic or population growth or requires additional housing; (2) removes obstacles to growth; (3) taxes community services or facilities to such an extent that new services or facilities would be necessary; or (4) encourages or facilitates other activities that cause significant environmental effects. CEQA Guidelines Section 15126.2(d). While growth inducing impacts of a project need not be labeled as adverse, the secondary impacts of growth (e.g., gentrification and displacement, demand for additional housing and services, traffic, air pollution, etc.) may be significant and adverse. In such cases, the secondary impacts of growth inducement must be disclosed as significant secondary or indirect impacts of the project. The analysis required is similar in many respects to the analysis required to analyze impacts associated with population and housing.

a. Growth Inducement Analysis is Woefully Lacking

The DEIR contains a short, 3 and 1/2-page discussion of Growth Inducing Effects. The discussion acknowledges the Project will increase the campus population by approximately 4,100 persons by 2030 and an additional 1,080 persons by 2050, including students and faculty and staff. The DEIR also calculates the multiplier of 0.73 for an additional 3,420 jobs that could

be indirectly caused or induced by the Project. The Project includes construction of 142 net new housing units/beds within the Aldea housing complex and an additional 620 new residential units for a net total of 984 new units by 2050.

The DEIR concedes "[c]ampus population growth under the proposed CPHP would not be entirely accommodated by the existing and new housing on site, and therefore would result in indirect housing demand beyond the campus site." DEIR at 5-5. The discussion provides little real analysis of the Project's potential to induce growth in accordance with CEQA, nor does the discussion reach any conclusions as to the significance of growth inducing impacts instead relying on the assertion that the growth allowed by the Project is not substantial when "compared to the study area growth projections and to the extent that demand for new housing would exceed the capacity of the market area.[4]" DEIR at page 4.12-10. Yet, the discussion does not identify any potentially significant impacts associated with population growth as a result of the elimination of the existing space ceiling and implementation of the Plan.

The DEIR goes on to state:

> "Generally, the housing demand associated with employment growth under the proposed CPHP would be satisfied by the housing that could be added in San Francisco and in other parts of the region." DEIR at 4.12-8.

San Francisco and the region has been grossly underbuilding planned housing while generating significant new jobs; facts not disclosed by the DEIR. There is no information in the DEIR about the current housing crisis in San Francisco and region as summarized below. Nor does the DEIR contain any information about housing availability in the surrounding neighborhood and City, or information about housing affordability. Moreover, the DEIR fails to describe the breakdown of new students, faculty and staff in terms of numbers by typical jobs and salaries; information critical to estimating the percent of new staff, faculty and students who qualify as low income or very low income requiring lower cost housing options. Finally, the DEIR fails to acknowledge that UCSF is a major contributor to the affordable housing crisis, and will exacerbate that crisis by building out its expansion plan without building additional units affordable to new students, faculty, staff and employees of supporting services. See Jobs Housing Nexus Analysis SF, Kaiser Marston Associates, 2018 submitted under separate cover

Instead of the required analysis, the DEIR points to the Population and Housing Section conclusion to support its cursory overview of growth inducement impacts:

> "Implementation of the proposed CPHP would induce population growth in the Bay Area, but the population growth would not be substantial in comparison to growth that is projected and planned for San Francisco and the four study area counties in Plan Bay Area 2040 and the local general plans for the study area communities. Further, the population

[4] Five county study area.

growth would not result in a demand for new housing that would exceed the capacity of the five-county market area." DEIR at 4.12-9. Emphasis added.

By comparing the Project's growth to the entire City and region, the DEIR seeks to diminish the significance of housing demand generated by the Project. There is no question the Project will generate substantial additional growth in a highly constrained neighborhood[5], by increasing the daily average population by approximately 45%, nearly 5,200 students, faculty and staff. DEIR at page 4.12-1. In addition, the Project generates an additional 3,420 jobs based on a multiplier of 0.73%; jobs that will put additional demand on a tight housing market. No information is provided about the nature of these jobs or the associated salary ranges of employees. The Project will also increase likely increase the demand for housing in the immediately surrounding neighborhoods and City as people avoid transit in a COVID worried world and seek to walk and or bike to work.

The Project most certainly will induce growth that will in turn significantly impact housing. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, assuming all new students need housing and only 50% of faculty and staff need housing, at 4,000+ units, would still constitute a significant impact on a highly constrained housing market and could result in displacing local residents due to competition and gentrification. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis because under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing. Salaries disclosed for the Mission Bay Project for UCSF's workforce, suggest the majority of new students, staff and faculty will need housing affordable to low incomes. See www.payscale.com/research/USEmployer=UCSFMedicalCenter

Housing Demand Range			
Direct/Multiplier Growth at 2040 DEIR page 4.12-7	Students 504	Faculty and Staff 4,680	Multiplier/Indirect Employees: 3,420
Housing Demand Estimates	High Demand (worst case scenario 100 require housing): 504 units	High Demand: (worst case scenario 80% not housed, net new): 3,744 units	High Demand: 50% not housed, new demand):

[5] Constrained in terms of circulation and housing.

	Low Demand (50% not housed, new demand) 252 units	Low Demand (50% not housed, new demand) 2,340 units	1,760 units

These housing-related impacts are more than glossed over by a discussion that excludes any information about the dire housing crisis.

Substantial new non-residential and residential growth in San Francisco includes total population growth based on household size assumptions[6], in addition to new students, staff and faculty estimated in the DEIR to be as high as 12,220 people by 2050. DEIR at page 4.12-8. This estimate does not include indirect growth associated with the multiplier, but does assume all new growth is in San Francisco. This significant new growth will require additional public services, likely including expansion and therefore construction of facilities in the neighborhood or adjacent neighborhoods of a myriad of services. Yet the DEIR provide cursory information about these services and facilities and fails to analyze the associated impacts, including fiscal impacts. CEQA requires that if new construction of housing will occur to accommodate the Project's employees or services beyond that included in the Project, then the EIR must analyze the environmental impacts of that construction. The appropriate components for an adequate analysis include: (1) estimating the amount, location and time frame for growth that may result from the implementation of the Project (e.g., additional housing); (2) considering whether the new population would place additional demands on public services such as fire, police, recreation, emergency, health, childcare or schools; (3) applying impact assessment methodology to determine the significance of secondary or indirect impacts as a result of growth inducement; and (4) identifying mitigation measures or alternatives to address significant secondary or indirect impacts. CEQA Guidelines Appx. G Section XIII(a). The DEIR must be revised to provide this analysis and based on this analysis, to revise other environmental analyses including but not limited to population and housing, transportation, air quality, among other topics where impacts are derived in part from direct and indirect growth assumptions.

The DEIR dismissal of likely growth inducing impacts because the impacts are "impossible to determine" violates CEQA. Virtually the sum total of the discussion, below, lacks analysis and supporting facts and evidence while at the same time identifying the potential areas of significant impacts associated with significant growth:

> "While it is acknowledged above that the precise nature, location, and magnitude of effects of indirect and induced growth cannot be determined, the proposed CPHP

[6] 2.36 persons per HH; assumes only one student per HH. DEIR at page 4.12-8.

> would likely increase overall demand in the region for housing, commercial and industrial space, and associated infrastructure. Potential effects could include increased traffic congestion; increased air pollutant emissions; loss of agricultural land and open space; loss of habitat and associated flora and fauna; increased demand on public utilities and services, such as fire and police protection, water, recycled water, wastewater, solid waste, energy, and natural gas; and increased demand for housing. An increase in housing demand in the Bay Area region would also require governmental services including, but not limited to schools, libraries, and parks to serve new commercial and residential development." DEIR at 5-7.

The discussion also acknowledges that this growth could contribute to a loss of open space by converting those lands to housing, commercial space and infrastructure, but attempts to discount the many impacts associated with conversion of natural and working lands by pointing out without evidence that "most jurisdictions have adopted smart-growth policies that discourage or prohibit this type of development." DEIR at 5-7.

A revised growth inducing analysis must be included in a recirculated DEIR. The impacts of growth must also be considered in new analysis concerning the social equity impacts of the Project. See Attachment 4, Draft Planning Commission Resolution.

b. The DEIR's Analysis of and Mitigation for the Project's Population and Housing Impacts is Inadequate

The DEIR's approach to analysis of population and housing does not adequately analyze Project-related impacts associated with changes that would occur with Project implementation to the population, including employment and residential growth. Instead of actually analyzing the Project's impacts related to population and housing, the DEIR asserts that all impacts both direct and indirect will be less than significant. The DEIR lacks facts, analysis and evidence to support this conclusion. The result is a lack of information about the actual severity and extent of impacts associated with significant growth in population including students, faculty, staff and patients and visitors. For a Project that will guide development of the campus for 30+years and likely be the basis of streamlined permitting for project facilities and infrastructure, it is especially important that the DEIR comprehensively identify and analyze its impacts on growth, population, housing and employment.

In determining impact significance associated with growth in population, employment and housing, CEQA requires analysis of the following topics (substantially similar in DEIR at page 4.12-6):

- Would the project induce substantial population growth in the area, either directly (for example by proposing new homes and businesses) or indirectly (for example, through extension of roads and other infrastructure)?

- Would the project displace substantial number of existing housing units or create demand for additional housing, necessitating the construction of replacement housing?
- Would the project displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

In order to analyze the above significance thresholds, the DEIR must also address the following questions:

- Would the project result in the net loss of any existing housing units affordable to very low income or low income households through any means including gentrification?
- What is the net change in affordable versus market rate units in the surrounding neighborhoods as a result of the Project?
- Would the Project impact a disadvantaged community (DAC)?
- Would the project result in a greater imbalance between jobs and housing, including jobs housing fit?[7]

Finally, the DEIR fails to disclose the Project's inconsistency with the UCSF 2014 LRDP Community Planning Principle HI which calls for projects to make a positive contribution to San Francisco's affordable housing stock…in order to relieve housing demand in the local community. DEIR at page 4.12-4.

The DEIR's analysis of these potential impacts associated with population, employment and housing is inadequate starting with the lack of any credible environmental setting or context for the discussion including the following basic facts:

- San Francisco and the region added more jobs than housing over the last decade. Census data shows that San Francisco added 8.2 jobs per home since 2010. Overall, the Bay Area has added 2 jobs for every home built since 1990. See also Plan Bay Area Final Plan 2040, Attachment 5.
- Between 2011 and 2017, the region added 658,000 jobs and 140,000 housing units, or on average 4.7 jobs for every housing unit. SPUR Regional Strategy, Attachment 6.
- The shortfall of housing units is estimated by SPUR to be nearly 700,000 units including units to meet the needs of both middle income and lower income households. Id.

[7] Jobs-Housing fit means the extent to which housing prices or rents are matched to the local job salary ranges. Jobs-Housing balance provides a general sense of how in or out of balance housing to fit the local workforce may be. Jobs-Housing fit provides an essential and more granular sense of whether – even if in balance – local employees are able to reside locally or must commute long distances for housing affordable to them and their families. Without jobs-housing fit information, readily available using Census and other data, it is not possible for the DEIR to adequately analyze many Project-related and cumulative impacts including demand for new housing and vehicle miles traveled, among others.

- In order to meet the unmet past need plus future needs for housing, the Bay Area would need to build 45,000 units per year to produce an additional 2.2 millions units by 2070. Id.
- The production of affordable housing has lagged behind production of housing affordable to higher incomes, with significant shortfalls of housing production for moderate or middle income wage earners and lower income wage earners. From 1999 to 2014, the Bay area issued permits for only about 35% of the units to meet the needs of vulnerable populations such as low-income families. Id.
- Much of the older housing stock located in higher density areas such as San Francisco have experienced gentrification pressures due to competition from new and higher income wage earners. Id.

A revised DEIR must provide baseline information about the housing crisis and re-analyze housing-related impacts of the Project in light of that information. Based on accurate information about the pre-Covid SF and Bay Area housing crisis (summarize above), it can reasonably be concluded that the additional of 5,200 students, faculty and staff by 2050 and only 984 units produced, the housing need generated constitutes a significant impact. Demand for housing is further exacerbated by the job multiplier of 0.73 creating an additional 3,420 jobs induced by the Project. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, based on more new staff and faculty already housed, at an estimated 4,000+ units, would still constitute a significant impact. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis. Under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing.

The Project is also inconsistent with the Community Planning Principle HI directed at relieving housing demand on the local community. The DEIR's conclusion that "population growth would not result in a demand for new housing that would exceed the capacity of the five-county market area," and that "CPHP's impact related to population and housing would be less than significant" is clearly incorrect.

c. A Revised DEIR Must Include Feasible Mitigation Measures and Alternatives to Address Significant Impacts to Housing

The DEIR must identify feasible mitigation measures and alternatives capable of reducing or eliminating significant impacts. The DEIR fails to do so.

In reaction to the housing crisis, SF voters passed Measure E in March 2020, limiting construction of new office building unless affordable housing goals are met. Measure E is instructive as to the kinds of mitigation measures UCSF should consider in addressing the increased imbalance of housing and jobs the Project would foster.

Feasible mitigation measures that should be included in a revised DEIR include the following:

- Increase Project housing to provide sufficient and affordable housing for new students, faculty and staff as well as a portion of induced demand (multiplier) by increasing housing proposed by the Project and decreasing new jobs.
- Provide sufficient housing in advance of the development and occupation of non-residential buildings (in line with Measure E).
- Adopt a project that adheres to the existing space ceiling thereby reducing increased staff and faculty and associated housing demand.

These and other feasible mitigation measures must be identified in a revised DEIR to address the significant population and housing impacts of the Project and cumulative development on the Project area, the City and region. A Financial Analysis should accompany the revised Plan and DEIR setting forth costs associated with housing, services and other community benefits of the Project and laying out a revised approach to funding implementation of these Project elements.

- Would the project displace substantial number of existing housing units or create demand for additional housing, necessitating the construction of replacement housing?

2. The DEIR's Analysis of Land Use and Planning Is Incomplete and Inadequate, Thereby Failing to Disclose and Mitigate Significant Impacts

The DEIR incorrectly identifies as Less Than Significant the Project's Land Use and Planning impacts. At the heart of the analysis of land use and planning impacts is the question of the Project's consistency with applicable policies and other provisions including UC's as well as the City's. Contrary to the DEIR's conclusions, the Project is incompatible with the surrounding area and conflicts with numerous policies and provisions of San Francisco's General Plan and Planning Code, as well as UC policies. Due to UC's constitutional autonomy, development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local land use regulations. However, UCSF has indicated its intent to adhere to local policies and regulations to the extent practicable and to review policies germane to the analysis of land use impacts. DEIR at page 4.10-6. In the pertinent topical sections (e.g., Land Use and Planning, Noise, Aesthetics) the DEIR does describe pertinent policies and regulations, finding in each case that the Project is compatible with surrounding land uses and as such would not create any significant impacts. As described below, the analysis of land use and policy consistency is flawed and the conclusions

unsupported by evidence. Contrary to conclusions reached in the DEIR, there is evidence of policy and regulation inconsistency resulting in significant environmental impacts, only two of which – wind and cultural – are disclosed and acknowledged.

Planning and Land Use Context: The *San Francisco General Plan* provides policies and objectives to guide land use decisions and along with the San Francisco Planning Code prescribes the permitted uses and development standards to carry out the City's policies for the 107-acre Parnassus Campus site. In a 1987 Memorandum of Understanding (MOU), UCSF agree to advise and consult with the City of San Francisco on any proposed construction projects. The MOU states that the City Planning Commission will advise UCSF about the "conformance of such development with the Master Plan of San Francisco and Planning Code Section 304.5 (Institutional Master Plans) with recommendations, of any, for amendment to the proposal… Should the City Planning commission and UCSF disagree on any matter which is the subject of this MOU, either party may request the participation of the Mayor and the Chancellor in attempting to resolve the dispute." (MOU, para. IV). The DEIR must, include a complete and forthright analysis of the Project's consistency with the General Plan and other applicable planning documents, ordinances and regulations so that UCSF can honor its intent to adhere to the extent practicable, the City's policies and "zoning codes related to building use, height, and bulk limitations; floor areas; and parking requirements or restrictions for the purpose of ensuring compatibility with the surrounding uses." DEIR at page 4.10-6. Inconsistencies between the Project and the General Plan or other applicable planning documents that were enacted to protect the environment may constitute significant impacts in themselves and can also be evidence of other significant impacts that must be analyzed in the DEIR. Where elements of the Project are not part of its educational mission, and are inconsistent with the General Plan it may not be lawfully adopted or approved. Additional information is needed about the Project elements in order to describe and document how the entirety of the Project is in support of UCSF's educational mission. It is not possible to determine that without more details about how the new space will be used and occupied and for what specific purposes.

While not considered by UCSF objectives or regulations, reference is made in the UCSF 2014 LRDP, to the Community Planning Principles which were produced in collaboration with the UCSF Community Advisory Group. These Principles include the following:

- Land Use LU1. Plan for growth and renovations that are substantially consistent with use limitations and height and bulk limitations in the City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects. The University should consider City planning proposals that are underway. UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns.

- LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density, and that do not negatively affect surrounding land uses.
- LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights Campus site.

DEIR at page 4.10-3 to 4.10-4.

The Parnassus Heights campus site, the oldest and largest of the UCSF campuses, is located in among some of the oldest neighborhoods in San Francisco, characterized by unique physical characteristics and mix of land uses including residential areas ranging from single family to multi-family housing and charming neighborhood serving commercial districts such as located along Irving and Judah Streets and 9th Avenue. In addition to Mount Sutro Open Space Reserve, several park and open space areas are located near the campus. This area is characterized by local serving streets fraught with traffic, parking congestion and lack of transit.

Compliance with the City of San Francisco's adopted policies and regulations are a key indicator of whether the Project is or is not compatible with the surrounding neighborhood. UCSF clearly understood the breaking point for compatibility in its 1976 Regents' Resolution. Recognizing the unique and constrained location the Parnassus Heights campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part: "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." See Attachment 2.

In addition, the Resolution recognizes the transportation problems in the area and commits funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit.

In a letter to Chancellor Hawgood, dated January 16, 2020, Mayor London Breed, President of the Board of Supervisors Norman Yee and Supervisor Dean Preston note the need for a revised MOU to adopt and formalize arrangements for coordination and consideration of both our interests and inputs in the context of land use approvals, transportation needs and ongoing service provisions, noting the common challenges faced include housing supply, affordability and climate and seismic related risks. See Attachment 3.

In this case, after discussing only some of the applicable plans, the DEIR incorrectly concludes across the board that the Project would be compatible with adjacent lands uses and impacts would be insignificant. Some examples of the Project's glaring inconsistencies with the General Plan and Code include, but are not limited to, the following:

San Francisco General Plan and Zoning Code Excerpt	Inconsistency
Land Use and Urban Design Elements LU-2: Plan for growth and renovations that are substantially consistent with use limitations and bulk limitations in City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects…UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns. LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density and do not negatively affect surrounding land uses. LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights campus site. Policy 3.5: Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development. Policy 3.6: Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction. San Francisco Planning Code – Use Districts City's P (Public) Zoning District Housing along Third and Fifth Avenues – see also Residential House District, Two-Family (RH-2) Code sections Height and Bulk Districts: 25-X, 40-X, 65-D, 80-D, 130-D and 220-F. Floor areas rations are determined by allowable height and coverage.	The DEIR correctly concludes that the New Hospital, as well as Millberry Union, certain West Side development and the Aldea Housing densification project would not be consistent with City Planning Code height and/or bulk regulations for their respective building sites. DEIR at 4.10-16. The DEIR continues on to incorrectly conclude despite evidence to the contrary, that these conflicts would not result in significant incompatibility with adjacent land uses or impacts on surrounding uses. Taking just the New Hospital as an example, at about 955,000 gross square feet and up to 294 feet in height, the New Hospital clearly demonstrates the Project's incompatibility with the surrounding area resulting in significant adverse environmental impacts including but not limited to, wind, visual and environmental impacts associated with an inadequate supply of housing affordable to new students, faculty and staff. The New Hospital is patently inconsistent with SF Land Use and Design policies and height and bulk requirements in multiple ways. First, the New Hospital is within three height and bulk districts and exceeds height limits for portions of the site within two of these, the 65-D and 22-F Height and Bulk districts, by over 70 feet and X stories. Second, the New Hospital would require use of a portion of the Reserve and would be located even closer to the off-site residences on Edgewood. The DEIR concedes: Impact AES-2 finds that the New Hospital would be the most noticeable visual change under the CPHP program, and would contrast sharply both in height and scale with the nearby residential development…". DEIR at 4.10-17. In justifying the conclusion that the New Hospital is compatible with adjacent land uses, the DEIR points to the proposed amendments to the 2014 LRDP which increase the space ceiling. In addition, the DEIR (Impact AES-3) finds that with implementation of appropriate design standards and exterior materials light and glare and other impacts would be reduced to less than significant.

	Even so, the DEIR concedes that the New Hospital will still result in significant unavoidable wind hazards. Analysis by Jared Ikeda provides clear evidence the New Hospital with also result in significant and unavoidable visual impacts. See Attachment 7. There are clear inconsistencies between the New Hospital and the City's General Plan policies and Code resulting in documented significant and unavoidable impacts associated with wind hazard, visual and housing, among other impacts. <u>These inconsistencies and the associated physical environmental impacts are not resolved by the amendment to the LRDP to raise the space ceiling.</u> Combined with other Project elements – Millberry Union, West Side – and the Project scale and bulk overall, the Project is clearly incompatible with the surrounding area resulting in significant and unavoidable impacts including those omitted from the DEIR but disclosed (wind) and some revealed by expert analysis (e.g., visual, cultural, housing). A revised and recirculated DEIR must re-analyze Project consistency with these and other applicable provisions of the City's Plans and Codes and Impact LU-2 must be found to be a significant and unavoidable impact. In addition, the Project is clearly inconsistent with CPHP Policy 3.6, which states that the height of buildings should be related to the prevailing scale and character of existing development. The New Hospital at nearly 100 feet taller than the tallest existing building on the campus, Moffit Hospital, is clearly inconsistent with this Policy. A revised DEIR must include in a revised Land Use and Planning section a systematic and thorough analysis of inconsistencies with all applicable (City, UC, other) policies and regulations.
Urban Design Element Policy 1.1: Recognize and protect major views in the city, with particular attention to those of open space and water.	The DEIR incorrectly concludes the project will not conflict with these policies and specifically that "[d]evelopment under the CPHP would not have a substantial adverse effect on a scenic vista" (AES-1) or "conflict with the applicable zoning and other

Policy 3.4: Promote building forms that will respect and improve the integrity of open spaces and other public areas.	regulations governing scenic quality" (AES-2) and therefore no mitigation is required. In his analysis of visual impacts, Jared Ikeda concludes that the New 16-story Hospital would result in significant visual impacts including specifically that it would block views to Mt Sutro and the Reserve and would block views of the ocean and Golden Gate Park from trails and other public vantage points resulting in policy inconsistencies with direct significant environmental impacts. See Attachment 7. A revised DEIR must change the disposition of these impacts (AES-1 and 2) to significant and unavoidable and identify feasible mitigation measures including alternatives to the Project.
Shadow Proposition M, adopted by the voters in 1986, added section 101.1 to the SF Planning Code and established 8 priority policies. Priority Policy No. 8 calls for the protection of parks and open space and their access to sunlight and vistas.	The DEIR incorrectly states that the implementation of the Project would not create new shadow that substantially and adversely affects the use and enjoyment of publicly accessible open spaces. In his analysis of aesthetic impacts, Jared Ikeda reviewed the DEIR's analysis with respect to shadows and reached a different conclusion documented in his letter: "It appears though that certain areas along Parnassus Avenue and Irving Street will be subject to frequent shadows throughout the year." See Attachment 7. These more frequent shadows will clearly affect the use and enjoyment of these public spaces and as such should be called out as a Significant and Unavoidable impacts of the Project as proposed. Feasible mitigation measures must be identified.
Regents' Resolution: Space Ceiling of 3.55 Million Gross Square Feet	The DEIR conveniently concludes that the impacts associated with the Project's significant increase in gross square feet (an increase of approximately 1.5 million GSF about the existing space ceiling) and population increase from 18,500 to nearly 25,000, would be less than significant because the LRDP would be amended to increase both space and population. An amendment to the space and population ceiling does not eliminate the physical environmental impacts described in the table above associated with the increased scale of the Project. Such impacts include wind hazard (found SU by the DEIR), cultural (found SU by the DEIR) and additionally,

	aesthetic (visual and shadows) and housing, among others. A revised DEIR must identify this as an inconsistency, re-analyze the associated environmental impacts and identify feasible mitigation including alternatives to Project components such as the New Hospital.

A revised DEIR must include expanded and forthright analysis of the Project's potential inconsistencies with applicable plans and policies including the City of San Francisco's, and disclose the significant and significant and unavoidable, environmental impacts associated with those inconsistencies.

In addition, a revised DEIR must include feasible mitigation measures and alternatives to reduce or eliminate the significant impacts associated with those inconsistencies. Mitigation measures including, but not limited to the following should be considered:

- Retain the space ceiling and adopt an Alternative consistent with the space ceiling and other UCSF commitments.
- Seismically upgrade the existing hospital at Parnassus in combination with a New Hospital off-site (Mission Bay, Hunters Point, see other options in Alternatives discussion below).

3. The DEIR Alternatives Analysis is Legally Deficient

Alternatives are optional ways that the Project could achieve most of the objectives while also reducing or eliminating the environmental impacts of the Project. (California Public Resources Code Section 21002). Typically, alternatives to the Project involve changes to the location, scope, design, and intensity but can also include method of construction and/or operation. Where the Project includes a mix of land use types as in the case of this Project, alternatives may also include alterations in the mix of land uses proposed in order to reduce or eliminate impacts (e.g., increase Project housing to meet demand for growth within the space ceiling).

The fundamental mandate is that "public agencies should not approve projects if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of the project" (PRC Section 21002, 21081). Government agencies are required to consider alternatives to proposed actions affecting the environment. (PRC Section 21001 (g)).

The DEIR's alternatives analysis is legally deficient because it fails to describe a reasonable range of alternatives, or to the location of the Project, which would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the significant effects of the Project, and evaluate the merits of the alternatives. "An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision-making." (*Laurel*

Heights I, 47 Cal.3d at 404). An EIR must also include "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (*Id. At 405*.)

In developing a list of alternatives for analysis, both project objectives and known or likely significant impacts of the Project must be factored in. Alternatives need not meet all of the objectives and their fundamental purpose is to reduce or eliminate Project impacts. The Project setting can also influence the range and choice of alternatives. Offsite alternatives should be considered. Offsite alternatives must be feasible (e.g., site control by Project proponent or possible for the proponent to acquire the property).

Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)).

The DEIR's Alternatives Analysis is Legally Deficient Because it Improperly Rejects Feasible Off-Site Alternatives and Omits Others Feasible Off-Site Alternatives

Feasible alternatives to the Project that would reduce or eliminate significant Project impacts including those acknowledged by the DEIR briefly considered but dismissed include:

- No New Hospital at Parnassus Heights Campus Site/Implement Phase 2 of Medical Center at Mission Bay Campus Site
- New Hospital at Mount Zion Campus Site

Omitted from the list of feasible offsite options are:

- Seton Hall Hospital Facility, which stands empty
- New Hospital at Hunters Point, which would provide jobs in and health services to an underserved and disadvantaged community

The reasons provided in the short approximately one-page discussion dismissing the alternative of a new hospital at Mission Bay comes down to the alternatives' reported failure to meet very focused Project objectives and a purported conflict with the 2014 LRDP and CPHP. Specifically the DEIR states that the alternative would not meet some of the Project objectives (e.g., expansion of some services and other benefits from an interdisciplinary program) and would conflict with several 2014 LRDP and CPHPs objectives for Parnassus Heights campus including but not limited to adequate space to foster collaboration and to facility inter-dependence and connectivity for operational efficiency, adequate clinical and administrative support and aligned with other programs, increase in beds, and modern industry standards including seismic safety. Page 6-55 to 6-55. The discussion concedes that the alternative would reduce the significant

wind impacts, cultural and construction impacts, but that in so doing, it would likely also result in increased cross town traffic between the Parnassus and Mission Bay campus sites. Not analyzed was a combination of a smaller, new hospital at Parnassus in combination with Mission Bay; another feasible option that has the potential to address total need and allow phasing to accommodate patients and services.

Dismissal of these alternatives (New Hospital at Mission Bay and Combination of New Hospital at Mission Bay and Reduced Hospital at Parnassus) is not justified. First, the alternative would meet most of the Project objectives. If a New Hospital at Mission Bay is combined with a rebuilt smaller hospital at Parnassus, the alternative could meet the need for additional beds and services as well. The argument that this alternative would increase cross town traffic is not supported by any evidence or analysis. Finally, the conflicts with the 2014 LRDP are not persuasive since that document is being amended to break the space ceiling and this alternative would not require that significant amendment to the LRDP. In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus. These alternatives must be fully analyzed in a revised and recirculated DEIR, including additional facts and analysis to support the arguments concerning the alternatives conflicts.

The DEIR similarly dismisses the alternative of a new hospital at the Mount Zion Campus Site, stating that this alternative would result in UCSF hospitals operating at three different campus sites which would be "less than ideal and inefficient," would not help achieve the benefits realized through interdisciplinary collaboration and convergence between clinical care, research and education, land acquisition would be difficult and citing undisclosed conflicts with LRDP and CPHP objectives. The discussion concedes that the alternative would reduce the significant wind impacts, cultural and construction impacts, but that in so doing, it would likely also result in localized impacts at the Mt. Zion site and increased cross town traffic between the Parnassus and Mission Bay campus sites. This alternative also merits full analysis in a revised and recirculated DEIR because it would reduce or eliminate Project impacts and could be carried out in combination of seismic retrofits to the existing hospital at Parnassus to meet objectives and remain consistent with the space ceiling.

Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)). Rejection of the Mission Bay and Mt. Zion sites for a new hospital, either in lieu of or in combination with a smaller hospital at Parnassus, is not supported by the evidence and analysis provided and both require full analysis in a revised and recirculated DEIR.

In addition, the revised and recirculated DEIR should also fully analyze a new hospital at Hunters Point and reuse of Seton Hall. A new hospital at Hunters point would eliminate the

significant impacts associated with the Project and provide jobs and health care to a disadvantaged and underserved community.

Since the Mission Bay alternative reduces the Project's significant impacts, while achieving almost all Project objectives, the DEIR is arbitrary and capricious for dismissing this alternative in particular from full review and in rejecting this alternative. In addition, the Mission Bay Campus was justified by the cap at Parnassus, making this alternative essential for full review. In light of the development cap at Parnassus, each of these alternatives warrants review in a revised and recirculated DEIR with priority on Mission Bay and Hunters Point.

III. The DEIR Must be Revised and Recirculated

Decision makers and the public cannot possibly assess the Project's impacts through the present DEIR which is riddled with omissions, errors and inconsistencies. Among other fundamental deficiencies, the DEIR repeatedly understates the Project's significant environmental impacts and therefore fails to formulate feasible mitigation to reduce these impacts. To resolve these issues, a revised DEIR that would necessarily include substantial new information must be prepared and recirculated.

Sincerely,

Terry Watt

Terry Watt Planning Consultants

1937 Filbert Street - San Francisco, CA 94123

terryjwatt@gmail.com Cell: 415-377-6280

Terry Watt, AICP, owns Terry Watt Planning Consultants. Ms. Watt's firm specializes in planning and implementation projects with a focus on regionally-significant land use and conservation work that advances sustainable development patterns and practices. Prior to forming her own consulting group, she was the staff planning expert with the environmental and land use law firm Shute, Mihaly & Weinberger. She is an expert in general and specific planning and zoning, open space and agricultural land conservation strategies and approaches and environmental compliance, including CEQA and NEPA. Her skills also include facilitation and negotiation, public outreach and project management. Terry is a frequent presenter at regional, national and statewide workshops and symposiums. She holds a master's degree in City and Regional Planning from the University of Southern California and a multi-disciplinary bachelor's degree in Urban Studies from Stanford University.

Terry works with a wide variety of clients throughout California including non-profit organizations, government agencies and foundations. She volunteers up to half her professional time on select projects. Recent projects and roles include:

- Project Manager and Governor's Office Liaison for San Joaquin Valley: Least Conflict Lands for Solar PV project. Project funding came from the Hewlett and Energy Foundation's, matched by environmental organizations, the California Energy Commission and other private parties. The objective of the project was to identify areas in the Valley that had very low resource values for renewable energy to serve as an incentive for development of least conflict lands rather than valuable resource lands. Watt was responsible for overall project management and day to day coordination, multi-stakeholder (150 stakeholders) and agency (57 federal, local and agency advisors) outreach and participation, facilitation of meetings, Governor's Office convening's, all project logistics and project report. Link to Collaboration Platform – Data Basin San Joaquin Valley: http://sjvp.databasin.org/
- Governor's Office Liaison and Outreach Coordinator for the State's portion of the Desert Renewable Energy Conservation Plan (DRECP). As outreach coordinator, worked closely with local governments on DRECP related consistency issues with local general plans.
- Planning Consultant to California Attorney General's Office - Environment Section focusing on climate change, CEQA and general plans. (2007- 2010). While working with the Environment Section, assisted with settlements (Stockton General Plan, Pleasanton Housing Element and CEQA litigation); identified locally based best practices for local government planning to address climate change issues; and managed government outreach and consultation on general plans and climate action plans/energy elements/sustainability planning efforts. Post 2010 continue to provide periodic consulting services to the Environment Section related to select cases.
- Strategic Advisor and Planning Consultant to the Santa Clara Valley Open Space Authority, Greenbelt

Alliance and Committee for Green Foothills for the Coyote Valley Project focused on developing a conservation and development plan for the Valley. Watt was responsible for preparing the group's early CEQA comment letter on the negative declaration for a proposed Warehouse Project and assisting with scoping comments for the EIR.

