UCSF New Hospital at Parnassus Heights Environmental Impact Report

Volume 1

Volume 2

CHAPTER 8
Comments and Responses

8.1 Introduction

8.1.1 Purpose of the Comments and Responses Document

The University of California, San Francisco (UCSF) is proposing to construct a new hospital and related improvements at the east end of UCSF's Parnassus Heights campus core, collectively known as the New Hospital at Parnassus Heights project (NHPH). The NHPH would increase inpatient beds at the Parnassus Heights campus site; address seismic safety requirements and meet other regulatory requirements and industry standards for contemporary hospitals; accommodate modern technologies; and enhance functionality and efficiency at the campus site. Construction of the NHPH would begin in 2023 with the proposed New Hospital and majority of related improvements completed and operational by the end of 2030, and completion of the remaining related improvements by 2034. A minor amendment to the UCSF 2014 Long Range Development Plan (2014 LRDP) would be required to adjust the Reserve boundary and maintain the Reserve at a minimum of 61 acres.

As required by the California Environmental Quality Act (CEQA), this EIR: (1) assesses the potentially significant direct and indirect environmental impacts, as well as the potentially significant cumulative impacts, associated with implementation of the NHPH; (2) identifies feasible means of avoiding or substantially lessening significant adverse impacts; and (3) evaluates a range of reasonable alternatives to the proposed NHPH, including the required No Project Alternative.

The University of California (University or UC) is the "lead agency" for the environmental review of the NHPH and for the minor LRDP amendment. UC is governed by the Board of Regents of UC (UC Regents), which under Article IX, Section 9, of the California Constitution, has "full powers of organization and government" subject only to very specific areas of legislative control. The UC Regents has the responsibility for certifying this Final EIR, approving design of the New Hospital and the minor LRDP amendment.

As described in greater detail under Section 8.1.2, Environmental Review Process, below, UCSF published a Draft EIR on the proposed NHPH on December 16, 2021, and the public review period for that document ended on February 14, 2022. The Draft EIR, as revised (see consolidated Draft EIR in Volume 1 of this Final EIR), together with this Comments and Responses document (Volume 2 of this Final EIR), and appendices to these documents – see Section 8.1.2.3, below, constitute the Final EIR for the proposed NHPH in fulfillment of

requirements of CEQA and consistent with CEQA Guidelines Section 15132. The Final EIR will be considered by decision-makers before deciding whether to approve the design of the New Hospital and the proposed minor LRDP amendment and reflects the Lead Agency's independent judgment and analysis of the physical impacts of the project on the environment (CEQA Guidelines, Section 15090).

This Comments and Responses document provides written responses to comments received during the public review period for the Draft EIR. It contains a list of agencies, organizations and persons that commented on the Draft EIR made in response to comments received; copies of comments received on the Draft EIR; and written responses to those comments. It also contains revisions to the Draft EIR to clarify or correct information in the Draft EIR. Section 8.1.3, Method of Organization, below, provides a description of the overall contents and organization of this Comments and Responses document.

8.1.2 Environmental Review Process

8.1.2.1 Notice of Preparation and Public Scoping

On July 28, 2021, a Notice of Preparation (NOP), including an Initial Study, was published for the NHPH EIR. A 30-day public comment period ended on August 27, 2021. A copy of the NOP/Initial Study is included in **Appendix A** to this Final EIR. A scoping meeting was held on August 17, 2021 to accept public input on environmental topics to be analyzed in the EIR and approaches to the impact analyses. Due to the COVID-19 pandemic, the scoping meeting was held via Zoom. Written comments received on the NOP, and a transcript of the scoping meeting, are included in **Appendix B** to this Final EIR.

8.1.2.2 Draft EIR Public Review

On December 16, 2021, UCSF released for public review the Draft EIR on the NHPH. A 60-day public review and comment period on the Draft EIR began on December 16 and closed on February 14, 2022. During the public review period, UCSF received one comment letter from a governmental agency, five comments letters from organizations, and 21 comment letters from individuals. UCSF also held a public hearing on January 19, 2022 via Zoom to receive oral comments on the Draft EIR.

8.1.2.3 Final EIR: Consolidated Draft EIR and Comments and Responses Document

This Final EIR consists of two parts (Volumes 1 and 2):

- Volume 1 of this Final EIR is a consolidated Draft EIR that incorporates staff-initiated changes and revisions made in response to comments that were received on the Draft EIR; and includes associated appendices.

- Volume 2 of this Final EIR consists of this Comments and Responses document, as described under Section 8.1.1, above, and Section 8.1.3, below; and includes associated appendices.

The UC Regents will hold a public hearing to consider whether to certify the Final EIR as complying with the requirements of CEQA, and whether to approve the design of the New Hospital and the minor LRDP amendment. UCSF will notify all public agencies that submitted comments on the Draft EIR of the availability of the Final EIR at least 10 days prior to the UC Regents meeting on the Final EIR (CEQA Guidelines, Section 15088(b)). Additionally, as a courtesy, UCSF will also notify all others who submitted comments on the Draft EIR of the availability of the Final EIR at least 10 days prior to the UC Regents meeting on the Final EIR.

The UC Regents must certify the Final EIR before deciding whether to approve the design of the New Hospital and the minor LRDP amendment. Prior to approval of a project for which the EIR identifies significant environmental effects, CEQA requires the adoption of Findings of Fact (CEQA Guidelines, Sections 15091 and 15092). If the Findings of Fact identify significant adverse impacts that cannot be avoided or substantially lessened, the UC Regents must adopt a statement of overriding considerations for those impacts (CEQA Guidelines, Section 15093(b)).

8.1.3 Method of Organization

This Comments and Responses document is organized as follows:

- Chapter 8, *Comments and Responses*, organized as follows:
  - Section 8.1, *Introduction*, describes the purpose of the Comments and Responses document, the environmental review process, and the organization of this document.
  - Section 8.2, *Agencies, Organizations and Individuals Commenting on the Draft EIR,* lists all agencies, organizations, and persons that submitted written and/or oral comments on the Draft EIR during the public review period.
  - Section 8.3, *Master Responses*, contains comprehensive responses on topics that were discussed frequently in public comments on the Draft EIR.
  - Section 8.4, *Written and Oral Comments on the Draft EIR, and Responses to Comments*, contains all comment letters received, and a copy of the transcript of the public hearing held, during the public review period for the Draft EIR, and the UCSF's responses to significant environmental points raised in these letters and the public hearing.
  - Section 8.5, *Revisions to the Draft EIR*, presents changes and revisions to the Draft EIR. UCSF made changes and revisions to the Draft EIR either in response to comments received on the document, or as necessary to clarify statements and conclusions made in the document. None of the changes and revisions in Section 8.5 substantially affect the analysis or conclusions presented in the Draft EIR.
- Chapter 9, *Mitigation Monitoring and Reporting Program,* presents the Mitigation Monitoring and Reporting Program (MMRP) required under CEQA, which identifies the specific timing and roles and responsibilities for implementation of adopted mitigation measures.

8.1.4 Draft EIR Recirculation Not Required

CEQA Guidelines Section 15088.5 requires Draft EIR recirculation when "significant new information" is added to an EIR because the EIR is changed in a way that deprives the public of a meaningful opportunity to comment on a project's significant environmental effects or feasible mitigation measures or alternatives to reduce or avoid such effects that are not proposed for adoption. The comments, responses, and Draft EIR revisions presented in this document do not constitute such "significant new information;" instead, they clarify, amplify, or make insignificant modifications to the Draft EIR. For example, none of the comments, responses, and Draft EIR revisions disclose new or substantially more severe significant environmental effects of the proposed NHPH, or new feasible mitigation measures or alternatives considerably different than those analyzed in the Draft EIR that would clearly lessen the proposed NHPH's significant effects which UC declines to adopt. Recirculation of the NHPH Draft EIR is therefore not required.

8.2 Agencies, Organizations and Individuals Commenting on the Draft EIR

This Comments and Responses document provides written responses to comments received on the Draft EIR during its public review period (December 16, 2021 through February 14, 2022), including all written comments submitted either by letter or email, and all oral comments presented at the public hearing for the Draft EIR.

This section lists all agencies, organizations, and individuals ("persons") who submitted comments on the Draft EIR. Persons who submitted written comments are grouped according to whether they represent a public agency, organization, or an individual citizen, and persons who provided oral comments at the public hearing are also listed.

For each commenter on the Draft EIR, the person's name, agency or organization as applicable, comment format, comment date, and a commenter code are provided. The commenter codes were assigned to facilitate the preparation of responses, and there is a unique commenter code for each comment letter, email, and public hearing transcript comment based on the name of the agency, organization, or individual submitting the comment. Comments submitted by mail, email, or orally at the public hearing (as transcribed in the official public hearing transcript) are all coded and numbered the same way.

The commenter code for comments on the Draft EIR begins with a prefix indicating whether the commenter represents a public agency (A), an organization (O), an individual (I), or a speaker at the public hearing (PH). This is followed by a hyphen and the acronym of the agency or organization, or the individual's last name. Within each category, commenters are listed in alphabetical order by code.

The commenter codes are used to identify individual comments on separate topics within each comment letter, email, comment card, or public hearing transcript. Each individual comment from each commenter is bracketed and numbered sequentially following the commenter code. The bracketed comments and corresponding comment codes are shown in the margins of the comments. There is a unique comment code for each distinct comment.

8.2.1.5 Other Miscellaneous Correspondence

Other miscellaneous correspondence was received during the NHPH Draft EIR public review period, but which did not comment directly on the adequacy of the NHPH Draft EIR. This correspondence is included as **Appendix MC** in this Final EIR.

8.3 Master Responses

8.3.1 Introduction

This section presents "master responses" addressing a number of similar or recurring topics in the comments received on the Draft EIR. The intent of the master responses is to avoid repetition within this document and improve readability by giving a single, comprehensive response to these comments. Responses to the individual comments that raise these recurring topics refer the reader to the master responses in this chapter.

8.3.2 Summary of Master Responses

- **Master Response 1: Non-CEQA Comments**
- **Master Response 2: General Comments on EIR and Environmental Topics**
- **Master Response 3: Community Outreach**
- **Master Response 4: Bird Strikes**

8.3.3 Master Responses

8.3.3.1 Master Response 1: Non-CEQA Comments

Under CEQA, the lead agency "shall evaluate comments on environmental issues" received from people who have reviewed a draft EIR and prepare written responses that "describe the disposition of each significant environmental issue that is raised by commenters" (Pub. Res. Code Section 21091(d); CEQA Guidelines Section 15088(c)). CEQA does not require that substantive responses be provided for comments that do not address the adequacy or accuracy of the environmental analysis in the Draft EIR or that do not raise a significant environmental issue (Id.).

A number of comments were received on the Draft EIR that did not question the adequacy or accuracy of the environmental analysis or raise a significant environmental issue requiring a response. Examples include but are not limited to:

- ***Opinions on the Project, and other Miscellaneous Opinions:*** Comments were received that express support for, or opposition to, the proposed NHPH, and/or on the perceived merits or demerits of the NHPH. Other comments express opinions and observations, or editorialize on non-environmental issues that are beyond the purview of CEQA and the EIR. These comments do not address the adequacy or accuracy of the environmental analysis in the Draft EIR, or pertain to environmental effects of the proposed NHPH.

- ***Socioeconomic Comments:*** A number of comments were received related to socioeconomic issues. As discussed on page 4.0-5 in Section 4.0, Introduction to Environmental Analysis, in the Draft EIR, under CEQA, economic and social effects of a proposed project by themselves are not considered to be significant impacts, and are relevant only insofar as they may serve as a link in a chain of cause and effect that may connect the proposed project with a physical environmental effect, or they may be part of the factors considered in determining the significance of a physical environmental effect. In addition, economic and social factors may

be considered in the determination of feasibility of a mitigation measure or an alternative to the proposed project (see CEQA Guidelines Section 15064(e)). As such, the potential effect of the NHPH on economic and social issues, in and of themselves, such as tax revenues, the cost of public services, cost of housing or property values, are not part of this EIR.

- ***Quality of Life Comments:*** Comments were received that stated that increased growth at the Parnassus Heights campus site under the proposed NHPH would have an adverse effect on the quality of life of the local residents and on the character of the community. Potential effects of a proposed project on the quality of life and related conditions, in and of themselves, are not considered environmental impacts under CEQA. See *San Franciscans for Reasonable Growth v. City and County of San Francisco* (1989) 209 Cal.App.3d 1502. Similarly, changes in community character are not environmental effects under CEQA. See *Preserve Poway v. City of Poway*, 245 Cal. App. 4th 560, 575-82 (2016) (changes in community character are not effects under CEQA). CEQA does require that the environmental document evaluate and disclose significant impacts, among others, on transportation, air quality, noise, and public services at the project site and its vicinity. Those effects are fully analyzed and disclosed in the Draft EIR.

UCSF acknowledges the public's concerns about these types of issues. UCSF generally does not provide individual responses to these comments in this Comments and Responses chapter of the Final EIR. In some cases, UCSF has elected to provide individual responses to certain non-CEQA issues for informational purposes. In all cases, these non-CEQA comments are part of the record on the NHPH, and will be considered by the UC decision-makers as part of the project consideration process.

8.3.3.2 Master Response 2: General Comments on EIR and Environmental Topics

A number of general, unsubstantiated statements were received regarding overall concerns with the Draft EIR, including, but not limited to, potential impacts on various environmental topics, mitigation measures, and alternatives. Due to the lack of specificity in these comments, the responses to these comments are generally incorporated in the responses to specific comments raised on the same general topics.

UCSF acknowledges the receipt of these types of comments. While UCSF generally does not provide individual responses to these comments in this Comments and Responses chapter of the Final EIR, they are part of the record on the NHPH, and will be considered by the UC decision-makers as part of the project consideration process.

8.3.3.3 Master Response 3: Community Outreach

Certain comments, including **I-Welborn-8, I-Jones-5, I-Kessler-10, PH-Huntington-5 and PH-Vassan-9**, expressed opinions about the community outreach process that has been conducted for the NHPH, including regarding the adequacy of the process. While the community outreach comments here are not directly related to CEQA, the master response below is provided.

The University engaged in a public process that fully meets requirements prescribed by CEQA. Furthermore, in addition to the CEQA process, the University created several community

planning processes related to the Comprehensive Parnassus Heights Plan (CPHP) and New Hospital. As described further below, the University engaged in several robust public processes (first for the CPHP and then the New Hospital itself) in order to meaningfully engage the public, drill down on feedback/concerns and ultimately bring forth the best possible project.

Moving to Online Meetings

The CPHP community process began in 2018 with the establishment of the Parnassus Community Working Group, followed in 2019 by the Advisory Committee on the Future of Parnassus Heights. With these two community planning efforts, nearly two dozen public community meetings, including open houses, were held over the course of two years. All community meetings through February 2020 were held in-person at the Parnassus Heights campus site. In March 2020, San Francisco Mayor London Breed instituted a shelter-in-place public health order in response to the novel coronavirus, COVID-19. UCSF then surveyed Advisory Committee members to determine their interest in continuing the engagement process over an online format, and the majority of the members who responded were interested in doing so. Consequently, online meetings were held in April and May 2020. The final CPHP community meeting was in June 2020.

The NHPH community process began in October 2020 and continues at present. During much of 2021, restrictions on indoor gatherings and concerns over COVID-19 variants precluded in-person public meetings. While the situation continues to evolve and governmental mandates have been eliminated or loosened, the pandemic has not yet ended, and out of an abundance of caution and concern at this time about public gatherings at a major medical center, UCSF community meetings will continue in the online format for the time being.

In addition to concerns related to the pandemic, the online format of the community meetings allows UCSF to engage with a broader group of community individuals. The number of people attending the meetings has increased as a result of easier and more convenient accessibility. The ability to engage from one's own home, without having to deal with parking, walking, child or elder care, has allowed a broader range of community individuals to participate in the engagement process.

Public Input

Over the course of the multi-year planning process for the Parnassus Heights campus site, UCSF has in fact listened to the community. Since the start of the community process on the broader plan -- the CPHP – beginning in 2018 with the Parnassus Community Working Group, community input helped to shape the plan. Community input was memorialized in the Community Ideas Report, and included six focus areas of housing, campus design, connectivity with nature, multi-modal mobility, public realm and programs and amenities that benefit the neighborhood. These community ideas were incorporated into the CPHP.

Additionally, through the Advisory Committee for the Future of UCSF Parnassus Heights community process which was focused on ideating on community investments, participants identified 25 potential community investment ideas falling under three categories: open space,

transportation and mobility, and housing. The community investment ideas became the basis and starting point for what would ultimately become a package of substantial community benefits to be provided by UCSF, as well as commitments by the City of San Francisco to provide services that are beyond UCSF's control to provide, such as expanded public transit service. These commitments were memorialized in 2021 in the Memorandum of Understanding between UCSF and the City of San Francisco.

In some instances, during the above community processes, concerns were raised about project impacts relating to environmental topics that are covered under CEQA, such as aesthetics, shadows, wind, and increased population, and concomitant impacts on transportation, parking, and water supply. Those discussions about environmental impacts were not evaded or ignored as asserted by some commenters; they were appropriately deferred to the CEQA process, as the environmental impacts of the CPHP were to be analyzed under the CPHP EIR.

Specifically, with regard to the NHPH, UCSF listened to the community throughout the CPHP and NHPH community processes. Hearing concerns about the size of the NHPH, UCSF and its design team modified the NHPH design as follows:

- Reduced the size of the proposed building from the original 955,000 gross square feet (gsf) to the proposed 900,000 gsf discussed in the NHPH Draft EIR.
- Reduced the mass of the proposed building by incorporating substantial building setbacks and terraces at the upper levels.
- Modified the proposed building footprint so that the building would no longer encroach into the Reserve.
- Minimized rooftop mechanical equipment as much as possible on the reduced upper level, and incorporated screens.

Given the complex nature of the NHPH project and the tremendous demand for space in the NHPH, the above changes were difficult to make, but prioritized by UCSF nonetheless. Additionally, based on community feedback, UCSF incorporated amenities into the NHPH project for the broader community to enjoy, such as an all-day eatery and open terrace planned on the sixth level, which would be accessible to the general public and provide expansive views and a place of respite. The design includes substantial landscaping for visitors to enjoy and provides a visual green connection to the adjacent Mount Sutro Open Space Reserve.

8.3.3.4 Master Response 4: Bird Strikes

One commenter expressed concern about an increase in bird strikes from the larger structure and glass-covered design proposed for the NHPH (**O-SM-82**). This commenter considered the Draft EIR analysis of bird strike impacts to be inadequate because it did not quantify the magnitude of this potential impact, and recommends revisions to assess these impacts (**O-SM-84**). Comments **O-SM-81** and **O-SM-83** considered the New Hospital to pose a threat to bird movement along the Pacific Flyway that it would limit access to Mount Sutro Open Space Reserve (Reserve) and impedes bird movement between existing buildings. While taller buildings may be more likely to

cause collisions with migrating birds, this potential impact is highly localized within the context of the Pacific Flyway, which encompasses the whole western United States. There are few gaps between existing buildings on the mostly developed site such that bird movement would not be limited or restricted on the project site. In addition, the presence of extensive wooded habitat in the neighborhood surrounding the site and in the nearby open space reserve provide ample opportunities for bird movement.

Comment **O-SM-85** estimated that the New Hospital could result in over 1,400 additional bird deaths per year, assuming a certain amount of glass façade per foot of office space based on other buildings in San Francisco. Numerous factors affecting the likelihood of bird strikes are described, including the size, extent and reflectance of windows of the New Hospital (**O-SM-86**). This commenter further details numerous "window collision risk factors" (**O-SM-86** and **O-SM-87**) that may impact birds, and describes siting and designing methods to minimize impacts to birds.

Commenters noted that the building would feature expansive glass, glass railings and overhangs that may increase risk to birds, and urge that the building be designed using state-of-the-art approaches to minimize bird risk (**O-SM-94, O-GGAS-3, O-GGAS-7**). Commenters recommended that UCSF adhere to American Bird Conservancy guidelines (2015), as well as San Francisco's 2011 guidelines (**O-SM-96, O-GGAS-4**).

The NHPH Draft EIR Section 4.3, *Biological Resources*, Impact BIO-2 discusses the potential for bird window collisions, noting the location of San Francisco along the Pacific Flyway, and that approximately 100 million to 1 billion birds die in North America as a result of collisions each year. The NHPH Draft EIR acknowledges that construction of the New Hospital, which would be developed adjacent to the Reserve boundary, could increase the likelihood of birds striking windows of that building during flight. The building siting analysis considered the potential impact of new facilities on migratory birds, but the proposed building configuration was also influenced by the needs of the campus, the limitations of available space, and other factors. Attempting to quantify the potential future increase in bird strikes from the New Hospital on an annual basis would be speculative.

The NHPH Draft EIR considered and analyzed the potential that construction night lighting and building night lighting associated with operation of the new development could attract migratory birds and potentially increase bird strike injuries or mortality. Accordingly, the Draft EIR considered the impact of NHPH construction to result in bird strikes as significant, and identified NHPH Mitigation Measure BIO-2a to reduce construction-phase impacts to birds, by avoiding night construction in habitat areas and reducing lighting, and NHPH Mitigation Measure BIO-2b, to design buildings using less reflecting glass, reduce lighting, and site them to reduce reflectivity consistent with City of San Francisco *Standards for Bird-Safe Buildings* (City of San Francisco, 2011). Specifically, UCSF plans to use a design which minimizes the amount of exterior lighting along the outside of the building while meeting minimum code requirements for lighting at egress and the areas within the public right of way.

The NHPH Draft EIR included numerous provisions to reduce the likelihood of bird strikes. As stated in the NHPH Draft EIR (Section 4.3-20) "UCSF would coordinate with a qualified

ornithologist to incorporate design features into the New Hospital that would minimize the potential for bird strikes. Building architectural features and operational strategies under consideration include, but are not limited to, use of fritted and frosted glazing; use of building architectural features to minimize reflectively and visually interrupt glazed facades; minimize exterior lighting, and use of controls to reduce internal lighting emitted from patient rooms; implementation of a food waste management strategy to ensure appropriate handling of food waste in all proposed outdoor public areas to minimize the risk of attracting birds to the vicinity; and following LEED Pilot Credit #55, Bird Collision Deterrence guidance to further minimize potential adverse impacts to birds. Further, UCSF proposes to implement a three-year post-construction monitoring plan to monitor the effectiveness of the building and site design and practices in preventing bird collisions. UCSF would also comply with the allowed backlight, uplight, and glare (BUG) ratings for exterior lighting, which would serve to minimize the potential for bird strikes from exterior night lighting." These measures are derived from San Francisco's *Standards for Bird-Safe Buildings* (2011). UCSF also will consider incorporating methods from the American Bird Conservancy's 2015 guidelines as appropriate during the design process.

The design team's methods for reducing the bird strike risk of the New Hospital would include minimizing the amount of large format glazing wherever possible on the building and elevated pedestrian walkway. The design includes overhangs which help to break the visual line of sight to the upper glazing areas. The design plans to identify the necessary threat factor solution for the glass guardrail along the outdoor terrace at levels 6 and level 8. For the proposed elevated garden, the design includes distance between the glazed areas and the landscaped elements by a maintenance and access route from the building enclosure to the perimeter guardrail which provides more light for the vegetation and would also reduce the likelihood of birds striking the glass.

One commenter detailed potential approaches to post-construction fatality monitoring for birds in comments **O-SM-98** through **O-SM-101**. These comments suggested first collecting baseline mortality data, including behavioral studies, and, following construction, implementing a plan that includes regular search intervals, carcass detection, and potentially trained dogs. In addition, the commenter recommended nocturnal surveys (**O-SM-100**), compensatory mitigation for bird fatalities (**O-SM-97**), and peer review and data sharing (**O-SM-101**). As stated in the NHPH Draft EIR (4.3-20), UCSF plans to implement a three-year post-construction fatality monitoring program. This program would include regular surveys for detection of bird and bat carcasses and record data. Prior to commencement of monitoring, the program would identify threshold levels of fatality and adaptive management actions to take, such as reduction in lighting, if thresholds are exceeded. Nocturnal monitoring and data sharing will be considered as part of the program; however, compensatory mitigation is not required under the City of San Francisco Bird-Safe Guidance (2011), and is not recommended or required by federal or state resource agencies, particularly for an urban site.

This monitoring program with adaptive management, in combination with the enforceable performance standards in NHPH Mitigation Measure BIO-2b, which would implement specific design approaches to minimize risk to birds from glass in the New Hospital, would reduce the risk to migrating birds from striking the New Hospital to a less than significant level.

8.4 Written and Oral Comments on the Draft EIR, and Responses to Comments

8.4.1 Introduction

This section contains copies of the written comment letters (including emails) received from agencies, organizations and individuals, and copies of the public hearing transcript during the public review period on the Draft Environmental Impact Report (December 16, 2021 through February 14, 2022). Each letter received during this comment period is reproduced here in its entirety, with the exception of certain exhibits and/or attachments to three comment letters (Comment Letters O-TL1, O-TL2, and O-SM; in those instances, the subject exhibits and attachments are included in their entirety in Appendix O-TL1, Appendix O-TL2, and Appendix O-SM, respectively, in this Comments and Responses document).

8.4.2 Comments and Responses

Each written comment letter is designated with commenter code in upper right-hand corner of the letter. As discussed in Section 8.2 in this Comments and Responses document, the commenter code begins with a prefix indicating whether the commenter represents a public agency (A), an organization (O), an individual (I), or a speaker at the public hearing (PH). This is followed by a hyphen and the acronym of the agency or organization, or the individual's last name.

Within each written comment letter, individual comments are labeled with a number in the margin. Immediately following each comment letter is a corresponding individual response to each numbered comment.

Within the public hearing transcript, individual speaker comments are labeled with the name of the speaker followed by the numbered comment of the speaker in the margin. Immediately following the public hearing transcript are the corresponding individual responses to all of the numbered comments.

Where responses have resulted in changes to the Draft EIR, the reader is referred to changes that appear in Section 8.5 of this Comments and Responses document. Where the individual response refers to the reader to one or more master responses, the reader is referred to the applicable master response(s) in Section 8.3 of this Comments and Responses document.

Re: City and County of San Francisco Comment Letter on the University of California San Francisco New Hospital at Parnassus Heights Draft Environmental Impact Report

Dear Diane Wong,

The City and County of San Francisco ("City") appreciates the University of California, San Francisco ("UCSF") and the Regents of the University of California ("Regents") for their ongoing contributions to San Francisco. The City also appreciates UCSF for engaging the City and San Francisco community in the planning process for the Comprehensive Parnassus Heights Plan ("CPHP" or "the Plan") which led to a Memorandum of Understanding ("MOU") between the City and the Regents. As an MOU signee and responsible agency under the California Environmental Quality Act ("CEQA"), the City continues to be interested in working with UCSF and the Regents to continue refining the Plan, including mitigating environmental impacts from implementation of the Plan and addressing concerns of the City and its residents.

The City recognizes the need to upgrade, expand, and modernize older medical facilities, an objective of the Plan. Thus, we recognize the importance of the New Hospital at Parnassus Heights project ("project") and hope to shape the important details of how the project interfaces with the surrounding context. The City is appreciative of the opportunity that UCSF has provided to the City, per the terms of the MOU, to review and comment on the schematic design of the project over the past year.

It is in that spirit that the City submits these comments on the project's Draft Environmental Impact Report ("draft EIR"). These comments reflect combined comments from the San Francisco Planning Department, and San Francisco Municipal Transportation Agency ("SFMTA").

1

The following comments are primarily related to issue areas impacting City land and items over which the City retains jurisdiction: a pedestrian bridge and tunnel across Parnassus Avenue, air quality impacts, and transportation impacts. We are optimistic that UCSF can address these comments through its EIR process, ongoing collaboration during and after the current design phase, and ongoing implementation of the MOU and the Plan. We look forward to continued collaboration for decades to come. 1 cont.

Bridge and Tunnel across Parnassus Avenue

The City has approval authority of the bridge and tunnel within City right-of-way, as stated in the draft EIR (e.g., p. 1-6). The draft EIR provides limited details regarding the bridge and tunnel (e.g., p. 3-43 and 3-44). The City will require further details and coordination with UCSF in the years to come to understand both proposed elements' impacts and alignment with City policy before the City can use its decision-making authority for these proposed elements. 2

The draft EIR should clarify if it fully or accurately considered the bridge's environmental impacts, given the bridge is dependent on the construction of the planned Irving Street Arrival structure, which is not part of the project description and not yet designed. Examples of analysis requiring clarity are wind, air quality, and consistency with plans: 3

- *Wind*: the draft EIR should identify the impacts with and without the bridge. The draft EIR only assesses the bridge impacts under the Cumulative 2050 scenario combined with other changes (p. 4.1-21). The City can make a more informed future decision on the bridge with this information, especially given the proximity of the bridge to wind hazard locations.

  UCSF shall also list in the mitigation measure as an example of design changes and wind reduction strategies to include changes to location, design, or elimination of the bridge. UCSF shall list the City for consultation in the mitigation measure as the hazard impacts affect the public right-of-way. 4

- *Air quality*: please clarify if the draft EIR estimated the impacts of the Parnassus Avenue bridge and tunnel. If yes, please clarify assumptions for those estimates. Draft EIR p. 4.2-26 implies the modeling assumed compliance with the City's Clean Construction ordinance (Environment Code, Chapter 25). The project does not appear to meet the definition of a "Public Work" per that code section. Any modeling assumptions based on compliance with that code section may be incorrect. Thus, the project may have more severe impacts and require strengthened mitigation such as addressing emissions from on-road heavy-duty vehicles. The mitigation must also identify the monitoring and reporting requirements for compliance with the Plan, such as those requirements in the Clean Construction ordinance. 5 6 7

- *Aesthetics and General Plan*: Contrary to the generalized statement in the draft EIR about UC having sole jurisdiction over programs and projects proposed on the Parnassus Heights campus site (AES-2, p. 4.1-31), the pedestrian bridge across Parnassus Avenue *is* under City jurisdiction. The EIR must primarily consider the aesthetics impacts of the bridge against the policies of the General Plan of the City, not against UCSF's Plan. There is little available detail on the design of the proposed bridge, and little to no analysis of the bridge in relation to the General Plan. 8

- *Consistency with Plans (Better Streets Plan, General Plan)*: additionally, the analysis and conclusion drawn in draft EIR pages 4.10-18, 4.10-22, and 4.10-36 is insufficient regarding the proposed bridge in reference to the policies of the Better Streets Plan (BSP) and General Plan. These policy documents explicitly discourage the use of pedestrian bridges (e.g., BSP Policy 7.2) in favor of safe and pleasant street crossings and discuss the limited and extraordinary circumstances necessary to justify a pedestrian bridge; the General Plan Urban Design Element also stresses the importance of maintaining public view corridors unobstructed along streets. The discussion on page 4.10-18 describes how the proposed tunnel is justified by the need to carry patients and hospital materials *between medical facilities* on either side of Parnassus Avenue. However, there is little to no explanation as to who would be served by the pedestrian bridge and why it is justified or consistent with these policies. General statements about congestion are insufficient. It appears that the bridge is primarily intended as a convenience for visitors arriving in the parking structure and the new "Irving Street Arrival", a structure that is neither designed yet nor part of the project description. 9

Air Quality

Please clarify how the draft EIR considered the combined air quality (and potentially other) effects of the project and the Plan. The project is the largest component of the Plan. The Plan EIR identified significant air quality impacts on some topics that the project draft EIR does not identify. Given this, the project draft EIR does not apply mitigation measures applicable to the Plan (e.g., measures related to reducing vehicle trips under Plan impact AIR-2 such as transit pass program) that should also be applicable to the project. For example, the Plan EIR states: 10

> "The results presented in Table 4.2-9 reflect the incremental emissions that would occur at the buildout of the proposed CPHP (inclusive of the New Hospital), and the significant impact related to PM_{10} emissions is identified based on net new emissions in 2050. As noted earlier, due to a lack of adequate details about the operational characteristics of the New Hospital, it is not possible to estimate the operational emissions from the New Hospital at this time. The New Hospital, however, represents a large percentage of the proposed CPHP development. In fact, based on building space, the Initial Phase development program (including the New Hospital), which would be completed by 2030, makes up about 74 percent of the total new development under the CPHP. Given the size of the Initial Phase development program, it is anticipated that with the completion of the New Hospital in 2030, VMT [vehicle miles traveled]

associated with the campus site would increase substantially such that a significant impact related to PM_{10} emissions would likely begin in 2030 or shortly after." (p. 4.2-34, impact AIR-2)

"As this significant impact would likely begin upon the completion of the New Hospital, the annual monitoring and reporting program shall be commenced upon the completion and occupancy of the Initial Phase projects, i.e., after 2030…" (p. 4.2-37, impact AIR-2, mitigation measure AIR-2b)

10 cont.

The City understands UCSF has updated information for the new hospital, and that the project-level EIR does not tier from the Plan EIR (project draft EIR p. 1-4). But UCSF is understating the cumulative impact of the project with the context of the Plan. Thus, UCSF should reassess its cumulative air quality impact analysis, including applicability of standard approaches for it, based on the above plan EIR analysis and/or explain how Plan EIR mitigation is incorporated into the project.[1]

Transportation

The City appreciates the commitment UCSF has made in the MOU to address transportation impacts, such as loading and transit. The City appreciates the supplemental loading analysis, but we continue to disagree with UCSF's misunderstanding of applicable significance criteria for physical transportation impacts under CEQA (see City's draft EIR letter on the Plan). The following relate to details regarding design details of the project and its context within the Plan:

- *Vehicular Circulation and Loading*: the City prefers the vehicular circulation option 2 (figure 3-14b), assuming valet operations would occur on-street under vehicular circulation option 1. On-street valet operations on Parnassus could create conflicts and could lead to substantial delay that would be unacceptable to the SFMTA. Please also provide plans and turn templates for access to and from the loading dock, including from Parnassus Avenue. Please also include as part of the project appendix TRANS recommendations for loading dock operations and additional passenger loading operations measures to meet any unmanaged, unmet demand.

11

- *Parnassus Avenue Streetscape*: the MOU (Section III.F.5) restates UCSF's commitment to working with the City to update, within two years of the New Hospital EIR, and implement a Parnassus Avenue Streetscape Plan. The design and function of the New Hospital's streetscape and vehicular circulation along Parnassus Avenue implicates the broader Parnassus Avenue streetscape and functions, including the vehicular circulation options (figures 3-14). The City calls on UCSF to advance the Parnassus Avenue Streetscape Plan effort with the City in order to inform and coordinate the final design of the sidewalks, street trees, landscaping, and curb functions along the street, inclusive of the New Hospital frontage.

12

[1] For example, the project draft EIR includes stormwater and wastewater standards into the Plan and project that the Plan EIR included as mitigation measure HYD-1.

Conclusion

The City continues to support collaboration with UCSF on addressing the needs of the City and UCSF. We are optimistic that UCSF can address these comments through its EIR process, ongoing collaboration, and implementation of the MOU. Please contact Wade.Wietgrefe@sfgov.org to follow up on CEQA aspects, and please contact Joshua.Switzky@sfgov.org to follow up on MOU/design aspects. 13

Sincerely,

Rich Hillis
Director of Planning

Responses to Comments from San Francisco Planning Department

A-SFP-1 The City expresses appreciation for UCSF's on-going contributions to San Francisco, and for engaging the City and the San Francisco community in the planning process for the CPHP, which has led to the Memorandum of Understanding (MOU) between the City and the Regents. The City indicates its interest in working with UCSF and the Regents to continue refining the CPHP, including mitigating impacts from its implementation and addressing concerns of the City and its residents. These comments are acknowledged; no response is required.

The City indicates its recognition of the need to upgrade, expand, and modernize older medical facilities, an objective of the CPHP; and to shape the important details of how the project interfaces with the surrounding context. The City expresses appreciation of the opportunity provided by UCSF to review and comment on the schematic design of the project over the past year. These comments are acknowledged; no response is required.

The City indicates its comments are primarily related to issue areas impacting City land and items over which the City retains jurisdiction. For those comments related to the pedestrian bridge and tunnel across Parnassus Avenue, please see response to Comments A-SFP-2 through A-SFP-9, below. For those comments related to the air quality impacts, please see responses to Comments A-SFP-5, A-SFP-6, and A-SFP-10. For those comments related to the transportation impacts, please see response to Comments A-SFP-11 and A-SFP-12.

Lastly, the City indicates its optimism that its comments can be addressed through the EIR process, ongoing collaboration during and after the current design phase, and ongoing implementation of the MOU[1] and the CPHP; and states that it looks forward to continued collaboration with UCSF. These comments are acknowledged; no response is required.

A-SFP-2 The City indicates that the City has approval authority of the proposed pedestrian bridge and tunnel, as acknowledged in the NHPH Draft EIR, page 1-6. The City indicates the NHPH Draft EIR has limited details regarding the bridge and tunnel, and that the City will require further details and coordination in the future to understand both proposed elements' impacts and alignment with City policy before the City can use its decision-making authority for these elements.

The NHPH Draft EIR presents available information on the proposed pedestrian bridge and tunnel, including its approximate proposed location along Parnassus Avenue, bridge and tunnel height and width, and elevation above and below

[1] *Memorandum of Understanding, University of California, San Francisco – Comprehensive Parnassus Heights Plan*, January 22, 2021, https://sfplanning.org/project/ucsf-parnassus-campus-plan-memorandum-understanding#:~:text=The%20University%20of%20California%20San,and%20largest%20of%20UCSF's%20campuses.

grade, respectively; and the functional purpose of both facilities. While it is expected that further design details on the proposed pedestrian bridge and tunnel will become known as the design process proceeds for these project elements, the pedestrian bridge and tunnel are nonetheless described at a sufficient level of detail in the NHPH Draft EIR to allow evaluation of their potential environmental impacts during both construction and operation. Please see NHPH Draft EIR Section 4.1, *Aesthetics, Wind and Shadow*, and Section 4.2 *Air Quality*; and response to Comments A-SFP-3 through A-SFP-9, below.

A-SFP-3 The City indicates that the NHPH Draft EIR should clarify if it fully considered the bridge's environmental impacts, given the bridge is dependent on the construction of the planned Irving Street Arrival. The proposed pedestrian bridge was part of the overall CPHP program that was programmatically addressed in the CPHP EIR. Further, the proposed pedestrian bridge is analyzed in the NHPH Draft EIR Project Description as part of the overall NHPH project, and a related improvement of the proposed New Hospital. While the pedestrian bridge would ultimately connect to, and from a pedestrian circulation perspective would operate in conjunction with, the Irving Street Arrival, they are considered separate projects and subject to separate approvals. The proposed pedestrian bridge is not anticipated to be constructed concurrently with the New Hospital.

The City states that the NHPH Draft EIR should identify the wind impacts with and without the pedestrian bridge, and questions why the NHPH Draft EIR only assessed the pedestrian bridge impacts under the Cumulative 2050 scenario combined with other changes. As explained in the NHPH Draft EIR Project Description, page 3-47, Table 3-3; and under the approach to wind analysis in Section 4.1, *Aesthetics, Wind and Shadow*, page 4.1-21, the specific timing for construction of the proposed pedestrian bridge is not yet determined, however, it would occur at some point after 2030. Accordingly, the proposed Parnassus Avenue pedestrian bridge is appropriately evaluated in the wind model under the Cumulative 2050 scenario.

Further, UCSF's wind consultant expects that the inclusion of the pedestrian bridge in the Cumulative 2050 configuration would have little, if any influence on the wind conditions predicted along Parnassus Avenue, including the identified hazard locations to the east. The proposed pedestrian bridge itself would represent a relatively small vertical cross section relative to prevailing winds flowing west to east along Parnassus Avenue, and therefore, would not be expected to intercept and accelerate winds towards grade to an adverse extent. The proposed pedestrian bridge is also located at an appreciable height above Parnassus Avenue that is not expected to channel winds between the bridge and road below. This is evident through CPP's wind tunnel testing where the measurement point below the bridge (Location 24) was not observed to show an increase in wind speeds with the addition of the bridge.

A-SFP-4 The City indicates UCSF should list changes to location, design, or elimination of the bridge as examples of design changes and wind reduction strategies in the mitigation measure. As explained in response to Comment A-SFP-3, above, the proposed pedestrian bridge would not be expected to adversely affect wind conditions on Parnassus Avenue, and consequently, would not warrant wind mitigation.

It should be noted that UCSF has conducted substantial planning since the development of the original CPHP concept design to minimize wind effects of the proposed New Hospital. The efforts to minimize wind have included making the building smaller and reducing the building mass, pulling the east side of New Hospital out of the Reserve, articulating the façade, and making modifications to the building at the ground level.

The City further indicates that UCSF should list the City for consultation in the mitigation measure as the hazard impacts affect the public right-of-way. This comment is acknowledged. As lead agency, UCSF is constitutionally exempt from local land use control and processes whenever using property under its control in furtherance of its educational mission. Therefore, it is not necessary for UCSF to include City consultation within the mitigation measure itself. However, outside of CEQA, UCSF is more than willing to consult with the City regarding planned measures to reduce wind impacts.

A-SFP-5 The comment requests confirmation that the analysis of air quality impacts included emissions from the proposed Parnassus Avenue bridge and tunnel.

The quantification of construction-related emissions for the bridge and tunnel connections, along with those of the Moffitt and Long Hospital renovations, were included in the CalEEMod run and assumed to occur from January 2030 to January 2033, during the last phase of construction, after completion of the New Hospital based on timing provided by UCSF's construction team. These emissions are presented in Table 4.2-7 on page 4.2-27 of the NHPH Draft EIR. The CalEEMod output file for the construction analysis is provided in Appendix AIR of the NHPH Draft EIR. The analysis assumed 315 haul truck trips for soil removal, as estimated by UCSF's construction team as well as 141 vendor trips for concrete delivery.

A-SFP-6 The comment raises concern that the estimation of construction-related air pollutant emissions may have considered elements of compliance with the City of San Francisco's Clean Construction Ordinance, which may not be applicable to the proposed NHPH.

The statement on page 4.2-27 of the NHPH Draft EIR referencing the City's Clean Construction Ordinance was specific to improvements that would be constructed outside the campus site boundary, such as the proposed Parnassus Avenue bridge and tunnel, and simply stated that it "*may* involve the cooperation

of the City of San Francisco and, as public works projects, would be subject to the City of San Francisco's Clean Construction Ordinance" (emphasis added). However, the estimation of emissions presented in Table 4.2-7 on page 4.2-27 of the NHPH Draft EIR did not consider any of the requirements of the City's Clean Construction Ordinance. The Ordinance would require the use of biodiesel in construction equipment and that construction equipment have either U.S. EPA-certified Tier 2 engines or CARB verified diesel emission controls. It should be noted that implementation of NHPH Mitigation Measure AIR-3: Clean Construction Equipment for NHPH Construction would require U.S. EPA-certified Tier 4 engines and is, therefore, more stringent than the Clean Construction ordinance.

In response to this comment, this text on the first paragraph, last sentence of page 4.2-27 of the Draft EIR is revised to remove reference to the Clean Construction Ordinance; please refer to Section 8.5 of this Comments and Responses document for the proposed revision.

A-SFP-7 This comment suggests that the construction emission impact may be more severe than calculated due to on-road heavy duty vehicles and that the "mitigation" should identify monitoring and reporting requirements.

As discussed in response to Comment A-SFP-5, above, the estimation of construction emissions for the proposed Parnassus Avenue bridge and tunnel connections assumed 315 haul truck trips for soil removal, as estimated by the UCSF's construction team as well as 141 vendor trips for concrete delivery. As discussed in response to Comment A-SFP-6, the estimation of construction emissions for the bridge and tunnel connections did not consider compliance with any measures required by the Clean Construction Ordinance, and were unmitigated estimates. As stated on page 4.2-27 of the NHPH Draft EIR, daily construction emissions of ROG, NOx, and $PM_{2.5}$ would be less than the 54 pound per day threshold, and emissions of PM_{10} would be less than the 82 pound per day threshold, in all years of construction. Therefore, the project would have a less than significant impact with respect to construction-related emissions of criteria air pollutants, and no mitigation measures are required. On page 4.2-38 of the NHPH Draft EIR, the analysis acknowledges that for construction-related fugitive dust impacts of projects to be less than significant, a suite of recommended dust-control measures should be implemented. Therefore, NHPH Mitigation Measure AIR-1 is identified to reduce construction-related fugitive dust impacts to less than significant levels. The required Mitigation Monitoring and Reporting Program is provided in Chapter 9 of this Final EIR and identifies implementation procedures, responsible parties and reporting mechanisms for NHPH Mitigation Measure AIR-1.

A-SFP-8 The City indicates that the proposed pedestrian bridge is under City jurisdiction. This statement is consistent with the NHPH Draft EIR's treatment of the

proposed pedestrian bridge. Chapter 1, *Introduction*, page 1-7, notes the various City approvals required for the pedestrian bridge. Further, each technical section in Chapter 4 considers the off-site impacts of the proposed pedestrian bridge, and acknowledges applicable City plans, policies and regulations that would apply to its construction and operation.

The City states that there is little detail of the design of the proposed pedestrian bridge; please see response to Comment A-SFP-2, above. The City also indicates that the NHPH EIR should primarily consider the aesthetic impacts of the bridge against the policies of the City's General Plan.

First, with respect to aesthetics, as discussed in Section 4.02, *Scope of Analysis*, the NHPH meets the criteria of CEQA Statute Section 21099(d) which states that aesthetic impacts of an employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment. Nevertheless, the NHPH Draft EIR provides an assessment of potential aesthetic impacts since the public and decision-makers may be interested in information pertaining to the aesthetic effects of the proposed NHPH, and may desire that such information be provided as part of the environmental review process.

The commenter does not cite any specific General Plan policy that the proposed Parnassus Avenue pedestrian bridge should be considered against. However, NHPH Draft EIR Section 4.1, Aesthetics, Wind and Shadow, pages 4.1-16 to 4.1-17 presents a number of policies from the General Plan Urban Design and Recreation and Open Space Elements that are particularly relevant to the NHPH. It should also be noted that the General Plan does not designate the segment of Parnassus Avenue where the pedestrian bridge is proposed as a street that either defines city form, provides a street view of an important building, extends the effect of public open space, or provides an important street view for orientation. Furthermore, the General Plan characterizes the segment of Parnassus Avenue where the pedestrian bridge is proposed as having only an average quality street view (as opposed to good or excellent). NHPH Draft EIR Section 4.1, pages 4.1-42 to 4.1-43 provides an informational discussion of consistency of the NHPH with the General Plan, and concludes that none of the NHPH's related improvements (including the proposed pedestrian bridge) would involve changes to the built environment that would clearly conflict with the City General Plan policies.

A-SFP-9 The City asserts that the analysis of the proposed Parnassus Avenue pedestrian bridge in NHPH Draft EIR Section 4.10, *Land Use and Planning*, is insufficient with respect to consistency with the Betters Streets Plan and General Plan. The City references Better Streets Plan Policy 7.2 as discouraging the use of pedestrian bridges in favor of safe and pleasant street crossings. Section 4.10 in the NHPH Draft EIR also acknowledges Policy 7.2 on page 4.10-18. The City indicates that there is little to no discussion as to who would be served by the

pedestrian bridge and why is its justified. Currently, approximately 20,000 daily pedestrian crossings occur on the eastern side of the campus site encompassing the crossings at the Millberry Union, the Medical Center, and Hillway Avenue. The NHPH is expected to add new pedestrian crossings of Parnassus Avenue. The purpose of the pedestrian bridge is to provide UCSF employees (faculty/staff/students), patients, and visitors to campus with another safe option to cross Parnassus Avenue. It would be open for any population to use, but it is expected that most of the use would occur by populations associated with the NHPH and the Medical Building 1. The proposed pedestrian bridge is not seen as a substitute for efforts to improve the pedestrian crossing experience included in the Parnassus Avenue Streetscape Plan; specifically, wider crosswalks that are better aligned with pedestrian desire lines. UCSF remains committed to the Parnassus Avenue Streetscape Plan. Implementation of the plan would continue through development and occupation of the NHPH, and the improvements is estimated to be complete in 2032. However, as discussed in NHPH Draft EIR Chapter 3, *Project Description*, the proposed weather protected pedestrian bridge would facilitate pedestrian safety, ease of crossing, and patient transport over Parnassus Avenue. The pedestrian bridge would also, as the City notes, enable easy travel for pedestrians between the parking garage on Irving Street and the Hospital via the planned Irving Street Arrival.

As discussed in Section 4.10 on page 4.10-18 to 4.10-19, the Better Streets Plan's overarching goal related to convenient connections is to design streets to "facilitate safe, accessible, and convenient connections among major destinations such as transit centers and land use and activity centers." Therefore, while tunnel and pedestrian bridge crossings in general are not the favored types of crossings, they are needed in this instance to facilitate and support safe UCSF operations, and further, would reduce congestion and potential vehicle conflicts with pedestrians along Parnassus Avenue. Given this unique circumstance and that UCSF plans on improving pedestrian access across Parnassus Avenue, the proposed pedestrian bridge and tunnel would not substantially conflict with this policy.

With respect to consistency of the proposed pedestrian bridge with the General Plan, the City indicates that the General Plan stresses the importance of maintaining public views corridors unobstructed along streets. However, as explained in response to Comment A-SFP-8, above, the location of the proposed pedestrian bridge on Parnassus Avenue is determined by the City General Plan to not be a street area important to urban design and views, and the quality of street views at this location is considered by the City to be average. It should also be noted, as shown in the visual simulation of the proposed pedestrian bridge in Figure 4.1-13 in the NHPH Draft EIR, the proposed pedestrian bridge would include glass panels that would serve to limit corridor view obstruction from locations along Parnassus Avenue. Given these factors, overall, the proposed pedestrian bridge would not substantially conflict with the General Plan.

A-SFP-10 This comment raises concerns that, because the CPHP EIR identified a significant unavoidable cumulative impact with respect to operational criteria air pollutants, the proposed NHPH in combination with other development under the CPHP should result in a significant cumulative impact in consideration of that the NHPH represents a large percentage of the CPHP development.

The analysis of operational criteria air pollutant impacts of the NHPH is a project-level analysis for the NHPH alone, and does not include the other developments planned under the CPHP. As discussed on page 4.2-25 of the NHPH Draft EIR, the contribution of a project's individual air emissions to regional air quality impacts is by its nature, a cumulative effect. Pursuant to BAAQMD's *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance,* while emissions from past, present and future projects in the vicinity also have or will contribute to adverse regional air quality impacts on a cumulative basis, no single project by itself would be sufficient in size to result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality conditions. As described in the NHPH Draft EIR, the project-level thresholds for criteria air pollutants are based on levels at which new project-related sources are not anticipated to contribute to an air quality violation, cause a significant human health risk, or result in a considerable net increase in criteria air pollutant emissions. Therefore, if a project's emissions are below the project-level thresholds, the project would not be considered to result in a considerable contribution to cumulative regional air quality impacts. Consequently, while full development under the CPHP was identified to have a significant unavoidable cumulative impact with respect to operational criteria air pollutants resulting from emissions of particulate matter (PM_{10}), because the emissions calculated for the NHPH would be below the project-level thresholds for criteria air pollutants, the NHPH would not be considered to result in a considerable contribution to cumulative regional air quality impacts, and no mitigation measure is warranted for either project-level or cumulative operational criteria air pollutant emissions, including PM_{10}, under the NHPH.

Notwithstanding this finding of the NHPH Draft EIR, CPHP Mitigation Measure AIR-2b: TDM Program Enhancements would still be implemented pursuant to the MMRP which requires implementation of the annual monitoring and reporting program upon the completion and occupancy of the Initial Phase projects, i.e., after 2030. As a practical matter, this TDM program is largely already being implemented with six of the eight identified measures already in place. For example, in addition to the existing shuttle service that serves the 16th Street Bart Station from Mission Bay, in fall 2021, a new shuttle stop serving the Civic Center area and BART station began operating. The past year was a highly unusual commute year due to the pandemic (an estimated 38 percent of UCSF employees and students were able to work remotely or in hybrid mode during the second year of the pandemic in 2021), and UCSF continues to promote telework

and see a growth in telemedicine. Half of UCSF's vanpools closed during the pandemic, as more employees worked completely off-site or at a reduced on-site schedule, and sharing of vehicles was discouraged during the pandemic. To meet UCSF's commuter needs post-pandemic, UCSF Transportation Services is offering a new vanpool program starting in spring 2022. The program gives participants more control over their commute, greater flexibility, lower fees, and provides a $250 subsidy to qualifying vanpools. To meet the needs of many hybrid workers who do not come to campus daily, in 2021, UCSF introduced a new daily parking rate to employees and students. With this change, fewer employees and students purchase monthly parking permits, and they make a conscious decision to drive, park, and pay only when necessary.

Other TDM programs are under consideration and evaluation, including the transit pass program that was also identified under CPHP Final EIR Mitigation Measure AIR-2b. UCSF Transportation Services regularly monitors TDM program usage and adjusts services based on demand and feedback.[2]

A-SFP-11 The commenter includes several statements and requests from the City:

- a statement that UCSF misunderstands applicable transportation significance criteria under CEQA;
- a statement of their preference for one of two vehicle circulation options presented and analyzed in the NHPH Draft EIR;
- a request that UCSF provide turning templates of the types of trucks that will use the new NHPH loading dock accessed from Parnassus Avenue onto Medical Center Way; and
- a request that UCSF include recommendations for measures to meet any unmanaged, unmet loading demand.

CEQA provides for lead agencies to adopt their own thresholds of significance and to evaluate the significance of a project's impact based on substantial evidence. The Regents of the University of California (UC or University) is unique among public agencies because it is a constitutionally created entity of the State of California with "full powers of organization and government" (Cal. Const. Art. IX, Section 9), and typically acts as both the project proponent and lead agency under CEQA. Under UC's significance thresholds, the NHPH would have a significant effect on the environment if the NHPH would:

- Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities
- Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)

[2] Email from Tammy Chan, Senior Planner, Campus Planning, UCSF Real Estate to ESA, April 17, 2022.

- Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)
- Result in inadequate emergency access
- Adversely affect travel conditions along sidewalks and roadways serving the project site due to construction activities

With respect to the City's assertion that UCSF misunderstands applicable significance criteria for physical transportation impacts under CEQA, presumably the City is suggesting that UCSF needs to employ the City's standards of significance for transportation impacts, which differ from the CEQA Guidelines Appendix G standards described above, which UCSF uses. However, as described above, UCSF is constitutionally exempt from local land use regulation whenever using property under its control in furtherance of its educational mission. As such, UCSF, as the CEQA lead agency, is within its rights to both adopt and use the above criteria to make determinations of impacts related to transportation. This transportation impact determination discussion, including supporting analysis, is presented in the NHPH Draft EIR on pages 4.13-44 to 57.

The City's preference for vehicular circulation option 2 (Figure 3.14b) as shown on page 3-28 of the NHPH Draft EIR is noted. Turning templates of the range of vehicles that will access the Central Receiving Area, Long Dock, and the new NHPH Loading Dock, which were used as part of the NHPH design process, are included **Appendix TRANS-A**. These templates show the typical vehicle sweep path of SU-30 and SU-40 (box trucks), 34-foot dumpster trucks, and WB-40 and WB-50 (articulated tractor trailers) that would access loading docks from Medical Center Way. Table 2 in Appendix TRANS-A summarizes the existing and forecast average daily and peak hour deliveries compared to the loading supply at the Central Receiving Area, Long Dock, and NHPH Loading Dock areas under project conditions.

A discussion of passenger loading demand and supply under project conditions is included on page 4.13-37 to 41 of the NHPH Draft EIR. This includes comparisons of peak hour loading demand projections for the three new passenger loading areas (proposed as part of the NHPH) accessible off Parnassus Avenue – the "Main Loop," "ED Loop," and "Valet Area" to the supply of loading areas. This analysis, along with an assessment of the loading area design, is further described and supported on pages 4.13-49 to 51 of the NHPH Draft EIR. Each of these passenger loading areas were shown to meet the highest levels of anticipated demand and their future operation and design were determined not to be impacts under CEQA. Thus, the project would not create unmanaged, unmet passenger loading demand and a new operations measure is not required. As part of the operation of the NHPH, UCSF Health is committed to providing a positive experience for patients and visitors. This commitment extends to the patient and visitor arrival and departure experience, where they will determine the right levels of staffing to manage vehicle operations within the loops to meet this goal.

A-SFP-12 The commenter makes a request for UCSF to coordinate with the City and advance the Parnassus Avenue Streetscape Plan. UCSF affirms its commitment to continue to advance the plan (generally from the west side of the campus to the east side over the next approximately 10 years). Streetscape elements as called for in the plan were included as part of the renovation of the Clinical Sciences Building, which was completed in 2021. The next major phase (of three phases identified in the plan) of work is expected to be completed as part of the RAB several years from now. Implementation of the streetscape elements included in the plan will continue through development and occupation of the NHPH, and is estimated to be complete in 2032.

A-SFP-13 The City concludes its letter by indicating it continues to support collaboration with UCSF on addressing the needs of the City and UCSF, and that it is optimistic that UCSF can address these comments through its EIR process, ongoing collaboration, and implementation of the MOU. These comments are acknowledged; no response is required.

Re: New Hospital at Parnassus Heights Draft Environmental Impact Report: Comments on Water Quality, Population and Housing, Historic Resources, and Air Quality.

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents. I write on its behalf to comment on the Draft Environmental Impact Report (DEIR) for the New Hospital at Parnassus Heights (NHPH) with respect to its analysis of project impacts on population and housing; water quality; historic resources; and air quality.

San Franciscans objects to the approval of this Project. The DEIR fails to comply with the California Environmental Quality Act (CEQA) for the reasons described below. 1 2

San Franciscans previously submitted comments on the Comprehensive Parnassus Heights Plan Environmental Impact Report ("CPHP EIR") and is currently prosecuting litigation challenging the legality of the CPHP EIR entitled *San Franciscans for Balanced & Livable Communities v The Regents of the Univ. of CA, et al.;* Alameda Superior Court Case No. RG21089332. With respect to its analysis of impacts and mitigation measures relating to water quality, population and housing, historic resources, and air quality, the NHPH DEIR repeats many of the same informational inadequacies as the CPHP EIR. 3

Therefore, I refer to selected comment letters on the CPHP EIR as well as San Franciscans' Revised Opening Merits Brief filed in Case No. RG21089332 (attached as Exhibit 2) and San Franciscans' Reply Merits Brief filed in Case No. RG21089332 (attached as Exhibit 3).

1. The DEIR Fails to Lawfully Assess Impacts on Beach Water Quality. 4

Like the CPHP EIR, the NHPH DEIR fails to lawfully assess impacts on beach water quality, and for the same reasons. San Franciscans, therefore, submits under separate cover its comment letters regarding beach water quality impacts on the CPHP Draft EIR with accompanying exhibits. These reasons are also described in detail in San Franciscans' Revised

Opening Merits Brief filed in Case No. RG21089332 (attached as Exhibit 2) and San Franciscans' Reply Merits Brief filed in Case No. RG21089332 (attached as Exhibit 3). 4 cont.

Like the CPHP EIR, the NHPH DEIR fails to describe the physical and regulatory components of the environmental setting as they relate to potentially significant impacts on beach water quality. Information regarding this setting is set forth in detail in San Franciscans' comment letters on the CPHP Draft and Final EIRs and accompanying exhibits. (See also, Ex 2, pp. 25-26; Ex 3, pp.17-18) 5

Just like the CPHP EIR, with respect to Impact HYD-1 the NHPH DEIR improperly bases its less-than-significant impact conclusion on the ratio theory and compliance with other agencies' regulatory requirements. (See San Franciscans' comment letters on the CPHP Draft and Final EIRs; Ex 2, p. 27; Ex 3, pp. 18-19.)

For example, the DEIR states:

> All discharges from the City's CSS to San Francisco Bay, through either the outfalls or the CSD structures, are conducted in compliance with the federal Clean Water Act and the State Porter-Cologne Water Quality Control Act by meeting the requirements set forth in the City's National Pollutant Discharge Elimination System (NPDES) permit (RWQCB Order No. R2-2013-0029) for discharges from the SEP, NPF, Bayside Wet Weather Facilities, and Wastewater Collection System (see Section 4.9.2, Regulatory Framework, below).

(NHPH DEIR, p. 4.9-4.) But the DEIR fails to disclose that the City of San Francisco routinely and frequently violates the terms of its NPDES permits. 6

Similarly, the DEIR states:

> The SFPUC and San Francisco Department of Public Health collaborate to monitor beach water quality in the City. Seventeen beach sites along the perimeter of San Francisco are monitored weekly year-round where water contact recreation is common, including those City beach locations that are identified in the Basin Plan. Water samples are collected and analyzed for three different bacterial indicators of impaired water quality (total coliform, Escherichia coli/fecal coliform, and enterococcus) to determine compliance with the California Sanitation, Healthfulness and Safety of Ocean Water-Contact Sports Areas Regulations, Title 17, California Code of Regulations. When water quality does not meet California standards for water contact recreation, or whenever a CSS discharge occurs that affects a recreational beach, the beach is posted for public notification.

(NHPH DEIR, p. 4.9-13.) But the DEIR fails to disclose the results of this monitoring program. 6 cont.

Like the CPHP EIR, with respect to Impact HYD-1 the NHPH DEIR improperly compresses analyzing the significance of impacts with identifying mitigation measures. (See San Franciscans' comment letters on the CPHP Draft and Final EIRs; Ex 2, p. 27.) 7

With respect to Impact HYD-1, the NHPH DEIR improperly bases its less-than-significant impact conclusion on the modeling results presented in Appendix HYD. This appendix is entirely unsupported for the reasons described in the February 14, 2022, letter from hydrologist Greg Kamman, attached as Exhibit 1. 8

As discussed in more detail in Exhibit 1, the DEIR fails to provide enough information for the reader to evaluate the validity of the modeling results. In particular, the DEIR fails to include, and UCSF refused to provide access to, two reports referenced in the DEIR as:

- At DEIR p. 4.9-26: Arup, 2021. Final UCSF New Hospital at Parnassus Heights StormDrainage Design Report. December 6, 2021.

- At DEIR, Appendix HYD; p. 2 of 13: Arup, "UCSF NHPH Combined Sewer System Modeling Updates", November 1, 2021. 9

I sent a total of three emails to UCSF requesting these documents, on January 28, 2022, February 4, 2022, and February 7, 2022 (attached as Exhibits 6, 7, and 8, respectively). On February 4, 2002, I also left a voice mail for Diane Wong requesting these documents. To date, I have not received the documents or any response to my request. As a result, the DEIR must be recirculated for public comment because its analysis of water quality impacts is so fundamentally and basically inadequate and conclusory in nature that public comment on this issue was in effect meaningless.

2. The DEIR's Analyses of Growth Inducement and Population and Housing Impacts are Inadequate.

Like the CPHP EIR, the NHPH DEIR unlawfully excludes certain housing displacement impacts from analysis, stating: 10

> As stated in the Initial Study, there would no impact related to the following topic for the reasons described below: Displacement of people or housing. The proposed New Hospital and related improvements would not displace any residents or housing units since no housing units currently exist on the project site. Therefore, the proposed NHPH would have no impact related to displacement of housing units or people and would not necessitate the construction of replacement

housing. This topic will not be evaluated further in this section.

(NHPH DEIR, p. 4.12-6) This determination is inconsistent with CEQA because it defines the impact of displacing people or housing solely in terms of physical displacement of existing housing by placing the new hospital in its proposed location. It ignores "displacement of people," which is a physical impact on people, caused by the project's economic and social effects of exacerbating San Francisco's jobs/housing imbalance and the process of gentrification. It also ignores the impacts on the physical environment of building new housing to meet project-induced housing demand. 10 cont.

These are real impacts that have been fully discussed in comments submitted by Planner Terry Wattt on the CPHP EIR and in San Franciscan's merits briefs in Case No. RG21089332. (See Exhibit 4, pp. 8-15; Exhibit 5 [SAR63067-68]; Ex 2, pp. 15-23; Ex 3, pp. 12-17.) 11

Consistent with this unlawful approach, the DEIR defines Impact POP-1 solely in terms of whether the project will cause "substantial *unplanned* population growth" or "create a demand for housing *outside the market area*." (DEIR, 4.12-6-7.) These arbitrary limits on the EIR's analysis of the project's physical impact are unlawful for the same reasons the CPHP's identical limitations are unlawful. These reasons are fully explained in Exhibits 2 (pp. 15-23) and 3 (pp. 12-17.) 12

In addition, the DEIR uses "substantial unplanned growth" as a threshold of significance, and defines "substantial unplanned growth" as "an increase ... that is inconsistent with growth anticipated in adopted planning documents." (DEIR, p. 4.12-7.) Therefore, the DEIR should consider any growth not "anticipated" by ABAG to be "substantial." But the DEIR fails to disclose whether project-induced or cumulative growth is planned or unplanned. Therefore, the reader cannot meaningfully evaluate the DEIR's conclusion that project-induced and cumulative growth is not "substantial" relative to ABAG forecasts. 13

Further, the DEIR admits that "some" Parnassus growth was included in the Plan Bay Area 2040 projections and "conservatively" assumes it was not, but finds it not "substantial." (DEIR 4.12-8.) But the DEIR fails to define "substantial" or explain what level of unanticipated, unplanned growth would be considered "substantial." Consequently, the DEIR's determination is entirely conclusory, 14

Moreover, the second POP-1 TOS (significance criterion "c" on page 4.12-6) is whether the project or cumulative projects would create a housing demand outside the market area, which is defined as the five-county Bay Area region (at p. 4.12-9). The DEIR concludes that the "share of projected household growth" represented by the project's employees would not "trigger shifts of demand ... beyond the regional housing market area." First, there is no evidence that the project's employees are included in the "projected household growth." Second, the bare claim 15 16

that the increase in residents would not trigger any shift in demand is purely conclusory with no support. 16 cont.

3. The DEIR's Analysis of Impacts on Historic Resources is Inadequate.

Like the CPHP EIR, the NHPH DEIR's analysis of impacts on historic resources is inadequate. For example, the DEIR fails to evaluate the impact of the NHPH project on UCSF's Parnassus campus considered as a "historic resource" or "historic district" (defined in Public Resources Code section 5020.1, subdivisions (j) and (h), respectively) in its own right. This comment is explained in more detail in the September 10, 2020, letter from architectural historian Kara Brunzell, regarding the CPHP DEIR, attached hereto as Exhibit 9. (See Ex 9 [AR 6037-38]; see also, Ex 2, pp. 40-42; Ex 3, 26-27.) 17

In addition, the DEIR unlawfully piecemeals CEQA review of the CPHP and NHPH with respect to impacts on the historic significance of the Langley Porter Psychiatric Institute (LPPI) building, stating:

> A number of buildings occupy the footprint of the proposed New Hospital, including the Langley Porter Psychiatric Institute (LPPI) which was determined to be eligible for listing in the National Register and the California Register. These buildings would be demolished and removed prior to the initiation of NHPH construction. Furthermore, as discussed in Chapter 3, Project Description, the demolition and removal of these buildings is being completed separately from, and therefore not associated with, the NHPH project; see also Impact C-CUL-1, below. 18

(NHPH DEIR, pp. 4.4-11.) This approach piecemeals CEQA review of the CPHP and NHPH with respect to impacts on the historic significance of LPPI for the reasons stated in the comment letter of today's date authored by Patrick Soluri on behalf of the Parnassus Neighborhood Coalition ("PNC").

4. The DEIR's Analysis of Impacts on Air Quality is Inadequate.

Like the CPHP EIR, the NHPH DEIR fails to lawfully assess the project's cancer risk impacts, and for the same reasons. San Franciscans, therefore, submits under separate cover its comment letters regarding cancer risk impacts on the CPHP Draft EIR with accompanying exhibits. These reasons are also described in detail in Exhibit 2, pp. 44-51 and Exhibit 3, pp. 29-31). 19

The EIR uses cancer risk thresholds of significance adopted by the Bay Area Air Quality Management District (BAAQMD) for general use without adapting them or how they are applied

to reflect anything unique about this project or its environmental setting. CEQA requires that before UCSF uses such generalized thresholds of significance, it must adopt the thresholds by a public rule-making process in which it must show that the thresholds are supported by substantial evidence. (*Golden Door Properties, LLC v. County of San Diego* (2018) 27 Cal.App.5th 892, 903 (*Golden Door I*).) By failing to undertake this process, UCSF failed to proceed in the manner required by law. 19 cont.

The DEIR describes existing conditions (i.e., baseline) for TAC-related cancer risk from ambient TAC concentrations as 161.8 cases per million. (NHPH DEIR 4.2-10.)

The DEIR describes the existing conditions for cancer risk from diesel particulates (DPM) as follows:

> CARB identified DPM as a TAC in 1998, primarily based on evidence demonstrating cancer effects in humans. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Mobile sources such as trucks and buses are among the primary sources of diesel emissions, and concentrations of DPM are higher near heavily traveled highways. The board estimated that as of 2000, the average Bay Area cancer risk from exposure to DPM, based on a population-weighted average ambient DPM concentration, is approximately 480 in one million, which is much higher than the risk associated with any other toxic air pollutant routinely measured in the region. The statewide risk from DPM as determined by the board declined from 750 in one million in 1990 to 570 in one million in 1995; by 2012, the board estimated the average statewide cancer risk from DPM at 520 in one million (CARB, 2009; CARB, 2019).

(NHPH DEIR 4.2-11) 20

The DEIR's description of the overall cancer risk is insufficient because the DPM baseline risk is not current as of the date of the Notice of Preparation of the EIR.

The DEIR borrows its thresholds of significance for project-level and cumulative cancer risk impacts from BAAQMD's CEQA Guidelines and deploys them without regard to the extreme baseline cancer risk in San Francisco. In doing so, the DEIR commits the fundamental error of failing to add the Project's effects to the baseline for purposes of determining significance because it applies the threshold without regard to the magnitude of the baseline cancer risk. Under CEQA, an EIR analyzes the environmental impacts of the proposed project on the environmental setting (or "baseline"). (*Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 315; *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 722-23; *Friends of the Eel River v.* 21

Sonoma County Water Agency (2003) 108 Cal.App.4th 859, 88-82; Guidelines, §§ 15125 (a)(1), 15126.2 (a).)

21 cont.

Regarding project-level impacts, the DEIR states: "The estimated excess cancer risk for a 30-year lifetime exposure from operation of the NHPH would be 8.6 per million, which is below the 10 in one-million excess cancer risk threshold." (NHPH DEIR 4.2-34.)

Regarding cumulative impacts, the DEIR states:

> When added to the projected increased cancer risks from the NHPH project-level analysis presented in Table 4.2-11 of 8.6 in one million, resultant increased operational cancer risk of 18.86 in one million (10 in one million plus 0.26 in a million for RAB and 8.6 in a million for NHPH) would be well below the cumulative threshold of 100 in one million.

(NHPH DEIR 4.2-34.)

The DEIR's uncritical use of the 10 additional cases per million project-level threshold implies that an increase of less than ten additional cases per million is always less than significant, regardless of the baseline risk.

22

Similarly, the DEIR's uncritical use of the 100 additional cases per million cumulative threshold implies that an increase of less than 100 additional cases per million is always less than cumulatively considerable, regardless of the baseline risk.

These are legal errors, because the severity of existing conditions is always a factor in determining significance of project impacts. (*Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"], disapproved on other grounds by *Berkeley Hillside Preservation v. City of Berkeley* (2015) 60 Cal.4th 1086; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 718.) The EIR's unevaluated assumption that an increase of less than ten cases per million is always less than significant is a policy judgment, not a finding of fact based on evidence. This violates CEQA because determinations of significance must be based on evidence. (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1109 ["thresholds cannot be used to determine automatically whether a given effect will or will not be significant"].)

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

Hydrology | Hydraulics | Geomorphology | Design | Field Services

February 14, 2022

Mr. Tom Lippe, Law Office of Thomas N. Lippe, APC
201 Mission Street, 12th Floor
San Francisco, CA 94105

Subject: Technical Review and Comment on Draft EIR
UCSF New Hospital at Parnassus Heights

Dear Mr. Lippe:

I am a hydrologist with over thirty years of technical and consulting experience in the fields of geology, hydrology, and hydrogeology. I have been providing professional hydrology and geomorphology services in California since 1989 and routinely manage projects in the areas of surface- and groundwater hydrology, water supply, water quality assessments, water resources management, and geomorphology. Most of my work has been in the Coast Range watersheds of California, including Sonoma County. My areas of expertise include: characterizing and modeling watershed-scale hydrologic and geomorphic processes; evaluating surface- and ground-water resources/quality and their interaction; assessing hydrologic, geomorphic, and water quality responses to land-use changes in watersheds and causes of stream channel instability; assisting and leading in the development of CEQA environmental compliance documents and project environmental permits; and designing and implementing field investigations characterizing surface and subsurface hydrologic and water quality conditions. I earned a Master of Science degree in Geology, specializing in sedimentology and hydrogeology as well as an A.B. in Geology from Miami University, Oxford, Ohio. I am a Certified Hydrogeologist (CHg) and a registered Professional Geologist (PG) in the state of California. A copy of my current CV is attached.

I have been retained by your practice to review the DEIR (including Appendix HYD) for the UCSF New Hospital at Parnassus Heights and evaluate if the project may impact surrounding properties and the environment, with a particular emphasis on beach water quality. Based on my review, it is my professional opinion that the IS/MND is inadequate in evaluating the potential significant impacts of project actions on hydrology and water quality. The rationale for this opinion is based on multiple findings presented below

1.0 Background

Section 4.9 Hydrology and Water Quality of the DEIR indicates that all NHPH project stormwater and sanitary flow discharge to the City of San Francisco's Combined Sewer System (CSS), which is conveyed to the City's Bayside treatment, storage and discharge facilities. The DEIR provides an analysis on the impacts of these discharges on CSS capacity, flooding and water quality to receiving waters. This analysis addresses the changes in stormwater and wastewater flows from 21.6 acres of the NHPH site and adjacent upstream area within the campus site that contribute flows that pass through the NHPH site and discharge into the City CSS main in Parnassus Avenue. On page 4.9-15 of the DEIR, the DEIR states that UCSF has established stormwater and wastewater performance standards that the NHPH must meet to avoid off-site impacts. Accordingly, the NHPH shall:

1. Avoid increasing the likelihood of surcharges by exceeding the capacity of the pipes in the City CSS;
2. Avoid increasing the extent or duration of ponding or overland flow; and
3. Avoid discharges to the City's CSS that could increase the frequency or volume of CSDs to the receiving waters.

The DEIR goes on to state, "*To meet the third (hydrologic) performance standard, UCSF has committed to ensure that the total volume of stormwater discharges from the Parnassus Heights campus site **in wet weather** is decreased by an amount sufficient to offset flows from any increase in impervious surfaces and any increases in wastewater discharges as a result of the proposed new development. Necessary reductions may be achieved via LID, on-site detention and re-use, on-site detention for discharge, and/or other strategies in conformance with the City's Stormwater Management Ordinance, and may be less than the unmitigated total wet weather discharges from Parnassus Heights campus site if modeling demonstrates there is sufficient storage, pumping, and treatment capacity in the City's CSS to avoid increased discharges to the receiving waters from the CSS discharge structures*." 24

The DEIR indicates (page 4.9-17) that the NHPH would result in an increase in peak stormflows generated on the NHPH site, and an increase in wastewater generation of 125,280 gallons per day (gpd), which would be collected in the University's on-campus CSS and storm drain system and discharged off-site into the City's CSS. As cited in the DEIR[1], USCS commissioned three (3) hydrologic studies by ARUP and Hydroconsult Engineers to estimate the increases in stormwater and wastewater that result from the NHPH project and to develop and estimate of the storage needed to detain peak flows and volumes so that the stormwater and wastewater performance criteria would be met. Appendix HYD to the DEIR

- [1] At DEIR page 4.9-26: Arup, 2021. Final UCSF New Hospital at Parnassus Heights Storm Drainage Design Report. December 6, 2021.
- At DEIR Appendix HYDA; page 2 of 13: Arup, UCSF NHPH Combined Sewer System Modeling Updates, November 1, 2021.
- At DEIR page 4.9-18: Hydroconsult Engineers, 2021, UCSF New Hospital at Parnassus Heights (NHPH) Modeling to Evaluate NHPH Impacts on Downstream Flooding, Sewer Capacity and Combined Sewer Discharges (CSDs), December 3, 2021.

presents a summary of the ARUP November 1, 2021 study. Based on the results of these studies, the DEIR determined that the project would not significantly impact Hydrology and Water Quality and no mitigation is required.

24 cont.

2.0 Concerns about CEQA Findings to Hydrology and Water Quality

Based on the information provided in DEIR I am not able to evaluate the validity of the finding of no significant impact to Hydrology and Water Quality. In addition, based on the information provided in the DEIR, I have concerns about the interpretation of hydrologic study results. As a result, in my opinion, the project may result in significant adverse impacts to water quality of receiving waters.

25

2.1 Lack of Study Information Presented in DEIR

The DEIR and Appendix HYD base their findings and conclusions on technical modeling reports that are not included in the DEIR and therefore the validity of these findings cannot be evaluated. These reports are referred to as "Arup, 2021. Final UCSF New Hospital at Parnassus Heights Storm Drainage Design Report. December 6, 2021" (referenced at DEIR page 4.9-26) and "Arup, UCSF NHPH Combined Sewer System Modeling Updates, November 1, 2021" (referenced at DEIR, Appendix HYD; page 2 of 13). In order to evaluate these findings, I would need to see specific information contained in the modeling reports that would address specific questions pertaining to project storm- and waste-water operations, including the following.

26

- The summary of model findings refers to a single total volume of water discharged to the CSS. What are the corresponding volumes and flow rates from the storm water vs. wastewater contributions that make up the total? What are the representative values under baseline conditions used for comparison? Does the relative contribution from wastewater discharge increase over the stormwater discharge under project conditions? This last question is particularly important to determine impacts on water quality if the ratio of wastewater increases over stormwater under project conditions.
- The modeling was used to determine the necessary size of detention basin storage required to detain peak flows and volumes for the Project. How was this analysis completed?

27

- Does storage infrastructure creation result in their own potential impacts to the environment? The DEIR states (pages 3-29 and 4.9-18), "*The preferred proposal is to repurpose the existing underground diesel fuel tanks in Medical Center Way to provide storage for approximately 120,000 gallons of stormwater, and install a new underground tank at the Ammonia House site to store an additional 30,000 gallons of stormwater*." The DEIR doesn't provide a description of how the new detention basin would be built, other than a reference to it being in the "basement" (DEIR page 3-29 and Appendix PD2 page sheet 2). This is an omission in the project description.

28

- The estimated net change in water demand for the project is 199,140 gpd (Appendix WSE, Appendix B; table on last page of DEIR) and the estimated increase in wastewater flow from NHPH is 125,280 gpd (DEIR page 4.9-18). What is the net change in storm water flow? What

29

is the fate of the other 73,860 gpd of daily water used by the NHPH (i.e., where does that water go)? Is this captured in the modeling? 29 cont.

- The Project proposes constructing a 150,000-gallon on-site storm water detention facility (DEIR page 3-29 and 4.9-18). Given the increase in daily wastewater generation and presumed storage of this water in the detention facility, how does the storage of storm water affect the concentration of wastewater constituents being discharged to the CSS (i.e., with less storm water available to dilute wastewater, does this increase the concentration of wastewater constituents discharged to the CSS and receiving waters)? When and how is water released from the detention facility, especially during large rainfall events? How is this factored into modeling? How does the "emergency sewer tank" indicated on sheet 2 of Appendix PD2 factor into the modeling of discharges to the CSS? 30

These answers to these questions are important to determine the relative changes in storm water and wastewater concentrations being discharged to the CSS, treatment facilities and receiving waters. The EIR's finding can't be validated without providing the technical studies that address this question and the DEIR should be considered incomplete until they provide the background information that provides the reader with the ability to do so. 31

2.2 Increased Discharge Volume during 5-year, 24-hour Storm

The modeling results for the 5-year storm indicate that the total flow volume from the NHPH study area would increase from 0.210 MG under existing conditions to 0.213 MG with the NHPH project (Appendix HYD, page 4). These results indicate an increase in the volume of discharge to receiving waters and exceeds the stormwater and wastewater performance standard number 3 listed above. The appendix and DEIR consider that because this is only a small increase, they aren't significant. However, the DEIR does not provide the rationale for this determination, even though this significance criteria is exceeded. 32

2.3 Potentially Contradictory Findings, 100-year Storm Simulation

Modeling results summarized in Appendix HYD indicate there is no increase in flood volume from the NHPH during the 100-year storm model simulation. This result is counter-intuitive given the increase in flood volume experienced under the 5-year storm simulation. I would have expected an increase in discharge volumes during a 100-year storm given the 5-year storm simulation results. An evaluation of these counter-intuitive results isn't possible without access to the Arup report(s). 33

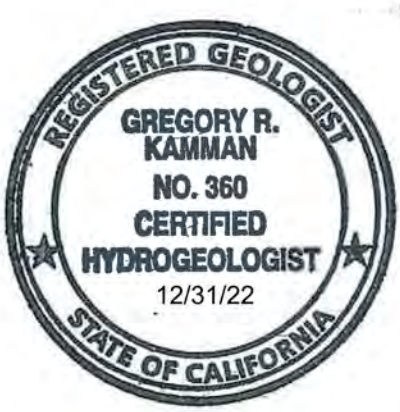
2.4 Questionable Use of Typical Water Year Type in Model Analysis

To evaluate the stormwater and wastewater performance standard number 3 listed above, the model analysis used a typical year precipitation to calculate changes in the predicted frequency and volume of combined sewer discharge to receiving waters. The rationale for choosing a year of average annual frequency and volume of combined sewer discharge (CSD) to evaluate these impacts on receiving waters is not provided in Appendix HYD. It is my opinion that water quality exceedances to receiving waters occur more frequently during wet years when there are higher rates and volumes of CSD and modeling using typical year hydrology masks the adverse findings that would occur during a wet year. Therefore, the DEIR should be considered incomplete until it evaluates the likely adverse impacts on receiving waters during above average wet water year-types. 34

Please feel free to contact me with any questions regarding the material and conclusions contained in this letter.

Sincerely,

Greg Kamman, PG, CHG
Senior Ecohydrologist



Responses to Comments from Law Offices of Thomas N. Lippe, APC

Please note that Comment Letter O-TL1 contained several exhibits. A portion of Exhibit 1 in Comment Letter O-TL1 included comments on the NHPH Draft EIR, which are responded to, below. The remainder of Exhibit 1, and all of Exhibits 2 through 9 in Comment Letter O-TL1 did not comment directly on the NHPH Draft EIR and no responses are required. These exhibits are included in Appendix O-TL1 in this Final EIR.

O-TL1-1 The commenter asserts that the citizens group it represents objects to approval of the project. This comment does not address the adequacy of the NHPH Draft EIR; consequently, as explained in Master Response 1: Non-CEQA Comments, no response is required. However, the comment has been noted and will be forwarded to the decision-makers.

O-TL1-2 The commenter generally asserts the NHPH Draft EIR fails to comply with CEQA. Please see the specific responses provided below.

O-TL1-3 The commenter indicates that the citizen group it represents is currently challenging the legality of the CPHP Final EIR. This comment does not address the adequacy of the NHPH Draft EIR; no response is required.

The commenter also asserts that the NHPH Draft EIR repeats many of the same informational inadequacies as the CPHP EIR for analysis of impacts and mitigation measures related to water quality, population and housing, historic resources, and air quality. For specific comments raised on the NHPH Draft EIR related to water quality, please see response to Comments O-TL1-4 through O-TL1-9, and response to Comments O-TL1-23 through O-TL1-34. For comments raised on the NHPH Draft EIR related to population and housing, please see response to Comments O-TL1-10 through O-TL1-16. For comments raised on the NHPH EIR related to historic resources, please see response to Comments O-TL1-17 and O-TL1-18. For comments raised on the NHPH Draft EIR related to air quality, please see response to Comments O-TL1-19 through O-TL1-22.

O-TL1-4 The commenter asserts that the NHPH Draft EIR fails to lawfully assess impacts on beach water quality for the reasons described in the San Franciscans' for Balanced and Livable Communities (San Franciscans') Revised Opening Merits Brief filed in Case No. RG21089332 and San Franciscans' Reply Merits Brief filed in Case RG21089332.

The briefs referenced by the commenter pertain specifically to the CPHP and the CPHP Final EIR, and do not represent formal comments on the content and adequacy of, the NHPH Draft EIR. The following discussion provides context for why the comments previously made on the CPHP EIR are not applicable to the NHPH Draft EIR.

The descriptions of the CPHP and NHPH, and the associated CEQA analyses conducted in the respective EIRs for these projects, are necessarily different. The CPHP is a plan to meet projected space needs for a number of programs in research, patient care and education at the Parnassus Heights campus site. The CPHP program involved the development of 2.90 million gross square feet (gsf) of new building space at the Parnassus Heights campus site by 2050, including a range of clinical, educational, research, and housing uses. Accordingly, the CPHP Final EIR programmatically addressed the potential environmental impacts of implementation of the entire space program under the CPHP (it also included a project-level analysis of three CPHP Initial Phase projects – Irving Street Arrival, Research and Academic Building, and initial phase of Aldea Housing development). To mitigate the potential for increases in stormwater and wastewater volumes generated under the CPHP to contribute to off-site hydrologic and water quality effects (as analyzed in Impacts HYD-1, HYD-2, C-HYD-1 and C-HYD-2), the CPHP Final EIR established stormwater and wastewater performance standards that subsequent CPHP development would be required to meet (as included in CPHP Mitigation Measure HYD-1). The CPHP Final EIR determined that implementation of this mitigation measure, along with compliance with required regulatory permits and programs, would sufficiently ensure potential hydrologic and water quality effects of the CPHP, including the CPHP's contribution to cumulative effects, would be less than significant.

In contrast, the NHPH project involves the implementation of the proposed New Hospital project by 2030, along with certain related improvements. Accordingly, the NHPH Draft EIR provides a project-level analysis of environmental impacts of the proposed New Hospital and its related improvements. The NHPH Draft EIR relies on a stormdrainage design report prepared by Arup for the NHPH project that provides project-specific stormwater and wastewater technical analyses. As determined through on-campus hydrologic modeling, the Arup report identifies a number of on-site infrastructure improvements to be incorporated into the proposed NHPH, including stormwater and wastewater collection, and stormwater storage facilities that would provide both retention and detention storage uses. In addition, in support of the Draft EIR, a hydrologic modeling analysis of the NHPH's off-campus downstream effects on the City's combined sewer system (CSS) infrastructure and receiving waters was conducted by Hydroconsult Engineers Inc. in alignment with the stormwater and wastewater performance standards identified in CPHP Mitigation Measure HYD-1.

As described in the NHPH Draft EIR Impact HYD-1, the project-specific analysis demonstrates that the NHPH would not exceed the capacity of the City's CSS, would not increase the extent or ponding of overland flow, would not increase the frequency or volume of combined sewer discharges (CSDs) to receiving waters, and would not result in adverse water quality effects associated with additional sources of polluted runoff. As a result, the NHPH Draft EIR shows that with the incorporation of the proposed NHPH project features,

including on-site stormwater storage facilities, along with UCSF compliance with numerous applicable permits and programs, including National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP), Phase II Municipal Separate Storm Sewer System (MS4) permit, and UCSF Storm Water Program, consistent with the City's Stormwater Management Ordinance, the potential for the NHPH to violate water quality or waste discharge requirements would be less than significant. In addition, as demonstrated in Impact HYD-2 in the NHPH Draft EIR, with the proposed on-site wastewater and stormwater facilities, and UCSF's proposed incorporation of post-construction best management practice (BMP) requirements and low impact development (LID) measures into the project in compliance with applicable permits, NHPH impacts to off-site flooding and to the capacity of downstream stormwater drainage capacity from stormwater flow increases would be less than significant. Similarly, as demonstrated in Impacts C-HYD-1 and C-HYD-2, the potential NHPH contribution to cumulative hydrology and water quality impacts would also be less than significant.

As discussed above, comments in the briefs referenced by the commenter associated with the CPHP Final EIR do not represent formal comments on the content and adequacy of the NHPH Draft EIR. To the extent any specific comments on hydrology and water quality raised in Comments O-TL1-5 to O-TL1-9, below, are directly related to the NHPH Draft EIR, those comments are responded to below.

O-TL1-5 The commenter asserts that the NHPH Draft EIR fails to describe the physical and regulatory components of the environmental setting as they relate to potentially significant impacts on beach water quality.

To the contrary, the NHPH Draft EIR Section 4.9, *Hydrology and Water Quality* includes a thorough description of the existing physical and regulatory setting. In particular, the commenter is referred to the following information in the *Environmental Setting* and *Regulatory Framework*:

- Page 4.9-6, in the *Water Quality* subsection in the NHPH Draft EIR, which describes those existing Regional Water Quality Control Board (RWQCB) listed impaired water bodies and beaches in the San Francisco vicinity, and identifies the types of pollutants for which these locations are listed as impaired.
- Page 4.9-9, under *Impaired Water Bodies and TMDLs* subsection, the NHPH Draft EIR discusses that the USEPA has also approved TMDLs for bacteria in certain San Francisco Bay beaches (including Candlestick Point Beaches, Aquatic Park Beach, and Crissy Field), and they have been officially incorporated into the Basin Plan. The NHPH Draft EIR also discusses RWQCB adopted Order No. R2-2016-0021, which amended the Basin Plan for the San Francisco Bay Basin to establish TMDL and Implementation Plan for bacteria in these San Francisco Bay beaches.

- Page 4.9-12, the *SEP, NPF, Bayside Wet Weather Facilities and Wastewater Collection System NPDES Permit* subsection in the NHPH Draft EIR discusses that "the existing water quality in the Bay and the Ocean has been negatively affected, on occasions, by CSD discharges, which has affected the beneficial uses of the San Francisco Bay, and the use of beaches."
- Page 4.9-13, the *San Francisco Beach Water Quality Monitoring Program* subsection in the NHPH Draft EIR, which discusses that seventeen beach sites in San Francisco are monitored weekly year-round where water contact recreation is common; and that when water quality does not meet California standards for water contact recreation, or whenever a CSS discharge occurs that affects a recreational beach, the beach is posted for public notification.

O-TL1-6 The commenter asserts that Impact HYD-1 in the NHPH Draft EIR improperly bases its less than significant impact conclusion on the ratio theory and compliance with other agencies' regulatory requirements. However, the NHPH Draft EIR does not rely on a ratio theory. As described in response to Comment O-TL1-4, above, the NHPH Draft EIR provides a project-level analysis of hydrologic and water quality impacts of the proposed New Hospital and its related improvements. This analysis is based on hydrologic modeling of on-campus conditions, including proposed on-site stormwater storage facilities; and of downstream off-campus conditions within the City CSS system and receiving waters, pursuant to the stormwater and wastewater performance standards consistent with City requirements identified in NHPH Draft EIR. The conclusions as to the significance of Impact HYD-1 are not based on any suggestions that the NHPH would only make a di minimus contribution to an existing impact.

The commenter includes an excerpt from page 4.9-4 in the NHPH Draft EIR, which discusses that discharges from the City's bayside facilities to San Francisco Bay are conducted in compliance with federal Clean Water Act and State Porter-Cologne Water Quality Control Act by meeting requirements set forth in the City's NPDES permit (RWQCB Order No. R2-2013-0029). The commenter then asserts that the City of San Francisco routinely and frequently violates the terms of its NPDES permits. As discussed in response to Comment O-TL1-5, above, the NHPH Draft EIR identifies the impaired water bodies and beaches in the San Francisco vicinity, lists the pollutants for which these locations are listed as impaired; and acknowledges that the existing water quality in the Bay and the Ocean has been negatively affected, on occasion, by CSD discharges, which has affected the beneficial uses of the San Francisco Bay, and the use of beaches.

The commenter then includes an excerpt from page 4.9-13 in the NHPH Draft EIR that provides an overview of the San Francisco Beach Water Quality Monitoring Program, and asserts that the NHPH Draft EIR fails to disclose the results of the monitoring program. As discussed in the NHPH Draft EIR, the SFPUC and the San Francisco Department of Public Health (SFDPH) collaborate to monitor beach water quality. Seventeen sites are included in the program and monitored weekly year-round. Water samples are collected and analyzed for

three different bacterial indicators of impaired water quality to determine compliance with the California Sanitation, Healthfulness and Safety of Ocean Water-Contact Sports Areas Regulations, Title 17, California Code of Regulations. The City's website for this program[1] presents only weekly results for each monitoring site for the most recent approximate 3-month period; and as such, no comprehensive long-term (e.g., annual) results are available that would be useful for presentation in this EIR for informational purposes.

O-TL1-7 The commenter asserts that Impact HYD-1 in the NHPH Draft EIR improperly compresses analyzing the significance of impacts with identifying mitigation measures.

The commenter is referred to response to Comment O-TL1-4, above. As described in that response, the NHPH Draft EIR provided a project-level analysis of hydrologic and water quality impacts of the proposed New Hospital and its related improvements. The NHPH Draft EIR demonstrates that runoff and wastewater generated by the NHPH would not violate water quality or waste discharge requirements (Impact HYD-1) or result in an increase in off-site flooding, or adversely affect the capacity of downstream stormwater drainage capacity (Impact HYD-2), or result in a considerable contribution to cumulative effects in these topic areas (Impacts C-HYD-1 and C-HYD-2). Accordingly, since these impacts are determined to be less than significant, no mitigation measures are required under CEQA.

O-TL1-8 The commenter asserts that the less than significant conclusion in NHPH Draft EIR Impact HYD-1 is based on modeling results in NHPH Draft EIR Appendix HYD that are unsupported based on the reasons described in Exhibit 1 attached to the comment letter.

Please see responses to Comments O-TL1-9, and O-T1-23 to O-TL1-34, below.

O-TL1-9 The commenter asserts that the NHPH Draft EIR fails to provide enough information for the reader to evaluate the validity of the modeling results, and specifically references the following reports:

- Arup *Final UCSF New Hospital at Parnassus Heights Storm Drainage Design Report*. December 6, 2021.
- Arup *UCSF NHPH Combined Sewer System Modeling Updates*, November 1, 2021.

The December 6, 2021 Arup report was directly cited in the NHPH Draft EIR. The November 1, 2021 report was cited in Appendix HYD in the NHPH Draft EIR. Both sources of information were included in the administrative record

[1] https://sfpuc.org/programs/ocean-and-beach-monitoring

compiled for the Draft EIR, and further, have been included as appendices in this Final EIR, as **Appendix HYD-A** and **Appendix HYD-B**, respectively.

The commenter also references three emails to UCSF requesting the above documents. These emails are also presented in Exhibits 6, 7 and 8 in the commenter's letter (included in Appendix O-TL1 in this Comments and Responses document). The commenter asserts that the NHPH Draft EIR must be recirculated for public review because its analysis of water quality is so inadequate and conclusory in nature such that public comment on this issue was in effect meaningless. As demonstrated in the individual responses provided to the comments raised, and further in Section 8.1.4 in this Comments and Responses document, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments, including this comment, is not warranted.

O-TL1-10 The commenter argues that UCSF inappropriately excluded the displacement of housing from detailed analysis in the NHPH Draft EIR, and that displacement of population due to jobs/housing imbalance and gentrification should have been included in the analysis. The commenter also asserts that the NHPH Draft EIR ignores the physical impacts from the construction of housing that would be built to serve the project's housing demand.

Direct displacement of existing residents or housing is clearly an issue to be considered under CEQA. Section 4.12, *Population and Housing* in the NHPH Draft EIR is compliant with CEQA as it considers the issue of the direct displacement of people or housing due to the project, and finds that there would be no such displacement because no housing is located on the site of the proposed NHPH.

The CEQA checklist question under Population and Housing does not require an analysis of jobs/housing imbalance or gentrification. Gentrification or displacement of existing residents and businesses due to increases in real estate costs is an indirect economic effect with associated social effects. Such indirect effects on housing are social and economic effects, which, though important, are not properly considered environmental impacts under CEQA in the absence of physical effects (*Joshua Tree Downtown Business Alliance v. County of San Bernardino* (2016); *Maintain Our Desert Environment v. Town of Apple Valley* (2004))

It is outside the scope of a population and housing impact analysis to analyze the physical impacts from the construction of new housing, unless the new housing is part of the proposed project. Such an analysis is appropriately addressed under growth inducing effects of the proposed project. As required per CEQA Guidelines Section 15126.2(e), the NHPH Draft EIR includes on pages 5-4 and 5-5 in Section 5.4, *Growth Inducing Effects*, a discussion of the ways in which the proposed NHPH could directly or indirectly foster economic or population growth,

or the construction of additional housing and how that growth and additional housing would, in turn, affect the surrounding environment. As the courts have explained: An EIR is not "required to make a detailed analysis of the impacts of a project on housing and growth. Nothing in the Guidelines, or in the cases, requires more than a general analysis of projected growth. The detail required in any particular case necessarily depends on a multitude of factors, including, but not limited to, the nature of the project, the directness or indirectness of the contemplated impact and the ability to forecast the actual effects the project will have on the physical environment" (*Clover Valley Foundation v. City of Rocklin* (2011)). Even where a project may indirectly result in a need for additional housing outside the project area, for example, by creating employment opportunities, an EIR is sufficient if it "warns interested persons and governing bodies of the probability that additional housing will be needed so that [such persons] can take steps to prepare for or address that probability" *(Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001)).

O-TL1-11 The commenter refers to similar assertions made by other commenters on the CPHP EIR and in legal briefs submitted by the commenter in the pending CPHP litigation.

All relevant comments received on the CPHP Draft EIR are fully addressed in the CPHP Final EIR. With respect to the NHPH Draft EIR, as shown in the response above, the population and housing impacts are accurately analyzed in Section 4.12 consistent with the CEQA Guidelines Appendix G, and the growth inducing impacts are accurately analyzed in Section 5.4 consistent with CEQA Guidelines Section 15126.2(e).

O-TL1-12 The commenter asserts that the NHPH Draft EIR unlawfully limits the scope of the population and housing impacts as presented in Impact POP-1 to an assessment of whether the project would cause substantial unplanned population growth or a demand for housing outside the market area.

Please note that the first criterion that asks whether the project would cause substantial *unplanned* growth is taken verbatim from Appendix G of the CEQA Guidelines and reflects the State's guidance relative to the types of impacts related to population and housing that would constitute significant environmental impacts. The University has not inserted the word "unplanned" to narrow the scope of analysis or bias the impact analysis in any way.

As the Appendix G CEQA Checklist questions show, CEQA does not require a CEQA document to analyze how a project's demand for housing would be met or whether affordable housing would be available to the project-related population. The third criterion used in the NHPH Draft EIR that focuses on the project's demand for housing was developed by UCSF during the preparation of the 2014 LRDP EIR, and is not derived from the CEQA Guidelines. As a lead agency, the

University is within its right to develop and use significance thresholds that it finds appropriate for its analysis.

O-TL1-13 The commenter asserts that the NHPH Draft EIR fails to disclose whether the project-induced population growth or cumulative growth would be substantial or unplanned.

The project-related population increase of 1,449 persons is reported on page 4.12-7 and analyzed relative to ABAG projections on the following page. The NHPH Draft EIR appropriately concludes that even if it were to be assumed that the project-related population increase is not accounted for in the ABAG projections, an increase of 1,449 persons would not be substantial relative to the existing and projected population of the 5-county study area.

The cumulative impact of the proposed project on population and housing is analyzed in Impact C-POP-1 in the NHPH Draft EIR. As discussed there, the proposed NHPH, in combination with cumulative development under the CPHP would result in a student, faculty, and staff population increase of approximately 5,180 by 2050 at the campus site. This combined growth would similarly not substantially increase the employment levels in San Francisco above those projected by ABAG. The NHPH Draft EIR provides a complete analysis of both the project-level and cumulative impacts of the proposed NHPH project.

O-TL1-14 The commenter asserts that the NHPH Draft EIR does not define what level of unplanned growth would be considered substantial, and therefore the NHPH Draft EIR's determination is conclusionary.

The NHPH Draft EIR, Section 4.12, *Population and Housing,* under Approach to Analysis, page 4.12-6, defines "substantial unplanned population growth" resulting from implementation of the NHPH as "an increase in population or employment that is inconsistent with growth anticipated in adopted planning documents." The NHPH Draft EIR analyzes existing population and employment in the five-county study area, establishing an appropriate baseline, and then analyzes the projected growth in population and employment associated with the NHPH.

As a first step, the Draft EIR explains that because some of the employment growth associated with the NHPH was previously included in the 2014 LRDP, that employment and population growth is already accounted for in *Plan Bay Area 2040*. In fact, UCSF received confirmation from ABAG that UCSF employment and population growth under the 2014 LRDP is accounted for in ABAG's employment and population projections. Further, for reasons presented in response to Comment O-TL1-15 below, based on the methodology used by ABAG to develop population and employment projections, it is reasonable to assume that all of the NHPH-related employment and population growth is accounted for in the growth analyzed and

planned for in *Plan Bay Area 2040*. In other words, NHPH employment and population growth does not represent unplanned growth.

The NHPH Draft EIR, however, also includes a conservative analysis that assumes that NHPH employment growth is not included in the Bay Area growth projections. For this conservative analysis, the NHPH Draft EIR presents population data to explain to the reader why the project-related population increase would not be considered substantial. The commenter is referred to pages 4.12-8 and -9 in the NHPH Draft EIR which explain that if about 53 percent of the new employees associated with the project live in San Francisco, and adjusting for persons per household, the project would be responsible for an approximately 0.8 percent increase in the City's population. If it is conservatively assumed that all new employees would live in San Francisco, and adjusting for persons per household, the project would be responsible for a 1.5 percent increase in the City's population. Both these percentage increases are small relative to the 28 percent increase in population projected to occur between 2010 and 2030 in San Francisco. The NHPH Draft EIR's determination is not conclusionary.

O-TL1-15 The commenter asserts that contrary to the NHPH Draft EIR analysis under Impact POP-1, there is no evidence that the project's employees are included in the projected household growth.

The commenter is referred to page 4.12-8 in the NHPH Draft EIR. Even though the University has reason to believe that the project's employment and household growth is accounted for in ABAG's employment and population projections for San Francisco, conservatively the University has based the analysis in the NHPH Draft EIR on the assumption that that the project's employment and population is not included and has proceeded to analyze it as incremental employment and population growth.

The reason why the University believes that the employment and population is included in ABAG projections is because of the methodology that ABAG uses to develop its projections. As stated by ABAG in the Regional Forecast Supplemental Report, "To better understand growth dynamics in the nine-county Bay Area region, the Association of Bay Area Governments (ABAG) tracks and projects the region's demographic and economic trends. The regional forecast is an important component of the *Plan Bay Area 2040*, the Bay Area Sustainable Communities Strategy (SCS), and provides a set of common regional assumptions informing the discussion among regional and local jurisdictions and organizations of how the region might grow. The forecast describes changes in employment, population, households, and income distribution over three decades for the region, focusing on long-term trends, rather than cyclical variations. The regional forecast also serves as the control totals for the scenario analysis in which the estimated increment of growth is econometrically distributed to jurisdictions and smaller geographic areas within the region according to a set of policy assumptions."

As a first step, ABAG used a suite of customized and in-house models, including a population model (Pitkin Myers model) and an economic model (REMI) to project economic activity, including changes in employment, population growth and composition, household growth, income distribution, and the regional housing control total at the regional level. Regarding employment projections, both national and Bay Area data were input into the economic model to develop regional projections of employment by major sector, including health and education services sector. Once regional projections were developed, in a second step, they were used as control to develop small area projections (i.e., at the local jurisdiction level such as the City of San Francisco). Due to the top- down approach used by ABAG to develop the regional and local area projections, it is reasonable to conclude that the projected employment growth at the Parnassus Heights campus site, including that associated with the proposed NHPH, and the related population growth and housing demand are accounted for in the ABAG projections that form the basis of *Plan Bay Area 2040,* and the NHPH-related employees are included in the projected growth.

O-TL1-16 The commenter asserts that the NHPH Draft EIR analysis under Impact POP-1 that the project's housing demand would not trigger any shifts in demand outside the five-county study area is conclusionary and not supported by analysis.

The NHPH Draft EIR presents projected housing information from ABAG to explain why the project's housing demand would not trigger a shift in demand outside the market area. As discussed in the NHPH Draft EIR, the vast majority of the current employees at UCSF live in a five-county study area, and new employees added to UCSF upon completion of the NHPH project would also be expected to reside in a similar manner. As stated on NHPH Draft EIR page 4.12-9, the housing demand associated with employment growth due to NHPH would be satisfied by the housing that is expected to be added in San Francisco and in other parts of the region. Between 2010 and 2030, San Francisco is expected to add about 91,695 new households, which would represent a 27 percent increase over its 2010 household levels. Assuming the current pattern of residential location preferences, the housing demand in San Francisco associated with UCSF employment growth from NHPH by 2030 would represent approximately 0.8 percent of the projected household growth — a share that is small and would not be anticipated to trigger shifts of demand to other parts of the study area or beyond the regional housing market area.

O-TL1-17 The commenter claims that the analysis of impacts on historic resources is inadequate and refers to the September 10, 2020 letter prepared by Brunzell Historical on the CPHP Draft EIR. The commenter states, as an example, that the Parnassus Heights campus site was not considered a historic resource or historic district in its own right with regards to the impacts analysis.

As previously discussed in the CPHP Final EIR, Volume 2, Comments and Responses, Carey & Co.'s 2011 Historic Resources Survey report for UCSF, on page 2, in the methodology section states, "Digital photographs were taken of

each structure visible from the public right-of-way, and the firm noted the overall environment and relationships of the buildings *to determine if the campuses contain potential historic districts*" [emphasis added]. In the Regulatory and Planning Framework section on page 4, the report states, "The regulatory background outlined below offers an overview of federal and state laws and regulations and the criteria used to assess the historic significance and eligibility of a building, structure, object, site, *or district* for listing in the National Register of Historic Places (NRHP) and in the California Register of Historical Resources (CRHR)." All of this indicates that Carey & Co. did consider the possibility of a historic district(s) at the Parnassus Heights campus site, and did not find sufficient evidence to identify an historic district.[2]

Also, as discussed in the CPHP Final EIR, Volume 2, Comments and Responses, the historic analysis in the CPHP Final EIR was based on the existing technical reports as well as the expertise of ESA's own architectural historians. In the process of preparing the CPHP EIR, ESA did consider whether or not the Parnassus Heights campus site should be considered a historic district, in which the individual buildings would have been considered as either contributing or non-contributing, rather than considering each of the buildings/structures/ landscapes as potentially significant individual resources. Given the wide range of architectural styles and uses of the buildings, the long period of development (1917-2010), and a lack over overall thematic context or initial master plan guiding development from the beginning, it was determined that the campus as a whole did not constitute a historic district. Therefore, the individual buildings evaluations were the best approach in determining potential significance.

Furthermore, as discussed in the NHPH Draft EIR, Section 4.4 *Cultural Resources* section, the only historical resource that could be impacted by the NHPH is the Reserve. However, the NHPH Draft EIR finds that the NHPH would not result in significant changes to the character-defining features of the Reserve. As such, the NHPH would have a less-than-significant impact on historical resources. Also see response to Comment O-TL1-18, below, as it relates to the treatment of the LPPI in the CPHP and NHPH EIRs.

O-TL1-18 The commenter claims that the NHPH Draft EIR piecemeals CEQA review of the CPHP and NHPH with respect to impacts on the historic significance of the LPPI building for the reasons cited in the comment letter on the NHPH Draft EIR prepared by Patrick Soluri on behalf of the Parnassus Neighborhood Coalition (Comment Letter O-SM in this Comments and Responses document).

The demolition of the LPPI was analyzed in the 2014 LRDP Final EIR; and the 2014 LRDP included the planned demolition of the LPPI. Additionally, after the

[2] The Carey & Co. survey did find a potential historic district along Third Avenue comprised of University-owned houses built in the Craftsman style in the 1910s. This portion of the campus site is located several blocks from the NHPH site.

certification of the 2014 LRDP Final EIR and prior to the CPHP EIR effort, the LPPI was determined to be individually eligible for the National Register and California Register. Therefore, the CPHP Final EIR addressed the potential effect of demolition of the LPPI on historic resources as part of the CPHP. The CPHP Final EIR determined the demolition of the LPPI to be a significant and unavoidable impact even after the implementation of CPHP Mitigation Measures CUL-1a, CUL-1b, and CUL-1c, and the Regents, in certifying the CPHP Final EIR, adopted a Statement of Overriding Considerations with respect to significant and unavoidable impacts, including impacts to historic resources, identified in the CPHP EIR.

Accordingly, the demolition and removal of LPPI was not included in the NHPH project and is being completed separately from the NHPH project. Nevertheless, the demolition of LPPI was considered in the cumulative context in Impact C-CUL-1 in the NHPH Draft EIR in Section 4.4, *Cultural Resources*. Impact C-CUL-1 acknowledged that, despite mitigation, the alteration or demolition of the LPPI and other historical resources on the campus site not associated with the NHPH would combine with known or reasonably foreseeable demolition or alteration projects on the campus site and its vicinity to result in cumulatively considerable impacts. However, implementation of the proposed NHPH would result in a contribution that would not be considerable to the previously identified significant cumulative impacts to historical resources. Therefore, impacts on historic architectural resources as a result of the implementation of the NHPH are considered less than significant.

The commenter is also referred to response to Comment O-SM-8, above, as it relates to responses to Comment Letter O-SM claims regarding piecemealing.

O-TL1-19 The commenter suggests that the cancer risk thresholds of the Bay Area Air Quality Management District (BAAQMD) applied in the analysis of health risks in the NHPH Draft EIR should be adjusted to reflect unique aspects of the environmental setting.

Under CEQA, lead agencies have discretion in determining the appropriate threshold of significance to determine the severity of a particular impact. “A threshold of significance is an identifiable, quantitative, qualitative, or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.” (CEQA Guidelines, § 15064.7 subd. (a).) CEQA Guidelines further state, “When adopting or using thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.” (CEQA Guidelines, § 15064.7 subd. (c.)).

As lead agency, the University of California has discretion to rely on BAAQMD's recommended thresholds of significance. Further, similar to other cities and counties that utilize BAAQMD CEQA guidance and thresholds, the University does not need to adopt these thresholds in a formal rule-making process. In consideration of State and federal air quality standards, and based on its own independent review of thresholds of significance for air quality impacts recommended by the BAAQMD, UCSF has determined that BAAQMD's recommended significance thresholds are appropriate to use to evaluate potentially significant air quality impacts associated with the proposed project. While others may disagree, such disagreement does not alter the fact that UCSF, and BAAQMD's expert conclusions developed in its 2009 document *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance* referenced in the NHPH Draft EIR (pages 4.2-22 to 4.2-25) constitute substantial evidence upon which UCSF may rely. (See *Center for Biological Diversity v. Department of Forestry & Fire Protection* (2014) 232 Cal.App.4th 931, 948 ["disagreement is insufficient… [a challenger must] *affirmatively show* there was no substantial evidence in the record…" (original emphasis)].) BAAQMD's 2009 Justification Report develops and considers a variety of air quality thresholds and recommends numeric significance criteria that BAAQMD staff believe provide a fair share of emission reductions from land use development.

Further, the project site is not located in a portion of the City of San Francisco that experiences poor air quality. As stated on page 4.2-9 of the NHPH Draft EIR, the Parnassus campus site is not located within an Air Pollution Exposure Zone, which are locations designated by the San Francisco Planning Department that experience poor air quality based on health-protective criteria. Therefore, there is nothing unique about the project site area that would warrant adjustments to BAAQMD-recommended health risk thresholds.

O-TL1-20 The comment raised concerns that the NHPH Draft EIR's description of the environmental baseline with respect to risks from diesel particulate matter is not current with respect to the date of the NHPH NOP.

The estimates of health risk exposure presented on page 4.2-10 of the NHPH Draft EIR are based on the latest available air toxic summary of the BAAQMD for the only BAAQMD monitoring station where TACs are monitored. These estimates are based on the concentrations of several TACs measured at the Arkansas Street station and are not reflective of the localized conditions of the Parnassus Heights campus site.

The health risk estimates provided on page 4.2-11 of the NHPH Draft EIR are based on data published by the California Air Resources Board (CARB). CARB has not updated these basin-wide health risk estimates from DPM since the

summary through year 2012 and, therefore, the background health risks related to DPM are, in fact, current through the NOP date.

However, CARB has published projected trends of DPM emissions for the San Francisco Bay Area Air Basin.[3] Based on the latest trends document, basin-wide emissions of DPM were predicted to decrease from 10 tons per day in 2000 to 2 tons per day in 2020, an 80 percent reduction. As stated on page 4.2-11 of the NHPH Draft EIR, as of 2000, the average Bay Area cancer risk from exposure to DPM based on a population-weighted average ambient DPM concentration was approximately 480 in one million. Consequently, one may expect that the current (2020) basin-wide risk solely from DPM to be on the order of 96 in one million. Other toxic air contaminant emissions within the basin will further contribute to this estimated risk. These basin-wide risks are also inclusive of transport emissions from outside the basin and are, therefore, very conservative.

With respect to a San Francisco-specific baseline, as stated on NHPH Draft EIR pages 4.2-8 to 4.2-9, the City and County of San Francisco partnered with the BAAQMD to inventory and assess air pollution exposure from vehicles, stationary sources, and area sources within San Francisco. Citywide dispersion modeling was conducted to assess the emissions from the following primary sources: vehicles on local roadways, permitted stationary sources, port and maritime sources, and diesel emissions from Caltrain. Modeling results were used to identify areas in the city with poor air quality, which are designated as the *Air Pollutant Exposure Zone* (APEZ). An APEZ is defined as a location where health risk exposures exceed 100 in one million. The methodology and technical documentation for modeling citywide air pollution are available in a recently updated document entitled *San Francisco Citywide Health Risk Assessment: Technical Support Documentation*. These most recent citywide modeling results indicate that the Parnassus Heights campus site and its surrounding area are not located within an APEZ, as stated on page 4.2-9 of the NHPH Draft EIR, and is therefore not located in a portion of San Francisco that is exposed to poor air quality conditions. Because this updated study was prepared in 2020, it is, in fact, representative of the conditions at the time of the NOP. Therefore, the commenter's contention that the NHPH Draft EIR's description of existing baseline health risks is not accurate.

O-TL1-21 The comment suggests that the project-level and cumulative health risk thresholds published by the BAAQMD and applied in the analysis of health risk in the NHPH Draft EIR are inappropriate because the existing baseline health risk is high.

[3] California Air Resources Board, *California Almanac of Emissions and Air Quality—2013 Edition*, 2013, Table 4-16. Available at https://ww2.arb.ca.gov/our-work/programs/resource-center/technical-assistance/air-quality-and-emissions-data/almanac-4.

As discussed above, in response to Comment O-TL1-20, most recent citywide modeling results indicate that the Parnassus Heights campus site and its surrounding area are not located within an APEZ and, therefore is located in an area of the City where the background health risk is less than 100 in one million. As stated on page 4.2-43 of the NHPH Draft EIR, as described by the BAAQMD, USEPA considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cumulative cancer risk. Because the cumulative increase in cancer risk from all operational sources would be well below 100 in one million, the NHPH's cumulative impact to local health risk and hazards is appropriately identified as less than significant. Further, the impact assessment methodology and cumulative threshold set forth by the BAAQMD does not require the estimated risk from the cumulative projects to be added to the background risk to determine the significance of a project's cumulative impact. Rather, the threshold is an incremental risk threshold and is based on the reasoning (which is supported by scientific analysis) is that if a project's TAC emissions when combined with the TAC emissions from other existing and proposed sources within 1,000 feet of the project site produce a combined increase in cancer risk that is less than 100 in a million, such an increase will not substantially change the background risk levels in the study area, and the cumulative impact will be less than significant.

Similarly, the threshold set forth by the BAAQMD for project-level cancer risk impact is also an incremental risk threshold that is based on the reasoning (which is supported by scientific analysis) that if the increased cancer risk due to a project's TAC emissions is less than 10 in a million, the increase would not substantially change the background risk levels in the study area and the impact will be less than significant.

O-TL1-22 This comment suggests that the application of the BAAQMD's recommended project-level threshold of an increased cancer risk of 10 in one million and the cumulative threshold of an increased cancer risk of 100 in one million are inappropriate given the existing baseline risk levels and is not based on evidence.

Please see response to Comment O-TL1-20, above which explains the thresholds and approach to human health impact analysis put forth by the BAAQMD. BAAQMD methodology does not suggest or identify the need for adjusting its recommended project-level or cumulative health risk thresholds of significance based on existing background health risk and the analysis of the NHPH Draft EIR, appropriately, did not stray from the BAAQMD-recommended guidance.

O-TL1-23 The commenter opines that the Initial Study/Mitigated Negative Declaration is inadequate in evaluating the potential significant impacts of project actions on hydrology and water quality, and that the rationale for this opinion is based on the multiple findings presented in the commenter letter.

The commenter incorrectly refers to the NHPH Draft EIR as an Initial Study/Mitigated Negative Declaration. In any case, the commenter is referred to the individual responses to the comments that follow.

O-TL1-24 The commenter briefly summarizes aspects of the analysis in Section 4.9, Hydrology and Water Quality section in the NHPH Draft EIR, and cites specific excerpts in the section's approach to analysis and impact analysis subsections. The commenter concludes by stating that based on results of the Hydroconsult Engineers' December 3, 2021 report and the Arup November 1, 2021 and December 6, 2021 reports, the NHPH Draft EIR determined the project would not significantly impact hydrology and water quality and no mitigation is required.

The results of the reports that the commenter references were considered by UCSF along with the entire record of information referenced in the section when making conclusions regarding the significance of hydrologic and water quality impacts of the NHPH in the NHPH Draft EIR.

O-TL1-25 The commenter asserts that they are not able to evaluate the validity of the findings of no significant impact to hydrology and water quality, and expresses concerns about the interpretation of hydrology study results; and as a result, the commenter opines that the project may have significant adverse impacts on the water quality of receiving waters.

Please see responses that follow that address specific issues raised by the commenter regarding the validity of findings and interpretation of the hydrology study results.

O-TL1-26 The commenter asserts that the NHPH Draft EIR and Appendix HYD base their findings and conclusions on technical modeling reports that are not included in the NHPH Draft EIR and thus, the validity of findings cannot be evaluated. As indicated in response to Comment O-TL1-9, both sources of information were included in the administrative record compiled for the NHPH Draft EIR, and further, have been included as appendices in this Final EIR, as Appendix HYD-A and Appendix HYD-B, respectively.

The commenter indicates that the model findings refer to a single total volume of water discharged to the CSS, and inquires what are the corresponding volumes and flow rates of the stormwater and wastewater under baseline and project conditions. The commenter is referred to the Arup stormdrainage design report in Appendix HYD-A, and Appendix HYD-B, in this Final EIR for the methodology and approach used to estimate stormwater and wastewater from the project study area under baseline and with NHPH conditions. This analysis considers the proposed changes in land use, pipe network, wastewater flows in the project study area, as well as the proposed 150,000 gallons of on-campus stormwater storage.

Please note, however, that the analysis conducted by Hydroconsult Engineers in support of the NHPH Draft EIR (Appendix HYD in the NHPH Draft EIR) determined potential impacts that could result from the NHPH-related combined flows to the City's CSS system and receiving waters downstream of the proposed NHPH project site. The Hydroconsult Engineers' analysis evaluated whether the proposed NHPH, as designed, would meet the NHPH stormwater and wastewater performance standards established in the Draft EIR. As discussed in the NHPH Draft EIR, in the case of the first performance standard, conditions were modeled based on wastewater flows combined with runoff resulting from a 5-year, 3-hour storm; for the second performance standard, wastewater combined with runoff from a 100-year, 24-hour storm was analyzed; and for the third performance standard, wastewater combined with runoff from a typical year were analyzed. It is further noted that these performance standards are consistent with the requirements of the City's Stormwater Management Ordinance, and do not require consideration of changes in the ratio of wastewater vs. stormwater contributions. Please see also the additional responses that follow.

O-TL1-27 The commenter inquires how the analysis was completed by Arup to determine the size of detention basin storage required to detain peak flows and volumes generated by the project. Please see the Arup storm drainage design report in Appendix HYD-A in this Final EIR. An InfoWorks Integrated Catchment Modelling (ICM) hydraulic model was developed to study existing and future conditions of the NHPH study area for SFPUC 1- and 2-year 24-hour stormwater events. Several scenarios of the future model were developed, including with and without the proposed stormwater storage. The future model with no storage was used to determine the amount of storage required to match existing conditions. Results of the modeling indicate that a storage volume of 150,000 gallons would be required to detain stormwater on the campus site under NHPH conditions.

O-TL1-28 The commenter inquires if storage infrastructure creation would result in their own potential impacts to the environment. The commenter references the NHPH Draft EIR Project Description, which refers to repurposing of underground fuel diesel fuel tanks in Medical Center Way to provide storage for approximately 120,000 gallons of stormwater, and install a new underground tank at the Ammonia House site to store an additional 30,000 gallons of stormwater.

With respect to the preferred proposal to repurpose the existing 120,000-gallon capacity underground fuel diesel fuel tanks in Medical Center Way, no substantial new below grade construction would be required to repurpose these tanks. Rather, those tanks would be disinfected prior to repurposing them for use for stormwater storage, and stormwater collection infrastructure would be connected to the tanks. With respect to the potential installation of a 30,000-gallon capacity stormwater storage tank at the Ammonia House site, construction of this underground storage tank would be carried out in accordance with all applicable regulations and permits. Construction activities and related environmental effects associated with

installation of this tank are accounted for in the overall construction scenario analyzed in the NHPH Draft EIR, and as applicable, construction-related mitigation measures would be implemented for this component of the proposed project.

O-TL1-29 The commenter cites the Water Supply Evaluation (WSE) prepared by West Yost in support of the NHPH Draft EIR (Appendix WSE). However, the commenter appears to incorrectly interpret the water use for the NHPH as 199,140 gallons per day (gpd) in the WSE. Rather, WSE Appendix B table estimates the net increase in water use associated with the entire CPHP as 199,140 gpd, whereas the net increase in water use associated with the NHPH is estimated in the WSE as 57,960 gpd.

In any case, however, water demand in the WSE was estimated expressly for the purpose of evaluating potential effects of the NHPH on available water supplies. In contrast, in Arup's storm drainage design report (see Appendix HYD-A in this Comments and Responses document), Arup estimated baseline sewer flows at the site based on historical monthly water demand data adjusted at 90 percent return for the LPPI, and monitored sewer flow data for Moffitt and Long Hospitals. From this data, Arup derived a baseline per bed sewer flow rate, and then used this rate to estimate the wastewater generation for the New Hospital.

As such, the commenter's calculation of subtracting the wastewater generation estimate in the Arup storm drainage design report from the CPHP annual water demand estimate in the WSE to estimate stormwater is not appropriate or correct.

Lastly, with respect to the commenter's inquiry about net changes in stormwater flow, as explained in Section 4.9 in the NHPH Draft EIR, in addition to estimating the increase in wastewater from NHPH implementation, the storm drainage design report estimated the increases in stormwater that would result from NHPH implementation, and developed an estimate of the storage needed to detain peak flows and volumes so that the performance standards for the combined stormwater and wastewater flows established for the project would be met. The storm drainage design report used InfoWorks ICM 9.5 hydraulic modeling software to assess baseline and NHPH condition under several design storm events. The stormwater drainage study area included the NHPH site and the adjacent upstream area within the campus site that contributes storm flows through the NHPH site. Please see Appendix HYD-A in this Final EIR for additional detail.

O-TL1-30 The commenter inquires how the storage of stormwater in the proposed on-campus stormwater storage facility would affect the concentration of wastewater constituents that would be discharged to the CSS. The commenter is referred to response to Comment O-TL1-26. The Hydroconsult Engineers' analysis determined whether the proposed NHPH, as designed, would meet the NHPH

performance standards for the combined stormwater and wastewater flows established in the EIR, which are consistent with the requirements of the City's Stormwater Management Ordinance. These performance standards do not require consideration of changes in the concentration of wastewater constituents discharged to the CSS.

The commenter inquires how stormwater would be released from the proposed on-campus stormwater storage facility. The proposed stormwater storage system has not yet been designed. However, as discussed on NHPH Draft EIR, Chapter 3 Project Description page 3-29, the storage facilities would provide both retention and detention storage uses, with collected stormwater to be either pumped out into the CSS, and/or re-used for irrigation purposes on the campus site, as appropriate.

The commenter also inquires how the proposed emergency sewer tank is factored into the modeling of discharges to the CSS. As indicated on in Chapter 3, *Project Description*, page 3-29, and referenced in NHPH Draft EIR Appendix PD2, an emergency sewer tank is proposed to be located in the New Hospital basement. The emergency sewer tank is not related to, and would not connect to, the proposed stormwater storage tank. While the emergency sewer tank would connect to the City's CSS, any discharge of wastewater flows from this tank to the CSS would be infrequent, such as during maintenance, or during emergency conditions. Accordingly, it has not been included in the model to evaluate the effects of the combined stormwater and wastewater flows on the City's CSS.

O-TL1-31 The commenter indicates that answers to the commenter's inquiries are important to determine the relative changes in stormwater and wastewater concentrations being discharged to the CSS, treatment facilities and receiving waters. The commenter adds that the NHPH Draft EIR's findings cannot be validated without providing the technical studies that address this question and that the NHPH Draft EIR should be considered incomplete until the background information is provided.

As described in response to Comment O-TL1-9, above, Arup's December 2021 and November 2021 reports are included as appendices in this Final EIR as Appendix HYD-A and Appendix HYD-B, respectively. See also responses to Comments O-TL1-26 to O-TL1-30, above, which respond to specific issues raised by the commenter regarding various background information.

O-TL1-32 The commenter states the modeling results for the 5-year storm indicate that the total flow volume from the NHPH study area would increase from 0.210 million gallons (MG) under existing conditions to 0.213 MG with the NHPH project. The commenter then asserts these results indicate an increase in the volume of discharge to receiving waters and exceedance of the third performance standard listed in the EIR (related to discharges to receiving waters). The commenter further indicates that Appendix HYD and the NHPH Draft EIR consider that

because this is only a small increase, they aren't significant, but do not provide the rationale for this determination, even though the significance criteria is exceeded.

First, as discussed in the NHPH Draft EIR Section 4.9, *Hydrology and Water Quality*, and Appendix HYD, the results of the modeling of 5-year storm were used to evaluate impacts on the City's CSS pipes, pursuant to the first performance standard in the EIR. Based on the results in Appendix HYD, the NHPH Draft EIR, page 4.9-18 reports that there would not be a measurable increase in peak flows and there would only be a slight increase in total flows (3,000 gallons) immediately downstream of the NHPH project; but also, that there would not be a measurable increase in peak or total flows further downstream (i.e., downstream of the North Shore and Channel Basins). Given these results, the NHPH Draft EIR concluded that the NHPH project would not increase the likelihood of surcharges by exceeding the capacity of the pipes in the City's CSS, and accordingly, water quality effects related to overflows would be less than significant.

Secondly, however, the modeling results referenced by the commenter are those flows from the NHPH study area to the City's CSS, they are not the flows to the receiving waters. Rather, it is the analysis in the Draft EIR pursuant to the third performance standard that models the combined flows resulting from the typical year storm to estimate the increases in the frequency of combined sewer discharges (CSDs) to receiving waters. Based on the results in Appendix HYD (page 7), the NHPH Draft EIR, page 4.9-19 reports that the NHPH would not result in a measurable increase in the frequency of CSD events or CSD volumes at the study CSD outfall locations within the Channel and North Shore basins. The NHPH Draft EIR concluded that because stormwater and wastewater discharges from the NHPH would not affect the frequency or cause an increase in the volumes of CSDs, the impact of the NHPH related to changes in CSDs would be less than significant.

O-TL1-33 The commenter states that modeling summarized in Appendix HYD indicate that there is no increase in flood volume from the NHPH during the 100-year storm model simulation. The commenter then asserts that this result is counterintuitive given the increase in flood volume under the 5-year storm simulation. The commenter expects an increase in discharge volumes during a 100-year storm given the 5-year storm simulation results.

The results of the modeling of the 5-year storm to evaluate impacts on the City's CSS pipes are summarized in response to Comment O-TL1-32, above, and determined to be less than significant. That is, it would not result in manhole surcharges due to inadequate pipeline capacity.

The results of the modeling of 100-year storm were used to evaluate impacts related to flooding or ponding, pursuant to the second performance standard in the EIR. The modeling results presented in Appendix HYD show that due to the on-campus storm water storage included in the project, the NHPH would not measurably increase peak flows or total flows either immediately downstream of the NHPH project or downstream of the North Shore and Channel basins. Accordingly, the NHPH Draft EIR concluded that the NHPH project would not increase the extent or duration of downstream ponding or overland flows, and consequently, water quality effect related to downstream flooding or ponding would be less than significant.

In summary, the modeling results conducted in Appendix HYD and presented in the NHPH Draft EIR show no increase in flooding for either the 5 or 100-year simulations. In any case, flood volume refers to overflows from the CSS, not discharges to the receiving water. As discussed in response to Comment O-TL1-32, above, the appropriate modeling scenario to evaluate impacts related to increases in the frequency of CSDs to receiving waters is the typical year analysis, and that modeling demonstrated that because the combined stormwater and wastewater discharges from the NHPH would not increase the frequency or cause an increase in the volumes of CSDs, the impact of the NHPH related to changes in CSDs would be less than significant.

The commenter inquires about the availability of the Arup reports. As indicated in response to Comment O-TL1-31, above, Arup's December 2021 and November 2021 reports are included as appendices in this Final EIR, as Appendix HYD-A and Appendix HYD-B, respectively.

O-TL1-34 The commenter indicates that the model analysis used a typical year precipitation to calculate changes in the predicted frequency and volume of CSDs to receiving waters. The commenter inquires about the rationale for choosing a year of average annual frequency and volume of CSDs to evaluate impacts on receiving waters. The commenter opines that water quality exceedances to receiving waters occurs more frequently during wet years when there are higher rates and volumes of CSD, and modeling using typical year hydrology masks the adverse findings that would occur during a wet year. On this basis, the commenter asserts the NHPH Draft EIR should be considered incomplete until it evaluates impacts on receiving waters during above average wet water years.

Combined sewer systems transport both rainfall runoff and sanitary sewage. Wetter years which produce more rainfall runoff might produce more discharge, but not necessarily as there is storage, pumping, and treatment available (as described in the Environmental Setting in the NHPH Draft EIR *Hydrology and Water Quality* section. So a wetter than average year that includes longer, less intense storms may produce less discharge than a year with less total annual rainfall but more intense storms that the storage, pumping and treatment cannot

keep up with. Thus, the approach for considering all multiple scenarios is to analyze a long-term annual average that includes storms of various sizes. The "typical year" is a computation tool used to simulate a long-term annual average in a shorter period of model run time. It is not an actual year; it is synthesized to reflect long-term rainfall trends by combining storms of various sizes from the actual rainfall record. The results of the typical year runs are expected to be the same as running 30 years of actual rainfall.

Re: New Hospital at Parnassus Heights Draft Environmental Impact Report: Comments on Water Quality, Population and Housing, Historic Resources, and Air Quality.

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents.

I am submitting today, under separate cover, a comment letter on behalf of San Franciscans regarding the Draft Environmental Impact Report (DEIR) for the New Hospital at Parnassus Heights (NHPH) with respect to its analysis of project impacts on population and housing; water quality; historic resources; and air quality. 1

In connection with that letter, I attach hereto the following letters that San Franciscans previously submitted to UCSF regarding the Comprehensive Parnassus Heights Plan Environmental Impact Report ("CPHP EIR"): 2

- September 11, 2020, letter from Thomas Lippe to UCSF regarding the CPHP Draft EIR's analysis of impacts on beach water quality.
- September 11, 2020, letter from Thomas Lippe to UCSF regarding the CPHP Draft EIR's analysis of impacts on air quality.
- January 18, 2021, letter from Thomas Lippe to the Regents regarding the CPHP Draft CPHP Final EIR's analysis of impacts on air quality.

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

Responses to Comments from Law Offices of Thomas N. Lippe, APC

Please note that Comment Letter O-TL2 contained several exhibits. Exhibits 1 through 3 (including their sub-exhibits) in Comment Letter O-TL2 did not comment directly on the NHPH Draft EIR and no responses are required. These exhibits are included in Appendix O-TL2 in this Final EIR.

O-TL2-1 The commenter references a comment letter submitted under separate cover with respect to analysis of project impacts on population and housing, water quality, historic resources, and air quality.

The commenter is referencing Comment Letter O-TL1 which is included and responded to in this Comments and Responses document.

O-TL2-2 The commenter includes three letters that were previously submitted to UCSF, consisting of a September 11, 2020 comment letter on the CPHP Draft EIR's analysis of impacts of beach water quality; a September 11, 2020 comment letter on the CPHP Draft EIR's analysis of impacts on air quality; and a January 28, 2021 letter on the CPHP Final EIR's analysis of impacts on air quality.

The comment letters included by the commenter pertain specifically to the CPHP and the CPHP Draft and Final EIRs, and do not represent formal comments on the content and adequacy of, the NHPH Draft EIR. Nevertheless, please also see responses to Comments O-TL1-4 to O-TL1-9 as it relates to comments on beach water quality impact analysis in the NHPH Draft EIR; and responses to comments O-TL1-19 to O-TL1-22 as it relates to comments on the air quality impact analysis in the NHPH Draft EIR.

RE: Comments on the Draft Environmental Impact Report for the UCSF New Hospital at Parnassus Heights Project (State Clearinghouse No. 2021070547)

Dear Ms. Wong:

This letter, submitted on behalf of the Parnassus Neighborhood Coalition ("PNC"), provides comments on the Draft Environmental Impact Report ("DEIR") for the proposed UCSF New Hospital at Parnassus Heights ("NHPH").[1] The NHPH is identified as a major component, and certainly most environmentally impactful component, of the Comprehensive Parnassus Heights Plan ("CPHP") that was recently approved by the UC Regents ("UC") in January 2021. UC's release of a purportedly "stand-alone" EIR for the NHPH less than one year after UC's certification of the Comprehensive Parnassus Heights Plan EIR ("CPHP EIR") raises serious questions about UC's environmental review strategy. Our review of the DEIR suggests that its purpose is not to facilitate public disclosure of the CPHP's impacts, but rather to justify piecemealed review of the broader CPHP, which thwarts public disclosure of the CPHP's environmental impacts. 1

1. The DEIR Is Not a stand-alone EIR

The DEIR asserts: 2

> The NHPH EIR is ***a stand-alone project EIR, and does not "tier"*** from the CPHP Final EIR under the tiering provisions of CEQA (CEQA Guidelines Section 15152). As such, while the NHPH EIR draws from CPHP Final

[1] This letter also transmits expert comments by SWAPE (Exhibit 1), Shawn Smallwood, PhD (Exhibit 2), and Andrew Coleman, PhD (Exhibit 3), which are incorporated by reference.

> EIR for relevant background information and information about future development on the Parnassus Heights campus site under the CPHP where appropriate, it assesses all environmental topics required under CEQA ***without focusing out any issues or incorporating analyses in the CPHP by reference***, discloses all project and cumulative impacts, and identifies project-specific mitigation measures to reduce or avoid significant impacts.

(DEIR, p. 1-4, emphasis added.)

It is understandable that UC would prefer to limit the impact of legal infirmities in the CPHP EIR, which is riddled with fatal flaws and presently subject to judicial review, because a second-tier EIR must be set aside if a court vacates a first-tier EIR. (See *Friends of the Santa Clara River v. Castaic Lake Water Agency* (2002) 95 Cal.App.4th 1373.) UC cannot avoid this result, however, because the CPHP and NHPH are inextricably intertwined as a matter of fact, logic and law.

The DEIR's claim that it provides "stand alone" comprehensive analysis of the NHPH is demonstrably false. CEQA Guidelines section 15378, subdivision (a) clarifies, "'Project' means the whole of an action," and subdivision (c) further clarifies, "The term 'project' refers to the activity which is being approved and which may be subject to several discretionary approvals by government agencies. The term 'project' does not mean each separate approval." 2 cont.

The CPHP EIR's project description plainly stated, "The Plan includes an 'Initial Phase' that comprises: 1) Irving Street Arrival improvements, 2) Research and Academic Building (RAB), 3) New Hospital, and 4) initial Aldea Housing Densification, and as well as other Initial Phase improvements." (CPHP DEIR, p. 3-16.) What is more, the CPHP EIR explains that the NHPH requires the CPHP for its validity because the NHPH is inconsistent with the smaller hospital already approved by the UC as part of the 2014 LRDP. (CPHP DEIR, App. SNA, p. 2 ["UCSF will seek an amendment to the 2014 LRDP because implementation of the CPHP recommendations would require modification of the 2014 LRDP's Parnassus Heights development plan"]; see also CPHP DEIR, p. 1-7 ["UCSF has begun to plan the New Hospital at Parnassus Heights (NHPH or New Hospital) and is projecting the need for a larger hospital than was planned in the 2014 LRDP"].) There is no question that the NHPH relies on the validity of the CPHP. If the CPHP is set aside then the NHPH cannot move forward.

The inextricable relationship between the CPHP and NHPH is further demonstrated by declarations submitted by UC employees in connection with the pending litigation challenging the CPHP and its EIR. As just one example, Senior Associate Vice Chancellor Brian Newman declared under penalty of perjury:

> 10. The New Hospital, which was analyzed at a program-level in the CPHP EIR and which will be the subject of a project-specific EIR anticipated to be certified by the Regents in 2022, will be built on the site of the existing Langley Porter Psychiatric Institute ("LPPI"). Abatement of hazardous building materials and demolition of the interior of LPPI is scheduled to begin in the first quarter of 2022 and be completed in the summer of 2023. Exterior demolition of LPPI will be completed in the first three quarters of 2023. Early site work and OSHPD review of the New Hospital will commence in September 2023 and be completed in the summer of 2024. Construction of the New Hospital is scheduled to commence in summer of 2024 and be completed in 2029.
>
> 11. While abatement and demolition activities are conducted on UC Hall and LPPI, work will also be commencing on the Irving Street Arrival project and some of the Initial Phase Improvements.
>
> 12. If any of the actions implementing the CPHP Initial Phase projects described above is delayed, it will cause a chain reaction that leads to delays in other projects, and ultimately threaten UCSF's ability to comply with SB 1953 by 2030 and meet the currently unmet demand for patient beds as Parnassus Heights.

3

(Exhibit 4, p. 5.)

Similarly, Kevin Beauchamp, Executive Director of UCSF Physical Planning, declared under penalty of perjury:

> 15. The two major nonresidential projects implementing the CPHP are the 870,000 gsf New Hospital and the 271,000 gsf RAB. Both are proposed to be developed on sites with extant buildings, UC Hall for the RAB and LPPI for the New Hospital. As the buildings to be demolished for these CPHP projects are very old, 1917 for UC Hall and 1941 for LPPI, actual hard demolition of these structures must be preceded by extensive abatement of hazardous materials and soft demolition, which is scheduled to take approximately 12 to 16 months. . . . Due to the dense development

4

> pattern on the 46-acre portion of the Parnassus Heights campus site that is not dedicated to the Mount Sutro Reserve and to Parnassus Heights' location surrounded by residential development, it is essential that demolition and construction projects at Parnassus Heights are coordinated and synchronized to ensure that they can be completed on schedule and on budget. This is particularly so with the unmet need for state of the art research space at Parnassus Heights to support the clinical activities and with the need to complete and open the New Hospital by 2030 because of SB 1953.

4 cont.

(Exhibit 5, p. 7.)

These declarations establish unequivocally that the NHPH's "whole of the action" includes demolition of the LPPI. Despite this, the DEIR states, "[D]emolition and removal of these buildings are not included in the NHPH project and will be completed separately from the NHPH project." (DEIR, p. 3-4.) This is piecemealed CEQA review by entitlement, which is disallowed. (CEQA Guidelines, § 15378, subd. (c) ["The term 'project' refers to the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term 'project' does not mean each separate governmental approval"].) That the CPHP EIR purports to analyze the impact of demolition of LPPI on historic resources does not mean that demolition of the LPPI is now somehow a separate CEQA project from development of the NHPH. The same is true regarding other environmental resource impacts.

5

To avoid duplicating analysis, CEQA encourages agencies to use "tiering." "'Tiering' refers to using the analysis of general matters contained in a broader EIR (such as one prepared for a general plan or policy statement) with later EIRs and negative declaration on narrower projects; incorporating by reference the general discussions from the broader EIR; and concentrating the later EIR or negative declaration solely on the issues specific to the later project." (CEQA Guidelines, § 15152.) In an apparent attempt to insulate any flaws in the CPHP EIR, however, UC expressly disavows any tiering from the CPHP EIR. Notwithstanding this claim, the DEIR's discussion of water quality impacts reveals tiering from the CPHP EIR:

6

> This section assesses the potential for construction and operation of the New Hospital at Parnassus Heights (NHPH), including the related improvements, to result in significant impacts related to hydrology and water quality. In contrast to the program-level hydrology and water quality impact analysis previously conducted for the CPHP Final EIR, this section

> provides a project-level impact analysis of the proposed NHPH on those resources.

6 cont.

(DEIR, p. 4.9-1.)

Setting aside this inconsistency, there is no dispute that UC's claim to not rely on tiering necessarily means that the four corners of the DEIR must contain comprehensive analysis of the "whole of the action." The DEIR fails to comply with this requirement through its impermissibly truncated view of the scope of the NHPH as a CEQA project. As such, UC's attempt to have it both ways results in a fundamentally flawed EIR.

7

2. Review Is Impermissibly Piecemealed

a. The DEIR's Mischaracterization of the CPHP Development Program as a Cumulative Project Results in Piecemealed Review

The EIR has engaged in piecemealed CEQA review by mischaracterizing the CPHP development program, which includes the NHPH, as independent cumulative projects from the NHPH. This deprives the public of necessary project-level analysis.

The DEIR identifies cumulative projects as including "Implementation of the development program planned in the CPHP, including Initial Phase projects anticipated by Year 2030 [Irving Street Arrival, Research and Academic Building (RAB), initial phase of Aldea Housing densification, and Initial Phase Improvements]." (DEIR, p. 4.0-8.) The CPHP's planned development program, however, does not have independent utility from the NHPA. (*Del Mar Terrace Conservancy*, *Inc. v. City Council* (1992) 10 Cal.App.4th 712, 736.) The absence of independent utility is demonstrated with clarity in Mr. Newman's declaration, which explains:

> If any of the actions implementing the CPHP Initial Phase projects described above is delayed, it will cause a chain reaction that leads to delays in other projects, and ultimately threaten UCSF's ability to comply with SB 1953 by 2030 and meet the currently unmet demand for patient beds as Parnassus Heights.

8

(Exhibit 4, ¶ 12.)

This flawed strategy of segregating the CPHP from the balance of the CPHP's development program has the effect of minimizing project-level impacts. A few examples are provided below.

9

The CPHP EIR failed to quantify the NHPH's operational cancer risk to neighbors because UC claimed that inadequate project-level information was unavailable at that time. (CPHP DEIR, p. 4.2-23.) That project-level cancer-risk information is now available, yet the DEIR minimizes that risk by applying a cumulative threshold of 100 increased cancer risks rather than the project-level threshold of 10 increased cancers. (DEIR, pp. 4.2-42 – 43.) The DEIR concludes that the resulting cancer risk to neighbors would be less than significant even though the resulting cancer risk is well above BAAQMD's project-level significance standard of 10 increased cancer risks. 9 cont.