- Measure M-2 Sales Tax and Environmental Mitigation Measure. (2009-). Terry was the Co-project manager/facilitator of a 30+-member environmental coalition that through a unique partnership with the Orange County Transportation Authority (OCTA) and state and federal wildlife agencies generated nearly $500 million in funding for programmatic environmental mitigation (conservation land acquisition and stewardship) in Measure M2, Orange County Transportation Sales Tax.
- State Office of Planning and Research Special Projects (2011 – 2017). Advisor to OPR on General Plan Guidelines, Infill and Renewable Energy Templates as part of the required update of the General Plan Guidelines. Expert panelist for workshops on SB 743.
- Marin Countywide General Plan and Environmental Impact Report (2004 to 2007). Project Manager for the award-winning Marin Countywide Plan Update and its Environmental Impact Report. The General Plan was among the first to incorporate leading edge climate change, greenhouse gas emissions reduction and sustainability policies as well as monitoring, tracking and implementation measures to measure success.
- Staff to the Martis Fund, a joint project of five environmental groups and a Business Group (Highlands Group and DMB Inc.). (2008 – ongoing). The Fund was created as a result of litigation settlement. The Fund has distributed over $15 million dollars since its inception to a range of conservation (acquisition of over 5,000 acres of open space), stewardship and restoration projects and workforce housing projects (emergency rental housing support, down payment assistance and low income apartments). Funding comes from a permanent transfer fee on all real estate sales at Martis Camp. http://www.martisfund.org/PDFs/Martis-Fund-Brochure.pdf
- Tejon Ranch Land Use and Conservation Agreement. (2006 – ongoing). Project coordinator for a dialogue process between environmental groups (Natural Resources Defense Council, Sierra Club, Endangered Habitats League, Planning and Conservation League, Audubon California) and The Tejon Ranch Company that resulted in a major Land Use and Conservation Agreement for the permanent protection of 240,000+ acres (90%) of the 270,000 acre Tejon Ranch. Secretary John Laird refers to the Agreement as a "miracle" agreement. In return for permanent conservation of 240,000+ acres, environmental groups agreed not to oppose projects within the development footprints; but can comment on regional planning efforts and the projects. Terry has an ongoing role overseeing implementation of the Agreement, including early role forming and managing the Conservancy formed by the Agreement. The Agreement provided the cornerstone of the Habitat Conservation Plan for a major portion of the Ranch; the Tejon Multi-Species Habitat Conservation Plan, TUMSHP, approved in April 2013. She recently joined the Board of the Tejon Ranch Conservancy created and funded by the Agreement.
- Orange County Wildlife Corridor. Project coordinator and architect for dialogue process between environmental and conservation organizations, City of Irvine and Lennar/Five Points development team that resulted in an 8 party Agreement, related general plan amendment and full funding to build an urban wildlife corridor to the specifications of the science team (6-member team jointly selected by all groups) connecting two high value conservation areas in central Orange County (Coastal and Eastern NCCP/HCP lands). Watt provides some ongoing implementation support. Recently (2017) coordinated DEIR comments letters on two Orange County Project proposals that could adversely impact the 5 Point/Irvine Wildlife Corridor.
- Ongoing assistance and authorship of expert comments on projects with recent letters on the proposed draft Amador County General Plan on behalf of the Foothill Conservancy and the proposed Squaw Valley Resort on behalf of a coalition of environmental and labor organizations.

- Facilitator to the Bolsa Chica Land Trust for recent agreement with Landowners to purchase remaining private acres of the Bolsa Chica uplands. Currently assisting with fundraising for the property.
- Advisor to the Nature Conservancy, the American Farmland Trust, Center for Law, Energy and Environment on numerous publications concerning urban infill and conservation.

Land Use Regulation for Resource Conservation

Attachment 2

APPENDIX F: 1976 REGENTS' RESOLUTION

"DESIGNATION OF OPEN SPACE RESERVE, ALTERATION OF CAMPUS BOUNDARIES, COMMITMENT OF HOUSES TO RESIDENTIAL USE, AUTHORIZATION TO NEGOTIATE SALE OF PROPERTIES AND COMMITMENT OF TRANSPORTATION STUDIES."

The following recommendations were approved by the Board of Regents on May 21, 1976:

1. That the reserve on Mount Sutro, which was designated as open space for a twenty-five year period by The Regents in October, 1975, be increased from fifty-two to approximately fifty-eight acres, and that the designation be made permanent.

2. That the boundaries of the San Francisco campus be altered to exclude properties on the west side of Third Avenue from 1309-11 Third Avenue to and including 1379 Third Avenue, and that the new boundaries be made permanent. The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent. These restrictions prohibit expansion by UCSF by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the new campus boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton and Clarendon. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

3. That the Regents redefine their commitment, made as part of the October, 1975, approval of the Long Range Development Plan, to return certain existing houses to residential use as alternative campus space and funds for rehabilitation and relocation become available for the activities now housed therein, and that as part of this commitment: The ten houses on Third Avenue, outside the campus boundaries revised as recommended in 2. above, be sold subject to the provisions set forth in 4. below; the thirty-four houses on Third, Fifth, and Parnassus Avenues and on Irving and Kirkham Streets be rehabilitated as required and leased for residential purposes, with priority given to University students, faculty, and staff; and the seven houses on Fourth Avenue remaining after clearance of the site for the School of Dentistry Building project be retained for non-residential campus use.

4. That the Treasurer be authorized to negotiate the sale of the lots and structures, and other improvements thereon, located at 1309-11, 1319, 1325, 1337, 1343, 1355, 1361-63, 1367-69, 1373, and 1379 Third Avenue; the lot between 1355 and 1343 Third Avenue; and the lot between 1309-11 and 1319 Third Avenue, subject to the provisions listed in 4(a) through 4(e) below and that the results of said negotiations be presented to The Regents for final approval and authority to sell based on offers acceptable to The Regents:

    (a) The offer for sale of the two vacant lots shall commence within six months and the offer for sale of all remaining properties shall commence within thirty-six months, except that no relocation of University activities or tenants or conversion of houses for residential uses shall

be initiated until funds for such purpose are on hand as specified in 4(b) below and until space into which activities or tenants can be relocated is available;

(b) A special fund shall be established to fund projects within the Capital Improvement Program for the purpose of, first, providing accommodation for activities displaced by sale of houses, second, providing accommodation for campus activities displaced by conversion of the structures retained for residential use, and, third, converting and rehabilitating the structures retained for residential use, said fund to be funded from proceeds of the sale of the properties, except as noted in 4(c) below, and, if funds are not on hand from the sale of properties, from an advance, as needed, of not to exceed $50,000 from the University Opportunity Fund, such advance to be on a revolving basis and to be repaid with proceeds, as received, from subsequent sale of properties, it being understood that, at the completion of the sale of the properties, any part of the advance not repaid shall be converted to an appropriation;

(c) The portions of the proceeds of the sales of the lots between 1309-11 and 1319, and between 1343 and 1355 Third Avenue, attributable to the eighteen parking spaces currently located thereon, shall be deposited in the Net Revenue Account of the University of California Parking System;

(d) Funds not to exceed $10,000 shall be allocated by the President obtain an appraisal of market value of the properties for use as residences; and

(e) All properties shall be sold in the then existing condition, it being made clear to the buyer that he or she may be required to conform to all applicable State and City and County of San Francisco codes in converting the structures to residential use;

5. That funds not to exceed $25,000 be allocated to the San Francisco campus from the University Opportunity Fund for the purpose of retaining an independent consultant firm to develop additional plans for the alleviation of transportation problems such as traffic, parking congestion, and availability of public transit, it being the intent that such plans be implemented to the extend feasible within resources normally available to the campus for such purposes or within additional State appropriations that might be made available for such purposes;

6. That the Long Range Development Plan for the San Francisco campus, as approved by The Regents in October, 1975, be amended to reflect the described changes in designation of open space, boundaries, and use of housing;

7. That The Regents recognize the principle that the San Francisco campus will be administered so that the annual average of the daily campus population at the Parnassus site will remain substantially in accordance with the projections set forth in the Environmental Impact Report related to the Long Range Development Plan for the campus, approved by The Regents in October 1975.

OFFICE OF THE MAYOR
SAN FRANCISCO

LONDON N. BREED
MAYOR

January 16, 2020

Chancellor Sam Hawgood
University of California, San Francisco
513 Parnassus Avenue, Room 115 F, Box 0402
San Francisco, CA, 94143

Dear Chancellor Hawgood,

Happy New Year! As we begin this new year, this new decade, we look forward to continuing to work with you and the leadership of UCSF to help advance UCSF's mission of being the leading university dedicated to advancing health worldwide through preeminent biomedical research, graduate-level education in the life sciences and health professions, and excellence in patient care. We know UCSF is devoted at every level to serving the public, and the residents of San Francisco are fortunate to have your 22,500 employees serving them, as well as, to benefit from the nearly $6.5 billion you generate annually for the Bay Area economy.

Working collaboratively has been the hallmark of the City and County of San Francisco and UCSF's relationship over the years. As examples, we can proudly point to UCSF's partnership with our Department of Public Health in operating Zuckerberg General Hospital, or more recently, your assistance reviewing the methodology of the environmental testing surrounding the Shipyard at Hunter's Point. Indeed, both the City and UCSF tremendously benefit from working together.

To that end, and to further this collaborative spirit, as UCSF embarks on its rebuild and, truly, its reimaging of its Parnassus Height Campus, we propose that the City's Planning Department convene a City stakeholder process and directly engage with your planning team on the future design and uses of the campus. We are well aware of your growing needs and of the public's growing demands on your health care system and the services you provide. However, we want to ensure that as UCSF moves forward with its proposal, the input of the City's Planning Department and UCSF's surrounding neighborhoods are heard.

Moreover, as we discuss the growth at Parnassus Heights, the common challenges we both face – housing supply, affordability, transportation infrastructure, demand for more community and social services, and climate and seismic related risks – should be addressed in manners consistent with both UCSF's and the City's polices. By working with the City's Planning Department, the Mayor's office, District Supervisors, and neighborhood residents, we are confident such challenges can be met to address both of our short term and long-term needs.

LONDON N. BREED
MAYOR

In 2007, the City and County of San Francisco entered into a Memorandum of Understanding with San Francisco State University, as they embarked on their own campus redesign, which adopted and formalized arrangements for the coordination and consideration of both of our interests and inputs in the context of land use approvals, transportation needs, and ongoing service provisions. This is a model of collaboration that we recommend we pursue jointly as you move forward with the Parnassus project. As a first step in this process, we would like to meet with you and your team to outline a proposal for how such an MOU could be adopted by both of us. Should you have any initial questions or comments, please do not hesitate to contact any one of us. We look forward to discussing this further.

Sincerely,

London N. Breed
Mayor, City and County of San Francisco

Norman Yee
President, San Francisco Board of Supervisors

Recommendation:	**Adopt the Resolution**

PROPOSED POLICY AND PLANNING AMENDMENT

In the context of the recent displays of institutional and structural racism and white supremacy, and the responding popular outcries for deep and lasting transformation, the Planning Department Staff prepared a Resolution requested by the Planning Commission to consider and adopt regarding the centering of the Planning Department's work program and resource allocation on racial and social equity. The Resolution acknowledges and apologizes for the history of inequitable Planning policies resulting in racial disparities; directs the Planning Department to implement its Racial and Social Equity Action Plan; directs the Planning Department to develop proactive strategies to address structural and institutional racism in collaboration with Black and American Indian communities and Communities of Color; directs the Planning Department to amend its hiring and promotion practices to ensure the Department's staff reflects the diversity and demographics of the community at all staff levels; recommends that the Board of Supervisors condemn discriminatory government actions; and directs the Planning Department to build accountability through metrics and reporting.

RESOLUTION CENTERING THE PLANNING DEPARTMENT'S WORK PROGRAM AND RESOURCE ALLOCATION ON RACIAL AND SOCIAL EQUITY; ACKNOWLEDGING AND APOLOGIZING FOR THE HISTORY OF INEQUITABLE PLANNING POLICIES THAT HAVE RESULTED IN RACIAL DISPARITIES; DIRECTING THE DEPARTMENT TO IMPLEMENT ITS RACIAL AND SOCIAL EQUITY ACTION PLAN; DIRECTING THE DEPARTMENT TO DEVELOP PROACTIVE STRATEGIES TO ADDRESS STRUCTURAL AND INSTITUTIONAL RACISM, IN COLLABORATION WITH BLACK, AMERICAN INDIAN AND COMMUNITIES OF COLOR; DIRECTING THE DEPARTMENT TO AMEND ITS HIRING AND PROMOTION PRACTICES TO ENSURE THAT THE DEPARTMENT'S STAFF REFLECTS THE DIVERSITY AND DEMOGRAPHICS OF THE COMMUNITY AT ALL STAFF LEVELS; RECOMMENDING THAT THE BOARD OF SUPERVISORS CONDEMN DISCRIMINATORY GOVERNMENT ACTIONS; AND, DIRECTING THE DEPARTMENT TO BUILD ACCOUNTABILITY THROUGH METRICS AND REPORTING.

PREAMBLE

WHEREAS, the Planning Commission has reflected on the current events of COVID-19 and its disproportionate effects on American Indian communities, Black communities, and communities of color; the murders of George Floyd, Breonna Taylor, Ahmaud Arbery, Alex Nieto, Mario Woods, Luis Góngora Pat, and countless others as a result of police brutality and misconduct; and underlying government and economic structures that create the platform for these events; and

WHEREAS, the San Francisco Human Rights Commission states that racial equity means the systematic fair treatment of people of all Races that results in equal outcomes, while recognizing the historical context and systemic harm done to specific racial groups; and,

WHEREAS, San Francisco has a long history of creating and/or enforcing laws, policies, and institutions that have promoted white supremacy and perpetuated racial inequities in the City and County of San Francisco ("the City"), much of which is difficult to document due to historical erasure. The conditions that have created such racial inequities are also compounded by the intersection of race with class, gender,

sexuality, immigration status, disability, and other social identities and experiences that result in inequitable treatment or opportunities; and,

WHEREAS, using the power of zoning and land use, the City, its Planning Department ("Department") and other government agencies and private organizations have intentionally advanced policies aligned with white supremacy to segregate, displace, dispossess and extract wealth from Black communities, the American Indian community, and other communities of color. With the acknowledgement that this list is by no means exhaustive, examples include but are not limited to the following: Our history of state-sanctioned racism began with the genocide, exploitation, and dispossession of resources of the American Indian people on whose land our state and nation were founded. The City's 1870 Cubic Air Ordinance and 1880 Laundry Ordinance targeted the Chinese population using appeals of public safety to limit where they could live and work. Starting in the 1930s, Federal policies like redlining and local practices like racial covenants explicitly blocked American Indians, Black people and people of color from loans for homeownership and maintenance, as well as access to neighborhoods with good services and jobs; these policies led to cycles of disinvestment, segregation and poverty concentration among these communities. In 1942, in response to the bombing of Pearl Harbor, San Francisco aided the federal government in the forced eviction and internment of thousands of people of Japanese ancestry. In 1945, the Department identified neighborhoods that were predominately people of color as "blighted," including the Western Addition, South of Market, Chinatown, the Mission, and Bayview/Hunter's Point, and used this designation to justify the wholesale removal of Black communities and other communities of color through eminent domain. Furthermore, in the early 2000s, people of color were more likely to receive subprime housing loans than White borrowers. These predatory lending practices led to the foreclosure crisis starting in 2008, disproportionately impacting Black, Latinx, American Indian, and low-income people; during this period, middle-income Black and Latinx households lost nearly one-half of their wealth due to foreclosure. The cumulative impacts of these and other policies have resulted in the persistent outmigration and displacement of communities of color: the American Indian community in San Francisco experienced a decline from 0.5% of the population in 2006 to 0.1% today; while the Black community in San Francisco decreased from 11% of the City's population in 1990 to 5% in 2018; and,

WHEREAS, Although the City has taken steps to undo the damage caused by past policies and practices, the racial disparities caused continue to the present day. Despite progress in addressing explicit discrimination, racial inequities continue to be deep, pervasive, and persistent in San Francisco. In the 1950s and beyond, particularly in the context of a national Civil Rights Movement, systemic racism in San Francisco became much less explicit. Moving away from overtly race-based exclusionary policies regarding land or business ownership, the City's more recent and increasingly sophisticated racism has been defined by inaction or lack of intervention with regards to racial discrimination in employment, housing, neighborhood choice (through implicit exclusionary zoning), education, health care, or the criminal justice system; and,

WHEREAS, the legacy of these discriminatory policies is that San Francisco's American Indian, Black , and people of color have historically been, and many currently are, denied equal access to essential services and means of creating wealth, including affordable housing and homeownership opportunities, high-performing public schools, adequate transportation options, safe parks and open spaces, affordable health care, access to financial capital and entrepreneurship opportunities, and stores selling healthy food, among others; and,

WHEREAS, San Francisco's American Indian, Black, and people of color have historically been, and many currently are, disproportionately exposed to more environmental stressors including air and soil pollution, illegal dumping, industrial uses and transportation impacts, and are more likely to live in housing conditions where degraded indoor air quality contributes to the prevalence of asthma, other airborne diseases, and other health disparities; and,

WHEREAS, stark disparities continue to exist for City residents along racial lines. Race predicts worse outcomes for people of color across key indicators, including education, income, health, and incarceration, among others. For example, household income for White households is close to three times that of Black families and close to double that of American Indian and Latinx households, respectively. 53% of inmates in San Francisco County Jail are Black, while they only comprise about 5% of the City's total population. In 2018, American Indian and Black San Franciscans were more than three times more likely to be unemployed than Whites (11.9% and 12.5% versus 3.6%, respectively); and unemployment rates were similarly high for Native Hawaiian / Pacific Islanders (8.8%) and Latinxs (9.4%); and,

WHEREAS, The 2019 San Francisco Community Health Needs Assessment conducted by the San Francisco Health Improvement Partnership ("SFHIP") found that racial health inequities and poverty were foundational issues affecting the health of San Franciscans, impacting life expectancy, infant and maternal health, nutrition, stress, heart disease, and more. For example, in 2015-2017 the life expectancy in San Francisco was 72.1 years for Blacks, 76 years for Pacific Islanders, 81.7 years for White people, 85.1 years for Latinxs, and 87 years for Asians. (San Francisco data on American Indians was not included; such data is often unavailable in urban areas due to low population counts, which perpetuates disparities in documentation and policies that address their community needs.) The rates of asthma and COPD hospitalizations in the Black community are more than 10 times higher than for Asians; Pacific Islanders have the second highest rates. In San Francisco, Black women are twice as likely as White women to give birth prematurely, and Black and Pacific Islander women have the highest rates of prenatal morbidity. SFHIP also found that between 2007 and 2016, Black mothers had about 4% of births in San Francisco, but experienced 50% of maternal deaths, and 15% of infant deaths. While data on health outcomes in the American Indian population in San Francisco is limited, this community also faces persistent health disparities across a number of indicators. For instance, even though the overall rate of infant mortality in California has been declining since 2005, the American Indian/Alaska Native infant mortality rate in California remains high, averaging 6-7 infant deaths per 1,000 live births between 2005 and 2012; and,

WHEREAS, the impact of the redlining that went into effect in 1937 in San Francisco can still be seen today: 87% of redlined neighborhoods in San Francisco are neighborhoods currently undergoing displacement. The 2010 Census data showed a decline in the number of children of every racial group (including American Indian, Black, Latinx, and Asian and Pacific Islander) residing in San Francisco except white and multiracial children. Between 1990 and 2014-15, as housing prices rose, neighborhoods became more segregated, with the share of Black households in San Francisco living in high-poverty neighborhoods increasing from 41% in 2000 to 65% in 2015 (compared to Asian (27%), Latinx (19%), and White (12%) households). 50% of Black households, 31% of American Indian, and 30% of Latinx households are severely burdened by housing costs (spending more than 30% of their income on housing) while 16% of White households are similarly burdened. American Indian, Black, and Latinx residents have the lowest home ownership rates, at 0.3%, 4%, 9%, respectively. Latinxs reported the highest percentage of having been

threatened with eviction (24%), with 11% of those evictions having been raised with no cause, exceeding the percentage of no-cause evictions for other racial groups. 34% of Latinxs also reported having faced unstable living conditions in the last five years, with 36% stating they would have no other housing options if they were forced to move from their current residence.

WHEREAS, racial disparities in the rates of infection and death from COVID-19 have been documented, with American Indian, Black, and people of color disproportionately impacted by the disease. As of June 3rd, 2020 COVID-19 data for San Francisco, , indicate that Black communities in San Francisco comprised 9.3% of deaths, even though they comprise 5% of the population; Latinx communities comprised 47.8% of diagnosed cases (and comprise 15.2% of the population); American Indian communities comprised 0.4% of diagnosed cases (and comprise 0.1% of the population); and Asian communities comprised 46.5% of deaths (and comprise 34.1% of the population). In the April 2020 UCSF assessment in Mission District, 90% of the Latinx people tested for COVID-19 were positive, The health and economic impacts of the pandemic are exacerbating the existing disparities; and,

WHEREAS, Black and American Indian people are overrepresented among the homeless population. The 2019 San Francisco Homeless Count and Survey found that 37% of people experiencing homelessness were Black, while they represent only 5% of San Francisco's population. Overrepresentation in the homeless population was also high for American Indians (5% compared to 0.1%) and Pacific Islanders (2% compared to 0.2%). Of all people surveyed, 61% reported not being able to afford rent and 37% reported having no income. Discrimination and lack of access to opportunities for American Indian, Black and people of color put them at a higher risk of homelessness; and,

WHEREAS, San Francisco and other cities across the nation are part of a movement to eliminate institutional racism in partnership with the Government Alliance on Race and Equity (GARE), a national network dedicated to achieving racial equity and advancing opportunities for all. The Department's ongoing participation in GARE since January 2016 has given staff the training, tools, and support to build the Department's organizational capacity to advance racial equity in its programs, policies, and services; and,

WHEREAS, the Board of Supervisors, through Resolution No. 190547 on July 11, 2019, amended the Administrative Code to create an Office of Racial Equity as a Division of the Human Rights Commission, with authority to create a citywide Racial Equity Framework, analyze the impact of Board ordinances on racial equity, and create a racial reconciliation process; require City departments to create Racial Equity Action Plans and to provide annual updates on such Plans; require City departments to designate employees as racial equity leaders, and require the Department of Human Resources to produce an annual report concerning racial equity in the City workforce; and,

WHEREAS, in the coming years the Department will amend the General Plan through adoption of updated Housing and Transportation Elements, adoption of a Preservation Element, and updates to incorporate environmental justice, racial and social equity, and climate resilience across all relevant elements. On May 28, 2020, the Department launched the first of these updates: the Housing Element 2022 Update. The Housing Element policies will be grounded on the following values: racial and social equity, minimum displacement, more housing for all in all neighborhoods, and neighborhoods resilient to climate and health crises. The Transportation Element will be the next Element to undergo an update and will center its

policies in ConnectSF's goals of equity, economic vitality, environmental sustainability, safety and livability, and accountability and engagement; and,

WHEREAS, the Planning Commission (Commission) adopted the Racial & Social Equity Action Plan, Phase I on November 21, 2019 to guide the Department and Commission actions to strengthen our internal-facing processes and practices to address disparities in the Department's internal functions to advance organizational equity, through strategies that include: ongoing training for all staff; a biannual staff survey to assess Department attitudes and progress towards racial and social equity; and an interim Racial & Social Equity Assessment Tool to apply to relevant projects, policies, and practices; and,

WHEREAS, the Planning Commission adopted a Racial & Social Equity Vision on November 21, 2019, which envisions: inclusive neighborhoods that provide all with the opportunity to lead fulfilling, meaningful, and healthy lives; a city where public life and public spaces reflect the past, present and future of San Franciscans; a city where a person's race does not determine their lives' prospects and success; an inclusive Planning Department and Commissions that represent and engage the communities we serve; a Department that proactively infuses racial and social equity in both internal operations and external Planning work; and reimagines what the Planning field is and can be – inclusive, diverse and one that centers racial and social equity both as a practice and as an indicator of success; and

WHEREAS, the Planning Commission directed the Department to develop a Racial & Social Equity Action Plan, Phase II in collaboration with the new Office of Racial Equity, other City agencies, the Mayor's Office, the Board of Supervisors, and community stakeholders, to carefully examine and address legacy racial and social inequities and disparities in the Department's programs and policies and to develop Phase II with bold and forward-thinking strategies to advance racial and social equity in San Francisco; and,

MOVED, that the Commission considered public comment and reviewed the information before them and hereby adopts this Resolution.

FINDINGS

Having reviewed the materials identified in the preamble above, and having heard all testimony and arguments, this Commission finds, concludes, and determines as follows:

The Resolution directs the Planning Department to center its work program and resource allocation on racial and social equity; acknowledges and apologizes for the history of racist, discriminatory and inequitable planning policies that have resulted in racial disparities; directs the Department to develop proactive strategies to address and redress structural and institutional racism, in collaboration with Black and American Indian communities and communities of color; directs the Department to amend its hiring and promotion practices to ensure that the Department's staff reflects the diversity and demographics of the community at all staff levels; recommends that the Board of Supervisors condemn discriminatory government actions; and directs the Department to build accountability through metrics and reporting.

General Plan Compliance. The Resolution is in conformity with the General Plan's overall principles and discussion of preserving the cultural and economic diversity of our neighborhoods, although further changes to the General Plan may be needed to implement better the Planning Department's racial and social equity policies. While the current General Plan contains some discussion of equity as indicated in the

sections listed below, current objectives and policies across Elements do not adequately address disparities that are closely associated with race as well as other vulnerable populations.

I. HOUSING ELEMENT

POLICY 5.3. Prevent housing discrimination, particularly against immigrants and households with children.

POLICY 9.3. Maintain and improve the condition of the existing supply of public housing, through programs such as HOPE SF.

II. COMMERCE AND INDUSTRY ELEMENT

OBJECTIVE 3. PROVIDE EXPANDED EMPLOYMENT OPPORTUNITIES FOR RESIDENTS, PARTICULARLY THE UNEMPLOYED AND ECONOMICALLY DISADVANTAGED.

III. RECREATION AND OPEN SPACE ELEMENT

POLICY 1.2. Prioritize renovation in highly-utilized open spaces and recreational facilities and in high needs areas.

IV. TRANSPORTATION ELEMENT

POLICY 1.7. Assure expanded mobility for the disadvantaged.

V. COMMUNITY FACILITIES ELEMENT

POLICY 3.6 Base priority for the development of neighborhood centers on relative need.

VI. COMMUNITY SAFETY ELEMENT

OBJECTIVE 4. ASSURE THE SOUND, EQUITABLE AND EXPEDIENT RECONSTRUCTION OF SAN FRANCISCO FOLLOWING A MAJOR DISASTER.

VII. ARTS ELEMENT

OBJECTIVE II-2. SUPPORT ARTS AND CULTURAL PROGRAMS WHICH ADDRESS THE NEEDS OF DIVERSE POPULATIONS.

VIII. AIR QUALITY ELEMENT

POLICY 4.3. Minimize exposure of San Francisco's population, especially children and the elderly, to air pollutants.

IX. BAYVIEW HUNTERS POINT AREA PLAN

OBJECTIVE 15. COMBINE SOCIAL REVITALIZATION WITH PHYSICAL AND ECONOMIC REVITALIZATION EFFORTS.

POLICY 15.3. Make maximum use of Indigenous community resources to increase civic pride and support physical and economic revitalization.

X. CHINATOWN AREA PLAN

OBJECTIVE 1. PRESERVE THE DISTINCTIVE URBAN CHARACTER, PHYSICAL ENVIRONMENT AND CULTURAL HERITAGE OF CHINATOWN.

XI. EAST SOMA AREA PLAN

OBJECTIVE 7.3. REINFORCE THE IMPORTANCE OF THE SOUTH OF MARKET AS THE CENTER OF FILIPINO-AMERICAN LIFE IN SAN FRANCISCO.

XII. MISSION AREA PLAN

OBJECTIVE 7.3. REINFORCE THE IMPORTANCE OF THE MISSION AS THE CENTER OF LATINO LIFE IN SAN FRANCISCO .

XIII. WESTERN SOMA AREA PLAN

OBJECTIVE 9.4 REINFORCE THE IMPORTANCE OF THE SOUTH OF MARKET AS A CENTER FOR FILIPINO-AMERICAN AND LGBTQ LIFE IN SAN FRANCISCO.

POLICY 9.4.3. Protect and support Filipino, LGBTQ and other minority or culturally significant local business, structures, property and institutions in Western SoMa.

POLICY 9.4.6. Prioritize maintenance and support funding for cultural and service facilities that support Filipino-Americans, such as the Bayanihan Center, the Filipino Education Center, and the West Bay Pilipino Multi-Services Center.

THEREFORE, BE IT RESOLVED, that the Planning Commission condemns all forms of racism, sexism, homophobia, ableism, and other forms of discrimination; and affirms that all people – which explicitly includes American Indian people, Black and people of color – have a right to be in our City and have a right to safe and affordable housing, neighborhoods free from pollution and violence, opportunities for educational advancement and wealth creation, and access to essential services such as parks, transportation, health care, and places selling healthy food, among others; and,

BE IT FURTHER RESOLVED, that the Planning Commission stands in solidarity with the civil unrest and demands for justice of our fellow San Franciscans and communities across the nation, and affirms that Black Lives Matter; and,

BE IT FURTHER RESOLVED, that the Planning Commission must carry its responsibility for guiding the development of our city, streets, and open spaces with a central planning focus on racial and social equity; and,

BE IT FURTHER RESOLVED, that the Planning Commission condemns and apologizes for government practices that have resulted in and continue to have disproportionate impacts upon American Indian people, Black people, and people of color, including racist, discriminatory, and inequitable land use planning policies, programs and government actions, such as redlining, exclusionary zoning, racial covenants, urban renewal and discriminatory enforcement of land use policies; and,

BE IT FURTHER RESOLVED, that the Planning Commission recommends that the Board of Supervisors condemn all discriminatory government practices, including law enforcement practices that have resulted in a disproportionate number of American Indian people, Black people and people of color dying at the hands of law enforcement; and,

BE IT FURTHER RESOLVED, that the Planning Commission recommends that the Board of Supervisors reallocate resources towards expanding access to open space, housing, transportation, and services for American Indian, Black, and communities of color; and that it minimize the negative impacts of budget cuts due to the COVID-19 pandemic on these communities; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs all Department staff to move beyond acknowledgement of injustice and take concrete actions that are visible in the reallocation of resources and work program to (1) increase the American Indian and the Black population and provide stability to communities of color; (2) expand access to open space, housing, transportation, quality amenities and public services, and reduce exposure to environmental pollution in these communities, while ensuring that such investments do not lead to displacement or exacerbate inequities; and, (3) develop and expand participation for American Indian, Black and communities of color ; and

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to collaborate with the Office of Racial Equity (ORE) to align its work with ORE's framework to dismantle structural and institutional racism, which asserts that the City's work shall: (1) Affirmatively address racial and social inequities; (2) Assert that housing is a human right, and prioritize equitable housing development without displacement of American Indian, Black, and communities of color; (3) Develop public land strategies to meet affordable and inclusionary housing goals; (4) Support wealth-building through home ownership for American Indian, Black, and communities of color; (5) Champion housing choice by dismantling exclusionary zoning policies; (6) Promote environmental justice; and (7) Redress the consequences of government-sanctioned racial harm via meaningful City-supported, community-led processes; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs Department staff to expand the implementation of Phase I of the Racial & Social Equity Action Plan, to ensure that the Department's internal practices are thoughtfully examined and amended to advance racial and social equity across all of its core functions; and

BE IT FURTHER RESOLVED, that the Planning Commission directs Department staff to devote the resources necessary for the successful completion and implementation of Phase II of the Racial & Social Equity Action Plan to ensure that its plans, policies and programs actively address and redress structural and institutional racism; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs Department staff to address racial and social equity as it develops policies and programs to respond to the health, economic and housing crises resulting from the COVID-19 pandemic, prioritizing meeting the needs of Black communities, American Indian communities, and communities of color through its policies and programs to support the adaptive use and design of the public realm, community engagement and planning, protection of tenants and cultural resources, affordable housing preservation and production, streamlining and other support for small businesses, and funding for public services and infrastructure, among others; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to assess, strengthen and fund its outreach and engagement strategies to ensure that American Indian, Black and communities of color have true access to representation and participation in planning processes, as well as resources for participatory capacity building; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to amend the General Plan to incorporate policies that explicitly prioritize racial and social equity for American Indian communities, Black communities, and communities of color; that subsequent amendments to the General Plan utilize a racial and social equity lens; and

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to change hiring and promotion practices to correct the underrepresentation of American Indian people, Black people, and people of color across all staff levels and ensure the workforce reflects the needs of our communities; and,

BE IT FURTHER RESOLVED, that the Planning Commission directs the Department to build accountability by identifying actions it will implement to advance racial and social equity, including developing performance measures, incorporating a racial and social equity lens in budgeting decisions, and reporting to the Commission on its progress at regular intervals; and,

BE IT FURTHER RESOLVED, that the Planning Commission asserts that the responsibility for implementing these structural and institutional changes falls upon all Department staff, across all levels and functions, and that it should not fall solely or disproportionately upon the American Indian, Black, or people of color staff who are already burdened with their lived experiences of racism; and,

NOW THEREFORE BE IT RESOLVED that the Commission hereby APPROVES the proposed Resolution on June 11, 2020.