The DEIR engages in a similar sleight of hand regarding wind impacts. The CPHP EIR failed to include a project-level wind tunnel analysis for the CPHP development program — including the NHPH — because final building design was purported not complete. (CPHP FEIR, pp. 4.1-47, 4.1-49.) Although this design-level information is now available, the DEIR's project-level wind analysis is limited to the NHPH. (DEIR, pp. 4.1-46 – 50.) Analysis of the CPHP development program is relegated to a cumulative impact analysis. (DEIR, pp. 4.1-86 – 91.) Since it is well settled that a cumulative impact analysis may be less detailed than a project-level analysis, the DEIR's mischaracterization of the CPHP development program as a cumulative project deprives the public of a project-level wind tunnel analysis. (CEQA Guidelines, § 15130, subd. (b).) 10

The same flaw exists regarding the DEIR's analysis of hazardous materials. The declaration of Kevin Beauchamp explains that construction of the NHPH requires demolition of the LPPI, which involves "extensive abatement of hazardous materials and soft demolition" occurring over "12 to 16 months." (Exhibit 5, ¶ 15.) The EIR's discussion of whether this abatement work would "create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials" dismisses the impact altogether as having "no impact" because such demolition is a "separate planned project." (DEIR, p. 4.8-19.) While this "extensive abatement of hazardous materials" is admittedly necessary to demolish the LPPI in order to make way for the NHPH, and thus unquestionably within the "whole of the action," the DEIR makes no attempt to tier from the CPHP's analysis of this issue. (*Ibid*.) Instead, the DEIR relegates this activity to a cumulative project, and then dismisses the cumulative impact based on conclusory assumption that "any existing hazardous materials associated with those facilities and soils would be removed pursuant to applicable federal, State and local regulations." (DEIR, p. 4.8-30.) 11

In summary, the UC's flawed legal posture of characterizing the CPHP's development program as a separate cumulative project means that project-level impacts have not been adequately analyzed and disclosed. The DEIR fails to provide the 12

promised "stand-alone" project-level analysis of all aspect of the NHPH "whole of the action." 12 cont.

b. The DEIR's Truncated Project Description Thwarts Adequate Analysis of Impacts Related to the Ammonia House

The DEIR relies on its truncated scope of the NHPH to avoid necessary analysis of activities related to stormwater retention/detention. The DEIR provides:

> To avoid increases in peak CSS flows and volume that would occur with the NHPH (including the increased wastewater flows), the analysis in the storm drainage design report determined that approximately 150,000 gallons of on-campus stormwater storage capacity would be needed. The preferred proposal is to re-purpose the existing underground diesel fuel tanks in Medical Center Way to provide approximately 120,000 gallons of stormwater storage, and **install a new underground tank at the Ammonia House site to store an additional 30,000 gallons of stormwater**.

(DEIR, 4.9-18, bold added.) Additionally, the DEIR states:

> As discussed above, certain supporting utility improvements, including proposed electrical switchgear equipment and an underground stormwater storage tank, would be installed across Medical Center Way from the New Hospital **on the site of the former Ammonia House.**

13

(DEIR, p. 4.1-40, bold added.) Finally, the DEIR suggest that the site would also be a new electrical service entrance point, with metering and distribution switchgear. (DEIR, p. 3-29.)

Setting aside the DEIR's use of an inconsistent baseline (i.e. assuming removal of the Ammonia House tank), these discussions also simply assume without analysis that the current use of the Ammonia House would no longer be used for storage of ammonia. However, the DEIR fails to provide any discussion regarding the removal of the current ammonia tank. One must turn to the CPHP FEIR to understand the UC's plan regarding the ammonia tank. The CPHP FEIR states:

> UCSF currently maintains an 8,000-gallon ammonia tank in a small building located near the intersection of Parnassus Avenue and Medical Center Way. Under the CPHP, UCSF would remove and replace this tank

with an 10,000-gallon aqueous urea tank, to be located just south of the CUP.

(CPHP FEIR, p. 3-31.)

This cursory discussion lacks any analysis of potential impacts, which would perhaps be appropriate for a programmatic analysis that assumes a subsequent project-level review. However, the DEIR does not provide that programmatic review. The DEIR simply assumes the tank has been removed, but fails to provide additional discussion or analysis regarding its removal. For instance, the current tank is only 8,000-gallons. Is the site large enough to house a 30,000-gallon tank? Does the site contain contaminants that need to be remediated before a new tank is installed? The DEIR also fails to provide any information regarding aesthetics, lighting or glare. Instead, the DEIR makes conclusory statements that these impacts would be less than significant. (DEIR, p. 4.1-40 [NHPH would be consistent with 2014 LRDP scenic quality objectives]; DEIR, p. 4.1-44 [any new lighting at the Ammonia House are not anticipated to result in substantial light or glare impacts].) Last, the NHPH does not provide any information regarding the future storage of ammonia. The DEIR is simply not disclosing, much less analyzing, a significant component of the NHPH. These issues will need to be addressed in the Revised DEIR. 13 cont.

3. The DEIR's Analysis of Project Alternatives Is Arbitrary and Fails to Comply with CEQA

An EIR must describe a range of reasonable alternatives to the Project, or to the location of the Project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. "An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision making." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 404 (*Laurel Heights I*.) An EIR must also include "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (*Id*. at 405.) 14

CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring "environmentally superior" alternatives and all feasible mitigation measures. (CEQA Guidelines, § 15002, subd. (a)(2) and (3); *see also*, *Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners* (2001) 91 Cal.App.4th 1344, 1354 (*Berkeley Jets*); *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564.) The EIR serves to provide agencies and the public with information about the

environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced." (CEQA Guidelines, § 15002, subd. (a)(2).) If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns." (Pub. Resources Code, § 21081; CEQA Guidelines, § 15092, subd. (b)(2)(A) & (B).) A "feasible" alternative is one that is capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors. (Pub. Resources Code, § 21061.1; CEQA Guidelines, § 15364.)

14 cont.

Here, the DEIR: (i) fails to acknowledge Alternative 1B as the environmentally superior alternative; (ii) fails to approve the environmentally superior Alternative 1B; and (iii) fails to describe a reasonable range of alternatives including offsite alternatives.

a. Alternative 1B Is the Environmentally Superior Alternative

CEQA requires that lead agencies consider alternatives at two stages in the EIR process. First, a draft EIR must analyze a range of reasonable alternatives to the project. (CEQA Guidelines, § 15126.6.) Later, when the agency considers whether to approve or carry out the project as proposed, it cannot do so if a feasible alternative would substantially reduce significant effects. (CEQA Guidelines, § 15092, subd. (b)(2)(A).) To explore ways for a project to meet as many goals as possible while protecting the environment, EIRs thus must evaluate alternatives that accomplish "most" basic objectives. (CEQA Guidelines, § 15126.6, subd. (a); *Preservation Action Counsel v. San Jose* (2006) 141 Cal.App.4th 1336, 1353 (*Preservation Action*).) Alternatives warrant study in the EIR process if they can reduce or avoid impacts and are "potentially feasible." (CEQA Guidelines, § 15126.6, subds. (a), (c), (f); *Watsonville Pilots Assn. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1087 (*Watsonville Pilots*).) As with the CPHP EIR[2], Alternative 1B was analyzed along with other project alternatives to identify the most environmentally superior alternative. (DEIR, Ch. 6.) The DEIR

15

[2] The DEIR and CPHP EIR both include as Alternative 1B the new hospital consistent with the 2014 LRDP. The CPHP EIR states that Alternative 1B would provide a total of 439 inpatient beds. (CPHP DEIR, p. 6-14.) The DEIR states that Alternative 1B would provide only 431 beds. If the CPHP EIR's number is correct, then Alternative 1B would reduce hospital beds only by 36, not 44 as reported in the DEIR. The DEIR fails to explain this discrepancy regarding hospital plans that were approved back in 2014.

identified the no project alternative as the environmentally superior alternative and so, as required by CEQA, the DEIR purported to identify the next environmentally superior alternative that was not the no-project alternative.

Incredibly, however, the DEIR identified Alternative 2 as the environmentally superior alternative even though Alternative 1B clearly resulted in lesser environmental impacts. (DEIR, table 6-3.) Alternative 1B is predicted to have lesser impacts than Alternative 2 for 16 different identified impacts. (*Ibid*.) There is not a single impact where Alternative 2 is predicted to have a lesser impact than Alternative 1B.

Despite the DEIR's own analysis showing that Alternative 1B is predicted to have lesser impacts than Alternative 2, the DEIR asserts that Alternative 2 is the environmentally superior alternative. (DEIR, p. 6-48 – 49.) The DEIR bases this conclusion *not* on the comparative severity of environmental impact but rather on the DEIR's claim that Alternative 1B would not achieve all of the Project objectives. (*Ibid*.) As explained above, however, consideration of feasibility vis-à-vis project objectives is not relevant to selection of the environmental superior alternative. This point is demonstrated with clarity in the DEIR's selection of the no project alternative as the environmentally superior alternative. (DEIR, p. 6-39 ["From the alternatives evaluated in this EIR, the environmentally superior alternative would be the No Project – No Development Alternative"].) If consideration of project objectives were relevant in determining the environmentally superior alternative then the no project alternative – consisting of no hospital at all – could not possibly be the environmentally superior alternative over all other alternatives that include some variation of a new hospital. The DEIR *did not consider* project objectives in identifying the no project alternative as the environmentally superior alternative. Alternative 1B is clearly the next environmentally superior alternative to the no project alternative. The DEIR's internally inconsistent, and frankly absurd, reliance on project objectives to identify the *environmentally superior* alternative suggests that UC's true concern is to avoid the limited discretion associated with that designation.

15 cont.

b. Alternative 1B Is Feasible

Since Alternative 1B is the environmentally superior alternative, UC's discretion to reject it is significantly constrained. The lead agency is required to select the environmentally preferable alternative unless it is infeasible. As explained by our Supreme Court, an environmentally superior alternative may not be rejected simply because it is more expensive or less profitable:

16

> The fact that an alternative may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible. What is required is evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.

(*Citizens of Goleta Valley v. Bd. of Supervisors* (1988) 197 Cal.App.3d 1167, 1180-81 (*Goleta I*); *see also*, *Burger v. County of Mendocino* (1975) 45 Cal.App.3d 322; *County of El Dorado v. Dept. of Transportation* (2005) 133 Cal.App.4th1376 (agency must consider small alternative to casino project); *Preservation Action*, *supra*, 141 Cal.App.4th at 1336.)

Further, an environmentally superior alternative may not be rejected because it does not meet all of the Project's objectives. Inconsistency with only some of the Project objectives is not necessarily an appropriate basis to eliminate impact-reducing project alternatives from analysis in an EIR. (CEQA Guidelines, § 15126.6, subds. (c), (f); *see also Watsonville Pilot*, *supra*, 183 Cal.App.4th at 1089.) 16 cont.

While the DEIR does not directly assert that Alternative 1B is infeasible (it would be improper to do so at this stage), the DEIR asserts that it would "not fully meet the key objectives for the NHPH." But as explained above, the standard for feasibility is not "fully" meeting project objectives. (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1089 ["the purpose of an alternatives analysis is to allow the decisionmaker to determine whether there is an environmentally superior alternative that will meet most of the project's objectives"].)

Since the DEIR analysis is premised on the incorrect legal standard of "fully meeting" project objectives, the DEIR never actually determines whether Alternative 1B would meet "most" of the Project's objectives. It does. In fact, only two project objectives, both of which expressly require an "increase inpatient beds at Parnassus Heights," are not met by Alternative 1B.[3] (DEIR, p. 3-10.) Most legitimate objectives would be achieved. (*North Coast Rivers Alliance v. Kawamura* (2015) 243 Cal.App.4th 647, 669 [agencies may not manipulate project objectives in order to exclude otherwise feasible alternatives].)

---

[3] Even these two objectives would be achieved by a slight modification to Alternative 1B. The DEIR states that an additional 49 inpatient beds would be provided as a result of renovations to Moffitt Hospital. (DEIR, p. 3-34.) The DEIR fails to explain why this renovation could not occur along with Alternative 1B. This is a reasonable partial alternative that would result in the same or more inpatient beds, and will need to be considered in the Revised DEIR.

The DEIR conclusively asserts, "The New Hospital proposed under this alternative would also not have sufficient space to meet modern regulatory requirements and industry standards of contemporary hospitals, such as construction codes, sized of operating rooms, ratio of operating rooms to pre- and post-recovery issues, and space for privacy and infection control issues." (DEIR, p. 6-18.) While the new hospital pursuant to Alternative 1B would admittedly provide fewer beds, the DEIR provides no support for these other specific claims. These unsubstantiated claims are particularly troublesome given UC seemingly found these standards satisfied just seven years earlier when it approved the 2014 LRDP. The DEIR fails to substantiate how these standards are so dramatically different from 2014.

16 cont.

The DEIR goes to great lengths to describe UCSF Health's predictions for increased demand for clinical services. (DEIR, p. 3-9.)[4] This discussion may help explain why UCSF Health desires additional physical space as a market participant in order to capture demand in competition with other providers of healthcare, but does not explain why USCF must capture *all* predicted demand for clinical service in order to remain a leading health science institution. Finally, the DEIR's discussion completely fails to explain why this additional space must be located at Parnassus Heights as opposed to the other medical center locations such as Mission Bay and Mount Zion.

At bottom, the DEIR's implied infeasibility argument is that changes in technology demand additional physical space — and that additional space can only be satisfied at the Parnassus campus. (DEIR, 6-18.) This is precisely where the DEIR's analysis breaks down when viewed in context. A similar argument for new space driven by changes in technology and applicable standards was previously raised by the UC in the context of its need to expand to Laurel Heights. In 1988, the Laurel Heights DEIR explained:

17

> [C]hanges in research methods in the biomedical sciences have escalated the space needs of faculty members. For example, space intensive computerized equipment is now frequently used for examining molecular structures in order to design potential new drugs.

[4] DEIR obliquely refers to "observed shortages in the availability of beds, especially intensive care unit (ICU) and acute care beds." (DEIR, p. 3-9.) To the extent this is intended to suggest that San Francisco or the broader Bay Area are suffering from a shortage of ICU or acute care beds into the foreseeable future, the DEIR has failed to support this provocative claim.

> Additional space is essential both to recruit new faculty who are pioneering new techniques and to retain faculty who have created research programs that now need room for reasonable growth. Further, to capitalize on the new understandings and possibilities created by current research, additional faculty must be recruited in fields that have not previously existed. In 1980, for example, no one could have foreseen the explosion in both research and patient care in response to the AIDS epidemic.
>
> Adequate space must be developed to support academic programs and related faculty recruitments that cannot be predicted today, but are likely to flow from rapid advancesin molecular biology, genetics, and immunology. UCSF's leadership role in the biochemical sciences gives UCSF both the opportunity and the obligation to apply its expertise to advances in research and to the education of graduate students in the health science fields. With that obligation goes the need to marshal the necessary physical facilities to support those teaching and research activities.

17 cont.

(Exhibit 6, p. 20.)

UC's prior EIR for the Laurel Heights expansion asserted, as now, that UC required additional physical space in order to perform critical functions. Unlike now, however, UC argued that this need for additional space had to be satisfied *outside of the Parnassus campus*. (See Exhibit 6.) Indeed, UC vigorously argued that any expansion at Parnassus Heights was both infeasible and would result in significantly greater environmental impacts than expansion at an off-site location, stating in relevant part:

> The Parnassus alternative was discussed in the Draft EIR. See Regents' Op. Br. at 30. It was also discussed in greater detail in the Final EIR. *Id*. Both documents found, as did the Regents, that the Parnassus alternative would be infeasible. DEIR. 19-23, 67-70; FEIR. 735; Findings, A.15 at 491. If that were not enough, the Final EIR also found that the Parnassus alternative would result in greater adverse environmental impacts than the proposed project. FEIR 728-35 (greater adverse impacts relating to University plans and policies, land use and planning, parking, air quality, construction noise); in no respect was the Parnassus alternative superior to the proposed project.

(Exhibit 7, p. 18.)

In 2014, or 25 years later, UC reaffirmed the position, as memorialized in its approval of the 2014 LRDP, that UCSF could continue to meet its space needs through a combination of facilities at Parnassus Heights within the 3.55 million gsf development limitation — including a new Hospital — together with facilities located at its other campuses.[5] To be clear, UC's prior position was that any expansion at Parnassus was both infeasible and result in significantly greater environmental impacts than development at another campus. UC is now wholly reversing itself by claiming that any alternative other than significant expansion at Parnassus is infeasible. This complete reversal is not adequately explained on this record. The DEIR fails to describe the changes in healthcare technologies or standards have occurred so much more rapidly in the years following 2014 than over the 40 years prior. The only documented significant change in circumstances justifying UC's dramatic reversal is the unprecedented $500 million donation to UCSF.[6]

17 cont.

c. The DEIR Impermissibly Rejected Analysis of Any Off-Site Alternative

18

As with the CPHP EIR, the DEIR formulates but dismisses from analysis the off-site alternatives of building the new hospital at UCSF's Mission Bay or Mount Zion properties and completely ignores UC's property at Hunters Point. (DEIR, pp. 6-34 –

---

[5] "The 2014 LRDP also is driven by the pursuit of compliance with the requirements of California's Alfred E. Alquist Hospital Facilities Seismic Safety Act of 1983 (Alquist Seismic Safety Act) and subsequent amendments, 12 the UC Seismic Safety Policy,13 the UC Sustainable Practices Policy,14 and the 1976 Regents' Resolution regarding the Parnassus Heights space ceiling, as well as numerous other state and local policies, codes, and plans. Also, with increased constraints on operating budgets, this LRDP strives to address UCSF's goal to improve operational efficiency through better utilization and consolidation of, and investment in, existing facilities. Further development at the Mission Bay campus site is secondary to these objectives, but serves as a mechanism to accomplish these goals while also providing opportunity for growth." (2014 LRDP, p. 17.)

[6] The DEIR is conspicuously silent as to the role played by the $500 million donation or resulting involvement in hospital planning by the Helen Diller Foundation. Documents that were improperly withheld by UC, and only recently produced by order of the Court, reveal that representatives of the Helen Diller Foundation were actively engaged by UCSF on such issues as whether to mitigate GHG emissions through project design features or carbon offsets (Exhibit 8), and even hospital design. (Exhibit 9.) (Pub. Resources Code, § 21082.1; CEQA Guidelines, § 15084, subd. (e); *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 194.)

37.) UC fails to comply with CEQA by refusing to analyze these off-site alternatives within the DEIR.

Since the DEIR's analysis of these alternative locations is the same as set forth in the CPHP EIR, the following comments on the CPHP EIR are incorporated by reference:

- Exhibit 10, letter dated September 11, 2020, from Lozeau Drury, pages 15 – 17.
- Exhibit 11, letter dated September 9, 2020, from Terrell Watt Planning Consultants, pages 21 – 24.
- Exhibit 12, letter dated January 18, 2021, from Lozeau Drury, pages 15 – 17.
- Exhibit 13, letter dated January 19, 2021, from Terrell Watt Planning Consultants, pages 5 – 6.
- Exhibit 14, Petitioners' Revised Opening Brief on the Merits, pages 66 – 72.
- Exhibit 15, Petitioners' Reply Brief on the Merits, pages 9 – 12.

18 cont.

i. *The Mission Bay Location*

The DEIR admits that the Mission Bay alternative would reduce the CPHP's significant wind impact in the vicinity of the new hospital, and also avoid a number of construction and operational impacts associated with the new hospital. (DEIR, p. 6-35.) The DEIR also finds that the Mission Bay alternative would result in "an estimated 291 fewer overall beds at Parnassus Heights campus site, and hence at UCSF campus-wide." (*Ibid*.) However, increasing beds "at Parnassus Heights" is an unduly and self-servingly narrow EIR objective, precluding adequate analysis of any off-site alternative. The DEIR fails to explain why the Mission Bay alternative could not be configured to increase available beds.

19

The DEIR also finds, without support or reasonable analysis, that the Mission Bay alternative would "conflict with several 2014 LRDP objectives for the Parnassus Heights campus site." (DEIR, p. 6-35.) The purported conflicts are unsupported to the point of absurdity, rendering the DEIR's analysis inadequate. The EIR fails to explain that the 2014 LRDP contemplated meeting the same objectives without the vast expansion proposed in the CPHP. Moving some new facilities to Mission Bay would not conflict with either the LRDP's objectives or fundamental EIR objectives for the NHPH. (DEIR, p. 3-10-11.)

The DEIR pronounces that "by not developing a New Hospital at the Parnassus Heights campus site, and focusing future new clinical uses at the Mission Bay campus site, this potential alternative would also result in decreased efficiency for UCSF staff and students." (DEIR, p. 6-35.) "Decreased efficiency" is subjective, is not a fundamental

objective á la *In re Bay-Delta* (2008) 43 Cal.4th 1143, and is a trumped-up reason not to analyze this alternative. Meeting all conceived objectives is not the standard at the EIR stage for an alternative that can reduce significant impacts. (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1087.)

Citizens of Goleta Valley v. Board of Supervisors (1988) 197 Cal.App.3d 1167, 1179–80 (*Goleta I*) held that an EIR for a resort hotel should have considered an alternate site: "Reason requires that the agency charged with the duty to protect the environment compare impacts at feasible alternative locations." Off-site alternatives cannot be rejected for analysis because a project proponent does not want an off-site project, any more than a reduced-size project can be rejected for that reason. (*Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 602; *Preservation Action, supra*, 141 Cal.App.4th at 1355-56.) Otherwise, CEQA's requirement for consideration and analysis of off-site alternatives is meaningless.

19 cont.

The Yerba Buena Neighborhood Consortium submitted comments to the CPHP EIR explaining that Mission Bay could

> . . . fully accommodate expanded UCSF development of this scale and meet fundamental project objectives (*In re Bay-Delta* (2008) 43 Cal.4th 1143.) That of course is exactly what happened once before in 1996 with the decision to locate a new UCSF research campus in the already-approved Mission Bay Redevelopment Project.

(CPHP FEIR, p. 8.4.2.2-342.)

Mission Bay is a logical, beneficial site at which to achieve project benefits without significant impacts. "In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus." (CPHP FEIR, p. 8.4.2.2-19.) The claim of increased crosstown traffic is not supported by evidence or analysis. As further pointed out in comments to the CPHP EIR, "The now almost-finished Mission Bay Project has conclusively proved that a UCSF campus can be a catalyst project that makes master-planned projects like these financially feasible for development. In particular, associated bio-med commercial development remains potentially viable."

20

ii. *The Mount Zion Location*

The Mount Zion alternative location, two miles from the Parnassus Heights project site, reduces or avoids the same significant environmental impacts as the Mission Bay location. It was rejected for EIR analysis for failing to meet the same non-fundamental

21

project objectives and creating the same purported "inefficiencies." The DEIR objects to Mount Zion as "less than ideal." (DEIR, p. 6-37.) This is not a CEQA standard. (*Laurel Heights I*, *supra*, 47 Cal.3d at 400.) Like Mission Bay, locating the new hospital at Mount Zion would remove significant impacts at Parnassus and meet fundamental objectives. (UCSF CPHP CEQA Findings, pp. 75-76.)

21 cont.

iii. *The Hunters Point Location*

As with the CPHP EIR, the DEIR fails to mention the Hunters Point off-site alternative that commenters to the CPHP EIR urged for consideration. UC owns 3.8 acres in Hunters Point with two single-story buildings used for an animal care facility. (UCSF 2014 Final LRDP, p. 117.) The City submitted comments to the CPHP EIR that included a draft "Racial & Social Equity Initiative" planning approach referencing Bayview/Hunters Point. (CPHP FEIR, Appendix O-LD2, Attachments 3 and 4.) When the 2014 LRDP was published, San Francisco had approved the Candlestick-Hunters Point Shipyard Development Plan, an extensive mixed-use redevelopment plan that did not proceed. (*Ibid*.) As previously point out by planner Terry Watt in response to the CPHP EIR:

22

> Feasible alternatives to the Project, improperly dismissed by the Final EIR, that would reduce or eliminate significant Project impacts should be reinstated for consideration including . . . No New Hospital at Parnassus Heights Campus Site and instead one of the following: Implement Phase 2 of Medical Center at Mission Bay Campus Site; New Hospital at Mount Zion Campus Site; . . . New Hospital at Hunters Point at the Candlestick site formerly slated for a new shopping mall. Locating the new hospital here would avoid many of the impacts associated with the Parnassus site, and would have many co-benefits such as providing jobs in and health services to an underserved and disadvantaged community.

(Exhibit 13, pp. 5-6.)

These same arguments apply with equal force to the DEIR. A revised DEIR is required to analyze and consider the above alternatives and to select the environmentally superior alternative unless it is truly infeasible.

4. The DEIR Applies an Inconsistent Baseline

23

Every CEQA document must start from a "baseline" assumption. The CEQA "baseline" is the set of environmental conditions against which to compare a project's

anticipated impacts. CEQA Guidelines section 15125, subdivision (a) states in pertinent part that a lead agency's environmental review under CEQA:

> ". . . must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time [environmental analysis] is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant." (Emphasis added.)

23 cont.

(CEQA Guidelines, § 15125, subd. (a); see, *Save Our Peninsula Committee v. County of Monterey* (2001) 87 Cal.App.4th 99, 124-125.) Here, the DEIR plainly stated its baseline assumption: "While the NOP for the NHPH was published on July 29, 2021, the appropriate baseline condition for this EIR would be the same as that used in the CPHP Final EIR, which was January 2020." (DEIR, p. 4.0-6.) The DEIR's actual analysis of impacts, however, does not use this baseline. A few examples are provided:

The DEIR's Land Use section asserts that the NHPH is consistent with the Space cap, as it was amended by the Regents in 2021:

> The 1976 Regent's Resolution as amended in 2021 increased the space ceiling limit at the Parnassus Heights campus site from 3.55 million gsf to 5.05 million gsf, and the projected daily population estimate at the campus site was revised from approximately 18,500 in 2035 to approximately 25,300 persons by 2050.
>
> Under the proposed NHPH, the New Hospital would be 900,000 gsf, which is approximately 9 percent less than the 955,000 gsf included in the 2014 LRDP as amended by the CPHP. The proposed renovation of Moffitt and Long Hospitals would increase the net size of these two buildings (by 4,500 gsf for Moffitt Hospital, and up to 5,000 gsf for Long Hospital). The combined building space in the three hospitals under the proposed NHPH would be 1,668,900 gsf, which is approximately two percent less than the 1,709,400 gsf included in the 2014 LRDP as amended by the CPHP. Consequently, the building program at Parnassus Heights with the New Hospital and renovated Moffitt and Long Hospitals under the NHPH would be within the space ceiling limit set in the Regent's Resolution, as amended.

24

(DEIR, p. 4.10-14.)

This is clearly inconsistent with the DEIR's earlier assertion that the baseline conditions are the same as the ones at the time of the CPHP. Further, this allows the DEIR to conclude that the New Hospital would be consistent with UC Plans and Policies, thus finding the land use impact less than significant. (DEIR, p. 4.10-14.) 24 cont.

Similarly, the DEIR's analysis of population and housing impacts relies on the 2021 MOU between UCSF and the City of San Francisco, which committed UCSF to deliver 1,263 new units by 2050, and half by 2030. (DEIR, p. 4.12-10.) "This would double UCSF's current housing portfolio citywide." (DEIR, p. 4.12-9.) Reliance on this information to determine significance is inconsistent with the DEIR's asserted baseline. 25

A third example is the DEIR's analysis of aesthetic impacts, which relies on a baseline that assumes approval of "Amendment #7 to the 2014 LRDP." (DEIR, p. 4.1-39.) However, Amendment #7 was approved on January 20, 2021, which is well after the DEIR's earlier claim that it would analyze impacts against a baseline date of January 2020." (DEIR, p. 4.0-6.) The DEIR improperly relies on this inconsistent baseline in order to find the impact is less than significant. 26

A final example is the DEIR's reliance on the removal of the current ammonia tank located at the Ammonia House. The DEIR finds Impact-HYD-1 to be less than significant. (DEIR, p. 4.9-20.) This determination is based on the conclusion that newly designed stormwater storage would allow the NHPH to avoid several flooding and discharge impacts. (*Ibid*.) However, the DEIR relies on an inaccurate baseline by assuming the current ammonia tank has been removed. 27

In sum, the DEIR relies on an unlawfully inconsistent baseline that appears designed to minimize environmental impacts in violation of CEQA. 28

5. The DEIR's Analysis and Mitigation of Noise Impacts Violates CEQA

a. The DEIR Fails to Adequately Connect Noise Levels with Human Health Impacts

The DEIR finds that Impact NOI-1 would be significant and unavoidable with mitigation. (DEIR, p. 4.11-16.) The DEIR finds that construction noise would exceed the standard of 80 dBA at 100 feet provided by San Francisco Police Code section 2909. (DEIR, p. 4.11-17.) The DEIR also finds that the 100 block of Edgewood Avenue would experience noise increases of more than 10 dBA, which would be a potentially significant impact. (DEIR, p. 4.11-18.) 29

CEQA requires an EIR to "identify and focus on the significant environmental effects of the proposed project . . . examin[ing] changes in the existing physical condition in the affected area," including "health and safety problems caused by the physical changes." (CEQA Guidelines, § 15126.2, subd. (a).) This section "also suggests that a connection be drawn between . . . potential project emissions and human health impacts. Such a connection would meet CEQA's requirements." (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 520 (*County of Fresno*).) If it is not scientifically possible to determine potential human health impacts, "the EIR itself must explain why, in a manner reasonably calculated to inform the public of the scope of what is and is not yet known about the Project's impacts." (*Ibid*.) Although *County of Fresno* addressed the need to correlate air emissions to human health, *Sierra Watch v. County of Placer* (2021) 69 Cal.App.5th 86 recently applied similar analysis to the effects of noise emissions on human health.

Here, the DEIR acknowledges that noise emissions can result in human health impacts and provides the following information:

> The World Health Organization (WHO) is perhaps the best source of current knowledge regarding the health effects of noise impacts because European nations have continued to study noise and its health effects, while the United States Environmental Protection Agency (USEPA) all but eliminated its noise investigation and control program in the 1970s.[7] According to WHO, sleep disturbance can occur when continuous indoor noise levels exceed 30 dBA or when intermittent interior noise levels (such as from traffic) reach 45 dBA, particularly if background noise is low. With a bedroom window slightly open (a reduction from outside to inside of 15 dB), the WHO criteria suggest that exterior continuous (ambient) nighttime noise levels should be 45 dBA or below, and short-term events should not generate noise in excess of 60 dBA. WHO also notes that maintaining noise levels within the recommended levels during the first part of the night is believed to be effective for the ability of people to initially fall asleep (WHO, 1999).
>
> **Other potential health effects of high noise levels identified by WHO include decreased performance for complex cognitive tasks, such as reading, attention span, problem solving, and memorization; physiological effects such as hypertension and heart disease** (after many

29 cont.

[7] The *San Francisco General Plan* Land Use Compatibility Guidelines for Community Noise, presented below in Figure 4.11-2, were created during the same era.

> years of constant exposure, often of workers, to high noise levels); and hearing impairment (again, generally after long-term occupational exposure, although shorter-term exposure to very high noise levels, for example, exposure several times a year to concert noise at 100 dBA, can also damage hearing). Finally, noise can cause annoyance and can trigger emotional reactions like anger, depression, and anxiety. WHO reports that, during daytime hours, few people are seriously annoyed by activities with noise levels below 55 dBA or moderately annoyed with noise levels below 50 dBA.
>
> Vehicle traffic and continuous sources of machinery and mechanical noise contribute to ambient noise levels. Short-term noise sources, such as truck backup beepers, the crashing of material being loaded or unloaded, and car doors slamming contribute very little to 24-hour noise levels but are capable of causing sleep disturbance and annoyance. The importance of noise to receptors depends on both time and context. For example, long-term high noise levels from large traffic volumes can make conversation at a normal voice level difficult or impossible, while short-term peak noise levels, if they occur at night, can disturb sleep.

29 cont.

(DEIR, pp. 4.11-3 – 4, bold added.)

Though this information provides an overview, it fails to identify the "high noise levels" at which the "other potential health effects" may occur. (*Ibid.*) This omission makes it impossible to determine whether the Project's noise levels would create these "other potential health effects." (See Exhibit 14, pp. 35-36.) This is precisely the pitfall the California Supreme Court pointed out in *County of Fresno*. The *County of Fresno* court explained:

> The EIR's discussion of health impacts of the named pollutants provides only a general description of symptoms that are associated with exposure to the ozone, particulate matter (PM), carbon monoxide (CO), and nitrogen dioxide (NOx), and the discussion of health impacts regarding each type of pollutant is at most a few sentences of general information. The disclosures of the health effects related to PM, CO, and sulfur dioxide ***fail to indicate the concentrations at which such pollutants would trigger the identified symptoms***.

(*County of Fresno*, *supra*, 6 Cal.5th 502, 519, emphasis added.) The NHPH DEIR follows the same tract.

The DEIR estimates the duration of construction activities to be at least twelve years. (DEIR, p. 3.47.) Rather than describe how twelve years of consistent demolition and construction noise might impact the cognitive and emotional health of the surrounding area, the DEIR chose a more conclusory route. (DEIR, p. 4.11-22 – 23.) Without describing the levels at which cognitive and emotional health may be impacted, the DEIR concludes, "NHPH construction noise would not result in adverse health effects related to pain, the onset of hearing loss or other significant health impacts." (DEIR, p. 4.11 –23.) The DEIR reaches this conclusion because the noise levels "would not exceed 85 dBA, with the exception of occasional use of concrete saws, operation of individual pieces of construction equipment under the NHPH would be consistent with the City's Noise Ordinance restriction (noise level of 80 dBA Leq or less at a distance of 100 feet)[.]" (DEIR, p. 4.11-22.)

29 cont.

The DEIR fails to indicate the levels and durations (concentrations) that "would trigger the identified symptoms." (*County of Fresno*, *supra*, 6 Cal.5th at 519.) The *County of Fresno* court held that the failure to indicate the concentrations needed to trigger symptoms was a violation of CEQA due to its failure to properly inform the public. (*Id*. at 522.) The same is true here.

b. DEIR Fails to Adequately Analyze Nighttime Noise Impacts

In addition to the construction noise impacts, the NHPH's five cooling towers would increase ambient noise level to 63 dBA. (DEIR, pp. 4.11-23.) This is a 10 dBA increase above the existing 53 dBA nighttime noise levels. (*Ibid*.) This increase exceeds the City of San Francisco's noise ordinance, which prohibits commercial and industrial equipment from increasing the ambient noise level by 8 dBA. (DEIR, pp. 4.11-24.) Further, the DEIR finds that the interior noise levels would be raised to 48 dBA, which exceeds the City's 45 dBA standard for interior noise. (*Ibid*.) Due to these levels being exceeded, the DEIR finds that the noise from the cooling towers "would result in a potentially significant operational impact. NHPH Mitigation Measures NOI-2 is identified to reduce this impact to less than significant." (*Ibid*.)

30

MM-NOI-2 states:

> [G]iven the existing monitored nighttime noise level at the nearest property line of 53 dBA, cooling towers shall be selected, designed, or enclosed to achieve an exterior performance standard of 61 dBA or less at the nearest property line. Achievement of this exterior standard would be sufficient to also achieve an interior nighttime standard of 45 dBA.

(DEIR, p. 4.11-24.)[8] Thus, the mitigation measure intends to reduce the increase in ambient noise to exactly 8 dBA, the maximum allowed by the City's noise ordinance. (*Ibid*.) Further, this mitigation assumes that the residents in question would or even could close their windows and doors at night, which raises a question of enforceability and effectiveness. An impact analysis cannot conclude that mitigation would reduce the impact to less than significant if the mitigation measure relies on the actions of third parties. (CEQA Guidelines, § 15126.4, subd. (a)(2) ["Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally binding instruments."].)

Since an EIR cannot simply assume that people will always keep their windows closed every night, the DEIR must address the potential health impacts resulting from its own prediction that people will be forced to sleep with ambient noise at 61 dB. (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108 (*Amador Waterways*) ["an established regulatory standard could not be applied in a way that would foreclose the consideration of other substantial evidence showing that there might be a significant environmental effect from a project"].) The DEIR's failure to address this issue is prejudicial given the WHO's criteria, which "suggest that exterior continuous (ambient) nighttime noise levels should be 45 dBA or below, and short-term events should not generate noise in excess of 60 dBA." (DEIR, pp. 4.11-3 – 4; DEIR, p.4.11-1 ["sleep disturbance can occur at noise levels above 35 dBA."].) The DEIR fails to correlate these increased levels of ambient noise with sleep disturbance and other potential health impacts, or explain why such a correlation is infeasible.

30 cont.

c. Mitigation Measures NOI-1b is Unenforceable and Deferred Mitigation

CEQA Guidelines allow deferred mitigation in some instances. (CEQA Guidelines, § 15126.4, subd. (a)(1)(B).) However, if an agency chooses to defer formulation of mitigation, it must "(1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard." (*Ibid*.) The NHPH DEIR's Mitigation Measure NOI-1b is identical to the CPHP's FEIR Mitigation Measures NOI-1b. CPHP's NOI-1b is unenforceable and impermissibly deferred, the same is true here.

31

[8] The DEIR fails to explain how the mitigation measure provides an exterior decrease of 2 dBA, but an interior decrease of 3 dBA.

> Mitigation Measures NOI-1b states:
>
> Construction hours *shall be restricted* to the hours listed in the table below. In rare circumstances, *work may need to occur* outside of these work hour limits. In such cases, UCSF Community and Government Relations will receive advance notice from the project manager, at least one week in advance as feasible, and will engage the community to identify measures to minimize potential impacts. These measures may include, but not be limited to, restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers to shield the short-term nighttime activity.

(DEIR, p. 4.11-21, italics added.) The mitigation measure defines timeframes for construction in the first sentence and completely disregards those timeframes in the next. Therefore, NOI-1b does not actually impose time restrictions for construction. Rather, construction could occur at any hour of any day, as long as, UCSF Community and Government Relations provide notice, "as feasible." (DEIR, p. 4.11-21.) Due to the lack of enforcement, the DEIR cannot rely on mitigation measure NOI-1b to limit construction to daytime hours. (DEIR, p. 4.11-22 ["Because construction would be restricted by NHPH Mitigation Measure NOI-1b to only occur during daytime hours, health effects associated with the potential for nighttime awakenings would be avoided."].)

31 cont.

Additionally, the DEIR provides various measures that "may" be imposed to "minimize potential impacts." (DEIR, p. 4.11-21.) First, the use of the word *may* produces an optional mitigation measure. Second, the measures that may be utilized include, "restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers to shield the short-term nighttime activity." (*Ibid*.) This language is devoid of performance standards and fails to provide any noise limits to after-hours construction.

Mitigation measures NOI-1b fails to restrict construction to daytime hours and fails to provide performance standards that would protect the health of the surrounding neighbors. The result is a mitigation measure that fails to meet CEQA requirements of enforceability and is deferred mitigation. The Recirculated EIR must include performance standards and enforceability mechanisms to address the above-mentioned deficiencies.

6. The DEIR Fails to Disclose and Mitigate the Project's GHG Emissions

Expert comments addressing the DEIR's analysis of greenhouse gas emissions ("GHG") have been prepared by SWAPE, which are attached as Exhibit 1 and incorporated by reference. Additional comments are provided below. 32

a. The DEIR fails as an informational document regarding GHG emissions

CEQA requires EIRs to provide adequate information to inform the public and decision makers. Specifically:

> An EIR is an informational document which will inform public agency decision makers and the public generally of the significant environmental effect of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project. The public agency shall consider the information in the EIR along with other information which may be presented to the agency.

(CEQA Guidelines, § 15121.) The DEIR's GHG emissions information fails to meet this standard. 33

As a preliminary matter, the DEIR fails to provide detailed information regarding the ability to adequately purchase offsets. MM-GHG-1 appears to rely on two forms of offsets. (DEIR, pp. 4.7-39 – 40.) One, the CARB-regulated cap-and-trade program. (DEIR, pp. 4.7-39.) Two, voluntary carbon credit offsets. (DEIR, pp. 4.7-39 – 40.) However, the DEIR fails to provide information regarding the amounts each program would use or whether those amounts are available.

For example, the DEIR states, UCSF is a covered entity under the cap-and-trade program. (DEIR, p. 4.7-38.) The cap-and-trade program only allows eight percent of a covered entity's compliance obligation be met using AB 32 compliant offsets. (DEIR, pp. 4.7-16 – 17.) The DEIR fails to explain whether the calculations provided in Table 4.7-3 reflect an eight percent decrease and, if so, fails to indicate where the eight percent reduction occurred. For example, is the eight percent reduction to mobile emissions, natural gas combustion, solid waste, or something else? (DEIR, p. 4.7-36.) The DEIR also fails to describe whether annual emissions of 27,449 MT CO_2e accounts for the cap-and-trade reduction of eight percent. This makes a difference because the next page states that the NHPH would offset 27,449 MT CO_2e per year. (DEIR, p. 4.7-37.)

Without accurate information the DEIR fails to provide decision-makers and the public with the opportunity to evaluate the Project's impacts or efficacy of proposed mitigation. (*Washoe Meadows v. Dept. of Parks and Rec*. (2017) 17 Cal.App.5th 277, 285 ["Informed public participation is essential to environmental review under CEQA."]; *Inyo v. City of L.A.* (1977) 71 Cal.App.3d 185, 192-193 ["Only through accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental costs"].)

33 cont.

b. The DEIR's Relies on Unenforceable GHG Mitigation

GHG-1 violates CEQA because it is unenforceable mitigation. CEQA requires a lead agency to consider several factors when determining the significance of GHG impacts. (CEQA Guidelines, § 15064.4, subd. (b).) These factors include:

> (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting.
>
> (2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
>
> (3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions (see, e.g., section 15183.5(b)). Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project. In determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable.

34

(*Ibid*.)

The DEIR determined that "the NHPH would result in a significant impact on the environment if GHG emissions from its construction and operations would exceed a threshold of zero net additional GHG emissions compared to the existing GHG emissions at Parnassus Heights campus site, estimated to be 127,083 MT CO_2e." (DEIR, p. 4.7-34.) The DEIR finds this impact would be significant because the NHPH would increase GHG emissions by 27,449 MT CO_2e annually. (DEIR, p. 4.7-36.) In order to decrease the impact to less than significant, the DEIR relies solely on Mitigation Measure GHG-1 (GHG-1). (*Ibid*.)

GHG-1 is divided into several parts, "Continued Compliance with CARB's Cap and Trade Program," "Compliance with UC Policy – Offsets for Emissions from Commuters and Air Travel," "Compliance with UC Policy – Carbon Neutrality" and "Commitment to control Parnassus Height Annual Emissions to not exceed existing baseline." (DEIR, pp. 4.7-39 – 40.) However, these four parts can be broken down to two, compliance with CARB's cap-and-trade program and compliance with UC policy. The main distinction between the two is that CARB-covered entities may offset up to 8 percent of its covered emissions with AB 32 approved offsets. (DEIR, p. 4.7-16.) Cap-and-trade program is described as follows:

> Up to eight percent of a covered entity's compliance obligation can be met using carbon offset credits, which are created through the development of projects, such as renewable energy generation or carbon sequestration projects, that achieve a reduction of emissions or an increase in the removal of carbon from the atmosphere from activities not otherwise regulated, covered under the cap, or resulting from government incentives. Offsets are verified reductions of emissions whose ownership can be transferred to others. As required by AB 32, any reduction of GHG emissions used for compliance purposes must be real, permanent, quantifiable, verifiable, enforceable, and additional. ***Offsets used to meet regulatory requirements must be quantified according to CARB-adopted methodologies, and CARB must adopt a regulation to verify and enforce the reductions.*** The criteria developed will ensure that the reductions are quantified accurately and are not double-counted within the system (CARB, 2008).

(DEIR, pp. 4.7-16 – 17, emphasis added.)

34 cont.

UC policy, on the other hand, allows an infinite amount of offsets to be bought through a voluntary offset market (DEIR, pp. 4.7-39 – 40). This is not the same as the cap-and-trade market.

35

The voluntary offset market is not required to meet the same stringent enforceability standards as those established in CARB's cap-and-trade program. (See Cal. Code Regs., tit. 17, § 95802, subd. (a).) For example, CARB requires offset credits must be "real, permanent, additional quantifiable, verifiable, and enforceable," as described by California regulations. (DEIR, p. 4.7-39.) The voluntary markets do not require these regulatory standards be met. Instead, the DEIR states "The protocols of each registry, and UC [sic] own internal screens, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols." (DEIR, p. 4.7-40.)

35 cont.

This shortcoming is similar to the one described in *Golden Door*. In *Golden Door*, as here, the agency's proposed offsets did not meet the protocols of the CARB cap-and-trade program designed to ensure that they are "real, permanent, verifiable, additional, and enforceable." (*Golden Door Properties, LLC. v. County of San Diego* (2020) 50 Cal.App.5th 467, 511 (*Golden Door*).) Further, the language used in GHG-1 is nearly identical to language used as the mitigation in *Golden Door*. The court in *Golden Door* held:

> Unlike M-GHG-1, under cap-and-trade, it is not enough that the registry be CARB-approved. Equally important, the protocol itself must be CARB-approved. (Cal. Code Regs., tit. 17, § 95970, subd. (a)(1) & (2).)[26] *This distinction is significant because some offset protocols administered by CARB-approved registries are not Assem. Bill No. 32 compliant.* Indeed, CARB has stated that offset protocols developed by CARB-approved registries (including registries named in M-GHG-1) do *not by that fact alone* meet the offset criteria in Assem. Bill No. 32:
>
> "Voluntary offset programs such as the American Carbon Registry, Climate Action Reserve, Verified Carbon Standard, and others may submit protocols to [C]ARB for review. However, regardless of how the voluntary protocols are developed, [C]ARB staff must determine whether the voluntary protocol should be developed for use in the Cap-and-Trade Program and if so, to conduct its own rulemaking process under the Administrative Procedure Act. . . . *This process ensures that any voluntary protocol . . . demonstrates the resulting reductions meet the offset criteria in [Assem. Bill No. 32]*.
>
> "Protocols developed by the voluntary programs are not Compliance Offset Protocols as they are not developed through a rulemaking process, *may not*

36

> *meet the [Assem. Bill No. 32] and Cap-and-Trade Regulation criteria*, and were not approved by [CARB]." (Italics added.)
>
> Furthermore, before approving a protocol, CARB subjects the proposed offset protocol to public notice, a comment period, and a public hearing. (Cal. Code Regs., tit. 17, §§ 95970, subd. (a)(2), 95971, subd. (a).) CARB also requires that emission reductions for offset credit be from sources not already covered by cap-and-trade. For example, CARB would not approve an offset protocol for installing solar panels because electricity generation is already covered under cap-and-trade.
>
> The CARB Protocols are the heart of cap-and-trade offsets—but the word "protocol" is not even mentioned in M-GHG-1. Contrary to the County's contention, M-GHG-1 is not equivalent to cap-and-trade offset programs because M-GHG-1 does not require the protocol itself to be consistent with CARB requirements under title 17, section 95972, subdivision (a)(1)-(9) of the California Code of Regulations, quoted *ante.* For example, CARB will not approve a protocol unless its GHG reductions are permanent. (*Id.*, § 95970, subd. (a)(1).) If the project is to sequester carbon (e.g., planting trees), the protocol must ensure that the GHG will not be released for 100 years. M-GHG-1 is deficient because it has no such safeguards.

36 cont.

(*Golden Door*, *supra*, 50 Cal.App.5th at 511-512.)

The DEIR relies on UC's internal screens, therefore, it is unclear whether the protocols the UC may choose to utilize are consistent with CARB requirements. Without this information the DEIR cannot rely on GHG-1 as mitigation because it is unenforceable.

37

c. GHG-1 Is Impermissibly Deferred Mitigation

In addition to being unenforceable, the court in *Golden Door* found the GHG mitigation used in that case to be deferred. This finding was based in part because the County's planning director determined whether to approve the voluntary offsets, without applying an objective criteria. (*Golden Door*, *supra*, 50 Cal.App.5th at 519.) Similarly, the DEIR relies on "internal guidelines" and "internal screens" that must be satisfied. (DEIR, pp. 4.7-39 – 40.) The result is the same. The DEIR fails to provide information regarding the "internal screens," who is responsible for defining them, or whether the screens would meet CARB offset standards.

38

An additional problem with the deferral of this mitigation is whether offsets would be available. The DEIR states, "local (within the air district) and in-state carbon offset credits shall be prioritized over in-nation offset credits. If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming national offset credits registered with an approved registry." (DEIR, p. 4.7-40.) Nothing in this discussion indicates an adequate availability of offsets for the New Hospital. An email obtained through litigation illuminates this potential shortcoming. Jackie Safier of the Helen Diller Foundation discussing a Berkeley project, "If in Berkeley we decide to apply come January or February 20202 [sic], we would need to buy the credits then. Issue with there being a supply available given the A's purchases and pricing." (Exhibit 8.)

38 cont.

Therefore, two deferral issues exist within GHG-1. First, the public and decision-makers have not been provided the information needed to determined what "internal screens" or "internal guidelines" would be used to determine the efficacy of the voluntary mitigation offsets. Second, the DEIR fails to provide information regarding the availability of voluntary offsets. As noted in Exhibit 8 other projects are concerned over the availability of voluntary offsets. These deficiencies result in impermissibly deferred mitigation.

d. Construction and Operation of the NHPH Would Conflict with State Policy

Operation of the NHPH would result in a net increase of emissions of 27,449 MT CO_2e annually. (DEIR, p. 4.7-36.) This is problematic because California policy is to significantly reduce GHG emissions.

Specifically, the state's policy is to reduce state-wide greenhouse gas emissions to 1990 levels by the year 2020 (Health and Saf. Code, § 38550), 40 percent below 1990 levels by the 2030 (Health and Saf. Code, § 38566), 80 percent below 1990 levels by 2050 (Executive Order S-3-05). (*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497 ["These targets were based on a scientific consensus that climate change was largely caused by human activity resulting in elevated levels of carbon dioxide and other heat-trapping gases in the atmosphere and that drastic reductions in greenhouse gas emissions were required to stabilize the climate"].) Although the CEQA Guideline Appendix G significance threshold asks whether a project would "conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases," these straightforward and applicable standards are not used in the DEIR for assessing the Project's impact on GHG emissions. Rather, the DEIR explains that its "approach to analysis" of GHG impacts is to analyze

39

consistency with CARB's 2017 Scoping Plan Update ("Scoping Plan"). (DEIR, p. 4.7-34.)

The use of the 2017 Scoping Plan in lieu of State policies creates a loophole. Rather than reduce GHG emissions pursuant to Health and Safety Code sections 38550 and 38566, the DEIR's approach is to reach "net zero" emissions. (DEIR, p. 4.7-34.) However, net zero and emissions reductions are not the same. Therefore, Impact GHG-2 should be significant because it conflicts with State policy that was adopted to reduce emissions.

Further, the 2017 Scoping Plan is not intended to be used by the UC. The DEIR quotes the 2017 Scoping Plan, the language quotes is derived from the Scoping Plan section titled "Climate Action through Local Planning and Permitting." That section explains:

> To support local governments in their efforts to reduce GHG emissions, the following guidance is provided. This guidance should be used in coordination with OPR's General Plan Guidelines guidance in Chapter 8, Climate Change. While this guidance is provided out of the recognition that local policy makers are critical in reducing the carbon footprint of ***cities and counties***, the decision to follow this guidance is voluntary and should not be interpreted as a directive or mandate to local governments.

(Scoping Plan, p. 99, emphasis added.)

On its face, the Scoping Plan's language is inapplicable to UCSF because it is neither a city or county. The DEIR fails to provide any explanation regarding its reliance on the 2017 Scoping Plan or how it is applicable to a state-wide institution such as the UC. In fact, the DEIR states, "UCSF is constitutionally exempt from local land use regulations whenever using property under its control in furtherance of its educational purposes." (DEIR, p. 4.7-32.) Therefore, the Scoping Plan's section providing guidance to cities and counties regarding private development in their jurisdictions simply does not apply to the UC.

The DEIR use of the 2017 Scoping Plan, which is patently inapplicable to use in the analysis, results in a legal error. Further, this error is prejudicial because using a "net zero" significance standard reduces UC's mitigation obligation as compared to using a significance standard tied to the state's 2030 and 2050 GHG reduction goals.

39 cont.

e. The DEIR Fails to Include a Discussion of Other Feasible GHG Mitigation Strategies

An EIR must provide feasible mitigation that could minimize significant impacts. (CEQA Guidelines, § 15126.4, subd. (a)(1).) "Where several measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be identified." (*Id*. at subd. (a)(1)(B).) In *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, the court discusses infeasibility of mitigation and alternatives. There the court states, "Even though the agency ultimately finds mitigation measures adequate or proposed alternatives infeasible, the EIR must still contain a meaningful discussion of both alternatives and mitigation measures." (*Id*. at 731.) The court goes on to clarify, "An environmentally superior alternative cannot be deemed infeasible absent evidence the additional costs or lost profits are so severe the project would become impractical." (*Id*. at 736.)

The DEIR fails to provide this information. As discussed above, the DEIR relies solely on purchasing offsets to reduce the GHG emissions impact to less than significant. (DEIR 4.7-36.) However, there are other mechanisms for lowering emissions resulting from the construction and operation of the NHPH. The SWAPE report provides other feasible mitigation measures: 40

> As demonstrated above, the DEIR fails to implement any additional mitigation measures to reduce localized GHG emissions, and instead proposes the use of carbon offsets to maintain carbon neutrality. Thus, as the DEIR fails to define an exceedance limit, Project-generated GHG emissions may considerably exceed the campus site year 2019 baseline. UCSF's intended use of only carbon offsets to maintain carbon neutrality is irresponsible and careless…Furthermore, review of correspondence between UCSF staff dated August 19, 2020 to August 20, 2020 demonstrates that a cost benefit analysis indicated that carbon offsets are cheaper than project design or engineering features intended to actually reduce emissions. [(See Attachment A.)] By concluding a less-than-significant GHG impact after relying solely on carbon offset mitigation, it appears that UCSF prioritizes cost rather than environmental protection. We find this to be in direct contradiction with CEQA's intent to prevent or minimize damage to the highest extent possible. As such, to reduce the Project's GHG impacts to the maximum extent possible, we recommend additional feasible mitigation measures be incorporated, such as those suggested in the section of this letter titled "Feasible Mitigation Measures Available to Reduce Emissions." As a result, we recommend the Project

> not be approved until an updated EIR is prepared and incorporates all feasible mitigation, including specifically project design and engineering features, to reduce localized Project-generated GHG emissions.

(Exhibit 1, pp. 16-17.)

The SWAPE report goes on to provides a list of feasible mitigation derived from SCAG's *2020 RTP/SCS*. (Exhibit 1, pp. 17-22.) An internal UC email string only recently produced by court order suggests that the DEIR does not need to analyze whether the NHPH could be engineered to lower emissions. (Exhibit 8.) The email states:

> We did analyze the cost of meeting the greenhouse gas requirements of SB 995 on our Berkeley project with Ramboll. Sharing this as it applies to UCSF if going this route. Here is what we found preliminarily as it applies to our project in Berkeley.
>
> - Basically our 300 million project, we need 32,000 tons – to buy carbon credits it would cost about $300K. To engineer it into the project would be $20 million (***so buying the offsets is the route to go***)
> - Issue is A's need 531K tons (so 15 times more than us) so about $4.8 million in carbon offset credits to purchase.
> - If in Berkeley we decide to apply come January or February 20202 [sic], we would need to buy the credits then. Issue with there being a supply available given the A's purchases and pricing.

(Exhibit 8, emphasis added.)

The DEIR fails to consider other feasible alternatives to lower GHG emission impacts. (See Exhibit 1, pp. 15-16.) Additionally, the DEIR fails to provide a cost analysis showing that the additional cost to engineer GHG emissions reductions into the project are so extensive the project would become "impractical." The Recirculated DEIR must contain this information.

40 cont.

7. The DEIR Piecemeals TAC Emissions and Thereby Fails to Disclose Cancer Risks To Neighbors

41

CEQA requires an EIR to consider all phases of a project when evaluating a project's impacts on the environment. (CEQA Guidelines, § 15126.) Assessing impacts

of the project, the lead agency shall identify direct and indirect effects of the project, "giving due consideration to both the short-term and long-term effects." (CEQA Guidelines, § 15126.2, subd. (a).) Direct physical changes in the environment include construction and operations related to the project. (CEQA Guidelines, § 15064, subd. (d)(1).) Further, "An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences." (CEQA Guidelines, § 15151.) Here, the DEIR fails as an informational document because it fails to disclose the human health risk resulting from the total toxic air contaminants ("TAC") emitted by the NHPH's construction and operation. This omission creates misinformation for both decision makers and the public regarding the NHPH's TAC impacts.

The SWAPE Report states:

> The Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California, released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* in February 2015.[9] According to OEHHA guidance, "the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location."[10] Here, the DEIR includes two HRAs evaluating the health risk impacts to nearby, existing receptors as a result of Project construction and operation, but violates OEHHA guidance by failing to evaluate the combined lifetime cancer risk as a result of Project construction and operation together. Thus, the DEIR's HRAs fail to sum each age bin to evaluate the total cancer risk over the course of the Project's total construction and operation. This is incorrect and, as such, an updated analysis should quantify the entirety of the Project's construction and operational health risks and then sum them to compare to the BAAQMD threshold of 10 in one million, as referenced by the DEIR (p. 4.2-33).

(Exhibit 1, p. 11.)

41 cont.

[9] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/air/crnr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0.

[10] "Guidance Manual for preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf p. 8-4

The DEIR does not combine the figures. Instead, the DEIR creates two separate impacts (AIR-3 and AIR-4), which are identical, other than one measuring construction TAC emissions and the other measuring operation TAC emissions. (DEIR, pp. 4.2-30 and 4.2-34.) The DEIR concludes the mitigated cancer risk stemming from construction would be 5.6, less than the significance threshold of 10. (DEIR, p. 4.2-32.) Therefore, Impact AIR-3 is less than significant after mitigation. (*Ibid*.) The DEIR concludes cancer risk from operations would be 8.6, less than the significance threshold of 10. (DEIR, p. 4.2-34.) Therefore, Impact AIR-4 is less than significant. (*Ibid*.) Thus, the DEIR has framed the analysis in a manner that allows the DEIR to conclude there would not be a significant impact. This is inaccurate, misleading and not a good faith disclosure of environmental impacts. (*Laurel Heights I*, *supra*, 47 Cal.3d at 392 ["If CEQA is scrupulously followed, the public will know the basis on which its responsible officials either approve or reject environmentally significant action, and the public, being duly informed, can respond accordingly to action with which it disagrees."].)

41 cont.

A Recirculated DEIR must be prepared that accurately discloses the CPHP's cancer risk to neighbors or, failing that, the NHPH's total cancer risk to neighbors.

8. The DEIR's Finding of a Less Than Significant Impact Ground Shaking Is Not Supported By Substantial Evidence

The DEIR's section addressing Geology and Soils was reviewed by expert geologist Andrew Jay Coleman, Ph.D. Mr. Coleman's letter is attached as Exhibit 3, and incorporated by reference. Dr. Coleman explains that it is not possible to adequately determine whether the NHPH will have a significant impact on nearby properties due to direct or indirect earth shaking without use of a microseismic array.

42

9. The DEIR Fails as an Informational Document Regarding Bird Strike Impacts

The DEIR's analysis of impacts to biological resources, including with particularly the NHPH's significant bird strike hazard, was reviewed by expert biologist Shawn Smallwood, Ph.D. Dr. Smallwood's comments are attached as Exhibit 2, and incorporated by this reference. Dr. Smallwood has identified numerous shortcomings in the DEIR's formulation of baseline conditions, analysis of NHPH impacts, and formulation of mitigation measures for biological impacts.

43

10. The DEIR's Conclusion of Less Than Significant Visual Impacts Is Based on Legal Error

The DEIR acknowledges that "the introduction of the New Hospital would . . . contrast sharply both in height and scale with the nearby residential development." (DEIR, p. 4.10-21.) This sharp contrast in height and scale is precisely the type of visual impact that does not even require expert testimony to establish. (*Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903; *Georgetown Preservation Society v. County of El Dorado* (2018) 30 Cal.App.5th 358.)[11] Despite this, the DEIR concludes that the NHPH's impact would be less than significant without the need for any mitigation. (DEIR, p. 4.1-39 -40.)

The DEIR does not even attempt to offer a factual dispute that the NHPH would "contrast sharply" with the surrounding areas and violate San Francisco's zoning standards. Instead, the DIER's conclusion is based on purely legal arguments that: (i) "the building would be consistent with the 2014 LRDP as amended," and (ii) "would not conflict with applicable zoning and other regulations governing scenic quality." Neither of these legal arguments has merit, and certainly does not overcome the factual support for significant visual and aesthetic impacts resulting from the NHPH's sharply contrasting size and bulk. 44

As explained above, the DEIR's first legal argument is without merit because the argument conflicts with the DEIR's own assertion of a January 2020 baseline. An agency may not rely on an internally inconsistent baseline simply to avoid disclosing a significant impact.

The DEIR's second legal argument is similarly without merit. Even if San Francisco's zoning standards are "inapplicable" as the DEIR asserts, this may not be used to foreclose consideration of substantial evidence supporting a fair argument of significant impact. (*Amador Waterways*, *supra*, 116 Cal.App.4th at 1108 – 09.) That said, the record does not establish that San Francisco's zoning restrictions are "inapplicable" to the NHPH. The DEIR asserts, "Pursuant to the University of California's constitutional autonomy, development and uses on property under the

[11] While expert testimony is not required to support a significant aesthetic impact, such evidence has been previously submitted as is incorporated by reference. (Exhibits 11, 13, 16.) While these comments were submitted before the "design" of the NHPH was released, these comments remain relevant because they are based on the size and scale of the NHPH, which are largely unchanged. (Compare CPHP EIR, p. 3-26 [294 ft high and 955,000 gsf] and DEIR, p. 3-13 [294 ft high and 900,000 gsf].)

control of the University that are in ***furtherance of the University's educational purposes*** are not subject to local land use regulation." (DEIR, p. 4.1-31.) As discussed more fully in section 3.b. above, the DEIR makes clear that its need for additional physical space is driven primarily by the need for UCSF Heath to provide more beds for anticipated demand for its clinical services as a healthcare provider. (DEIR, p. 3-9.) However, UCSF Health is just one of UCSF's three enterprises; the other two are "UCSF's education enterprise" and "UCSF's research enterprise." While the three enterprises are "inter-dependent," the DEIR fails to explain how many additional hospital beds are necessary to maintain that inter-dependance and UC's status as "one of the country's leading health sciences campuses." Presumably the answer is "zero," since that status has already been achieved without the additional hundreds of new beds now being proposed. Thus, the additional contemplated beds are not in furtherance "of the University's educational purposes," but rather in furtherance of UC Health's goal of capturing demand in competition with other providers in the healthcare market.

44 cont.

11. <u>Analysis and Mitigation of Wind Impacts are Improperly Deferred</u>

The DEIR acknowledges that the NHPH would result in significant wind impacts. (4.1-55, 4.1-101.) Labeling an impact "significant" does not allow an agency to avoid disclosing the severity of the acknowledged significant impact. (*Berkeley Jets*, *supra*, 91 Cal.App.4th 1344, 1371.) As explained above, the UC's legal posturing means that a project-level analysis has not been performed for the NHPH along with the other elements of the CPHP. The CPHP EIR justified UC's failure to prepare that wind-tunnel analysis by claiming there was no design available for the NHPH at that time. Incredibly, the DEIR is now suggesting exactly the opposite, namely that design-level information is available only for the NHPH. The DEIR's proposed wind mitigation provides:

45

> **NHPH Mitigation Measure C-AES-3: Design new cumulative buildings to minimize wind impacts at pedestrian level.**
>
> Prior to the approval of the design of individual cumulative buildings, which will be developed pursuant to the CPHP, for which one or more building facades would have a height of 80 feet or more, UCSF shall engage a qualified wind consultant to conduct wind tunnel testing of the proposed building(s) to determine whether the building(s) would result in new exceedance(s) of the City of San Francisco's pedestrian wind hazard criterion. The wind tunnel testing shall be conducted for the building(s) under consideration in the context of then-existing conditions as well as in the context of conditions representative of then-anticipated CPHP buildout (the buildout scenario in this EIR, as may be modified from time to time by

> UCSF to reflect actual building designs known at the time) so as to determine whether the individual building(s) and/or the buildout condition would result in exceedances of the wind hazard criterion.
>
> If the wind tunnel analysis determines that the building(s)' design or buildout conditions would increase the hours of wind hazard exceedance or the number of test points subject to hazardous winds, compared to then-existing conditions, UCSF shall work with the wind consultant to identify feasible mitigation strategies, including design changes (e.g., setbacks, rounded/chamfered building corners, stepped facades, etc.), to eliminate or reduce wind hazards to the maximum feasible extent. If UCSF finds that these changes or other wind speed reduction strategies are not feasible as they would unduly restrict the proposed building's space program, result in operational inefficiencies, and/or substantially higher costs, the building(s) may nonetheless be approved provided that the project incorporates wind speed reduction strategies to the maximum feasible extent, as determined by UCSF in consultation with the wind consultant. Wind speed reduction strategies could also include features such as landscaping, localized installation of porous/solid screens, installation of canopies along building frontages, and the like.

45 cont.

(DEIR, p. 4.1-100 – 101.)

This mitigation measure assumes that designs for RAB, Irving Street Arrival and Aldea Housing Densification are not yet available, and yet the CPHP EIR previously asserted exactly the opposite, explaining in relevant part:

> **Approach to Analysis of Initial Phase Projects, including New Hospital, and Initial Phase Improvements**
>
> This EIR includes project-level analysis for certain Initial Phase projects anticipated to be completed by about the year 2030; specifically, the Irving Street Arrival, Research and Academic Building (RAB), and initial Aldea Housing Densification; and Initial Phase improvements, as described below. The New Hospital is also an Initial Phase project anticipated to be completed by about the year 2030, ***but is analyzed at a program level in this EIR within the context of the overall CPHP and will be analyzed at a project level in a subsequent EIR when more details are available***.

(CPHP EIR, p. 4.1-23.)

In other words, the CPHP EIR asserted that sufficient detail was available about all CPHP "Initial Phase" projects except the New Hospital, and now the DEIR claims exactly the opposite is true. This shell game is inexcusable. The DEIR cannot defer analysis and mitigation of admittedly significant wind impacts by falsely claiming building designs are not available. A Revised DEIR will need to include a detailed and comprehensive project-level wind tunnel analysis that discloses wind impacts and imposes all feasible mitigation. 45 cont.

* * *

For the foregoing reasons, PNC believes that the DEIR for NHPH is wholly inadequate and urges the UC to prepare a Revised DEIR to address the concerns raised herein. Thank you for considering our comments.

Very truly yours,

Subject: **Comments on the UCSF New Hospital at Parnassus Heights Project (SCH No. 2021070547)**

Dear Mr. Soluri,

We have reviewed the December 2021 Draft Environmental Impact Report ("DEIR") for the UCSF New Hospital at Parnassus Heights Project ("Project") located in the City of San Francisco ("City"). The Project proposes to construct a 900,000-square feet ("SF") hospital and related improvements as part of the 1,668,900-SF New Hospital at Parnassus Heights Project ("NHPH"). 46

Our review concludes that the DEIR fails to adequately evaluate the Project's hazards and hazardous materials, air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential hazards and hazardous materials, air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment. 47

Hazards and Hazardous Materials

Inadequate Analysis and Disclosure of Impacts

A Phase I Environmental Site Assessment ("ESA") was not prepared for the Project site. The preparation of a Phase I ESA is routinely undertaken in the preparation of CEQA documents to identify and disclose hazardous waste issues that may present impacts to the public, workers, or the environment, and which may require further investigation, including environmental sampling and cleanup. 48

Standards for performing a Phase I ESA have been established by the US EPA and the American Society for Testing and Materials Standards ("ASTM").[1] Phase I ESAs are conducted to identify conditions that would indicate a release of hazardous substances and include:

- a review of all known sites in the vicinity of the subject property that are on regulatory agency databases undergoing assessment or cleanup activities;
- an inspection;
- interviews with people knowledgeable about the property; and
- recommendations for further actions to address potential hazards.

Phase I ESAs conclude with the identification of any "recognized environmental conditions" ("RECs") and recommendations to address such conditions. A REC is the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. If RECs are identified, then a Phase II ESA generally follows, which includes the collection of soil, soil vapor and groundwater samples, as necessary, to identify the extent of contamination and the need for cleanup to reduce exposure potential to the public.

A Phase I ESA, completed by a licensed environmental professional, is necessary for inclusion in a revised EIR to identify and disclose recognized environmental conditions, if any, at the proposed Project site. If past land uses have resulted in RECs, a Phase II should be conducted to sample for residual concentrations of contaminants in soil. Any contamination that is identified above regulatory screening levels, including California Department of Toxic Substances Control Soil Screening Levels[2], should be further evaluated and cleaned up, if necessary, in coordination with the Regional Water Quality Control Board and the California Department of Toxic Substances Control.

48 cont.

Air Quality

Unsubstantiated Input Parameters Used to Estimate Project Emissions

The DEIR's air quality analysis relies on emissions calculated with CalEEMod.2020.4.0 (p. 4.2-22).[3] CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence. Once all of the values are inputted into the model, the Project's construction and operational emissions are calculated, and "output files" are generated. These output

49

[1] http://www.astm.org/Standards/E1527.htm

[2] https://dtsc.ca.gov/wp-content/uploads/sites/31/2019/04/HHRA-Note-3-June-2020-A.pdf

[3] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/user-guide-2021/01_user-39-s-guide2020-4-0.pdf?sfvrsn=6.

files disclose to the reader what parameters are utilized in calculating the Project's air pollutant emissions and make known which default values are changed as well as provide justification for the values selected.

When reviewing the Project's CalEEMod output files, provided in the Air Quality Appendix ("AQA") as Appendix AIR to the DEIR, we found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated. Therefore, an updated EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

49 cont.

Unsubstantiated Changes to Off-Road Construction Equipment Horsepower, Load Factor, and Usage Hours

Review of the CalEEMod output files demonstrates that the "UCSF NHPH Construction Run" model includes several reductions to the default off-road construction equipment horsepower, load factor and usage hour values (see excerpt below) (Appendix AIR, pp. 845).

Table Name	Column Name	Default Value	New Value
tblOffRoadEquipment	UsageHours	8.00	4.00
tblOffRoadEquipment	UsageHours	8.00	6.00
tblOffRoadEquipment	UsageHours	8.00	2.40
tblOffRoadEquipment	UsageHours	7.00	1.60
tblOffRoadEquipment	UsageHours	7.00	1.60
tblOffRoadEquipment	UsageHours	7.00	2.40
tblOffRoadEquipment	UsageHours	7.00	1.60
tblOffRoadEquipment	UsageHours	6.00	0.80
tblOffRoadEquipment	UsageHours	7.00	2.00
tblOffRoadEquipment	UsageHours	7.00	2.00
tblOffRoadEquipment	UsageHours	8.00	0.80
tblOffRoadEquipment	HorsePower	402.00	325.00
tblOffRoadEquipment	LoadFactor	0.38	0.38

Note: This image only captures a handful of the off-road construction equipment horsepower, load factor, and usage hours.

50

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[4] According to the "User Entered Comments and Non-Default Data" table, the justification provided for these changes is:

> "Construction equipment and usage factors provided by Herrero Bolt Webcor" (Appendix AIR, pp. 839).

[4] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1.

However, this justification is insufficient, as the DEIR and associated documents fail to provide the purported construction equipment list from Herrero Bolt Webcor. According to the CalEEMod User's Guide:

> "CalEEMod was also designed to allow the user to change the defaults to reflect site- or project-specific information, when available, provided that the information is supported by substantial evidence as required by CEQA."[5]

Here, as the DEIR and associated documents fail to provide substantial evidence that substantiates the off-road construction equipment horsepower, load factor, and usage hours, we are unable to verify the revised values.

50 cont.

These reductions present an issue, as CalEEMod uses off-road equipment horsepower, load factor and usage hours to calculate the emissions associated with off-road construction equipment.[6] By including incorrect changes to the default off-road construction equipment usage hours, the model may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Hauling and Worker Trip Numbers

Review of the CalEEMod output files demonstrates that the "UCSF NHPH Construction Run" model includes several changes to the default hauling and worker trip numbers (see excerpt below) (Appendix AIR, pp. 845).

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	HaulingTripNumber	8.00	460.00
tblTripsAndVMT	HaulingTripNumber	14,188.00	11,790.00
tblTripsAndVMT	HaulingTripNumber	325.00	520.00
tblTripsAndVMT	HaulingTripNumber	0.00	170.00
tblTripsAndVMT	WorkerTripNumber	306.00	150.00
tblTripsAndVMT	WorkerTripNumber	306.00	250.00
tblTripsAndVMT	WorkerTripNumber	306.00	250.00
tblTripsAndVMT	WorkerTripNumber	306.00	250.00
tblTripsAndVMT	WorkerTripNumber	0.00	20.00
tblTripsAndVMT	WorkerTripNumber	28.00	150.00
tblTripsAndVMT	WorkerTripNumber	25.00	150.00
tblTripsAndVMT	WorkerTripNumber	25.00	150.00
tblTripsAndVMT	WorkerTripNumber	15.00	100.00

51

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[7] According to the "User Entered Comments & Non-Default Data" table, the justification

[5] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 13-14.
[6] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 33.
[7] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1.

provided for these changes is: "Number of workers and haul trips provided by Herrero Bolt Webcor" (Appendix AIR, pp. 839). Furthermore, regarding the Project's anticipated number of hauling trips required for construction, the AQA provides the following calculations (Appendix AIR, pp. 835):

Calculation of Construction Haul Truck Trips

From EIR Attachment A from Hererro Bolt Webcor

		One Way Trips
Fuel Tank Excavation = 85 truck loads	85 truck loads	170
Moffett/Long Demo	230 truck loads	460
Hospital Export	110700 cy	
Truck capacity	20 cy	
Truck loads =	5535	11070
Hospital Import	5400 cy	
Truck capacity	15 cy	
Truck loads =	360	720
Total Hospital =		**11790**
Site Preparation Export	2600 cy	
Truck capacity	10 cy	
Truck loads =	260	520

51 cont.

Additionally, regarding the Project's anticipated number of worker trips during construction, the AQA provides the following calculations (Appendix AIR, pp. 834):

Calculation of Worker Construction Vehicle Trips - NHPH

Construction Workers

From EIR Attachment A from Hererro Bolt Webcor

Assume 2 trips per worker per day all in SOV
Otherwise use default

Phases (if applicable)	Number of Workers (Max.)	trips/day
LPPI Demolition		
Site Preparation / MCWUtilities	75	150
Grading / Shoring / Mass Excavation	75	150
Drainage / Utilities / Subgrade Utilities	75	150
Foundations	75	150
Structure	125	250
Exteriors Building Construction	125	250
Interiors Building Construction	250	500
Final Site Improvements	50	100
Other 1: Commissioning		
Other 2: ML Renovations/Bridge Tunnel Connection	TBD	

However, these changes remain unsupported for three reasons.

First, the DEIR and associated documents fail to provide access to the above-mentioned EIR Attachment A from Herrero Bolt Webcor. As such, we cannot verify the revised hauling and worker trip numbers are accurate. 52

Second, the model cannot simply assume a 20 cubic yard ("cy") haul truck capacity (Appendix AIR, pp. 835). According to the CalEEMod User's Guide:

> "Haul trips are based on the amount of material that is demolished, imported or exported assuming a truck can handle 16 cubic yards of material."[8] 53

Here, as the DEIR and associated documents fail to substantiate the use of 20 cy haul trucks during construction, the model may include an overestimated haul truck capacity and therefore underestimate the number of required hauling trips.

Third, the DEIR and associated documents fail to substantiate the estimated number of construction workers anticipated on the site, as listed by the AQA (Appendix AIR, pp. 834). Thus, we cannot verify the number of worker trips assumed in the model. 54

These unsubstantiated changes present an issue, as CalEEMod uses the hauling and worker trip numbers to estimate the construction-related emissions associated with on-road vehicles.[9] Thus, by including unsubstantiated changes to the default hauling and worker trip numbers, the model may underestimate the Project's mobile-source construction-related emissions and should not be relied upon to determine Project significance. 55

Unsubstantiated Reductions to Energy Use Values

Review of the CalEEMod output files demonstrates that the "UCSF New Hospital Operational Run" model includes several changes to the default energy use values (see excerpt below) (Appendix AIR, pp. 915). 56

Table Name	Column Name	Default Value	New Value
tblEnergyUse	LightingElect	4.23	0.00
tblEnergyUse	NT24E	5.52	0.00
tblEnergyUse	NT24NG	15.80	0.00
tblEnergyUse	T24E	5.78	0.00
tblEnergyUse	T24NG	84.04	0.00

As you can see in the excerpt above, the lighting electricity ("LightingElect"), Nontitle-24 electricity energy intensity ("NT24E"), and Title-24 electricity energy intensity ("T24E") values were all reduced to 0 kilowatt hours per square feet ("KWhr/SF"). As previously mentioned, the CalEEMod User's Guide

[8] "Appendix A Calculation Details for CalEEMod." California Air Pollution Control Officers Association (CAPCOA) , May 2021, *available at*: https://www.aqmd.gov/caleemod/user's-guide, p. 14.
[9] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 35.

requires any changes to model defaults be justified.[10] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is:

> "UCSF Net zero electricity by 2025. No new Natural Gas hookups. Natural gas through CUP calculated separately" (Appendix AIR, pp. 914).

Furthermore, regarding the Project's anticipated energy use, the DEIR states:

> "UCSF purchases electricity from the UC Regents through the Direct Access Program, also referred to as the UC Clean Power Program. As of 2019, the UC Clean Power Program became 100 percent carbon neutral through the purchase of carbon-free electricity. UCSF has committed that by 2025, all of its purchased electricity will be carbon-free" (p. 4.5-5).

Finally, the DEIR states:

> "UCSF has committed to net zero electricity by 2025 and no GHG emissions are predicted from electrical usage under buildout of the NHPH" (p. 4.7-36).

56 cont.

However, these justifications are insufficient for four reasons.

First, UCSF's commitment to carbon-free electricity by 2025 is not included as a binding mitigation measure. This is incorrect, as according to the Association of Environmental Professionals ("AEP") *CEQA Portal Topic Paper* on mitigation measures:

> "While not "mitigation", a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact."[11]

57

As you can see in the excerpt above, project design features ("PDFs") that are not formally included as mitigation measures may be eliminated from the Project's design altogether. As such, absent additional information on UCSF's alleged commitment to carbon-free electricity, there is no guarantee that net zero electricity would actually be achieved on the Project site.

Second, while the DEIR claims that "UCSF purchases electricity from the UC Regents through the Direct Access Program, also referred to as the UC Clean Power Program," we cannot verify that UCSF purchases 100% of its electricity through the UC Clean Power Program. Furthermore, according to the University of California ("UC") 2021 Annual Report on Sustainable Practices, "UC Clean Power currently supplies

58

[10] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1.
[11] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 6.

approximately 30% of the University [of California]'s purchased electricity."[12] As such, the UC Clean Power Program is not widely used across all UC campuses. Thus, as the DEIR fails to provide substantial evidence that *all* electricity would be purchased through the UC Clean Power Program, we cannot guarantee that UCSF's commitment to carbon-free electricity would actually be achieved on the Project site.

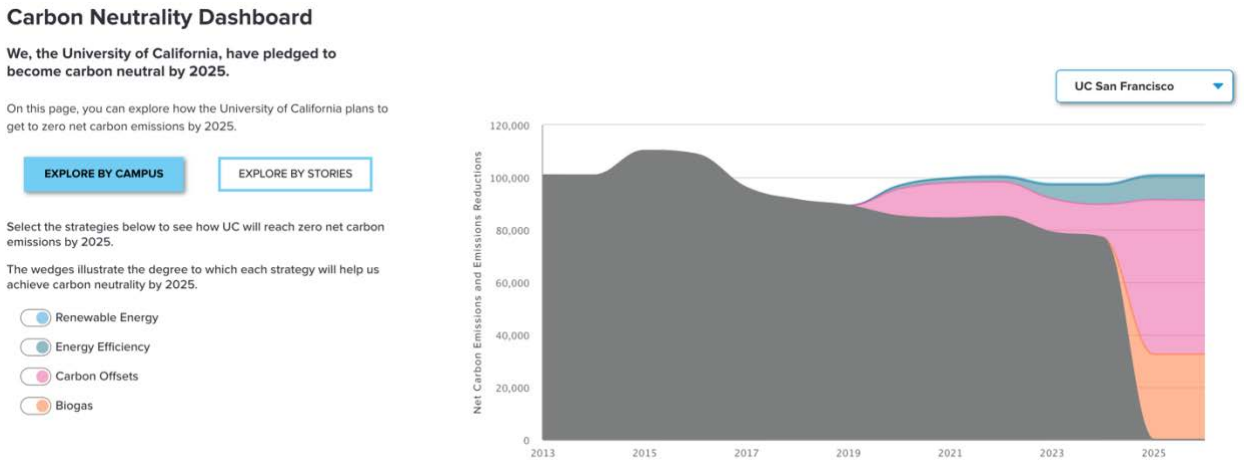
58 cont.

Third, the above-mentioned UC 2021 Annual Report on Sustainable Practices states:

> "To achieve the carbon neutrality goal by 2025, UC locations need to continue on the path to 100% carbon-free electricity, at least 40% biomethane, all-electric new buildings and increased energy efficiency, while also advancing plans for decarbonizing all campus energy systems in the long run and purchasing high quality carbon offsets in the near term."[13]

The UC 2021 Annual Report on Sustainable Practices references the Carbon Neutrality Initiative ("CNI"), which commits UC to emitting net zero greenhouse gas ("GHG") emissions from its buildings and vehicle fleet by 2025.[14] However, as indicated in the above excerpt, CNI does not specifically commit UC or UCSF to net zero electricity. Furthermore, UCSF specifically intends to use a combination of renewable energy, energy efficiency, carbon offsets, and biogas to achieve net zero GHG emissions (see excerpt below).[15]

59



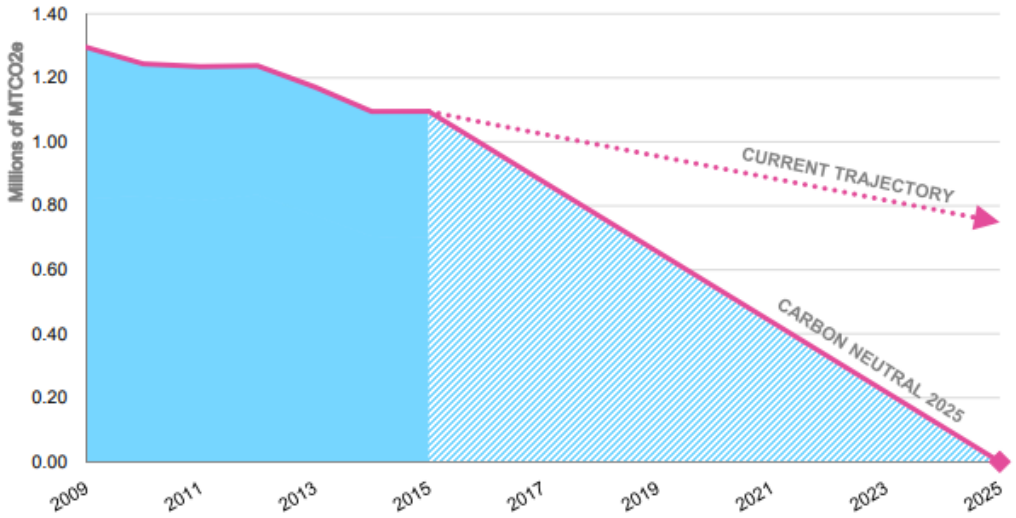
However, as demonstrated above, UCSF intends to primarily rely on carbon offsets, and seemingly no renewable energy, to achieve net zero GHG emissions. As such, UCSF not only fails to adequately commit to net zero electricity or substantiate the purchase of 100% carbon-free electricity, but also

[12] "2021 Annual Report on Sustainable Practices." University of California (UC), 2021, *available at:* https://sustainabilityreport.ucop.edu/2021/wp-content/uploads/sites/3/2021/12/2021-UC-Annual-Report-on-Sustainable-Practices-Summary.pdf, p. 2.
[13] "2021 Annual Report on Sustainable Practices." University of California (UC), 2021, *available at:* https://sustainabilityreport.ucop.edu/2021/wp-content/uploads/sites/3/2021/12/2021-UC-Annual-Report-on-Sustainable-Practices-Summary.pdf, p. 2.
[14] "Carbon Neutrality Initiative." University of California Office of the President, *available at:* https://ucop.edu/carbon-neutrality-initiative/index.html.
[15] "Carbon Neutrality Dashboard." University of California, *available at:* https://cnidashboard.ucop.edu/.

plans to use mostly carbon offsets, which allow for the continued release of GHG emissions and the consequent pollution, to achieve net zero GHG emissions. 59 cont.

Fourth, simply because UCSF has committed to net zero GHG emissions by 2025 does not guarantee that this goal will be achieved. According to the University of California's ("UC['s]") 2017 *Overcoming Barriers to Carbon Neutrality* report, the UC is not currently on track to achieve net zero electrical energy by 2025 (see excerpt below).[16] 60

UC Scope 1 and 2 Greenhouse Gas Emissions: Current Emissions and Trajectory Necessary to Reach Carbon Neutrality by 2025



This graph illustrates UC's current rate of progress toward eliminating carbon from our operations. We are on track for 2040. The question is how to gain sufficient momentum to achieve carbon neutrality by 2025.

As such, without additional information regarding how the proposed Project would feasibly achieve zero net electrical energy by 2025, the revised energy use values are unsubstantiated.

These unsubstantiated changes present an issue, as the energy use values are used by CalEEMod to calculate the Project's emissions associated with building electricity and natural gas usage.[17] By including unsubstantiated reductions to the Project's anticipated energy use values, the model may underestimate the Project's operational emissions and should not be relied upon to determine Project significance. 61

Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated

The DEIR concludes that the NHPH Project would result in a less-than-significant health risk impact based on quantified construction-related and operational health risk analyses ("HRA(s)") (p. 4.2-32, 4.2-35). Specifically, the DEIR estimates that the mitigated residential cancer risk posed to nearby, existing 62

[16] "Overcoming Barriers to Carbon Neutrality." University of California, August 2017, *available at:* https://ucop.edu/carbon-neutrality-initiative/_files/overcoming-barriers-to-carbon-neutrality.pdf, p. I.
[17] CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 43.

sensitive receptors associated with Project construction and operation would be 5.6 and 8.6 in one million, respectively (see excerpts below) (p. 4.2-32, Table 4.2-10; p. 4.2-35, Table 4.2-11).

NHPH Construction:

TABLE 4.2-10
MITIGATED PROJECT HEALTH RISK ESTIMATED, NHPH CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Off-Campus Residence			
Project Construction[d]	5.6	0.01	0.03
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

NHPH Operation:

TABLE 4.2-11
ESTIMATED OPERATIONAL HEALTH IMPACTS OF THE NHPH

Receptor Type	Cancer Risk	Chronic Hazard Index	Acute Hazard Index	$PM_{2.5}$ Concentration ($\mu g/m3$)[d]
Off-Campus Residence				
Project Operations	8.6	0.01	0.02	0.14
Significance Threshold	10	1.0	1.0	0.3
Significant (Yes or No)?	No	No	No	No

62 cont.

However, the DEIR's evaluation of the Project's potential health risk impacts, as well as the subsequent less-than-significant impact conclusion, is incorrect for two reasons.

First, the DEIR's operational HRA fails to account for all mobile-source diesel particulate matter ("DPM") emissions. Specifically, the DEIR states:

> "Emissions calculations and air dispersion modeling was completed for the New Hospital building's fume hoods, cooling tower and emergency diesel generators, the increase in natural gas combustion at the CUP, and loading dock emissions associated with increased deliveries" (p. 4.2-34).

As demonstrated above, the DEIR's operational HRA calculations consider emissions associated with delivery vehicles. However, according to the DEIR:

63

> "Increased vehicle emissions from additional hospital visitors and staff, would be one of the major sources of operational emissions. The net increase in VMT that would occur with operation of the NHPH that was used in this analysis to estimate vehicle-related emissions was derived from the transportation analysis in Section 4.15, *Transportation*. Project operations are projected to generate approximately 53,600 additional daily VMT. In addition to exhaust emissions, vehicles would also generate PM_{10} and $PM_{2.5}$ emissions from entrained road dust and tire and brake wear" (p. 4.2-29).

As demonstrated above, the Project's mobile-source emissions are largely generated by hospital visitors and staff. As such, by failing to evaluate all mobile-source emissions, the DEIR's operational HRA and associated cancer risk are underestimated.

Second, the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California, released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* in February 2015.[18] According to OEHHA guidance, "the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location." [19] Here, the DEIR includes two HRAs evaluating the health risk impacts to nearby, existing receptors as a result of Project construction and operation, but violates OEHHA guidance by failing to evaluate the combined lifetime cancer risk as a result of Project construction and operation together. Thus, the DEIR's HRAs fail to sum each age bin to evaluate the total cancer risk over the course of the Project's total construction and operation. This is incorrect and, as such, an updated analysis should quantify the entirety of the Project's construction and operational health risks and then sum them to compare to the BAAQMD threshold of 10 in one million, as referenced by the DEIR (p. 4.2-33). 64

Failure to Identify a Potentially Significant Health Risk Impact

As previously described, the DEIR estimates that the maximum individual cancer risk posed to nearby, existing sensitive receptors as a result of Project construction and operation would be 5.6 and 8.6 in one million, respectively, neither of which individually exceed the BAAQMD significance threshold of 10 in one million (p. 4.2-32, Table 4.2-10; p. 4.2-35, Table 4.2-11). However, as previously discussed, the DEIR should have evaluated the combined construction-related and operational cancer risks resulting from the Project. In order to correctly evaluate and disclose the Project's health risk impact, we summed the DEIR's construction-related and operational cancer risk estimates and found that the resulting cancer risk exceeds the BAAQMD threshold of 10 in one million (see table below). 65

NHPH Total Cancer Risk	
HRA	**Cancer Risk** (in one million)
Construction	5.6
Operation	8.6
SWAPE	14.20
BAAQMD Threshold	**10**
Exceeds?	***Yes***

As demonstrated in the table above, the resulting combined cancer risk estimate exceeds the BAAQMD threshold of 10 in one million. Thus, the Project poses a potentially significant health risk to nearby existing sensitive receptors, which was not previously identified or addressed by the DEIR. As such, the

[18] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/air/crnr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0.

[19] "Guidance Manual for preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf p. 8-4

DEIR is required under CEQA to implement all feasible mitigation to reduce impacts to a less-than-significant level. According to CEQA Guidelines § 15096(g)(2):

> "When an EIR has been prepared for a project, the Responsible Agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment."

65 cont.

As you can see, the proposed Project should not be approved until all feasible mitigation has been considered and incorporated where feasible, such as those suggested in the section of this letter titled "Feasible Mitigation Measures Available to Reduce Emissions." As such, the DEIR fails to identify and adequately mitigate the Project's potentially significant health risk impact, and the less-than-significant impact conclusion should not be relied upon.

Furthermore, when accounting for the UCSF Comprehensive Heights Plan Project ("CPHP") as a whole, the proposed Project poses a greater health risk impact. Specifically, the DEIR states:

> "The CPHP included an "Initial Phase" to be completed by approximately year 2030 that primarily comprised: 1) Irving Street Arrival improvements, 2) a Research and Academic Building (RAB), 3) a New Hospital, and 4) initial Aldea Housing Densification; as well as certain other Initial Phase improvements" (p. 3-2).

As such, when considering construction and operation of all four components of the CPHP, the proposed Project results in a larger combined cancer risk. Review of the July 2020 Draft Environmental Impact Report for the UCSF Comprehensive Parnassus Heights Plan ("CPHP EIR") demonstrates that construction of the Irving Street Arrival, RAB, and Initial Aldea Housing Densification would result in cancer risks pf 1.17, 2.91, and 0.67 in one million, respectively, after the implementation of CPHP Mitigation Measure AIR-1a (see excerpts below) (p. 4.2-53-56, Table 4.2-15, Table 4.2-16, Table 4.2-18).

66

Irving Street Arrival Construction:

TABLE 4.2-15
MITIGATED PROJECT HEALTH IMPACTS ESTIMATED, IRVING STREET ARRIVAL CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Resident – Offsite Receptor			
Project Construction[d]	1.17	<0.01	<0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

RAB Construction:

TABLE 4.2-16
MITIGATED PROJECT HEALTH IMPACTS ESTIMATED, RAB CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Resident – Offsite Receptor			
Project Construction[d]	2.91	<0.01	0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

Initial Aldea Housing Densification Construction:

TABLE 4.2-18
MITIGATED PROJECT HEALTH IMPACTS ESTIMATED, INITIAL ALDEA HOUSING DENSIFICATION CONSTRUCTION

Receptor Type[a]	Cancer Risk	Chronic Hazard Index[b,c]	$PM_{2.5}$ Concentration ($\mu g/m^3$)[c]
Resident – Offsite Receptor			
Project Construction[d]	0.67	<0.01	<0.01
Significance Threshold	10	1.0	0.3
Significant (Yes or No)?	No	No	No

66 cont.

Furthermore, the CPHP EIR estimates that the residential cancer risk posed to nearby, existing sensitive receptors associated with operation of the RAB component of the Initial Phase would be 0.26 in one million (see excerpt below) (p. 4.2-62, Table 4.2-19).

RAB Operation:

TABLE 4.2-19
ESTIMATED OPERATIONAL HEALTH IMPACTS OF THE RAB

Receptor Type	Cancer Risk	Chronic Hazard Index	Acute Hazard Index	$PM_{2.5}$ Concentration ($\mu g/m3$)[d]
Resident – Offsite Receptor				
Project Operations	0.26	<0.01	<0.01	0.01
Significance Threshold	10	1.0	1.0	0.3
Significant (Yes or No)?	No	No	No	No
Resident – Onsite Residence				
Project Operations	0.04	<0.01	<0.01	<0.01
Significance Threshold	10	1.0	1.0	0.3
Significant (Yes or No)?	No	No	No	No

However, as previously discussed, the DEIR should have evaluated the combined the construction-related and operational cancer risks resulting from the Project. In order to correctly evaluate the Project's health risk impact, we summed the DEIR's construction-related and operational cancer risk estimates and found that the resulting cancer risk exceeds the BAAQMD threshold of 10 in one million (see table below).

67

CHPH Total Cancer Risk	
HRA	**Cancer Risk** (in one million)
NHPH Construction	5.6
Irving Street Arrival Construction	1.17
RAB Construction	2.91
Initial Aldea Housing Densification Construction	0.67
NHPH Operation	8.6
RAB Operation	0.26
SWAPE	19.21
BAAQMD Threshold	**10**
Exceeds?	***Yes***

67 cont.

As demonstrated in the table above, the resulting combined cancer risk estimate associated with all four components of the UCSF CPHP exceeds the BAAQMD threshold of 10 in one million by a greater extent. Furthermore, the resulting combined cancer risk still fails to include and sum the cancer risk associated with operation of the Irving Street Arrival and Initial Aldea Housing Densification components of the CPHP. Regardless, the Project again poses a potentially significant health risk to nearby existing sensitive receptors, which was not previously identified or addressed by the DEIR.

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR estimates that the Project would generate net annual greenhouse gas ("GHG") emissions of 27,449 metric tons of carbon dioxide equivalents per year ("MT CO_2e/year"), which exceeds the net zero threshold (see excerpt below) (p. 4.7-36, Table 4.7-3).

68

TABLE 4.7-3
ANNUAL OPERATIONAL GHG EMISSIONS: YEAR 2030 WITH THE NHPH

Emission Source	Emissions (metric tons year)			
	CO_2	CH_4	N_2O	Total CO_2e
Mobile Sources[a]	5,550	<1	<1	5,644
Electricity[b]	0	0	0	0
Natural gas combustion (CUP)	19,729	0.3	1.04	20,047
Water and wastewater	35.8	3.7	<1	154
Solid Waste	434	25.7	<1	1,075
Generators	237	<1	<1	237
Construction (Amortized 30 years)	292	<1	<1	292
Total Increase in GHGs (2030)	**26,278**	29.7	1	**27,449**
Achieve Net Zero Increase?				No
Significant Impact?				Yes

However, the DEIR concludes that the Project would result in a less-than-significant GHG impact after the implementation of Mitigation Measure ("MM") GHG-1 (p. 4.7-38 - 4.7-40). Specifically, MM GHG-1 states:

> "NHPH Mitigation Measure GHG-1: Monitor emissions annually and acquire carbon offset credits in conformance with CARB guidance, prioritizing local and in- State offsets to achieve and maintain carbon neutrality for the NHPH as part of campus-wide emissions.
>
> As part of this mitigation measure, UCSF is making the following separate, though overlapping, GHG emission reduction commitments: (1) As a CARB-covered entity, UCSF will maintain compliance with CARB's cap and trade program; (2) Per existing UC Policy, UCSF's Scope 1 and Scope 2 GHG emissions shall, commencing in 2025, be entirely carbon neutral; (3) Also per existing UC Policy, commencing in 2025, UCSF's Scope 1 and Scope 2 emissions shall be voluntarily offset while Scope 3 emissions from commuters and air travel shall be voluntarily offset by 2050; and (4) UCSF's total GHG operational emissions from all Scope 1, 2, and 3 sources (as defined in this EIR) shall not exceed the Parnassus Heights campus's baseline emissions from these sources in 2019" (p. 4.7-38 – 4.7-39).

68 cont.

However, the DEIR's GHG analysis, as well as the subsequent less-than-significant impact conclusion, is incorrect for three reasons.

First, as previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 27,449 MT CO_2e/year (p. 4.7-36, Table 4.7-3). However, the DEIR's quantitative GHG analysis is unsubstantiated. As previously discussed, when we reviewed the Project's CalEEMod output files, provided in the AQA as Appendix AIR to the DEIR, we found that several of the values inputted into the model are not consistent with information disclosed in the DEIR. As a result, the model underestimates the Project's emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. An updated EIR should be prepared that adequately assesses the potential GHG impacts that construction and operation of the proposed Project may have on the surrounding environment.

69

Second, the air model assumes the Project will achieve net zero electricity. As such, DEIR estimates that the Project would generate zero energy-related GHG emissions (see excerpt below) (p. 4.7-36, Table 4.7-3).

70

TABLE 4.7-3
ANNUAL OPERATIONAL GHG EMISSIONS: YEAR 2030 WITH THE NHPH

Emission Source	Emissions (metric tons year)			
	CO_2	CH_4	N_2O	Total CO_2e
Mobile Sources[a]	5,550	<1	<1	5,644
Electricity[b]	0	0	0	0
Natural gas combustion (CUP)	19,729	0.3	1.04	20,047
Water and wastewater	35.8	3.7	<1	154
Solid Waste	434	25.7	<1	1,075
Generators	237	<1	<1	237
Construction (Amortized 30 years)	292	<1	<1	292
Total Increase in GHGs (2030)	**26,278**	29.7	1	**27,449**
Achieve Net Zero Increase?				No
Significant Impact?				Yes

70 cont.

However, as previously discussed in the section of this letter titled "Unsubstantiated Reductions to Energy Use Values," UCSF fails to commit to net zero electricity. Rather, the Carbon Neutrality Initiative loosely commits UCSF to emit net zero GHG emissions through the use of carbon offsets, which allow for the continued release of GHG emissions. As a result, because the DEIR's analysis assumes that the Project would utilize net zero electrical energy by 2025, and the record does not support that assumption, we cannot verify the DEIR's less-than-significant impact conclusion.

Third, we recommend the Project consider further mitigation measures to reduce tangible Project-generated GHG emissions. According to NHPH Mitigation Measure ("MM") GHG-1:

> "UCSF shall monitor GHG operational emissions from all Scope 1, 2 and 3 sources annually. Upon the completion and occupancy of the NHPH, inclusive of the related improvements, in 2033, the estimated annual emissions shall be compared to the campus site year 2019 baseline of 127,083 MT CO_2e per year to determine whether the emissions have increased above the baseline level. For the identified amount of exceedance of the performance standard, UCSF shall purchase carbon offset credits sufficient to maintain carbon neutrality" (p. 2-20).

71

As demonstrated above, the DEIR fails to implement any additional mitigation measures to reduce localized GHG emissions, and instead proposes the use of carbon offsets to maintain carbon neutrality. Thus, as the DEIR fails to define an exceedance limit, Project-generated GHG emissions may considerably exceed the campus site year 2019 baseline. UCSF's intended use of only carbon offsets to maintain carbon neutrality is irresponsible and careless. Instead of making any attempt to directly reduce Project-generated GHG emissions, the Project uses carbon offsets as a way to keep polluting the environment. According to Greenpeace, the largest environmental organization in the world:

> "There is a reason that Indigenous Environmental Network and Indigenous Climate Action held a protest against offsetting at COP26, the UN's annual climate conference: Offsetting incentivizes the commodification of nature and allows powerful corporations to take over the lands of vulnerable communities, risking human rights abuses. Offset schemes often exclude local and

> Indigenous Peoples from land management practices that allow them to grow food and preserve biodiversity."[20]

71 cont.

Furthermore, according to the World Economic Forum:

> "What these polluting profiteers see as their "get-out-of-jail-free card" in the climate game is offsetting – or, to speak plainly, the heap of voluntary net-zero commitments that are being rolled out almost daily. Nothing new, offsetting is about paying for someone else to reduce or remove carbon, while you continue pumping it into the atmosphere."[21]

72

Thus, as one of the nation's leading academic medical centers, UCSF's reliance on carbon offsets is imprudent and sets a bad precedent. Additionally, California's Cap-and-Trade Program limits the use of offsets to only 4% of a company's compliance obligation each year, thus demonstrating that the use of offsets should not act as an entire solution.[22]

Furthermore, review of correspondence between UCSF staff dated August 19, 2020 to August 20, 2020 demonstrates that a cost benefit analysis indicated that carbon offsets are cheaper than project design or engineering features intended to actually reduce emissions.[23] By concluding a less-than-significant GHG impact after relying solely on carbon offset mitigation, it appears that UCSF prioritizes cost rather than environmental protection. We find this to be in direct contradiction with CEQA's intent to prevent or minimize environmental damage to the highest extent possible.

73

In order to reduce the Project's GHG impacts to the maximum extent possible, we recommend additional feasible mitigation measures be incorporated, such as those suggested in the section of this letter titled "Feasible Mitigation Measures Available to Reduce Emissions." As a result, we recommend the Project not be approved until an updated EIR is prepared and incorporates all feasible mitigation, including specifically project design and engineering features, to reduce localized Project-generated GHG emissions.

74

Feasible Mitigation Measures Available to Reduce Emissions

Our analysis demonstrates that the Project would result in a significant health risk impact that should be mitigated further. We also recommend that the DEIR consider mitigation measures to reduce localized GHG emissions at the Project site. As such, in an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project. Therefore, to reduce the Project's emissions, we recommend consideration of SCAG's 2020 *RTP/SCS* PEIR's Air Quality Project

Level Mitigation Measures ("PMM-AQ-1") and Greenhouse Gas Project Level Mitigation Measures ("PMM-GHG-1"), as described below: [24]

SCAG RTP/SCS 2020-2045
Air Quality Project Level Mitigation Measures – PMM-AQ-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:
b) Suspend grading and earth moving when wind gusts exceed 25 miles per hour unless the soil is wet enough to prevent dust plumes.
d) Stabilize the surface of dirt piles if not removed immediately.
e) Limit vehicular paths on unpaved surfaces and stabilize any temporary roads.
f) Minimize unnecessary vehicular and machinery activities.
h) Revegetate disturbed land, including vehicular paths created during construction to avoid future off-road vehicular activities.
j) Require contractors to assemble a comprehensive inventory list (i.e., make, model, engine year, horsepower, emission rates) of all heavy-duty off-road (portable and mobile) equipment (50 horsepower and greater) that could be used an aggregate of 40 or more hours for the construction project. Prepare a plan for approval by the applicable air district demonstrating achievement of the applicable percent reduction for a CARB-approved fleet.
n) Utilize existing power sources (e.g., power poles) or clean fuel generators rather than temporary power generators.
o) Develop a traffic plan to minimize traffic flow interference from construction activities. The plan may include advance public notice of routing, use of public transportation, and satellite parking areas with a shuttle service. Schedule operations affecting traffic for off-peak hours. Minimize obstruction of through-traffic lanes. Provide a flag person to guide traffic properly and ensure safety at construction sites.
p) As appropriate require that portable engines and portable engine-driven equipment units used at the project work site, with the exception of on-road and off-road motor vehicles, obtain CARB Portable Equipment Registration with the state or a local district permit. Arrange appropriate consultations with the CARB or the District to determine registration and permitting requirements prior to equipment operation at the site.
t) Where applicable, projects should provide information about air quality related programs to schools, including the Environmental Justice Community Partnerships (EJCP), Clean Air Ranger Education (CARE), and Why Air Quality Matters programs.
u) Projects should work with local cities and counties to install adequate signage that prohibits truck idling in certain locations (e.g., near schools and sensitive receptors).
y) Projects that will introduce sensitive receptors within 500 feet of freeways and other sources should consider installing high efficiency of enhanced filtration units, such as Minimum Efficiency Reporting Value (MERV) 13 or better. Installation of enhanced filtration units can be verified during occupancy inspection prior to the issuance of an occupancy permit.

75 cont.

[24] "4.0 Mitigation Measures." Connect SoCal Program Environmental Impact Report Addendum #1, September 2020, available at: https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocal_addendum_4_mitigationmeasures.pdf?1606004420, p. 4.0-2 – 4.0-10; 4.0-19 – 4.0-23; See also: "Certified Final Connect SoCal Program Environmental Impact Report." Southern California Association of Governments (SCAG), May 2020, *available at:* https://scag.ca.gov/peir.

z) Develop an ongoing monitoring, inspection, and maintenance program for the MERV filters.

aa) Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities.

bb) The following criteria related to diesel emissions shall be implemented on by individual project sponsors as appropriate and feasible:

- Diesel nonroad vehicles on site for more than 10 total days shall have either (1) engines that meet EPA on road emissions standards or (2) emission control technology verified by EPA or CARB to reduce PM emissions by a minimum of 85%
- Diesel generators on site for more than 10 total days shall be equipped with emission control technology verified by EPA or CARB to reduce PM emissions by a minimum of 85%.
- Nonroad diesel engines on site shall be Tier 2 or higher.
- Diesel nonroad construction equipment on site for more than 10 total days shall have either (1) engines meeting EPA Tier 4 nonroad emissions standards or (2) emission control technology verified by EPA or CARB for use with nonroad engines to reduce PM emissions by a minimum of 85% for engines for 50 hp and greater and by a minimum of 20% for engines less than 50 hp.
- Emission control technology shall be operated, maintained, and serviced as recommended by the emission control technology manufacturer.
- Diesel vehicles, construction equipment, and generators on site shall be fueled with ultra-low sulfur diesel fuel (ULSD) or a biodiesel blend approved by the original engine manufacturer with sulfur content of 15 ppm or less.
- The construction contractor shall maintain a list of all diesel vehicles, construction equipment, and generators to be used on site. The list shall include the following:
    i. Contractor and subcontractor name and address, plus contact person responsible for the vehicles or equipment.
    ii. Equipment type, equipment manufacturer, equipment serial number, engine manufacturer, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation.
    iii. For the emission control technology installed: technology type, serial number, make, model, manufacturer, EPA/CARB verification number/level, and installation date and hour-meter reading on installation date.
- The contractor shall establish generator sites and truck-staging zones for vehicles waiting to load or unload material on site. Such zones shall be located where diesel emissions have the least impact on abutters, the general public, and especially sensitive receptors such as hospitals, schools, daycare facilities, elderly housing, and convalescent facilities.
- The contractor shall maintain a monthly report that, for each on road diesel vehicle, nonroad construction equipment, or generator onsite, includes:
    i. Hour-meter readings on arrival on-site, the first and last day of every month, and on off-site date.
    ii. Any problems with the equipment or emission controls.
    iii. Certified copies of fuel deliveries for the time period that identify:
        1. Source of supply
        2. Quantity of fuel
        3. Quantity of fuel, including sulfur content (percent by weight)

cc) Project should exceed Title-24 Building Envelope Energy Efficiency Standards (California Building Standards Code). The following measures can be used to increase energy efficiency:

- Provide pedestrian network improvements, such as interconnected street network, narrower roadways and shorter block lengths, sidewalks, accessibility to transit and transit shelters, traffic calming measures, parks and public spaces, minimize pedestrian barriers.
- Provide traffic calming measures, such as:
    i. Marked crosswalks
    ii. Count-down signal timers
    iii. Curb extensions iv. Speed tables

75 cont.

iv. Raised crosswalks
v. Raised intersections
vi. Median islands
vii. Tight corner radii
viii. Roundabouts or mini-circles
ix. On-street parking
x. Chicanes/chokers

- Create urban non-motorized zones
- Provide bike parking in non-residential and multi-unit residential projects
- Dedicate land for bike trails
- Limit parking supply through:
  i. Elimination (or reduction) of minimum parking requirements
  ii. Creation of maximum parking requirements
  iii. Provision of shared parking
- Require residential area parking permit.
- Provide ride-sharing programs
  i. Designate a certain percentage of parking spacing for ride sharing vehicles
  ii. Designating adequate passenger loading and unloading and waiting areas for ride-sharing vehicles
  iii. Providing a web site or messaging board for coordinating rides
  iv. Permanent transportation management association membership and finding requirement.

Greenhouse Gas Project Level Mitigation Measures – PMM-GHG-1

In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:

75 cont.

b) Reduce emissions resulting from projects through implementation of project features, project design, or other measures, such as those described in Appendix F of the State CEQA Guidelines.

d) Measures that consider incorporation of Best Available Control Technology (BACT) during design, construction and operation of projects to minimize GHG emissions, including but not limited to:

i. Use energy and fuel-efficient vehicles and equipment;
ii. Deployment of zero- and/or near zero emission technologies;
iii. Use lighting systems that are energy efficient, such as LED technology;
iv. Use the minimum feasible amount of GHG-emitting construction materials;
v. Use cement blended with the maximum feasible amount of flash or other materials that reduce GHG emissions from cement production;
vi. Incorporate design measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse;
vii. Incorporate design measures to reduce energy consumption and increase use of renewable energy;
viii. Incorporate design measures to reduce water consumption;
ix. Use lighter-colored pavement where feasible;
x. Recycle construction debris to maximum extent feasible;
xi. Plant shade trees in or near construction projects where feasible; and
xii. Solicit bids that include concepts listed above.

e) Measures that encourage transit use, carpooling, bike-share and car-share programs, active transportation, and parking strategies, including, but not limited to the following:

i. Promote transit-active transportation coordinated strategies;
ii. Increase bicycle carrying capacity on transit and rail vehicles;
iii. Improve or increase access to transit;
iv. Increase access to common goods and services, such as groceries, schools, and day care;
v. Incorporate affordable housing into the project;
vi. Incorporate the neighborhood electric vehicle network;
vii. Orient the project toward transit, bicycle and pedestrian facilities;
viii. Improve pedestrian or bicycle networks, or transit service;
ix. Provide traffic calming measures;
x. Provide bicycle parking;
xi. Limit or eliminate park supply;
xii. Unbundle parking costs;
xiii. Provide parking cash-out programs;
xiv. Implement or provide access to commute reduction program;

f) Incorporate bicycle and pedestrian facilities into project designs, maintaining these facilities, and providing amenities incentivizing their use; and planning for and building local bicycle projects that connect with the regional network;

g) Improving transit access to rail and bus routes by incentives for construction and transit facilities within developments, and/or providing dedicated shuttle service to transit stations; and

h) Adopting employer trip reduction measures to reduce employee trips such as vanpool and carpool programs, providing end-of-trip facilities, and telecommuting programs including but not limited to measures that:

i. Provide car-sharing, bike sharing, and ride-sharing programs;
ii. Provide transit passes;
iii. Shift single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching services;
iv. Provide incentives or subsidies that increase that use of modes other than single-occupancy vehicle;
v. Provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms;
vi. Provide employee transportation coordinators at employment sites;
vii. Provide a guaranteed ride home service to users of non-auto modes.

i) Designate a percentage of parking spaces for ride-sharing vehicles or high-occupancy vehicles, and provide adequate passenger loading and unloading for those vehicles;

j) Land use siting and design measures that reduce GHG emissions, including:

i. Developing on infill and brownfields sites;
ii. Building compact and mixed-use developments near transit;
iii. Retaining on-site mature trees and vegetation, and planting new canopy trees;
iv. Measures that increase vehicle efficiency, encourage use of zero and low emissions vehicles, or reduce the carbon content of fuels, including constructing or encouraging construction of electric vehicle charging stations or neighborhood electric vehicle networks, or charging for electric bicycles; and
v. Measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse.

k) Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities. The measures provided above are also intended to be applied in low income and minority communities as applicable and feasible.

75 cont.

l) Require at least five percent of all vehicle parking spaces include electric vehicle charging stations, or at a minimum, require the appropriate infrastructure to facilitate sufficient electric charging for passenger vehicles and trucks to plug-in.
m) Encourage telecommuting and alternative work schedules, such as: i. Staggered starting times ii. Flexible schedules iii. Compressed work weeks
n) Implement commute trip reduction marketing, such as: i. New employee orientation of trip reduction and alternative mode options ii. Event promotions iii. Publications
o) Implement preferential parking permit program
p) Implement school pool and bus programs
q) Price workplace parking, such as: i. Explicitly charging for parking for its employees; ii. Implementing above market rate pricing; iii. Validating parking only for invited guests; iv. Not providing employee parking and transportation allowances; and v. Educating employees about available alternatives.

75 cont.

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation. An updated EIR should be prepared to include all feasible mitigation measures, as well as include updated health risk and GHG analyses to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The updated EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible.

76

Disclaimer

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

RE: UCSF New Hospital at Parnassus Heights

Dear Ms. Wong,

I write to comment on UCSF's (2021) Draft Environmental Impact Report ("DEIR") prepared for the UCSF New Hospital at Parnassus Heights project, which I understand would add 900,000 square feet of floor space within a 15-story building on Block/lot 2634A/011 & 005. The DEIR inadequately addresses bird-window collisions. 77

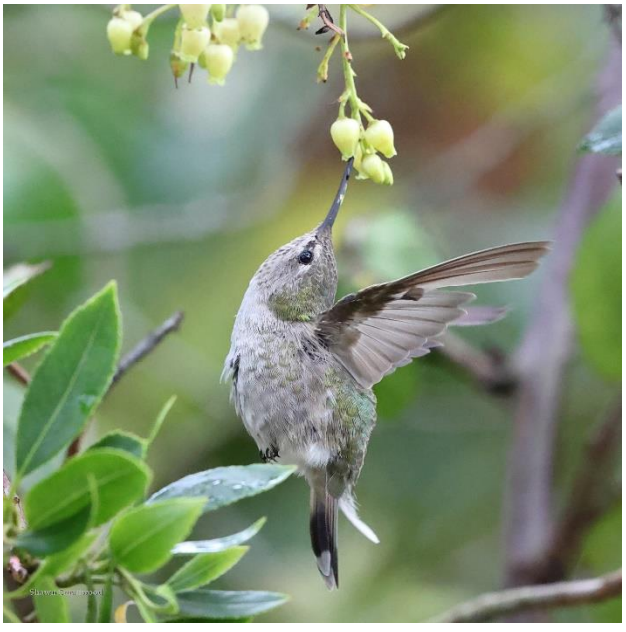
My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I subsequently worked for four years as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, habitat restoration, interactions between wildlife and human infrastructure and activities, and conservation of rare and endangered species. I perform research on wildlife mortality caused by wind turbines, electric distribution lines, agricultural practices, and road traffic, among other human activities and structures. I authored numerous papers on special-status species issues. I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and the Raptor Research Foundation, and I've been a part-time lecturer at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-three years, including at many proposed project sites. My CV is attached.

SITE VISITS

I twice visited the Parnassus Campus Hospital site and the Mount Sutro Open Space Reserve including Aldea Housing. I included Mount Sutro Open Space Reserve in my visits because it would be both a source and destination of flying birds at risk of colliding with the proposed new building, so it was important to identify as many of the bird species that occur there as possible within the survey time available. I visited for 3.5 hours starting at 08:17 hours on 20 August 2020, and for 3.57 hours starting at 09:14 hours on 16 July 2021. During both visits, the Marine Layer dominated the sky until the last 90 minutes or so. I surveyed on foot, using binoculars to scan for wildlife. My reporting of my first visit also appears in my comment letter of 1 September 2020 regarding the proposed Comprehensive Parnassus Heights Plan. 78

The forested areas east and south of the proposed project site supports many Allen's and Anna's hummingbirds (Photos 1 and 2). I saw Downy woodpeckers and Nuttall's woodpeckers (Photos 3 and 4), pygmy nuthatches and common ravens (Photos 5 and 6), Wilson's warblers and song sparrows (Photos 7 and 8), dark-eyed juncos and house finches (Photos 9 and 10), Pacific wrens (Photo 11), American robins and chestnut-backed chickadees (Photos 12 and 13), and red-masked parakeets (Photo 14). There were many fledgling birds.

78 cont.



Photos 1 and 2. *Allen's hummingbird (above) and Anna's hummingbird (right) in Mount Sutro Open Space Reserve, 16 July 2021. As found at the nearby California Academy of Sciences Building, these species are highly vulnerable to window collision mortality (Kahle et al. 2016).*

Photos 3 and 4. *Downy woodpecker (left) and Nuttall's woodpecker (right) on the Mount Sutro Open Space Reserve, 16 July 2021 and 20 August 2020.*

78 cont.

Photos 12 and 13. *American robin finch (left) and chestnut-backed chickadee with worm (right) on the Mount Sutro Open Space Reserve, 16 July 2021.*

Photo 14. *Red-masked parakeets in intense social drama on the Mount Sutro Open Space Reserve, 16 July 2021.*

Between my two visits, I detected at least 39 species of vertebrate wildlife, but the survey outcomes of Golden Gate Audubon Society (GGAS 2021) added 32 species for a total 71 species detected recently by biologists (Table 1). Thirteen (18%) of the species detected are special-status species and only 4 non-native species. If the Reserve was surveyed over several years, the number of bird species would likely far exceed the 71 species GGAS and I detected altogether. eBird and iNaturalist records further indicate a long list of species use Mount Sutro Open Space Reserve and the Parnassus Campus (Table 2), including 48 special-status species of birds and Monarchs. The site is richer in bird species than my surveys and those of GGAS indicate at face value.

78 cont.

CURRENT ENVIRONMENTAL SETTING

The first step in analysis of potential project impacts to biological resources is to accurately characterize the existing environmental setting, including the species that use the site, their relative abundances, how they use the site, key ecological relationships, and known and ongoing threats to those species with special status. A reasonably accurate characterization of the environmental setting can provide the baseline against which to analyze project impacts. Methods to achieve this first step should include surveys of the site for biological resources and reviews of literature, databases and local experts for documented occurrences of special-status species. In this case, there was no survey of the site for biological resources and the other essential steps were left incomplete. Herein I provide additional characterization of the wildlife community as a component of the current environmental setting, including the identification of special-status species likely to use the site at one time or another, and including the species using the Mount Sutro Open Space Reserve. The wildlife community of Mount Sutro Open Space Reserve is of critical importance to the proposed project because it includes the birds that would be put at risk of collision with the new building.

The DEIR determines the occurrence likelihoods of only a few special-status species, i.e., 7 species in Table 2. I expect that determinations of occurrence likelihood would have been made for many more special-status species had the consulting biologists completed surveys at and around the project site. Had surveys been completed, those biologists likely would have seen at least some of the 39 species I saw at the project site and within the adjacent Mount Sutro Open Space Reserve. I detected 8 special-status species of vertebrate wildlife, only 1 of which was considered in the DEIR. The DEIR determines that peregrine falcon has a moderte likelihood of occurrence, but I saw it looking over Mount Sutro Open Space Reserve both times I surveyed there. 79

The DEIR makes no mention of my findings from my first survey, which I reported in my comment letter of 1 September 2020 regarding the Comprehensive Parnassus Heights Plan. Nor does the DEIR mention the findings of surveys performed by Golden Gate Audubon Society on behalf of University of California, San Francisco (GGAS 2020, 2021). Between the GGAS surveys and mine, we detected 71 species including 13 with special status. Only 1 of these 13 special-status species is assigned a likelihood of occurrence determination in the DEIR, and that is peregrine falcon. The DEIR fails to sufficiently report findings that bear on the accurate characterization of the current environmental setting.

The DEIR reports documentation of 99 bird species reported on the project site or within Mount Sutro Open Space Reserve. I expect that many of the species included in the tally of 99 are special-status species, but the DEIR reports only the tally and not which species have been documented there. My Table 2 reports some of the 99 species cited by the DEIR. The DEIR should be revised to include full documentation of what was found on eBird as well as what was found by me and GGAS (2020, 2021).

Regarding my surveys, there were only so many species I was likely to detect within the short time I had available to perform visual-scan surveys on 20 August 2020 and 16 July

2021. As would be the case for any reconnaissance-level survey, the time I could commit to my survey was grossly short of the time needed to sufficiently inventory the species that use the area. Observers are imperfect at detecting all the species that occur within their surveyed space, and not all of the species that would occur in the surveyed space would occur there during the period of the observer's survey. However, one can model the pattern in species detections during a survey as a means to estimate the number of species that used the site but were not detected during the survey. To support such a modeling effort, the observer needs to record the times into the survey when each species was first detected. Cumulative first detections increase with increasing survey time, but eventually with diminishing returns (Figure 1). (Minutes into the survey can be thought of as person-minutes, thereby constraining model predictions to the environmental conditions experienced during the time period of the survey.) This modeling approach is useful for more realistically representing the species richness of the site at the time of the survey, but it cannot represent the species richness throughout the year or across multiple years because many species are seasonal or even multi-annual in their movement patterns and occupation of habitat.

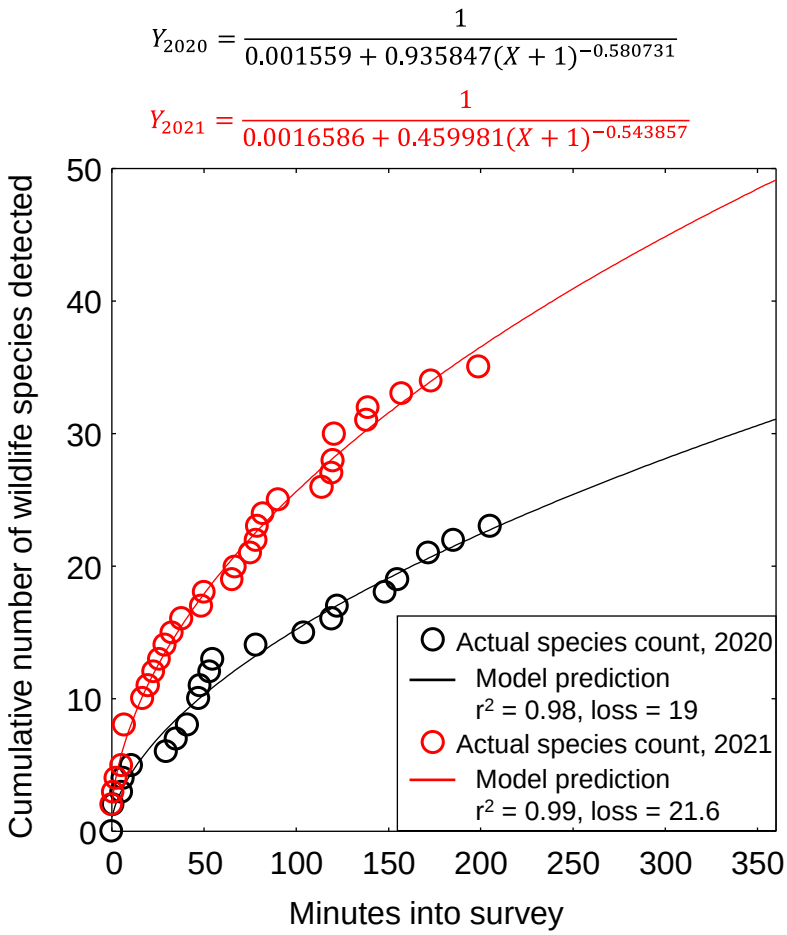

Figure 1. *Actual and predicted relationships between the number of vertebrate wildlife species detected and the elapsed survey time based on my visual-scan surveys on 20 August 2020 and 16 July 2021. Note that the relationships would differ if the surveys were based on another method or during another season. Also note that the cumulative number of vertebrate species across all methods, times of day, and seasons would increase substantially.*

79 cont.

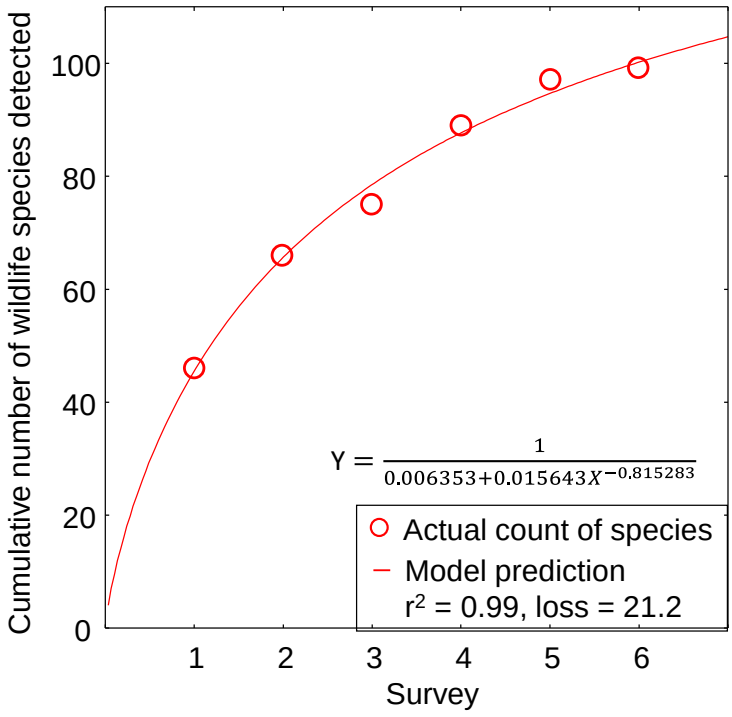
I could have detected many more species than predicted had I also performed surveys at different times of day/night to detect nocturnal and crepuscular species with appropriate methods and technology, or had I performed surveys in different seasons

and years to detect migrants and species with multi-annual cycles of abundance. My reconnaissance-level surveys inform me that the site is richer in wildlife than the 39 species I detected and the 71 species GGAS (2021) and I detected there so far, but also that the environmental setting of the project remains insufficiently characterized as foundation for analysis of impacts to special-status species. A more realistic representation of species richness at the site could be obtained by simply repeating visual-scan surveys on various dates through the year.

As a case in point, I repeated visual-scan surveys 6 times over the period of one year at a proposed project site in Rancho Cordova, California Survey outcomes ranged 40 to 67 species per survey, but a least-squares regression model that I fit to the cumulative number of species detections predicted that 157 species of vertebrate wildlife would eventually be detected by continuing to repeat the visual-scan surveys (Figure 2). Repeated surveys achieved diminishing returns, but they were necessary to document the occurrences of the scarcer and more cryptic species. Given the example illustrated in Figure 2, and assuming the pattern of survey returns is robustly represented by Figure 2, the 39 species I detected after my two surveys at the project site likely represented 42% of the species likely to be detected after six visual-scan surveys. With five more repeat surveys, I would likely detect $^{39}/_{0.42} = 93$ species of vertebrate wildlife at the site. But these predictions are based on one site where I measured the outcomes of repeat surveys. It would help to know the robustness of the pattern of cumulative species detections with increasing survey time, and it would help to represent species richness added with surveys in multiple seasons.

79 cont.

Figure 2. *Cumulative number of species detected as a function of the number of visual-scan surveys performed through one year at one site near Sacramento, California.*



As part of my research, I completed a much larger survey effort across 167 km² of annual grasslands of the Altamont Pass Wind Resource Area, where from 2015 through 2019, I

performed 721 1-hour visual-scan surveys, or 721 hours of surveys, at 46 stations. I used binoculars and otherwise the methods were the same as the methods I use for surveys at proposed project sites. At each of the 46 survey stations, I tallied new species detected with each sequential survey at that station, and then related the cumulative species detected to the hours (number of surveys, as each survey lasted 1 hour) used to accumulate my counts of species detected. I used combined quadratic and simplex methods of estimation in Statistica to estimate least-squares, best-fit nonlinear models of cumulative species detected regressed on hours of survey (number of surveys) at the station: $\hat{R} = \frac{1}{1/a+b\times(Hours)^c}$, where $\hat{R}$ represented cumulative species richness detected. Coefficients of determination of model-fit ranged 0.88 to 1.00, with a mean of 0.97 (95% CI: 0.96, 0.98). I projected the predictions of each model to thousands of hours to find predicted asymptotes of wildlife species richness. The mean model-predicted asymptote of species richness was 57 after 11,857 hours of visual-scan surveys. I also averaged model predictions of species richness at each incremental increase of number of surveys, i.e., number of hours (Figure 3). On average I detected 20.8 species over the first 7 hours of surveys in the Altamont Pass, which composed 36.5 % of the total predicted species I would detect with a much larger survey effort. Note that this value is close to the 42% value I obtained from the Rancho Cordova project site that I used as my first example in Figure 2. Given the example illustrated in Figure 3, and assuming the pattern of survey results is much more robustly represented by Figure 3 than it was in Figure 2, the 39 species I detected after my 7 hours of survey in the project area likely represented 36.5% of the species to be detected after many more visual-scan surveys. With many more repeat surveys, I would likely detect $39/0.365 = 107$ species of vertebrate wildlife in the project area. Given the much greater robustness of the model derived from the Altamont Pass, it is 107 species of vertebrate wildlife that I predict would be detected at the site after repeat diurnal visual-scan surveys throughout a year.

79 cont.

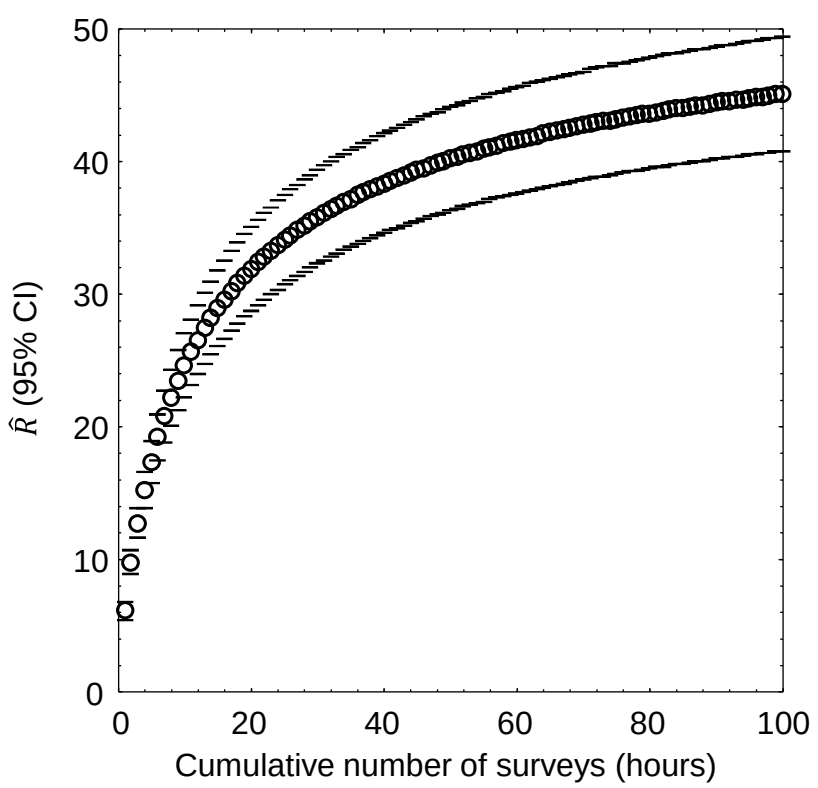


Figure 3. *Mean (95% CI) predicted wildlife species richness, $\hat{R}$, as a nonlinear function of hour-long survey increments across 46 visual-scan survey stations across the Altamont Pass Wind Resource Area, Alameda and Contra Costa Counties, 2015–2019.*

There is no question that a larger survey effort would result in a longer list of species documented to use the project site, thereby changing our understanding of the current environmental setting. But still unknown are which species have yet to be detected, how many of the yet-to-be-detected species are special-status species, and how many are listed species. The likelihood of detecting special-status species is typically lower than that of more common species. This difference can be explained by the fact that special-status species tend to be rarer and thus less detectable than common species. Special-status species also tend to be more cryptic, fossorial, or active during nocturnal periods when reconnaissance surveys are not performed. Another useful relationship from careful recording of species detections and subsequent comparative analysis is the probability of detection of listed species as a function of an increasing number of vertebrate wildlife species detected (Figure 4). (Note that listed species number fewer than special-status species, which are inclusive of listed species. Also note that I include California Fully Protected species and federal Candidate species as listed species.)

79 cont.

As was demonstrated in Figures 1 – 3, the number of species detected is largely a function of survey effort. Greater survey effort also increases the likelihood that listed species will be detected (which is the first tenet of detection surveys for special-status species). Based on the outcomes of 152 previous surveys that I performed at sites of proposed projects, my survey effort at the project site carried an 52% chance of detecting 1 listed species and a 17.5% chance of detecting 2 listed species, whereas the survey efforts of GGAS and myself combined, carried a 90% chance of detecting 1 listed species and a 58% chance of detecting 2 listed species. I detected peregrine falcon – a California Fully Protected species, and GGAS detected willow flycatcher, which is a

California Endangered species, so our survey efforts beat the odds. In summary, whereas a couple of reconnaissance-level surveys are incapable of detecting enough of the wildlife species that occur at a site to realistically characterize the site's wildlife community, they can inform of the species richness of the site and they can confirm the occurrences of those species that are detected. The current environmental setting is much richer in species than characterized in the DEIR, and this species richness is composed of more special-status species than determined by the DEIR.

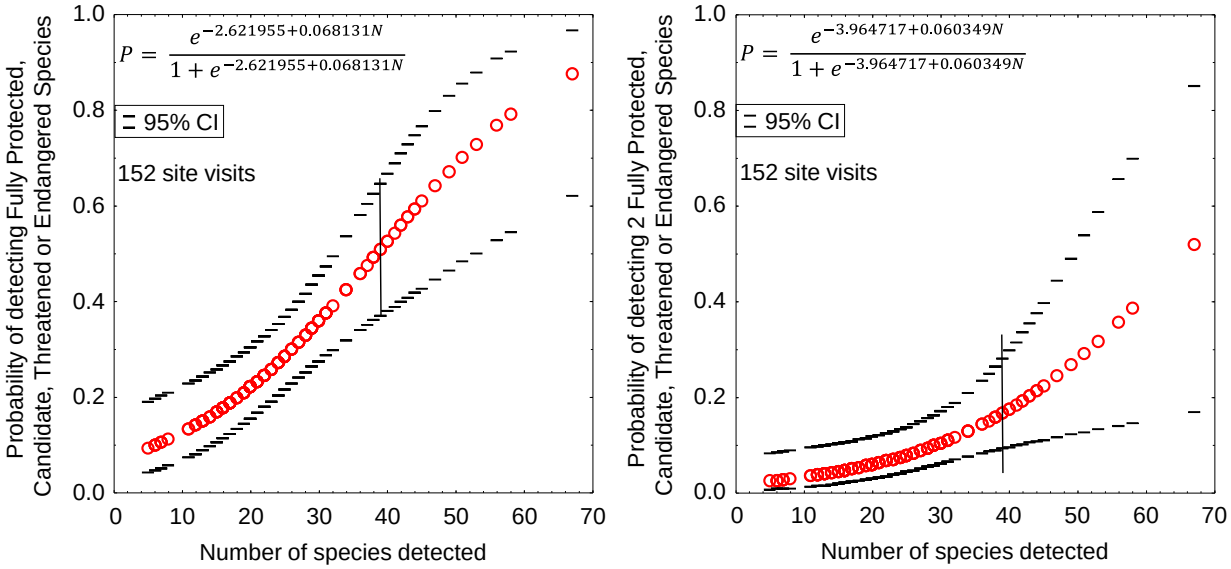

Figure 4. *Probability of detecting ≥1 Candidate, Threatened or Endangered Species of wildlife listed under California or federal Endangered Species Acts, based on survey outcomes logit-regressed on the number of wildlife species I detected during 152 site visits in California. The dashed vertical line represents the number of species detected by Chambers Group and the solid vertical line represents the number I detected.*

79 cont.

IMPACTS TO BIOLOGICAL RESOURCES

Determination of occurrence likelihoods of special-status species is not, in and of itself, an analysis of potential project impacts. An impacts analysis should consider whether and how a proposed project would affect members of a species, larger demographic units of the species, or the whole of a species. In the following, I analyze several types of impacts likely to result from the project, and none of which are analyzed adequately in the DEIR.

80

HABITAT

The DEIR concludes the Project would result in no significant impacts to special-status species or their habitats. However, this conclusion neglects the aerosphere as habitat of volant wildlife. Habitat is defined by a species' use of the environment (Hall et al. 1997, Morrison et al. 1998, Smallwood 2002), and a major part of the environment that is used by birds is the aerosphere. Every species on Earth is morphologically adapted

through thousands of generations of life and death to exist within environmental media such as water, soil, air and other organisms. Many of the species at issue at the project site have wings, which is the morphological adaptation that suits these species to thrive by moving through the medium of the aerosphere, which is obviously a very important medium of life (Davy et al. 2017, Diehl et al. 2017). Indeed, an entire discipline of ecology has emerged to study this essential aspect of habitat – the discipline of aeroecology (Kunz et al. 2008). The DEIR neglects the aerosphere as an essential habitat element, which would be diminished by the project.

80 cont.

WILDLIFE MOVEMENT

Whereas the DEIR notes the importance of the project site within the Pacific Flyway and the importance of migratory stopover opportunities within Mount Sutro Open Space Reserve, it concludes that Mount Sutro Open Space Reserve is "disconnected and do not constitute a wildlife movement corridor" (page 4.3-3). The DEIR, however, adopts a CEQA standard of analysis that does not exist. The CEQA standard is whether a project will "Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors…" The primary phrase of the standard goes to wildlife movement regardless of whether the movement is channeled by a corridor or a linkage. And anyhow, corridors are typically regarded in science as human-created landscape structures intended to reduce the effects of habitat fragmentation, and only infrequently as a channelization of wildlife movement caused by landscape structure (Smallwood 2015).

Wildlife movement in a region is often diffuse rather than channeled (Runge et al. 2014, Taylor et al. 2011) unless anthropogenic changes have forced channeling or targeting of "island" patches of habitat (Smallwood 2015). Wildlife movement must include stopover opportunities for birds and bats (Taylor et al. 2011), and staging opportunities (Warnock 2010) during dispersal, migration or home range patrol. Many species of wildlife likely use Mount Sutro Open Space Reserve for movement across the region, because Mount Sutro Open Space Reserve is one of the last patches of open space remaining on the San Francisco Peninsula. Based on my brief observations at the site, multiple species do in fact use the site to move across the region. A gap between buildings allows for passage by birds flying to and from Mount Sutro Open Space Reserve. The project, with its large glass-facaded building, would block the passage between existing buildings as well as passage opportunities at much greater heights above ground. Southbound birds would be prevented from reaching their stopover and staging opportunities in Mount Sutro Open Space Reserve without having to fly greater distances to circumnavigate the building. Those birds flying in inclement weather or at night would be vulnerable to colliding with the building. The project, therefore, would interfere with wildlife movement in the region.

81

BIRD-WINDOW COLLISION MORTALITY

Inserting such a large 15-story building onto the project site would intercept some portion of the birds flying through the project's airspace, and would otherwise interfere with movement of volant wildlife. The project's building would be inserted into the

82

aerosphere of the Pacific Flyway, which is used by millions of birds during migration. Furthermore, it would insert the building right in front of Mount Sutro, which is a major stopover destination of migratory birds. Further yet, based on depictions of the project in the DEIR, one of the most prominent features of the proposed building is its liberal use of structural glass on its facades, its interior lighting, its use of overhangs and open-cornered windows, and the windows' transparency and reflectance. The proposed elevated pedestrian crossing is enclosed in glass, which is consistent with pedestrian walkways have been elsewhere found to be exceptionally dangerous to birds. The building depicted in the DEIR appears to includes glass rails on balconies, again unnecessarily exposing birds to high collision risk. The project as depicted would introduce substantial bird collision hazards to an aerosphere that currently provides critically important habitat to birds, and which would impose lethal traps to flying birds.

Figure 5. DEIR depictions of the airspace used by birds without the project building (left) and with the building (right). Side by side, these images depict the massive blocking of bird movement to and from Mount Sutro Open Space Reserve that would result from the project.

82 cont.

Window collisions are often characterized as either the second or third largest source or human-caused bird mortality. The numbers behind these characterizations are often attributed to Klem's (1990) and Dunn's (1993) estimates of about 100 million to 1 billion bird fatalities in the USA, or more recently Loss et al.'s (2014) estimate of 365-988 million bird fatalities in the USA or Calvert et al.'s (2013) and Machtans et al.'s (2013) estimates of 22.4 million and 25 million bird fatalities in Canada, respectively. However, these estimates were likely biased too low, because they were based on opportunistic sampling, volunteer study participation, fatality monitoring by more inexperienced than experienced searchers, and usually no adjustments made for scavenger removals of carcasses before searchers could detect them (Bracey et al. 2016).

Millions of birds migrate along the Pacific Flyway. My observations during my visit to the site confirmed that birds fly through the airspace of the project, even during the nonmigratory season. Many special-status species of birds are known to the project area

83

(Table 2). According to the scientific literature, most of the special-status species in Table 2 have been documented as window collision fatalities and are therefore susceptible to new structural glass installations (Supplemental Material to Basilio et al. 2020; Smallwood unpublished review). Many more species of migratory birds, newly protected by California's revised Fish and Game Code section 3513, have also been documented as window collision victims (Basilio et al. 2020).

83 cont.

The proposed building of the project can and should be designed to be safter to birds. Depictions of the building's façades are inconsistent with standards identified in Bird-Safe Guidelines I have reviewed. Depictions of the project show that large windows would reflect outdoor vegetation, and large transparent windows would give birds the false sense of open space. The DEIR provides no analysis of bird-window collision impacts. As I will show in the next section, many birds can be expected to be killed by the many large, expansive windows of the proposed project. The DEIR should be revised to include an analysis of this potential impact.

84

Project Impact Prediction

While it is possible to predict the impacts caused by loss of aerial habitat and the energetic costs of birds having to navigate around the buildings, I am unable to make such predictions because the DEIR has failed to include surveys that would have allowed such prediction. However, I am prepared to predict bird-window collision mortality. By the time of these comments I had reviewed and processed results of bird collision monitoring at 213 buildings and façades for which bird collisions per m^2 of glass per year could be calculated and averaged (Johnson and Hudson 1976, O'Connell 2001, Somerlot 2003, Hager et al. 2008, Borden et al. 2010, Hager et al. 2013, Porter and Huang 2015, Parkins et al. 2015, Kahle et al. 2016, Ocampo-Peñuela et al. 2016, Sabo et al. 2016, Barton et al. 2017, Gomez-Moreno et al. 2018, Schneider et al. 2018, Loss et al. 2019, Brown et al. 2020, City of Portland Bureau of Environmental Services and Portland Audubon 2020, Riding et al. 2020). These study results averaged 0.073 bird deaths per m^2 of glass per year (95% CI: 0.042–0.102). This empirically founded collision mortality is in need of a predicted extent of windows in the project.

85

The DEIR does not include a numerical prediction of the extent of windows in the project. I measured the sizes of windows depicted in the DEIR's renderings of the building, and otherwise estimated their numbers and extent. Including the elevated pedestrian walkway, I estimate total window extent would be 19,400 m^2.

Multiplying the project's extent of windows of 19,400 m^2 to the empirically predicted collision mortality of 0.073 bird deaths per m^2 of glass per year (95% CI: 0.042–0.102) would predict **1,418 bird deaths per year (95% CI: 842–1,994)**. The 100-year toll from this average annual fatality rate would be **141,814 bird deaths (95% CI: 84,196–199,432)**. These estimates would be perhaps 3 times higher after accounting for the proportions of fatalities removed by scavengers or missed by fatality searchers where studies have been performed. Collision fatalities would continue until the buildings are either renovated to reduce bird collisions or they come down. If the

project moves forward as proposed, and annually kills more than 1,400 birds protected by state and federal laws, then the project would cause significant unmitigated impacts. 85 cont.

Bird-Window Collision Factors

Below is a list of collision factors I found in the scientific literature, and which I suggest ought to be considered in a revised DEIR. Following this list are specific notes and findings taken from the literature and my own experience.

(1) Inherent hazard of a structure in the airspace used for nocturnal migration or other flights
(2) Window transparency, falsely revealing passage through structure or to indoor plants
(3) Window reflectance, falsely depicting vegetation, competitors, or open airspace
(4) Black hole or passage effect
(5) Window or façade extent, or proportion of façade consisting of window or other reflective surface
(6) Size of window
(7) Type of glass
(8) Lighting, which is correlated with window extent and building operations
(9) Height of structure (collision mechanisms shift with height above ground)
(10) Orientation of façade with respect to winds and solar exposure
(11) Structural layout causing confusion and entrapment
(12) Context in terms of urban-rural gradient, or surrounding extent of impervious surface vs vegetation
(13) Height, structure, and extent of vegetation grown near home or building
(14) Presence of birdfeeders or other attractants
(15) Relative abundance
(16) Season of the year
(17) Ecology, demography and behavior
(18) Predatory attacks or cues provoking fear of attack
(19) Aggressive social interactions

86

(1) Inherent hazard of structure in airspace.—Not all of a structure's collision risk can be attributed to windows. Overing (1938) reported 576 birds collided with the Washington Monument in 90 minutes on one night, 12 September 1937. The average annual fatality count had been 328 birds from 1932 through 1936. Gelb and Delacretaz (2009) and Klem et al. (2009) also reported finding collision victims at buildings lacking windows, although many fewer than they found at buildings fitted with widows. The takeaway is that any building going up at the project site would likely kill birds, although mortality would increase with larger expanses of glass.

(2) Window transparency.—Widely believed as one of the two principal factors contributing to avian collisions with buildings is the transparency of glass used in windows on the buildings (Klem 1989). Gelb and Delacretaz (2009) felt that many of the collisions they detected occurred where transparent windows revealed interior vegetation.

(3) Window reflectance.—Widely believed as one of the two principal factors contributing to avian collisions with buildings is the reflectance of glass used in windows on the buildings (Klem 1989). Reflectance can deceptively depict open airspace, vegetation as habitat destination, or competitive rivals as self-images (Klem 1989). Gelb and Delacretaz (2009) felt that many of the collisions they detected occurred toward the lower parts of buildings where large glass exteriors reflected outdoor vegetation. Klem et al. (2009) and Borden et al. (2010) also found that reflected outdoor vegetation associated positively with collisions.

(4) Black hole or passage effect.—Although this factor was not often mentioned in the bird-window collision literature, it was suggested in Sheppard and Phillips (2015). The black hole or passage effect is the deceptive appearance of a cavity or darkened ledge that certain species of bird typically approach with speed when seeking roosting sites. The deception is achieved when shadows from awnings or the interior light conditions give the appearance of cavities or protected ledges. This factor appears potentially to be nuanced variations on transparency or reflectance or possibly an interaction effect of both of these factors.

(5) Window or façade extent.—Klem et al. (2009), Borden et al. (2010), Hager et al. (2013), Ocampo-Peñuela et al. (2016), Loss et al. (2019), Rebolo-Ifrán et al. (2019), and Riding et al. (2020) reported increased collision fatalities at buildings with larger reflective façades or higher proportions of façades composed of windows. However, Porter and Huang (2015) found a negative relationship between fatalities found and proportion of façade that was glazed.

86 cont.

(6) Size of window.—According to Kahle et al. (2016), collision rates were higher on large-pane windows compared to small-pane windows.

(7) Type of glass.—Klem et al. (2009) found that collision fatalities associated with the type of glass used on buildings. Otherwise, little attention has been directed towards the types of glass in buildings.

(8) Lighting.—Parkins et al. (2015) found that light emission from buildings correlated positively with percent glass on the façade, suggesting that lighting is linked to the extent of windows. Zink and Eckles (2010) reported fatality reductions, including an 80% reduction at a Chicago high-rise, upon the initiation of the Lights-out Program. However, Zink and Eckles (2010) provided no information on their search effort, such as the number of searches or search interval or search area around each building.

(9) Height of structure.—Except for Riding et al. (2020), I found little if any hypothesis-testing related to building height, including whether another suite of factors might relate to collision victims of high-rises. Some of the most notorious buildings are low-rise buildings.

(10) Orientation of façade.—Some studies tested façade orientation, but not convincingly. Some evidence that orientation affects collision rates was provided by

Winton et al. (2018). Confounding factors such as the extent and types of windows would require large sample sizes of collision victims to parse out the variation so that some portion of it could be attributed to orientation of façade. Whether certain orientations cause disproportionately stronger or more realistic-appearing reflections ought to be testable through measurement, but counting dead birds under façades of different orientations would help.

(11) Structural layout.—Bird-safe building guidelines have illustrated examples of structural layouts associated with high rates of bird-window collisions, but little attention has been directed towards hazardous structural layouts in the scientific literature. An exception was Johnson and Hudson (1976), who found high collision rates at 3 stories of glassed-in walkways atop an open breezeway, located on a break in slope with trees on one side of the structure and open sky on the other, Washington State University.

(12) Context in urban-rural gradient.—Numbers of fatalities found in monitoring have associated negatively with increasing developed area surrounding the building (Hager et al. 2013), and positively with more rural settings (Kummer et al. 2016).

(13) Height, structure and extent of vegetation near building.—Correlations have sometimes been found between collision rates and the presence or extent of vegetation near windows (Hager et al. 2008, Borden et al. 2010, Kummer et al. 2016, Ocampo-Peñuela et al. 2016). However, Porter and Huang (2015) found a negative relationship between fatalities found and vegetation cover near the building. In my experience, what probably matters most is the distance from the building that vegetation occurs. If the vegetation that is used by birds is very close to a glass façade, then birds coming from that glass will be less likely to attain sufficient speed upon arrival at the façade to result in a fatal injury. Too far away and there is probably no relationship. But 30 to 50 m away, and birds alighting from vegetation can attain lethal speeds by the time they arrive at the windows.

86 cont.

(14) Presence of birdfeeders.—Dunn (1993) reported a weak correlation ($r = 0.13$, $P < 0.001$) between number of birds killed by home windows and the number of birds counted at feeders. However, Kummer and Bayne (2015) found that experimental installment of birdfeeders at homes increased bird collisions with windows 1.84-fold.

(15) Relative abundance.—Collision rates have often been assumed to increase with local density or relative abundance (Klem 1989), and positive correlations have been measured (Dunn 1993, Hager et al. 2008). However, Hager and Craig (2014) found a negative correlation between fatality rates and relative abundance near buildings.

(16) Season of the year.—Borden et al. (2010) found 90% of collision fatalities during spring and fall migration periods. The significance of this finding is magnified by 7-day carcass persistence rates of 0.45 and 0.35 in spring and fall, rates which were considerably lower than during winter and summer (Hager et al. 2012). In other words, the concentration of fatalities during migration seasons would increase after applying seasonally-explicit adjustments for carcass persistence. Fatalities caused by collisions

into the glass façades of the project's building would likely be concentrated in fall and spring migration periods.

(17) Ecology, demography and behavior.—Klem (1989) noted that certain types of birds were not found as common window-caused fatalities, including soaring hawks and waterbirds. Cusa et al. (2015) found that species colliding with buildings surrounded by higher levels of urban greenery were foliage gleaners, and species colliding with buildings surrounded by higher levels of urbanization were ground foragers. Sabo et al. (2016) found no difference in age class, but did find that migrants are more susceptible to collision than resident birds.

(18) Predatory attacks.—Panic flights caused by raptors were mentioned in 16% of window strike reports in Dunn's (1993) study. I have witnessed Cooper's hawks chasing birds into windows, including house finches next door to my home and a northern mocking bird chased directly into my office window. Predatory birds likely to collide with the project's windows would include Peregrine falcon, red-shouldered hawk, Cooper's hawk, and sharp-shinned hawk.

86 cont.

(19) Aggressive social interactions.—I found no hypothesis-testing of the roles of aggressive social interactions in the literature other than the occasional anecdotal account of birds attacking their self-images reflected from windows. However, I have witnessed birds chasing each other and sometimes these chases resulting in one of the birds hitting a window.

For most of the known or suspected collision risk factors, the proposed project's design would either contribute amply to collision risk, or its contribution remains unknown due to insufficient reporting of existing environmental conditions and project design (Table 3). Focused study of birds in the area could reduce the uncertainty of potential project impacts. Such studies could make use of radar (Gauthreaux et al. 2008) or visual-scan surveys (Smallwood 2017). Key information useful for impacts assessment and mitigation would include intensity and timing of bird traffic, heights above ground, travel trajectories, and specific behaviors of birds in flight.

Window Collision Solutions

Given the magnitude of bird-window collision impacts, there are obviously great opportunities for reducing and minimizing these impacts going forward. Existing structures can be modified or retrofitted to reduce impacts, and proposed new structures can be more carefully sited, designed, and managed to minimize impacts. However, the costs of some of these measures can be high and can vary greatly, but most importantly the efficacies of many of these measures remain uncertain. Both the costs and effectiveness of all of these measures can be better understood through experimentation and careful scientific investigation. **Post-construction fatality monitoring should be an essential feature of any new building project**. Below is a listing of mitigation options, along with some notes and findings from the literature.

87

Table 3. *Window collision risk factors, their weightings based on the scientific literature, and the level of risk introduced by the proposed project.*

Collision risk to volant wildlife		
Factor	**Weighting**	**Added by project**
Inherent hazard of structure	Universal	Amply
Window transparency	Very high	Amply
Window reflectance	Very high	Amply
Black hole or passage effect	High	Amply
Window or façade extent	Very high	Amply
Size of window	High	Amply
Type of glass	High	Amply
Lighting	High	Amply
Height of structure	High	Amply
Orientation of façade	Unknown	Unknown
Structural layout	High	Unknown
Context in urban-rural gradient	Likely high	Unknown
Height, structure and extent of vegetation near building	High	Amply
Presence of birdfeeders	Moderate	Unknown
Relative abundance	Uncertain	Amply
Season of the year	Nonspatial	Not applicable
Ecology, demography and behavior	Uncertain	Amply
Predatory attacks	Uncertain	Amply
Aggressive social interactions	Uncertain	Unknown

87 cont.

The environmental review of any new project should be informed by surveys of daytime and nocturnal flight activity. Such surveys can reveal the one or more façades facing the prevailing approach direction of birds, and these revelations can help prioritize where certain types of mitigation can be targeted. It is critical to formulate effective measures prior to construction, because post-construction options will be limited, likely more expensive, and probably less effective.

(1) Retrofitting to reduce impacts

(1A) Marking windows
(1B) Managing outdoor landscape vegetation
(1C) Managing indoor landscape vegetation
(1D) Managing nocturnal lighting

(1A) Marking windows.— Whereas Klem (1990) found no deterrent effect from decals on windows, Johnson and Hudson (1976) reported a fatality reduction of about 69% after placing decals on windows. In an experiment of opportunity, Ocampo-Peñuela et al. (2016) found only 2 of 86 fatalities at one of 6 buildings – the only building with windows treated with a bird deterrent film. At the building with fritted glass, bird collisions were 82% lower than at other buildings with untreated windows. Kahle et al. (2016) added external window shades to some windowed façades to reduce fatalities 82% and 95%. Brown et al. (2020) reported an 84% lower collision probability among fritted glass windows and windows treated with ORNILUX R UV. City of Portland

Bureau of Environmental Services and Portland Audubon (2020) reduced bird collision fatalities 94% by affixing marked Solyx window film to existing glass panels of Portland's Columbia Building. Many external and internal glass markers have been tested experimentally, some showing no effect and some showing strong deterrent effects (Klem 1989, 1990, 2009, 2011; Klem and Saenger 2013; Rössler et al. 2015).

Following up on the results of Johnson and Hudson (1976), I decided to mark windows of my home, where I have documented 5 bird collision fatalities between the time I moved in and 6 years later. I marked my windows with decals delivered to me via US Postal Service from a commercial vendor. I have documented no fatalities at my windows during the 10 years hence. In my assessment, markers can be effective in some situations.

87 cont.

(2) Siting and Designing to minimize impacts

(2A) Deciding on location of structure
(2B) Deciding on façade and orientation
(2C) Selecting type and sizes of windows
(2D) Designing to minimize transparency through two parallel façades
(2E) Designing to minimize views of interior plants
(2F) Landscaping to increase distances between windows and trees and shrubs

(3) Monitoring for adaptive management to reduce impacts

(3A) Systematic monitoring for fatalities to identify seasonal and spatial patterns
(3B) Adjust light management, window marking and other measures as needed.

CUMULATIVE IMPACTS ANALYSIS

The DEIR's assertion that mitigation for the project's direct impacts would prevent cumulative impacts implies that cumulative impacts are really just residual impacts of incomplete mitigation. If that was CEQA's standard, then cumulative effects analysis would be merely an analysis of mitigation efficacy. The DEIR's implied standard is not the standard of analysis of cumulative effects. CEQA defines cumulative impacts, and it outlines two general approaches for performing the analysis.

88

An analysis of cumulative impacts to birds caused by window collisions is needed, especially in light of the recently documented 29% decline in bird abundance across North America over the last 48 years (Rosenberg et al. 2019). The proposed project alone is predicted to cause >1,400 bird deaths per year. These deaths would add to many thousands more killed by windows in San Francisco. Buildings already constructed in San Francisco must be killing large numbers of birds, considering the liberal use of glass in the City. The DEIR should be revised, and it should include an appropriate, serious analysis of cumulative impacts. It needs to address cumulative impacts from habitat fragmentation, and from collision mortality with glass facades.

MITIGATION

NHPH Mitigation Measure BIO-1a: Protection of Monarch Butterflies

The DEIR proposes preconstruction surveys for overwintering populations of Monarchs. But detection surveys are needed first to estimate potential impacts and to formulate appropriate avoidance, minimization and compensatory mitigation. These surveys are needed to inform the readers of the DEIR. Should the project go forward, the results of the detection surveys would also improve the efficacy of preconstruction take-avoidance surveys by directing survey personnel to where they would be most likely to find any animals in need of salvage or protection. The DEIR skips an important survey step. 89

NHPH Mitigation Measure BIO-1b: Protection of Nesting Birds

I concur with the measures to time construction outside the seasons of impacts to breeding animals, if feasible. I also concur with performing preconstruction surveys should construction have to take place during the breeding season. However, I must point out that preconstruction surveys would realistically detect only a very small fraction of bird nests across the project site and surrounding area within Mount Sutro Open Space Reserve. Birds are expert at hiding their nests, and there currently are many mature trees with dense foliage in which birds undoubtedly nest in the area. Finding more than a few of the bird nests would be unlikely. Furthermore, this measure would do nothing to diminish long-term project impacts to wildlife productivity; it would not prevent the loss of productive capacity from the many nest sites that occur in the project area today. Lastly, this measure is incomplete without a commitment to substantial compensatory mitigation. 90

NHPH Mitigation Measure BIO-1c: Protection of Roosting Bats

My comments regarding the efficacy of preconstruction surveys for nesting birds also applies to roosting bats. 91

NHPH Mitigation Measure BIO-1d: Worker Education

A worker awareness program should be implemented. I must note, however, that this measure would prevent few of the impacts I addressed in this comment letter. Most of the impacts would happen outside the control of the workers. Aware workers would not prevent loss of avian and bat access to the aerosphere, nor would they prevent bird collisions with windows. 92

NHPH Mitigation Measure BIO-2a: Prevention of Harm to Migrating Birds During Construction

I concur with the measures proposed to minimize harm to migrating birds during construction. I must point out that this benefit would be brief relative to the lifespan of the project. 93

NHPH Mitigation Measure BIO-2b: Bird-Safe Building Treatments

I concur with the implementation of bird-safe building design elements and the commitment to a 3-year post-construction monitoring program for bird fatalities. I am concerned, however, that the commitment to post-construction fatality monitoring appears on page 3-30 of the DEIR instead of in the section on mitigation beginning on page 4.3-21, where I expected to see it along with more details. Overall, the DEIR is short on details of the bird-safe building treatments. More importantly, the treatments that are proposed seem inconsistent with the design of the building that is presented in the DEIR. The DEIR presents a glass window-dominated building that appears to emphasize the very design elements that are thought to pose the greatest collision risks to birds. The DEIR's depictions of the building include expansive glass that is both transparent and reflective of planted trees. It shows corner windows that would give the false impression of unobstructed space for birds to attempt to fly through. It shows abundant use of overhangs and insets of windows into which many birds might seek cavities for roosting or sage passage. Relative to what is known of causal factors of bird-window collision mortality, the proposed building looks dangerous to birds.

The DEIR explains that an expert on bird-window collision hazards would be retained to help with bird-safe building treatments. The timing of this expert input would come too late, however. Most of the design elements are already in place, leaving the bird-safe design elements as mere rectification of impacts that would be caused by expansive windows, cornering and overhangs, interior lighting, and exterior landscaping that would draw birds to the zones of greatest collision risk. Glass rails should be removed from the project at the outset. Also, Mitigation Measure Bio-2b should be revised to commit at the outset to specific levels of implementation of fritted or etched glass. As written, Measure Bio-2b appears to leave ample room for minimizing the building's use of safer glass. 94

On page 3-30, the DEIR explains that "In consideration of the proposed New Hospital's proximity to the Reserve, UCSF would coordinate with a qualified ornithologist to incorporate design features into the New Hospital generally consistent with the City's Standards for Bird-Safe Buildings that would minimize the potential for bird strikes." This statement reveals that the University acknowledges the increased level of bird-window collision mortality due to the project's proximity to one of the last remaining patches of open space on the Peninsula. The circumstances of the project location heightens the danger of the project to birds, which is all the more reason why the design standards need to be incorporated into the building's architectural design at the outset, and not after the major design features have already been decided. Designing the building with bird safety in mind can save lots of birds as well as lots of money having to later retrofit the building to reduce collision mortality.

The DEIR should be revised after the building has been redesigned with input from qualified ornithologists. And rather than assuring that design standards would be "generally consistent with the City's *Standards for Bird-Safe Buildings*" (page 3-30), the revised DEIR should identify the specific design standards that would be implemented as well as any variations on those or other standards, as appropriate.

Science has advanced our understanding of bird-window collision mortality, so it would be understandable to implement the design standards with modifications. Whichever standards are applied, the DEIR needs to clearly describe them and to clearly explain why they are being applied, and these explanations need to be written into the mitigation section of the Biological Resources chapter rather than in the Project Description chapter of the DEIR.

The DEIR needs to be revised to provide much more detail about the three-year post-construction monitoring plan that is mentioned on page 3-30. It should state the minimum qualifications of the monitor, as well as standards of methodology and what would happen should collision mortality prove excessive.

94 cont.

RECOMMENDED MEASURES

Detection Surveys for Special-status Species

Protocol-level detection surveys are needed for the special-status species in Table 2. Additionally, to inform a revised DEIR, surveys for all wildlife are needed to inventory wildlife occurring within Mount Sutro Open Space Reserve. In order to effectively support the DEIR's needed impacts analysis from the resulting species inventory, and to most effectively measure impacts of the project post-construction, I recommend an impact-gradient design, whereby survey stations are sited at increasing distances along linear transects extending from the project site. Such a design can more effectively inform of the nearness of species to the project before the project goes forward, and it can measure the effects of the project on species occurrences and on species richness. I further recommend that the impact-gradient design be implemented before project construction to factor in before and after phases as experimental design elements. I suggest that these surveys would be ideally suite to graduate students or to Golden Gate Audubon Society, who has already been performing surveys in the Reserve for the University

95

Guidelines on Building Design

If the project goes forward, it should adhere to the available guidelines prepared by American Bird Conservancy and New York and San Francisco. The American Bird Conservancy (ABC) produced an excellent set of guidelines that recommend actions to: (1) Minimize use of glass; (2) Placing glass behind some type of screening (grilles, shutters, exterior shades); (3) Using glass with inherent properties to reduce collisions, such as patterns, window films, decals or tape; and (4) Turning off lights during migration seasons (Sheppard and Phillips 2015). The City of San Francisco (San Francisco Planning Department 2011) also has a set of building design guidelines, based on the excellent guidelines produced by the New York City Audubon Society (Orff et al. 2007). The ABC document and both the New York and San Francisco documents provide excellent alerting of potential bird-collision hazards as well as many visual examples. The San Francisco Planning Department's (2011) building design guidelines are more comprehensive than those of New York City, but they could have gone further. For example, the San Francisco guidelines probably should have also covered scientific

96

monitoring of impacts as well as compensatory mitigation for impacts that could not be avoided, minimized or reduced. 96 cont.

Fund Wildlife Rehabilitation Facilities

Compensatory mitigation ought also to include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Most of the injuries will likely be caused by bird-window collisions and wildlife collisions with project-generated traffic. 97

Post-construction Monitoring

In the face of high uncertainty over the efficacies of candidate mitigation measures to minimize or reduce bird-window collision fatalities, post-construction fatality monitoring should be implemented in the context of a before-after, control-impact (BACI) experimental design. Monitoring as part of a BACI design would more quickly and more confidently reveal patterns of fatalities that can identify causal factors and test mitigation efficacy. It should begin immediately in the project area. Qualified monitors should be selected, and the monitors should make use of graduate students.

Understanding why wildlife fatalities are happening and how to reduce them requires high accuracy in fatality rate estimation. But understanding causal factors also requires behavior surveys performed by qualified behavioral ecologists, who would need to sample the project with sufficient survey effort and at sufficient spatial/temporal grain to discern avian reactions to project elements and to any experimental treatments applied to reduce fatalities. Fatality monitoring and behavior surveys can inform of the efficacies of mitigation measures that are implemented with appropriate tenets of experimental design (Sinclair and DeGeorge 2016). 98

A post-construction monitoring plan should be prepared, and it should be included with a revised DEIR. Consideration should be given to the desired avian carcass detection rate, because this rate would determine the speed at which fatality searches can be completed, the accuracy of fatality estimates, and the appropriate duration of fatality monitoring. It also affects the cost of the fatality monitoring effort. Below is a framework of a fatality monitoring plan that includes best practices:

1. Keep it simple;
2. Have a plan and a budget for responding to the discoveries of injured wildlife;
3. Ask university employees to leave carcasses alone;
4. Search all of the building perimeter and balconies where carcasses can land, or search a substantial randomized sample or a systematic sample with random starting points;
5. Delineate unsearchable areas due to hazards or other constraints;
6. If feasible, use leashed scent-detection dogs with skilled handlers (Smallwood et al. 2020);

7. Implement no more than one search interval, i.e., number of days between searches, but the search interval should be a targeted average rather than a strict time to provide flexibility to the scent-detection dog team;
8. Minimum monitoring duration should be 3 years;
9. Refrain from performing 'clearing searches' because they're ineffective and unnecessary;
10. Upon discovery of feathers, stop and search increasingly larger circles to determine whether more feathers can lead to the carcass;
11. Integrate carcass detection trials into routine fatality monitoring by randomly placing just-thawed, fresh-frozen carcasses of appropriate bird species onto the search areas at a rate of about 2.3 g/ha/year, where appropriate species means those likely to be killed by features of the project and include the full range of body sizes;
12. In carcass detection trials, place many more of the smallest birds because detections of those trial carcasses are necessary but more rarely achieved;
13. Mark trial carcasses discreetly and safely with regard to scavengers – snipping toes and the ends of flight feathers works well;
14. Weigh trial carcasses just prior to placement;
15. Keep searchers blind to the trial placements by using a disciplined trial administrator who places carcasses while searchers are not onsite and who leaves no obvious evidence of each visit other than the carcass itself;
16. Upon placement, drop each trial carcass from waist height, and then photograph and map the location with high-end GPS and take notes of the location;
17. Leave all fatality and trial carcasses in the field, thereafter monitoring subsequent detections of the same carcasses;
18. All carcasses in integrated trials are either found or not found, so do not attempt to separate trials for searcher detection and carcass persistence;
19. Count fatalities discovered incidentally to routine fatality monitoring, including those found beyond the maximum search radius of a surveyed area, but omit those found in areas not selected for sampling (if sampling was used instead of census);
20. Map and photograph all fatalities and trial carcasses every time they are detected;
21. Enter data into electronic spreadsheet daily and share data with supervisor no less often than weekly to identify and resolve problems in a timely manner;
22. Identify all remains to species, so include sufficient budget for visiting museums or experts to achieve this objective (every species misidentification adds error to two species – to the species misidentified and to the species not identified);
23. See Smallwood et al. (2018) for details on how to use the data in a simple estimator;
24. Repeat the monitoring effort 10 years after the first monitoring effort;
25. Share data and reports publicly and require peer-review by independent party.

98 cont.

Below is a framework for behavior surveys that aim to inform of causal factors via rates of certain risky behaviors and collision near-misses:

99

1. Use behavioral ecologists to either perform behavior surveys or to train the biologists who would perform the surveys;

2. Perform 1-hour visual scan surveys focused on each building facade that is also searched by scent-detection dogs per fatality monitoring;
3. Record positions of behavior survey stations;
4. Alter start times randomly from dawn until dusk, but not while the fatality searchers are present;
5. Record observations into a handheld digital voice recorder, which are to be transcribed to an electronic spreadsheet later the same day;
6. Record significant events to handheld printed photos of the building facade, where significant events include collisions, near-misses and other reactions to teh building, as well as uses made of project elements by birds (perching, nesting);
7. Record species of birds visiting the plot, flock size, behavior, height above ground, flight path (record on map) and time on plot;
8. Record wind speed and direction, temperature and weather conditions at beginning and end of each survey;
9. Digitize data recorded on photos for spatial analysis using GIS or other means;
10. See methods in Smallwood (2017).

99 cont.

I further recommend that nocturnal surveys be performed. I used a FLIR T620 thermal-imaging camera with an 88.9 mm telephoto lens for this purpose, but other options are available. I recommend surveys are performed within 3 hours after dark to determine whether collisions might be happening at night rather than during the day. Such surveys allowed me to witness actual collisions with wind turbines, but more importantly many near-misses (Smallwood and Bell 2020a,b). The same should be done for nocturnal birds flying around the building.

100

As mentioned in recommended fatality monitoring practice 25, above, transparency is critically important. Peer review is essential, and so is the sharing of data in a timely manner.

101

Thank you for your attention,

_____

Shawn Smallwood, Ph.D.

RE: UCSF New Hospital at Parnassus Heights
Comments on Geology and Soils

Dear Mr. Soluri:

I reviewed the draft Environmental Impact Report ("DEIR") for the UCSF New Hospital at Parnassus Heights. This letter transmits my comments as to DEIR Chapter 4.6 (Geology and Soils).

Drilling deep borings for construction of new buildings can induce and trigger seismic waves causing physical damage to surrounding infrastructure, edifices and homes through ground motion. The potential exists for drill borings to cause ground shaking or seismic-related ground failure in rock and the settlement of soils. Data must be collected in order to assess the significance of the potential impact to nearby residences.

Use of a microseismic array is necessary to obtain ambient ground motion data for a large construction site such as this multi-story hospital that will reside on sedimentary rock, surrounded by neighborhoods and city infrastructure. Data collected through a microseismic array will allow for detection of ambient motion from the construction site for understanding wave propagation mechanisms that may cause ground motion. Seismic waves from downhole borings can propagate sustained homogeneous shear waves in unconsolidated sediments.

The classical case of seismic waves occurs where a pulse of energy propagates across a planar fracture in rock. Microseismicity is often induced when drilling propagates energy downwards in borings. Based on the trends in stress and depth in a hole, the downward propagation of microseismicity is typically observed across a fracture network of any case study of rock. Trends in stress and depth can be responsible for propagation of these pulses of energy across a natural fracture network and affect the in-situ stress state in rock or anything keyed into the rock (e.g., foundations). Microseismicity observations do not necessarily coincide with one single planar fracture formed by drilling in rock, rather a network of fractures can be induced as well as opening further fractures in pre-existing fractures.

In construction settings where, as here, there is the possibility of affecting nearby dwellings, microseimic monitoring arrays are necessary to ensure detection of a seismic-induced event of some minimum size. The DEIR does not appear to require this, and so significant impacts related to ground shaking may remain undisclosed.

102

Responses to Comments from Soluri Meserve, A Law Corporation

Please note that Comment Letter O-SM contained several exhibits. A portion of Exhibits 1 and 3; and Exhibit 2 in Comment Letter O-SM, included comments on the NHPH Draft EIR which are responded to, below. The remainder of Exhibits 1 and 3; and Exhibits 4 through 16 (including their sub-exhibits and attachments) in Comment Letter O-SM did not comment directly on the NHPH Draft EIR and no responses are included below. These exhibits are included in Appendix O-SM in this Final EIR.

O-SM-1 The commenter indicates that the comment letter is submitted on behalf of the Parnassus Neighborhood Coalition (PNC). The comment is noted; no response is required.

The commenter makes a general assertion that the NHPH is the most environmentally impactful component of the CPHP. The NHPH Draft EIR discloses all potential environmental impacts of the proposed NHPH and mitigates significant impacts to the extent feasible. See also responses that follow, below.

The commenter asserts that UCSF's release of a purportedly stand-alone EIR for the NHPH raises serious questions about UCSF's environmental review strategy. Please see responses to Comments O-SM-2 through O-SM-7, below.

The commenter asserts that the NHPH Draft EIR purpose is to justify piecemealed review of the broader CPHP, which thwarts public disclosure of the CPHP's environmental impacts. Please see responses to Comments O-SM-8 and O-SM-9, below.

O-SM-2 The commenter indicates the CPHP and NHPH are inextricably intertwined as a matter of fact, logic and law. The commenter asserts that the NHPH Draft EIR's claim that is provides a stand-alone comprehensive analysis of the NHPH is demonstrably false. The commenter quotes CEQA Guidelines Section 15378, that indicates that "project" means whole of the action; that the term "project" refers to the activity which is being approved and which may be subject to several discretionary approvals; and that the term "project" does not mean each separate approval. The commenter furthers asserts that the NHPH relies on the validity of the CPHP, and if the CPHP is set aside, then the NHPH cannot move forward.

The NHPH Draft EIR correctly states that the EIR has been prepared as a project-specific EIR which does not "tier" from the CPHP Final EIR and the commenter has not provided substantial evidence to the contrary, instead focusing on the definition of the "project" analyzed in the CPHP Final EIR and how the CPHP Final EIR describes the new hospital. The CPHP Final EIR analyzed the new hospital programmatically based on information available as of January 2020, the date the Notice of Preparation (NOP) was issued for the CPHP EIR. The CPHP

Final EIR (SCH# 2020010175) was certified by the Board of Regents as meeting all requirements of CEQA in January of 2021.

The NHPH EIR is a new EIR (SCH# 2021070547) for which a separate NOP was issued in July 2021 and correctly states (Introduction, page 1-4) that the document does not focus out any issues because they were addressed in the earlier EIR and does not incorporate any analyses in the CPHP Final EIR by reference. Focusing out issues and incorporating by reference are the strategies described as "tiering" in CEQA Guidelines Section 15152(a).

Lead agencies can decide what kind of EIR to prepare in various circumstances (CEQA Guidelines Section 15160), and in this case, UCSF has chosen to prepare a stand-alone project EIR that does not tier from the CPHP Final EIR. In doing so, UCSF is providing a detailed and complete evaluation of the NHPH project described in Chapter 3 of the NHPH Draft EIR, and has chosen to prepare the most common type of EIR, which examines the environmental impact of a specific project (CEQA Guidelines Section 15161).

The fact that the CPHP Final EIR described the new hospital as a part of its Initial Phase, and that the CPHP Final EIR stated that the NHPH would require the modifications to the 2014 LRDP's Parnassus Heights development plan proposed by the CPHP, does not mean that the NHPH cannot be evaluated independently. As noted in CEQA Guidelines Section 15168(c)(1), an analysis that follows preparation of a program level EIR (the CPHP Final EIR in this instance) "*may* tier from the program EIR [emphasis added]," however, a lead agency is not required to do so. Furthermore, Public Resources Code (PRC) Section 21093(b) provides that, "…environmental impacts reports shall be tiered whenever feasible, *as determined by the lead agency* [emphasis added]."

The scope and adequacy of the NHPH EIR, like all EIRs, must be evaluated based on its contents, and not the contents of other prior EIRs. In this case, the NHPH Draft EIR describes all aspects of the proposed NHPH and related improvements (NHPH Draft EIR Project Description, Section 3.7.1), the construction process (NHPH Draft EIR Section 3.7.2), and that the NHPH project would require an amendment of the 2014 LRDP as previously amended by Amendment #7, which was approved following certification of the CPHP Final EIR (NHPH Draft EIR, Chapter 3, page 3-8 and Section 3.7.3). The NHPH Draft EIR also contains a thorough analysis of potential impacts of the NHPH project (NHPH Draft EIR Chapter 4) and all other required contents of an EIR (CEQA Guidelines Section 15120 *et seq*.).

O-SM-3 The commenter asserts that there is an inextricable relationship between the CPHP and NHPH that is demonstrated by declarations submitted by UC employees in connection with the pending litigation challenging the CPHP and its EIR. The CPHP Final EIR certified in January 2021 is a program-level EIR

and describes numerous individual projects that would be undertaken at the Parnassus Heights campus site to implement the CPHP. As noted by the commenter and in the declarations cited in the comment, these projects include abatement of hazardous building materials and demolition of the LPPI, and construction of the proposed new hospital and other "initial phase" projects. The proposal of multiple projects for concurrent or sequential implementation in close proximity to each other was the rationale for preparing the CPHP program-level EIR, which analyzed the new hospital at a program-level.

UCSF does not dispute the role that the NHPH will play in the overall redevelopment of the Parnassus Heights campus site, and the NHPH Draft EIR acknowledges that the proposed NHPH "is part of the overall CPHP development program" (Draft EIR page 4.0-6). Nonetheless, the NHPH Draft EIR analyzes impacts of the new hospital at a project-level, while considering other CPHP projects, such as demolition of the LPPI and construction of the RAB, as reasonably foreseeable components of the cumulative context (NHPH Draft EIR page 4.0-8).

O-SM-4 See response to Comment O-SM-3 above.

O-SM-5 The commenter asserts that the NHPH's "whole of the action" includes the demolition of LPPI, but the NHPH Draft EIR piecemeals CEQA review by entitlement. The commenter further asserts that because the CPHP EIR purports to analyze the impact of demolition of LPPI does not mean that the demolition of LPPI is now somehow a separate CEQA project from development of the NHPH. As noted in the NHPH Draft EIR Project Description (page 3-4), demolition and removal of the LPPI and supporting structures were planned under the 2014 LRDP and are considered part of that plan. Because the LPPI was subsequently determined eligible for the National Register, the potential effect of demolition of the LPPI on historic resources was also analyzed as part of the CPHP EIR certified in January 2021.

The previously proposed and analyzed demolition of the LPPI is considered a separate and distinct project from development of the NHPH because it would occur under the 2014 LRDP as amended whether or not the NHPH is approved as currently proposed. In keeping with CEQA Guidelines Section 15373(c), the NHPH is the activity that is being proposed for approval by the Regents, and is therefore the "project" analyzed in the NHPH Draft EIR.

See also response to Comment O-TL1-18.

O-SM-6 The commenter asserts that UC expressly disavows any tiering from the CPHP EIR in an attempt to insulate any flaws in the CPHP EIR; however, the commenter also claims the NHPH Draft EIR's discussion of water quality impacts reveals tiering from the CPHP EIR. As discussed in response to Comment O-SM-2, an analysis that follows preparation of a program level EIR

"*may* tier from the program EIR [emphasis added]," and thus, is not required to do so (CEQA Guidelines Section 15005(c) ("'May' identifies a permissive element which is left fully to the discretion of the public agency involved"); and PRC Section 21093(b) states that "environmental impacts reports shall be tiered whenever feasible, *as determined by the lead agency* [emphasis added].

In this instance, UCSF has chosen to prepare a stand-alone, project-specific EIR for the NHPH that does not tier from the earlier program-level CPHP EIR. The commenter has failed to provide any evidence that the NHPH Draft EIR *does* in fact tier from the prior document, instead providing a statement from page 4.9-1 of the NHPH Draft EIR *Hydrology and Water Quality* section affirming that the analysis provides a project-level impact analysis of the proposed NHPH's impacts to hydrology and water quality: "In contrast to the program-level hydrology and water quality impact analysis previously conducted for the CPHP Final EIR, this section provides a project-level impact analysis of the proposed NHPH..." Section 4.9 of the NHPH Draft EIR also considers potential cumulative impacts of the NHPH when combined with projects proposed as part of the CPHP and other development in the City of San Francisco (NHPH Draft EIR pages 4.9-23 through -25).

Please also see response to Comments O-TL1-4 through O-TL1-7.

O-SM-7 The commenter asserts that there is no dispute that UC's claim to not rely on tiering necessarily means that the four corners of the NHPH Draft EIR must contain comprehensive analysis of the "whole of the action;" but the NHPH Draft EIR fails to comply with this requirement through its impermissibly truncated view of the scope of the NHPH as a CEQA project. As discussed in response to Comment O-SM-5, the NHPH is the activity that is proposed for approval by the Regents, and is therefore the "project" analyzed in the NHPH Draft EIR (CEQA Guidelines Section 15373(c)). The NHPH Draft EIR comprehensively analyses the whole of this action, which is described in Chapter 3, *Project Description* of the Draft EIR, and the Draft EIR contains all required components of an EIR (CEQA Guideline Section 15120 *et seq*.) without focusing out any issues that were analyzed in the CPHP Final EIR and without incorporating sections of the CPHP Final EIR by reference. The CEQA Guidelines are clear that a lead agency may choose to tier from a prior program-level EIR, but is not required to do so, and the commenter has not provided substantial evidence to demonstrate that the NHPH Draft EIR *does* tier from the prior EIR despite statements to the contrary. Where comments identify supposed deficiencies to specific analyses in the NHPH Draft EIR, these are responded to throughout these responses to comments.

O-SM-8 The commenter asserts that the EIR has engaged in piecemealed CEQA review by mischaracterizing the CPHP development program, which includes the NHPH, as independent cumulative projects from the NHPH, which deprives the

public of necessary project-level analysis. The commenter further asserts that the CPHP's planned development program, however, does not have independent utility from the NHPH (incorrectly referred to as the NHPA by the commenter). As described in response to Comment O-SM-7, above, the NHPH is the "project" analyzed in the NHPH Draft EIR, and the NHPH Draft EIR comprehensively analyses the whole of this action. Accordingly, the other planned CPHP development, including the three other CPHP Initial Phase projects and the CPHP Future Phase development, were appropriately considered and analyzed within the cumulative context in the NHPH Draft EIR.

O-SM-9 The commenter indicates the CPHP EIR failed to quantify the NHPH's operational cancer risk to neighbors because UC claimed that adequate project-level information was not available at that time. The commenter then indicates the project-level cancer risk information is now available, yet the NHPH Draft EIR minimizes that risk by applying a cumulative threshold of 100 increased cancer risks rather than the project-level threshold of 10 increased cancers. The commenter then states that the NHPH Draft EIR concludes that the resulting cancer risk is well above BAAQMD's project-level significance threshold of 10 increased cancer risks.

The NHPH Draft EIR correctly assessed the project-level health risks associated with project construction of the NHPH on pages 4.2-30 through 4.2-34 and appropriately compares these risks to the BAAQMD-recommended project-level threshold of 10 in one million. The NHPH Draft EIR correctly assessed the project level health risks associated with project operation of the NHPH on pages 4.2-34 through 4.2-36 and appropriately compares these risks to the BAAQMD-recommended project-level threshold of 10 in one million. The NHPH Draft EIR assesses the cumulative risks of the proposed project and other foreseeable projects on pages 4.2-42 through 4.2-44 and appropriately compares these risks to the BAAQMD-recommended cumulative threshold of 100 in one million.

O-SM-10 The commenter states that the NHPH Draft EIR impermissibly piecemeals the wind analysis because it includes only a project-specific wind tunnel analysis of the proposed NHPH. As described above in response to Comment O-SM-7 and other responses above, the NHPH is the "project" analyzed in the NHPH Draft EIR, and the NHPH Draft EIR comprehensively analyses the whole of this action. This includes a comprehensive wind tunnel analysis of the proposed NHPH and two separate cumulative analyses—for years 2030 and 2050—to evaluate the effects of the proposed NHPH along with other projects from the CPHP Initial Phase and related changes anticipated to occur by 2030, as well as to evaluate the effects of the project and 2030 development in the context of other cumulative development up through UCSF's 2050 planning horizon.

The commenter incorrectly asserts that "design-level information is now available" for projects other than the proposed NHPH. This is not correct: there

are no building-specific detailed plans yet available for the Research and Academic Building (RAB), Irving Street Arrival, or the initial phase of the densification of the existing Aldea Housing complex, nor are such project-specific detailed plans available for other UCSF Parnassus Heights projects planned under the CPHP. As indicated above, these other proposed buildings do not constitute the "proposed project," which is the NHPH. Accordingly, as explained above in the responses to Comments O-SM-3 and O-SM-6, these buildings are properly evaluated in the NHPH Draft EIR's cumulative analysis. It is noted that quantitative project-specific wind tunnel testing, such as was conducted for the NHPH, is only meaningful in the context of the City and County of San Francisco's pedestrian wind hazard criterion if based upon detailed building plans; otherwise, the results are of more limited value. As explained in the NHPH Draft EIR (page 4.1-21):

> The analysis was based on a relatively detailed developed massing model of the New Hospital under project conditions, and a *comparatively more simple massing model of the planned CPHP development under the two cumulative scenarios, because actual building designs do not yet exist for the structures anticipated in the cumulative scenarios* (emphasis added).

The analysis continues by explaining that the cumulative analysis "can be considered to generate conservative results, in that the model incorporates little in the way of setbacks and no façade detail on the cumulative buildings," and that setbacks and other articulation would likely reduce wind impacts of cumulative buildings. This is precisely the "less detailed" cumulative analysis that the commenter asserts, under "well settled" CEQA law, may be prepared.

As stated on NHPH Draft EIR page 4.1-100, all of the cumulative projects that would be greater than 80 feet in height and therefore could potentially result in adverse effects on pedestrian-level winds would be subject to NHPH Mitigation Measure C-AES-3, which would require project-specific wind tunnel testing for such projects when specific building designs are available, and would require, where applicable based on the results of the wind tunnel analysis, that feasible mitigation strategies, including design changes (e.g., setbacks, rounded/chamfered building corners, stepped facades, etc.), be employed to eliminate or reduce wind hazards to the maximum feasible extent. The wording of this mitigation measure is nearly identical to that of CPHP Mitigation Measure AES-4 from the CPHP Final EIR, which would also be applicable to all projects developed under the CPHP. It is clear from these mitigation measures that, the commenter's assertion notwithstanding, the NHPH Draft EIR's cumulative analysis would NOT "deprive[] the public of a project-level wind tunnel analysis" for any of the cumulative projects that could adversely affect pedestrian-level winds.

As stated on page 4-1-101 of the NHPH Draft EIR, however, until specific building designs are tested in the wind tunnel and feasible mitigation implemented,

where applicable, "it cannot be stated with certainty that no wind hazard exceedances would result from cumulative development including the proposed NHPH, and therefore this impact could be significant even with mitigation. Accordingly, this impact would be considered significant and unavoidable with mitigation."

O-SM-11 The commenter asserts that the abatement of the LPPI is necessary in order to demolish the LPPI and make way for the NHPH, and therefore should not be considered a separate cumulative project.

As discussed in the CPHP Final EIR, there were a number of projects at the Parnassus Heights campus site that were previously approved under the UCSF 2014 LRDP that had not yet been implemented at the time of preparation of the CPHP EIR, including demolition of the LPPI. Because the LPPI had been determined to be eligible for the California Register of Historical Resources subsequent to certification of the 2014 LRDP Final EIR, the CPHP Final EIR additionally addressed the potential effect of demolition of the LPPI on historic resources as part of the CPHP. All other environmental impacts associated with the demolition of the LPPI, including those related to abatement of hazardous materials, were deemed to be adequately addressed in the LRDP Final EIR. Accordingly, the CPHP Final EIR appropriately treated the demolition of LPPI (with the exception of the effects of demolition of LPPI on historic resources) as a cumulative project.

Similarly, the demolition and removal of LPPI was not included as part of the NHPH project, and was appropriately treated as a cumulative project in the NHPH Draft EIR (as addressed in the cumulative impact analysis on page 4.8-8 in the NHPH Draft EIR). This was the basis for the NHPH Draft EIR reporting the results of a hazardous materials survey that was underway for the LPPI in the cumulative context in Impact C-HAZ-1.

O-SM-12 The commenter makes a general assertion that how UC characterizes the CPHP's development program as a separate cumulative project means that project-level impacts have not been adequately analyzed and disclosed. The commenter is referred to responses to Comments O-SM-8 to O-SM-11, above.

The commenter also generally asserts that the NHPH Draft EIR fails to provide a stand-alone project level analysis of all aspects of the NHPH "whole of the action." The commenter is referred to responses to Comments O-SM-2 to O-SM-7, above.

O-SM-13 The commenter asserts that the NHPH Draft EIR uses an inconsistent baseline with regard to the existing ammonia tank at the Ammonia House site. The commenter states that the NHPH Draft EIR assumes the ammonia tank has been removed, but fails to provide additional discussion or analysis regarding its removal.

The removal of the existing 8,000-gallon ammonia tank at the Ammonia House site was proposed under the CPHP and analyzed in the CPHP Final EIR, and was included in the LRDP Amendment #7 approved in January 2021. The planned removal of that tank will occur after the planned aqueous urea tank is built near the Central Utility Plant, in 2024/2025.

The commenter asserts that the truncated project description in the NHPH Draft EIR thwarts adequate analysis of impacts related to the proposed project components at the Ammonia House. The commenter inquires if the Ammonia House site is large enough to house a 30,000-gallon tank. UCSF has determined sufficient space exists at the Ammonia House site to accommodate the 30,000-gallon stormwater storage tank proposed under the NHPH project. As noted above, UCSF plans to remove the existing ammonia underground storage tank as was approved under the CPHP, once the planned aqueous urea tank is completed in 2024/25, following which the proposed underground stormwater storage tank would be installed.

The commenter inquires if the Ammonia House site contains contaminants that need to be remediated before a new tank is installed. The NHPH Draft EIR did not identify the Ammonia House site as being included on a known list of hazardous materials sites compiled by governing regulatory agencies pursuant to Government Code 65962.5. Nevertheless, the NHPH Draft EIR Impact HAZ-4 acknowledges that the possibility exists during construction at the NHPH site (which includes the Ammonia House site) to encounter previously unidentified contamination. Accordingly, NHPH Mitigation Measure HAZ-4 requires that prior to NHPH development, a Soil Management Plan shall be implemented to ensure the NHPH would not create a significant hazard to the public or the environment as a result of exposure to unknown contamination or hazardous release sites, ensuring that this impact would be less than significant.

The commenter asserts that the NHPH Draft EIR fails to provide any information on aesthetics, light or glare impacts from the use of the Ammonia House site. The proposed underground storm water storage tank would be installed at the Ammonia House site, which would not result in any perceptible changes to this site. In addition, the possible installation of electrical metering and distribution switchgear would, as described on page 3-29, be fenced off, and screened from street view. Further, NHPH Draft EIR Section 4.1, *Aesthetics, Wind and Shadow* on page 4.1-44, discusses that any new lighting at the Ammonia House site would be limited to security lighting, similar to existing lighting at this site. Consequently, project improvements that would be located at Ammonia House site would not be anticipated result in a source of substantial light or glare which would adversely affect daytime or nighttime views in the area.

O-SM-14 The commenter reiterates the guidance set forth in the CEQA Guidelines with respect to the identification and treatment of alternatives in an EIR. The

commenter then asserts that the Draft EIR fails to identify and approve Alternative 1B as the environmentally superior alternative. For reasons set forth in the NHPH Draft EIR, the University finds Alternative 2, Reduced Project, to be environmentally superior, and not Alternative 1B, No Project – Smaller Hospital Per 2014 LRDP. Please note that EIRs do not approve alternatives; it is the responsibility of the lead agency to make findings regarding the feasibility of alternatives and approve the project or an alternative.

The commenter also asserts that the EIR does not describe a reasonable range of alternatives. First and foremost, the responsibility to formulate a range of reasonable alternatives lies with the lead agency, not a project's critics. (Laurel Heights, 47 Cal.3d at 406-07.). Further, as discussed in Chapter 6, *Alternatives*, the identification of a "reasonable range of alternatives" is governed by the "rule of reason," which requires the EIR to describe and consider only those alternatives necessary to permit informed public participation, and an informed and reasoned choice by the decision-making body (CEQA Guidelines Section 15126.6(a), (f)). Also, according to the CEQA Guidelines, the range of alternatives must, at a minimum, include alternatives that could feasibly attain most of the basic objectives of the project and could avoid or substantially lessen any of the significant effects of the project (CEQA Guidelines Section 15126.6(a)-(c)). Consistent with these provisions of CEQA, the NHPH Draft EIR analyzes two "no project" alternatives, a reduced project alternative, and a phased hospital alternative, for a total of four alternatives. The alternatives analyzed in detail represent a reasonable range of alternatives to permit informed decision making by the Regents. Note that consistent with the CEQA Guidelines, the Draft EIR also describes a number of alternatives that were considered but were not carried forward for detailed evaluation and presents the specific reasons for not carrying those alternatives forth for detailed evaluation.

O-SM-15 The commenter asserts that among the alternatives analyzed in detail in the NHPH Draft EIR, Alternative 1B would avoid or reduce the project's impacts the most, and therefore it must be identified as the environmentally superior alternative. The commenter also argues that the identification of the environmentally superior alternative must be based solely on the comparative environmental impacts of the alternatives, and not on a consideration of the alternative's ability to meet most of the basic project objectives, arguing that an alternative's ability to meet objectives must be considered at the time when the findings are prepared. This assertion is incorrect. Section 15126.6 of the CEQA Guidelines clearly states that the analysis of alternatives in an EIR is to be guided by the rule of reason and feasibility is listed among the factors to be considered. The section also states that in looking at the alternatives whether during their initial screening or in their detailed analysis, the EIR must examine the alternative for its ability to avoid or reduce the significant impacts of the project as well as meet the basic objectives of the proposed project. Therefore, the NHPH Draft EIR correctly uses both the alternative's ability to reduce project

impacts and its ability to meet basic project objectives to identify Alternative 2 as the environmentally superior alternative. The NHPH Draft EIR clearly explains on pages 6-48 and 6-49 that when the ability to reduce the project's impacts and the ability to meet most of the project's objectives are taken into consideration, Alternative 1B would not be considered environmentally superior. Further, contrary to the commenter's argument, in the final analysis, even Alternative 1A (No Project – No Development Alternative) is not considered environmentally superior because while it will reduce the project's impacts, it will not meet any of the basic objectives of the project.

O-SM-16 The commenter claims that Alternative 1B is the environmentally superior alternative and is feasible. Citing CEQA Guidelines Section 15126.6 (c) and (f) and *Watsonville Pilot Association vs City of Watsonville*, he further asserts that an environmentally superior alternative may not be rejected because it does not meet all of the project's objectives. First and foremost, the NHPH Draft EIR does not "reject" Alternative 1B. Instead, Alternative 1B is carried forth for detailed evaluation in the NHPH Draft EIR. The EIR fully describes the alternative, discloses its comparative impacts and evaluates its ability to meet key project objectives. The NHPH Draft EIR identifies the specific objectives that Alternative 1B would not meet, and fulfills the CEQA requirements as a disclosure document that provides the decision makers with the information they need about all the alternatives, including Alternative 1B. Having completed the analysis of this alternative and three other alternatives, the NHPH Draft EIR concludes that another alternative is environmentally superior.

The commenter agrees that this alternative would not meet the two key objectives of the proposed NHPH which are to provide an increased number of inpatient beds at the Parnassus Height campus site. Alternative 1B would not only provide substantially fewer beds than the proposed project but would actually reduce the existing number of beds at Parnassus Heights by 44 beds. In other words, the alternative does not address the main purpose of the project which is to provide more inpatient beds than are available at the present time. In a footnote, the commenter suggests that a variation of Alternative 1B could be developed to add 49 beds by renovating Moffitt Hospital. Even if this variant were to be looked at, it would increase the number of beds at the Parnassus Heights campus site by only 5 more beds compared to current conditions, and therefore would not meet the objective of addressing the need for more inpatient beds.

The commenter further asserts that the NHPH Draft EIR does not adequately explain why this alternative would not meet the other objectives of the project, which include providing adequate space to meet industry and regulatory standards of contemporary hospitals, such as the ratio of operating rooms to pre- and post-recovery spaces, and questions why the standards would not be met when in 2014, a smaller hospital was considered to be feasible and code compliant.

UCSF's current patient census and volume projections have changed since 2014 necessitating additional beds beyond those originally anticipated, and which thus makes a smaller hospital footprint not feasible. However, UCSF not only needs to provide more inpatient beds, but the increase in more operating rooms and recovery spaces is equally as critical in meeting the needs of patients seeking care at UCSF. The smaller hospital footprint did not allow for growth in these areas. Further, operating rooms and recovery spaces are much larger now in order to accommodate the equipment, mechanical, and IT/digital infrastructure that has all advanced. Contemporary hospitals need to include sufficient space to accommodate modern technology, including telemedicine, robotics, and new diagnostic, imaging, testing, treatment, surgery and laboratory equipment.

Please note that while Alternative 1B would provide 431 beds compared to 682 beds under the proposed project (a 37 percent reduction in number of beds), the amount of building space under this alternative (308,000 square feet) would reflect a 65 percent reduction from the 900,000 square feet of space under the proposed project. In other words, to keep the hospital at seven stories and to maximize the number of inpatient beds, the hospital under this alternative would not include some of the other clinical spaces that a modern hospital requires.

The commenter argues that UCSF does not justify the need for expanded clinical services at the Parnassus Heights campus site and that UCSF does not have to "capture all the predicted demand for clinical services to remain a leading health science institution." The commenter is referred to NHPH Draft EIR Section 3.5 in Chapter 3.0, *Project Description* which provides an adequate discussion of the need for the proposed project, including why the additional space is needed at this campus site. The project is not intended to capture all the predicted demand but to further the research, education, and public service mission of the University of California. As the NHPH Draft EIR explains, the three missions of clinical care, education, and research are inter-dependent and require balanced support to ensure continued excellence. Therefore, the outdated Moffitt Hospital must be replaced with a state-of-the-art teaching and research hospital that is sized to serve the projected needs of the community. Please also see NHPH Draft EIR Section 6.4.1 as to why the proposed project cannot be located at Mission Bay campus site and Section 6.4.3 as to why the new hospital cannot be located at the Mount Zion campus site. Both off-site alternatives would also not address growing demand for emergency, surgical, interventional radiology, and imaging services at Parnassus Heights campus site and would not help achieve the benefits that can be realized through interdisciplinary collaboration by continued co-location of clinical care, research, and education. Such interdisciplinary collaboration is a hallmark of UCSF and key to the many breakthrough scientific discoveries by the institution. Further, as all five professional programs (Medicine, Nursing, Pharmacy, Dentistry, and Physical Therapy) are established at the Parnassus Heights campus site, these off-site alternatives would not foster collaboration to the same extent as the proposed project.

O-SM-17 The commenter presents text from the Laurel Heights EIR to argue that when the University prepared that EIR, it argued that additional space was needed due to changes in research methods and technology, that it was infeasible to provide the additional space at the Parnassus Heights campus site, and that greater environmental impacts would occur if the space was provided at this campus site. The commenter states that the University took the same position in 2014, but now has completely reversed its position because it has received a large donation.

The NHPH Draft EIR acknowledges in Section 3.4 that while the 2014 LRDP included a more limited development program including a smaller hospital at the Parnassus Heights campus site, in 2018, UCSF undertook a planning process to re-envision and revitalize the Parnassus Heights campus site engaging both internal and external stakeholders. The planning process resulted in the development of the CPHP which was aimed at updating the projected space needs for critical programs in research, patient care, and education at the campus site, improving the functional and aesthetic design of the campus environment, and planning for needed on-campus housing. UCSF also began to plan the NHPH, which projects the need for a larger hospital than was planned in the 2014 LRDP.

As discussed in detail in the NHPH Draft EIR Section 3.5, *Project Need*, the Medical Center at Parnassus Heights inpatient census is at a record high and continues to experience unprecedented growth. The Medical Center is already at capacity and has to turn away transfer patients who need complex care. It is anticipated that there will be a 14 percent increase in medically necessary transfers by 2030. Further, the complex tertiary and quaternary cases treated by UCSF specialists at Parnassus Heights are forecast to increase in number over the coming years and decades, due to the Bay Area's projected population growth, which includes an increase in the Medicare population due to an aging regional population.

The proposal for a New Hospital at Parnassus Heights in fact would implement the second step in the hospital replacement plan that has been decades in the making following the adoption by the State Legislature of Senate Bill 1953 establishing new seismic safety standards for inpatient facilities in California. A campus-wide assessment of inpatient facilities across UCSF's campus sites was undertaken in the early 2000s. In 2005, the Regents approved LRDP Amendment #2 to the 1996 LRDP, which envisioned a hospital replacement plan with potential new inpatient facilities both at Mission Bay and at Parnassus Heights. The plan further envisioned that Mount Zion would be transitioned to primarily an outpatient hub. In 2008, the Regents approved LRDP Amendment #3 to the 1996 LRDP to provide an update to the plan, as well as to share details regarding the plans for the new hospital at Mission Bay. LRDP Amendment #3 summarizes (p. 3) "The Initial Phase ('LRDP Phase') of those recommendations, which were adopted in LRDP Amendment #2, are to: 1) develop three integrated

specialty hospitals with about 210 beds at Mission Bay by 2012; 2) maintain tertiary and quaternary care with about 600 beds at Parnassus Heights for a total of about 810 beds during the LRDP phase; 3) provide ambulatory care facilities at both Parnassus Heights and Mission Bay; and 4) populate both sites with basic and translational disease oriented research programs."[4] UCSF is implementing this plan, first with the opening of Phase I of the Mission Bay hospitals in 2015, followed by other clinical facilities to complete the Initial Phase of the Medical Center at Mission Bay. The proposed New Hospital at Parnassus Heights is the next step.

The University has prepared a project-level EIR that analyzes and discloses the significant environmental impacts from the construction and operation of the proposed hospital and related improvements.

Donations to UCSF for the construction of the New Hospital or any other project are not required to be analyzed under CEQA.

O-SM-18 The commenter asserts that the Draft EIR impermissibly rejects analysis of any off-site alternatives, including locating the proposed hospital at Mission Bay, Mount Zion or Hunters Point, and incorporates by reference comments made by others on the CPHP Final EIR regarding off-site alternatives, as well as petitioner's briefs submitted in the litigation filed against the certification of the CPHP Final EIR.

The NHPH Draft EIR appropriately dismisses the off-site alternatives from detailed evaluation. While a lead agency's task is to identify a range of alternatives that satisfy basic project objectives while reducing significant impacts, alternatives that are not at least "potentially feasible," are excluded at the initial stage because there is no point in studying alternatives that cannot be implemented or that will not succeed (CEQA Guidelines Section 15126.6(a). The NHPH Draft EIR sets forth a number of reasons why the off-site alternatives would not succeed. Those reasons are reiterated in the responses below and as appropriate, additional explanation is also provided.

All of the comments on the CPHP EIR cited by the commenter and the briefs were reviewed and to the extent that the comments/arguments concern alternative locations for the proposed NHPH, they have been reviewed carefully and are addressed in response to Comments O-SM-19 through O-SM-22 below.

[4] UCSF, *Long Range Development Plan Amendment #2 – Hospital Replacement Program Final Environmental Impact Report*, certified March 2005.
UCSF, *UCSF Medical Center at Mission Bay Final Environmental Impact Report*, certified September, 2008.
UCSF, *UCSF Long Range Development Plan Amendment #2 and 2004 LRDP Update*, approved by the Regents March 17, 2005.
UCSF, *UCSF Long Range Development Plan Amendment #3 and 2008 LRDP Update,* approved by the Regents July 15, 2008 and September 17, 2008.

O-SM-19 In these two comments, the commenter makes several references to the CPHP, and not NHPH which is the subject of the current EIR. The University assumes that the reference to the CPHP is in error and that the commenter intended to say NHPH. The University has therefore provided responses to these comments below.

In Section 6.4, the NHPH Draft EIR considers an alternative called No New Hospital at Parnassus Heights Campus Site / Implement Phase 2 of Medical Center at Mission Bay Campus Site, generally describing this alternative as not building a new hospital at Parnassus Heights and instead, advancing the development of "Phase 2" of the Medical Center at the Mission Bay campus site as analyzed in the 2008 Final EIR for the UCSF Medical Center at Mission Bay. As discussed in the NHPH Draft EIR and pointed out by the commenter, this alternative would reduce significant and unavoidable impacts at the Parnassus Height's campus such as the wind impact and also reduce or avoid other impacts such as temporary construction and operational impacts associated with the New Hospital. However, many construction and operational effects that were identified to occur at the Parnassus Heights campus site would be shifted to the Mission Bay campus site under this potential alternative. Also, while some transportation and air quality impacts experienced at the Parnassus Heights campus site would be reduced, other transportation and air quality impacts could be greater overall due to increased cross-town traffic between the two campus sites, as students, faculty, staff, and patients travel between the facilities.

Also, as noted by the commenter and explained in Section 6.4.1 of the NHPH Draft EIR, this alternative would result in an estimated 291 fewer overall beds at the Parnassus Heights campus site and UCSF campus-wide than with the proposed project, thereby not fully addressing existing and projected bed shortages in San Francisco and the region for the adult clinical services and specialties provided at Parnassus Heights. This alternative would also not address growing demand for emergency, surgical, interventional radiology, and imaging services at the Parnassus Heights campus site and would not help achieve the benefits that can be realized through interdisciplinary collaboration by continued co-location of clinical care, research, and education. Such interdisciplinary collaboration is a hallmark of UCSF and key to the many breakthrough scientific discoveries by the institution. Co-location of clinical uses in the New Hospital would allow UCSF to operate more efficiently, allow the Moffitt, Long, and New hospitals to share resources, and also minimize intra-campus travel for patients and staff. Further, as all five professional programs (Medicine, Nursing, Pharmacy, Dentistry, and Physical Therapy) are established at Parnassus Heights, this alternative would not foster collaboration to the extent that would occur with the proposed project. For all of the above reasons, the NHPH Draft EIR appropriately dismissed this off-site alternative from in-depth analysis.

The commenter questions why the number of beds cannot be increased at Mission Bay. Future development of additional inpatient beds at Mission Bay is already part

of UCSF's long-term clinical facilities planning. The proposed NHPH in fact would implement the second step in the hospital replacement plan that has been decades in the making following the adoption by the State Legislature of Senate Bill 1953 establishing new seismic safety standards for inpatient facilities in California. A campus-wide assessment of inpatient facilities across UCSF's campus sites was undertaken in the early 2000s. In 2005, the Regents approved LRDP Amendment #2 to the 1996 LRDP, which envisioned a two-hospital plan with potential new inpatient facilities both at Mission Bay and at Parnassus Heights. In 2008, the Regents approved LRDP Amendment #3 to the 1996 LRDP to provide an update to the two-hospital plan, as well as to share details regarding the plans for the new hospital at Mission Bay. LRDP Amendment #3 summarizes (page 3) "The Initial Phase ('LRDP Phase') of those recommendations, which were adopted in LRDP Amendment #2, are to: 1) develop three integrated specialty hospitals with about 210 beds at Mission Bay by 2012; 2) maintain tertiary and quaternary care with about 600 beds at Parnassus Heights for a total of about 810 beds during the LRDP phase; 3) provide ambulatory care facilities at both Parnassus Heights and Mission Bay; and 4) populate both sites with basic and translational disease oriented research programs." UCSF is implementing this plan, first with the opening of Phase I of the Mission Bay hospitals in 2015, followed by other clinical facilities to complete the Initial Phase of the Medical Center at Mission Bay. The proposed NHPH is the next step. Completion of the next phase of the Mission Bay hospitals would occur in the future.

The commenter asserts that the NHPH Draft EIR does not provide an adequate analysis of why the Mission Bay alternative or an alternative that moves some of the facilities to Mission Bay would conflict with the 2014 LRDP. The 2014 LRDP includes objectives to replace Moffitt Hospital with a New Hospital and ensure operational efficiency, effectiveness and proximity of clinical uses with other campus site uses; and ensure that Long Hospital and the New Hospital have adequate clinical and administrative support and are aligned with education, research and specialized care programs and support that remain at the campus site. If the New Hospital were to be located at Mission Bay, those objectives would not be realized.

The commenter also argues that "decreased efficiency" due to the location of the New Hospital at Mission Bay is not a fundamental objective and not a valid reason to not analyze this alternative in detail, and that an alternative is not required to meet all of the objectives of the project. As stated in the NHPH Draft EIR, operational efficiency is one of ten objectives of the proposed NHPH, that is "to site and develop a new inpatient facility in a way that optimizes operational activities with other clinical facilities at Parnassus Heights, such as Moffitt and Long Hospitals, and Medical Building 1." As stated above, co-location of clinical uses in the New Hospital alongside existing clinical uses would allow UCSF to operate more efficiently, allow the Moffitt, Long, and New hospitals to share resources, and also minimize intra-campus travel for patients and staff. Conversely, locating the

hospital at Mission Bay would not allow for this efficiency to be achieved and would result in inconvenience for patients, staff and students. Also, note that NHPH Draft EIR does not dismiss this alternative from detailed evaluation based on just this one reason, but because the alternative would not satisfy two other objectives related to provision of an adequate number of inpatient beds.

Citing *Goleta I,* the commenter argues that off-site alternatives cannot be rejected for analysis because a project proponent does not want an off-site project. The University did not summarily dismiss the Mission Bay (and other off-site alternatives) from detailed evaluation. It looked at the alternative for its ability to meet the key objectives of the proposed project and found that the alternatives would not meet those objectives, making the alternatives infeasible, and that any further evaluation of those alternatives would be of no value to the decision makers. Further, as discussed above, the New Hospital at Parnassus Heights represents phase two of the UCSF hospital replacement program adopted by the Regents in 2005.

O-SM-20 Commenters (on the CPHP Final EIR) stated that the Mission Bay hospital was justified in part by the development cap at Parnassus Heights campus site, and suggested that because locating the New Hospital at Mission Bay alternative would reduce impacts of the proposed project and is feasible, it should be fully evaluated in the EIR and ultimately approved in lieu of the proposed project. However, for reasons set forth in the NHPH Draft EIR and the responses above, the NHPH Draft EIR does not conclude that this alternative is feasible, recognizing that "failure to meet most of the basic project objectives" is "among the factors that may be used to eliminate alternatives from detailed consideration" (CEQA Guidelines Section 15126.6(c)).

O-SM-21 The commenter argues that as with the Mission Bay alternative, the alternative to locate the New Hospital at Mount Zion is also rejected in the NHPH Draft EIR for failing to meet project objectives and for resulting in inefficiencies. Similar and other comments were made on the analysis of the Mount Zion alternative in the CPHP EIR and those comments were also reviewed and considered in the response presented below.

All of the reasons for dismissing the Mission Bay alternative that are listed in response to Comment O-SM-20 above also apply to the Mount Zion alternative. This alternative will also not meet the key objectives of providing the needed beds at Parnassus Heights and the operational efficiencies from the co-location of the New Hospital with Moffitt and Long Hospitals and Medical Building 1 as well as the benefits that derive from the co-location of clinical, research and educational facilities. Furthermore, as explained in Section 6.4.3 of the NHPH Draft EIR, UCSF does not own the Mount Zion south block sites, making it unclear whether UCSF can reasonably acquire or have access to that site (CEQA Guidelines Section 15126.6(f)(1)). For all of the above reasons, the NHPH Draft EIR appropriately dismissed this off-site alternative from detailed analysis.

O-SM-22 A number of commenters on the CPHP EIR suggested that a University-owned, 3.8-acre site at Hunters Point should be considered for the New Hospital. The commenter notes that this alternative was not considered in the NHPH Draft EIR. The commenter also asserts that a revised Draft EIR is required to consider and analyze all of these alternatives and select the environmentally superior alternative unless it is truly infeasible.

This suggestion does not represent a feasible alternative for consideration in the NHPH EIR because similar to the off-site alternative at the Mission Bay campus site, it would not meet most of the basic objectives of the project. As explained above, interdisciplinary collaboration is a hallmark of UCSF and key to the many breakthrough scientific discoveries by the institution. As all five professional programs (Medicine, Nursing, Pharmacy, Dentistry, and Physical Therapy) are established at Parnassus Heights, this alternative would not foster collaboration given the distance of the Hunters Point site from UCSF's main facilities. It should be noted that the Hunters Point facility is a small remote site, consisting of small structures used for research, and has no clinical facilities that could be converted to a robust, multidisciplinary campus site needed to support the inpatient clinical, outpatient, research and teaching needed.

For reasons set forth in the responses above, the University has determined that a revised Draft EIR is not required, and the NHPH Draft EIR appropriately identified Alternative 2 as the environmentally superior alternative.

O-SM-23 The commenter summarizes CEQA Guidelines Section 15125(a) and references CEQA case law. The commenter also cites an excerpt from the NHPH Draft EIR Section 4.0, *Approach to Environmental Analysis*, that while the NOP was published on July 29, 2021, the appropriate baseline condition for this EIR would be the same as that used in the CPHP Final EIR, which was January 2020. No response is required for these comments.

The commenter then asserts that the NHPH Draft EIR's actual analysis of impacts, however, does not use this baseline. Please see responses that follow.

O-SM-24 The commenter cites an excerpt from the NHPH Draft EIR Section 4.10, *Land Use and Planning* and indicates that the NHPH Land Use section finds that the NHPH is consistent with the Space cap, as it was amended by the Regents in 2021. The commenter then claims that this is inconsistent with the NHPH Draft EIR's earlier assertion that the baseline conditions are the same at the ones at the time of the CPHP, and allows the NHPH Draft EIR to conclude that the New Hospital would be consistent with UC Plans and Policies, thus finding that the land use impact is less than significant.

There is no inconsistency. The NHPH Draft EIR land use environmental setting describes land uses on the campus site and vicinity as they existed in January 2020 (to the extent information was available). However, the NHPH Draft EIR

land use regulatory framework discussion also acknowledged notable subsequent changes in the regulatory environment that had occurred since January 2020, including Amendment No. 7 to the 2014 LRDP that was approved in January 2021 to incorporate the CPHP and make other conforming changes, including but not limited to, the revisions to the Regents' Resolution to increase the space ceiling and population estimates.

NHPH Draft EIR Impact LU-1 appropriately analyzes the proposed NHPH in consideration of the approved Amendment No. 7 to the 2014 LRDP, and revision to the Regents' Resolution, among other conforming changes. NHPH Draft EIR Impact LU-1 accurately explains that the combined building space in the three hospitals on the campus site under the NHPH (i.e., the New Hospital, and Moffitt and Long Hospitals) would be two percent less than the total building space assumed for the hospitals in the 2014 LRDP as amended, and consequently, would be within the space ceiling limit set in the amended Regents' Resolution. Impact LU-1 also acknowledges that the slightly higher bed count proposed under the NHPH over that included in the 2014 LRDP as amended would not have a meaningful effect on the projected daily population estimates at the campus site in the amended Regents' Resolution. Impact LU-1 finds that the proposed building program and population associated with the New Hospital and renovation of Moffitt and Long Hospitals would therefore be consistent with the 2014 LRDP Parnassus Heights objective related to conformance with the space limit and population estimates established in the Regents' Resolution as amended; and the impact would be less than significant.

O-SM-25 The commenter asserts that the NHPH Draft EIR analysis of population and housing impacts relies on the 2021 MOU between UCSF and the City of San Francisco, which committed UCSF to deliver 1,263 new units by 2050. The commenter claims that reliance on this information to determine significance is inconsistent with the NHPH Draft EIR's baseline.

There is no inconsistency. The NHPH Draft EIR Population and Housing section's environmental setting described existing population, employment and housing as it existed in January 2020 (to the extent information was available). However, the NHPH Draft EIR population and housing regulatory framework discussion also acknowledged notable subsequent changes in the planning and regulatory environment that had occurred since January 2020, including an updated *Plan Bay Area* (2050) by the Association of Bay Area Governments (ABAG) and the Metropolitan Transportation Commission, and evolving updates to ABAG's Regional Housing Needs Allocation for the Bay Area.

NHPH Draft EIR Impact C-POP-1 appropriately analyzes the proposed NHPH in consideration of approved agreements, including the Memorandum of Understanding (MOU) between UCSF and the City (January 22, 2021). As discussed in Impact C-POP-1, some of the additional population associated with

the NHPH and cumulative projects would be expected to be housed in the approximately 1,263 net new units that would be provided by UCSF in the city by 2050 under the MOU, half delivered by 2030, with the remaining half divided equally by 2040 and 2050, thereby reducing demand for off-campus housing in the city and Bay Area. This includes the 762 net new housing units at Parnassus Heights analyzed in the CPHP EIR. In addition, UCSF has agreed under the MOU to explore and develop additional housing in other parts of the City to accommodate UCSF students and employees, including those that study and/or work at Parnassus Heights. These would include 71 units of faculty housing at 2130 Post Street, and about 230 units in the Civic Center in collaboration with UC Hastings; both projects completed CEQA environmental review. Also, as part of the MOU, UCSF committed to facilitating the delivery of 200 additional units in the future in the City that could simply be met by an in lieu payment to the City and for which the City would complete CEQA review of such units.[5]

NHPH Draft EIR Impact C-POP-1 finds that the NHPH growth would not be anticipated to trigger shifts in demand for housing in the study area or beyond the regional housing market area, and the contribution made by the proposed NHPH would not be cumulatively considerable, and consequently, the impact would be less than significant.

5 *Memorandum of Understanding, University of California, San Francisco – Comprehensive Parnassus Heights Plan*, January 22, 2021.

Letter from Janet Napolitano, President, University of California Board of Regents to Chancellor and Dean David Faigman, UC Hastings College of Law, *RE: 198 McAllister Housing Occupancy Agreement*, May 27, 2020.

Decision Memo from Peggy Arrivas, Associate Vice President Systemwide Controller, *Occupancy Agreement for 198 McAllister (UC Hastings Housing)*, February 27, 2020.

Chancellor of the University of California, San Francisco to Executive Vice President –Chief Financial Officer, University of California, Office of the President, *Action for Approval under Chancellor Authority –Approval of Budget for Capital Improvements, Amendment #5 to the UC San Francisco 2014 Long Range Development Plan, and Design Following Action Pursuant to California Environmental Quality Act, 2130 Post Street Faculty Housing Seismic Retrofit, San Francisco Campus; Action for Approval Under Executive Vice President –Chief Financial Officer –Approval of External Financing, 2130 Post Street Faculty Housing Seismic Retrofit, San Francisco Campus*.

Certification of Final Environmental Impact Report and Approval of the Long Range Campus Plan for University of California, Hastings College of the Law, including: *Mitigation Monitoring and Reporting Plan* (July 6, 2016), *Environmental Impact Report –Response to Comments* (June 13, 2016), *Errata –Long Range Campus Plan Final EIR* (July 6, 2016), *Draft Environmental Impact Report* (March 25, 2016), *Final Environmental Impact Report for the University of California, Hastings College of the Law, Long Range Campus Plan, State Clearinghouse No. 2015122035*, certified on July 14, 2016.

O-SM-26 The commenter asserts that the NHPH Draft EIR analysis of aesthetics improperly relies on a baseline that assumes approval of Amendment No. 7 to the 2014 LRDP, which was approved on January 20, 2021 after the Draft NHPH baseline of January 2020.

First, with respect to aesthetics, as discussed in Section 4.02, *Scope of Analysis*, the NHPH meets the criteria of Public Resources Code Section 21099(d) which states that aesthetic impacts of an employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment. Nevertheless, the NHPH Draft EIR provides an assessment of potential aesthetic impacts since the public and decision-makers may be interested in information pertaining to the aesthetic effects of the proposed NHPH, and may desire that such information be provided as part of the environmental review process.

The NHPH Draft EIR aesthetics environmental setting described the aesthetic conditions as they existed in January 2020. However, the NHPH Draft EIR aesthetics regulatory framework discussion also acknowledged notable subsequent changes in the UCSF regulatory and planning environment that had occurred since January 2020, including Amendment No. 7 to the 2014 LRDP that was approved in January 2021; the Physical Design Framework amended in December 2020; and Parnassus Heights Design Guidelines, completed in May 2020.

NHPH Draft EIR Impact AES-2 appropriately analyzes the proposed NHPH in consideration of the approved Amendment No. 7 to the 2014 LRDP, and other updated UCSF planning documents. As described in Impact AES-2, the proposed New Hospital would be consistent with applicable 2014 LRDP objectives governing scenic quality. Amendment No. 7 to the 2014 LRDP incorporated the CPHP planning concepts and proposals and other necessary conforming changes into the 2014 LRDP. While as discussed above, Amendment No. 7 clarified that sub-objectives 1B and 1C do not apply to the New Hospital in recognition of the substantial amount of space required for the New Hospital and need for proximity to the existing hospitals, UCSF would make efforts to come as close as possible to meeting these objectives, as feasible. The design of the New Hospital would be consistent with UCSF's Physical Design Framework and Parnassus Heights Design Guidelines. The New Hospital would also be consistent with applicable CPHP objectives related to space and urban design. The NHPH Draft EIR finds that given the above factors, the New Hospital would not conflict with the 2014 LRDP objectives related to scenic quality, and the impact would be less than significant.

O-SM-27 The commenter asserts that the NHPH Draft EIR relies on an inaccurate baseline by assuming the removal of the ammonia tank located at the Ammonia House. The commenter is referred to response to Comment O-SM-13, above. The

removal of the ammonia tank at the Ammonia House was included as part of the approval of LRDP Amendment #7 in January 2021. UCSF plans to remove the existing ammonia underground storage tank after the planned aqueous urea tank is built near the Central Utility Plant, in 20242025, and prior to installation of the stormwater underground storage tank at the Ammonia House site as proposed under the NHPH.

As such, the improvements planned at the Ammonia House under the CPHP, and those proposed at the Ammonia House under the NHPH, would not occur until after 2024/2025 and would be coordinated by UCSF to occur in a logical progression.

O-SM-28 The commenter asserts that the NHPH Draft EIR relies on an unlawfully inconsistent baseline that appears to minimize environmental impacts in violation of CEQA. For the reasons described in responses to Comments O-SM-23 to O-SM-27, above, an appropriate and consistent baseline is used in the NHPH EIR, and all environmental impacts are adequately analyzed and mitigated to the extent feasible.

O-SM-29 The comment raises concerns that the analysis of construction noise impacts in the NHPH Draft EIR does not correlate high noise levels with "other potential health effects" given the 12-year construction period.

As the commenter indicates, the construction noise analysis in the NHPH Draft EIR, which identified a significant and unavoidable impact with mitigation, followed this analysis with a discussion of the potential health effects of the significant NHPH construction noise impacts on pages 4.11-22 and 4.11-23 of the NHPH Draft EIR.

Table 4.11-6 on page 4.11-19 of the NHPH Draft EIR identified a predicted noise level of 71 dBA or less at the nearest receptor for all active NHPH construction activities when these activities are occurring at the closest point to the receptors, providing a worst-case analysis. As a practical matter, the majority of work would be conducted at a greater distance than these reported setbacks, and consequently resultant noise levels at the receptors during the majority of the construction period would be less than these predicted values. NHPH Mitigation Measure NOI-1a: Construction Noise Control Measures identifies several noise control strategies that would further reduce these predicted noise levels.

Occasional deliveries and movement of materials from the proposed Surge Parking Lot staging area could generate noise levels at the property line of up to 84 dBA. As stated on page 4.11-20 of the NHPH Draft EIR, NHPH Mitigation Measure NOI-1a would require shielding of the staging area where adjacent sensitive receptors have direct line-of-sight with loading and delivery activities. Depending on the materials used, such shielding can provide anywhere from 5 to 15 dBA of noise reduction, reducing this predicted noise level.

The identified significant construction noise impact in the NHPH Draft EIR is a result of the elevated noise level compared to the relatively quiet conditions in the residential areas on Edgewood Avenue, and is not due to very high noise levels that may result in health impacts.

O-SM-30 The commenter is concerned that the operation noise analysis of impacts from the proposed rooftop cooling towers may understate the resultant nighttime noise impacts to the closest receptors, and assumes that the residents would need to keep their windows closed.

The noise impact assessment for the cooling towers is provided on pages 4.11-23 and 4.11-24 of the NHPH Draft EIR. This analysis assumes a 15 dBA exterior to interior noise reduction from standard building materials at the impacted residential uses with windows open and not closed. The analysis applies the City of San Francisco's nighttime interior noise standard codified in Section 2909(d) of the Police Code (page 4.11-13 of the NHPH Draft EIR). This is consistent with Appendix G of the CEQA Guidelines which recommend that a noise analysis under CEQA assess whether a project would generate a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance. Additionally, this interior noise level standard is consistent with the requirements of the California Building Code (page 4.11-9 of the NHPH Draft EIR). If windows are closed, a further 10 dBA of exterior to interior noise reduction may be expected and the resultant interior noise level would be lower than those conservatively estimated in the NHPH Draft EIR.

O-SM-31 The comment identifies NHPH Mitigation Measure NHPH NOI-1b as unenforceable deferred mitigation because it allows for some construction activity to occur during nighttime work if certain conditions are met.

NHPH Mitigation Measure NOI-1b is not "deferred mitigation" as it imposes specific restrictions and commits the University to restricted construction hours that are more restrictive than those promulgated by Section 2908 of the San Francisco Police Code which allow construction during weekdays until 8:00 p.m. to prohibit construction noise during the most noise sensitive periods for surrounding receptors. It also provides that "in rare circumstances, work may need to occur outside of those work hour limits." This limited exception, if invoked in rare circumstances, such as for large concrete pours that need to be continuous and often require cooler nighttime temperatures, includes additional measures to be identified through community engagement to further reduce potential noise impacts.

The comment suggests these additional measures are vague and lack performance standards, however, "restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary

barriers to shield the short-term nighttime activity" as specified in Mitigation Measure NOI-1b are not considered vague. Furthermore, performance standards based on specific standards that inform the agency "what it is to do and what it must accomplish" are sufficient (*Center for Biological Diversity v. Dept. of Fish and Wildlife* (2015) 234 Cal.App.4th 214, 245 ("*CBD*"), and so they are in this case: the measures are enforceable and not deferred; they give specific direction about how to conduct the work; and the NHPH Draft EIR found that the construction noise impact would remain significant and unavoidable after mitigation.

O-SM-32 This comment introduces other comments prepared by Soli/Water/Air Protection Enterprise (SWAPE) that are provided and addressed in response to Comments O-SM-57 through O-SM-61, and O-SM-68 through O-SM-75, below. Please refer to the responses to these individual comments.

O-SM-33 This comment asserts that the NHPH Draft EIR does not contain information about the allocation of cap-and-trade offsets and whether they are already applied to the cited offset amount of 27,449 MT CO2e per year.

As discussed on pages 4.7-36 and 4.7-37 of the NHPH Draft EIR, NHPH Mitigation Measure GHG-1 sets forth a numerical performance standard based on the estimated GHG emissions projected to be generated by the operation of the proposed NHPH (27,449 MT CO_2e per year) to be offset. These emissions only reflect GHG emissions attributable to the proposed project without implementation of the identified NHPH Mitigation Measure GHG-1 offsets whether they are cap-and-trade-based or voluntary. The sources of these predicted emissions are inventoried in Table 4.7-3 on page 4.7-36 of the NHPH Draft EIR, as well as in Appendix GHG of the NHPH Draft EIR.

It is true that that the University is limited by State law to offset up to eight percent of its compliance obligation using carbon offset credits under the cap-and-trade program. This is clearly stated on page 4.7-16 of the NHPH Draft EIR. This is why NHPH Mitigation Measure GHG-1 makes a distinction between its continued compliance with CARB's cap-and-trade program and its commitment to control Parnassus Heights campus site annual emissions to not exceed existing baseline levels using voluntary carbon offsets.

O-SM-34 This comment suggests that NHPH Mitigation Measure GHG-1 is unenforceable.

This comment ignores the fact that NHPH Mitigation Measure GHG-1 requires that "Carbon offset credits used for this purpose shall originate from a voluntary carbon credit registry that TCR recognizes, such as: CAR, ACR, or Verra (other registries are also applicable). Offset credits in this case shall be registered, transferred, and retired at such registries. The offsets will also be subjected to an internal UC peer review process. The protocols of each registry, and UC's own internal screens and criteria, shall be used to demonstrate that the carbon offset

credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols." Note that UC Policy requires that offsets be reported publicly and tracked through the Climate Registry (TCR). TCR is a non-profit organization governed by U.S. states and Canadian provinces and territories. UCSF's TCR reports are third-party verified and posted publicly. As the NHPH Draft EIR explains, in order to demonstrate that the voluntary carbon offset credits purchased by UCSF are real, permanent, additional, quantifiable, verifiable, and enforceable, as those terms are defined in 17 California Code of Regulations § 95802(a), UCSF shall document in its annual report: (i) the protocol used to develop those credits, and (ii) the third-party verification report concerning those credits. As and when the credits are retired, UCSF shall document in its annual report the unique serial numbers of those credits showing that they have been retired. Please note that the text of NHPH Mitigation Measure GHG-1 has been expanded to include direction regarding offsets provided in the updated UC *Sustainable Practices Policy*; this direction will be applicable to all voluntary carbon offsets purchased by UC campuses, including UCSF. Please see Chapter 8.5, *Revisions to the Draft EIR*. Please also see response to Comment O-SM-37 below regarding the recent update to the UC *Sustainable Practices Policy* related to procurement of offsets.

O-SM-35 This comment raises concerns that UCSF's purchase of voluntary offsets credits identified in NHPH Mitigation Measure GHG-1 will not require the same stringent enforceability as credits from the cap-and-trade market.

The voluntary offset credits that UCSF will purchase to offset the increase in GHG emissions due to the proposed project will be as enforceable as the carbon offset credits purchased from the cap-and-trade market because the mitigation measure sets forth very specific performance standards and screens that the credits must clear in order to be used for mitigation. These standards include the requirement that "offset credits shall be third-party verified by a major registry recognized by CARB such as CAR (Climate Action Reserve) or equivalent," are subjected to UC's internal peer review, and that UCSF shall document in its annual report: (i) the protocol used to develop those credits, and (ii) the third-party verification report concerning those credits. Please also see response to Comment O-SM-36 below which provides additional detail as to why the voluntary offset credits will be enforceable and effective.

O-SM-36 The commenter suggests that UCSF's purchase of voluntary offsets credits identified in NHPH Mitigation Measure GHG-1 will not require the same stringent enforceability as credits from the cap-and-trade market and would therefore be in conflict with the court's decision in *Golden Door Properties, LLC v. County of San Diego* (2020). 50 Cal.App.5th 467 ("*Golden Door II*") and would not be subject to protocols and safeguards to ensure adequacy and enforceability.

The comment references the recent decision in *Golden Door II* in suggesting that NHPH Mitigation Measure GHG-1 is "unenforceable." That case—which the court expressly "limited" to its specific facts—is inapplicable because UC's analysis and mitigation measure do not suffer from any of the specific flaws in the mitigation set forth in *Golden Door II*.

Golden Door II involved a mitigation measure that allowed General Plan Amendment ("GPA") project applicants to mitigate in-county GHG emissions by purchasing carbon offsets originating out-of-county, including internationally. Although the mitigation required all GPA projects to first mitigate GHG emissions through all feasible onsite design features, once onsite measures were exhausted, GPA projects would have been able to use off-site mitigation, including the purchase of domestic or international carbon offset credits. The court noted that "[a]n international offset in a developing country is inevitably dependent upon the host country or third parties to validate the activities giving rise to the offset.

Corruption at any stage in the development of the offset . . . will undermine the offset." The court held that this mitigation measure violated CEQA by containing unenforceable performance standards and by deferring and delegating mitigation, but also noted: "Our decision is not intended to be, and should not be construed as a blanket prohibition on using carbon offsets—even those originating outside of California—to mitigate GHG emissions under CEQA." In comparison, NHPH Mitigation Measure GHG-1 commits UCSF to monitoring emissions annually and acquiring high-quality voluntary carbon offset credits, prioritizing local and in-State offsets to achieve and maintain carbon neutrality for the NHPH.

The comment also suggests that, as in *Golden Door II*, the voluntary market offsets do not meet CEQA's enforceability requirement for mitigation because NHPH Mitigation Measure GHG-1 does not "require the protocol itself to be consistent with CARB requirements." Again, it is incorrect to compare this project to *Golden Door II*. There, the court noted that the "CARB Protocols are the heart of cap-and-trade offsets—but the word "protocol" is not even mentioned in M-GHG-1." In contrast, NHPH Mitigation Measure GHG-1 expressly states on page 4.7-40 of the NHPH Draft EIR: "The protocols of each registry . . . and UC's own internal screens and criteria shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols." Additionally, NHPH Mitigation Measure GHG-1 requires voluntary carbon offsets to originate from a voluntary carbon credit registry that The Climate Registry recognizes, be verified by a major registry, and be consistent with UC's internal screens and criteria developed as part of the Carbon Neutrality Initiative (CNI) to ensure that any use of voluntary offset credits will result in additional, verified GHG emission reductions. These requirements specifically address the enforceability and adequacy of voluntary offset credits.

O-SM-37 The comment suggests the NHPH Mitigation Measure GHG-1 is unenforceable because the NHPH Draft EIR does not provide a description of UC's internal screens to be used, in addition to the protocols of each registry, to demonstrate that the voluntary carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols.

UC is expending considerable resources to ensure its' purchased voluntary offsets will be "real, permanent, quantifiable, verifiable, and enforceable." The UC Berkeley Carbon Trading Project in collaboration with Carbon Direct, has developed a database that contains all carbon offset projects, credit issuances, and credit retirements listed by four major voluntary offset project registries: Climate Action Reserve (CAR), American Carbon Registry (ACR), Verra (VCS), and Gold Standard. These four registries generate almost all of the world's voluntary market offsets and also include projects eligible for use under the California / Quebec linked cap-and-trade programs. This database is meant to increase the transparency of the carbon offset market, providing the offset buyer (UCSF) with the ability to see offset credits and projects in a single database. Dynamic charts and tools allow the offset buyer to see trends over time, and review the projects and credits on the market by location, type, registry, etc. The database[6] was specifically developed by the UC Berkeley researchers to explore offset credit types and offset quality.

UCSF has also established an internal committee to screen offset purchases to ensure that they are "real, permanent, quantifiable, verifiable, enforceable, reflecting the educational mission and the values of the institution. The committee consists of representatives of the Sustainability office, faculty, students, the utilities purchasing group, and Budget and Planning staff. As an example of campus-specific, offset procurement, UCSF is currently in the process of acquiring a CARB certified offset that involves the removal and disposal of refrigerants from the campus with a high global warming potential.

With respect to voluntary GHG offsets, UC Office of the President has updated the UC *Sustainable Practices Policy* to include direction on the procurement of voluntary carbon offsets by UC campuses, medical centers and national laboratories. The updated policy notes the following with respect to voluntary carbon offsets:

a. *The University will prioritize direct reductions of its covered scope 1, 2, and 3 emissions. This Policy does not require the University, as a system and as individual campuses and units, to purchase carbon offsets to meet their carbon neutrality goals; instead, it sets priorities and minimum standards if they decide to purchase offsets. In meeting the UC Sustainable Practices*

6 Available at: https://gspp.berkeley.edu/faculty-and-impact/centers/cepp/projects/berkeley-carbon-trading-project/offsets-database

Policy climate goals as outlined in section III.C., the University will use offsets as a transitional strategy while implementing all feasible reductions in its scope 1, 2, and 3 emissions. The University will reevaluate and update section III.C and V.C of the Sustainable Practices Policy by 2025.

b. *The University will only use high-quality offset credits to meet its climate protection goals, beyond its requirements under California's cap-and-trade program and will draw on the University's academic capacity to vet the quality of all voluntary offset credits it uses.*

c. *To align its voluntary offset program with its research, education, and public service mission, the University will choose offset projects that demonstrate or advance scalable climate solutions aligned with a path towards deep decarbonization; prioritize projects that advance University research and support student education; prioritize projects with health and social justice benefits, and benefits to the UC community and communities surrounding the campuses; and prioritize projects with the potential for climate benefits well beyond the credited reductions, recognizing the urgency of near-term reductions. The University will analyze the ecological, health, social, and human rights impacts of its offset decisions to avoid negative outcomes for low-income communities, communities of color, and other marginalized populations and to prioritize projects that benefit these communities.*

d. *The University will develop and implement its voluntary offset procurement strategy in a way that advances understanding of and models how institutions of higher education and in other sectors can use offsets as an effective climate mitigation strategy aligned with their institutional mission.*

This UC direction regarding voluntary offsets has come out of work performed over the last two years under a UC Global Climate Leadership Council-funded project: UC's Offset Strategy Development. The work involved (1) research on the quality of offsets available on the voluntary offset market, resulting in practical guidance on how UC can ensure offset purchases represent real additional emissions reductions, and (2) piloting its own offset projects originating from UC research and operations.

Further, the University has defined for its internal use that offsets will be considered:

i. Additional if the credited reductions would not have occurred were it not for the offset program or the University's climate protection policy. Additionality can be assessed for an individual project or for a project type

ii. Durable if there is a very high likelihood that they will remain out of the atmosphere for 40 years on-site or through commitments to replace credits.

iii. Enforceable if the University is able to reasonably ensure that its quality standards are met. The University recognizes that not all offset credits available for purchase from projects registered in the major offset registries represent high-quality emissions reductions.

The University will evaluate the quality of each offset project it uses, involving a peer review process overseen by the Carbon Abatement Technical Committee (CATC). The CATC will be made up of at least one representative from each University of California campus, LBNL, Office of the President, and at least one student and one faculty member representative from the University. This review will include evaluating individual projects, or types of projects, against the University's offset quality criteria by appropriate experts. Peer review is in addition to third-party verification.

Credits are considered to be real if the quantity of credits generated and used by a project, or a project type, does not exceed conservative estimates of the actual effect of the project, or the set of projects of the project type, on emissions. When there is uncertainty in emissions reduction/removal estimates, estimates are conservative when they are more likely to underrepresent than to over-represent actual emissions reductions/removals achieved. Evaluations will take into account the following factors as detailed in the UC Offset Procurement Guidelines: project additionality, conservativeness of methods used to estimate emission reductions including the baseline, and effects outside of project boundaries such as through leakage. The results of these evaluations, including quantitative assessments of credit quality and justifications for the assumptions and determinations made, will be released publicly for all offset projects or project types the University uses to meet its climate targets.

UCSF shall continue to monitor the voluntary carbon offsets market and implement offset procurement procedures that are in compliance with state laws and regulations concerning voluntary carbon offsets, as well as in alignment with any further changes and refinements to the UC *Sustainable Practices Policy* related to greenhouse gases and offset procurement.

O-SM-38 This comment asserts that NHPH Mitigation Measure GHG-1 is deferred mitigation and questions whether sufficient availability of offsets exists to address the quantities needed.

The comment suggests that NHPH Mitigation Measure GHG-1 is "deferred mitigation" because its internal screening process for procurement of voluntary GHG offsets is not specified in the NHPH Draft EIR. As explained in the NHPH Draft EIR and updated in this Final EIR, NHPH Mitigation Measure GHG-1 specifically states: "Carbon offset credits used for this purpose shall originate from a voluntary carbon credit registry that TCR recognizes, such as: CAR, ACR, or Verra (other registries are also applicable). Offset credits in this case shall be registered, transferred, and retired at such registries. The offsets will also be subjected to an internal UC peer review process. The protocols of each registry, and UC own internal screens and criteria, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols. For

this purpose, local (within the air district) and in-state carbon offset credits shall be prioritized over in-nation offset credits." As further explained in the NHPH Draft EIR, if sufficient local and in-state offset credits are not available, UC will purchase CARB- conforming or equivalent national offset credits registered with an approved registry. Please see UC's updated *Sustainable Practices Policy* in response to Comment O-SM-37, above.

With respect to the availability of offsets, a recent study published by Trove Research and University College London predicts that demand for carbon offsets will increase fivefold or even tenfold over the next decade as companies, governments, and projects seek to deliver on their net-zero emissions pledges.[7] As demand for carbon credits increases, the costs of undertaking emission reduction projects will rise as lower cost projects are used up, raising the price of offsets up to $50 per $MTCO_2e$ by 2030 and $100 per $MTCO_2e$ by 2050. As with any market-based system, the resulting price increase will make a larger set of offset projects financially viable; the higher prices will drive real investment in new projects to reduce emissions. Also as the study notes, as the cost of using carbon credits rises, investing in direct GHG reduction measures will become more attractive.

Trove Research also conducted a voluntary carbon market quarterly update in April 2021, which found that global surplus carbon credits totaled 399 million in the first quarter of 2021.[8] The Climate Action Reserve has issued nearly 165 million offset credits and has retired more than 48 million of the credits for projects within the U.S.; this suggests that more than 116 million offset credits are currently available for projects in the U.S. through the Climate Action Reserve.[9,10] The American Carbon Registry has issued nearly 188 million offset credits and has retired nearly 13 million of the credits for projects within the U.S, which suggests that more than 175 million offset credits within the U.S. are currently available through the American Carbon Registry.[11,12] Element Markets, an offset credit broker, has issued 50 million offset credits to date and currently represents more than 40 projects in the U.S.

UC's current (2021) estimate of the total offset volumes of the 10 campus sites required to achieve climate neutrality could be as high as a maximum of 650,000 metric tons CO2e (tCO2e) in 2025, declining to 450,000 tCO2e by 2030. The voluntary carbon market has grown over five-fold over the past five years. The current quantity of offset credits issued in the US is 395,396,035 tCO2e.

11 American Carbon Registry, 2021. Projects, July 16, 2021.
12 American Carbon Registry, 2021. Retired Credits, July 16, 2021.

The quantity of offsets credits remaining, unredeemed, in the U.S. is 140,660,786 tCO2e. The current quantity of CARB offset credits issued is 248,694,864 tCO2e. The quantity of offset credits remaining, unredeemed, is 83,307,503 tCO2e.

This information indicates that sufficient offset credits are available to satisfy the project's obligation through NHPH Mitigation Measure GHG-1, with more offset credits being created in the future.

O-SM-39 The comment contends that because the proposed NHPH would result in an increase in GHG emissions, it is fundamentally in conflict with the State's GHG reduction targets for 2030 and 2050. The comment also suggests that the analysis of consistency with the 2017 Update to the State Scoping Plan is not a necessary or applicable component of assessing the NHPH's consistency with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The NHPH Draft EIR addresses GHG emissions significance criteria (b) "conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases" on pages 4.4-40 through 4.7-43 by analyzing a number of plans, including the 2017 Scoping Plan Update, in order to address this topic robustly.

First, the NHPH's consistency with UC plans and policies was analyzed and followed by an assessment of consistency of the NHPH with 2040 Plan Bay Area, CARB's 2017 Scoping Plan Update, and Executive Order S-3-05 to fully consider the range of local, regional and statewide planning efforts. The determination of whether NHPH would conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG is presented in Impact GHG-2 in the EIR. By virtue of the NHPH's consistency with the updated GHGRS and implementation of NHPH Mitigation Measure GHG-1, thereby achieving consistency with the CNI, the NHPH would be consistent with CARB's 2017 Scoping Plan Update and with Executive Order S-3-05, which established a goal of reducing California's GHG emissions to 80 percent below the 1990 level by the year 2050. As indicated in the EIR, the GHGRS was recently updated to address UC's CNI (adopted after 2014) and to include emissions from the CPHP inclusive of the NHPH. It should be noted that UC's CNI is more stringent than all state requirements for reduction of GHG emissions, including AB 32, SB 32, and 2017 Scoping Plan.

Further, in its recently released *Draft Justification Report: CEQA Thresholds for Evaluating Land Use Projects and Plans*, BAAQMD indicates that it is embracing carbon neutrality as its threshold of significance for land use development projects. As stated in this document, a land use project's "fair share" contribution to GHG reduction will not necessarily include everything that

will need to happen in order to achieve carbon neutrality by 2045. There will likely be certain aspects of achieving carbon neutrality that are beyond the scope of how a land use project is designed and thus cannot reasonably be allocated to its "fair share." To determine a proposed land use project's "fair share," the analysis should therefore focus on the design elements that need to be incorporated into the project in order to lay the foundation for achieving carbon neutrality by 2045. Therefore, it is not incumbent upon a land use development project to reduce GHG emissions statewide, but rather, to incorporate appropriate design elements into a project to reduce GHG emissions. As indicated in Table 4.7-4, the proposed NHPH includes 11 specific design measures that are applicable pursuant to UC *Sustainable Practices Policy* and existing GHGRS measures. Therefore, the analysis of the Draft EIR appropriately addresses the state's goals to reduce GHG emissions.

With respect to inclusion of the 2017 Update to the State Scoping Plan as a component of assessing the NHPH's consistency with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases, as stated above, the Draft EIR included a consistency analysis with the updated GHGRS inclusive of UC's CNI which is more stringent than all state requirements for reduction of GHG emissions, including AB 32, SB 32, and 2017 Scoping Plan. The analysis included consistency with the 2017 Scoping Plan Update, in order to address this topic robustly.

O-SM-40 This comment raises concerns that the mitigation measures identified in the Draft EIR are insufficient and should include other feasible GHG reduction strategies.

As stated on page 4.7-36 of the NHPH Draft EIR, NHPH Mitigation Measure GHG-1 is identified to reduce GHG emissions to a net zero increase and a less than significant impact with mitigation. To achieve the net zero increase, NHPH Mitigation Measure GHG-1 sets forth a numerical performance standard based on the estimated GHG emissions generated for the proposed NHPH (27,449 MT CO_2e per year) to be offset. Consequently, GHG emissions associated with the NHPH would be reduced to a less-than-significant level with implementation of NHPH Mitigation Measure GHG-1. Beyond the implementation of NHPH Mitigation Measure GHG-1, the project would implement the additional GHG reduction measures identified in Table 4.7-4 on pages 4.7-37 and 4.7-38 of the NHPH Draft EIR. These measures include a minimum level of LEED Gold Certification for the proposed NHPH, that the project is designed, constructed, and commissioned to outperform ASHRAE 90.1 - 2010 by at least 30 percent or meet the whole-building energy performance targets, and implementation of lighting with efficiencies surpassing Title 24 requirements. Furthermore, in compliance with UC *Sustainable Practices Policy*, 92 percent of the imported electricity currently used at UCSF is carbon free and UCSF has committed that 100 percent of its imported electricity shall be carbon free by 2025. So GHG emissions from imported electricity usage under full operation of the NHPH are essentially avoided. Similarly, no new

natural gas service is included in the New Hospital for heating or any other purposes, and GHG emissions from natural gas combustion in the building are also avoided by design. UCSF is also implementing an aggressive transportation demand management program to minimize vehicle trips to all its campus sites, including Parnassus Heights, which will apply to the New Hospital and will help towards minimizing GHG emissions from travel to and from the project. Therefore, UCSF is not relying solely on carbon offsets to mitigate the project's impacts.

Please also see response to Comment O-SM-37 above which presents the updated UC *Sustainable Practices Policy*. The update to the policy addresses reduction of GHG emissions and the use of offsets. The policy clearly states that "The University will *prioritize direct reductions* of its covered scope 1, 2, and 3 emissions. This Policy does not require the University, as a system and as individual campuses and units, to purchase carbon offsets to meet their carbon neutrality goals; instead, it sets priorities and minimum standards if they decide to purchase offsets. In meeting the UC *Sustainable Practices Policy* climate goals as outlined in section III.C., the University will use *offsets as a transitional strategy while implementing all feasible reductions in its scope 1, 2, and 3 emissions*"

The "cost benefit analysis" that the commenter is referring to was a rough analysis of the cost of purchasing offsets that might be needed for the NHPH and was prepared in another context, and not for this EIR or for the purpose of informing the formulation of NHPH Mitigation Measure GHG-1.

The commenter asserts that an internal email at UC suggests that "the DEIR does not need to analyze whether NHPH could be engineered to reduce emissions." The commenter then reproduces text from an email. Regarding the email text that is reproduced in this comment, please note that the commenter is not from the University of California and provided the comment in the context of a UC Berkeley housing project. The comment does not represent UC policy nor does it concern the NHPH.

In summary, because identified project sustainability elements and project design in combination with NHPH Mitigation Measure GHG-1 are sufficient to achieve a less than significant impact, no further GHG reduction measures are necessary should any others exist that are technically or economically feasible.

O-SM-41 The comment raises concerns that the NHPH Draft EIR did not disclose the human health risks associated from the combination of construction and operation of the NHPH.

The health risks impacts associated with the combination of NHPH construction and operation are appropriately addressed in the cumulative impact section on page 4.2-44 of the NHPH Draft EIR. Here the NHPH Draft EIR states:

> "Because the project-level construction health risk impact (an excess cancer risk of 5.6 in one million) would be less than significant after mitigation as described in Impact AIR-3, and the resultant increased operational cancer risk from cumulative operations would be 18.9 in one million, the total increased cancer risk from cumulative combination of operational and construction-related emissions would be 24.5 in one million which is below the 100 in one million threshold. Additionally, given that there are no impacted CARE communities in the campus site vicinity, the NHPH's cumulative impact to local health risk and hazards would be less than significant."

O-SM-42 The commenter references comments made by Andrew Coleman on the NHPH Draft EIR related to potential impacts on neighboring properties due to direct or indirect earth shaking without use of a microseismic array. Please see response to Comment O-SM-102.

O-SM-43 The commenter indicates that Dr. Smallwood has identified numerous shortcomings in the NHPH Draft EIR's formulation of baseline conditions, analysis of NHPH impacts, and formulation of mitigation measures for biological impacts.

Please see responses to Comments O-SM-77 to O-SM-101.

O-SM-44 The commenter asserts that the NHPH development would contrast sharply with the surrounding areas, and would violate San Francisco's zoning standards. As quoted in the excerpt cited by the commenter, the NHPH Draft EIR Impact AES-2 acknowledges that the New Hospital would contrast sharply in height and scale with the nearby residential neighborhood. Further, the NHPH Draft EIR notes that the New Hospital would represent a prominent newly visible feature in the viewsheds from nearby neighborhoods. This circumstance is evident in several of the visual simulations prepared in support of the NHPH Draft EIR. With respect to City zoning, NHPH Impact AES-2 also acknowledges that the proposed New Hospital would exceed the height limits of the City's 65-D and 220-F Height and Bulk Districts, and would represent a substantial increase in development, and associated increase in scale and density, on the campus site.

The commenter asserts that the NHPH Draft EIR conclusion regarding scenic quality is based on legal arguments that the building i) would be consistent with the 2014 LRDP, as amended; and ii) would not conflict with applicable zoning and other regulations governing scenic quality; and that neither of these arguments have merit, and do not overcome the factual support for a significant visual and aesthetic impact based on the NHPH's sharply contrasting size and bulk.

The commenter asserts that the first legal argument is without merit because the argument conflicts with the NHPH Draft EIR's assertion of a January 2020 baseline. However, the NHPH Draft EIR environmental setting, appropriately

describes the visual environment as it existed in January 2020. The NHPH Draft EIR aesthetic regulatory framework discussion also acknowledged notable subsequent changes in the regulatory environment that had occurred since January 2020, including Amendment No. 7 to the 2014 LRDP that was approved in January 2021 to incorporate the CPHP and make other conforming changes.

As discussed in Impact AES-2, pursuant to the University of California's constitutional autonomy, development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. The University is the only agency with land use jurisdiction over programs and projects proposed on the Parnassus Heights campus site, and the 2014 LRDP, as amended, is the applicable land use plan adopted by the University for guiding the development of the campus site while avoiding or mitigating its environmental impacts. As such, the UCSF 2014 LRDP, as amended, governs scenic quality at the campus site, and, accordingly, potential conflicts of the NHPH with the 2014 LRDP as amended are used as the basis to determine if the NHPH would have a significant impact related to scenic quality.

As evaluated in Impact AES-2, the proposed New Hospital would be consistent with applicable 2014 LRDP objectives governing scenic quality. While Amendment #7 clarified that 2014 LRDP sub-objectives 1B and 1C do not apply to the New Hospital in recognition of the substantial amount of space required for the New Hospital and need for proximity to the existing hospitals, UCSF would make efforts to come as close as possible to meeting these objectives, as feasible. The design of the New Hospital would be consistent with UCSF's Physical Design Framework and Parnassus Heights Design Guidelines as amended. The New Hospital would also be consistent with applicable CPHP objectives related to space and urban design. Given the above factors, the New Hospital would not conflict with the 2014 LRDP objectives related to scenic quality, and the impact would be less than significant.

The commenter asserts that the second legal argument is without merit because even if San Francisco zoning standards are inapplicable, it may not be used to foreclose consideration of substantial evidence supporting a fair argument of significant impact. However, as described above, Impact AES-2 provides a detailed evaluation supported by substantial evidence to demonstrate that the NHPH would not conflict with the 2014 LRDP as amended.

O-SM-45 As explained in the response to Comment O-SM-10, the cumulative wind analysis in the NHPH Draft EIR, which includes the other three CPHP Initial Phase projects (RAB, Irving Street Arrival, and initial Aldea Housing densification) as well as longer-term CPHP development to 2050, is appropriately less detailed than the NHPH Draft EIR's project-specific analysis of the NHPH—a presentation that the commenter explains is consistent with

"well settled" CEQA law. The commenter incorrectly asserts, with no evidence, that project-specific designs for the other Initial Phase projects (and possibly other CPHP projects; the commenter is not specific on this point) are available and should be included in a quantitative wind tunnel test along with the NHPH. Yet the commenter provides no documentation in support of this claim. It is noted that UCSF announced the selection of an architectural team for the proposed RAB only in July 2021, and the complexity of such a project precludes the completion in the period that has elapsed since then of design drawings at the level of detail necessary for wind tunnel testing.[13]

With respect to the analysis of the other three CPHP Initial Phase projects presented in the CPHP Final EIR, that EIR explained (page 4.1-21) that the evaluation of potential wind impacts of these three projects undertaken through a "screening-level analysis," using computational wind engineering and not wind tunnel testing. The analysis was based on a "simple massing model" of proposed CPHP development, "and not on actual building designs, which have not yet been prepared." Finally, while the computational analysis can "reliably predict wind *comfort* conditions across a relatively wide area, such as the Parnassus Heights campus site," it "cannot identify exceedances of the wind *hazard* criterion due to its inability to reliably simulate turbulence using currently accepted methods" (emphasis added). Accordingly, the analysis in the CPHP Final EIR concluded, on page 4.1-48, that the Irving Street Arrival could potentially result in a significant wind impact along Carl Street and that the RAB could potentially result in a significant wind impact along Parnassus Avenue. Accordingly, these buildings would be subject to CPHP Mitigation Measure AES-4 in the CPHP Final EIR, which would require that wind-tunnel testing of the specific designs of these buildings be implemented to reduce wind impacts as feasible. However, in the absence of wind tunnel testing of specific building designs, the CPHP Final EIR found that "it cannot be concluded that effects would be reduced to a less than significant level. Therefore, this impact would be significant and unavoidable with mitigation." This is precisely the conclusion reached with respect to cumulative development—including the three other CPHP Initial Phase projects—in the Draft EIR for the proposed NHPH, as explained in the response to Comment O-SM-10, above. As stated there, despite the commenter's assertion that the NHPH Draft EIR's cumulative analysis "deprives the public of a project-level wind tunnel analysis" of the cumulative projects, this is not the case, because all of the cumulative projects that would be greater than 80 feet in height and therefore could potentially result in adverse effects on pedestrian-level winds would be subject to NHPH Mitigation Measure C-AES-3. And, as explained herein, these projects would also be subject

[13] UCSF, "UCSF Selects Design Team for Parnassus Research and Academic Building," Campus News, July 15, 2021. Available on the internet at: https://www.ucsf.edu/news/2021/07/421001/ucsf-selects-design-team-parnassus-research-and-academic-building. Accessed March 21, 2022.

to the very similar and complimentary language of CPHP Mitigation Measure AES-4 in the CPHP Final EIR.

O-SM-46 The commenter briefly summarizes the proposed NHPH project. No response is required.

O-SM-47 The commenter makes a general statement that the NHPH Draft EIR fails to adequately evaluate the Project's hazards and hazardous materials, air quality, health risk, and greenhouse gas impacts; that emissions and health risk impacts associated with construction and operation are underestimated and inadequately addressed.

With respect to specific comments raised regarding on hazards and hazardous materials, please see response to Comment O-SM-48, below. With respect to specific comments raised on air quality and health risks, please see response to Comments O-SM-49 through O-SM-56, and responses to Comments O-SM-62 through O-SM-67, below. With respect to specific comments raised on greenhouse gas emissions, please see responses to Comments O-SM-57 through O-SM-61, and response to Comments O-SM-68 through O-SM-74.

The commenter asserts that an updated EIR should be prepared to adequately assess and mitigate the potential hazards and hazardous materials, air quality, health risk and greenhouse gas impacts that the project may have on the environment.

All environmental impacts in the NHPH Draft EIR, including those associated with potential hazards and hazardous materials, air quality, health risk and greenhouse gas emissions are adequately addressed and mitigated to the extent feasible. Further, as demonstrated in the individual responses provided to the comments raised, none of the specific issues identified in the comments, or response to these comments, result in any of the conditions of Section 15088.5(a) being met. Thus, UCSF has determined that recirculation of the Draft EIR on the issues raised by the comments is not warranted.

O-SM-48 The commenter indicates a Phase 1 Environmental Site Assessment was not prepared for the Project site, which can identify and disclose hazardous waste issues that may present impacts to the public.

The commenter is referred to NHPH Draft EIR Section 4.7, *Hazardous Materials* section which describes the background conditions on the project site and vicinity. As described on NHPH Draft EIR Section 4.9, page 4.8-7, a review of relevant regulatory databases was conducted in support of the EIR, including the Department of Toxic Substances Control Envirostar Database, and the State Water Resources Control Board Geotracker Database. These databases indicate there are no cases recorded within the NHPH project site as being impacted by hazardous materials releases, and the two cases in the project site vicinity were

closed in accordance with applicable regulatory agency oversight, with no further action needed.

NHPH Draft EIR Impacts HAZ-1 and C-HAZ-1discuss that as a separate planned project, the existing buildings on the New Hospital site, including the LPPI and support structures, would be removed prior to development of the New Hospital. The NHPH Draft EIR reports that a Preliminary Hazardous Materials Survey of these existing buildings indicates presence of former commonly-used hazardous materials in the buildings, including asbestos, lead, PCBs and mercury. The NHPH Draft EIR discusses that any existing hazardous materials associated with these facilities; and similarly, those which may be encountered within Moffitt and Long Hospitals when renovating those buildings, would be removed pursuant to applicable federal, State and local regulations; and as such there would be a less than significant impact related to exposure to existing hazardous building materials at these sites.

In addition, implementation of NHPH Mitigation Measure HAZ-1 (Excavation Management Plan) would ensure that if naturally occurring asbestos is present in areas that would be disturbed during construction, exposure risks would be reduced to less than significant. Also, implementation of NHPH Mitigation Measure HAZ-4 (Soil Management Plan) would ensure risks to the public or environment as a result of exposure to previously unknown contamination or hazardous release sites would be less than significant.

O-SM-49 In this introductory comment, the commenter states that their review of the air quality modeling included in the NHPH Draft EIR appendix concludes that the emissions from the construction and operation of the proposed NHPH are underestimated, and therefore the project's air quality impacts are inadequately analyzed in the NHPH Draft EIR. The commenter is referred to responses to Comments O-SM-50 through O-SM-76, below, which show that the air quality modeling in the NHPH Draft EIR is accurate. Accordingly, the air quality, health risk, and GHG impacts in the NHPH Draft EIR are accurately analyzed, and an updated EIR is not required.

O-SM-50 The commenter raises concerns that adjustments made to the default values for the CalEEMod model to estimate construction emissions have not been adequately justified.

As the commenter states, changes were to usage hours and some horsepower values. These changes were made to provide a project-specific analysis with data provided by the UCSF construction team, and also include equipment types which are not in the default database of the CalEEMod model. UCSF's construction team's response to a request for information which provided this project-specific information is included in **Appendix AIR-A** in this Final EIR. These data provide the basis for a justifiable change to the model default values,

and consequently, no further revisions to the calculation of air pollutant emissions are warranted.

O-SM-51 The commenter raises concerns about changes made to haul trip and worker trip default values. As stated above, changes were made to model default values to provide a project-specific analysis with data provided by the UCSF's construction team. These data included data points such as the number of truck trips, workers and haul truck capacity. The construction team's response to a request for information which provided this project-specific information is included in **Appendix AIR-A** in this Final EIR. These data provide the basis for a justifiable change to the model default values, and consequently, no further revisions to the calculation of air pollutant emissions are warranted.

O-SM-52 The commenter suggests that the UCSF construction contractor's response to the request for information should be included in the NHPH EIR. The construction team's response to a request for information which provided project-specific information is included in **Appendix AIR-A** in this Final EIR

O-SM-53 The commenter is concerned that some of the calculation of haul truck trips used an assumed truck capacity of 20 cubic yards, rather than the CalEEMod default value of 16 cubic yards. As stated above, changes were made to model default values to provide a project-specific analysis with data provided by UCSF's construction team. These data included data points such as the number of truck trips, workers and haul truck capacity. The construction team's response to a request for information which provided this project-specific information is included in **Appendix AIR-A** in this Final EIR. Trucks hauling 20 cubic yard of material would consist of a combination of two, 10-cubic yard trailers. These data provide the basis for a justifiable change to the model default values, and consequently, no further revisions to the calculation of air pollutant emissions are warranted.

O-SM-54 The commenter is concerned that some of the calculation of construction worker trips are different than the CalEEMod default values. As stated above, changes were made to model default values to provide a project-specific analysis with data provided by UCSF's construction team. These data included data points such as the number of truck trips, workers and haul truck capacity. The construction team's response to a request for information which provided this project-specific information is now included in the revised air quality appendix as part of his Final EIR. These data provide the basis for a justifiable change to the model default values, and consequently, no further revisions to the calculation of air pollutant emissions are warranted.

O-SM-55 The commenter reiterates concern that changes to the CalEEMod default values to conduct a refined project-specific analysis may have resulted in an underestimation of construction emissions that may result in a different finding of significance.

As stated above, changes were made to model default values to provide a project-specific analysis with data provided by the UCSF's construction team. These data included data points such as the number of truck trips, workers and haul truck capacity. The construction team's response to a request for information which provided this project-specific information is now included in **Appendix AIR-A** in this Final EIR. These data provide the basis for a justifiable change to the model default values, and consequently, no further revisions to the calculation of air pollutant emissions are warranted. Further, as shown in Table 4.2-7 of the NHPH Draft EIR, construction-related unmitigated emission of oxides of nitrogen (NOx) are approximately half of the BAAQMD significance threshold without mitigation while the unmitigated emissions of reactive organic gases (ROG) are one fifth of the applicable threshold and emissions of particulate matter substantially less than the applicable thresholds.

O-SM-56 The commenter takes issue with the justification provided for the adjustment to zero value for electricity-related GHG emissions in the CalEEMod model. The commenter then goes on to quote text of the NHPH Draft EIR that provides further support for UCSF's clean power program which is on the verge of achieving carbon neutrality.

The most recent third-party verified inventory for UCSF for year 2020 shows that 92 percent of all purchased electricity was carbon free. This achievement has been third-part verified and demonstrates that UCSF is already approaching its 2025 goal of net zero electricity, so the assumption that the proposed NHPH would not result in an increase in electricity-related GHG emissions is justifiable, as are the changes to the model default values.

O-SM-57 The commenter recommends that UC's commitment to carbon-free electricity should be included as a mitigation measure so as to ensure its achievement, as project design features that are dropped from consideration would no longer provide their associated emissions reduction.

The commenter conflates UC's commitment to 100 percent carbon-free electricity with a design feature of the project. The most recent third-party verified inventory for UCSF for year 2020 shows that 92 percent of all purchased electricity was carbon free. Future contracts for the remaining 8 percent will ensure carbon free procurement. So the achievement of 100 percent carbon-free electricity is on the verge of realization five years prior to the target date and is not an uncertain design feature of the NHPH that could be easily overlooked, as suggested by the comment.

O-SM-58 This commenter is concerned that they cannot verify the portion of UCSF's purchased electricity that is carbon free.

UC's *Sustainable Practices Policy* sets a standard that by 2025, each campus and health location will obtain 100 percent clean carbon-free electricity ([14]). UCSF reports to the Regents annually on this policy and tracks this specific metric closely. As identified in the NHPH Draft EIR (page 4.5-4) - UCSF purchased 92 percent clean electricity for CY 2019. For the most recent verified year (2020), UCSF also purchased 92 percent clean electricity (see Table below). The California Energy Commission has not yet released utility provider power content labels yet for 2021. UCSF expects that when they release this data – the UCSF percentage will be 92 percent again (or slightly greater). Future contracts for the remaining 8 percent will ensure carbon free procurement. So the achievement of 100 percent carbon-free electricity is on the verge of realization five years prior to the target date and is not an uncertainty of the future.

Purchased Electricity (Source)	Total (MWH)	Carbon Free (MWH)	Carbon Free (%)
UCOP	46,543	46,543	100%
WAPA	6,335	6,335	100%
PG&E	65,733	55,873	85%
CPSF	4,744	4,573	96%
Solar PPA	2,314	2,314	100%
Total (MWH)	**125,668**	**115,638**	**92%**

NOTE: MWH = megawatt hours

O-SM-59 The commenter cites the UC 2021 Annual Report on Sustainable Practices, which references UC's Carbon Neutrality Initiative (CNI), and contends that the CNI does not commit UCSF to net zero electricity and takes issue with the idea that UCSF intends to use carbon offsets to achieve net zero emissions.

As indicated in the UC 2021 Annual Report on Sustainable Practices, UC will purchase the vast majority of its electricity as carbon-free. Although a small portion of UCSF's procured electrical demand (8 percent) is currently not carbon free UCSF is ahead of schedule to attain 100 percent carbon neutrality for its procured electrical demand by 2025 and thus meet the goals of the CNI. This has occurred for the past two years running, as discussed in response to Comment O-SM-58. Future contracts for the remaining 8 percent will ensure carbon free procurement.

O-SM-60 The commenter is concerned that UCSF's commitment to net-zero GHG emissions does not guarantee that the goal will be achieved and that this possibility is demonstrated by a graph provided from UC's 2017 report on *Overcoming Barriers to Carbon Neutrality*.

[14] https://policy.ucop.edu/doc/3100155/SustainablePracticesBy.

The provided graph shows the trajectory of GHG emission reductions compared to the 2025 timeline. The cited report states that, however, that eliminating direct carbon emissions from the heating and cooling plants cannot occur by 2025 given the large capital costs required to do so. As a result, the Carbon Abatement Technical Group will make recommendations about how to use offsets as a transition measure. It further goes on to say that some stakeholders have jumped to the conclusion that UC's primary solution will be to achieve carbon neutrality solely by purchasing offsets. This is not the case as outlined by Appendix II of 2017 report which identifies 28 separate recommendations to be implemented by the UC campuses.

As stated above in response to Comment O-SM-59, pursuant to UC's *Sustainable Practices Policy*, UCSF reports to the Regents annually to obtaining 100 percent clean electricity and tracks this specific metric closely. UCSF purchased 92 percent clean electricity for CY 2019 and CY 2020. Future contracts for the remaining eight percent will ensure carbon free procurement. Therefore, the achievement of 100 percent carbon-free electricity is on the verge of realization five years prior to the target date and is not an uncertainty of the future.

O-SM-61 This comment reiterates the commenters contention that UCSF's commitment to net-zero GHG emissions does not guarantee that the goal will be achieved.

See response to Comments O-SM-59 and O-SM-60, above.

O-SM-62 The commenter acknowledges that the analysis of potential health risk impacts in the Draft EIR identified a less than significant impact with respect to construction and operational impacts individually.

It is correct that the assessment of health risks from construction and operation were calculated and compared to BAAQMD thresholds separately within the NHPH Draft EIR. This was done in accordance with BAAQMD methodology as indicated in page 8-7 of its most recent CEQA Air Quality Guidelines document (BAAQMD, 2017).

O-SM-63 The commenter raises concerns that the assessment of health risks associated with vehicle emissions focused on delivery vehicles and not on passenger vehicles which the EIR identifies as a major component of criteria pollutant emissions.

This comment is focused on "mobile-source diesel particulate matter (DPM)" but quotes text provided in the NHPH Draft EIR with respect to regional emissions of criteria air pollutants to argue that the health risk analysis may underestimate risks. With respect to passenger vehicles trips generated by the proposed project, the default fleet mix generated by CalEEMod and used in the analysis of air quality impacts indicates that less than one half of one percent of vehicle trips generated by the project would be diesel vehicles that could generate DPM. This

is why the health risk analysis focused on delivery vehicles which were conservatively assumed to all be diesel and to idle for 15 minutes per visit. The risks from these conservative assumptions far outweigh the negligible contribution of diesel fueled passenger vehicle trips.

It should be noted that for health risk analysis, the BAAQMD defines a significant traffic volume roadway as a freeway or arterial roadway with greater than 10,000 vehicles per day (BAAQMD. *CEQA Air Quality Guidelines*. May 2017). As indicated on page 12 of the NHPH Draft EIR Appendix TRANS, the proposed NHPH would generate approximately 2,500 external daily vehicle trips which is far below BAAQMD's recommended volume consideration for inclusion in a health risk assessment analysis under CEQA.

O-SM-64 The commenter suggests that because the assessment of health risks from construction and operation were calculated and compared to BAAQMD thresholds separately within the NHPH Draft EIR that the analysis is in conflict with the guidance for analysis published by the state Office of Environmental Health Hazard Assessment (OEHHA).

It is correct that the assessment of health risks from construction and operation were calculated and compared to BAAQMD thresholds separately within the NHPH Draft EIR. This was done in accordance with BAAQMD methodology as indicated on page 8-7 of its most recent CEQA Air Quality Guidelines document (2017).

It should be noted that, the health risks impacts associated with the combination of NHPH construction and operation are appropriately addressed in the cumulative impact section on page 4.2-44 of the NHPH Draft EIR. Here the NHPH Draft EIR states:

"Because the project-level construction health risk impact (an excess cancer risk of 5.6 in one million) would be less than significant after mitigation as described in Impact AIR-3, and the resultant increased operational cancer risk from cumulative operations would be 18.9 in one million, the total increased cancer risk from cumulative combination of operational and construction-related emissions would be 24.5 in one million which is below the 100 in one million threshold. Additionally, given that there are no impacted CARE communities in the campus site vicinity, the NHPH's cumulative impact to local health risk and hazards would be less than significant."

O-SM-65 The commenter raises concerns that the health risk assessment should have combined risks associated with construction and operation of the NHPH and compared them to the 10 in one million increased cancer risk threshold recommended by the BAAQMD which would result in a significant impact and require all feasible mitigation measures.

Impact C-AIR-2 evaluates the cumulative impacts of construction and operations of the full NHPH plus foreseeable off-site construction projects in the vicinity, and existing background risk of the campus site and surrounding areas. The health risks impacts associated with the combination of NHPH construction and operation are appropriately addressed in the cumulative impact section on page 4.2-44 of the NHPH Draft EIR. Here the EIR found that project-level construction health risk impact (an excess cancer risk of 5.6 in one million) would be less than significant after mitigation as described in Impact AIR-3, the resultant increased operational cancer risk from cumulative operations would be 18.9 in one million, and the total increased cancer risk from cumulative combination of operational and construction-related emissions would be 24.5 in one million which is below the 100 in one million threshold and that the NHPH's cumulative impact to local health risk and hazards would be less than significant. Therefore, because NHPH Mitigation Measures AIR-3 would reduce construction-related health risks to a less than the increased cancer risk threshold of 10 in one million and maintain cumulative increased health risks inclusive of construction, operation, and other foreseeable projects to below the cumulative increased cancer risk threshold of 100 in one million, additional mitigation measures are not required or identified in the NHPH Draft EIR. Please also see response to Comment O-SM-64 above.

O-SM-66 The comment expresses concern that the cumulative analysis of health risk does not adequately address construction of the Initial Phase projects under UCSF's CPHP and operation of the RAB.

Impact C-AIR-2 evaluates the cumulative impacts of construction and operations of the full NHPH plus foreseeable off-site construction projects in the vicinity, and existing background risk of the campus site and surrounding areas. Page 4.2-42 of the NHPH Draft EIR specifically addresses increases in health risks from cumulative construction activities.

As stated on page NHPH Draft EIR page 4.2-42, construction activities for the planned RAB would be located approximately 800 feet from the closest activities for construction of the New Hospital. Receptors potentially affected by the cumulative project demolition and construction activities in 2022 through 2025 would be the existing residences on Irving Street between Arguello Boulevard and 2nd Avenue. The planned Irving Street Arrival construction activities would occur on the Parnassus Avenue across the NHPH site. Residential receptors on Irving Street would be 450 feet away from construction activities of the New Hospital.

Based on a construction HRA prepared for the Irving Street Arrival and RAB projects, the maximum mitigated excess cancer risk would be approximately 1.1 in one million from construction activities for the Irving Street Arrival and the maximum mitigated excess cancer risk from construction activities for the

RAB would be approximately 2.9 in one million. These increased cancer risks, while individually less than significant, would further contribute to the less than significant NHPH mitigated construction excess cancer risk of 5.6 in one million identified in Impact AIR-3. Resultant construction-related cumulative excess cancer risk of 9.6 in one million (1.1 in one million for the Irving Street Arrival plus 2.9 in a million for RAB and 5.6 in a million for NHPH) would be well below the cumulative threshold of 100 in one million. While the maximally exposed individual (MEI) may vary for each of these calculated risk levels and therefore technically these values may not lend themselves to a direct summation, the summed risk is likely conservative because each of the maximum contributions summed above would actually be less at a different cumulative MEI location, and would still result in a value substantially below the cumulative threshold of 100 in one million.

O-SM-67 The commenter reiterates their concern that construction-related health risks and operational health risks of the NHPH should be summed and compared to the BAAQMD recommended threshold of an increased cancer risk of 10 in one million.

It is correct that the assessment of health risks from construction and operation were calculated and compared to BAAQMD thresholds separately within the NHPH Draft EIR. This was done in accordance with BAAQMD methodology as indicated in page 8-7 of its most recent CEQA Air Quality Guidelines document (2017). Also, as indicated in the CPHP Draft Final EIR at page 4.2-61, neither the Irving Street arrival nor the Initial Aldea Housing Densification projects would generate operational TAC emissions.

O-SM-68 The commenter acknowledges that the GHG analysis for the NHPH Draft EIR identified a significant impact resulting from project-related GHG emissions of 27,449 metric tons of CO2 equivalents (CO2e) annually which exceeds the net zero threshold and that the NHPH Draft EIR identified NHPH Mitigation Measures GHG-1 to address this significant impact.

The NHPH Draft EIR addresses CEQA-related GHG impacts with respect to whether construction and operation of the NHPH would generate GHG emissions that may have a significant impact on the environment on pages 4.7-35 through 4.7-40. This impact was identified as significant resulting from project-related GHG emissions of 27,449 metric tons of CO2e annually which exceeds the net zero threshold and the NHPH Draft EIR identified NHPH Mitigation Measures GHG-1 to mitigate this significant impact.

O-SM-69 The comment contends that the assessment of and findings of GHG impacts of the NHPH Draft EIR are incorrect because the modeling of GHG emissions made adjustment to the default factors in the CalEEMod model that were unsubstantiated.

The Draft EIR acknowledges that changes were made to model default values to provide a project-specific analysis with data provided by UCSF' construction team. These data included data points such as the number of truck trips, workers and haul truck capacity. UCSF's construction team's response to a request for information which provided this project-specific information is included **Appendix AIR-A** in this Final EIR. These data provide the basis for a justifiable change to the model default values, and consequently, no further revisions to the calculation of air pollutant emissions are warranted Further, as shown in Table 4.2-7 of the NHPH Draft EIR, the estimated construction-related emission of oxides of nitrogen (NOx) are approximately half of the BAAQMD significance threshold without mitigation while the unmitigated emissions of reactive organic gases (ROG) are one fifth of the applicable threshold and emissions of particulate matter substantially less than the applicable thresholds.

O-SM-70 The commenter contends that the assessment of and findings of GHG impacts of the NHPH Draft EIR are incorrect because the analysis assumes that the proposed NHPH will achieve net zero emissions from purchased electricity.

Please see response to Comment O-SM-59 and O-SM-60, above.

O-SM-71 The commenter contends that the assessment of and findings of GHG impacts of the NHPH Draft EIR is incorrect because the analysis does not consider GHG-related mitigation measures beyond NHPH Mitigation Measure GHG-1. The commenter is also concerned that the use of offsets identified under NHPH Mitigation Measure GHG-1 may be inappropriate.

NHPH Mitigation Measure GHG-1 is identified in the NHPH Draft EIR to ensure that all new emissions of GHGs from both construction and operation are sufficiently offset to realize a net zero increase in GHG emissions for the NHPH. As this measure would reduce GHG emissions consistent with the net zero is appropriately identified in the NHPH Draft EIR as less than significant with implementation of NHPH Mitigation Measure GHG-1.

Beyond the implementation of NHPH Mitigation Measure GHG-1, the project would not rely only on offsets, but would implement the additional GHG reduction measures identified in Table 4.7-4 on pages 4.7-37 And 4.7-38 of the NHPH Draft EIR. These measures include a minimum level of LEED Gold Certification for the proposed NHPH; that the New Hospital be designed, constructed, and commissioned to outperform ASHRAE 90.1 - 2010 by at least 30 percent or meet the whole-building energy performance targets, and the project will include lighting with efficiencies surpassing Title 24 requirements. The New Hospital would be fully electric and would not include the use of natural gas and would thereby avoid GHG emissions from natural gas combustion. All of the purchased electricity used in the hospital would be carbon free. Further the project would be covered by UCSF's TDM program to minimize employee trips and associated GHG emissions.

The identified project sustainability elements and design in combination with NHPH Mitigation Measure GHG-1 are sufficient to achieve a less than significant impact. Therefore, no further GHG reduction measures are warranted or necessary.

As stated in Section 8.5 of this Comments and Responses document, expanded NHPH Mitigation Measure GHG-1 would prioritize local (within the air district) and in-state offset credits over in-nation offset credits. Offset credits shall be third-party verified by a major registry recognized by CARB such as CAR (Climate Action Reserve) or equivalent. If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming or equivalent national offset credits registered with an approved registry.

O-SM-72 The commenter contends that the use of offsets identified under NHPH Mitigation Measure GHG-1 may be an inappropriate method of reducing a project's emissions because it sets a bad precedent.

In its most recent (2017) CEQA Air Quality Guidelines, BAAQMD recognizes emission offsets as a viable method of addressing significant air emission impacts. On page 4-2 of these guidelines, BAAQMD states that "facilities also may purchase an emissions reduction credit to offset their emissions." On page 4-12 the guidelines state "In implementing offsite mitigation measures, the lead agency must ensure that emission reductions from identified projects are real, permanent through the duration of the project, enforceable, and are equal to the pollutant type and amount of the project impact being offset."

And on page 5-7, BAAQMD states "If emissions would exceed the *Threshold of Significance*, more refined modeling or mitigation measures to offset emission can be considered.

Because the BAAQMD, the agency with regulatory authority over air quality for the San Francisco Bay Area, acknowledges offsets as a method of mitigating emission impacts under CEQA, as do the CEQA Guidelines, they represent a viable tool in for mitigating the impact of significant GHG emissions.

O-SM-73 The commenter suggests that UCSF inappropriately considers the cost of GHG reduction measures to be used as mitigation.

Please see response to Comment O-SM-40 above.

O-SM-74 This comment recommends that the NHPH Draft EIR identify additional mitigation measures to reduce GHG emissions to the maximum extent feasible.

As stated on page 4.7-36 of the NHPH Draft EIR, NHPH Mitigation Measure GHG-1 is identified to reduce GHG emissions to a net zero increase, and thus, result a less than significant impact with mitigation. To achieve the net zero

increase, NHPH Mitigation Measure GHG-1 sets forth a numerical performance standard based on the estimated GHG emissions generated for the proposed NHPH (27,449 MT CO_2e per year) to be offset. Consequently, GHG emissions associated with the NHPH would be reduced to a less-than-significant level with implementation of NHPH Mitigation Measure GHG-1.

As discussed in response to Comment O-SM-73 above, because identified project sustainability elements and design in combination with NHPH Mitigation Measure GHG-1 are sufficient to achieve a less than significant impact, no further GHG reduction measures are necessary should any others exist that are technically or economically feasible.

O-SM-75 The commenter identifies mitigation measures to address air quality and GHG emissions from a regional transportation plan in southern California, and suggests they be considered for the proposed NHPH.

The identified measures clearly state a that a lead agency (within the jurisdiction of the South Coast Association of Governments) should consider these measures to reduce substantial effects for individual projects that violate air quality standards. Impact AIR-1 of the NHPH Draft EIR identified emissions of construction-related emissions of criteria air pollutants to be less than significant and therefore no measures related to reducing construction-phase criteria air pollutant emissions are warranted. Impact AIR-1 of the NHPH Draft EIR did identify a potential significant impact with respect to emissions of fugitive dust and identified a mitigations measure which consists of dust control measures to be implemented as recommended by BAAQMD, the agency with regulatory authority over air quality for the San Francisco Bay Area to reduce this potential impact to a less than significant level. Most, if not all of the dust control measures in the suggested list are included in NHPH Mitigation Measure AIR-1, Best Management Practices for Controlling Particulate Emissions during Construction.

The recommended list of GHG reduction measures mirror most of those already being implemented by UCs *Sustainable Practices Policy*. Please refer to Table 4.7-4 on pages of 4.7-37 and 4.7-38 of the NHPH Draft EIR to review the correlation of the proposed NHPH with these measures.

Ultimately, because identified project sustainability elements and design in combination with NHPH Mitigation Measure GHG-1 are sufficient to achieve a less than significant impact, no further GHG reduction measures are necessary.

O-SM-76 This conclusory comment reiterates the commenters recommendation of implementing mitigation measures to address air quality and GHG emissions from a regional transportation plan in southern California.

Please refer to the response to Comment O-SM-75, above, with respect to these recommended measures.

O-SM-77 The commenter states that the project inadequately addresses bird-window collisions. Please refer to **Master Response 4: Bird Strikes**.

O-SM-78 The commenter details results of bird surveys conducted by the commenter's consultant in the Reserve on August 20, 2020 and July 16, 2021, which identified numerous bird species. The commenter also lists species from Golden Gate Audubon studies and eBird, which identified additional bird species in the Reserve, and the results of the California Academy of Sciences study of bird strikes in Golden Gate Park. The commenter's effort at cataloguing bird species diversity in the Reserve is noted; however, for purposes of CEQA analysis of the NHPH project, the array of resident and transient species present in the Reserve is not required, or particularly relevant to the project setting or impact analysis. The comment's "on-site" bird sightings in Table 2 (comment letter pg. 75 et seq., pages 10 to 13), appear to be from the Reserve and do not represent bird occurrences on the project site. All native migratory nesting bird species are protected under Migratory Bird Treaty Act (MBTA) and California Fish and Game Code.

O-SM-79 The commenter asserts that the NHPH Draft EIR did not adequately characterize the site's biological resources because it lacked a survey of the birds of Mt. Sutro Open Space Reserve. The commenter includes graphs showing the predicted species richness of the Reserve increases with survey time. The commenter states that the NHPH Draft EIR neglects to include birds known to occur in the Reserve. The NHPH Draft EIR project area includes bordering areas of the Reserve where medical gas tanks will be located; birds such as yellow warbler (*Setophaqa petechia*) which have been observed in the Reserve, are unlikely to occur on developed areas of the campus. A survey was not conducted in the Open Space Reserve, because the Reserve is not part of the Project area for the NHPH. Further, the purpose of the Environmental Setting section of the NHPH Draft EIR Biological Resources section is to characterize the affected environment for biological resources (e.g., special-status species, vegetation communities, and migration corridors) that are present, not to inventory general wildlife species that would not be affected by the project.

The commenter claims that the NHPH Draft EIR omitted discussion of certain special-status birds. Special-status birds were identified as such in the NHPH Draft EIR if they were federal or State listed species, or state species of special concern in California. The Draft EIR also noted that all native migratory bird species are protected under the MBTA, both special-status and common birds. Thus, all bird species identified by the commenter, eBird, Audubon, and others, are included in the environmental baseline and will be protected from impacts to active nests, consistent with State and federal regulations, as provided under NHPH Mitigation Measure BIO-1b.

The commenter notes that he observed a peregrine falcon during his surveys of the Reserve and project site; this species was noted in the NHPH Draft EIR to have

moderate potential to occur in the Reserve. The commenter states that additional special-status species not included in the NHPH Draft EIR were observed at the Project site or in the Reserve. The special-status species table in NHPH Draft EIR Appendix-BIO lists bird species recorded in the vicinity of the project in the California Natural Diversity Data Base and USFWS database; while it is not a comprehensive list, all native migratory birds are protected under the Migratory Bird Treaty Act and California Fish and Game Code 3513, and would be protected from significant impacts by NHPH Mitigation Measures BIO-1b, BIO-2a and BIO-2b, regardless of whether the species is named in the NHPH Draft EIR.

O-SM-80 The commenter requests consideration of the aerosphere, air space above the developed building site, as a habitat medium for wildlife species. CEQA protects general wildlife movement and nursery sites through criterion (d). The NHPH Draft EIR considers bird movement and potential for bird strikes during flight. Please refer to **Master Response 4: Bird Strikes**.

O-SM-81 The commenter states that the NHPH Draft EIR discussion of wildlife movement corridors lacks sufficient discussion of the energetic expense to birds and bats of circumnavigating the New Hospital. Please refer to **Master Response 4: Bird Strikes**.

O-SM-82 The commenter asserts that the New Hospital design and use of glass would introduce substantial bird collision hazards. Please refer to **Master Response 4: Bird Strikes**.

O-SM-83 The commenter notes that numerous species of birds, including special-status species, may be victims of window strikes. **Please refer to Master Response 4: Bird Strikes**.

O-SM-84 The commenter recommends revising the design of the New Hospital to be safer to birds and revising the NHPH Draft EIR to assess bird-window collision impacts. **Please refer to Master Response 4: Bird Strikes**.

O-SM-85 The commenter states that the NHPH Draft EIR discussion of bird strike impacts is insufficient because it lacks quantitative estimation of collision risk. The commenter estimates that more than 1,400 birds could strike the new hospital annually. Please refer to **Master Response 4: Bird Strikes**.

O-SM-86 The commenter discusses factors which contribute to the likelihood of bird-window collisions. Please refer to **Master Response 4: Bird Strikes**.

O-SM-87 The commenter discusses retrofitting windows, siting and other options to reduce bird-window collisions. Please refer to **Master Response 4: Bird Strikes**.

O-SM-88 The commenter states that the NHPH Draft EIR cumulative effects analysis should address the issue of bird window strikes by quantifying bird fatalities

from recent, planned, or foreseeable buildings in San Francisco. Although window strikes are a major source of bird mortality nationwide, no federal or State law protects birds from strike impacts. As discussed in the NHPH Draft EIR, Section 4.3.2, page 4.3-11, the City of San Francisco published bird-safe guidance in 2011. As noted in Section 4.3, UCSF is not subject to local land use regulation whenever using land under its control in furtherance of its educational mission. However, UCSF has voluntarily elected to implement mitigation (NHPH Mitigation Measures BIO-2a and 2b) consistent with the City's *Standards for Bird-Safe Buildings* for new construction, to protect birds from window strikes to the maximum extent feasible, and to reduce this impact to a less than significant level. While construction of the NHPH would increase the likelihood of bird strikes, in the context of the Pacific Flyway, used by an estimated billion birds per year, these impacts are minor, and not cumulatively considerable. A study estimating fatality rates for birds for all San Francisco buildings recently built, planned, or reasonably foreseeable, is not required for this EIR.

O-SM-89 The commenter asserts that more extensive surveys for monarch butterflies are required to formulate appropriate mitigation for this species in the Reserve. As noted in the NHPH Draft EIR, Section 4.3.1, page 4.3-5, monarch butterflies have been recorded in Golden Gate Park, Twin Peaks and other sites in San Francisco. However, overwintering monarchs have never been recorded within the campus site or the Reserve. While eucalyptus stands within the Reserve provide suitable roosting conditions for wintering monarch butterflies, these trees would not be harmed as a result of the Project. Pre-construction surveys of eucalyptus trees in the vicinity of the New Hospital would observe any monarchs present in the trees and NHPH Mitigation Measure BIO-1a would mitigate for any butterflies found by establishing an avoidance buffer for the duration of the overwintering period.