The Regional Housing Crisis

No matter what, the future will bring major challenges. Overburdened infrastructure, climate change, disruptive technological innovation, and the changing regional and national economy are just some of the many issues that will call for coordinated and concerted regional action. One challenge above all, however, requires immediate attention: housing.

The Bay Area's housing affordability and neighborhood stability crisis has been decades in the making. Although the housing crisis has many components, its foundation is clear: there simply is not enough housing, whether market-rate or affordable, given the growing number of residents and jobs.

Instead of increasing housing supply to accommodate household and employment growth, for example, many local governments slowed permitting over time. Concurrently, the state and federal governments have pulled back financial support for affordable housing. Given a limited supply of both market-rate and affordable housing, combined with strong demand driven by exceptional regional economic performance, rents and home prices have risen rapidly. Today the Bay Area may have the most severe housing crisis of any of the nation's large metro areas and, at this time, there are limited policy tools to help address the problem at a regional level.

Supply, Demand and the Impacts of Income Inequality

The Bay Area's rate of housing construction first started to lag in the mid-1970s. Each subsequent decade has seen lower levels of overall housing permitting, as seen in Figure 1.2. Since 1990, other metropolitan regions with strong economies and growing populations, such as Washington, D.C., Seattle and Denver, have permitted housing units at significantly higher rates than the Bay Area. New housing construction in the Bay Area has been much more akin to slower growing, older metropolitan regions such as Philadelphia and New York.

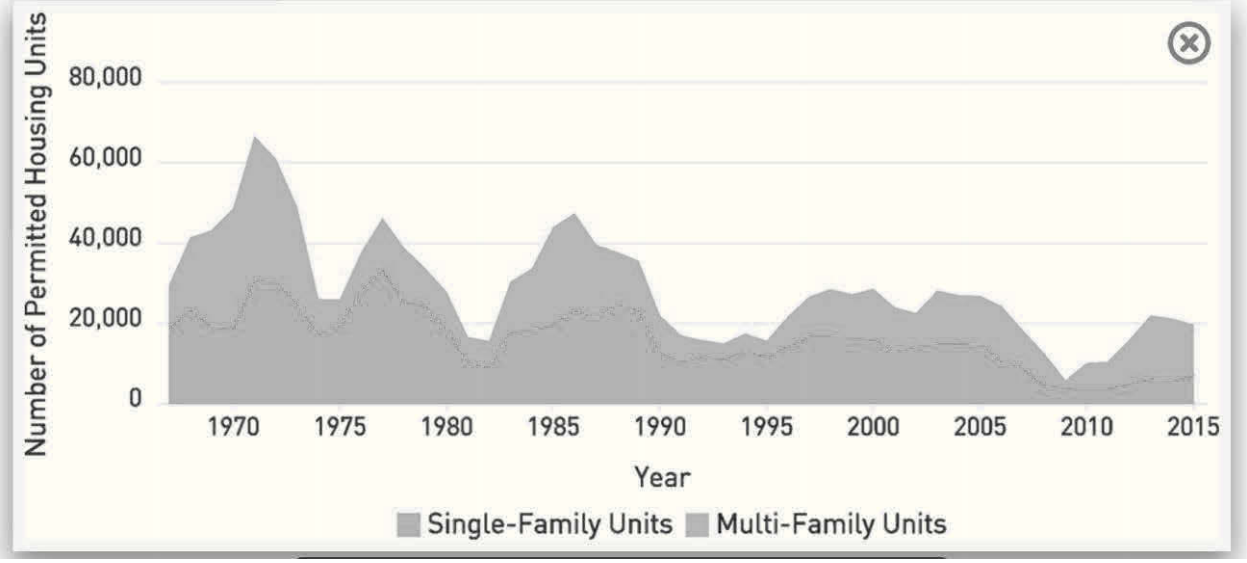

FIGURE 1.2 The historical trend for annual permitted housing units in the Bay Area. This graph shows the historical trend of permitted units for both single-family and multi-family units in the Bay Area, stretching back several decades. As can be seen, annual growth in permitted units stagnated even during the employment booms of the 1990s and 2010s.
Source: Vital Signs; Construction Industry Research Board, 1967–2010; California Homebuilding Foundation/Construction Industry Research Board, 2011–2015

There has been a particular mismatch between employment growth relative to the housing supply. Overall, the Bay Area has added nearly two jobs for every housing unit built since 1990. The deficit in housing production has been particularly severe in terms of housing affordable to lower- and middle-wage workers, especially in many of the jobs-rich, high-income communities along the Peninsula and in Silicon Valley. The booming regional economy combined with increased household formation among the millennial generation has further contributed to an evermore-acute housing crunch.

The widening income gap between high- and low-income households has further exacerbated the housing crisis. As seen in Table 1.1, the total number of households in the nine-county Bay Area increased by 20 percent from 1990 to 2015. The vast majority of this growth, however, was concentrated among households earning $150,000 or more annually, with the remaining growth among households earning less than $35,000 a year. Over a period spanning 25 years, there was a net decrease in the number of households earning between $35,000 and $149,999 in the Bay Area, as these households declined from 64 percent to 52 percent of total households in the region.

Bay Area Household Income*	1990		2015		Change from 1990 to 2015	
	Number of Households	Percent of 1990 Total**	Number of Households	Percent of 2015 Total**	Growth/ (Decline) in Households	Percent of Household Growth
Less than $35,000	446,000	20%	550,000	20%	104,000	+23%
$35,000 to $74,999	645,000	29%	625,000	23%	(20,000)	-4%
$75,000 to $149,999	785,000	35%	793,000	29%	8,000	+2%
$150,000 or more	375,000	17%	741,000	27%	366,000	+80%
Total Households	2,251,000		2,709,000		458,000	+20%

* Income shown in inflation-adjusted 2015 dollars.
** Values may not sum due to rounding.

TABLE 1.1 A comparison of the number of households by income level in the Bay Area over a 25-year period from 1990 to 2015.
From 1990 to 2015, households earning more than $150,000 a year have greatly increased their share of the total number of households in the region and comprised a vast majority of the regional growth in households over the same period. As a share of total households, those earning between $35,000 and $149,999 have declined significantly and in absolute numbers have either stagnated or decreased.

The Regional Housing Crisis
Legacy of Leadership
A Call to Action

These dynamics have had significant implications for the Bay Area housing market. With the increased number of higher income households and most income growth going to the top 20 percent, demand for housing has remained very strong at the upper end of the market. Conversely, it has become more difficult for low- and middle-wage households to compete for market-rate housing as a larger pool of high-wage workers bid up a limited housing supply. This has further intensified competition for scarce affordable housing opportunities.

Policy Contributors to the Housing Crisis

What led to such a mismatch between housing supply and demand? Why does the Bay Area today lack so much needed housing, especially housing affordable to low- and moderate-income households? The causes of this situation are complex and there are many competing interpretations of the available evidence, including a range of economic and demographic factors that extend beyond the Bay Area itself.

Generally, however, the policy drivers — things that local, regional and state governments have the power to address or alleviate — fall into a few interrelated categories: regulatory barriers and tax policy challenges that act to restrict the production of all types of housing, especially infill development; and insufficient support for affordable housing.

The Bay Area Today
The Regional Housing Crisis
Legacy of Leadership
A Call to Action

Regulatory Barriers and Tax Policy Challenges

Although the availability of developable land in the Bay Area is limited due to topography and protected conservation lands, state and local regulations often prevent instead of promote higher-density, mixed-use development in urban infill areas. Lengthy review processes in many communities stall transit-oriented projects long enough to make them infeasible, leading to the loss of grant funding and private investment that would otherwise flow into cities along with desperately needed new housing. The California Environmental Quality Act (CEQA) often acts as another obstacle to both affordable and market-rate housing. Although CEQA has been essential for improving air quality and protecting natural habitats, the law is sometimes used as a litigation tool for blocking projects that are otherwise designed to advance California's environmental policy objectives, such as reducing greenhouse gas (GHG) emissions.

In addition, the current approach to taxation creates incentives to attract development that maximizes sales tax revenues and minimizes costs for public services (such as schools, police and social services), rather than encouraging more balanced approaches to land use. This trend — the so-called "fiscalization of land use" — has discouraged housing development and small business growth in many communities. The tax revolt measures of 40 years ago, such as Proposition 13 and other restrictions on new funding sources, caused many jurisdictions to view housing as a "fiscal loser" because property tax rates were capped below the cost of delivering services compared to retail or commercial development. Commercial property owners also often lack the motivation to develop vacant parcels since the cost of holding these properties is relatively low and a potential windfall from rising land values over time is relatively high.

Legacy of Leadership

A Call to Action

Finally, as part of the 2011 Budget Act, the California Legislature approved the dissolution of the state's 400+ redevelopment agencies. California is now one of a small number of U.S. states without tax increment financing to support urban infill development.

Reduced Support and Insufficient Progress in Building Affordable Housing

In addition to the regulatory and tax policy challenges cited above, recent years have seen major reductions in funding for affordable housing programs at both the state and federal levels. There has also been insufficient progress in the production of "naturally occurring" affordable housing — unsubsidized rental units that are affordable to low- and moderate-income households. This has severely affected the region's low- and moderate-income households by further reducing the supply of new and existing affordable housing, whether government-subsidized or market-rate, especially given median wage deflation from 2000–2013.

Since 2000, for example, there have been cuts of over 50 percent to federal affordable housing programs, and most remaining federal funds go to rehabilitation rather than increasing supply. At the state level, the aforementioned dissolution of redevelopment agencies eliminated a large source of funding for affordable housing, including a loss of more than $200 million for the Bay Area in 2011 alone, according to Enterprise Community Partners and the Non-Profit Housing Association of Northern California.

The Regional Housing Crisis

Legacy of Leadership

A Call to Action

The production of housing affordable to low- and moderate-income households has lagged behind production of housing affordable to higher-income households, with the most significant shortfall occurring in the moderate or middle income category — housing that is typically produced by the market without subsidy in most metro regions. From 1999 to 2014, the Bay Area issued permits for only about 35 percent of the units required to meet the needs of vulnerable populations such as low-income families, seniors and the homeless. This left over 100,000 needed affordable housing units unbuilt.

At the same time, much of the older housing stock that typically forms the backbone of "naturally occurring" affordable housing is located in higher density, transit rich areas that have experienced gentrification pressures and the loss of affordable units, further exacerbating the challenges of sluggish affordable housing production. Moving forward, the annual funding needed to build an adequate supply of low- and moderate-income housing through cost-restricted units rather than through market mechanisms is estimated at $1.4 billion annually, according to the Association of Bay Area Governments (ABAG).

Impacts on the Region's Present and Future

The housing crisis raises major concerns about negative impacts to the region. Affordability, a primary concern of Bay Area residents, continues to be a major challenge. This in turn poses risks to the Bay Area's socioeconomic diversity, transportation system, environmental goals and robust economy.

Housing Affordability

Housing affordability has significantly worsened over time. Home prices are at record levels in some counties and near record levels in the rest. Rent payments have almost doubled in real dollars since the 1970s. While median wages are close to the top nationally, the Bay Area has by far the highest median home sale prices of any major metro region in the country, as shown in Figure 1.3. The region is now also home to three of the five most expensive rental markets in the nation, according to Zillow.

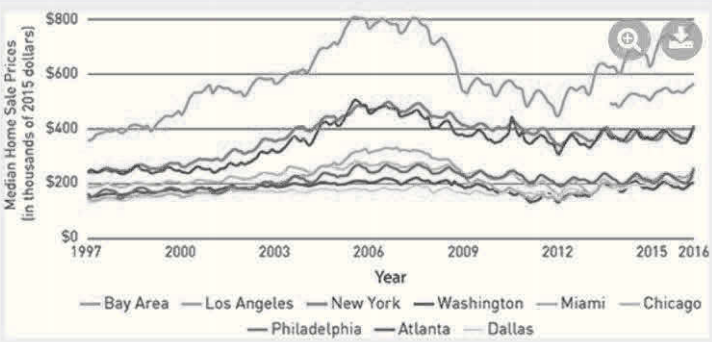

FIGURE 1.3 Median home sale prices by metro area from 1997 to 2016.
Over the last 20 years the Bay Area has seen one of the "spikiest" real estate markets in the country, with bigger booms and busts than other large metros. In particular, prices have risen much faster in the Bay Area coming out of the recent Great Recession.
Source: Vital Signs; Zillow, 1997–2016

The prospects and benefits of home ownership are simply out of reach for many Bay Area households. Amid the affluence and new wealth generated in the post-recession era, approximately 24 percent of the Bay Area's population lives below 200 percent of the federal poverty level, and the vast majority of households with annual incomes below $50,000 experience an excessive housing cost burden, as shown in Figure 1.4.

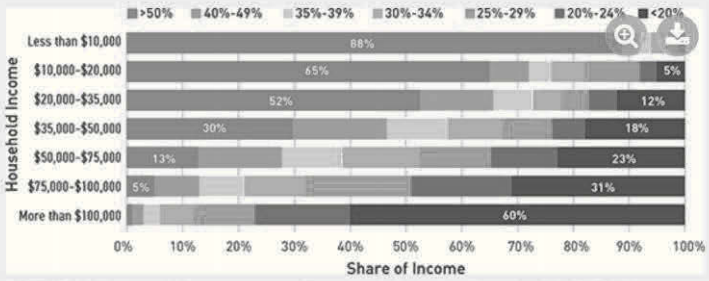

FIGURE 1.4 Share of income spent on housing by Bay Area households in 2015, segmented by income level.
A significant majority of households earning less than $35,000 in the Bay Area spent more than 50 percent of their household income on housing in 2015.
Source: Vital Signs; U.S. Census Bureau/American Community Survey, 2015

Displacement and Quality of Life Concerns

While the cost of housing has increased significantly for both owner and renter households, renters are also at higher risk for displacement during periods of growth and expansion. Currently there are hundreds of thousands of lower-income households at risk of displacement in the Bay Area, with the majority of them living in San Francisco, Santa Clara and Alameda counties.

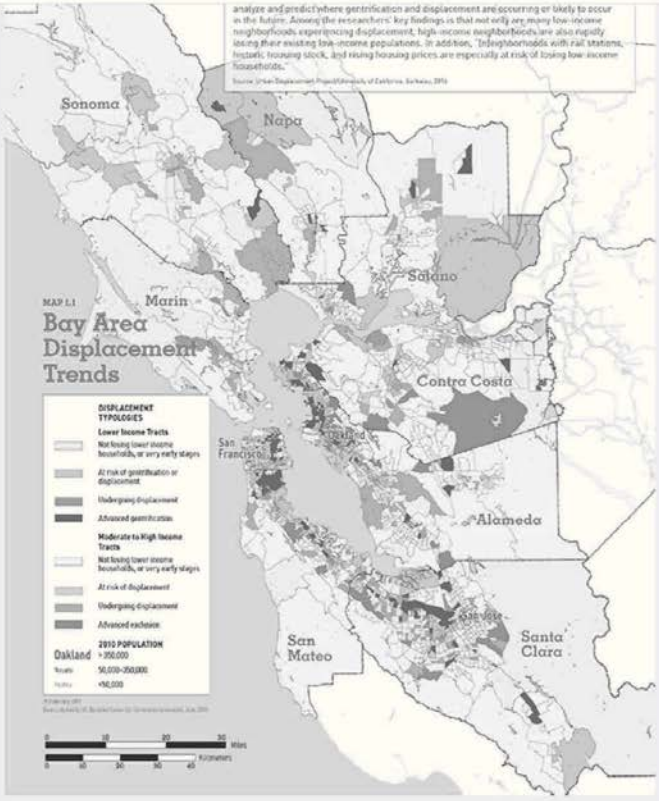
The lack of adequate tenant protections — or availability of subsidized or "naturally affordable" market-rate units in neighborhoods with quality transit service and other amenities — has accelerated the displacement of lower-income residents and even many businesses from the region's core urban areas. As shown in Map 1.1, displacement is no longer just a San Francisco problem, but a region-wide challenge.

The Bay Area Today

The Regional Housing Crisis

Legacy of Leadership

A Call to Action



MAP 1.1 Bay Area displacement trends.
Scholars at UC Berkeley looked at regional housing, income and other demographic data to analyze and predict where gentrification and displacement are occurring or likely to occur in the future. Among the researchers' key findings is that not only are many low-income neighborhoods experiencing displacement, high-income neighborhoods are also rapidly losing their existing low-income populations. In addition, "[n]eighborhoods with rail stations, historic housing stock, and rising housing prices are especially at risk of losing low-income households."
Source: Urban Displacement Project/University of California, Berkeley, 2016

Given insufficient support for affordable housing, many individuals who perform important but lower- paying jobs face either substandard or overcrowded and unhealthy housing; costly, long-distance work commutes; or sometimes even homelessness — the most severe expression of the region's housing shortage. Rising prices in the region's core have driven many lower-income households to outlying jurisdictions farther away from jobs, transit and amenities, even as low- and middle-wage job growth has been concentrated in three counties: San Francisco, San Mateo and Santa Clara. This shift contributes to increased development pressures on open space and agricultural lands, more pollution from passenger vehicles, adverse health impacts, higher transportation costs, and greater levels of highway and transit congestion.

SPUR REGIONAL STRATEGY

BRIEFING PAPER
MARCH 2020

What It Will Really Take to Create an Affordable Bay Area

How much housing does the region need to build to prevent income inequality from getting worse?

This report is one in a series of publications that lay the groundwork for the SPUR Regional Strategy.

Introduction

The San Francisco Bay Area continues to be one of the country's least affordable housing markets. The region's lack of housing and limited affordability have significant ramifications for the people who currently live here, the people who once lived here but have been forced to move elsewhere and the people who used to be housed but now live on the street.[1] These housing pressures are remaking the region's diversity,[2] culture, economy and environment. Limited housing affordability and its impacts across California have dominated the state legislative conversation, resulting in groundbreaking state legislation that has the potential, for the first time in decades, to move the needle on addressing the housing crisis.

And yet much more needs to be done if the Bay Area is going to become a region that builds enough housing for all of the people who want to live here — and for the children of those people to be able to stay here when they grow up.

SPUR is developing a Regional Strategy to envision what the Bay Area could be like 50 years from now if the region is successful in addressing the housing crisis, making great places that support a high quality of life, creating a transit system that works and combating climate change so that future generations can continue to comfortably inhabit this planet.

As part of this effort, we are delving into the causes, nature and sheer size of the housing crisis to make sure the solutions we propose are far-reaching enough to address the scale of the problem. We are testing our proposed solutions for "enough-ness" so that the region's policies don't just continue tinkering around the edges but, when taken together, actually solve the problem. It won't be easy to do. But it is SPUR's hope that by laying out the challenge in all of its complexity, we can help local, regional and state government adopt solutions that will ultimately have a chance of working.

What caused the housing crisis?

Two interrelated factors drive the housing crisis: a failure to build enough housing for all of the people who live and work here, and increases in both incomes and the number of people with higher incomes. SPUR has been working with The Concord Group, a real estate economics firm, to understand both trends.

Driver 1:
The Bay Area has not built enough housing.

Although demand for housing has increased dramatically over the years — most notably due to a rapidly expanding regional economy — the amount of housing produced in the nine-county Bay Area has decreased in recent decades. Through the 1980s, the region produced a significant amount of housing on an annual basis, though much of it was built in lower-density development patterns, including single-family housing, master planned communities and garden-style apartments. In recent years, housing has increasingly been concentrated in fewer locations at higher densities,[3] and the number of units produced annually has decreased. This trend has multiple causes. The region has done a better job of protecting open space and seeking to concentrate growth in places that have already experienced development. Meanwhile, local governments have added more requirements to the development process, making it harder and harder to build housing in already-developed areas. More recently, real estate investors concerned by the Great Recession (and the subprime lending that exacerbated it) moved capital toward less risky investments in high-end urban development.

FIGURE 1
Residential Building Permits Issued in the Bay Area, 1980–2018

3 Romem, Issi, "America's New Metropolitan Landscape: Pockets of Dense Construction in a Dormant Suburban Interior," BuildZoom, February 1, 2018, https://www.buildzoom.com/blog/pockets-of-dense-construction-in-a-dormant-suburban-interior

While housing production declined, the number of jobs rose significantly. From 2011 to 2017, the region added 658,000 jobs and 140,000 housing units, or 4.7 jobs for every housing unit. In many parts of the region, particularly those areas closest to the explosion in tech jobs, the ratio was significantly higher.

FIGURE 2

Ratio of Jobs to Housing in Bay Area Counties

COUNTY	JOBS TO HOUSING RATIO 2004–2008	JOBS TO HOUSING RATIO 2011–2017
San Francisco County	4.27	6.26
Alameda County	-0.05	3.86
Contra Costa County	0.66	3.04
San Mateo County	0.91	8.14
Santa Clara County	1.71	4.15
Marin County	0.27	4.82
Napa County	1.88	8.41
Sonoma County	-0.63	5.15
Solano County	0.55	4.27

The region's new jobs have attracted new residents. Since 2000, the Bay Area's population has increased by 15%, or roughly 1 million people. Adding more people without sufficiently expanding the amount of available housing has exacerbated the housing shortage and driven up the cost of housing.

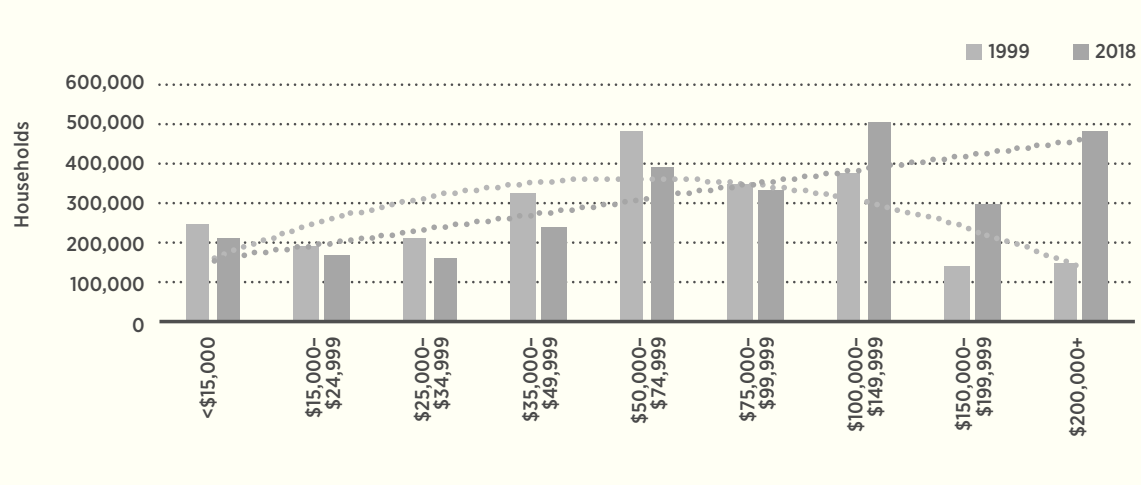
Driver 2:
The Bay Area is becoming richer.

The Bay Area is becoming increasingly wealthy. Just 20 years ago, incomes were distributed in a bell curve, meaning that more middle-income people lived in the region than either low-income people or wealthy people. Over the past two decades, that distribution has shifted to favor wealthier households. Since 1999, the Bay Area has seen a decrease of 300,000 households making under $100,000 and an increase of 625,000 households making over $100,000.[4]

FIGURE 3
Change in Bay Area Household Income Distribution, 1999–2018



Previous SPUR research provides two explanations for the shifts in household income.[5] The first is that wages in high-wage occupations have grown much faster than wages in low- and middle-wage occupations. The second reason is that middle-wage jobs did not grow during the past decade and are projected to grow more slowly than high- and low-wage jobs in the future. Some other reasons for shifts in income could include changes in household formation (when people marry or move in with roommates or family members) and wage increases over time as some people have moved up the job ladder. The net result is that as more higher-income households compete for a limited number of available homes on the market, they bid up rents and purchase prices across the board. This particularly affects new entrants into the housing market, making finding a first-time home expensive — if not impossible — for everyone but the high earners.

4 Analysis by the Concord Group. Note that income figures are not inflation-adjusted because typical inflation adjustments use housing as a major component of ongoing Consumer Price Index calculations. If income is inflation-adjusted to include housing costs, the enormous impact that housing has on income distribution would be eliminated from the analysis.

5 Levy, Stephen, "How the Retirement Wave Will Impact Bay Area Jobs and Workers," SPUR, 2019, https://www.spur.org/news/2019-01-17/how-retirement-wave-will-impact-bay-area-jobs-and-workers

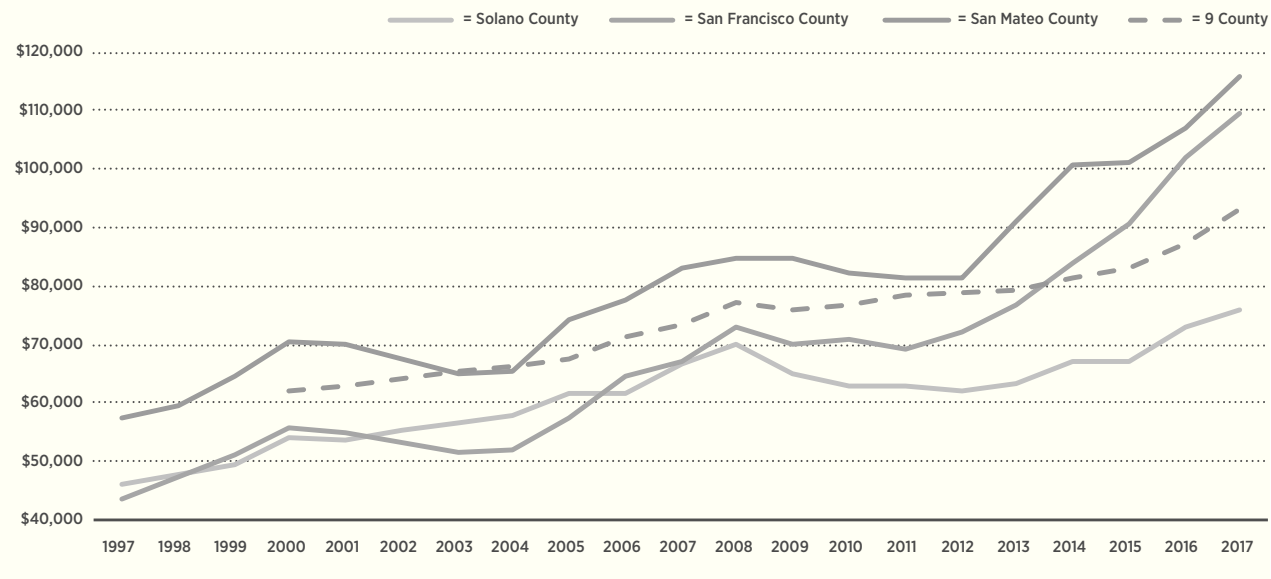
The change in the Bay Area's income distribution can be summarized by a significant shift in median income: The median Bay Area household became 50% wealthier over the last 20 years, with median income rising from $60,000 to $90,000.[6]

FIGURE 4
Change in Bay Area Median Household Income, 1997–2016

Median household income has grown significantly in the Bay Area over the last 20 years. San Mateo, San Francisco and Solano counties are included to show the range of distribution across the region.



These shifts have enormous implications not just for the Bay Area but for the 21-county Northern California megaregion, a geography that stretches from Santa Cruz to Sacramento. As more people move out of the Bay Area to seek affordable housing, the income distribution of the megaregion has also shifted, albeit less dramatically in the 12 outer-region counties than in the nine-county Bay Area.[7] The 12 outer counties — Mendocino, Lake, Colusa, Yolo, Sacramento, Placer, San Joaquin, Stanislaus, Merced, San Benito, Monterey and Santa Cruz — saw growth in households making $50,000 to $75,000 but still saw losses in households making under $50,000.

6 Analysis by the Concord Group. Note that income figures are not inflation-adjusted, as explained in footnote 4.

7 Analysis by the Concord Group. Note that income figures are not inflation-adjusted, as explained in footnote 4.

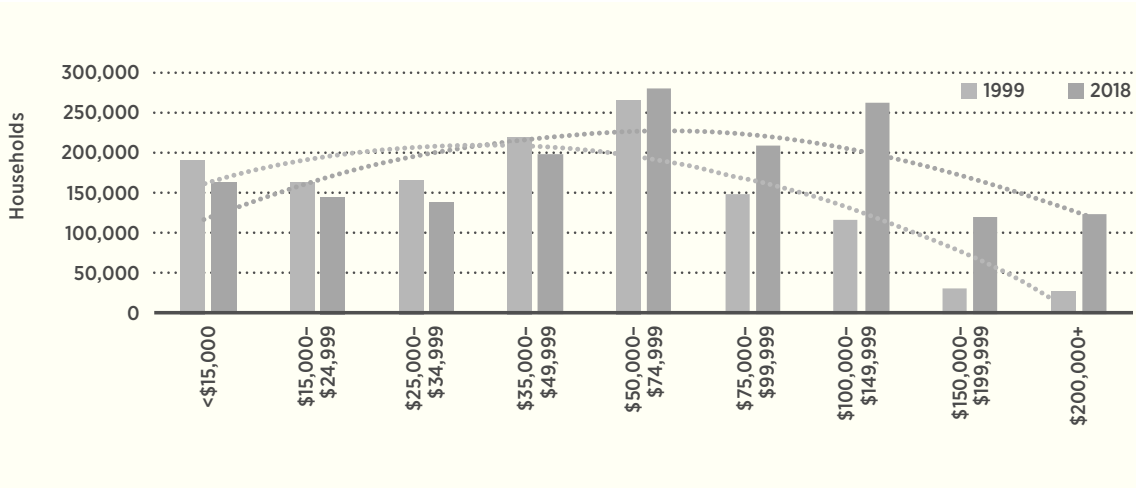
FIGURE 5

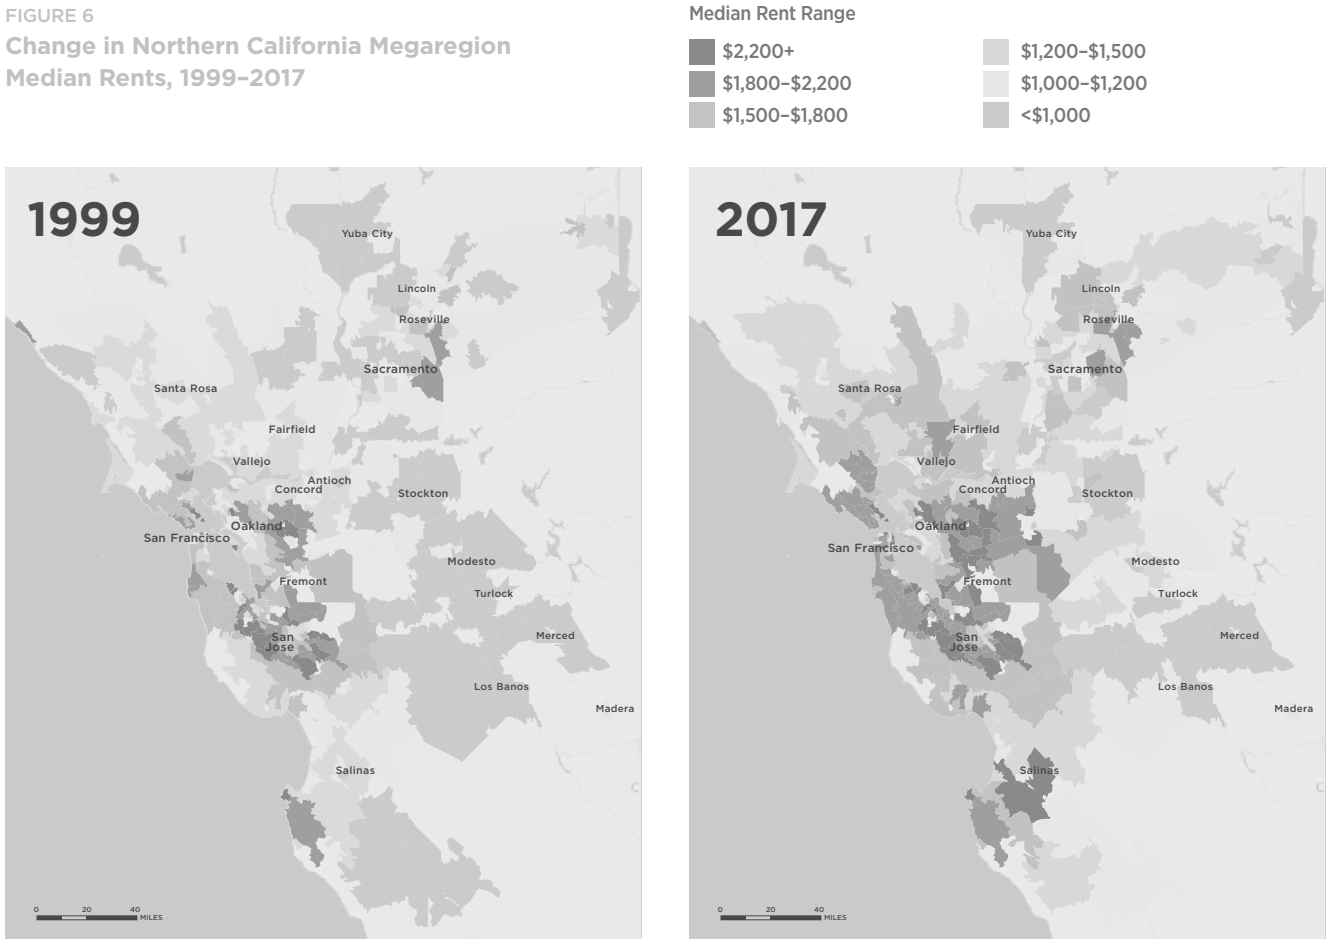
Change in Outer-Region Household Income Distribution, 1999–2018



Unsurprisingly, during this same time period, housing prices in the megaregion have increased as well, although the starkest increases have occurred mainly within the nine-county Bay Area.