O-SM-90 The commenter asserts that NHPH Mitigation Measures BIO-1b is inadequate because preconstruction surveys are limited in their mitigation effect and they detect only small fractions of bird nests occurring on a project site. While the commenter is correct regarding the difficulty of identifying bird nests and bat roosts in dense vegetation, NHPH Mitigation Measures BIO-1b (and BIO-1c) require a qualified biologist to perform the survey, who is experienced in identification of active nests and roosts. Furthermore, for the NHPH, tree and shrub removal would occur in developed areas of the campus site where nests and roosts are less likely to be present and are easier to observe if they are. The request to provide "substantial compensatory mitigation" is unwarranted, as the project would not cause the loss of habitat for federal or state-listed species.

O-SM-91 The commenter indicates that their comments on the efficacy of preconstruction survey for nesting birds also applies to roosting bats in Mitigation Measure BIO-1c. The preconstruction bat surveys identified in NHPH Mitigation Measure BIO-1c will detect signs of current or recent bat use, or potential for bat presence, and are based on survey methodologies that meet California Department of Fish and

Wildlife guidance. Any potential bat habitat areas will be removed using the bat-safe two-stage approach in NHPH Mitigation Measure BIO-1c. These mitigation measures will protect nesting birds and roosting bats in the path of construction.

O-SM-92 The comment that implementation of the construction worker awareness program (NHPH Mitigation Measure BIO-1d) would not reduce impacts to flying wildlife, including collisions with windows, is noted. The construction worker awareness program is not intended to avoid bird collisions with windows.

O-SM-93 The commenter expresses support for the measures to minimize harm to birds during construction. No revision to this section is requested.

O-SM-94 The commenter recommends a number of specific design changes to reduce bird strikes at the New Hospital, and requests the qualifications of the biological monitor, and suggests that an adaptive approach to fatality monitoring be implemented. Please refer to **Master Response 4: Bird Strikes**.

O-SM-95 The commenter recommends conducting detection surveys for special-status birds at gradients from the proposed New Hospital site and surveys for all wildlife in the Reserve. Please refer to response to Comment O-SM-79.

O-SM-96 The commenter recommends adhering to design guidelines from the American Bird Conservancy, as well as the New York and San Francisco guidelines. Please refer to **Master Response 4: Bird Strikes**.

O-SM-97 The commenter suggests requiring funding contributions to wildlife rehabilitation facilities to cover injuries resulting from construction and operation of the NHPH. Please refer to **Master Response 4: Bird Strikes**.

O-SM-98 The commenter proposes a study design for post-construction fatality monitoring for birds. Please refer to **Master Response 4: Bird Strikes**.

O-SM-99 The commenter provides recommendations to improve post-construction fatality monitoring for birds, including behavioral studies. The University acknowledge receipt of the input on bird protection guidelines and has included them as part of the record of information that will be considered during the decision-making process for this proposed project. Also, please refer to **Master Response 4: Bird Strikes**.

O-SM-100 The commenter recommends incorporating nocturnal surveys to post-construction fatality monitoring for birds. Please refer to **Master Response 4: Bird Strikes**.

O-SM-101 The commenter recommends publication and peer review of data from post-construction fatality monitoring for birds. Please refer to **Master Response 4: Bird Strikes**.

O-SM-102 The commenter asserts that it is not possible to adequately determine whether the New Hospital would have a significant impact on nearby properties due to direct or indirect earthshaking without use of a microseismic array.

This comment is related to a phenomenon that has been observed with respect to earthquake-induced vibration of a building. Simply stated, if the New Hospital is shaken by an earthquake, the building can induce vibration in the ground in its vicinity. That vibration can spread to the nearby properties. It is possible to detect the specific vibration from the New Hospital in the neighborhood with a microseismic array only if there is no ground shaking at the locations where detection devices are installed.

However, the New Hospital can only be shaken by earthquakes originating from various active faults in the region. Such earthquakes would induce shaking at New Hospital as well as the entire neighborhood and beyond. The vibrations felt in the neighborhood would be predominantly vibrations originating from the earthquake source. In such cases, vibration contribution from the shaking of the New Hospital would be non-detectable in the neighborhood because it would be negligible in comparison to the contribution from the earthquake source. There has been no evidence showing that the negligible contribution from a vibrating building during an earthquake can cause damage to the buildings in the neighborhood. Any damage to a building in the neighborhood can only be attributed to the earthquake-induced vibration in the neighborhood.

In addition, even in the unlikely event that the vibration contribution from the New Hospital to the neighborhood vibration could be detected during an earthquake, it is likely to be of the long period (approximately 4 seconds) variety, which corresponds approximately to the fundamental period of the New Hospital. The buildings in the neighborhood are likely to have much shorter periods than the New Hospital and are therefore unlikely to be impacted by the long period vibration from the New Hospital.[15]

Based on the preceding discussion, it is concluded that the performance of the existing buildings in the neighborhood during an earthquake is likely to be dictated by their response to direct vibrations from earthquake sources rather than by vibrations originating from a shaking New Hospital. It is further concluded that the installation of a microseismic array in the neighborhood in connection with the NHPH project is not warranted for the stated reasons.

15 If the period of the structures in the neighborhood were to match the period of the vibrations originating from the proposed New Hospital, then those neighborhood structures would be shaken substantially by the vibrations from New Hospital in an earthquake because of resonance between the period of the structures and the period of the vibrations. However, there would be no resonance if the period of the neighborhood structures does not match the period of the vibrations from the proposed New Hospital. As such, the neighborhood structures would not be shaken substantially by the vibrations from proposed New Hospital.

Subject: Draft Environmental Report for the New Hospital at Parnassus Heights from GGAS
Date: Monday, February 14, 2022 5:03:59 PM

February 14, 2022

Ms. Diane Wong
UCSF Campus Planning, Box 0286
San Francisco, CA 94143-0286
EIR@ucsf.edu

Re: Draft Environmental Report for the New Hospital at Parnassus Heights

Dear Ms. Wong,

Thank you for the opportunity to comment on the draft EIR for the NHPH. Golden Gate Audubon Society (GGAS) is a non-profit organization with over 10,000 members and supporters in San Francisco and the East Bay. Our mission is to engage people to experience the wonder of birds and translate that into action to conserve and restore natural ecosystems, focusing on birds, other wildlife, and their habitats for the benefit of the earth's biological diversity that is under severe stress. 1

We recognize the need for expanding the number of hospital beds at Parnassus Heights, and the code requirements for up to date facilities mean that while Moffitt Hospital be seismically retrofitted it cannot be remodeled to meet the modern hospital standards for all kinds of care. 2

The New Hospital will be the tallest building in this part of the city, standing just north of the Mt. Sutro Reserve. One of our major concerns with this structure is the unavoidable bird strikes that will occur. The dEIR contains many encouraging features in this regard.

We applaud the plan to seek LEED Gold or above certification for New Hospital. According to the dEIR, the plan will follow LEED and US Green Building Council's Pilot Credit 55 for bird collision deterrence. The architects outline a plan to choose external materials that are consistent with collision deterrence. The building design presented in the dEIR also incorporates features that reduce large expanses of glass, and the glazing would be targeted to visible light reflectance 10 to 20 percent, wherever possible. The dEIR also states that the project will follow the San Francisco bird-safe ordinance. We do note that San Francisco has the oldest Bird-safe building ordinance in the US. It was state of the art in 2011 when it was passed, but since then many scientific studies have contributed to additional knowledge about the bird building collision issue. Now it is important to go beyond what is actually required in that ordinance. In particular we recommend ground 3 4

level and higher glazed surfaces should be treated with a product with a threat factor of 25 or lower according to American Bird Conservancy laboratory testing. (https://abcbirds.org/glass-collisions/products-database/) 4 cont.

Lighting design includes the use of automated internal shading in patient rooms on the upper floors to reduce the emissions of artificial lighting at night. The dEIR says this about exterior lighting "The New Hospital would comply with the allowed backlight, uplight, and glare (BUG) ratings for exterior lighting, for its specific Model Lighting Ordinance (MLO) lighting zone, or the maximum vertical and horizontal lumen allowances for its lighting zone. Either approach would serve to minimize lighting effects associated with the light sources." Up lighting is not safe for nearby nesting and migrating birds or for insects. We urge the project to use the minimum amount of exterior lighting necessary, minimize any blue light emissions, and provide fully shielded, 90 degree cutoff lighting fixtures. These fixtures direct the lighting to the areas where it is needed for people to see while minimizing sky glow, glare and light trespass. 5

The dEIR proposes that the construction contractor shall follow bird-safe procedures during construction, including following lighting principles described to the extent possible. During nesting season they propose to avoid working in bird habitat, and if they need to work in bird habitat, they propose to hire a biologist to spot potential nests, and establish a safe perimeter. However in the more general sections of dEIR, it is noted that a significant amount of noise and vibration is "unavoidable and cannot be mitigated". The construction timeline begins in January 2023 and continues through 2028 for exterior construction of the NHPH, with the final 2 years spent on interior, and landscaping. During the years of construction on the New Hospital, and the decades of construction on the Comprehensive Parnassus Heights Plan, there will be an extended period of disruption to birds and other wildlife in the vicinity of the Parnassus Campus. 6

The dEIR states that UCSF plans to employ a qualified ornithologist to ensure the most up-to-date measures for bird-safe buildings are followed. Golden Gate Audubon urges UCSF to ensure that the individual hired is well versed in the latest research and has knowledge of the latest mitigations available to ensure that the final design choices are the best possible. Following up to date best practices should result in a building that reduces bird strikes as much as possible. The dEIR states that this makes the threat to birds "less than significant", but state of the art measures cannot eliminate all threats. 7

Reducing the footprint of the hospital so that it no longer extends across Medical Center Way as it did in the CPHP EIR is a big improvement; the placement of medical gas tanks within reserve boundaries seemed like a good tradeoff. However this dEIR notes that 30 feet from the building and from tanks constitutes an 'ember' free zone for fire regulations, and an additional 100 feet is a defensible space with restrictions on vegetation, meaning that a large proportion of this section of the OSP is subject to strict regulation of permitted vegetation. 8

The New Hospital design features an extensive terrace on the sixth level that is proposed to become a public "garden". In addition, landscaping is proposed for balconies associated with articulated terraces and the upper levels. There are also courtyards between the new hospital and existing buildings and spaces at ground level where there are opportunities for 9

new landscaping. The dEIR shows planned placement of trees and shrubs in several of the spaces but still talks vaguely about the use of native plants for this landscaping--noting that native and adaptive plants will be used. 9 cont.

This NHPH project at completion, on balance, seeks to minimize negative effects on birds and wildlife. However the effects of construction are "significant and unavoidable with mitigation", thus for years to come, the project will be disruptive to birds and wildlife. 10

Golden Gate Audubon is mindful of the value of native plants for thriving bird populations and we propose mitigation for the adverse effects of non-zero threat to birds and extended periods of construction; (1) A commitment to the use of native plants in the landscaping of the New Hospital and throughout the CPHP is a small way to mitigate some of these effects going forward. We advise that UCSF consult a native plant expert who is also experienced at the use of local native plants in landscape design for this purpose. 11 (2) A larger mitigation could be achieved in the Mt. Sutro OSP. The Sutro Stewards are planting native understory plants, but only 50 % of replacement trees are designated to be native. Increasing this proportion to 75% would greatly improve the habitat value of the preserve in future decades. 12

Sincerely,

Whitney Grover

Chair, GGAS San Francisco Conservation Committee
Board Member, GGAS

Responses to Comments from Golden Gate Audubon Society

O-GGAS-1 The commenter describes the Golden Gate Audubon Society's purpose and mission. The comment is noted; no response is required.

O-GGAS-2 The commenter recognizes the need for the facility improvements at Parnassus Heights. The comment is noted; no response is required.

O-GGAS-3 The commenter expresses concern for the bird strike potential of the New Hospital, and support for the building design features to follow LEED and reduce light reflectance, and for the proposed bird-safe glass and other measures in NHPH Mitigation Measure BIO-2b. The commenter notes that the San Francisco bird-safe ordinance dates from 2011 and does not reflect the state of the art. Please refer to **Master Response 4: Bird Strikes**.

O-GGAS-4 The commenter recommends treating windows with a product from the American Bird Conservancy that reduces threats by a factor of 25 or more. The University acknowledges receipt of the input on bird protection and has included the recommendations as part of the record of information that will be considered during the decision-making process for this proposed project. Please refer to **Master Response 4: Bird Strikes**.

O-GGAS-5 The commenter recommends that exterior lighting be minimized, lighting be shielded and blue lighting minimized. NHPH Mitigation Measures BIO-2a and 2b promote use of yellow-red spectrum lighting for construction and operational lighting.

O-GGAS-6 The commenter notes that the NHPH Draft EIR describes noise and vibration during construction as unavoidable, and questions whether this noise and vibration would impact birds during nesting season. NHPH Mitigation Measure BIO-1b provides for work exclusion buffers around active nests, and monitoring by a qualified biologist for any occupied nest located within a protective buffer zone in order to determine if the designated buffer zone is effective. If noise and vibration from construction penetrate the buffer and disturb the nesting bird, the measure states that the buffer will be increased until it is effective, up to one-quarter mile.

O-GGAS-7 The commenter recommends hiring an ornithologist experienced with state-of-the-art bird-safe window treatments in order to make the best design choices. Please refer to **Master Response 4: Bird Strikes**.

O-GGAS-8 The commenter acknowledges that the reduced footprint of the New Hospital to not extend across Medical Center Way (as it did when proposed under the CPHP) is a big improvement, with the proposed placement of the medical gas tanks within the Reserve being a good tradeoff. The comment is noted.

The commenter expresses concern about the fire management buffer around the medical gas tanks within the Reserve boundary. The management of vegetation within the 30-foot ember-free zone and the 100-foot defensible space are designed to minimize fire risk. As described in Chapter 3, *Project Description*, within the 30-foot ember-free zone, vegetation management would primarily consist of removal of dead or dying grass, plants, shrubs, trees, branches, weeds, leaves and pine needles. Within the 30- to 100-foot defensible space, vegetation management would include horizontal and vertical spacing among shrubs and trees. It is noted that, as illustrated in Figure 3-21 in Chapter 3, the great majority of the area that would be subject to vegetation management under the NHPH overlaps with an area that is presently subject to vegetation management activities under the Mt. Sutro Open Space Reserve Vegetation Management Plan; thereby minimizing the amount of new vegetation management that would be required under the NHPH. Thus, the buffer area would continue to provide foraging and nesting habitat for birds following construction.

O-GGAS-9 The commenter notes that the NHPH Draft EIR includes landscaping for the sixth level terrace, courtyards and other spaces but is unclear on the use of native plants for landscaping. The commenter suggest that the use of native plants would provide value for bird populations and help to mitigate for the years of disturbance to birds and other wildlife. The commenter suggests that UCSF use native plants in landscaping of the New Hospital and CPHP and within the Reserve. This EIR concerns only the areas that would be affected by the NHPH project. For these areas, UCSF's design team plans to utilize a selection of native and non-native species (Mediterranean climate species adapted to the Bay Area climate).

O-GGAS-10 The commenter notes that construction disturbance in the NHPH Draft EIR is considered significant and unavoidable. However, the NHPH Draft EIR concludes that impacts to nesting and migratory birds are mitigated to a less than significant level with implementation of NHPH Mitigation Measures BIO-1b, 2a and 2c.

O-GGAS-11 and O-GGAS-12 The commenter suggests that the use of native plants would provide value for bird populations and help to mitigate for the years of disturbance to birds and other wildlife during construction of the NHPH. The commenter suggests that UCSF use native plants in landscaping of the New Hospital and CPHP and within the Reserve. This NHPH Draft EIR concerns only the NHPH hospital and surroundings. For these areas, UCSF's design team plans to utilize a selection of native and non-native species.

UC Board of Regents
Office of the Secretary and Chief of Staff to the Regents
1111 Franklin St.,12th Floor
Oakland, CA 94607

Dear UC Board of Regents,

On behalf of the membership of the International Union of Elevator Constructors Local 8, I am writing to express our full support for the proposed new hospital at UCSF Helen Diller Medical Center at Parnassus Heights. 1

The historic Community Workforce Agreement (CWA) between UCSF and San Francisco Building & Construction Trades Council (SFBCTC) will create an estimated 1,000 new unionized, good paying jobs for the construction of the new hospital alone. The CWA ensures the new hospital build will employ a union workforce with strong representation of local labor from 32 trade unions that represent 30,000 local skilled workers. Our agreement with UCSF will also ensure that apprentices in the trades and military veterans will be given ample opportunity to work on this $3 billion construction project. Our state-of-the-art apprenticeship programs are jointly administered with our industry partners, certified by the State, with two-thirds of all California apprentices identify as people of color.

Additionally, the Memorandum of Understanding (MOU) between UCSF and the City and County of San Francisco commits UCSF to expanding its EXCEL workforce training program by 50% and its partnership with the CityBuild pre-apprenticeship training program by a combined $5 million and sets a 30% local hire target for all construction workers. You may already know that CityBuild is the premier and only SF based Multi-Craft Core Curriculum (MC3) certified program by North America's Building Trades Unions, which boasts 78% percent people of color with 17% female participation. 2

As our city and region continue to recover from the economic impacts of the COVID-19 pandemic, this project will serve as a much-needed shot in the arm for San Francisco's economy and workforce. Furthermore, UCSF's pledge to honor San Francisco's long history of organized labor and collective bargaining will guarantee that working class families will continue to benefit from this investment in our local economy throughout the term of the project.

Local 8 strongly urges the UC Board of Regents to approve this project to help our city and its workers recover and thrive. Please support UCSF's new hospital at UCSF Helen Diller Medical Center at Parnassus Heights and help strengthen the health of our community and local economy. 3

Sincerely,

Greg Hardeman
Business Representative/ Recording Secretary

GMH/mrs

O-IUEC-1 The commenter expresses general opinions regarding the merits of the proposed NHPH. This comment does not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, the comment has been noted and will be forwarded to the decision-makers.

O-IUEC -2 The commenter provides background information on the IUEC and expresses opinions regarding the merits of the proposed NHPH. This comment does not address the adequacy of the NHPH Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to the decision-makers.

O-IUEC -3 The commenter expresses opinions regarding the merits of the proposed NHPH. This comment does not address the adequacy of the NHPH Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to the decision-makers.

8.4.2.3 Draft EIR Comment Letters – Individuals

From:	Lisa Heschong
To:	Campus Planning - EIR
Subject:	UCSF Parnassus Hospital v UCSB Munger Hall
Date:	Friday, January 7, 2022 1:33:32 PM

Dear UCSF and UCOP folks:

How is it that there is a such a thoughtful, community responsive, science driven design process for the proposed UCSF Parnassus Hospital, and the exact opposite for the proposed Munger Hall Dorm at UCSB?

Surely, the UC Board of Regents cannot follow a careful process for review of UCSF's proposed project, and then completely ignore all the same inputs for the UCSB Dorm. The proposed UCSB dorm has raised concerns not just locally, but across the world. It has been labeled "The Most Hated Building in the World" by French internet commentors. The entire California AIA community has condemned the UCSB design, along with experts from many other fields weighing in about how fundamentally unhealthy the design will be. 1

I do hope that the UC system can continue to demonstrate leadership in designing and building the very best buildings in the world—healthy, safe, efficient, beautiful and community friendly--and as a result, the Munger Hall proposal will be thoroughly rejected by the Regents.

Best,
Lisa Heschong, FIES
Santa Cruz, CA

Subject:	Public Comment on Parnassus Expansion
Date:	Thursday, January 13, 2022 9:18:36 PM

Dear Ms. Diane Wong,

I strongly support the expansion of UCSF's Parnassus campus.

It's a gift to have a world-class research hospital in our neighborhood. It's even better that it's part of a well-run organization that's been extremely thoughtful with it's planning, community engagement, expansion designs and environmental planning. Thank you for a comprehensive EIR.

My only constructive comment is that it's unfortunate it is taking so long to start the project. Let's get this hospital built!

1

Sincerely,
Nick Meyer

SF, CA 94122

January 14, 2022

Dear Ms. Wong,

I live across from the dental school. I have been in this building for 11 ½ years. I have been following the process on the NHPH. I read some of the EIR from a few years ago. 1

While it's nice that UC wants to provide more hospital beds the environmental impact to the neighborhood would be significant.

I am retired and can't afford to move. The noise and added heavy traffic would significantly impact my quality of life. 2

I hope the Board of Regents will consider building the new hospital in Mission Bay where they have already put a large project. 3

Sincerely,
Marsha Bird

Responses to Comments from Marsha Bird

I-Bird-1 The commenter provides some background comments that are not related to the adequacy of the NHPH Draft EIR; consequently, no response is required.

I-Bird-2 The commenter makes a general statement that the environmental impact to the neighborhood would be significant. The commenter adds that the noise and added heavy traffic would significantly affect the quality of life.

With respect to noise and transportation impacts, those topics are fully analyzed and mitigated to the extent feasible in Section 4.11, Noise and Vibration and Section 4.13, Transportation in the NHPH Draft EIR. Please note, however, that as discussed in **Master Response 1: Non-CEQA Comments**, potential effects of a proposed project on the "quality of life" and related conditions, in and of themselves, are not considered environmental impacts under CEQA.

I-Bird-3 The commenter indicates support for placing the New Hospital in Mission Bay. Please see NHPH Draft EIR Section 6.4.1 which explains that while the University did consider locating the proposed New Hospital at the Mission Bay campus site, it determined that such an alternative would not meet most of the key objectives of the proposed project, and while it would reduce impacts at the Parnassus Heights campus site, it would result in similar impacts at the Mission Bay site as well as the additional traffic and air quality impacts from travel between the two campus sites. Based on this, the University did not carry the alternative forth for detailed evaluation in the Draft EIR.

From: Denise Louie
To: Wong, Diane C.
Subject: Re: UCSF Draft EIR on the New Hospital at Parnassus Heights
Date: Saturday, January 22, 2022 10:53:35 PM

Hi Diane,
Regarding UCSF's Parnassus Heights Plan EIR, I am sorely disappointed that my concern over water does not appear in Volume 2. I had raised this issue more than once during online meetings.

The EIR does not adequately address my concern that we must all conserve water wherever we can. Water must be treated as a precious resource for all life, including species other than our own. It is 20th century thinking that we will always have plenty of freshwater to use. However, fish in the San Francisco Bay and Delta and in headwaters are in peril, at the brink of extinction. Entire ecosystems are on the verge of collapse. Natural ecosystem functions are disappearing. All of this is related to the negative environmental impacts of human activities. And yet, humans depend on healthy ecosystems.

Section 4.16, Impact UTIL-2 states "Sufficient water supply would be available from existing entitlements and resources to serve development under the proposed CPHP under normal, dry and multi-dry years if the Bay Delta Plan Amendment is implemented. If the Bay Delta Plan Amendment is implemented, the SFPUC may address the shortfalls thro would ugh rationing and/or develop new or expanded water supply facilities to address shortfalls in single and multiple dry years. The CPHP would not make a considerable contribution to impacts from increased rationing or from the development of new supply sources." This impact is described as "Less Than Significant" with no remediation required. 1

In new construction, pipes should carry rainwater and greywater for landscaping and flushing toilets, for example. Tanks and treatment facilities should be part of the architectural design and the construction. Because we can do better and leave more cool, fresh flowing water for fish.

I strongly urge UCSF to require that my concern over water use, conservation and remediation be detailed in the EIR. Because our use of water has had perilous effects on Delta Smelt, Salmon and entire ecosystems. The Environmental Impact Report's failure to address water use impacts on the environment is a serious deficiency.

Sincerely,
Denise Louie

Responses to Comments from Denise Louie

I-Louie-1 The commenter asserts that the NHPH Draft EIR did not adequately address water conservation. The commenter further asserts that fish in the Bay, Delta and in headwaters are in peril, and that natural ecosystem functions are on the verge of collapse.

The NHPH Draft EIR discusses the adoption of the amendments to the Bay Delta Plan Amendment by the State Water Resources Control Board in 2018. As stated on page 4.14-8 of the NHPH Draft EIR, among the goals of the adopted Bay-Delta Plan Amendment is to increase salmonid populations in three San Joaquin River tributaries and the Bay-Delta. Specifically, the plan amendment requires increasing flows in the Stanislaus, Tuolumne, and Merced Rivers of 30 to 50 percent of unimpaired flow from February through June every year, whether it is wet or dry.

The NHPH Draft EIR also discusses the 2020 Urban Water Management Plan (2020 UWMP) adopted by San Francisco Public Utilities Commission (SFPUC) for the City and County of San Francisco. As indicated on page 4.14-9 of the NHPH Draft EIR, the 2020 UWMP includes information on the SFPUC system supplies and demands, water supply reliability, Water Conservation Act of 2009 compliance, water shortage contingency planning, and water demand management. The 2020 UWMP considers future water supply scenarios both with and without the implementation of the Bay Delta Plan Amendment.

The NHPH Draft EIR also describes the UC Sustainable Practices Policy, updated in 2019. As discussed on pages 4.14-8 to 4.14-9, the UC Sustainable Practices Policy establishes goals for sustainable practices, including for sustainable water systems, and sustainability at UC Health locations. The NHPH Draft EIR notes that UCSF saves millions of gallons of potable water annually through implementation of a comprehensive Water Action Plan, which outlines the campus's methods for reducing dependence on potable water and identifies broader opportunities for water conservation. Over the past 10 years, potable water use at the Parnassus Heights campus site has decreased approximately 40 percent, from a maximum of 0.56 million gallons per day in FY 2010/11 to 0.33 million gallons per day in FY 2018/2019 as a result of the UCSF Water Action Plan. Development on the Parnassus Heights campus site must comply with the goals set forth in the Water Action Plan. The UC Sustainable Practices Policy identifies the goal of a 20 percent reduction in growth-adjusted potable water consumption by 2020, and by 36 percent by 2025 (compared to a 3-year average water consumption baseline of FY 2005–06, FY 2006–07, and FY 2007–08).

The commenter references Impact UTIL-2 in the NHPH Draft EIR. Impact UTIL-2 incorporates the findings of the water supply evaluation prepared for the NHPH in support of the NHPH EIR. Impact UTIL-2 correctly concludes that sufficient water supplies would be available from SFPUC to serve the NHPH and reasonably

foreseeable future development under normal, dry and multi-dry years even if the Bay Delta Plan is amended. If the Bay Delta Plan is implemented, the SFPUC would address the anticipated shortfalls through rationing and/or develop new or expanded water supply facilities to address shortfalls in single and multiple dry years. Further, the Impact UTIL-2 finds that the NHPH would not make a considerable contribution to environmental impacts from increased rationing or from the development of new supply sources. Accordingly, the impact was determined to be less than significant, and no mitigation was required.

The commenter also indicates that in new construction, pipes should carry rainwater and graywater for landscaping and flushing toilets, and that tanks and treatment facilities should be part of the architectural design and construction. The commenter is referred to the NHPH Draft EIR Chapter 3, Project Description, which includes a description of proposed utility improvements to serve the NHPH. This includes, but not limited to, development of a 150,000-gallon capacity stormwater storage facilities on the campus, which can be potentially be re-used for irrigation purposes on the campus. Furthermore, the NHPH would be subject to all applicable water conservation codes and requirements, such as low-flow water fixtures, showers and toilets. However, it should be noted it is not feasible for hospitals such the proposed NHPH to be piped for use of rainwater/graywater for facilities such as toilets.

The proposed NHPH project would incorporate the latest available water conservation technologies, including the use of the highest efficiency flow and flush fixtures, kitchen equipment, medical equipment, sterilizers and laundry equipment. An estimated 44 percent reduction in water use would be achieved compared to standard equipment.

The proposed NHPH project would also include native and adaptive plant types and high-efficiency irrigations systems to achieve an estimated 44 percent reduction in water use, in comparison to standard landscaping and systems without such efficiencies.

Comment Letter I-Pierotti

From: Karen Pierotti
To: Campus Planning - EIR
Subject: UCSF new hospital on Parnassus
Date: Thursday, February 3, 2022 5:05:19 PM

We have been a homeowners at 1279 3rd Avenue since 1999. We are against this huge building in our neighborhood. It is way out of proportion to our neighborhood. When we purchase our home we were promised that UCSF made a promise to all nearby neighbors that they would not build out the campus more than they already had done. Go build your enormous hospital in Mission Bay with the rest of your development. Your building will cause huge traffic, parking & noise problems to our neighborhood. The shadow of the hospital will ruin our homes. It's a ridiculous size for the community. The disruption of soil & water will have very bad consequences for us neighbors downhill. You are placing a big burden on us. If we wanted to live near a skyscraper, then we would move downtown. 1 2 3

The Board of Regents should be ashamed of itself. They have betrayed the trust of the Inner Sunset community .

Karen & Richard Pierotti
1279 3rd Ave

Sent from my iPhone

Responses to Comments from Karen Pierotti

I-Pierotti-1 The commenter expresses opposition to the proposed New Hospital, indicating it is too large and out of proportion to the neighborhood. The commenter adds that when they purchased their home, that they were promised that UCSF would not build out the campus more than they already had. The commenter is referred to Section 4.1, *Aesthetics, Wind and Shadow*, which evaluates the potential aesthetic effects of the New Hospital on scenic vistas (Impact AES-1), and with potential conflicts of the New Hospital with applicable zoning and other regulations governing scenic quality (Impact AES-2); and determines these impacts to be less than significant.

In addition, as discussed in Section 4.10, *Land Use and Planning*, Impact LU-1, while the proposed NHPH would result in an increase in square footage and population at the Parnassus Heights campus site, the 2014 LRDP as amended in January 2021 revised the space program, updated the projected population, and revised the Regents' Resolution to increase the space ceiling at the campus site. As such, the NHPH would be within the size and population parameters of the 2014 LRDP, as amended.

I-Pierotti-2 The commenter indicates the New Hospital should be built in Mission Bay. The commenter indicates support for placing the New Hospital in Mission Bay. Please see NHPH Draft EIR Section 6.4.1 which explains that while the University did consider locating the proposed New Hospital at the Mission Bay campus site, it determined that such an alternative would not meet some of the key objectives of the proposed project, and while it would reduce impacts at the Parnassus Heights campus site, it would result in similar impacts at the Mission Bay site as well as the additional traffic and air quality impacts from travel between the two campus sites. Based on this, the University did not carry the alternative forth for detailed evaluation.

I-Pierotti-3 The commenter expresses opinions that do not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, this comment has been noted and will be forwarded to decision-makers.

Re: Draft EIR for New Hospital at Parnassus Heights

We have lived and raised a family on Woodland Avenue since 1972. Neighbors in this area have dealt with UCSF's expansion plans for many years. The current plans to greatly increase the square footage and population at Parnassus violates past agreements of a space ceiling and does damage to a neighborhood and environment that cannot be covered in even a many-thousand page EIR. 1 2

The area that surrounds the Parnassus Heights UCSF campus is a compact residential neighborhood. UCSF is the largest landowner, employer and institution here. Its impacts are felt everywhere for good and for bad. Many of our neighbors work for UCSF, most people here value the important work, research and health care that occurs there. We are also very aware of the impacts of visitors, patients and employees on parking, traffic, congestion and pressure on housing. Needed upgrades to the Parnassus campus were approved by neighborhood representatives in UCSF's 2014 Long Range Development Plan. But the new plan to add over one million square feet of building and many thousands of people to an already crowded campus sounds like a planning nightmare. For those of us who live nearby it seems more like a living nightmare: More than 10 years of construction noise and traffic congestion on Parnassus and Judah. And in the end, the same two-lane Parnassus Avenue, thousands more people in the area every day and an enormous hospital looming above and encroaching on Sutro Forest. 3 4 5 6

What happened to plans for UCSF to expand further at Mission Bay? That area is certainly a more realistic location for a new hospital and other needed spaces. It is not congested. It is also an area that the city would like to see utilized, enlivened and a community emphasizing health care created. The current EIR mentions consideration of other locations for the planned expansion but basically dismisses the possibility with vague claims of undesirability. 7

In Alternative 2 of the draft EIR a Reduced Project is described that suggests a renovation of Moffitt Hospital, reduction in height of about 82 feet, smaller footprint and lessening of all the problems to be "mitigated" such as wind tunnel effect and historic preservation. If UCSF insists on the expansion they should at least consider their own EIR-suggested alternatives. 8

Molley and Richard Lowry

Responses to Comments from Molley and Richard Lowry

I-Lowry-1 The commenter provides some background comments that are not related to the adequacy of the NHPH Draft EIR; consequently, no response is required.

I-Lowry-2 The commenter asserts the current plans to increase the square footage and population at Parnassus violates past agreements of a space ceiling and would do damage to the neighborhood and environment.

While the proposed NHPH would result in an increase in square footage and population at the Parnassus Heights campus site, the 2014 LRDP as amended in January 2021 revised the space program, updated the projected population, and revised the Regents' Resolution to increase the space ceiling at the campus site. As such, the NHPH would be within the size and population parameters of the 2014 LRDP, as amended.

I-Lowry-3 The comments indicates that UCSF's impacts are felt everywhere, including from visitors, patients and employees on parking, traffic, congestion and pressure on housing.

As discussed in **Master Response 2: General Comments on EIR and Environmental Topics**, due to lack of specificity in the comment, no direct response is possible. However, please also see NHPH Draft EIR Sections 4.12, *Population and Housing*, which addresses how the NHPH may induce population growth and create a demand for new housing.

I-Lowry-4 The comment opines that the plan to add over one million square feet of building and several thousand people to an already overcrowded campus would be a planning nightmare; and for those live nearby the campus site it would seem like a living nightmare. This comment does not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments,** no response is required. However, the comment has been noted and will be forwarded to decision-makers.

I-Lowry-5 The commenter references more than 10-years of construction noise and traffic congestion on Parnassus Avenue and Judah Street. As discussed in **Master Response 2: General Comments on EIR and Environmental Topics**, due to lack of specificity in the comment, no direct response is possible. However, the NHPH Draft EIR Section 4.11, Noise and Vibration and Section 4.13, Transportation address all construction noise and transportation impacts, and identify mitigation measures to mitigate all significant impacts to the extent feasible.

I-Lowry-6 The commenter indicates the New Hospital would loom above and encroach on Sutro Forest. In fact, in contrast to the prior New Hospital concept previously

proposed under the CPHP, the New Hospital design proposed under the NHPH, no portion of the New Hospital would encroach within the Reserve.

I-Lowry-7 The commenter states that Mission Bay is a more realistic location for the New Hospital. Please see NHPH Draft EIR Section 6.4.1 which explains that while the University did consider locating the proposed New Hospital at the Mission Bay campus site, it determined that such an alternative would not meet most of the basic objectives of the proposed project, and while it would reduce impacts at the Parnassus Heights campus site, it would result in similar impacts at the Mission Bay site as well as the additional traffic and air quality impacts from travel between the two campus sites. Based on this, the University did not carry the alternative forth for detailed evaluation in the NHPH Draft EIR.

I-Lowry-8 The commenter suggests that as Alternative 2 would reduce many impacts of the proposed New Hospital, the University should consider approving this alternative. Alternative 2 was analyzed in detail in the NHPH Draft EIR and upon completion of the analysis, was determined to be the environmentally superior alternative. All of the alternatives, including Alternative 2, and their relative merits and demerits will be considered by the Regents when making a final decision as to approve the project as proposed or an alternative to the project.

From: John Gilmore
To: Haight Ashbury Neighborhood Council; gnu@toad.com; Campus Planning - EIR; dean.preston@sfgov.org; myrna.melgar@sfgov.org; mayorlondonbreed@sfgov.org
Subject: Re: Comment on UCSF Draft EIR by February 14 - and related action
Date: Sunday, February 6, 2022 11:22:57 PM

I fully support the construction of a large seismically-safe hospital in the Parnassus Heights campus. 1

It's sad that the Haight-Ashbury Neighborhood Council (HANC) has returned to its NIMBY roots, even after getting caught opposing low-income housing on Stanyan St. I recommend significantly discounting all NIMBY input such as HANC's. Their UCSF Flyer amounts to: 2

"A new hospital is required by law, but [don't build it in our backyard]!"

The reason that UCSF has to build a new hospital is so it will survive a 9.0 earthquake. "State law requires hospital facilities to comply with seismic safety building standards as defined by the Office of Statewide Health Planning and Development. In order to comply with these standards, Moffitt Hospital must be structurally retrofitted or decommissioned as an inpatient facility by 2030." The theory of HANC seems to be that after such a quake, the nearest functioning hospital should be as far from the Haight as possible. (I think Parnassus Heights is already pretty far away from the Haight anyway, so why does HANC care?) Most important, a distant hospital would poorly serve the Haight-Ashbury population that HANC claims to represent. 3

Or perhaps HANC thinks that a small hospital is better than a large one. This reasoning is suspect. During COVID, would a small hospital have been better than the large dual hospital we have today? Just so that if we had run out of patient rooms and people were dying for lack of care, HANC could be happy about how the hospital looks on the skyline, or how much or little transit runs past it? The function of a hospital is to serve the whole population with medical issues -- not to satisfy armchair critics. 4

Perhaps a clue to HANC's objection is their phrase "UCSF's desire to serve more well-paying patients". Why should UCSF not serve well-paying patients? Should they not serve well-paying medical students either? Perhaps they should not serve well-paying government research agencies too? Perhaps UCSF should poorly serve the taxpayers who pay top union prices for the hospital construction, too? Why not have UCSF serve NOBODY well -- would that satisfy HANC's objection? 5

Is HANC's theory that people should NOT be served if they pay well? So the only people who should get good service are people who pay poorly or not at all? If so, the objection makes no sense. They don't object to restaurants in the Haight that are so good that they can charge high prices. They don't object to computers and phones so good that they cost high prices, like Apple's. Their objection to hospitals that will serve more people who can actually pay for service is inconsistent and nonsensical.

Perhaps HANC thinks that the Haight should only have a shitty hospital

that nobody with any money would want to go to? Leaving both the rich and the poor to die when they have medical issues after 2030, would not serve anything but HANC's own political ambitions.

5 cont.

UCSF should build its "new giant hospital on Parnassus Avenue". Thank you for asking the neighbors their opinion. I am one of them.

Responses to Comments from John Gilmore

I-Gilmore-1 The commenter expresses support for the NHPH. This comment does not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

I-Gilmore-2 The commenter presents opinions that do not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1**, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

I-Gilmore-3 The commenter accurately summarizes the need for Moffitt Hospital to be structurally retrofitted to comply with applicable seismic safety building standards. No response is required.

I-Gilmore-4 The commenter presents opinions that do not address the adequacy of the NHPH Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

I-Gilmore-5 The commenter presents opinions that do not address the adequacy of the NHPH Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

I-Gilmore-6 The commenter expresses support for the NHPH. This comment does not address the adequacy of the NHPH Draft EIR; consequently, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

February 7, 2022 dEIR comments Pinky Kushner, San Francisco

I thank you for the opportunity of commenting on the dEIR of the proposed new UCSF hospital at Parnassus Heights.

1. LIGHTS— How will skyglow be measured?

The Parnassus location in San Francisco very frequently has nights with low clouds. These clouds cause a broad spreading of lights from their source. The light spreads laterally as well as upward and downward. It bounces from the cloud cover back to the below—ground, street, earth generally, back up to the cloud cover and down again and again.

Termed skyglow by the International Dark Sky Organization, this spread of light is most annoying in the residential communities. It can, however, be measured. **How will UCSF measure night light? The measurements should include spread or *skyglow* and quality of light in terms of color temperature (Kelvins).** There are monitors available. **What monitors will UCSF use? Will UCSF commit to modifying their lights if the skyglow is more than the current level?** 1

The upper floors of this very, very tall, glass building may even occasionally be 'above the could,' making the entire cloud cover glow far and wide. The lower floors, however, will also contribute significantly to skyglow. The building is of course a hospital with interior lights 24 hours a day.

Skyglow is more than annoying—-it is unhealthy. "….[A]rtificial light at night can negatively affect human health, increasing risks for obesity, depression, sleep disorders, diabetes, breast cancer and more." (IDSO).

An additional problem is that the new hospital backs into a nature preserve, where night should be night. 2

"For billions of years, all life has relied on Earth's predictable rhythm of day and night. It's encoded in the DNA of all plants and animals. Humans have radically disrupted this cycle by lighting up the night. Plants and animals depend on Earth's daily cycle of light and dark rhythm to govern life-sustaining behaviors such as reproduction, nourishment, sleep and protection from predators. Scientific evidence suggests that artificial light at night has negative and deadly effects on many creatures including amphibians, birds, mammals, insects and plants." (IDSO)

I live on 6th Avenue between Judah and Irving. We have two east-facing upstairs bedrooms. I would be happy to help UCSF do light measurements from my windows, baseline and once new lights are in place. 3

In sum, the EIR must consider light dispersal seriously and technically. The EIR only mouths the commonplace statement that it will do 'as much as is feasible.' What does 'feasible' mean? Standardized measurements must be made and shared with the public.

2. SIZE of patient rooms

This may or may not be part of a typical EIR, but it should be part of a hospital EIR. 4

I understand the patient rooms are around 400 sq ft in area. I find this a bit surreal since a one bedroom apartment is about that size. If this is accurate, that size makes a very heavy burden on the hospital staff having to navigate from one patient to another. Staff—nurses, aides, and other medical personnel—must attend more than one patient. The larger the rooms, the more

spread out the rooms are, requiring staff to walk miles a day to perform their duties, leading to staff fatigue and ADA and OSHA issues. An environmental review of a hospital facility should incorporate design principles that do not stretch personnel resources, that do not cause ADA and OSHA complications. Four hundred square feet has to be explained as to how staff can manage the distances this design will require.

4 cont.

3. LOCATION of the new hospital—the elephant in the room.

The location of this new, large Parnassus hospital is not appropriate. This location is cramped and should be considered full. At the present, sidewalks are crowded, transportation is a nightmare, significantly so. The dEIR ignores these impacts, claims unrealistic mitigations, or states that the impacts are 'unavoidable.' This is nonsense. As an example, the number of new hospital beds demands a significant increase in supply deliveries. The EIR says the deliveries 'will occur in the evening or night hours.' This is no mitigation. The impact to the community will still be there. The only way to avoid these impacts is to move the new hospital to an appropriate location.

Responses to Comments from Pinky Kushner

I-Kushner-1 The commenter references skyglow as termed by the International Dark Sky Organization, and inquires how UCSF will measure night light.

It is assumed the commenter is referring to the International Dark-Sky Association, not the International Dark Sky Organization. The NHPH Draft EIR Chapter 3, Project Description subsection on New Hospital Lighting states the New Hospital would comply with the allowed backlight, uplight, and glare (BUG) ratings for exterior lighting, for its specific Model Lighting Ordinance (MLO) lighting zone, or the maximum vertical and horizontal lumen[1] allowances for its lighting zone. The NHPH Draft EIR additionally describes that the International Dark-Sky Association and the Illuminating Engineering Society (IES) developed a Model Lighting Ordinance (MLO) to address the need for a consistent outdoor lighting regulation in North America. The MLO uses a classification of five lighting zones for different land uses, ranging from LZ0 (for pristine natural environments) to LZ4 (for limited application in areas of extensive development in cities). The MLO also limits the amount of light used for properties. In addition, the MLO uses the IES's backlight, uplight, and glare (BUG) classification of outdoor lighting fixtures to ensure that well-shielded fixtures are used, and that no uplighting is used.

The proposed approach described above would be effective in minimizing light effects associated the NHPH nightlight sources. In addition, the NHPH Draft EIR also identifies additional nightlight and glare measures in NHPH Mitigation Measure AES-3 and NHPH Mitigation Measures BIO-2a-b to further ensure potential light and glare impacts would be less than significant.

I-Kushner-2 The commenter asserts that scientific evidence suggests that artificial light has negative and deadly effects on creatures, including amphibians, birds, mammals, insects and plants.

Impacts of artificial light on migrating birds during both NHPH construction and operation are addressed in Section 4.3 in Impact BIO-2, and identified as potentially significant. These effects are mitigated to a less than significant level with implementation of NHPH Mitigation Measure BIO-2a, which requires minimizing and fully shielding construction lighting, and NHPH Mitigation Measure BIO-2b, which requires avoiding unnecessary night lighting, motion sensors, and shielding for operational lighting. The minimization and shielding of external lighting would similarly protect other wildlife, including amphibians, mammals, and invertebrates; and vegetation in the vicinity of the NHPH

I-Kushner-3 The commenter indicates the EIR must consider light dispersal seriously and technically; and that standardized measurements must be made and shared with

[1] The lumen is a measure of the total quantity of visible light emitted by a source per unit of time.

the public. As described in response to Comment I-Kushner-1, above, UCSF proposes a framework as part of the project consistent with professional standards to ensure that lighting from the New Hospital would be within allowances defined for the lighting zone established for the land use. This, combined with the mitigation measures identified in the NHPH Draft EIR, will ensure nightlight effects associated with the NHPH project, will be less than significant.

The commenter also inquires what does "feasible" mean. Per Section 15364 of the CEQA Guidelines, "feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.

I-Kushner-4 The commenter questions the need for the proposed size of the patient rooms in the New Hospital being 400 square feet. Current hospital codes require that patient rooms meet specific clear area and dimensional requirements, which necessitate the new rooms be at least 250 square feet for Acute Care, and 300 square feet for Intensive Care. UCSF would create a flexible building that can accommodate both Acute Care and Intensive Care in the same patient room footprint, positioning UCSF to serve the clinical needs of the next 50 to 100 years. The size of the patient rooms in the proposed New Hospital would allow them to be acuity adaptable and service the clinical needs of patients at various levels of care. The standard sizing of all patient rooms enables UCSF to quickly convert an acute care floor to a critical care floor. As the need for critical care increases, due to unforeseen issues such as pandemics or as a trend in intensity of health care, UCSF must be ready to meet this need to provide care to the most critically ill. This degree of resiliency is best practice for Academic Medical Centers and has been implemented by many of UCSF's peer institutions.

The commenter also asserts that the larger the rooms, the more spread out the rooms are, requiring staff to walk miles a day to perform their duties, leading to staff fatigue and ADA and OSHA issues. NHPH patient rooms have been designed to optimize treatment space for staff and equipment as well as space for family members who may be engaged in support patient care. The room configuration allows for nurse servers and line of sight for caregivers and support efficient care delivery. In addition, patient room groupings of 12 or 18 rooms further support staff mitigating travel beyond the cluster area. Please note that development of the patient room plans is still in progress, and while it is anticipated that some rooms for bariatric patients and other specialty needs may be larger than standard, UCSF is working to keep all patient rooms within a range of 290 to 320 square feet.

I-Kushner-5 The commenter indicates the location for the proposed New Hospital is not appropriate, citing that the location is cramped, sidewalks are crowded, and that transportation is adverse.

The New Hospital was designed in consideration of its location along Parnassus Avenue, proximity to the Reserve and surrounding neighborhood. It should be noted the overall size of the proposed New Hospital has been reduced by 55,000 gross square feet from its original proposal under the CPHP.

As described in the NHPH Draft EIR Project Description, the proposed NHPH project proposes a variety of circulation improvements to improve vehicle and pedestrian access in the New Hospital vicinity.

- The sidewalks along Parnassus Avenue adjacent to the New Hospital and the renovated Moffitt and Long Hospitals would be improved to provide a minimum width of eight feet, thus providing sufficient space for pedestrian travel, and unobstructed passage for people, strollers and wheelchairs; and include streetscape improvements such as new street trees.
- The proposed tunnel and pedestrian bridge would serve to better facilitate public access across Parnassus Avenue and reduce congestion along the roadway.
- The New Hospital would include a vehicular turnaround located beneath the New Hospital building podium on the street level to provide a drop-off for patients and visitors.
- A new traffic signal would be installed at the intersection of Parnassus Avenue and Hillway Avenue to improve vehicular operations at this location.
- Medical Center Way would be improved, as it would be standardized to 26 feet in width (curb to curb), and thereby meet City Fire Department fire truck access standards, and additionally provide five-foot-wide sidewalks on both sides.

As demonstrated in the NHPH Draft EIR Section 4.13, *Transportation*, all NHPH operational transportation impacts were determined to be less than significant.

The commenter expresses concern about proposed deliveries associated with the New Hospital, and indicates that deliveries occurring in the evening or night hours is not mitigation.

As discussed in NHPH Draft EIR, page 3-27, loading for general hospital services would occur at rebuilt loading docks at the south side (rear) of Long Hospital. While not an issue that required analysis under CEQA, for informational purposes, Appendix TRANS in the NHPH Draft EIR discussed commercial loading dock operations at the Parnassus Heights campus site associated with increased commercial traffic. While no mitigation is required, Appendix TRANS did include a recommendation for a dockmaster to be used to manage deliveries and dwell times, and thus, better facilitate loading dock operations.

Subject:	Comments on the Draft EIR
Date:	Wednesday, February 9, 2022 5:31:50 PM

The Draft EIR for the new hospital at Parnassus Heights contains several claims that are factually incorrect. For instance, the document repeatedly states that the project will have no substantial impact on 1) scenic vistas; 2) shadows; 3) light or glare; 4) housing; and 5) transportation. It also claims to have 6) no conflict with applicable zoning regulations. This new hospital will be 300 feet tall and its base will rest above all the other structures in Cole Valley. That neighborhood consists of single family houses, and their zoning height limit is 40 feet. Clearly, a structure of the proposed size and height, on top of the highest roadside spot, **WILL** have a substantial negative impact on its neighbors' views, shadows and nighttime glare. 1

In addition, it has been recited elsewhere that the proposed hospital will add at least 9,0000 new visitors to UCSF's Parnassus site each day. However, the Draft EIR document also claims that the new hospital will have no substantial impact on housing or transportation. Again, by increasing the current pressure on scarce housing, scarce parking and overcrowded public transit in the immediate vicinity, the dramatic daily influx of new new patients, visitors and staff to UCSF's proposed new hospital **WILL** have a substantial negative impact on its residential neighbors. 2

For these reasons, I believe that the Draft EIR report is factually misleading. I also believe that UCSF should not go forward with this project without mitigating the aforementioned substantial negative impacts on its neighbors. Such mitigation would likely require a revised proposal for a much less bulky physical addition to its already congested Parnassus campus. 3

San Francisco, CA 94117

Responses to Comments from Cynthia Travis

I-Travis-1 The commenter asserts the NHPH Draft EIR contains several claims that are factually incorrect. The commenter cites, as examples, the NHPH Draft EIR's findings that the NHPH would have no substantial impact on scenic vistas, shadows, light or glare, housing, and transportation. The commenter adds at the end of the comment that a structure of the proposed size and height, on top of the highest roadside spot, will have a substantial negative impact on its neighbors' views, shadows and nighttime glare.

First, with respect to aesthetics, as discussed in Chapter 1, *Introduction*, the NHPH meets the criteria of Statute Section 21099(d) which states that aesthetic impacts of an employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment. Nevertheless, the NHPH Draft EIR provides an assessment of potential aesthetic impacts since the public and decision-makers may be interested in information pertaining to the aesthetic effects of the proposed NHPH, and may desire that such information be provided as part of the environmental review process.

As demonstrated in Section 4.1, *Aesthetics, Wind and Shadow*; Section 4.12, *Population and Housing*; and Section 4.14, *Transportation*, the NHPH Draft EIR discusses the methodology used for evaluating impacts, analyzes the respective project and cumulative impacts pursuant to the significance standards established in the EIR, and identifies feasible mitigation measures (in this case, for light and glare, and disruption of travel conditions during construction) to reduce the significant impacts in these topic areas to a less than significant level. The requisite analyses, including for aesthetics, shadow and light/glare, were conducted in consideration of the campus site's location, terrain and elevation in relation to surrounding land uses, as was supported by detailed visual simulations, and shadow modeling. See also response to Comment I-Travis-2, below, for information on population and housing, and transportation issues.

The commenter also asserts disagreement with the NHPH Draft EIR's finding that the NHPH would have no conflict with applicable zoning regulations. The commenter indicates that the proposed hospital would be 300 feet tall, and above the single family houses and their zoning limits of 40 feet in the Cole Valley neighborhood. As explained Section 4.10, *Land Use and Planning*, in the case of Impact LU-1 (conflicts with land use plans, policies and regulations adopted for the purpose of mitigating an environmental impact), development and uses on property under the control of the University and that are in furtherance of the University's educational purposes, are not subject to local land use regulation. Accordingly, in this impact, Impact LU-1 evaluated significance as it relates to its potential to conflict with UCSF's 2014 LRDP and the 1976 Regents' Resolution as amended. As demonstrated in the NHPH Draft EIR, the NHPH would have a less than significant impact regarding these UCSF governing

documents. For informational purposes, the NHPH Draft EIR also finds that on balance, the proposed NHPH would not substantially conflict with the San Francisco General Plan and Better Streets Plan.

In Impact LU-2 (conflict with local land use regulations such that a significant incompatibility with adjacent land uses is created), it is acknowledged that the New Hospital would exceed the height limits in the City zoning on the site, the tallest City height limit on the site being 220 feet; however, similar to Impact LU-1, Impact LU-2 explains that the NHPH components within the campus site are exempt from the City's zoning. Impact LU-2 also explains that the New Hospital would be compatible and not create a significant land use impact with adjacent campus site land uses. Impact LU-2 reports the finding of Impact AES-2 that the New Hospital would be a noticeable visual change, and contrast sharply with nearby residential development. However, Impact LU-2 finds that the New Hospital would be consistent with the 2014 LRDP and Regents' Resolution as amended, as well as the amended UCSF Physical Design Framework, and would not conflict with applicable zoning and other regulations governing scenic quality. Impact LU-2 concludes that the New Hospital would not conflict with local land use regulations such that a significant incompatibility is created with adjacent land uses.

I-Travis-2 The commenter asserts that the daily influx of visitors and staff to the New Hospital will have a substantial negative impact on its residential neighbors, and cites increasing the pressure on scarce housing, scarce parking, and overcrowded public transit in the immediate vicinity.

The commenter is incorrect that the proposed NHPH would bring 9,000 people to the site. Please see NHPH Draft EIR Section 4.12 *Population and Housing*, Table 4.12-2, which identifies that the projected average daily (daytime) population of the NHPH would be 2,275 persons, including faculty, staff, patients, visitors, and vendors.

With respect to potential effects on housing, Impact POP-1 in the NHPH Draft EIR Section 4.12, *Population and Housing*, finds that implementation of the NHPH would induce population growth in the Bay Area, but the growth would not be substantial in comparison to growth that is projected and planned for San Francisco and the four other study area counties in *Plan Bay Area 2040* and the local General Plans for the study area communities. The residential units planned on the campus site under the CPHP will provide more on-campus housing to employees near their workplaces, including those that work in UCSF hospitals at the campus site. In addition, as part of the Memorandum of Understanding between UCSF and the City of San Francisco, UCSF has committed to providing additional off-campus housing beyond that called for in the CPHP. As such, the proposed NHPH impact related to population and housing would be less than significant.

With respect to parking, as discussed in Chapter 1, *Introduction*, the NHPH meets the criteria of Statute Section 21099(d) which states that parking impacts of an employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment. As such, potential impacts of the NHPH on parking activity was not determined to be an impact under CEQA.

Furthermore, impacts on parking are not included in the CEQA Appendix G checklist for transportation. Accordingly, CEQA does not require that a project's effect on parking be analyzed. Please note that although parking was not considered in determining if the project has the potential to result in significant environmental impacts, the NHPH Draft EIR presents information regarding the existing parking supply in relation to the parking demand, both on- and off-street facilities, in the Parking Conditions section, pages 4.13-21 to 4.15-23 for context and for informational purposes. Furthermore, the supply of parking is fully considered in developing the changes in mode choice that would occur with the NHPH project; i.e., parking supply is factored into the analysis of how people choose to travel at the present time and how they would travel in the future as a result of a smaller increase in parking relative to the population increase (Mode Choice section, pages 4.13-30 to 4.13-34).

With respect to transit, the NHPH Draft EIR Impact TRANS-1 finds that the New Hospital would not conflict with the UC Plans and policies that address transit, including the 2014 LRDP; and furthermore, would not conflict with San Francisco's Transit First Policy. While UC does not consider effects on transit demand to be a significant impact under CEQA, for informational purposes, Appendix TRANS in the NHPH Draft EIR provided a qualitative discussion of potential impacts on transit operations.

I-Travis-3 The commenter asserts that for the reasons identified in Comments I-Travis-1 and I-Travis-2, the NHPH Draft EIR is factually misleading; that the project should not go forward with the project without mitigating the aforementioned impacts on its neighbors; and that such mitigation would likely require a revised proposal for a less bulky addition to the already congested campus site. As explained in responses to Comments I-Travis-1to - I-Travis 2, above, all impacts of the NHPH are adequately analyzed in the NHPH Draft EIR and mitigated to the extent feasible.

Responses to Comments from Michael Sullivan and Paul Loeffler

I-Sullivan/Loeffler-1 The commenter expresses support for the New Hospital, and indicates the NHPH Draft EIR was properly completed. No response is required. However, this comment has been noted and will be forwarded to decision-makers.

EIR Comments re New Parnassus Hospital Tes Welborn 2-13-2022

- REVISED -

GENERAL COMMENTS ON THE EIR

1. While UCSF will self-certifiy this EIR, there are several other bodies, on pp. 1-6 and 1-7, that will have to give approve of a few of the actions that the plan requires. While UCSF has no doubt approached all of these bodies, these bodies can be approached by San Francisco residents to address matters that the public has raised and UCSF has ignored or brushed aside. 1
2. **UCSF does <u>not</u> present compelling, factual reasons** for the vast increase in size of new hospital. In fact, nearly every reason given was also true when the new hospital has planned and approved in the 2014 LRDP. These including an aging San Francisco population, new hospital standards, modern regulatory requirements and industry standards, and large private rooms. 2

The Covid-19 pandemic took very little of Parnassus hospitals' rooms. Yet UCSF then turns around and proposes a dense new hospital that may not be adaptable to stringent pandemics, and may actually facilitate virus spread. 3

UCSF has said that large private rooms are necessary for standardization and seriously ill patients. But there could be a significant portion of private rooms that could be smaller, saving space. 4

3. **4.1 Aesthetics.** Again, the current proposed site for the new hospital largely ignores that that a heavily built residential environment exists on three sides of the UCSF Parnassus campus [the fourth being the Sutro Reserve]. This giant tower will <u>block sun, shadow interior rooms, gardens, yards and decks, as well as solar panels</u>, is an exceptionally cruel action to take. 5

   Furthermore, many of the immediate neighbors actually work at UCSF. While these substantial impacts on neighbors are not officially part of the EIR process, UCSF should care more about the community around it. 6

   Many of the homes to the east are only a few hundred feet from the proposed construction site: Edgewood Avenue, Farnsworth, Belmont, and Willard. 7

   And major portions of Cole Valley will also experience considerable daytime shadow and noise. UCSF's ignoring of community interests is a major reason why the Cole Valley Improvement Association <u>withdrew</u> from the Community Advisory Group. 8

These losses to aesthetics - wind, shadow, as well as noise and vibration- these losses to residents' quality of life, will also result in a significant loss to homeowner property values. 9

4. **Planned new hospital height.** I note that UCSF has gone to exceptional lengths to <u>minimize</u> 10

the height of the proposed new hospital, and instead focuses attention on gross square feet in opening statements. This is deceptive. [see pp 1-1, 2-2, 3-13] The planned new hospital is so massive it would stand out from most of San Francisco. Putting a giant new hospital at the top of a hill on a two lane street also seems like an obvious poor choice. And this appears to be part of the reason that UCSF has chosen to bury actual building height. 10 cont.

5. **6.4 Geology and Soils**. The proposed lot is the steepest one on Parnassus. There have not been sufficient geological studies performed on this site. A nearby site on Mt. Sutro had a significant landslide. A new hospital should be built on stable land. It should not jeopardize staff and patients, nor hazard the significant financial investment. 11
6. **3.5 Project need.** UCSF says that it anticipates "that there will be a 14% increase in medically necessary transfers by 2030," and a variety of other assertions. All of these assertions lack documentation, and most, if not all, were not known when the 2014 LRDP new (smaller) hospital was approved. I have heard UCSF staff say that they turn away approximately 700 patients a year, but that is only 2-3 per day. 12

ALTERNATIVES

In general, all of the alternatives result in less impact on neighbors and the public. UCSF claims that it needs the large hospital on Parnassus, and on the particular lot now occupied by Langley-Porter, for "efficient" staffing. Yet UCSF already has built/occupied multiple hosptial sites in San Francisco, Mt. Zion, SF General, Mission Bay. Multiple hospital sites increase patient access to transportation and medical services, rather than a single site. Furthermore, multiple sites have benefits to the City of San Francisco in economic development. The City's MOU with UCSF includes these economic, as well as health, services. 13

6.3.2 Alternative 1B – A smaller hospital as approved in the 2014 LRDP.

This alternative is preferable because: 14

- It is just 110 feet tall and seven stories, with 17 feet of on-roof equipment
- In aggregate, it provides 431 campus hospital beds [140 new]
- UCSF does not present compelling, factual reasons for the vast increase in size of new hospital.

In fact, nearly every non-factual reason was also true in the new hospital planned and approved in the 2014 LRDP. These including an aging San Francisco population and new hospital standards, etc.

- There is no case made that significant factors changed within the 2-3 years before the commencement of planning the vastly expanded hospital.

Aesthetics

- **Impact AES-1** "no substantial adverse effect on a scenic vista"
  - This alternative would greatly reduce the gross scenic impact on San Francisco. Anywhere in the northern part of the city, a 300 foot tall building sticks out like a sore thumb. The alternative is much closer in height to existing campus buildings.
  - **Shadow.** The only shadow EIR officially considers is that on public schools and parks and this alternative would virtually eliminate the primary proposal's shadow impacts. And it goes further, in that the immediately adjacent housing to the east would not have their homes, solar panels, gardens, yards and decks, and windows thrust into shadow much of every day, and most of every day during winter months. This alternative wouldn't have such a gross impact on the resale value of these homes. Furthermore, because many of those immediate neighbors actually work at UCSF, this alternative benefits UCSF by reducing the impact on the quality of life of its staff.
  - **Air Quality, Noise and Vibration.** This alternative is highly preferable for all nearby residents, and particularly those who live on Edgewood, Farnsworth, Willard and Belmont. Many of those home lots are as close as 100-200 yards from the proposed hospital site. This alternative would reduce the amount of time residents face a living hell during work hours and work days. This is also true for Cole Valley area residents.
  - **Population and Transportation.** This alternative would greatly reduce the planned 8,000 daily additional persons on campus and arriving and leaving the campus. Parnassus Avenue is a narrow street with one lane in each direction. It is often congested at present. No additional parking construction has been proposed. This alternative would mean a much smaller impact on public transportation, private transportation, and alternative transportation means.
- **Moffit Hospital.** This alternative could still include the upgrades to Moffit Hospital proposed in the plan, adding more medical services. It doesn't appear to have been included in this alternative.

14 cont.

6.3.3 Alternative 2 – Reduced Project

A new hospital reduced to 212 feet in height, 629,000 gsf, 12 stories, and 288 beds, which added to Moffit Hospital, would result in campus total of 634 beds, only 48 less beds than the proposed plan.

- As discussed in the comparison of this Alternative with the planned project, Scenic Vistas, Scenic Quality,Wind and Shadow would be greatly reduced [pp 6-19 to 6-21].
- UCSF has grown inside a residential community and cannot disregard its plans impacts on neighbors. This Alternative more adequately considers neighbors east and north.

15

6.3.4 Alternative 3 – Phased hospital construction

This Alternative would include a "566,000 gsf, 13 story building." [p. 6-26] Note that UCSF has again deliberately not included actual physical height, concealing from the public the full impact of this alternative. One can imagine, based on other statements, that this alternative would be about 200 feet tall, substantially taller than current campus buildings. It would have considerable impacts in aesthetics, wind, noise, etc. over the prior two alternatives.

The phased portion calls for the demolition and replacement of Moffit Hospital. While there would be a delay in UCSF meeting the enormous increase in patients and staffing, this alternative would meet their target – which I have previously challenged as not based on factual data. UCSF only refers to "patient demand" [p.6-34].

The delayed hospital bed production would have positive and negative effects.

Negative: construction costs in the future are unpredictable

Positive: a shorter height hospital, achieves UCSF's bed count goal

Both positive and negative: longer construction period impacting neighbors, staff and patients

16

6.4 Alternative considered and dismissed

Each of these has a number of pluses that deserve more consideration, rather than quick dismissal.

6.4.1 New hospital at Mission Bay. This plus a smaller hospital at Parnassus would be a good compromise. It also supports the MOU with the City of San Francisco and spreading of economic growth throughout San Francisco. It reduces construction and transportation impacts at Parnassus, and aesthetic, wind, shadow impacts on residential neighbors.

17

6.4.2 New hospital on UC Hall site. A few lines on paper show a new RAB building at this site,

18

which has not been funded or designed. Combining that site with the current faculty building and/or part of the current dental complex make even the gigantic hospital building feasible. And it would be less of an eysore on Parnassus Avenue for the City of San Francisco. The bulk, as seen from city hall or Golden Gate Park, would be reduced.

18 cont.

6.4.3 This is the most specious argument of all! Page 6-37 states that "This potential alternative could result in UCSF hospitals operating at three different campus sites (Parnassus Heights, Mission Bay, and Mount Zion) which would be less than ideal and inefficient." I have news for UCSF: you already have three hospitals that you deliberately chose and built, and operate, after considerable community input.

UCSF's argument that a Mt. Zion site "would also result in decreased efficiency for UCSF staff and students..." apparently didn't stop UCSF from building three different sites. And many San Francisco residents appreciate having a hospital near them for medical services. Furthermore, in case of a disaster such as an earthquake, dispersed hospital locations are highly preferable. One site that could be blocked from access in an earthquake is poor planning.

19

UCSF could build on the more northern Mount Zion blocks, and purchase or lease the more southern blocks and build a smaller hospital, as approved in the 2014 LRDP, and supported by the larger community.

Responses to Comments from Tes Welborn

I-Welborn-1 The commenter notes other bodies besides UCSF with approval authority over certain actions that the plan requires. The commenter indicates all of these bodies can be approached by San Francisco residents to address matters that the public has raised and UCSF has ignored or brushed aside. The commenter expresses opinions that do not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

I-Welborn-2 The commenter asserts that UCSF does not provide compelling factual reasons for the increase in size of the New Hospital, and indicates that nearly every reason was also true when the new hospital was planned and approved in the 2014 LRDP, citing an aging city population, new hospital standards, modern regulatory requirements and industry standards, and large private rooms.

As discussed in Chapter 3, *Project Description*, subsequent to certification of the 2014 LRDP Final EIR, UCSF initiated a planning process to re-envision the Parnassus Heights campus site, which resulted in the development of the Comprehensive Parnassus Heights Plan (CPHP). Among other things, the CPHP updated the projected space needs for critical programs, including in patient care, and to improve the functional design of the campus site. The CPHP included a larger development program at the Parnassus Heights campus site, including a larger New Hospital, and a larger net increase of in-patient beds at the campus site, compared to that included in the 2014 LRDP. At the time of preparation of the CPHP, UCSF proposed a 955,000 gsf New Hospital, which under the NHPH has been reduced to a proposed 900,000 gsf.

Please also see Subsection 3.5, Project Need, pages 3-8 to 3.10 in the Project Description, which explains in detail the considerations factored by UCSF in projecting the space need for the New Hospital.

I-Welborn-3 The commenter asserts that the COVID-19 pandemic took very little of Parnassus Heights' hospital rooms, and then indicates UCSF proposes a dense new hospital that may facilitate a virus spread.

The COVID-19 pandemic has been a catalyst to provide greater focus on flexibility and preparedness for emergencies, while promoting efficiency and safety in care delivery for hospital design and operations. Design for the NHPH is emblematic of the emphasis on patient and staff safety and experience, maintaining the highest level of infection control protocols for all aspect of clinical care delivery. Design for the New Hospital includes design enhancements such as conversion ready rooms that are able to flex and adapt to

levels of acuity, additional airborne isolation rooms with improved air exchanges and the incorporation of technology to maximize patient care space and quality.

I-Welborn-4 The commenter points out that UCSF states that private rooms are necessary for standardization and seriously ill patients; and indicates that there could be a substantial portion of private rooms that could be smaller, saving space.

Please see response to Comment I-Kushner-4 for information on space requirements on patient room size.

I-Welborn-5 The commenter indicates the campus site is surrounded on three sides by residential development, and indicates the New Hospital will block sun, shadow interior rooms, gardens, yards and decks, as well as solar panels.

As demonstrated Section 4.1, *Aesthetics, Wind and Shadow* the NHPH Draft EIR discusses the methodology used for evaluating impacts, analyzes the respective project and cumulative impacts pursuant to the significance standards established in the EIR, and identifies feasible mitigation measures (in this case, for light and glare) to reduce the significant impacts in these topic areas to a less than significant level.

With respect to sun blockage and shadow creation, as explained in Impact AES-5 in the NHPH Draft EIR, the shadow analysis is limited to whether the NHPH would cast new shadow on publicly accessible open spaces in the vicinity of the campus site and whether this new shadow would adversely affect the use and enjoyment of these open spaces. Accordingly, the analysis assesses shadow impacts of the NHPH on three City parks (Golden Gate Park, Richard Gamble Memorial Park, and Grattan Playground), and on two schoolyards that participate in the Shared Schoolyard Project and provide public access on weekends (Independence High School and Grattan Elementary School). The Interior Greenbelt located adjacent to and east of the Reserve, and the Reserve itself located within the campus site, were also studied for this analysis. As analyzed in Impact AES-5, implementation of the NHPH would not adversely or substantially affect the use and enjoyment of these open spaces, and the impact was therefore concluded to be less than significant. Impact C-AES-4 determined that implementation of the NHPH in combination with cumulative projects reached a similar conclusion, and consequently, the cumulative shadow impact would also be less than significant.

I-Welborn-6 The commenter indicates many of the immediate neighbors actually work at UCSF, and that UCSF should care more about the community around it. The commenter expresses opinions that do not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

I-Welborn-7 The commenter indicates that many of the homes to the east are only a few hundred feet from the proposed construction site, and major portions of Cole Valley will also experience considerable daytime shadow and noise. With respect to how the NHPH Draft EIR analyzed shadow impacts, please see response to Comment I-Welborn-5, above.

With respect to noise, Section 4.11, *Noise and Vibration*, addresses all potential construction and operational noise impacts of the NHPH, and identifies mitigation measure to reduce potential noise impacts to the extent feasible.

I-Welborn-8 The commenter asserts that community interests were ignored by UCSF, and that is a major reason why the Cole Valley Improvement Association withdrew from the Community Advisory Group. The commenter expresses opinions that do not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, the comment has been noted and will be forwarded to decision-makers. See also **Master Response 3: Community Outreach**, which discusses the extensive community processes as well as changes made to the project in response to community feedback, including reducing the size of the project, revising the design so that it no longer encroaches into the Reserve, and reducing the mass of the structure by incorporating building setbacks at upper levels.

I-Welborn-9 The commenter asserts that losses to aesthetics, wind, shadow and noise and vibration affect quality of life, and result in a substantial loss to homeowner property values. As required by CEQA, environmental impacts associated with aesthetics, wind, shadow and noise and vibration are fully evaluated and disclosed in the NHPH Draft EIR in Sections 4.1 and 4.11. However, as explained in **Master Response 1: Non-CEQA Comments**, quality of life comments and socioeconomic comments are not under the purview of the NHPH EIR.

I-Welborn-10 The commenter asserts that UCSF attempts to minimize the height of the proposed New Hospital, instead focusing on gross square footage in opening statements. Please note the NHPH Draft EIR Chapter 3, *Project Description*, clearly discloses the proposed height of the New Hospital in text (page 3-13) and in illustrative graphics (Figures 3-7 through 3-10); as well as mentions the building height in Impact AES-1 (page 4.1-24), Impact AES-4 (page 4.1-46), Impact AES-5 (Page 4.1-58), Impact AIR-1 (page 4.2-26), and Impact LU-2 (page 4.10-19).

The commenter asserts that putting the New Hospital at the top of a hill on a two-lane street also seems like a poor choice. The commenter expresses an opinion that does not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

I-Welborn-11 The commenter asserts that the proposed lot is the steepest on Parnassus; that there have not been sufficient geological studies performed on the site; that a nearby site on Mt. Sutro had a substantial landslide; and that a new hospital should be built on stable land.

The commenter is referred to NHPH Draft EIR Section 4.6, *Geology and Soils*. The section relies in part on specific analyses conducted by UCSF's geotechnical consultant on the campus site and the NHPH site, including a geotechnical data report prepared in 2021, and campus-wide slope stability risk assessment prepared in 2019. These reports informed the NHPH Draft EIR description of campus site geological conditions, landslides and slope stability in the vicinity of NHPH site. The NHPH impact analysis disclosed all potential impacts associated with geology and soils, including risks from seismic groundshaking, and relatedly, with seismic ground failure (e.g., liquefaction) and landslides; erosion and loss of topsoil; and with potential unstable soils that may cause conditions such as landslides, lateral spreading, liquefaction and subsidence. In all cases, impacts were determined to be either less than significant, or mitigable to a less than significant level with implementation of feasible mitigation and compliance with applicable regulatory codes and requirements.

I-Welborn-12 The commenter quotes an excerpt from NHPH Draft EIR, Chapter 3, *Project Description*, that UCSF estimates there will be a 14 percent increase in medically necessary transfers by 2030. The commenter asserts that these and other statements lack documentation, and most, if not all, were not known when the 2014 LRDP new (smaller hospital) was approved. The commenter also anecdotally claims that UCSF staff turns away only two to three patients per day.

The forecasted bed demand for the future (2030 and beyond) is based on numerous factors, including:

- Recent historical increases in patient census projected into the future. UCSF has experienced a 19 percent growth in average daily census since 2016. This growth is expected to continue as the population ages and the demand for complex and specialized care increases.
- Sg2 Analytics, a healthcare analytics firm, projects growth rates by demographic regions based on market and population trends.
- Data that is kept that tracks the number of requests for transfer to UCSF that we are unable to accept. In the last 12-month period, there were 3,839 patients that were unable to transfer to UCSF who needed care that could not be received at health care facility where they were admitted. UCSF has evaluated all of these data sources three separate times between 2018-2021. Consistently, analysis has indicated that UCSF needs a hospital on the Parnassus site that can accommodate an average daily census of over 650 patients.

I-Welborn-13 The commenter argues that all of the alternatives result in less impacts on the neighbors and the public, and that building the New Hospital at a location other than the LPPI site would increase patient access to medical services.

As part of the NHPH Draft EIR analysis, the University did consider off-site locations for the proposed New Hospital, including locating the hospital at Mission Bay or at Mount Zion campus site (see NHPH Draft EIR Sections 6.4.1 and 6.4.3). However, both sites were not carried forth for detailed evaluation because locating the hospital at either location would not meet some of the key objectives of the proposed project and would result in additional traffic and air quality impacts from the travel between the Parnassus Heights campus site and the location of the New Hospital. As stated in the NHPH Draft EIR, operational efficiency is one of ten objectives of the proposed NHPH, that is "to site and develop a new inpatient facility in a way that optimizes operational activities with other clinical facilities at Parnassus Heights, such as Moffitt and Long Hospitals, and Medical Building 1." Co-location of clinical uses in the New Hospital alongside existing clinical uses would allow UCSF to operate more efficiently, allow the Moffitt, Long, and New hospitals to share resources, and also minimize intra-campus travel for patients and staff. Conversely, locating the hospital at an off-site location would not allow for this efficiency to be achieved and will result in inconvenience for patients, staff and students. Interdisciplinary collaboration is a hallmark of UCSF and key to the many breakthrough scientific discoveries by the institution. As all five professional programs (Medicine, Nursing, Pharmacy, Dentistry, and Physical Therapy) are established at Parnassus Heights, an off-site alternative would not foster collaboration given the distance between the off-site location and UCSF's main facilities.

I-Welborn-14 The commenter notes that Alternative 1B, which includes a smaller hospital that was included in the 2014 LRDP, is preferable because it is a shorter building than the proposed project, provides 140 new beds, and reduces the impacts of the proposed project on scenic vistas, shadows, air quality, noise and vibration, population, transportation. The commenter also states that the alternative could be modified to include the needed upgrades to Moffitt Hospital, and the commenter argues that the University has not made a strong case why this smaller hospital should be rejected in favor of the proposed larger hospital.

Alternative 1B is considered a No Project alternative as it represents a possible scenario that could be implemented by UCSF in the event that the proposed project is not approved by the Regents. The alternative was carried forth for detailed evaluation in the NHPH Draft EIR. The NHPH EIR fully describes the alternative, discloses its comparative impacts and evaluates its ability to meet key project objectives.

The NHPH Draft EIR acknowledges that this alternative would further reduce the proposed project's less than significant impact on scenic vistas. It would result in

less new shadows and therefore further reduce the proposed project's less than significant shadow impacts. It would also reduce the proposed project's construction and operational air quality, noise and vibration impacts, as well as population and transportation impacts.

However, this alternative would not meet the two key objectives of the proposed NHPH which are to provide an increased number of inpatient beds at the Parnassus Height campus site; and optimize the reuse of Moffitt Hospital by seismically retrofitting the building. Alternative 1B would not only provide substantially fewer beds than the proposed project (251 fewer beds than the NHPH) but would actually reduce the existing number of beds at Parnassus Heights campus site by 44 beds. In other words, the alternative does not address the main purpose of the project which is to provide more inpatient beds than are available at the present time. Even if Moffitt Hospital were renovated to provide additional beds as suggested by the commenter, only 49 beds could be added. Therefore, a modified Alternative 1B would increase the number of beds at the Parnassus Heights campus site by only 5 more beds compared to current conditions, and therefore would not meet the objective of addressing the need for more inpatient beds.

The commenter is directed to the discussion on the NHPH Draft EIR page 6-18, which explains why this alternative does not meet some of the other key objectives of the proposed project, including providing adequate space to meet industry and regulatory standards of contemporary hospitals, such as the ratio of operating rooms to pre- and post-recovery spaces. Contemporary hospitals also need to include sufficient space to accommodate modern technology, including telemedicine, robotics, and new diagnostic, imaging, testing, treatment, surgery and laboratory equipment. Please note that while Alternative 1B would provide 431 beds compared to 682 beds under the proposed project (a 37 percent reduction in number of beds), the amount of building space under this alternative (308,000 square feet) would reflect a 65 percent reduction from the 900,000 square feet of space under the proposed project. In other words, to keep the hospital at seven stories and to maximize the number of inpatient beds, the hospital under this alternative would not include some of the other clinical spaces that a modern hospital requires. The commenter is also referred to NHPH Draft EIR Section 3.5 in Chapter 3.0, *Project Description* which provides a discussion of the need for the proposed project, including why the additional space is needed at this campus site. The project is intended to further the research, education, and public service mission of the University of California. As the NHPH Draft EIR explains, the three missions of clinical care, education, and research are inter-dependent and require balanced support to ensure continued excellence. Therefore, the outdated Moffitt Hospital must be replaced with a state-of-the-art teaching and research hospital that is sized to serve the projected needs of the community.

I-Welborn-15 The commenter summarizes the main attributes of Alternative 2, Reduced Project Alternative, and notes that this alternative would greatly reduce the visual, wind and

shadow impacts of the proposed project. The commenter states that this alternative more adequately considers the neighbors to the east and north.

The comment regarding impact reduction under this alternative is consistent with the conclusions of the Draft EIR. The comment will be provided to the decision makers for consideration when deciding whether to approve the proposed project or an alternative.

I-Welborn-16 The commenter describes Alternative 3, Phased Hospital Construction, and notes that the NHPH Draft EIR does not report the actual height of the hospital under this alternative, and that the 13-story hospital would be substantially taller than the existing buildings and result in greater visual, wind, and noise impacts than the other alternatives considered in the NHPH Draft EIR. The commenter questions the need for the number of beds that would be provided in the New Hospital. The commenter further notes that the phasing would have positive effects that it would provide the number of beds that are needed in two buildings that are 10 to 13 stories high. The negative effects would be a prolonged period of construction and the late delivery of the second phase beds.

The comment is consistent with the description and analysis of Alternative 3 in the NHPH Draft EIR. Given the conceptual nature of this alternative, the specific height is not identified, although could be on the order of +/- 240 to 260 feet.

Regarding the need for the number of beds that would be provided in the New Hospital, please refer to the response to I-Welborn-12.

I-Welborn-17 The comment concerns the alternatives considered but dismissed from detailed evaluation. The commenter states that a new hospital at Mission Bay plus a smaller hospital at Parnassus Heights would reduce the impacts on the neighbors at Parnassus Heights.

The Draft EIR considered locating the New Hospital at Mission Bay but dismissed it from detailed evaluation as it would not provide the total number of beds that are needed. As discussed in Chapter 3, *Project Description*, under Project Need, there are bed shortages for critical and acute care in San Francisco, the greater Bay Area, and beyond, particularly for the adult tertiary and quaternary level of care provided by UCSF, primarily at Parnassus Heights. In addition, this potential alternative would not meet this growing demand, or allow for an expansion of emergency, surgical, interventional radiology, and imaging services, at the Parnassus Heights campus site. Co-location of clinical uses in the New Hospital would allow UCSF to operate more efficiently, allow the Moffitt, Long, and New hospitals to share resources, and also minimize intra-campus travel for patients and staff. Also, given that the Parnassus Heights campus site is the hub for the five professional programs and the majority of adult clinical care, the absence of a New Hospital at the Parnassus Heights campus site would not allow UCSF to achieve the benefits that can be realized through interdisciplinary collaboration and convergence between

clinical care, research, and education. Furthermore, by focusing future new clinical uses at the Mission Bay campus site, this potential alternative would also result in decreased efficiency for UCSF staff and students, and therefore have the potential to increase cross-town traffic between Parnassus Heights and Mission Bay campus sites, and related transportation effects and air emissions.

I-Welborn-18 The commenter states that with some modifications, the New Hospital on UC Hall site would be a good alternative to the proposed project as it would reduce the visual impacts of the proposed project.

The New Hospital under this alternative would be a 13- to 14-story structure, and therefore not as high as the 15-story New Hospital under the proposed project. Therefore, it is correct that this alternative would further reduce the proposed project's less than significant visual impacts. However, the alternative was found to be infeasible for a number of reasons that are discussed in the NHPH Draft EIR at pages 6-35 to 6-36, and was dismissed from detailed evaluation.

I-Welborn-19 The commenter states that the NHPH Draft EIR is incorrect in stating that operating hospitals at three different campus sites results in inefficiency, and that UCSF already has hospitals in three locations. The commenter further states that UCSF could develop more inpatient beds at the Mount Zion campus site and build a smaller hospital at the Parnassus Heights campus site.

As one of the country's leading health sciences campuses and UC's only campus focused exclusively on health sciences, UCSF's mission is to deliver instruction, conduct research, and provide clinical care. All three elements of its mission are inter-dependent and inextricably linked. Collaboration and discoveries that are the hallmark of UCSF are facilitated by physical adjacencies between clinical, research and instruction environments.

UCSF is recognized globally for innovative treatments, advanced technology and pioneering research applied to patient care. While serving the local community, UCSF is also major tertiary and quaternary referral center for patients from around Northern California, the West Coast, and across the nation. UCSF's quaternary care designation is the highest designation for facilities that can treat the most complex and specialized conditions.

UCSF Medical Center inpatient facilities consist of three main clinical sites at Parnassus Heights, Mission Bay, and Mount Zion campus sites, and maintains numerous primary care and specialty clinics throughout San Francisco and Northern California. The Parnassus Heights campus site is the oldest and largest of the UCSF campus sites, comprised of a tight network of interconnected facilities where faculty, physicians, learners, staff, and other are engaged in patient care, research and education activities.

The two main hospital facilities are at Parnassus Heights and Mission Bay, each with a distinct focus. The Mission Bay inpatient facilities consist of three specialty hospitals dedicated to children's, women's, and cancer care. The Parnassus Heights hospital facilities are the nexus of the majority of adult acute care, intensive care, emergency care, and a range of specialized services.

At Mount Zion, inpatient beds were only recently restored in the last two years on a limited basis. For example, to respond to an immediate need for increased bed capacity at the outset of the COVID-19 pandemic, a respiratory isolation unit for patients with infectious diseases was created at Mount Zion. Also, short stay inpatient stay surgical beds were added at Mount Zion, allowing for predictive workflows for patient throughput and more standardized care. In addition, inpatient psychiatric beds from LPPI are planned to be relocated to Mount Zion.

As noted above, each main campus site offers distinctly different services. Accordingly, each site requires unique medical equipment, staffing, clinical specialists, and support, with the added complexity of being a high-performing, tertiary and quaternary health system. The projected patient volume growth, driven largely by health care and demographic trends, support the need for a hospital of the size proposed even with the utilization of Mount Zion for the areas identified above. UCSF Health requires both the utilization of the Mount Zion and Mission Bay campus sites, in addition to an expanded hospital on the Parnassus Heights campus site. The cost of building on two sites simultaneously (to increase inpatient capacity at both Mount Zion and Parnassus Heights as suggested by the commenter) to address the demand, along with the cost and staffing inefficiencies involved in "splitting" adult services, is not practical. The plan for continued adult acute care, intensive care, emergency care and specialized services at Parnassus Heights, and the need for increased bed capacity proposed under the NHPH, along with the substantial support functions required to run a hospital, necessitates a hospital of the size proposed at the Parnassus Heights campus site.

The commenter refers to a prior statement that it would be inefficient to operate hospitals at three campus sites. While there are inefficiencies in operating at three separate sites, UCSF has come to the conclusion that the clinical need and patient volumes dictate that UCSF needs all three campuses to meet the current and evolving patient care volumes. Please refer the NHPH Draft EIR Project Description, *Section 3.5 Project Need*.

Re: Draft EIR Comment - UCSF New Hospital at Parnassus Heights

Dear Ms. Wong:

I am writing on my own behalf regarding the Draft Environmental Impact Report ("Draft EIR") for the UCSF New Hospital at Parnassus Heights Project ("Project"). My family and I will be direct neighbors of the new hospital. We live less than 500 feet away on Hill Point Avenue, where my partner and I are raising our toddler and have another child on the way soon. Thus, construction of the new hospital, which would occur over seven years, would directly impact us for an extended period of time. 1

I am generally supportive of the new hospital and believe it is necessary to ensure that UCSF continues to provide world-class healthcare to the City and the region. However, I am concerned that the Draft EIR fails to comply with the California Environmental Quality Act ("CEQA"), Public Resources Code section 21000 et seq. CEQA is designed to ensure that public entities, like UCSF, are accountable for their actions that impact the environment. The statute does this in part by (1) requiring disclosure of a proposed project's environmental impacts, to inform both the public and decision makers and (2) requiring mitigation of the proposed project's significant impacts to the extent feasible. Disclosure of impacts and proposed mitigation are required in an EIR, which the California Supreme Court has described as "the heart of CEQA." *Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 392 (citations omitted). Specifically, the Court described the EIR as 2

> an environmental "alarm bell" whose purpose is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return. The EIR is also intended "to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action." Because the EIR must be certified or rejected by public officials, it is a document of accountability.

2 cont.

Id. (citations omitted).

After carefully reviewing the Draft EIR, I am concerned that it fails in a number of respects to comply with the requirements of CEQA. I believe these shortcomings could leave UCSF vulnerable to litigation that would delay the Project and deny the region access to an improved healthcare facility for possibly years. Risk of litigation aside, as a neighbor, I expect UCSF to comply with the law and correct the inadequacies of the Draft EIR discussed in this letter, which would directly impact myself and my family.

While there may be other shortcomings in the Draft EIR, here, I focus only on those that would directly impact my family: (1) failure to adequately disclose and mitigate the Project's impacts on air quality, and (2) failure to adequately mitigate the Project's construction noise impacts.

3

I. AIR QUALITY

A. The Draft EIR does not adequately describe the actual health impacts of air pollution from the Project construction.

A significant shortcoming of the Draft EIR is that it fails to give the reader any clue of how the Project's increased air pollution during the seven years of construction would actually impact the health of sensitive receptors in the area. This issue is especially important to my family, as my very young children would be exposed to that pollution daily for years, and CEQA requires its disclosure. Specifically, CEQA requires that an EIR make "a reasonable effort to discuss relevant specifics regarding the connection between … the general health effects associated with a particular pollutant and the estimated amount of that pollutant the project will likely produce." *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 521. Only then can the public "make an informed decision [about the project], as CEQA requires." *Id.* The Draft EIR fails to make that

4

critical link between the amount of pollution anticipated and what health impacts are anticipated from *that specific increase in pollution*. 4 cont.

First, the Draft EIR identifies health effects of air pollutants. For example, the Draft EIR discloses that elevated levels of PM10 and PM2.5 are linked to "premature deaths, hospital admissions, emergency room visits, and asthma attacks," and "may significantly reduce lung function growth in children." Draft EIR at 4.2-4. Exposure to PM2.5 in particular is "strongly associated with mortality, respiratory diseases, and poor lung development in children, and other health effects, such as hospitalization for cardiopulmonary disease." *Id.* at 4.2-8. The Draft EIR also describes what kind of health impacts can result from exposure to Diesel Particulate Matter ("DPM"), and Toxic Air Contaminants ("TAC"). *Id.* at 4.2-7, 4.2-11. Children and the elderly are particularly sensitive to the health impacts of air pollutants. *Id.* at 4.2-12. 5

The Draft EIR then goes on to disclose that construction of the Project would result in increased emissions of air pollutants, including PM10 and PM2.5 – a significant impact. *Id.* at 4.2-27.

What the Draft EIR fails to do is link the *amount of increase* in air pollution from construction to *actual anticipated health impacts*. This incomplete analysis leaves the reader in exactly the situation that the California Supreme Court found to violate CEQA in *Sierra Club v. County of Fresno*. *See* 6 Cal.5th at 519-20 (EIR must both disclose what concentrations of pollutants would cause health effects and identify what concentrations would result from project). Like in that case, the Draft EIR here deprives its audience of the essential information necessary to link emissions and health impacts and to understand what the Project's real, on-the-ground impacts to human health would actually be. 6

B. The Draft EIR improperly defers identification of defined, enforceable mitigation for the Project's construction air pollution impacts.

The Draft EIR also improperly relies on deferred mitigation for air quality impacts. In particular, the Draft EIR discloses in Impact AIR-3 that construction of the Project would expose sensitive receptors – specifically, people who live near the construction site, like my family – to a cancer risk double the threshold of significance. Draft EIR at 4.2-31. The Draft EIR proposes to mitigate this significant impact by requiring the construction contractor to "develop a plan demonstrating that the off-road equipment used on-site to 7

construct the [Project] would achieve a fleet-wide average 70 percent reduction in PM10 exhaust emissions." *Id.* at 4.2-32. The Draft EIR then goes on to suggest a couple of options that could be included in this plan. *Id.* at 4.2-33.

7 cont.

Generally, an EIR must describe feasible mitigation, and "may not defer formulation of mitigation measures to a future time." *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 280; *see also Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467, 519-20. However, where the agency has identified practical considerations that prevent formulation of specific mitigation at the time of the EIR's preparation (*Preserve Wild Santee*, 210 Cal.App.4th at 280), identification of detailed mitigation measures can be deferred *only* if the EIR:

> (1) commits [the agency] to the mitigation,
> (2) adopts specific performance standards the mitigation will achieve, and
> (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated into the mitigation measure

(Cal. Code Regs, tit. 14 ("CEQA Guidelines") § 15126.4(a)(1)(B)).

8

First, the Draft EIR does not explain why development of the mitigation plan must be delayed until after the Project is approved. UCSF can anticipate now what sort of construction will be required and what equipment will be needed to do that work. Thus, it has no practical reason why it cannot develop specific mitigation now that would be properly subject to review by and input from the public and decision makers.

9

Further, while the mitigation measure purports to identify a performance standard of reducing PM10 emissions by at least 70 percent, it does not identify *what* that 70 percent reduction would be from, leaving the reader in the dark about how effective the required mitigation could actually be. What if, for example, the equipment used has *higher* emissions than anticipated by the EIR, and a 70 percent reduction in that equipment's emissions did not reduce emissions to a less than significant level? To be effective, a performance threshold must set a specific level of emissions at which mitigation requirements will be considered met. This is the only way to discern whether the impact would be mitigated to a less than significant level.

10

Additionally, the purported performance standard for the mitigation measure focuses only on PM10 reduction, but it does not explain how reducing PM10 emissions would end up reducing cancer risk. The Draft EIR should explain how PM10 emissions can be a proxy for all other emissions that could increase cancer risk (like PM2.5, DPM, and TAC) or it must provide for mitigation of other cancer-causing pollutants specifically. 11

Finally, if the EIR is revised to explain why deferred mitigation is necessary and to identify adequate performance standards, the EIR should also include a full suite of "the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated into the mitigation measure" (CEQA Guidelines § 15126.4(a)(1)(B)) – not just describe "[o]ne feasible plan" that could be considered (*see* Draft EIR at 4.2-33). 12

II. CONSTRUCTION NOISE MITIGATION

The Draft EIR recognizes that construction noise – which will last over seven years – will be a significant and unavoidable impact (that is, even with the described mitigation, the impact will be significant). In light of the very real impact the noise from construction of the Project will have on sensitive receptors in the area – especially residents in the area who spend their days largely at home (e.g., small children, individuals working from home, retired people) – it is essential that the EIR provide for all feasible mitigation.

However, at least one of the mitigation measures set forth in the Draft EIR to address construction noise falls short of CEQA's requirement that mitigation be specifically described in the EIR. *See, e.g.*, *Sierra Watch v. Placer County* (2021) 69 Cal.App.5th 86, 110. Here, Mitigation Measure NOI-1a provides in part: 13

> Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible; this could achieve a reduction of 5 dBA. *Quieter procedures, such as use of drills rather than impact tools, shall be used where feasible.*

Draft EIR at 4.11-21 (emphasis added). The California Court of Appeal recently rejected a measure exactly as vague as this one. In *Sierra Watch v. Placer County*, one mitigation measure – like here – described some specific noise-reduction mitigation, then went on to require, vaguely, that "'operations and techniques' … 'be replaced with quieter procedures (e.g., using welding instead of riveting, mixing concrete off-site instead of on-site) where feasible and consistent with building codes and other applicable laws and regulations.'" 69 Cal.App.5th at 110. The Court held that the measure was impermissibly vague, explaining: 14

> This language, in effect, only tells construction contractors to be quieter than normal when they can. Although that may be good neighborly advice, it is not sufficient as a mitigation measure. It defers until later the determination of which construction procedures can feasibly be changed and how these procedures can be modified to be quieter. And it offers no instruction on how either of these determinations are to be made. It is inadequate as a result.

Id. Because the Draft EIR here takes the same, improper approach as was invalidated in *Sierra Watch*, Mitigation Measure NOI-1a must be revised to provide a specific and detailed list of quieter procedures that must be employed to reduce noise impacts on surrounding sensitive receptors. 15

III. CONCLUSION

My family and I appreciate UCSF's attention to these critical shortcomings in the Draft EIR. I know it is UCSF's goal to be a good neighbor. But to achieve this, UCSF must correct the issues I have identified in this letter, which are key to the health and wellbeing of the medical center's closest neighbors. This will ensure both compliance with CEQA and provide the proper attention to impacts of this significant project on UCSF's neighbors. 16

Best regards,

Laura D. Beaton

Responses to Comments from Laura Beaton

I-Beaton-1 The commenter indicates that the construction of the New Hospital would directly impact the commenter's family for an extended period of time. As discussed in **Master Response 2: General Comments on EIR and Environmental Topics**, due to lack of specificity in the comment, no direct response is possible. However, please see responses to Comments I-Beaton-3 to I-Beaton-15 that address specific comments raised below.

I-Beaton-2 The commenter indicates general support for the New Hospital and its purpose. This comment does not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, this comment has been noted and will be forwarded to decision-makers.

The commenter expresses concern that the NHPH Draft EIR fails to comply with CEQA. As discussed in **Master Response 2**, due to lack of specificity in the comment, no direct response is possible. However, please see responses to Comments I-Beaton-3 to I-Beaton-15 that address specific comments raised below.

The commenter cites CEQA case law. This comment does not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1**, no response is required.

I-Beaton-3 The commenter asserts that the Draft EIR fails in a number of respects to comply with the requirements of CEQA; and indicates the issues that would directly affect the commenter's family are 1) failure to adequately disclose and mitigate the Project's impacts on air quality, and 2) failure to adequately mitigate the Project's construction noise impacts. As discussed in **Master Response 2**, due to lack of specificity in the comment, no direct response is possible. However, please see responses to Comments I-Beaton-3 to I-Beaton-12 for responses to specific comment raised on air quality mitigation; and I-Beaton-13 to I-Beaton-15 for responses to specific comments raised on construction noise mitigation.

I-Beaton-4 The commenter expresses concern that the NHPH Draft EIR does not provide the public with information regarding the health impacts anticipated from the increase in pollutant emissions from project construction.

The NHPH Draft EIR provides a discussion of potential health hazard impacts from toxic air contaminants from both construction and operation of the proposed NHPH. NHPH Draft EIR Impact AIR-3 on pages 4.2-30 through 4.2-34 of the Draft EIR specifically address the health risks at localized receptors within 1,000 feet of the proposed NHPH site associated with project construction activities. This impact focuses on emissions of fine particulate matter ($PM_{2.5}$) and diesel particulate matter (DPM), as other construction emissions such as nitrogen

oxides and reactive organic gases are regional pollutants that contribute to ozone formation and are not a health concern to localized receptors.

As shown in Table 4.2-9 on page 4.2-31 of the NHPH Draft EIR, unmitigated construction-related emissions of DPM would result in an increased cancer risk exceeding the BAAQMD threshold of 10 in one million at the maximally exposed off-site receptor, while emissions of $PM_{2.5}$ would be below the BAAQMD threshold of 0.3 micrograms per cubic meter and the resultant hazard index would be below the BAAQMD threshold of 1.0. Consequently, the NHPH Draft EIR identified a significant impact with respect to increased cancer risk for off-site receptors. NHPH Mitigation Measure AIR-3 is identified to require the use of clean construction equipment during NHPH construction. Implementation of NHPH Mitigation Measure AIR-3 would reduce DPM emissions generated by the NHPH construction activities so that increased cancer risk would be below the BAAQMD threshold of 10 in one million at the maximally exposed receptor; and consequently, would mitigate the impact to a less than significant level.

I-Beaton-5 The commenter acknowledges that the NHPH Draft EIR discusses the health effects of particulate matter and DPM and then contends that the NHPH Draft EIR identifies a significant impact with respect to emissions of PM_{10} and $PM_{2.5}$ on page 4.2-27.

The commenter is correct that the NHPH Draft EIR discusses the potential health effects of particulate matter and DPM exposure in Section 4.2.1, *Environmental Setting*. The commenter is incorrect with regard to the NHPH Draft EIR's finding of significance with respect to construction-related emissions of PM_{10} and $PM_{2.5}$ on page 4.2-27. Table 4.2-7 of the NHPH Draft EIR shows that the maximum average daily unmitigated emissions of PM_{10} and $PM_{2.5}$ would be 0.4 and 0.3 pounds per day, respectively. These emissions are substantially below the BAAQMD's thresholds for these construction emissions of 82 and 54 pounds per day, respectively. Therefore, the NHPH Draft EIR identified a less than significant impact with respect to construction-related emissions of PM_{10} and $PM_{2.5}$.

As stated on page 4.2-21 of the NHPH Draft EIR, these thresholds were developed by BAAQMD to assess the potential for a project to result in cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard by applying the State and federal Clean Air Acts emissions limits for stationary sources. These levels represent emissions below which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants that could result in increased health effects.

I-Beaton-6 The commenter contends that the NHPH Draft EIR does not provide the public with information regarding the health impacts anticipated from the increase in pollutant emissions from project construction.

The commenter is incorrect. Please refer to the response to Comment I-Beaton-4, above for the discussion on how the NHPH Draft EIR analyzes the potential health-related impacts that could arise from construction activities associated with the NHPH. Additionally, please refer to the response to comment I-Beaton-5, above for the discussion on how the NHPH Draft EIR analyzes the potential health related impacts associated with increased emissions of criteria air pollutants generated during construction.

The commenter also cites the findings of the California Supreme Court in *Sierra Club v. County of Fresno* which found that an EIR must both disclose what concentrations of pollutants would cause health effects and identify what concentrations would result from project. However, unlike the air quality significance determination for that EIR, the Draft EIR for the NHPH identified a less than significant impact with respect to emissions of criteria air pollutants which are below significance thresholds of the BAAQMD that were developed to address regulatory thresholds.

I-Beaton-7 The commenter is concerned that the NHPH Draft EIR defers identification of mitigation for the project's construction-related impacts.

The commenter is correct that the NHPH Draft EIR identifies a significant impact with respect to construction related emissions of DPM in Impact AIR-3 and then identifies NHPH Mitigation Measure AIR-3 to address this potential significant impact. NHPH Mitigation Measure AIR-3 requires construction contractor(s) to develop a plan demonstrating that the off-road equipment used on-site to construct the NHPH would achieve a specified performance standard of a fleet-wide average 70 percent reduction in PM_{10} exhaust emissions, compared to uncontrolled aggregate statewide emission rates for similar equipment. Because this mitigation measure identifies a specific performance standard to achieve the required reduction in emissions necessary to reduce the impact to a less than significant level and because the mitigation measure identifies specific methods that have been demonstrated to be capable of achieving the reductions of the performance standard, NHPH Mitigation Measure AIR-3 does not represent deferred mitigation under CEQA.

I-Beaton-8 The commenter is concerned that NHPH Mitigation Measure AIR-3 of the NHPH Draft EIR represents deferred mitigation under CEQA for the project's construction-related impacts.

NHPH Mitigation Measure AIR-3 requires construction contractor(s) to develop a plan demonstrating that the off-road equipment used on-site to construct the NHPH would achieve a specified performance standard of a fleet-wide average

70 percent reduction in PM_{10} exhaust emissions, compared to uncontrolled aggregate statewide emission rates for similar equipment. Because this mitigation measure identifies a specific performance standard to achieve the required reduction in emissions necessary to reduce the impact to a less than significant level and because the mitigation measure identifies specific methods that have been demonstrated to be capable of achieving the reductions of the performance standard, NHPH Mitigation Measure AIR-3 does not represent deferred mitigation under CEQA.

I-Beaton-9 The commenter suggests that UCSF should have the contractor prepare the emissions reduction control plan required under NHPH Mitigation Measure AIR-3 now to be included as part of the EIR rather than deferring this to a later date.

CEQA requires that an EIR identify ways in which significant environmental impacts can be lessened in severity or avoided, including by the adoption of feasible and effective mitigation measures (State CEQA Guidelines Section 15126.4). To this end, mitigation measures must reduce the severity of potentially significant impacts, their effectiveness must be clear, and they must be enforceable (State CEQA Guidelines Section 15126.4(a)). Although formulation of mitigation measures cannot be deferred until some future time, State CEQA Guidelines Section 15126.4(a)(1)(B) provides:

> *The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review, provided that the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard that will be considered, analyzed, and potentially incorporated in the mitigation measure.*

In the current case, the reason is that the effectiveness of various mitigation strategies is likely to change over time, and thus, flexibility is required to ensure that strategies can adapt and be refined as long as a performance standard is met. NHPH Mitigation Measure AIR-3 contains performance standards that are quantitative. The mitigation measures also contain a list of *required* actions, a menu of other specific actions that may be used to supplement the required actions, and a process for ensuring that the performance standard is met. This type of "menu" approach to a mitigation measure is not "deferred" because the specific actions are identified that can be combined and quantitatively calculated to meet the performance standard.

I-Beaton-10 The commenter is concerned that the required performance standard of NHPH Mitigation Measure AIR-3 does not specify a reference baseline for its targeted reduction of 70 percent.

The text of NHPH Mitigation Measure AIR-3, on pages 4.2-32 and 4.2-33, specifically states that the 70 percent reduction in PM_{10} exhaust emissions should be compared to that from uncontrolled aggregate statewide emission rates for similar equipment. The unmitigated scenario risk emissions presented in Table 4.2-9 of the NHPH Draft EIR assumed aggregate statewide emission rates for equipment as calculated by the CalEEMod model and based on the OFFROAD2011 emission factor model.

NHPH Mitigation Measure AIR-3 suggests that all mobile diesel-powered off-road equipment larger than 25 horsepower and operating on the project site for more than two days continuously shall be equipped with engines meeting USEPA NOx and PM_{10} emissions standards for Tier 4 final engines or equivalent. These engines would result in the reduction of emissions sufficient to reduce risks as indicated in Table 4.2-10.

I-Beaton-11 This commenter requests information on why PM_{10} emissions are an appropriate proxy for DPM emissions and is concerned about $PM_{2.5}$ and other toxic air contaminants (TACs) as well.

For the HRA analysis, it is assumed that DPM is the same as exhaust PM_{10}. Given that $PM_{2.5}$ is a subset of PM_{10}, the use of PM_{10} as a surrogate for DPM results in more conservative (i.e., overestimate) concentrations than using $PM_{2.5}$ as a surrogate for DPM.[2] All health risk analyses used the toxicity values for DPM. DPM is the only TAC of concern associated with construction. The operational health risk assessment considered other TACs such as fume hood emissions of various TACs used in UCSF's analysis and research at the NHPH. Refer to Appendix AIR of the NHPH Draft EIR for more detail.

DPM is a subset of $PM_{2.5}$, and $PM_{2.5}$ analysis is separate from DPM, consistent with BAAQMD guidance. Table 4.2-9 of the NHPH Draft EIR shows that unmitigated construction-related emissions of $PM_{2.5}$ exhaust would be less than significant.

I-Beaton-12 This commenter suggests that if the NHPH Draft EIR is revised to explain why deferred mitigation is necessary, it should include a full suite of actions incorporated into NHPH Mitigation Measure AIR-3.

As discussed above in response to Comment I-Beaton-7, NHPH Mitigation Measure AIR-3 requires construction contractor(s) to develop a plan demonstrating that the off-road equipment used on-site to construct the NHPH would achieve a specified performance standard of a fleet-wide average 70 percent reduction in PM_{10} exhaust emissions, compared to uncontrolled

[2] Refer to CARB's information page at (*https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health#:~:text=5%2C%20DPM%20also%20contributes%20to,decreased%20lung%20function%20in%20children*) for more detail.

aggregate statewide emission rates for similar equipment. Because this mitigation measure identifies a specific performance standard to achieve the required reduction in emissions necessary to reduce the impact to a less than significant level and because the mitigation measure identifies specific methods that have been demonstrated to be capable of achieving the reductions of the performance standard, NHPH Mitigation Measure AIR-3 does not represent deferred mitigation under CEQA and no revisions are required. Because the performance standard and methods of achieving the performance standard identified in NHPH Mitigation Measure AIR-3 are sufficient to reduce risks to a less than significant level, as demonstrated in Table 4.2-10 on page 4.2-32 of the NHPH Draft EIR, no further mitigation measures or suite of actions are required or necessary to be implemented to achieve this less than significant impact with mitigation.

I-Beaton-13 The commenter calls into question for lack of specificity one mitigation measure which provides for measures to address impact tools included as part of NHPH Mitigation Measure NOI-1a: Construction Noise Control Measures.

The referenced mitigation measure addresses methods by which noise from impact tools may be reduced in an effort to include all feasible mitigation measures. It specifies what available measures can possibly be implemented if conditions allow and what the associated reductions in noise may be expected. Therefore, the measure is specific to a variety of noise control actions, and the potential resultant noise reduction that may be expected.

I-Beaton-14 The commenter contends that the measure to address impact tools included as part of NHPH Mitigation Measure NOI-1a: Construction Noise Control Measures is invalid based on the California Court of Appeal's finding in *Sierra Watch v. Placer County*, such that it acknowledges that some of the measures may not be feasible for certain tasks and conditions encountered by the construction contractor.

The referenced mitigation measure addresses methods by which noise from impact tools may be reduced in an effort to include all feasible mitigation measures for an impact identified as significant and unavoidable. Because the measures may not be reasonably implemented in some situations does not mean that they should be discarded out of hand. Please refer to the response to comment I-Beaton-15, below, which has resulted in a revision to NHPH Mitigation Measure NOI-1a to provide a mechanism by which contractors must substantiate infeasibility of specific measures for UCSF approval.

I-Beaton-15 This commenter suggests that the measure to address impact tools included as part of NHPH Mitigation Measure NOI-1a: Construction Noise Control Measures should be revised provide a specific and detailed list of quieter procedures that must be employed.

In response to this comment, the text of the second bullet of NHPH Mitigation Measure NOI-1a: Construction Noise Control Measures has been revised. Please see Section 8.5, *Revisions to the Draft EIR*, for the edits made to NHPH Mitigation Measure NOI-1a.

I-Beaton-16 The commenter indicates UCSF must correct the issues identified in the comment letter, and ensure both compliance with CEQA and provide the proper attention to impacts of this project on UCSF's neighbors.

As demonstrated in the responses, above, the NHPH Draft EIR adequately addressed all potential environmental impacts associated with the NHPH, including those air quality and noise issues cited by the commenter, and identified mitigation to reduce all significant impacts to the extent feasible.

From: Sarah Jones
To: Campus Planning - EIR
Subject: UCSF NHPH EIR comments
Date: Monday, February 14, 2022 2:50:35 PM

To Whom it May Concern:

After several years of public comment and attending meetings, feeling that my concerns have been unheard and unabated, I am once again commenting on the UCSF EIR for the New Hospital at Parnassus Heights. 1

First and foremost, UCSF's new project anticipates bringing upwards of 8000 more people on campus a day, but has established neither adequate public transportation nor parking nor housing for them. This is a huge increase in the number of people in a relatively tight space and the tiny number of housing units proposed in the larger plan to be built in 20 years does not mitigate it in the slightest. Our streets will be jammed with vehicles, parking will be impossible, to say nothing of increased power and sewer needs. 2

Second, the noise from UCSF is already overwhelming most days, and UCSF proposes to cut down the trees in Sutro Forest between Medical Center Way and Edgewood Avenue starting tomorrow (2/15/22), further decimating the sound barrier between the neighborhood and the hospital before demolition and construction. Although trees will be replanted, it will take at least a decade for them to reach a size and girth to once again provide the noise and pollution barrier that would be needed during and after construction. 3

Next, the pollution created by the demolition, rebuilding and the everyday use of the hospital will directly affect the children living on Edgewood Ave. and neighboring streets. The plans for mitigating the number of large and fine pollutants in the air are inadequate and the building and running of the hospital will substantially degrade the air quality of the neighborhoods and cause harm to those communities. 4

Finally, UCSF has conducted some of the worst community outreach I have ever had the misfortune to be a part of. Instead of receiving input and trying to find a compromise, UCSF has come to the (virtual Zoom) table with their plans set in stone, unwilling to discuss changes or meaningful mitigation. Instead of addressing, for example, how 8000 more bodies on campus will affect the neighborhood and coming up plans to assuage the very real concerns of the surrounding communities, UCSF instead asked whether neighbors would like more trees planted, or more bike racks installed, sidestepping and ignoring the very real concerns of traffic, parking and resources. And then they have the nerve to assert they have been working with the neighborhood organizations. It's been a poor show of community engagement, and university/neighborhood relations now are at a nadir. 5

Sincerely,
Sarah Smith Jones
President, Edgewood Association

Responses to Comments from Sarah Jones

I-Jones-1 The commenter asserts that the commenter's concerns have been unheard and unabated. This comment does not address the adequacy of the Draft EIR; however, please see responses to specific issues raised in responses to Comments I-Jones-2 through I-Jones-5, below.

I-Jones-2 The commenter asserts that UCSF has not established public transportation, parking or housing that would be associated with the NHPH population.

The commenter is incorrect that the proposed NHPH would bring 8,000 people to the site. Please see NHPH Draft EIR Section 4.12 *Population*, Table 4.12-2, which identifies that the projected average daily (daytime) population of the NHPH would be 2,275 persons, including faculty, staff, patients, visitors, and vendors.

With respect to public transportation, the NHPH Draft EIR Impact TRANS-1 finds that the New Hospital would not conflict with the UC Plans and policies that address transit, including the 2014 LRDP; and furthermore, would not conflict with San Francisco's Transit First Policy. While UC does not consider effects on transit demand to be a significant impact under CEQA, for informational purposes, Appendix TRANS in the NHPH Draft EIR provided a qualitative discussion of potential impacts on transit operations.

With respect to parking, as discussed in Chapter 1, *Introduction*, the NHPH meets the criteria of Statute Section 21099(d) which states that parking impacts of an employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment. As such, potential impacts of the NHPH on parking activity were not determined to be an impact under CEQA.

Furthermore, impacts on parking are not included in the CEQA Appendix G checklist for transportation. Accordingly, CEQA does not require that a project's effect on parking be analyzed. Please note that although parking was not considered in determining if the project has the potential to result in significant environmental impacts, the NHPH Draft EIR presents information regarding the existing parking supply in relation to the parking demand, both on- and off-street facilities, in the Parking Conditions section, pages 4.13-21 to 4.15-23 for context and for informational purposes. Furthermore, the supply of parking is fully considered in developing the changes in mode choice that would occur with the NHPH project; i.e., parking supply is factored into the analysis of how people choose to travel at the present time and how they would travel in the future as a result of a smaller increase in parking relative to the population increase (Mode Choice section, pages 4.13-30 to 4.13-34).

With respect to potential effects on housing, Impact POP-1 in the NHPH Draft EIR Section 4.12, *Population and Housing*, finds that implementation of the NHPH would induce population growth in the Bay Area, but the growth would not be substantial in comparison to growth that is projected and planned for San Francisco and the four study area counties in *Plan Bay Area 2040* and the local General Plans for the study area communities. It should also be noted that the estimated NHPH growth reported in Section 4.12 are likely overstated, as some of the employment growth associated with the NHPH was previously included in the 2014 LRDP and potentially already accounted for in *Plan Bay Area 2040*. The residential units planned on the campus site under the CPHP will provide more on-campus housing to employees near their workplaces, including those that work in UCSF hospitals at the campus site. In addition, as part of the Memorandum of Understanding (MOU) between UCSF and the City of San Francisco, UCSF has committed to providing additional housing beyond that called for in the CPHP. In accordance with the MOU, UCSF will deliver a total of 1,263 net new units in San Francisco, half delivered by 2030, with the remaining half divided equally by 2040 and 2050. This includes the 762 net new housing units at Parnassus Heights analyzed in the CPHP EIR. In addition, UCSF has agreed under the MOU to explore and develop additional housing in other parts of the City to accommodate UCSF students and employees, including those that study and/or work at Parnassus Heights. These would include 71 units of faculty housing at 2130 Post Street, and about 230 units in the Civic Center in collaboration with UC Hastings; both projects completed CEQA environmental review. Also, as part of the MOU, UCSF committed to facilitating the delivery of 200 additional units in the future in the City that could simply be met by an in lieu payment to the City and for which the City would complete CEQA review of such units. As such, the proposed NHPH impact related to population and housing would be less than significant.

I-Jones-3 The commenter is concerned that the removal of vegetation on the hillside east of the NHPH site may require a reexamination of the assessment of and noise impacts from the NHPH.

With respect to the analysis of noise impacts of the NHPH, all modeling of noise levels conservatively did not consider any attenuation associated with vegetation. Caltrans reports that research on the shielding effectiveness of vegetation concluded that the mean noise reduction was less than 1 dBA, and ranged from 0 dBA to less than 3 dBA.[3] The research further concluded that such vegetative barriers were not an effective measure to reduce noise on a routine basis. Consequently, the removal of vegetation on the hillside has no effect on the analysis of noise impacts in the NHPH Draft EIR.

3 Caltrans, 2013. *Technical Noise Supplement to the Traffic Noise Analysis Protocol*, September 2013.

I-Jones-4 This comment raises concerns that the construction and operation of the NHPH would result in air quality and health risk impacts to children that are not adequately mitigated in the NHPH Draft EIR.

Construction-related air quality impacts from criteria air pollutants are addressed on pages 4.2-26 through 4.2-29 of the NHPH Draft EIR. Average daily construction-related exhaust emissions of reactive organic gases, nitrogen oxides, particulate matter (PM_{10}) and fine particulate matter ($PM_{2.5}$) were modeled and determined to be less than the BAAQMD their recommended thresholds which represents a cumulatively considerable contribution to air pollution and, therefore, these exhaust emissions were determined to be less than significant and no mitigation measures were required. Construction dust impacts were found to be potentially significant and NHPH Mitigation Measure AIR-1 was identified, which implements BAAQMD best management practices for controlling fugitive dust which would reduce construction-related fugitive dust impacts to a less than significant level.

The NHPH Draft EIR considers the health impacts of emissions of diesel particulate Matter (DPM) and $PM_{2.5}$ on pages 4.2-20 through 4.2-34 for construction-related emissions and pages 4.2-34 through 4.2-36 for operational emissions of the NHPH. These analyses were conducted using the latest guidance of the BAAQMD and the state Office of Environmental Health Hazard Assessment (OEHHA). These analyses consider residential, day care and school receptors and, consistent with OEHHA guidance.

With respect to emissions of DPM, as discussed in Appendix AIR of the Draft EIR, the analysis was prepared in accordance with OEHHA *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.* the last step was accomplished by applying the highest estimated concentrations of TAC at the receptors analyzed to the established cancer potency factors and acceptable reference concentrations for non-cancer health effects. Increased cancer risks were calculated using the modeled TAC concentrations and OEHHA-recommended methodologies for both a child exposure (starting at 3rd trimester) as well as daycare and school exposure. The cancer risk calculations were based on applying the OEHHA-recommended age sensitivity factors and breathing rates, as well as fraction of time at home and an exposure duration of 30 years. Age-sensitivity factors reflect the greater sensitivity of infants and small children to cancer causing air pollutants. Construction-related health risk impacts were determined to be significant and NHPH Mitigation Measure AIR-3 was identified to require the contractor to reduce emissions through development of a Plan the requires clean construction equipment. Modeling of the mitigated scenario demonstrated that health risks would be reduced to values deemed less than significant by the BAAQMD.

The NHPH Draft EIR also includes a localized analysis of $PM_{2.5}$ concentrations from construction and compares predicted resultant concentrations to the BAAQMD annual average threshold of 0.3 micrograms per cubic meter. This concentration is the U.S. EPA staff-proposed significant impact level for $PM_{2.5}$ in order to permit to emit a regulated pollutant in an area that meets the National Ambient Air Quality Standard (NAAQS). The NAAQS were developed by EPA to represent the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without harming public health, and thus, it defines clean air. As indicated by Table 4.2-9 of the NHPH Draft EIR, resultant $PM_{2.5}$ concentrations from construction would be 0.06 micrograms per cubic meter and, thus, would not represent a potential health impact to people, including children.

Similarly, a health risk analysis was conducted for operation of the NHPH and is addressed on pages 4.2-34 through 4.2-36 of the NHPH Draft EIR. This analysis also considered age sensitivity factors and breathing rates to include consideration of exposure to children. Emissions calculations and air dispersion modeling was completed for the New Hospital building's fume hoods, cooling tower and emergency diesel generators, the increase in natural gas combustion at the Central Utilities Plant, and loading dock emissions associated with increased deliveries. As indicated in Table 4.2-11, operational health risk impacts would be less than significant and no mitigation is required.

I-Jones-5 The commenter expresses concern for the community outreach that has been conducted by UCSF. **Please see Master Response 3: Community Outreach**.

Comment on NH Draft EIR
Attn: Diane Wong, UCSF Campus Planning
February 14, 2022

After decades of mutual cooperation and respect, UCSF has demonstrated that the health and safety of the residents and families who live adjacent to campus are no longer relevant to them. The New Hospital draft EIR is filled with inadequate data, vague assumptions, handwaving, excuses, and empty promises. UCSF must be forced to take into account the significant environmental impacts that their New Hospital Plan has on the neighborhood, the Mt Sutro Preserve greenspace, the larger community, and the city of San Francisco. 1 2

1. **Air Quality** - UCSF's mitigation plans for dealing with the air quality, particulate matter, increased cancer risks, and toxic exposure are inadequate. This is the air that my children and all the neighborhood children on our street breathe every day of their lives. The data UCSF offers doesn't make sense, with vague mitigation strategies that seem to magically bring the numbers down to "less than significant" without any convincing analysis. I believe that this is because given the scope of the project, it is simply not possible to mitigate the health impacts on the surrounding neighborhoods without fudging the numbers. I would like to see an independent review of UCSF's air quality, toxicology, and cancer risk data and analysis, and more detailed explanations of their proposed mitigation strategies. 3 4
2. **Pediatric impacts** - Many children are the "sensitive receptors" who live in the homes on Edgewood closest to the construction. UCSF must provide data on the impact of anticipated nitrogen dioxide, ozone, coarse particulate matter (PM10), fine particulate matter (PM2.5), and sulfur dioxide exposures from this project specifically on the health of neighborhood children, including pediatric asthma and other short and long term respiratory effects. 5
3. **Noise** - existing noise from the current power plant is already extremely disruptive and bothersome. The expected noise during the construction, and in perpetuity from the operations of the new hospital building, are far above what is reasonable and legal, especially for the occupants of residences on Edgewood Avenue. It appears that UCSF's "mitigation strategy" is to give noise data based on estimated decibel levels indoors with closed windows and soundproof glass. Is the expectation that neighbors shouldn't be able to open their home windows or be outdoors on their property without being exposed to not just annoying noise, but a noise level that is dangerous to their hearing and mental health? This is inexcusable and UCSF must not proceed until they can ensure the noise of the construction and NH operations can be mitigated adequately. 6
4. **Vegetation Barrier** - In response to my previous comment in the CPHP EIR about noise and air pollution concerns, UCSF responded in the CPHP EIR stating "there is a vegetated hillside between the campus site and the residences to the east, including those on Edgewood Avenue. This vegetated hillside provides approximately 200 feet of buffer between the residences and any structures to the west." It continues by explaining that their analysis and modeling was done with existing topography and conditions. Now, UCSF plans to remove most of this existing vegetation - a project which conveniently starts removal the *day after the draft EIR comment deadline*. The removal of hundreds of feet of dense vegetation buffer and mature trees which effectively screens the homes on Edgewood from the construction site cannot be accounted for with "cumulative analysis". UCSF must redo their noise and air quality analysis after the vegetation barrier is removed so that the impact and mitigation strategies for the health and safety of the neighbors can be accurately assessed. Photos of the existing vegetation and screening are attached below; I will resubmit new photos after the vegetation removal to demonstrate the significant decrease in the "vegetation buffer" and the potential impact on the sensitive receptors to the east of the project. 7
5. **Transportation/traffic/housing** - the impact of the proposed workforce population increase on the city is going to be incalculable. UCSF cannot solve this problem with shuttle buses and electric bicycles. Their inability to account for this massive increase is so inadequate that it is absurd. Every business in the city of San Francisco must account for increases in workers/workspace with respect to demands on transportation and availability of affordable housing and UCSF should not be exempt from this requirement. 8 9
6. **Community engagement** - UCSF has lied and evaded their way through two years of disingenuous community engagement on this project. They have silenced all opposition and used "zoom" to host meetings that are basically marketing presentations that neither respond to community concerns nor invite reasonable community participation. Even as a member of the CPHP Community Advisory Committee, I have had no opportunity to question or engage in any meaningful way. At a stage in the pandemic when I can eat in a restaurant, work out in a gym, go to a Warriors game or attend the Symphony, it is inexcusable that UCSF continues to hide behind online meetings where they control every aspect of the presentation. They should not be allowed to proceed any further with this EIR without returning to legitimate in-person community dialogue. 10
7. **Space Ceiling** - 1976 REGENTS' RESOLUTION states "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." (source: 1976 Regents' Resolution) This is a permanent, 11

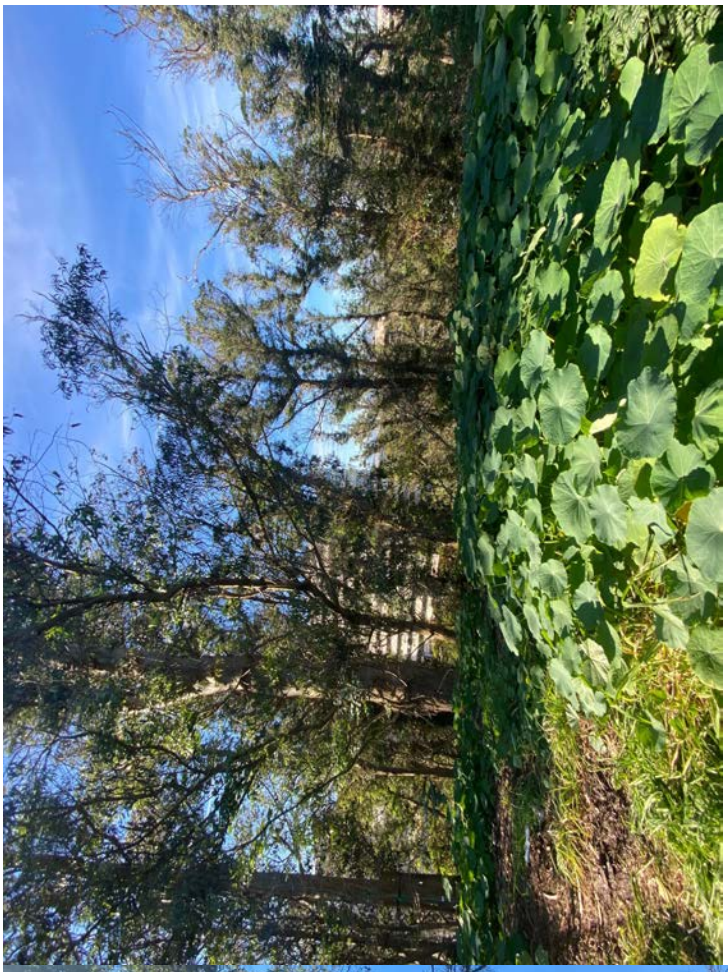
binding promise from UCSF that has shaped over four decades of University development. The Space Cap limitation on the Parnassus site has been used by UCSF to secure funding for major capital projects and to justify massive real estate transactions, including the building of a new campus at Mission Bay. It is inexplicable that UCSF is trying to claim that this permanent limitation is now moot.

11 cont.

As a neighbor, UCSF Medical School alumna, patient, donor, and concerned citizen of San Francisco, I am disgusted with the way UCSF has steamrolled this project through without any concern for the health and safety of the surrounding community, the massive impact on city infrastructure, or the permanent space ceiling agreement.

12

Thank you,
Lisa Kessler, MS, MD



Responses to Comments from Lisa Kessler, MS, MD

I-Kessler-1 The commenter asserts that after decades of mutual cooperation and respect, UCSF has demonstrated that the health and safety of the residents who live adjacent to the campus site are no longer relevant to them. This comment does not address the adequacy of the Draft EIR; however, please see responses to specific issues raised in responses to Comments I-Kessler-3 through I-Kessler-11 below.

I-Kessler-2 The commenter asserts the NHPH Draft EIR is filled with inadequate data, vague assumptions, and handwaving, excuses, and empty promises. The commenter adds that UCSF must be forced to take into account for significant environmental impacts that the NHPH would have on the neighborhood, the Reserve, the larger community and the city of San Francisco. As discussed in **Master Response 2: General Comments on EIR and Environmental Topics**, due to lack of specificity in the comment, no direct response is possible. However, please see the responses to comments below that address those specific issues raised by the commenter.

I-Kessler-3 This comment expresses concern that the mitigation measures for addressing air quality health risk impacts are inadequate and requests further support for the mitigation measures reducing the impact to less than significant.

The assessment of potential health hazards related to construction of the NHPH is addressed on pages 4.2-30 through 4.2-34 of the NHPH Draft EIR. Table 4.2-9 presents the unmitigated health risk assuming the state-wide aggregate of construction equipment. Table 4.2-10 presents the resultant health risk assuming that the majority of construction equipment is equipped with U.S. EPA Tier 4 final engines. As can be seen from these tables, the health risks decline appreciably with the use of newer construction equipment.

Prior to 1994, there were no standards (Tier 0) to limit the amount of emissions from off-road equipment. In 1994, the EPA established emission standards for hydrocarbons, nitrogen oxides, carbon monoxide, and particulate matter to regulate new pieces of off-road equipment. These emission standards came to be known as Tier 1. Since that time, more stringent Tier 2, Tier 3, and Tier 4 (interim and final) standards were adopted by the EPA, as well as CARB. Each adopted emission standard was phased in over time. New engines built in 2015 across all horsepower sizes have to meet Tier 4 final emission standards. In other words, new manufactured engines cannot exceed the emissions established for Tier 4 Final. CARB data indicate that Tier 4 engines reduce particulate matter emissions by more than 90 percent compared to Tier 1 engines. This substantial reduction contributes to the reduction in diesel particulate matter (DPM) and associated reduction in health risks indicated in these tables. Appendix AIR of the NHPH Draft EIR provides further detail on the calculation of health risks from construction of the NHPH.

I-Kessler-4 The commenter states that they would like to see an independent review of the NHPH Draft EIR's assessment of health risk impacts and mitigation measures.

The analysis of air quality impacts and health risks provided in the NHPH Draft EIR was prepared by UCSF's environmental consultant technical specialists who are professionals in the field of environmental impact analysis. The analysis in the NHPH Draft EIR was made available for review and comment by responsible and interested agencies, organizations and the public. Specific concerns or questions about the analysis by these parties, including those raised in this comment letter, are addressed in this Final EIR.

I-Kessler-5 This comment requests an assessment of the pediatric impacts from project emissions of nitrogen oxide, ozone, PM_{10}, $PM_{2.5}$ and sulfur dioxide.

The NHPH Draft EIR considers the health impacts of emissions of diesel particulate Matter (DPM) and $PM_{2.5}$ on pages 4.2-20 through 4.2-34 for construction-related emissions and pages 4.2-34 through 4.2-36 for operational emissions of the NHPH. These analyses were conducted using the latest guidance of the BAAQMD and the state Office of Environmental Health Hazard Assessment. These analyses consider residential, day care and school receptors and, consistent with OEHHA guidance.

With respect to emissions of DPM, as discussed in Appendix AIR of the NHPH Draft EIR, the analysis was prepared in accordance with OEHHA *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.* the last step was accomplished by applying the highest estimated concentrations of TAC at the receptors analyzed to the established cancer potency factors and acceptable reference concentrations for non-cancer health effects. Increased cancer risks were calculated using the modeled TAC concentrations and OEHHA-recommended methodologies for both a child exposure (starting at 3rd trimester) as well as daycare and school exposure. The cancer risk calculations were based on applying the OEHHA-recommended age sensitivity factors and breathing rates, as well as fraction of time at home and an exposure duration of 30 years. Age-sensitivity factors reflect the greater sensitivity of infants and small children to cancer causing air pollutants.

The NHPH Draft EIR also includes a localized analysis of $PM_{2.5}$ concentrations from construction and compares predicted resultant concentrations to the BAAQMD annual average threshold of 0.3 micrograms per cubic meter. This concentration is the U.S. EPA staff-proposed significant impact level for $PM_{2.5}$ in order to permit to emit a regulated pollutant in an area that meets the National Ambient Air Quality Standard (NAAQS). The NAAQS were developed by EPA to represent the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without harming public health, and thus, it defines clean air. As indicated by Table 4.2-9 of the NHPH Draft EIR, resultant

$PM_{2.5}$ concentrations from construction would be 0.06 micrograms per cubic meter and, thus, would not represent a potential health impact to people, including children.

With respect to construction-related emissions of nitrogen oxides (NOx) and ozone, NOx is considered with respect to its potential to form ozone. As discussed on page 4.2-2 of the NHPH Draft EIR, ozone is a regional pollutant and generally not directly emitted to the atmosphere but, rather, produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases. Therefore, the analysis of NOx in an air quality analysis is with respect to its potential to eventually cause ozone formation on a regional scale and not as a localized health impact. As shown in Table 4.2-7 of the NHPH Draft EIR, NOx emissions from construction would be less than 27 pounds per day which is well less than the BAAQMD threshold of 54 pounds per day which represents a cumulatively considerable contribution to ozone formation and, therefore, a less than significant impact.

With respect to localized emissions of sulfur dioxide (SO_2), as discussed on page 4.2-5 of the NHPH Draft EIR, pollutant trends suggest that the SFBAAB currently meets and will continue to meet the State standard for SO_2 for the foreseeable future. SO_2 emissions from construction activities are minimal and BAAQMD guidance does not suggest that such emission be assessed in an analysis of construction-related air emissions.

I-Kessler-6 This comment expresses concern that the analysis of noise impacts applies the assumption that adjacent receptors would have their windows closed and that construction-related and operational noise impacts of the NHPH are not adequately mitigated.

As stated on page 4.11-16 of the NHPH Draft EIR, Section 2909(d) of the City of San Francisco Police Code provides an interior noise limit for noise generated by mechanical equipment, stating that noise levels from mechanical sources may not exceed 45 dB(A) between the hours of 10:00 PM and 7:00 AM or 55 dB(A) between the hours of 7:00 AM and 10:00 PM with windows open except where building ventilation is achieved through mechanical systems that allow windows to remain closed. In the assessment of UCSF's voluntary compliance with this Code requirement, the analysis assumed that the receptors to the east of the project site were single family residences that do not have mechanical systems that allow windows to remain closed. This assumption is specifically stated on page 4.11-23 of the NHPH Draft EIR.

The NHPH Draft EIR identified construction noise as a significant and unavoidable impact with all feasible mitigation measures. Suggestions for additional specific mitigation measures are considered in this Final EIR as part of the response to comment process.

I-Kessler-7 This comment is concerned that the removal of vegetation on the hillside east of the NHPH site may require a reexamination of the assessment of air quality and noise impacts from the NHPH.

With respect to the assessment of air quality impacts of the NHPH, dispersion modeling conducted for the assessment of health risk impacts considered local topography and structures. It conservatively did not consider any additional absorption or other reduction of air pollutant dispersion associated with vegetation. The Risk Assessment Guidelines prepared by the State Office of Environmental Health Hazard Assessment do not provide for consideration of intervening vegetation not does the dispersion model (AERMOD) provide for such a consideration.

With respect to the analysis of noise impacts of the NHPH, all modeling of noise levels conservatively did not consider any attenuation associated with vegetation. Caltrans reports that research on the shielding effectiveness of such vegetation concluded that the mean noise reduction was less than 1 dBA, and ranged from 0 dBA to less than 3 dBA.[4] The research further concluded that such vegetative barriers were not an effective measure to reduce noise on a routine basis.

I-Kessler-8 The commenter asserts that UCSF cannot solve the problem of the proposed workforce population increase with shuttle buses and electric vehicles. The commenter is referred to Section 4.13, *Transportation,* pages 4.13-9 to 4.13-10 in the NHPH Draft EIR, which describes UCSF's existing shuttle system that serves the Parnassus Heights campus site; and pages 4.13-12 to 4.13-13, under Transportation Demand Plan, which describes that electric vehicle charging stations and priority parking spaces are available for Green Vehicles. In addition, NHPH Draft EIR Impact TRANS-1 determined that the NHPH would not conflict with applicable programs, plans, ordinances or policies addressing the circulation system, including for transit, roadway, bicycle and pedestrian facilities.

The commenter also asserts that UCSF should not be exempt from the requirement to account for increases in workers/workforce with respect to demand on transportation and availability of affordable housing. With respect to worker demand for transportation, see paragraph above, all potential impacts of operation of the NHPH on transportation under CEQA, including with the consistency of the NHPH with applicable transportation program, plans and policies (Impact TRANS-1, pages 4.13-44 to 4.13-46); and with the NHPH impacts on vehicles miles travelled (Impact TRANS-2, pages 4.13-47 to 4.13-50), would be less than significant.

With respect to NHPH worker/workforce impacts on housing, the NHPH Draft EIR, Section 4.12, *Population and Housing,* under Approach to Analysis, page 4.12-6, defines "substantial unplanned population growth" resulting from

4 Caltrans, 2013. *Technical Noise Supplement to the Traffic Noise Analysis Protocol*, September 2013.

implementation of the NHPH as "an increase in population or employment that is inconsistent with growth anticipated in adopted planning documents." The NHPH Draft EIR analyzes existing population and employment in the five-county study area, establishing an appropriate baseline, and then analyzes the projected growth in population and employment associated with the CPHP.

Impact POP-1 in the NHPH Draft EIR finds that population growth under the NHPH would not be substantial in comparison to growth that is projected and planned for San Francisco and the four study area counties in *Plan Bay Area 2040* and the local General Plans for the study area communities. It should also be noted that the estimated NHPH growth reported in Section 4.12 are likely overstated, as some of the employment growth associated with the NHPH was previously included in the 2014 LRDP and potentially already accounted for in *Plan Bay Area 2040*. The residential units planned on the campus site under the CPHP will provide more on-campus housing to employees near their workplaces, including those that work in UCSF hospitals at the campus site. In addition, as part of the Memorandum of Understanding (MOU) between UCSF and the City of San Francisco, UCSF has committed to providing additional housing beyond that called for in the CPHP. In accordance with the MOU, UCSF will deliver a total of 1,263 net new units in San Francisco, half delivered by 2030, with the remaining half divided equally by 2040 and 2050. This includes the 762 net new housing units at Parnassus Heights analyzed in the CPHP EIR. In addition, UCSF has agreed under the MOU to explore and develop additional housing in other parts of the City to accommodate UCSF students and employees, including those that study and/or work at Parnassus Heights. These would include 71 units of faculty housing at 2130 Post Street, and about 230 units in the Civic Center in collaboration with UC Hastings; both projects completed CEQA environmental review. Also, as part of the MOU, UCSF committed to facilitating the delivery of 200 additional units in the future in the City that could simply be met by an in lieu payment to the City and for which the City would complete CEQA review of such units. As such, the proposed NHPH impact related to population and housing would be less than significant.

I-Kessler-9 The commenter asserts that similar to other businesses in San Francisco, UCSF must be subject to the City's requirements that address the effect of the project-related population increase on transportation and affordable housing.

Pursuant to the University of California's constitutional autonomy, development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local land use regulation, including any requirements imposed by the City on businesses located in San Francisco. However, in compliance with CEQA, the impacts of the proposed NHPH on transportation and housing are fully evaluated in the NHPH Draft EIR Section 4.13, *Transportation* and Section 4.12, *Population and Housing*, respectively.

To ensure that development at the Parnassus Heights campus site under the CPHP aligns with City's priorities for housing, transportation and other topics, and sufficiently addresses the needs created by the proposed growth, UCSF and the City of San Francisco entered into a Memorandum of Understanding (MOU) on January 22, 2021. As discussed in response to Comment I-Kessler-8 above, as part of a MOU, UCSF agreed to deliver a total of 1,263 net new units in San Francisco by 2050 (inclusive of the 762 units in the CPHP), half delivered by 2030, with the remaining half divided equally by 2040 and 2050. This would double UCSF's current housing portfolio citywide. Transportation improvements agreed to under the MOU include an upgrade the UCSF Parnassus transit stop; contributing funds to increase the capacity and frequency of the N-Judah and/or other Muni lines; and identifying a bicycle route between Golden Gate Park and the campus site.

I-Kessler-10 The commenter expresses concern over the community engagement that has occurred over the last two years. Please refer to **Master Response 3: Community Outreach**.

I-Kessler-11 The commenter quotes an excerpt the 1976 Regents' Resolution, and indicates her belief that this is a permanent binding promise from UCSF that has shaped University development over four decades; and then asserts that it is inexplicable that UCSF is trying to claim that this permanent limitation is now moot.

While the proposed NHPH would result in an increase in square footage and population at the Parnassus Heights campus site, the 2014 LRDP as amended in January 2021 revised the space program, updated the projected population, and revised the Regents' Resolution to increase the space ceiling at the campus site. As such, the NHPH would be within the size and population parameters of the 2014 LRDP, as amended.

This comment does not address the adequacy of the NHPH Draft EIR.

I-Kessler-12 The commenter expresses concern related to UCSF processing of the NHPH project without concern for the health and safety of the surrounding communities, the impact on city infrastructure; or her belief of a space ceiling agreement. With respect to impacts of the NHPH on health and safety, please see NHPH Draft EIR Section 4.2, *Air Quality;* Section 4.6, *Geology and Soils*; and Section 4.8, *Hazards and Hazardous Materials;* and 4.9, *Hydrology and Water Quality*. With respect to impacts of the NHPH on city infrastructure, please see NHPH Draft EIR Section 4.13, *Transportation;* and Section 4.4, *Utilities and Service Systems*. With respect to the space ceiling, please see response to Comment I-Kessler-11, above. Please note that the NHPH Draft EIR addresses all potential environmental impacts of the proposed NHPH and mitigates significant impacts to the extent feasible.

IN RE: Comments on UCSF New Hospital at Parnassus Heights, Draft Environmental Impact Report, December 2021

DATE: February 13, 2022

VIA EMAIL: EIR@planning.ucsf.edu

General Comments

While it is impossible to provide precise details and estimates of impacts of the Comprehensive Parnassus Heights Plan (CPHP) and the New Hospital at Parnassus Heights (NHPH), I am disappointed that the Draft NHPH EIR does not fully address numerous issues raised by the community and the advisory groups that date back to the development of the CPHP.

The new hospital and the other projects planned for the first ten years represent a front-loaded impact of the CPHP. The NHPH EIR must incorporate more detailed information, broaden the discussion of environmental effects, and increase UCSF commitments and touchpoints to the surrounding neighborhoods.

Because of this, I believe the DRAFT NHPH EIR is not fully responsive to issues that have been raised, has insufficient or weak mitigation proposals in some areas of impact, does not sufficiently address the cumulative impact of multiple construction sites during the initial 10-year period, and still lacks sufficient analysis of alternative proposals. For these reasons, I believe the DRAFT NHPH EIR requires further revision before it is submitted to the Regents.

1

The DRAFT NHPH EIR is not fully responsive to issues that have previously been raised.

As one example, please refer to the comment letter I submitted in response to the Notice of Preparation of Environmental Impact Report and Initial Study regarding UCSF New Hospital at Parnassus Heights, dated August 26, 2021.

Specific omissions/insufficient responses include:

- Request to increase UCSF commitment to a greater number of project specific reviews or EIRs over the course of the 30-year CPHP. 2
- Request to increase UCSF frequency and scope of project planning updates and assess cumulative impacts over the course of the CPHP beyond currently scheduled Project Planning Updates. 3
- A full project timeline, including demolitions and construction of other facilities expected concurrent with the construction period for the NHPH. 4
- Discussion of how the evolving experience with the COVID pandemic has affected planning for the size, layout, and staffing for the NHPH and the renovations at Long and Moffitt. 5
- Parnassus Avenue pedestrian, vehicle, public transportation, and delivery/loading circulation, both during and following NHPH construction. The cumulative impact discussion must include consideration of the proposed RAB construction on the west end of campus during the same 10-year time period. 6
- More aggressive Transportation Demand Management (TDM) proposals to substantially increase faculty, staff and student use of public transit and reduce single car trips to campus. 7
- More analysis of the request to lower the height of NHPH, including placing floors below grade. 8

Selected Issues that require fuller discussion and analysis in the UCSF NHPH EIR

1. **Provide a more comprehensive construction timeline and expand analysis of cumulative impact over the 10-year period.** 9

I appreciate the effort to estimate impacts in some areas, such as transportation and energy use during the 2020-2030 period separately from the impact by the 2050 endpoint of the CHPH, but the analysis is insufficient.

The DRAFT NHPH EIR appropriately attempts to isolate the direct impacts of the NHPH development, but does not reference the context of the NHPH within the CPHP. The Draft NHPH EIR is woefully inadequate in discussing cumulative impacts of UCSF planned

development over that time period. The proposed mitigation efforts are likely insufficient when such cumulative impacts are incorporated. 9 cont.

- The timeline does not include relocation of faculty, staff and services from Langley Porter Psychiatric Institute (LPPI) to the Mount Zion campus and demolition of those buildings in preparation for construction of the USCF NHPH. 10
- There is no mention of long promised demolition of buildings in the Surge and Woods parking lots, although they may be used for staging during NHPH construction. 11
- The cumulative analysis does not include demolition of other buildings, particularly UC Hall, that are planned during the same time period. 12
- There is NO acknowledgement that the timing of construction for the NHPH overlaps the planned construction of a new Research and Academic Building (RAB) at the west end of Parnassus and improvements to the Irving Street (N Judah) entrance that will affect Millberry Union, also on Parnassus Avenue. 13
- The Draft EIR does not adequately assess the cumulative effect of three overlapping major construction projects in a five-block length of Parnassus Avenue, from Hillway/Medical Center Way to Fourth Avenue. 14

The overlapping construction schedule affects numerous aspects the Draft NHPH EIR, at minimum, sections on Hazards and Hazardous Materials, Noise and Vibration, Traffic Circulation and Transportation – including additional construction vehicles. The cumulative impact of these projects must be incorporated into a FINAL NHPH EIR and further mitigation efforts are necessary. 15

2. The Transportation Demand Management (TDM) plan

The TDM appears insufficient to shift a significant proportion of faculty, staff and student travel to the campus onto public transportation and out of single use vehicles. While the analysis may be accurate in projecting continuing and future trends, such as use of Taxi/Uber/Lyft, and recognizes there will be reduced UCSF off street parking by 2050, it does not include aggressive new programs or mitigation efforts beyond what is currently in place, such as shuttles and car share. 16

Other than a "pilot" type program of MUNI passes for UCSF students, and to-be-developed enhancements to the N Judah line as outlined in the Memorandum of Understanding with the City and County of San Francisco, there is limited direct effort to encourage increased use of public transportation, or to assess other alternatives.