FIGURE 6

Change in Northern California Megaregion Median Rents, 1999–2017



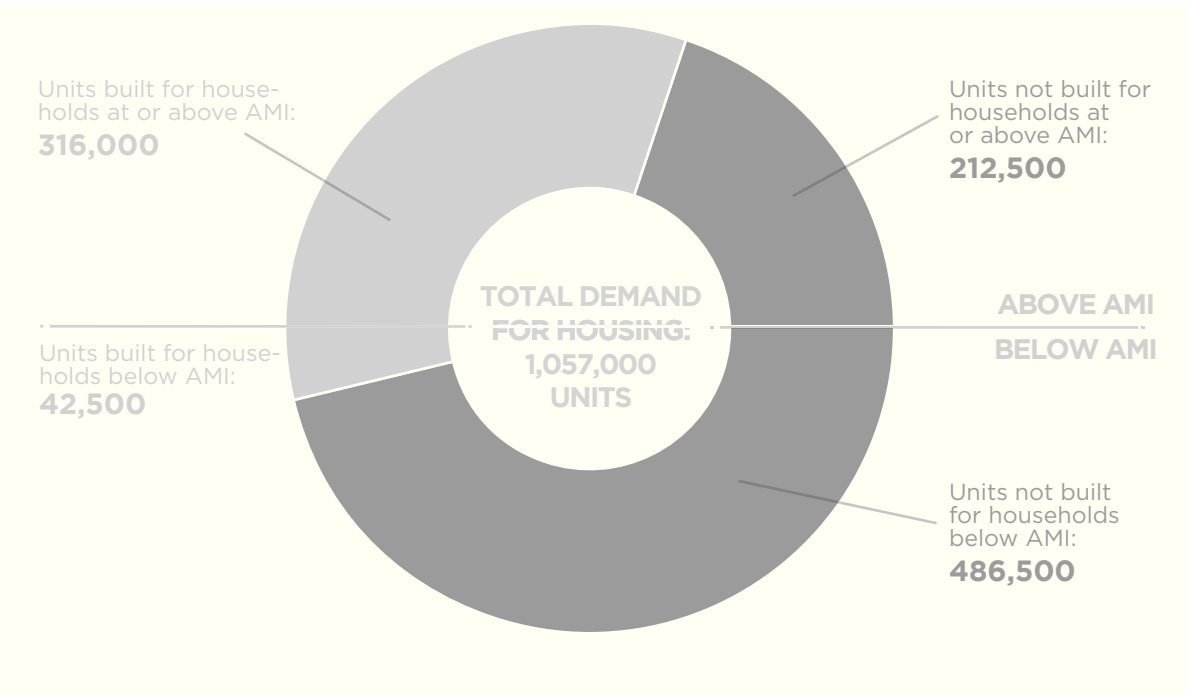
How much housing should the Bay Area have built?

Escalating housing unaffordability has been a contributing factor to massive income distribution changes since 1999, increasing the number of evictions, displacing historic residents of Bay Area communities and threatening the health and growth of the region. How much housing would the Bay Area have needed to build over the last 20 years to prevent income inequality from getting worse? Working with the Concord Group, SPUR sought to answer this question.

We found that the Bay Area saw the construction of 358,500 total housing units over a time period where typical long-term regional growth patterns would have called for a little over 1 million units. This created a shortfall of 699,000 housing units. The market largely served those able to pay the most for housing. Roughly 316,000 of the newly built units were rented or sold to those with higher incomes and/or higher levels of wealth, who were able to absorb the rapidly rising housing costs. At the same time, affordable housing developers built roughly 42,500 units of permanently affordable subsidized housing — not nearly enough to satisfy the demand for housing at the lowest end of the price spectrum. The missing 699,000 units fall into two categories: 486,500 units of housing needed for those below the median income and 212,500 units of housing needed for those above the median income, meaning that the demand for affordable and middle-income housing went largely unmet.

FIGURE 7
Historical Housing Shortfall
Bay Area Housing Demand, 2000–2018

How much housing would the Bay Area have needed to build over the last 20 years to prevent income inequality from getting worse? Analysis by SPUR and the Concord Group shows a shortfall of 699,000 housing units, most of them for households below the area median income (AMI).



Data visualization by Justin Fung. Source: See appendix for sources and methodology.

What was the impact of this failure to produce enough housing? Where did all of those people go? As SPUR has written about previously,[8] some moved to other places, some decided to stay and pay more of their income toward rent and others never showed up in the first place: Individuals who may have contemplated moving to the Bay Area decided to go elsewhere due to the region's high housing costs. Of those who have stayed, some live in overcrowded housing, doubling up with friends and family, or in units that are ill-suited to their family size. Others have not left their childhood homes, delaying adulthood. Of those who have left the Bay Area, some have moved to outer-county cities such as Sacramento in search of cheaper housing,[9] enduring lengthy super-commutes to keep their Bay Area jobs. Others have left Northern California altogether for more affordable metro areas, like Denver or Austin. Most distressing of all, many have lost all forms of housing, leading to the region's current homelessness crisis.

8 Terplan, Egon, "How Much Housing Should the Bay Area Have Built to Avoid the Current Housing Crisis?," SPUR, February 21, 2019, https://www.spur.org/news/2019-02-21/how-much-housing-should-bay-area-have-built-avoid-current-housing-crisis

9 Kneebone, Elizabeth and Issi Romem, "Disparity in Departure: Who Leaves the Bay Area and Where Do They Go?," Buildzoom and Terner Center for Housing Innovation, http://ternercenter.berkeley.edu/uploads/Disparity_in_Departure.pdf

How much housing does the Bay Area need to build for the future?

We also investigated how much and what type of housing the region should produce to keep up with future demand. More housing will be needed as the region's children grow up and create families of their own and as the economy continues to evolve, adding new workers in the decades to come. Accounting for growing demand is particularly important in stemming the flow of lower- and middle-income households from the region.

It's not possible to know how much the region's population will grow over the next 50 years, but data analysis can offer helpful projections. For this investigation, our partners at the Center for Continuing Study of the California Economy estimated a high population growth target and a low population growth target.[10] The Concord Group then modeled what those targets mean for housing demand. Using the high growth projection (one that includes more aggressive assumptions regarding levels of immigration and job growth), SPUR estimates that the Bay Area will need a minimum of 1.5 million new units between now and 2070 both to keep up with population growth and to stop the current trend of losing low- and moderate-income households as the region gains wealthier households.

If we include the existing housing shortfall — the 699,000 units the region should have built over the last 20 years but didn't — we estimate that the Bay Area needs to produce a minimum of 2.2 million units by 2070, or roughly 45,000 units per year (see Figure 9). We believe it is important to include the shortfall, as current residents of the Bay Area are already experiencing the impacts of the region's failure to deliver a sufficient amount of housing: high housing costs, overcrowding and homelessness. As we have shown, the region's inability to deliver a sufficient amount of housing at all income levels has led to a loss of lower-income households. By addressing the shortfall, the region could ameliorate some of these negative impacts.

SPUR's housing target of 2.2 million units (45,000 per year) is somewhat higher than the regional target developed by CASA (the Committee to House the Bay Area) of 35,000 units per year.[11] McKinsey estimates that California needs to produce a minimum of 3.5 million homes statewide to meet a backlog demand of 2 million homes plus a growth demand for 1.5 million homes by 2025.[12] The Bay Area's housing growth target from 2015 to 2023, set at the state level through the Regional Housing Needs Allocation (RHNA) process, shows a need for 188,000 housing units over an eight-year period, or roughly 23,500 units per year. SPUR is recommending housing growth targets that are almost double the RHNA estimates and slightly more than double the region's annual production from 2000 to 2018.

---

10 The Center for Continuing Study of the California Economy provided SPUR with population and job projections as detailed in its report *High and Low Projections of Jobs and Population for the Bay Area to 2070 — Projection Framework, Specific Assumptions and Results,* https://www.spur.org/sites/default/files/wysiwyg/CCSCE_High_and_Low_Projections_of_Jobs_and_Population_for_the_Bay_Area_to_2070-Projection_Framework_Assumptions_and_Results.pdf
The report included a high growth target and a low growth target based on national projections for jobs and population, as well as assumptions about immigration, growth in various economic sectors and the share of the population and job growth that the Bay Area will attract. SPUR chose to base its analysis on the high growth projection due to the following factors. First, it is unknown how rapidly the Bay Area's population will grow, but it most likely will reach both the low and the high targets eventually, if not within 50 years. Planning for the high growth target enables the region to fully meet future housing demand and plan for appropriate density. Second, if housing growth exceeds population growth targets, then housing prices might stabilize or decline for a period of time. Stabilizing prices would halt further displacement. While a period of declining prices might make existing owners worse off, it might help renters and assist many in the middle of the income distribution in buying a home for the first time. It is also easier to stop building when prices drop too quickly than it is to begin building rapidly when housing prices spike.

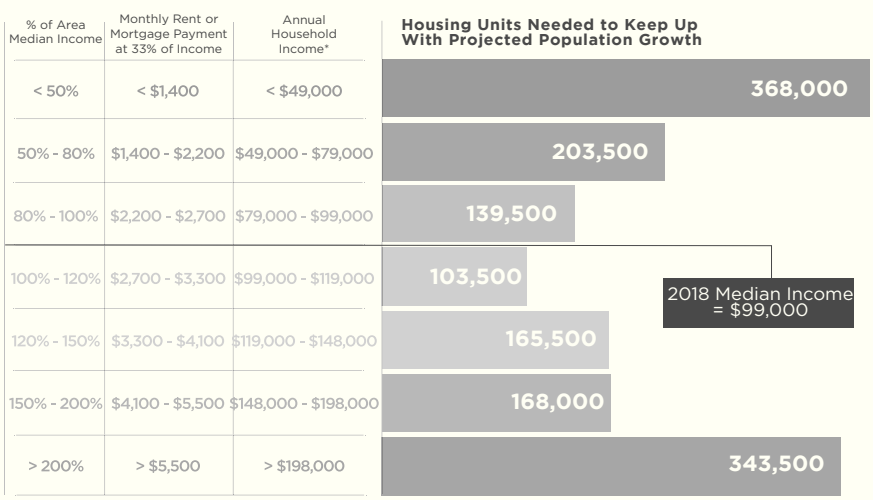
FIGURE 8

How Much Housing Does the Region Need to Build?

Projected Bay Area Housing Demand at All Income Levels, 2018–2070



The Concord Group's model (see Figure 8) looks at housing demand at various income levels based on population growth and seeks to answer the question: How much housing does the Bay Area need to add at different price levels to prevent income inequality from getting worse? It assumes that those who left the Bay Area over the last 20 years aren't coming back and focuses on making things better for the people who are here now and those who might come in the future.

It's important to note that the Concord Group's modeling doesn't answer the question: How much housing is needed to drive down housing prices? This question is notoriously challenging to answer accurately due to the confluence of many factors. To take just three issues: First, developers won't build new housing unless they are able to cover the costs of construction (labor, materials, land and financing). The ability to cover these costs is often dependent on rising housing prices. If housing prices drop below the level needed to build new units, private developers will stop building new housing and prices will rise. Second, if housing prices do decrease, then the Bay Area becomes a more desirable place to live for more people, which increases demand, and that increases prices. Lastly, driving housing prices down (rather than just flattening out price increases) can have negative impacts for homeowners, who can find themselves upside down on their mortgage if what they owe is more than the value of their home.

Because it's so hard to answer the question of how much housing the region would need to build to drive prices down, we are treating the answers that come from our modeling as minimum targets, knowing that the Bay Area would need to outproduce these numbers by some factor in order to reduce housing prices over time. It will be important to develop a housing delivery system that can change based on housing prices, allowing for more rapid housing production when prices spike. This system should also take into account the locations and types of housing needed to address demand.

The Bay Area will also need to adopt new policies to help develop housing for people at different incomes. The region will still need to produce a significant amount of market-rate housing — a minimum of 343,500 units for households making more than 200% of the area median income. For those at 80% of the area median income and below, the region will need to produce a minimum of 571,500 units. And for those between 80% and 200% of the area median income, another 576,500 units will be needed.

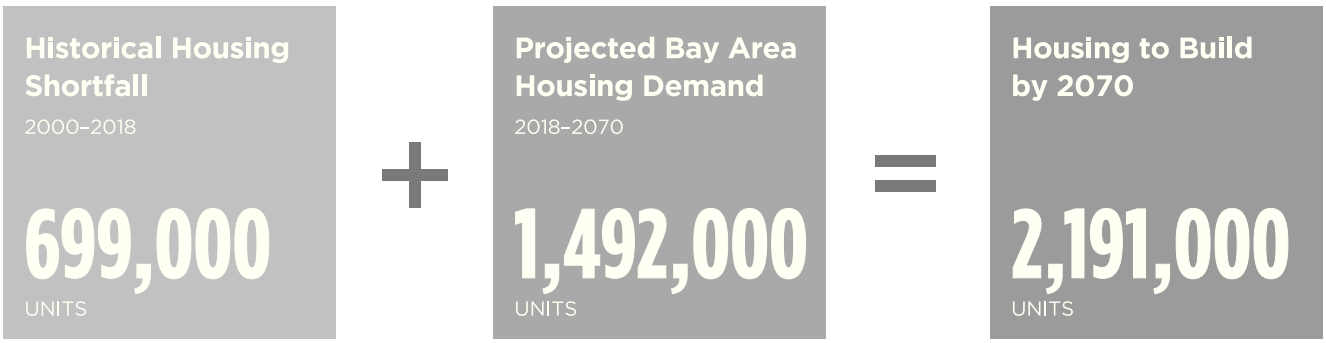
Data visualization by Justin Fung. Source: See appendix for sources and methodology.

FIGURE 9

SPUR's 2070 Housing Target

Total Bay Area Housing Demand, 2000-2070

By adding the existing housing shortfall from Figure 7 to the projected housing need in Figure 8, SPUR estimates that the Bay Area needs to produce almost 2.2 million new housing units by 2070, or about 45,000 units per year.



Source: See appendix for sources and methodology.

What will it take to get there?

SPUR is deep in the process of developing an agenda to address the Bay Area's affordable housing challenge at the scale of the problem. While housing unaffordability may seem like an impossible problem to surmount, there are steps that those of us who live and work in the Bay Area can take. We can double the amount of housing our cities build, change our taxation and governance structures to fund the housing we need and adopt policies to protect the people who live here now. But to make all of this happen requires political will. The following are SPUR's initial thoughts about what it will take to create an affordable region.

Treat housing as infrastructure.

Housing is not something that's nice to have, like a new pair of shoes or a vacation. It is critical to human beings to have a place to live, just as it is critical to have food to eat, clean water to drink and power to provide heat in the winter. When we need new water pipes to ensure regional access to clean water, government doesn't just change the zoning code to allow for the new pipes and wait for the private sector to build them. Government develops the plan for the new water pipes, the public funds their construction and the government hires private contractors to build them.

If we treated housing as infrastructure, the same way we treat roads and water delivery as infrastructure, what in our housing delivery system would change? For starters, it might not be enough to rely solely on the private market to provide enough housing. Privately financed development in the Bay Area requires the careful alignment of a variety of factors: a local jurisdiction that will permit enough housing to be built, land prices low enough for the developer to recoup the cost over time, access to sufficient private lending at a low-enough rate to finance the construction, a workforce available to build the housing — and rising housing prices to pay for all of the above. This system of financing often means that housing can only be built when housing prices are escalating. When the market is down, housing production slows to a trickle — or sometimes stops altogether.

What if we rethought some aspects of this housing delivery system in order to achieve different objectives? For example, what if we could use public financing to build housing, particularly affordable and middle-income housing, at the bottom of the market (when land is cheaper and labor is more available) rather than at the top of the market? Being able to deliver housing at the low end of the market would have the added benefit of providing construction jobs throughout the market cycle, making them more secure over time.

What if there were other ways the public sector could provide readily available, lower-cost capital to finance the creation of middle-income housing — in ways that didn't cannibalize funding for more deeply affordable housing? And what if we were able to squeeze risk out of the development process by ensuring the faster, clearer permitting of housing so that developers functioned more like contractors? If their role was more focused on building the housing rather than negotiating a complicated and risky entitlement process, could they bring housing to market at more affordable price points?

It is not impossible to devise a different housing system than the one we have today. Other countries have made it a societal priority to build enough housing for everyone.[13] We can learn from them.

13 For example, in Vienna, roughly half of the city's housing stock is highly regulated, affordable "social housing." See: Holeywell, Ryan, "Vienna Offers Affordable *and* Luxurious Housing," *Governing*, February 2013, https://www.governing.com/topics/health-human-services/gov-affordable-luxurious-housing-in-vienna.html

Make it less expensive to build housing.

Regardless of how housing is financed, one thing is clear: We need to build significantly more of it — at all price points — if we're going to get ahead of the housing crisis. The region hasn't produced 45,000 units per year since the 1980s, when roughly half of new housing came in the form of sprawl-style single-family housing development, a less expensive building type to construct. Apartments, particularly those in taller buildings, are more complicated to build, so labor costs are higher; they take longer to build, so developers need to pay land costs, such as loan payments, property taxes, insurance and security, for a longer period of time before being able to rent or sell homes; and the construction materials, such as steel or mass timber, are more expensive. In order to produce housing at the scale needed, in denser development patterns that preserve the environment, all of the cost components of housing need to be examined: land prices, financing, construction, building permits, planning and building code requirements, taxes and fees. There can be no sacred cows: We need to examine every aspect of the housing delivery system to see how we can produce enough housing at the scale needed.

Change the governance structure to support housing construction.

Our current system of governance is not up to the challenge of solving our current housing crisis. Each city is responsible for deciding how much housing will be built within its boundaries and in which neighborhoods. The ability to determine zoning at the local level is called "home rule," a power enshrined in our state governance structure. Although the state sets a goal for how much housing each region should produce, and then regional agencies provide each city with a target, there is almost no consequence for failing to meet these goals. So each city has the power to engage in zoning practices that exclude middle- and low-income residents, such as allowing single-family homes only and requiring large lot sizes and plentiful parking. The requirements squeeze out apartment buildings, townhomes, duplexes and other more affordable housing types. Home rule creates a no-win situation for local politicians who support housing. They can approve the housing that is needed and face the anger of constituents who don't want more housing in their neighborhoods, or they can oppose the housing and make the housing crisis worse. The cumulative result of each city deciding how much housing to allow within its boundaries is the current statewide housing shortage.

State government has a very important role to play in addressing the housing crisis because it can create new rules around what gets built where. Senate Bill 50, a proposed bill that would have prevented cities from blocking housing near transit and in areas with good jobs and good schools, is one example of what state legislators can do. State government can also create new sticks and carrots to discourage or encourage certain behaviors. It can diminish local control for jurisdictions that don't help to address the housing crisis and offer new funding for jurisdictions that work to build the housing needed. It can also reform existing laws, like the California Environmental Quality Act, that make it harder to build housing in already-developed areas.

Regional institutions likewise can play an increased role. The newly created Bay Area Housing Finance Authority has certain powers to help create funding for affordable housing. Such an agency could eventually have other powers, including the power to land-bank parcels for future housing development and assemble land for housing construction.

Ensure that low-income people can stay in their current homes while new housing is being built.

If we are really to solve the housing crisis, we need to find ways to enable low-income Bay Area residents to remain in their homes. Roughly 282,000 low-income families in the Bay Area live in housing that is affordable to them but is currently at risk of cost escalation because those units are not subsidized or price-restricted.[14] And of course, many more housing units are occupied by low-income households at unaffordable rents, causing overcrowding and financial strain. As rents continue to rise, vulnerable families are displaced from the Bay Area.

Recent research has brought to light more information about the patterns and ramifications of displacement.[15] Long-standing theories that new housing development causes gentrification and displacement are giving way to a more nuanced understanding of this complicated dynamic. In most cases, new market-rate housing follows, rather than causes, gentrification. Developers seek to purchase land and build new units when and where prices are already on the upswing — that's when the odds are good that they can recoup their costs through higher rents or sale prices. In neighborhoods already experiencing gentrification, the development of new market-rate housing can speed up the process by further signaling that a neighborhood is a desirable place for investment. Once those new buildings are built and occupied, gentrification can intensify, adding to displacement pressures.

How do we address displacement? The solution to this problem is not to stop building market-rate housing. Without a sufficient amount of market-rate housing, high-income workers will continue to outcompete everyone else and shift housing prices for the entire region. Building more housing for market-rate buyers can reduce their impact on the housing market as a whole and help limit rapid increases in price.

But building more housing is only part of the solution. We also need to find ways to combat displacement by enabling low-income residents of the Bay Area to remain in their homes.

Finding ways to strengthen community ownership of land, taking existing housing out of the speculative market and making it permanently affordable, and developing other tools to stabilize neighborhoods are of critical importance in addressing the housing crisis. Helping low- and moderate-income families find a path to homeownership (without being swept up in the next foreclosure crisis) is another way to engage the problem. Thoughtful interventions that protect renters, like California's recent anti-price-gouging law,[16] are also needed.

---

14 Analysis completed by the California Housing Partnership and Enterprise Community Partners. This number represents an estimate of the total number of unrestricted units offered at rents affordable to low-income (< 80% Area Median Income [AMI)]) households *and* occupied by either an extremely low-income (< 30% AMI), very low-income (< 50% AMI) or low-income (< 80% AMI) household. While this number accounts for most deed-restricted affordable housing, due to data limitations the methodology does not incorporate public housing or locally restricted housing, such as units made affordable through inclusionary zoning. It also excludes housing occupied by tenants using a Housing Choice Voucher, since the units themselves are technically still subject to changes in the market and landlord participation is voluntary.

15 The Urban Displacement Project at UC Berkeley has developed substantial tools to understand displacement pressures in the Bay Area. See: https://www.urbandisplacement.org/

16 Chandler, Jenna, "Here's How California's Rent Control Law Works," *Curbed,* January 6, 2020, https://la.curbed.com/2019/9/24/20868937/california-rent-control-law-bill

Add significant new resources for affordable housing and find ways to build a lot more of it.

Stabilizing existing housing for low-income people and building the amount of affordable housing the Bay Area needs over the next 50 years will require a significant realignment of resources. It is important to note that the past 50 years of housing policy have predominately benefited one segment of the population: property owners, in particular white homeowners, who were not harmed by historic redlining policies. These laws systematically denied communities of color low-cost mortgages and other resources needed to build wealth. As a result of these disparities, white families have greater homeownership rates and have been able to transfer far more wealth over generations than families of color.[17] The largest housing program in the country has been the mortgage interest income tax deduction, which benefits only those homeowners with enough income to qualify for a deduction. In 2017, the cost of this program was $71 billion. While the Trump tax plan of 2017 has reduced the value of the mortgage interest income tax deduction to an estimated $41 billion,[18] none of the cost savings was redistributed to affordable housing programs.

California needs to consider significant new ways to fund affordable housing. It's time to reexamine Proposition 13, the 1978 law that caps property tax increases for both businesses and homeowners. Prop. 13 limits the taxable value of property to its last sale price, even if that sale was decades ago. This has dramatically curbed the amount of funding available for all public goods in California, including affordable housing. We need to find ways as a society to pay for affordable housing, not just through fees on new housing construction or large bond issues that require passage every few years, but through ongoing, stable, large-scale programs that are sized to address the need.

Affordable housing faces the same problems as market-rate housing. Construction costs are the same no matter if the housing is for low-income or high-income residents. The entitlements process is uncertain, as affordable housing must win approvals in jurisdictions that may not want housing for low-income families. And affordable housing often faces even more scrutiny than market-rate housing during the permitting process. There is also significant uncertainty in financing, as affordable housing developers must pull together a dizzying array of funding sources in order to make projects financially viable. This process has led to skyrocketing development costs. We need to find ways to reduce cost and risk in the affordable housing development process so we can build more housing more quickly at a reasonable cost.

Build housing for the "missing middle."

SPUR's research has found that the private real estate market addresses the needs of the highest-income households. These households outcompete and set prices for everyone else due to the limited supply of housing. And while the prices they pay are at record highs, households in this category are not in fact paying a higher percentage of their income now than they have historically. At the same time, affordable housing developers, subsidized by public funding, have made a valiant effort to build permanently affordable housing for the region's

17 Traub, Amy et al., *The Racial Wealth Gap: Why Policy Matters,* Demos, June 21, 2016, https://www.demos.org/research/racial-wealth-gap-why-policy-matters

18 Tax Policy Center, "Key Elements of the U.S. Tax System," *The Tax Policy Center's Briefing Book,* https://www.taxpolicycenter.org/briefing-book/what-are-tax-benefits-homeownership

lowest-income households. But there is a significant part of the population that is not served by either the existing market or subsidized affordable housing programs: the "missing middle."

As mentioned above, SPUR estimates that over the next 50 years, in order to accommodate future growth, the Bay Area will need to build 576,500 units that are affordable to people making between 80% and 200% of the area median income. One part of the solution is to allow enough market-rate housing to be built to lower prices enough that eventually a larger percentage of middle-income people can participate in the housing market. But another part of the solution involves developing new programs and interventions that can reach middle-income households. Secondary units, smaller units that come without a parking space, mixed-income housing that uses the proceeds from market-rate units to subsidize middle-income units, and co-housing (where households collectively finance housing and some common spaces are shared)[19] all need to be examined as tools to address this portion of the market.

Change the cultural assumptions about housing.

Lastly and perhaps most importantly, we need to change the way we think about housing. The American Dream has always involved land ownership, from the Jeffersonian agrarian ideal[20] to the cultural elevation of the single-family home and the white picket fence. Yet other countries and cultures do not place homeownership on such a pedestal. Part of the cultural value of homeownership has to do with the role it plays in the United States as a primary mechanism of wealth generation and wealth transfer from one generation to the next. Another part has to do with our country's extraordinary lack of a social safety net relative to other developed countries. One's ability to retire and enjoy old age often hinges on property ownership. But the American conception of property rights has deeply negative consequences for renters. Unlike homeowners, most renters can't rely on being able to stay in their homes for the long term and aren't guaranteed stable housing costs.

If we are going to change our housing system in any meaningful way, we need to change our collective dream. What if we dreamed of a future where all families could afford housing and go to great schools? Where no one had to live in fear that the next illness or change of job could result in losing their home? Where commutes were short and pleasant and it was easy to get around by train, bus, biking or walking? What if there were ways to build assets for future generations that didn't involve owning a home? What if asset building were not a matter of life and death because our society took care of its people? What if homelessness were not tolerated and we found a way to house our most vulnerable populations?

Dreaming a new dream is the prerequisite for a better future. It's time for us to rise to the challenge.

Methodology to Determine "A Historical Housing Shortfall" (Figure 7) and "How Much Housing Does the Region Need to Build?" (Figure 8)

Figures 7 and 8 in this paper, "A Historical Housing Shortfall" and "How Much Housing Does the Region Need to Build?" were developed by The Concord Group (TCG) to illustrate demand for housing at each whole dollar of income and monthly housing cost, which means that the model reflects true demand for each individual income. For the model, TCG used data from Claritas's Spotlight, a syndicated data source that provides yearly demographic data for the United States. This model specifically used the household income distribution from the year 2018. Spotlight, like the U.S. Census, presents its household income distribution in ranges ($25,000 to $50,000, $50,000 to $75,000, etc.). In total, there are 10 delineated income ranges.

TCG made a set of assumptions that informed the model. First, that "housing affordability" would be defined as a household spending no more than 33% of its income on housing costs and that every household would demand housing at that percentage of their yearly income. TCG then quantified the units demanded at each household income range based on each household in that income range spending 33% of its income on housing. For example, households making under $49,000, or under 50% of the area median income, would have a maximum affordable housing cost of $1,400 per month. The equation to reach this figure is (Annual Income x Housing Burden [33%]) / 12 (months in a year).

Second, TCG assumed that households in the nine-county Bay Area would grow at a rate determined by the Center for the Continuing Study of the California Economy (CCSCE). CCSCE used two different growth scenarios: a high growth potential and a low growth potential for the nine-county Bay Area. The maximum growth scenario projected 1% growth through 2040, 1% growth from 2040 to 2050, 0.5% growth from 2050 to 2060, and 0.5% growth from 2060 to 2070. In total, the maximum growth scenario projected a need for roughly 1,492,000 units of housing in the nine-county Bay Area from 2018 to 2070. The low growth scenario projected 0.6% growth through 2040, 0.4% growth from 2040 to 2050, 0.3% growth from 2050 to 2060, and 0.3% growth from 2060 to 2070. In total, the low growth scenario projected a need for roughly 748,000 units of housing in the nine-county Bay Area from 2018 to 2070.

Third, TCG assumed that the 2018 income distribution would remain constant. While TCG and SPUR do not expect income distribution to remain constant over the next 50 years due to a variety of factors, including wage growth, inflation, employment trends and other major economic events, TCG and SPUR wanted to look at the equitable housing needs independent of those factors and give a broad understanding, in today's dollars, of how much new housing would be needed at which income levels to ensure that housing would be at least as affordable as it is today.

Additional Methodology to Determine "A Historical Housing Shortfall" (Figure 7)

TGC developed a second model to quantify the total housing need for the nine-county Bay Area from 2000 to 2018 as a way to identify the unmet housing needs. In this model, TCG used a household annual growth rate of 2% (the average employment growth per year during this period for the nine-county Bay Area) to reflect what growth could have been for households in this period if sufficient housing had been available. TCG also used the original income distribution of the year 2000. Overall, TCG believes that about 1,057,000 units of housing should have been built during this time period. However, only 358,000 units were built.

The blue number at the lower left represents the affordable housing built in the nine-county Bay Area from 2000 to 2018. The data for affordable units came from the Department of Housing and Urban Development's (HUD's) Low Income Housing Tax Credits Database (https://lihtc.huduser.gov/), which tracks all affordable housing projects, including all projects funded through HUD, state service, local government, for-profit or nonprofit sponsors or any housing project with an income limit. TCG has assumed that, while affordable units can affect households making up to 80% of the area median income, these units served the lowest-earning households within the nine-county Bay Area. This blue number at the lower left represents the units built that are affordable to those making under 100% of the area median income.

The blue number at the top left of the figure represents the total market-rate units built in the nine-county Bay Area from 2000 to 2018. The data for built housing was taken from HUD's building permit website (https://socds.huduser.gov/permits/), with the assumption that all units from the years of 2000 through 2018 were built and operated at an occupancy of 93%. TCG has assumed that, while market-rate units can affect households making any level of income, these units most likely served the highest-wage earners in the nine-county Bay Area. This blue number at the top left represents the units built that are affordable to those making over 100% of the area median income.

The red number at the bottom of the figure represents the units that should have been built for households below the area median income but were not built. The red number at the upper right of the figure represents the units that should have been built for households above the median income but were not built. Overall, TCG has determined that the housing shortfall for the nine-county Bay Area from 2000 to 2018 was roughly 699,000 units.

A Black Nurse Saved Lives. Today She May Save Art.

Once a slave, Biddy Mason went on to a life of extraordinary accomplishments. The fact that she figures in W.P.A. murals in San Francisco may save them from destruction.

By Carol Pogash

Published Aug. 11, 2020 Updated Aug. 13, 2020

SAN FRANCISCO — In June, Laura Voisin George, a graduate student, was writing a scholarly article about a series of W.P.A. frescoes at the University of California, San Francisco.