Further analysis should be provided for:

- Impact of COVID on hospital staffing and use of telehealth by hospital staff who may not have direct clinical care responsibilities. 17

I recognize that most of the new faculty and staff positions will be in-person to provide direct care, but there is no nuanced discussion of the impact of COVID on the number of employees or how expanded use of telehealth might impact the count of daily trips. 17 cont.

- Increased support and subsidies for faculty, staff and students to use public transportation.

  For example, as part of its agreement with the City of Palo Alto in 2011, Stanford Hospital agreed to purchase annual CalTrain Go Passes for all existing and new employees who work more than 20 hours per week for a period of approximately 50 years, the expected functional lifespan of their new hospital.

  Another alternative is to provide a transportation subsidy benefit on a sliding scale, using the well-established Univ of California model of greater contribution towards monthly health insurance premium for employees with lower income. A relatively small subsidy/voucher, in conjunction with improved outreach to staff to sign up for the Federal Transit Subsidy Benefit Program and the San Francisco or other local government transit fee reduction programs (such as the SF Low Income Transit Lifeline fares), may encourage a more significant increase in use of public transit to the campus. 18

- Improvements to support improved bicycle travel lanes and on-campus bicycle storage.

  This is not addressed. 19

- Improvements to public transportation for bus lines traveling along Parnassus Avenue. 20

As part of the request to install a new traffic light at Hillway and Parnassus, UCSF should consider support for improved bus stops, including shelters, seating, and contributions towards Next Bus/arrival signage. This could include contribution towards installation of transit preferential communication with traffic lights, similar to equipment that has been installed for the N Judah from Irving and Fourth Ave to the intersection of Ninth Ave and Judah. 21

3. Further analysis of alternative hospital size and design options, including 6.4.4., Shorter New Hospital with Additional Basement Levels.

I object to the quick dismissal and no further analysis of an option to reduce the height of the new hospital by placing more services below grade. I find the arguments against consideration, while they have some merit, to be somewhat self-serving and disingenuous, plus uncreative. 22

Comments on specific arguments against consideration of additional basement levels:

- Services appropriate for windowless areas/Access to natural light

Other hospitals, including Chan-Zuckerberg San Francisco General, have services below grade and in basement levels. Based on ZSFGH Institutional Master Plan Update Revision dated June 2015, basement level services in the new hospital include Perioperating/Gastro-Intestinal, Clinical laboratory, Cardiology/Radiology/Auxiliary Support and Plant Services. It is also the case that a number of current UCSF Parnassus clinical services have been or are housed in windowless spaces, including the gastroenterology colonoscopy suites that were in the basement area of Clinical Sciences and Imaging Services off the Irving Street entrance under the garage. I am sure there are other windowless clinical service locations on the campus.

There are probably design solutions that would permit light to reach levels below grade. The hospital design already includes floor setbacks and projections. The ground floor and street entrance could be designed to provide lightwells that allow sunshine to reach lower basement levels that have a smaller floor plan than the street entrance level.

22 cont.

- Additional excavation/disrupt construction schedule/cost

These comments have some merit, but must be evaluated in the context of the CPHP and actions and decisions by the University to date and are not sufficient to dismiss the alternative without additional analysis.

23

- NHPH construction will have to excavate below the planned basement level and below current Parnassus Avenue Street infrastructure to build the proposed connecting underground tunnel. The Draft NHPH EIR provides little discussion of how that portion of construction will occur, but additional below ground areas would be considered and expansion of already planned excavation.
- Although the SB-1953 seismic deadline is December 31, 2030, that may not be a "hard" stop. The SB-1953 deadline has been extended multiple times (from 2008, to 2013, 2020 and 2030 if hospitals met certain requirements). COVID has put a financial strain on many hospitals and it is likely the California Hospital Association will lobby for additional flexibility, including further extensions. In this context, a six-month delay is small and not sufficient to discard alternative.

24

- Although excavating additional basement levels will add to costs and require additional structural changes, the cost increases (estimated at $8-9 million per month or $48 - $54 million for 6 months) is relatively small compared to the estimated cost of the NHPH, renovations to Long and Moffitt, and the entire CPHP.

25

- UCSF reversed itself in the CPHP with the decision to demolish UC Hall and build a new RAB. I suspect the required excavation for RAB is many times greater than what would be required to excavate for additional basement levels for the NHPH. 26
- Lowering the height of the hospital by placing more services in basement levels would allow the hospital design to maintain the desired square footage and bed size, but reduce long term adverse impacts identified in the Draft NHPH EIR, such as shadow and wind effects. 27

Thank you for considering these remarks. I look forwards to the Revised Draft EIR for the NHPH.

Responses to Comments from Susan Maerki

I-Maerki-1 The commenter expresses disappointment that the NHPH Draft EIR does not fully address issues raised by the community and the advisory groups that date back to the development of the CPHP. As discussed in **Master Response 2: General Comments on EIR and Environmental Topics**, due to lack of specificity in the comment, no direct response is possible. Please also see **Master Response 3: Community Outreach**, as it relates the community outreach that has been conducted by UCSF to date on the NHPH project.

I-Maerki-2 The commenter requests an increase in UCSF commitment to a greater number of project-specific reviews or EIRs over the course of the 30-year CPHP. This comment does not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, please also see NHPH Draft EIR Chapter 1, Introduction for a discussion of the relationship of the NHPH to the CPHP and 2014 LRDP, and a description of the environmental review process for the NHPH EIR.

I-Maerki-3 The commenter requests an increase in UCSF frequency and scope of project planning updates and assess cumulative impacts over the course of the CPHP beyond currently scheduled Project Planning Updates.

With respect to project planning updates, please see **Master Response 3: Community Outreach**, as it relates the community outreach conducted by UCSF on the NHPH project. Community outreach on the NHPH and other projects will continue. With respect to approach to assessment of cumulative impacts in relation to the proposed NHPH, please see Section 4.0, *Approach to Environmental Analysis*, on pages 4.0-7 to 4.0-9 in the NHPH Draft EIR. The NHPH Draft EIR cumulative impact analysis in each of the impact topics addressed all potential impacts of the NHPH, in combination with other cumulative development, including that of the CPHP, as applicable. This analysis may be updated in the future for specific project approvals, as required by CEQA.

I-Maerki-4 The commenter requests a project timeline, including demolition and construction of other facilities expected concurrent with the proposed construction period for the NHPH.

NHPH Draft EIR Section 4.0, *Approach to Environmental Analysis*, identified the cumulative projects in the local geographic area considered in the cumulative impact analysis. The table, below, consolidates the current timeline for those on-campus cumulative construction projects that would occur concurrent with that of the NHPH, and thus, have potential to combine for cumulative effects. This includes demolition for projects previously approved under the 2014 LRDP that have not yet been implemented; demolition and new construction for and CPHP

projects, none of which have yet been implemented; and ongoing management activities under the UCSF Mount Sutro Open Space Reserve Vegetation Management Plan.

ON-CAMPUS CUMULATIVE CONSTRUCTION CONCURRENT WITH NHPH CONSTRUCTION

Cumulative Project	Timeline
CPHP - Irving Street Arrival	2025 to 2026
CPHP - Research and Academic Building (includes demolition of UC Hall and School of Nursing)	UC Hall interior abatement/demolition: 2022 UC Hall hard demolition: late 2022 through mid-2023 RAB construction: mid-2023 through mid-2026 School of Nursing hard demolition: 2026-2027 (following RAB completion)
CPHP - Initial phase of Aldea Housing Densification	From 2028 to end of 2030
CPHP - Renovation of Existing Buildings	Ongoing
CPHP - Parnassus Avenue Streetscape	Concurrent with adjacent projects within campus site
2014 LRDP – Demolition of LPPI and supporting structures	Interior abatement/demolition of space vacated by the LPPI outpatient clinics: summer 2022 Remaining interior abatement and demolition of buildings: summer 2023 Hard demolition of LPPI and supporting structures: fall 2023
2014 LRDP – Demolition of Woods and Surge Buildings	Fall 2022 and Spring 2023
2014 LRDP – Demolition of Proctor Building	Not defined yet
UCSF Mount Sutro Open Space Reserve Vegetation Management Plan	Ongoing

The NHPH Draft EIR analyzed a cumulative scenario using construction timelines for the cumulative projects consistent with those presented in the CPHP Final EIR. The table above reflects updated timelines for the planned demolition of LPPI, construction of the Irving Street Arrival, and demolition and new construction associated with the RAB, in which the timelines for these cumulative projects are proposed to be pushed back. It should be noted, however, that these specific modifications to construction timelines would not affect any conclusions reached in the NHPH Draft EIR regarding the level of significance of cumulative impacts, or require any changes to mitigation measures identified in the NHPH Draft EIR to reduce cumulative effects, as described below:

- With respect to construction-generated criteria air pollutants, Table 4.2-7 of the NHPH Draft EIR presented annual construction emissions generated for the NHPH by year of activity. While alterations of the schedules for certain cumulative projects will change the years of simultaneous construction with NHPH, for the purposes of criteria pollutant assessment, the BAAQMD thresholds applied in the construction emissions analysis represent a cumulatively considerable contribution of the project. Therefore, as stated on

page 4.2-41 of the NHPH Draft EIR, because the project-level emissions for each year would be below BAAQMD thresholds its cumulative impact would be less than significant with mitigation, regardless of the contributions, per the methodology cited in BAAQMD's Air Quality CEQA Guidelines.

- With respect to construction-generated fugitive dust, NHPH Mitigation Measure AIR-1 is identified to reduce this impact to a less than significant level. Because the other cumulative UCSF projects also have required mitigation measures to address fugitive dust emissions, the adjusted schedule of certain cumulative projects would not result in a different impact conclusion or the need an intensified dust control measures, which already meet the standards specified in the BAAQMD's Air Quality CEQA Guidelines.

- With respect to potential construction health risk impacts, although the timelines may result in a shift in the temporal occurrence of the more intensive activities that result in DPM emissions, this shift would not affect the overall associated cancer risk contributions that are summed and discussed on pages 4.4-42 through 4.2-44 of the NHPH Draft EIR.

- With respect to cumulative construction noise, the analysis on pages 4.12-33 through 4.12-34 of the NHPH Draft EIR assumes that construction of the Irving Street Arrival and the NHPH would occur simultaneously, which is still the case under the revised schedule. Construction of the RAB would be sufficiently distant to avoid cumulative contributions to receptors affected by the NHPH and Irving Street Arrival construction. Consequently, with the revised schedule for Initial Phase Projects planned under the CPHP, the NHPH would still have a significant and unavoidable cumulative construction noise impact as was identified in the NHPH Draft EIR and implementation of NHPH Mitigation Measures NOI-1a and NOI-1b, and NHPH Mitigation Measure TRANS-5: Construction Coordination and Monitoring Measures, would still apply.

Beyond these on-campus cumulative projects, the only notable off-campus cumulative project in the NHPH site vicinity identified in the NHPH Draft EIR with the potential to contribute cumulative impacts is at 350 Parnassus Avenue building. Originally, UCSF was in negotiations continue to lease the 350 Parnassus Avenue property, and seismically upgrade the building in 2022 to meet UC standards per the UC Seismic Safety Policy. However, UCSF has since decided instead to vacate this building, and consequently, would not seismically upgrade the building pursuant to UC standards. It is UCSF's understanding that the property owner will carry out minimal seismic work in the building, along with interior renovations on building floors as needed as new tenants are brought on. Consequently, there are no aspects of changes related this cumulative project that would affect any prior conclusions reached regarding cumulative impacts in the NHPH Draft EIR.

I-Maerki-5 The commenter requests a discussion of how the evolving experience with the COVID pandemic has affected planning for the site, layout, and staffing for the NHPH and the renovations at Long and Moffitt Hospitals.

The planning for the New Hospital and renovation of Long and Moffitt Hospital are being conducted in consideration of the COVID pandemic. As explained in the NHPH Draft EIR Chapter 3, *Project Description*, Subsection 3.5 *Project Need*, learning from the current COVID-19 pandemic, it is extremely critical for clinical facilities to be flexible and have the ability to increase inpatient capacity to accommodate additional clinical needs during these times, rather than reducing or canceling non-essential surgeries in order to reduce patient census. Based on observed shortages in the availability of beds, especially intensive care unit and acute care beds; an analysis of demographic trends that indicate that the Medical Center will need to serve not only a larger population but also a population that includes more elderly patients; an analysis of the demand/need for private rooms; and an analysis of trends in health care which show an increased need for tertiary and quaternary health care, UCSF Health determined that the proposed hospital would need to provide inpatient beds, along with other necessary facilities that include additional operating rooms, additional emergency room bays and spaces, additional interventional labs, and ambulance bays. The proposed renovation of Moffitt and Long Hospitals would provide inpatient beds to augment those proposed at the New Hospital, and facilitate the inpatient clinical and support program needs for the increased patient capacity at Parnassus Heights.

I-Maerki-6 to -7 These comments express concerns that the NHPH Draft EIR inadequately analyzes multimodal transportation activity on Parnassus Avenue, insufficiently accounts for cumulative construction impacts, fails to propose aggressive transportation demand management (TDM) strategies and inadequately assesses impacts on transit.

CEQA provides for lead agencies, such as the University of California (UC), to adopt their own thresholds of significance and to evaluate the significance of a project's impact based on substantial evidence. UC's significance criteria for the NHPH are based on Appendix G of the State CEQA Guidelines. Under UC's significance thresholds, the NHPH would have a significant effect on the environment if the NHPH would:

- Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities
- Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)
- Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)
- Result in inadequate emergency access

- Adversely affect travel conditions along sidewalks and roadways serving the project site due to construction activities

The transportation analysis presented in the NHPH Draft EIR is complete and adequate per these requirements.

The first four of these criteria are based on those set forth in *State CEQA Guidelines* Appendix G, and are presented in the NHPH Draft EIR on page 4.13-27 to -57. With respect to analysis of potential impacts relative to each of these criteria, the NHPH Draft EIR discusses relevant programs, plans, ordinances and policies on pages 4.13-23 to 26. The NHPH's compliance with each of these programs, plans, ordinances and policies is discussed in Impact TRANS-1 on pages 4.13-44 to 4.13-46. While this section discusses local plans and policies, including the City of San Francisco's Transit First Policy and Better Streets Plan, the University of California is constitutionally exempt from local land use control and other local plans, policies, and ordinances whenever using property under its control in furtherance of its educational mission. City plans, ordinances and policies are not applicable to UCSF; however, certain policies are discussed in the NHPH Draft EIR as a means of presenting information and analysis that may be of value to the City in its planning processes.

The NHPH Draft EIR discusses the project's consistency with CEQA Guidelines Section 15064.3, subdivision (b) in Impact TRANS-2 on pages 4.13-47 to 4.13-50. The NHPH Draft EIR assesses VMT impacts based on the recommendations presented in the Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA, which states that a project would "generate substantial additional VMT" if it would exceed regional household VMT per capita minus 15 percent or regional work-based VMT per employee minus 15 percent. This threshold is based on statewide air quality and greenhouse gas emissions targets and is therefore reasonable for assessing project VMT. As presented in Tables 4.13-20 on page 4.13-48, the Parnassus Heights campus site with the proposed NHPH would generate VMT at rates substantially below the regional averages. Therefore, the NHPH Draft EIR appropriately finds the impact related to VMT to be less than significant.

The NHPH Draft EIR discusses the analysis and finding that the project would not substantially increase hazards due to a design feature or result in inadequate emergency access on pages 4.13-50 to 4.13-52 and pages 4.13-52 to 4.13-53 of the NHPH Draft EIR, respectively.

The cumulative condition for the NHPH includes all projects to be implemented pursuant to the CPHP, including the RAB. As noted on p. 4.13-57 of the NHPH Draft EIR, all CPHP projects would be required to complete construction management plans to coordinate and consolidate the construction activities throughout the Parnassus Heights campus site, including arranging for an off-site

material staging facility or facilities (NHPH Mitigation Measure TRANS-5: Construction Coordination and Monitoring Measures).

Concerns about the ability of proposed TDM measures to shift significant portions of campus travel out of single-occupancy vehicles (SOVs) or to reduce parking demand are not a comment on the adequacy of the transportation analysis or EIR. The amount of SOV travel was not determined to be an impact under CEQA due to the Project's compliance with the UC Sustainable Practices Policy mode share goals, discussed on page 4.13-44 of the NHPH Draft EIR.

With respect to TDM measures, notwithstanding the finding of less than significance related to this subject, UCSF is subject to CPHP Mitigation Measure AIR-2a and AIR 2-b of the CPHP Final EIR which specify the reduction in average daily vehicle trips that UCSF must achieve at the campus site through a variety of TDM program enhancements such as providing and maintaining secure bicycle parking, new shuttle connections to regional transit, and enhanced patient TDM programs.

With respect to parking, as discussed in Chapter 1, *Introduction*, the NHPH meets the criteria of Statute Section 21099(d), and as such, potential impacts of the NHPH on parking activity was not determined to be an impact under CEQA. Furthermore, impacts on parking are not included in the CEQA Appendix G checklist for transportation. Accordingly, CEQA does not require that a project's effect on parking be analyzed.

The increase in campus population and visitation due to implementation of the NHPH is expected to occur over a 10+ year timeline. The CPHP, of which the NHPH is a part, will occur over a 30-year timeline. UCSF monitors transportation conditions at all campus sites where development is proposed and will continue to monitor vehicle traffic conditions, employee and patient mode split, and shuttle ridership within and surrounding the Parnassus Heights campus site.

Above and beyond the changes due to these mitigation measures, UCSF will continue to monitor conditions and consider new TDM measures, such as the ones suggested in the comments that preceded this response and modify its TDM programs to better address challenges and serve both current and future UCSF populations. Changes to UCSF's TDM offerings could be triggered due to campus travel demand changes because of population changes, staffing levels, the use of telehealth by patients, patient preference changes due to the COVID-19 pandemic, and other such inputs as well as the way in which people travel to the campus, whether by car, transit, bicycle, walk, or other means. Monitoring transportation conditions and revising the TDM program based on evolving conditions is important in order to capture potentially compounding or cross-cutting trends. An example of a compounding trend would be if monthly parking

passes for faculty and staff were discontinued when a new shuttle connection to regional transit was implemented, allowing those with a preference for travel by transit, but concerned with getting a return on their monthly parking pass to travel by transit on most days and pay for a daily parking pass when car travel is required. An example of cross-cutting trends would be if faculty, staff, patients, and visitors come to the Parnassus Heights campus site at a lower rate in the future because of increased telehealth and telecommuting, but this resulting decrease in total car travel to the campus site is offset by an increased preference for SOV car travel to the campus site.

The travel demand analysis presented from p. 4.13-29 to 35 of the NHPH Draft EIR is complete and adequate per UC requirements. UC does not consider effects on transit demand to be a significant impact under CEQA and therefore a public transit plan is not required as part of CEQA. While UCSF does have control over its shuttle service, regularly monitoring the capacity utilization of its routes to best provide service, it has no direct control over Muni's transit service planning. SFMTA makes transit service decisions based on its own data, such as ridership, vehicle and staff availability, and passenger surveys. This allows SFMTA the flexibility and responsiveness to provide the most efficient transit service possible to the city as a whole. The four transit lines that serve the Parnassus Heights campus (6-Haight/Parnassus, 7-Haight/Noriega, 43-Masonic, and N-Judah) are all proposed to see service changes under SFMTA's "Muni Forward" program. These changes are not necessarily to serve the NHPH or any particular project; they are based on SFMTA's general assessment of needs and will be implemented based on the priorities of SFMTA.

That being said, UCSF works closely with SFMTA to assure that the city is informed of changes at the Parnassus Heights campus site. UCSF is also supportive of the use of transit to travel to and from the campus site. As evidence of this coordination and support, UCSF and the City, acting through various departments, including the SFMTA entered into a Memorandum of Understanding (MOU) in January 2021 that acknowledged the interdependent relationship between UCSF and the surrounding transportation system and recognized their shared responsibility to provide a full complement of transportation services to the Campus community. Transportation and mobility elements of the MOU include:

- SFMTA will endeavor to increase the capacity of the N-Judah transit line, inclusive of modifications required to support three-car trains and provide more frequent service.
- UCSF will pay SFMTA a transportation contribution to increase the capacity and the frequency of service of the N-Judah and/or other Muni lines, services, and facilities provided by SFMTA that directly serve Campus community.

- UCSF will upgrade (or pay SFMTA to upgrade) the N-Judah UCSF Parnassus stop platform for three-car trains as an in-kind contribution to improve the pedestrian realm and encourage transit use by making the area more comfortable for people waiting for SFMTA transit service.
- UCSF will implement feasible safety improvements at the intersection of Arguello Boulevard, Carl Street, and Irving Street.
- UCSF will continue to implement the Parnassus streetscape plan as well as:
  - explore additional pick-up and drop-off activities and commercial loading activities related to the CPHP,
  - refresh the plan to include a curb management plan within two years of the EIR certification for the NHPH and share said plan with SFMTA, and
  - evaluate the streetscape plan to consider intersection modifications and traffic control devices at Judah Street – Parnassus Avenue/Fifth Avenue; Parnassus Avenue/Fourth Avenue; Parnassus Avenue/Third Avenue; Parnassus Avenue/Hillway Avenue, as needed to address additional traffic delay and accessibility concerns related to the CPHP.
- UCSF will continue to partner with the City to identify a bicycle route between Golden Gate Park and the Campus.

It should be noted that the obligations contained in the MOU are contingent on UCSF proceeding with the CPHP as contemplated and securing successful entitlement and requisite approvals to implement it.

I-Maerki-8 The commenter states that the NHPH Draft EIR has an insufficient response to the request that the height of NHPH be lowered, including placing floors below grade. The NHPH Draft EIR, Section 6.4.4 explains in detail that one basement level is already included in the proposed New Hospital and programmatically, there are no additional functions that can be placed in basement levels. Further, the excavation of the site to create additional levels below grade would add time and cost to the construction of the project resulting in a delay in the delivery of the needed inpatient beds. Other reasons are also set forth in Section 6.4.4. CEQA requires that an EIR briefly explain why an alternative is not feasible and therefore not carried forth for detailed evaluation. Section 6.4.4 satisfies this CEQA requirement.

I-Maerki-9 The commenter requests a more comprehensive construction timeline and expanded analysis of cumulative impacts over the 10-year period. The NHPH Draft EIR provided a thorough NHPH construction discussion in Subsection 3.7.2 in Chapter 3, *Project Description*, pages 3-46 to 3-49. This included a detailed preliminary timeline of the principal construction components for the New Hospital and its related improvements on page 3-47. This construction timeline, along with a construction equipment and operations list provided by UCSF's construction contractor, served as the basis for determining the

appropriate periods for construction analysis in the NHPH Draft EIR, including which peak NHPH construction impacts would occur.

NHPH Draft EIR Section 4.0, *Approach to Environmental Analysis*, identified the cumulative projects in the local geographic area considered in the cumulative impact analysis. The NHPH project timeline was considered in conjunction with the cumulative project timeline to determine when overlapping effects would be greatest. Please see response to Comment I-Maerki-4 for additional information on the updated cumulative project timelines, and a determination that these modifications would not affect prior conclusions made regarding the significance of cumulative impacts, or those mitigation measures identified to lessen cumulative effects.

As such, the NHPH EIR conservatively addressed both NHPH project and cumulative project impacts.

I-Maerki-10 The commenter suggests that cumulative construction timeline does not include the relocation of faculty, staff and services from LPPI, and the demolition of LPPI. As shown in response to Comment I-Maerki-4, based on the updated cumulative construction schedule, the demolition of LPPI would occur in 2022 to 2023. LPPI outpatient clinics and the Department of Psychiatry will be relocated to the Child, Teen and Family Center and Department of Psychiatry Building at 675 18th Street near the Mission Bay campus site, which is nearing completion. LPPI inpatient and partial hospitalization programs will be relocated to the Mount Zion campus site.

I-Maerki-11 The commenter inquires about the timeline for the demolition of the Surge and Woods buildings. As shown in response to Comment I-Maerki-4, above, the demolition of the Woods and Surge Buildings would occur in Fall 2022 and Spring 2023, respectively.

I-Maerki-12 The commenter asserts that the cumulative analysis does not include demolition of other buildings, particularly UC Hall. The NHPH Draft EIR does consider the demolition of buildings planned under 2014 LRDP and CPHP in the cumulative analysis. As shown in response to Comment I-Maerki-4, the demolition of UC Hall and School of Nursing are part of the RAB project. The hard demolition of UC Hall would occur in late 2022 through mid-2023; and the hard demolition of the School of Nursing would occur in 2026-2027, following completion of the RAB.

I-Maerki-13 The commenter asserts that there is no acknowledgement that the timing of the NHPH overlaps the planned construction of the Irving Street Arrival and RAB projects. As described in NHPH Draft EIR Section 4.0, *Approach to Environmental Analysis*, page 4.0-6, the list of on-campus cumulative projects considered in the NHPH Draft EIR cumulative analysis includes the Irving Street Arrival and RAB projects, and their timelines. See also response to Comment I-

Maerki-4 regarding updated construction timelines of certain cumulative projects.

I-Maerki-14 The commenter asserts that the Draft EIR does not adequately address the cumulative effect of three overlapping major construction projects in a five block length of Parnassus Avenue, from Hillway/Medical Center to Fourth Avenue. It is assumed that the three overlapping major construction projects on Parnassus Avenue the commenter is referring to are the NHPH, the Irving Street Arrival and the RAB. As discussed in response to Comment I-Maerki-13, above, both the Irving Street Arrival and RAB were considered in the NHPH Draft EIR cumulative analysis. For example, please see cumulative Impact C-AIR-2 in Section 4.2, *Air Quality* and cumulative Impact C-NOI-1 in Section 4.11, *Noise and Vibration,* where the NHPH is considered in conjunction with both the Irving Street Arrival and RAB cumulative projects.

I-Maerki-15 The commenter indicates that the overlapping construction schedule affects numerous aspects of the NHPH Draft EIR, including Hazardous Materials, Noise and Vibration, and Traffic and Circulation, including additional construction vehicles.

Please see cumulative Impact C-HAZ-1 in the NHPH Draft EIR Section 4.8, *Hazards and Hazardous Materials*. Impact C-HAZ-1 notes that prior to construction of the New Hospital, as a separate planned project, the LPPI and support buildings would be removed from the NHPH site, and any existing hazardous materials associated with those facilities and soils would be removed pursuant to applicable federal, State and local regulations. Similarly, other existing or planned clinical and/or research facilities at the campus site would be subject to similar applicable regulations and oversight from the University EH&S. As a result of these existing regulatory requirements, the potential hazardous materials and hazard impacts would not combine to become cumulatively considerable. Consequently, the NHPH Draft EIR concludes that the cumulative construction impact related to hazards and hazardous materials would be less than significant.

Cumulative Impact C-NOI-1 in Section 4.11, *Noise and Vibration,* considers construction noise impacts of the NHPH in conjunction with both the Irving Street Arrival and RAB cumulative projects. The NHPH Draft EIR finds that the addition of construction noise from the Irving Street Arrival would likely result in times when cumulative construction noise would exceed 10 dBA over existing ambient levels at some off-site receptors even after implementation of identified mitigation measures identified for that project, and consequently, the cumulative construction noise impact would be significant and unavoidable. Cumulative Impact C-NOI-3, considered cumulative construction vibration impacts. The NHPH Draft EIR described that architectural damage impacts to adjacent buildings are not a concern in the cumulative scenario because the NHPH is

sufficiently distant from cumulative projects so as to not cumulatively combine to result in architectural damage impacts. As such, cumulative vibration impacts of the NHPH would be similarly less than significant with implementation of NHPH Mitigation Measure NOI-3.

Cumulative Impact C-TRANS-1 in Section 4.13, *Transportation*, acknowledges that the construction of the cumulative construction projects will overlap with the construction of the NHPH, however, all UCSF projects at the Parnassus Heights campus site would implement construction management plans pursuant to mitigation measures adopted at the time of project approval. Construction management plans would ensure that construction impacts do not cumulate to result in a significant impact. The NHPH's contribution to the cumulative impact would be rendered not considerable with the implementation of NHPH Mitigation Measure TRANS-5, and the impact would be less than significant.

See also response to Comment I-Maerki-4, above.

I-Maerki-16 The commenter indicates the TDM appears insufficient to shift a significant portion of faculty, staff and student travel to the campus site onto public transportation; and that it does not include aggressive new programs or mitigation efforts, such as shuttles and car share. The commenter adds that there is limited direct effort to encourage increased use of public transportation, or to assess other alternatives. Please see responses to Comments I-Maerki-6 to I-Maerki-7, above.

I-Maerki-17 The commenter asserts that further analysis should be provided for the impact of COVID on hospital staffing and use of telehealth by hospital staff who may not have direct clinical care responsibilities. Please see responses to Comment I-Maerki-5, above.

I-Maerki-18 The commenter asserts that further analysis should be provided for increased support and subsidies for faculty, staff and students to use transportation. These would constitute actions taken under the UCSF TDM Program. Please see responses to Comments I-Maerki-6 to I-Maerki-7, above.

I-Maerki-19 The commenter asserts that further analysis should be provided for improvements to improved bicycle travel lanes and on-campus bicycle storage. These would constitute actions taken under the UCSF TDM Program. Please see responses to Comments I-Maerki-6 to I-Maerki-7, above.

I-Maerki-20 The commenter asserts that further analysis should be provided for improvements to public transportation for bus lines on Parnassus Avenue. This would require action by SFMTA. Please see responses to Comments I-Maerki-6 to I-Maerki-7, above.

I-Maerki-21 The commenter asserts that as part of the request to install a new traffic light at Hillway/Parnassus, UCSF should consider support for improved bus stops, including shelters, seating, contributions to Next Bus/arrival signage, and signal enhancements. These improvements would require action by SFMTA. Please see responses to Comments I-Maerki-6 to I-Maerki-7, above.

I-Maerki-22 The commenter indicates further analysis of the alternative hospital size and design options, including the Shorter New Hospital with Additional Basement Levels. The commenter argues that additional services can be placed underground in windowless spaces. The commenter indicates that the Zuckerberg San Francisco General Hospital have services and in basement levels, including Perioperating/Gastro-Intestinal, Clinical laboratory, Cardiology/Radiology/ Auxiliary Support and Plant Services. The commenter adds that a number of current UCSF Parnassus Heights Clinical Sciences and Imaging Services off the Irving Street entrance under the parking garage. The commenter also asserts that there are design solutions that would permit light to reach levels below grade.

The NHPH project includes limited clinical functions that would benefit from, or be indifferent to, windowless environments as suggested. To reduce the overall scope of the project, some clinical functions would remain in existing buildings and those functions proposed in the new building would be collocated to promote the sharing of patient care and support spaces to reduce area and maximize clinical staff efficiency. Fragmenting a few procedure rooms to the basement would require additional space and additional nursing staff. Following best practices and similar to peer institutions, patient preparation and recovery areas for all procedure rooms are standardized and adjacent to windows whenever possible.

Early design options maximized the basement area by placing the Imaging department in the basement, however, as inpatients in the tower above would be the primary patient population this will support, the location presented challenges with increased elevator demand. Additionally, the density of the program above would offer limited lightwell opportunities for access to daylight for patients and for the staff that would be working in the department for extended time periods.

The proposed design would place the Sterile Processing department in the basement, with dedicated elevators to receive and distribute surgical instrument carts to the procedure floors above. For other time-sensitive support functions, it was determined that these areas, including Pharmacy and Blood Bank, would be best located close the patient populations they serve for safety and efficiency reasons.

The proposed design also places certain mechanical infrastructure in the basement and a sub-basement. This includes mechanical chillers, plumbing pumps and storage tanks; all systems that are connected to the rest of the building

through pipe networks. Substantial studies were completed to evaluate if mechanical air handling equipment or electrical equipment could be placed in the basement. Analysis determined that the necessary resiliency of these systems and the amount of floor area necessary to provide clean air movement from a safe distance above street level down to the basement for conditioning, and then back up to the clinical departments would be too detrimental to the utilization of the remaining floor space.

I-Maerki-23 The commenter indicates the factors discussed in the NHPH Draft EIR that contribute to the Shorter New Hospital with Additional Basement Levels not being feasible, including additional excavation, construction disruption and schedule/costs must be evaluated in the context of the CPHP. The NHPH Draft EIR Section 6, *Alternatives*, Section 6.4.4 explanation of those construction, technical and cost factors that would pose a constraint in providing additional basement levels in the New Hospital are similarly applicable when considered in the context of the CPHP, given the site-specific nature of the constraints.

The commenter also indicates the NHPH Draft EIR provides little discussion of how the planned basement level with connection to the underground tunnel would occur. With respect to proposed tunnel beneath Parnassus Avenue, the NHPH Draft EIR Chapter 3, *Project Description*, provides a description of this feature to the extent information is currently available. As explained in Chapter 3, two potential tunnel alignments are under consideration (i.e., west and east connection options), as illustrated in Figures 3-22 and 3-23 in the NHPH Draft EIR. Under either option, the proposed tunnel would be about 20 feet wide and be located approximately 30 to 40 feet below grade. As shown in Figure 3-23 in the NHPH Draft EIR, Chapter 3 *Project Description*, the proposed tunnel would connect to an elevator in the New Hospital that would provide access to the hospital basement level.

I-Maerki-24 The commenter states that the deadline of December 13, 2030 imposed by SB 1953 may not be a hard deadline, because the deadline was previously extended on several occasions.

As discussed in NHPH Draft EIR Section 4.6, *Geology and Soils*, UCSF's hospitals fall under the jurisdiction of the *Alquist Seismic Safety Act* and SB 1953, which is an amendment of the Act. SB 1953 was adopted in part so that, after a major earthquake or disaster, hospital facilities can continue to provide care to their current occupants as well as any new patients that might arrive after the event. The *Alquist Seismic Safety Act* and SB 1953 require all hospital facilities to comply with seismic safety building standards as defined by the California Department of Health Care Access and Information. It would inappropriate for the NHPH Draft EIR analyses to arbitrarily assume that a scheduled regulatory deadline will be extended, despite the circumstance that prior extensions may have occurred.

It would also not be prudent for UCSF to base its planning efforts for the New Hospital on an uncertain extension of the 2030 regulatory deadline.

I-Maerki-25 The commenter argues that the incremental cost from adding additional basement levels is small relative to the NHPH project, and the entire CPHP. The NHPH Draft EIR discloses all factors considered by UCSF in determining the feasibility of this potential alternative, including ability to achieve project objectives; construction, operational and schedule constraints; and potential increases in construction-related environmental impacts; in addition to cost implications. When considering all these factors, UCSF concludes that this potential alternative would not be feasible, and on this basis, it was not carried forward for detailed evaluation in the NHPH Draft EIR.

I-Maerki-26 The commenter argues that the cost of excavation for the construction of the RAB project is likely many times greater than the cost of excavation for the additional basement levels for the New Hospital.

It is not for this EIR to compare the cost of the proposed project to other projects that will be undertaken by UCSF. No response is required. It should be noted, however, that the amount of excavation required for the NHPH project, including the proposed tunnel, is 110,700 cubic yards (page 3-48 in the NHPH Draft EIR), whereas the amount of excavation estimated for the RAB project was 77,000 cubic yards (page 3-37 in the CPHP Final EIR).

I-Maerki-27 The commenter argues that by placing more services in basement levels and lowering the overall height of the New Hospital, the project's shadow and wind effects would be reduced.

CEQA requires an EIR to evaluate feasible alternatives that reduce the significant effects of the proposed project. Based on the analysis conducted by UCSF presented in the NHPH Draft EIR, it is not feasible to add additional basement levels and bring the overall height down. Therefore, the NHPH Draft EIR appropriately dismisses this alternative from detailed evaluation.

February 14, 2022

UCSF Campus Planning
P.O. Box 0287
San Francisco, CA

Attn: Diane Wong (EIR@ucsf.edu)

Subject: Draft Environmental Impact Report (DEIR) on New Hospital at Parnassus Heights (NHPH) Project

Dear Ms. Wong:

We are submitting comments on the subject DEIR. Over the past thirty years, we have been property owners and concerned members of the Haight Ashbury neighborhood located adjacent to the project site. We are both professionally trained and experienced in land use law, regulation, and long-range planning, and have over sixty years of combined related experience working for the State of California. Also, we (and family members and friends) have been patients at UCSF and have great respect for the institution. That said, we **oppose** the project as described in the DEIR because the document violates the provisions of California Environmental Quality Act (CEQA) and inadequately analyzes and describes the adverse impacts (including those potentially resulting from a full build-out of the project site, i.e., CPHP, for which details are not specifically provided in the subject DEIR). In addition, the comment period is inadequate to provide meaningful input for such a large project and a 1400-page document, and we, therefore, ask that the comment period be extended. Our comments about the proposed NHPH *only* are below: 1 2 3

Scale and Scenic Impacts: The proposed 15-story hospital—actually 16 stories when including the rooftop utility story—is significantly out of scale with the immediate, surrounding (including open space area), and more distant neighborhoods from where the project would be visible (and impacts experienced), as shown in figures provided on Pages 148-158 of the DEIR. The scale of the project has substantial adverse impacts on views of and from within the Sutro Reserve. To ensure a scale appropriate for the general and extended neighborhood, the proposed new hospital height should be lowered to match that of existing adjacent buildings. Moreover, all rooftop utilities should be removed from proposed building and moved to the back of the structure or be located at a lower or ground level. 4 5

Shadows: The shadows to be cast by the proposed development as clearly shown in studies prepared by your team would adversely affect the following foundational and critical community resources used by neighbors and residents throughout the City of San Francisco: Grattan playground and community center, Grattan Elementary School, and Golden Gate Park including the nursery grounds that grow and provide landscaping materials for the entire park. The DEIR inadequately discusses the impacts related to 6 7

this significant change in local climate conditions for school children and teachers, recreation enthusiasts, nursery operations, etc. 7 cont.

Capacity and Project Necessity: We understand that the proposed project is intended to support patient care and stay and other elements related to campus function. At a time when more and more employees are working remotely—*including* those employed full-time by the Parnassus campus—we believe that the DEIR inadequately discusses these changed work conditions and how a reduced on-site work force relates to the capacity needs related to the proposed development. In addition, the document inadequately explains how the proposed project fits with UCSF's operations at the Mission Bay campus, which is an ever-expansive development with what appears to be ample and even excess capacity for employees, patients, and visitors. Furthermore, it is our understanding that a prior agreement between UCSF and the community established a limit on development at the Parnassus campus and that the project now proposed in the DEIR significantly exceeds that limit and, thus, would potentially violate the terms of prior agreements. 8 9 10

Pedestrian Bridge: The majority of figures and images in the DEIR, including the cover image, do not show the proposed bridge making it extremely difficult to comment on the design, view impacts, and functionality of this project element. The document does not adequately explain why the bridge is needed especially since it appears to be redundant with a proposed tunnel. Besides we are concerned as to why project sponsors would include a bridge when other such structures are presently being removed in San Francisco, i.e., along Geary Street. Pedestrian bridges can send the wrong signal to motorized vehicles encouraging drivers to exceed allowable speed limits since pedestrians are no longer in the way! The DEIR should discuss this project element and its impacts as well as address how it would fit in with the City's Vision Zero program. 11 12 13

Biological Resources: The DEIR discusses cutting away a portion of the adjacent open space area to widen a road behind the hospital and construct a retaining wall. The document should discuss how the loss of this area would impact the natural resources and wildlife depending on the open space area—not only at the immediate location impacted by proposed construction but throughout the entire reserve. The project would clearly have a substantial impact on the open space area in its entirety as enjoyed by wildlife and people. 14

Transit: The document inadequately analyzes and projects the demands on transit associated with the proposed project after (and during) construction. We are concerned that a significantly expanded community hospital is not coupled with a serious public transit plan developed through and in close collaboration with SFMTA. It is unconscionable that the document examines only four existing MUNI transit lines when the hospital serves the *entire* city with visitors traveling from throughout its boundaries. Further, the DEIR states that four MUNI lines would be "improved" if needed to serve the proposed project. Why wait until after the project has been built and in operation for public transit improvements to be assessed and implemented? In light of the project scope and size, the DEIR should include a sophisticated feasible transit plan that 15 16 17

examines (and proposes) affordable, accessible, frequent, and adequate service: without that, the proposed project looks like one out a different era before intelligent cities and people understood that getting people out of private vehicles mattered and providing meaningful public transit options was essential. On a related note, last we checked, Mayor Breed's administration committed to a Climate Action Plan, therefore the DEIR should discuss how the omission of a sophisticated public transit program for the project facilitates reaching the goals of that plan.

Responses to Comments from Jamie Michaels and Tim Eichenberg

I-Michaels/Eichenberg-1 The commenters provide some background comments that are not related to the adequacy of the NHPH Draft EIR; consequently, no response is required.

I-Michaels/Eichenberg-2 The commenters indicate they oppose the project as described in the NHPH Draft EIR because the document violates the provisions of CEQA and inadequately analyzes and describes the adverse impacts, including those potentially related to those potentially resulting from a full buildout of the project site.

As discussed in **Master Response 2: General Comments on EIR and Environmental Topics**, no direct response is possible to the majority of the comment, as it lacks specificity. However, with respect to the comment made about analysis of impacts of full buildout, please see Section 4.0, *Approach to Environmental Analysis*, on pages 4.0-7 to 4.0-9 in the NHPH Draft EIR. The NHPH Draft EIR cumulative impact analysis in each of the impact topics addressed all potential impacts of the NHPH, in combination with other cumulative development, including that of the CPHP under full buildout, as applicable.

I-Michaels/Eichenberg-3 The commenters assert that the comment period is inadequate to provide meaningful input for the large project and NHPH Draft EIR, and request the comment period be extended.

UCSF released for public review the Draft EIR on the NHPH on December 16, 2021. A 60-day public review and comment period on the Draft EIR began on December 16 and closed on February 14, 2022, which exceeded the 45-day public review and comment period required under CEQA (State CEQA Guidelines Section 15105(a)). UCSF also held a public hearing on January 19, 2022 via Zoom to receive oral comments on the Draft EIR.

Pursuant to CEQA Guidelines Section 15105(a), the public review period should not be longer than 60 days except under unusual circumstances. UCSF did not determine any unusual circumstances merited extending the public review period beyond 60 days.

I-Michaels/Eichenberg-4 The commenters assert that the scale of the New Hospital is significantly out of scale with the immediate surrounding and has substantial adverse impacts of views of and from the Sutro Reserve, and recommend lowering the height to match that of existing adjacent buildings.

All potential aesthetic impacts of the proposed New Hospital were addressed in the NHPH Draft EIR, including those related to views to and from the Sutro Reserve.

With respect to views of the Reserve, as discussed on NHPH Draft EIR page 4.1-24, from certain scenic viewpoints in the City, such as from Grandview Park, the New Hospital would be noticeable and partially obstruct views of the lower portion of the north slope of Mount Sutro. However, the Reserve would continue to be a prominent scenic resource from this view due to its elevation and visibility from long distance. In addition, with respect to views from within the Reserve, as discussed in Impact AES-1, pages 4.1-27 to 4.1-28, while from certain viewpoints within the Reserve, the proposed New Hospital would be noticeable and would obstruct northward scenic views across the campus core views from within the Reserve are largely obstructed under existing conditions by dense vegetation and/or topography, and in general, the Reserve does not provide long range scenic views. As such, development of the New Hospital would not adversely affect scenic vistas from within the Reserve. The NHPH Draft EIR finds that the New Hospital's impact on scenic vistas would be less than significant.

The commenters are also referred to the NHPH Draft EIR, Chapter 6, *Alternatives*, which addressed a number of potential alternatives to the proposed project that were lower in height than the New Hospital proposed under the NHPH, including a Smaller Hospital per the 2014 LRDP, a Reduced Project, and a New Hospital – Phased Option.

I-Michaels/Eichenberg-5 The commenters suggest that all New Hospital rooftop equipment should be removed from the building and moved to the back of the structure or to a lower or ground level.

The proposed New Hospital design accommodates as much mechanical equipment indoors within the basement of the building as feasible, thereby minimizing the amount of mechanical equipment on the roof. The design locates certain roof equipment that require access to the outdoors, such as the cooling towers and generators. Locating these elements outdoors at grade level behind the New Hospital as the commenter suggests would take away substantial square footage for the entire NHPH project, resulting in a smaller building footprint that would necessitate a taller building to achieve the same program. As a result, this suggested design change would not be feasible.

I-Michaels/Eichenberg-6 to I-Michaels/Eichenberg-7

The commenters assert that the shadows to be cast by the proposed development would adversely affect resources used by neighbors and residents throughout the City, and affect the change in climate conditions for school children and teachers, recreation enthusiasts, and nursery operations, among other issues.

With respect to shadow impacts, as explained in Impact AES-5 in the NHPH Draft EIR, the shadow analysis is limited to whether the NHPH would cast new shadow on publicly accessible open spaces in the vicinity of the campus site and whether this new shadow would adversely affect the use and enjoyment of these open spaces. Accordingly, the analysis assesses shadow impacts of the NHPH on three City parks (Golden Gate Park, Richard Gamble Memorial Park, and Grattan Playground), and on two schoolyards that participate in the Shared Schoolyard Project and provide public access on weekends (Independence High School and Grattan Elementary School). The Interior Greenbelt located adjacent to and east of the Reserve, and the Reserve itself located within the campus site, were also studied for this analysis. As analyzed in Impact AES-5, implementation of the NHPH would not adversely or substantially affect the use and enjoyment of these open spaces, and the impact was therefore concluded to be less than significant. Impact C-AES-4 determined that implementation of the NHPH in combination with cumulative projects reached a similar conclusion, and consequently, the cumulative shadow impact would also be less than significant.

I-Michaels/Eichenberg-8 The commenter indicates that the NHPH Draft EIR should discuss changes in work changes due to employees working remotely, and how a reduced workforce affects capacity needs of the proposed New Hospital.

As discussed in Section 4.13 *Transportation*, page 4.13-2, UCSF states that as part of its existing TDM program, that it implements telecommuting policies that allow certain employees to work remotely for one or more days per week, which reduces travel demand to/from the campus sites, including the Parnassus Heights campus site. Also, Section 4.13, page 4.13-31 acknowledges that the COVID-19 pandemic has resulted in less total travel to the campus; while the majority of clinical staff have continued to work in-person, the majority of administrative staff continue to work from home. Whether and when staff who have shifted to remote work during the pandemic will return to the workplace at full or reduced capacity will be determined by job position/requirements and individual departments.

Section 4.13, page 4.13-33 reports that at the time of publication of the NHPH Draft EIR, the medium- or long-term effects of the COVID-19 pandemic on travel behavior are uncertain and it would be speculative to estimate any of these possible changes, which may include various effects such as increased telework and telemedicine services or less transit ridership. To the degree that telework/telemedicine increases over the long-term, as compared to a pre-COVID-19 (January 2020)

baseline, this could result in less VMT than projected as part of this study. Should transit ridership decrease over the long-term, as compared to a pre-COVID-19 (January 2020) baseline, with more people choosing to drive or be driven, this could result in additional VMT than projected as part of this study.

The planning for the New Hospital and renovation of Long and Moffitt Hospital are being conducted in consideration of the evolving conditions. As explained in the NHPH Draft EIR Chapter 3, *Project Description,* Subsection 3.5 *Project Need*, learning from the current COVID-19 pandemic, it is extremely critical for clinical facilities to be flexible and have the ability to increase inpatient capacity to accommodate additional clinical needs during these times, rather than reducing or canceling non-essential surgeries in order to reduce patient census. Based on observed shortages in the availability of beds, especially intensive care unit and acute care beds; an analysis of demographic trends that indicate that the Medical Center will need to serve not only a larger population but also a population that includes more elderly patients; an analysis of the demand/need for private rooms; and an analysis of trends in health care which show an increased need for tertiary and quaternary health care, UCSF Health determined that the proposed hospital would need to provide inpatient beds, along with other necessary facilities that include additional operating rooms, additional emergency room bays and spaces, additional interventional labs, and ambulance bays. The proposed renovation of Moffitt and Long Hospitals would provide inpatient beds to augment those proposed at the New Hospital, and facilitate the inpatient clinical and support program needs for the increased patient capacity at Parnassus Heights.

Please also see responses to Comments I-Maerki-6 to I-Maerki-7.

I-Michaels/Eichenberg-9 The commenter indicates that the NHPH Draft EIR inadequately explains how the proposed project fits in with UCSF operations at the Mission Bay campus site.

Please see the response to Comment I-Welborn-19. As explained in more detail there, the Mission Bay inpatient facilities consist of three specialty hospitals dedicated to children's, women's, and cancer care. This is distinct from the Parnassus Heights hospital which is the nexus of the majority of adult acute care, intensive care, emergency care, and range of specialized services. The proposed NHPH would expand upon adult services at Parnassus Heights to address the need for increased bed capacity.

I-Michaels/Eichenberg-10 The commenter indicates a prior agreement established a limit on development at the Parnassus Heights campus site, and the that NHPH project substantially exceeds that limit, and thus, would potentially violate the terms of prior agreements.

While the proposed NHPH would result in an increase in square footage and population at the Parnassus Heights campus site, in January 2021, the Regents amended the 2014 LRDP to revise space program, update the projected population, and revise the Regents' Resolution to increase the space ceiling at the campus site. As such, the NHPH would be within the size and population parameters of the 2014 LRDP, as amended.

I-Michaels/Eichenberg-11 The commenters indicate that the majority of figures and images in the NHPH Draft EIR do not show the proposed Parnassus Avenue pedestrian bridge.

The NHPH Draft EIR presents available information on the proposed pedestrian bridge and tunnel, including its approximate proposed location along Parnassus Avenue, bridge and tunnel height and width, and elevation above and below grade, respectively; and the functional purpose of both facilities. While it is expected that further design details on the proposed pedestrian bridge and tunnel will become known as the design process proceeds for these project elements, the pedestrian bridge and tunnel are nonetheless described at a sufficient level of detail in the NHPH Draft EIR to allow evaluation of their potential environmental impacts during both construction and operation.

I-Michaels/Eichenberg-12 The proposed pedestrian bridge and proposed tunnel would address different needs and functions. The commenters indicate the NHPH Draft EIR does not adequately explain why the bridge is needed especially since it appears to be redundant with the proposed tunnel.

The proposed pedestrian bridge would facilitate travel for New Hospital patrons, UCSF employees and the public over Parnassus Avenue, and connect the New Hospital to the planned Irving Street Arrival. The proposed tunnel would serve to facilitate travel for UCSF employees and patients, movement of goods and materials, and accommodate utility lines across Parnassus Avenue between Medical Building 1 and the New Hospital.

I-Michaels/Eichenberg-13 The commenter indicates the NHPH Draft EIR should discuss the Parnassus Avenue pedestrian bridge and its impacts and how it would fit in with the City's Vision Zero program.

With respect to environmental impacts, as applicable, each impact statement in the NHPH Draft EIR provides a dedicated discussion of impacts solely as a result of the proposed Parnassus Avenue pedestrian bridge and tunnel.

With respect to the City Vision Zero program, Vision Zero SF is the City's road safety policy adopted in 2014, and intended to build safety and livability into the City's streets, educate the public on traffic safety, and enforce traffic laws. The *2021 Vision Zero SF Action Strategy* sets out strategic actions for city departments and agencies to reach the city's Vision Zero goal.

As discussed in Section 4.10, *Land Use and Planning,* the Parnassus Avenue pedestrian bridge would serve to reduce existing traffic congestion related to the transport of patients that are admitted to Medical Building 1, and then must be transported across Parnassus Avenue by ambulance to Moffitt Hospital. In addition, the pedestrian bridge would be situated up to 30 feet above grade, providing enough clearance so that the overhead catenary wires for the electric bus system have enough clearance to allow for safe operation. Furthermore, as discussed in Section 4.13, *Transportation*, the proposed Parnassus Avenue pedestrian bridge project would improve pedestrian connections between the north and south sides of the street and would not conflict with a program, plan, ordinance, or policy addressing the circulation system. The proposed Parnassus Avenue pedestrian bridge project would be designed based on applicable design standards for pedestrian bridges in San Francisco, and would be subject to review and approval by relevant City departments. Given all these factors, the proposed Parnassus Avenue pedestrian bridge would not appear to conflict with the City's Vision Zero program.

I-Michaels/Eichenberg-14 The commenters indicate the NHPH Draft EIR discusses cutting away a portion of adjacent open space area to widen Medical Center Way and construct a retaining wall, and the commenter then indicates that the NHPH Draft EIR should discuss how the loss of this area would impact the natural resources and wildlife in the immediate area at the Reserve as to the Reserve as a whole.

The commenter is apparently referring to the proposed medical gas tanks replacement project, which as described in the EIR Project Description, pages 3-38 to 3-39, would cause both a temporary construction disturbance area and a permanent encroachment area within the Reserve.

NHPH Draft EIR Section 4.3, *Biological Resources,* Impact BIO-1 discussed the potential for the proposed medical tanks replacement

project to potentially disturb or remove coastal triquetrella that may be present in the area of disturbance; and that construction noise and related effects could impact special-status wildlife species. The NHPH Draft EIR determined that implementation of NHPH Mitigation Measure BIO-1e, Botanical Surveys would reduce the potential impact of the NHPH on the coastal triquetrella plant species to a less-than-significant level. The NHPH Draft EIR also determined that implementation of NHPH Mitigation Measure BIO-1a, Protection of Monarch Butterflies; NHPH Mitigation Measure BIO-1b, Protection of Nesting Birds; NHPH Mitigation Measure BIO-1c, Protection of Roosting Bats, and NHPH Mitigation Measure BIO-1d, Worker Education, would ensure potential impacts of the NHPH on wildlife species would be less than significant.

Also, NHPH Draft EIR Section 4.3, *Biological Resources*, Impact BIO-2 discussed the potential for temporary construction lighting; and during operation, permanent nighttime security lighting, at the location of the proposed medical tanks replacement project to potentially pose an increased hazard for bird strikes. The NHPH Draft EIR determined that implementation of NHPH Mitigation Measure BIO-2a, Prevention of Harm to Migrating Birds During Construction; and NHPH Mitigation Measure BIO-2b, Bird-Safe Building Treatments, would ensure potential lighting impacts from the medical gas tanks replacement project would be less than significant.

I-Michaels/Eichenberg-15 The commenters assert that the document inadequately analyzes and projects the demands on transit associated with the proposed project after and during construction; and that the New Hospital is not coupled with a serious public transit plan development in collaboration with SFMTA. The commenter questions why the NHPH Draft EIR only examines four Muni lines when the hospital serves the entire city. Please see responses to Comments I-Maerki-6 to I-Maerki-7, above.

I-Michaels/Eichenberg-16 The commenters inquire why wait until after the project has been built and in operation for the public transit improvements to be assessed and implemented. Please see responses to Comments I-Maerki-6 to I-Maerki-7, above.

I-Michaels/Eichenberg-17 The commenters assert the NHPH Draft EIR should include a sophisticated feasible transit plan that examines and proposes affordable, accessible, frequent, and adequate service. Please see responses to Comments I-Maerki-6 to I-Maerki-7, above.

I-Michaels/Eichenberg-18 The commenters state that the NHPH Draft EIR should address consistency with the City's Climate Action Plan under its assessment

of relevant Plans and Policies, and that the Project does not adequately promote public transit use. As the NHPH is under the jurisdiction of the University of California, the NHPH Draft EIR assesses compliance with the UC Policy on Sustainable Practices in the Energy, Greenhouse Gas Emissions, and Transportation sections, and notes that it is in compliance with the relevant transportation strategies set forth in the 2017 Clean Air Plan (p. 4.2-38 to -39; 4.13-44). Please see the responses to Comments I-Maerki-6 to I Maerki-7 for a discussion of UCSF' coordination with SFMTA and support for transit that serves the campus community as well as UCSF's approach to and obligations of TDM measures for the campus site.

From:	Nancy Wuerfel
To:	Campus Planning - EIR
Subject:	COMMENTS on DRAFT EIR for New Hospital at Parnassus Heights
Date:	Monday, February 14, 2022 4:55:33 PM

February 14, 2022

TO: Diane Wong UCSF
FROM: Nancy Wuerfel, 2516 23rd Avenue, San Francisco, CA 94116
RE: DRAFT EIR for New Hospital at Parnassus Heights

This email is in response to the draft Environmental Impacts Review for the UCSF New Hospital at Parnassus Heights (NHPH). I request that the EIR acknowledge the impacts on the Public Services that I present in my response, and that the EIR is revised to find that there are significant impacts by the project which may be mitigated through an amendment to the UCSF-CCSF MOU. 1 2

Please acknowledge receipt of my comments.

SPECIFIC CONCERNS

SECTION 3.2 Campus Site Location and Characteristics

ENVIRONMENTAL SETTING (a) An EIR must include a description of the physical environmental conditions in the vicinity of the project AND (c) Knowledge of the regional setting is critical to the assessment of environmental impacts.

COMMENT: This section does not include information from the United States Geological Survey (USGS) website that states "The San Francisco Bay Area is transected by a series of subparallel faults that together accommodate the relative motion between the Pacific and North American plates. The San Andreas Fault and 6 other significant fault zones are present in the Bay Area: the Calaveras, Concord-Green Valley, Greenville, Hayward, Rodgers Creek, and San Gregorio Faults." San Francisco will be impacted to some degree by rupture of any of these faults. Also, the USGS website states that "**Secondary Earthquake Hazards** are caused by a consequence of the ground shaking, which is caused by earthquakes. These secondary earthquake hazards can result in tsunamis, seiches, floods and fires. Fires, often associated with broken electrical and gas lines, are one of the most common side effects of earthquakes. Gas is set free as gas lines are broken and a spark can start a fire. To complicate things, earthquakes can cause water lines to break so there is no water source to extinguish the fire." 3

SECTION 4 Introduction to Environmental Analysis,

This section does not state the correct ruling of the California Supreme Court's decision for CALIFORNIA BUILDING INDUSTRY ASSOCIATION, Plaintiff and Respondent, v. BAY AREA AIR QUALITY MANAGEMENT DISTRICT, Defendant and Appellant. No. S213478. Decided: December 17, 2015: 4

EIR language: "Effects of the Environment on the Project - In a change since the certification of the 2014 LRDP Final EIR, in 2015 the California Supreme Court held that “CEQA generally does not require an analysis of how existing environmental conditions will impact a project’s future users or residents.” *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369, 386. The Supreme Court explained that, where existing hazards exist, an agency is only required to

analyze the potential impact of such hazards on future residents if the project would exacerbate those existing environmental hazards or conditions. Thus, with respect to such issues as geologic and seismic hazards, exposure to existing levels of air pollution and noise, and the like, CEQA does not require consideration of the effects of bringing a new population into an area where such hazards exist, as long as the project itself would not increase or otherwise affect the conditions that create those hazards."

Verbatim ruling: III. Disposition for this case is as follows: "For the foregoing reasons, we hold that CEQA does not generally require an agency to consider the effects of existing environmental conditions on a proposed project's future users or residents. What CEQA does mandate, consistent with a key element of the Resources Agency's interpretation, is an analysis of how a project might exacerbate existing environmental hazards. "

4 cont.

COMMENT: The EIR must cite the exact language of the Supreme Court's decision. The EIR must include analysis of what the environmental hazards are and how the project might exacerbate the hazards.

SECTION 4 Environmental Setting

Impacts for UTIL-2 must discuss the Estimated Water Demand for firefighting required to protect the NHPH. This water is provided by the SFPUC, but it is not metered and not billed, and is provided without cost throughout San Francisco. The WSE report from WEST YOST only documents use and demand for *potable water* that is billed and metered, not for firefighting water. The following documents describe the inadequacy of water supply to and infrastructure for firefighting activities citywide and specifically on the westside:

(1) 2018-2019 CIVIL GRAND JURY report "Act now before it is too late: Aggressively expand and enhance our high-pressure emergency water system." The report concludes that San Francisco must rapidly expand the City's Emergency Firefighting Water System (EFWS) to protect all neighborhoods in the event of a major earthquake and fire, given that the vulnerability of the City poses a serious threat to the well being of San Francisco and the safety of its inhabitants and environment. Appendix A provides details of the Findings and Recommendations. Appendix G provides a map of the USGS fault lines in the Bay Area. Appendix H and I provide maps of the EFWS and the high-pressure AWSS systems.

(2) The Board of Supervisors (BOS) Resolution 484-19 File 191029, passed November 19, 2019, declared **a state of urgency** to expand the EFWS to cover all unprotected neighborhoods by 2034 and required reports from City departments on the city's preparedness. The BOS continues to hold hearings on the City's progress to comply with the resolution. However, the City has not committed to a specific plan of action, with specific funding identified, or even agreed to completing all projects before the USGS estimated date of 2043 when a major earthquake is likely to hit the Bay Area.,

5

(3) Professor Charles Scawthorn, S.E. prepared a report dated June 7, 2021 commissioned by the SFPUC entitled "Fire Following Earthquake Water Requirements Study." The study was shared with the Board of Supervisors in response to a commitment made to the 2019 Civil Grand Jury. "The purpose of this project has been the estimation of water required to suppress fires following a major eathquake affecting the city of San Francisco." "San Francisco has substantial assets at risk... threatened by earthquakes and the fires that will follow." "The San Francisco FIre Department (SFFD) will be challenged by a major earthquake... will likely generate about 130 fires in the first 24 hours..." "Lacking adequate water leads to continued fire growth and a larger demand for firefighting water than at first arrival..." "In conclusion, depending on the expansion of the Emergency Firefighting Water System (EFWS) and the capacity of SFFD, there may or may not be adequate amounts of water at some fires when the engines arrive, which would lead to continued fire growth and a larger demand for firefighting water..."

(4) The SFPUC has received CEQA statutory exemption for Project Number CUWAW2AW29 in

2016, 2017 and 2018 to construct the Clarendon Water Supply Project that would tie-in potable water system from a main on Clarendon to connect this water to the Auxiliary Water Supply System (AWSS) at Twin Peaks Reservoir This is necessary because "additonal supply to the Twin Peaks Zone is required to strengthen the AWSS system to allow potable waster to be used by the AWSS in an emergency," and to meet anticipated firefighting demands in western San Francisco following the next large earthquake.

COMMENT: These reports are directly relevant to the EIR for the NHPH to clarify the danger that UCSF users and residents are exposed to from fires following an earthquake because of the need for the SFFD to have access to more water for firefighting. The current plan is for the SFPUC to use the locally stored potable water in city reservoirs for firefighting. This action creates a new environmental hazard - that of depleting potable water needed for human uses and sanitation instead of using unlimited ocean seawater for fighting fires.

Firefighting water issues do exacerbate the secondary earthquake hazard of fires, since UCSF will be major provider of healthcare services after an earthquake but it will be compromised by a lack of potable water when local water supplies are redirected. Therefore, there is a significant environmental impact on UTIL 2 that requires further analysis and mitigation because the project might cause or risk exacerbating by bringing development and people into the area affected

5 cont.

2019 CEQA STATUTE AND GUIDELINES published by the Association of Environmental Professionals

CEQA GUIDELINES FOR MITIGATION:

Section 15126.4 - CONSIDERATION AND DISCUSSION OF MITIGATION MEASURES PROPOSED TO MINIMIZE SIGNIFICANT EFFECTS. (a) Mitigation Measures in General. (2) Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally binding instruments. In the case of the adoption of a plan, policy, regulation, or other public project, mitigation measures can be incorporated into the plan, policy, regulation, or project design.

EXISTING REGULATIONS AND AGREEMENTS

---The California Constitution Article XIII , section 2.2 (a) Protection of Fire Services, Emergency Response, and County Services. It is the intent of the Legislature in proposing, and the people in adopting, this section and Section 2.3 to do both of the following: (1) Dedicate revenue for fire protection and emergency response, *address inequities in underfunded fire districts,* ensure all communities are protected from wildfires, and safeguard the lives of millions of Californians. (2) Protect county revenues and other vital local services, and section 35 (2) The *protection of the public safety is the first responsibility of local government* and local officials have an obligation to give priority to the provision of adequate public safety services.

---The Regents of the University of California minutes for its meeting on November 18, 2021, Item 1 Strategic Campus Overview, San Francisco Campus, included Chancellor Hawgood's comments that presented an overview of UCSF's vision for the future including the ten-year plan for a new hospital at Helen Diller Medical Center. He noted "As part of the Parnassus Heights Comprehensive Program, *UCSF entered into a MOU with the City of San Francisco* to add another 1,200 housing units for staff, specifically lower compensated staff."

---Mayor London Breed announced on January 4, 2021 that San Francisco and UCSF had a landmark comunity benefits package as part of the New Hospital Project at Parnassus Heights Campus. The package includes affordable workforce housing, transit improvements, and other community investments while improving a critical emergency facility serving San Francisco's westside.

MITIGATION REQUESTED FOR SIGNIFICANT IMPACTS ON UTILITIES

6

COMMENT: Chancellor Hawgood's comments at the UC Regents meeting in 2021 that UCSF had entered into an MOU with CCSF provides the instrument to be used for mitigating the significant EIR impacts on Section 4.14 Utilities and Service Systems, UTIL 2 and C-UTIL 1. To comply with the documented need for an increase in fire fighting water to be available to serve the westside of San Francisco where the NHPH is located, there should be an amendment to the MOU between UCSF and the City and County of San Francisco (CCSF) . This amendment must specify an agreement for the CCSF to provide unlimited seawater through dedicated high pressure pipelines and hydrants necessary to suppress fires that threaten the NHPH, while preserving locally stored potable water for human uses and sanitation. To help realize Mayor Breed's announcement that the new hospital will be improving a critical emergency facility serving San Francisco's westside, the City and UCSF must both contribute towards financing projects that will achieve the California Constitution's requirement to "Dedicate revenue for fire protection and emergency response [to] *address inequities in underfunded fire districts..."* To achieve the timelines for completing NHPH project as planned and to complete the fire protection projects for the underserved westside, It is strongly recommended that both parties to the MOU expedite negotiations for this MOU amendment.

6 cont.

Thank you for considering my comments.

Sincerely,

Nancy Wuerfel

Responses to Comments from Nancy Wuerfel

I-Wuerfel-1 The commenter indicates their comments on the NHPH Draft EIR. The comment is acknowledged; please see responses that follow.

I-Wuerfel-2 The commenter requests that the NHPH EIR acknowledge impact on public services as presented in her comment letter, and that the NHPH Draft EIR be revised to disclose significant impacts which may be mitigated through an amendment to the UCSF-CCSF Memorandum of Understanding (MOU). Please see responses to specific comments raised on these issues, below, particularly response to Comment I-Wuerfel-6.

I-Wuerfel-3 The commenter asserts that NHPH Draft EIR Section 3.2, *Campus Site Location and Characteristics*, should include information from the United States Geological Survey regarding faults in the region; and secondary earthquake hazards associated with groundshaking that can result in tsunamis, seiches, floods and fires.

Please see NHPH Draft EIR Section 4.6, *Geology and Soils.* Subsection 4.6.1, *Environmental Setting* discusses and illustrates active faults in the vicinity of San Francisco, including those mentioned by the commenter.

With respect to potential fires associated with broken electrical and gas lines, or the potential for water lines to break, as a result of an earthquake, this is addressed in Section 4.6 in Impact GEO-1, where it is acknowledged that "(i)ntense ground shaking and high ground accelerations would affect the entire area and the primary and secondary effects of ground shaking could damage structural foundations, distort or break infrastructure, and place people at risk of injury or death." However, Impact GEO-1 also discusses that with compliance with the regulatory requirements and the implementation of geotechnical design recommendations consistent with seismic design criteria, impacts related to seismic shaking associated with earthquakes that may occur at the New Hospital site would be less than significant.

With respect to potential effects associated with tsunamis, seiches and floods, including potentially related to earthquakes, the NHPH Initial Study (see NHPH Draft EIR Appendix A, Section 5.10(d) determined that NHPH site is not located within a 100-year flood zone; has no potential to be affected by future sea level rise; and due to its elevation and inland location, and its distance from the nearest major body of water, the project site is not susceptible to the potential effects of a tsunami or seiche. Since it was concluded no impact would occur with respect to these issues, this topic did not require further analysis in the NHPH EIR.

I-Wuerfel-4 The commenter asserts that the NHPH Draft EIR Section 4.0, *Introduction to Environmental Analysis*, does not accurately present the ruling from 2015, and

argues that CEQA still requires an analysis of how a project might exacerbate existing environmental hazards.

The NHPH Draft EIR accurately summarized the *California Building Industry Association v. Bay Area Air Quality Management District* (2015) decision in Section 4.0, page 4.0-4, stating (emphasis added):

> "The Supreme Court explained that, where existing hazards exist, an agency is only required to analyze the potential impact of such hazards on future residents if the project would exacerbate those existing environmental hazards or conditions. Thus, with respect to such issues as geologic and seismic hazards, exposure to existing levels of air pollution and noise, and the like, CEQA does not require consideration of the effects of bringing a new population into an area where such hazards exist, *as long as the project itself would not increase or otherwise affect the conditions that create those hazards.*"

As noted above, the NHPH Draft EIR acknowledges that in instances where a project may increase or affect conditions that create environmental hazards, such impacts are not exempt from analysis in CEQA. Similar text is repeated in NHPH Section 4.2, *Air Quality*, page 4.2-24, below (emphasis added):

> In the *California Building Industry Association v. Bay Area Air Quality Management District* case decided in 2015, the California Supreme Court held that CEQA does not generally require lead agencies to consider how existing environmental conditions might impact a project's users or residents, *except where the proposed project would exacerbate an existing environmental condition.*

Similar text is also repeated in NHPH Section 4.6, *Geology and Soils*, page 4.6-17 (emphasis added):

> "In 2015, the California Supreme Court held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of a project [*California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal. 4th 369.]. *However, if a project exacerbates a condition in the existing environment, the lead agency is required to analyze the impact of that exacerbated condition on the environment, which may include future occupants of the project.*

As such, the NHPH Draft EIR accurately interprets and applies the *California Building Industry Association v. Bay Area Air Quality Management District* decision in analyzing impacts where existing hazards exist and could be exacerbated by the project.

I-Wuerfel-5 The commenter asserts Impact UTIL-2 in the NHPH Draft EIR must discuss the estimated water demand for firefighting required to protect the NHPH. The

commenter indicates the Water Supply Evaluation (WSE) prepared in support of the NHPH Draft EIR does not reflect water used for firefighting.

The focus of Impact UTIL-2 in the NHPH Draft EIR is to answer the CEQA Guidelines Appendix G significance criteria item: Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years? The WSE prepared in support of the NHPH Draft EIR appropriately estimated the NHPH water demand based on operational characteristics of the New Hospital (specifically, using a UCSF water demand rate based on adjusted patient days). It would be speculative, and thus, inappropriate for the NHPH WSE to additionally estimate potential emergency water demand associated with fighting fires, given the unpredictability and infrequency of emergency water use at the campus site for firefighting.

Nevertheless, for informational purposes, the NHPH Draft EIR Section 4.14, page 4.14-5 provides a detailed description of the existing domestic and fire water system serving the campus site, including distribution pipes, storage tanks, pump stations, fire hydrants, and connections to the City's water system.

Please also refer to the NHPH Initial Study, Section 5.15, Public Services, which addressed the impact of the NHPH on fire protection services. As stated on page 63, the campus site, including the NHPH site, is located in an urban area and would not extend demand of the San Francisco Fire Department (SFFD) beyond the current limits of its service area. The anticipated population increase associated with the New Hospital and other planned development at the campus site would not adversely affect SFFD service standards nor require an increase in SFFD staff and/or equipment that would require the construction of new fire protection facilities. It was concluded that implementation of the proposed NHPH would have a less than significant impact regarding the construction of new or physically altered fire protection facilities, and this topic did not require further analysis in the NHPH EIR.

The commenter references the following sources of information and asserts that these reports are directly relevant to clarify the danger that UCSF users and residents are exposed to fire following an earthquake because of the need for the SFFD to have access to more water for firefighting:

1) a 2019 San Francisco Civil Grand Jury report that identified that areas of the City, including in the western and southern districts, were not adequately covered by the City's Auxiliary Water Supply System (AWSS);

2) San Francisco Board of Supervisors Resolution 484-19 that declared a State of Urgency to rapidly expand the City's Emergency Firefighting Water System (EFWS) to protect all neighborhoods in the event of a major earthquake and fire, and called for a comprehensive EFWS action plan to expand the City's EFWS to cover all unprotected neighborhoods by 2034;

3) a report prepared by Professor Scawthorn, S.E. commissioned by the SFPUC entitled "Fire Following Earthquake Water Requirements Study;"

4) a CEQA Statutory Exemption the SFPUC received to construct the Clarendon Water Supply Project that would tie-in the potable water system from a main on Clarendon to connect to the AWSS at Twin Peaks Reservoir.

Please note the SFPUC, in collaboration with the SFFD and San Francisco Public Works, have completed a number of EFWS construction projects within the City to improve the reliability of the EFWS following an earthquake or other disaster. These improvements have included repairs to existing reservoirs and cisterns, installation of new cisterns to improve coverage throughout the City; seismic strengthening of core facilities, and repair and expansion of pipelines and tunnel components.[5]

In addition, in recognition of the need for the City to further safeguard and enhance the its fire, earthquake and emergency response by rehabilitating critical facilities, the City passed the Earthquake Safety and Emergency Response (ESER) 2020 Bond in March 2020. One of the conceptual alternatives discussed in the 2020 ESER Bond Report to improve protection of the City's western neighborhoods is a Potable Emergency Firefighting Water System, which would consist of new seismically resistant high pressure pipelines supplied by multiple water sources, and designed to provide redundancy and ensure reliability. The selection of the ESER 2020 projects will be guided by the system's Technical Steering Committee, and determined by the Management Oversight Committee, and would be subject to the CEQA environmental review process, as applicable.[6]

When considering the existing City EFWS and domestic water systems in the campus site vicinity, UCSF's on-campus emergency water system, ongoing improvements being implemented by the City for its EFWS system, and emergency water supply and distribution improvements planned by UCSF at the campus site under the CPHP, it is not anticipated that there would be any notable deficiencies in emergency water systems serving the campus site under the NHPH.

I-Wuerfel-6 The commenter references parts of Section 15126.4 of the CEQA Guidelines regarding consideration of mitigation measures; and parts of the California Constitution Article XIII, Sections 2.2 and 2.35 related to fire protection and protection of public safety, respectively. The commenter references an announcement by the San Francisco Mayor in January 2021 that the MOU between UCSF and the City had a community benefits package that included affordable workforce housing, transit improvements and other community

5 San Francisco Public Utilities Commission website, Emergency Firefighting Water System, https://sfpuc.org/about-us/our-systems/emergency-firefighting-water-system, accessed March 15, 2022.

6 San Francisco Public Utilities Commission website, 2020 Earthquake and Emergency Response Bond Report, https://sfpublicworks.org/sites/default/files/ESER%202020%20Bond%20Report.pdf

investments while improving a critical emergency facility serving San Francisco's westside. The commenter then asserts that Chancellor Hawgood's comments at the UC Regents meeting in 2021 that UCSF had entered into a MOU with the City provide the instrument to be used for mitigating the significant EIR impacts on Section 4.14, Utilities and Service Systems, Impacts UTIL-1 and C-UTIL-1.

Please note that, contrary to commenter's assertion, the NHPH Draft EIR Impacts UTIL-1 and C-UTIL-1 were determined to be less than significant. Impact UTIL-1 addressed the potential for the NHPH to require or result in the construction of new expanded water, wastewater treatment or storm drainage, electric power or communications facilities, the construction or relocation of which would not cause significant environmental impacts. Impact UTIL-1 explained that implementation of construction-related mitigation measures and compliance with other construction-related regulatory requirements discussed in the NHPH Draft EIR would reduce construction-related effects associated with the utility improvements to a less than significant level, with no mitigation required.

Impact C-UTIL-1 addressed the potential for the NHPH, in combination with cumulative development, to not substantially contribute to cumulative impacts to utilities and service systems. As with Impact UTIL-1, Impact C-UTIL-1 showed that with implementation of construction-related mitigation measures and compliance with other construction-related regulatory requirements, cumulative impacts related to the installation of new utilities would similarly be less than significant. Impact C-UTIL-1 also determined that from an operational perspective, the NHPH would not make a considerable contribution to cumulative impacts on water supply, and cumulative impacts on the need for wastewater treatment would also be less than significant.

The commenter asserts that there should be an amendment to the MOU between UCSF and City to specify an agreement for the City to provide unlimited seawater through dedicated high pressure pipelines and hydrants to suppress fires that threaten the NHPH, while preserving locally stored potable waters for human uses and sanitation. However, the NHPH Draft EIR does not find any significant fire hazard impacts associated with the NHPH requiring mitigation or necessitating an amendment to the 2021 MOU. Please see response to Comment I-Wuerfel-3 for how the NHPH Draft EIR addressed the potential fires associated with broken utilities that could occur a result of an earthquake. Please see response to Comment I-Wuerfel-5 as it relates to the impact of the NHPH on fire protection services. Please also see the NHPH Initial Study Section 5.9(g) and Section 5.20(a-d) as it relates to potential for the NHPH to expose people or structures to risk of loss, injury or death involving wildland fires. In all cases, potential NHPH fire hazard related impacts would be less than significant.

Subject:	Re: Parnassus UCSF Campus renovations
Date:	Wednesday, March 9, 2022 12:36:17 PM

As I walked around my neighborhood today I notice cars just circling to find a place to park after dropping friends or relatives off to go to the clinics or hospital. Since for the monstrous building that is going up with no more parking being built, where are these people going to part. They are not taking their friends or relatives to the hospital on Bart or Muni or certainly not all are coming by ambulance. So between the larger influx of people coming to the hospital and the larger influx of people to care for them how are you pretending that the traffic problems are being solved. Is the University going to do what it originally did "wipe out existing housing to build more large ugly buildings" or just cause more conjestion in the neighborhoods that they are ruining? 1

Responses to Comments from Mei Lie Wong

I-Wong-1 The commenter indicates that currently, cars circle in the neighborhood to find a place to park. The commenter indicates the New Hospital would not provide parking, and inquires where people are going to park.

With respect to parking, as discussed in Chapter 1, *Introduction*, the NHPH meets the criteria of Statute Section 21099(d) which states that parking impacts of an employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment. As such, potential impacts of the NHPH on parking activity were not determined to be an impact under CEQA.

Nevertheless, Section 4.13, *Transportation*, pages 4.13-12 to -13 in the NHPH Draft EIR discusses UCSF existing TDM program, which includes priced permit parking, carpool/vanpool, and telecommuting programs and policies that are effective strategies to help reduce the number of drive-alone trips to/from the UCSF Parnassus Heights campus site, and thus reduce demand for parking. Section 4.13, pages 4.13-21 to -23 provides an informational discussion regarding the existing parking supply in relation to the parking demand, for both on- and off-street facilities.

I-Wong-2 The commenter cites different UCSF sources that discuss community outreach conducted by UCSF for the NHPH to date. This comment does not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required.

I-Wong-3 The commenter indicates UCSF did not address the circumstance of not building more parking garages, and not making Muni better by putting a reasonable amount into that system, but putting more people on campus. The commenter further asserts that the neighborhood is already flooded with cars, and this would only get worse when the number of researchers, students and medical personnel is increased on the campus site. Please see responses to Comments I-Maerki-6 to I-Maerki-7.

I-Wong-4 The commenter indicates UCSF is not welcoming to the neighborhood in creating spaces or anything on campus. The commenter adds that UCSF is creating a building that will take away light from the neighborhood and parking, and create noise and trash.

With respect to the commenter's statement on the New Hospital related to shadow creation, as explained in Impact AES-5 in the NHPH Draft EIR, the shadow analysis is limited to whether the NHPH would cast new shadow on publicly accessible open spaces in the vicinity of the campus site and whether this new shadow would adversely affect the use and enjoyment of these open spaces. Accordingly, the analysis assesses shadow impacts of the NHPH on three

City parks (Golden Gate Park, Richard Gamble Memorial Park, and Grattan Playground), and on two schoolyards that participate in the Shared Schoolyard Project and provide public access on weekends (Independence High School and Grattan Elementary School). As analyzed in Impact AES-5, implementation of the NHPH would not adversely or substantially affect the use and enjoyment of these open spaces, and the impact was therefore concluded to be less than significant. Impact C-AES-4 determined that implementation of the NHPH in combination with cumulative projects reached a similar conclusion, and consequently, the cumulative shadow impact would also be less than significant.

With respect to noise generation associated with the NHPH, the NHPH Draft EIR addressed all noise and vibration impacts associated with the NHPH, including construction increases in noise levels and groundborne vibration, and operational increases in noise levels (e.g., from on-campus stationary sources, New Hospital-related ambulance noise, and increases in off-site NHPH traffic). In all cases, noise impacts were mitigated to the extent feasible; however, the project and cumulative construction noise impacts (Impact NOI-1 and Impact C-NOI-1) were concluded to be significant and unavoidable.

With respect to commenter's statement that the New Hospital would create trash, as discussed in **Master Response 1: Non-CEQA Comments**, potential effects of a proposed project on the quality of life and related conditions, such as trash, in and of themselves, are not considered environmental impacts under CEQA. However, UCSF Parnassus Heights maintenance staff routinely collect and dispose of trash generated within the campus site, and this practice would continue with the proposed NHPH. Please also see the NHPH Initial Study included in Appendix A in the NHPH Draft EIR, which addressed the impact of the NHPH project on public services, including solid waste, and determined that these effects would be less than significant.

---o0o---

PUBLIC HEARING ON THE

DRAFT ENVIRONMENTAL IMPACT REPORT

FOR THE

UCSF NEW HOSPITAL AT PARNASSUS HEIGHTS

WEDNESDAY, JANUARY 19, 2022

VIA ZOOM WEB CONFERENCING PLATFORM

---o0o---

REPORTED VIA ZOOM WEB CONFERENCING
BY: DEBORAH FUQUA, CSR #12948
CERTIFIED STENOGRAPHIC REPORTER

APPEARANCES

---o0o---

ALICIA MURASAKI, Assistant Vice Chancellor - Campus Planning

PAUL TAKAYAMA, Assistant Vice Chancellor - Community & Government Relations

DIANE WONG, Principal Planner, Environmental Quality Act Coordinator

ABBY ELLIS, Associate Director, Community Relations

---o0o---

Wednesday, January 19, 2022 6:00 p.m.

---o0o---

P R O C E E D I N G S

---o0o---

ABBY ELLIS: All right. It's 6:00 o'clock, everyone. Thank you for joining us for tonight's public hearing on the Draft Environmental Impact Report for the proposed New Hospital at Parnassus Street. I'm Abby Ellis, Assistant Director of Community Relations with UCSF. We're just going to wait another minute or two for people to join the call, but we appreciate you all taking the time out of your evening to join us. And we'll go ahead and get started in just a couple minutes. Thank you.

(Pause in proceedings)

ABBY ELLIS: Hi, good evening to all those who just joined. You are at the public hearing on the Draft Environmental Impact Report for the New Hospital at Parnassus Heights or UCSF. We're just waiting a minute or two for other community members to join the call, and then we'll get started in the next minute or so. Thank you.

(Pause in proceedings)

ABBY ELLIS: Hi, everyone. Thanks for joining us tonight.

Val, will you go to the next slide? I think we should go ahead and get started.

So I'm Abby Ellis, Assistant Director of Community Relations with UCSF. You are at the Draft EIR hearing for New Hospital at Parnassus Heights. Before we get started, we just want to go through a couple Zoom housekeeping items, just to make sure everybody understands the process for how this will work, even though we've all been on Zoom calls for the better part of two years at this point.

So we'll be taking the public comment by raising your virtual hand by clicking the icon at the bottom of your screen that's labeled "raise hand." If you're on the phone, you can dial star 9.

Staff will send you a request to unmute when it's your turn to speak. Diane Wong will be helping to facilitate that. She'll read out the first few names to speak so you're prepared and then run through until there's no more hands raised. As it says in the purple box, commenters will be called on in the order of who raised their hand first. And don't lower your hand, as you will lose your place in the queue.

As a reminder, this meeting is being recorded for note-taking and follow-up purposes. A court reporter is on the line to prepare a transcript of the

proceedings.

Next slide, please. Great. Thank you. That's it from me. I'll hand it over to Alicia Murasaki now.

ALICIA MURASAKI: Good evening. Thank you for joining us tonight. Due to the Zoom format, I'm going to ask you to bear with me because I will be reading the contents of the slides so that those who do not have access to a computer screen or who have vision issues can also fully participate.

So UCSF is one of the ten universities of California campuses and the only one that's focused exclusively on health. Parnassus Heights is one of UCSF's major campus sites, and we have challenges there: aging buildings and infrastructure, regulatory and seismic compliance, building overcrowding, and lack of quality spaces. Parnassus Heights requires major renewal and investment in infrastructure and facilities.

We completed a comprehensive Parnassus Heights Plan to address these needs, and tonight, the New Hospital at Parnassus Heights has been analyzed in a separate project-specific environmental impact report. And tonight, we will be taking comments on the draft.

Next slide, please.

So the New Hospital is required to address critical seismic capacity and patient care issues. These include our patient census is at record highs; it is essential that we expand access to accommodate increasing patient demand.

For recruitment and retention: Providing quality facilities is critical to retaining and recruiting top clinicians, staff, researchers, and students.

The age of the campus: Moffitt Hospital was built in 1958. The facilities are outdated, inflexible, undersized, and clinically obsolete.

The state seismic law: Moffitt Hospital must be structurally retrofitted or decommissioned as an inpatient facility by the year 2030.

And quality: Investing in UCSF Health's future is critical to sustaining our public mission of top quality patient care, research, and education.

Next slide, please.

Here is a very high level timeline of the hospital project. You can see that we started with visioning in 19- -- not 19, sorry -- 2018. We are currently in the design phase, and we will be requesting Regental approval in mid 2022. You can see that we will be demolishing an existing building to

make way for a construction start in the year 2023. We expect to complete construction, testing, preoccupancy planning, and fit-up by 2029, 2030, with a grand opening planned for the year 2030. Following that, we will have some limited renovations in Moffitt and Long.

Next slide, please.

This slide is now an overview and timeline of the New Hospital at Parnassus Heights EIR. So we have, in October 2020 to October 2021, completed a series of public community meetings. On July 28th, 2021, the Notice Of Preparation and the Initial Study for the EIR was published. In August 17 -- on August 17th, the EIR scoping meeting was held. On December 16th, the New Hospital Draft EIR was published. And that brings us to today. January 19th, 2022, where we are holding our public hearing on the Draft EIR.

Our next steps -- and these dates are subject to change, but we are targeting -- well, this one won't change. February 14th, 2022 will be the end of the 60-day Draft EIR public comment period. And then in early 2022, we will be preparing the responses to all comments received. And in mid 2022, we will publish and certify the Final EIR as our plan.

Next slide, please.

So as a public hearing, the purpose is to

receive comments on this Draft EIR for the proposed New Hospital at Parnassus Heights project. Since this is not a community meeting to discuss the project, please limit your remarks and comments to the Draft EIR.

As required by the California Environmental Quality Act, UCSF will respond to all substantive comments in writing, and therefore, we will not respond verbally to comments tonight or engage in a dialog.

The next slide, please.

If you wish to speak, please raise your virtual hand. And for those on the phone only, press star 9 to raise your virtual hand. Each speaker will have two minutes to provide comments. If you speak, your comments will be transcribed, so you do not need to also send written comments. If you would like to provide comments on the Draft EIR in writing, all comments are due by 5:00 p.m. on February 14th, 2022.

I'd just like to highlight we do have a chat function for technical support, but any comments entered into the chat are not visible to the court reporter. So we really need you to speak or send in written comments.

And if we go to the next slide, you'll get to see where those written comments can happen. So to submit public comment, email written comments to

eir@ucsf.edu, or you can mail comments to Ms. Diane Wong at UCSF Campus Planning, Box 0287, 654 Minnesota Street, San Francisco, California 94143. Again, all comments must be received no later than February 14th, 2022.

And if you would like a paper copy of the Draft EIR, please call Campus Planning Office at number -- the phone number 415-502-5952. Again, that is 415-502-5952. You can find a Draft EIR electronic copy at tiny.ucsf.edu\hospitaldrafteir. There are no spaces in "hospitaldrafteir."

And the next slide, please.

So we do want you to stay involved, and there are some upcoming opportunities to engage in dialog with UCSF regarding the New Hospital at Parnassus Heights. So in the spring, which is right around the corner, the UCSF Parnassus Heights experience will include an in-person opportunity to view scale models of the design. In 2023, we will have the introduction of the project at UCSF's quarterly construction meetings, and that is an opportunity to understand and provide feedback on the proposed construction plans and impacts.

To keep informed when these events and meetings are scheduled, please sign up for our

listserve by e-mailing community.cgr@ucsf.edu. And that is community.cgr@ucsf.edu

And with that, I'm going to hand over the presentation to my colleague Diane Wong.

DIANE WONG: Thanks, Alicia.

Hi, everyone. I'm Diane Wong. I'm with the Campus Planning Office, and I am managing this Draft Environmental Impact Report process. We'll leave this slide up on the screen, and it's just a summation of what Alicia went over. And we'll have -- again, at the end of the presentation today, we'll have the contact information for added comment in writing.

So we'll start with the public comment now. I'm going to call out three names at a time. If you'd like to speak, please raise your digital hand. As Alicia mentioned, that's down on the reactions button; there's a way to click and raise your hand. So I will call on folks as do you that. I'll wait a second while you figure out how to do that.

And, again, folks will have two minutes to speak. During the last 30 seconds of that two minutes, you will see on the screen a count-down clock which will let you know you have 30 seconds remaining.

So would anyone like to speak? Please raise your digital hand at this time. And if you're calling

in, press star 9.

(Pause in proceedings)

DIANE WONG: I am not seeing any raised hands.

(Pause in proceedings)

DIANE WONG: I'll give it another minute. I'm not seeing any raised hands, so if you would like to speak, please do raise your hand.

PAUL TAKAYAMA: Diane, maybe it would be helpful if you would remind people where that raise-hand function is.

DIANE WONG: Yes. If you will -- you can see on the bottom of your screen, if you hover your cursor over the bottom there should be a reactions button there. If you click on that, there's a raise hand button. That will get you in the queue here.

So I'm seeing a message that someone's saying they don't think the raise hands function is enabled for this meeting. Is that right? Oh, okay. I'm seeing raised hands now.

Okay. Tes?

TES WELBORN: Yes. Regarding transportation, you're proposing to add a very large number of people to the very narrow Parnassus Heights street, narrow Parnassus Avenue, and with no additional transportation, no additional parking. The

PH-Welborn-1

transportation is a very key issue. Locating this hospital at Mission Bay would make a lot more sense for accessibility to the city. Thank you.

PH-Welborn-2

DIANE WONG: Thank you, Tes.

Are there any other folks who would like to speak? Please raise your hand.

(Unintelligible; unidentified speaker)

UNIDENTIFIED SPEAKER: Isn't that raise your hand?

DIANE WONG: Yes, we see it now.

Dorrie Huntington?

UNIDENTIFIED SPEAKER: Let me -- [unintelligible].

DIANE WONG: Dorrie, we can hear you now. So if you'd like to -- to go ahead and relay your comment.

UNIDENTIFIED SPEAKER: [Unintelligible] I think you can raise your hand there, if you want to ask questions.

UNIDENTIFIED SPEAKER: [Unintelligible] See raise hand? [Unintelligible] Your cursor [unintelligible].

UNIDENTIFIED SPEAKER: I see it.

DIANE WONG: Hi, Dorrie Huntington? You can go ahead and speak now.

UNIDENTIFIED SPEAKER: [Unintelligible]. Do

you have to unmute yourself?

DIANE WONG: Yeah, you're not muted. We can hear you.

UNIDENTIFIED SPEAKER: Where are the cars going to go? I mean, is this going to be a city with no cars?

PH-Unidentified-3

DORRIE HUNTINGTON: This is Dorrie. Can you hear me now?

DIANE WONG: We can hear you, yes.

DORRIE HUNTINGTON: Okay. So I was a member of the EIR CAG many, many years ago. I am a neighbor that lives on Frederick Street, directly across from Kezar Stadium. And a couple points I just want to make that -- just surrounding this meeting and other meetings that UCSF has had around the EIR and other development there is it's -- so many people that I've spoken to about this and several couple people in the park today that I've known that have been part of the committee is that UC will just do what they want to do, and that they have these meetings -- and I actually left that committee many years ago because I felt like, during that time, is that all the efforts that the UC makes in order to engage with the community, I have to tell you, a lot of the community just feels that they're just measures that they do to put it through a

PH-Huntington-4

process to, like, get community support -- or hearings because they need to do that.

But ultimately, I think that really people -- people feel powerless, that really -- it really doesn't matter. And so there's that's point that I want to make, just because it's a feedback that I also receive from people. So I'm representing other people also.

PH-Huntington-4 cont.

But then my other big concern, again, is the density, the parking. You know, I live across the street from Kezar Stadium, and -- where there's Monday parking. And right now, there's just people that just are lined up on the sidewalk, waiting to get full-day parking that are all coming out, ready to go to UCSF. And so, you know, it's definitely, definitely a negative impact on our community because you witness, you know, 25 cars lining up on a sidewalk in order to gain parking.

PH-Huntington-5

So that -- there are a couple of comments that I have -- I just felt like I needed to share. And I wish you all the best. I think a hospital -- people need hospitals. You do a great job as a university. But, again, I think this should be better placed in -- in Mission Bay.

PH-Huntington-6

DIANE WONG: Thank you for your comments.

DORRIE HUNTINGTON: You're welcome.

DIANE WONG: All right. Any other comments? Please raise your digital hand. There's a reaction button on the bottom of your screen, and if you click on that, there's another button to raise your hand.

Susheela Vasan?

SUSHEELA VASAN: Hi, yes. I'm a neighbor on Third Avenue, and I wanted to reiterate the comment about the density and the transportation. The traffic flow in this area and the limited public transportation just does not seem to have been addressed in your impact report. PH-Vasan-7

The other thing I wanted to ask about that I didn't see in the impact report is the shadow and the darkness that the -- you know, the higher building is going to project around the neighborhood. There was nothing that really talked about the -- and showed the impact of the shadow of the building on neighbor homes and yards. And so I would like you to try to provide that information in your -- in your reporting. PH-Vasan-8

And, you know, and UCSF is -- I also would have to say, reiterate the comment that the last speaker made that I've been to a number of these meetings, and it does feel like UCSF really isn't listening, that you're just checking the box to have these meetings, but you're not really addressing or PH-Vasan-9

considering the feedback that you're getting from the community.

DIANE WONG: Thank you. Next speaker is Matt Full [sic]. Matt, you can unmute yourself and speak.

MATT FULLER: Hi there. Can you here me?

DIANE WONG: We can hear you.

MATT FULLER: Great. My name is Matt Fuller. I am a property owner in the 1300 block of Third Avenue. I don't quite now how to file this complaint as a formal objection, but I would say that UCSF is the sociopathic neighbor. You have consistently negotiated in bad faith with this neighborhood that I have lived in for the past 20 years.

And as a university, you cannot even follow your own rules. I walk to the Starbucks two blocks away along Parnassus every day. And I see your police vehicles consistently parked in front of fire hydrants and blocking pedestrian view paths and making it dangerous and difficult as it exists today.

Part of the resolution of this was the development of the Mission Bay neighborhood. The City of San Francisco literally gave you an entire neighborhood, from scratch, to do anything you wanted with because we knew San Francisco was going to grow,

PH-Vasan-9 cont.

PH-Fuller-10

PH-Fuller-11

PH-Fuller-12

and we knew that Cole Valley and Parnassus Heights and the Inner Sunset would remain residential.

This hospital is a farce. It's out of place. And it is, once again, an enormous middle finger to the entire neighborhood. Thank you.

DIANE WONG: Thank you, Matt.

Would anyone else like to speak?

SEAN McGEEVER: Yes. I think I had my hand up.

DIANE WONG: Could you please identify yourself?

SEAN McGEEVER: Sean McGeever. Can you hear me?

DIANE WONG: Yes. Sean, could you please spell your name? I don't see your name.

SEAN McGEEVER: Well, it's -- first name is S-E-A-N, and the last name is McGever, M-C G-E-V-E-R.

DIANE WONG: Thank you.

SEAN McGEEVER: Yeah, my comments are -- I live on Carl Street, actually on the 400 block on Carl Street. So I live literally at the bottom of the hill from UCSF.

And you know, while I -- you know, UCSF is certainly a world class, you know -- you know, hospital and studying and all the rest. It seems to me that,

PH-Fuller-12 cont.

PH-Fuller-13

PH-McGeever-14

PH-McGeever-15

you know, if you build something that's 13 stories high, you're going to create -- you're going to block out the sun for people who live on Carl Street. That's number one.

Number two, I mean, this is a largely residential area. From a purely municipal planning point of view, it seems to me that, you know, the positioning of UCSF where it is right now is really out of whack with what has happened as far as residential living is concerned. You know, the fact, if you moved on to Mission Bay, seemed like -- seemed like that's the way you should be going as an institution.

The thing that -- if you take a look at California Pacific, California Pacific just -- just moved out of their -- you know, where they were on California Street, to a corner -- to two of the most busy corners in San Francisco, at Van Ness and Geary. And it would -- it would have seemed like, you know, a -- a location on the periphery away from residential area would be a much more appropriate place to move, you know, to actually move your whole hospital.

That -- those are my comments.

DIANE WONG: Thank you, Sean.

Are there any others who would like to speak? And, again, the reactions button on the bottom will

PH-McGeever-15 cont.

PH-McGeever-16

take you to a raise-hand button, and that will get you in the queue.

(Pause in proceedings)

DIANE WONG: All right. Well, I don't see any other hands raised, so we will close the public comment portion of this meeting -- oh, I'm sorry. We just got two hands.

Susheela, did you have another comment? You can unmute yourself.

SUSHEELA VASAN: Yes, I did have another comment -- actually, a question. I really haven't seen a traffic flow report from you guys. It wasn't really part of the EIR that I saw -- to really explain how you expect the traffic to flow in and out in that number of individuals, both patients and hospital workers, to be flowing in and out of this area, given the current transportation and parking situation. And I didn't see any incremental parking or transportation plans.

And maybe you guys have them, and it wasn't, you know, readily apparent in -- in the plans that I've seen to date. So I would like you guys to respond to that and to really provide a more detailed traffic flow information so that we can have really a better understanding of what you guys are anticipating the traffic to be and how you are planning to manage that.

PH-Vasan-17

DIANE WONG: Thank you, Susheela. There is a -- why don't we connect offline. We'll take that as a comment, that you wanted to have that ready available. But you and I can connect offline to talk about that.

SUSHEELA VASAN: Okay. Is there an actual plan that shows your estimated volume of traffic in and out and parking and a plan that shows how you are anticipating managing that increase? And if so, what is the -- the increase in volume that you're expecting?

PH-Vasan-18

DIANE WONG: There is information in the EIR. Today, we're just taking public comment. So you and I can connect offline on this.

Next speaker, Susan Maerki.

Susan, you can unmute yourself.

SUSAN MAERKI: I'm unmuted. Can you hear me?

DIANE WONG: You are. We can hear you now. Thank you.

SUSAN MAERKI: So a couple of things -- I'm not going to renegotiate or discuss the location of the hospital, a couple of things, though.

One, I do think the transportation demand management plan, it continues to be insufficient and not sufficiently aggressive. Even based on your own projections, we're seeing some slight -- you know, basically no movement on the public transportation

PH-Maerki-19

mode.

The -- to the extent there's a reduction in the drive-alone population you're projecting is going to be increased by Ubers and Lyfts and other cars kind of thing. So during the process, I really urge you to think about not just the federal transportation subsidies but to evaluate -- and I think I submitted the information on what Stanford had to do in terms of paying for passes and to really increase the use of public transportation and reduce the use of single-occupancy vehicles.

PH-Maerki-19 cont.

The other -- you know, I -- the other thing, and this is more of a little sort of a nitty gritty. You talk about what you call the excess space from reducing the size of the hospital in the various iterations. But you're proposing to add one to two stories to other plans. And I think that the -- the cumulative effect in some of your scenarios and visualizations need to show those one or two stories on the research and academic building or the other buildings where you might likely add those things because I don't think that this is giving a -- a sufficient cumulative impact, and particularly if you put it on top of the research and academic buildings, the impact in the next ten years. Thank you.

PH-Maerki-20

DIANE WONG: Thank you, Susan.

All right. Any other speakers?

(No response)

DIANE WONG: Okay. Seeing no hands raised, we will go ahead and close out the public comment portion of the meeting. And just as a reminder, if you would like to submit written comments, you can do so by sending an email to eir@ucsf.edu. Or you can send me a letter to the address indicated on the screen there. And, again, we must receive comments no later than February 14th, 2022.

If you'd like a paper copy of Draft EIR, please call me at 415-502-5952. And again, the electronic copy of the Draft EIR can be found at tiny.ucsf.edu/hospitaldrafteir.

That concludes our public meeting. Thank you, everyone, and have a great evening.

(Whereupon, the proceedings concluded at 6:31 p.m.)

I, DEBORAH FUQUA, a Certified Shorthand Reporter of the State of California, do hereby certify that the foregoing proceedings were reported via Zoom web conferencing by me, a disinterested person, and thereafter transcribed under my direction into typewriting and which typewriting is a true and correct transcription of said proceedings.

I further certify that I am not of counsel or attorney for either or any of the parties in the foregoing proceeding and caption named, nor in any way interested in the outcome of the cause named in said caption.

Dated the 8th day of February, 2022.

DEBORAH FUQUA

CSR NO. 12948

Responses to Comments from the Public Hearing Transcript

PH-Welborn-1 The commenter indicates that regarding transportation, UCSF is proposing a large number of people to the very narrow Parnassus Heights street, and with no additional transportation, and no additional parking. Please see response to Comment I-Kushner-5.

PH-Welborn-2 The commenter indicates that locating the proposed New Hospital in Mission Bay would make more sense for accessibility to the City. Please see NHPH Draft EIR Section 6.4.1 which explains that while the University did consider locating the proposed New Hospital at the Mission Bay campus site, it determined that such an alternative would not meet some of the key objectives of the proposed project, and while it would reduce impacts at the Parnassus Heights campus site, it would result in similar impacts at the Mission Bay site as well as the additional traffic and air quality impacts from travel between the two campus sites. Based on this, the University did not carry the alternative forth for detailed evaluation.

PH-Unidentified-3 The commenter inquires where are the cars going to go; and is this going to be a city with no cars. This comment does not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments,** no response is required.

PH-Huntington-4 The commenters expresses concern over the community outreach that has occurred for the project. Please see **Master Response 3: Community Outreach**.

PH-Huntington-5 The commenter expresses concern over parking, and indicates that currently, in the vicinity of Kezar Stadium there are people that line up to get full day parking, and then go to UCSF. With respect to parking, as discussed in Chapter 1, *Introduction*, the NHPH meets the criteria of Statute Section 21099(d) which states that parking impacts of an employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment. As such, potential impacts of the NHPH on parking activity was not determined to be an impact under CEQA.

PH-Huntington-6 The commenter indicates that the New Hospital should be placed in Mission Bay. Please see response to Comment PH-Welborn-2, above.

PH-Vasan-7 The commenter indicates the traffic flow in the area and the limited public transportation does not seem to be addressed in the NHPH Draft EIR. With respect to traffic flow in the area, please see response to Comment PH-Vasan-17 to PH-Vasan-18, below.

With respect to transit, the NHPH Draft EIR Impact TRANS-1 finds that the New Hospital would not conflict with the UC Plans and policies that address transit, including the 2014 LRDP; and furthermore, would not conflict with San Francisco's Transit First Policy. While UC does not consider effects on transit demand to be a significant impact under CEQA, for informational purposes, Appendix TRANS in the NHPH Draft EIR provided a qualitative discussion of potential effects on transit operations.

PH-Vasan-8 The commenter inquires about shadows that would be created by the New Hospital, including on neighbors' homes and yards. With respect to shadow creation, as explained in Impact AES-5 in the NHPH Draft EIR, the shadow analysis is limited to whether the NHPH would cast new shadow on publicly accessible open spaces in the vicinity of the campus site and whether this new shadow would adversely affect the use and enjoyment of these open spaces. Accordingly, the analysis assesses shadow impacts of the NHPH on three City parks (Golden Gate Park, Richard Gamble Memorial Park, and Grattan Playground), and on two schoolyards that participate in the Shared Schoolyard Project and provide public access on weekends (Independence High School and Grattan Elementary School). The Interior Greenbelt located adjacent to and east of the Reserve, and the Reserve itself located within the campus site, were also studied for this analysis. As analyzed in Impact AES-5, implementation of the NHPH would not adversely or substantially affect the use and enjoyment of these open spaces, and the impact was therefore concluded to be less than significant. Impact C-AES-4 determined that implementation of the NHPH in combination with cumulative projects reached a similar conclusion, and consequently, the cumulative shadow impact would also be less than significant.

PH-Vasan-9 The commenters expresses concern over the community outreach that has occurred for the project. Please see **Master Response 3: Community Outreach**.

PH-Fuller-10 The commenter expresses personal opinions about the project and UCSF. These comments do not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1: Non-CEQA Comments**, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

PH-Fuller-11 The commenter expresses personal opinions about existing parking of UCSF police vehicles. These comments do not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1**, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

PH-Fuller-12 The commenter indicates the Mission Bay campus site is more appropriate for UCSF growth than neighborhoods on the west side of the City. Please see response to Comment PH-Welborn-2, above.

PH-Fuller-13 The commenter expresses personal opinions about the project. These comments do not address the adequacy of the NHPH Draft EIR; consequently, as explained in **Master Response 1**, no response is required. However, the comment has been noted and will be forwarded to decision-makers.

PH-McGeever-14 The commenter provides background information that does not address the adequacy of the Draft EIR; consequently, no response is required.

PH-McGeever-15 The commenter indicates that the proposed New Hospital would block out the sun for people that live on Carl Street. Please see response to Comment PH-Vasan-8, above.

PH-McGeever-16 The commenter indicates the Mission Bay campus site would be a more appropriate location for the NHPH project. Please see response to Comment PH-Welborn-2, above. The commenter also indicates that California Pacific Medical Center located on Van Ness and Geary, located away from residential areas, is an example of appropriate location for a hospital. The comment is noted. The NHPH Draft EIR, Chapter 6, *Alternatives* contains a detailed analysis of all potential alternatives to the proposed project that would considered in the EIR.

PH-Vasan-17 to PH-Vasan-18

The commenter requests additional information about how new vehicle traffic generated by the NHPH project would flow in and out of the study area and how this new traffic would be managed.

The 'Existing Plus CPHP' and 'Cumulative' intersection volumes are shown on Figures 3 and 6 (page 9 and 17) of the CPHP Final EIR Transportation Appendix, respectively. These traffic volumes represent an estimate of the amount of traffic that will flow through study area intersections during a typical weekday PM peak hour (when the transportation network is most used) with the addition and occupation of the CPHP if it were to occur in the near term ('Existing plus Project') and longer term ('Cumulative'). As shown in Table 4.13-13 of the NHPH Draft EIR, the 'Existing' PM peak hour vehicle trips generated by the Parnassus Heights campus is 1,800. The NHPH is projected to add 300 vehicle trips during this period, with another 900 vehicle trips added by the full buildout and implementation of the CPHP by the 'Cumulative' scenario. The vehicle traffic generated by the NHPH project was analyzed as part of the NHPH Draft EIR and was not determined to be an impact under CEQA.

As described on p 4.13-6 of the NHPH Draft EIR, UCSF is committed to monitoring the number and classification (vehicle type, e.g., private passenger vehicle, taxi, parcel/mail delivery, etc.) of vehicles at key gateways of the Parnassus Heights campus site every two years as part of the Measurement and Accountability section (4.6) of the 2014 Long Range Development Plan (LRDP), as amended. These monitoring results have been shared with the community at regular two-year intervals beginning in 2016.

PH-Maerki-19 The commenter assets that the transportation demand management plan is insufficient and not insufficiently aggressive, including as it relates to public transportation. The commenter urges UCSF to think about not just the federal transportation subsidies and increase use of public transportation and reduce use of single-occupancy vehicles.

Please see responses to Comments I-Maerki-6 to I-Maerki-7.

PH-Maerki-20 The commenter refers to the building space that would be rendered surplus due to the reduction of the hospital program and assumed to be assigned to other buildings on the campus site during the CPHP Future Phase (described in Chapter 3, *Project Description*, on page 3-7). The commenter indicates that some of the scenarios and visualizations need to show that additional development where it is likely to be added.

As explained in Section 4.0, *Introduction to Environmental Analysis*, page 4.0-8, under the NHPH, the size of the proposed New Hospital would be reduced from that envisioned under the CPHP, and Moffitt and Long Hospitals would increase slightly in size. For purposes of this EIR, the building space [up to about 40,500 gross square feet (gsf)] authorized through 2014 LRDP Amendment No. 7 that would be rendered surplus due to the net reduction of the hospital program is assumed to be assigned to other buildings on the campus site during the CPHP Future Phase. This would result in one to two additional building floors potentially to be added to the planned Millberry Union New Towers, and to research buildings planned immediately south and west of the planned RAB. Please note that none of the CPHP Future Phase buildings have been designed yet. The cumulative impact analysis in this Draft EIR accounts for this change in the Future Phase development under the CPHP.

Accordingly, this reassigned development was accounted for in the 3D model for the CPHP buildout scenario that was used as to basis to develop the cumulative visual simulations, as well as assess cumulative shadow and wind impacts in the NHPH Draft EIR.

8.5 Revisions to the Draft EIR

8.5.1 Overview

This chapter presents revisions to the text, tables and figures to the Draft EIR. These revisions include both (1) revisions made in response to comments on the Draft EIR, as well as (2) UCSF staff-initiated text changes to correct minor inconsistencies, to add minor updates to information or clarification related to the NHPH, and to provide updated information where applicable. None of the revisions or corrections in this chapter substantially change the analysis and conclusions presented in the Draft EIR.

The chapter includes all revisions to the Draft EIR (see Section 8.5.2) in the sequential order that they appear in that document. Preceding each revision is a brief explanation for the text change, and the section/page number in the Draft EIR where the revision occurs. Deletions in text and tables are shown in strikethrough (~~strikethrough~~) and new text is shown in underline (<u>underline</u>). The same revisions presented in this chapter are also incorporated in the consolidated Draft EIR in Volume 1 of this Final EIR, which includes the full text of the integrated Draft EIR, as revised.

8.5.2 Revisions to the Draft EIR

Chapter 1, Introduction

UCSF has determined that the minor encroachment for the proposed medical gas storage tanks would be slightly larger than that reported in the Draft EIR (approximately 0.21 acres instead of 0.15 acres), however, this change would not affect the overall minimum acreage of the Reserve (61 acres). Draft EIR Chapter 1, *Introduction*, page 1-4, first full paragraph, fourth sentence is revised as a staff-initiated change, as follows:

> However, the related improvement for the proposed medical gas storage tanks would result in a minor encroachment into the Reserve ~~(though to a lesser extent than the New Hospital encroachment into the Reserve that was approved under 2014 LRDP Amendment #7)~~.

Draft EIR Chapter 2, Summary

Draft EIR Chapter 2, *Summary*, Table 2-2, pages 2-18 to 2-20, third column, NHPH Mitigation Measure GHG-1 is revised as a staff-initiated change, as follows:

> **NHPH Mitigation Measure GHG-1: Monitor emissions annually and acquire carbon offset credits in conformance with CARB guidance, prioritizing local and in-State offsets to achieve and maintain carbon neutrality for the NHPH as part of campus-wide emissions.**
>
> As part of this mitigation measure, UCSF is making the following separate, though overlapping, GHG emission reduction commitments: (1) As a CARB-covered entity, UCSF will maintain compliance with CARB's cap and trade program; (2) Per existing UC Policy, UCSF's Scope 1 and Scope 2 GHG emissions shall, commencing in 2025, be entirely

carbon neutral; (3) Also per existing UC Policy, commencing in 2025, UCSF's Scope 1 and Scope 2 emissions shall be voluntarily offset while Scope 3 emissions from commuters and air travel shall be voluntarily offset by 2050; and (4) UCSF's total GHG operational emissions from all Scope 1, 2, and 3 sources (as defined in this EIR) shall not exceed the Parnassus Heights campus's baseline emissions from these sources in 2019. Each of these commitments is described in more detail below.

***Continued Compliance with CARB's Cap and Trade Program*:** Any carbon offset credits purchased for the purpose of compliance with CARB's cap and trade program shall be purchased from an accredited carbon credit market. Such offset credits (or California Carbon Offsets) shall be registered with, and retired[3] by an Offset Project Registry, as defined in 17 California Code of Regulations § 95802(a), approved by the California Air Resources Board such as, but not limited to, Climate Action Reserve, American Carbon Registry or Verra (formerly Verified Carbon Standard). In order to demonstrate that the carbon offset credits provided are real, permanent, additional, quantifiable, verifiable, and enforceable, as those terms are defined in 17 California Code of Regulations § 95802(a), UCSF shall document in its annual report: (i) the protocol used to develop those credits, and (ii) the third-party verification report concerning those credits. As and when the credits are retired, UCSF shall document in its annual report the unique serial numbers of those credits showing that they have been retired.

***Compliance with UC Policy - Offsets for Emissions from Commuters and Air Travel*:** Compliance with UC's policies for carbon neutrality from specific Scope 3 sources (as defined by Second Nature's Carbon Commitment) by 2050 or sooner as required by UC's Policy on Sustainable Practices (UCES, 2020). Neutrality may be achieved through reductions in direct emissions, ~~the purchase of renewable electricity and possibly biomethane,~~ and the purchase of carbon offset credits. UCSF will purchase voluntary carbon offset credits as the final action to reach the GHG emission reduction targets. As part of the UC Carbon Neutrality Initiative, UC Sustainable Practices Policy has been updated and internal guidelines have been developed to ensure that only high-quality voluntary carbon offsets are purchased by UC and any use of offsets for this purpose will result in additional, verified GHG emissions reductions from actions that align, as much as possible, with UC's research, teaching, and public service mission. Specifically, any voluntary carbon offset credits used by UCSF to mitigate Scope 3 GHG emissions will:

1. Prioritize local (within the air district) and in-state offset credits over in-nation offset credits. Offset credits shall be third-party verified by a major registry recognized by CARB such as CAR (Climate Action Reserve) or equivalent and will also subjected to an internal peer review process. If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming or equivalent national offset credits registered with an approved registry and which meet UC criteria for high-quality offsets.

2. Be reported publicly and tracked through the Climate Registry (TCR) as required by UC policy. TCR is a non-profit organization governed by U.S. states and Canadian provinces and territories. UCSF's TCR reports will be third-party verified and posted publicly.

[3] When Climate Reserve Tonnes (CRTs) are transferred to a retirement account in the Reserve System, they are considered retired. Retirement accounts are permanent and locked to prevent a retired CRT from being transferred again. CRTs are retired when they have been used to offset an equivalent ton of emissions or have been removed from further transactions on behalf of the environment.

Compliance with UC Policy – Carbon Neutrality: Ensure achievement of net zero greenhouse gas emissions from its buildings and vehicle fleet by 2025. For purposes of this section, campuses shall include their related health location for all goals. GHG emissions reduction goals pertain to emissions of the six Kyoto greenhouse gasses[4] originating from all Scope 1 and Scope 2 sources as specified by the Climate Registry, and from Scope 3 emissions as specified by Second Nature's Carbon Commitment, which includes air travel paid through the institution, and commuting to and from campus by students, faculty and other academic appointees, and staff.

***Commitment to control Parnassus Heights Annual Emissions to not exceed existing baseline*:** UCSF shall monitor GHG operational emissions from all Scope 1, 2 and 3 sources annually. Upon the completion and occupancy of the NHPH, inclusive of the related improvements, in 2033, the estimated annual emissions shall be compared to the campus site year 2019 baseline of 127,083 MT CO_2e per year to determine whether the emissions have increased above the baseline level. For the identified amount of exceedance of the performance standard, UCSF shall purchase carbon offset credits sufficient to maintain carbon neutrality. These offset credits shall be purchased for the types of Scope 1 and Scope 2 emissions that are already reported to and verified by a third-party verification body annually, as well as for Scope 3 emissions from patient and visitor vehicle trips, indirect emissions from water and wastewater demand, and solid waste emissions, all of which are included in the EIR analysis above as required by CEQA.

Carbon offset credits used for this purpose shall originate from a voluntary carbon credit registry that TCR recognizes, such as: CAR, ACR, or Verra (other registries are also applicable). Offset credits in this case shall be registered, transferred, and retired at such registries. The offsets will also be subjected to an internal UC peer review process. The protocols of each registry, and UC own internal screens and criteria, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols. For this purpose, local (within the air district) and in-state carbon offset credits shall be prioritized over in-nation offset credits. If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming or equivalent national offset credits registered with an approved registry and which meet UC criteria for high-quality offsets. As and when the credits are retired, UCSF shall document in its annual report the unique identifier of those credits showing that they have been retired and accepted by TCR.

[4] The six greenhouse gasses identified in the Kyoto Protocol are carbon dioxide, methane, nitrous oxide, sulfur hexafluoride, hydrofluorocarbons, and perfluorocarbons.

Draft EIR Chapter 2, *Summary*, Table 2-2, page 2-23, third column, NHPH Mitigation Measure NOI-1a, second bullet is revised in response to Comment I-Beaton-5, as follows:

- Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. If the contractor deems the~~Where~~ use of pneumatic tools to be~~is~~ unavoidable, the contractor shall prepare a mitigation measure variance explaining the conditions that make the exemption necessary and submit it to the UCSF Project Manager, and an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools

themselves shall be used where feasible; this could achieve a reduction of 5 dBA. Quieter procedures, such as use of drills rather than impact tools, shall be used unless the contractor, based on professional judgment, deems these alternative methods inappropriate for conditions encountered or reasonable allocation of manpower, whereby the contractor shall prepare a mitigation measure variance explaining the conditions that make the exemption necessary and submit it to the UCSF Project Manager~~where feasible~~.

Draft EIR Chapter 3, Project Description

UCSF has determined that the minor encroachment for the proposed medical gas storage tanks would be slightly larger than that reported in the Draft EIR (approximately 0.21 acres instead of 0.15 acres), however, this change would not affect the overall minimum acreage of the Reserve (61 acres). Draft EIR Chapter 3, *Project Description*, page 3-8, first paragraph, fourth sentence is revised as a staff-initiated change, as follows:

> However, the related improvement for the proposed medical gas storage tanks would result in a minor encroachment into the Reserve as described below ~~(though to a lesser extent than the New Hospital encroachment into the Reserve that was approved under 2014 LRDP Amendment #7)~~.

Relatedly, Draft EIR Chapter 3, *Project Description*, page 3-49, second to last paragraph, last sentence is revised as a staff-initiated change, as follows:

> These areas are about the same size, such that the Reserve would be maintained at a minimum of 61 acres.

Draft EIR Section 4.2, Air Quality

Draft EIR Section 4.2, *Air Quality*, Impact AIR-1, page 4.2-27, first paragraph, last sentence is revised in response to Comment A-SFP-6, to remove reference to the City's Clean Construction Ordinance, as follows:

> Any improvements that would be constructed outside the campus site boundary, such as the proposed Parnassus Avenue bridge and tunnel, may involve the cooperation of the City of San Francisco ~~and, as public works projects, would be subject to the City of San Francisco's Clean Construction Ordinance~~.

Draft EIR Section 4.4, Cultural Resources

Draft EIR Section 4.4, *Cultural Resources*, Impact C-CUL-1, page 4.4-14, fifth paragraph, first sentence is revised as a staff-initiated change, as follows:

> The result of all past, present and reasonably foreseeable future projects would result in a cumulatively ~~considerable~~ significant impact on historical resources.

Draft EIR Section 4.7, Greenhouse Gas Emissions

Draft EIR Section 4.7, *Greenhouse Gas Emissions*, pages 4.7-38 to 4.7-40, NHPH Mitigation Measure GHG-1 is revised as a staff-initiated change, as follows:

> **NHPH Mitigation Measure GHG-1: Monitor emissions annually and acquire carbon offset credits in conformance with CARB guidance, prioritizing local and in-State offsets to achieve and maintain carbon neutrality for the NHPH as part of campus-wide emissions.**
>
> As part of this mitigation measure, UCSF is making the following separate, though overlapping, GHG emission reduction commitments: (1) As a CARB-covered entity, UCSF will maintain compliance with CARB's cap and trade program; (2) Per existing UC Policy, UCSF's Scope 1 and Scope 2 GHG emissions shall, commencing in 2025, be entirely carbon neutral; (3) Also per existing UC Policy, commencing in 2025, UCSF's Scope 1 and Scope 2 emissions shall be voluntarily offset while Scope 3 emissions from commuters and air travel shall be voluntarily offset by 2050; and (4) UCSF's total GHG operational emissions from all Scope 1, 2, and 3 sources (as defined in this EIR) shall not exceed the Parnassus Heights campus's baseline emissions from these sources in 2019. Each of these commitments is described in more detail below.
>
> ***Continued Compliance with CARB's Cap and Trade Program*:** Any carbon offset credits purchased for the purpose of compliance with CARB's cap and trade program shall be purchased from an accredited carbon credit market. Such offset credits (or California Carbon Offsets) shall be registered with, and retired[22] by an Offset Project Registry, as defined in 17 California Code of Regulations § 95802(a), approved by the California Air Resources Board such as, but not limited to, Climate Action Reserve, American Carbon Registry or Verra (formerly Verified Carbon Standard). In order to demonstrate that the carbon offset credits provided are real, permanent, additional, quantifiable, verifiable, and enforceable, as those terms are defined in 17 California Code of Regulations § 95802(a), UCSF shall document in its annual report: (i) the protocol used to develop those credits, and (ii) the third-party verification report concerning those credits. As and when the credits are retired, UCSF shall document in its annual report the unique serial numbers of those credits showing that they have been retired.
>
> ***Compliance with UC Policy - Offsets for Emissions from Commuters and Air Travel*:** Compliance with UC's policies for carbon neutrality from specific Scope 3 sources (as defined by Second Nature's Carbon Commitment) by 2050 or sooner as required by UC's Policy on Sustainable Practices (UCES, 2020). Neutrality may be achieved through reductions in direct emissions, ~~the purchase of renewable electricity and possibly biomethane,~~ and the purchase of carbon offset credits. UCSF will purchase voluntary carbon offset credits as the final action to reach the GHG emission reduction targets. As part of the UC Carbon Neutrality Initiative, UC Sustainable Practices Policy has been updated and internal guidelines have been developed to ensure that only high-quality voluntary carbon offsets are purchased by UC and any use of offsets for this purpose will result in additional, verified GHG emissions reductions from actions that align, as much as possible, with UC's research, teaching, and public service mission. Specifically, any voluntary carbon offset credits used by UCSF to mitigate Scope 3 GHG emissions will:

[22] When Climate Reserve Tonnes (CRTs) are transferred to a retirement account in the Reserve System, they are considered retired. Retirement accounts are permanent and locked to prevent a retired CRT from being transferred again. CRTs are retired when they have been used to offset an equivalent ton of emissions or have been removed from further transactions on behalf of the environment.

1. Prioritize local (within the air district) and in-state offset credits over in-nation offset credits. Offset credits shall be third-party verified by a major registry recognized by CARB such as CAR (Climate Action Reserve) or equivalent and will also subjected to an internal peer review process. If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming or equivalent national offset credits registered with an approved registry and which meet UC criteria for high-quality offsets.

2. Be reported publicly and tracked through the Climate Registry (TCR) as required by UC policy. TCR is a non-profit organization governed by U.S. states and Canadian provinces and territories. UCSF's TCR reports will be third-party verified and posted publicly.

Compliance with UC Policy – Carbon Neutrality: Ensure achievement of net zero greenhouse gas emissions from its buildings and vehicle fleet by 2025. For purposes of this section, campuses shall include their related health location for all goals. GHG emissions reduction goals pertain to emissions of the six Kyoto greenhouse gasses[23] originating from all Scope 1 and Scope 2 sources as specified by the Climate Registry, and from Scope 3 emissions as specified by Second Nature's Carbon Commitment, which includes air travel paid through the institution, and commuting to and from campus by students, faculty and other academic appointees, and staff.

***Commitment to control Parnassus Heights Annual Emissions to not exceed existing baseline*:** UCSF shall monitor GHG operational emissions from all Scope 1, 2 and 3 sources annually. Upon the completion and occupancy of the NHPH, inclusive of the related improvements, in 2033, the estimated annual emissions shall be compared to the campus site year 2019 baseline of 127,083 MT CO_2e per year to determine whether the emissions have increased above the baseline level. For the identified amount of exceedance of the performance standard, UCSF shall purchase carbon offset credits sufficient to maintain carbon neutrality. These offset credits shall be purchased for the types of Scope 1 and Scope 2 emissions that are already reported to and verified by a third-party verification body annually, as well as for Scope 3 emissions from patient and visitor vehicle trips, indirect emissions from water and wastewater demand, and solid waste emissions, all of which are included in the EIR analysis above as required by CEQA.

Carbon offset credits used for this purpose shall originate from a voluntary carbon credit registry that TCR recognizes, such as: CAR, ACR, or Verra (other registries are also applicable). Offset credits in this case shall be registered, transferred, and retired at such registries. The offsets will also be subjected to an internal UC peer review process. The protocols of each registry, and UC own internal screens and criteria, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols. For this purpose, local (within the air district) and in-state carbon offset credits shall be prioritized over in-nation offset credits. If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming or equivalent national offset credits registered with an approved registry and which meet UC criteria for high-quality offsets. As and when the credits are retired, UCSF shall document in its annual report the unique identifier of those credits showing that they have been retired and accepted by TCR.

[23] The six greenhouse gasses identified in the Kyoto Protocol are carbon dioxide, methane, nitrous oxide, sulfur hexafluoride, hydrofluorocarbons, and perfluorocarbons.

Draft EIR Section 4.11, Noise and Vibration

Draft EIR Section 4.11, *Noise and Vibration*, NHPH Mitigation Measure NOI-1a, page 4.11-21, second bullet is revised in response to Comment I-Beaton-5, as follows:

- Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. If the contractor deems the~~Where~~ use of pneumatic tools to be~~is~~ unavoidable, the contractor shall prepare a mitigation measure variance explaining the conditions that make the exemption necessary and submit it to the UCSF Project Manager, and an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible; this could achieve a reduction of 5 dBA. Quieter procedures, such as use of drills rather than impact tools, shall be used unless the contractor, based on professional judgment, deems these alternative methods inappropriate for conditions encountered or reasonable allocation of manpower, whereby the contractor shall prepare a mitigation measure variance explaining the conditions that make the exemption necessary and submit it to the UCSF Project Manager~~where feasible~~.

This page intentionally left blank

CHAPTER 9
Mitigation Monitoring and Reporting Program

9.1 Introduction

When approving projects with mitigation measures that if implemented would avoid or lessen significant impacts, the California Environmental Quality Act (CEQA) requires public agencies to adopt monitoring and reporting programs or conditions of project approval to mitigate or avoid the identified significant effects (Public Resources Code Section 21081.6(a)(1)). A public agency adopting measures to mitigate or avoid the significant impacts of a proposed project is required to ensure that the measures are fully enforceable, through permit conditions, agreements, or other means (Public Resources Code Section 21081.6(b)). The mitigation measures required by a public agency to reduce or avoid significant project impacts not incorporated into the design or program for the project may be made conditions of project approval as set forth in a Mitigation Monitoring and Reporting Program (MMRP). The program must be designed to ensure project compliance with mitigation measures during NHPH implementation.

The MMRP includes the mitigation measures identified in the NHPH EIR which are required to address the significant impacts associated with the proposed NHPH. The required mitigation measures are summarized in this program; the full text of the impact analysis and mitigation measures are presented in the Final EIR.

9.2 Format

The MMRP is organized in a table format (see Table 9-1), keyed to each significant impact and each mitigation measure. Only mitigation measures adopted to address significant impacts are included in this program. Each mitigation measure is set out in full, followed by a tabular summary of monitoring requirements. The column headings in the tables are defined as follows:

- **Environmental Impact:** This column presents the environmental impacts identified in the EIR.
- **Mitigation Measures:** This column identifies the mitigation measures associated with the impacts identified in the EIR.
- **Implementation Procedure:** This column identifies the procedure for implementing each mitigation measure.
- **Responsible Unit:** This column contains an assignment of responsibility for the monitoring and reporting tasks.

- **Report Mechanism:** This column refers to the outcome from implementing the mitigation measure.

9.3 Enforcement

If the proposed NHPH is approved, the MMRP would be adopted by the Regents. Therefore, all mitigation measures for significant impacts must be carried out in order to fulfill the requirements of approval. A number of the mitigation measures would be implemented during the course of the development review process. These measures would be checked on plans, in reports, and in the field prior to construction. Most of the remaining mitigation measures would be implemented during the construction or NHPH implementation phase.

TABLE 9-1
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.1 Aesthetics, Wind, and Shadow				
Impact AES-3: The NHPH would create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area.	**NHPH Mitigation Measure AES-3: Minimize light and glare resulting from new development.** Light and glare from new development shall be minimized through use of landscaping materials and choice of primary facade materials. Design standards and guidelines to minimize light and glare shall be adopted for the new development, including: • Reflective metal walls and mirrored glass walls shall not be used as primary building materials for facades. • Installation of illuminated building signage shall strive to be consistent with UCSF design guidelines and/or City Planning Code sign standards for illumination. • Exterior light fixtures shall be configured to emphasize close spacing and lower intensity light. Light fixtures shall use luminaries that do not direct the cone of light towards off-campus structures. • New above-ground tanks shall be painted so as to not contain reflective surfaces.	Issue instructions to design teams to incorporate design standards in all project plans and designs. Require architects and design professionals to document how design standards are addressed and incorporated. Review project plans to ensure that such features have been incorporated in the design to address the impacts.	UCSF Project Manager and Design Teams	Ensure project incorporates design standards prior to final project approval. After construction, the Project Manager shall provide written verification to the Monitor that design standards have been incorporated to address the impacts.
Impact AES-4: Implementation of the NHPH would potentially create wind hazards in publicly accessible areas of substantial pedestrian use.	**NHPH Mitigation Measure AES-4: Implement Wind Mitigation and Safety Measures.** Prior to project construction, UCSF shall engage a qualified wind consultant to identify potential further feasible design alterations to the New Hospital and to evaluate potential other wind reduction measures, such as wind screens, with the goal of reducing the number of hours by which wind speeds on Parnassus Avenue exceed the City of San Francisco's pedestrian wind hazard criterion, without increasing the total number of test point locations exceeding the wind hazard criterion. The ultimate intent is to eliminate any wind hazard exceedance on Parnassus Avenue in the vicinity of the New Hospital in the Existing plus NHPH scenario without unduly burdening the New Hospital design program in a manner that would adversely affect the building's intended function. Prior to project construction, UCSF shall engage a qualified wind consultant to identify potential further feasible design alterations to the New Hospital and to evaluate potential other wind reduction measures, such as wind screens, with the goal of reducing the number of hours by which wind speeds on Parnassus Avenue exceed the City of San Francisco's	Issue instructions to alert the architect and design team that UCSF will engage, or require the design team to engage, a qualified wind consultant to evaluate the proposed New Hospital building design. Require documentation of the findings of all wind consultation and testing, where deemed necessary, and proposed wind-reducing measures. Review project plans to ensure that necessary wind-reducing features have been incorporated in the design. If determined feasible by the wind consultant and by the UCSF chancellor or the chancellor's designee, in consultation with the NHPH design team.	UCSF Project Manager and Design Teams	Provide written verification in report form to the Monitor that provisions are included for wind hazard consultation and testing, documentation of the results, and incorporation into the building design of any necessary wind reduction features.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.1 Aesthetics, Wind, and Shadow (cont.)				
Impact AES-4 (cont.)	pedestrian wind hazard criterion, without increasing the total number of test point locations exceeding the wind hazard criterion. The ultimate intent is to eliminate any wind hazard exceedance on Parnassus Avenue in the vicinity of the New Hospital in the Existing plus NHPH scenario without unduly burdening the New Hospital design program in a manner that would adversely affect the building's intended function. If UCSF finds that potential design change(s) or other wind speed reduction strategies that would avoid one or more wind hazard exceedances in the Existing plus NHPH scenario to be feasible, then UCSF shall implement the change(s)) needed to achieve such avoidance. If UCSF finds that these potential design change(s) or other wind speed reduction strategies are not feasible as they would unduly restrict the proposed building's space program, result in operational inefficiencies, and/or substantially higher costs, the New Hospital may nonetheless be constructed as approved, provided that the New Hospital incorporates wind speed reduction strategies to the maximum feasible extent, as determined by UCSF in consultation with the wind consultant. Potential design changes could include, but not necessarily be limited to, such measures as horizontal or vertical fins or other projections added to the NHPH, added building setbacks, and/or further rounded/chamfered corners, and other building modifications. Other wind speed reduction strategies could potentially include features such as landscaping, localized installation of porous/solid screens, installation of canopies along non-NHPH building frontages, and the like.	If the wind consultant determines that no design change(s) or other wind speed reduction strategies that would avoid one or more wind hazard exceedances in the Existing plus NHPH scenario would be feasible, and/or if the UCSF chancellor or the chancellor's designee, in consultation with the NHPH design team, determines that identified wind speed reduction strategies would unduly restrict the proposed building's space program, result in operational inefficiencies, and/or substantially higher costs, the UCSF chancellor or the chancellor's designee shall document such determination(s) in writing.		
Impact C-AES-3: Implementation of the NHPH, combined with cumulative projects, would potentially create wind hazards in publicly accessible areas of substantial pedestrian use.	**NHPH Mitigation Measure C-AES-3: Design new cumulative buildings to minimize wind impacts at pedestrian level.** Prior to the approval of the design of individual cumulative buildings, which will be developed pursuant to the CPHP, for which one or more building facades would have a height of 80 feet or more, UCSF shall engage a qualified wind consultant to conduct wind tunnel testing of the proposed building(s) to determine whether the building(s) would result in new exceedance(s) of the City of San Francisco's pedestrian wind hazard criterion. The wind tunnel testing shall be conducted for the building(s) under consideration in the context of then-existing conditions as well as in the context of conditions representative of then-anticipated CPHP buildout (the buildout scenario in this EIR, as may be modified from time to time by UCSF to reflect actual building designs known at the time) so as to determine whether the individual building(s) and/or the buildout condition would result in exceedances of the wind hazard criterion.	Issue instructions in the bid package to alert the architect and design team that UCSF will engage, or require the design team to engage, a qualified wind consultant to evaluate proposed building designs for buildings 80 feet or more in height. Require documentation of the findings of all wind consultation and testing, where deemed necessary, and proposed wind-reducing measures. Review project plans to ensure that necessary wind-reducing features have been incorporated in the design.	UCSF Project Manager and Design Teams	Provide written verification in report form to the Monitor for the contract bid that the bid includes provision for wind hazard consultation and testing, where deemed necessary, for buildings 80 feet or more in height, documentation of the results, and incorporation into the building design of any necessary wind reduction features.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.1 Aesthetics, Wind, and Shadow (cont.)				
Impact C-AES-3 (cont.)	If the wind tunnel analysis determines that the building(s)' design or buildout conditions would increase the hours of wind hazard exceedance or the number of test points subject to hazardous winds, compared to then-existing conditions, UCSF shall work with the wind consultant to identify feasible mitigation strategies, including design changes (e.g., setbacks, rounded/chamfered building corners, stepped facades, etc.), to eliminate or reduce wind hazards to the maximum feasible extent. If UCSF finds that these changes or other wind speed reduction strategies are not feasible as they would unduly restrict the proposed building's space program, result in operational inefficiencies, and/or substantially higher costs, the building(s) may nonetheless be approved provided that the project incorporates wind speed reduction strategies to the maximum feasible extent, as determined by UCSF in consultation with the wind consultant. Wind speed reduction strategies could also include features such as landscaping, localized installation of porous/solid screens, installation of canopies along building frontages, and the like.			
EIR Section 4.2 Air Quality				
Impact AIR-1: Construction activities associated with the NHPH would result in a cumulatively considerable net increase in emissions of a criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard.	**NHPH Mitigation Measure AIR-1: Best Management Practices for Controlling Particulate Emissions during Construction** The following BAAQMD Best Management Practices for particulate emissions control will be required for all construction activities related to the NHPH (BAAQMD, 2017a). These measures will reduce particulate emissions primarily during soil movement, grading and demolition activities but also during vehicle and equipment movement on unpaved project sites. • All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day. • All haul trucks transporting soil, sand, or other loose material off-site shall be covered. • All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited. • All vehicle speeds on unpaved roads shall be limited to 15 mph.	Issue instructions in the bid package of the construction project for contractor to incorporate the mitigation measure. The successful contractor will prepare a construction air pollution control strategy to report on the implementation of the mitigation measure.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for the contract bid on each phase to certify that selected bid includes provision for construction air pollution control. Provide a report on construction air pollution control strategies and report to Monitor upon request; but no less than quarterly after beginning each construction phase.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.2 Air Quality (cont.)				
Impact AIR-1 (cont.)	• All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used. • Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, § 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points. • All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation. The construction contractor shall post a publicly visible sign on the project site(s) with the telephone number and person to contact at UCSF regarding dust complaints. This person shall respond and take corrective action within 48 hours. BAAQMD's telephone number shall also be visible to ensure compliance with applicable regulations.			
Impact AIR-3: Construction activities for the NHPH could expose sensitive receptors to substantial pollutant concentrations and exceed the LRDP EIR standard of significance by exposing receptors to toxic air contaminant emissions that (1) result in a cancer risk greater than 10 cancer cases per 1 million people; or (2) for acute or chronic effects, result in concentrations of toxic air contaminant emissions with a Hazard Index of 1.0 or greater.	**NHPH Mitigation Measure AIR-3: Clean Construction Equipment for NHPH Construction** The construction contractor(s) shall develop a plan demonstrating that the off-road equipment used on-site to construct the NHPH would achieve a fleet-wide average 70 percent reduction in PM_{10} exhaust emissions, compared to uncontrolled aggregate statewide emission rates for similar equipment. One feasible plan to achieve this reduction would include the following: • All mobile diesel-powered off-road equipment larger than 25 horsepower and operating on the project site for more than two days continuously shall be equipped with engines meeting USEPA NOx and PM_{10} emissions standards for Tier 4 final engines or equivalent[1]; and • Use of electrically-powered construction equipment to the degree available and feasible.	Issue instructions in the construction bid package for contractor to incorporate the required clean construction equipment plan. The successful contractor will prepare a plan to achieve a fleet-wide average 70 percent reduction in PM_{10} exhaust emissions, compared to uncontrolled aggregate statewide emission rates for similar equipment.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for the contract bid on each phase to certify that selected bid includes provision for construction PM_{10} emissions reduction. Provide a report on construction emissions reduction strategies and report to Monitor upon request; but no less than quarterly after beginning each construction phase.

[1] An equivalent method for particulate emissions may include Level 3 Verified Diesel Emissions Control Strategies of the CARB for particulate matter (filtration).