The ten panels of "History of Medicine in California," completed in 1938 by Bernard Zakheim, a Polish-born muralist, show such scenes as Native Americans offering herbs to doctors and a trapper inoculating someone with the smallpox vaccine.

Ms. Voisin George recognized a central figure in one of the vivid social realist tableaus: Biddy Mason, a Black nurse, is depicted alongside a white doctor, as they treat a malaria patient. Mason, an enslaved woman born in 1818, went on to become a midwife, a nurse, a philanthropist and a founder of the First African Methodist Episcopal Church in Los Angeles.

Ms. Voisin George, who studies history at the University of California, Santa Barbara, learned that the frescoes were about to be destroyed while she was researching. The Jewish News of Northern California reported the news. Her reaction, she said, was "What? How could this be?"

U.C.S.F. had announced plans to demolish the building to make way for a state-of-the-art research center. The university had informed Zakheim's son Nathan that if his family didn't retrieve the frescoes, which weigh as much as 2,500 pounds, they would be destroyed.

Bernard Zakheim painting the mural, housed in an auditorium at the University of California, San Francisco, in 1937. UCSF Archives and Special Collections

Until Ms. Voisin George identified Mason, neither the artist's family nor university officials knew about her presence in the frescoes. As news outlets have reported this discovery, Mason has become a star of the murals and their potential savior. An assertion by the federal government that it owns the frescoes has further complicated matters.

Adam Gottstein, the artist's grandson, said that the university's placing responsibility on the family to save the artwork "boiled my blood." It showed a "complete lack of respect and concern for historical art." Mason's presence, he said, "adds considerable pressure to U.C.S.F. to do the right thing."

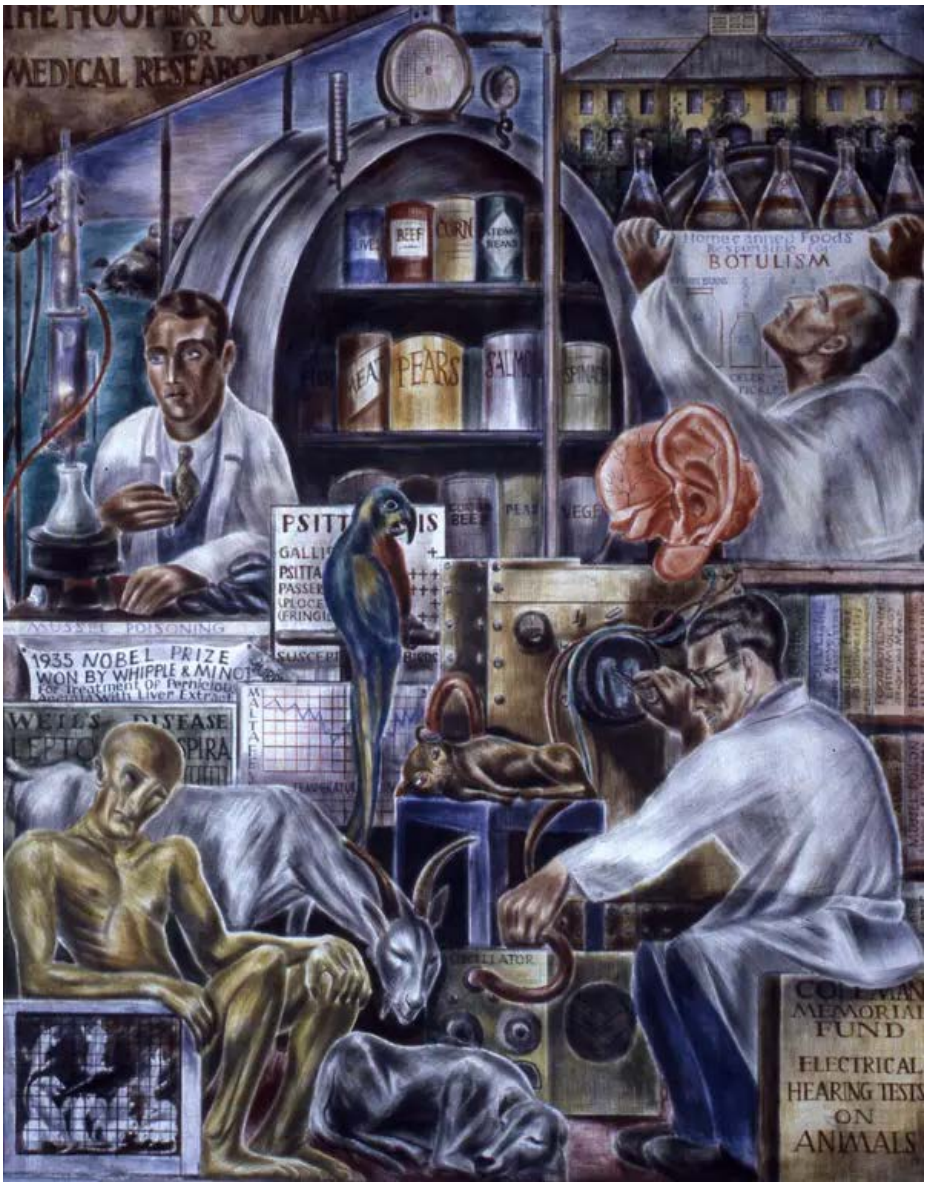
The frescoes were part of the W.P.A.'s Federal Art Project, which hired unemployed artists. Since their creation, the Zakheim murals have been praised, criticized and painted over because a professor said they distracted medical students attending lectures in the auditorium where they are on display. Because of concerns about earthquakes, that auditorium is no longer used.

In 2015, Polina Ilieva, U.C.S.F.'s archivist, wrote that the murals "remain the jewel of the university's art collection."

Zakheim was "one of the most prominent artists in Northern California with a national reputation," said Robert Cherny, a history professor retired from San Francisco State and an expert on New Deal art. "These murals are his largest work," he said. Zakheim, who also created other Depression-era murals for the project, died in 1985.

Nathan Zakheim, the artist's son, an art conservator who in 1976 restored the murals, said he was shocked when he and other heirs received a letter from U.C.S.F.'s lawyers, dated June 4, giving them 90 days to produce a plan to remove the murals. If they failed to respond, the letter said, the university would "presume" it had their consent "to proceed with destruction."

Nathan Zakheim told the university he could move the murals for less than $1 million. There was one hitch: The family lacked the funds.



The series depicts the progression of modern medicine, with this panel focusing on botulism research. UCSF Archives and Special Collections

The series has been criticized for distracting medical students over the years. Liz Hafalia/The San Francisco Chronicle, via Polaris

But the university said it would not spend public money on the move because money was tight during the pandemic. It described the murals as “fragile,” even though an analysis by Page & Turnbull, a historic preservation architecture firm the university hired, said they were “structurally sound.”

Then, on June 18, the university received a letter from the General Services Administration stating that “ownership of the murals resides with G.S.A., on behalf of the United States.” The federal agency wanted the murals to be preserved.

“We were surprised when the G.S.A. said, ‘We assert an ownership interest,’” said Brian Newman, U.C.S.F.’s vice chancellor for real estate. The university said it rejects the G.S.A.’s ownership claim.

Bernard Zakheim with his son, Nathan, in 1967. UCSF Archives and Special Collections

Putting further pressure on the university, The Los Angeles Times published an op-ed piece on July 10 that was based in part on Ms. Voisin George's research. Its headline read: "A monument to California's Black history — and a great work of art — may soon be destroyed."

Cheryl and Robynn Cox, sisters who are descendants of Biddy Mason, grew up knowing that their famous ancestor was painted on the frescoes, as had their mother and grandparents. She also was the subject of a 2015 young adult book illustrated with the mural.

Both women assumed the murals would always be available to the public, until they read the reports about plans to destroy them.

"It's interesting, if you look through the lens of race and gender, this extraordinary Black woman and former slave is bringing attention to the destruction of these murals, but no one personally reached out to us," said Robynn Cox, an assistant professor of social work at the University of Southern California.

"Across the country, everyone is talking about diversity, equity and inclusion," said Cheryl Cox, who works in philanthropy. "To take down a mural of somebody who is showing diversity, equity and inclusion is kind of hard to swallow."

The mural shows "a former slave who is on an equal footing, or maybe an even more than equal footing with white men at a time in which there was still slavery in this country," she added. "I don't know if there's anything like it."

The Cox sisters said they recently met over Zoom with U.C.S.F. officials, including a meeting on Aug. 10 attended by the chancellor, Sam Hawgood.

Last week, the school announced it was seeking bids to remove the 10 frescoes and place them in storage, at a price not to exceed $1.8 million. "We are hoping we can come up with a viable plan for the murals to preserve them," Mr. Newman, the vice chancellor, said.

The federal government response, in an email from Pamela D. Pennington, the G.S.A. press secretary, said: “Until a new location for the murals is determined, their removal, preservation and storage by U.C.S.F. is supported by G.S.A.”

But the descendants of the artist and the famous nurse want the art to be seen.

Mr. Gottstein said, “If they are in storage and never see the light of day, then we will have lost, after all.”

OPINION

Op-Ed: A monument to California's Black history — and a great work of art — may soon be destroyed

Artist Bernard Zakheim showed African American Biddy Mason as an equal among medical authorities in a mural commissioned by UC San Francisco in the 1930s. (Chris Carlsson)

By JACKIE BROXTON AND KEVIN WAITE

JULY 10, 2020 3:18 AM

As antiracist activists topple statues of slaveholders across the country, UC San Francisco threatens to demolish a very different kind of monument: a mural depicting a celebrated former slave.

The work shows Biddy Mason, an African American midwife who rose to fortune in Los Angeles after winning her freedom in the mid-1850s. Since the Great Depression, the mural has been displayed alongside nine others in UC Hall on the university's main campus. But now the building and its artwork are slated for demolition to make way for new office, medical and research space.

In the mid-1930s, UC San Francisco commissioned the Polish-born artist Bernard Zakheim to paint a set of murals of California's medical history. Zakheim, who studied with Diego Rivera, had become regarded as one of the state's major artistic figures. Like his murals in San Francisco's Coit Tower, his UC San Francisco works are landmarks in the bold, modern style of the New Deal era. They have been hailed as "the jewel of the University's art collection."

The panel featuring Biddy Mason is perhaps the most historically significant of the 10 murals. In it, Mason tends to a malaria patient alongside Dr. John Griffin, one of Los Angeles' preeminent early medical authorities. Below, other patients await treatment from Griffin and Mason, who formed a renowned medical partnership in mid-19th century Los Angeles.

What makes the mural unique is its composition. Mason occupies center stage. She's surrounded by a group of white men — soldiers, patients, doctors, city officials — but she's not subordinate to them. Rather, she tends to the patient directly as a medical authority in her own right. Zakheim depicts Mason as she was: a healing presence and a pillar of early Los Angeles.

Biddy Mason began her days in radically different circumstances. Born into slavery in the Georgia cotton belt in 1818, she was seemingly destined for a life of hard labor and a death in obscurity. Like other enslaved African Americans, she lacked a legal family name. She was simply Bridget, or Biddy.

In the late 1840s, Biddy began a long, strange trip — one that took her out of the South and across the continent. She went as a slave, forcibly transported by her master, along with several other Black women and children. They arrived first in Utah before moving to a small Mormon colony in San Bernardino, Calif., in 1851.

Although California was technically a free state, authorities turned a blind eye to slaveholding settlers in their midst. Several dozen slaves worked in San Bernardino alone. Only in 1856 — six years after California outlawed human bondage — did Biddy, along with 13 other African American women and children, win their freedom in a Los Angeles courtroom.

Once free, Biddy took the last name Mason and began an improbable rise through the social ranks of early Los Angeles. She used money earned as Dr. Griffin's assistant to invest in real estate, just as L.A. was beginning to boom. Although illiterate and subject to both racial and gender discrimination, Mason amassed a tremendous fortune. Some estimates place her total wealth at $300,000 (equivalent to $8.5 million today).

Mason is remembered not only for her uncanny business acumen, but also for her philanthropy. She gave liberally — of her time, money and medical expertise — to those in need around Los Angeles. She also co-founded the first African American house of worship in the city. First African Methodist Episcopal Church remains a mainstay of L.A.'s Black community to this day.

Now, a piece of Mason's legacy — the oldest known artistic representation of the famous freedwoman — faces demolition.

University spokespeople claim that UC San Francisco is unable to cover the costs of removing and preserving the murals, estimated at $8 million. If the price of saving 10 frescoes is prohibitive, one wonders where the university will find the funds for its proposed 1.5 million-square-foot expansion project. Perhaps the university could start by dipping into its nearly $4-billion endowment.

Local residents have already begun to protest the development project, set to break ground in 2023. They argue that the expansion will add thousands of workers to the Parnassus Heights campus, further straining the community's overtaxed transit systems and housing options. Critics can add the university's destruction of history to their list of grievances.

The artist's son, Nathan Zakheim, has been given three months to propose a plan to remove the murals at the family's expense. After that, the university will solicit proposals from the public to adopt the murals — again without financial support from UC San Francisco. If no one comes forward: demolition.

UC San Francisco proposes a Silicon Valley solution: a digital re-creation of the murals, which would later be featured in a virtual reality display. Through goggles, visitors would get a secondhand look at art destroyed by the university.

The timing could not be worse. During a crossroads in race relations, when Black American voices are finding new purchase, the university threatens an important piece of Black women's history.

The United States boasts vanishingly few monuments to women of color. Fewer still if the university is allowed to go forward with its ill-considered plans to bulldoze the Biddy Mason mural along with nine others. Black Lives Matter. And so does Black history.

Jackie Broxton is the executive director of the Biddy Mason Charitable Foundation, which provides services and support to L.A.'s foster youth population. Kevin Waite is an assistant professor of history at Durham University and co-director of an National Endowment for the Humanities-funded project on the life and times of Biddy Mason.

UCSF New Deal murals could be destroyed

J.K. Dineen

June 12, 2020 | Updated: June 12, 2020 7:13 p.m.

Professor Robert Schindler talks about murals painted by artist Bernard Zakheim on the UCSF Parnassus campus in 2015.

Photo: Liz Hafalia / The Chronicle 2015

A series of celebrated New Deal-era murals on the UCSF Parnassus campus could be destroyed unless someone comes up with as much as $8 million that the school says would be needed to safely move and preserve the artwork.

In 2015, UCSF invited members of the public into a lecture hall on the campus to see what it described as the “crown jewel” of its art collection: a series of New Deal-era frescoesdepicting the history of medicine in California.

Art history buffs flocked to see the murals, which were painted in the 1930s by Diego Rivera collaborator Bernard Zakheim. Emeritus professor of medicine Dr. Robert Schindler called the murals "enormously significant."

Five years later, however, the future of the artwork is uncertain as UCSF prepares to knock down UC Hall, where the 10 frescoes are located, as part of an ambitious plan to build a new 1.5 million-square-foot hospital and research campus there.

In a statement, UCSF spokeswoman Jennifer O'Brien said the university doesn't have the $8 million it would cost to move the artwork to a new building, and moving the "fragile murals would likely cause irreparable damage," she said.

"Based on these factors, UCSF has decided not to use public funds to physically preserve the murals, especially at a time when the UC system faces financial challenges in the wake of COVID-19," she said.

Instead the university will hire a digital preservation firm to "create a three-dimensional digital recording of the murals that would be prominently highlighted in an interpretive virtual reality exhibit on campus."

O’Brien said the school has reached out to Nathan Zakheim, the 76-year-old son of the artist, to see if the family would like to remove the murals “at their own expense.” The family has 90 days to submit a detailed proposal for how the murals would be removed from the building and preserved. If they do not submit a plan, UCSF will issue a public request for proposals to see if any other individual or group is interested in taking them. If no one responds to that, the murals would be destroyed.

Nathan Zakheim accused the university of “railroading” his family. Zakheim, an art conservator based in Los Angeles, said that the $8 million estimate was “grossly inflated” and that he could do it for $1 million. He suggested that UCSF should “design a square room in the new campus” specifically for the artwork or put it in the library.

“It is a magnificent, unparalleled historic document,” said Zakheim.

“It’s a key part of the university’s history and a key part of San Francisco’s history. If they don’t care about that, well, it’s ridiculous,” he added.

He also said that UCSF administrators had told him that some students and faculty members had complained about the content of the work, particularly the way that Native Americans and Spanish missionaries are depicted.

Bernard Zakheim’s work in San Francisco

Zakheim was a Polish-born San Francisco muralist, best known for his work on the Coit Tower murals. In the early 1930s, he committed himself to the preservation and interpretation of Jewish American life and culture through the making of art. He was one of the organizers of a Yiddish school in the Fillmore District, back when that neighborhood was largely Jewish. He helped found the San Francisco Artists and Writers Union, which lobbied for government arts funding. Eventually that led to the funding of Zakheim’s work in Coit Tower.

In San Francisco, Zakheim’s artwork can be found at UCSF’s Parnassus campus, the lobby of Coit Tower and the San Francisco Jewish Community Center. He also painted murals inside the former Alemany Health Center.

O’Brien said the subject matter of the murals had nothing to do with the decision to attempt to find a new home for them.

Robert Cherny, an emeritus professor of history at San Francisco State University, said the decision to jettison the murals surprised him, especially since the school seemed enthusiastic about the artwork in the past.

“They seem to be very proud of the murals and very much wanted to share them,” he said. “It’s a big turnaround for the UCSF administration. To me this is just somebody in the UCSF administration saying, ‘We don’t want to bother.’ It’s a very cavalier disregard for both history and art.”

In total Zakheim painted 12 murals at UCSF in 1930s: the 10-panel “History of Medicine in California” and two-panel “Modern Medicine” and “Ancient Medicine: Superstition in Medicine” in the Health Sciences West lecture halls. The latter two works are not threatened with removal.

There is precedent for rescuing Zakheim’s mural art. The Jewish Community Center of San Francisco saved a 1933 fresco, “The Jewish Wedding,” when constructing its current building, and unveiled the restored work in 2004. The Zakheim family assisted in the restoration effort.

CULTUREART

Jewish muralist's historic work faces demolition at UCSF

BY **LAURA PAULL** | JUNE 18, 2020

How does a significant piece of public art go from being the "jewel of the University's art collection" to a work designated for the wrecking ball in just five years?

That is the question the descendants of the 20th-century Jewish artist Bernard Zakheim are asking UCSF Medical Center, which on June 4 sent a legal letter to a member of the family saying that the murals he painted in the 1930s could be destroyed to make way for construction of a new building.

The 10-panel series "History of Medicine in California," which Zakheim produced between 1935 and 1938, was commissioned by UCSF and partly funded by the Works Project Administration. Installed in Toland Hall, a lecture room inside UC Hall, the vivid images of doctors, lab scientists, suffering and recovered patients have been studied by generations of medical students — except for one 20-year period

after a particular professor objected that the art was a distraction from the lectures and the university wallpapered it over.

Since freed from that censorship, for decades the university has promoted the art as a visual symbol of its humanistic values. In 2015, as part of the institution's 150th anniversary, the public was allowed to tour the murals, and UCSF archivist Polina Ilieva wrote a blog describing them as "the jewel of the University's art collection."

Physicians on the faculty have recorded lectures elucidating the details of the murals to classes and the public, including a 1996 presentation in which Dr. Robert Schindler lauded the murals as "the product of an extraordinary individual."

But now that UC Hall is scheduled to be torn down starting in 2022 to make way for a 27,000-square-foot, state-of-the-art research and academic building — part of a multiyear, multibillion overhaul of the Parnassus campus, paid for in part by a $500 million gift from the Helen Diller Foundation — those values have come into question.

"Up until very recently my impression was that the UCSF administration understood the value of the murals as history and as art and wanted to preserve and conserve them," said Robert Cherny, professor emeritus of history at San Francisco State and author of "Victor Arnautoff and the Politics of Art" and many articles about the artists of the New Deal era, including Zakheim. "An earlier plan was to convert Toland Hall into a community center so that more of the public could see the murals. The new plan is an abrupt turnaround by the university administration."

Zakheim, a major artist of the period who immigrated from Poland to San Francisco in 1920 and studied fresco technique and painting with Mexican artist Diego Rivera, already had made a name for himself as a muralist when UCSF commissioned the work. Most notedly, he had spearheaded the 1934 Coit Tower mural project, which resulted in murals by 25 local artists depicting California life.

But of all Zakheim's output, the massive Toland Hall murals are his largest single work, Cherny said.

According to Nathan Zakheim, his father "considered those to be his greatest murals. They are extremely powerful works."

Cherny regards Bernard Zakheim as "one of the most prominent of the New Deal artists; I'd place him in a group of the top three on the Pacific Coast, with Victor Arnautoff and Lucien Labaudt, who painted the Beach Chalet mural."

Zakheim was also a Jewish artist with "a commitment to Jewish culture," Cherny said.

Leah Royall, one of Zakheim's granddaughters, remembers him as "a character" who spoke five languages in addition to his native Polish.

"In his dusty house on the Sebastopol property that he called Farm Arts, he'd stomp around singing Yiddish songs. He used to glue articles from the Jewish Bulletin [now J.] into his typewritten letters to us, and he loved talking politics. This was a man who opposed 'art for art's sake' — life and his art were informed by his left-wing political convictions," Royall told J.

In 1933, Zakheim created the mural "The Wedding Ceremony" for the JCC of San Francisco. When the old building was torn down for a new one that opened in 2004, the Zakheim family fought for the work's preservation, and the JCC ultimately agreed to remove the mural and reintegrate it into the new facility.

> Erasing artwork that is historically significant to both San Francisco and California stands in stark contrast to the university's original vision.

In its letter to Nathan Zakheim, as well as in an official statement explaining its proposal to replace UC Hall, UCSF cited the conclusions of two historic preservation firms that the removal of the murals prior to demolition would result in irreparable damage to the works.

"UCSF has decided not to use public funds to physically preserve the murals, especially at a time when the UC system faces financial challenges in the wake of Covid-19. This decision in no way has to do with any complaints about the murals," the university said in its official statement. After requesting additional comment from the administration, J. was referred back to the statement.

The UCSF letter offered the Zakheim family a 90-day period to submit a proposal to remove the murals at their own expense, after which the university said it would make a public announcement calling for other proposals to remove and take possession of the murals within an additional 120 days.

The university's estimate of the cost of removal is around $8 million.

Nathan Zakheim, 76, an art conservator based in Los Angeles, says that figure is unnecessarily high. In phone conversations with Brian Newman, UCSF's senior associate vice chancellor in charge of campus space planning, design, construction and management, the artist's elder son said he believed he could get

the job done for under $1 million. The ace up his sleeve is the fact that his father taught him how to remove the murals during the time when they worked together to remove and restore two other murals in UCSF's Cole Hall in 1967.

"These murals can be removed," Cherny concurs. "Bernard Zakheim foresaw that eventuality and planned for it, and taught Nathan the technique. That is what the UCSF administration doesn't seem to acknowledge."

Bernard Zakheim with son Nathan in 1967 discussing mural removal and restoration at UCSF. (Photo/Courtesy UCSF Archives & Special Collections)

The far-flung family of Zakheim's descendants have united in a response to the university that prioritizes the preservation of the murals.

"Ninety days is an unreasonable amount of time, and the clock is already ticking," said Zakheim grandson Adam Gottstein, 64. "I don't want to get into the politics of it; my hyperfocus is to find a resolution that will save the work from demolition."

Zakheim's daughter, 97-year-old Ruth Gottstein, a lifelong social activist and former independent publisher, dictated an irate letter from her assisted-living facility in Jackson, Amador County.

"It is egregious to me that people today assign themselves the moral right to decide what should happen to these historic and irreplaceable pieces of art. They were painted in 1935! These were the thoughts and principles of the artists at that time. To destroy them is to willfully ignore what was taking place in our world and arbitrarily erase significant portions of our history and evolution. Nobody has that kind of authority. Nobody."

She called the university's offer to commission a "three-dimensional digital recording" of the artwork in lieu of preserving the physical murals "a travesty."

Ruth Gottstein's niece, Bethany Stark, took "umbrage" at the university's a priori decision to destroy the murals unless the family took them away.

"These are works that have artistic, historical and community value," Stark said by phone from L.A. "They belong to the community, to the public and to the university. The murals are not just some antique chair that they can say, 'It doesn't work anymore, do you want it back?"

Royall, an editor in London, shared the outrage, describing the university's decision as "criminal short-sightedness."

"Erasing artwork that is historically significant to both San Francisco and California stands in stark contrast to the university's original vision," Royall said.

Ruth Gottstein also says that the history, ideas and research integrated into the murals continue to provide value for present and future generations.

"At a time of a global health care–based pandemic," she points out, "the need for the 'messaging' in my father's works in Toland Hall are ironically more applicable today than ever."

"It is my hope that we can extend the deadline in order to come up with a collaborative solution to save my grandfather's murals," Adam Gottstein wrote in his own June 15 letter to UCSF.

Arts and preservation organizations and concerned individuals around the city are rousing to the cause. On June 23, S.F. Supervisor Aaron Peskin planned to introduce a resolution to the Board of Supervisors to designate the murals as historic landmarks. The motion would have to be taken up by the Historic Preservation Commission and the Planning Department. While such a designation would not legally protect the murals, because the university is a state institution, "I wouldn't initiate this process if I didn't

believe the murals merit protection, and I hope this symbolic action helps to bring the university to its senses," Peskin told J.

Meanwhile, Nathan Zakheim says his ongoing discussions with the university have been good so far.

"I'm not approaching this as an activist," he said. "I'm a technician. I know how to take murals off walls, and that's what I want to do."

Viewing Zakheim Murals at UCSF

Posted on **March 2, 2015** by **Polina Ilieva**

As part of UCSF's 150th anniversary celebration, the university has arranged special public viewing hours for the Zakheim murals through the spring:

Friday, March 13th: 4 – 7 p.m.
Friday, April 17th: 3 – 5 p.m.
Friday, May 22nd: 3 – 5 p.m.

Location:
Toland Hall on the UCSF Campus
533 Parnassus Ave., Room U-142
San Francisco, CA
Map of UCSF Parnassus Campus and Directions (printable PDF)

Recent article in San Francisco Chronicle highlights history of the Zakheim murals at UCSF.

Do you have questions or need additional information about public viewing?
Please contact UCSF Public Affairs: 415-476-2557

Recent Acquisition: Bernard Zakheim Collection

Posted on **February 24, 2015** by **Polina Ilieva**

Ever since the Polish-born artist Bernard Zakheim painted a series of murals at UCSF in 1930s they remain the jewel of the University's Art Collection. These murals include ten panel series in Toland Hall, "History of Medicine in California," and two panels originally located in the Cole Hall and later moved to the Health Sciences West (HSW) lecture halls – "Modern Medicine" and "Ancient Medicine: Superstition in Medicine." Zakheim worked with Diego Rivera in Mexico City and is best known for contributing the Library Periodical Room fresco and helping organize the New Deal art project at the Coit Tower in San Francisco. From the time of their unveiling, the archives has been compiling reference materials about these murals and now we are delighted to report that a comprehensive set of materials documenting how these frescoes were created and preserved was donated to UCSF (Bernard Zakheim collection, MSS 2014-15).

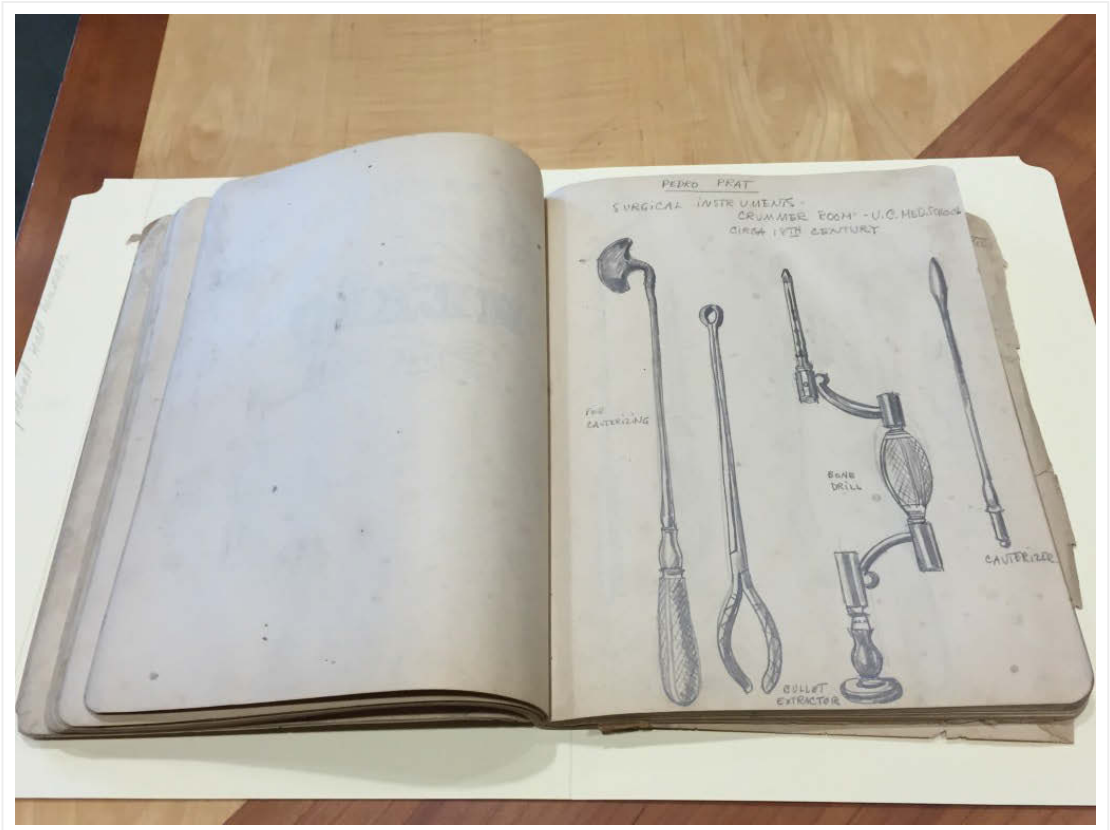
— Viewing murals at Toland Hall at UCSF, left to right: F. Stanley Durie, Superintendent of UC Hospital, Dr. William E. Carter, Phyllis Wrightson, Joseph Allen, State Director of WPA Federal Art Project, Bernard Zakehim (ca. 1939)

Last year I had the privilege to meet one of the sons of the artist who also helped restore the frescoes in 1970s when the wallpaper covering them for almost two decades was removed and the two panels were relocated from the original Cole Hall to HSW.

— Artist Bernard Zakheim with his son Nathan Zakheim (1967)

One of the biggest archives' advocates, Dr. Robert Sherins (SOM, 1963) introduced me to Nathan Zakheim. Nathan, a talented art conservator based in Los Angeles, is the keeper of his father's extensive archives and art collection. Last fall we met at his warehouse to review and pack the documents destined for UCSF.

The idea to commission murals was brought by Dr. Isabella Perry, professor of pathology after seeing the frescoes Zakheim painted at the Alemany Public Health Center and then spearheaded by Chauncey D. Leake, professor of pharmacology and medical historian. The university murals undertaking which was partially funded by the WPA Federal Art Project and also sponsored by the university was a true collaborative effort between Zakheim's team and UCSF faculty (including renowned UCSF doctors, Chauncey D. Leake, George Lyman, Langley Porter, Salvatore P. Lucia, W. E. Carter, and F. W Lynch). The artist was provided unrestricted access to the Crummer Room containing numerous books on the history of medicine, including recently published "California's Medical Story" by Dr. Henry Harris. Zakheim's assistant, Phyllis Wrightson did extensive research about California medical history which becomes apparent in the sketchbook that she kept for the project. The instruments depicted by her on these pages are still preserved at the archives' artifact collection and will be displayed as part of the 150th anniversary exhibit.