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.2 Air Quality (cont.)				
Impact C-AIR-1: Construction and operation of the NHPH, combined with cumulative development in the project area, would result in a cumulatively considerable net increase of a criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard.	Implement NHPH Mitigation Measure AIR-1.	See NHPH Mitigation Measure AIR-1.	See NHPH Mitigation Measure AIR-1.	See NHPH Mitigation Measures AIR-1.
Impact C-AIR-2: Implementation of the NHPH could contribute considerably to cumulative emissions of TACs and $PM_{2.5}$ that could expose sensitive receptors to substantial pollutant concentrations or health risks.	Implement NHPH Mitigation Measures AIR-3.	See NHPH Mitigation Measure AIR-3.	See NHPH Mitigation Measure AIR-3.	See NHPH Mitigation Measure AIR-3.
EIR Section 4.3 Biological Resources				
Impact BIO-1: Implementation of the NHPH would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.	**NHPH Mitigation Measure BIO-1a: Protection of Monarch Butterflies** • Prior to demolition activities, a qualified biologist familiar with monarch butterfly behavior and habitat shall conduct a preconstruction survey for the presence of overwintering monarch butterfly aggregations. The survey shall be conducted in December or January during the period when overwintering aggregations appear. Should an overwintering aggregation be identified in trees within 200 feet of the proposed work sites within or adjacent to the Reserve, a 200-foot buffer shall be established around the occupied trees until the aggregation has dispersed, and construction within the buffer zone shall be avoided for the duration of the overwintering period.	Engage a qualified biologist to undertake the survey(s) specified in the mitigation measure.	UCSF Project Manager	Provide written verification in report form to the Monitor for that the required survey(s) have been conducted prior to ground disturbance.
	NHPH Mitigation Measure BIO-1b: Protection of Nesting Birds • Tree and vegetation removal or pruning associated with project construction and commencement of outdoor project construction activities shall be avoided from February 1 through August 31, the primary local bird nesting season, to the extent feasible. If tree and vegetation removal or pruning associated with project construction is proposed during the nesting period, within seven days prior to the proposed start of construction activities a qualified biologist shall conduct a nesting bird survey of all potential habitat at the construction site and within 250 feet of the perimeter of the construction site.	Issue instructions in bid package of the construction project for the contractor to incorporate the mitigation measure. The contractor will demonstrate knowledge of appropriate timing for tree and vegetation removal and pruning for protection of nesting birds.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor on each phase to certify that provisions are included for implementation of mitigation measure. Provide construction status report to Monitor upon request.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.3 Biological Resources (cont.)				
Impact BIO-1 (cont.)	• If any active nests are detected during the pre-construction survey, the qualified biologist shall recommend a work-exclusion buffer zone that shall be designated around the active nest to allow for both the successful fledging of the birds and initiation of work on some portions of the project site. A qualified biologist shall monitor any occupied nest located within a protective buffer zone in order to determine if the designated buffer zone is effective and when the buffer zone is no longer needed. If the buffer zone is determined to be ineffective, its size shall be increased until it is effective, as determined by the qualified biologist, or work within one-quarter mile of the nest shall cease until the young have fledged and are independent of the nest.			
	NHPH Mitigation Measure BIO-1c: Protection of Roosting Bats • Prior to project construction, a qualified bat biologist shall conduct a pre-construction survey for roosting bats in trees to be removed or pruned and structures to be demolished within the work area and within a 50-foot radius of the work area. If no roosting bats are found, no further action is required. If active bat roosts are found within 50 feet of the work area, these roosts shall be flagged and avoided with a suitable buffer, determined in coordination with CDFW. • If a non-maternal roost of bats is found in a tree or structure to be removed or demolished as part of project construction, the individuals shall be safely evicted, under the direction of a qualified bat biologist, by opening the roosting area to allow airflow through the cavity. Removal or demolition should occur no sooner than at least two nights after the initial minor site modification (to alter airflow). This action allows bats to leave during darkness, thus increasing their chance of finding new roosts with a minimum of disturbance. Departure of the bats from the construction area shall be confirmed with a follow-up survey by a qualified bat biologist prior to start of construction. • If active maternity roosts are found in trees or structures that will be removed or demolished as part of project construction, tree removal or demolition of that tree or structure shall commence and be completed before maternity roosting colonies form (generally before March 1), or shall not commence until after young are flying (generally after July 31). Active maternity roosts shall not be disturbed between March 1 and July 31.	Issue instructions for the construction contractor to incorporate the mitigation measure. The contractor will demonstrate knowledge of appropriate procedures for protection of nesting bats.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor that provisions are included for implementation of mitigation measure. Provide construction status report to Monitor upon request.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.3 Biological Resources (cont.)				
Impact BIO-1 (cont.)	**NHPH Mitigation Measure BIO-1d: Worker Education** • A qualified biologist shall provide training to all construction workers prior to starting work on plan components. The training shall cover special-status species with potential to be found onsite, avoidance measures to be undertaken if a species is found, and best management practices for site housekeeping. **NHPH Mitigation Measure BIO-1e: Botanical Surveys** • Within suitable habitat for special-status plant species (open gravel areas along roadsides and hillsides for coastal triquetrella), a qualified biologist approved by CDFW shall conduct a focused survey for all species with potential to be present prior to ground disturbance. If no special-status plants are observed, no further action is required. • If special-status plant species, including coastal triquetrella are observed, the plants will be avoided with a suitable buffer, determined in coordination with CDFW. The buffer zone shall be clearly demarcated using exclusion fencing. If establishing an avoidance buffer is not feasible, individual plants shall be transplanted to an area with suitable physical and biological conditions outside of the work area and monitored and adaptively managed for five years.			
Impact BIO-2: Implementation of the NHPH would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	**NHPH Mitigation Measure BIO-2a: Prevention of Harm to Migrating Birds During Construction** The construction contractor shall ensure that construction areas requiring lights shall include the following measures to the extent feasible: • Construction-related lighting shall be fully shielded and focused down to ensure no significant illumination passes beyond the immediate work area. Lighting shall be positioned around the perimeter of the work area positioned toward activity and not surrounding habitat of the Reserve. • Yellow or orange light shall be used where possible. • Construction personnel shall reduce the amount of lighting to the minimum necessary to safely accomplish the work. • Night construction near suitable habitat for nesting and migratory birds and bats (i.e. the Reserve forest and understory vegetation) shall be avoided during nesting season (February 15 – August 15). If night construction near these areas cannot be avoided, light shall not be allowed to shine directly into suitable habitat.	Issue instructions for the construction contractor to incorporate the mitigation measure. The contractor will demonstrate knowledge of appropriate procedures for construction lighting and nigh construction activity to protect migrating birds.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor for each phase to certify that provisions are included for implementation of mitigation measure. Provide construction status report to Monitor upon request.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.3 Biological Resources (cont.)				
Impact BIO-2 (cont.)	**NHPH Mitigation Measure BIO-2b: Bird-Safe Building Treatments** UCSF staff shall confirm that building plans include the required building design measures prior to the start of construction: • Avoid installation of lighting in areas where not required for public safety. • Examine and adopt alternatives to bright, all-night, floor-wide lighting when interior lights would be visible from the exterior or when exterior lights must be left on at night, including: – Installing motion-sensitive lighting – Installing task lighting – Installing programmable timers – Installing fixtures that use lower-wattage, sodium, and yellow-red spectrum lighting (if compatible with personnel safety requirements) • Where exterior lights are to be left on at night, install fully shielded lights to contain and direct light away from the sky. • Employ glazing options such as use of either fritted glass, Dichroic glass, etched glass, translucent glass, or glass that reflects ultraviolet light in appropriate portions of the building façade. • Minimize light and glare resulting from the new building through the use of landscaping materials and choice of primary façade materials. Project design shall not include reflective metal walls and mirrored glass walls as primary building materials for facades.	Issue instructions to design team to incorporate bird-safe building treatments in building designs. Require architects and design professionals to document use of bird-safe treatments and review project plans to ensure that such features have been incorporated in the design.	UCSF Project Manager and Design Teams	Verify that project incorporates treatments prior to final project approval. After construction, the Project Manager shall provide written verification to the Monitor that treatments were installed according to the design.
Impact C-BIO-1: Implementation of the NHPH would not result in cumulatively considerable impacts on biological resources, in combination with past, present and reasonably foreseeable future projects in the vicinity of the NHPH site.	Implement NHPH Mitigation Measures BIO-1a through BIO-1e, and BIO-2a and BIO-2b.	See NHPH Mitigation Measures BIO-1a through 1e, BIO-2a, and BIO-2b.	See NHPH Mitigation Measures BIO-1a through 1e, BIO-2a, and BIO-2b.	See NHPH Mitigation Measures BIO-1a through 1e, BIO-2a, and BIO-2b.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.4 Cultural Resources and Initial Study Sections V and XVII: Cultural Resources and Tribal Cultural Resources				
Initial Study Impact V.b: Implementation of the NHPH could cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5.	**NHPH Mitigation Measure CUL-V.b: Inadvertent Discovery of Archaeological Resources and Tribal Cultural Resources** Prior to commencement of construction activities, all on-site personnel shall attend a mandatory pre-project training to outline the general archaeological and tribal cultural sensitivity of the project area. The training will include a description of the types of resources that could be encountered and the procedures to follow in the event of an inadvertent discovery of resources. If prehistoric or historic-era archaeological resources are encountered by construction personnel during ground-disturbing activities, all construction activities within 100 feet shall halt and the contractor shall notify the UCSF Environmental Coordinator (EC). The UCSF EC shall retain a Secretary of the Interior-qualified archaeologist (qualified archaeologist) to inspect the find within 24 hours of discovery. If it is determined that the project could damage a historical resource or a unique archaeological resource, construction shall cease in an area determined by the qualified archaeologist until a mitigation plan has been prepared and implemented [CEQA Guidelines 15064.5(b)(4)]. If the find is a potential tribal cultural resource, the UCSF EC shall contact a Native American representative or representatives (as provided by the Native American Heritage Commission) [PRC 21074(2)(c)]. The qualified archaeologist, in consultation with the UCSF EC and the Native American representative(s), shall determine when construction can resume. If the resource is determined to be a historical resource or a unique archaeological resource, the preferred mitigation shall be preservation in place. In accordance with PRC Section 21083.2(b), preservation in place shall be accomplished through: (1) modifying the construction plan to avoid the resource; (2) incorporating the resource within open space; (3) capping and covering the resource; or (4) deeding the resource site into a permanent conservation easement. If preservation in place is not feasible, the qualified archaeologist, in consultation with the UCSF EC and the Native American representative(s) (if the resource is prehistoric), shall prepare and implement a detailed treatment	Issue instructions for the construction contractor to incorporate the mitigation measure. The successful contractor will demonstrate knowledge of procedures and requirements when cultural resources are discovered during construction activities.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor on each phase to certify that provisions are included for implementation of mitigation measure if cultural resources are discovered during construction activities. Provide construction status report to Monitor upon request and on completion of construction.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.4 Cultural Resources and Initial Study Sections V and XVII: Cultural Resources and Tribal Cultural Resources (cont.)				
Initial Study Impact V.b (cont.)	plan. In all cases treatment will be carried out with dignity and respect (including protecting the cultural character, traditional use, and confidentiality of the resource). For prehistoric resources, the Native American representative(s) will be consulted on the research approach, methods, and whether burial or data recovery or alternative mitigation is appropriate for the find. Treatment for most resources could consist of (but shall not be limited to) sample excavation, site documentation, and historical research, as appropriate to the discovered prehistoric resource. The treatment plan shall include provisions for analysis of data in a regional context as appropriate to the discovered prehistoric resource, reporting of results within a timely manner, and dissemination of reports to local and state repositories, libraries, and interested professionals.			
Initial Study Impact V.c: Implementation of the NHPH could disturb human remains, including those interred outside of dedicated cemeteries.	**NHPH Mitigation Measure CUL-V.c: Inadvertent Discovery of Human Remains** In the event of discovery or recognition of any human remains during ground-disturbing activities, treatment shall comply with all applicable state and federal laws. All construction activities within 100 feet shall halt and the contractor shall notify the UCSF Environmental Coordinator (EC). In accordance with PRC 5097.98, the UCSF EC shall contact the San Francisco Office of the Medical Examiner (Medical Examiner) to determine that no investigation of the cause of death is required. The Medical Examiner shall contact the Native American Heritage Commission (NAHC) within 24 hours if it is determined that the remains are Native American. The NAHC will then identify the person or persons it believes to be the most likely descendant (MLD) from the deceased Native American. Within 48 hours, the MLD shall make recommendations to the UCSF EC of the appropriate means of treating the human remains and any grave goods. Whenever the NAHC is unable to identify an MLD, the MLD fails to make a recommendation, or the parties are unable to agree on the appropriate treatment measures, the human remains shall be reinterred with appropriate dignity on the property in a location not subject to further and future subsurface disturbance.	Issue instructions for the construction contractor to incorporate the mitigation measure. The contractor will demonstrate knowledge of procedures and requirements when cultural resources are discovered during construction activities.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor on each phase to certify that provisions are included for implementation of mitigation measure if cultural resources are discovered during construction activities. Provide construction status report to Monitor upon request and upon completion of construction.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.4 Cultural Resources and Initial Study Sections V and XVII: Cultural Resources and Tribal Cultural Resources (cont.)				
Initial Study Impact XVII.a and XVII.b: Implementation of the NHPH could cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe.	Implement Mitigation Measure NHPH Mitigation Measure CUL-V.b:	See NHPH Mitigation Measure CUL-V.b.	See NHPH Mitigation Measure CUL-V.b.	See NHPH Mitigation Measure CUL-V.b.
EIR Section 4.6 Geology and Soils and Initial Study Section VII: Geology and Soils				
Impact GEO-3: Construction and operation of the NHPH would not directly or indirectly cause substantial adverse effects, including the risk of loss, injury, or death involving landslides.	**NHPH Mitigation Measure GEO-3:** UCSF shall implement the following geotechnical recommendations as adapted from those contained within the Rutherford & Chekene March 2019 report: • Remove selected trees located on or at the crest of steep rock slopes on which tree root wedging decreases stability. Determination of specific trees to be removed shall be made in association with a certified arborist and state licensed geotechnical engineer or engineering geologist. Removal will involve cutting trees and leaving stumps such that the root system can rot in situ with minimal disturbance to the surface geology. • Conduct qualitative monitoring of identified slopes by a state licensed geotechnical engineer or engineering geologist or as directed by said professional. Monitoring shall occur, at a minimum, after each major storm or earthquake, as defined by the geotechnical professional. The geotechnical professional shall submit a report of findings to UCSF that includes recommendations for additional slope stability improvements, if deemed necessary, to maintain continued safety in accordance with geotechnical standards and building code requirements.	For NHPH improvements proposed adjacent to and within the Reserve that would involve excavation or cut slope cut excavation, project-specific geotechnical evaluations shall be prepared as part of the design process and include evaluations of potentially affected slopes, recommendations for tree removal on or at the crest of steep rock slopes, and recommendations for monitoring frequency.	A state-licensed geotechnical engineer in consultation with certified arborist, shall report to the UCSF Project Manager.	The UCSF Project Manager shall submit the results of each tree assessment to the Monitor.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.6 Geology and Soils and Initial Study Section VII: Geology and Soils (cont.)				
Initial Study Impact VII.f-6: Construction associated with the NHPH could have the potential to directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	**NHPH Mitigation Measure GEO-VII.f:** Prior to commencement of construction activities, all on-site personnel shall attend a mandatory pre-project training to outline the general paleontological sensitivity of the project area. The training will include a description of the types of resources that could be encountered and the procedures to follow in the event of an inadvertent discovery of resources. If paleontological resources, such as fossilized bone, teeth, shell, tracks, trails, casts, molds, or impressions are discovered during ground-disturbing activities, work shall stop in that area and within 100 feet of the find until a qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) Standards can assess the nature and importance of the find and, if necessary, develop appropriate salvage measures in conformance with SVP standards (2010). If the discovery can be avoided and no further impacts will occur, no further effort shall be required. If the resource cannot be avoided and may be subject to further impact, a qualified paleontologist shall evaluate the resource and determine whether it is "unique" under CEQA. Any discovered paleontological resources that are determined by the qualified paleontologist to be "unique" in accordance with CEQA shall be given appropriate salvage measures in conformance with SVP standards (2010).If paleontological resources, such as fossilized bone, teeth, shell, tracks, trails, casts, molds, or impressions are discovered during ground-disturbing activities, work shall stop in that area and within 100 feet of the find until a qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) Standards can assess the nature and importance of the find and, if necessary, develop appropriate salvage measures in conformance with SVP standards (2010). If the discovery can be avoided and no further impacts will occur, no further effort shall be required. If the resource cannot be avoided and may be subject to further impact, a qualified paleontologist shall evaluate the resource and determine whether it is "unique" under CEQA. Any discovered paleontological resources that are determined by the qualified paleontologist to be "unique" in accordance with CEQA shall be given appropriate salvage measures in conformance with SVP standards (2010).	Issue instructions for the construction contractor to incorporate the mitigation measure. The contractor will demonstrate knowledge of procedures and requirements when paleontological resources are discovered during construction activities.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor on each phase to certify that provisions are included for implementation of mitigation measure if paleontological resources are discovered during construction activities. Provide construction status report to Monitor upon request and upon completion of construction.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.7 Greenhouse Gas Emissions				
Impact GHG-1: Construction and operation of the NHPH would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.	**NHPH Mitigation Measure GHG-1: Monitor emissions annually and acquire carbon offset credits in conformance with CARB guidance, prioritizing local and in-State offsets to achieve and maintain carbon neutrality for the NHPH as part of campus-wide emissions.** As part of this mitigation measure, UCSF is making the following separate, though overlapping, GHG emission reduction commitments: (1) As a CARB-covered entity, UCSF will maintain compliance with CARB's cap and trade program; (2) Per existing UC Policy, UCSF's Scope 1 and Scope 2 GHG emissions shall, commencing in 2025, be entirely carbon neutral; (3) Also per existing UC Policy, commencing in 2025, UCSF's Scope 1 and Scope 2 emissions shall be voluntarily offset while Scope 3 emissions from commuters and air travel shall be voluntarily offset by 2050; and (4) UCSF's total GHG operational emissions from all Scope 1, 2, and 3 sources (as defined in this EIR) shall not exceed the Parnassus Heights campus's baseline emissions from these sources in 2019. Each of these commitments is described in more detail below. ***Continued Compliance with CARB's Cap and Trade Program*:** Any carbon offset credits purchased for the purpose of compliance with CARB's cap and trade program shall be purchased from an accredited carbon credit market. Such offset credits (or California Carbon Offsets) shall be registered with, and retired[2] by an Offset Project Registry, as defined in 17 California Code of Regulations § 95802(a), approved by the California Air Resources Board such as, but not limited to, Climate Action Reserve, American Carbon Registry or Verra (formerly Verified Carbon Standard). In order to demonstrate that the carbon offset credits provided are real, permanent, additional, quantifiable, verifiable, and enforceable, as those terms are defined in 17 California Code of Regulations § 95802(a), UCSF shall document in its annual report: (i) the protocol used to develop those credits, and (ii) the third-party verification report concerning those credits. As and when the credits are retired, UCSF shall document in its annual report the unique serial numbers of those credits showing that they have been retired.	Throughout the lifetime of the CPHP, prepare, or cause to be prepared by a qualified GHG emissions expert, an annual report of campus GHG emissions (Scope 1, 2, and 3). If the annual monitoring shows that emissions for a given year exceed the 2018 baseline emissions, purchase carbon offset credits that comply with CARB guidance, prioritizing local and in-State offsets.	UCSF Project Manager	Provide the annual GHG report to the Monitor. If the annual report reveals the need for purchase of carbon offset credits, provide the Monitor with documentation that such purchase has occurred, in compliance with CARB guidance.

[2] When Climate Reserve Tonnes (CRTs) are transferred to a retirement account in the Reserve System, they are considered retired. Retirement accounts are permanent and locked to prevent a retired CRT from being transferred again. CRTs are retired when they have been used to offset an equivalent ton of emissions or have been removed from further transactions on behalf of the environment.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.7 Greenhouse Gas Emissions (cont.)				
Impact GHG-1 (cont.)	***Compliance with UC Policy - Offsets for Emissions from Commuters and Air Travel*:** Compliance with UC's policies for carbon neutrality from specific Scope 3 sources (as defined by Second Nature's Carbon Commitment) by 2050 or sooner as required by UC's Policy on Sustainable Practices. (UCES, 2020). Neutrality may be achieved through reductions in direct emissions, and the purchase of carbon offset credits. UCSF will purchase voluntary carbon offset credits as the final action to reach the GHG emission reduction targets. As part of the UC Carbon Neutrality Initiative, UC Sustainable Practices Policy has been updated and internal guidelines have been developed to ensure that only high-quality voluntary carbon offsets are purchased by UC and any use of offsets for this purpose will result in additional, verified GHG emissions reductions from actions that align, as much as possible, with UC's research, teaching, and public service mission. Specifically, any voluntary carbon offset credits used by UCSF to mitigate Scope 3 GHG emissions will: 1. Prioritize local (within the air district) and in-state offset credits over in-nation offset credits. Offset credits shall be third-party verified by a major registry recognized by CARB such as CAR (Climate Action Reserve) or equivalent and will also subjected to an internal peer review process. If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming or equivalent national offset credits registered with an approved registry and which meet UC criteria for high-quality offsets. 2. Be reported publicly and tracked through the Climate Registry (TCR) as required by UC policy. TCR is a non-profit organization governed by U.S. states and Canadian provinces and territories. UCSF's TCR reports will be third-party verified and posted publicly. ***Compliance with UC Policy – Carbon Neutrality:*** Ensure achievement of net zero greenhouse gas emissions from its buildings and vehicle fleet by 2025. For purposes of this section, campuses shall include their related health location for all goals. GHG emissions reduction goals pertain to emissions of the six Kyoto greenhouse gasses[3] originating from all Scope 1 and Scope 2 sources as specified by the Climate Registry, and from Scope 3 emissions as specified by			

[3] The six greenhouse gasses identified in the Kyoto Protocol are carbon dioxide, methane, nitrous oxide, sulfur hexafluoride, hydrofluorocarbons, and perfluorocarbons.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.7 Greenhouse Gas Emissions (cont.)				
Impact GHG-1 (cont.)	Second Nature's Carbon Commitment, which includes air travel paid through the institution, and commuting to and from campus by students, faculty and other academic appointees, and staff. ***Commitment to control Parnassus Heights Annual Emissions to not exceed existing baseline*:** UCSF shall monitor GHG operational emissions from all Scope 1, 2 and 3 sources annually. Upon the completion and occupancy of the NHPH, inclusive of the related improvements, in 2033, the estimated annual emissions shall be compared to the campus site year 2019 baseline of 127,083 MT CO_2e per year to determine whether the emissions have increased above the baseline level. For the identified amount of exceedance of the performance standard, UCSF shall purchase carbon offset credits sufficient to maintain carbon neutrality. These offset credits shall be purchased for the types of Scope 1 and Scope 2 emissions that are already reported to and verified by a third party verification body annually, as well as for Scope 3 emissions from patient and visitor vehicle trips, indirect emissions from water and wastewater demand, and solid waste emissions, all of which are included in the EIR analysis above as required by CEQA. Carbon offset credits used for this purpose shall originate from a voluntary carbon credit registry that TCR recognizes such as: CAR, ACR, or Verra (other registries are also applicable). Offset credits in this case shall be registered, transferred, and retired at such registries. The offsets will also be subjected to an internal UC peer review process. The protocols of each registry, and UC own internal screens and criteria, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols. For this purpose, local (within the air district) and in-state carbon offset credits shall be prioritized over in-nation offset credits. If sufficient local and in-state offset credits are not available, UCSF will purchase CARB conforming or equivalent national offset credits registered with an approved registry and which meet UC criteria for high-quality offsets. As and when the credits are retired, UCSF shall document in its annual report the unique identifier of those credits showing that they have been retired and accepted by TCR.			

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.8 Hazards and Hazardous Materials				
Impact HAZ-1: Construction and operation of the NHPH could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.	**NHPH Mitigation Measure HAZ-1:** An Excavation Management Plan shall be prepared by a qualified consultant to include the California Air Resource Board (CARB) Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations to minimize naturally occurring asbestos through the application of best management practices for fugitive dust from construction, grading and excavation operations. Unless site specific testing by a certified laboratory can demonstrate the absence of naturally occurring asbestos in materials to be excavated, construction specifications shall include implementation of this CARB ATCM.	Issue instructions for the construction contractor to incorporate the mitigation measure. The contractor will demonstrate knowledge of procedures and requirements for managing naturally occurring asbestos.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor on each phase to certify that provisions are included for implementation of mitigation measure for managing naturally occurring asbestos during ground-disturbing activities. Provide construction status report to Monitor upon request.
Impact HAZ-4: The NHPH would not be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. However, previously unknown contamination could be encountered during construction and could have the potential to create a significant hazard to the public or the environment.	**NHPH Mitigation Measure HAZ-4:** Prior to development on the NHPH sites, a Soil Management Plan shall be prepared by a qualified environmental consulting firm to reflect current regulatory requirements and risk management protocols that are in accordance with Regional Water Quality Control Board oversight. The Plan shall include measures to address protocols for identifying, handling, and characterizing suspect contaminated soils. On-site personnel shall attend mandatory pre-project training regarding the Plan. Notification and sampling requirements for adequate characterization shall be in accordance with the overseeing agency (RWQCB or SFDPH) requirements and any required removal or remediation work shall be completed to the overseeing agency's standards prior to occupancy of the new structure.	Issue instructions for the construction contractor to incorporate the mitigation measure. The contractor will demonstrate knowledge of procedures and requirements for soil management with respect to suspected soil contamination.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor on each phase to certify that provisions are included for implementation of mitigation measure for managing suspected soil contamination during ground-disturbing activities. Provide construction status report to Monitor upon request.
EIR Section 4.11 Noise and Vibration				
Impact NOI-1: Construction activities under the NHPH would generate a substantial temporary increase in ambient noise levels in the vicinity of the construction project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	**NHPH Mitigation Measure NOI-1a: Construction Noise Control Measures** UCSF contractors shall employ site-specific noise attenuation measures during construction of projects under the NHPH to reduce the generation of construction noise. These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by UCSF to ensure that construction noise is consistent with the standards set forth in the City's Noise Ordinance. Measures specified in the Noise Control Plan and implemented during project construction shall include, at a minimum, the following noise control strategies: • Equipment and trucks used for construction shall use the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds).	Issue instructions for the construction contractor to incorporate the mitigation measure. The contractor will prepare a construction noise control plan to report on the implementation of the mitigation measure.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor on each phase to certify that provisions are included for construction noise control. Provide a report on construction noise control to Monitor upon request; but no less than quarterly after beginning each construction activity.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.11 Noise and Vibration (cont.)				
Impact NOI-1 (cont.)	• Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. If the contactor deems the use of pneumatic tools to be unavoidable, the contractor shall prepare a mitigation measure variance explaining the conditions that make the exemption necessary and submit it to the UCSF Project Manager, and an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible; this could achieve a reduction of 5 dBA. Quieter procedures, such as use of drills rather than impact tools, shall be used unless the contractor, based on professional judgment, deems these alternative methods inappropriate for conditions encountered or reasonable allocation of manpower, whereby the contractor shall prepare a mitigation measure variance explaining the conditions that make the exemption necessary and submit it to the UCSF Project Manager. • Stationary noise sources shall be located as far from adjacent receptors as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or include other measures. • Shield staging areas where adjacent sensitive receptors have direct line-of-sight with loading and delivery activities. Shielding may consist of plywood fencing with no gaps or acoustical paneling erected in K-rails.			
	NHPH Mitigation Measure NOI-1b: Construction Hours Construction hours shall be restricted to the hours listed in the table below. In rare circumstances, work may need to occur outside of these work hour limits. In such cases, UCSF Community and Government Relations will receive advance notice from the project manager, at least one week in advance as feasible, and will engage the community to identify measures to minimize potential impacts. These measures may include, but not be limited to, restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers to shield the short-term nighttime activity.	Issue instructions for the construction contractor to incorporate the mitigation measure. The contractor will prepare a construction noise control plan to report on the implementation of the mitigation measure.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor on each phase to certify that provisions are included for construction noise control through limitations on construction hours (may be incorporated into report for Mitigation Measure NOI-1a). Provide a report on construction noise control to Monitor upon request; but no less than quarterly after beginning each construction activity (may be incorporated into report for Mitigation Measure NOI-1a).

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

<table>
<tr><th>Environmental Impact</th><th>Mitigation Measures</th><th>Implementation Procedure</th><th>Responsible Unit</th><th>Report Mechanism</th></tr>

2 Extended hours to be considered by UCSF Community and Government Relations with advance notice from the project manager.

NHPH Mitigation Measure NOI-1c: Pile-Installation Noise-Reducing Techniques

Noise-reducing pile-installation techniques shall be employed during project construction. These techniques shall include:

Installing cast-in-place concrete piles. Noise from auger drilling is 17 dBA less than an impact pile driver.
Vibrating piles into place, and installing shrouds around the pile-driving hammer where feasible.
Implement “quiet” pile-installation technology (such as pre-drilling of piles and the use of more than one pile driver to shorten the total pile installation duration).

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.11 Noise and Vibration (cont.)				
Impact NOI-2: Implementation of the NHPH would generate substantial permanent increases in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	**NHPH Mitigation Measure NOI-2: New Hospital Cooling Tower Noise Control** New Hospital cooling tower equipment shall be designed to meet the City's Police Code requirements of not exceeding 8 dBA over existing ambient noise levels without the equipment operating as well as an interior noise standard at any sleeping or living room in any dwelling unit located on residential property of 45 dBA between 10:00 PM and 7:00 AM, and 50 dBA between 7:00 AM and 10:00 PM. Specifically, given the existing monitored nighttime noise level at the nearest property line of 53 dBA, cooling towers shall be selected, designed, or enclosed to achieve an exterior performance standard of 61 dBA or less at the nearest property line. Achievement of this exterior standard would be sufficient to also achieve an interior nighttime standard of 45 dBA. The proposed cooling tower manufacturer offers towers with "ultra quiet" fans capable of a noise level reduction of up to 12 dBA (Marley, 2021). A qualified acoustical consultant shall be retained to assess mechanical noise to determine the necessary methods by which the selected units would need further attenuation measures to achieve the identified performance standard and conform with the City's Police Code.	Retain, or cause to be retained as part of the mechanical systems design for each new building or building renovation that includes installation of new mechanical equipment, a qualified acoustical consultant to evaluate noise generation characteristics of new mechanical systems and to ensure that noise levels comply with the City's Police Code. Following commissioning of new mechanical equipment, conduct noise measurements to ensure Police Code compliance.	UCSF Project Manager and Design Teams	Provide written verification in report form to the Monitor that the selected mechanical equipment will comply with the City's Police Code, including enumeration and evaluation of any required noise control or reduction measures. Following commissioning of new mechanical equipment, provide written verification in report form to the Monitor that the selected mechanical equipment does comply with the City's Police Code. If non-compliance is detected, identify and install additional noise reduction features.
Impact NOI-3: Construction activities for the NHPH and related improvements could result in generation of excessive groundborne vibration or groundborne noise levels.	**NHPH Mitigation Measure NOI-3: Assessment and Relocation/Retrofitting of Vibration-Sensitive Equipment** UCSF shall evaluate the presence of vibration-sensitive equipment within 150 feet of construction and demolition areas. Any sensitive equipment shall be evaluated for the existing extent of vibration isolation and relocated or vibration isolation shall be further embellished, as warranted. Based on available guidance (FTA, 2018), a performance standard of 65 VdB shall be implemented in lieu of any other available equipment-specific criterion.	Prior to the start of any demolition or construction activity, identify vibration-sensitive equipment within 150 feet, assess the vibration isolation of such equipment, and enhance isolation if deemed necessary.	UCSF Project Manager	Provide written verification in report form to the Monitor that vibration-sensitive equipment within 150 feet of construction and demolition shall be used, and, if deemed necessary, provisions to enhance vibration isolation; or alternatively, that equipment is suspended during substantial vibration-generating activities within 150 feet.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.11 Noise and Vibration (cont.)				
Impact C-NOI-1: Implementation of the NHPH, combined with cumulative construction noise in the project area, would generate a substantial temporary increase in ambient noise levels from construction activity in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	Implement NHPH Mitigation Measures NOI-1a, NOI-1b, and NHPH Mitigation Measure TRANS-5: Construction Coordination and Monitoring Measures.	See NHPH Mitigation Measures NOI-1a, NOI-1b, and TRANS-5.	See NHPH Mitigation Measures NOI-1a, NOI-1b, and TRANS-5.	See NHPH Mitigation Measures NOI-1a, NOI-1b, and TRANS-5.
Impact C-NOI-2: Implementation of the NHPH, combined with cumulative development in the project area, would generate substantial permanent increases in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	Implement NHPH Mitigation Measure NOI-2.	See NHPH Mitigation Measure NOI-2.	See NHPH Mitigation Measure NOI-2.	See NHPH Mitigation Measure NOI-2.
Impact C-NOI-3: Implementation of the NHPH, combined with cumulative construction in the project area, would result in generation of excessive groundborne vibration or groundborne noise levels.	Implement NHPH Mitigation Measure NOI-3.	See NHPH Mitigation Measure NOI-3.	See NHPH Mitigation Measure NOI-3.	See NHPH Mitigation Measure NOI-3.
EIR Section 4.15 Transportation				
Impact TRANS-5: Construction of the New Hospital and related improvements could temporarily impact travel conditions along sidewalks and roadways serving the campus site.	**NHPH Mitigation Measure TRANS-5: Construction Coordination and Monitoring Measures** ***Construction Traffic Control Plan.*** In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the project site, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g., demolition, construction, or renovation of individual buildings). UCSF and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations (e.g., Parnassus Avenue) and utilities and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the NHPH. For any work within the	Issue instructions for construction contractor to incorporate the mitigation measure. The contractor will demonstrate the ability to prepare a complete and thorough Construction Traffic Control Plan that addresses traffic, transit, pedestrian, and bicycle movement; incorporates measures to limit single-occupancy vehicle travel by construction workers; and ensures minimal disruption of access for nearby residences, institutions, and businesses.	UCSF Project Manager and Construction Teams	Provide written verification in report form to the Monitor on each phase to certify that a complete and thorough Construction Traffic Control Plan is included. Provide a report on construction traffic control to Monitor upon request; but no less than quarterly after beginning each construction activity.

TABLE 9-1 (CONTINUED)
SUMMARY OF NHPH IMPACTS AND MITIGATION MEASURES

Environmental Impact	Mitigation Measures	Implementation Procedure	Responsible Unit	Report Mechanism
EIR Section 4.15 Transportation (cont.)				
Impact TRANS-5 (cont.)	public right-of-way, the contractor will also be required to comply with the City of San Francisco's *Regulations for Working in San Francisco Streets*, which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic. ***Reduce Drive Alone Mode Share for Construction Workers.*** In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Construction Traffic Control Plan methods to encourage walking, bicycling, carpooling, and transit access to the campus site by construction workers. Strategies that may be included in this plan could be to have a construction worker shuttle or allow preferential parking for carpools. ***Project Construction Updates for Adjacent Residents and Businesses*** – In order to minimize construction impacts on access for nearby residences, institutions, and businesses, UCSF shall provide nearby residences and businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours, excavation),and travel lane closures, via a newsletter, website, and/or quarterly construction update meetings with neighbors.

Balance Hydrologics, Inc., Berkeley, CA , Sr. Hydrologist/ Vice President, 1994-1997

Geomatrix Consultants, Inc., San Francisco, CA, Project Geologist/Hydrogeologist, 1991-1994

Environ International Corporation, Princeton, NJ, Sr. Staff Geologist/Hydrogeologist, 1989-1991

Miami University, Oxford, OH, Field Camp Instructor and Research Assistant, 1986-1989

Greg Kamman is a professional geologist and certified hydrogeologist with over 30 years of technical and consulting experience in the fields of geology, hydrology, and hydrogeology. He specializes in directing and managing projects in the areas of surface and groundwater hydrology, stream and tidal wetland habitat restoration, water supply and water quality assessments, water resources management, and geomorphology. Mr. Kamman has worked extensively throughout California's coastal watersheds and estuaries, and on multiple projects in Oregon and Hawaii.

Mr. Kamman's experience and expertise includes evaluating surface and groundwater resources and their interaction, stream and wetland habitat restoration assessments and design, characterizing and modeling basin-scale hydrologic and geologic processes, assessing watershed hydraulic and geomorphic responses to land-use change , and designing and conducting field investigations characterizing surface and subsurface hydrologic and water quality conditions. Greg commonly works on projects that revolve around sensitive fishery, wetland, wildlife, and/or riparian habitat enhancement within urban and rural environments. Mr. Kamman performs many of these projects in response to local, state (CEQA) and federal statutes (NEPA, ESA), and other regulatory frameworks. Mr. Kamman frequently applies this knowledge to the review and expert testimony on state and federal water operation plan EIR/EIS reports, Groundwater Sustainability Plans, Habitat Conservation Plans, and biological assessments.

Mr. Kamman is accustomed to working multi-objective projects as part of an interdisciplinary team including biologists, engineers, planners, architects, lawyers, and resource and regulatory agency staff. Mr. Kamman is a prime or contributing author to over 360 technical publications and reports in the discipline of hydrology, the majority pertaining to the protection and enhancement of aquatic resources. Mr. Kamman has taught the following courses: stream restoration through U.C. Berkeley Extension (2001-2008); wetland hydrology through San Francisco State University's Romberg Tiburon Center (2007 and 2012-2014); and presented webinars (2020) to California Water Boards staff on hydrologic and hydraulic modeling. He has devoted his career to the protection, enhancement and sustainable management of water resources and associated ecosystems.

SELECTED EXPERIENCE

Floodplain Management Projects

Flood Reduction, Mitigation Planning, and Design on Yreka Creek, Siskiyou County, CA
City of Yreka as subcontractor to WRA, Inc., 2008-2010

Mr. Kamman completed a series of field and hydraulic model investigations for restoration planning and design along Yreka Creek to reduce flood hazards and potential damage to the City's water treatment plant and disposal field infrastructure. This work also addresses and satisfies dike repair mitigation conditions stipulated by state resource agencies. While achieving these goals, Mr. Kamman tailored analyses and study objectives to assist the City in: enhancing the ecological floodplain restoration along Yreka Creek; providing opportunities for expanded public access and trail planning consistent with the goals of the Yreka Creek Greenway Project; and improving the water quality of Yreka Creek.

Key elements of this work included: review and synthesize existing information; identify and analyze the feasibility for three conceptual alternatives; and conceptual design and report preparation. Funding for implementation of restoration work over such a large area was a significant concern to the City. Therefore, designs identify and define phasing in a fashion that gives the City flexibility in implementation.

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

West Creek Drainage Improvement Assessment, Marin County, CA
Marin County Flood Control, 2006-2008

Mr. Kamman prepared a study focused on characterizing existing flood conditions and developing and evaluating flood reduction measures along West Creek in Tiburon. The work was completed through the implementation of hydrologic and hydraulic feasibility and design assessments. The conceptual design and analysis of potential flood reduction strategies (alternatives) was completed through the development of a HEC-RAS hydraulic model that simulates historic, existing and proposed project flood conditions. It was intended that the conceptual design developed under this scope of work would be of sufficient detail and quality to initiate project permitting and the environmental compliance process and documentation. Opportunities for riparian corridor and aquatic habitat enhancement were also considered and integrated into the conceptual design. Mr. Kamman also developed and assessed six alternative flood hazard reduction measures. The hydraulic model results for each alternative were compared against baseline conditions in order to evaluate their ability to alleviate flood hazards.

Gallinas Creek Restoration Feasibility Assessment, Marin County, CA
San Francisco Bay Institute, 2003-2005

Mr. Kamman completed a feasibility assessment for restoration of Gallinas Creek in northern San Rafael. Restoration will require removal of a concrete trapezoidal flood control channel and replacement with an earthen channel and floodplain in a “green belt” type corridor. Work included the collection of field data and development of a HEC-RAS hydraulic model to evaluate and compare existing and proposed project conditions. Designs must continue to provide adequate flood protection to the surrounding community. The study also includes and evaluation of existing habitat values, potential habitat values, and restoration opportunities and constraints.

Hydrologic and Hydraulic Evaluation for Trinity County Bridge Replacement, Trinity County, CA
Trinity County Planning Department, 2002

Mr. Kamman completed technical peer review of peak flow estimates and hydraulic design parameters associated with the replacement of 4 bridges across the upper Trinity River in Trinity County, California. A primary study component was accurately predicting the magnitude and frequency of flood releases from Trinity Dam. Numerous flood frequency analytical approaches were evaluated and used throughout this study.

Restoration of Lower Redwood Creek Floodway and Estuary, Humboldt County, CA
California State Coastal Conservancy and Humboldt County DPW, 2002-2003

Mr. Kamman provided technical review for the development of a hydraulic model to evaluate river and estuary restoration alternatives along the lower portions of Redwood Creek between Orrick (Highway 1) and the Pacific Ocean. This work was completed to evaluate the feasibility for creek/estuary restoration alternatives developed by the County, and effects on flood hazards along this flood-prone reach.

In order to better address and evaluate the current flood hazards along the entire floodway and identify potential flood hazard reduction measures, Mr. Kamman was retained to update HEC-2 models previously prepared by the Army Corps, and to evaluate the impacts of vegetation encroachment (increased roughness) and sediment deposition on floodway conveyance. Mr. Kamman expanded the Corps hydraulic model with newly completed channel surveys and channel roughness observations. The impetus for this work was to assist the County in identifying mutually beneficial strategies for ecosystem restoration and flood hazard reduction. Technical work was completed under close coordination and communication with county engineers. Study results and findings were presented at public meetings of local area landowners and stakeholders.

Tembladero Slough Small Community Flood Assessment, Monterey County, CA
Phillip Williams & Associates, Ltd., 1997

Mr. Kamman completed a flood information study of Tembladero Slough near Castroville on behalf of the San Francisco District Corps of Engineers. The purpose of this work was to identify and document local flood risks existing in the community and propose potential floodplain management solutions as part of the Corps 1995/1997-flood recovery process. Work centered on conducting a field reconnaissance, reviewing available historical data, and conducting discussions/interviews with local landowners and agency personnel.

Fluvial Projects

Muir Woods National Monument Bank Stabilization Plan for Conlon Creek, Marin County, CA
Golden Gate National Parks Conservancy (GGNPC), 2018-present

Mr. Kamman developed a grading and drainage plan for the Conlon Avenue Parking Lot, located adjacent to Redwood Creek and sensitive Coho salmon habitat. More recently, he has assisted GGNPC and the NPS in assessing the planning and design for creek bank stabilization and ecological enhancement at a failed culvert on a tributary channel at the project site. This work includes constructing a HEC-RAS model to evaluate: culvert removal and channel design; fish passage; and water quality impacts. Work is currently in development of 50% engineering design.

Hydrology and Hydraulic Assessments for Design of Butte Sink Mitigation Bank Project, Colusa County, CA
WRA, Inc., 2017-2018

Mr. Kamman was retained to provide hydrology and hydraulic modeling support in the development of design and Draft Prospectus for the Butte Sink Mitigation Bank (Bank). This work entailed developing the necessary hydrology information, hydraulic model and documentation to support further design, environmental compliance and agency approvals/permitting of the Bank. The main objective of work was to develop a design that provides the necessary ecological conditions and functions for successful establishment and operation of the Bank.

Lagunitas Creek Salmonid Winter Habitat Enhancement Project, Marin County, CA
Marin Municipal Water District, 2013-2018

Mr. Kamman designed and led a study to evaluate opportunities to enhance winter habitat for coho and other salmonids in Lagunitas Creek and its largest tributary - Olema Creek. This work was done as a two-phase assessment and design effort. The first phase (completed in 2013) included a winter habitat assessment to evaluate existing juvenile salmonid winter habitat in Lagunitas Creek and lower Olema Creek. The results of this assessment were used to prioritize winter habitat needs, and identify opportunities for winter habitat enhancement to increase

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

the winter carrying capacity of coho salmon and steelhead. The second phase (completed in 2017) consisted of a designing winter habitat enhancements. These enhancements focused on restoring floodplain and in-channel habitat structures. Winter habitat enhancement work also needed to consider potential impacts to or benefits for California freshwater shrimp (Syncaris pacifica), a federally endangered species.

This work included field reconnaissance, topographic surveys and the preparation of final design drawings at nine different project sites. An overall self-maintaining design approach was developed to guide individual project plan, with minimal earthwork and disturbance to existing riparian and wetland habitat. Self-sustained, natural evolution of a multi-thread channel within a more active floodplain is a desired outcome of project actions. Design elements and structures are intended to enhance or restore natural hydrologic processes to promote geomorphic evolution of more active high flow (side) channels and floodplain. Design elements include construction of 24 individual log structures.

Lower Miller Creek Management and Channel Maintenance, Marin County, CA

Las Gallinas Valley Sanitary District, 2013-2015

Mr. Kamman was commissioned to formulate and implement a plan for sediment removal and improved flood flow conveyance in the Lower Miller Creek channel. The need for improved flood and sediment conveyance is driven by the following factors. Progressive accumulation of course sediment in the project reach had reduced area wide discharge efficiencies along Miller Creek and at District outfalls. The District had an immediate need to dredge Lower Miller Creek to protect existing operations and facilities. Miller Creek supports a population of federally listed Steelhead, and adjacent wetland areas potentially support other state and federally listed special status species. Therefore, permitting requirements and cost efficiency required minimizing the extent and frequency of channel excavation/maintenance that may adversely impact habitats in the wetland and riparian corridor.

The design objective of the project was to define and optimize an integrated channel maintenance, flood, and sediment management plan, that protects existing facilities from stream and coastal flood hazards. The plan's objective was to minimize costs and ecological impacts of future anticipated and designed maintenance activities required under District operations. Working with District Staff, Mr. Kamman developed a suite of potential project alternatives and identified a preferred approach. Mr. Kamman completed all CEQA compliance (IS/MND) and permitting. Mr. Kamman also managed and directed development of engineered drawings and assisted in bid document preparation.

Mr. Kamman provided site assessment, long term management planning and channel maintenance support to the Sanitary District to maintain flood conveyance, manage sediment aggrading at District outfalls, and improve ecological values in the intertidal Bayland reaches of Miller Creek. The creek supports multiple federal and state listed endangered species. Initial work included completing hydraulic and geomorphic assessments to characterize causes of channel aggradation, and quantify sediment yields. Assessments included evaluation of climate change impacts on habitat and flood hazards, and water quality modeling of District outfalls to quantify tidal exchange and dilution. Based on this analysis and supporting biological resource assessments, Mr. Kamman identified alternatives for channel maintenance, performed a cost benefit assessment of dredging alternatives, and is assisted the District in developing short and long term management objectives. Mr.Kamman also led a multidisciplinary design team in the preparation of engineering plans and specifications as well as permits and environmental compliance documents.

Vineyard Creek Channel Enhancement Project, Marin County, CA

Marin County Department of Public Works, 2007-2013

Mr. Kamman managed the preparation of designs and specifications for a flood conveyance and fish habitat and passage improvement project on Vineyard Creek. Creek corridor modifications included replacing the box culvert at the Center Road crossing with a free span bridge or bottomless arch culvert (civil and structural design by others), providing modifications to the bed and bank to eliminate erosion risks to adjacent properties and improve water quality, promoting active channel conveyance of both water and sediment, and providing improved low and highflow fish passage, improved low flow channel form and enhanced in-stream habitat, repairing eroding banks, and expanding/enhancing adjacent channel floodplains. The riparian corridor was replanted to provide a low-density native understory, "soft" bank erosion protection, and increased tree canopy along the tops of banks. Mr. Kamman prepared the JARPA for the project and conducted permit compliance and negotiations with all participating resource agencies. Designs and permitting also address the known presence of Native American artifacts. This work was contracted under an expedited design schedule and phased construction was initiated the summer of 2008 and continued the summer of 2009.

Bear Valley Creek Watershed and Fish Passage Enhancement Project, Marin County, CA

The National Park Service and Point Reyes National Seashore Association, 2005-2013

Working on behalf of the NPS and PRNSA, Mr. Kamman completed a watershed assessment and fish passage inventory and assessment for Bear Valley Creek. Work included a geomorphic watershed assessment and completing field surveys and hydraulic modeling (including flood simulations) of ten road/trail crossings to identify and prioritize creek and watershed restoration efforts while considering and addressing current flooding problems at Park Headquarters – a major constraint to channel restoration efforts that would likely exacerbate flooding. Mr. Kamman also completed a suite of conceptual restoration designs (Phase 1) including: the replacement of two county road culvert crossings with bridges; channel creation through a ponded freshwater marsh (former tidal marsh); and replacement of 4 trail culverts with prefabricated bridges; and associated in-channel grade control and fishway structures. Engineered drawings and specifications were also developed for some of these sites to assist PORE with emergency culvert replacements after damages sustained during the New Year's Eve flood of 2005. Mr. Kamman also directed geotechnical, structural and civil design of project components.

Two projects were completed in 2006 on emergency repair basis resulting from flood damages suffered during the New Year's Eve storm of 2005. The two most recent projects were constructed in 2013, consisting of a large bank repair and adjacent to main access road/trail and culvert replacement further upstream on same road. The bank repair utilized bioengineering approaches including engineered log revetments and log diversion vanes.

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

Kellogg Creek Restoration Project, Contra Costa County, CA
Olberding Environmental on behalf of the Contra Costa County Water District, 2012-2013

Mr. Kamman led the development of PS&E to restore 3,000 linear feet of riparian and associated creek corridor habitat. Project was designed as compensatory mitigation for direct and indirect impacts to jurisdictional waters from the Los Vaqueros Reservoir Expansion Project that Contra Costa Water District. Work included field investigations and data analysis to characterize hydrologic/ geomorphic conditions and numerical modeling to optimize desired inundation and hydroperiods. Work was completed under subcontract to.

Miller Creek Sanitary Sewer Easement Restoration, Marin County, CA
Las Gallinas Valley Sanitary District, 2010

Working on behalf of the District, Mr. Kamman completed field surveys and technical feasibility studies to develop engineering plans and specifications for a stream bank restoration project to protect an exposed sanitary sewer pipeline, stabilize incised banks, and promote an ecologically healthy stream corridor along an approximately 50 linear foot damaged reach of Miller Creek. The design includes backfill and materials to accommodate construction of a vegetated stabilized slope. The eroded bank repair included design of a 1:1 Envirolok vegetated slope with geogrid reinforced soil lifts extending eight to ten feet back from the slope face. One-quarter-ton rock will be placed in front of the Envirolok wall at the toe of the reconstructed bank to provide added scour protection. In order to perform the work, the project site will be dewatered. An existing felled tree perpendicular to the creek flow will be relocated and secured into the right creek bank with root wad remaining in active channel. All work on the bank and within the creek bed must be completed pursuant to project permits due to presence of steelhead trout.

California Coastal Trail Planning and Design at Fitzgerald Marine Reserve, San Mateo County, CA
WRA, Inc., 2008-2009

Mr. Kamman provided hydrology and hydraulics expertise in the planning and design for the 0.25-mile segment of the California Coastal Trail at the Fitzgerald Marine Reserve. The project was overseen by the San Mateo County Parks Department. This segment of Coastal Trail provides improved access from the trailhead to the beach as well as a free span bride over Vicente Creek. Greg completed the field surveys and hydraulic modeling to assist an interdisciplinary team to design the project. Understanding the hydrology of Vicente Creek and quantifying flood conditions was critical to successfully designing and constructing the free span bridge. He also evaluated how creek hydrology and coastal wave processes interact at the beach outfall in order to identify opportunities and constraints to beach access improvements (which will include crossing the creek on the beach) during both wet and dry season conditions in order to evaluate both permanent and seasonal crossing design alternatives.

Hydrologic Assessment and Conceptual Design for Conservation and Wetland Mitigation Bank Project, Stanislaus County, CA
WRA, Inc., 2009

Working as a subcontractor to WRA, Inc., Mr. Kamman provided hydrology, geomorphology and engineering support for the planning and design for a Conservation and Wetland Mitigation Bank on the San Joaquin River, in the Central Valley near Newman, California. The property is currently owned by the Borba Dairy Farms. The primary objective of the study was to characterize the hydrologic and geomorphic controls on the spatial distribution of habitat types. To meet this objective, Mr. Kamman's assessment included: (1) collecting and synthesizing hydrologic data to characterize existing and historic streamflow, geomorphic and shallow groundwater conditions; (2) filling a data gap by collecting topographic data of hydrologic features; (3) developing a hydraulic model capable of predicting water surface profiles for a range of design flows; and (4) quantifying the linkage between surface water/groundwater conditions and specific vegetation communities and habitat types through implementation of reference site assessments. Mr. Kamman also provided conceptual design and permitting support in evaluating habitat enhancement and creation opportunities on the site.

Redwood Creek Floodplain and Salmonid Habitat Restoration, Marin County, CA
Golden Gate National Recreation Area and Golden Gate Parks Conservancy, 2005-2008

Mr. Kamman lead development of a preferred project alternative and final project design drawings and specifications for a floodplain and creek restoration and riparian corridor enhancement effort on lower Redwood Creek above Muir Beach at the Banducci Site. A primary objectives of the project was to: improve salmonid passage/rearing/refugia habitat; riparian corridor development to host breeding by migratory song birds; and wetland/pond construction to host endangered red-legged frog. The preferred design includes: excavation along the creek banks to create an incised flood terrace; engineered log deflector vanes; removing and setting back (constructing) approximately 400-feet of levee; creating in- and off-channel salmonid rearing and refugia habitat; reconnecting tributary channels to the floodplain; and creating California red-legged frog breeding ponds. Designs were completed in 2007 and the project constructed in the summer of 2007.

Considerable hydraulic modeling was completed to evaluate and develop means to help reduce chronic flood hazards to surrounding roadways and properties. Alternatives that included set-back levees and road raising were developed and evaluated. Detailed and careful hydraulic (force-balance) analyses and computations were completed as part of engineered log deflector designs. These were unique and custom designed structures, building on past project efforts and in consultation with other design professionals.

This project demonstrates Mr. Kamman's ability to work closely with the project stakeholders to develop a preferred restoration alternative in a focused, cost-effective and expedited fashion. This was achieved through close coordination with the NPS and the effective and timely use of design charrette-type meetings to reach consensus with participating stakeholders. Conceptual through full PS&E were completed on-time and on-budget in 2007 and was project constructed in the fall of 2007. Mr. Kamman worked closely with NPS staff to "field fit" the project, by modifying grading plans to protect existing riparian habitat. Mr. Kamman also provided construction management and oversight to floodplain grading and installation of engineered log structures. Based on field observations, the project is performing and functioning as desired.

Pilarcitos Creek Bank Stabilization Project, San Mateo County, CA
TRC Essex, 2006-2007

Mr. Kamman directed field surveys and technical modeling analyses to develop restoration design alternatives for a Bank Stabilization Project on Pilarcitos Creek

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

in unincorporated San Mateo County, California. This work included hydrology and hydraulic design and preparation of plan sheets and technical specifications as well as a revegetation plan. Due to the importance of protecting an existing gas mainline, the design package will be completed in close coordination with TRC Essex geotechnical staff and revegetation subcontractor and PG&E civil staff. Design feasibility analyses focused on developing hydraulic design criteria for the project, including: estimates of design flood flow magnitudes (2-, 5-, 10-, 25-, 50- and 100-year floods); water surface elevation estimates for a suite of design floods; associated average channel velocities and shear stresses; and estimates for riprap sizing for channel bank toe protection. Plan sheets, technical specifications and cost estimates were provided for review and approval.

Watershed Assessments

Evaluation of Project Impacts on Oregon Spotted Frog, Klamath County, OR
Oregon Water Watch and Earthjustice, 2016-2019

Mr. Kamman designed a suite of hydrologic, hydraulic and geomorphic studies to evaluate proposed change operations of the Crane Prairie, Wickiup and Crescent Lake dams and reservoirs as related to harm to Oregon spotted frogs. Work began with analyzing impacts associated with proposed water delivery operations and developing a proposed alternative prioritizing protection and enhancement of frog habitat. This work followed with a technical review and critique of the USFWS's Biological Assessment. Work included preparation of four declarations for the clients.

Tennessee Hollow Creek Riparian Corridor Restoration, San Francisco County, CA
Presidio Trust, 2001-present

Mr. Kamman has been leading and assisting the Trust and Golden Gate National Recreation Area (GGNRA) in the planning and design on over a dozen multi-objective riparian corridor restoration and watershed management projects in the Tennessee Hollow/Crissy Marsh watershed since 2001. Specific project objectives include: daylighting creeks; riparian corridor restoration; expanding Crissy Marsh; enhancing recreation, education, archeological, and cultural resource opportunities; improving water quality discharges to San Francisco Bay; and remediation of numerous landfills within the watershed. Typical initial phases of work focus on characterizing surface and groundwater conditions within each project area and identifying opportunities and constraints to restoration of natural wetlands and creek/riparian corridors. Notable challenges of this work include restoring heavily disturbed natural resources in an urban setting while integrating designs with recreation, archeology/cultural resources, education and remediation programs. Mr. Kamman has acted as lead hydrologist and designer on eight separate reaches in the 271-acre Tennessee Hollow Creek watershed and several other projects within and in the vicinity of Mountain Lake.

All task authorizations under these on-call and individual design contracts and included hydrology and water quality assessments and conceptual restoration planning and design. The project areas overlapped both the Presidio Trust and NPS-GGNRA management areas. Preliminary construction cost estimates for project alternatives within the Tennessee Hollow watershed range from $10- to $20- million. Several restoration projects are also tied to providing mitigation for the current San Francisco Airport expansion and Doyle Drive Seismic Improvement projects. Several projects have been constructed since 2012 (Thompson's Reach, El Polin Loop), two projects (East Arm Mtn. Lake and YMCA Reach) were constructed in 2014, and MacArthur Meadow restoration in 2016.

This work illustrates the Mr. Kamman's ability to complete a broad variety of hydrologic analyses, including: multiple years of rigorous and thorough surface water and groundwater hydrologic and water quality monitoring throughout the entire watershed to characterize and quantify existing hydrologic conditions; development of a detailed watershed-scale water budget for existing and proposed land-used conditions (capturing existing and proposed vegetation cover types and land use activities) to calculate groundwater recharge estimates input into the numerical watershed model; preparation of EA sections on water resources and water quality (NEPA compliance) regarding Environmental Conditions, proposed Impacts, and Proposed Mitigations associated with the project; preparing detailed alternative plans; and coordination and preparation of engineered plans/specifications for construction. All work was completed on budget and in a timely fashion.

Mountain Lake Water Budget, San Francisco County, CA
Presidio Trust, 2012-2017

Mr. Kamman was retained to develop a water balance model for Mountain Lake in the Presidio of San Francisco. Through development of a water balance model, the Trust seeks to understand: the major source(s) of inflow to both Mountain Lake; anticipated seasonal (monthly) changes in water level relative to various outflow assumptions; and the relationship of surface and groundwater interaction. This information gained from this study will be used to: 1) better understand and manage lake levels for ecological habitats; 2) identify flood storage capacity of Mountain Lake and fluctuations in lake level under various storm conditions; 3) better understand and maintain wetland habitat in the east arm; and 4) complete mass balance calculations to assess water quality in and feeding into the lake.

To implement this study, Mr. Kamman developed a water budget model to identify and quantify the primary water inputs and outputs to the lake and determine major controls over water storage. Primary water budget variables analyzed includes: precipitation; evaporation/evapotranspiration; groundwater exchange; and surface runoff. This study also included a long-term field investigation completed between 2012 and 2016 to: identify all point source inputs such as culverts and drainage outlets; identify diffused surface runoff inputs from surrounding lands, including a golf course; better characterizing the function and performance of the primary lake outfall structure; monitor groundwater levels surrounding the lake; and continuously monitor lake water level and storage over a mult9i-year period. These data were used to quantify water budget variables used to build the water budget model. Precipitation and barometric pressure data used in the model was provided by the Trust maintained weather station. Model daily evaporation estimates came from a variety of local area gauges maintained by state agencies.

The water budget model developed for this study is successful in accurately simulating historic water level conditions. The model using a daily time-step appears more accurate than model using a weekly time-step, but both provide reasonable agreement with observed conditions. The model is highly sensitive to groundwater exchange with the lake. The water budget is also a proven useful tool for the design and analysis of improvements to the lake outfall structure and establishing flood storage needs to protect the adjacent highway.

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

Cordilleras Creek Hydrologic Assessment, San Mateo County, CA
City of Redwood City, 2002-2003

Mr. Kamman assisted the Cordilleras Creek Watershed Coordinator in planning, seeking funding, and implementing a hydrologic and biologic assessment of the Cordilleras Creek watershed. Work completed included completing a full creek reconnaissance and channel stability assessment, preparation of a watershed assessment work plan, presentations at public meetings, and study/review of flooding issues in the watershed. Challenges faced in this predominantly privately owned watershed include removal of numerous fish passage barriers and educating/coordinating property owners.

Capay Valley Hydrologic and Geomorphic Watershed Assessment, Yolo County, CA
Yolo County RCD, 2008-2010

Mr. Kamman designed and supervised a hydrologic, geomorphic watershed assessment, and conceptual restoration design for the Capay Valley segment of Lower Cache Creek . Funding for the project was from a CALFED Watershed Program grant. The Capay Valley reach of Cache Creek experiences considerable stream bank erosion, which contributes to downstream sedimentation. The channel instability also threatens adjacent homes and can negatively impact the riparian habitat along the creek that functions as an important wildlife corridor from the Western Coastal Range to the Yolo Bypass. Additionally, a significant proportion of methylmercury transported into the Bay-Delta originates from the Cache Creek watershed. The main goal of this proposed study is to address both the causes and the aforementioned consequences of bank erosion.

The assessment was designed to evaluate and quantify changes in hydrologic and geomorphic conditions in response to historical changes in land-use and water development (e.g., diversions, reservoir construction, groundwater pumping, etc.). This assessment also evaluated how historic human induced changes in hydrologic and geomorphic conditions affect riparian ecology in terms of the lost or altered floodplain area, character, and inundation frequency. A key product of this assessment was to distinguish between “natural” and “accelerated” bank erosion, and to identify the underlying causes (both natural and anthropogenic) so that appropriate solutions can be developed. Desired outcomes of the study included: reduce bank erosion by developing restoration designs for typical trouble sites; produce a ranking system to prioritize sites for stabilization and restoration; contribute to community education through watershed science education and the Yolo STREAM Project outreach program; improve water quality through reduction in accelerated erosion; and contribute to riparian corridor restoration and support the RCD’s Wildlife Conservation Board funded efforts to remove non-native tamarisk and around from the creek corridor. Work was completed through a broad spectrum of field and analytical investigations that received close review by the RCD, stakeholders, and a Technical Advisory Committee.

Ventura River Unimpaired Flow and Habitat Assessment, Ventura County, CA
City of Buenaventura and Nautilus Environmental, 2006-2007

Mr. Kamman completed a hydrology feasibility assessments as part of evaluating the reuse of Ojai Valley Sanitary District (OVSD) effluent for other beneficial uses. Currently, OVSD discharges treatment plant effluent to the lower Ventura River. The City and OVSD recognize that the reduction in the discharge of treated effluent to the Ventura River could have an environmental effect on sensitive and endangered species. In light of these concerns, this study was conducted to determine if a reuse project is feasible without significant environmental harm.

The assessment included hydrologic and geomorphic field and analytical assessments of past (unimpaired), current and proposed surface and groundwater flow conditions over a wide range of dry- through wet water year-types. The main objective if these analyses was to determine the linkage to water quality and aquatic habitat conditions including: flow durations; extent of gaining vs. losing reaches; low flow inundation/wetted area; and influence on barrier beach dynamics. Mr. Kamman collaborated with a team of other professionals to prepare a facility plan documenting the analyses and conclusions of respective water recycling investigations.

Hydrologic Analysis of FERC Minimum Flows on Conway Ranch Water Rights, Mono County, CA
Law Office of Donald Mooney, 2001-2002

Mr. Kamman completed a hydrologic analysis to evaluate if FERC’s proposed Minimum Flow Plan for Mill Creek would interfere with the exercise of the Conway Ranch’s water rights from Mill Creek. The approach to this analysis was to quantify the duration of time the Conway Water right was met under historic gaged and simulated proposed Minimum Flow Plan conditions. The primary objective of the analysis was to evaluate impacts during the winter period when flows are typically limited due to water storage as snow pack. Minimum Flow Plan conditions were simulated by developing a spreadsheet model that redistributes actual (historic) Lundy Lake releases in a fashion that maintains a minimum flow of 4 cfs to Mill Creek to accommodate the downstream Southern California Edison’s (SCE) power plant. The analysis period for both historic and simulated Minimum Flow Plan conditions consisted of water years (WY) 1990 through 1998 to capture an exceptionally diverse range of wet and dry year-types.

The primary method used to quantify changes in flow between historical and simulated Minimum Flow Plan conditions was to prepare and compare flow duration curves for each condition during both the winter and summer periods during a variety of water year types. Model results were tabulated for each conditions to determine the differences in the percentage of time target flows were equaled or exceeded. Based on these findings, Greg was contracted to complete more in-depth monthly modeling.

Groundwater Management Projects

Assessments of Groundwater-Surface Water Interaction, Stanislaus County, CA
The Law Offices of Thomas N. Lippe, APC and California Sportfishing Protection Alliance, 2015-present

Since 2015, Mr. Kamman has been assessing groundwater conditions within Stanislaus County and evaluating potential impacts of groundwater pumping on surface water flow and aquatic habitat of the Stanislaus, Tuolumne and San Joaquin Rivers. Mr. Kamman completed a comprehensive review and synthesis report of available groundwater and interconnected surface water (ISW) reports and data. Using available soils, geology and hydrology information, Mr. Kamman also delineated and mapped subterranean streams and Potential Stream Depletion Areas (PSDAs) to identify stream corridors susceptible to adverse impacts from groundwater pumping. This information is intended to help Groundwater Sustainability Agencies identify potential impacts to ISW.

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

Most recently, Mr. Kamman has been retained to review and comment on 7 Groundwater Sustainability Plans (GSPs) for critically overdraft groundwater subbasins within or adjacent to Stanislaus County. This review focused on how GSPs address Groundwater Dependent Ecosystems (GDE) and ISW. Comments included recommendations on monitoring and study plans to identify and quantify impacts of groundwater pumping on stream flow rates and associated ecological habitats.

Assessment of Surface Water-Groundwater Interaction, Humboldt County, CA
Friends of the Eel River (FOER), 2020-present

Mr. Kamman is currently providing technical assistance in understanding surface water-groundwater interactions in the Lower Eel River Valley. Work includes reviewing and synthesizing available reports and hydrologic data and providing a science-based opinion on the role groundwater plays in supporting stream flow and aquatic habitats. This analysis addresses conditions and changes associated with seasonal and long-term wet-dry cycles. Data gaps will be identified and documented during the analysis.

This work is being completed to support FOER efforts at protecting aquatic resources within the framework of current water management practices and the public trust doctrine under California law. Additionally, this work includes providing hydrologic and hydrogeologic review, comment and recommendations during development of the basin's Groundwater Sustainability Plan (GSP) under the California Sustainable Groundwater Management Act (SGMA).

Scott Valley Subbasin Technical Hydrogeologist Assistance, Siskiyou County, CA
Klamath Tribal Water Quality Consortium and Quartz Valley Indian Reservation, 2019-present

Mr. Kamman is providing technical review and comment on the groundwater models and associated studies in the Scott Valley groundwater subbasin under the Sustainable Groundwater Management Act (SGMA) process. Work includes: review of groundwater models; synthesis and review of available groundwater quality data; assisting to identify constituents of concern; and review of the planning and technical studies being used to develop a basin Groundwater Sustainability Plan (GSP).

Middle Russian River Valley Shallow Groundwater Storage Enhancement Study, Sonoma County, CA
Friends of the Eel River, 2016

Working on behalf of Friends of the Eel River, Mr. Kamman completed a study to identify and quantify the volume of recoverable aquifer storage along two independent 6-mile reaches within the alluvial fill valley of the Russian River. The approach to this study was to quantify how channel incision has reduced shallow groundwater levels and quantify how much aquifer storage can be increased if channel bed elevations are restored to historic levels. The goal of this investigation was to identify feasible approaches to increase groundwater storage that would off-set losses associated with the termination of out-of-basin diversions from the Eel River. This work was completed through: intensive review and mapping of available groundwater level data; quantification of aquifer hydraulic properties; and calculating the shallow aquifer storage volume. In total, reclaiming the shallow aquifers within these two areas yield a total added storage volume of over 20,000 AF.

Green Gulch Farm (GGF)/Zen Center Water Resources Investigation, Marin County, CA
Green Gulch Farm, 1998-2019

Mr. Kamman completed a multi-phase study to evaluate the short- and long-term water uses and resources at GGF. Work was initiated by developing comprehensive water usage/consumption estimates and assessing available water resources, including spring, surface water, and ground water sources. Water demand estimates included quantifying potable and agricultural water usage/demands. Once reliable water supplies were identified and water usage/demand figures calculated, Mr. Kamman provided recommendation for improvements to water storage and distribution systems, land-use practices, conservation measures, treatment methods, waste disposal, and stream and habitat restoration. The initial phase of work included: in-depth review of available reports and data; review of geology maps and aerial photography; review of water rights and historic land use records; field reconnaissance including year-round spring flow monitoring; mapping and quantifying existing runoff storage ponds; and surface water peak- and base-flow estimates.

The second phase of work included identification of possible groundwater sources and siting and installation of production wells. This included sighting three drilling locations, obtaining County and State well drilling permits for a domestic water supply; coordination and oversight of driller; and directing final well construction. Upon completion of a well, Mr. Kamman directed a well pumping yield test and the collection and analysis of water quality samples (including Title 22) for small water supply system use. The final phase of work included assisting GGF with water treatment system options at the well head and integration of the groundwater supply into an existing ultra-violet light treatment system servicing spring water sources. Work was completed in 2000 with a budget of approximately $25,000, including all driller and laboratory subcontracting fees.

Stanford Groundwater Assessments, Santa Clara County, CA
Stanford University Real Estate Division, 2012-2016

Mr. Kamman provided technical hydrogeologic services to evaluate groundwater conditions and drainage requirements associated with the construction of several new facilities on or near Page Mill Road. The main objective of this study is to determine the seasonal depth to groundwater beneath the project site under existing and potential future conditions and provide an opinion on if the project is required to comply with the City of Palo Alto, Public Works Engineering Basement Exterior Drainage Policy (effective October 1, 2006). This work included obtaining and reviewing available technical reports, maps and literature pertaining to groundwater conditions in the project vicinity. Based on this review, we have prepared a letter report of findings and recommendations.

Bodega Bay Wetland Water Supply, Sonoma County, CA
Friends of Bodega Bay, 2007

Mr. Kamman Conducted an evaluation of the groundwater underflow feeding a large coastal wetland in Bodega Bay and recommended mitigation measures for potential losses in supply associated with proposed residential development in recharge areas. Work included: long-term monitoring of ground water quality and supply; monitoring surface water and spring flow and water quality; assessing and characterizing the interaction between surface and subsurface water sources during different seasons and water year-types; developing a detailed water budget for the site to assess impacts to recharge areas; and developing a number of physical solutions to mitigate for recharge losses.

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

L.A. Department of Water and Power, Groundwater Recharge Facility Operation Study, Los Angeles County, CA
ICF Consulting, 2006

Working as a subcontractor to ICF Consulting of Laguna Niguel, California, Mr. Kamman provided technical assistance in the hydraulic modeling of sediment accumulation in selected spreading ground facilities owned and operated by the Los Angeles Department of Public Works. The object of this work is to evaluate changes in infiltration and groundwater recharge rates over time within the spreading grounds in association with sediment accumulation from turbid waters.

Corde Valle Golf Club Surface-Groundwater Interaction Study, Santa Clara County, CA
LSA Associates, 2004

On behalf of LSA Associates of Pt. Richmond, CA, Mr. Kamman completed a 3rd party independent review of available reports and data sets (boring logs, well water levels, groundwater quality, aquifer pump-test, and surface water monitoring) to evaluate if pumping of the Corde Valle irrigation well is adversely impacting flow in West Llagas Creek. This investigation was implemented in response to a concern expressed by California Department of Fish and Game staff regarding the potential for differential drying of the West Branch of Llagas Creek along Highland Avenue. The analysis was also complicated by the likely effects of pumping from surrounding off-site wells.

Aquifer Testing for Tennessee Hollow Watershed Project, San Francisco County, CA
Presidio Trust, 2002

The Mr. Kamman assisted in the design and implementation of an aquifer test at the Presidio of San Francisco. We prepared an aquifer test work plan and conducted step-drawdown and constant-rate aquifer tests at the site using both manual and electronic data collection methods. This work included interpretation of the aquifer test results using software-based solution methods and prepared a written summary of methods and findings. In addition, Mr. Kamman located, coordinated and managed a drilling effort for the logging and installation of several groundwater monitoring wells in the project area to address identified data gaps.

San Joaquin River Riparian Corridor Restoration Project, San Joaquin Valley, CA
McBain-Trush, 2002

Mr. Kamman completed an assessment of historic and existing shallow groundwater conditions beneath and adjacent to the San Joaquin River between Friant Dam and the Merced River. This work focused on reviewing available reports and flow/groundwater- level data to characterize surface water and groundwater interaction and implications for riparian vegetation, water quality and fishery habitat restoration. Hydrologic analyses were performed to identify the location and seasonal evolution of losing and gaining reaches an implication on future restoration planning and design efforts. The main deliverable for this analysis was a report section focused on describing the historical changes in regional and local groundwater conditions in the San Joaquin Valley and evolution of anthropogenic activities (e.g., groundwater withdrawals, irrigation drainage systems and return flows, development of diversion structures, changes in land-use; and introduction of CVP/State Water Project deliveries) and associated impacts on deep/shallow groundwater levels, surface water flows, and surface and groundwater quality.

Tidal, Estuarine & Coastal Projects

Quartermaster Reach Wetland Restoration Project, San Francisco County, CA
Presidio Trust, 2006-present

Mr. Kamman was retained in 2006 as part of a multi-disciplinary team to develop restoration alternative designs for a 10-acre filled and paved site marking the historic confluence of Tennessee Hollow Creek and Crissy Marsh adjacent to San Francisco Bay. The Trust's planning documents define the main objectives for Tennessee Hollow restoration as: a) "Restoration [of Tennessee Hollow] will expand riparian habitat and allow for an integrated system of freshwater streams and freshwater, brackish, and tidal marsh, re-establishing a connection to Crissy Marsh" and b) "Restore and protect Tennessee Hollow as a vibrant ecological corridor". The project is located within the setting of a National Park and a National Historic Landmark District. Thus, another goal for the project is to protect the area's historic buildings and sensitive cultural and archeological resources to the extent possible, to enhance visitor experience to the area, and to integrate creek restoration with other urban land uses.

Mr. Kamman provided H&H technical input and consultation to the design team to develop a restoration project consisting of a creek-brackish marsh-salt marsh interface and associated upland habitats. His work included evaluating surface water, groundwater and tidal sources. In addition, the development of a hydrodynamic model has informed and guided a preferred project design, including evaluation of storm surge, road crossing and Tsunami impacts to the project. A technical challenge addressed with the use of the model included predicting and quantifying salt/brackish marsh habitat zones within the restored wetland in response to periodically but prolonged closed-inlet conditions to Crissy Marsh - a water body that serves as the downstream connection to the proposed project.

Another unique challenge to this project includes integrating restoration planning and design efforts with the replacement and retrofit of Doyle Drive, the main on/off-ramp for the Golden Gate Bridge, being replaced along the entire northern boundary of the Presidio. Mr. Kamman is providing long-term technical review of this project to the Trust with respect to impacts to water resources and associated existing ecological habitats. The Quartermaster project also falls within the managerial jurisdiction of both the Presidio Trust and NPS-GGNRA, requiring work in close cooperation with both Presidio Trust and National Park Service (NPS) staff.

Salt River Ecosystem Restoration Project, Humboldt County, CA
Humboldt County RCD, 2005-2019

Mr. Kamman provided hydrology, engineering and environmental compliance services towards the planning and design of river and tidal wetland restoration on the Salt River (Eel River Delta plain) near Ferndale, California, in Humboldt County. The purpose of the Salt River Ecosystem Restoration Project (SRERP) is to restore historic processes and functions to the Salt River watershed. These processes and functions are necessary for re-establishing a functioning riverine, riparian, wetland and estuarine ecosystem as part of a land use, flood alleviation, and watershed management program. The Salt River Project has three components: 1) dredging the lower Salt River and lower Francis Creek from near the Wastewater Treatment Plant downstream for 2.5 miles; 2) restoring 247 acres of wetland estuary habitat in the lower Salt River within the 440-acre former

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

dairy; and 3) reducing sediment inputs from tributary watersheds. The Salt River Project was designed using an "ecosystem approach" to address hydrology, sedimentation, and fish and wildlife habitat.

As part of project feasibility assessment, Mr. Kamman completed a hydrologic and water quality monitoring program, and developed a MIKE11 hydrodynamic model of the lower Salt River and Eel River estuary in Humboldt County, for the Humboldt County RCD. The purpose of this work was to complete a hydrologic, geomorphic, and hydraulic modeling assessments of the character and dominant physical processes controlling flow of water and sediment through the lower Salt River. Land use changes in the area have caused significant aggradation and infilling of the Salt River, significantly reducing tidal exchange, fish passage, and exacerbating flooding in upland areas. A primary goal of this study is to evaluate the feasibility of proposed restoration elements intended to increase tidal prism and exchange and in-channel sediment scour and transport. The desired outcome is a sustained increase in river conveyance capacity to improve drainage of surrounding flood-prone lands and improve aquatic, wetland, and riparian habitat.

As part of project development and feasibility assessment, Mr. Kamman completed a hydrologic and water quality monitoring program and MIKE11 hydrodynamic model development of the lower Salt River and Eel River estuary in Humboldt County for the Humboldt County RCD. The purpose of this work is to complete a hydrologic, geomorphic, and hydraulic modeling assessments of the character and dominant physical processes controlling flow of water and sediment through the lower Salt River. Land use changes in the area have caused significant aggradation and infilling of the Salt River, significantly reducing tidal exchange, fish passage, and exacerbating flooding in upland areas. A primary goal of this study is to evaluate the feasibility of proposed restoration elements intended to increase tidal prism and exchange and in-channel sediment scour and transport. The desired outcome is a sustained increase in river conveyance capacity to improve drainage of surrounding flood-prone lands and improve aquatic, wetland and riparian habitat.

Western Stege Marsh Restoration Project, Contra Costa County, CA
Tetra Tech, 2008-2010

Mr. Kamman provided technical hydrology and wetland hydraulics support to post-project monitoring of the Western Stege Marsh Restoration Project. His involvement began by providing an independent technical review of previous year's hydrologic monitoring results to evaluate the proposed monitoring success criteria and the rationale used to develop these criteria. This work entailed reviewing historic monitoring data and available natural slough channel geometry data-sets for San Francisco Bay area marshes. Mr. Kamman's study approach was to independently develop desired and sustainable channel geometry relationships for natural, healthy San Francisco Bay salt-marshes and compare them to the published success criteria. Greg was also retained to implement the Year 4 post-project hydrologic monitoring, with modifications to aid in better linking hydrologic processes to ecological conditions and function within the restored marsh. This work consisted of completing more targeted water level monitoring and channel geometry surveys in reference marsh areas containing desired physical and ecological attributes. These data were used to develop geomorphic success criteria (target channel geometry) more tailored to the project marsh and augment the criteria provided in available literature. Working closely with the project team of scientists, Mr. Kamman compared these hydrologic monitoring results to available vegetation surveys to better assess the overall success and evolutionary trend of the marsh.

Giacomini Wetland Restoration Project, Marin County, CA
The National Park Service and Point Reyes National Seashore Association, 2003-2012

Mr. Kamman managed a multi-year project for the NPS in the design and feasibility analysis of a tidal wetland, riparian, and freshwater marsh complex, on the 500-acre Giacomini Dairy Ranch, at the south end of Tomales Bay. The project began in 2003 and included hydraulic, hydrologic, and geomorphic assessments to characterize existing physical conditions, developing restoration alternatives, and completing hydrologic feasibility analyses. Restoration alternatives evaluated creation of a mosaic of subtidal through upland wetland and riparian habitat zones, as well as improvements to salmonid passage, red-legged frog habitat, tidewater goby habitat, and clapper-rail habitat. Emphasis was placed on completing detailed studies to quantify project-induced changes in flood frequency, magnitude and duration, impacts on water quality to local groundwater supply wells, and changes in sediment and water quality conditions in Tomales Bay.

Beginning in 2006, Mr. Kamman managed and assisted design engineers, preparing plans, specification, and cost estimates for a three phased construction schedule, that was completed in the summer of 2008. This project illustrates Mr. Kamman's ability to complete a broad variety of hydrologic feasibility analyses, including flood frequency analyses for contributing watersheds, reproducing historic flood events through numerical modeling, flow duration analysis and evaluation of environmental flow regimes, development of a water budget for created freshwater marsh and frog breeding ponds, sediment yield estimates, completing field monitoring (flow, water level, groundwater level, sediment, and water quality monitoring) to characterize existing site hydrologic and geomorphic conditions (fluvial and tidal), wind-wave setup and run-up for levee stability determination and construction design, coordinating and performing topographic and hydrographic surveys, performing hydrodynamic and water quality modeling of existing and alternative conditions, developing detailed construction cost estimates preparation of technical reports and design drawings and specifications in support of NEPA/CEQA environmental compliance, and public meeting presentation and participation. In addition, Mr. Kamman managed staff in the generation of DEM and TIN models of the existing site and all action alternatives. All work was completed on budget and in a timely fashion, despite repeated expansions to the project boundary and last minute changes driven by endangered species issues.

Critical Dune Habitat Restoration to Protect Threatened and Endangered Species, Marin County, CA
The National Park Service, 2009-2010

Mr. Kamman provided and managed engineering, design, and implementation planning support for the restoration of 300 acres of critical dune habitat at Abbots Lagoon within the NPS Point Reyes National Seashore. He developed engineered drawings, technical specifications and engineer's cost estimates, and assisted NPS in defining a range of methodologies suitable to local conditions and sensitive flora and fauna. This area of the park supports the best remaining intact dune habitat, including some of the largest remaining expanses of two rare native plant communities: American dune grass (Leymus mollis) foredunes, and beach pea (Lathyrus littoralis). European beach grass and iceplant were removed from

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

the project site using mechanical removal and hand removal techniques. The project goal was to remove these invasive species from approximately 135 acres of prime dune habitat in the 300-acre project site, while not impacting sensitive species and habitats. The intended result was to remobilize this historic dune field and restore their natural form and migratory processes.

This project illustrates Mr. Kamman's ability to work closely with NPS staff to balance habitat protection and restoration across the landscape. As part of project design, he developed grading plans, and specified work flow, equipment movement and access routes which minimize impacts to special status species. Extensive fencing and exclusions zone planning was required to protect existing native habitats, and minimize tracking of plant stock to or through restored sties. In addition work elements had to be structured and prioritized to maximize ground work subject to budgetary constraints and work flow uncertainties. All work has been completed on budget and in a timely fashion, even with repeated expansions to the project boundary and affected area and last minute changes driven by endangered species issues.

Lower Gualala River and Estuary Assessment and Management Plan, Mendocino County, CA

California State Coastal Conservancy and Gualala River Watershed Council, and Sotoyome RCD, 2002-2005

Mr. Kamman worked with fisheries biologists to evaluate the hydrologic and water quality conditions in the lower Gualala River and estuary and identify and evaluate potential impacts to summer rearing habitat for salmonids and other aquatic organisms. This work included: assessing how the impacts of upstream land use (logging and water diversions) have altered water delivery and water quality to the Lower River and estuary over time; characterizing the physical coastal and riverine processes controlling opening and closure of the estuary inlet and lagoon morphology; monitoring and characterizing real-time and seasonal changes in lagoon water level and water quality; and evaluating the sediment transport capacity and geomorphic condition of the lower river and estuary. Mr. Kamman took the lead in developing and editing a management plan for the lagoon, prescribing actions to preserve, protect and enhance ecological habitats (with emphasis on salmonids) within the lagoon and lower Gualala River.

This project was completed on-time and on-budget and demonstrates Mr. Kamman's ability to integrate physical, water quality and biological data and information into a coherent and understandable description of the interrelated processes controlling the aquatic ecology of a lagoon system. A big challenge on this project was completing a high-quality and defensible field monitoring program on a "shoe-string" budget. The outcome of this study provides important understanding on how and why steelhead are surviving in a heavily logged (95% private ownership) watershed. The management plan prescribes recommendations to preserve and protect the lagoon as primary rearing habitat for steelhead.

Suisun Bay Tidal Wetland Restoration Design, Contra Costa County, CA

East Bay Regional Park District and LSA Associates, 1999-2005

Mr. Kamman provided hydrologic design services to the restoration of a 55-acre tidal wetland on Suisun Bay. The design will maximize habitat for special status fish species, and (to the extent possible) habitat for other special status animal and plant species. Working with a multi-disciplinary design team, Mr. Kamman assisted in developing a design based on analysis of habitat needs, tidal hydrodynamic and geomorphic processes, sedimentation rates and soil characteristics. Project tasks included: a site analysis defining existing ecological and hydrologic conditions; a hydrologic and biological restoration opportunities and constraints analysis to define restoration and management objectives; and hydrodynamic and sedimentation modeling to evaluate design alternatives. The final restoration and management plan included a grading plan, landscape revegetation plan and monitoring and maintenance plans. This work again illustrates his capabilities in the characterization of physical site conditions, development and feasibility analysis of project alternatives, and preparation of preliminary designs of sufficient detail to allow for environmental compliance through the CEQA/NEPA process.

Santa Clara River Estuary and Lower River Assessment, Ventura County, CA

Nautilus Environmental on behalf of the City of Ventura, Public Works Department, 2003-2004

Mr. Kamman directed a hydrologic and geomorphic assessment of the lower Santa Clara River and estuary. This work was completed for prime contractor in an effort to assist with re-permitting of treated effluent discharges to the estuary. The proposed study entailed characterizing existing and historic hydrologic and physiographic conditions and an assessment of historic changes in inflow to the estuary. This task included a comprehensive review and evaluation of available hydrologic reports and flow data within the watershed to characterize changes in flow associated with development of numerous water projects within the Santa Clara River basin. The main deliverable from this analysis was the development of a historic unimpaired flow record to the estuary based on regional regression analyses and water operations modeling. Within the estuary, Mr. Kamman designed and conducted a multi-year monitoring program of water levels, water quality (temperature, dissolved oxygen, salinity, and pH), and sand-spit morphology in order to evaluate inlet opening/closure frequency and associated changes in aquatic habitat (esp. tidewater goby) and other ecologic communities. A considerable portion of this subtask included detailed coastal process analysis (including wave power analyses and littoral sand transport), which, considered with the inflow analysis, provides a basis to evaluate the seasonal cycle of barrier beach buildup and destruction.

This project illustrates Mr. Kamman's ability to complete a broad variety of hydrologic and coastal process analyses under strict regulatory oversight. A premier study completed on this project was the development of a detailed water and salinity budget model for the estuary to evaluate the impacts of a wide variety of proposed and modified estuary inflow regimes to determine potential future water level and salinity conditions in the lagoon and impact on frequency of inlet breaching. In addition to coordinating and implementing a variety field monitoring and surveys, Mr. Kamman also provided real-time information and input to informational and negotiation meetings with state resource and regulatory agencies.

Eden Landing Ecological Reserve Restoration, Alameda County, CA

East Bay Regional Park District, 2000-2003

Mr. Kamman developed and completed hydraulic and hydrodynamic modeling assessments for the design of an approximately 1000-acre tidal marsh restoration in former Cargil salt manufacturing ponds, located a mile inland of San Francisco Bay. The restoration goals required balancing the desires to restore tidal marsh conditions to the site, while maintaining and enhancing the open water and salt

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

panne habitats preferred by resident and migratory shorebirds. The restoration plan also needed to incorporate restoration objectives with remediation of high soil salinities resulting from past salt production, subsided ground elevations, dredging of new channels to the bay, existing infrastructure constraints, public access for the San Francisco Bay Trail, and preservation of several important cultural and historical sites. Hydraulic design objectives include maximizing both interior circulation and tidal exchange between the restoration parcel and the bay. A series of one-dimensional unsteady hydrodynamic models (MIKE11) were used to design the channel network, identify high velocity areas requiring erosion protection, and characterize expected habitat conditions. An important component of this design and feasibility assessment was to translate desired ecological habitat conditions identified in the EIR into specific hydrologic design criteria, considering channel velocities, scour, sediment transport, tidal water inundation frequencies and seasonality of ponding. Mr. Kamman worked closely with EBRPD civil engineers, assisting with the translation of hydraulic design criteria into final engineered drawings and specifications.

Wetland & Pond Projects

Design of California Red-Legged Frog Breeding Ponds, San Francisco Bay Area (various), CA

The National Park Service and Golden Gate National Parks Conservancy, 1997-present

Mr. Kamman has lead or provided hydrologic and engineering design assistance to the sighting and design of nearly two dozen breeding ponds for California red-legged frog throughout the San Francisco Bay Area. Work has been completed in Marin, Sonoma, Solano, Contra Costa, Alameda, and Santa Clara Counties under the auspices of numerous federal, state, and local county/city agencies. A common study approach consists of an initial site reconnaissance of watershed conditions and identification of potential sites. The reconnaissance is followed by a surface water hydrologic sufficiency analysis using available meteorologic and stream flow information. An important variable sought during pond sighting is the presence of migration corridors between known breeding areas and/or perennial water sources. Based on in-depth research and post-project monitoring, Mr. Kamman has refined or developed site-specific evapotranspiration estimates, which commonly do not match standard applied values. Accurate evapotranspiration rates are necessary if ponds are intended to periodically dry-down as a means to preclude undesired species such as bullfrog or mosquito fish. In many instances, a seasonal groundwater-monitoring program is implemented in order to better investigate and quantify potential and seasonal groundwater contributions. Other design challenges we commonly experience include: design of impermeable liners for ponds located in upland areas or highly permeable soils; hydraulic analyses and design of outfalls/spillways; sedimentation management/maintenance approaches; and requirements of inoculum and water used to line and fill the pond, respectively.

Hydrologic Feasibility Assessment for Mana Plain Wetland Restoration Project, Kauai, HI

State of Hawaii Department of Land and Natural Resources, 2010-2019

Working on behalf of the Mana Plain Wetland Restoration Partnership, Mr. Kamman completed a hydrologic feasibility assessment for the Mana Plain Wetland Restoration Project proposed by the State of Hawaii Department of Land and Natural Resources (DLNR), Division of Forestry and Wildlife (DOFAW) on the island of Kauai. The Mana Plain Wetland Restoration Project site is approximately 105 acres of low-lying abandoned sugarcane fields immediately north of the Kawaiele Waterbird Sanctuary and east of the Pacific Missile Range Facility. The purpose of the Mana Plain Wetland Restoration Project is to maximize the area of constructed wetlands within the restoration site. Palustrine emergent wetlands within the project will create habitat for four species of endangered Hawaiian waterbirds and other sensitive species, including: Hawaiian stilts; Hawaiian ducks; Hawaiian coots; Hawaiian moorhen; migratory waterfowl; and migratory shorebirds. The Mana Plain is of vital importance for the recovery of endangered waterbirds species. This restoration project will be designed to provide important breeding and feeding wetland habitats on an island where; 1) wetlands have been severely degraded, and 2) mongoose, an introduced predator, have not been established.

Mr. Kamman's work on this project included technical assessments and development of proposed restoration alternatives. Analyses completed included: a synthesis of the physical site setting (topography, geology, hydrogeology and soil); reviewing available data to characterize site meteorology, surface water drainage, water quality, and groundwater conditions; preparing a detailed water budget to describe the characteristics and processes of surface water and groundwater movement into and through the project area; evaluating project feasibility, water supply alternatives and costs; and completing a flood hazard impact assessment to evaluate potential project benefits and impacts to local area flooding. Working with the project partners, Mr. Kamman developed a preferred project alternative and supported in preparation of the project Environmental Assessment document. Mr. Kamman's firm was also retained by the State of Hawaii to develop engineering designs of the project.

MacArthur Meadow Wetland Restoration, San Francisco County, CA

Presidio Trust, 2013-2016

Mr. Kamman has been working on over a dozen independent wetland and creek restoration planning and design efforts within the Presidio of San Francisco since 2001. Most recently (2016), he developed a wetland restoration grading plan for the MacArthur Meadow Wetland Restoration Project in the central portion of the Tennessee Hollow watershed. As part of the site assessment, Greg characterized and modeled surface and groundwater interactions and identified a unique opportunity to restore 4 acres of mixed meadow, natural wetlands and creek/riparian corridor. This was possible due to the discovery of shallow groundwater conditions beneath this historically disturbed landscape. Various design components were integrated into the grading plan in order to enhance groundwater recharge and storage in the Meadow, while retarding runoff and drainage out of the wetland, including: daylighting storm drain runoff into the Meadow; reconfiguring internal channel alignments to enhance channel habitat and groundwater recharge; creation of wetland depressions to retain and recharge surface water; and removal of fill material to decrease the depth to the water table. Notable challenges of this work include restoring heavily disturbed natural resources in an urban setting while integrating designs with archeology/cultural resources, education and remediation programs.

Dragonfly Creek Restoration Project, San Francisco County, CA

Presidio Trust, 2007-2011

Mr. Kamman designed and managed hydrologic monitoring and analysis studies in support of planning and design for riparian and wetland habitat restoration along approximately 500-linear feet of the Dragonfly Creek corridor near Fort Scott of the Presidio of San Francisco. Work has included completing subsurface

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

investigations including the installation of shallow wells and a sharp-crested weir with recorder to gauge creek flows. Mr. Kamman assisted in the development and selection of a preferred project alternative, considering on-site cultural resource protection, education and resource management issues (including flood control). Mr. Kamman prepared permit applications. Major components of the project included removal of significant fill and building foundations and installation of a new creek road crossing that will maintain the historical alignment, function and architectural character of a culturally significant roadway. Mr. Kamman oversaw development of PS&E for this project, which will create mitigation wetlands for a highway earthquake retrofit project that passes through the Park.

This project illustrates Mr. Kamman's ability to complete a broad variety of hydrologic analyses, including: surface water and groundwater hydrologic monitoring to characterize and quantify existing hydrologic conditions; rainfall-runoff modeling; hydraulic modeling of flood and scour conditions (including road crossing); preservation of existing wetland habitat and vegetation communities; integration with other Presidio Trust programs; and contracting flexibility to assist in conceptual planning and environmental compliance without increasing project design costs.

Mori Point Sensitive Species Habitat Enhancement Project, San Mateo County, CA
Golden Gate National Recreation Area and Golden Gate National Parks Conservancy, 2005-2011

Mr. Kamman provided hydrologic analyses, sighting and engineering design (PS&E) for three California red-legged frog breading ponds within the 105-acre Mori Point area. These efforts were completed in association and collaboration with a larger Coastal Trail improvement and ecosystem restoration effort. Quarrying and off-road vehicle use have left this site heavily scarred. The focus of restoration work was to protect the endangered San Francisco garter snake and the threatened red-legged frog. Most of this work will be focused on invasive species removal and enhancing endangered species habitat. As part of species habitat improvement, Mr. Kamman worked with project ecologists to design the ponds to optimize breeding habitat for California red-legged frog.

Work started with an initial site reconnaissance and study of watershed conditions and identification of potential sites. The reconnaissance was followed by a surface water hydrologic sufficiency analysis using available meteorological and stream flow information and installation and monitoring of shallow piezometers to quantify the proximity and seasonal variability in depth to water table. An important variable sought during pond sighting was the presence of migration corridors between known breeding areas and/or perennial water sources. Based on in-depth research and post-project monitoring for other ponds they created in the San Francisco Bay area, Mr. Kamman refined site-specific evapotranspiration estimates. Accurate evapotranspiration rates are necessary if ponds are intended to periodically dry-down as a means to preclude undesired species such as bullfrog or mosquito fish.

Other design challenges experienced included: design of impermeable liners for ponds located in upland areas or highly permeable soils; hydraulic analysis and design of outfalls/spillways; sedimentation management/maintenance approaches; and requirements of inoculum and water used to line and fill the pond, respectively. Mr. Kamman has designed numerous ponds for the NPS and affiliates within the Bay Area, including Mori Point (constructed 2007), Banducci (constructed 2007) and Giacomini (Phase I and Phase II constructed in 2007 and 2008) project sites.

Hydrologic Assessment and Restoration Feasibility Study for Shadow Cliffs Regional Recreation Area, Alameda County, CA
East Bay Regional Park District, 2009-2010

Mr. Kamman developed and implemented an assessment to identify groundwater levels and supplemental water supplies that will sustain seasonal wetland restoration areas and riparian habitats under an altered future hydrologic regime. This work will inform a forthcoming Land Use Plan Amendment for park occupying a series of former gravel quarry pits. Work included: obtaining and synthesizing available surface water and groundwater data to characterize existing hydrologic and water supply conditions and seasonal variability; quantifying the likely changes in groundwater conditions and quarry pit lake levels in association with changes in regional water transmission and groundwater recharge operations; and identifying, developing and evaluating a suite of ecosystem restoration alternatives. Other important project objectives include: improving habitat for waterfowl and wildlife; broadening recreational use; enhancing visitor education and wildlife interpretation; improve park aesthetics. Mr. Kamman evaluated a preferred park and ecosystem enhancement alternative that involves diverting high winter flows from an adjacent arroyo. This project demonstrates Greg's ability to characterize hydrologic conditions and quantify the relationship between groundwater, surface water and wetland habitat conditions, both under existing conditions and in predicting future hydrologic and ecologic conditions under an altered hydrologic regime (i.e., lower groundwater table).

Laguna Salada Marsh and Horse Stable Pond Restoration Project, San Mateo County, CA
Tetra Tech, 2007-2009

Mr. Kamman provided technical hydrology and hydraulics support to the planning and conceptual restoration design of Laguna Salada marsh and Horse Stable Pond, located adjacent to Sharp Park Golf Course in the town of Pacifica, California. The primary objectives of the project are: to reduce flood impacts within the project vicinity; improve sustainable ecological habitat for the endangered San Francisco garter snake and the threatened California red-legged frog; better understand and characterize the hydrologic and water quality conditions/processes affecting flood and ecological habitat conditions within the project vicinity; provide an effective pumping operation plan to meet ecological objectives; and develop appropriate hydrologic analytical approaches and models to assist Tetra Tech and the San Francisco Recreation and Park Department in the planning and design for marsh, pond, and creek restoration. The project is also a unique opportunity to connect this resource with the California Coastal Trail, the Bay Area Ridge Trail, and the surrounding GGNRA lands.

Mr. Kamman's work included completing a comprehensive review of available hydrologic and site information and implementing selected field investigations to develop and calibrate an integrated hydrology-flood routing-pond water operations model that will quantify the volume and depth of water moving through the project system. The investigation will also further characterize shallow groundwater conditions and water quality with respect to effects on Laguna Salada and Horse Stable Pond. Analytical and numerical modeling tools are being used to better characterize existing hydrologic and water quality conditions and to assist in identifying project opportunities and constraints as well as evaluate potential restoration design components - all necessary to inform a sustainable

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

and successful restoration design.

Tolay Lake Restoration Feasibility Assessment, Sonoma County, CA
Sonoma County Agricultural Preservation and Open Space District, 2003

Mr. Kamman completed a detailed hydrologic feasibility analysis to evaluate a suite of potential freshwater lake and wetland restoration alternatives. Sites were evaluated under existing watershed land-use practices and under existing and forecasted water demands (in the form of existing water rights/applications). Analysis consisted of developing a detailed water budget model to simulate alternative restored lake inundation areas and depths under median and dry year conditions, as well as a 50-year historic period (1947-1997) displaying highly variable rainfall and runoff supplies. Three lake restoration alternatives were evaluated based on existing topography and likely historic lake configurations. The restoration alternatives include lakes with storage volumes equivalent to 136-, 1100-, and 2550-acre feet.

Haypress Pond Decommissioning and Riparian and Channel Restoration, Marin County, CA
Golden Gate National Recreation Area (GGNRA), 2001-2002

This project restored 170 meters of historic creek and riparian habitat through removal of Haypress Pond dam in Tennessee Valley within GGNRA. The goals of the project were to alleviate long-term maintenance needs and eliminate non-native bullfrog habitat threatening native California red-legged frog habitat in adjacent watersheds.

Working with the Park biologist, Mr. Kamman developed designs to decommission the dam and restore natural riparian and meadow habitat. This work included: characterization of existing topographic conditions; design of a channel profile through the proposed restoration project reach; preparation of a grading plan for the restoration project; and hydrologic and hydraulic analyses to evaluate the performance of the creek channel and flood plain below the former dam during a variety of flows. Challenges of this work included integrating sediment reuse into plans and construction phasing.

Damon Slough Site Seasonal Wetland Design, Alameda County, CA
Port of Oakland, 1999-2001

Working on behalf of the Port of Oakland, Mr. Kamman completed extensive surface and groundwater monitoring and data analyses to develop a detailed water budget to assist in the evaluation and design of a 7.5 acre seasonal freshwater wetland. Primary project objectives included a design that would provide shorebird/waterfowl roosting habitat, minimize impacts to existing seasonal wetland areas, and lengthen the duration of ponding through the end of April to promote use by migratory birds. In addition to developing hydrologic design criteria, responsibilities included development of grading plans to accommodate a local extension of the Bay Trail and wetland outlet works.

Water Quality Projects

Chicken Ranch Beach Soil and Groundwater Quality Investigation and Restoration Planning, Marin County, CA
Tomales Bay Watershed Council, 2007-present

Mr. Kamman is leading scientific and engineering efforts for a wetland and riparian corridor restoration project on Third Valley Creek and Chicken Ranch Beach in Inverness, California. The main project goals are to create a self-sustaining riparian and wetland system (requiring minimal operation and maintenance) and eliminate public exposure to high levels of bacteria that exist in a site drainage ditch discharging to the beach. The design will likely include establishing a blend of habitats, including: riparian stream corridor, seasonal/perennial freshwater marsh, and tidal/saltwater marsh.

Current efforts have included the development and implementation of a soil and groundwater quality investigation to delineate the source of elevated bacteria levels. This work includes: the collection and testing of depth-discrete soil samples; groundwater well installation, sampling and testing; and surface water sampling and testing; analysis of laboratory results; and reporting, including recommendations for further/expanded investigations. Mr. Kamman coordinated this time-sensitive sampling and analysis (six hour hold times) with Brulje and Race Laboratories in Santa Rosa.

Lower Miller Creek Channel Maintenance and Material Reuse Sampling Analysis Plan, Marin County, CA
Las Gallinas Valley Sanitary District, 2015

Mr. Kamman was commissioned to formulate and implement a plan for sediment removal and improved flood flow conveyance in the Lower Miller Creek channel. Accumulation of course sediment in the project reach had reduced discharge efficiencies at District outfalls. Miller Creek supports a population of federally listed Steelhead and adjacent wetland/marsh areas potentially support other state and federally listed special status species. Working with District Staff, Greg developed a suite of potential project alternatives and identified a preferred approach. Mr. Kamman completed all CEQA compliance (IS/MND), permitting and oversaw development of engineered plans and specifications.

In order to evaluate if reuse of excavated material from 2,655 feet of creek corridor in upland areas was feasible, Mr. Kamman developed and implemented a Sampling Analysis Plan (SAP) pursuant to U.S. Army Corps Guidance for Dredging Projects within the San Francisco District. Sample collection, sample handling, and analysis were performed in accordance with the SAP. Results for analytes were compared to a variety of screening criteria to determine the material's suitability for reuse in aquatic environments. A full suite of chemical and physical analyses were performed on soil samples collected from 16 locations, including: metals, PAHs, PCBs, pesticides, TOC, specific conductance, pH, sulfides, percent moisture and grain-size. Mr. Kamman managed all aspects of this effort including reporting and presentations/negotiations at multi-agency meetings through the Corps Dredge Materials Management Office (DMMO).

Lower Pitkin Marsh Hydrologic and Water Quality Monitoring, Sonoma County, CA
Sonoma Land Trust, 2008-2010

Mr. Kamman was retained to develop and implement a hydrologic and water quality monitoring program at Lower Pitkin Marsh outside of Forestville, California. The Pitkin Marsh area is one of the most valuable complexes of mixed riparian woodland and thicket, freshwater marsh, wet meadow, oak woodland and grassland in Sonoma County. The complex interaction of surface water, ground water, and scattered seeps and springs on the site creates unusual hydrologic conditions that promote a rare assemblage of plant species which includes several endemics. The primary objective of the hydrologic monitoring program was to understand the annual and season sources of both surface and ground water supplying wetlands. Hydrologic and water quality monitoring was

cbec eco engineering

Hydrology | Hydraulics | Geomorphology | Design | Field Services

SELECTED EXPERIENCE *(CONTINUED)*

initiated during the winter wet season of 2008/09 and will be conducted for a 12-month period through the ensuing summer dry-down and into the following wet season. Understanding how groundwater levels, spring flow and creek flow rates recede from winter wet to summer dry conditions will provide an important understanding and quantification of the seasonal variability in water supplies feeding selected wetland types. General water quality parameters (temperature, pH, specific conductance, and ORP) are measured at all monitoring locations during each visit. Nutrients (N and P) are measured in selected surface water and groundwater samples collected during at least three monitoring events, including a winter high flow, spring high base flow and summer low baseflow.

Pescadero Lagoon Restoration and Enhancement, San Mateo County, CA
California State Coastal Conservancy, 2005-2006

Mr. Kamman was retained to support restoration and water quality enhancement planning efforts in Pescadero Lagoon. In 2005-2006, he completed a synthesis of available hydrologic and water quality information in responding to requests for development of a hydrodynamic and water quality model of the lagoon. This model was considered as a means to identify causes for repeated fish-kills in the lagoon that occurred during initial breaching of the inlet. Mr. Kamman assisted in preparing a synthesis and model development feasibility report from this effort.

Water Temperature Simulations for Trinity River Fish and Wildlife Restoration Project, Trinity County, CA
Trinity County Planning Department, 1994-2004

For over a decade, Mr. Kamman completed a number of hydrology and water quality investigations in support of alternative feasibility studies on the Trinity River Fish and Wildlife Restoration Project in direct support of the Trinity River Restoration EIR/EIS. Studies involve assessing the effects of proposed flow alternatives on water temperature within and downstream of Lewiston Reservoir. Mr. Kamman was responsible for data collection, processing, and flow/temperature modeling of Lewiston Reservoir as part of a coordinated evaluation including other Trinity River system models. Another study included evaluating how project operations could be implemented or modified to optimize Lewiston Lake release temperatures to meet downstream temperature criteria and compensate for increased warming of the river associated with side channel and feather edge restoration activities. Mr. Kamman continues to evaluate how more recent water projects (raising Shasta Dam, Sites Reservoir, and the Waterfix tunnels) consider and integrate with the Trinity Restoration Project.

Upper Eel River Unimpaired Flow and Water Temperature Assessments, Humboldt County, CA
CalTrout, 1997-1999

Mr. Kamman evaluated changes in the natural flow regime of the upper Eel River, and developed an Upper Eel River proposed release schedule to enhance downstream Chinook and Steelhead spawning and rearing habitat. This work was triggered by proposals set forth by PG&E as part of their Potter Valley Project FERC relicensing process. Work consisted of two main investigations. The first included reviewing results of a ten year PG&E study and development of multivariate regression and stream reach (SSTEMP) temperature models to assess the effects proposed flow alternatives would have on downstream temperatures. The second investigation consisted of characterizing unimpaired flow conditions and developing a daily unimpaired flow record for use in project operation models.

Sixteen-story, 995,000 Square-Foot New Hospital
Proposed in Parnassus Heights

(Administrative Record (AR) 3667, 5914.)

Introduction

UCSF's Parnassus Heights campus lies in a beautiful but constrained location within a residential community on the slopes of Mount Sutro. This action challenges the Comprehensive Parnassus Heights Plan ("CPHP" or "Project") approved by the respondent University of California. The CPHP is wildly out of scale in Parnassus Heights. It envisions about six million square feet of construction, including a hospital of almost a million square feet. Decades ago, UC committed not to expand the campus in such impactful manner. Instead, it repeatedly leveraged its space cap promise to justify locating medical facilities that it now it operates successfully in other parts of the City — including at Mission Bay.

The CPHP EIR fails to analyze or mitigate many significant Project impacts and refused to study alternate sites for a new hospital at any other of UC's City properties. Petitioners thus seek enforcement of mandates of the California Environmental Quality Act via this Court's judgment and writ.[1]

Statement of Facts

UCSF's Parnassus Heights Campus in San Francisco includes 107 acres in the Inner Sunset. The sixty-acre Mount Sutro Open Space Reserve lies within the central and southern portion of the campus.

In response to neighborhood concerns, in 1976 UCSF permanently committed to limit buildings on the Parnassus campus to 3.55 million gross square feet (the "space ceiling"). (AR 43029-31; 43046-47.) UC reaffirmed this commitment in 2014 in the UCSF Long Range Development Plan ("2014 LRDP"). (AR 13483.) UC's space ceiling resolution designated the Mount Sutro Open Space Reserve as permanent open space and altered campus boundaries to permanently exclude certain properties and prohibit further expansion within a defined surrounding area. (AR 43029-31; 43046-47.)

The 2014 LRDP established strategies to reduce a space ceiling "overage" that existed at that time by "1) converting some existing office space (UC Hall and Millberry Union towers) to residential use; 2) demolishing a number of buildings and either moving occupants and programs to other campus sites or absorbing them into other buildings at Parnassus Heights; and 3) excluding all residential space from the space ceiling calculation." (AR 13523.) The 2014 LRDP also limited new construction "to the need to comply with state seismic legislation and to better meet campus housing goals" (AR 13519) and to build a "New Hospital Addition." (AR 13523.)

The CPHP would gut and exceed the 3.55 million gross square foot permanent space ceiling by 1.44 million gross square feet. Housing was excluded from the calculation, and so the resulting development would be approximately six million gross square feet, exceeding the promised space

[1] CEQA is codified at Public Resources Code sections 21000, *et seq*. All statutory citations *post* are to the Public Resources Code unless otherwise noted.

ceiling by nearly 100%. (AR 3684.) The CPHP proposes several projects to be completed by 2030, the largest being a sixteen-story, 294 foot-tall New Hospital and a new research and academic building. Other phases would be constructed through 2050. The CPHP calls for 2.9 million gross square feet of new buildings at the campus and amends the 2014 LRDP. (AR 3684 [Table3-2].)

The 2014 LRDP required retaining, and in some cases re-purposing, several historic campus buildings, including UC Hall and Milberry Union. (AR 13523.) The CPHP reverses course. It proposes to demolish buildings that are historically significant and eligible for or already listed in the California Register of Historical Resources. Their loss would cause significant environmental impact. These buildings include UC Hall, Millberry Union, School of Dentistry, Langley Porter Psychiatric Institute, Aldea San Miguel Housing Buildings 8, 10, and 12, and Saunders Court. (AR 238-43; 1738-49; 1755-56; 3890-3906; 3912-13; 6621-22.)

Standard of Review

"The foremost principle under CEQA is that the Legislature intended the act 'to be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language.'" (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 511 [Citations] (*County of Fresno*).) An EIR must reflect a good faith effort at full disclosure, with "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (*Laurel Heights Improvement Association v. Regents of University of California* (1988) 47 Cal.3d 376, 405 (*Laurel Heights I*); Cal. Code Regs., tit.14 ("Guidelines"), § 15151.)

In reviewing an EIR, courts determine whether the agency prejudicially abused its discretion by: (1) failing to proceed in the manner required by law, or (2) reaching a decision or determination that is not supported by substantial evidence. (*Laurel Heights I*, *supra*, 47 Cal.3d at 392.) "A reviewing court must adjust its scrutiny to the nature of the alleged defect, depending on whether the claim is predominantly one of improper procedure or a dispute over the facts." (*Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 435 (*Vineyard*).)

If an EIR fails to address an issue or omits essential information, courts employ de novo review to determine whether the agency violated the statute's disclosure requirements. (*Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal.5th 918, 935 (*Banning Ranch*).) Similarly, the sufficiency of an EIR's discussion of environmental impacts is reviewed de novo. (*County of Fresno*, *supra*, 6 Cal.5th at 514 ["whether a description of an environmental impact is insufficient because it lacks analysis or omits the magnitude of the impact is not a substantial evidence question."].) An EIR must analyze every issue for which the record contains substantial evidence supporting a "fair

argument" of significant impact. (*Visalia Retail, LP v. City of Visalia* (2018) 20 Cal.App.5th 1, 13 (*Visalia Retail*); *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 (*Amador Waterways*).)

Courts use the "substantial evidence" test to review an agency's factual conclusions. (*Vineyard, supra,* 40 Cal.4th at 435.) But "the existence of substantial evidence supporting the agency's ultimate decision . . . *is not relevant* when one is assessing a violation of [CEQA's] information disclosure provisions." (*Communities v. Richmond, supra,* 184 Cal.App.4th at 82 (italics added).) While substantial evidence review defers to an agency's role as fact-finder, such deference does not abdicate vigorous judicial review. (*Laurel Heights I, supra,* 47 Cal.3d at 409, fn. 12 ["We do not suggest that a court must uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference."].)

Argument

A. The EIR's Analyses of Growth Inducement and Population and Housing Impacts are Inadequate[2]

1. Facts Regarding Growth Inducing and Population/Housing Impacts

The campus population of students, faculty, staff, patients, and visitors is currently almost 18,000 and would increase due to the Project by almost 8,000 people by 2050, for a total campus population of over 25,000. (AR 4143; 4262; 1979.) The EIR explains that CPHP-induced population growth by 2050 in San Francisco would be about 7,300 and in the surrounding four counties about 5,500 persons. (AR 4262; 1979.) The EIR does not disclose campus-related employment, but indicates the Project would add over 4500 staff and faculty positions and 3400 related jobs by 2050; a total creation of about 8,100 new jobs. (AR 4143; 4264.)

The CPHP as proposed and evaluated in the EIR would develop 762 units of on-campus housing for students, faculty, and staff by 2050. (AR 13; 3670; 3675-76; 4262; 4145). At the eleventh hour before approving the CPHP, UC decided to build another 1,263 off-campus housing units. (AR 13; 262.) These off-campus units are not included in the EIR's project description, analysis of growth inducing impacts, analysis of population and housing impacts, or Mitigation Monitoring and Reporting Program ("MMRP"). (AR 3643-86; 4262-65; 4142-49; 6577-6607).

2. Introduction to Growth Inducement and Population/Housing Impacts

The EIR commits several legal errors in its analysis of off-campus housing displacement effects. It uses thresholds of significance that exclude consideration of substantial evidence that such impacts

[2] The issues in this section are "exhausted" in comments at AR 5822; 5878-84; 5894-5901; 758-59; SAR 63067-68. "SAR" refers to the proposed Supplemental Administrative Record attached to Petitioner's Motion to Augment Administrative Record.

may be significant. (*Visalia Retail, supra,* 20 Cal.App.5th at 13 [EIRs must analyze every issue for which the record provides a "fair argument" of significant impact]; *Amador Waterways, supra,* 116 Cal.App.4th at 1108-1109 ["thresholds cannot be used to determine automatically whether a given effect will or will not be significant"].)

As the Project would create many more jobs than houses, it would contribute to the severe existing "jobs/housing imbalance" in San Francisco and the Bay Area. When the people employed in an area greatly exceed available affordable housing, economic and social consequences lead to adverse impacts on the physical environment — within the purview of CEQA. Housing costs increase, driven by high demand and low supply, resulting in population displacement by "gentrification," as people with lower income are forced to seek lower housing costs elsewhere. The EIR omits analysis of such impacts, erroneously dismissing them as "social and economic."

CEQA recognizes a "significant effect on the environment" where "effects of a project will cause substantial adverse effects on human beings, either directly or indirectly." (§ 21083 (b)(3).) The San Francisco Department of Public Health has published guidance for assessing the effects of housing displacement caused by development projects, finding that physical effects include stress, unsafe housing, crowding, homelessness, unmet transport needs, and increased service needs. (AR 6867, 6869-70 ["Inadequate or unaffordable housing forces San Francisco residents into crowded or substandard conditions; requires them to compromise access to jobs and services, and quality education; and requires them to work multiple jobs to make ends meet"].)

CEQA requires that an EIR include a detailed statement of the growth-inducing impact of a proposed project. (§ 21100 (b)(5); Guidelines, § 15126.2 (e) [an EIR must "[d]iscuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment"].) A project has significant impacts if it would "induce substantial population growth in an area, either directly . . . or indirectly . . . ," or if it would "[d]isplace substantial numbers of people, necessitating the construction of replacement housing elsewhere." (Guidelines, Appendix G, §§ XIV(a), (b)).) The interplay between a project's economic and social effects is explained in the Guidelines at section 15064 subdivision (e):

> Economic or social changes may be used to determine that a physical change shall be regarded as a significant effect on the environment. Where a physical change is caused by economic or social effects of a project, the physical change may be regarded as a significant effect in the same manner as any other physical change resulting from the project. . . . If the physical change causes adverse economic or social effects on people, those adverse effects may be used as a factor in determining whether the physical change is significant. For example, if a project would cause overcrowding of a public facility and the overcrowding causes an adverse effect on people, the overcrowding would be regarded as a significant effect.

(*Citizen's Association for Sensible Development v. County of Inyo* (1985) 172 Cal.App.3d 151, 170-71 (*County of Inyo*) ["the lead agency shall consider the secondary or indirect environmental consequences of economic and social changes"].)

3. The EIR Omits Analysis of the CPHP's Off-Campus Housing Displacement Effects

The EIR analyzes "growth inducing" and "population and housing" impacts in separate chapters (AR 4262 [Ch 5.4]; 4137 [Ch 4.12]) but acknowledges that they are closely related. (AR 2097-99, 4262-64.) The EIR recognizes "the pressing need for affordable housing in San Francisco." (AR 3675-76.) The EIR concedes that "[c]ampus population growth under the proposed CPHP would not be entirely accommodated by the existing and new housing on site, and therefore would result in indirect housing demand beyond the campus site." (AR 4262.) Despite these facts, the EIR fails to analyze the off-campus housing displacement effects of CPHP-induced increases in student, faculty, and staff populations, new jobs, and housing demand.

For "population and housing" impacts, the EIR establishes three "significance criteria," querying whether the CPHP would:

> a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?
> b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?
> c) Exceed the LRDP EIR standard of significance by creating a demand for housing outside the market area where the facilities or site are located?

(AR 4142.) The EIR explains that criteria a) and c) are addressed in Impact POP-1 and criterion b) is addressed in Impact POP-2. (AR 4142.)

Impact POP-I relates to "unplanned population growth" and the creation of "demand for housing outside the market area." (AR 1979-83.) Impact POP-2 ostensibly relates to whether the CPHP would "displace substantial numbers of existing people or housing" that would "necessitate the construction of replacement housing elsewhere." (AR 1983, 4147.) The EIR admits that the project would draw thousands of new residents to the area; Impact POP-1 acknowledges "the housing demand associated with employment growth under the proposed CPHP." (AR 1982; 4146.) But while the EIR acknowledges that the CPHP-induced increase in population growth and associated demand for housing in the City's housing-short environment might indirectly displace residents and increase housing demand, its analyses of Impacts POP-1 and POP-2 do not analyze Project "housing displacement" effects in San Francisco or in the campus environs. The EIR discusses Impact POP-2 only as to temporary displacement of tenants in the Aldea housing complex on campus. (AR 1983-84, 4147.)

The EIR erroneously contends that gentrification is merely a social impact that need not be analyzed. (AR 5797-5800.) The EIR deploys thresholds of significance that artificially confine analysis to on-campus effects. It then fails to assess the indirect physical effects of gentrification/displacement as outlined by the Department of Public Health. (AR 5879, 5989; 6867-85.) The ignored effects include the CPHP-induced need for building new housing, which is a significant environmental impact. (*Ante*; Guidelines, Appendix G, § XIV (b).) The EIR's analysis of Impacts POP-1 and POP-2 and the FEIR's responses to comments as to those impacts are thus either irrelevant to the claimed legal error or not supported by substantial evidence.

Urban planner Terry Watt, ACIP [American Institute of Certified Planners], provided substantial evidence supporting a fair argument that the CPHP may cause a significant impact on housing demand in San Francisco; to wit: (1) the City is suffering a severe shortage of housing as well as a severe shortage of affordable housing; (2) for well over a decade, new jobs in the City far outstrip the rate of construction of new housing; and (3) the Project would exacerbate both of these existing conditions. (AR 5894-5901; 6711-13.) The EIR was thus required to analyze and mitigate the impact, and did not. (*Visalia Retail*, *supra,* 20 Cal.App.5th at 13.)

As Ms. Watt explained, the EIR fails to disclose that while Project-generated demand for housing would vastly outstrip construction of Project-related housing, San Francisco and the region have been grossly under-building while generating significant new jobs. In fact, the EIR provides no information about the current local and regional housing crisis, housing availability in the surrounding neighborhood and City, or affordability. The EIR fails to describe typical anticipated jobs and salaries of new faculty and staff, critical to estimating the percent that may qualify — along with students — as low income or very low income and likely require new low-cost housing. The EIR fails to acknowledge or offer mitigation for the fact that UCSF is a major contributor to the affordable housing crisis and would exacerbate that crisis by building out the CPHP without providing additional units affordable to new students, faculty, staff, and employees of supporting services. (AR 5894-5901.)

Since the record contains a fair argument that impacts may be significant, the EIR's omission of these analyses is prejudicial legal error. The standard for whether information omitted from an EIR is "essential" is similar to whether any procedural violation of CEQA is prejudicial. For the omission of essential information, "[t]he ultimate inquiry . . . is whether the EIR includes "enough detail 'to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'" (*County of Fresno*, *supra,* 6 Cal.5th at 516.) Similarly, "omission in an EIR's significant impacts analysis is deemed prejudicial if it deprived the public and decision makers of

substantial relevant information about . . . likely adverse impacts." (*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 463.)[3]

In addition to failing to assess physical effects of displacement and gentrification, the EIR erred by limiting analysis to on-campus effects. CEQA requires that an EIR evaluate, and that public agencies mitigate or avoid, significant effects of projects in the "area which will be affected." (*City of San Diego v. Board of Trustees of California State University* (2015) 61 Cal.4th 945, 957 (*City of San Diego*); *City of Marina*, *supra*, 39 Cal.4th at 367 ["CEQA does not . . . limit a public agency's obligation to mitigate or avoid significant effects to effects occurring on the agency's own property"]; Guidelines, § 15360.)

This rule applies to UCSF with particularity because CEQA and the Education Code require that UC analyze and mitigate off-campus impacts. (§ 21080.09 (b); Ed. Code, § 67504 (b)(1) ["the expansion of campus *enrollment and facilities* may negatively affect the surrounding environment. Consistent with . . . CEQA, it is the intent of the Legislature that the University of California sufficiently mitigate significant off-campus impacts related to campus growth and development" (italics added)]; *Save Berkeley's Neighborhoods v. Regents of University of California* (2020) 51 Cal.App.5th 226, 231 ("[G]rowth includes student enrollment increases, which the Legislature has acknowledged 'may negatively affect the surrounding environment'" [citing Ed. Code, § 67504 (b)(1)]).) The EIR's narrow focus on the Project's growth-inducing potential and tenant relocation impacts *on campus* ignores the physical impacts of CPHP-induced growth that would occur in the surrounding area.

The FEIR's response to comments raising concerns about housing are non-responsive or reflect legal errors discussed in the next section. Master Response 14 simply restates what the DEIR said about growth-inducing and population/housing impacts. (AR 5792-96.) It provides no new analysis in response to the comments. For example, it states that the Draft EIR "finds that the new households would create a demand for housing that would not be entirely accommodated by the existing and new housing on the Parnassus Heights campus site; that the result would be housing demand (and associated population growth) beyond the campus site;" and that while San Francisco

> . . . is the primary area that would be affected directly by CPHP-related population and housing effects, effects would extend beyond San Francisco to neighboring counties in the Bay Area. The Draft EIR explains that it would be speculative to characterize the site-specific environmental effects resulting from the development of such off-site housing as the development would occur over a large five-county area and over a period of time (note that the CPHP covers a period of 30 years).

[3] See also *San Joaquin Raptor I*, *supra*, 27 Cal.App.4th at 721-722 ["error is prejudicial 'if the failure to include relevant information precludes informed decisionmaking and informed public participation, thereby thwarting the statutory goals of the EIR process,'"], quoting *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712 (*Kings County*)].

(AR 6796.) The response artfully evades the question presented by the comments regarding the nature and extent of impacts on the community and the environment of additional affordable housing demand in a city with a dire shortage.

Master Response 14 also contends that the comments "conflate the conclusions of the population and housing analysis . . . with the CPHP's growth inducing effects . . . to assert that the Draft EIR is seeking to diminish the significance of the effects of the project on housing" and that "the two analyses are distinctly different in the impacts that they address." (AR 5796.) This response is immaterial. The EIR is required to analyze and identify mitigation for the CPHP's housing displacement impact; it fails to do so as described above, and the response fails to explain how or why any purported differences between population/housing and growth-inducing impacts under CEQA are relevant.

Master Response 15 makes two legal arguments, *i.e.*, that gentrification need not be studied because it is *only* a social and economic effect *and* that analyzing the indirect effect on the physical environment of the gentrification caused by the CPHP would be "speculative." (AR 5797-5800.) Both arguments constitute legal error.

The response cites appellate decisions for the proposition that gentrification is a social and economic effect. (AR 5798-800.) It fails to explain that the cases recognize that where substantial evidence supports a fair argument that a project's social and economic effects may indirectly lead to significant impacts on the physical environment, they must be studied in an EIR. (*E.g.*, *Joshua Tree Downtown Business Alliance v. County of San Bernardino* (2016) 1 Cal.App.5th 677, 685 ["only if the loss of businesses affects the physical environment — for example, by causing or increasing urban decay — will CEQA be engaged"]; *Maintain Our Desert Environment v. Town of Apple Valley* (2004) 124 Cal.App.4th 430, 446 ["social, economic and business competition concerns are not relevant to CEQA analysis unless it is demonstrated that those concerns will have a significant effect on the physical environment"]; *Goleta Union School Dist. v. Regents of University of California* (1995) 37 Cal.App.4th 1025, 1030-31 ["An EIR may trace a chain of cause and effect from a proposed decision on a project through anticipated economic or social changes resulting from the project to physical changes caused in turn by the economic or social changes"].)

As noted above, Ms. Watt's expert opinion provides substantial evidence supporting a fair argument. (*E.g.*, AR 5900 ["Based on accurate information about the pre-Covid SF and Bay Area housing crisis (summarized above), it can reasonably be concluded that the addition of 5,200 students, faculty and staff by 2050 and only 984 units produced, the housing need generated constitutes a significant impact"].) The EIR cannot lawfully omit any analysis of the issue.

The EIR's conclusion that the analysis would be "speculative" is unsupported by fact. (*Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The EIR must contain facts and analysis, not just the bare conclusions of a public agency"].) Ms. Watt details many types of information the EIR could and should have developed to conduct the required analysis. (AR 5894-5901.) UC failed to "use its best efforts to find out and disclose all that it reasonably can." (Guidelines, § 15144.) In *Stanislaus Audubon Society, Inc. v. County of Stanislaus* (1995) 33 Cal.App.4th 144, for example, the Court found substantial evidence that a proposed country club could induce housing development. As a result, it was inappropriate for the County to postpone review of the likely environmental effects until such effects had manifested. (*Id*. at158-59; see also *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal.App.4th 342, 370-71 (*Napa Citizens*) [an agency may not defer analysis of housing effects simply because the nature and extent of such development is unknown]; *City of Antioch v. City Council* (1986) 187 Cal.App.3d 1325, 1338.)

In sum, the EIR fails to include mandatory analysis of whether CPHP-induced increases in population and demand for housing would indirectly cause significant impacts on the physical environment and people off-campus by displacing people from their homes and creating a need for construction of new housing.

4. The EIR Incorrectly Applies "Ratio Theory" and Improper Baseline to Growth Inducement and Population and Housing Impacts [4]

The EIR's conclusion that CPHP growth inducement and population/housing impacts would be less than significant is based on additional errors of law. The EIR states:

> Implementation of the proposed CPHP would induce population growth in the Bay Area, but the population growth would *not be substantial in comparison* to growth that is projected and planned for San Francisco and the four study area counties in Plan Bay Area 2040 and the local general plans for the study area communities. Further, the population growth would not result in a demand for new housing that would exceed the capacity of the five-county market area.

(AR 1981; 4145 (italics added).) The EIR's rationale that the CPHP's growth is "not substantial in comparison" to growth projected for San Francisco and the four-county study area invokes the discredited "ratio theory."

CEQA prohibits such "drop in the bucket" analysis. (*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 515 (*Cleveland I*) ["SANDAG's conclusory statement that its role in achieving the Executive Order's 2050 emission reduction target is 'likely small' is not a valid reason for rejecting the target as a measure of significance"]; *San Francisco Baykeeper, Inc. v. State Lands Commission* (2015) 242 Cal.App.4th 202, 223 ["this approach 'avoids analyzing the

[4] These issues are "exhausted" in comments at AR 5880.

severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling.'"]; *Friends of Oroville v. City of Oroville* (2013) 219 Cal.App.4th 832, 841-42; *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 (*CBE v. Resources*) ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County*, *supra*, 221 Cal.App.3d at 718.)

Also, by comparing CPHP-induced growth to *planned* growth in the entire City and region, the EIR improperly compares the impact to what is allowed in planning documents rather than what exists in the environment. (*Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 321, n.6 (*South Coast*); *Environmental Planning and Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 358-59.)

5. The EIR Piecemeals Analysis of the New Housing Initiative[5]

Only days before approval of the CPHP, UC and the City and County of San Francisco agreed to a Memorandum of Understanding in which UC agreed to build 1,263 off-campus housing units. (AR 13; 262; 1302; 1314-15; 1355.) As noted above, this construction was *not* included in the EIR's project description, analysis of growth inducing or population and housing impacts, or the MMRP. But this new housing became part of the Project. Therefore, the EIR was required to study and mitigate its impacts.

CEQA's conception of the term "project" remains broad to maximize protection of the environment. (*Friends of the Sierra Railroad v. Tuolumne Park & Recreation Dist.* (2007) 147 Cal.App.4th 643, 653; *San Joaquin Raptor I*, *supra*, 27 Cal.App.4th at 730). "This big picture approach to the definition of a project (*i.e.*, including "the whole of an action") prevents a proponent or a public agency from avoiding CEQA requirements by dividing a project into smaller components which, when considered separately, may not have a significant environmental effect." (*Nelson v. County of Kern* (2010) 190 Cal.App.4th 252, 270-271.) Lead agencies must also evaluate the environmental impacts of reasonably foreseeable future activities associated with a CEQA project that may contribute to significant environmental effects. (*Laurel Heights I*, *supra*, 47 Cal.3d at 395-396.) This obligation attaches whether the new housing is considered part of the Project, a foreseeable future activity, or a separate project subject to cumulative effects analysis; one way or the other the EIR must conduct the analysis. (*San Joaquin Raptor I*, *supra*, 27 Cal.App.4th at 733.) Construction of off-campus housing is a reasonably foreseeable future activity associated with implementation of the CPHP.

Moreover, CEQA does not permit last minute changes to the project description. (*Washoe Meadows Community v. Dept. of Parks & Recreation* (2017) 17 Cal.App.5th 277 ["[F]or a project to be

[5] These issues are "exhausted" in comments at AR 750-753; SAR 3067-68.

stable, the DEIR, the FEIR, and the final approval must describe substantially the same project."]) "The defined project and not some different project must be the EIR's bona fide subject." (*Concerned Citizens of Costa Mesa v. 32nd Dist. Agricultural Assn*. (1986) 42 Cal.3d 929, 934.)[6] After adding 1,263 residential units, the DEIR, FEIR, and Findings do not describe the Project.

The EIR's omission of any analysis of whether CPHP-induced housing demand would cause significant environmental effects by displacing people from their homes and construction of new housing is a prejudicial legal error warranting issuance of a peremptory writ. Its absence precludes "those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'" (*County of Fresno*, *supra*, 6 Cal.5th at 516).

B. The EIR Fails to Lawfully Assess Impacts on Beach Water Quality[7]

1. Introduction and Standard of Review for Beach Water Quality Claims

CEQA requires that an EIR evaluate, and that agencies mitigate or avoid, significant effects of projects in the "area which will be affected by a proposed project." (*City of San Diego*, *supra*, 61 Cal.4th at 957; Guidelines, § 15360.) The project description is the activity the EIR evaluates for environmental impact (*Nelson v. County of Kern* (2010) 190 Cal.App.4th 252, 271-272; § 21065), while the environmental setting (i.e., baseline) is the condition of the environment against which the EIR will evaluate project changes for environmental harm (*South Coast*, *supra*, 48 Cal.4th at 315). Therefore, CEQA requires that an EIR describe the environmental setting. (*Ibid*; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 874 (*Eel River*); Guidelines, § 15125.) An EIR's description of the environmental setting must also describe relevant regulatory actions by other agencies that affect the setting. (*Eel River*, *supra*, 108 Cal.App.4th at 874 ["the EIR's description of the Project's environmental setting is deficient because it does not disclose . . . the fact that FERC is considering proposals to curtail these diversions in order to prevent harm to these species"].)

Here, the DEIR fails to describe either physical or regulatory components of the environmental setting as they relate to potential significant impacts on beach water quality. The DEIR then fails to assess Project impact on that water quality, which is severely degraded. The whole issue is ignored. (AR 1895-1911 [DEIR, Ch.4.9].) Extensive comments, including data showing current water quality conditions, explained how the Project's admitted increases in waste and storm water discharges would exacerbate this pollution. (AR 6052-65, 7461-8889.) Because substantial evidence supports a "fair argument" that the Project may cause a significant impact on beach water quality, the EIR was required

---

[6] Whether an EIR correctly describes a project is a question of law, subject to de novo review. (*South of Market Community Action Network v. City & County of San Francisco* (2019) 33 Cal.App.5th 321, 332.)

[7] The issues in this section were "exhausted" at AR 6052-65; 856-862; 7461-8889.

to analyze the issue. (*Visalia Retail, supra.)* The claim that the EIR omitted essential information is reviewed de novo. (*County of Fresno*, 6 Cal.5th at 516.)

2. The DEIR's Analysis of Impacts on Water Quality

The DEIR discloses that the project would add about 2.0 million square feet of new space and generate about 0.18 mgd (million gallons per day) of new wastewater/sewage. (AR 2084.) The EIR assesses this impact solely in terms of whether it may require construction of new wastewater treatment capacity, which construction might cause secondary environmental impacts. (AR 2063-91.) The DEIR concludes that such new construction would not be needed because "[w]astewater flows from the Parnassus Heights campus site would be directed to the OSP [Oceanside Treatment Plant]" that "has about 26 mgd of excess dry weather treatment capacity, which is adequate to accommodate the increase in flow generated by the net new development envisioned under the proposed CPHP." (AR 2084.)

With respect to stormwater discharges, the DEIR discloses that the campus drains both west to the OSP and east to the Southeast Treatment Plant (SEP) and that San Francisco operates a combined sewer system (CSS) that combines stormwater with sewage for treatment at these plants. The EIR concludes that impacts on surface water quality would be less than significant because the Project-induced increase in the acreage of impervious surfaces is only 4% compared to the current acreage of impervious surfaces on campus, and because operation of the CSS, the OSP, and the SEP is regulated by the San Francisco Regional Water Quality Control Board (Water Board) through permits issued pursuant to the National Pollutant Discharge Elimination System (NPDES) established by the federal Clean Water Act and the state Porter-Cologne Water Quality Control Act. (AR 1905-06.) The DEIR reaches this conclusion without quantifying the increase in stormwater discharge associated with the increase in impervious surface, without mentioning beach water quality or its severely degraded condition, and without a single word devoted to how combined Project-induced increases in sewage and stormwater discharges might exacerbate these conditions.

In addition to the increase in impervious surfaces and unquantified stormwater runoff from the "campus core," the DEIR discloses additional increases in impervious surfaces outside the campus core. (AR 1906.) The DEIR concludes these increases would also not cause significant impacts because of the "same or similar regulatory requirements as those described" for the campus core and because improvements constructed outside the campus boundary would be subject to "construction site runoff requirements and post-construction stormwater controls in accordance with the City Public Works Code and in compliance with the City's Stormwater Management Ordinance." (AR 1906.)

This portion of the DEIR is singularly uninformative. As it did with the increases in runoff from the campus core area, the DEIR provides no clues regarding the degree of increased stormwater runoff

associated with the increase in impervious surfaces outside the core. Also, while the DEIR intimates that off-campus facilities would be subject to San Francisco's "post-construction stormwater controls," it provides no information on the extent to which these controls might reduce CPHP-caused increases in runoff. As it does with Project-generated increases in sewage, the DEIR also relies on "the relatively small change" in Project-generated increases in stormwater discharge to conclude the impact on "stormwater drainage capacity, or additional sources of polluted runoff would be less than significant." (AR 1908.) In sum, the DEIR fails to assess whether increases in sewage and stormwater discharges, which are combined in the city's CSS, may cause significant impacts on beach water quality.

a. The DEIR Fails to Describe San Francisco's Degraded Beach Water Quality

Comments documented the degraded condition of San Francisco's beach water quality. (AR 6055-57.) The San Francisco Public Utilities Commission (SFPUC) monitors shoreline bacteria (*i.e.*, total coliform, e. coli and enterococcus) at sixteen stations around the perimeter of San Francisco where water contact recreation occurs, including additional monitoring whenever a treated discharge from the City's combined sewer system affects a recreational beach. When monitoring shows that bacterial contamination exceeds state health standards, the affected beach is "posted" to discourage water contact recreation. This database shows that between January of 2016 and June of 2020, there were 131 days on which at least one ocean side beach was posted for exceeding state health standards for any of the three types of bacteria tested; 333 days on which at least one bay side beach was posted, and 464 days on which at least one beach was posted.[8] (AR 6056; 7461-75 [Figures 1 through 15 summarizing beach water quality monitoring data January 1, 2016, though June 30, 2020].)[9] These results are in Table 2.[10]

Table 2 [Summary of Figures 1-15]

January 1, 2016, through June 30, 2020	**# of days when at least one beach was posted for at least one exceedance of a state health standard [Blue Bars]**	**# of beach postings for exceedances of state health standards or due to combined sewer system (CSS) overflow [Yellow Bars]**	**# of exceedances of any state health standard at any beach [Red Bars]**
Ocean Side beaches	131	210	298
Bay Side beaches	333	546	936
Ocean and Bay beaches	464	756	1,234

[8] Ocean side beaches are: Baker, China, Ocean, and Fort Funston. Bay side beaches are: Crissy Field, Aquatic Park, Mission Creek, Candlestick Point State Recreation Area, and Islais Creek.

[9] Figures 1 through 15 present monthly totals of days on which San Francisco ocean side and bay side beaches exceeded state health standards for any of the three types of bacteria tested.

[10] For January 1, 2016, though June 30, 2020, these figures show monthly totals for ocean side beaches (Figures 1-5), bay side beaches (Figures 6-10), and ocean and bay side beaches (Figures 11-15.) The SFPUC's raw water quality monitoring data for this time period is at AR 8047-8172.

The DEIR fails to disclose this information. Remarkably, the DEIR also fails to disclose that the waters of San Francisco Bay are listed as impaired for bacterial contamination under section 303(d) of the Clean Water Act ("CWA"), or that in 2016, the State Water Resources Control Board adopted a Total Maximum Daily Load for bacterial contamination for the bay. (AR 6056-57; 7484-86 [Ex 2]; 7488-7502 [Ex 3].)[11] Thus, any discharge exceeding the City's bacterial load allocation violates the CWA. In short, the current environmental setting/baseline at San Francisco's ocean side and bay side beaches is one of severe water quality degradation and the DEIR ignores this elephant in the room.

b. The DEIR Fails to Describe the Dysfunctional Regulatory System Governing San Francisco's Sewage Treatment Plants

As noted above, the Water Board regulates San Francisco's operation of the OSP and SEP through NPDES permits.[12] These permits require the SFPUC to submit monthly and annual self-monitoring reports (SMRs) to the Water Board, by online upload to the California Integrative Water Quality System database (CIWQS). The SMRs include raw data regarding water quality and narrative cover letters. The cover letters describe instances of permit non-compliance. The CIWQS database also includes notices of violations issued by the Water Board.

All instances of NPDES permit non-compliance at the OSP and SEP recorded from January 2016, to June 2020, are presented at AR 8004-22 [Ex 10] and AR 8024-45 [Ex 11], respectively. There were 171 instances of non-compliance and 44 Notices of Violation.[13] All instances of permit non-compliance at the OSP and SEP for the years 2008 through 2014 are presented at AR 7994-8002 [Ex 9]. The OSP and SEP have consistently failed to comply with their NPDES permits, including permit terms limiting bacterial contamination in their effluent discharges to the ocean and bay. Indeed, in 2019 the U.S. Environmental Protection Agency sent two Notice of Violation letters to the City detailing many of the worst violations of federal and state water pollution control laws due to bacterial contamination. (AR 7984-86 [Ex 7]; 7988-91 [Ex 8].) The DEIR ignores all of this.

c. The DEIR's Omission of Essential Information and Analysis Regarding Beach Water Quality Impacts Is Prejudicial

The DEIR's handling of impacts on beach water quality precluded meaningful consideration of the issue. The DEIR fails to describe the most important components of the environmental and regulatory settings relating to beach water quality, including severely degraded water quality conditions

---

[11] The Water Board's Order and Basin Plan Amendment to establish a Total Maximum Daily Load for bacteria at San Francisco bay beaches are AR 7484-86 [Ex 2] and 7488-7502 [Ex 3], respectively.

[12] The OSP is governed by NPDES Permit No. CA0037681, by way of Water Board Orders R2-2009-0062 (AR 7504-7663 [Ex 4]) and R2-2019-0028 (AR 7665-7814 [Ex 5]). The SEP is governed by is NPDES Permit No. CA0037664; Order No. R2-2013-0029. (AR 7816-7982 [Ex 6].)

[13] See AR 8177- 8501 [Ex 13], for the OSP, and AR 8503-8720 [Ex 14], for the SEP.

and the demonstrated inability of San Francisco's CSS to prevent these conditions. (*San Joaquin Raptor I, supra*, 27 Cal.App.4th at 722-30; *Eel River, supra,* 108 Cal.App.4th at 874.) Establishing the baseline environmental setting at the beginning of the CEQA process is a fundamental requirement so that project changes can be seen in context and significant effects accurately identified. (*Communities v. Richmond, supra,* 184 Cal.App.4th at 89.) Here, the DEIR ignores not only the baseline but the entire issue. Readers of the DEIR would have no idea that beach water quality is degraded, that regulatory efforts have failed to clean it up, or that the project may make it worse.

The DEIR also fails to describe the Project in enough detail to inform any analysis of water quality impacts, most egregiously with respect to increases in impervious surfaces outside the campus core. In addition, discussion of water quality impacts fails to account for stormwater and sewage being combined in the same pipes for conveyance to the OSP and SEP. Instead, the DEIR describes these waste streams in separate chapters, minimizing their combined impact. (AR 1895-1911; 2063-91.)

d. The DEIR's Reliance on the "Ratio Theory" and Another Agency's Regulatory Program are Errors of Law

The DEIR concludes that water quality impacts would be less than significant based on the relatively small increases in Project-generated sewage to be conveyed to the OSP and the relatively small increases in impervious surfaces that would increase stormwater runoff to the OSP and SEP. These are errors of law. As discussed *ante,* the "ratio" approach is a legal error.

The DEIR also bases its conclusion that water quality impacts would be less than significant on its unlawful reliance on other agencies' regulatory programs. As discussed, regardless of the DEIR's assertion that the OSP has sufficient *dry weather capacity* to meet current and projected demand, and regardless of the fact that San Francsico's CSS is regulated by NPDES permits enforced by the Water Board, the waters at San Francisco beaches frequently exceed state bacterial health standards. This error is especially prejudicial where, as here, the relied-upon regulatory program is failing to prevent severe beach water pollution. (*Ebbetts Pass Forest Watch v. California Dept. of Forestry and Fire Protection* (2008) 43 Cal.4th 936, 957 (*Ebbetts Pass*) [error to conclude that compliance with pesticide restrictions precludes significant impact]; *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16.)

3. The FEIR Fails to Cure the DEIR's Omission of Essential Information Regarding Beach Water Quality Impacts and the FEIR's Response to Comments Is Legally Inadequate

Lead agencies must meaningfully respond to significant environmental comments on a Draft EIR. (*Santa Clarita Organization for Planning the Environment v. County of Los Angeles* (2003) 106 Cal.App.4th 715, 723 ["It is not enough for the EIR simply to contain information submitted by the

public and experts. Problems raised by the public and responsible experts require a good faith reasoned analysis in response"]; *Environmental Protection Information Center v. Johnson* (1985) 170 Cal.App.3d 604, 628 ["Non-specific, general, or conclusory responses unsupported by empirical information, scientific authorities or explanatory information "fail to crystallize issues"]; *People v. County of Kern* (1974) 39 Cal.App.3d 830, 841 [Responses to comments must "set forth in detail the reasons why the particular comments and objections were rejected."].)

a. The FEIR's Responses Confirm the DEIR's Omission of Essential Information

Extensive comments on the DEIR, including data showing current beach water conditions, explained how the Project's admitted increases in waste and storm water discharges would exacerbate pollution. (AR 6052-65, 7461-8889.)[14] The DEIR failed to discuss beach water quality but generally found that Project-related water quality impacts would be less than significant. (AR 1904.) In response to comments, the FEIR and Findings reversed field and found that beach water quality impacts could be significant. (AR 4062; 222-226; 5783-5788 [Master Response 12].) The FEIR concedes that comments on the DEIR made "the valid point that existing water quality in the Bay and the Ocean is negatively affected by wet weather discharges, and that condition is part of the CEQA baseline for evaluation of impacts." (AR 5784.) The FEIR, does not however, remedy the DEIR's failure to describe "existing water quality in the Bay and the Ocean," nor how it is "negatively affected by wet weather discharges," nor provide this missing information as "part of the CEQA baseline for evaluation of impacts." The FEIR does not analyze the extent of use of the waters at San Francisco beaches for water contact recreation like swimming, kayaking, surfing, kite boarding, wind-surfing, and fishing, nor the extent to which degraded water quality and the SFPUC's beach water quality postings dissuade people from engaging in water recreation. The Draft EIR's omission of essential information is unremedied.

The change from the DEIR's finding that the impact is *not* potentially significant to the FEIR's finding that it *is* potentially significant is also not accompanied by any new information regarding the nature and severity of the potentially significant impact. As a result, the DEIR omits essential information. (*County of Fresno, supra*, 6 Cal.5th at 519 ["a sufficient discussion of significant impacts requires not merely a determination of whether an impact is significant, but some effort to explain the nature and magnitude of the impact"]; *accord, Cleveland I, supra*, 3 Cal.5th at 514–15, 529.)

[14] The Draft EIR comment letter is at AR 6052-6065. The Figures and Exhibits submitted with the comment are at AR 7461-8889.

b. The FEIR's Responses Improperly Compress Analyzing the Significance of Impacts with Identifying Mitigation Measures

Instead of analyzing the significance of the beach water quality impact, the FEIR proposes mitigation by expanding Mitigation HYD-1. (AR 5786-88; 6544-50.) Substituting mitigation for impact analysis violates CEQA. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 658 (*Lotus*) ["The failure of the EIR to separately identify and analyze the significance of the impacts . . . before proposing mitigation measures . . . precludes both identification of potential environmental consequences arising from the project and also thoughtful analysis of the sufficiency of measures to mitigate"]; *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 663 (*San Joaquin Raptor II*) ["A mitigation measure cannot be used as a device to avoid disclosing project impacts"].)

c. The FEIR's Responses Require Recirculation of a Revised Draft EIR

Amendment of Mitigation HYD-1 to reduce a newly-identified potentially significant effect requires recirculation of a revised Draft EIR. (*Pesticide Action Network North America v. Department of Pesticide Regulation* (2017)16 Cal.App.5th 224, 252 (*Pesticide Action*); *Spring Valley Lake Assn. v. City of Victorville* (2016) 248 Cal.App.4th 91, 108 [recirculation required where EIR proposes "ostensibly feasible way to mitigate" impacts and "a complete redesign of the project's stormwater management system"]; *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1120 [EIR's failure to evaluate or discuss feasibility of water supply mitigation requires recirculation]; Guidelines, § 15088.5 (a).)

The new terms in Mitigation HYD-1 include applying San Francisco's regulatory program for stormwater control and modeling stormwater flows from the Parnassus campus to "demonstrate that future incremental increases in stormwater and/or wastewater from the campus site under the CPHP would not cause or contribute to any increase in overflow volumes from the City's CSS discharge structures." (AR 4064-65.) While this is an improvement over ignoring the problem, the FEIR simply assumes that HYD-1 would be effective in reducing the newly-identified significant impact to less-than-significant. This is insufficient. The FEIR's supporting evidence raises more questions than it answers. (AR 5787-88.) For example, would it be physically feasible to impound enough stormwater during the rainy season to reduce the campus contribution to the CSS and avoid contributing to CSS overflows?