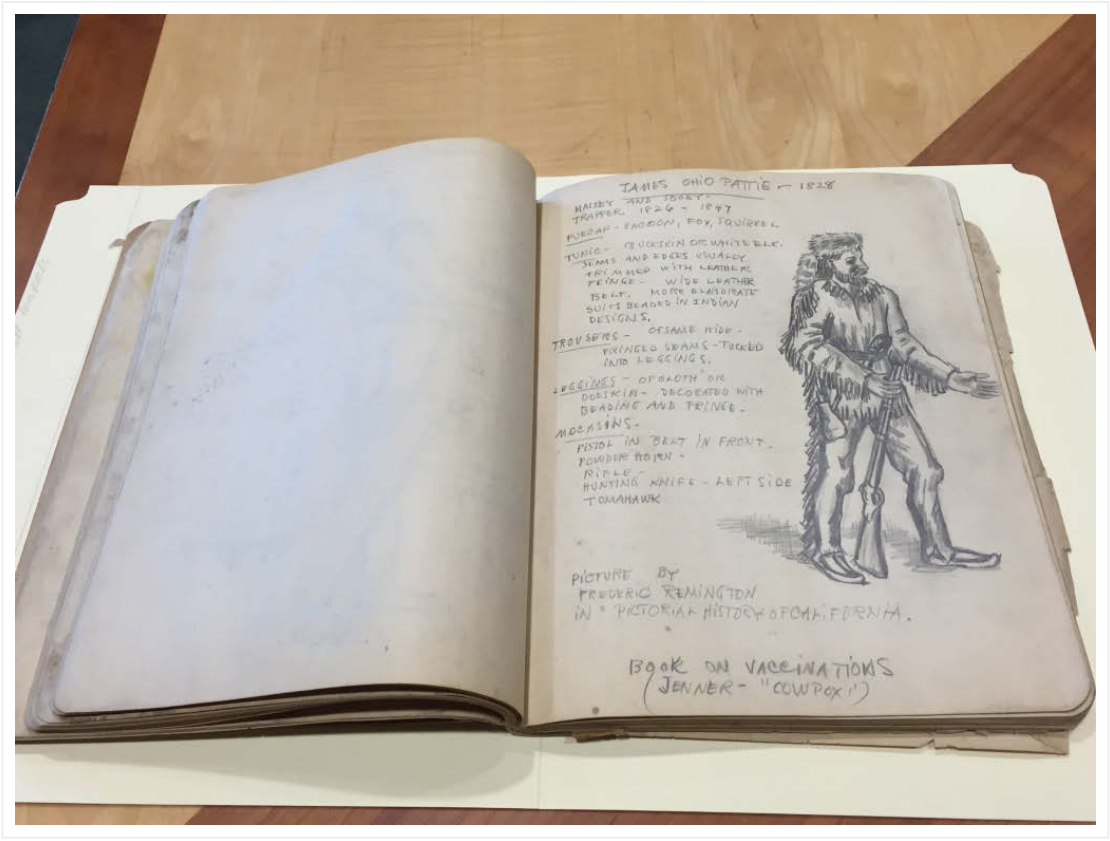


— Drawings of surgical instruments from the UCSF collection for the panel devoted to Don Pedro Prat, surgeon of the Portolá expedition.

— Surgeon Don Pedro Prat treats patient's leg, James Ohio Pattie vaccinates Californians.

One of the sketches portrays fur trader James Ohio Pattie who was captured for illegal trapping in California and earned his release from Mexican imprisonment in San Diego by using the smallpox vaccine to curtail the epidemic spreading among Californians (that story based on the Pattie's "Personal Narrative" was later proved to be inaccurate as it was measles epidemic* that occurred in Alta California at that time).

— Bernard Zakheim at work, 1937



— Drawing of James Ohio Pattie.

Bernard Zakheim and his team interviewed numerous faculty members who are depicted in the panel “Rational Medicine,” including Robert Stone, professor of radiology, Francis S. Smith, pediatrician and dean of the School of Medicine, Karl F. Meyer, director of the Hooper Foundation, anesthesiologist Arthur Guedel and Isabella Perry to name just a few.

— Scaffoldings in the original Cole Hall (that was located at the School of Medicine building) set up while Bernard Zakheim was working on the panel "Rational Medicine."

We are grateful to the Zakheim family and in particular to Nathan Zakheim for donating this unique collection to the University. It will be organized and described in the next few months, selected slides and documents will be digitized and uploaded to the library website.
Are you interested in viewing the murals, but unable to visit San Francisco? Please check these two video recordings from the UCSF archives:
Dr. Robert Schindler (Chair emeritus of the UCSF Department of Otolaryngology) presents a video tour of the murals painted by Bernard Zakheim in Toland Hall at UCSF, 1996:
https://archive.org/details/cum_00001
Toland Hall murals tour by Dr. Chauncey Leake, 1976: https://archive.org/details/cum_000015

We would also like to bring to your attention a manuscript put together by Dr. Sherins chronicling the life story and work of Bernard Zakheim that can be accessed on the Alumni Association website.

Oakland, CA 94607

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project")[1]. My review focused on the DEIR's treatment of visual and shadow impacts. My comments are attached as follows:

[1] See appendix for Jared Ikeda qualifications

VISUAL IMPACT

As described in the Comprehensive Parnassus Heights Plan Draft Environmental Impact Report, the proposed plan would provide 2.9 million gross square feet (gsf) of new building space. Currently, there is approximately 3.92 million gsf of building space. With full implementation of the CPHP, the total gross square feet would be approximately 5.97 million, including instruction, research, clinical and support space, housing and structured parking. This is a substantial increase in building area, mass and height, and will undoubtedly create significant visual impacts.

Within this plan a new 16 story hospital is to be constructed at the far east end of the campus and rise to 294 feet in height. As stated in the Draft EIR, this new hospital will be subject to a subsequent project specific environmental review as more details of this project becomes available. However, the Draft EIR states (*pg 4.1-23*) that development under the CPHP would not have a substantial adverse effect on scenic vistas. A significant effect on a scenic vista as defined in the DEIR, is a substantial block or degrade of scenic view from public vantage points. In review of this plan and DEIR, it is apparent that the proposed building plan and particularly the new 16 story hospital would have significant visual impacts. (*see figure 1 and 2*)

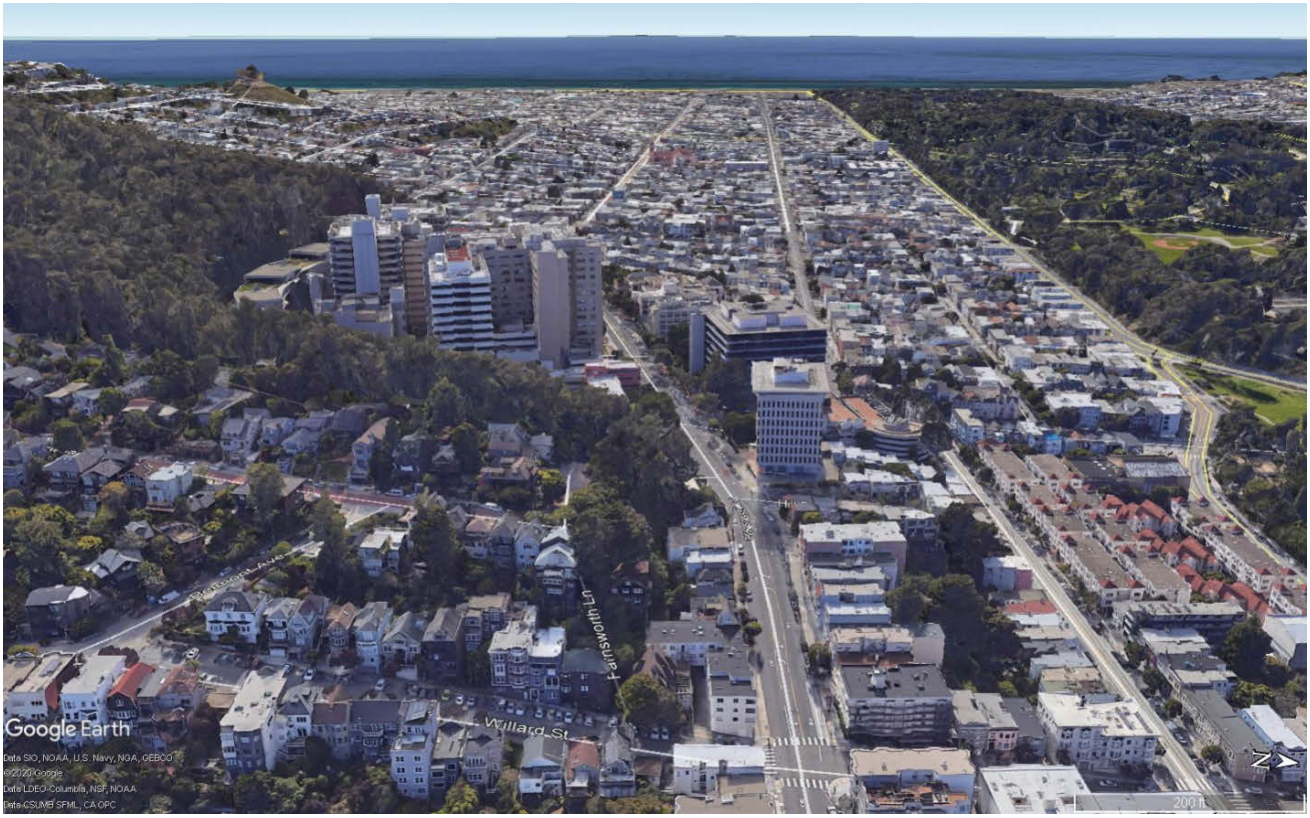

Fig 1 Existing view west from adjacent neighborhood

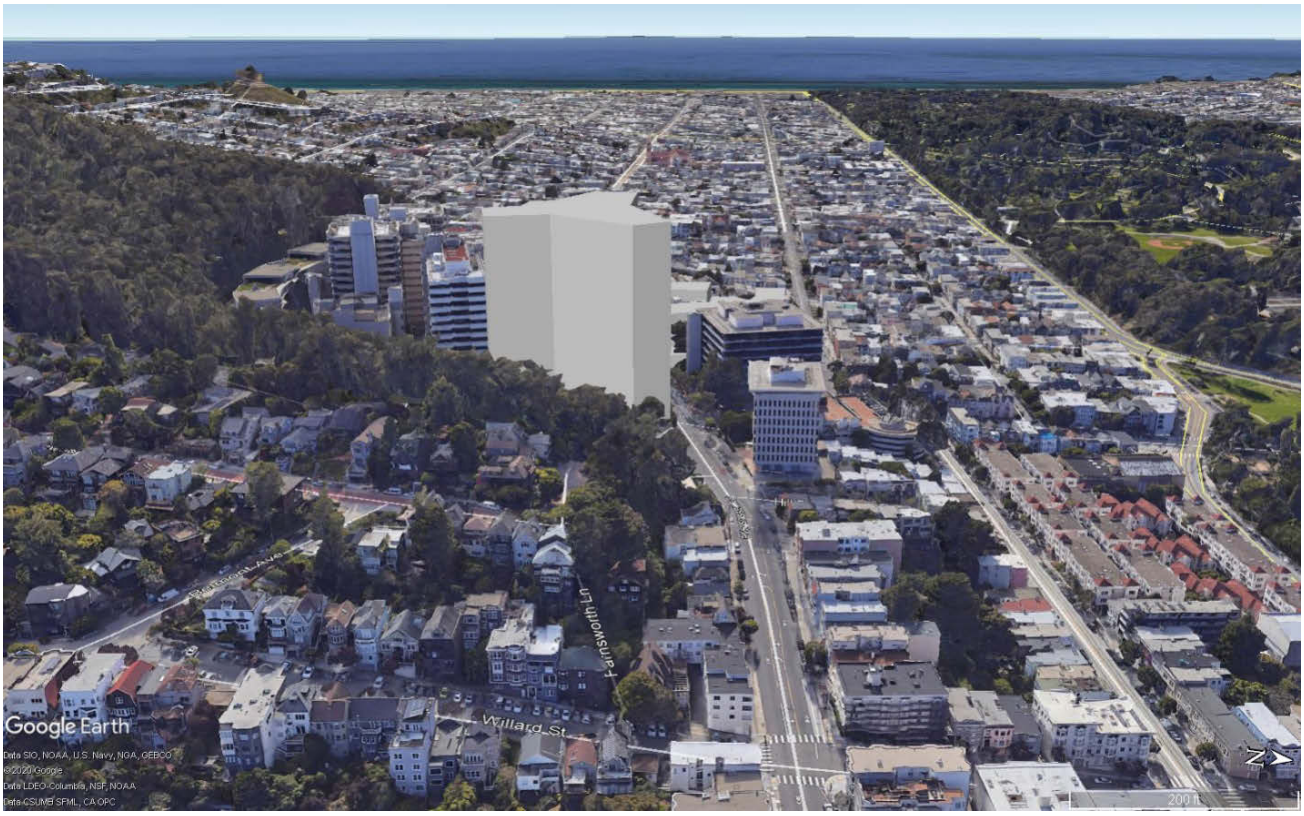

Fig 2 View west with proposed new hospital

By including this new hospital plan within this DEIR and concluding that it would not have a substantial adverse impact on a scenic vista, avoids discussion and possible mitigation measures in subsequent environmental review. This is not the intent of CEQA. Environmental review is a means to avoid or lessen adverse environmental effects at the outset, and by dismissing this issue at this time implies that it will not be address at a project level EIR in the future.

The topography of Mount Sutro and the green of the forested reserve are major elements that visually shape the adjacent neighborhoods as well as the overall city scape as seen from a distance. The views from publically accessible areas in and around the proposed UCSF Parnussus campus to these landmarks are of importance in establishing the quality of the environment here. One particularly significant local view point is the trail head near the intersection of Farnsworth Lane and Edgewood.

Public Trail Head at the end of Farnsworth Lane

The proximity and mass of the proposed new hospital will substantially impact this viewpoint. The 294 ft height and form of the proposed building will be seen and will block views to the west. The existing tree masses in this area and subsequently along the trail leading down, may tend to screen and filter the vistas but, the new proposed hospital will entirely block scenic vistas and dominate the view. This is a significant change to the public view and the inherent quality of the trail head and experience of accessing and walking this trail. This impact to the environmental quality of this publically accessible trail is significant and should be taken into account in considering mitigation measures or alternatives.

Furthermore the entire neighborhoods to the east, and views from streets such as Edgewood and Belmont and Willard and areas to the north of Parnassus Ave such as Hill Point Way will also be visually impacted by the large dominant mass of the new hospital. The size and height of the new hospital will also block views to Mt Sutro and the forest reserve from areas north of Parnassus Ave and Irving Street, and the visual experience of seeing a natural setting of a forested hillside from the local sidewalks and streets will be changed to one of a large urban building.

The visual simulations shown here have been constructed within Google Earth and incorporate scale models of the building masses and heights identified in the DEIR.

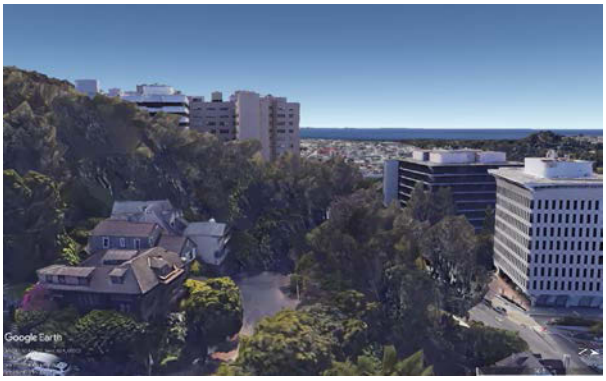

Figure 3 View west from end of Farnsworth

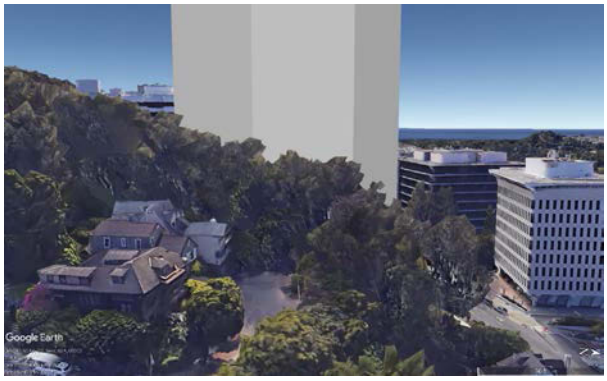

Figure 4 View west from end of Farnsworth with new hospital

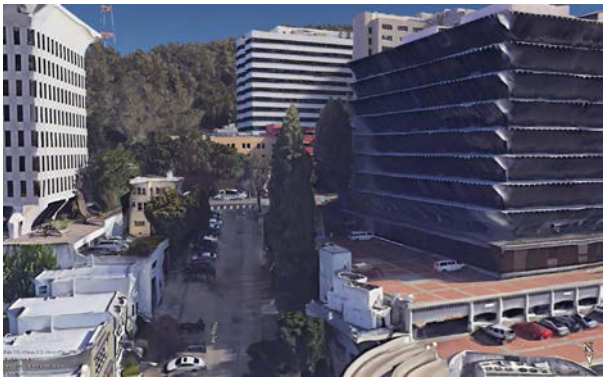

Figure 5 View south from Hill Point Way

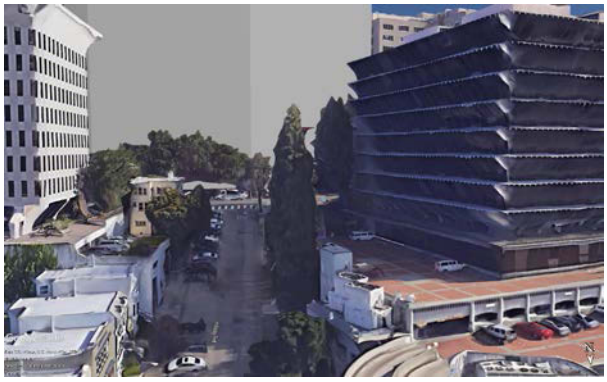

Figure 6 view south from Hill Point Way with new hospital

The views from the trailhead at the end of Farnsworth and adjacent residential neighborhood will become dominated by the mass of the new proposed hospital.

By stating that impacts to publically available scenic vistas are less than significant, the DEIR does not provide any possible mitigation measures or alternatives. This precludes further discussion and possible mitigation measures in future specific project environmental review and essentially allows development of the height and massing of the proposed buildings at this stage of the review process.

Views from other Prominent Vantage Points

The DEIR also identifies several other prominent publically accessible vantage points. These include Tank Hill natural area, Buena Vista Park, and Corona Heights Park. These are all located to the east of the Parnassus Heights campus. The DEIR states that the implementation of the CPHP would not result in a substantial adverse impact to scenic vistas from these publically accessible vantage points. However, in review it is again apparent that the new proposed hospital would change the skyline. (*see figures 7 through 12)*

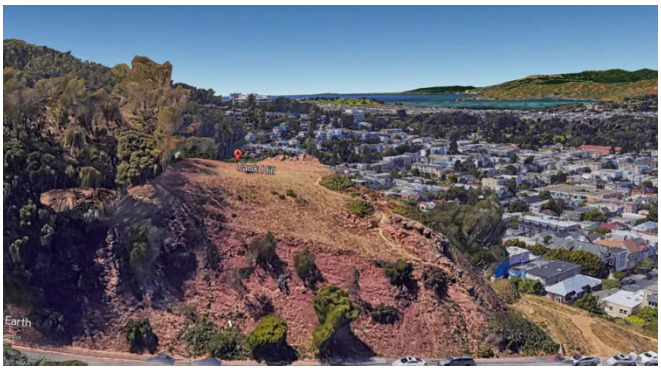

Fig 7 view westward from Tank Hill natural area

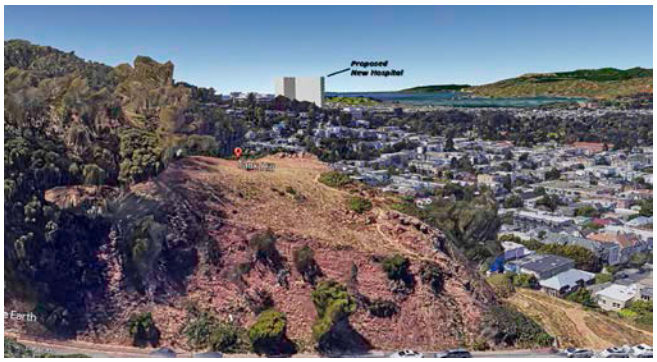

Fig 8 view from Tank Hill natural area with proposed new hospital

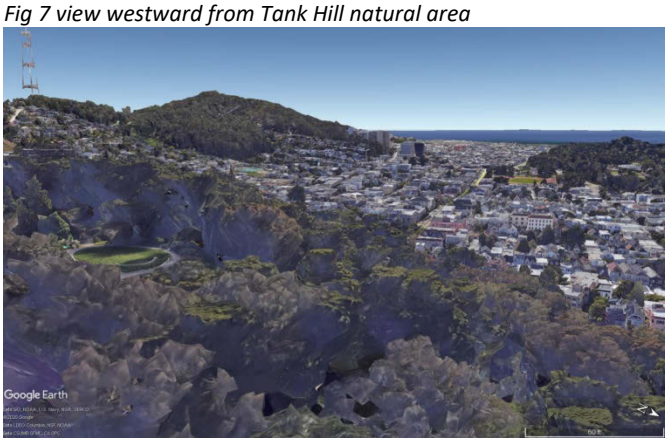

Figure 3 view from Buena Vista Park

Figure 5 view from Buena Vista Park with proposed hospital

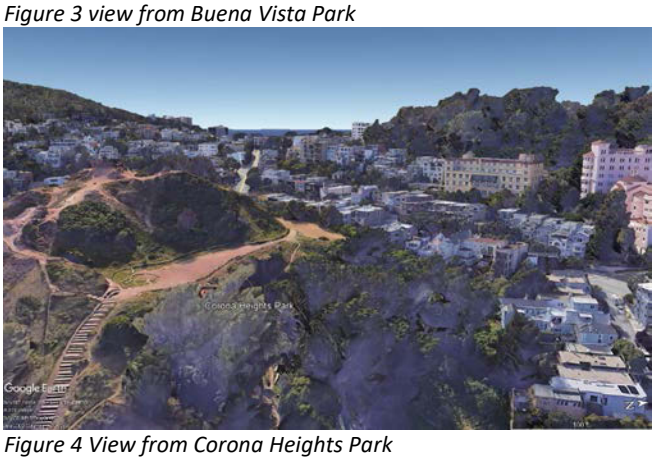

Figure 4 View from Corona Heights Park

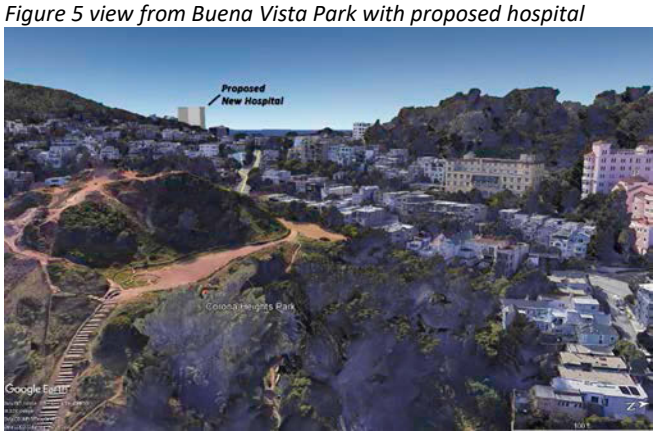

Figure 6 View from Corona Heights Park with proposed hospital

The development of the CPHP will undoubtedly change the visible skyline by addition of the new 294 foot high hospital. This is a noticeable change and should be addressed in the context of the Urban Design

Element of the San Francisco General Plan. The height and mass of the proposed new hospital will be highly visible as a new feature in the skyline from these public parks as well as from various other locations and streets within the surrounding neighborhoods. The Urban Design Element includes a policy to: "*Recognize and protect major views in the city, with particular attention to those of open space and water. Views contribute immeasurably to the quality of the city and to the lives of its residents. Protection should be given to major views whenever it is feasible, with special attention to the characteristic views of open space and water that reflect the natural setting of the city and give a colorful and refreshing contrast to man's development."*

The Urban Design Element of the city's General Plan states that shape, height and bulk of tall building with respect to views from important vantage points around the city should contribute to the beauty of the skyline. While views from private property are not protected in city regulations, the General Plan does protect specific view corridors from the public realm.

It is not clear in the DEIR whether the CPHP has undergone an initial Preliminary Project Assessment by the city's Urban Design Advisory Team (UDAT) to determine consistency with Urban Design Guidelines and other relevant design regulations, the Planning Code, and other policies in the General Plan. Is this review to come at a later environmental review as the project evolves? If so, does this mean that the height and mass of the new hospital is a given if this plan is approved. Since the proposed new hospital will be seen from several publically accessible view points and parks, it seems that such a major feature that will change the visible skyline should be reviewed and assessed by UDAT prior to further project level environmental review.

Overall Impact on Shadow

The DEIR states that implementation of the CPHP would not create new shadows in a manner that would substantially and adversely affect the use and enjoyment of publically accessible open spaces. The DEIR provides description and diagrams of shadow impacts onto various public locations during different seasons and times of day. These public locations include parks and schools which are some distance away and will receive "occasional shadow". The DEIR states that these areas would not be adversely affected and the impact is considered less than significant.

It appears though that certain areas along Parnassus Ave and Irving St. will be subject to "frequent shadows" throughout the year. (*Fan 1 of the Shadow Study Appendix within the DEIR*) Although these are not officially called out as "publically accessible open spaces" needing to be addressed within the city's Urban Design Element guidelines, they are public sidewalk and streets that are frequented by pedestrians and passerbys. These areas currently receive shadows from existing structures but, it can be expected that the increased height of the proposed new hospital and Milberry Terrace and Irving St Gateway projects will further increase the time and frequency of the shadows along Irving St and Parnassus Ave.
Although shadows do not directly affect change in air temperature, they do affect the direct exposure to sun radiation and the resulting feeling of warmth to a person's body. Further, sun radiation can affect the temperature of a surface struck by sunlight and increase that temperature and it's surroundings. The comfort and attractiveness of these particular areas to pedestrians and passerbys may be adversely affected and should be addressed in the EIR. The city's Urban Design Guidelines state that plazas or parks located in the shadows cast by large buildings can be unpleasant for the user and large buildings can be oriented to minimize shadows falling on public or semi-public open space. The guidelines state that the height and mass of tall, closely packed buildings can be shaped to permit sunlight to reach open spaces.

The CPHP does provide new open pedestrian areas within the campus and that is welcomed and appreciated and is a positive. But, discussion of the impact to the existing local areas and circulation patterns should still be noted and made aware to the public. There should be a discussion of how impact to these public areas might be mitigated.

Conclusion

The existing features of Mt Sutro and the Forest Reserve provide form and a sense of place and living within the environment to the UCSF campus and adjacent neighborhoods. The new CPHP with its heights and mass of proposed buildings would alter and change that sense. As noted in the city's Urban Design Element:

"The uses and benefits of the city pattern are many and profound. This pattern is, first of all, bound up in the image and character of the city. To weaken or destroy the pattern would make San Francisco a vastly different place. Second, the city pattern has important psychological effects upon residents of the city. It provides organization and measured relationships that give a sense of place and purpose and reduce the degree of stress in urban life. Outlooks upon a pleasant and varied pattern provide for an extension of individual consciousness and personality, and give a comforting sense of living with the environment."

The visual change from the implementation of the CPHP will be seen from many locations throughout the adjacent neighborhoods as well as other areas and parks within the city including areas of Golden Gate Park. The impact of the shadow patterns to the adjacent neighborhoods will also affect the quality experiences of spaces and pedestrian walkways by the public. These should be considered in the approval process and given recognition in the EIR.

Jared M. Ikeda

Jared Ikeda is a retired Landscape Architect and environmental planner with experience in preparation of land use planning studies, community planning, environmental impact studies, urban site planning, landscape development plans, and recreation planning. He has been involved in a wide range of studies and projects for both public and private sector clients and has participated in and directed all phases of land planning, investigative studies and landscape development. He has served on the board of directors of a major international landscape architectural firm, and Landwatch Monterey County, and served as a lecturer in the Department of Landscape Architecture at California State Polytechnic University, Pomona. His teaching activities focuses upon advanced landscape design and stressed use of computer technology including AutoCAD and ArcMap GIS software. He has prepared a number of visual impact and simulation studies using a variety of computer software including Sketchup and Google Earth. He has been involved in the preparation of the Monterey County General Plan Update from 1999 to 2004 and was responsible for studies and preparation of the Environmental Resource Management Element and the Circulation Element. He also directed consultant work on the Environmental Impact Report.

Project Experience
A selected list of relevant project experience includes:

Granite Chief Wilderness Area – Visual simulation of a proposed gondola
Client: Mountain Area Preservation Foundation

Preparation of a visual simulation of a proposed gondola system connecting the Squaw Valley Resort with Alpine Meadows village. The gondola system crosses an area adjacent to the Granite Chief Wilderness area and impacts the visual quality within the wilderness area.

Donner Summit Development Impact Study

Client: Sierra Watch and the Sierra Club

As part of a consulting team charged with review and comment upon a potential new development of an environmentally sensitive area of the Donner Summit, Mr Ikeda prepared GIS mapping and visual simulation of the proposed plan utilizing Google Earth software.

Dyer Mountain Visual Simulations

Client: Shute Mihaly Weinberger, llc

Mr Ikeda prepared 3 dimensional visual simulations of a proposed forest management plan and ski resort development in Lassen County. The work was utilized to demonstrate the visual impact of the proposed plan.

Colosseum Gold Mine – Visual Impact Analysis
Client: Bureau of Land Management

Prepared a visual impact analysis and land restoration plan for the Colosseum Gold Mine, an open pit gold mine near the California/Nevada border. The project utilized computer generated visual simulations.

Professional Experience
Principal: Ikeda Consulting, 2005 to Present
Monterey County Redevelopment Agency, 2004-2005
Senior Admin Analyst: County of Monterey, Environmental Resource Policy, 1999-2004
Lecturer: Cal Poly Pomona, Dept of Landscape Architecture 1997-1999
Vice-President/Officer-in-Charge EDAW Inc., Irvine Office: 1980 to 1987

EDAW, Inc. 1969 to 1989

Education

Bachelor of Science in Environmental Design, California State Polytechnic University, Pomona, 1968.

Honors

Best Comprehensive Plan, Orange Co. Section, American Planning Association, San Juan Capistrano Master Open Space Plan, 1992
Distinguished Alumnus Award, 1983, School of Environmental Design, California State Polytechnic University, Pomona.
Merit Award, American Society of Landscape Architects, Santa Ana River Open Space Study, 1973

Lectures & Publications

Mr. Ikeda has served as a guest lecturer at UCLA, UC Irvine, and Cal Poly Pomona. Mr. Ikeda has also served as Chairman of a panel on Computers and Landscape Architecture for the Southern California Chapter of the American Society of Landscape Architecture.
Contributor to *"Design with Digital Tools"* McGraw Hill, 2000

RE: Comprehensive Parnassus Heights Plan

Dear Ms. Wong,

I write to comment on UCSF's (2020) Environmental Impact Report ("EIR") prepared for the Parnassus Heights Plan, which I understand would add 2.04 million square feet of new floor space to 168 acres of land between the Parnassus Campus, Aldea Housing, and Mount Sutro Open Space Reserve. The buildings would vary in height, up to 294 feet. Given trends in the use of structural glass on the façades of Bay Area multi-story buildings, and the trend in using extensive glass on University buildings throughout the USA, I anticipate the buildings of the proposed project would add extensive new glass windows that would threaten birds with collision mortality. I write to comment on this and other potential project impacts to special-status species of vertebrate wildlife.

My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I subsequently worked for four years as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, habitat restoration, interactions between wildlife and human infrastructure and activities, and conservation of rare and endangered species. I perform research on wildlife mortality caused by wind turbines, electric distribution lines, agricultural practices, and road traffic, among other human activities and structures. I authored numerous papers on special-status species issues. I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and the Raptor Research Foundation, and I've been a part-time lecturer at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-three years, including at many proposed project sites. My CV is attached.

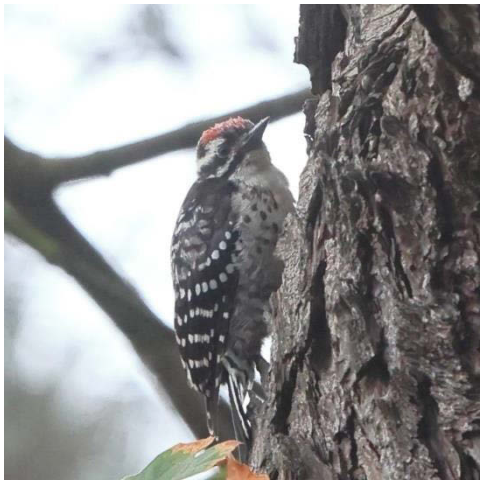
SITE VISIT

I visited Aldea Housing, Mount Sutro Open Space Reserve, and the Parnassus Campus for 3 hours and 30 minutes, starting at 08:17 hours on 20 August 2020. The Marine Layer dominated the sky until the last 90 minutes or so. I surveyed on foot, using binoculars to scan for wildlife.

Campus buildings occur immediately north of the steeply sloped Mount Sutro (Figure 1) and the densely forested environment of Mount Sutro Open Space Reserve (Figure 2). Aldea Housing is likewise tucked into the forested slopes of Mount Sutro, but on the southeast aspect.

Figures 1 and 2. A building proposed for replacement (left) looms near the densely forested Mount Sutro Open Space Reserve (right).

Not surprisingly, given its forestation and the fact that Mount Sutro Open Space Reserve is one of the last remaining substantial patches of open space in San Francisco, I saw and heard many birds during my visit. Among other species, I detected Anna's hummingbirds (Figure 3), Nuttall's woodpecker (Figure 4), pygmy nuthatches (Figure 5), common ravens (Figure 6), Wilson's warbler (Figure 7), song sparrows (Figure 8), dark-eyed juncos (Figure 9), and house finches (Figure 10). Many of the birds I detected were fledglings accompanied by their parents, thus proving the site is productive for birds (Figure 11). Foraging on the site was abundantly evident (Figure 12). In all, I detected at least 23 species of vertebrate wildlife (Table 1), including 5 special-status species and only 2 non-native species. Both of the non-native species were within built-over areas, including a rock pigeon on the Parnassus Campus and house sparrows at Aldea Housing.