Thus, recirculating a revised Draft EIR with the new mitigation and supporting evidence is required to provide opportunity for the public and other agencies to review and comment.

d. The FEIR's Responses Improperly Defer the Formulation of Mitigation Measures

Mitigation HYD-1 includes the post-approval deferral of formulation of mitigation based on future analyses outside of the EIR's public review process. Even if the DEIR had first analyzed the problem, which did not occur here, CEQA would not allow such deferral unless the EIR satisfied several criteria. The EIR would have to show that it was impracticable to develop mitigation during the CEQA process and that there is evidence that future mitigation is feasible and will be subject to specific performance standards. (Guidelines, § 15126.4 (a)(1)(B); *Golden Door Properties, LLC. v. County of San Diego* (2020) 50 Cal.App.5th 467, 518-525 (*Golden Door II*); *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 858; *Cleveland II*, *supra*, 17 Cal.App.5th at 440-443 ["[i]mpermissible deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR"]; *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173 (*CCEC*) , 195 [a mitigation that does not commit the agency to specific action or standards is inadequate]; *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 740 (*POET I*) ["The deferral of the formulation of mitigation measures requires the agency to commit itself to specific performance criteria for evaluating the efficacy of the measures implemented."].)

Mitigation HYD-1 is a classic example of improperly deferred mitigation because it proposes a future process ungoverned by objective performance standards. An air pollution standard of "no increase in nitrogen oxide (NOx)" was held insufficient because the EIR established "no objective performance criteria for measuring whether the stated goal [*i.e.*, no net increase] will be achieved." (*POET I, supra*, 218 Cal.App.4th at 739-740.) Another case rejected a mitigation measure that proposed a "bilateral negotiation between a project proponent and the lead agency after project approval." (*Communities v. Richmond*, 184 Cal.App.4th at 92-6.) Here, MM HYD-1 is worse; it proposes a *unilateral* decision by the lead agency *after* project approval and *outside* of CEQA's public comment process.

Mitigation HYD-1 is also unenforceable. It includes no objective benchmarks, milestones, or reporting processes providing a basis for enforcement review or enforcement action by anyone outside of UCSF. CEQA requires that mitigations be enforceable. (*Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491; *Federation of Hillside & Canyon v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261.) The lack of enforceability is illustrated by the Integrated Catchment Model (ICM) component of Mitigation Measure HYD-1, which includes many layers of contingency: establishing a baseline, conducting modeling, determining if new infrastructure is needed, determining UCSF's fair share, paying fair share cost, etc. (AR 5787.)

Mitigation HYD-1 contemplates that UCSF would pay "its proportional share of the costs of expanding the CSS." This measure is illusory because there is no adopted fair share fee program to turn the dollars into infrastructure. The EIR cannot find the impact less than significant based on UCSF's intention to pay a fair share of construction costs where there is no assured plan to build the infrastructure. (*Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 1186-87.)

The FEIR admits that UCSF's contribution to combined sewer system overflows is potentially significant, but does not establish a threshold of significance for judging what degree of reduction of the contribution would reduce its contribution to less than "cumulatively considerable" in violation of CEQA. (*Lotus*, *supra*, 223 Cal.App.4th at 655 ["the EIR fails to identify any standard of significance, much less to apply one to an analysis of predictable impacts from the project"].)

UC was required — but failed — to revise the DEIR to analyze beach water quality impacts and to recirculate the revised DEIR for public and agency comment. The new information provided in the Final EIR triggers recirculation because it demonstrates that the DEIR circulated for comment on an issue of environmental import "was so fundamentally and basically inadequate or conclusory in nature that public comment was in effect meaningless." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1123, 1130 (*Laurel Heights II*); see also *Mountain Lion Coalition v. Fish & Game Com.* (1989) 214 Cal.App.3d 1043, 1052 ["If we were to allow the deficient analysis in the [DEIR] to be bolstered by a document that was never circulated for public comment . . . we would be subverting the important public purposes of CEQA"]; Guidelines, § 15088.5 (a)(4).)

C. The EIR Fails as an Informational Document Regarding Impacts to Transit Capacity

Three Muni lines run at the edge of the UCSF campus. These include the "N-Judah" line, which is the busiest in the Muni system. (AR 6097.) UC's findings acknowledge that the Project would have an impact on transit service: "The plan would increase traffic and demand for parking and public transit service." (AR 12.) Despite this, the DEIR failed to analyze the Project's impact on transit capacity:

> *Consistent with the CEQA Guidelines and the SF Guidelines*, the transportation impact analysis in this EIR analyzes the change to VMT [vehicle miles traveled] that would result from the implementation of the CPHP at the Parnassus Heights campus site. Changes to traffic operations in the study area (i.e., the level of service of project area intersections) and *transit operations (e.g. project generated transit ridership and effect on capacity utilization, potential delay to transit vehicles) is outside the scope of the CEQA analysis* and are not discussed below.

(AR 2035, italics added.)

The EIR further explains that impacts to transit are analyzed "for informational purposes only" in an appendix to the DEIR that "is provided for decision-makers' consideration, independent of the

environmental review process." (AR 2036.) The only purported analysis of transit impacts is contained in two Appendix paragraphs disclosing that the CPHP's generated vehicle trips and passenger loading activities "may periodically:

- Result in transit delay on Parnassus Avenue (6 Haight/Parnassus, 43 Masonic) and Irving Street (N Judah)
- Reduce accessibility by blocking multimodal transportation facilities, such as crosswalks, bicycle lanes, and/or transit stops."

(AR 3516.) The EIR Appendix further notes that "[T]here may be peak passenger travel periods where demand, either for the campus site overall, or for specific locations is greater than supply. During these periods there would be a higher chance of delay to transit or a reduction in access to transportation facilities." (AR 3517.) Relative to the inadequacy of this analysis, one expert traffic engineer noted that "[N]o feasibility study has been conducted on how much capacity is available to serve the UCSF expansion or how additional transit capacity can be provided to decrease solo vehicle trips." (AR 6097.) The DEIR applies no significance standard for impacts to transit capacity, makes no significance determination, and discussed no mitigation. The EIR's failure to analyze CPHP impacts on transit delay, and indirect increase to VMT is error that renders the EIR insufficient as an informational document.

1. Transit Delay Is a Cognizable Impact Under CEQA

While the DEIR is correct that automobile delay ("level of service" aka LOS) is no longer a CEQA measure of transportation impact, the same is not true for impacts to transit facilities. Impact to transit capacity is a relevant consideration under both the CEQA Guidelines and City Guidelines, with which the EIR purports to comply. (Guidelines, § 15064.3 (a)["[o]ther relevant consideration may include the effects of the project on transit"]; AR 991 [significance criteria include "[s]ubstantially delay public transit"]; 999 ["The department uses a quantitative threshold of significance and qualitative criteria to determine whether the project would substantially delay public transit"]; 1002 [required analysis for "public transit delay"]; 1005 [required cumulative analysis for "public transit delay"].) Guidelines Appendix G asks whether a project would "conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadways, bicycle and pedestrian facilities." (Guidelines, Appendix G, § XVII (a).) OPR's *Technical Advisory on Evaluating Transportation Impacts in CEQA* ("OPR Technical Advisory"), another document that the EIR purports to follow, includes a section entitled "Impacts to Transit" that provides in relevant part:

> Because criteria for determining the significance of transportation impacts must promote "the development of multimodal transportation networks" pursuant to Public Resources Code section 21099, subd. (b)(1), lead agencies should consider project impacts to transit systems and bicycle and pedestrian networks.

(AR 34406.) Rather than provide the required analysis, the FEIR doubles down on UC's position that

overcrowding a transit system is "not a CEQA concern." (AR 6120.) Incredibly, UC squarely points its finger at Muni to analyze the CPHP's impact on transit: "The CPHP is not responsible for analyzing the potential effects of Muni operational issues or changes, and Muni is expected to adjust operations accordingly." (AR 6113.) This is legal error. CEQA requires analysis of whether a project would overwhelm the existing transit system. (*Mission Bay Alliance v. Office of Community Investment & Infrastructure* (2016) 6 Cal.App.5th 160, 191 ["substantial evidence supports the conclusion that the Warriors can be expected to work with the transit agencies 'to provide additional . . . service' sufficient to mitigate the project's impacts on regional transit"].)

The FEIR asserts that UC's cramped view of its duties under CEQA is based "on the CEQA Guidelines and OPR Technical Advisory ["Advisory"]." (AR 6113.) As established above, Guidelines section 15064.3, subdivision (a) in no way supports omitting consideration of transit delay impacts. Similarly, the Advisory explains that "lead agencies should consider project impacts to transit systems and bicycle and pedestrian networks." (AR 34406.) While the Advisory also states that agencies "generally should not treat the addition of new transit users as an adverse impact," the "addition of new transit users" is not the same as overwhelming transit capacity. (AR 34406.) Further, the Advisory provides that impacts to transit capacity should be analyzed, at minimum, as a cumulative impact: "Increased demand throughout a region may, however, cause a cumulative impact by requiring new or additional transit infrastructure." (*Ibid*.)

2. Increased Transit Delay May Increase Vehicle Miles Traveled ("VMT")

Analysis of impacts to transit capacity is also required because overwhelming the transit system may have an indirect impact by increasing the Project's VMT. (AR 6096.) Transportation engineer Tom Brohard explained that "the table assigns relatively high percentages for transit use for faculty/staff/ students as well as residents. The higher transit percentages will likely go down if the transit system is overwhelmed and automobile use goes up." (AR 6096.) The CEQA Guidelines are in accord, noting that even a purely qualitative analysis of VMT "would evaluate factors such as the availability of transit." (Guidelines, § 15064.3 (b)(3).) A bare qualitative analysis is only allowed "if existing models or methods are not available." (*Ibid*.) Quantitative modeling is readily available for estimating VMT and transit impacts, and so must be utilized here. (AR 991-1003; *Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners* (2001) 91 Cal.App.4th 1344, 1381 (*Berkeley Keep Jets*).)

In response, the FEIR inaccurately pronounced that "there is no evidence to suggest that transit crowding *alone* leads to an increase in VMT that would result in a significant impact under CPHP." (AR 6113-14, italics added.) This mischaracterization does not justify ignoring the issue. First, engineer Brohard's comment provides evidentiary support for the uncontroversial fact that overwhelming transit

would lead more people to choose automobiles. (AR 6096.) The City — which operates the transit system — agrees that "transit delay greater than one-half headway . . . might result in a significant impact . . . due to a substantial number of people riding transit switching to riding in private or for-hire vehicles." (AR 999].) Second, UC cannot justify ignoring transit overcrowding simply based on speculation that such overcrowding "alone" may not push VMT above the relevant significance standard. (Guidelines, § 15358 (a)(2) [requiring an EIR to analyze "indirect or secondary effects"].)

Moreover, even without transit overcrowding, the Project would increase VMT. (AR 6099 ["Here, VMT is shown to increase by 23% and 15% for the CPHP"].) Engineer Brohard explains that the existing transit system in the Project area may already be overwhelmed, so that the Project may result in higher VMT than disclosed in the DEIR. (AR 6096-97.) The EIR therefore fails as an informational document by lacking analysis as to whether the Project's predicted impact on transit overcrowding (AR 3516) would indirectly exacerbate the Project's acknowledged increase in VMT.

In summary, no authority supports UC's claim that transit overcrowding is "not a CEQA concern." (AR 6120.) The Guidelines, OPR Guidance, and San Francisco guidance demonstrate that it is a relevant consideration, and even provide methodology for analyzing the impact. Further, overcrowding transit may indirectly contribute to increased VMT. Finally, even if UC is correct that no significance standard is directly "applicable" due to its Constitutional status, that does not obviate the need for analysis where, as here, the record supports a fair argument of a significant impact.

D. The EIR Fails to Properly Analyze and Mitigate Construction Noise Impacts

Although construction-related impacts are sometimes trivialized because of their typically "short" duration compared to potentially indefinite operational impacts, that is not the case here — where the Project will be ongoing for nearly 30 years. The CPHP's "*Initial"* Phase projects would be under construction until 2030. (AR 1951.) The "*Future*" Phase of construction would go on for another twenty years — between 2030 and 2050. (*Id*.) This means that if UC starts construction in 2022 (as it says it will), "sensitive receptors" — people who live and work adjacent to and surrounding the Parnassus Heights campus would be exposed to nearly three decades worth of construction noise, activity and emissions. During that time, residences on all sides of the campus, some as close as 70 feet from active construction, would be menaced by sustained noise levels over 75 dBA. (AR 1956-57.)

The EIR attempts to minimize the extraordinary amount of expected noise, at times 27 dBA above ambient levels, by stating that they "would only occur a short percentage of the overall construction period." (AR 1955.) Considering the nearly three-decades of construction, this vague assertion is not reassuring. Potential health impacts of exposure should have been analyzed and effective mitigation identified, but were not. These failures violate CEQA and require revision of the EIR.

1. Predicted Noise Levels are Not Correlated to Identified Human Health Impacts

The EIR finds that construction activities implementing the CPHP would generate noise levels in excess of applicable standards, identified as a significant impact. However, the EIR must take the analysis a step further by correlating significant noise to potential health effects. (*County of Fresno, supra*, 6 Cal.5th at 520 [EIR failed to correlate significant emissions to human health impacts.].) The EIR violates CEQA because it fails to correlate significant construction noise impacts and resulting human health effects to neighbors.

CEQA requires an EIR to "identify and focus on the significant environmental effects of the proposed project…examin[ing] changes in the existing physical condition in the affected area," including "health and safety problems caused by the physical changes." (Guidelines, § 15126.2 (a).) This section "also suggests that a connection be drawn between . . . potential project emissions and human health impacts. Such a connection would meet CEQA's requirements." (*County of Fresno, supra*, 6 Cal.5th at 520.) If it is not scientifically possible to determine potential human health impacts, "the EIR itself must explain why, in a manner reasonably calculated to inform the public of the scope of what is and is not yet known about the Project's impacts." (*Ibid*.) Although *County of Fresno* addressed the need to correlate air emissions to human health, *Sierra Watch v. County of Placer* (2021) 69 Cal.App.5th 86 recently applied similar analysis to the effects of noise emissions on human health.

"CEQA requires that the EIR have made a reasonable effort to discuss relevant specifics regarding the connection between two segments of information already contained in the EIR, the general health effects associated with a particular pollutant and the estimated amount of that pollutant the project will likely produce." (*County of Fresno*, *supra*, 6 Cal.5th at 521.) As in *County of Fresno*, the Project EIR fails to correlate the Project's environmental effects with impacts to human health.

While the EIR contains a section titled "Health Effects of Environmental Noise" that identifies a list of "other potential health effects" from "high noise levels" (AR 1937), the EIR fails to identify the noise levels at which these health effects may occur, much less whether the Project's noise levels would trigger impacts. For example, the EIR generally states that noise results in "decreased performance for complex cognitive tasks, such as reading, attention span, problem solving, and memorization," but fails to identify whether and to what extent CPHP noise levels may cause these health impacts. (AR 1937.)

One commentor explained, "While the DEIR briefly mentions some of these 'other potential heath effects' from noise emissions, the DEIR does not correlate these various health effects (and others as reflected in WHO 2018) to noise emissions." (AR 6091.) UC responded that the discussion of health effects on DEIR pages 4.11-3 – 4 is provided as introductory information. (AR 6118.) The "introductory information" states that "noise can cause annoyance and can trigger emotional reactions like anger,

depression, and anxiety. WHO reports that, during daytime hours, few people are seriously annoyed by activities with noise levels below 55 dBA or moderately annoyed with noise levels below 50 dBA." (AR 1937.) Rather than address the health impacts identified by WHO, the noise section states:

> Construction equipment would comply with the City's Noise Ordinance restriction (noise level of 80 dBA or less at a distance of 100 feet), and the resultant predicted noise levels at the nearest receptors would be below this level. Therefore, project construction noise would not result in adverse health effects related to pain, the onset of hearing loss or other significant health effects.

(AR 1960.) This significance determination fails to correlate the level of noise that nearby residents would be exposed to for up to thirty years and whether those levels would produce health impacts described in the "introductory information." (AR 1937; see *County of Fresno, supra*, 6 Cal.5th at 520.)

Further, the EIR fails to connect large increases in dBA to potential health impacts. The EIR states that "analysis provided . . . indicates that noise levels from proposed peak demolition and construction activities at the closest receptors could exceed existing noise levels by as much as 27 dBA at receptors approximately 70 feet away." (AR 1951.) The EIR provides a table describing noise levels of normal construction equipment at 100 feet, and none lower than 70 dBA. (AR 1951.) Therefore, any residence within 100 feet would potentially be exposed to all-day noise levels of at least 70 dBA and as high as 80 dBA. (AR 1956.) The EIR fails to describe how this level of long-term noise would affect the health of neighbors or why that impact cannot yet be described. Our Supreme Court has identified this flaw: "Because the EIR as written makes it impossible for the public to translate the bare numbers provided into adverse health impacts or to understand why such translation is not possible at this time . . . the EIR's discussion of air quality" was inadequate." (*County of Fresno, supra*, 6 Cal.5th at 521.)

UC thus glosses over the health impacts that would result from CPHP construction noise. (AR 1959.) As held in *Berkeley Keep Jets, supra*, 91 Cal.App.4th at 1371 the "EIR's approach of simply labeling the effect 'significant' without accompanying analysis of the project's impact on the health of [] employees and nearby residents is inadequate to meet the environmental assessment requirements of CEQA"].) The EIR fails as an informational document because it does not correlate the admittedly high and long-lasting construction noise emissions to human health impacts on the surrounding community.

2. Noise Mitigation Measure NOI-1b Is Both Unenforceable and Impermissibly Deferred Mitigation

As discussed *ante*, the Guidelines allow deferral of some details of mitigation measures, to be developed after project approval. (Guidelines, § 15126.4, subd. (a)(1)(B).) However, CEQA requires that "the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that

performance standard." (*Ibid*.) The CPHP EIR does not meet these requirements. Mitigation measure NOI-1b suffers from a myriad of flaws that renders it ineffective. It states:

> **CPHP Mitigation Measure NOI-1b: Construction Hours**
>
> Construction hours *shall be restricted* to the hours listed in the table below. In rare circumstances, *work may need to occur* outside of these work hour limits. In such cases, UCSF Community and Government Relations will receive advance notice from the project manager, at least one week in advance as feasible, and will engage the community to identify measures to minimize potential impacts. These measures may include, but not be limited to, restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers to shield the short-term nighttime activity.

Construction Hours

	"Not Noisy" Work[1]		Noisy Work	
	Regular hours	**Extended hours[2]**	**Regular hours**	**Extended hours**
Monday - Friday	7:00 a.m. to 5:00 p.m.	5:00 p.m. to 8:00 p.m.	8:00 a.m. to 5:00 p.m.	
Saturday		8:00 a.m. to 5:00 p.m.		9:00 a.m. to 4:00 p.m.
Sunday		8:00 a.m. to 5:00 p.m.		

1 "Not Noisy" work = 80 decibels or less at 100 feet; "Noisy" work = more than 80 decibels at 100 feet.
2 Extended hours to be considered by UCSF Community and Government Relations with advance notice from the project manager.

(AR 1953, italics added.) The first sentence states that the construction hours "shall be restricted" as listed on the table; the next sentence states that work "may need to occur outside of these work hour limits." (*Ibid*.) NOI-1b does not impose finite restrictions as construction may proceed 24 hours a day when "need[ed.]" The mitigation is therefore not effective or enforceable.[15]

In the event of after-hours construction work, NOI-1b provides a short list of measures that "may" be imposed to reduce resultant noise impacts. (*Ibid*.) "These measures *may* include . . . restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers to shield the short-term nighttime activity." (*Ibid*.) The first problem is that "smaller time windows" and "condensing the overall duration" are not performance standards, as required. As held in *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 858, "[t]he terms 'increase' and 'reduce'— even though preceded by the mandatory term 'shall' and modified by the phrase 'to the extent feasible'— are not specific performance standards." The EIR provides no

[15] The EIR misrepresents that NOI-1b would prevent nighttime construction noise. (AR 1959 ["Implementation of CPHP Mitigation Measure NOI-1b would ensure that nighttime noise impacts from construction activities would be avoided"]; 1960 ["Because construction would be restricted by CPHP Mitigation Measure NOI-1b to only occur during daytime hours, health effects associated with the potential for nighttime awakenings would be avoided"].)

noise level threshold, measurement, or performance standard for after-hours work. Finally, there is no analysis of what the referenced "temporary barriers" would consist of or whether they would be effective to mitigate noise to an [unstated] standard. Ambient "nighttime noise levels should be 45 dBA or below, and short-term events should not generate noise in excess of 60 dBA." (AR 1937.) NOI-1b fails to address how after-hours work would relate to these levels and fails to impose any type of performance standard that would be used to enforce this mitigation measure.

Rather than prohibit construction outside of regular working hours to protect the health of neighbors, the adopted mitigation measure for noise is ineffective and impermissibly deferred without performance standards. The mitigation does not support a finding that the Project's construction noise would be less than significant. The EIR is inadequate on this issue and must be revised.

E. The EIR Fails to Lawfully Assess Impacts on Historic Buildings[16]

1. The EIR's Conclusion That It Is Infeasible to Avoid Demolishing Historically Significant Buildings, Including UC Hall, Is Based on Errors of Law and Is Not supported by Substantial Evidence

The Project proposes to demolish many buildings that it concedes are historically and culturally significant, are eligible for listing in the California Register of Historic Resources or are already so listed, and as to which the demolition represents a significant environmental impact. These buildings include UC Hall, Millberry Union, School of Dentistry, Langley Porter Psychiatric Institute, Aldea San Miguel Housing Buildings 8, 10, and 12, and Saunders Court. (AR 1738-49; 1755-56; 3890-3906; 3912-13; AR 6621-22; 238-243.)

The DEIR finds these significant impacts unavoidable because — according to UCSF — it is infeasible to continue to use these buildings. Just six years ago, however, UCSF's 2014 LRDP did not propose to demolish UC Hall, Millberry Union, School of Dentistry, Aldea San Miguel Housing Buildings 8, 10, and 12, and Saunders Court. Therefore, it was presumptively feasible to continue to use these buildings in 2014. In fact, the 2014 LRDP proposed to re-purpose UC Hall and Milberry Union for student housing (AR 13472; 13523-24); to renovate Saunders Court "to improve its functionality for general use and special events" (AR 13526); and to continue to use the School of Dentistry building (AR 13483; 13484-85) and Aldea housing buildings (AR 13520).

The record contains no evidence that anything has changed to make it infeasible to continue the 2014 LRDP's plans for one of more of these buildings rather than to demolish all of them. "[T]he deference provided to governing bodies with respect to land use planning decisions must be tempered by the presumption that the governing body adopted the mitigation measure in the first place only after due

[16] These issues are "exhausted" in comments at AR 6027-29; 6031-39; 888-89.

investigation and consideration." (*Napa Citizens, supra,* 91 Cal.App.4th at 359.) One of CEQA's core purposes is to avoid unnecessary environmental harm. The lead agency "may not . . . approve the project as proposed if there are feasible alternatives or mitigation measures that would avoid or substantially lessen the adverse environmental effects." (*Stockton Citizens for Sensible Planning v. City of Stockton* (2010) 48 Cal.4th 481, 498; see also *County of Fresno, supra,* 6 Cal.5th at 524-25 ["Even when a project's benefits outweigh its unmitigated effects, agencies are still required to implement all mitigation measures unless those measures are truly infeasible"]; *City of San Diego, supra,* 61 Cal.4th at 967; *Newhall Ranch I, supra,* 62 Cal.4th at 231 ["the lead agency must adopt feasible mitigation measures or project alternatives to reduce the effect to insignificance"].)

Mitigations or alternatives are not infeasible unless they make it impractical to proceed with the project. (*Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1181 (*Goleta I*); *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 599 (*Uphold Our Heritage*); *Preservation Action Council v. City of San Jose* (2006) 141 Cal.App.4th 1336 (*Preservation Action*) [city's finding that reduced-size alternative was infeasible due to competitive disadvantage was not supported by substantial evidence where record contained no data about competing stores].)

Here, neither the EIR nor UCSF's CEQA Findings present any evidence that it is infeasible to avoid demolishing each or any of these buildings. (AR 3878-3915; 238-43.) Given the contrast between the CPHP and the 2014 LRDP, this represents a significant omission of essential information and a failure to support an environmental conclusion with substantial evidence. (*County of Fresno, supra,* 6 Cal.5th at 527 [EIR must evaluate whether a mitigation measure is infeasible.].)

The FEIR's response to comments is also inadequate. The response and the Board's Findings say, in essence, that UCSF prefers to demolish all of these buildings so it is infeasible not to demolish them. (AR 6042; AR 238-42.) That preference does not equate to infeasibility. Neither the FEIR nor the Findings analyze ways to modernize the campus without demolishing every historically significant buildings. As the San Francisco Historic Preservation Commission commented, "the DEIR did not adequately consider alternatives that focused on the preservation of historic resources. Specifically, the DEIR did not analyze an alternative that retained just UC Hall, the building where the Zakheim murals are located, or just Toland Hall, the part of UC Hall where the Zakheim murals are located." (AR 5812.) This is an error of law because, as noted above, mitigation measures or alternatives are not infeasible unless they make it impractical to proceed with the project. (*City of Marina, supra,* 39 Cal.4th 341 at 368-69 ["CEQA does not authorize an agency to proceed with a project that will have significant, unmitigated effects on the environment, based simply on weighing of those effects against the project's benefits, unless the measures necessary to mitigate those effects are truly infeasible"].)

2. The DEIR Fails to Evaluate UCSF's Parnassus Campus as a Historic Resource or Historic District

The DEIR and the two *Carey & Company* reports upon which its analysis of historic buildings is based address one building at a time and fail to evaluate UCSF's Parnassus campus as a "historic resource" or "historic district" (defined in Public Resources Code section 5020.1, subdivisions (j) and (h), respectively) in its own right. (AR 1738-56; 3890-3913; 40072-130 [Carey 2011]; 40131-393 [Carey 2003].) Indeed, of the many "Form 523s" prepared for the many historic buildings on the campus and attached to the 2003 and 2011 Carey reports, not one describes the "Resource Present" as a "District" (AR 40106-121 [Carey 2003], including 40106 [UC Hall]; 40109; 40111 [Langley-Porter]; 40144; 40116; 40118; 40120]; 40131-40393 [Carey 2011], including 40283 [Aldea San Miguel 8]; 40287 [Aldea San Miguel 10]; 40291 [Aldea San Miguel 12]; 40295 [Ambulatory Care Center]; 40299 [Community Dental Clinic Building]; 40303 [Environmental Health and Safety (EH&S) Building]; 40305 [Faculty Alumni House]; 40309 [HSIR East]; 40313 [HSIR West]; 40317; 40319; 40351 [Milberry Student Union Building].)

Architectural historian Kara Brunzell explains this point:

> Preparers of the DEIR were clearly aware of the importance of looking at the campus as a whole. The document acknowledges districts as one of the important categories of historical resources . . . and divides the campus into six districts "based in part on existing land use patterns." ¶ An adequate cultural resources DEIR section would bring a similar intellectual rigor to the investigation of the potential historical significance of the campus as an entity in its own right, using a district (or districts) to organize the discussion of the built environment's significance. This would allow the cultural resources section to reflect the spatial and historical relationships between buildings, the street grid, open spaces, and other features of the site. . . . The attempt to evaluate each building individually without considering context, setting, or the site as whole means that the DEIR has not considered a potential historical resource: the Parnassus Heights Campus.

(AR 6037.)[17] CEQA requires that in preparing an EIR a lead agency must "use its best efforts to find out and disclose all that it reasonably can." (Guidelines, § 15144.) CEQA defines three categories of historic resources: mandatory, presumptive, and discretionary. (*Valley Advocates v. City of Fresno* (2008) 160 Cal.App.4th 1039, 1051 (*Valley Advocates*); § 21084.1; Guidelines, § 15064.5 (a).)

Mandatory historic resources are those "listed in, or determined to be eligible for listing in, the California Register of Historical Resources." (*Valley Advocates*, *supra,* 160 Cal.App.4th at 1051; § 21084.1, first sentence; Guidelines, § 15064.5 (a)(1).) Presumptive historical resources are those listed in a local historic register or identified as significant in a qualified historical resource survey. (*Valley Advocates*, *supra,* 160 Cal.App.4th at 1054; § 21084.1, third sentence; Guidelines, § 15064.5 (a)(2).)

[17] The EIR's analysis of visual impacts divides the campus into several "districts." (AR 1552; 3700.) It is inarguable that the site is more than a collection of unrelated buildings.

Lead agencies also have a mandatory duty to exercise their discretion to determine if a resource is historic. (Guidelines, § 15064.5(a)(3).) Discretionary historic resources are those a lead agency has discretion to designate even if not listed in a state or local register or identified in a qualified survey. (*Friends of Willow Glen Trestle v. City of San Jose* (2016) 2 Cal.App.5th 457, 467 ["final sentence of section 21084.1 clearly permits a lead agency to make a determination as to whether a resource that is neither deemed nor presumed to be a historical resource is nevertheless a historical resource for CEQA purposes"]; *Valley Advocates, supra*, 160 Cal.App.4th at 1059-60; § 21084.1, final sentence; Guidelines, §§ 15064.5(a)(3), (a)(4) .)

Lead agencies have a mandatory duty to exercise their discretion to determine if a resource is historic. (Guidelines, § 15064.5(a)(3) ["Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources . . ."].) The word "shall" identifies "a mandatory element which all public agencies are required to follow." (Guidelines, § 15005 (a); see *Valley Advocates, supra*, 160 Cal.App.4th at 1060, 1063 ["a prejudicial abuse of discretion occurs when a public agency is misinformed regarding its discretionary authority and, as a result, does not actually choose whether to exercise that discretionary authority"].) Where, as here, the agency fails to exercise its discretionary authority to determine if a resource is a "discretionary" historic resource, the error is reviewed de novo as a failure to proceed in the manner required by law. (*Valley Advocates, supra*, 160 Cal.App.4th at 1063.)

UC failed to proceed in the manner required by law because it failed to exercise its discretion to determine if the campus as a whole is a "discretionary" historic resource. (§ 21084.1; Guidelines, § 15064.5 (a), citing §§ 5020.1 and 5024.1.) "'Historic district' means a definable unified geographic entity that possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development." and "'Historical resource' includes, but is not limited to, any . . . area, which is historically . . . significant." (§§ 5020.1 (h), (j).) The EIR gives this no consideration.

The FEIR's response to comments (AR 6040-41) points to only two sentences in the DEIR or its supporting materials where the concept of a "historic district" is mentioned, as if this shows the concept was evaluated and rejected. It fails to reference any other information in the DEIR — because there is none — that explains why the DEIR or FEIR declined to evaluate the campus for qualification as a historic district. The response also refers to the new evaluation in FEIR Appendix HR (AR 6609-29) as if this provides the missing analysis. It does not. In fact, the new memorandum in Appendix HR says nothing about the campus as a "historic district" and never uses the word "district."

Instead, the response to comments offers an entirely new rationale for not evaluating the campus as a historic district: "Given the wide range of architectural styles and uses of the buildings, the long period of development (1917-2010), and a lack of overall thematic context or initial master plan guiding development from the beginning, it was determined that the campus as a whole did not constitute a historic district." (AR 6041.) This rationale is not in the DEIR; it is significant new information requiring recirculation of a revised Draft EIR for public and agency comment. A change in EIR reasoning supporting a significance conclusion warrants recirculation. (*Sutter Sensible Planning, Inc. v. Board of Supervisors* (1981) 122 Cal.App.3d 813, 817 (*Sutter*) [recirculation required because the FEIR provided 'a more elaborate discussion of ground water availability and the projected impact of the plant on the water table']; *Pesticide Action, supra*, 16 Cal.App.5th at 252 [recirculation required for new rationale for significance conclusion in FEIR].)

Also, the new evaluation in the FEIR's Appendix HR presents aerial photos/maps showing all historic resources that would be demolished or altered. (AR 6621-22.) This aerial photo/map is a revelation. The DEIR failed to provide a visual aid showing the radical transformation of the entire campus from the loss of many historically significant buildings. This omission prevented a reader of the DEIR — even a careful reader — from understanding the wide geographic scale and intensity of the transformation the CPHP proposes for the campus as a whole.

Thus, the EIR omits essential information regarding the environmental setting and fails to assess the CPHP's potentially significant effects on all potential historic resources in the affected environment.

F. The EIR Fails to Adequately Assess Impacts from Air Emissions[18]

1. The EIR Impermissibly Piecemeals the Project's Human Health Impacts from Toxic Air Contaminant Emissions

The EIR fails as an informational document by not disclosing the human health risk resulting from the Project's combined emissions of toxic air contaminants ("TAC"). The EIR acknowledges that the Project "would result in development that would generate operational emissions of TACs and result in localized contributions to PM2.5 concentrations from a variety of sources." (AR 1684.) The EIR also acknowledges that Project construction over 30 years would generate TAC emissions. (AR 1671.) While the EIR utilizes a significance threshold of ten increased cancer risks, its analysis of the Project's impacts against this standard is defective because it piecemeals various emission sources and thereby fails to identify the overall health risk resulting from the combined emissions from all Project emissions.

Specifically, the EIR concludes that the Project's construction emissions for the Irving Street Arrival, RAB, New Hospital, and Aldea Housing Densification would result in a combined 9.47

[18] The issues in this section were exhausted in public comments at AR 6069-6075; 890-896.

increased cancer risks (AR 5962-63), very close to the applicable significance standard of ten. (AR 1642.) UC keeps the health impact below the threshold by arbitrarily omitting key elements of the Project's TAC emissions. (AR 5964.) The expert retained by petitioner Parnassus Neighborhood Coalition ("PNC") explained that state guidance requires an overall health risk assessment to account for both construction and operational TAC emissions, stating in relevant part:

> According to OEHHA guidance, as referenced by the DEIR, "the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location." However, the HRAs conducted in the DEIR fail to sum each age bin to evaluate the total cancer risk over the course of the Project's construction and operation, as is required by the guidance. This is incorrect and thus, an updated analysis should quantify the Project's construction and operational health risks and then sum them to compare to the BAAQMD threshold of 10 in one million, as referenced by the DEIR (p. 4.2-16).

(AR 5964.) The most significant sources for the omitted operational TAC emissions include mobile-source emissions and emissions from the New Hospital. The mobile-source TAC emissions omitted from the EIR's analysis are not insignificant, as PNC's expert further explains:

> [W]hile DEIR includes an HRA assessing the health risk impacts associated with the emergency generators associated with the operation of the RAB component of the Initial Phase of the Project, the DEIR fails to evaluate the health risk impacts resulting from the Project's entire operation. This is incorrect, as the DEIR indicates that the CPHP would result in 52,200 daily vehicle trips throughout operation, which will result in additional exhaust (p. 4.15-29, Table 4.15-7).

(*Ibid.*, italics added.) TAC emissions from the New Hospital are also not insignificant. "Fume hood emissions also contribute to exposure to TACs." (AR 11049.) UC revealed in the 2014 LRDP EIR that "Risks associated with fume hood emissions were estimated at 4.46 in one million at the maximally exposed individual . . ." (AR 10936.)

The FEIR does not supply this missing analysis of mobile-source or Hospital TAC emissions nor provide any expert testimony demonstrating that California Office of Health Hazard Assessment ("OEHHA") does not require it. (AR 6012.) Instead, the FEIR relies upon the "plan-level" nature of its review as to these Project components to conclude that health risks from the New Hospital and future phase projects will undergo separate subsequent CEQA review. (*Ibid*.)

This is a legal error. First, the FEIR does not explain why it is too speculative to include these emission sources in the overall health risk as required by Guidelines section 15145. "The fact more precise information may be available during the next tier of environmental review does not excuse [an agency] from providing what information it reasonably can now." (*Cleveland II*, *supra*, 17 Cal.App.5th at 440; *San Joaquin Raptor II*, *supra*, 149 Cal.App.4th at 660 [EIR was required to analyze "an aspect of the Project itself, as well as a reasonably foreseeable use"].) Readily available information about the

Project's operational TAC emissions includes the acknowledged 28,800 daily vehicle trips, a major source of diesel particulate emissions (AR 4204), as well as the Project's increase in mobile-source diesel consumption by 505,297 gallons per year. (AR 1779.) Additionally, conservative estimates of the number of hood fumes required for the New Hospital are available. (AR 10936 ["At present, there are approximately 208 active fume hoods in operation at the Parnassus Heights campus site"].)

Thus, ample information regarding the Project's mobile-source and Hospital TAC emissions was available to estimate the Project's combined health risk. Either emission source alone, when added to the Project's acknowledged 9.47 increased cancer risks, would overcome the relevant significance standard of ten increased cancer risks. The addition of both emission sources together would put the Project's combined health risk well beyond that standard.

UC alternatively asserted in the FEIR that the health risks from the various components of the Project should not be measured against the project-level threshold of ten increased cancers, but rather the cumulative threshold of 100 increased cancers. (AR 6012-13.) This position ignores that these different aspects of the CPHP are nowhere else identified in the EIR as separate projects for purposes of CEQA. Indeed, nowhere does UC claim that these various construction activities have independent utility. In fact, the EIR combined the emissions from these various construction activities for purposes of assessing the Project's impact from criteria air emissions. (Compare AR 1658 [combining criteria air emissions for different construction activities] with 1679-1682 [dividing human health impacts according to construction activity].) UC's argument that the Project's various emission sources should be measured against a cumulative threshold constitutes impermissible piecemealing.

In short, the EIR fails as an informational document by piecemealing the Project's TAC emissions for purposes of minimizing the resulting health risk to nearby residents.

2. The EIR's Use of Thresholds of Significance for the CPHP's Cancer Risk Impact Is Based on Legal Errors and Not Supported by Substantial Evidence

The EIR errs by using thresholds of significance for both project-level and cumulative cancer risk that fail to take into consideration the severity of existing cancer risk conditions.

a. The EIR's Thresholds of Significance for Cancer Risk

The DEIR explains that "[a]s part of assessment of Initial Phase projects, a HRA [Health Risk Assessment] was conducted to provide quantitative estimates of health risks from exposures to TACs" and that the EIR "uses quantitative significance thresholds adopted by BAAQMD [Bay Area Air Quality Management District]." (AR 1650.)[19] For "project level" TAC related cancer risk, this threshold is

[19] The DEIR states: "These thresholds are based on substantial evidence identified in Appendix D

"exposing receptors to toxic air contaminant emissions that (1) result in a cancer risk greater than 10 cancer cases per 1 million people exposed in a lifetime . . ." (AR 1645.)[20] For "cumulative" TAC-related cancer risk, the EIR uses a threshold of 100 per one million, stating: "BAAQMD considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cancer risk. (AR 1650.)

b. UC Failed to Adopt Its Cancer Risk Thresholds of Significance in a Public Rule-Making Process[21]

The EIR uses cancer risk thresholds of significance adopted by BAAQMD for general use without adapting them or how they are applied to reflect anything unique about this project or its environmental setting. CEQA requires that before UCSF uses such generalized thresholds of significance, it must adopt the thresholds by a public rule-making process, and must show in that process that the thresholds are supported by substantial evidence. (*Golden Door Properties, LLC v. County of San Diego* (2018) 27 Cal.App.5th 892, 903 (*Golden Door I*).) By failing to undertake this process, UCSF failed to proceed in the manner required by law.

c. The EIR Fails to Adequately Describe Existing Cancer Risk Conditions

The DEIR describes existing conditions (*i.e.*, baseline) for TAC-related cancer risk from ambient TAC concentrations as 248.3 cases per million. (AR 1636.) The DEIR describes the existing conditions for cancer risk from diesel particulates (DPM) as 480 in one million in the year 2000 in the Bay Area; and 520 in one million in the year 2012 statewide. (AR 1637.) The DEIR indicates that in 2000, the California Air Resources Board (CARB) approved a Diesel Risk Reduction Plan that it anticipated would result in an 80 percent decrease in statewide diesel health risk in 2020 compared with the diesel risk in 2000. The DEIR does not disclose what the statewide diesel risk was in 2000, so the reader cannot calculate what an 80% reduction would be in 2020. The DEIR also does not disclose what the statewide diesel risk is in 2020.

The EIR's description of the overall cancer risk is insufficient because the DPM baseline risk is not current as of the date of the Notice of Preparation of the EIR.[22] The FEIR responds to this comment by calculating this risk using projections CARB made in the year 2000 regarding reductions in DPM cancer risk that could be expected by the year 2020. The response provides, for the first time, an

---

of the 2017 BAAQMD CEQA Guidelines and its 2009 Justification Report." (AR 1650 [DEIR 4.2-24].) The 2017 BAAQMD CEQA Guidelines is at AR 15672. Appendix D thereof is at 15832. The purported "justification" and "substantial evidence" for these thresholds is at AR 15860-15876.

[20] The DEIR also uses a threshold of "localized PM2.5 concentration exceeding 0.3 ìg/m3" (AR 1650.) The DEIR also establishes more general threshold of significance, as follows: "Expose sensitive receptors to substantial pollutant concentrations." (AR 1645.)

[21] This claim is exhausted at AR 896.

[22] This claim is exhausted at AR 6071.

estimate of the statewide diesel risk in 2000, which it uses to calculate a current basin wide cancer risk of 96 cases of cancer per 1 million people. (AR 6076.)

This response is too little, too late. It is an estimate based on 20 year-old projections, not a current analysis when the Notice of Preparation issued. (*South Coast*, *supra*, 48 Cal.4th at 327, citing Guidelines, § 15125 (a).) Also, the FEIR suggests the TAC and DPM risks are additive, stating: "Other toxic air contaminant emissions within the basin will further contribute to this estimated risk." (AR 6076.) Thus, baseline cancer risk from TAC and DPM may be 344 cases per one million people (*i.e.*, 248 cases per one million people for TAC plus 96 cases per 1 million for DPM). (AR 6076.) The omission of this information from the DEIR precludes informed public comment.

d. The DEIR's Assessment of the "Project-Level" Cancer Risk Impact Is Based on Legal Error and Not Supported by Substantial Evidence

The DEIR concludes that the Project's "project-level" or incremental increase in cancer risk is less than significant because the project would increase cancer risk by 9.8 new cases per one million people, which is below the DEIR's threshold of significance of any increase in risk over 10 cases per million. (AR 1671-84 [Impact AIR-3: Construction]; 1684- 89 [Impact AIR-4: Operations].) The DEIR borrows this threshold from BAAQMD's CEQA Guidelines and then deploys it without regard to the extreme baseline cancer risk in San Francisco. In doing so, the DEIR commits the fundamental error of failing to add the Project's effects to the baseline for purposes of determining significance because it applies the threshold without regard to the magnitude of the baseline cancer risk. Under CEQA, an EIR analyzes the environmental impacts of the proposed project on the environmental setting (or "baseline"). (*South Coast*, *supra*, 48 Cal.4th at 315; *San Joaquin Raptor I*, *supra*, 27 Cal.App.4th at 722-23; *Eel River*, *supra*, 108 Cal.App.4th at 881-82; Guidelines, §§ 15125 (a)(1), 15126.2 (a).)

The baseline cancer risk in San Francisco is 248 cases per million from TAC plus at least 96 cases per million from DPM. The DEIR's uncritical use of the ten cases per million BAAQMD threshold implies that an increase of less than ten cases per million is always less than significant, regardless of the baseline risk. This is a legal error, because the severity of existing conditions is always a factor in determining significance of project impacts. (*CBE v. Resources*, *supra*, 103 Cal.App.4th at 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County*, *supra*, 221 Cal.App.3d at 718.) The EIR's unevaluated assumption that an increase of less than ten cases per million is always less than significant is a policy judgment, not a finding of fact based on evidence. This violates CEQA because determinations of significance must be based on evidence. (*Amador Waterways*, *supra*, 116 Cal.App.4th at 1108-1109 ["thresholds cannot be used to determine

automatically whether a given effect will or will not be significant"].)

Moreover, while "the existence of substantial evidence supporting the agency's ultimate decision . . . is not relevant when one is assessing a violation of [CEQA's] information disclosure provisions,"[23] the EIR's use of this threshold is not supported by substantial evidence. Other than pointing to the BAAQMD threshold, the DEIR fails to explain why the Project's admitted incremental increase in cancer risk is not significant given that it is being added to a severe baseline cancer risk.

Instead, the FEIR's responses to comments states that "The 10.0 in one million cancer risk criterion. . . is also the level set by the Project Risk Requirement in the Air District's Regulation 2, Rule 5 new and modified stationary sources of TAC, which states that the Air Pollution Control Officer shall deny an Authority to Construct or Permit to Operate for any new or modified source of TACs if the project risk exceeds a cancer risk of 10.0 in one million." (AR 6077.) Neither the response to comments or the BAAQMD CEQA Guidelines (at AR 15866) explain why a threshold used in a different regulatory program to deny permission to operate a stationary source of TAC represents an appropriate threshold for determining significance under CEQA, where such a determination does not require denial of the project. Indeed, BAAQMD's Regulation 2, Rule 5 process for new and modified stationary sources of TAC may require the project to "implement Best Available Control Technology for Toxics (T-BACT), as determined by BAAQMD." (AR 15730.) According to BAAQMD, "Regulation 2-5 dictates that the cancer risk is acceptable if it is below one in a million, or if T-BACT is applied and the cancer risk is below 10 in a million." (AR 16163.) Thus, for UC to accurately use BAAQMD's Regulation 2-5 criterion for issuing stationary source permits as its threshold of significance, it would have to use the "one in a million" threshold instead of the "ten in a million" threshold because BAAQMD has not required that the CPHP implement T-BACT.[24]

e. The DEIR's Assessment of the Project's Cumulative Increased Cancer Risk Is Based on Legal Error and Not Supported by Substantial Evidence

The DEIR concludes that the Project's "cumulative" increase in cancer risk when considered in combination with other sources of risk is less than significant (AR 1695-97; 3846-48 [Impact C-AIR-2: Construction and Operation].) For cumulative increased risk, the DEIR uses a threshold of any exceedance of 100 cases per one million because "BAAQMD considers a cancer risk of 100 cases per one million or less to be within the 'acceptable' range of cancer risk." (AR 1650; 1653; 3800; 3803.)

Assuming arguendo that this is an appropriate threshold for assessing whether the Project's cumulative cancer risk impact is significant, the DEIR fails to apply it. After stating this threshold, the

[23] *Communities v. Richmond*, *supra*, 184 Cal.App.4th at 82.

[24] Also, as discussed in the next section, "acceptable" under CEQA is not the same as "significant."

DEIR changes it, stating: "Because the cumulative increase in cancer risk from all sources would be well below 100 in one million . . . the CPHP's cumulative impact to local health risk and hazards would be reduced to less than significant with identified mitigation." (AR 1696, 3847.)

Thus, instead of considering a post-project cumulative cancer risk above 100 cases per one million to be significant, the DEIR shifts to requiring that the cumulative "increase" in cancer risk contributed by the Project in combination with other projects exceed 100 cases per one million to be found significant. This shift reflects several legal errors.

First, the DEIR is confusing as to what the cumulative threshold is, which frustrates meaningful public comment. Therefore, the DEIR must be revised and recirculated using a clear and stable cumulative threshold.

Second, both thresholds, as described at AR 1650 and employed at AR 1696 for both construction and operation, suffer the same legal defect as the incremental standard: they are applied without regard to the baseline cancer risk. That risk in San Francisco is 248 cases per million from TAC plus at least 96 cases per million from DPM. According BAAQMD and the DEIR, this baseline risk is "unacceptable." The cumulative increase in cancer risk contributed by the Project in combination with other projects would make this existing "unacceptable" condition worse. The EIR fails to explain why the Project's admitted cumulative increase in cancer risk above an already unacceptable baseline level is not significant given that it is being added to a severe cancer baseline. (*CBE v. Resources, supra*, 103 Cal.App.4th at 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County, supra*, 221 Cal.App.3d at 718.)

This legal error is illustrated by a simple example. According to the DEIR, the threshold of a cumulative increase of 100 cases per million applies regardless of baseline risk. Thus, a project with a baseline cancer risk of 50 cases per million would need a post-project cancer risk of 150 cases per million for the cumulative impact to be deemed significant, while a project with a baseline cancer risk of 75 cases per million would need a post-project cancer risk of 175 cases per million for the cumulative impact to be deemed significant. Thus, a project with the higher baseline risk (75 per million) would not be deemed to have a significant cumulative impact with a post-project cancer risk of 150 cases per million, but a project with the lower baseline risk (50 per million) would be deemed to have a significant cumulative impact with a post-project cancer risk of 150 cases per million. In short, the widely repudiated "ratio theory" in which "the greater the overall problem, the less significance a project has in

a cumulative impacts analysis" is improperly embedded in the EIR's threshold of significance for the Project's cumulative cancer risk impact. (*Kings County, supra*, 221 Cal.App.3d at 721.)[25]

The Final EIR responds to comments regarding the invalidity of the EIR's use of the cumulative threshold by noting that the BAAQMD considers any cancer risk below 100 cases of cancer in one million people to be "acceptable" and cancer risk above 100 cases of cancer in one million people to be unacceptable. (AR 6082-83.) Thus, the EIR must explain why any CPHP-induced increase in cancer risk above the severe existing condition (which clearly exceeds 100 in one million) is not significant. The EIR fails to do so. This is a failure to proceed in the manner required by law.

The FEIR responds to the comment that the DEIR employs the TAC cancer risk thresholds in a manner that fails to account for the severity of existing baseline conditions by arguing that these thresholds are supported by "substantial evidence." (AR 6076-78.) This is not responsive to the comment that the EIR commits a procedural/informational error by "failing to add the Project's effects to the baseline for purposes of determining significance."

The FEIR's response to comments argues that because BAAQMD, San Francisco and other agencies agree that these thresholds are appropriate, this somehow provides "substantial evidence" supporting their use. (AR 6076-78.) The FEIR misconceives the task at hand, because the response is entirely abstract, untethered to the facts of this Project or its setting. (*Golden Door I, supra*, 27 Cal.App.5th at 903-905 ["the Efficiency Metric 'allows the threshold to be applied evenly to most project types,' but it does not account for variations between different types of development; nor does it explain why the per person limit would be appropriately evenly applied despite project differences. Without substantial evidence explaining why statewide GHG reduction levels would be properly used in this context, the County fails to comply with CEQA Guidelines"].)

CEQA neither requires nor allows the DEIR to use the BAAQMD's or EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts. (*Ebbetts Pass, supra*, 43 Cal.4th at 957 (error to conclude that compliance with pesticide restrictions precludes significant impact).) The EIR's reliance on the increase over 100 in one million threshold to determine cumulative significance improperly imports considerations of cost and feasibility of mitigation into a determination of significance, whereas CEQA requires that these determinations be made in distinct steps.[26] UC's discretion to decide that significant harm is "acceptable" in light of Project benefits arises at the end of

[25] The environmental justice implications of the DEIR's use of this threshold are dire.

[26] The EPA standard was designed to support a different regulatory scheme, not to support determinations of significance under CEQA. The EPA is permitted and required to consider factors of cost and feasibility in its regulation of toxics under the Clean Air Act.

the CEQA analysis, in a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant. (*City of Marina, supra*, 39 Cal.4th 341 at 368-369.)

The FEIR argues that the 100 in one million cancer risk threshold is based on guidance developed by the United States EPA for "acceptable" risk. (AR 6077.) The response misrepresents actual EPA policy, which is to assess increased cancer risk based on a host of site-specific factors within a range of values from one in one million to 100 in one million. This policy reflects the agency's attempt to balance the costs and benefits of protecting public health in its implementation of a host of federal environmental laws, including the Clean Air Act, Clean Water Act, Resource Conservation and Recovery Act, CERCLA (Superfund), etc. (AR 898 [Starfield, L.E., "The 1990 National Contingency Plan: More Detail and More Structure, But Still a Balancing Act;" *Environmental Law Reporter*, June 1990].) Instead of following this analytic approach, the EIR selects one value at the least environmentally protective end of the EPA's "acceptable risk" range and uses it to determine the significance of the Project's impacts, but without regard to the Project's site-specific considerations.

The distinction is important, because where the impact does not exceed a threshold of significance erroneously inflated by the concept of "acceptable risk," UC is absolved of further legal obligation to mitigate the impact. As a result, the public cannot know whether UC would allow an unknown number of cancer cases to occur that it could have feasibly avoided had it scrupulously followed CEQA. Nor does the public know, had the EIR found the Project's additional cancer risk insignificant, whether UC would have found the Project's benefits outweigh its environmental and adverse human health effects. (*County of Fresno, supra*, 6 Cal.5th at 512 ["the EIR . . . is a document of accountability"].)

3. Additional Responses to a Comment Regarding the EIR's Method for Determining the Significance of Cumulative Cancer Risk are Inadequate

Commentors noted that the DEIR is confusing because it is unclear if it considers any resulting post-project cumulative cancer risk above 100 cases per one million to be a significant project impact, or if it requires that the cumulative "increase" in cancer risk contributed by the Project in combination with other projects exceed 100 cases per one million be found significant. (AR 6072-73.) The FEIR fails to respond to this comment or clarify how the threshold was applied.

The response also purports to find substantial evidence support for using these thresholds in the fact that BAAQMD developed its 100 in one million cumulative criterion because it is reflective of air quality in a 'pristine' portion of the Bay Area. (AR 6079.) It is difficult to see how this supports the EIR's use of the cumulative threshold to find this Project's cumulative cancer risk impacts to be less than significant. If the EIR uses the cumulative threshold to conclude that if the Project contributes to an

increase in cancer risk where total post-project cancer risk exceeds 100 cases of cancer per one million, then the fact that cancer risk in pristine areas is 100 in one million supports finding this Project's cumulative contribution to be "considerable" because it would increase cancer risk above the baseline cancer risk of at least 248 or 344 cases per one million people. Alternatively, if the EIR requires that the cumulative "increase" in cancer risk contributed by the Project in combination with other projects exceed 100 cases per one million to be found significant, then the fact that cancer risk in pristine areas is 100 in one million is irrelevant to the determination of significance.

The response to comments also refers to a 1,000-foot distance from sources of cancer risk. (AR 7078; 6080.) The response does not explain how this distance supports the EIR's application of its thresholds to this Project and its setting. If this distance limit is used to exclude the contribution of regionally or globally transported TACs to this Project's cumulative excess cancer risk, the EIR commits an error of law. Baseline risk cannot be arbitrarily reduced by this artifice. Also, the fact that pollutants from a particular source may attenuate with distance does not explain why the cumulative background cancer risk pollutants from all sources, including more distant sources, can be ignored in a cumulative analysis. CEQA requires consideration of all existing conditions in cumulative analysis. (*CBE v. Resources*, *supra*, 103 Cal.App.4th at 114; *Kings County*, *supra*, 221 Cal.App.3d at 718.)

G. The EIR's Visual Impacts Analysis Is Based on Errors of Law and Improperly Defers the Formulation of Mitigation Measures for Significant Visual Impacts[27]

1. The EIR's Analysis of Impacts AES-1 and AES-2 Omits Essential Information

The EIR divides its analysis of the CPHP's visual impacts into three types of impacts using three separate thresholds of significance: physical impacts on scenic vistas (AR 3719 [Impact AES-1]), "conflict with applicable zoning and other regulations governing scenic quality" (AR 3726 [Impact AES-2]), and "new sources of substantial light or glare which would adversely affect daytime or nighttime views" (AR 3741 [Impact AES-3].)

The EIR deploys these thresholds in a manner that excludes consideration of substantial evidence supporting a fair argument that visual impacts as perceived from surrounding neighborhoods may be significant. The EIR achieves this result by (1) artificially limiting its analysis of *physical* changes to the visual character of the area to impacts on scenic vistas (i.e., Impact AES-1) and (2) measuring the CPHP's conflict with applicable regulations governing visual impact against a legally erroneous baseline of future regulations.

[27] The issues in this section are exhausted at AR 5862-64; 5903-06; 5913-18; 6137-43.

Regarding Impact AES-2, the EIR identifies the "applicable regulations governing scenic quality" as UC's 2014 LRDP sub-objectives 1B and 1C, which provide, respectively, that the campus: "Acknowledge and respond to local zoning and height and bulk limitations to the extent possible" and "Design new buildings to be sensitive to the surrounding neighborhood and landscape, taking into account use, scale, potential noise generation, and density." (AR 3726.)

The EIR finds that the New Hospital, at 955,000 gross square feet, 16 stories tall, and 294 feet in height (AR 3668), would:

> contrast sharply both in height and scale with the existing residential development to the east, which is limited to 40 feet in height. The proposed New Hospital would also be nearly 100 feet taller than other existing buildings on the campus site (adjacent Moffitt Hospital is currently the tallest building at 197 feet). In addition, the proposed New Hospital would be a prominent newly visible feature in the viewsheds from nearby neighborhoods . . . . As such . . . the height and scale of the proposed New Hospital would be inconsistent with 2014 LRDP sub-objective 1C.

(AR 3731.) Having shown that the impact is significant, the EIR performs a neat trick by finding the impact less than significant because the CPHP would do away with the 2014 LRDP's regulations governing scenic quality with which it conflicts. The EIR states:

> To the extent the CPHP would be inconsistent with applicable 2014 LRDP objectives as described above, UCSF would seek amendments to the 2014 LRDP to bring the CPHP and 2014 LRDP into conformity. In particular, the 2014 LRDP would be amended clarify (sic) that sub-objectives 1B and 1C would not apply to the New Hospital project . . . ."

(AR 3737; see also AR 3727.) By this artifice, the EIR improperly considers the baseline to be the future project under the amended LRDP policy, rather than comparing the CPHP's environmental impact to current conditions. (*South Coast*, *supra*, 48 Cal.4th at 320-21; *Environmental Planning and Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 355.)

When this error is combined with the EIR's self-selected limitation on Impact AES-1 to only consider impacts on scenic vistas, the EIR commits the additional legal error of deploying its thresholds of significance to foreclose consideration of substantial evidence supporting a fair argument of significant impact. (*Ante*, *Visalia Retail*, *supra*, 20 Cal.App.5th at 13; *Amador Waterways*, *supra*, 116 Cal.App.4th at 1108–09.)

Here, a fair argument of significant impact is provided, not only by the EIR's analysis of Impact AES-2 (AR 3726-41), but by public comments from expert planners Terry Watt (AR 5903-06) and Jared Ikeda of Ikeda Consulting. (AR 5913-14). Mr. Ikeda opined that the proposed building under the CPHP, and particularly the sixteen-story New Hospital "would have significant visual impacts," providing visual simulations to show the extreme inconsistency with surrounding development. (AR 5913-14.) Mr. Ikeda described the New Hospital as the "dominant mass" in the neighborhood, that will "block views"

to Mount Sutro. (AR 5915.) He concluded that "the height and mass of the proposed new hospital will be highly visible as a new feature in the skyline from . . . public parks as well as from various other locations and streets within the surrounding neighborhoods." (AR 5917.) The New Hospital would also be visible from Golden Gate Park. (AR 5918.) Golden Gate Park is one block (400 feet) from campus. (AR 3644, 3699.)

In short, the EIR's analysis of Impacts AES-1 and AES-2 reveal a rabbit warren of legal errors that combine to omit an essential analysis of the CPHP's physical impacts on the area's visual quality as seen from the surrounding neighborhood, requiring revision of the DEIR.

2. UC Erroneously Claims That It Is Exempt from Considering Visual Impacts Pursuant to Public Resources Code Section 21099

The EIR claims, based on section 21099 subdivision (d), that it need not analyze visual impacts and that the analysis that is provided is solely for informational purposes. (AR 3715-16; 3691-92; 5766.) That is incorrect. The CPHP does not qualify for exemption from CEQA's requirements to assess visual impacts. "The scope of an exemption may be analyzed as a question of statutory interpretation and thus subject to independent review." (*Covina Residents for Responsible Development v. City of Covina* (2018) 21 Cal.App.5th 712, 724.) Courts review exemptions narrowly. (*San Lorenzo Valley Community Advocates for Responsible Education v. San Lorenzo Valley Unified School Dist.* (2006) 139 Cal.App. 4th 1356, 1382; *Mountain Lion Foundation v. Fish and Game Commission* (1997) 16 Cal.4th 105, 125 (*Mountain Lion Foundation*.)

Section 21099, subdivision (d)(1) states that "[a]esthetic and parking impacts of a residential, mixed use-residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." The EIR contends the CPHP "substantially meets the definition of an employment center as the campus site includes a variety of commercial uses." (AR 3692.) But the exemption narrowly defines an "employment center project" as "a project located on property zoned for commercial uses." (§ 21099 (a)(1).) To the extent the campus has any zoning classification, it is partially zoned by the City as "(Public) Zoning District" and "Residential House District, Two-Family (RH-2)." (AR 4082.) It is not zoned for "commercial use."

In responses to comments, the FEIR argues that pursuant to its "constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation, including those of the City of San Francisco." (AR 5765.) Assuming this is true, it is not relevant to whether the campus meets the statutory requirement of being zoned for commercial uses. It is either zoned for "(Public) Zoning

District" and "Residential House District, Two-Family (RH-2)" or it is not zoned at all.[28]

The FEIR also presents a new argument that the CPHP is a "residential" or "mixed-use residential" project because it "proposes substantial new on-campus housing, consisting of 772 net new housing units." (AR 5765-66.) These characterizations are incorrect as a matter of law. While section 21099 does not define "residential" or "mixed-use residential" projects, another closely-related section of CEQA does. Section 21159.28 subdivision (d) defines a "residential or mixed-use residential project" as one "where at least 75 percent of the total building square footage . . . consists of residential use or a . . . transit priority project as defined in Section 21155." "Transit priority projects" are defined as containing "at least 50 percent residential use, based on total building square footage." (§ 21155.)

The CPHP proposes 915,300 square feet of housing out of total proposed development of over five million square feet. (AR 3684.) Thus, housing represents less than 20% of the CPHP development footprint, not nearly enough to qualify it as a "residential" or "mixed-use residential" project under CEQA's limited exemptions for housing projects. (*Berkeley Hillside Preservation v. City of Berkeley* (2015) 60 Cal.4th 1086, 1099-1100 ["statutes must be read in the context of "the entire scheme of law of which it is part so that the whole may be harmonized and retain effectiveness"].)

The CPHP is not within the scope of section 21099 and requires EIR analysis of visual impacts.

H. The EIR Improperly Defers the Formulation of Mitigation Measures for Significant Biological and Visual Impacts

In its analysis of biological Impact BIO-2, the EIR finds significant wildlife impacts from increased bird strikes due to light and glare associated with higher buildings, particularly the New Hospital adjacent to the Mount Sutro Reserve; and that the adoption of Mitigation Measure BIO-2b (MM BIO-2b) would reduce this impact to less than significant. (AR 3870-71.) In its analysis of aesthetic Impact AES-3, the EIR finds the CPHP would create new sources of substantial light or glare which would significantly and adversely affect daytime or nighttime views in the area, and that the adoption of Mitigation Measure AES-3 (MM AES-3) would reduce this impact to less than significant.

Both MM BIO-2b and MM AES-3 improperly defer the formulation of specific mitigation measures until after project approval. MM BIO-2b provides:

> ***Minimize*** light and glare resulting from new buildings through the orientation of the building, use of landscaping materials and choice of primary façade materials. Design standards and guidelines to minimize light and glare shall be adopted for the new buildings, including: reflective metal walls and mirrored glass walls shall not be used as primary building materials for facades.

(AR 3871.) As biologist Dr. Shawn Smallwood stated in his comments on the DEIR, the proposed

[28] UC does not dispute that it must comply with CEQA before approving the CPHP.

mitigation does not reduce the impact to a less-than-significant level, the choice of materials has been deferred, and the measure does not establish "performance standards." (AR 5938-39; 5868-69.) The "design standards and guidelines to minimize light and glare" are also deferred and are not linked to any performance standards.

MM AES-3 provides:

> Light and glare from buildings ***shall be minimized*** through the orientation of the building, use of landscaping materials and choice of primary facade materials. Design standards and ***guidelines to minimize light and glare shall be adopted*** for new buildings, including:
>
> - Reflective metal walls and mirrored glass walls shall not be used as ***primary*** building materials for facades.
> - Installation of illuminated building signage ***shall strive*** to be consistent with UCSF design guidelines and/or City Planning Code sign standards for illumination. . ..
> - Design parking structure lighting to ***minimize*** off-site glare.

(AR 3742) This measure improperly defers the formulation of actual mitigations because it does not establish performance standards against which future planners or the public can judge whether the impact is reduced to less than significant. The terms "minimize," "primary," and "strive" are too vague to be enforceable. (See case law discussion *ante*).

I. The EIR Fails to Assess the Project's Shadow Impacts on Surrounding Neighborhoods

Shadow impacts from the huge CPHP buildings are of major concern. UC prejudicially abused its discretion because the EIR was required, but failed, to analyze the impact of new shadows on the surrounding neighborhood. The EIR restricted its analysis of new shadows to three city parks; to wit, Golden Gate, Richard Gamble Memorial, and Gratton. (AR 1597-1624; 3759, 3771.) The FEIR's Master Response concedes that new shadow is considered significant only if it "substantially and adversely affect[s] the use and enjoyment of publicly accessible open spaces. (AR 5779.) Commentors objected to the Draft EIR's failure to analyze the significance of new shadows on surrounding neighborhoods, including those created by the proposed 16-story New Hospital. Comments presented substantial evidence supporting a fair argument that such new shadows may have significant impacts. (AR 5775; 5864; 5906; 5917-18; 6311, 6313, 6401, 6443, 6509-10.)[29]

[29] "As currently envisioned, the proposed New Hospital would be 16 stories and up to 294 feet in height. Although the building has not yet been designed, the 16-story building would exceed the City's height limits for the portions of the project site within the 65-D and 220-F Height and Bulk Districts. As for any portion of the New Hospital that would be located within the Open Space Height and Bulk District, although General Plan policies discourage the placement of buildings or additions within this district." (AR 4091.) UC is "exempt from local zoning whenever using property under its control in furtherance of its educational mission." (*Ibid*.)

Planner Jared Ikeda commented on the lack of analysis of shadow impacts on public places outside of parklands. (AR 5863, 5912, 5917-18.) Based on the DEIR's Shadow Study Appendix (AR 3749-63.), Mr. Ikeda observed that the increased height of the proposed New Hospital, Milberry Terrace, and Irving Street Gateway projects "will further increase the time and frequency" of shadows cast throughout the year on public sidewalks and streets along Parnassus Avenue and Irving Street frequented by pedestrians. (AR 5917.) Mr. Ikeda also observed that shadows "affect the direct exposure to sun radiation and the resulting feeling of warmth to a person's body;" that "sun radiation can affect the temperature of a surface struck by sunlight and increase that temperature and its surroundings;" and that "[t]he comfort and attractiveness of these particular areas to pedestrians and passersby may be adversely affected and should be addressed in the EIR." (AR 5917.)

The EIR's refusal to analyze the significance of shadow impacts on neighborhood life outside of city parks, when presented with substantial evidence supporting a fair argument that such impacts may be significant, renders it inadequate. (See *ante*.) The EIR cannot use a self-selected threshold of significance to ignore a fair argument of significant impact. (*Amador Waterways, supra*, 116 Cal.App.4th at 1109 ["a threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant."].)

The FEIR's response to comments also summarizes what the DEIR's shadow study shows regarding the timing and extent of new shadows. (AR 5779 [2nd full ¶].) But, like the DEIR, the FEIR fails to determine the significance of this impact. (*Amador Waterways, supra*, 116 Cal.App.4th at 1111-12 ["The question the Agency had to answer was whether the reduction of the surface flow in the streams constituted a significant environmental effect."].)

The CPHP EIR failed to adequately address shadow impacts, in multiple respects.

J. The EIR Improperly Deferred the Formulation of Mitigation for Significant Wind Impacts[30]

The New Hospital, sixteen stories tall and over 294 feet high, would be the tallest building in the vicinity of the Parnassus campus. (AR 3731, 3668.) The EIR concludes that wind is already "uncomfortable" on Parnassus Avenue near the existing Moffitt-Long Hospital and Medical Building 1: "Winds that approach the campus from the southwest through the northwest tend to be accelerated as they flow between Mount Sutro and the taller campus buildings along the south side of Parnassus Avenue, as well as along Parnassus Avenue between taller campus buildings to either side of the street." (AR 3708.) The EIR concluded that wind impacts in the vicinity of the proposed New Hospital and

[30] This issue was exhausted in public comments at AR 1014-1016; 1021-1112.

other buildings would exceed the comfort criterion for pedestrians and would be "significant and unavoidable with mitigation." (AR 3743-46.)

The EIR identifies (and the Findings adopt) Mitigation Measure AES-4 to reduce the significant impact. However, MM AES-4 defers the formulation of specific mitigation measures to future analyses when specific building designs become available:

> CPHP Mitigation Measure AES-4 would require that wind-tunnel testing of specific building designs for structures 80 feet tall or greater be implemented to reduce wind impacts as feasible. However, in the absence of wind tunnel testing of specific building designs, it cannot be concluded that effects would be reduced to a less than significant level. Therefore, this impact would be significant and unavoidable with mitigation.

(AR 3744; see also 145-146, 3743, 4092.)

As discussed, to defer mitigation until after project approval it must be impracticable to achieve in the present and the agency must adopt performance standards. UC violates both criteria for deferral.

1. The EIR's Implied Finding That It Is Impractical to Formulate Specific Mitigation Measures Before Approval Is Not Supported by Substantial Evidence

The EIR states that wind impacts require computational analysis, which it includes, and an "individual point-based analysis undertaken in a wind tunnel," which it asserts cannot occur without final building designs:

> The computational analysis provides information regarding wind flows over the entire site, unlike the individual point-based analysis undertaken in a wind tunnel, and thus is able to reliably predict wind comfort conditions across a relatively wide area, such as the Parnassus Heights campus site. Computational wind engineering does not, however, account for turbulence (variation in wind speed and direction) in the same manner as does wind-tunnel testing, which is more appropriate for evaluation of actual specific designs of tall buildings. Moreover, computational analysis cannot identify exceedances of the wind hazard criterion due to its inability to reliably simulate turbulence using currently accepted methods.

(AR 3717.) On such basis, the EIR defers final analysis of the significance of wind impacts caused by the New Hospital, the Irving Street Arrival, Research and Academic Building ("RAB") and the Initial Aldea Housing Densification. (AR 3774, 3745.) It also defers the formulation of specific mitigation measures for those buildings until final designs are completed and subjected to wind-tunnel testing. (AR 3744, 3746.) The FEIR comment response is that "precise evaluation of a building's wind effects can only be undertaken in a wind-tunnel analysis, and because such an analysis provides useful information only when an actual specific building design is evaluated, *it is not possible* to provide more detail regarding potential wind impacts and potential mitigation measures . . . (AR 5773, italics added.)

Assuming, *arguendo*, that the absence of final designs precludes final wind-tunnel testing, the FEIR fails to explain or provide substantial evidence that it is impractical to complete final designs

before approval of the CPHP and to conduct the necessary wind tunnel testing to enable this EIR to analyze wind impacts and evaluate mitigations or alternative designs *before approval*.[31]

Moreover, relevant EIR evidence points in the opposite direction. The approximate mass and size of the buildings, including the New Hospital, are already known and modeled. (AR 3663.)[32] UC designed the New Hospital during the preparation of the EIR and consideration of the CPHP, noting that "sufficient detail will be available to publish a project-level Draft EIR for the New Hospital in the summer of 2021." (AR 3585.) An architectural firm prepared the CPHP and produced a visual rendering of the new buildings, after which UC hired another architect for the New Hospital in July 2020. (AR 1133; 1137-43; 1154-59.)[33] There is no substantial evidence that it would be impractical to complete building designs and conduct wind tunnel testing before EIR certification and project approval. UC's deferral of formulation of specific mitigation measures was a prejudicial abuse of discretion.

2. UC's Mitigation Fails to Require Compliance with Specific Performance Standards

MM AES-4 identifies a specific performance criterion: new exceedance(s) of the City's 26-mph pedestrian wind hazard criterion, *but it does not require that it be met*. (AR 3744.) UC merely promises that "UCSF shall work with the wind consultant to identify feasible mitigation strategies, including design changes (e.g., setbacks, rounded/chamfered building corners, stepped facades, etc.), to eliminate or reduce wind hazards to the maximum feasible extent." (AR 3744.) It does not set a performance standard by which these mitigation measures would be measured nor commit UCSF to a course of action. This does not satisfy the mandates of CEQA. (*Ante*; Guidelines, § 15126.4 (a)(1)(B).)

The error is prejudicial because UC finds the CPHP's future wind impacts to be "significant and unavoidable." (AR 144-47.) This finding requires that UC impose feasible mitigation measures that would substantially reduce the impact or reduce it to less than significant. (§ 21081 (a)(3); Guidelines, § 15091 (a)(3).) UC chose to defer design-specific analysis of wind impacts until after approval, and thus it is also its choice that no mitigation measure is ready to approve.

Also, UC's refusal to conduct design-specific analysis before approval means that its statement of overriding considerations based on Project benefits outweighing significant environmental effects

---

[31] "Where there are impacts that cannot be alleviated without imposing an alternative design, their implications and the reasons why the project is being proposed, notwithstanding their effect, should be described." (Guidelines, § 15126.2(c).)

[32] "The preliminary concept for the New Hospital consists of a 5-story podium, above which an 11-story tower would rise." (AR 3668.)

[33] SF submitted additional detailed literature regarding specific design features to reduce pedestrian wind impacts, including the use of building features, massing, rounded corners, orientation of building in relation to wind, and consideration of terrain, and including information about how "podium designs" affect wind. (AR 1021-1112; 1095-1098; 1105-1111.)

was adopted without adequate basis, because neither UC nor the public know the severity of the significant effect. (*County of Fresno*, *supra*, 6 Cal.5th at 519 ["a sufficient discussion of significant impacts requires not merely a determination of whether an impact is significant, but some effort to explain the nature and magnitude of the impact"].)

Finally, MM AES-4 requires the use of an incorrect baseline to determine the success of the mitigations. The mitigation requires comparison of the "wind hazard exceedance or the number of test points subject to hazardous winds, compared to then-existing conditions . . . ." (AR 3744.) The proper baseline is the present, not future environmental conditions. (*South Coast*, *supra*, 48 Cal.4th at 320-321.)

K. The EIR Fails to Lawfully Analyze and Mitigate GHG Emissions

Implementation of the CPHP would increase electricity consumption at the Parnassus Heights campus by 116 percent, natural gas would be increased by 61 percent, diesel would be increased by 71 percent, and gasoline would be increased by 22 percent. (AR 1779.) These drastic increases in energy consumption would, in turn, significantly increase GHG emissions at the Parnassus campus. The EIR's analysis and mitigation for these GHG emission violates CEQA. UC's strategy to primarily rely on purchasing voluntary market offsets results in both unenforceable and improperly deferred mitigation. UC also improperly relies on the inapplicable 2017 Scoping Plan to establish a significance standard.

1. The EIR Relies on Unenforceable Mitigation

CEQA requires a lead agency to consider the "extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions[.]" (Guidelines, § 15064.4 (b)(3).) One of the EIR's significance criteria for GHG emissions is whether the CPHP would "generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment." (AR 1851.) The DEIR stated that the criterion would be potentially surpassed, because "the CPHP would result in a significant impact on the environment if GHG emissions from construction and operations of the Parnassus Heights campus site would exceed a threshold of zero net additional GHG emissions compared to the existing conditions, currently estimated below to be 125,426 MT CO2e annually for all Scope 1, Scope 2, and Scope 3 sources[.]" (AR 1852.)

To decrease the GHG emissions to less than significant (i.e., less than net-zero), the EIR relies on Mitigation GHG-1c. (AR 1855.) GHG-1c is divided into two parts, "Compliance with CARB's Cap and Trade Program" and "Compliance with UC Policy." (AR 1858.) There are two critical distinctions between the parts. Compliance with CARB's cap and trade program requires offset credits to be registered and retired by an Offset Project Registry pursuant to 17 California Code of Regulations section 95802 subdivision (a). However, these offsets may only be applied to UCSF's Central Utility

Plant ("CUP") because it is the only aspect of the CPHP that is a "Covered Entity" (AR 1834) – and then only up to a maximum of eight percent of UC's cap and trade program compliance obligation (AR 6128.) For the remainder of its compliance obligation, UC proposes to "utilize *the voluntary carbon market* to offset the remainder of the emissions from the CPHP that are above the project significance criterion*."* (AR 6128, italics added; 1858.)

The EIR concedes the eight percent maximum decrease under the cap-and-trade program is insufficient to meet its net-zero increase standard. (AR 1854.) In 2018, UCSF Parnassus produced 125,426 MT CO_2e of emissions. (*Ibid*.) Implementing the CPHP would increase emissions to 187,241 MT CO_2e, which is an increase of 61,815 MT CO_2e. (*Ibid*.) An eight percent decrease from the CUP would be insufficient to cover this increase and so, to avoid a significant impact determination, UC relies on the purchase of offsets *in a voluntary market* for all other CPHP emissions (equal to roughly 59,000 MT CO_2e a year). (AR 1855.)

The legal problem, however, is that these voluntary market offsets do not meet the same enforceability standard as CARB's cap and trade program (i.e., "real, permanent, verifiable, additional, and enforceable") and, therefore, are not "fully enforceable through permit conditions, agreements, or other legally binding instruments" as required by CEQA. (Guidelines, § 15126.4 (a)(2); see *Golden Door II*, *supra*, 50 Cal.App.5th at 506-514 [offset-based GHG mitigation violated CEQA because unenforceable].) In *Golden Door II,* as here, the agency's proposed offsets did not meet the protocols of the CARB cap-and-trade program designed to ensure that they are "real, permanent, verifiable, additional, and enforceable." (*Id*., *supra,* 50 Cal.App.5th at 511.) The CPHP's mitigation here, M-GHG-1c, uses nearly identical language as the mitigation in *Golden Door II.* (Compare AR 1859 to 50 Cal.App.5th at 511.) *Golden Door II* held that voluntary market offsets did not meet CEQA's enforceability requirement for mitigation because "M-GHG- does not require the protocol itself to be consistent with CARB requirements." (*Golden Door II*, *supra,* 50 Cal.App.5th at 506, 512.) The same is true here. (AR 1859 ["The protocols of each registry . . . shall be used"].)

2. The EIR Impermissibly Defers Mitigation for GHG Emissions

As discussed above, "Deferred mitigation violates CEQA if it lacks performance standards to ensure the mitigation goal will be achieved." (*Golden Door II*, *supra*, 50 Cal.App.5th at 520; Guidelines, § 15126.4 (a)(1)(B).) In *Golden Door II*, the court found the relevant offset mitigation impermissibly deferred because the county's planning and development director determined whether to approve offsets, without applying objective criteria. (*Golden Door II*, *supra*, 50 Cal.App.5th at 519.) UC's mitigation strategy is analogous and therefore dictates the same outcome here. *Golden Door II* determined that "M-GHG-1 sets a generalized goal — no net increase or net zero GHG emissions . . .

achieving that goal depends on implementing undefined offset protocols, occurring in unspecified locations (including foreign countries), the specifics of which are deferred to those meeting one person's subjective satisfaction." (*Id*., *supra*, 50 Cal.App.5th at 520.) The only differences here are that (1) UC limits offsets to unspecified locations within the United States and (2) instead of a single person's subjective satisfaction it is UC's unspecified "internal guidelines" and "internal screens" that must be satisfied. (AR 1858.) Neither difference compels a different outcome.

With respect to the location of offsets, *Golden Door II* held that M-GHG-1 did not contain objective standards as to whether any specific offset project would be "available" or "financially feasible" in one location or another. (*Golden Door II*, *supra*, 50 Cal.App.5th at 520-21.) UC follows the same approach here by allowing a large portion of CPHP emissions to be "mitigated" by purchasing offsets. (AR 1854.) Rather than determine the locations and protocols of these offsets at the time of the EIR, UC has deferred these determinations.

Further, *Golden Door II* found the agency's criteria for determining whether an offset would be "real, permanent, verifiable and enforceable," was not sufficiently objective. (*Golden Door II*, *supra*, 50 Cal.App.5th at 521.) UC's mitigation also lacks the objective criteria, as the "protocols of each registry, and *UC own internal screens*, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols." (AR 1859, italics added.) The EIR provides no information about what these "internal screens" are, who is responsible for defining them, or whether the screens would provide offsets that are real, permanent, additional, and independently verified. (*Ibid*.) Without additional information, decision-makers and the public are left in the dark as to whether GHG-1c contains adequate, or any, performance standards. As in *Golden Door II*, GHG-1c is impermissibly deferred.

3. CARB's 2017 Scoping Plan Is Inapplicable by Its Own Terms to UC and Cannot Be Used to Reduce UC's Duty to Mitigate GHG Impacts

One of the EIR's thresholds of significance for GHG emissions asks: "Would implementation of the CPHP . . . Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases." (AR 1851.) In 2017, UCSF developed a combined Climate Action Plan and GHG Reduction Strategy ("GHGRS") "to provide streamlined analysis under CEQA for future development projects" (AR 1845-46) and to ensure that UCSF can answer 'no' to the above-stated questions (AR 1851). The GHGRS is also intended to ensure that UCSF is consistent with the state's GHG emission reduction targets for 2030 and 2050. (AR 1846; 1851.) Through legislation and executive orders, California has set the following emissions targets: by 2030, reduce GHG missions to 40 percent below 1990 levels; and by 2050, reduce GHG emissions to 80 percent below 1990 levels.

(AR 1830-31.) (See e.g., (*Cleveland I;* 3 Cal.5th at 428; *Newhall Ranch I, supra,* 62 Cal.4th at 221; *Spring Valley Lake, supra,* 248 Cal.App.4th at 101; *Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, 1168; *Citizens for Responsible Equitable Environmental Development v. City of Chula Vista* (2011) 197 Cal.App.4th 327, 335-36.)

The EIR, however, in selecting the standard for determining whether its "conflict with applicable plan" threshold is triggered, abandons UCSF's own "applicable" GHGRS and instead uses the "inapplicable" CARB 2017 Scoping Plan Update, which guides cities and counties to use a "zero net increase" significance standard for GHG emissions. (AR 1852, 26981.) But UCSF is not a city or county, and so the CARB 2017 Scoping Plan guidance is inapplicable by its own terms, and the EIR fails to substantively explain how such guidance is applicable to a statewide entity like UC. As the EIR explains, "UCSF is a constitutionally created state entity," and therefore not a city, county or local government. (AR 1741.) As such, guidance to cities and counties regarding review and approval of private development projects within their respective jurisdictions simply has no application to UC's management of its own development proposals on its own property, over which UC has plenary authority.

In short, the EIR says it will use "conflict with an applicable plan, policy, or regulation" as a threshold of significance, but then selects a patently inapplicable plan to use in the analysis. This is a legal error. Further, this error is prejudicial because using a "net zero" significance standard reduces UC's mitigation obligation as compared to using a significance standard tied to the state's 2030 and 2050 GHG reduction goals.

L. The EIR Fails to Adequately Assess Whether Significant Increases in Energy Consumption are Wasteful, Inefficient or Unnecessary

1. UC May Not Uncritical Rely on Title 24 and LEED Certification

The CEQA Guidelines require lead agencies to prepare a substantive analysis of a project's energy impacts and provides in relevant part:

> Energy Impacts. If analysis of the project's energy use reveals that the project may result in significant environmental effects due to *wasteful, inefficient, or unnecessary use of energy, or wasteful use of energy resources, the EIR shall mitigate that energy use.* This analysis should include the project's energy use for all project phases and components, including transportation-related energy, during construction and operation. *In addition to building code compliance, other relevant considerations may include, among others, the project's size, location, orientation, equipment use and any renewable energy features* that could be incorporated into the project.

(Guidelines, § 15126.2 (b), italics added.)

An EIR must affirmatively analyze a project's use and efficiency to determine whether there is "wasteful, inefficient, or unnecessary use of energy." Here, the EIR's perfunctory analysis of energy

falls well short of these mandates. There are two interrelated but distinct defects in the EIR's analysis of energy impacts. First, the EIR disregards Appendix F energy conservation factors. Second, the analysis relies heavily on compliance with Title 24 and LEED standards but otherwise fails to consider other relevant considerations of Guidelines section 15126.2, subdivision (b).

The EIR purports to analyze the considerations set forth in CEQA Guidelines, Appendix F, yet completely overlooks the introduction of Appendix F, which states:

> The goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include:
> a. decreasing overall per capita energy consumption,
> b. decreasing reliance on fossil fuels such as coal, natural gas and oil, and
> c. increasing reliance on renewable energy resources.

(Guidelines, Appendix F.)

The EIR makes no effort to demonstrate that the CPHP employs these specifically-identified "means" to achieve the stated goal of conserving energy. The most glaring conflict comes from a paragraph titled "Appendix F.II.C.1: Energy Requirements and Energy Use Efficiencies" of the EIR, which points the reader to Tables 4.5-2 and 4.5-3 for estimated energy usage. (AR 1779.) Table 4.5-2 discloses that electricity use would increase from 5,091 to 10,976 MWh/year, natural gas use would increase from 1,044,485 to 1,686,549 MMBtu/year, diesel use would increase from 681,823 to 1,198,763 gallons per year, and even gasoline use would increase from 4,246,449 to 5,178,022 gallons per year. (*Ibid*.) These numbers translate to a 116 percent increase in electricity use, 61 percent increase in natural gas use, 76 percent increase in diesel use and 22 percent increase in gasoline use. (*Ibid*.)

With respect to the three different "means" of achieving energy conservation, the EIR discloses that UCSF would dramatically increase its reliance on fossil fuels rather than "decreasing reliance." Further, the EIR's energy chapter does not break down energy use per capita so there is no evidence whether this is met. Last, the EIR is unclear whether renewable energy sources would be implemented into the CPHP, and this is particularly troublesome given "[t]he CUP currently supplies a substantial majority (98 percent) of the electricity service to the Parnassus Heights campus site by means of gas and steam turbine generators." (AR 1767.) Therefore, there is no indication that any of the identified means to achieve the goal of energy conservation are being met other than through reliance on compliance with Title 24 and LEED standards.

Though the EIR provides energy consumption data, the dramatic increases easily overcome the low threshold of whether the Project "may" result in wasteful, inefficient, or unnecessary use of energy, or wasteful use of energy resources. (Guidelines, § 15126.2 (b).) Put simply, the Project's proposed

increases in energy consumption imposes upon UC the duty to analyze in the EIR whether such consumption is "wasteful, inefficient or unnecessary." The EIR fails at this task.

The EIR's determination that energy impacts would be less than significant is based entirely on the Project's compliance with UC's Sustainable Practices Policy provisions "that are designed to conserve and reduce energy consumption," which in turn are premised on Title 24 and LEED compliance. (AR 1774, 1777.) However, both the CEQA Guidelines and applicable case law require more. Guidelines section 15126.2, subdivision (b) expressly requires, "In addition to building code compliance, other relevant considerations may include, among others, the project's size, location, orientation, equipment use and any renewable energy features that could be incorporated into the project." In *CCEC, supra*, 225 Cal.App.4th at 211, the court determined that requiring "compliance with Title 24 of the California Code of Regulations and other California green building codes did not meet the requirements of appendix F of the CEQA Guidelines." The court explains that such compliance

> . . . does not address many of the considerations required under appendix F of the CEQA Guidelines. These considerations include whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope. Here, a requirement that [the project] comply with the Building Code does not, by itself, constitute an adequate assessment of mitigation measures that can be taken to address the energy impacts during construction and operation of the project.

(*Ibid*.) In *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 Cal.App.4th 256, 265, the court relied on the *CCEC* court's analysis to conclude that the respondent city's EIR "improperly relies on compliance with the building code to mitigate operational and construction energy impacts, without further discussion of the CEQA Guidelines, Appendix F criteria."

Here, the EIR states that all "[i]ndividual projects under the proposed CPHP would be required to comply with the UC Policy on Sustainable Practices, which requires new construction of facilities to meet a minimum standard of LEED-NC Silver and strive for LEED-NC Gold when possible and requires 20 percent better energy performance than Title 24[.]" (AR 1786.) UC asserts, "UCSF has committed to implement the energy reduction measures within its GHGRS as part of the LRDP and the CPHP to improve efficiency of existing buildings, including the requirement that new buildings be designed to surpass Title 24 energy efficiency standards and . . . attain LEED 'Silver' certification or equivalent." (AR 5988.) Based on this conclusory analysis, the EIR determined the CPHP would not result in wasteful, inefficient, or unnecessary consumption of fuel or energy. (AR 5988.)

UC's reliance on LEED certification fails because, as in *CCEC*, it fails to consider "whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope."

(*CCEC, supra*, 225 Cal.App.4th at 21.) The EIR never explains whether the scope of LEED certification includes consideration of these issues.[34] Even if LEED certification accounted for such considerations, reliance on LEED certification also fails because the UC's Policy on Sustainable Practices, which the EIR identifies as the ultimate legal authority imposing the requirement for LEED Silver certification,[35] includes an express waiver procedure for LEED certification. (AR 33958 ["Any proposed waiver from section III.A of the Policy may be requested administratively from the UCOP Executive Director of Capital Programs prior to first project approval"].)

The EIR fails to analyze whether the Project's significant increase in energy consumption is wasteful, inefficient or unnecessary. Further, UC may not sidestep this required analysis by pointing to Title 24 or LEED certification.

2. UC Relies on the Ratio Theory to Avoid Adequate Analysis of Cumulative Energy Impacts

The EIR finds the CPHP would not result in cumulatively considerable impacts from wasteful, inefficient, or unnecessary energy consumption. (AR 1788.) To arrive at this conclusion, the EIR impermissibly relies on the long-repudiated "ratio theory." (See *ante*.) The EIR repeatedly emphasizes that the CPHP would account for a miniscule amount of energy use across the state or the City (AR 1781-83), however, this "drop in the bucket" analysis is being used to circumvent analysis of whether the project's energy consumption is cumulatively "wasteful, inefficient, or unnecessary." (Guidelines, § 15126.2 (b); AR 1787 ["Given the relatively small percentage of the CPHP's other fuel and energy uses compared to existing fuel and energy use in the region"].) Reliance on the "ratio theory" is improper.

Setting aside the EIR's reliance on the ratio theory, the cumulative analysis is defective also because it identifies no significance criteria for the cumulative impacts. (AR 1787.) The EIR's analysis relies heavily on Title 24 and LEED to show "efficiencies," but does not analyze the cumulative impact against any identifiable significance standard. (AR 1787; *Lotus, supra*, 223 Cal.App.4th 645, 657 ["Simply stating that there will be no significant impacts because the project incorporates 'special construction techniques' is not adequate or permissible" to meet CEQA requirements.].) Rather than analyze how the Project's large increase in energy consumption could contribute to a cumulative impact, the EIR instead concludes, "[O]perational electricity requirements of the CPHP would not be cumulatively considerable and the estimated consumption rate would not be substantial compared to the 2018 citywide consumption." (AR 1787.) What this fails to determine, for example, is whether doubling

[34] The most detailed description of LEED certification is buried in the administrative record, and characterizes LEED as "a green building rating system" and identifies four levels: Certified, Silver, Gold and Platinum. (AR 33941.)

[35] The revised LRDP accommodating the CPHP states, "The Sustainable Practices Policy sets the following additional requirements and goals relevant to GHG emissions reduction." (AR 48.)

the site's use of electricity would affect the local grid or whether an additional 642,064 MMBTU of natural gas a year would be cumulatively considerable. (AR 1779.)

In summary, the EIR fails as an informational document with respect to the Project's project-level and cumulative analysis as to whether the proposed dramatic increases in energy consumption are inefficient, wasteful or unnecessary.

M. The EIR Fails to Analyze Off-Site Alternatives

CEQA's mandates are enforced vis-à-vis project alternatives and mitigation measures. The Supreme Court set aside the EIR certified in *Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal.5th 918, 937 based on the city's failure to "meaningfully address feasible alternatives or mitigation measures." The Court rejected a flawed EIR for the expansive Newhall Ranch project following multiple EIRs spanning a decade. (*Newhall Ranch I, supra*, 62 Cal.4th 204.) Justice Kathryn Werdegar's majority opinion, noting Justice Ming Chin's dissent warning of "inordinate delay" attending an additional CEQA process, underscored that judicial review of an EIR cannot turn on

> ... independent assessment of the project's environmental merits. Even if Newhall Ranch offered the environmentally best means of housing this part of California's growing population, CEQA's requirements for informing the public and decision makers of adverse impacts, *and for imposition of valid, feasible mitigation measures,* would still have to be enforced.

(*Id.* at 240, italics added.)

1. Alternatives Enforce CEQA's Substantive Mandate

Public Resources Code section 21002 lays out the state policy that "agencies should not approve projects as proposed if there are feasible alternatives . . . that would substantially lessen their significant environmental effects." The same code section explains that environmental processes — in this case, an EIR — are practical: they are "*intended to assist public agencies*" in evaluating impacts and identifying alternatives. (§ 21002, italics added; *see* § 21002.1 (a).)

Consistent with this premise, the Supreme Court held in *City of Marina* that CEQA requires agencies "to avoid or mitigate, if feasible, the significant environmental effects of their project." (*City of Marina, supra*, 39 Cal.4th at 369; see also *Preservation Action, supra*, 141 Cal.App.4th at 1350 ["agencies should not approve projects as proposed if there are feasible alternatives . . . which would substantially lessen the significant environmental effects . . . ")

CEQA's "substantive mandate" is further implemented in section 21081, and *does not allow an agency to approve a project with significant impacts for which there are feasible alternatives.* (*Mountain Lion Foundation, supra*, 16 Cal.4th at 123, 134.) A further relevant mandate, applicable only *after* feasible mitigations and alternatives have been adopted, is that projects can be approved despite

significant impacts when specific "economic, social, or other conditions" — factors *external* to the project itself — make mitigation infeasible. (§§ 21002, 21002.1.)

To approve a project with significant environmental impacts, UC therefore must first impose project alternatives and mitigation measures found to be feasible — enforcing CEQA's substantive mandate — and then, if significant impacts remain, adopt a supportable finding of overriding public benefit. (§ 21081; *City of Marina, supra,* 39 Cal.4th at 350.) The findings must be made in order, and while both must be fact-based, the Legislature reserved policy considerations for the latter. (*Ibid.*)

2. EIRs Must Analyze Potentially Feasible Alternatives that Reduce Project Impacts

CEQA requires that lead agencies consider alternatives at two stages in the EIR process. First, a draft EIR must analyze a range of reasonable alternatives. (Guidelines, § 15126.6.) Later, when the agency considers whether to approve or carry out the project as proposed, it cannot do so if a feasible alternative would substantially reduce significant effects. (Guidelines, § 15092 (b)(2)(A).)

To explore ways to meet as many goals as possible while protecting the environment, EIRs thus must evaluate alternatives that accomplish "most" basic objectives. (Guidelines, § 15126.6 (a); *Preservation Action, supra,* 141 Cal.App.4th at 1353.) Alternatives warrant study in the EIR process if they can reduce or avoid impacts and are "potentially feasible." (Guidelines, §§ 15126.6 (a), (c) , (f); *Watsonville Pilots Association v City of Watsonville* (2010) 183 Cal.App.4th 1059, 1087 (*Watsonville Pilots*).) As to whether an EIR has evaluated a range of reasonable alternatives, "[e]ach case must be evaluated on its facts ... in light of the statutory purpose." (*Watsonville Pilots, supra,* 183 Cal.App.4th at 1086, citing *Citizens of Goleta v. Board of Supervisors of Santa Barbara County et al.* (1990) 52 Cal.3d 553, 566 (*Goleta II*).) The nature and scope of the alternatives to be studied are governed by the rule of reason. (Guidelines, § 15126.6 (a); *In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* (2008) 43 Cal. 4th 1143, 1163 (*In re Bay-Delta*).)

CEQA defines feasible: "capable of being accomplished in a successful manner within a reasonable . . . time, taking into account economic, environmental, social, and technological factors." (§ 21061.) External factors — "legal, social, . . . or other considerations, including considerations for the employment opportunities for highly-trained workers" — may also be relevant. (§ 21081 (a)(3).) Feasible alternatives are allowed to "impede to some degree the attainment of the project objectives, or . . . be more costly." (Guidelines, § 15126.6 (b).)

Finally, an "alternative that is potentially feasible should not be excluded from an EIR simply because it may not further all of the agency's policy objectives." (*Watsonville Pilots, supra,* 183 Cal.App.4th at 1087.) *Watsonville Pilots* found legal error when a draft EIR failed to evaluate a reduced

development that failed to meet two of twelve objectives: "The City's argument on this issue is premised on its claim that no discussion of an alternative is required if that alternative would not meet a project objective. This premise is mistaken." (*Ibid*.)

3. The EIR Fails to Analyze Alternate Locations for Expansion

The CPHP DEIR identified several alternatives suitable for analysis, as follows: "No Project Alternative, consisting of No Development and Development under the 2014 LRDP;" "Reduced Project;" CPHP including New Hospital: 19-Story Option;" and CPHP including New Hospital - Phased Option." (AR 2106, 4271, 5754.) The DEIR formulated but dismissed from analysis the off-site alternatives of building the new hospital at UCSF's Mission Bay or Mount Zion properties. (AR 2154; 2157; 4319; 4322.) UC prejudicially abused its discretion by refusing to analyze these off-site alternatives within the EIR process as well as rejecting the Hunters Point/Candlestick location.

a. The Mission Bay Location

The EIR admits that the Mission Bay alternative would reduce the CPHP's significant wind impact in the vicinity of the new hospital, avoid the significant adverse impact of demolishing the historic Langley Porter Psychiatric Institute, and would also avoid construction and operational impacts associated with the new hospital. (AR 2155, 4320.) The EIR also finds that the Mission Bay alternative would result in "an estimated 284 fewer overall [hospital] beds at Parnassus Heights;" that "there are bed shortages for critical and acute care" in the City and the greater Bay Area, and the Mission Bay site thus "would not meet this growing demand, or allow for an expansion of emergency, surgical, interventional radiology, and imaging services, at this campus site." (AR 2104, 2164; 4269, 4319.)

However, increasing beds "*at Parnassus Heights*" is an unduly and self-servingly narrow EIR objective, precluding consideration of *any* off-site alternative. The DEIR fails to explain why the Mission Bay alternative could not be configured to increase available beds and why it is not "potentially feasible," which is the applicable legal standard, and led to a later unsupported finding that all alternatives were infeasible and eliminated from further consideration in the Draft EIR. (AR 247.)

The DEIR also finds, without support or fact-based analysis, that the Mission Bay alternative would "conflict with several 2014 LRDP objectives for the Parnassus Heights campus site" including the preference to locate instruction, clinical, research, and support uses in proximity "to foster collaboration and to facilitate the inter-dependence and connectivity for operational efficiency and effectiveness of instruction, clinical, research and support uses in close physical proximity to each other;" and "(e)nsure that Long Hospital and the New Hospital Addition have adequate clinical and administrative support and are aligned with education, research and specialized care programs and support that remain at the campus site." (AR 2155, 4320.)

The purported conflict is unsupported to the point of absurdity, rendering the EIR analysis inadequate. The EIR fails to explain that the 2014 LRDP contemplated meeting the same objectives without the vast expansion proposed in the CPHP. Moving some new facilities to Mission Bay would not conflict LRDP objectives, nor fundamental EIR objectives for the "New Hospital." (AR 1449.)

The DEIR pronounces that "by not developing a New Hospital at the Parnassus Heights campus site, and focusing future new clinical uses at the Mission Bay campus site, this potential alternative would also result in decreased efficiency for UCSF staff and students." (AR 2155, 4320.) "Decreased efficiency" is subjective, is not a fundamental objective á la *In re Bay-Delta*, and is a trumped-up reason *not to analyze* this alternative. Meeting all conceived objectives is not the standard at the EIR stage for an alternative that can reduce significant impacts. (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1087.)

Goleta I, *supra*, 197 Cal.App.3d at 1179-80 held that an EIR for a resort hotel should have considered an alternate site: "Reason requires that the agency charged with the duty to protect the environment compare impacts at feasible alternative locations." As discussed ante, off-site alternatives cannot be rejected for analysis because a project proponent *does not want* an off-site project, any more than a reduced-size project can be rejected for that reason. (*Uphold Our Heritage*, *supra*, 147 Cal.App.4th at 602; *Preservation Action*, *supra*, 141 Cal.App.4th at 1355-56.) Otherwise, CEQA's requirement for consideration and analysis of off-site alternatives is meaningless.

Petitioner Yerba Buena Neighborhood Consortium submitted comments on the Draft EIR that explain that Mission Bay could

> ... fully accommodate expanded UCSF development of this scale and meet fundamental project objectives (*In re Bay-Delta* (2008) 43 Cal.4th 1143.) That of course is exactly what happened once before in 1996 with the decision to locate a new UCSF research campus in the already-approved Mission Bay Redevelopment Project.

(AR 6178.) Mission Bay is a logical, beneficial site at which to achieve project benefits without significant impacts, as is a promising hybrid alternative rejected from consideration: "No New Hospital at Parnassus Heights Campus Site/Implement Phase 2 of Medical Center at Mission Bay Campus." "In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus." (AR 5855.) The claim of increased crosstown traffic is not supported by evidence or analysis.

Failure to address alternatives utilizing the Mission Bay site in the DEIR was error warranting issuance of a peremptory writ. As pointed out in comments by the Consortium, "[t]he now almost-finished Mission Bay Project has conclusively proved that a UCSF campus can be a catalyst project that makes master-planned projects like these financially feasible for development. In particular, associated bio-med commercial development remains potentially viable."

b. The Mount Zion Location

The Mount Zion alternative location, two miles from the Parnassus Heights project site, reduces or avoids the same significant environmental impacts as the Mission Bay location. It was rejected for EIR analysis for failing to meet the same non-fundamental project objectives and creating the same purported "inefficiencies." The DEIR objects to Mount Zion as "less than ideal." (AR 2157, 4322.) This is not a CEQA standard. (*Laurel Heights I, supra*, 47 Cal.3d at 400.) Like Mission Bay, there is a rejected reasonable partial alternative that should also be considered; locating the new hospital at Mount Zion would remove significant impacts at Parnassus and meet fundamental objectives. (AR 255-57.)

c. The Hunters Point Location

The Draft and Final EIRs also fail to mention the Hunters Point off-site alternative that the Yerba Buena Neighborhood Consortium urged for consideration. UC owns 3.8 acres in Hunters Point with two single-story buildings used for an animal care facility. (AR 13583.) The City submitted EIR comments that included a draft "Racial & Social Equity Initiative" planning approach referencing Bayview/Hunters Point. (AR 6718, 6721-23, 6727-28.) When the 2014 LRDP was published, San Francisco had approved the Candlestick-Hunters Point Shipyard Development Plan, an extensive mixed-use redevelopment plan that did not proceed. (*Ibid.*) As pointed out by planner Terry Watt, the EIR fails to properly analyze project alternatives, including locating a new hospital at Hunters Point:

> Feasible alternatives to the Project, improperly dismissed by the Final EIR, that would reduce or eliminate significant Project impacts should be reinstated for consideration including . . . No New Hospital at Parnassus Heights Campus Site and instead one of the following: Implement Phase 2 of Medical Center at Mission Bay Campus Site; New Hospital at Mount Zion Campus Site; . . .New Hospital at Hunters Point at the Candlestick site formerly slated for a new shopping mall. Locating the new hospital here would avoid many of the impacts associated with the Parnassus site, and would have many co-benefits such as providing jobs in and health services to an underserved and disadvantaged community.

(SAR 63068-69.)

4. The FEIR Failed to Respond to Comments Regarding Off-site Alternatives

Petitioners have discussed the importance of adequate responses to EIR comments relative to EIR analysis, *ante*. As in many CEQA cases, especially those involving projects of regional importance and impact, the legal problem is both that the EIR failed to analyze the off-site alternatives *and*, as a separate violation of CEQA, that it failed to respond to public comments that requested the analysis.

The FEIR's "Master Response 5: EIR Alternatives" restates the DEIR's reasons for not analyzing the Mission Bay and Mount Zion alternatives and concludes that

> an alternative that would adopt and implement the CPHP without construction of a New Hospital at Parnassus Heights . . . would not address one specific need . . . which is the need for co-location of instructional, research, and clinical spaces, and would not achieve most of the basic project objectives as shown in Table 8.3-1 below.

(AR 5757 [Mission Bay]; 5759 [Mount Zion].) The master response points out that objectives "for the Parnassus Heights campus site... appropriately focus on UCSF's goals for the campus site, *since the proposed project is a plan for that campus site*." (AR 5754, italics added.) Under such circular logic, no project/plan EIR would need to consider off-site alternatives. Instead, CEQA requires consideration of "alternative locations" for a project based on the answer to a "key question":

> The key question and first step in analysis is whether any of the significant effects of the project would be avoided or substantially lessened by putting the project in another location. Only locations that would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR.

(Guidelines, § 15126.6 (f)(2)(A).) There is a caveat; if "no feasible alternative locations exist" of course a non-existent alternate site cannot be considered; "for example, . . . a geothermal plant or mining project must be in close proximity to natural resources at a given location." (*Id*. at (f)(2)(B).) The FEIR references *California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, which dealt with needs of a public park that could only be resolved in that location. (AR 5755.)

The FEIR master response conflates the "potentially feasible" standard for including an alternative for analysis in a draft EIR with the "actually feasible" standard applicable to an agency's decision to *adopt* an alternative instead of the proposed project. But neither standard requires that every listed project objective be met. (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1087.) The response never considers whether alternatives are "potentially feasible" and provides no substantial evidence to the contrary. Importantly, the omission of off-site alternatives for EIR discussion deprived the public and decision-makers of essential information.

Inadequate responses to individual comments regarding off-site alternatives include:

- **Comment Letter O-YNBC: Yerba Buena Neighborhood Consortium**. The Consortium urged EIR consideration of alternate off-site locations "to meet fundamental project objectives," noting "that is exactly what happened in 1996 with the decision to locate a new UCSF research campus in the already-approved Mission Bay Redevelopment Project." (AR 6178; see also Comment Letter I-Goodman (AR 23, 6316, 6326-27).) The FEIR relied on its inadequate Master Response 5, discussed *ante*, providing no comment-specific analysis. (AR 6179.)

- **Comment Letter I-Leonard: Edward Leonard**. The Leonard letter reiterates the need for the EIR to analyze alternate sites, especially in light of the space ceiling that UC committed to because "expansion at the Parnassus Campus was not feasible." (AR 6380, 6383-84.) "There are

several suitable, if not superior, alternatives to accomplishing UCSF's objectives, not requiring the building of an elephantine structure, completely unsuitable for the space it will occupy, in a residential neighborhood. If UCSF really requires a hospital as big as it claims, it should find an appropriately scaled new site." (AR 6379-84.) The FEIR again simply refers the commentor to its master response. (AR 6389.)

- **Comment Letter O-LD2: Lozeau Drury**. The 46-page letter written by attorney Richard Drury on behalf of the Parnassus Neighborhood Coalition addressed off-site alternatives in depth, including the need for analysis of the reasonable and potentially-feasible sites. (AR 5853-56.) Mr. Drury's analysis is reflected in the arguments presented *ante* regarding the DEIR's inadequate analysis of alternatives. The response again relies on Master Response 5. (AR 5978.)

The FEIR did not adequately respond to comments regarding the three off-site alternatives.

5. Approval Findings are Premature

In assessing feasibility of an alternative to reduce or avoid significant environmental impacts, an agency must consider whether external conditions stand in the way of its successful accomplishment rather than whether non-basic project objectives are met. UC's findings certifying the EIR and approving a project with many significant impacts and without locating any portion at an alternate site based on claimed infeasibility are both unsupported and premature. (AR 247-59.) As in the *Uphold Our Heritage* and *Preservation Action* cases, to name a few, an adequate EIR is prerequisite for considering CEQA approval findings. (*Ante*.) The UC Regents do not yet have sufficient information to determine feasibility of alternate sites for any or all Project purposes.

Conclusion

Petitioners request this Court's judgment and issuance of a peremptory writ of mandamus in the public interest, ordering the University of California to fully comply with CEQA. UC must first set aside approvals of the Comprehensive Parnassus Heights Plan and void its certification of the EIR.

Respectfully submitted.[36]

[36] This brief is co-written and is signed by counsel for Petitioners in three related cases (Case Nos. RG21088939, RG21089332, and RG21090517). By executing this brief, the undersigned counsel do not appear for or undertake representation of any petitioner other than as identified in the signature lines.

Treatise

Introduction

The merits of this public interest action are not refuted by the University of California. The CPHP EIR fails to achieve its purpose. As always, the standard of review plays a critical role in assessing CEQA compliance. The Supreme Court has in recent years reiterated that if an EIR process fails to comply with mandated procedures, or if the EIR omits essential information or insufficiently analyzes impacts, judicial review is de novo, while the substantial evidence standard applies to factual findings. UC's repeated, incorrect assertions of broader substantial evidence review invite error.

The context of UC efforts to overbuild the Parnassus Heights campus warrant mention as remarkable and relevant. The campus is beautiful, historic, and constrained. Indeed, in the 1990's UC developed a facility a few miles away at Laurel Heights justified by the claimed infeasibility of expansion at Parnassus. The constraints remain, and the CPHP EIR's failure to analyze *any* potentially feasible off-site alternatives at *sites owned by UC* — which it has long admitted are essential to avoid overbuilding Parnassus — violates CEQA.[1]

Petitioners in the related cases respectfully request this Court's judgment and peremptory writ.

Discussion

A. The EIR Fails to Analyze Any Off-Site Alternatives

The CPHP EIR failed to study — and therefore, the UC Regents had no opportunity to review or adopt — potentially feasible off-site alternatives. UC *owns multiple properties* in San Francisco that were acquired specifically to address space constraints at Parnassus, and so can meet fundamental plan objectives and avoid or reduce significant impacts at Parnassus. The error is prejudicial because identifying and adopting feasible alternatives is the primary goal of CEQA.

In arguing that it sufficiently studied and rejected off-site alternatives, UC's brief misstates the law. First, it posits that as the lead agency, it — instead of "a project's critics" — has sole responsibility for formulating a range of alternatives for the EIR to study (Respondents' Opening Brief (ROB) 67:11), citing *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 396, 406 (*Laurel Heights I*). In *Laurel Heights I*, the Regents had argued that "CEQA places the

[1] If UC is ordered to produce the relevant record documents that it has withheld to date, including, for example, documents that it describes as addressing its decision not to pursue EIR analysis of alternative UC-owned sites, petitioners will seek to supplement their merits briefing as appropriate.

burden of identifying alternatives" on environmental petitioners. The Supreme Court ruled their position was "not supported" because the *responsibility for EIR adequacy* lies with the lead agency. (*Ibid.*)

The take-away is that concerned citizens are *not required to* — but may — point out deficiencies in an EIR process so that a lead agency will meet its responsibilities to certify an adequate EIR. "'It is not limited to alternatives proposed and justified by objectors [to an EIR].' (*Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1178.)" (*Laurel Heights I, supra*, 47 Cal.3d at 406.)

It is ironic that UC relies on *Laurel Heights I,* in which the Supreme Court reviewed the inadequate EIR prepared when UC expanded its San Francisco properties to a new campus two miles away from Parnassus in Laurel Heights *because* "there were serious space constraints at the Parnassus campus and ... a need to develop off-campus locations for academic and support activities. (*Laurel Heights I, supra*, 47 Cal.3d at 388.) To be clear, UC justified acquisition of the Laurel Heights site to avoid new construction that otherwise would have caused significant impacts at Parnassus. (*Ibid.*)

The revised EIR for Laurel Heights was again at issue in *Laurel Heights Improvement Association v. Regents of the University of California* (1993) 6 Cal.4th 1112, 1141 (*Laurel Heights II*):

> [The Parnassus Heights] campus .... *is the most densely developed* of all [UC] facilities. The draft EIR ... explains that, because the necessary space at the Parnassus Heights campus can only be created by demolition of existing buildings fully in use or by violating the limits adopted in the long-range development plan, the alternative of *expansion at this site is infeasible*.

(Italics added.) UC lacks credibility when it now contends that it is not even *potentially* feasible to construct new facilities at its other City campuses, that the CPDP EIR thus need not study any off-site alternatives, and that it is *only* feasible to build new facilities at Parnassus. (ROB 67-69.) The Parnassus campus site has not grown since UC took the position that it could not feasibly accommodate a 370,000 square-foot research facility. (*Laurel Heights II, supra*, 6 Cal.4th at 1120.) The CPHP, including the proposed 995,000 square-foot New Hospital (Petitioners' Opening Brief (POB) 12), would cause significant environmental impacts and the demolition of buildings of even more historic importance today than in 1982. UC has to date protected its historic resources and avoided significant impacts by development at Laurel Heights, Mt. Zion, and Mission Bay, *away from* Parnassus.

UC argues, based on inaccurate references to CEQA Guidelines [14 Cal.Code Regs.], sections 15151 and 15384, that courts review an EIR's range of project alternatives for substantial evidence.[2]

---

[2] Guideline 15151 describes standards for EIR adequacy; 15384 defines substantial evidence. Neither directs that the range of alternatives for study in an EIR is reviewed for substantial evidence.

(ROB 67:12-13.) Instead, "[e]ach case must be evaluated on its facts ... in light of the statutory purpose." (*Watsonville Pilots Association v. City of Watsonville* (2010) Cal.App.4th 1059, 1086 (*Watsonville Pilots*) [Citation].) The nature and scope of the alternatives to be studied in an EIR is governed by the rule of reason. (Guidelines, § 15126.6 (a); *In re Bay-Delta* (2008) 43 Cal.4th 1143, 1163.) Further, "the fact that agency decision-makers may ultimately find an alternative infeasible does not necessarily preclude it from being discussed in the EIR. An alternative that is potentially feasible should not be excluded from an EIR simply because it may not further all of the agency's policy objectives." (*Watsonville Pilots*, *supra*, 183 Cal.App.4th at 1087.)

Of course, an EIR need not study "each and every conceivable variation" of a proposed project. (ROB 67:14-15.) And that is not what petitioners seek, any more than they pursue *any* trivial or "gotcha" CEQA violation. UC pronounces that no off-site alternative would meet its objective to "revitalize the aging Parnassus Heights campus." (ROB 67-68.) But three suggested off-site locations *already owned by UC* can accommodate the New Hospital *while revitalization of the Parnassus campus proceeds with other important, long-planned project components.* As the alternate sites can "attain most of the basic objectives" of the plan and reduce significant impacts, EIR review will "foster meaningful public participation and informed decision making." (ROB 67:17; Guidelines, § 15126.6 (f).)

UC unlawfully excluded study of *any and all* off-site alternatives based on an unduly narrow definition of "revitalizing the Parnassus campus." Analysis of alternate sites in the EIR is critical to inform the Regents' consideration of the feasibility of locating some new facilities — *e.g.*, the New Hospital — off-site to reduce or avoid significant impacts. "While a lead agency may not give a project's purpose an artificially narrow definition, [it] may structure its EIR alternative analysis around a reasonable definition of underlying purpose." (*In re Bay-Delta*, *supra*, 43 Cal.4th 1143, 1166.)

UC attempts to distinguish this case from *Watsonville Pilots, supra,*183 Cal.App.4th at 1087, arguing that the record proves that alternate sites *cannot* accomplish "most" project objectives. But UC focuses on only 5 out of 42 objectives, not "most;" further, the cites do not prove what UC says they do:

AR 247-48: UC's CEQA findings "screen out" EIR review of a New Hospital at Mission Bay or Mt. Zion. Any large project has environmental consequences. UC's omission of alternate sites from analysis relate to unstudied impacts of differences between the current and *any* revised project — fewer beds *at Parnassus*, theoretical increase in some cross-town traffic between Mission Bay and Parnassus, decreased benefits of interdisciplinary collaboration *at Parnassus.* The findings assume but do not show infeasibility, greater impacts than the current project, or failure to accomplish fundamental objectives.

AR 255-57: UC's CEQA findings address responses to EIR comments requesting analysis of off-site alternatives. The findings refuse to study the alternatives, but acknowledge that locating the New Hospital at the Mission Bay or Mt. Zion campuses would reduce conceded impacts at Parnassus, while other impacts will shift from Parnassus to the new hospital sites.

AR 2154-57; AR 4319-22: The Draft EIR provides a conclusory discussion as to why alternatives were "dismissed from further evaluation," later mirrored in the findings addressed at AR 247-48, above, without underlying analysis, *e.g.* "increase potential cross town traffic."

AR 5756-57: The EIR responds to comments requesting analysis of off-site alternatives, particularly for the New Hospital, and provides a conclusory discussion as to why *no* off-site alternatives could satisfy objectives relating to the Parnassus site, later mirrored in the findings addressed at AR 255-57, above. The conclusory response is not adequate.

Finally, UC argues that it had sufficient information as to whether alternate sites were feasible "including multiple prior EIRs addressing the issue." (ROB 71:17-19.) UC then repeats the AR citations to the findings and EIR pages discussed above regarding alternatives rejected from study in the EIR; adds a cite to the Draft EIR Alternatives section that contains the four (*on*-site) alternatives that the EIR did study, and ends with cites to a 5000-page block at AR 8981-13658 [documents from 2005-2014]. The citations are not probative or even helpful.

Absent analysis of *any* off-site alternatives *in the EIR*, UC's violation of CEQA is blatant.

B. EIR Analysis of Growth Inducing and Population/Housing Impacts is Inadequate

Contrary to UC's argument (ROB 25:9-16), petitioners do not confuse the EIR's growth inducement and population/housing analyses. Read together, both chapters fail to assess off-campus housing displacement impacts of increasing campus population or the physical impacts of building housing to meet increased demand. (POB 17:4-26.)

1. The EIR Omits Analysis of Off-Campus Housing Displacement Effects

Petitioners claim that the EIR's analyses of Impacts POP-1 and POP-2 improperly exclude consideration of housing displacement effects in the surrounding community. The EIR's analysis of Impact POP-1 relates to "unplanned population growth" and the creation of "demand for housing outside the market area" while its analysis of Impact POP-2 only considers temporary displacement of on-campus tenants. (POB 17-21.) UC fails to address the fact that the POP-2 analysis is improperly limited geographically and fails to assess displacement as opposed to mere growth in housing demand.

UC's argument that "the CPHP is adding housing for some of the population growth related to CPHP" (ROB 25:5-6, citing AR 1983) ignores the EIR's failure to analyze off-campus displacement. (POB 19:3-16; *American Canyon Community v. City of American Canyon* (2006) 145 Cal.App.4th 1062, 1066-1067, 1081-1082 [failure to consider extraterritorial effects]; *Lotus v. Dept. of Transportation* (2014) 223 Cal.App.4th 645, 658 (*Lotus*) [substituting mitigation for impact analysis violates CEQA].)

UC pronounces the EIR's characterization of population growth not off-set by new campus housing as "insubstantial" when compared to regional growth as "satisfied by housing that could be added" in the study area; and "within the capacity" of the five-county market area. (ROB 24:13-21; citing AR 1980-81, 1984-85.) But capacity to meet housing demand growth is not relevant under the threshold of significance: which is whether a project would "displace substantial numbers of existing people or housing" and create need for replacement housing. (POB at 18:4-7.) EIR review is needed.

While UC's new population might theoretically be housed without displacement if housed only in new units, that is not UC's plan. UC committed to provide over 1200 housing units for its population from existing units, so significant displacement of residents will certainly occur. (AR 1314-15.) What is missing from the EIR is analysis that relates the CPHP's 4,000 to 6,000-unit increased housing demand to baseline and cumulative conditions. Such analysis would allow a prediction of the extent to which the CPHP may cause off-campus displacement or require construction of housing.

Planner Terry Watt presented a fair argument that project demand would outstrip local supply and identified information that the EIR should have but fails to provide, including housing availability in the surrounding neighborhood, affordability, local and new population incomes, and rents. (POB 18:14-22.) Watt provided uncontroverted evidence that San Francisco has been creating 8.2 jobs per housing unit since 2010; that there is a regional housing shortfall of 700,000 units; that the Bay Area has produced only 35% of the units required for moderate and lower income workers since 1999; and that the City is experiencing gentrification. (AR 5989-5990.) Watt cites salary data that the new UCSF population would compete for housing affordable to lower income families. (AR 5896.) Watt reasonably concludes that housing demand would cause a significant impact. (AR 5900.)

2. The EIR Erroneously Treats Displacement as a Speculative Social Effect

Petitioners claim that the EIR fails to proceed as required by CEQA due to informational inadequacy; UC's argument that substantial evidence supports the EIR's conclusion regarding population and housing impacts is irrelevant. (ROB 23:9-24:21; POB 15:26-16:1.) Since the EIR fails to

assess the significance of project-induced off-campus displacement or need for replacement housing, whether substantial evidence could support a finding to that effect is premature. (POB 18:4-7.),

Contrary to UC's false flag argument, petitioners do not rely on *Stanislaus Audubon Society, Inc. v. County of Stanislaus* (1995) 33 Cal.App.4th 144, a negative declaration case, to support application of the fair argument standard here. (ROB 26:18-27:6; POB 14:27; 16:1, citing *Visalia Retail, LP v. City of Visalia* (2018) 20 Cal.App.5th 1, 13; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 (*Amador Waterways*) [EIR must analyze every issue for which the record contains substantial evidence supporting a fair argument of significant impact].)[3]

UC does not point to any evidence that the EIR addresses the substance of Watt's fair argument or that its experts considered or reached a different conclusion regarding the indirect physical effects associated with displacement. Instead, while conceding that "new off-site housing would be constructed," UC argues that "it would be speculative to characterize the site-specific environmental effects." (ROB 26:10-11, citing AR 2098.) The EIR's assertion on this point is conclusory, without factual support. An agency "cannot divest itself of its analytical and informational obligations by summarily dismissing the possibility" of indirect effects. (*Bakersfield, supra,* 124 Cal.App.4th at 1207.) CEQA does not permit deferral of analysis of housing-related impacts simply because the precise nature and extent of development are unknown. (POB at 21:1-10). Both Watt and the City's public health guidance identify the elements of the required analysis, and Watt followed that guidance to provide an unrebutted fair argument that displacement effects would be significant. (AR 5879, 5989; 5894-5901 [Watt]; AR 6867-85 [SFDPH] 4-15.)

UC's argument that it was entitled to disagree with Watt regarding the potential significance of the displacement impact is irrelevant because the EIR did not evaluate the issue. UC's argument that it was entitled to ignore the City guidance because it is "not subject to City policies" (ROB 26:26) misses the point that this guidance provides part of the basis for fair argument that the impact may be significant, even if it is not directly enforceable against UC.

3. The EIR Incorrectly Applies "Ratio Theory" and an Improper Baseline

UC argues that the EIR does not rely on a ratio theory because its definition of "substantial

---

[3] See also, *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1207 (*Bakersfield*) [EIR must evaluate indirect physical effects of economic and social effects where fair argument standard is met]; 1208 [standard of review for whether EIR fails to analyze potentially significant indirect physical impact is whether agency failed to proceed as required by law].)

unplanned population growth" is growth "inconsistent with growth anticipated in adopted planning documents." (ROB 27:17.) UC also argues that the EIR establishes "an appropriate baseline" (AR 1973-74) and that the EIR shows that projected growth is consistent with "growth anticipated in adopted planning documents." (ROB 27:19-21.) These defenses fail.

Neither the EIR nor UC dispute the existence of the regional housing shortage documented by Watt. (POB 18:12.) CEQA does not permit a "ratio" analysis in which a project's contribution to a cumulative impact is deemed less than significant based "upon the individual project's relative effects…" (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 721.) The EIR cannot dismiss the significance of the project's contribution to the regional housing shortage simply because it "would not be substantial in comparison to growth that is projected and planned" for the region. (POB 21:24-22:5.) UC fails to address petitioners' authorities on this point.

The EIR fails to provide a legally adequate non-comparative, non-ratio cumulative analysis. An adequate analysis requires that the EIR first assess whether there is a significant cumulative impact from all projects taken together; if so, the EIR must separately determine if the project's contribution is considerable. (Guidelines, §§ 15065(a)(3); 15130(a); 15355; *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 (*CBE v. Resources*) ["... the lead agency shall consider whether the cumulative impact is significant and whether the proposed project's incremental effects are cumulatively considerable"]; Kostka and Zischke, "Practice Under the California Environmental Quality Act" (2nd Ed., 2019 Update), § 13.39.) In that second determination, the EIR may not rely on a comparison or a ratio because "the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant." (*CBE v. Resources, supra,* 103 Cal.App.4th at 120.)

Regarding the EIR's improper application of a future planning baseline, the EIR's error lies in using this baseline to exclude consideration of substantial evidence tending to show the physical impact may be significant. (POB 16:1, citing *Amador Waterways*, *supra*, 116 Cal.App.4th at 1108-1109.) UC also fails to address authority that comparison to planned growth improperly compares a project's impact to a plan for the future rather than to existing conditions. (POB 22:6-10.) Here, the relevant comparison must be to the existing conditions, not to future conditions, because the project will contribute to a significant existing housing shortage. Further, the EIR fails to demonstrate that the use of an existing conditions baseline would result in an inadequate or misleading analysis (*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 457 (*Smart Rail*).)

4. The EIR Piecemeals Analysis of the New Housing Initiative

The EIR omits any analysis of UC's last-minute commitment to provide off-campus housing units in the City; therefore, it fails to evaluate the whole of the project. (POB 22:10-23:8.) UC does not dispute that its commitment to provide these units was not disclosed until issuance of the Final EIR.

The MOU commits UC to provide over 2500 rental units in the City for the UC population, of which about 1200 would be diverted from existing units and about 1200 would be new units. (AR 1314-15.) Of these units, 1,000 must be "UC Affordable Units" that are "comprised of new and existing units." (AR1315.) Thus, the MOU commits UC to displace non-UC tenants from at least 1,200 existing units and potentially to displace additional tenants as necessary to construct new units on existing residential sites. Omission of the MOU's housing unit commitment from the EIR's impact analysis understates the potential for displacing existing City residents.

Focusing on the 200 new units for which locations have not yet been identified, UC argues that there is "no proposal and no discretionary action yet to implement the additional 200 units." (ROB 28:7) This is incorrect. UC's commitment to provide these units is a discretionary action. (*Save Tara v. City of West Hollywood* (2008) 45 Cal.4th 116, 139 (*Save Tara*).)

UC argues that the new units include two projects that completed CEQA review years ago, plus 200 additional units for which City would conduct CEQA review in the future, thereby obviating the need for CEQA review now. (ROB 27:22-28:9.) These arguments fail. The EIR failed to "tier" to such past review as required by CEQA. (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 443 (*Vineyard Area Citizens*), quoting Guidelines, §§ 15150(c) [when an EIR incorporates an earlier environmental document by reference, "the incorporated part of the referenced document shall be briefly summarized" and "[t]he relationship between the incorporated part of the referenced document and the EIR shall be described"]; see § 15152 (g).) UC's brief cannot cure the EIR's failure to tier to an earlier CEQA document.

Regarding the promise of future CEQA review for the rest of the units, UC cites nothing in the MOU requiring such review. Even if it did, future "CEQA review" could result in an exemption from CEQA, perfecting the piecemealing violation that began with this EIR's failure to analyze the impact of providing the new units. Also, the EIR cannot tier *from* a future environmental document. (*Vineyard Area Citizens, supra,* 40 Cal.4th at 440 [Court rejected this "approach as legally improper"].) Also, UC's pre-commitment may improperly "preclude any alternatives or mitigation measures that CEQA

would otherwise require to be considered, including the alternative of not going forward with the project." (*Save Tara, supra,* 45 Cal.4th at 139.)

C. The EIR Inadequately Analyzes Beach Water Quality Impacts

1. Standard of Review

UC asserts that an EIR's description of the environmental baseline is reviewed for substantial evidence. (ROB 28, citing *Smart Rail, supra,* 57 Cal.4th at 447-49; *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 328 (*Communities*).) These cases are inapposite. *Smart Rail* involved a claim that an EIR's description of future conditions as its environmental baseline, rather than existing conditions, was improper. *Communities* challenged an agency's choice of methodology to measure changing baseline conditions. Here, the challenge is to the EIR's failure to describe the physical and regulatory components of the environmental setting as they relate to beach water quality. (AR 1895-1911.) The Court reviews de novo whether the EIR omitted this essential information as a failure to proceed in the manner required by law. (POB 14.)

2. The EIR Fails to Adequately Describe the Environmental Baseline

Petitioners' opening brief details the EIR's failure to describe severely-degraded existing beach water quality conditions and the ineffectiveness of existing regulatory controls. (POB 25-26.) In response, UC argues it is "not in a position to verify observed non-compliance or opine on potential future enforcement actions by regulatory agencies" nor to "compel regulatory agencies governing San Francisco's sewage treatment plants to enforce compliance with their own regulations." (ROB 29:6.) This argument misconceives the claim. The issue is not what actions UC must take to clean up water pollution in San Francisco; the issue is whether the EIR properly analyzes and discloses the significance of the CPHP's contribution to worsening existing water quality conditions. This legal obligation exists regardless of whether UC can single-handedly solve the problem.

UC argues that "[a]n EIR need not resolve existing environmental problems that will not be exacerbated by the project, which is the case here." (ROB 29:6.) The problem for UC is that the EIR admits the CPHP will *exacerbate* this environmental problem, generating about 0.18 million gallons per day (mgd) of new wastewater/sewage. (AR 2084.) The FEIR admits that the CPHP's beach water quality impacts could be significant. (AR 4062; 222-226; 5783-5788 [Master Response 12].) UC's lawyers cannot disavow these record facts in their brief.

> The audience to whom an EIR must communicate is not the reviewing court but the public and the government officials deciding on the project. That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR, for example, is irrelevant, because the public and decision makers did not have the briefs available at the time the project was reviewed and approved.

(*Vineyard Area Citizens, supra,* 40 Cal.4th at 443.)

UC argues that the DEIR's description of the City plumbing system satisfies its obligation under CEQA to describe existing degraded beach water quality conditions. (ROB 29:23-30:12.) But the description provides no clue to the reader that beach water quality is routinely unhealthy for humans.

UC also relies on the FEIR's addition of new provisions to MM-HYD-1, "to control where it makes sewer connections for the campus site to the City's CSS system, and therefore, control the flows it would send to either the OSP or the SEP." (ROB 30:1.) This information was first provided in the FEIR's response to comments, too late in the process. (AR 5783-88.) It is critical to provide accurate setting information in the DEIR as a basis for impact analysis, so that the public can comment on impacts, the FEIR can respond, and the agency has the benefit of the process in making decisions. (POB 24-2; *San Joaquin Raptor/Wildlife Rescue Center. v. County. of Stanislaus* (1994) 27 Cal. App. 4th 713, 727; *Communities for a Better Env't v. City of Richmond* (2010) 184 Cal.App.4th 70, 89 [baseline required "at the beginning of the CEQA process"]; *Galante Vineyards v. Monterey Peninsula Water Mgmt. Dist.* (1997) 60 Cal.App.4th 1109, 1124 [tardy baseline disclosure not cured by later analysis].)

UC's citation to information in the FEIR supports the claim that the EIR must be recirculated in revised form. (POB 29-30). Also, the information that UC cites is part of an illegally deferred and unenforceable new mitigation measure. (POB 30-31.)

Regarding the Draft and Final EIRs' failures to describe the ineffective regulatory system for protecting beach water quality, UC argues that "the EIR extensively discusses the environmental and regulatory settings of beach water quality and analyzes Project impacts on beach water." (ROB 30:23.) This bald legal conclusion is unsupported by any record cites.

3. The EIR Relies on Ratio Theory and Other Regulatory Programs

UC argues, without citing any record evidence, that the EIR did not rely on the small ratio of the CPHP's incremental contribution to beach water pollution to conclude that the impact is less than significant. (ROB 31:3-18.) UC ignores the opening brief's point that the EIR concludes the CPHP's impact would be less than significant because the increase in the acreage of impervious surfaces *is only*

4% compared to the current acreage of impervious surfaces on campus. (POB 24:13, citing AR 1905-06.) UC's unsupported defense should be rejected.

UC also argues, again without citing record evidence, that the EIR did not rely on another agency's regulatory program to conclude that the CPHP's impact would be less than significant. (ROB 31:19-27.) UC argues that the case cites offered in the opening brief are inapposite because in those cases the agencies "skipped" environmental analysis. (ROB 31:19-27.) UC (i) does not contest the legal rule that an agency cannot rely on another agency's regulatory program to conclude that an impact is less than significant; (ii) does not cite record evidence that the CPHP EIR did not do so; and (iii) does not rebut the evidence cited in the opening brief that this EIR does, in fact, "skip" environmental analysis. UC's defense is thus unavailing.

4. The FEIR's Responses Require Recirculation of a Revised Draft EIR

UC incorrectly argues that the Court reviews all "recirculation claims" for substantial evidence. In fact, the petitioners' recirculation claim regarding water quality is reviewed de novo.

Recirculation is required when "significant new information" is omitted from a Draft EIR and added to a Final EIR. (Pub. Resources Code, § 21092.1[4]; Guidelines, § 15088.5(a).) In its seminal recirculation case, the California Supreme Court explained the central role of public participation through comment and response, holding that "public participation is an 'essential part of the CEQA process.'" (*Laurel Heights II, supra,* 6 Cal.4th 1112, 1123.) Recirculation is intended to permit public comment on new information and require agency responses. (Guidelines, § 15088.5 (f).) *Laurel Heights II* enumerated four categories of "significant new information" that require recirculation, now identified in Guidelines section 15088.5 (a)(1)-(4). (*Laurel Heights II, supra,* 6 Cal.4th at 1130 and n.15.) Petitioners seek recirculation under the fourth category, alleging significant new information disclosed after the DEIR was published "that the draft EIR was so fundamentally and basically inadequate and conclusory in nature that public comment on the draft was in effect meaningless." (*Id.* at 1130.)

Laurel Heights II recognizes that the fourth recirculation criterion is different from the first three:

> With the addition of the fourth category of 'triggering information' to the list, we recognize that 'significance' for purposes of section 21092.1 cannot be defined exclusively in terms of the grounds for recirculation found in section 21166, from which the first three categories are drawn. The different circumstances governed by these statutes mandate this conclusion.

---

[4] All cites to statutory authority are to the Public Resources Code unless otherwise stated.

(*Laurel Heights II*, 6 Cal.4th at 1130.) The fourth criterion is similar to whether an EIR's omission of essential information precludes informed decisionmaking and public participation. Supreme Court decisions hold that this question is reviewed de novo. (POB 14-15.) Reviewing a fourth criterion recirculation claim for substantial evidence as urged by UC is inconsistent with these decisions.

Moreover, *Laurel Heights II* held that determining the standard of review for a recirculation claim is case-specific: "We conclude that the substantial evidence standard set forth in section 21168.5 governs the Regents' decision not to recirculate the EIR in this case." (*Laurel Heights II*, 6 Cal.4th at 1135.) The recirculation dispute involved five sources of new information that clarified or confirmed matters already fully disclosed and analyzed in the Regent's informationally adequate EIR. (*Id.* at 1136.) *Laurel Heights II* addressed whether that information constituted "significant new information" under the first three criteria of Guideline section 15088.5. (*Id.* at 1137-1141.) Again, the claim here addresses omission of essential information regarding beach water, implicating the fourth criterion.

UC's reliance on *South County Citizens for Smart Growth v. County of Nevada* (2013) 221 Cal.App.4th 316, 330, is similarly misplaced, as it addresses a mitigation measure adding "significant new information" under the third criterion, at Guideline section 15088.5(a)(3) and does not address the arguments above. Appellate decisions are not authority for propositions not expressly considered. (*People ex rel. City of Santa Monica v. Gabriel* (2010) 186 Cal.App.4th 882, 891.)

Save Our Peninsula v. Monterey County Board of Supervisors (2001) 87 Cal.App.4th 99, 111, 114, 122-128 [water quantity], 112, 131-134 [water source] required recirculation of an EIR that belatedly disclosed baseline water use and recharacterized the water source as riparian. The Final EIR in *Sutter Sensible Planning, Inc. v. Board of Supervisors* (1981) 122 Cal.App.3d 813, 817-18 required recirculation as it included "a more elaborate discussion of groundwater availability and the projected impact of the plant on the water table" and substituted new "estimates of evapo-transpiration potentials ... for figures used in the previous EIR which were repudiated by their purported author." (*Id.*, at 817-18.) Here, the FEIR makes analogous setting description changes because it reverses field and admits that the CPHP could make degraded beach water quality worse.

5. The EIR Improperly Defers the Formulation of Mitigation Measures

UC defends the "deferred" mitigation claim by arguing that MM-HYD-1 will be "implemented before final design approval to reduce the Project's potentially significant impacts on beach water quality." (ROB 33:9.) This is irrelevant, because "[t]he delayed implementation of mitigation measures is a type of delay distinct from deferred formulation," (*King & Gardiner Farms, LLC v. County of Kern*

(2020) 45 Cal.App.5th 814, 860 (*King & Gardiner Farms*); *POET v. State Air Resources* Board (2013) 218 Cal.App.4th 681, 738.)

> UC argues that MM-HYD-1 includes these enforceable performance standards:
>
> (a) the stormwater runoff rate and volume from the CPHP shall not exceed predevelopment conditions for the 1- and 2-year, 24-hour design storm; and
>
> (b) that the total volume of stormwater discharges from Parnassus Heights in wet weather is decreased by an amount sufficient to offset flows from any increase in impervious surfaces and any increases in wastewater discharges as a result of the CPHP. (AR 6599-601; AR 222-24.)

(ROB 33:20.) UC is incorrect because both measures require additional analyses, *post-approval*, to determine "predevelopment conditions for the 1- and 2-year, 24-hour design storm" and the magnitude of the decrease in "total volume of stormwater discharges" required to fully offset increases in stormwater *and* wastewater discharges. The analyses may lead to enforceable performance standards at some point, but to defer the formulation of mitigation the EIR must provide enforceable performance standards before approval. This EIR fails that test. Moreover, MM-HYD-1 fails to meet the other requirements for deferring the formulation of mitigation, *i.e.*, whether it is impracticable to develop mitigation during the CEQA process and there is evidence that future mitigation is feasible. (POB 30:2.)

D. The EIR Fails to Analyze Transit Delay Impacts

Petitioners explained that the EIR fails as an informational document because it does not analyze transit capacity impacts. (POB 31-34.) UC now asserts: "Substantial evidence supports UC's less than significant determination, and Petitioners have not met their burden to prove otherwise." (ROB 35.) This response is nonsensical because the EIR contends that transit capacity is not a CEQA issue and never made a significance determination that could be reviewed for substantial evidence. (AR 6120.) Whether transit capacity is within the scope of CEQA analysis is a question of law reviewed de novo. (*City of Marina v. Board of Trustees of California State University* (2006) 39 Cal.4th 341, 355 (*City of Marina*.)

1. The EIR was Required to Analyze Transit Delay

UC asserts that petitioners failed to address how delay in transit would conflict with other programs, plans, ordinances, or policies that address transit. (ROB 35:16-17.) That is untrue. Petitioners provided several citations to both San Francisco's Transportation Impact Analysis Guidelines and OPR's Technical Advisory on Evaluating Transportation Impacts in CEQA (OPR Technical Advisory). (POB 32-34.) Both provide directives that should be considered in the EIR. (Guidelines, § 15064.3 (a).)

When a lead agency is evaluating a project's transportation impacts, "Other relevant considerations may include the effects of the project on transit and non-motorized travel." (*Ibid.*)

UC misquotes the OPR Technical Advisory to argue that transit capacity is not a CEQA issue: "...that document states: 'increased ridership should not be considered an adverse effect, *even if it results in increased travel times*...' (ROB 36:10-12, italics added.) The Technical Advisory, however, does *not* include the above-italicized language. (AR 34406.) UC's attempt to insert this language into the quote falsifies OPR's guidance because the referenced paragraph is silent on whether increased transit delay is a project-level impact, and the next paragraph indicates that increased delay should be addressed as cumulative impact. (POB 33:11-15.) UC does not address OPR's assertion that increased transit delay may "cause a cumulative impact by requiring new or additional transit infrastructure." (AR 34406.)

The opening brief recites evidence in the record that demonstrates the need for additional analysis regarding transit. (POB 32:1-10.) UC responds by quoting the EIR Appendix: "With implementation of the CPHP, the campus site would have both more locations and capacity for passenger loading to occur," and that "loading supply for the campus site is expected to be greater than [transit loading] demand for most of the day." (ROB 35:13-16.) UC omits the remainder of the quote:

> [A]lthough passenger loading supply for the campus site is expected to be greater than demand for most of the day, there may be peak passenger travel periods where demand, either for the campus site overall, or for specific locations is greater than supply. During these periods there would be a higher chance of delay to transit or a reduction in access to transportation facilities.

(AR 3517.) The EIR Appendix does not refute that the CPHP would increase transit delay, much less that transit delay itself falls outside the scope of CEQA.

UC next cites Guidelines section 15064.3(b)(1) to argue that CPHP effects on transportation are presumed less than significant because it is within a half mile of "several major transit stops." (ROB 35:22-25.) This is irrelevant to whether transit capacity is within the scope of CEQA review. Also, any presumption provided by subdivision (b)(1) pertains to vehicle miles travelled (VMT), not the "effects of the project on transit," which is the issue here addressed in subdivision (a)(1). Finally, the Guideline provides only that this is "generally" the case. (Guidelines, § 15064.3 (b)(1).) If this presumption is applied uniformly, there would seldom be a need to address transportation impacts in the City, served extensively by public transit. City guidelines for analyzing transportation impacts under CEQA confirm this is not the case. (AR 980-1008.) They include impacts to transit delay as a CEQA issue. (AR 999.)

UC dismisses the import of the City's CEQA transportation guidelines, calling them "immaterial because the City is not the lead agency and UC is not subject to its thresholds." (ROB 36:6-7.) The statement is directly contrary to the EIR's representation that its transportation analysis is "[c]onsistent with the CEQA Guidelines and the SF Guidelines." (AR 4199.) Regardless, UC's refusal to establish a significance threshold for transit capacity impacts cannot allow its EIR process to ignore substantial evidence of an environmental impact. (*Amador Waterways, supra*, 116 Cal.App.4th at 1109.)

2. Transit Delay may Indirectly Impact Vehicle Miles Traveled

UC mischaracterizes petitioners' argument that impacts to transit capacity could create indirect impacts to VMT that remain unanalyzed. (POB 34:9-10.) UC provides several citations to the effect that the EIR analyzed VMT and substantial evidence supports the analysis. (ROB 37:2-3.) However, the EIR did not analyze transit capacity impacts, including potential increased transit capacity that would indirectly contribute to VMT. (AR 6120.) In fact, UC acknowledges that the EIR "assumed that 'the share of travel by public transit [would] remain the same or be slightly reduced from current levels.'" (ROB 37: 6-7.) Actual analysis of impacts on transit capacity could have required the EIR to abandon this assumption. (POB 33:26-34:10 [fair argument that transit delay from the CPHP may, in turn, increase VMT].) Thus, the EIR fails to analyze indirect impacts on VMT. (Guidelines, § 15126.2 (a).

E. The EIR Fails to Adequately Analyze and Mitigate Construction Noise Impacts

1. The EIR Fails to Adequately Address Potential Health Impacts

While construction of the CPHP would last three decades, UC argues that "occasional noise level of up to 76 dBA" would occur only "over several months of activity." (ROB 38:17-18.) UC's single-page AR citation provides no explanation. (AR 1960.) It is belied by UC's CalEEMod inputs, which assume 4.5 years of construction for the New Hospital (AR 2530), 3 years/10 months for the RAB (AR 2589-90), 11 months for Aldea Housing (AR 2502), and 9 months for the Irving Street Arrival (AR 2562). This translates to about ten years of construction for the "first phase" projected from March 2022 (AR 2562) to December 2029 (AR 2530). The EIR explains that "generally comparable" noise levels would occur for the next 20 years. (AR 1951-52). UC's claimed "several months of activity" is false.

UC claims that the EIR analyzed impacts of construction noise as "significant and unavoidable ..." (ROB 39:13-14.) But the four pages relied on do not discuss related human health impacts. (AR 1950-53.) Although the EIR was certified after the Supreme Court ruled in *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502 (*Sierra Club*) in 2018, discussion of health risks from construction noise is

in one paragraph that is detached from and plays no role in the significance determination for NOI-1. (AR 1960.) As in *Sierra Club*, the EIR provides a discussion of the human health impacts from noise levels, but fails to correlate those noise levels to project emissions for purposes of public disclosure or assessment of significance. UC's statement that its "EIR identifies the health impacts associated with noise caused by construction activities, the noise levels at which those health impacts may occur, and describes the noise levels associated with CPHP construction activities" is false. (ROB 40: 9-11.)