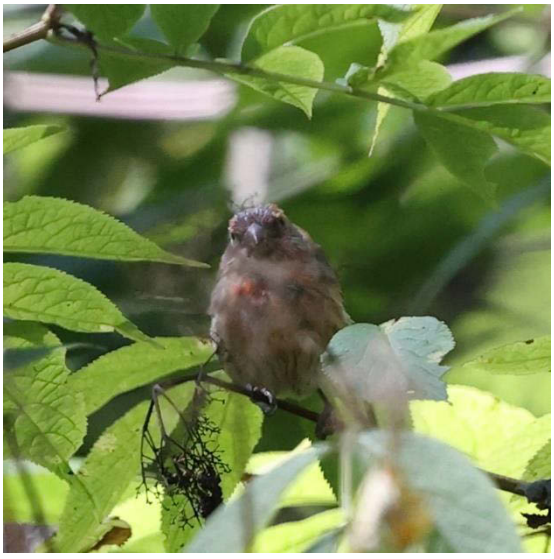


Figures 3 and 4. Anna's hummingbird (left) and Nuttall's woodpecker (right) on the project site, 20 August 2020.

Figures 5 and 6. Pygmy nuthatch (left) and common raven (right) on the project site, 20 August 2020.

Figures 7 and 8. Wilson's warbler (left) and song sparrow (right) on the project site, 20 August 2020.

Figures 9 and 10. Dark-eyed junco (left) and house finch (right) on the project site, 20 August 2020.



Figures 11 and 12. A fledgling house finch (left) and a song sparrow with worm (right).

Most of the species of birds I detected had also recently been detected by Golden Gate Audubon Society ("GGAS") (2020), who tallied 47 species of birds on Mount Sutro Open Space Reserve in about 54 hours of surveys between 16 March and 29 December 2019. I detected 5 bird species that GGAS (2020) did not, including peregrine falcon, Nuttall's woodpecker, acorn woodpecker, house sparrow, and American goldfinch. However, the peregrine falcon I detected was atop Sutro Tower, which might not have been detectable from the stations used by GGAS, or alternatively GGAS might have declined to include detections on Sutro Tower due to its location outside the Reserve. The house sparrows I detected were at Aldea Housing, which is another area outside GGAS's survey space. Some of the species detected by GGAS and not by me, and some of those I detected but GGAS did not, could have been represented by birds using the Reserve as stop-over habitat. If the Reserve was surveyed over several years, the number of bird species would likely far exceed the 52 species GGAS and I detected altogether. eBird records further indicate a long list of species use Mount Sutro Open Space Reserve, the Parnassus Campus and Aldea Housing.

GGAS (2020) confirmed breeding by 11 species, and suspected breeding by another 5 species. One of the species suspected of breeding was red-shouldered hawk, which I observed reacting defensively to the arrival of a red-tailed hawk. The red-shouldered hawk's reaction, including sustained calling each time the red-tailed hawk circled close to the red-shouldered hawk's tree, was typical of a breeding member of this species defending its nest. I concur with GGAS that Mount Sutro Open Space Reserve is an important breeding area for birds.

GGAS (2020) also tallied 136 observations of birds foraging on the Reserve, or about 2.5 foraging events per hour of survey. During my site visit I witnessed foraging at a minimum 1.4 events per hour. I was not specifically attempting to record foraging

events, so I did not record how many members of a flock of pygmy nuthatches I observed peel back bark for a food reward; I simply counted their foraging as one event. I also saw foraging by Wilson's warbler, Nuttall's woodpecker, song sparrow, and common raven. The Reserve is obviously an important foraging area for birds.

The western gray squirrel I saw (Table 1) was the only record of this species I could find for Mount Sutro Open Space Reserve. At the time of my observation, I had no doubt of my species identification, but I was unable to capture a photo. Another sighting of western gray squirrel was reported to iNaturalist in 2020 -- along with a photo -- for a site just northwest of the UCSF Parnassus Campus at 10th Ave. and Irving St.

Table 1. Species of wildlife I observed during my site visit on 20 August 2020.

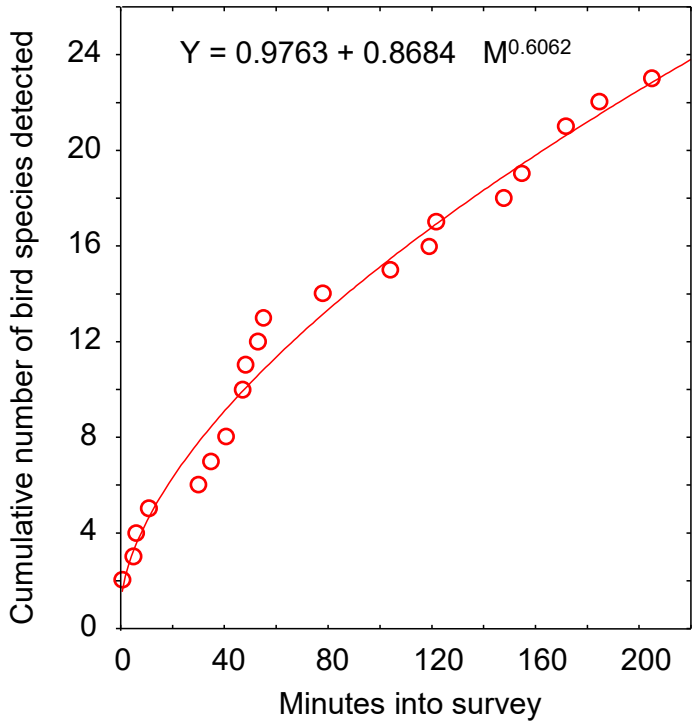
Species	*Scientific name*	**Status**[1]	**GGAS 2019**
Red-tailed hawk	*Buteo jamaicensis*	FGC 3503.5	Yes
Red-shouldered hawk	*Buteo lineatus*	FGC 3503.5	Yes
Peregrine falcon	*Falco peregrinus*	CE, CFP, FGC 3503.5	No
Rock pigeon	*Columba livia*	Non-native	Yes
Anna's hummingbird	*Calypte anna*		Yes
Nuttall's woodpecker	*Picoides nuttallii*	BCC	No
Acorn woodpecker	*Melanerpes formicivorus*		No
Steller's jay	*Cyanocitta stelleri*		Yes
California scrub-jay	*Aphelocoma californica*		Yes
Common raven	*Corvus corax*		Yes
Chestnut-backed chickadee	*Poecile rufescens*		Yes
Pygmy nuthatch	*Sitta pygmaea*		Yes
Pacific wren	*Thryomanes pacificus*		Yes
Ruby-crowned kinglet	*Regulus calendula*		Yes
American robin	*Turdus migratorius*		Yes
Yellow warbler	*Setophaga petechia*	SSC2, BCC	Yes
Wilson's warbler	*Wilsonia pusilla*		Yes
House sparrow	*Passer domesticus*	Non-native	No
Lincoln's sparrow	*Melospiza lincolnii*		No
Song sparrow	*Melospiza melodia*		Yes
Dark-eyed junco	*Junco hyemalis*		Yes
House finch	*Carpodacus mexicanus*		Yes
American goldfinch	*Carduelis tristis*		No
Western gray squirrel	*Sciurus griseus*		

[1] BCC = US Fish and Wildlife Serv ice's Birds of Conservation Concern, CE = California Endangered, CFP = California Fully Protected, SSC2 = California Species of Special Concern priority level 2, FGC 3503.5 = California Department of Fish and Wildlife Code -- Birds of prey.

The 23 species of birds I detected represented a fraction of those I would have detected had I been able to devote more time to the effort (Figure 13). The model in Figure 13 predicts I would have detected 47 species – equal to the number detected by GGAS – in

11 hours and 40 minutes. It also predicts I would have detected 117 species of birds had I surveyed as long as GGAS. The difference in detection rates did not result from any differences in skill levels, but rather in method. GGAS applied standard point count methods, which are suited for comparing species detections among locations or time periods; it is a method I often use. The survey method I implemented at Mount Sutro was a more aggressive move-and-encounter approach. Had GGAS implemented this method, they would have detected well over 100 species of birds.

Figure 13. Cumulative number of bird species detected as a power function of the number of minutes devoted to the survey. The model explained 98% of the variation, with a root mean square error of 17.71. Had I been able to commit more time to the survey, I am confident a different model would have better fit the resulting data – a model more expressive of an asymptote.



BIOLOGICAL IMPACTS ASSESSMENT

The project would mostly redevelop areas that are already built-up, including new buildings on campus and larger, taller buildings at Aldea Housing. To facilitate the tallest of the proposed buildings on Campus, the project would remove 0.15 acres from the Open Space Reserve, but would re-designate 0.4 acres to Open Space Reserve from another nearby area designated as Support. This other area designated as Support, however, is already forested and otherwise indistinguishable from the forested landscape of the surrounding areas of Mount Sutro Open Space Reserve. From the perspective of wildlife, the swap in land designations results in a 0.15-acre habitat loss.

Much more substantial habitat impacts than mere acreage loss would result from the heights, extent, and structural attributes of the proposed new buildings. In my experience, erecting tall structures into the aerohabitat of volant wildlife results in collision mortality and interference with wildlife movement. New, tall structures erected at the proposed locations would intercept many birds attempting to fly to or away from Mount Sutro Open Space Reserve. Most migratory or dispersing birds

attempting to stop-over at the habitat island that Mount Sutro represents in San Francisco, and most birds leaving Mount Sutro to continue their migration or dispersal, would expend extra energy – energy needed for long-distance flights – negotiating their way around the buildings, but some would collide with the buildings after becoming disoriented or misled by the buildings' nighttime lights and by transparent and reflective glass windows. Proposed mitigation measures should prevent numerous collisions (more on this later), but they cannot prevent enough of them to lessen the project's impacts to less-than-significant.

An example of what would be in store for birds encountering buildings of the new project was presented in San Francisco's bird-safe building standards (San Francisco Planning Department 2011). On page 15 is a photo of New York City's most dangerous building to birds, which is the Morgan Mail Building located next to a landscaped park. Though the Morgan Mail Building is not particularly tall for Manhattan, nor does it include more window space than other buildings, its location next to the park is what makes it more dangerous to birds than other buildings. The locations of the proposed new buildings on the Parnassus Campus and Aldea Housing would be proximal to a much more substantial habitat area than the small park next to the Morgan Mail Building in Manhattan.

Another example can be found practically next door to the Parnassus Campus, where a bird-window collision study was performed recently at California Academy of Sciences ("CAS") (Kahle et al. 2016). Like the Morgan Mail Building, CAS is located next to landscaped park – Golden Gate Park. Its fatalities were represented by 37 species. Its pre-mitigation bird-window collision rate of 0.0654 fatalities per m^2 of glass per year averaged close to the national average (more on this below). This rate translates to 62 bird-window collision fatalities per year before attempting to adjust the estimate for the proportion of fatalities not found by searchers due searcher error and removals of carcasses by scavengers. Assuming the scavenging community functions at Golden Gate Park as effectively as it does in the Altamont Pass Wind Resource Area, where carcass detection rates were carefully measured, and assuming the fatality searchers were equally skilled, then the 62 bird-window collisions per year estimated for CAS would be adjusted to 835 (95% CI: 429-3,689) bird-window collisions per year.[1] A principal reason for the large difference between adjusted and unadjusted fatality rates at CAS was the preponderance of small-bodied birds among window casualties. The species most often found as fatalities was Anna's hummingbird, including 131 carcasses. Averaging about 4.5 g, Anna's hummingbird carcasses can be picked up and removed by a much larger array of vertebrate scavengers than could a 322-g rock pigeon. A feral cat could consume 25 Anna's hummingbirds per day, but only about a third of a rock

[1] The fatality search interval at CAS was the same as that of half the wind turbines in the Vasco Winds Energy Project in Contra Costa County (Brown et al. 2016). To derive an overall detection rate for weekly search intervals, I selected detection trial carcasses that had been placed on open ground, which I assumed best represented the ground searched for fatalities at CAS. I fit a model to overall carcass detection rates as a function of body mass, and applied the model predictions to the numbers of fatalities of each species found as window collision victims at CAS (see Smallwood et al. 2018 for methodological details).

pigeon. Common ravens likely remove most of the carcasses of small birds around CAS, and likely do so without leaving any trace evidence of the fatality ever having happened.

Although relative abundance of bird species serves as a poor predictor of bird-window collision fatalities (Figure 14), a bird species must use the airspace occupied by a building before the species can become a collision victim of that building. Therefore, learning which species occur in the project area is an important first step in analyzing potential impacts of bird-window collisions. Learning which special-status species occur in the project area is even more important. Learning which species are known to be vulnerable to windows would also inform an analysis of potential project impacts. Table 2 identifies special-status species documented in the project area, as well as species detected as window collision victims at CAS or at other buildings.

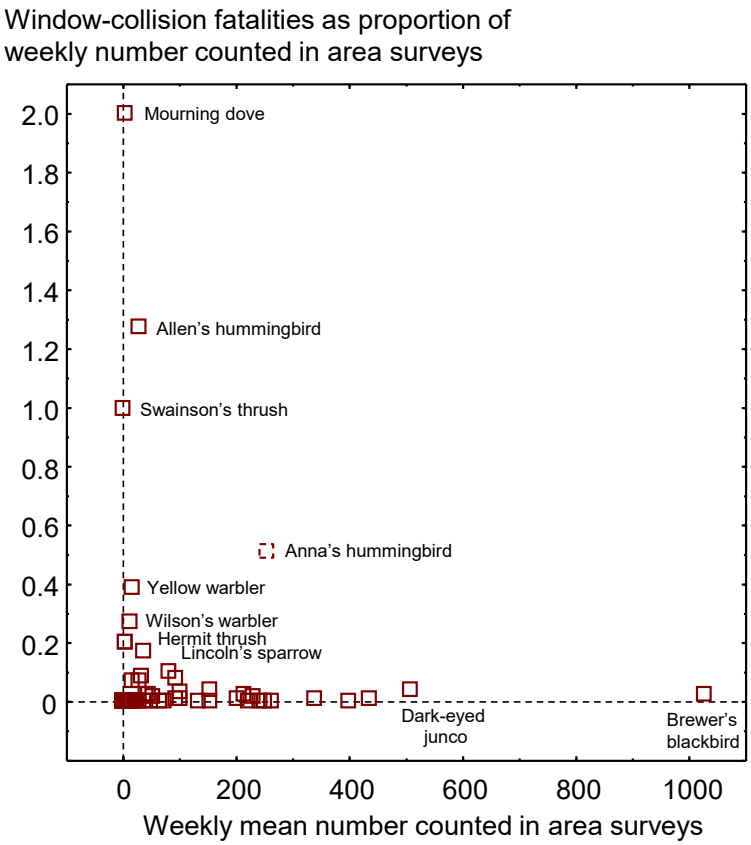


Figure 14. The ratio of window-collision fatalities to relative abundance related inversely to relative abundance, where some of the least abundant species contributed disproportionately to window-collision fatalities and some of the most abundant species contributed least to fatalities (data from Kahle et al. 2016). Data at the 0-intercept represent bird species either recorded as fatalities but never seen in relative abundance surveys or counted in relative abundance surveys and never recorded as fatalities.

The EIR inadequately analyzes potential impacts to wildlife. Of the 40 special-status species of birds documented by eBird, GGAS, and myself, the EIR addresses only 6 (15%) of them. Of the 6 bird species that are addressed, the EIR dismisses the likelihood of occurrence of 2 of them: northern harrier and San Francisco common yellowthroat, both of which have been seen on site (Table 2). The EIR assigns low likelihood of occurrence to another 3 of the 6 species it addresses, even though all 3 have been documented in the area (Table 2). The EIR assigns only moderate occurrence likelihood to peregrine falcon, a species I saw looking down at the project site from Sutro Tower. Furthermore, in a report prepared for UC San Francisco, GGAS reported having seen 7

special-status species of birds that are not addressed in the EIR (Table 2). I also note that the EIR addresses only 5 of the 8 special-status species of mammals I consider likely to occur at the project site at one time or another (Table 3).

The EIR argues that most special-status species of wildlife in San Francisco would not occur on the project site due to specialized habitat requirements which are lacking at the project site. The EIR summarizes habitat needs of those few species it addresses, but for each species it describes an artificially narrow portion of the environment that defies reality. For example, it says short-eared owls require marsh or meadow habitat, which is not present at the project site. I have certainly encountered short-eared owls in marsh and meadow, but I have also observed them in annual grassland and, more relevant to this project, in oak woodland. The short-eared owl I encountered in oak woodland might have been using the woodland for cover or perhaps it was moving through the area on migration or dispersal. That short-eared owls similarly use Mount Sutro Open Space Reserve is suggested by eBird, which shows sightings very close to the project site.

In another example, the EIR commits northern harrier to marsh. Most of the northern harriers I have recorded have been on annual grassland, but I have seen them in various environments, including over urban areas. Northern harrier has been documented on the project site (Table 2).

The EIR also argues that the project site lacks nesting habitat for various special-status species. However, the implied distinction between nesting and foraging habitat, or between nesting and stopover habitat, is more contrivance than real, because no animals can successfully breed without also successfully foraging or migrating. To breed successfully, birds must find sufficient forage and they must survive migration and non-breeding seasons by finding suitable stopover habitat and all the other habitat elements needed. Arguing that the habitat value of a place is somehow lesser because it lacks nest substrate is fallacious where the species can satisfy other needs that are critical for successful nesting elsewhere or later in the year.

Of the 40 special-status species of birds that have been documented at or near the project site, 16 (40%) have also been documented as window collision victims. Five of these species were documented as window collision victims at CAS, located very close to the project site. Of these species, I estimated Allen's hummingbird to have died from window collision at a rate of 179 per year until any mitigation measures were implemented. Prior to any mitigation, CAS windows killed an estimated 223 members of special-status species, or 27% of all birds.

Table 2. eBird (https://eBird.org) reports of special-status species near the project site and species reported as window-collision victims at the nearby California Academy of Sciences (CAS) buildings (Kahle et al. 2016).

Project Impact Prediction from Bird-Window Collisions

An empirical basis for robustly predicting bird-window collision mortality exists, not only in the research that was done at the nearby CAS, but also among all of the studies performed across North America. I reviewed reports of avian fatality monitoring among building structures in a wide variety of environmental settings, types of structures, and types of glass on structural façades. Specifically, I reviewed reports of bird collision monitoring at 181 buildings and façades for which bird collisions per m^2 of glass per year could be calculated and averaged (Johnson and Hudson 1976, O'Connell 2001, Somerlot 2003, Hager et al. 2008, Borden et al. 2010, Hager et al. 2013, Porter and Huang 2015, Parkins et al. 2015, Kahle et al. 2016, Ocampo-Peñuela et al. 2016, Sabo et al. 2016, Barton et al. 2017, Schneider et al. 2018). These study results averaged 0.077 bird deaths per m^2 of glass per year (95% CI: 0.04-0.11), before any adjustments were attempted to account for the proportion of fatalities not found due to searcher error and carcass removal by scavengers. This average and its 95% confidence interval provide a robust basis for predicting minimum fatality rates at a proposed new project.

A major shortfall of the EIR is its omission of any details about the design of proposed buildings, including the amount of glass, types of glass, and structural contexts of glass. The only detail I have to work with is the intended 2.04 million square feet of floor space. I applied this figure to an average rate (and 95% CI) of glass extents on 12 recently proposed buildings intended for use as offices hotels and mixed-use in California. The mean was 0.0328 m^2 of glass façade per ft^2 of floor space (95% CI: 0.0052-0.0603). To this extent of glass, I multiplied 2.04 million ft^2 of project floorspace to get 66,838 m^2 of glass façade (95% CI: 8,783-117,327 m^2). However, in my experience, both hospital and university buildings tend to use more glass on their façades (Figure 14). Additionally, recent advances in structural glass engineering have contributed to a proliferation of glass windows on building façades. This proliferation is readily observable in newer buildings, and it is represented by a worldwide 20% increase in glass manufacturing for building construction since 2016. Increasing window-to-wall ratios and glass façades have become popular for multiple reasons, including a growing demand for 'daylighting.' To account for these trends, I increased my estimated extent of glass composing façades of the proejct's buildings by anotehr 20%, to 80,206 m^2 of glass façade (95% CI: 10,594-140,792 m^2).

To the above prediction of the mean amount of glass composing the project's building façades, I multiplied the mean rate of bird collisions per m^2 of glass façade to predict **6,176 bird deaths per year (95% CI: 3,208-8,823)** at the Parnassus Campus. The 100-year toll from this average annual fatality rate would be **617,586 bird deaths (95% CI: 320,824-882,266)**, which would continue until the buildings are either renovated to reduce bird collisions or they come down. The vast majority of these deaths would be of birds newly protected under Fish and Game Code section 3513 (see above). If the project moves forward as proposed, and annually kills more than half a million birds protected by AB 454, the project will cause significant unmitigated impacts.

If the adjustment factors I applied to the CAS fatality data also apply to the proposed project, then we would predict much higher fatality rates caused by window collisions. The adjustment factors applied to CAS fatalities found by searchers increased the mean estimated annual fatalities by a factor of 13.5. If fatalities at the project's buildings are similarly represented by more small-bodied birds, then the mean annual fatlity rate would be 83,376 birds. Even if the project implemented mitigation measures that were 90% effective, it would still kill >8,000 birds per year.

Given the predicted bird-window fatality predictions for the project, it is understandable why window collisions are often characterized as either the second or third largest source or human-caused bird mortality. The numbers behind these characterizations are often attributed to Klem's (1990) and Dunn's (1993) estimates of about 100 million to 1 billion bird fatalities per year in the USA, or more recently Loss et al.'s (2014) estimate of 365-988 million bird fatalities in the USA or Calvert et al.'s (2013) and Machtans et al.'s (2013) estimates of 22.4 million and 25 million bird fatalities in Canada, respectively. However, these national estimates were based largely on study-specific fatality estimates that were not adjusted for the proportion of fatalities not found. These national estimates, as large as they are, are likely biased low.

Wildlife Movement

I concur with UCSF's (2020:4.3-3) conclusion, "*The San Francisco Peninsula is an important migratory stopover for birds along the Pacific Flyway—one of the four major migratory routes in North America*." However, I disagree with the EIR where it implies that lack of an established wildlife corridor contributes to its alleged less-than-significant impact on wildlife movement in the region. With this argument, the EIR introduces a false standard. The primary phrase of the CEQA standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. A site such as the proposed project site is critically important for wildlife movement because it composes a diminishing patch of natural cover within an expanse of anthropogenic land uses, forcing more volant wildlife to use the site as stopover and staging habitat during migration, dispersal, and home range patrol (Warnock 2010, Taylor et al. 2011, Runge et al. 2014).

The other argument leading to the EIR's less-than-significant determination is that proposed mitigation will lessen bird-window collision mortality. Even if mitigation measures *do* succeed in lessening bird-window collision mortality, it will have no effect on the project's impacts to movement of wildlife that survive their encounters with the buildings. The tall buildings on the Campus would pose a barrier to movement that is additional to the threat of window collision. Many birds and bats attempting to fly to or from Mount Sutro would have to detour around the buildings, risking predation by peregrine falcons which exploit these types of situations, and costing valuable energy needed for long-distance travel. Inserting multiple tall buildings into the aerohabitat of birds and bats would cause significant adverse impacts to those birds and bats.

CUMULATIVE IMPACTS

The EIR mischaracterizes cumulative impacts as merely residual impacts of mitigation that was incompletely effective. The EIR claims that because the impacts of the Mount Sutro Open Space Vegetation Management Plan were fully mitigated, there would be no cumulative impacts. If cumulative effects were indeed merely residual impacts of inadequate mitigation, then CEQA would require an inadequate mitigation analysis instead of a cumulative impacts analysis.

The other argument used in the EIR to dismiss cumulative impacts is that the only projects that could be listed or assessed in San Francisco would be redevelopment of areas already built. The EIR claims that redevelopment contributes no cumulative impacts because redeveloped areas already removed all biological resources. But this argument neglects the very impact that is likely the largest posed by the project to biological resources. Just as the project poses potentially severe bird-window collision impacts, so too do new buildings going up in place of older buildings. New buildings in San Francisco are glass-covered. An appropriate cumulative impacts analysis would include a tally of predicted or estimated fatality rates of birds colliding with glass façades of recently built, planned, and foreseeable buildings in San Francisco.

The nature of the project's likely impacts, and those of other buildings in San Francisco, warrant a serious cumulative impacts analysis. Bird abundance across North America has declined 29% over the last 48 years (Rosenberg et al. 2019). This decline will result in substantial ecological and economic consequences, the magnitude of which has yet to be understood. Because windows are recognized as one of the principal anthropogenic sources of bird mortality, their cumulative effects among San Francisco's new buildings must be analyzed and mitigated.

MITIGATION

BIO-1c and BIO-1d: Preconstruction Surveys for Bird Nests and Bat Roosts

I understand that the EIR proposes to mitigate potentially significant impacts by having a biologist conduct pre-construction surveys for nesting birds within 250 feet of the construction area and for roosting bats within 50 feet of the construction area within 7 days prior to initiation of construction activities. I disagree, however, that the proposed measures would reduce impacts to less-than-significant.

Preconstruction surveys should be performed. However, it needs to be understood that preconstruction surveys, which are also often referred to as take-avoidance surveys, are really just last-minute salvage efforts to prevent injury or death of the most readily detectable individuals. Preconstruction surveys are limited in their mitigation effect as they detect only small fractions of bird nests and roosting bats occurring on a project site. Bird nests are usually concealed so that they are not discovered and their

occupants destroyed by predators. Locating hummingbird nests, for example, can be nearly impossible. Locating roosting bats is likewise very difficult (Kunz and Lumsden 2003). Preconstruction surveys alone fail to prevent the deaths of most of the animals at risk, nor do they do anything to prevent habitat destruction and lost reproductive capacity.

Preconstruction surveys perform better when they are informed by earlier detection surveys, which have been carefully designed by species' experts and natural resource agency biologists. Detection surveys should be performed early enough to not only inform preconstruction surveys, but also the public and decision-makers about potential project impacts. This early timing of detection surveys is also needed to inform the formulation of mitigation measures, including compensatory mitigation for those impacts than cannot be avoided.

Take-avoidance surveys cannot lessen impacts to nesting birds and roosting bats without first informing the public and decision-makers of the magnitudes of potential impacts, nor without informing survey personnel where to look. The effort needs to be made to map out where birds are nesting and bats roosting, and it needs to be made according to biologically appropriate protocols rather than in a rush to stay just ahead of the tractor blade.

BIO-2b: Bird-Safe Building Treatments

I understand that the EIR proposes to mitigate potentially significant impacts by (1) minimizing unnecessary light emissions from interior and exterior portions of buildings; (2) exploring and adopting window glazing options such as marked glass or UV-reflective glass; and (3) minimizing light and glare of façades through orientation of the building, choice of materials, and landscaping. I disagree, however, that the proposed measures would reduce impacts to less-than-significant.

City of San Francisco (2011) prepared excellent standards for bird-safe buildings, which the EIR cites. City of San Francisco (2011) presents options that include (1) glass and façade treatments to mitigate the effects of transparent and reflective glass; and (2) lighting treatments. But much has been learned by research performed since 2011. For example, mitigation applied to CAS substantially reduced bird-window collision mortality (Kahle et al. 2016), yet the measure implemented was not covered in City of San Francisco (2011). Furthermore, the measures that were recommended in City of San Francisco (2011) were often of uncertain efficacy. Most of the evidence of mitigation efficacy has been anecdotal, although it always helps when the magnitude of effect is very large. As an example of convincing anecdotal evidence, the recent replacement of window panels with fritted glass reduced bird-window collision fatalities by 90% at New York City's Javits Center – a notoriously dangerous building to birds. More often, sound evidence of mitigation efficacy derives from experimentation. I will discuss experimentation further, but first I will recommend mitigation that should precede the measures proposed in the EIR.

The third of the three proposed measures in the EIR is minimizing light and glare of façades through orientation of the building, choice of materials, and landscaping. However, this approach needs to be informed by how birds would encounter and perceive the buildings. The EIR does not identify materials to be used, but it does illustrate building orientations that appear to have been decided already. The EIR is unclear about whether and how building orientation would be decided to minimize collision risk, nor does it indicate the structural materials to be used on any particular portions of buildings. It seems these decisions are either already decided, in the case of building orientation, or in the case of materials to be used, they are deferred to an unspecified later date. Neither are performance standards are linked to any of these measures.

To inform the third measure, as well as to inform of the relative hazards of building locations and building heights, behavioral ecologists need to survey the project area to adequately characterize flight patterns and reactions to existing buildings. Surveys are needed to learn how many of each bird species fly through the area and at what times of day and night. Nocturnal surveys can be performed using a thermal-imaging camera or radar. Such surveys would inform of collision risk, and could inform mitigation strategies involving light management and design of façades facing the prevailing approach directions of migrating birds.

Once it is better understood how birds use their aerohabitat at the project site, and after reasonable measures have been taken to minimize collision risk due to building location, height and orientation, structural measures need to be considered with the understanding that most remain highly uncertainty in their efficacy. An exception would be the decision to minimize the extent of glass on building façades; minimizing glass is surely the most effective measure other than building locations, heights and orientation. If some other measure is universally applied, and if it later proves ineffective, the cost to wildlife and to the University could be very high. Although I do not know the exact cost of the replacement of clear glass panels with fritted glass at the Javits Center, it was likely a major portion of a $1.5 billion renovation.

In the face of high predicted fatality rates, and in the face of high uncertainty over mitigation efficacy, erring on the side of caution would be the prudent approach. Informed decisions are needed. Implementation of measures according to tenets of experimental design would most quickly and most convincingly facilitate tests of efficacy. If fatality monitoring was initiated immediately and if it covered both old and new buildings, then opportune before-after, control-impact (BACI) experimental designs could be used to test the efficacy of various measures. As BACI tests are completed, mitigation measures could be revised for buildings yet to be built. Regardless of whether mitigation measures are experimentally tested, post-construction fatality monitoring should be performed.

The predicted magnitude of bird-window collision fatalities is so large that even if one or more mitigation measures reduce fatalities by 90%, the 10% of fatalities that could not be avoided will still be more than enough to warrant compensatory mitigation. UCSF

should mitigate bird-window collision impacts by purchasing easements or fee title to open space to be preserved as wildlife habitat.

Compensatory mitigation ought also to include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Most of the wildlife injuries will likely be caused by window collisions.

Recommendations on Siting

For birds encountering tall buildings, the project site is inherently dangerous due to its location at the base of a steeply-sloped, forested open space reserve, which is also one of the last remaining patches of open space for migrating and dispersing birds to find stop-over habitat in San Francisco. Even if mitigation measures could reduce bird collision fatalities by 90%, the unavoidable 10% of fatalities and the energetic costs of the barrier effect of the buildings would cause significant, long-term impacts to birds. What I found to be most effective at minimizing collision fatalities caused by wind turbines was careful siting (Smallwood et al. 2017). The same approach would likely prove most effective at minimizing building impacts on wildlife.

There are two types of siting: Macro and micro. Macro-siting refers to selection of a project site, whereas micro-siting refers to selection of locations for project components within the boundary of a project site. Both levels of siting can substantially mitigate impacts to wildlife, but macro-siting usually offers the greatest opportunity for minimizing impacts. Applying macro-siting to the proposed project would consider impacts to wildlife if the new square footage was located at the site of UCSF's Medical Center at Mount Zion, or in Bayview at the Hunters Point shipyard, as examples. Of course, macro-siting must also consider project objectives but can also consider collateral opportunities for students and host communities. Other factors considered, siting the project farther from Mount Sutro Open Space Reserve would vastly lessen impacts to birds.

Micro-siting also bears considerable capacity for reducing project impacts to birds, but probably not without reducing the size of the project and minimizing the extent of windows on building façades. Building heights would need to be reduced, both on the Parnassus Campus and Aldea Housing. The tallest of buildings would best be sited as far north as possible on the Parnassus Campus to minimize bird impacts. The tallest building in Aldea Housing would kill fewer birds if it was placed lower on the slope, closer to Clarendon Avenue, and if the shortest buildings were placed higher on the slope. In both cases, the micro-siting strategy would be to site the taller buildings farther from the steep, forested slopes of Mount Sutro in order to give birds more room to negotiate their ways hazard-free to or from Mount Sutro.

Thank you for your attention,

Shawn Smallwood, Ph.D.

Ecologist

Expertise

- Finding solutions to controversial problems related to wildlife interactions with human industry, infrastructure, and activities;

- Using systems analysis and experimental design principles to identify meaningful ecological patterns that can inform management decisions.

Education

Ph.D. Ecology, University of California, Davis. September 1990.
M.S. Ecology, University of California, Davis. June 1987.
B.S. Anthropology, University of California, Davis. June 1985.
Corcoran High School, Corcoran, California. June 1981.

Experience

- 443 professional publications, including:
- 80 peer reviewed publications
- 24 in non-reviewed proceedings
- 337 reports, declarations, posters and book reviews
- 8 in mass media outlets
- 84 public presentations of research results at meetings
- Reviewed many professional papers and reports
- Testified in 4 court cases.

Editing for scientific journals: Guest Editor, *Wildlife Society Bulletin*, 2012-2013, of invited papers representing international views on the impacts of wind energy on wildlife and how to mitigate the impacts. Associate Editor, *Journal of Wildlife Management*, March 2004 to 30 June 2007. Editorial Board Member, *Environmental Management*, 10/1999 to 8/2004. Associate Editor, *Biological Conservation*, 9/1994 to 9/1995.

Member, Alameda County Scientific Review Committee (SRC), August 2006 to April 2011. The five-member committee investigated the causes of bird and bat collisions in the Altamont Pass Wind Resource Area, and recommended mitigation and monitoring measures. The SRC

reviewed the science underlying the Alameda County Avian Protection Program, and advised the County on how to reduce wildlife fatalities.

Consulting Ecologist, 2004-2007, California Energy Commission (CEC). Provided consulting services as needed to the CEC on renewable energy impacts, monitoring and research, and produced several reports. Also collaborated with Lawrence-Livermore National Lab on research to understand and reduce wind turbine impacts on wildlife.

Consulting Ecologist, 1999-2013, U.S. Navy. Performed endangered species surveys, hazardous waste site monitoring, and habitat restoration for the endangered San Joaquin kangaroo rat, California tiger salamander, California red-legged frog, California clapper rail, western burrowing owl, salt marsh harvest mouse, and other species at Naval Air Station Lemoore; Naval Weapons Station, Seal Beach, Detachment Concord; Naval Security Group Activity, Skaggs Island; National Radio Transmitter Facility, Dixon; and, Naval Outlying Landing Field Imperial Beach.

Part-time Lecturer, 1998-2005, California State University, Sacramento. Taught Contemporary Environmental Issues, Natural Resources Conservation (twice), Mammalogy, Behavioral Ecology, and Ornithology Lab.

Senior Ecologist, 1999-2005, BioResource Consultants. Designed and implemented research and monitoring studies related to avian fatalities at wind turbines, avian electrocutions on electric distribution poles across California, and avian fatalities at transmission lines.

Systems Ecologist, 1996 to present, Consulting in the Public Interest, www.cipi.com. Member of a multi-disciplinary consortium of scientists facilitating large-scale, environmental planning projects and litigation. We provide risk assessments, assessments of management practices, and expert witness testimony.

Chairman, Conservation Affairs Committee, The Wildlife Society--Western Section, 1999-2001. Prepared position statements and led efforts directed toward conservation issues, including travel to Washington, D.C. to lobby Congress for more wildlife conservation funding.

Systems Ecologist, 1995-2000, Institute for Sustainable Development. Headed ISD's program on integrated resources management. Developed indicators of ecological integrity for large areas, using remotely sensed data, local community involvement and GIS.

Associate, 1997-1998, Department of Agronomy and Range Science, University of California, Davis. Worked with Shu Geng and Mingua Zhang on several studies related to wildlife interactions with agriculture and patterns of fertilizer and pesticide residues in groundwater across a large landscape.

Lead Scientist, 1996-1999, National Endangered Species Network. Headed NESN's efforts to inform academic scientists and environmental activists about emerging issues regarding the Endangered Species Act and other environmental laws pertaining to special-status species. Also testified at public hearings on behalf of environmental groups and endangered species.

Ecologist, 1997-1998, Western Foundation of Vertebrate Zoology. Conducted field research to

determine the impact of past mercury mining on the status of California red-legged frogs in Santa Clara County, California.

Senior Systems Ecologist, 1994-1995, EIP Associates, Sacramento, California. Provided consulting services in environmental planning. Developed quantitative assessment of land units for their conservation and restoration opportunities, using the ecological resource requirements of 29 special-status species. Developed ecological indicators for prioritizing areas within Yolo County to receive mitigation funds for habitat easements and restoration.

Post-Graduate Researcher, 1990-1994, Department of Agronomy and Range Science*, U.C. Davis*. Under the mentorship of Dr. Shu Geng, studied landscape and management effects on temporal and spatial patterns of abundance among pocket gophers and species of Falconiformes and Carnivora in the Sacramento Valley. Also managed and analyzed a data base of energy use in California agriculture, and assisted with a landscape (GIS) study of groundwater contamination across Tulare County, California.

Work experience in graduate school: Co-taught Conservation Biology with Dr. Christine Schonewald, 1991 & 1993, UC Davis Graduate Group in Ecology; Reader for Dr. Richard Coss's course on Psychobiology in 1990, UC Davis Department of Psychology; Research Assistant to Dr. Walter E. Howard, 1988-1990, UC Davis Department of Wildlife and Fisheries Biology, testing durable baits for pocket gopher management in forest clearcuts; Research Assistant to Dr. Terrell P. Salmon, 1987-1988, UC Wildlife Extension, Department of Wildlife and Fisheries Biology, developing empirical models of mammal and bird invasions in North America, and a rating system for priority research and control of exotic species based on economic, environmental and human health hazards in California. Student Assistant to Dr. E. Lee Fitzhugh, 1985-1987, UC Cooperative Extension, Department of Wildlife and Fisheries Biology, developing and implementing a statewide mountain lion track count for long-term monitoring of numbers and distribution.

Fulbright Research Fellow, Indonesia, 1988. Tested use of new sampling methods for numerical monitoring of Sumatran tiger and six other species of endemic felids, and evaluated methods used by other researchers.

Projects

Repowering wind energy projects through careful siting of new wind turbines using map-based collision hazard models to minimize impacts to volant wildlife. Funded by wind companies (principally NextEra Renewable Energy, Inc.), California Energy Commission and East Bay Regional Park District, I have collaborated with a GIS analyst and managed a crew of five field biologists performing golden eagle behavior surveys and nocturnal surveys on bats and owls. The goal is to quantify flight patterns for development of predictive models to more carefully site new wind turbines in repowering projects. Focused behavior surveys began May 2012 and continue. Collision hazard models have been prepared for seven wind projects, three of which were built. Planning for additional repowering projects is underway.

Test avian safety of new mixer-ejector wind turbine (MEWT). Designed and implemented a before-after, control-impact experimental design to test the avian safety of a new, shrouded wind turbine developed by Ogin Inc. (formerly known as FloDesign Wind Turbine Corporation). Supported by a

$718,000 grant from the California Energy Commission's Public Interest Energy Research program and a 20% match share contribution from Ogin, I managed a crew of seven field biologists who performed periodic fatality searches and behavior surveys, carcass detection trials, nocturnal behavior surveys using a thermal camera, and spatial analyses with the collaboration of a GIS analyst. Field work began 1 April 2012 and ended 30 March 2015 without Ogin installing its MEWTs, but we still achieved multiple important scientific advances.

Reduce avian mortality due to wind turbines at Altamont Pass. Studied wildlife impacts caused by 5,400 wind turbines at the world's most notorious wind resource area. Studied how impacts are perceived by monitoring and how they are affected by terrain, wind patterns, food resources, range management practices, wind turbine operations, seasonal patterns, population cycles, infrastructure management such as electric distribution, animal behavior and social interactions.

Reduce avian mortality on electric distribution poles. Directed research toward reducing bird electrocutions on electric distribution poles, 2000-2007. Oversaw 5 founds of fatality searches at 10,000 poles from Orange County to Glenn County, California, and produced two large reports.

Cook *et al*. v. Rockwell International *et al*., No. 90-K-181 (D. Colorado). Provided expert testimony on the role of burrowing animals in affecting the fate of buried and surface-deposited radioactive and hazardous chemical wastes at the Rocky Flats Plant, Colorado. Provided expert reports based on four site visits and an extensive document review of burrowing animals. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals. I testified in federal court in November 2005, and my clients were subsequently awarded a $553,000,000 judgment by a jury. After appeals the award was increased to two billion dollars.

Hanford Nuclear Reservation Litigation. Provided expert testimony on the role of burrowing animals in affecting the fate of buried radioactive wastes at the Hanford Nuclear Reservation, Washington. Provided three expert reports based on three site visits and extensive document review. Predicted and verified a certain population density of pocket gophers on buried waste structures, as well as incidence of radionuclide contamination in body tissue. Conducted transect surveys for evidence of burrowing animals and other wildlife on and around waste facilities. Discovered substantial intrusion of waste structures by burrowing animals.

Expert testimony and declarations on proposed residential and commercial developments, gas-fired power plants, wind, solar and geothermal projects, water transfers and water transfer delivery systems, endangered species recovery plans, Habitat Conservation Plans and Natural Communities Conservation Programs. Testified before multiple government agencies, Tribunals, Boards of Supervisors and City Councils, and participated with press conferences and depositions. Prepared expert witness reports and court declarations, which are summarized under Reports (below).

Protocol-level surveys for special-status species. Used California Department of Fish and Wildlife and US Fish and Wildlife Service protocols to search for California red-legged frog, California tiger salamander, arroyo southwestern toad, blunt-nosed leopard lizard, western pond turtle, giant kangaroo rat, San Joaquin kangaroo rat, San Joaquin kit fox, western burrowing owl, Swainson's hawk, Valley elderberry longhorn beetle and other special-status species.

Conservation of San Joaquin kangaroo rat. Performed research to identify factors responsible for the

decline of this endangered species at Lemoore Naval Air Station, 2000-2013, and implemented habitat enhancements designed to reverse the trend and expand the population.

Impact of West Nile Virus on yellow-billed magpies. Funded by Sacramento-Yolo Mosquito and Vector Control District, 2005-2008, compared survey results pre- and post-West Nile Virus epidemic for multiple bird species in the Sacramento Valley, particularly on yellow-billed magpie and American crow due to susceptibility to WNV.

Workshops on HCPs. Assisted Dr. Michael Morrison with organizing and conducting a 2-day workshop on Habitat Conservation Plans, sponsored by Southern California Edison, and another 1-day workshop sponsored by PG&E. These Workshops were attended by academics, attorneys, and consultants with HCP experience. We guest-edited a Proceedings published in Environmental Management.

Mapping of biological resources along Highways 101, 46 and 41. Used GPS and GIS to delineate vegetation complexes and locations of special-status species along 26 miles of highway in San Luis Obispo County, 14 miles of highway and roadway in Monterey County, and in a large area north of Fresno, including within reclaimed gravel mining pits.

GPS mapping and monitoring at restoration sites and at Caltrans mitigation sites. Monitored the success of elderberry shrubs at one location, the success of willows at another location, and the response of wildlife to the succession of vegetation at both sites. Also used GPS to monitor the response of fossorial animals to yellow star-thistle eradication and natural grassland restoration efforts at Bear Valley in Colusa County and at the decommissioned Mather Air Force Base in Sacramento County.

Mercury effects on Red-legged Frog. Assisted Dr. Michael Morrison and US Fish and Wildlife Service in assessing the possible impacts of historical mercury mining on the federally listed California red-legged frog in Santa Clara County. Also measured habitat variables in streams.

Opposition to proposed No Surprises rule. Wrote a white paper and summary letter explaining scientific grounds for opposing the incidental take permit (ITP) rules providing ITP applicants and holders with general assurances they will be free of compliance with the Endangered Species Act once they adhere to the terms of a "properly functioning HCP." Submitted 188 signatures of scientists and environmental professionals concerned about No Surprises rule US Fish and Wildlife Service, National Marine Fisheries Service, all US Senators.

Natomas Basin Habitat Conservation Plan alternative. Designed narrow channel marsh to increase the likelihood of survival and recovery in the wild of giant garter snake, Swainson's hawk and Valley Elderberry Longhorn Beetle. The design included replication and interspersion of treatments for experimental testing of critical habitat elements. I provided a report to Northern Territories, Inc.

Assessments of agricultural production system and environmental technology transfer to China. Twice visited China and interviewed scientists, industrialists, agriculturalists, and the Directors of the Chinese Environmental Protection Agency and the Department of Agriculture to assess the need and possible pathways for environmental clean-up technologies and trade opportunities between the US and China.

Yolo County Habitat Conservation Plan. Conducted landscape ecology study of Yolo County to spatially prioritize allocation of mitigation efforts to improve ecosystem functionality within the County from the perspective of 29 special-status species of wildlife and plants. Used a hierarchically structured indicators approach to apply principles of landscape and ecosystem ecology, conservation biology, and local values in rating land units. Derived GIS maps to help guide the conservation area design, and then developed implementation strategies.

Mountain lion track count. Developed and conducted a carnivore monitoring program throughout California since 1985. Species counted include mountain lion, bobcat, black bear, coyote, red and gray fox, raccoon, striped skunk, badger, and black-tailed deer. Vegetation and land use are also monitored. Track survey transect was established on dusty, dirt roads within randomly selected quadrats.

Sumatran tiger and other felids. Upon award of Fulbright Research Fellowship, I designed and initiated track counts for seven species of wild cats in Sumatra, including Sumatran tiger, fishing cat, and golden cat. Spent four months on Sumatra and Java in 1988, and learned Bahasa Indonesia, the official Indonesian language.

Wildlife in agriculture. Beginning as post-graduate research, I studied pocket gophers and other wildlife in 40 alfalfa fields throughout the Sacramento Valley, and I surveyed for wildlife along a 200 mile road transect since 1989 with a hiatus of 1996-2004. The data are analyzed using GIS and methods from landscape ecology, and the results published and presented orally to farming groups in California and elsewhere. I also conducted the first study of wildlife in cover crops used on vineyards and orchards.

Agricultural energy use and Tulare County groundwater study. Developed and analyzed a data base of energy use in California agriculture, and collaborated on a landscape (GIS) study of groundwater contamination across Tulare County, California.

Pocket gopher damage in forest clear-cuts. Developed gopher sampling methods and tested various poison baits and baiting regimes in the largest-ever field study of pocket gopher management in forest plantations, involving 68 research plots in 55 clear-cuts among 6 National Forests in northern California.

Risk assessment of exotic species in North America. Developed empirical models of mammal and bird species invasions in North America, as well as a rating system for assigning priority research and control to exotic species in California, based on economic, environmental, and human health hazards.

Representative special-status species experience

Common name	Species name	Description
Field experience		
California red-legged frog	*Rana aurora draytonii*	Protocol searches; Many detections
Foothill yellow-legged frog	*Rana boylii*	Presence surveys; Many detections
Western spadefoot	*Spea hammondii*	Presence surveys; Few detections
California tiger salamander	*Ambystoma californiense*	Protocol searches; Many detections
Coast range newt	*Taricha torosa torosa*	Searches and multiple detections
Blunt-nosed leopard lizard	*Gambelia sila*	Detected in San Luis Obispo County
California horned lizard	*Phrynosoma coronatum frontale*	Searches; Many detections
Western pond turtle	*Clemmys marmorata*	Searches; Many detections
San Joaquin kit fox	*Vulpes macrotis mutica*	Protocol searches; detections
Sumatran tiger	*Panthera tigris*	Research in Sumatra
Mountain lion	*Puma concolor californicus*	Research and publications
Point Arena mountain beaver	*Aplodontia rufa nigra*	Remote camera operation
Giant kangaroo rat	*Dipodomys ingens*	Detected in Cholame Valley
San Joaquin kangaroo rat	*Dipodomys nitratoides*	Research, conservation at NAS Lemoore
Monterey dusky-footed woodrat	*Neotoma fuscipes luciana*	Non-target captures and mapping of dens
Salt marsh harvest mouse	*Reithrodontomys raviventris*	Habitat assessment, monitoring
Salinas harvest mouse	*Reithrodontomys megalotus distichlus*	Captures; habitat assessment
California clapper rail	*Rallus longirostris*	Surveys and detections
Golden eagle	*Aquila chrysaetos*	Research in Altamont Pass
Swainson's hawk	*Buteo swainsoni*	Research in Sacramento Valley
Northern harrier	*Circus cyaeneus*	Research and publication
White-tailed kite	*Elanus leucurus*	Research and publication
Loggerhead shrike	*Lanius ludovicianus*	Research in Sacramento Valley
Least Bell's vireo	*Vireo bellii pusillus*	Detected in Monterey County
Willow flycatcher	*Empidonax traillii extimus*	Research at Sierra Nevada breeding sites
Burrowing owl	*Athene cunicularia hypugia*	Research at multiple locations
Valley elderberry longhorn beetle	*Desmocerus californicus dimorphus*	Research and publication
Analytical		
Arroyo southwestern toad	*Bufo microscaphus californicus*	Research and report.
Giant garter snake	*Thamnophis gigas*	Research and publication
Northern goshawk	*Accipiter gentilis*	Research and publication
Northern spotted owl	*Strix occidentalis*	Research and reports
Alameda whipsnake	*Masticophis lateralis euryxanthus*	Expert testimony

- NOA Draft Addendum to the Final Handbook for Habitat Conservation Planning and Incidental Take Permitting Process, termed the HCP 5-Point Policy Plan (Fed. Reg. 64(45): 11485 - 11490) (1999; 2 pp + attachments);
- Covell Center Project EIR and EIR Supplement (1997).

Position Statements I prepared the following position statements for the Western Section of The Wildlife Society, and one for nearly 200 scientists:

- Recommended that the California Department of Fish and Game prioritize the extermination of the introduced southern water snake in northern California. The Wildlife Society--Western Section (2001);
- Recommended that The Wildlife Society—Western Section appoint or recommend members of the independent scientific review panel for the UC Merced environmental review process (2001);
- Opposed the siting of the University of California's 10th campus on a sensitive vernal pool/grassland complex east of Merced. The Wildlife Society--Western Section (2000);
- Opposed the legalization of ferret ownership in California. The Wildlife Society--Western Section (2000);
- Opposed the Proposed "No Surprises," "Safe Harbor," and "Candidate Conservation Agreement" rules, including permit-shield protection provisions (Fed. Reg. Vol. 62, No. 103, pp. 29091-29098 and No. 113, pp. 32189-32194). This statement was signed by 188 scientists and went to the responsible federal agencies, as well as to the U.S. Senate and House of Representatives.

Subject: Comments on UCSF Comprehensive Parnassus Heights Plan (SCH No. 2020010175)

Dear Mr. Drury,

We have reviewed the July 2020 Draft Environmental Impact Report ("DEIR") for the UCSF Comprehensive Parnassus Heights Plan ("Project") located in the City of San Francisco ("City"). The Project proposes to demolish 287,000-SF of existing buildings and construct the Irving Street Arrival Project, which includes 25,000-SF of multi-story vertical circulation space; a 270,000-SF Research and Academic Building ("RAB"); a 955,000-SF New Hospital; and the Initial Aldea Housing Densification, including 184 residential dwelling units and 184 parking spaces, all on the 107-acre Project site.

Our review concludes that the DEIR fails to adequately evaluate the Project's air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment.

Air Quality

Unsubstantiated Input Parameters Used to Estimate Project Emissions

The DEIR's air quality analysis relies on emissions calculated with CalEEMod.2016.3.2.[1] CalEEMod provides recommended default values based on site-specific information, such as land use type,

[1] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4.

meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[2] Once all of the values are inputted into the model, the Project's construction and operational emissions are calculated, and "output files" are generated. These output files disclose to the reader what parameters were utilized in calculating the Project's air pollutant emissions and make known which default values were changed as well as provide justification for the values selected.[3]

Review of the Project's air modeling demonstrates that the DEIR underestimates emissions associated with Project activities. As previously stated, the DEIR's air quality analysis relies on air pollutant emissions calculated using CalEEMod. When reviewing the Project's CalEEMod output files, provided as Appendix AIR to the DEIR, we found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated. An updated EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

Unsubstantiated Utility Company and Intensity Factors

Review of the Project's CalEEMod output files demonstrates that the utility company was modeled as "User Defined" with a manually-inputted CO_2 intensity factor of 605.78 pounds per megawatt hour ("lbs/MWh"), a CH_4 intensity factor of 0 lbs/MWh, and an N_20 intensity factor of 0 lbs/MWh (see excerpt below) (Appendix AIR, pp. 1172, 1250, 1264, 1282, 1357, 1371).

Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	605.78	CH4 Intensity (lb/MWhr)	0	N2O Intensity (lb/MWhr)	0

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[4] According to the "User Entered Comments & Non-Default Data" table, the CO_2, CH_4, and N_20 intensity factors reflect the "UCSF specific CO2 EF prior to 2025 net zero" (Appendix AIR, pp. 1250). However, this is incorrect for two (2) reasons. First, this justification fails to provide a source for the intensity factors assumed by the model and as a result, we cannot verify the updated intensity factors. Second, the CH_4 and N_20 were *not* inputted and instead incorrectly left as 0 lbs/MWh. According to the CalEEMod User's Guide:

---

[2] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 1, 9.
[3] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, fn 1, p. 11, 12 – 13. A key feature of the CalEEMod program is the "remarks" feature, where the user explains why a default setting was replaced by a "user defined" value. These remarks are included in the report.
[4] CalEEMod User Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 2, 9

> "[I]f the utility for the project is not in the drop down list, the user may select User Defined and *the user will need to manually enter the various intensity factors*" (emphasis added).[5]

As you can see in the excerpt above, if "User Defined" is selected as the utility company, the CO_2, CH_4, and N_20 intensity factors should be manually inputted. Here, however, the CH_4 and N_20 values were incorrectly left as 0 lbs/MWh. Inputting an unsupported CO_2 intensity factor, as well as failing to input CH_4 and N_20 intensity factors, presents an issue, as CalEEMod uses the CO_2, CH_4, and N_20 intensity factors to calculate the Project's greenhouse gas ("GHG") emissions associated with electricity use. [6] As a result, the models may underestimate the Project's GHG emissions and should not be relied upon to determine Project significance.

Failure to Include All Proposed Land Uses

According to the DEIR, the Project would include a temporary construction office between 25,000- and 45,000-SF in size (p. 3-27). However, review of the Project's CalEEMod output files demonstrates that this land use was not modeled or evaluated whatsoever (Appendix AIR, pp. 1085, 1112, 1146, 1172, 1297, 1327, 1357, 1371). This presents an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[7] For example, the square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). Furthermore, CalEEMod assigns each land use type with its own set of energy usage emission factors.[8] Thus, by failing to include the proposed temporary construction office in any of the CalEEMod models, the DEIR fails to account for the Project's construction-related and operational emissions associated with this land use and should not be relied upon to determine Project significance.

Failure to Model Parking

According to the DEIR, the Initial Aldea Housing Densification component of the Project would include one parking space per unit (p. 3-28). Given that the Initial Aldea Housing Densification includes 184 student housing units, the corresponding model should have included 184 parking spaces (p. 3-28).[9] However, review of the Project's CalEEMod output files demonstrates that the models fail to include any amount of parking (see excerpt below) (Appendix AIR, pp. 1085, 1357).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area
Apartments High Rise	184.00	Dwelling Unit	2.97	184,000.00

[5] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 17.
[6] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* CalEEMod.com, p. 17.
[7] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/upgrades/2016.3/01_user-39-s-guide2016-3-1.pdf?sfvrsn=2, p. 17
[8] "CalEEMod User's Guide, Appendix D." CAPCOA, September 2016, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/upgrades/2016.3/05_appendix-d2016-3-1.pdf?sfvrsn=2
[9] Calculated: (184 residential units) * (1 parking space per residential unit) = 184 parking spaces.

This presents an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[10] For example, the square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). Furthermore, CalEEMod assigns each land use type with its own set of energy usage emission factors.[11] Thus, by failing to include the proposed parking associated with the Initial Aldea Housing Densification, the models underestimate the Project's construction-related and operational emissions and should not be relied upon to determine Project significance.

Incorrect Land Use Sizes

According to the DEIR, 24,000-SF of demolition would be required for the construction of new student housing structures associated with the Initial Aldea Housing Densification component of the Project (p. 3-37). Thus, the "Existing Emissions Aldea Housing Initial Phase Demolition" should have included 24,000-SF of residential land use space to be demolished. However, review of the Project's CalEEMod output files demonstrates that the "Existing Emissions Aldea Housing Initial Phase Demolition" model incorrectly includes 145,000-SF of "Research & Development" land use space (see excerpt below) (Appendix AIR, pp. 1282).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area
Research & Development	145.00	1000sqft	3.33	145,000.00

As you can see in the excerpt above, the existing land use to be demolished for the Initial Aldea Housing Densification is overestimated in size and modeled using an incorrect land use type. This presents an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[12] For example, the square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). Furthermore, CalEEMod assigns each land use type with its own set of energy usage emission factors.[13] By including an overestimated existing land use size and incorrect land use type, the model overestimates the emissions associated with the existing land use. As a result, the DEIR may *underestimate the net increase* in operational emissions resulting from the Initial Aldea Housing Densification component of the Project and the air quality significance determination should not be relied upon.

[13] "CalEEMod User's Guide, Appendix D." CAPCOA, September 2016, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/upgrades/2016.3/05_appendix-d2016-3-1.pdf?sfvrsn=2

Incorrect Operational Land Use Types & Sizes

Review of the Project's CalEEMod output files demonstrates that the land use types and sizes were inputted incorrectly into the Project's four (4) operational models. Specifically, review of the "CPHP Operational Existing" model demonstrates that that *all* of the Project's existing land use space was modeled as "Hospital" (see excerpt below) (Appendix AIR, pp. 1217).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Hospital	3,900.00	1000sqft	89.53	3,900,000.00	0

As you can see in the excerpt above, all 3,900,000-SF of the existing land use space was modeled as "Hospital" in the "CPHP Operational Existing" model. Second, review of the "CPHP Operational CPHP Campus Wide 2050" model demonstrates that *all* of the Project's land use space was again modeled as "Hospital" (see excerpt below) (Appendix AIR, pp. 1297).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Hospital	6,000.00	1000sqft	137.74	6,000,000.00	0

As you can see in the excerpt above, all 6,000,000-SF of the land use space was modeled as "Hospital" in the "CPHP Operational CPHP Campus Wide 2050" model. Third, review of the "CPHP Operational 2050 No Project" model demonstrates that *all* of the Project's land use space was again modeled as "Hospital" (see excerpt below) (Appendix AIR, pp. 1387).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Hospital	3,900.00	1000sqft	89.53	3,900,000.00	0

As you can see in the excerpt above, all 3,900,000-SF of the land use space was modeled as "Hospital" in the "CPHP Operational 2050 No Project" model. However, modeling *all* of the proposed and existing Projects' 3.9 million and 6 million square feet of land use space, respectfully, as "Hospital" in these three (3) operational models is incorrect. According to the DEIR:

> "Currently, there is approximately 3.92 million gsf of building space on the campus site. The total amount of campus building space upon full implementation of the CPHP would be approximately 5.97 million gsf (*including instruction, research, clinical, and support space; housing; and structured parking*), when accounting for existing campus site development, demolition, and proposed new development" (emphasis added) (p. 2-2 – 2-3).

As you can see in the excerpt above, modeling the *entirety* of the existing and proposed Projects' operational space as "Hospital" is incorrect and unsubstantiated. Instead, these models should have included *all* of the land use spaces described, including Housing, University/College, Library, Parking, Hospital, Medical Office Building, and Research and Development space.

Furthermore, review of the "UCSF Initial Phase Projects Operational" model demonstrates that the model only includes a total of 270,000-SF of "Research & Development" land use space and 142,000-SF of "Apartments High Rise" land use space (see excerpt below) (Appendix AIR, pp. 1327).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Research & Development	270.00	1000sqft	2.50	270,000.00	0
Apartments High Rise	142.00	Dwelling Unit	2.29	142,000.00	406

As you can see in the excerpt above, that the model only includes a total of 270,000-SF of "Research & Development" land use space and 142,000-SF of "Apartments High Rise" land use space *in total*. However, only including these two (2) land use types for the Project's Initial Phase is incorrect. Specifically, according to the DEIR:

> "The Plan includes an "Initial Phase" that comprises: 1) Irving Street Arrival improvements, 2) RAB, 3) New Hospital, and 4) initial Aldea Housing Densification, and as well as other Initial Phase improvements. The Initial Phase would account for approximately 1.43 million gsf of new building development" (p. 2-3).

As you can see in the excerpt above, the Project's Initial Phase comprises a total of approximately 1.43 million gsf of new development, including Hospital, Research & Development, Residential, and Parking land use space. However, as previously described, the "UCSF Initial Phase Projects Operational" model only includes a *total* of 412,000-SF, comprised of *only* Research & Development and Residential space. This is incorrect, as the model underestimates the proposed Project's Initial Phase's land use space by approximately 1,018,000-SF and fails to include any Hospital or Parking space.

The incorrect land use type and size inputs throughout these four (4) models present an issue, as the land use type and size features are used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations.[14] The square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts). By underestimating the floor surface area and failing to model the correct land use types as indicated by the DEIR, the models may underestimate the Project's construction-related and operational emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Construction Phase Lengths

The Project's CalEEMod output files demonstrate that three (3) of the models include unsubstantiated changes to the Project's anticipated individual construction phase lengths. As a result, the models may underestimate the Project's construction-related emissions.

First, the "New Hospital Construction" model includes five (5) changes to the Project's anticipated construction schedule (see excerpt below) (Appendix AIR, pp. 1113-1114).

New Hospital Construction, Annual:

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	10.00	521.00

[14] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.caleemod.com/, p. 18.

tblConstructionPhase	NumDays	200.00	522.00
tblConstructionPhase	NumDays	200.00	1,043.00
tblConstructionPhase	NumDays	4.00	152.00
tblConstructionPhase	NumDays	2.00	152.00

Specifically, the architectural coating phase was increased by approximately 5,110%, from the default value of 10 to 521 days; the "Foundations/Concrete Pour" building construction phase was increased by approximately 161%, from the default value of 200 to 522 days; the "Building Construction" phase was increased by approximately 422%, from the default value of 200 to 1,043 days; the grading phase was increased by approximately 3,700%, from the default value of 4 to 152 days; and the site preparation phase was increased by approximately 7,500%, from the default value of 2 to 152 days.

Second, the "UCSF Irving Street Arrival Construction Only" model includes five (5) changes to the Project's anticipated construction schedule (see excerpt below) (Appendix AIR, pp. 1147-1148).

UCSF Irving Street Arrival Construction Only, Annual:

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	10.00	66.00
tblConstructionPhase	NumDays	5.00	132.00
tblConstructionPhase	NumDays	1.00	66.00
tblConstructionPhase	NumDays	100.00	326.00
tblConstructionPhase	NumDays	5.00	152.00

Specifically, the architectural coating phase was increased by approximately 2,940%, from the default value of 5 to 152 days; the building construction phase was increased by approximately 226%, from the default value of 100 to 326 days; the paving phase was increased by approximately 2,540% from 5 to 132 days; the grading phase was increased by approximately 560%, from the default value of 10 to 66 days; and the site preparation phase was increased by approximately 6,500%, from the default value of 1 to 66 days.

Third, the "UCSF CPHP RAB Construction" model includes six (6) changes to the Project's anticipated construction schedule (see excerpt below) (Appendix D, pp. 1173-1174).

UCSF CPHP RAB Construction, Annual:

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	10.00	523.00
tblConstructionPhase	NumDays	220.00	130.00
tblConstructionPhase	NumDays	220.00	675.00
tblConstructionPhase	NumDays	20.00	66.00
tblConstructionPhase	NumDays	6.00	219.00
tblConstructionPhase	NumDays	3.00	66.00

Specifically, the architectural coating phase was increased by approximately 5,130%, from the default value of 10 to 523 days; the "Foundations/Concrete Pour" building construction phase was decreased by approximately 41%, from the default value of 220 to 130 days; the "Building Construction" phase was increased by approximately 207%, from the default value of 220 to 675 days; the grading phase was increased by approximately 3,550%, from the default value of 6 to 219 days; the site preparation phase was increased by approximately 2,100%, from the default value of 3 to 66 days; and the demolition phase was increased by approximately 230%, from the default value of 20 to 66 days.

Thus, as you can see in the excerpts above, the "New Hospital Construction" model, the "UCSF Irving Street Arrival Construction Only" model, and the "UCSF CPHP RAB Construction" model contain several unsubstantiated changes to the individual construction phase lengths. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[15] According to the corresponding "User Entered & Comments & Non-Default Data" tables for the models, the justifications provided for these changes are: "Construction Schedule per applicants RFI response. LPPI Demo in 2014 LRDP," Construction schedule per applicant RFI response," and "Construction schedule provided by applicant," respectively (Appendix AIR, pp. 1112, 1146, 1172). However, the DEIR and associated documents fail to disclose the referenced RFI response, as indicated by the above justifications, or the Project's anticipated construction schedule, including individual phase lengths. Furthermore, while the DEIR mentions the tentative start and end date of each Project component, the DEIR fails to provide the specific *individual construction phase lengths* (p. 3-36 – 3-37). As a result, we cannot verify the reivsed construction schedules and individual construction phase lengths included in the models.

These unsubstantiated changes improperly spread out construction emissions over a longer period than is expected for the Project, which results in an underestimation of the maximum daily emissions associated with construction. In addition, according to the CalEEMod User's Guide, each construction phase is associated with different emissions activities (see excerpt below).[16]

> *Demolition* involves removing buildings or structures.
>