The EIR's failure to correlate noise to health impacts is demonstrated by two simple questions:

(i) What noise levels and exposure periods are associated with "decreased performance of cognitive tasks" or "physiological effects such as hypertension and heart disease"? (ROB 39:20-23.)

(ii) If "few people are seriously annoyed by activities with noise level below 55 dBA," (ROB 39:25-26), what level causes most people to be annoyed?

These questions are critical since residents would be exposed to many years of construction noise at levels up to 80 dBA. (AR 1956.) The EIR fails to provide answers. (*Laurel Heights I, supra,* 47 Cal.3d at 405 [requiring "detail sufficient to enable those who did not participate in its preparation to understand"].) Rather than addressing likely health impacts at lower noise levels, the EIR focuses on "pain and hearing damage" that result at "120dB and 140 dB respectively." (AR 1960.) The EIR also fails to consider if hypertension, heart disease, decreased performance of cognitive tasks, and serious annoyance would constitute significant impacts. (*Amador Waterways, supra*, Cal.App.4th at 1108–09.)

UC argues that the EIR's analysis is saved as it "applies the standards established in the City's Police Code and General Plan...and the daytime construction noise criteria of the Federal Transit Administration." (ROB 38:19-21.) However, neither the City's noise ordinance (AR 31234-82) nor the FTA manual (AR 32212-27) indicate that their respective standards consider health impacts or correlate noise levels to health risks. Further, as explained below, the EIR does not apply these standards.

2. Mitigation for Construction Noise is Inadequate

UC first argues that MM NOI-1b "commits UC to restricted hours," and then acknowledges that MM NOI-1b allows exceptions. (ROB 40:24-27.) While it would minimize the exceptions to "rare circumstances ... such as large concrete pours," NOI-1c provides no limitation. (AR 1476, 1953.) "Rare circumstances" are defined neither as to their nature or the frequency of occurrence. (*Ibid.*)

UC next argues that "there is nothing vague about 'restricting work to smaller time windows, condensing the overall duration of nighttime work to the degree feasible, and erecting temporary barriers

to shield the short-term nighttime activity.'" (ROB 41:2-4.) Although quoted in the opening brief, UC ignores *King & Gardiner Farms, supra*, 45 Cal.App.5th at 858, which explains that the "terms 'increase' and 'reduce'— even though preceded by the mandatory term 'shall' and modified by the phrase 'to the extent feasible'— are not specific performance standards." UC provides no definition or performance standard for "smaller time windows" or "condensing the overall duration" of nighttime construction. Similarly, MM NOI-1b provides no standard for either the design of the "temporary barriers" or the performance of their noise shield.

Finally, UC points to "a *program*-level analysis and mitigation measures," requiring preparation of a future "Noise Control Plan." (ROB, 41:10-15.) This does not cure the defective *project*-level analysis and mitigation for the CPHP's "initial phase" construction. (AR 1948.) Further, any future "noise control plans" are to be approved "by UCSF" and not a regulatory agency, if construction noise "is consistent with the standards set forth in the City's Noise Ordinance." (AR1952.) The EIR's conspicuous use of the phrase "consistent with" appears shorthand for disclaiming commitment to comply with the City's standard, as the EIR explains: "Although UCSF is not subject to the noise ordinance, it *strives* to be consistent with it to the extent feasible." (AR 1530, italics added.) Generalized admonitions to operate more quietly "where feasible" or "wherever possible" are inadequate mitigation. (*Sierra Watch v. County of Placer* (2021) 69 Cal.App.5th 86, 110.) "This language, in effect, only tells construction contractors to be quieter than normal when they can. Although that may be good neighborly advice, it is not sufficient as a mitigation measure." (*Ibid.*) The same is true here, where neighbors would be exposed to significant construction noise over decades.

F. The EIR Fails to Adequately Analyze Historic Resource Impacts

1. UC Cannot Approve Demolition Based on a 'Policy Decision'

UC argues that it has discretion to find that retaining one or more historic buildings is infeasible based solely on a "policy decision." (ROB 41:20-42:26.) UC relies on *Sacramento Old City Association v. City Council* (1991) 229 Cal.App.3d 1011, 1018 (*SOCA*) for the proposition that courts must not "substitute their own opinions as to what constitutes wise public policy." Yet *SOCA* was generally discussing the substantial evidence standard for agency findings, not whether otherwise-feasible mitigations or alternatives to reduce significant impacts can be ignored based on declared 'public policy." (*Ibid.*) Under UC's view, any agency could approve demolition of historic resources by stating a policy preference for new versus historic buildings. That is assuredly not a proper CEQA interpretation

of "feasibility," and it is inappropriate here where UC has substantial properties in the City, unsupported verification of space needs, and great flexibility as to where to locate research and hospital facilities.

Feasibility is a question of fact, not "policy." UC's finding that avoidance of demolition is infeasible is not supported by substantial evidence. The finding must turn on facts as to whether the project could be accomplished with the identified mitigations or alternatives. (POB 19:8.) The historic resources at Parnassus are capable of being rehabilitated, as UC conceded in its 2014 Plan and EIR.

CEQA's "substantive mandate" requires that an agency not approve a project "as proposed if there are feasible alternatives or mitigation measures that would avoid or substantially lessen the adverse environmental effects." (*Stockton Citizens for Sensible Planning v. City of Stockton* (2010), 48 Cal.4th 481, 498; Guidelines, § 15092(b)(2)(A); POB 66:17.) UC unlawfully ignores the substantive mandate, contending that its policy decision to change land uses at Parnassus led it to consider and reject several alternatives that would have retained one or more historic buildings, and that is enough. (ROB, 42:2-21.)

As the California Supreme Court held in *City of Marina*, *supra*, 39 Cal.4th at 368-69, an agency cannot "proceed with a project that will have significant, unmitigated effects on the environment, based simply on a weighing of those effects against the project's benefits, unless the measures necessary to mitigate those effects are truly infeasible." Policy and public benefit considerations do not arise in determinations of feasibility, but only when an agency approves a project because its overriding benefits render *unavoidable* significant impacts "acceptable." (Guidelines, § 15093.)

2. The DEIR Fails to Evaluate the Campus as a Historic District or Area

UC contends that "the EIR has sufficient detail to provide an informed reader with the background necessary to understand (1) the *historic resources* that were evaluated, (2) those that may be present and were not evaluated before publication of the EIR, and (3) potential impacts of the CPHP." (ROB 19, italics added.) However, the only *historic resources* that the Draft EIR evaluated were individual buildings, plazas, and murals. The campus was not evaluated as a unified *historic resource* in its own right as a "historic district" or "historic area." (POB 41:16-21.) This is important because a substantial alteration to a historic district as a whole has a separate significant impact for which mitigations and alternatives must be identified and applied.

In response to comments, the FEIR contends but provides no supporting facts that the EIR adequately evaluates the campus as a historic district. (POB 41:22-27.) UC points to a sentence in Carey & Co.'s 2011 report suggesting that the possibility of a historic district at the Parnassus campus was considered but that the researchers "*did not find sufficient evidence* to identify an historic district." (ROB

43:24-44:5, italics in original.) Yet the only relevant reference in the report is a "negative pregnant" — an inference — because Carey & Co. surveyed all UCSF campuses for historic resources and *reported* only one potential historic district at Third Avenue. (AR 40134.)

Carey & Co. does not offer a word of explanation as to whether the Parnassus campus is or is not a potential "historic district" or "historic area." An inference that the issue was evaluated does not meet CEQA's requirements for public disclosure. Even where an EIR's environmental conclusion is correct, "there must be a disclosure of the 'analytic route the ... agency traveled from evidence to action.'" (*Sierra Club, supra,* 6 Cal.5th at 513, quoting *Laurel Heights I, supra*, 47 Cal.3d at 404 and *Topanga Assn. for a Scenic Community v. County of Los Angeles* (1974) 11 Cal.3d 506, 515.)

Moreover, while the 2011 Carey & Co. report is cited in the DEIR (AR 1757), it is not part of the EIR or attached as an appendix. "The data in an EIR must not only be sufficient in quantity, it must be presented in a manner calculated to adequately inform the public and decision makers... '[I]nformation scattered here and there in EIR appendices' or a report 'buried in an appendix,' is not a substitute for 'a good faith reasoned analysis.'" (*Vineyard Area Citizens, supra*, 40 Cal.4th at 442.) The EIR's failure to evaluate the whole campus as a potential historic resource fails to satisfy CEQA mandates for public disclosure and evaluation of impacts and feasible mitigation.

G. The EIR Fails to Adequately Assess Impacts from Air Emissions

1. The EIR Piecemeals Analysis of Health Impacts from TAC Emissions

The EIR piecemeals its analysis of human health impacts from TAC emissions to minimize significant impacts on neighbors' cancer risk. The critical issues are: (i) whether construction and operational TAC emissions should be segregated for EIR analysis, and (ii) whether the project-level significance threshold of 10 increased cancer risks applies rather than a cumulative threshold of 100.

(a) The EIR Fails to Address Cancer Risks from all TAC Emissions

In response to expert testimony and guidance from the California Office of Environmental Health Hazard Assessment (OEHHA) stating that a health risk assessment should include both construction and operational TAC emissions, UC pronounces a "disagreement among experts" as if that allows it to freely rely on its own methodology to determine whether cancer risks are significant. (ROB 47: 22-28.) UC fails, however, to identify any expert support for the EIR's methodology of segregating

health risks from TAC emissions. (ROB 47:26.)[5] BAAQMD's guidance is in accord with OEHHA, and provides in that "Some proposed projects would include both permitted and non-permitted TAC sources. For instance, a manufacturing facility may include some permitted stationary sources and also attract a high volume of diesel trucks and/or include a rail yard. *All sources should be accounted for* in the analysis." (AR 15733, italics added.) UC's failure to identify any expert support for its competing "methodology" is fatal to its defense.

This is not an issue of "competing experts" that entitles UC to deference. The EIR's failure to account for mobile-source TAC emissions for the entire CPHP, or any operational emissions from the New Hospital, is based on a legal posture that "future projects…will undergo separate review" rather than any identifiable expert evidence. (POB 43:19-23.) The opening brief responds directly[6] to UC's legal position, explaining that EIR analysis cannot be deferred where, as here, the record includes sufficient information allowing study of an impact. (POB, 43:24-44:9.) UC ignores this argument, including the opening brief's discussion of mobile-source diesel emissions and New Hospital operational emissions that were available for calculation of resulting TAC emissions. (ROB 5-48.)

(b) The CPHP is a Single Project for Purposes of CEQA Analysis

The opening brief explains that the EIR minimized TAC health risks by treating each infrastructure element of the CPHP as a separate CEQA project, and even purported to distinguish construction and operational TAC emissions. (POB 44:9-19.) UC's only discernible response is that "the only overlap between construction emissions and operational emissions would be cumulative ... because emissions from operations (generators and vehicles) cannot occur until construction of a building is complete." (ROB 47:8-11.)[7]

That operational emissions occur later than construction emissions means that they are "serial" or "consecutive," but not that they are "cumulative." It is absurd to suggest that construction of a building somehow has independent utility from operation of the same building. (*Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1223.) While UC now ignores this

---

[5] UC cites a single page from the record supporting its assertion, and that page is unrelated to TAC emissions. (AR 6979.) The FEIR's response to PNC's expert references no expert analysis or evidence supporting UC's methodology. (AR 6012-13.)

[6] UC falsely asserts that "Petitioners . . . ignore that the EIR indicates that the New Hospital and Future Phase Projects will undergo separate environmental review." (ROB 47:18- 19)

[7] UC concedes that these different buildings have no independent utility in its recitation of the "interrelated sequence of projects." (ROB 16:2-13.)

point, the record is replete with evidence that the EIR consistently treated the CPHP as a single project. (See, e.g. AR 1647, 1659 [criteria air emissions], 1786-1787 [energy], 2050 [transportation].) In any event, the scope of a project under CEQA is a legal question for the Court without deference to the lead agency. (*Stopthemillenniumhollywood.com v. City of Los Angeles* (2019) 39 Cal.App.5th 1, 15.) The EIR's unique approach to piecemeal the CPHP's various TAC emission sources in this manner unlawfully minimizes the CPHP's significant cancer risk impacts on UC's neighbors.

2. The EIR Incorrectly Applies Cancer Risk Thresholds of Significance

UC first argues, incorrectly, that the claims arising from the EIR's erroneous use of cancer risk thresholds of significance were not exhausted in the administrative process. (ROB 48:16.) They were exhausted by comments (POB, 45:28; 51:28, citing AR 890-96, 898-944, 6069-74, 5862-64; 5903-06; 5913-18; 6137-43) and the Final EIR responded. (AR 6076-6083.)

UC argues that it and other agencies have used the same cancer risk thresholds for years. (ROB 48:21.) This is irrelevant. The EIR failed to apply these thresholds to the environmental baseline established in the EIR to determine significance. Instead, it applies the thresholds without regard to the magnitude of baseline cancer risk. Also, there is no record evidence that UC and other agencies in fact have applied the thresholds in this manner for years. Even if they had, repeating a legal error would not make it legally correct. The emperor repeatedly parading without clothes remains naked.

(a) UC Failed to Adopt Its Thresholds in a Public Rule-Making Process

UC fails to defend this claim argued at POB 45:4. Judgment and a writ should issue.

(b) The EIR Fails to Adequately Describe Existing Cancer Risk Conditions

UC defends the EIR's use of the 100 in one million cancer risk criterion by arguing that "the predicted existing risk levels attributable solely to diesel particulate matter (DPM) are not a factor in the impact assessment of the EIR." (ROB 49:8.) This argument has three flaws. First, the idea that "existing risk levels are not a factor in the impact assessment" is contrary to CEQA case law requiring that the project-caused impact (increased risk) be added to existing conditions (existing risk). (POB 46:17-27.) Second, UC's argument implies that the EIR is exempt from CEQA's requirement to describe baseline conditions as of the Notice of Preparation date. UC cites no authority, and there is none. Third, UC's assertion that existing risks "attributable solely to DPM are not a factor in the impact assessment of the EIR" is a red herring. The claim is that existing risks attributable to both DPM and TAC are a factor in the impact assessment and need to be described in the EIR.

(c) The EIR inadequately analyzes Project and Cumulative Cancer Risk

The EIR's rationale for applying BAQMD's project-level and cumulative cancer risks thresholds were addressed in the opening brief. (ROB 49:14-50:25; POB 46:9-51:14.) UC now pronounces that "Petitioners' argument that the significance threshold should account for the existing baseline cancer risk would require virtually every CEQA project to prepare an EIR ... because the ambient risk exceeds the standard of significance; it would be absurd for CEQA to require this result." (ROB 50:25-28.)

UC thus concedes the gravamen of petitioners' claim, that in finding the CPHP's project-level and cumulative cancer risk to be less-than-significant, the EIR applied BAAQMD's thresholds in a manner that ignores the baseline's severely adverse cancer risk conditions. UC argues that "BAAQMD's threshold ... also does not require that existing background emissions be considered in evaluating the significance of a project's incremental emissions." (ROB 50:21.) Assuming arguendo that this is correct, it is unavailing since BAAQMD has no more license to ignore CEQA's requirements than does UC.

Moreover, under UC's approach there is no upper limit to air pollution that would require an agency to find that a project's impact is significant, because as long as each project stays under the 10 per million threshold, air could become unbreathable without a finding that any project would have a significant impact. CEQA does not allow such "creeping incrementalism" to remain undisclosed.

Instead of explaining why this approach does not violate CEQA, which it does (POB 46:9-51:14), UC makes a policy argument that courts should recognize an exception, implying that otherwise every project that would increase cancer risk above a preexisting severely degraded baseline would have a significant adverse effect, thereby necessitating the preparation of an EIR. UC's parade of horribles is incorrect and addressed to the wrong branch of government. It is incorrect because a lead agency's legal obligation is to determine if an increase in cancer risk is individually significant or "cumulatively considerable." (Guidelines, §§ 15065(a)(3); 15130(a); 15355; *CBE v. Resources, supra*, 103 Cal.App.4th at 120 [the 'one [additional] molecule rule' is not the law"].) The EIR *must explain*, based on facts rather than policy and what other agencies say, why worsening severely degraded conditions is individually significant or "cumulatively considerable." The EIR fails to do so.

UC's policy argument is overblown because CEQA has many exemptions for projects in urban areas even if they may worsen poor air quality. (§§ 21080.42; 21081.2; 21155.1; 21155.11; 21159.21; Guidelines, §§ 15301-15304; 15322.) UC's policy argument is addressed to the wrong branch of government because the Court may not rewrite a statute to suit UC's desire.

UC also generally argues that a 47-page technical document (AR 16491-537) not included in the EIR finds that the Parnassus campus is not in an Air Pollutant Exposure Zone (APEZ.) (ROB 51:1-9.) UC does not explain why this is relevant. Regardless, the EIR fails to disclose why worsening severely degraded ambient risk (conceded as above 100 in one million) is not individually significant or cumulatively considerable. (*Vineyard Area Citizens, supra*, 40 Cal.4th at 442 ["[I]nformation 'scattered here and there in EIR appendices' or a report 'buried in an appendix,' is not a substitute for 'a good faith reasoned analysis'"]; 443 ["That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR, for example, is irrelevant"].)

Regarding cumulative cancer risk, UC relies on the FEIR's response, that BAAQMD directs that a project would have a cumulatively considerable impact if all sources within a 1,000-foot radius plus the project exceeds an excess cancer risk level of more than 100 in one million. (ROB 51:20.) The response is inadequate. (POB 51:7-14.) The math is simple. Baseline risk in the area studied is above 100 in one million. The project would make that worse regardless of how far receptors are from sources of pollution or whether the CPHP "excess risk" exceeds another 100 in one million. Whether other agencies find that "acceptable" is not a relevant or legal basis to find the impact less than significant.

H. The EIR Inadequately Analyzes Visual Impacts

1. The EIR's Analysis of Impacts AES-1 and -2 Omits Essential Information

With two caveats, the opening brief fully anticipates UC's opposition regarding the validity of the EIR's analysis of Impacts AES-1 and AES-2. Those arguments are not repeated here. (POB 51-54.) UC repeats the EIR's unfounded assertion that it can reduce significant impacts by changing the baseline, in this case by amending the LRDP's regulations that minimize such impacts. (POB 52:1-19.)

UC's only new argument is to claim disagreement that "the threshold of significance should be changed to 'visual impacts as perceived from surrounding neighborhoods' rather than the selected criterion listed in Appendix G." (ROB 53:25, n.16.) UC misconceives the claim. It is not that a threshold of significance should be "changed," but that the EIR must assess the impact because otherwise it commits legal error by deploying its thresholds of significance to foreclose consideration of substantial evidence supporting a fair argument of significant impact. (POB 52:20.)

2. UC Erroneously Relies on Public Resources Code Section 21099

UC's discussion of the section 21099 exemption for aesthetic impacts fails to interpret CEQA "in such manner as to afford the fullest possible protection to the environment within the reasonable

scope of the statutory language.'" (*Laurel Heights I, supra,* 47 Cal.3d at 390.) Also, exemptions from CEQA "are narrowly construed." (*San Lorenzo Valley Community Advocates for Responsible Education v. San Lorenzo Valley Unified School Dist.* (2006) 139 Cal.App.4th 1356, 1382.)

UC's argument that the definition of "residential or mixed-use residential project" in section 21159.28 (d) does not provide guidance for defining these terms in section 21099 ignores their common parentage. Section 21099 was enacted to encourage transit-oriented, infill development to reduce greenhouse gases announced in Senate Bill No. 375, "one in a series of executive, legislative and administrative measures enacted to reduce greenhouse gas emissions ..." (*Covina Residents for Responsible Development v. City of Covina* (2018) 21 Cal.App.5th 712, 725) Section 21159.28 was enacted pursuant to Senate Bill 375. Since both statutes were enacted to further goals of SB 375, the provisions should be read *in pari materia*. (*Smith v. LoanMe, Inc.* (2021) 11 Cal.5th 183, 190.) Thus, section 21099's CEQA exemption for aesthetic impacts attributable to a residential or mixed-use project cannot reasonably be interpreted to apply to this EIR.

I. The EIR Defers Formulating Mitigation for Biological and Visual Impacts

UC denies that the EIR improperly defers formulation of mitigation measures MM BIO-2b and MM AES-3, treating it as a challenge to whether the EIR's conclusion that impacts will be less than significant is supported by substantial evidence. UC misconceives the nature of the claim, which is a procedural challenge to the EIR's assumption that it meets criteria for deferral. "The existence of substantial evidence ... is not relevant when one is assessing a violation of [CEQA's] information disclosure provisions." (*Communities for a Better Env't v. Richmond, supra*, 184 Cal.App.4th at 82.

J. The EIR Fails to Assess Shadow Impacts on Surrounding Neighborhoods

UC incorrectly argues that "[a]nalysis of shadow impacts is not required under CEQA." (ROB 57:18, citing Guidelines, Appendix G.) This argument is incorrect because CEQA requires analysis of all project-caused physical changes to the environment (§§ 21100, 21002.1, 21065) and loss of sunlight is unquestionably a physical change. Also, the fact that Appendix G does not mention "shadow" is irrelevant; its preamble expressly provides that "[s]ubstantial evidence of impacts not listed on this form must also be considered."

As with visual impacts, UC misconceives the issue. It is not that a threshold of significance should be "changed" but that the EIR unlawfully fails to analyze the significance of shadow impacts on

neighborhood life outside of city parks despite substantial evidence supporting a fair argument that such impacts may be significant. (*Amador Waterways, supra*, 116 Cal.App.4th at 1109.)

K. Deferral of Formulation of Mitigation for Significant Wind Impacts is Unlawful

UC implies that labeling the CPHP EIR a "program" EIR gives it a free pass to defer the formulation of mitigation for significant wind impacts. This is incorrect. The level of specificity for a program EIR is determined by the nature of the project and the 'rule of reason' and not by semantic labels. (*Citizens for a Sustainable Treasure Island v. City and County of San* Francisco (2014) 227 Cal.App.4th 1036, 1052.) A program EIR must provide "decision makers with sufficient analysis to intelligently consider the environmental consequences of [the] project." (*Ibid*; *Cleveland National Forest Foundation v. San Diego Ass'n of Governments* (2017) 17 Cal.App.5th 413, 426 (*Cleveland*).)

UC ignores extensive authority in the opening brief addressing the EIR's improper deferral of the formulation of mitigation for significant wind impacts. (POB 30; 36:25; 57:9 ["As discussed, to defer mitigation until after project approval it must be impracticable to achieve in the present and the agency must adopt performance standards. UC violates both criteria for deferral."].) The opening brief did not repeat these citations for each mitigation deferral claim.

UC's defense consists mostly of undisputed points. For example, the parties assume that wind tunnel testing is required for accurate prediction of wind speeds and that final building designs are necessary for accurate wind tunnel tests. Petitioners' claim is that the EIR presents no evidence that it is impractical for UC to develop final building designs before approving the CPHP; thus allowing wind tunnel testing. UC ignores this claim and cites to no such evidence.

Similarly, UC argues that MM AES-4 includes a specific performance criterion, *i.e.*, San Francisco's wind hazard threshold of 26 mph. Petitioners do not dispute that MM AES-4 references this criterion. The legal problem is that MM AES-4 does not mandate compliance with this criterion. (POB 58:12; *Cleveland, supra*, 17 Cal.App.5th at 440-443 ["[i]mpermissible deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR"]. UC fails to defend this claim.

UC argues that MM AES-4 does not use an incorrect, post-project baseline to determine the success of wind mitigation, contending that the "baseline" under CEQA has nothing to do with measuring the success of mitigation. (ROB, 60:15; POB 59:6.) This reflects a deep misunderstanding of how CEQA works. The environmental setting (i.e., pre-project baseline) is the condition of the

environment against which an EIR evaluates project changes for environmental harm. (*Communities, supra*, 48 Cal.4th at 315). For purposes of measuring the success of mitigation, changing the baseline to reflect conditions after portions of the project are built could partially or completely obscure the magnitude of the change caused by the project. The updated baseline would reflect more degraded environmental conditions than the pre-project baseline. The Court should reject UC's absurd argument.

L. GHG Emissions must be Analyzed and Mitigated

UC relies heavily on the purchase of voluntary carbon offsets to support the EIR's determination that greenhouse gas (GHG) emissions would be less than significant. (AR 1854-55 [UC to purchase roughly 59,000 metric tons of CO_{2e} a year, approximately 95 percent of the increased emissions from the buildout of the CPHP].) UC relies on this strategy because it is less expensive than lowering emissions. (AR 42215.) But UC's proposed voluntary offsets fail to meet CEQA's requirements that mitigation measures be "fully enforceable through permit conditions, agreements, or other legally binding instruments." (Guidelines, § 15126.4 (a)(2).)

UC first argues that *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467 (*Golden Door*) is limited to its facts and should not be relied upon. (ROB 62:1-4, 14-15.) *Golden Door* states, "Our decision is not intended to be, and should not be construed as blanket prohibition on using carbon offsets — even those originating outside of California — to mitigate GHG emissions under CEQA." (*Id.* at 483.) UC overreaches, as *Golden Door*'s limiting language reflects adherence to the principle of judicial restraint. The practice of distinguishing one case from another is based on the assumption that appellate rulings are limited to the facts of each case. But petitioners' claim is not premised, as UC states, on a "blanket prohibition on using offsets." Far from it, the material facts in *Golden Door* are substantively identical to the instant case and compel the same outcome.

UC argues that *Golden Door* is distinguishable because "MM GHG-1c commits UC to monitoring emissions annually and acquiring carbon offset credits in conformance with CARB guidance." (ROB 62:16-19.) UC fails to explain what is meant by "offset credits in conformance with CARB guidance." It cites only three pages from the EIR to support this assertion, and the only possible interpretation from them is that "Offset credits shall be third-party verified by a major registry recognized by CARB ... UCSF will purchase CARB conforming national offset credits registered with an approved registry." (AR 1858.) UC fails to acknowledge that CARB approval is rejected as a basis for enforceability. (*Golden Door, supra,* 50 Cal.App.5th at 511.) Further, UC relies on the same

registries as the agency in *Golden Door*. (Compare AR1858-1859 [discussion of CPHP's voluntary carbon offset registries] with *Golden Door*, *supra*, 50 Cal.App.5th at 570-571 [discussion of registries].)

UC next argues that MM-GHG-1c is distinguishable from *Golden Door* because the EIR mentions the use of protocols whereas the mitigation measure in *Golden Door* does not. (ROB 62:23-27.) This simplistic argument is unavailing because UC *fails to require CARB approval for the protocols*, which is necessary for enforceability. (AR 1859.) MM-GHG-1c only requires that "protocols of each registry, and UC's own internal screens, shall be used to demonstrate that the carbon offset credits provided are real, permanent, additional, and have been independently verified as adhering to its applicable project protocols." (*Ibid.*) This is inadequate, as *Golden Door* explains:

> [R]egardless of how the voluntary protocols are developed, [C]ARB staff must determine whether the voluntary protocol should be developed for use in the Cap-and-Trade Program and if so, to conduct its own rulemaking process.... *This process ensures that any voluntary protocol ... demonstrates the resulting reductions meet the offset criteria in [Assem. Bill No. 32]* ... Protocols developed by the voluntary programs are not Compliance Offset Protocols." (Italics added.)

(*Golden Door*, *supra*, 50 Cal.App.5th at 511-12.)

As in *Golden Door*, UC fails to require CARB approval for these protocols, or information regarding the protocols. (AR 1859.) Without additional requirements, MM-GHG-1c is unenforceable. The similarities to *Golden Door* are striking and compel the same result.

1. MM-GHG-1c is Impermissibly Deferred

There are two ways in which MM-GHG-1 is impermissibly deferred. First, offset protocols are undefined. (POB 61:1-5.) Second, offset locations are unspecified. (*Ibid.*) UC states that voluntary offsets would "prioritize" local and in-state offsets and, if no such offsets are "available," UC would purchase out-of-state offsets. (ROB 63:3-11.) *Golden Door* found the mitigation measure impermissibly deferred where it "contains no objective standards for determining whether any particular offset project is 'available' and 'financially feasible' in one location or another." (*Golden Door, supra*, 50 Cal.App.5th at 520.) As in *Golden Door*, UC fails to identify any objective standard for when local or in-state offsets are "available." (ROB 63:4–11.) Apparently attempting to distinguish *Golden Door*, UC states in a footnote that "it is not possible or feasible to specify exactly where future credits will be obtained." (ROB 63:27 fn. 22.) UC fails to explain, however, why requiring an objective standard for "availability" would be equivalent to "specify[ing] exactly where future credits will be obtained." Again, the facts here are substantively identical to *Golden Door*, and compel the same finding of improper deferral.

2. The EIR Relies on the CARB 2017 Scoping Plan to Analyze GHG Impacts

There are two flaws in the CPHP's use of the CARB's 2017 Scoping Plan. First, the 2017 Scoping Plan standard relied upon is not applicable to the UC. (POB 62:10-13.) Second, the CPHP's reliance on "zero net increase" conflicts with UC's own policies. (POB 61:21-62:6.)

In lieu of properly analyzing this conflict as required by CEQA, UC provides a handful of excerpts from the EIR that purport to show that the CPHP is consistent with "UC plans and policies, 2040 Plan Bay Area, CARB's 2017 Scoping Plan Updated, and Executive Order S-3-05." (ROB 63:16-18.) However, UC provides no explanation as to how the CPHP's goal of "no net increase" is consistent with state mandates for emission decreases.

UC's opposition concludes by stating "Petitioners ignore that UC's CNI [Carbon Neutrality Initiative] is more stringent than all state requirements for reduction of GHG emissions, including AB 32, SB 32, and 2017 Scoping Plan." (ROB 64:3-4.) UC's claim is false. The CNI is a carbon neutrality goal that is only half-heartedly entered into by the UC, and bears no relationship to state goals. (AR 41069 [noting that UC is not on track to meet its carbon neutrality goals by 2025].) Further, UC's opposition does not even attempt to argue how the 2017 Scoping Plan's guidance to cities and counties is applicable to UC as a state entity. UC has failed to adequately analyze how implementation of the CPHP is consistent with an applicable plan, policy, or regulation.

M. The EIR fails to Adequately Analyze Energy Conservation

1. Project Level Analysis Fails to Comply with Informational Mandates

A main focus of UC's arguments is to avoid applicable language in the CEQA Guidelines' Appendix F. UC attempts to brush aside a critical element of Appendix F by stating that "Petitioners' argument weakly relies on the aspirational goals listed in the introduction to Appendix F, all of which are still met by the EIR." (ROB 64:15-16.) First, this ignores "the fundamental rule of statutory construction which states that the court should ascertain the intent of the Legislature to best effectuate the purpose of the law. [Citation.] Legislative intent should be gathered from the whole act and applied reasonably to carry out the policy of the legislation. [Citation.]" (*Estate of Coudures* (1984) 151 Cal.App.3d 741, 746.)

The task is eased because Appendix F's policy is expressly stated: "The goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include: [¶] (1) decreasing overall per capita energy consumption, [¶] (2) decreasing reliance on fossil fuels such as

coal, natural gas and oil, and [¶] (3) increasing reliance on renewable energy sources." (Guidelines, App. F, § I.) *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 213 (*CCEC*) quoted this Appendix F language to invalidate an EIR that did "not indicate any investigation into renewable energy options that might be available or appropriate for the project." Here, the EIR fails to describe how the CPHP complies with any of the prescribed means to achieve energy conservation: the UC is increasing its reliance on fossil fuels, fails to assess whether its per capita energy consumption is increasing, and fails to require any increased renewable energy in favor of purchasing offsets.

Dismissing these fundamental issues, UC asserts that "CPHP will add about 2.90 million gsf of new building space and thus has to use more energy than the existing 3.92 million gsf of building space." (ROB 64:18-19.) UC fails to explain why this 74 percent increase in building space requires a 116 percent increase in electricity use, 76 percent increase in diesel use, and 61 percent increase in natural gas use. (AR 1779.) These increases suggest that CPHP development would be less energy efficient than the existing campus. (*Ibid.*) While it is possible that a per-capita energy consumption analysis pursuant to Appendix F, section I ("decreasing overall per capita energy consumption") might help explain this troublesome lack of energy efficiency, UC defiantly refuses to perform such analysis. (ROB, 65:11.) This is an informational failure under Guidelines section 15126.2 and Appendix F.

In an attempt to pivot from its excessive unexplained increases in energy consumption, UC points to Title 24 and LEED certifications to posit that "fossil fuel consumption would be reduced." (ROB 65:13.) However, the assumed "reduction" is illusory — both in terms of absolute numbers and in relation to the proposed increased building space. (AR 1779.)

UC expends much effort explaining how "UC is increasing renewable energy sources at all of its locations, including Parnassus Heights," referencing prior actions and contemplated future strategies actions that are neither elements of nor mitigation for the CPHP. (ROB 65:16-26.) Impacts from such unrelated projects are irrelevant, and information scattered about the record does not satisfy the EIR's informational disclosure requirements. (*Vineyard Area Citizens, supra,* 40 Cal.4th 412, 442.)

UC boasts that "the campus is developing *strategies* for adding new renewable generation including rooftop solar systems, and microgrid districts with battery storage." (ROB 65:24-25.) First, developing strategies to apply at some undefined date does not show a "decreas[ed] reliance on fossil fuels." (Guidelines, App. F, § I; AR 35130 ["Renovations and upgrades are recommended across many existing electrical facilities in the next 15 years to maintain business-as-usual operations"].) Second, the

CUP is scheduled "to remain in good operation until 2030-2035." (AR 35131.) UC fails to provide any performance standards to reduce reliance on fossil fuels, a primary path to achieve energy conservation.

UC's brief relies heavily on its goal to meet Title 24 and strive to achieve LEED Silver for new buildings, but does not dispute that these goals may be waived. (POB 65:1-6; ROB 64:21-24; 64:27-65:2 [claiming waivers would be limited to "exceptional circumstances"].) UC also relies on *Tracy First v. City of Tracy* (2009) 177 Cal.App.4th 912, to argue that reliance on building codes is sufficient to address energy impact concerns. (ROB 65:27-28, 66:1-4.) However, as in *CCEC*, UC here fails to provide any analysis regarding the other factors CEQA requires in addition to building code compliance. (*CCEC, supra*, 225 Cal.App.4th at 211; Guidelines, § 15126.2 (b).) It is thus impossible to determine whether changing certain aspects of the project would create a more efficient or less wasteful CPHP.

2. Cumulative Energy Impacts Analysis is Fatally Flawed

CEQA prohibits "drop in the bucket" or "ratio theory" analysis. (*San Francisco Baykeeper v. State Lands Comm.* (2015) 242 Cal.App.4th 202, 223.) UC argues that it only provides comparison to "statewide and regional energy use to provide a frame of reference." (ROB 66:21-23.) This attempted whitewash fails. The EIR dismisses cumulative energy impacts because "given the relatively small percentage of the CPHP's other fuel and energy uses compared to existing fuel and energy use in the region," there would be no adverse cumulative impacts. (AR 3944.) The EIR found a less than cumulatively considerable impact because electricity use would not be "substantial compared to 2018 citywide consumption." (AR 3944.) This is the hallmark of ineffective "drop in the bucket" analysis.

Additionally, the EIR determines that cumulative energy impacts would be less than significant — without reference to a significance standard. (AR 3944.) UC attempts to distinguish *Lotus, supra*, 223 Cal.App.4th 645 because it "does not discuss cumulative impacts" (ROB 65:66:24-27), but then fails to explain how that makes a difference since CEQA requires standards of significance for both types of impacts. (Guidelines, § 15064.) Alternatively, UC purports to create its own standard: "whether 'the collective effect of the project would be to use fuel or energy in a wasteful or inefficient manner.'" (ROB 66:27-67:1.) UC fails to explain how the "collective effect of the project" is comprehensible or provides a meaningful standard for either the cumulative impact or the CPHP's incremental contribution. Further, this confused statement is set forth in a response to comment and not the Draft or Final EIR's analysis of energy impacts. (Compare AR 6114 [response to comment] with 1787-1788 [DEIR] and 3944-3945 [FEIR].) The EIR's failure to identify a significance standard for its cumulative impact analysis of energy is uncorrected.

Conclusion

Petitioners in the three related cases respectfully request this Court's judgment and peremptory writ in the public interest, ordering UC to set aside the CPHP approvals including certification of the EIR, and to revise and recirculate the EIR in compliance with CEQA before reconsideration.

Respectfully submitted,

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project").[1] My review focused on the DEIR's treatment of:

- **Population and Housing**
- **Growth Inducement**
- **Land Use and Planning**
- **Alternatives**

In preparing these comments, I have reviewed the following information:

1. **Draft Environmental Impact Report for the Plan and Appendices**
2. **2014 LARDP**
3. **CPHP**
4. **1976 Regents' Resolution**
5. **January 16, 2020 Letter from Mayor London Breed to Chancellor Sam Hawgood citing the 2007 MOU and 1987 and 2007 MOU's**

After carefully reviewing the DEIR for the Project I have concluded the DEIR fails in numerous respects to comply with CEQA and to fulfill CEQA's fundamental mandate. As described below, the DEIR violates this law because it fails to analyze adequately the significant environmental impacts of the Project or propose sufficient mitigation measures. Where, as here, the EIR fails

53

[1] See Attachment 1 for Watt Qualifications

to fully and accurately inform decision-makers and the public of the environmental consequences of proposed actions, it does not satisfy the basic goals of the statute. Because of the DEIR's numerous and serious inadequacies, the Lead Agency must revise and recirculate the document to permit an adequate understanding of the environmental issues and potential solutions, including feasible mitigation measures and alternatives.

53 cont.

I. Context and Introduction

A. UCSF Should Honor the Space Ceiling and Other Commitments

UCSF should honor its commitment to the space ceiling and to development compatible with surrounding uses at the Parnassus Heights campus by selecting an alternative within the existing space ceiling. The Parnassus Heights campus site, the oldest and largest of the UCSF campuses, is located in among some of the oldest neighborhoods in San Francisco, which are characterized by a mix of unique residential areas ranging from single family to multi-family housing and neighborhood serving commercial districts such as located along Irving and Judah Streets and 9th Avenue. In addition to Mount Sutro Open Space Reserve, several park and open space areas are located near the campus. This area surrounding the Parnassus Heights campus is further characterized by local serving streets plagued with traffic, parking congestion and lack of transit. Approximately 43% of the main campus (exclusive of the Aldea area) borders the Reserve, breaking the City's normal grid pattern and limiting ingress and egress routes to the main campus. The surrounding neighborhoods, like all of San Francisco, also suffer from a lack of affordable housing and available sites to build new housing. Recognizing the unique and constrained location the Parnassus Heights campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part:

54

> "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." See Attachment 2.

The Regent's Resolution recognized the transportation problems in the area and committed funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit. Concern for the impacts of the Project on the neighborhood is an ongoing concern. In a letter to Chancellor Hawgood, dated January 16, 2020, Mayor London Breed, President of the Board of Supervisors Norman Yee and Supervisor Dean Preston note the need for a revised MOU to adopt and formalize arrangements for coordination and consideration of both our interests and inputs in the context of land use approvals, transportation needs and ongoing service provisions, noting the common challenges faced include housing supply, affordability and climate and seismic related risks. See Attachment 3. According to a June 4th Staff Report to the Planning Commission, the Planning Department and UCSF are engaged in ongoing conversations about how to structure a stakeholder process to achieve the Mayor and Supervisor's objectives, expected to culminate in an MOU.

While not part of the objectives or regulations in the UCSF 2014 LRDP, reference is made in the DEIR to the Community Planning Principles including:

- Land Use LU1. Plan for growth and renovations that are substantially consistent with use limitations and height and bulk limitations in the City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects. The University should consider City planning proposals that are underway. UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns.
- LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density, and that do not negatively affect surrounding land uses.
- LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights Campus site.

DEIR at page 4.10-3 to 4.10-4.

Although the University is constitutionally exempt from local land use regulation whenever using properties under its control in furtherance of its "educational mission," the University has committed to substantial consistency with local policies where feasible. This dual commitment – to the space ceiling and to adherence where feasible to local policy – is one UCSF should and can honor given the very real constraints to development in the area surrounding the Parnassus Heights campus. There are feasible alternatives to the Project, including a new hospital at Mount Zion, Mission Bay or Hunters Point, that should be fully considered in a revised and recirculated DEIR before the decision is made to break the space ceiling commitment and significantly impacting the surrounding neighborhoods.

54 cont.

B. The DEIR Should be Revised and Recirculated to Address the Outbreak in December 2019 of COVID 19

The outbreak of COVID 19 was first reported on December 31, 2019 in Wuhan China. The Notice of Preparation (NOP) for the UCSF Parnassus Heights campus was issued January 14, 2020. As described at page 4.0-6 of the DEIR, "[n]ormally, the baseline condition is the physical condition that exists when the Notice of Preparation ("NOP") is published. The NOP for the proposed CPHP was published in January 2020, and the baseline conditions contained in this CPHP EIR are generally taken from this time period. However, the CEQA Guidelines and applicable case law recognize that the date for establishing an environmental baseline cannot always be rigid." DEIR at 4.6-6. UCSF is a health based organization, therefore fully aware early on of the implications of the Wuhan outbreak. The DEIR itself acknowledged the potential implications of COVID 19, concluding that:

55

> "The net effect of the pandemic on the Parnassus Heights campus site development and operations cannot be predicted at this point in time without speculation." DEIR at page 1-9.

The DEIR concedes COVID 19 has implications for the Project. For example, the objectives for the New Hospital, objectives used in part to dismiss some alternatives, include an increase in beds to provide for inpatient health care in times of severe strain such as the current pandemic. DEIR at page 6-4. The brief discussion at page 1-9 also acknowledges that UCSF will likely consider operational changes such as increases in telehealth services and telework, among others.

COVID 19 was known or should have been known at the time of the issuance of the NOP and certainly, as reflected in Section 1.7 of the DEIR, was known prior to circulation of the DEIR for public comment. COVID 19 warrants changes and updates to existing environmental setting information, critical to complete an accurate impact analysis, as well as to the Project Description (e.g., space needs changes given a likely transition as noted in the discussion to telework and telehealth). Significant questions are raised by COVID 19 that have implications to the Project and related impacts – including but not limited to an acknowledgement that UCSF is likely to increase telework, telehealth consultations and remote learning. These are but a few of the changes warranting UCSF to hit pause both to revise the DEIR and to re-engage the public and experts, right-size the Project and evaluate other alternatives that would reduce or eliminate impacts while adhering to the existing space ceiling.

55 cont.

II. The Project Violates the California Environmental Quality Act

A. The Project Description is In Flux

A fundamental requirement of CEQA is that an EIR contain an accurate, complete and stable project description. Without a complete and stable project description, an agency and the public cannot be assured that all the project's environmental impacts have been revealed and mitigated. Further, CEQA and the CEQA Guidelines mandate that an EIR include a description of the "physical environmental conditions . . . from both a local and a regional perspective. . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines Section 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR – and thus the decision-makers, agencies and public who rely on the EIR – cannot accurately assess the potentially significant impacts of the proposed Project.

As discussed above, the Project is likely changing in fundamental ways due to COVID 19 – including adjustments to the Project due to a likely increase in telework and telehealth, among other adjustments:

> "UCSF will likely consider operational changes such as increases in telework and telehealth services, especially primary and secondary health care services." DEIR at 1-9.

56

In addition to telehealth and telework, distance learning also appears likely on the increase. The overall space needs and allocations for the Project should be revisited in light of COVID 19 and other rapidly changing conditions due to COVID. The emerging stakeholder process referenced in the June 2020 Staff Memo to the San Francisco Planning Commission provides another good reason to pause the proposed Project entitlement process and discuss an appropriately scaled Project for the Parnassus campus site. 56 cont.

B. The DEIR Includes Incomplete and Inadequate Baseline Information to Support the Analysis of Project Impacts

The DEIR fails to adequately describe baseline (environmental setting) conditions. Setting or environmental baseline information is as essential to adequately disclosing and analyzing project-related and cumulative impacts as a complete and consistent Project description. Without adequate and complete information about the environmental setting, it is not possible to determine whether the Project improves or makes worse existing environmental conditions or the extent of the Project-related and cumulative impacts. The Project NOP was issued January 14, 2020 after the COVID 19 pandemic was a known crisis. As such, the DEIR's baseline or existing environmental setting information must be updated to reflect conditions Pre-COVID 19 and Post emergence of COVID 19. Another option is to postpone the Project until more is known about the COVID crisis. Both pre- and post- emergence of COVID 19 information is critical if adequate analyses are to be completed for topics ranging from land use, housing and population to transportation. 57

Examples of baseline setting information that is missing from the DEIR includes but is not limited to the following.

1. Students, Faculty and Staff

The DEIR omits information essential to analysis of whether the Project will result in significant impacts to housing supply as well as related impacts of displacement due to increased demand for housing and gentrification. Such information includes at a minimum the general salary ranges of new students, faculty and staff. Such information was provided in the Mission Bay Hospital environmental documents and fiscal impact analysis, hereby incorporated by reference. . In addition, the DEIR should provide information about the current student, staff and faculty to inform analysis of new housing demand (e.g., where do current staff, faculty and students live? Etc.). 58

2. Demographics in the Surrounding Neighborhood and City

Basic demographic information must be part of the DEIR's revised baseline in order to support and inform analysis of Project impacts on housing. The DEIR includes no information about the surrounding area demographics or demographics in the City and study area, making adequate analysis of impacts impossible. 59

3. Affordable, Student, Workforce and Family Friendly Housing

The Project will significantly increase students, staff and faculty at the campus adding to the demand for scarce housing affordable to new students, staff and faculty in the areas surrounding the Project, the City and the region. In addition the Project will nearly double projected new job growth due to the multiplier effect. The DEIR must analyze the potential for the Project to raise housing prices, contribute to gentrification and displacement due to price increases and competition for scarce housing in the surrounding area, San Francisco and the region. Very little setting information is provided to support analysis in the short, 13 page section on Population and Housing and the even shorter, 8-page discussion of growth inducement.

To perform an adequate analysis of Project and cumulative impacts to population and housing and growth inducement, it is essential the DEIR include in the description of the Project baseline (setting) details concerning existing vacancy rates for affordable units, including deed restricted housing, family housing, and housing affordable to the workforce[2] in the surrounding neighborhoods[3], the City as well as the broader five-county study area. Little setting information is provided in support of the DEIR's across the board conclusions that impacts associated with project growth will be less than significant. The DEIR contains no information concerning affordable housing and workforce housing whatsoever.

60

Without current and complete information about the existing housing stock in the surrounding neighborhoods, the City and the study area, the DEIR cannot adequately analyze the Project's impact on affordable, workforce and family friendly housing and households, and the DEIR's conclusions concerning the insignificance of Project-related and cumulative impacts cannot be supported by facts and evidence. The DEIR must be revised to include this and other baseline information, including changes in housing stock and availability pre- and post- emergence of COVID 19. While long term effects of COVID 19 maybe speculative, some effects are known and should be disclosed where possible.

In addition to the above information, the DEIR must discuss and include in its revised analysis, the locations of disadvantaged communities. Such information is essential to support analysis of the extent to which the Project could further impact these DACs and exacerbate existing housing inequity. Sources of this information are readily available. See e.g., Urban Displacement Project www.urbandisplacement.org/map/sf. Project such as this one have a high potential to contribute to the gentrification and displacement of disadvantaged communities

[2] Workforce housing is housing at the lower end of market rate serving households with up to 200% of median income and often referred to as the "missing middle" or gap in affordable housing in San Francisco. Voters recently approved funding to build more housing, including for the SF workforce.

[3] Increasingly with the COVID 19 threat, workers and students choosing to avoid transit are increasingly putting pressure on nearby housing. This warrants adjustment of the DEIR's analysis of housing impacts in the surrounding neighborhoods.

due to the influx of additional students, staff and faculty who most likely will be seeking housing within walking and biking distance to the campus in a post COVID world.

60 cont.

4. Existing Jobs-Housing Balance and Fit within the Surrounding Neighborhood, City and Regional Study Area

The DEIR must analyze the potential for the Project to make worse the existing imbalance of jobs and housing. Little information is provided in the DEIR on jobs housing imbalance pre- or post-emergence of COVID 19. The DEIR fails to cite readily available information for San Francisco and Region concerning the growing imbalance. Specifically, San Francisco or more accurately in the SF-Oakland-Hayward census area, created only one new home per 6.8 new jobs between 2010 and 2015. Source: US Census Data. Looking just at San Francisco, it comes out to 8.2 jobs per new home during that same period, further increasing an enormous gap in the already out of balance housing to jobs ratio in the Bay Area. Not surprising rents increased by 43% over the same period due to housing scarcity and competition from new employees. Source: U.S. Census Data 2010 and 2015. This data is readily available and must be included in a revised DEIR to support a credible analysis of the Project's impacts on housing and growth.

61

C. Finding the right jobs-housing balance has long been an important concern for urban planners and an important policy consideration for general and area plans. More recently, attention has turned to jobs-housing fit – the extent to which housing price and rent is well matched to local job salary and quality. The DEIR are silent on the matter of jobs housing fit and fails to adequately address the issue of jobs housing balance. The DEIR should be revised to describe the existing job-housing balance and fit for the surrounding neighborhoods, the City and region. Updated baseline (environmental setting) information must include a description of changes in demand for housing in San Francisco Pre- and Post-Emergence of COVID 19. This information is not only necessary to adequately analyze environmental topics such as displacement and Project demand for new housing, but it is also essential to determining the extent to which the Project will increase commuting, traffic, transit demand, and vehicle miles traveled. Without this information, the full impacts associated with air quality and greenhouse gas emissions, among other impacts cannot be adequately analyzed and conclusions concerning the significance of Project-relation and cumulative impacts cannot be supported by facts and evidence. The DEIR must be revised to include this and other baseline information to inform revised impact analyses and conclusions. The DEIR's Analysis of, and Mitigation for, the Impacts of the Project Are Inadequate

62

The discussion of a project's environmental impacts is at the core of an EIR. See CEQA Guidelines Section 15126(a). As explained below, the DEIR's analysis of the Project's environmental impacts are deficient under CEQA because the DEIR fails to provide the necessary facts and analysis to support informed decisions about the Project, mitigation

63

measures and alternatives. An EIR must contain facts and analysis, not just bare conclusions. A conclusion regarding the significance of an environmental impact that is not based on analysis of the relevant facts fails to fulfill CEQA's information mandate.

Additionally, an EIR must identify feasible mitigation measures to mitigate significant environmental impacts. CEQA Guidelines Section 15126.4. Under CEQA, "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects. . . ." Pub. Res. Code Section 21002.

As explained below, the DEIR fails to provide detailed, accurate information about the full breadth of the Project's potentially significant impacts with respect to growth inducement, population and housing and land use and planning. The DEIR's cumulative analysis of these impacts is also deficient. Where the DEIR fails to adequately analyze the Project-related impacts, the cumulative analysis cannot be adequate. Further, the DEIR does not identify and analyze feasible mitigation measures that would reduce or avoid such impacts.

63 cont.

1. The DEIR's Analysis of the Project's Growth-Inducing and Population and Housing Impacts is Flawed

The DEIR's analysis of growth inducing and population and housing impacts is flawed and conclusions reached by the DEIR that all impacts are less than significant incorrect. These topics are closely related and the two sections contain multiple cross references. Therefore, these impact topics are discussed together in this section.

CEQA requires that an EIR include a detailed statement setting forth the growth-inducing impacts of a proposed project. Pub. Res. Code Section 21100(b)(5). A proposed project is either directly or indirectly growth inducing if it: (1) fosters economic or population growth or requires additional housing; (2) removes obstacles to growth; (3) taxes community services or facilities to such an extent that new services or facilities would be necessary; or (4) encourages or facilitates other activities that cause significant environmental effects. CEQA Guidelines Section 15126.2(d). While growth inducing impacts of a project need not be labeled as adverse, the secondary impacts of growth (e.g., gentrification and displacement, demand for additional housing and services, traffic, air pollution, etc.) may be significant and adverse. In such cases, the secondary impacts of growth inducement must be disclosed as significant secondary or indirect impacts of the project. The analysis required is similar in many respects to the analysis required to analyze impacts associated with population and housing.

64

a. Growth Inducement Analysis is Woefully Lacking

The DEIR contains a short, 3 and 1/2-page discussion of Growth Inducing Effects. The discussion acknowledges the Project will increase the campus population by approximately 4,100 persons by 2030 and an additional 1,080 persons by 2050, including students and faculty and staff. The DEIR also calculates the multiplier of 0.73 for an additional 3,420 jobs that could

65

be indirectly caused or induced by the Project. The Project includes construction of 142 net new housing units/beds within the Aldea housing complex and an additional 620 new residential units for a net total of 984 new units by 2050.

The DEIR concedes "[c]ampus population growth under the proposed CPHP would not be entirely accommodated by the existing and new housing on site, and therefore would result in indirect housing demand beyond the campus site." DEIR at 5-5. The discussion provides little real analysis of the Project's potential to induce growth in accordance with CEQA, nor does the discussion reach any conclusions as to the significance of growth inducing impacts instead relying on the assertion that the growth allowed by the Project is not substantial when "compared to the study area growth projections and to the extent that demand for new housing would exceed the capacity of the market area.[4]" DEIR at page 4.12-10. Yet, the discussion does not identify any potentially significant impacts associated with population growth as a result of the elimination of the existing space ceiling and implementation of the Plan.

The DEIR goes on to state:

> "Generally, the housing demand associated with employment growth under the proposed CPHP would be satisfied by the housing that could be added in San Francisco and in other parts of the region." DEIR at 4.12-8.

San Francisco and the region has been grossly underbuilding planned housing while generating significant new jobs; facts not disclosed by the DEIR. There is no information in the DEIR about the current housing crisis in San Francisco and region as summarized below. Nor does the DEIR contain any information about housing availability in the surrounding neighborhood and City, or information about housing affordability. Moreover, the DEIR fails to describe the breakdown of new students, faculty and staff in terms of numbers by typical jobs and salaries; information critical to estimating the percent of new staff, faculty and students who qualify as low income or very low income requiring lower cost housing options. Finally, the DEIR fails to acknowledge that UCSF is a major contributor to the affordable housing crisis, and will exacerbate that crisis by building out its expansion plan without building ad ditional units affordable to new students, faculty, staff and employees of supporting services. See Jobs Housing Nexus Analysis SF, Kaiser Marston Associates, 2018 submitted under separate cover

Instead of the required analysis, the DEIR points to the Population and Housing Section conclusion to support its cursory overview of growth inducement impacts:

> "Implementation of the proposed CPHP would induce population growth in the Bay Area, but the population growth would not be substantial in comparison to growth that is projected and planned for San Francisco and the four study area counties in Plan Bay Area 2040 and the local general plans for the study area communities. Further, the population

65 cont.

[4] Five county study area.

growth would not result in a demand for new housing that would exceed the capacity of the five-county market area." DEIR at 4.12-9. Emphasis added.

By comparing the Project's growth to the entire City and region, the DEIR seeks to diminish the significance of housing demand generated by the Project. There is no question the Project will generate substantial additional growth in a highly constrained neighborhood[5], by increasing the daily average population by approximately 45%, nearly 5,200 students, faculty and staff. DEIR at page 4.12-1. In addition, the Project generates an additional 3,420 jobs based on a multiplier of 0.73%; jobs that will put additional demand on a tight housing market. No information is provided about the nature of these jobs or the associated salary ranges of employees. The Project will also increase likely increase the demand for housing in the immediately surrounding neighborhoods and City as people avoid transit in a COVID worried world and seek to walk and or bike to work.

The Project most certainly will induce growth that will in turn significantly impact housing. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, assuming all new students need housing and only 50% of faculty and staff need housing, at 4,000+ units, would still constitute a significant impact on a highly constrained housing market and could result in displacing local residents due to competition and gentrification. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis because under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing. Salaries disclosed for the Mission Bay Project for UCSF's workforce, suggest the majority of new students, staff and faculty will need housing affordable to low incomes. See www.payscale.com/research/USEmployer=UCSFMedicalCenter

65 cont.

Housing Demand Range			
Direct/Multiplier Growth at 2040 DEIR page 4.12-7	Students 504	Faculty and Staff 4,680	Multiplier/Indirect Employees: 3,420
Housing Demand Estimates	High Demand (worst case scenario 100 require housing): 504 units	High Demand: (worst case scenario 80% not housed, net new): 3,744 units	High Demand: 50% not housed, new demand):

[5] Constrained in terms of circulation and housing.

	Low Demand (50% not housed, new demand) 252 units	Low Demand (50% not housed, new demand) 2,340 units	1,760 units

These housing-related impacts are more than glossed over by a discussion that excludes any information about the dire housing crisis.

Substantial new non-residential and residential growth in San Francisco includes total population growth based on household size assumptions[6], in addition to new students, staff and faculty estimated in the DEIR to be as high as 12,220 people by 2050. DEIR at page 4.12-8. This estimate does not include indirect growth associated with the multiplier, but does assume all new growth is in San Francisco. This significant new growth will require additional public services, likely including expansion and therefore construction of facilities in the neighborhood or adjacent neighborhoods of a myriad of services. Yet the DEIR provide cursory information about these services and facilities and fails to analyze the associated impacts, including fiscal impacts. CEQA requires that if new construction of housing will occur to accommodate the Project's employees or services beyond that included in the Project, then the EIR must analyze the environmental impacts of that construction. The appropriate components for an adequate analysis include: (1) estimating the amount, location and time frame for growth that may result from the implementation of the Project (e.g., additional housing); (2) considering whether the new population would place additional demands on public services such as fire, police, recreation, emergency, health, childcare or schools; (3) applying impact assessment methodology to determine the significance of secondary or indirect impacts as a result of growth inducement; and (4) identifying mitigation measures or alternatives to address significant secondary or indirect impacts. CEQA Guidelines Appx. G Section XIII(a). The DEIR must be revised to provide this analysis and based on this analysis, to revise other environmental analyses including but not limited to population and housing, transportation, air quality, among other topics where impacts are derived in part from direct and indirect growth assumptions. 65 cont.

The DEIR dismissal of likely growth inducing impacts because the impacts are "impossible to determine" violates CEQA. Virtually the sum total of the discussion, below, lacks analysis and supporting facts and evidence while at the same time identifying the potential areas of significant impacts associated with significant growth:

> "While it is acknowledged above that the precise nature, location, and magnitude of effects of indirect and induced growth cannot be determined, the proposed CPHP

[6] 2.36 persons per HH; assumes only one student per HH. DEIR at page 4.12-8.

> would likely increase overall demand in the region for housing, commercial and industrial space, and associated infrastructure. Potential effects could include increased traffic congestion; increased air pollutant emissions; loss of agricultural land and open space; loss of habitat and associated flora and fauna; increased demand on public utilities and services, such as fire and police protection, water, recycled water, wastewater, solid waste, energy, and natural gas; and increased demand for housing. An increase in housing demand in the Bay Area region would also require governmental services including, but not limited to schools, libraries, and parks to serve new commercial and residential development." DEIR at 5-7.

65 cont.

The discussion also acknowledges that this growth could contribute to a loss of open space by converting those lands to housing, commercial space and infrastructure, but attempts to discount the many impacts associated with conversion of natural and working lands by pointing out without evidence that "most jurisdictions have adopted smart-growth policies that discourage or prohibit this type of development." DEIR at 5-7.

A revised growth inducing analysis must be included in a recirculated DEIR. The impacts of growth must also be considered in new analysis concerning the social equity impacts of the Project. See Attachment 4, Draft Planning Commission Resolution.

b. The DEIR's Analysis of and Mitigation for the Project's Population and Housing Impacts is Inadequate

The DEIR's approach to analysis of population and housing does not adequately analyze Project-related impacts associated with changes that would occur with Project implementation to the population, including employment and residential growth. Instead of actually analyzing the Project's impacts related to population and housing, the DEIR asserts that all impacts both direct and indirect will be less than significant. The DEIR lacks facts, analysis and evidence to support this conclusion. The result is a lack of information about the actual severity and extent of impacts associated with significant growth in population including students, faculty, staff and patients and visitors. For a Project that will guide development of the campus for 30+years and likely be the basis of streamlined permitting for project facilities and infrastructure, it is especially important that the DEIR comprehensively identify and analyze its impacts on growth, population, housing and employment.

66

In determining impact significance associated with growth in population, employment and housing, CEQA requires analysis of the following topics (substantially similar in DEIR at page 4.12-6):

- Would the project induce substantial population growth in the area, either directly (for example by proposing new homes and businesses) or indirectly (for example, through extension of roads and other infrastructure)?

- Would the project displace substantial number of existing housing units or create demand for additional housing, necessitating the construction of replacement housing?
- Would the project displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

In order to analyze the above significance thresholds, the DEIR must also address the following questions:

- Would the project result in the net loss of any existing housing units affordable to very low income or low income households through any means including gentrification?
- What is the net change in affordable versus market rate units in the surrounding neighborhoods as a result of the Project?
- Would the Project impact a disadvantaged community (DAC)?
- Would the project result in a greater imbalance between jobs and housing, including jobs housing fit?[7]

Finally, the DEIR fails to disclose the Project's inconsistency with the UCSF 2014 LRDP Community Planning Principle HI which calls for projects to make a positive contribution to San Francisco's affordable housing stock...in order to relieve housing demand in the local community. DEIR at page 4.12-4.

66 cont.

The DEIR's analysis of these potential impacts associated with population, employment and housing is inadequate starting with the lack of any credible environmental setting or context for the discussion including the following basic facts:

- San Francisco and the region added more jobs than housing over the last decade. Census data shows that San Francisco added 8.2 jobs per home since 2010. Overall, the Bay Area has added 2 jobs for every home built since 1990. See also Plan Bay Area Final Plan 2040, Attachment 5.
- Between 2011 and 2017, the region added 658,000 jobs and 140,000 housing units, or on average 4.7 jobs for every housing unit. SPUR Regional Strategy, Attachment 6.
- The shortfall of housing units is estimated by SPUR to be nearly 700,000 units including units to meet the needs of both middle income and lower income households. Id.

[7] Jobs-Housing fit means the extent to which housing prices or rents are matched to the local job salary ranges. Jobs-Housing balance provides a general sense of how in or out of balance housing to fit the local workforce may be. Jobs-Housing fit provides an essential and more granular sense of whether – even if in balance – local employees are able to reside locally or must commute long distances for housing affordable to them and their families. Without jobs-housing fit information, readily available using Census and other data, it is not possible for the DEIR to adequately analyze many Project-related and cumulative impacts including demand for new housing and vehicle miles traveled, among others.

- In order to meet the unmet past need plus future needs for housing, the Bay Area would need to build 45,000 units per year to produce an additional 2.2 millions units by 2070. Id.
- The production of affordable housing has lagged behind production of housing affordable to higher incomes, with significant shortfalls of housing production for moderate or middle income wage earners and lower income wage earners. From 1999 to 2014, the Bay area issued permits for only about 35% of the units to meet the needs of vulnerable populations such as low-income families. Id.
- Much of the older housing stock located in higher density areas such as San Francisco have experienced gentrification pressures due to competition from new and higher income wage earners. Id.

A revised DEIR must provide baseline information about the housing crisis and re-analyze housing-related impacts of the Project in light of that information. Based on accurate information about the pre-Covid SF and Bay Area housing crisis (summarize above), it can reasonably be concluded that the additional of 5,200 students, faculty and staff by 2050 and only 984 units produced, the housing need generated constitutes a significant impact. Demand for housing is further exacerbated by the job multiplier of 0.73 creating an additional 3,420 jobs induced by the Project. Total new housing demand could be as high as 6,000+ units assuming that the majority of students, faculty, staff and indirect job employees are people who need housing. Lower demand for new housing, based on more new staff and faculty already housed, at an estimated 4,000+ units, would still constitute a significant impact. If demand is lower, due to a higher percent of new students, staff, faculty and indirect job employees are already housed (50%) the impact at 4,000+ units will still be significant due to the housing crisis. Under either scenario, UCSF would be generating between 4 and 8 jobs for each new unit constructed. Added to the existing jobs-housing deficit in San Francisco and the region and the even greater deficit of housing affordable to low and very low income households, the growth induced by the Project would result in a significant impact on housing. 66 cont.

The Project is also inconsistent with the Community Planning Principle HI directed at relieving housing demand on the local community. The DEIR's conclusion that "population growth would not result in a demand for new housing that would exceed the capacity of the five-county market area," and that "CPHP's impact related to population and housing would be less than significant" is clearly incorrect.

c. A Revised DEIR Must Include Feasible Mitigation Measures and Alternatives to Address Significant Impacts to Housing

The DEIR must identify feasible mitigation measures and alternatives capable of reducing or eliminating significant impacts. The DEIR fails to do so. 67

In reaction to the housing crisis, SF voters passed Measure E in March 2020, limiting construction of new office building unless affordable housing goals are met. Measure E is instructive as to the kinds of mitigation measures UCSF should consider in addressing the increased imbalance of housing and jobs the Project would foster.

Feasible mitigation measures that should be included in a revised DEIR include the following:

- Increase Project housing to provide sufficient and affordable housing for new students, faculty and staff as well as a portion of induced demand (multiplier) by increasing housing proposed by the Project and decreasing new jobs.
- Provide sufficient housing in advance of the development and occupation of non-residential buildings (in line with Measure E).
- Adopt a project that adheres to the existing space ceiling thereby reducing increased staff and faculty and associated housing demand.

These and other feasible mitigation measures must be identified in a revised DEIR to address the significant population and housing impacts of the Project and cumulative development on the Project area, the City and region. A Financial Analysis should accompany the revised Plan and DEIR setting forth costs associated with housing, services and other community benefits of the Project and laying out a revised approach to funding implementation of these Project elements.

- Would the project displace substantial number of existing housing units or create demand for additional housing, necessitating the construction of replacement housing?

67 cont.

2. The DEIR's Analysis of Land Use and Planning Is Incomplete and Inadequate, Thereby Failing to Disclose and Mitigate Significant Impacts

The DEIR incorrectly identifies as Less Than Significant the Project's Land Use and Planning impacts. At the heart of the analysis of land use and planning impacts is the question of the Project's consistency with applicable policies and other provisions including UC's as well as the City's. Contrary to the DEIR's conclusions, the Project is incompatible with the surrounding area and conflicts with numerous policies and provisions of San Francisco's General Plan and Planning Code, as well as UC policies. Due to UC's constitutional autonomy, development and uses on property under the control of the University that are in furtherance of the University's educational purposes are not subject to local land use regulations. However, UCSF has indicated its intent to adhere to local policies and regulations to the extent practicable and to review policies germane to the analysis of land use impacts. DEIR at page 4.10-6. In the pertinent topical sections (e.g., Land Use and Planning, Noise, Aesthetics) the DEIR does describe pertinent policies and regulations, finding in each case that the Project is compatible with surrounding land uses and as such would not create any significant impacts. As described below, the analysis of land use and policy consistency is flawed and the conclusions

68

unsupported by evidence. Contrary to conclusions reached in the DEIR, there is evidence of policy and regulation inconsistency resulting in significant environmental impacts, only two of which – wind and cultural – are disclosed and acknowledged.

68 cont.

Planning and Land Use Context: The *San Francisco General Plan* provides policies and objectives to guide land use decisions and along with the San Francisco Planning Code prescribes the permitted uses and development standards to carry out the City's policies for the 107-acre Parnassus Campus site. In a 1987 Memorandum of Understanding (MOU), UCSF agree to advise and consult with the City of San Francisco on any proposed construction projects. The MOU states that the City Planning Commission will advise UCSF about the "conformance of such development with the Master Plan of San Francisco and Planning Code Section 304.5 (Institutional Master Plans) with recommendations, of any, for amendment to the proposal… Should the City Planning commission and UCSF disagree on any matter which is the subject of this MOU, either party may request the participation of the Mayor and the Chancellor in attempting to resolve the dispute." (MOU, para. IV). The DEIR must, include a complete and forthright analysis of the Project's consistency with the General Plan and other applicable planning documents, ordinances and regulations so that UCSF can honor its intent to adhere to the extent practicable, the City's policies and "zoning codes related to building use, height, and bulk limitations; floor areas; and parking requirements or restrictions for the purpose of ensuring compatibility with the surrounding uses." DEIR at page 4.10-6. Inconsistencies between the Project and the General Plan or other applicable planning documents that were enacted to protect the environment may constitute significant impacts in themselves and can also be evidence of other significant impacts that must be analyzed in the DEIR. Where elements of the Project are not part of its educational mission, and are inconsistent with the General Plan it may not be lawfully adopted or approved. Additional information is needed about the Project elements in order to describe and document how the entirety of the Project is in support of UCSF's educational mission. It is not possible to determine that without more details about how the new space will be used and occupied and for what specific purposes.

69

While not considered by UCSF objectives or regulations, reference is made in the UCSF 2014 LRDP, to the Community Planning Principles which were produced in collaboration with the UCSF Community Advisory Group. These Principles include the following:

- Land Use LU1. Plan for growth and renovations that are substantially consistent with use limitations and height and bulk limitations in the City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects. The University should consider City planning proposals that are underway. UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns.

70

- LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density, and that do not negatively affect surrounding land uses.
- LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights Campus site.

DEIR at page 4.10-3 to 4.10-4.

The Parnassus Heights campus site, the oldest and largest of the UCSF campuses, is located in among some of the oldest neighborhoods in San Francisco, characterized by unique physical characteristics and mix of land uses including residential areas ranging from single family to multi-family housing and charming neighborhood serving commercial districts such as located along Irving and Judah Streets and 9th Avenue. In addition to Mount Sutro Open Space Reserve, several park and open space areas are located near the campus. This area is characterized by local serving streets fraught with traffic, parking congestion and lack of transit.

Compliance with the City of San Francisco's adopted policies and regulations are a key indicator of whether the Project is or is not compatible with the surrounding neighborhood. UCSF clearly understood the breaking point for compatibility in its 1976 Regents' Resolution. Recognizing the unique and constrained location the Parnassus Heights campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part: "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent." See Attachment 2.

In addition, the Resolution recognizes the transportation problems in the area and commits funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit.

In a letter to Chancellor Hawgood, dated January 16, 2020, Mayor London Breed, President of the Board of Supervisors Norman Yee and Supervisor Dean Preston note the need for a revised MOU to adopt and formalize arrangements for coordination and consideration of both our interests and inputs in the context of land use approvals, transportation needs and ongoing service provisions, noting the common challenges faced include housing supply, affordability and climate and seismic related risks. See Attachment 3.

In this case, after discussing only some of the applicable plans, the DEIR incorrectly concludes across the board that the Project would be compatible with adjacent lands uses and impacts would be insignificant. Some examples of the Project's glaring inconsistencies with the General Plan and Code include, but are not limited to, the following:

70 cont.

San Francisco General Plan and Zoning Code Excerpt	Inconsistency
Land Use and Urban Design Elements LU-2: Plan for growth and renovations that are substantially consistent with use limitations and bulk limitations in City planning and zoning codes that exist at the time UCSF initiates the site selection process for such growth and renovation projects…UCSF will endeavor to be consistent with applicable land use plans and mitigation approaches where consistent with UC policy, while respecting specific neighborhood plans and concerns. LU3. Ensure that future UCSF development is compatible with physical surroundings in use, scale, and density and do not negatively affect surrounding land uses. LU10. Work toward compliance with the Parnassus Heights space ceiling and adhere to boundaries for the Parnassus Heights campus site. Policy 3.5: Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development. Policy 3.6: Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction. San Francisco Planning Code – Use Districts City's P (Public) Zoning District Housing along Third and Fifth Avenues – see also Residential House District, Two-Family (RH-2) Code sections Height and Bulk Districts: 25-X, 40-X, 65-D, 80-D, 130-D and 220-F. Floor areas rations are determined by allowable height and coverage.	The DEIR correctly concludes that the New Hospital, as well as Millberry Union, certain West Side development and the Aldea Housing densification project would not be consistent with City Planning Code height and/or bulk regulations for their respective building sites. DEIR at 4.10-16. The DEIR continues on to incorrectly conclude despite evidence to the contrary, that these conflicts would not result in significant incompatibility with adjacent land uses or impacts on surrounding uses. Taking just the New Hospital as an example, at about 955,000 gross square feet and up to 294 feet in height, the New Hospital clearly demonstrates the Project's incompatibility with the surrounding area resulting in significant adverse environmental impacts including but not limited to, wind, visual and environmental impacts associated with an inadequate supply of housing affordable to new students, faculty and staff. The New Hospital is patently inconsistent with SF Land Use and Design policies and height and bulk requirements in multiple ways. First, the New Hospital is within three height and bulk districts and exceeds height limits for portions of the site within two of these, the 65-D and 22-F Height and Bulk districts, by over 70 feet and X stories. Second, the New Hospital would require use of a portion of the Reserve and would be located even closer to the off-site residences on Edgewood. The DEIR concedes: Impact AES-2 finds that the New Hospital would be the most noticeable visual change under the CPHP program, and would contrast sharply both in height and scale with the nearby residential development…". DEIR at 4.10-17. In justifying the conclusion that the New Hospital is compatible with adjacent land uses, the DEIR points to the proposed amendments to the 2014 LRDP which increase the space ceiling. In addition, the DEIR (Impact AES-3) finds that with implementation of appropriate design standards and exterior materials light and glare and other impacts would be reduced to less than significant.

70 cont.

	Even so, the DEIR concedes that the New Hospital will still result in significant unavoidable wind hazards. Analysis by Jared Ikeda provides clear evidence the New Hospital with also result in significant and unavoidable visual impacts. See Attachment 7. There are clear inconsistencies between the New Hospital and the City's General Plan policies and Code resulting in documented significant and unavoidable impacts associated with wind hazard, visual and housing, among other impacts. <u>These inconsistencies and the associated physical environmental impacts are not resolved by the amendment to the LRDP to raise the space ceiling.</u> Combined with other Project elements – Millberry Union, West Side – and the Project scale and bulk overall, the Project is clearly incompatible with the surrounding area resulting in significant and unavoidable impacts including those omitted from the DEIR but disclosed (wind) and some revealed by expert analysis (e.g., visual, cultural, housing). A revised and recirculated DEIR must re-analyze Project consistency with these and other applicable provisions of the City's Plans and Codes and Impact LU-2 must be found to be a significant and unavoidable impact. In addition, the Project is clearly inconsistent with CPHP Policy 3.6, which states that the height of buildings should be related to the prevailing scale and character of existing development. The New Hospital at nearly 100 feet taller than the tallest existing building on the campus, Moffit Hospital, is clearly inconsistent with this Policy. A revised DEIR must include in a revised Land Use and Planning section a systematic and thorough analysis of inconsistencies with all applicable (City, UC, other) policies and regulations.	70 cont.
Urban Design Element Policy 1.1: Recognize and protect major views in the city, with particular attention to those of open space and water.	The DEIR incorrectly concludes the project will not conflict with these policies and specifically that "[d]evelopment under the CPHP would not have a substantial adverse effect on a scenic vista" (AES-1) or "conflict with the applicable zoning and other	71

Policy 3.4: Promote building forms that will respect and improve the integrity of open spaces and other public areas.	regulations governing scenic quality" (AES-2) and therefore no mitigation is required. In his analysis of visual impacts, Jared Ikeda concludes that the New 16-story Hospital would result in significant visual impacts including specifically that it would block views to Mt Sutro and the Reserve and would block views of the ocean and Golden Gate Park from trails and other public vantage points resulting in policy inconsistencies with direct significant environmental impacts. See Attachment 7. A revised DEIR must change the disposition of these impacts (AES-1 and 2) to significant and unavoidable and identify feasible mitigation measures including alternatives to the Project.	71 cont.
Shadow Proposition M, adopted by the voters in 1986, added section 101.1 to the SF Planning Code and established 8 priority policies. Priority Policy No. 8 calls for the protection of parks and open space and their access to sunlight and vistas.	The DEIR incorrectly states that the implementation of the Project would not create new shadow that substantially and adversely affects the use and enjoyment of publicly accessible open spaces. In his analysis of aesthetic impacts, Jared Ikeda reviewed the DEIR's analysis with respect to shadows and reached a different conclusion documented in his letter: "It appears though that certain areas along Parnassus Avenue and Irving Street will be subject to frequent shadows throughout the year." See Attachment 7. These more frequent shadows will clearly affect the use and enjoyment of these public spaces and as such should be called out as a Significant and Unavoidable impacts of the Project as proposed. Feasible mitigation measures must be identified.	72
Regents' Resolution: Space Ceiling of 3.55 Million Gross Square Feet	The DEIR conveniently concludes that the impacts associated with the Project's significant increase in gross square feet (an increase of approximately 1.5 million GSF about the existing space ceiling) and population increase from 18,500 to nearly 25,000, would be less than significant because the LRDP would be amended to increase both space and population. An amendment to the space and population ceiling does not eliminate the physical environmental impacts described in the table above associated with the increased scale of the Project. Such impacts include wind hazard (found SU by the DEIR), cultural (found SU by the DEIR) and additionally,	73

	aesthetic (visual and shadows) and housing, among others. A revised DEIR must identify this as an inconsistency, re-analyze the associated environmental impacts and identify feasible mitigation including alternatives to Project components such as the New Hospital.

73 cont.

A revised DEIR must include expanded and forthright analysis of the Project's potential inconsistencies with applicable plans and policies including the City of San Francisco's, and disclose the significant and significant and unavoidable, environmental impacts associated with those inconsistencies.

In addition, a revised DEIR must include feasible mitigation measures and alternatives to reduce or eliminate the significant impacts associated with those inconsistencies. Mitigation measures including, but not limited to the following should be considered:

- Retain the space ceiling and adopt an Alternative consistent with the space ceiling and other UCSF commitments.
- Seismically upgrade the existing hospital at Parnassus in combination with a New Hospital off-site (Mission Bay, Hunters Point, see other options in Alternatives discussion below).

74

3. The DEIR Alternatives Analysis is Legally Deficient

Alternatives are optional ways that the Project could achieve most of the objectives while also reducing or eliminating the environmental impacts of the Project. (California Public Resources Code Section 21002). Typically, alternatives to the Project involve changes to the location, scope, design, and intensity but can also include method of construction and/or operation. Where the Project includes a mix of land use types as in the case of this Project, alternatives may also include alterations in the mix of land uses proposed in order to reduce or eliminate impacts (e.g., increase Project housing to meet demand for growth within the space ceiling).

The fundamental mandate is that "public agencies should not approve projects if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of the project" (PRC Section 21002, 21081). Government agencies are required to consider alternatives to proposed actions affecting the environment. (PRC Section 21001 (g)).

The DEIR's alternatives analysis is legally deficient because it fails to describe a reasonable range of alternatives, or to the location of the Project, which would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the significant effects of the Project, and evaluate the merits of the alternatives. "An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision-making." (*Laurel*

75

Heights I, 47 Cal.3d at 404). An EIR must also include "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (*Id. At 405*.)

In developing a list of alternatives for analysis, both project objectives and known or likely significant impacts of the Project must be factored in. Alternatives need not meet all of the objectives and their fundamental purpose is to reduce or eliminate Project impacts. The Project setting can also influence the range and choice of alternatives. Offsite alternatives should be considered. Offsite alternatives must be feasible (e.g., site control by Project proponent or possible for the proponent to acquire the property).

Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)).

75 cont.

The DEIR's Alternatives Analysis is Legally Deficient Because it Improperly Rejects Feasible Off-Site Alternatives and Omits Others Feasible Off-Site Alternatives

Feasible alternatives to the Project that would reduce or eliminate significant Project impacts including those acknowledged by the DEIR briefly considered but dismissed include:

- No New Hospital at Parnassus Heights Campus Site/Implement Phase 2 of Medical Center at Mission Bay Campus Site
- New Hospital at Mount Zion Campus Site

Omitted from the list of feasible offsite options are:

- Seton Hall Hospital Facility, which stands empty
- New Hospital at Hunters Point, which would provide jobs in and health services to an underserved and disadvantaged community

76

The reasons provided in the short approximately one-page discussion dismissing the alternative of a new hospital at Mission Bay comes down to the alternatives' reported failure to meet very focused Project objectives and a purported conflict with the 2014 LRDP and CPHP. Specifically the DEIR states that the alternative would not meet some of the Project objectives (e.g., expansion of some services and other benefits from an interdisciplinary program) and would conflict with several 2014 LRDP and CPHPs objectives for Parnassus Heights campus including but not limited to adequate space to foster collaboration and to facility inter-dependence and connectivity for operational efficiency, adequate clinical and administrative support and aligned with other programs, increase in beds, and modern industry standards including seismic safety. Page 6-55 to 6-55. The discussion concedes that the alternative would reduce the significant

wind impacts, cultural and construction impacts, but that in so doing, it would likely also result in increased cross town traffic between the Parnassus and Mission Bay campus sites. Not analyzed was a combination of a smaller, new hospital at Parnassus in combination with Mission Bay; another feasible option that has the potential to address total need and allow phasing to accommodate patients and services.

Dismissal of these alternatives (New Hospital at Mission Bay and Combination of New Hospital at Mission Bay and Reduced Hospital at Parnassus) is not justified. First, the alternative would meet most of the Project objectives. If a New Hospital at Mission Bay is combined with a rebuilt smaller hospital at Parnassus, the alternative could meet the need for additional beds and services as well. The argument that this alternative would increase cross town traffic is not supported by any evidence or analysis. Finally, the conflicts with the 2014 LRDP are not persuasive since that document is being amended to break the space ceiling and this alternative would not require that significant amendment to the LRDP. In fact, the Mission Bay Hospital was justified in part by the development cap at the Parnassus Campus. These alternatives must be fully analyzed in a revised and recirculated DEIR, including additional facts and analysis to support the arguments concerning the alternatives conflicts.

The DEIR similarly dismisses the alternative of a new hospital at the Mount Zion Campus Site, stating that this alternative would result in UCSF hospitals operating at three different campus sites which would be "less than ideal and inefficient," would not help achieve the benefits realized through interdisciplinary collaboration and convergence between clinical care, research and education, land acquisition would be difficult and citing undisclosed conflicts with LRDP and CPHP objectives. The discussion concedes that the alternative would reduce the significant wind impacts, cultural and construction impacts, but that in so doing, it would likely also result in localized impacts at the Mt. Zion site and increased cross town traffic between the Parnassus and Mission Bay campus sites. This alternative also merits full analysis in a revised and recirculated DEIR because it would reduce or eliminate Project impacts and could be carried out in combination of seismic retrofits to the existing hospital at Parnassus to meet objectives and remain consistent with the space ceiling.

76 cont.

Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)). Rejection of the Mission Bay and Mt. Zion sites for a new hospital, either in lieu of or in combination with a smaller hospital at Parnassus, is not supported by the evidence and analysis provided and both require full analysis in a revised and recirculated DEIR.

In addition, the revised and recirculated DEIR should also fully analyze a new hospital at Hunters Point and reuse of Seton Hall. A new hospital at Hunters point would eliminate the

significant impacts associated with the Project and provide jobs and health care to a disadvantaged and underserved community.

Since the Mission Bay alternative reduces the Project's significant impacts, while achieving almost all Project objectives, the DEIR is arbitrary and capricious for dismissing this alternative in particular from full review and in rejecting this alternative. In addition, the Mission Bay Campus was justified by the cap at Parnassus, making this alternative essential for full review. In light of the development cap at Parnassus, each of these alternatives warrants review in a revised and recirculated DEIR with priority on Mission Bay and Hunters Point.

76 cont.

III. The DEIR Must be Revised and Recirculated

Decision makers and the public cannot possibly assess the Project's impacts through the present DEIR which is riddled with omissions, errors and inconsistencies. Among other fundamental deficiencies, the DEIR repeatedly understates the Project's significant environmental impacts and therefore fails to formulate feasible mitigation to reduce these impacts. To resolve these issues, a revised DEIR that would necessarily include substantial new information must be prepared and recirculated.

77

Sincerely,

Terry Watt

Terry Watt, AICP

Terry Watt Planning Consultants

1937 Filbert Street - San Francisco, CA 94123

terryjwatt@gmail.com **Cell: 415-377-6280**

Terry Watt, AICP owns Terry Watt Planning Consultants Ms Watt's firm specializes in planning and implementation projects with a focus on regionally-significant land use and conservation work that advances sustainable development patterns and practices. Prior to forming her own consulting group, she was the staff planning expert with the environmental and land use law firm Shute, Mihaly & Weinberger. She is an expert in general and specific planning and zoning, open space and agricultural land conservation strategies and approaches and environmental compliance, including CEQA and NEPA. Her skills also include facilitation and negotiation, public outreach and project management. Terry is a frequent presenter at regional, national and statewide workshops and symposiums. She holds a master s degree in City and Regional Planning from the University of Southern California and a multi-disciplinary bachelor s degree in Urban Studies from Stanford University.

Terry works with a wide variety of clients throughout California including non-profit organizations, government agencies and foundations. She volunteers up to half her professional time on select projects. Recent projects and roles include:

- Project Manager and Governor s Office Liaison for San Joaquin Valley: Least Conflict Lands for Solar PV project. Project funding came from the Hewlett and Energy Foundation s matched by environmental organizations, the California Energy Commission and other private parties. The objective of the project was to identify areas in the Valley that had very low resource values for renewable energy to serve as an incentive for development of least conflict lands rather than valuable resource lands. Watt was responsible for overall project management and day to day coordination, multi-stakeholder (150 stakeholders) and agency (57 federal, local and agency advisors) outreach and participation, facilitation of meetings Governor s Office convening s all project logistics and project report. Link to Collaboration Platform – Data Basin San Joaquin Valley: http://sjvp.databasin.org/
- Governor s Office Liaison and Outreach Coordinator for the State s portion of the Desert Renewable Energy Conservation Plan (DRECP). As outreach coordinator, worked closely with local governments on DRECP related consistency issues with local general plans.
- Planning Consultant to California Attorney General s Office - Environment Section focusing on climate change, CEQA and general plans. (2007- 2010). While working with the Environment Section, assisted with settlements (Stockton General Plan, Pleasanton Housing Element and CEQA litigation); identified locally based best practices for local government planning to address climate change issues; and managed government outreach and consultation on general plans and climate action plans/energy elements/sustainability planning efforts. Post 2010 continue to provide periodic consulting services to the Environment Section related to select cases.
- Strategic Advisor and Planning Consultant to the Santa Clara Valley Open Space Authority, Greenbelt

Alliance and Committee for Green Foothills for the Coyote Valley Project focused on developing a conservation and development plan for the Valley Watt was responsible for preparing the group s early CEQA comment letter on the negative declaration for a proposed Warehouse Project and assisting with scoping comments for the EIR.

- Measure M-2 Sales Tax and Environmental Mitigation Measure. (2009-). Terry was the Co-project manager/facilitator of a 30+-member environmental coalition that through a unique partnership with the Orange County Transportation Authority (OCTA) and state and federal wildlife agencies generated nearly $500 million in funding for programmatic environmental mitigation (conservation land acquisition and stewardship) in Measure M2, Orange County Transportation Sales Tax.
- State Office of Planning and Research Special Projects (2011 – 2017). Advisor to OPR on General Plan Guidelines, Infill and Renewable Energy Templates as part of the required update of the General Plan Guidelines. Expert panelist for workshops on SB 743.
- Marin Countywide General Plan and Environmental Impact Report (2004 to 2007). Project Manager for the award-winning Marin Countywide Plan Update and its Environmental Impact Report. The General Plan was among the first to incorporate leading edge climate change, greenhouse gas emissions reduction and sustainability policies as well as monitoring, tracking and implementation measures to measure success.
- Staff to the Martis Fund, a joint project of five environmental groups and a Business Group (Highlands Group and DMB Inc.). (2008 – ongoing). The Fund was created as a result of litigation settlement. The Fund has distributed over $15 million dollars since its inception to a range of conservation (acquisition of over 5,000 acres of open space), stewardship and restoration projects and workforce housing projects (emergency rental housing support, down payment assistance and low income apartments). Funding comes from a permanent transfer fee on all real estate sales at Martis Camp. http://www.martisfund.org/PDFs/Martis-Fund-Brochure.pdf
- Tejon Ranch Land Use and Conservation Agreement. (2006 – ongoing). Project coordinator for a dialogue process between environmental groups (Natural Resources Defense Council, Sierra Club, Endangered Habitats League, Planning and Conservation League, Audubon California) and The Tejon Ranch Company that resulted in a major Land Use and Conservation Agreement for the permanent protection of 240,000+ acres (90%) of the 270,000 acre Tejon Ranch. Secretary John Laird refers to the Agreement as a miracle agreement. In return for permanent conservation of + acres environmental groups agreed not to oppose projects within the development footprints; but can comment on regional planning efforts and the projects. Terry has an ongoing role overseeing implementation of the Agreement, including early role forming and managing the Conservancy formed by the Agreement. The Agreement provided the cornerstone of the Habitat Conservation Plan for a major portion of the Ranch; the Tejon Multi-Species Habitat Conservation Plan, TUMSHP, approved in April 2013. She recently joined the Board of the Tejon Ranch Conservancy created and funded by the Agreement.
- Orange County Wildlife Corridor. Project coordinator and architect for dialogue process between environmental and conservation organizations, City of Irvine and Lennar/Five Points development team that resulted in an 8 party Agreement, related general plan amendment and full funding to build an urban wildlife corridor to the specifications of the science team (6-member team jointly selected by all groups) connecting two high value conservation areas in central Orange County (Coastal and Eastern NCCP/HCP lands). Watt provides some ongoing implementation support. Recently (2017) coordinated DEIR comments letters on two Orange County Project proposals that could adversely impact the 5 Point/Irvine Wildlife Corridor.
- Ongoing assistance and authorship of expert comments on projects with recent letters on the proposed draft Amador County General Plan on behalf of the Foothill Conservancy and the proposed Squaw Valley Resort on behalf of a coalition of environmental and labor organizations.

- Facilitator to the Bolsa Chica Land Trust for recent agreement with Landowners to purchase remaining private acres of the Bolsa Chica uplands. Currently assisting with fundraising for the property.
- Advisor to the Nature Conservancy, the American Farmland Trust, Center for Law, Energy and Environment on numerous publications concerning urban infill and conservation.

RE: Comments on Final Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Drury,

At your request, I have reviewed the Final Environmental Impact Report ("FEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project") as well as the terms of a recent Agreement entered into by UCSF and the City of San Francisco. This comment letter includes comments by Jared Ikeda, who submitted comments on the DEIR and who has also reviewed the FEIR. Our review focused on the new Agreement as well as the adequacy of the FEIR's Master and comment letter-specific responses directed at our comments on the Draft EIR.

After carefully reviewing the FEIR for the Project we have concluded the FEIR fails in numerous respects to comply with CEQA and to fulfill CEQA's fundamental mandate. As described below, the FEIR violates this law because it fundamentally fails to adequately respond to our comments. The purpose of each response to a comment on the Draft EIR is to address the significant environmental issue(s) raised by each comment. Specifically, Section 15088(b) of the CEQA Guidelines requires that the written response describe the nature of the significant environmental issues raised. When the lead agency's position conflicts with recommendations and objections raised in the comments, the environmental issues must be addressed in detail giving reason why specific comments and suggestions were not accepted. Here, the Final EIR summarily dismisses many comments without addressing their merits.

In addition to the Final EIR's failure to adequately address numerous comments on the Draft EIR, a recent agreement between UCSF and the City of San Francisco fundamentally changes the Project Description. Specifically, the agreement commits UCSF to build 1,263 additional new units for faculty, students and staff, for a Project total of 2,025 new housing units. While

increasing the number of housing units in the Project may have beneficial implications, the fact is the numerous, potentially significant impacts associated with more than doubling the housing in the Project have not been analyzed. Potentially significant impacts caused by this substantial increase in housing units include, but are not limited to impacts to public services and facilities, impacts to parking, traffic and transit, aesthetic impacts and other impacts associated with a significant increase in population in the neighborhood. Moreover, as described below, the addition of these units to the Project destabilizes the Project as described in both the DEIR and FEIR, requiring recirculation of a Draft EIR that adequately analyzes the impacts associated with the changed Project.

I. The Final EIR Fails to Adequately Respond to Comments

As stated above, the fundamental purpose of each response to a comment on the Draft EIR is to address the significant environmental issue(s) raised by each comment. Specifically, Section 15088(b) of the CEQA Guidelines requires that the written response describe the nature of the significant environmental issues raised. When the lead agency's position conflicts with recommendations and objections raised in the comments, the environmental issues must be addressed in detail giving reason why specific comments and suggestions were not accepted. Here, the Final EIR summarily dismisses many comments without addressing their merits.

There is no better example of the FEIR's failure to adequately respond to comments than the Final EIR's response to comments on the Project's aesthetic impacts. Responses to comments documenting significant impacts associated with the Project contend that placing a 294 foot tower in a residential neighborhood has no aesthetic impacts whatsoever. Comments are disregarded based on UC's argument that it need not comply with local planning, zoning and other regulations. This massive non-conformity – a nearly 300 foot tower – clearly causes a significant impact as documented in comments submitted by Jared Ikeda, me and many other commentors.

Comments concerning the significance of visual impacts are further dismissed based on the following responses:

- Visual simulations submitted in comments by Jared Ikeda are not the same as a ground-level observer would see.
- Simulations misrepresent the effect of the proposed new hospital. The new hospital would certainly be visible from these locations, but it would take up a small portion of the horizon and only from Tank Hill would the new building obscure any ocean view at all from publicly accessible viewpoints.
- The trailhead at Farnsworth would be partially obscured by vegetation and narrow field of view and is not a high quality viewpoint and visual change is not considered significant.

- UCSF is constitutionally exempt from local land use regulations and therefore not required to undergo review by City of San Francisco Planning Dept Urban Design Advisory Team or conform to policies, principles and other provisions concerning land use and aesthetics.

None of these responses address the pure fact that the Project's nearly 300 foot tower will result in significant visual impacts. Specifically, the preparation of visual simulations using Google Earth was intended to provide context to the visual impacts from the proposed building height and mass of the new hospital. The proposed new hospital at 16 stories and 294 feet in height is clearly shown by the before and after figures to radically alter the scenic quality from different nearby viewpoints. Simulations submitted by Jared Ikeda in comments on the DEIR illustrate that the proposed building mass changes the view scenery significantly. While not ground-level simulations, the simulations illustrate the expected change in scenery and provide the visual context from these locations. The fact that the views will be changed is irrefutable and cannot be denied or put aside as insignificant. In certain locations within the neighborhood as illustrated by the simulations submitted in comments on the DEIR, the view is blocked by the new structure in some cases and radically altered in others. The different simulations that were provided in comments demonstrate these conditions. The notion that vegetation and other features may partially obscure the view of the new hospital does not change the fact that there will be a change to the view and scenic qualities at the Farnworth Trail as well as other publicly accessible viewpoints and the neighborhood.

The argument that the proposed plan is constitutionally exempt from local land use regulations does nothing to the address the fact that the Project significantly impacts the view from publicly accessible viewpoints and the general neighborhood. It is a specious argument to say that because University is not required to undergo a review with the City's Urban Design Advisory Team or comply with the City's rules, that there are no significant impacts associated with this massive tower. The Final EIR simply fails to adequately respond.

The Final EIR states that the new hospital would be visible from various publicly accessible viewpoints but concludes that these scenic vistas would not be substantially or adversely impacted. Clearly the massive new hospital structure will significantly alter views and is out of scale with the neighborhood, but because the Final EIR does not agree, feasible mitigation measures and alternative capable of reducing or eliminating these impacts are also disregarded (e.g., reducing the height of the new hospital, off-site options for the new hospital component of the Project).

Moreover, compliance with the City of San Francisco's adopted policies and regulations remains a key indicator of whether the Project is or is not compatible with the surrounding neighborhood. UCSF clearly understood the breaking point for compatibility in its 1976 Regents' Resolution. Recognizing the unique and constrained location the Parnassus Heights

campus occupies, the Regents adopted a sensible "space ceiling" for the campus in its 1976 Regents Resolution, stating in pertinent part:

- "The total structures within the campus boundaries shall not exceed 3.55 million gross square feet (not including space committed to residential use on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) and this limit shall be permanent."

In addition, the Resolution recognizes the transportation problems in the area and commits funds to develop a plan to alleviate transportation problems including traffic, parking congestion and lack of transit. The Final EIR cannot dismiss significant impacts based on UCSF's disregard for City policy and regulations. The additional housing units will further strain this constrained neighborhood by increasing population and in turn putting additional demands on the transportation system and other support systems. The demands from additional housing can feasibly be offset by a reduced or relocated hospital so that the overall Project stays within the constraints and limitations of this unique neighborhood.

II. The DEIR Should be Revised and Recirculated to Address UCSF's Commitment to Build 1,263 New Housing Units

A fundamental requirement of CEQA is that an EIR contain an accurate, complete and stable project description. Without a complete and stable project description, an agency and the public cannot be assured that all the project's environmental impacts have been revealed and mitigated. Further, CEQA and the CEQA Guidelines mandate that an EIR include a description of the "physical environmental conditions . . . from both a local and a regional perspective. . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines Section 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR – and thus the decision-makers, agencies and public who rely on the EIR – cannot accurately assess the potentially significant impacts of the proposed Project.

Although the Final EIR responses summarily and improperly dismissed the argument that the Project Description is in flux due to COVID-19, there is no mistaking the significant change to the Project the addition of 1,263 new housing units for students, faculty and staff means. More than doubling housing constitutes a huge change in the Project as well as its overall impacts. As a result of this Agreement between UCSF and San Francisco, a revised and recirculated DEIR is required to address among other likely significant impacts, impacts to public services and facilities (including schools), traffic, parking and transit, as well as aesthetic and other impacts associated with such a massive increase in the scale of the project. This change in the Project also changes the analysis in the Draft and Final EIR's of the projects growth inducing effects since the new housing fundamentally changes the prior analysis. For example, 1,263 new units will have a multiplier effect in terms of public services and facilities needed in the neighborhood, including but not limited to parks and open space, schools and essential

services. This and other impacts must be analyzed in an environmental document, preferably a revised DEIR, that is circulated for public review and comment. A revised DEIR presents the opportunity to include an adequate growth inducing analysis and analysis of population and housing, missing from the DEIR and dismissed in the FEIR as too speculative. For a Project that will guide development of the campus for 30+years and likely be the basis of streamlined permitting for project facilities and infrastructure, it is especially important that the DEIR comprehensively identify and analyze its impacts on growth, population, housing and employment.

III. The FEIR Improperly Dismisses Feasible Alternatives

Alternatives are optional ways that the Project could achieve most of the objectives while also reducing or eliminating the environmental impacts of the Project. (California Public Resources Code Section 21002). The Final EIR improperly dismisses numerous alternatives as infeasible based on objectives alone, including off-site alternatives -- such as building the hospital at the Hunter's Point Candlestick Park site -- that reduce significant impacts associated with the Project.

The fundamental mandate is that "public agencies should not approve projects if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of the project" (PRC Section 21002, 21081). Government agencies are required to consider alternatives to proposed actions affecting the environment. (PRC Section 21001 (g)). Alternatives need not meet all of the objectives and their fundamental purpose is to reduce or eliminate Project impacts.

Alternatives may not be rejected merely because they fail to meet some of the project objectives, are beyond an agency's authority, would require new legislation or would be too expensive. An alternative may be eliminated from further review where it fails to meet most of the basic project objectives; is infeasible; does not avoid significant environmental impacts; and implementation cannot be reasonably ascertained or is remote and speculative. (CEQA Guidelines Section 15126.6 (f)).

Feasible alternatives to the Project, improperly dismissed by the Final EIR, that would reduce or eliminate significant Project impacts should be reinstated for consideration including the following:

- No New Hospital at Parnassus Heights Campus Site and instead one of the following:
    - Implement Phase 2 of Medical Center at Mission Bay Campus Site.
    - New Hospital at Mount Zion Campus Site.
    - Seton Hall Hospital Facility, which stands empty.

- New Hospital at Hunters Point at the Candlestick site formerly slated for a new shopping mall. Locating the new hospital here would avoid many of the impacts associated with the Parnassus site, and would have may co-benefits such as providing jobs in and health services to an underserved and disadvantaged community.

The reasons provided in the Final EIR for dismissing these alternatives largely come down to whether or not the alternative met narrowly drafted Project objectives. The opportunity to revise and recirculate the DEIR to include 1,263 units of additional new housing, also provides an opportunity to address the shortcomings in the alternatives analysis. The DEIR Must be Revised and Recirculated.

Decision makers and the public cannot possibly assess the Project's impacts through the present DEIR and FEIR, both riddled with omissions, errors and inconsistencies. Among other fundamental deficiencies, both DEIR and FEIR repeatedly understate the Project's significant environmental impacts and therefore fail to formulate feasible mitigation to reduce these impacts. To resolve these issues, a revised DEIR that would necessarily include substantial new information must be prepared and recirculated.

Sincerely,

Terry Watt

RE: Comments on Draft Environmental Impact Report for Proposed UCSF Comprehensive Parnassus Heights Plan

Dear Mr. Lippe,

At your request, I have reviewed the Draft Environmental Impact Report ("DEIR") for the proposed UCSF Comprehensive Parnassus Heights Plan ("Project"). My review focused on the DEIR's treatment of historical resources.

INTRODUCTION

In March 1995, California's State Office of Historic Preservation (SHPO) published *Instructions for Recording Historical Resources,* which was intended to provide official guidelines for the systematic recordation of cultural resources. The document establishes the DPR 523 series forms as the universal format for recordation of all types of cultural resources as well as for the evaluation of historical resources. It provides detailed methodological instructions for historical resource evaluation using these forms. *Instructions for Recording Historical Resources* is widely utilized by qualified professional architectural historians and historians as a manual for the proper production of such evaluations for historical resource located in California. The majority of California's state and local agencies (including Caltrans, the Department of General Services, and most city/county governments) require production of DPR 523 forms according to the standards outlined in this document. (A few agencies have adopted their own local guidelines for historical resource evaluation.) Larger agencies often have professionally qualified historians/architectural historians on staff who review historic resource evaluations to ensure proper preparation by professionally qualified consultants. Smaller agencies (such as small cities) typically require a peer review for historical resource evaluations (especially where a historical consultant is employed directly by a project proponent.) Proposed projects subject to CEQA review will not move forward under most California agencies until:

1. professionally qualified staff approves a historical evaluation, OR
2. peer review-identified deficiencies in a historical evaluation are addressed.

6

The letter report that follows outlines deficiencies in the DEIR's treatment of historical resources according to the *Instructions for Recording Historical Resources* as well as departures from generally accepted professional standards. A comprehensive historical resource study of a complex campus like this one should be undertaken for planning purposes and in order to outline appropriate maintenance plans for historical resources even in the absence of an undertaking that qualifies as a project under CEQA. The current project outlined by the DEIR proposes demolition or alteration of several historic-age buildings that were either recommended ineligible or not evaluated in the

7

studies; deficiencies in the historical resource evaluations must therefore be corrected in order to comply with CEQA. Moffitt Hospital (1955) designed by Milton T. Pflueger, Proctor Foundation (1956) designed by Higgins & Root, Medical Building 1 (1972) designed by Reid Rockwell Banwell, & Tarics, and the School of Nursing (1972) designed by George Matsumoto have all been recommended ineligible. Millberry Union Garage (1955) has never been evaluated. Demolition of these buildings cannot proceed until they have been properly evaluated according to professional standards. Specific flaws in the historical studies are discussed in detail below. The most significant deficiencies fall under the following categories:

1. Historical Resource Evaluations do not meet professional standards
2. Technical studies fail to evaluate the campus as a potential historic district
3. Historical resources were not evaluated or were evaluated before they were age-eligible

7 cont.

HISTORICAL RESOURCE EVALUATION DO NOT MEET PROFESSIONAL STANDARDS

The DEIR's treatment of historical resources is based on two technical reports, both prepared by Carey & Co. Inc. Architecture: *UCSF Parnassus Heights Campus, San Francisco, California, Draft Historic Resources Evaluation, September 2003* and *UCSF Historic Resources Survey, San Francisco, California, February 8, 2011*. Carey & Co. Inc. Architecture is a well-respected firm that employs professionally qualified architectural historians and historic architects. However, neither of their UCSF studies meets currently-accepted professional standards for historical evaluation, nor does either study conform to the standards outlined in *Instructions for Recording Historical Resources.*

8

Study Design Flaws

The DEIR and its technical reports are required under CEQA to evaluate all historic-age buildings on the Parnassus Heights Campus for potential eligibility to the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR). Neither study undertook evaluation of all buildings and structures that had reached historic age in 2003 and 2011 (when the studies where completed); no rationale or explanation is offered for this failure to undertake a comprehensive study (or two studies that would together comprehensively document the site's historical resources.)

The boundaries of each study should be clearly delineated; a lack of appropriate maps and graphics obscure the boundaries of the study area for both technical studies.

9

Details of each technical report are discussed in below.

Carey & Co, September 2003

The intensive survey undertook the evaluation of seven buildings on Parnassus Heights Campus that were over 45 years old and slated for demolition or other significant impacts. Milberry Union Garage was 48 years old but was excluded from the study without rationale.

A typical professionally-prepared historical evaluation report would include (at a minimum) a location map showing the site's relationship to the region and a more detailed map showing building footprints and site layout with all features clearly labeled. Most consultants would also provide additional maps (including historic aerial photographs/site plans as well as custom graphics) to visually demonstrate eras of development, historical site plans, and other relevant information. The maps in DPR 523 forms highlight each building individually and are inadequate for a basic understanding of the site as a whole.

10

Carey & Co, February 2011
The intensive survey undertook the evaluation of 53 buildings located on Parnassus Heights Campus as well as four other UCSF sites. A superficial review of the document would suggest that all the historic-period buildings on the Parnassus Heights Campus were included in the study, but several were excluded. No rationale is provided for why a number of buildings were excluded from the report. It is apparently focused on buildings not included in the 2003 survey. If that is the reason for the omission of many historic buildings from the 2011 study, the reason should be explained, the results of the 2003 study summarized and updated where necessary, and the previously prepared DPRs appended. The preparers appropriately reference a handful of unrelated previous studies for specific buildings but do not reference their own company's document of a decade earlier. "Appendix B. List of Buildings, Building Types, and Significance" appears to be intended as a complete list of buildings on the campus since it includes most of the buildings evaluated in the earlier study, but one of the oldest and most significant buildings on campus (UC Hall) is missing. A reader of this study who was not intimately familiar with the site could potentially be unaware that several buildings on the campus had previously been determined eligible to the NRHP.

11

The structure of the report, in which UCSF's various campuses are discussed under subheadings, is extremely awkward and confusing. If these disparate sites were to be handled appropriately in one report (an extremely challenging task), a substantial historic context focused on the administrative and institutional history would be required in order to explain how the disparate locations are related and why the institution spread to multiple locations. Rigorous hierarchical organization of this complex information could have made this report much more comprehensible.

The boundaries of a survey should be clearly delineated (ideally in graphics and in text) and a rationale provided when portions of a site such as a campus are excluded. Although a "survey area" is referenced in the technical report it is not mapped or otherwise defined within the body of the report. Adequate maps were included in the appendix, but would have been much more useful integrated into the text as exhibits.

Historic Context Deficiencies
Instructions for Recording Historical Resources defines historic context and clearly states its centrality to the evaluation of historical resources.

> The significance of a historical resource is best understood and judged in relation to a historic context. A historic context consists of: theme, pattern, or research topic; geographic area; and chronological period. The theme, pattern or research topic provides a basis for evaluating the significance of a resource when it is defined in relation to established criteria. A historical resource is considered significant, and hence, eligible for the National Register if it is associated with an important historic context… (SHPO 1995, 9).

12

"The statement of significance should explain why the resource is important in relation to its historic context(s)" (SHPO 1995, 12).

The above professional guidance demonstrates that the DEIR and its technical reports should include historic context and a brief site history that describes the eras of development. A historic context statement has a specific purpose: providing a framework that allows for assessment of historical significance of the built environment. The Parnassus Heights Campus was developed

beginning in the 1890s and therefore the most relevant era its evaluation is 1890 – 1970. An understanding of the Parnassus Heights Campus sufficient for historical evaluation would require (at a minimum) brief historic contexts of: medical education in the US, the City of San Francisco, the UC system, and UCSF as an institution as well as a site history describing the evolution of the campus built environment. These various contexts would typically be separated thematically, and clearly-defined periods of significance would be established in order to provide the required framework for evaluation and to organize complex report information into a comprehensible format. The DEIR's full page of discussion of the Spanish, Mexican and Early American periods of California history (UCSF 2020, 4.4-3) ends in 1850 and thus does not add to the reader's understanding of potential project impacts on historical resources and should be eliminated or condensed. The four-paragraph site history (UCSF p. 4.4-4) fails to explain the importance of the site, outline its periods of development, or even to describe its construction history in adequate detail. These serious flaws in the DEIR text stem from the failures of the technical reports to address historic context according to professional standards as discussed in detail below.

12 cont.

Carey & Co, September 2003

While there is no specific length requirement for a historic context, the Historical Overview section (Carey & Co 2003, 5 – 13) is inadequate to the purpose of the document according to current professional standards. It does not attempt to place the campus and UCSF within the context of the University of California, American medical education, or the development of other medical schools within the region. Biographical information on the few important individuals it names is too minimal to provide an understanding of their professional accomplishments or impact on the campus. The narrative provided is mainly a site history, with dates and descriptions of construction projects connected thinly by background information and a very small number of historic photographs. It does not fully explain why specific buildings were constructed at particular times.

The report is focused on buildings slated for demolition, a significant flaw. While the buildings not threatened by projects planned at the time of the study could have been exempted from detailed evaluation, they should have been included in the site history and historic overview. The narrative history of the campus simply does not make sense without a broad discussion of the development of the site. The historical information presented is based on just four sources, two of which are UCSF planning documents, and almost the entire narrative appears to have been adapted from a history on the UCSF website. No specific number of references is required, but a historian who meets the professional standards for this type of work would be expected to consult multiple primary sources (e.g. newspapers, maps, photographs, university correspondence) as well as secondary sources like published histories and journal articles.

13

The historic context section for a professionally-prepared historical evaluation would provide at least a paragraph on each architectural style present on the property, discussing its development, period of use, and character-defining features. Master architect's professional biographies provided are minimally adequate. Architects not assumed to be masters, furthermore, should have been discussed; if the preparer has concluded an architect was not significant, evidence demonstrating this must be provided. This information would assist in comparative analysis that should be undertaken to determine whether buildings are important for their architecture.

Carey & Co, February 2011

The opening line of the introduction to the Carey & Company report acknowledges the essentiality of historic context to historical evaluation of this site: "UCSF has engaged Carey & Co. to produce a

14

comprehensive historic context of the UCSF campuses…" (Carey & Co. 2011, 1). Preparers go on to describe the themes and research methodology used to produce this historic context. Themes identified in the introduction are "the history of the University of California, the Affiliated Colleges, and UCSF; the development of the neighborhood immediately adjacent to the Parnassus Heights campus; …and mid-century modernist and Bay Tradition architecture (Carey & Co. 2011, 3)." The preparers list primary- and secondary-source references consulted as including "historical maps; the United States census and the California Register of Voters; historic photographs; Calisphere, an online repository of primary sources from archival repositories throughout the state of California; correspondence with architects involved in the creation of buildings at the Parnassus Heights campus; and historic publications, including newspapers, journals, and books." Preparers also conducted research through the Environmental Design Archives at the University of California, Berkeley, UCSF archives, and the NWIC (SHPO's repository for cultural resource studies.)

The historic context of the neighborhood adjacent to campus (Carey & Co. 2011, 9-19) is adequately addressed and placed generally within the context of San Francisco's development. Although (like the DEIR) it is too focused on the period between the prehistoric era and the 1860s (since the campus was not developed until the 1890s) the themes in this section are detailed, well-footnoted, and appear to be based on substantial research. However, despite the preparers' clear demonstration in this section and in the introduction of a professional understanding of historic context requirements, sections devoted to the campus proper are too brief, poorly referenced, and disorganized.

No report section is devoted to the important historic context of the University of California despite its introduction by preparers as an important theme; its establishment and first thirty years of history are not discussed and it is merely mentioned as seeking land for a medical college in the 1890s (Carey & Co. 2011, 13). And the University of California is barely referenced as the report progresses. The history of the Affiliated Colleges (another theme introduced by the preparers as significant) receives two brief paragraphs (Carey & Co. 2011, 13-14) sandwiched between sections about the city and neighborhood. No references are provided for this bare-bones history of the inception of the site.

UCSF's history is never introduced in its own heading, but rather is discussed under the heading Postwar Expansion (Carey & Co. 2011, 16 -19). The section begins with a paragraph discussing site history *before* the postwar era (between 1890 and 1945) which provides no explanatory context for construction projects, no institutional history, and includes just one build date. UC Hall (1917) is mentioned briefly with no discussion of when it was built, why it was built, or who designed it. Historical resources like Clinical Sciences (1933) and Faculty Alumni House (1915) are not mentioned (here or elsewhere in the context), nor are the significant Zakheim murals. Important historic contexts like the 1920s master plan and development of the site in the Great Depression are never introduced.

The postwar site history that follows is far too brief for a site of this complexity. An adequate architectural history is provided, discussing designers, styles, materials, and building materials in appropriate detail. Sufficient historic context, however, is lacking, and the reader is given only the most glancing view into subjects like medical research on the campus, changes to medical education over time, establishment of UCSF as an independent campus in 1964, and the demographics of the student body. References are scanty; site history paragraphs have no footnotes and for architectural history no contemporaneous sources are cited prior to the 1960s. Few of the sources listed in the

14 cont.

methodology section are referenced in footnotes, and Wikipedia (not typically used as a reference by professional historians) is cited in one footnote. Rather than synthesizing multiple sources and providing analysis about the architecture of the School of Dentistry Building (which was constructed only 31 years prior to the study and therefore should not have been a main subject), the preparers quote the project architect for several unbroken paragraphs (Carey & Co. 2011, 20-22).

Organization of this section (the most important in the report) is chaotic, forcing the reader to skip from page to page in order to gain a coherent understanding of the information presented. LPPI (1941-3), Medical Sciences (1954), Moffitt Hospital (1955), and Surge (1966), and Health Sciences (1964-6) are all discussed under the main Postwar Expansion heading. The School of Nursing (1972) and School of Dentistry (1980) each receives its own section. As in the sections introductory paragraph, themes are often discussed using confusing backward-looking language rather than straightforward chronological narrative. For example, discussing the growth of the postwar student population, "In addition to benefiting from new revenue sources, resulting in expanded research programs and raising the prestige of the university, UCSF reintroduced the first two years of instruction to the San Francisco campus; since the 1906 earthquake, general courses in anatomy, biochemistry, and physiology had been taught at the Berkeley campus" (Carey & Co. 2011, 22).

14 cont.

Individuals important to UCSF history are not introduced in the narrative except a single reference to a provost that lists his dates of employment, birth, and death but does not explain his significance. Later in the report, several important individuals are listed with only names and dates of birth and death. The report should include a paragraph for each describing their professional accomplishments and impact on the campus.

Evaluation Deficiencies

Instructions for Recording Historical Resources states that:

> Evaluation requires three basic steps: (1) identification of a significant historic context associated with the resource; (2) identification of the types of resources important in illuminating that context, and the physical characteristics those resources must possess to reflect the significance of the historic context; and (3) an assessment of whether the resource being evaluated has those required physical characteristics (SHPO 1995, 10)

Since the DEIR and its technical reports did not establish adequate historic contexts (as discussed in detail above), evaluations for historic significance (Criterion A/1 and Criterion B/2) have not been undertaken to a standard that meets the basic requirements of CEQA. Both Carey & Company reports do not even bother to specifically evaluate many of the resources in the study under Criteria A/1 and B/2. Where buildings have been found architecturally significant, this can be dismissed as a technical deficiency that does not affect the outcome for the building (since a resource is eligible if it meets one *or more* criteria).

15

For some buildings recommended ineligible, however, only a conclusory statement that the building "does not appear to be eligible" under the first two criteria is provided without reference to supporting evidence.

The 2003 evaluation of Moffitt Hospital states "At the time of its completion, Moffitt Hospital was the largest and most modern teaching hospital in the western United States" but does not go on to explain why if that is true it is not historically significant. It asserts that the building's designer was "renowned San Francisco architect Milton Pflueger" and says the building is not one of his

masterworks without offering any comparative analysis to support this assertion. It states that the building lacks integrity, but does not specifically document original condition and alterations (Carey & Co. 2003 Appendix A).

The study's evaluation of the Proctor Foundation offers a statement that the building is not eligible for its architecture without any evidence or analysis. It is even weaker in it evaluation under A/1 and B/2: it does not cite specific evidence or even make a definitive recommendation of ineligibility, stating that "… research has not revealed whether the Foundation or Dr. Proctor have made contributions of the broad patterns of history significant enough to deem the building eligible for the California Register..."

The study's conclusions that these two buildings are ineligible do not meet professional standards because they are not supported by adequate investigations or evidence.

15 cont.

UCSF'S PARNASSUS HEIGHTS CAMPUS WAS NOT EVALUATED AS A HISTORIC DISTRICT

Instructions for Recording Historical Resources states that, [Historic] "Districts consist of a significant concentration or continuity of associated historical resources" (SHPO 1995, 15). California Public Resources Code section 5020.1, subdivision (h) provides a similar but more detailed definition of a historic district as "a definable unified geographic entity that possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development." Preparers of the DEIR were clearly aware of the importance of looking at the campus as a whole. The document acknowledges districts as one of the important categories of historical resources in its Section 4.4.1 Definitions: "Architectural resources include buildings, structures, objects, and historic districts." Additionally, Section 4.1 (Aesthetics) describes the characteristics of the site in terms of "a collection of hospitals, medical office buildings, laboratories, service buildings, and housing which were constructed between the late 1910s and early 2000s" and divides the campus into six districts "based in part on existing land use patterns."

An adequate cultural resources DEIR section would bring a similar intellectual rigor to the investigation of the potential historical significance of the campus as an entity in its own right, using a district (or districts) to organize the discussion of the built environment's significance. This would allow the cultural resources section to reflect the spatial and historical relationships between buildings, the street grid, open spaces, and other features of the site. The DEIR and its technical reports did not look at the campus as a potential historic district, a failure to assess the campus as it exists in the real world. The attempt to evaluate each building individually without considering context, setting, or the site as whole means that the DEIR has not considered a potential historical resource: the Parnassus Heights Campus. This flaw reflects the failure of historical technical reports to evaluate the site as a historic district. The preparers clearly understand the importance of historic districts: the 2011 report recommends the early twentieth century neighborhood adjacent to the campus eligible as a historic district. Failure to evaluate the campus within a similar framework is not explained in the DEIR or its technical reports.

16

HISTORICAL RESOURCES HAVE NEVER BEEN EVALUATED OR REQUIRE RE-EVALUATION

One historical resource, the Millbury Union Garage (1955) was not evaluated in either technical study. No rationale is provided for the DEIR's failure to evaluate this building. Any age-eligible building or structure can qualify as a historical resource; its use as a parking garage is not a valid reason to skip evaluation. Parking garages have been listed on the NRHP and every other level of

17

historic register. CEQA requires the evaluation of this building prior to any project that may alter its character-defining features.

In addition to the flaws detailed above, several buildings slated for demolition by the DEIR were evaluated before they were age-eligible. (The historic period begins 50 years before the present and therefore changes every year. For planning purposes, 45 years is typically used to allow studies to remain relevant as a project moves forward over several years.)

Medical Building 1 (Ambulatory Care Center) and the School of Nursing were both constructed in 1972 and evaluated in 2010 when they were only 38 years old. Their evaluations stated that the buildings did not meet the Criterion G "exceptional significance" standard that applies to buildings of unusual importance before they age into the historic period. These buildings are now 48 years old and they must be re-evaluated under the regular criteria now that "exceptional significance" is not required for eligibility.

Moffitt Hospital (1955) and Woods (1962) were both evaluated in 2003. Both buildings were on the cusp of being considered historic-age at the time and are now 65 and 58 years old. Scholarship on postwar architectural styles has progressed substantially since the buildings were evaluated 17 years ago. The passage of additional time also allows for a fuller assessment of their potential historical significance. Both buildings should therefore be re-evaluated before demolition is undertaken.

Reevaluation (and initial evaluation for the Millbury Union Garage) of all of the buildings discussed in this section is required to meet minimum professional standards.

17 cont.

HISTORIC BUILDINGS MISSING FROM THE DEIR

Two buildings are identified on the SHPO's Built Environment Resource Directory (BERD) for San Francisco as "Determined eligible for separate listing through a consensus determination by a federal agency and the State Historic Preservation Officer." Buildings 2274 and 2275 "Children's Hospital" are listed at 501 Parnassus Avenue, and were studied in 2010. Their location is unclear, and they were not included in the DEIR or Carey & Co.'s technical reports. Unless they have been demolished since the 2010 study in which they were determined eligible, the DEIR needs to consider these buildings as historical resources.

18

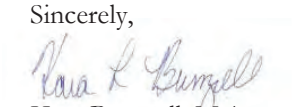
PREPARER'S QUALIFICATIONS

I meet the Secretary of Interior's Professional Qualifications for both History and Architectural History. I hold a Master's degree in Public History and have worked in multiple facets of historic preservation and cultural resource evaluation since 2007. My experience includes municipal preservation planning and working as the lead staff member of a non-profit preservation organization. Since 2012, I have worked full-time as a historical consultant, completing dozens of evaluations for CEQA and Section 106 compliance. Additionally, I regularly submit local and national register nominations, prepare historic context statements, and have managed HAER recordation projects. The greater Bay Area region is the center of my practice, but I frequently work in Sacramento, Santa Clara County, Monterey County, and Southern California. I have also completed projects in Oregon, Nevada, New York, and Puerto Rico. In addition to my work with historic-period residential, agricultural, and commercial properties for private clients, I have evaluated dozens of post offices and several military bases as well as university campuses, hospitals, church properties, and a NASA site. I am listed as a Historian and Architectural Historian on the

California Office of Historic Preservation's roster of qualified consultants for every county in California.

Please contact me by phone at 707/290-2918 or e-mail at kara.brunzell@yahoo.com with any questions or comments.

Sincerely,



Kara Brunzell, M.A.
Brunzell Historical

Re: Comprehensive Parnassus Heights Plan Draft Environmental Impact Report: Comments on Water Quality, Water Recreation, and Wastewater Public Services.

Dear Ms Wong:

This office represents San Franciscans for Balanced and Livable Communities (San Franciscans), a citizen's group composed of San Francisco residents. I write on its behalf to comment on the Draft Environmental Impact Report (DEIR) for the Comprehensive Parnassus Heights Plan (CPHP) with respect to its analysis of project impacts on water quality, water recreation, and wastewater public services.

This letter incorporates by reference the September 10, 2020, letter from Dr. Larry Russell, environmental engineer, which is attached hereto as Exhibit 1. In total, this letter attaches and incorporates 14 exhibits, which are listed at the end. Due to the size of Exhibit 13 and Exhibit 14, we are transmitting those it to you by email under separate cover.

The DEIR fails to assess the Project's impact on beach water quality, which is an important component of the Project's affected environment.

In Chapter 4.16, regarding potential impacts on wastewater treatment facility capacity, the DEIR discloses that the project will add about 2.0 million square feet of new space, and generate about 0.18 mgd (million gallons per day) of new wastewater/sewage. The DEIR assesses the impacts of this increase solely in terms of whether the increase will require the construction of new wastewater treatment capacity, the construction of which might cause secondary environmental impacts. The EIR concludes that construction of new wastewater treatment capacity will not be needed because:

> Assuming wastewater generation as 90 percent of water usage, the overall increase in wastewater resulting from the 2.0 million gsf net increase of building space associated with the proposed CPHP would be roughly 0.18 mgd. Wastewater flows from the Parnassus Heights campus site would be directed to the OSP [Oceanside Treatment Plant]. The OSP has a dry weather capacity of 43 mgd and is currently treating approximately 17 mgd. Therefore, based on current sewage flows, the plant has about 26 mgd of excess dry weather treatment

> capacity, which is adequate to accommodate the increase in flow generated by the net new development envisioned under the proposed CPHP. As a result, the proposed CPHP would not result in a determination by the SFPUC that it has inadequate capacity to serve the projected demand, and the impact would be less than significant. Mitigation: None required.

(DEIR p. 4.16-22 [pdf p. 672].)

With respect to stormwater discharge, Chapter 4.9 of the DEIR discloses that the campus drains both to the west to the Oceanside Treatment Plant (OSP) and to the east to the Southeast Treatment Plant (SEP) and that San Francisco operates a combined sewer system (CSS) that combines stormwater with sewage for treatment at these plants. This chapter concludes the Project's impacts on surface water quality are less than significant because the Project-induced increase in the acreage of impervious surfaces is only 4% compared to the current acreage of impervious surfaces on campus, and because the San Francisco Public Utilities Commission's (SFPUC) operation of the CSS, the OSP, and the SEP is regulated by the San Francisco Regional Water Quality Control Board (Water Board) through permits issued pursuant to the National Pollutant Discharge Elimination System (NPDES) established by the federal Clean Water Act and the state Porter-Cologne Water Quality Control Act.

The DEIR states:

> The campus core, where the majority of development and redevelopment under the CPHP is proposed, is largely developed and covered in impervious surfaces (estimated at approximately 86 percent impervious). Preliminary estimates indicate additional building development under the CPHP could incrementally increase the amount of impervious surfaces across the campus core by an additional 4 percent (about one acre) over existing conditions. Elsewhere on the campus site, the CPHP is not expected to notably increase impervious surfaces, as the proposed new housing buildings in the Aldea Housing complex would be sited largely within existing housing building footprints.

(DEIR p. 4.9-11.)

Using these numbers, one can calculate the number of current and future impervious acres in the campus core, as follows:

Table 1

Campus Impervious Surfaces	Percent of Campus	Acres
Pre-Project Condition	86%	21.5 acres
Project to Add	4%	1 acre
Post-Project Condition	90%	22.5 acres

The DEIR does not quantify the increase in stormwater discharge associated with this increase in impervious surface.

In addition to the quantified increase in impervious surfaces and unquantified stormwatrer runoff from the "campus core," the DEIR discloses that there will be additional increases in impervious surface outside the campus core. For example, the DEIR states:

> Development associated with the Irving Street Arrival, RAB, and initial Aldea Housing Densification projects, and Initial Phase improvements would be subject to the same or similar regulatory requirements as those described above during construction and operation. Furthermore, as applicable, any Initial Phase improvements that would be constructed outside the campus site boundary would be subject to construction site runoff requirements and post-construction stormwater controls in accordance with the City Public Works Code and in compliance with the City's Stormwater Management Ordinance. As such, the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade surface or groundwater quality would be less than significant.

(DEIR, p. 4.9-12.)

This singularly uninformative paragraph indicates there will be additional increases in impervious surfaces in several different areas, including outside the campus boundary, but provides no clues as to their magnitude. As it did with the increases in runoff from the campus core area, the DEIR again does not quantify the increase in runoff associated with the increase in impervious surfaces. Also, while the paragraph intimates that UCSF's off-campus facilities will be subject to San Francisco's "post-construction stormwater controls," it provides no information on the extent to which these controls may be expected to reduce Project-generated operational increases in stormwater runoff.

As it does with Project-generated increases in sewage, the DEIR also relies on "the relatively small change" in Project-generated increases in stormwater discharge to conclude the impact is less than significant, stating:

> Due to the relatively small change in impervious surfaces and the flow reductions that would be achieved with the implementation of LID stormwater features, storm water flows from the campus site would not adversely affect stormwater drainage capacity. In fact, the CPHP includes upgrades to the existing CSS within the campus core as discussed further in Section 4.16, Utilities. Therefore, considering the minor change in impervious surfaces, incorporation of LID stormwater features, and proposed improvements to the existing CSS that would occur with the program, the potential impacts related to flooding on- or off-site, stormwater drainage capacity, or additional sources of polluted runoff would be

less than significant.

(DEIR, p. 4.9-14.)

There are many legal deficiencies in the DEIR's handling of the Project's impacts on water quality, water recreation, and wastewater related public services.

The DEIR fails to describe the most important components of the environmental and regulatory settings, which are the severely degraded water quality conditions at San Francisco's beaches, in both the bay and the ocean, and the demonstrated inability of San Francisco's CSS to prevent these conditions.

The DEIR fails to describe the Project in enough detail to inform any analysis of water quality impacts, most egregiously with respect to increases in impervious surfaces outside the campus core.

The DEIR's assessment pf Project impacts on water quality fails to account for the fact that sewage and stormwater are combined in the same pipes for conveyance to the OSP and SEP. Instead, the DEIR assesses these waste streams separately.

After committing these legal errors, the DEIR bases its conclusion that water quality impacts will be less than significant on two errors of law: the relatively small change in Project-generated increases in sewage and stormwater discharges (i.e., the "ratio theory") and reliance on another agency's regulatory program.

The DEIR fails to describe the severely degraded water quality conditions at San Francisco's beaches.

The SFPUC, in cooperation with the San Francisco Department of Public Health, routinely monitors shoreline bacteria (i.e., total coliform, e. coli or enterococcus) at 16 stations around the perimeter of San Francisco where water contact recreation occurs, including additional monitoring whenever a treated discharge from the City's combined sewer system occurs that affects a recreational beach. When monitoring shows that bacterial contamination exceeds state health standards, the affected beach is "posted" to discourage water contact recreation.

The SFPUC's beach water quality monitoring data from January of 2016 through June of 2020 shows that between January of 2016 and June of 2020, there were 131 days on which at least one ocean side beach was posted for exceeding state health standards for any of the three types of bacteria tested; 333 days on which at least one bay side beach was posted, and 464 days

on which at least one SF beach was posted.[1]

Figures 1 through 15, attached hereto, summarize the SFPUC's beach water quality monitoring data for the last 4 ½ years by presenting monthly totals of days on which San Francisco ocean side and bay side beaches exceeded state health standards for any of the three types of bacteria tested.[2] Figures 1 through 5 show monthly totals for San Francisco ocean side beaches between January 1, 2016, and June 30, 2016. Figures 6 through 10 show monthly totals for San Francisco bay side beaches for the same period. Figures 11 through 15 show monthly totals for San Francisco ocean and bay side beaches in this period.

- Blue bars show the number of days when at least one beach was posted for at least one exceedance of a state health standard.
- Yellow bars show the number of beach postings for exceedances of state health standards or due to combined sewer system (CSS) overflow.
- Red bars show the number of exceedances of any state health standard at any beach.

Table 2 [Summary of Figures 1-15]

January 1, 2016, through June 30, 2020	**Days when at least one beach was posted for at least one exceedance of a state health standard [Blue Bars]**	**Beach postings for exceedances of state health standards or due to combined sewer system (CSS) overflow [Yellow Bars]**	**Red bars show the number of exceedances of any state health standard at any beach [Red Bars]**
Ocean Side beaches	131	210	298
Bay Side beaches	333	546	936
Ocean and Bay Side beaches	464	756	1,234

Remarkably, the DEIR also fails to disclose that the waters of San Francisco Bay are listed as impaired for bacterial contamination under section 303(d) of the Clean Water Act, or that in 2016, the State Water Resources Control Board adopted a Total Maximum Daily Load for

[1]The SFPUC's raw water quality monitoring data for this time period is attached hereto as Exhibit 12.

[2]Ocean side beaches are: Baker, China, Ocean, and Fort Funston. Bay side beaches are: Crissy Field, Aquatic Park, Mission Creek, Candlestick Point State Recreation Area, and Islais Creek.

bacterial contamination for the bay.[3] Thus, any discharge that exceeds the City's load allocation for bacterial contamination violates the Clean Water Act.

Thus, the current environmental setting (i.e., baseline) at San Francisco's ocean side and bay side beaches is one of severe environmental degradation. The DEIR ignores this elephant in the room.

The DEIR fails to describe severely dysfunctional regulatory setting of San Francisco's sewage treatment plants.

The Water Board regulates San Francisco's operation of the OSP and SEP through NPDES permits. The OSP is governed by NPDES Permit No. CA0037681, by way of Water Board Orders R2-2009-0062 and R2-2019-0028 (attached as Exhibits 4 and 5, respectively).[4] The permit for the SEP is NPDES Permit No. CA0037664; Order No. R2-2013-0029 (attached as Exhibit 6).[5]

The NPDES permits require the SFPUC to submit monthly and annual self-monitoring reports (SMRs) to the Water Board, by online upload to the California Integrative Water Quality System database (CIWQS). The SMRs include raw data regarding water quality and narrative cover letters. The cover letters describe any instances of non-compliance of the permit. The CIWQS database also includes notices of violations issued by the Water Board.

---

[3]The Water Board's Order and Basin Plan Amendment to establish a TMDL for Bacteria at San Francisco bay beaches are attached as Exhibits 2 and 3, respectively.

[4]Order No. R2-2009-0062 for the OSP became effective on October 1, 2009, and expired on September 30, 2014. The Water Board continued this permit's effective period administratively until November 1, 2019. R2-2019-0028 for the OSP became effective on November 1, 2019, for discharges to waters of the state from the OSP near-shore combined sewer discharge locations. The U.S. EPA, however, did not approve the jointly-issued order until December 10, 2019, with an effective date of February 1, 2020, for discharges to waters of the United States from the OSP deep water outfall (Discharge Point 001), which is 3.4 to 3.6 nautical miles offshore. The 'SFPUC' is challenging certain permit conditions in Order No. R2-2019-0028. The uncontested permit conditions that govern discharges into federal waters became effective on March 9, 2020.
Although the uncontested permit conditions for state waters for Order No. R2-2019-0028 became effective on November 1, 2019, the monthly self-monitoring reports for November and December of 2019 indicate that they continued to assess compliance against the R2-2009-0068 Order for these months regardless.

[5]Permit No. CA0037664 (Order No. R2-2013-0029) for the SEP became effective on October 1, 2013, and remains in effect at this time.

Notices of violations are issued for certain instances of non-compliance and not for others, suggesting either inconsistent enforcement or the existence of unknown, unpublished enforcement criteria.

For example, on February 6, 2016, a member of the public reported a strong odor of sewage coming from the combined sewer system outfall at Vicente Street on Ocean Beach, as well as discovery of sewage overflowing into the street at Wawona and 46th Street. These instances violate the permit (Order No. R2-2009-0062, Section 3.A. Order Conditions) and should have been issued a notice of violation as an unauthorized discharge of untreated wastewater. While this instance of non-compliance is reported, the Water Board did not issue a notice of violation.

Another instance of unauthorized unanticipated discharge occurred on October 17, 2016, when approximately 8,011 gallons of combined treated stormwater and wastewater was discharged from the Seacliff 2 Pump Station Outfall. The Water Board issued a notice of violation for this event (violation ID No. 1022988 as subsequently reported to CIWQS). The same pattern is apparent at the SEP.

My office has reviewed the Water Board's enforcement files for the period 2008 to 2014 and the period January 2016 through June 2020 for the NPDES permits issued to the SFPUC for operation of the OSP and SEP. This review identified all instances recorded in these files when the SFPU's operation of the OSP or SEP failed to comply with the terms of the applicable NPDES permit, including instances for which the Water Board issued a notice of violation and instances for which the Water Board did not issue a notice of violation.

Table 3 shows the total number of instances of non-compliance and notices of violations at each plant recorded in these files for the period between January 1, 2016, and June 30, 2020.

Table 3

Plant	Instances of Non-Compliance	Notices of Violation
OSP	71	8
SEP	100	36
Totals	1701	44

Exhibits 10 and 11 show all instances of non-compliance at the OSP and SEP recorded in these files for the period between January 1, 2016, and June 30, 2020.[6] The documents from the

[6]Exhibit 9 shows all instances of non-compliance with then applicable NPDES permits at the OSP and SEP recorded in the Water Board's enforcement files for the period between 2008 and 2014. The supporting documentation referenced in Exhibit 9 as "Ex #" is not included in this letter, but is available upon request.

Water Board's enforcement files evidencing these instances of non-compliance are attached as Exhibit 13, for the OSP, and Exhibit 14, for the SEP, and are referenced as such in Exhibits 10 and 11.

In short, for at least the past 10 plus years (i.e., the only period studied), San Francisco has consistently failed to comply with its NPDES permits for the OSP and SEP plants, including permit terms limiting bacterial contamination in the OSP's effluent discharges to the ocean and the SEP's effluent discharges to the bay.

The U.S. EPA sent two Notice of Violation letters to San Francisco in the fall of 2019 detailing the most egregious violations of federal and state water pollution control laws due to bacterial contamination. These letters are attached as Exhibits 7 and 8.

Remarkably, and egregiously, the DEIR ignores all of this. Therefore, the DEIR must be revised and recirculated to include an analysis of Project impacts on beach water quality based on these required categories of information to inform meaningful public comment.

The DEIR's reliance on the "ratio theory" is an error of law.

As discussed above, regardless of the DEIR's assertion that the OSP has sufficient *dry weather capacity* to meet current and projected demand, and regardless of the fact that San Francsico's CSS is regulated by NPDES permits enforced by the Water Board, there are many days every year when bacterial contamination in the waters at San Francisco beaches exceeds state health standards.

The DEIR's reliance on the relatively small increases in Project-generated sewage to be conveyed to the OSP and the relatively small increases in Project-generated stormwater to be conveyed to the OSP and SEP to conclude that the Project's water quality impacts are less than significant are errors of law. (*Communities For a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 ["the guiding criterion on the subject of cumulative impact is whether any additional effect caused by the proposed project should be considered significant given the existing cumulative effect"]; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 718.)[7]

---

[7] The decision in *Kings County* repudiates the "ratio theory," stating:
The [ ] EIR concludes the project's contributions to ozone levels in the area would be immeasurable and, therefore, insignificant because the [cogeneration] plant would emit relatively minor amounts of [ozone] precursors compared to the total volume of [ozone] precursors emitted in Kings County. The EIR's analysis uses the magnitude of the current ozone problem in the air basin in order to trivialize the project's impact ... The relevant question to be addressed in the EIR is not the relative amount of precursors emitted by the project when compared with

The DEIR's reliance on San Francisco's NPDES permits is an error of law.

The DEIR to find that water quality impacts are less than significant based on the NPDES regulatory program, especially where, as here, that regulatory program is failing to prevent severe environmental harm, is another error of law. (*Ebbetts Pass Forest Watch v. California Dept. of Forestry and Fire Protection* (*Ebbetts Pass*) (2008) 43 Cal.4th 936, 957 (error to conclude that compliance with pesticide restrictions precludes significant impact); *Californians for Alternatives to Taxies v. Department of Food & Agriculture* (2005) 136 CaL.App.4th 1, 16.)

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

ATTN: Tom Lippe, Esquire

Subject: Draft Comment on the UCSF-CPHP-Draft-EIR

Dear Mr. Lippe:

My name is Dr. Larry L. Russell, P.E.,T3 and my C.V. is attached as Appendix A. As with many environmental issues, the impacts of a development of over 2,000,000 square feet of new buildings are many fold. The potential impacts on the environmental compliance under the City of San Francisco Oceanside sewage treatment plant of adding this level of discharge are relatively straightforward. While the average dry weather flow of the treatment facility is reported to be 17 million gallons per day (MGD) and the design capacity is reported to be 43 MGD, the issue as shown by the water quality monitoring done by the City shows that there have been numerous violations of the National Pollution Discharge System (NPDES) expired permit, especially during the winter quarters. These violations have been noted and reported to the City by the Environmental Protection Agency (EPA) and are the subject of future (and present) enforcement actions (November 21, 2019, Notice of Violation October 2, 2019).

The EPA sternly reminded the City that the EPA CSO policy does not relieve them of their responsibility to meet all applicable Water Quality Standards (WQS) during CSO events. The EPA reminded the City that its CSO discharges occur in sensitive areas at Ocean Beach, China Beach and Baker Beach. The EPA also reminded the City that while in 1994 they were ahead of the CSO compliance curve, after 25 years, the City is well behind the nationwide compliance curve standards for CSO's. The EPA also made it painfully clear that the City is not even close to meeting the required 85 percent treatment levels required today for allowing CSO discharge, nor are the Beach WQS being met during events that were predicted to occur four to six times per year, but actually occur over 20 times per year releasing over 1.5 billion gallons of raw to partially treated but un-disinfected sewage into the beach receiving waters.

The NOV reported the following violations (edited for brevity) as follows:

1. Failure to properly operate and maintain its facilities including the associated collection systems...

2. Failure to comply with wet weather operational requirements to maximize use of the collection system for storage and to maximize flows to treatment plants...

3. Failure to post warning signs when public contact with wastewater could reasonably occur...

4. Failure to comply with reporting and record keeping requirements related to releases or diversions of untreated or partially-treated sewage from the combined sewer system...

5. Failure to comply with CSD [combined sewage discharge] monitoring and reporting...

6. Failure to notify the public of CSDs...

7. Failure to comply with water quality standards...

These Combined Sewer Overflows (CSO) discharges result from the impact of over loaded and aged sewage collection system that results in CSO's during wet weather which results in high wastewater flows. The problem with CSO's are many fold. First, a CSO occurs whenever the collection system and/or the treatment plant is (are) overwhelmed by the quantity of sewage that is moving through that section of pipe or the treatment plant. Second, a CSO results in the discharge of untreated sewage and all of its constituents without treatment or disinfection. These CSO discharges enter the watershed and henceforth into the Ocean and onto the City's beaches and other areas, which are used for recreation.

While there is a Total Maximum Daily Load (TMDL) for coliform bacteria in the Bay (which the City is also violating at the Southeast Plant), the Oceanside plant's NPDES permit in reality can be conceived as acting in a manner similar to a San Francisco Bay TMDL for bacteria (the Bay TMDL could also apply if UCSF (or the City) decide to route their wastewater to the Southeast Wastewater treatment plant which is also troubled with CSO issues). When a CSO occurs, the NPDES permit is violated when the Beaches receive the un-disinfected wastewater containing excessive coliform levels that are above the California Ocean Plan standards (summarized in Appendix B), resulting in a potentially significant impact on human and aquatic health.

How does all of this impact UCSF expansion plans? As noted previously, the UCSF EIR calls for the discharge of an additional 180,000 gpd (likely an underestimate) into a frequently overloaded sewage system. Under the TMDL concept and enforcement process, it is illegal to discharge any contaminants regulated by the TMDL into an already impaired water body (under section 503), which is exactly what the City is doing when the CSO's occur and cause the receiving water to violate the State's WQS. Therefore, adding more sewage to this already over taxed collection and treatment system during wet weather events, simply makes the situation worse. The intent of the EPA NOV letter is clear. It is clear that enforcement action (which could include hook up moratoriums) is coming in the very near future. It is possible that the enforcement action may include a prohibition on additional sewer hook ups until the CSO issue is addressed, by incorporation of the concept of the City's Article 12 C.

Therefore, due to the obvious impact of the coming enforcement action, the proposed project should not proceed without significant wastewater/storm water mitigation controls. The basic mitigation that should occur would begin with voluntary compliance with the City's Article 12 C, which requires all large developments over 250,000 square feet to incorporate grey (and or black) water treatment systems and recycle into their design. In addition to providing recycled water for toilet flush, Article 12 C incorporates design improvements to provide 24 hour storm and grey water on-site storage to allow for the delayed discharge of the development's grey water into the City's combined sewage collection system. It should also be noted that the UCSF EIR includes the replacement of the on-site 180,000 gallon water storage tanks, without comment on their cost or any anticipated difficulties with re-

constructing essentially the same size tanks that would be required to store the grey/black wastewater from the facility.

An additional consideration that should be taken into account regarding CSO discharges is that they occur in the surf zone on the recreational beaches of the western side of San Francisco. Thus, during a CSO, the low density (low salinity) untreated sewage is discharged at the ocean's surface where it floats. Therefore, the un-disinfected untreated wastewater floats onto the beaches and is slowly mixed into the water column by wave action rather than having the treated and disinfected wastewater being discharged via an outfall diluted with diffusers which result in substantial dilution into the water column offshore.

The proposed UCSF project increases impervious surface area from 21.5 to at least 22.5 acres. This increase should be considered to be "cumulatively considerable". The critical issue is that UCSF is still thinking of storm water as a "waste" that should be removed from the property, as soon as possible, instead of thinking of stormwater, as a resource. The 22.5 acres of impervious land based on normal SF rainfall (21 inches) results in the potential to allow for easily collecting and reusing approximately 13 million gallons (per year) of very fresh water that only requires storage and minimal treatment to be easily recycled as toilet flush water (this supply would eliminate the need for approximately 20 percent of their estimated fresh water needs). Combined with grey water recycling, UCSF could likely reduce their fresh water demand by more than 50 percent (and perhaps more than 90 percent depending upon how seriously UCSF approach the incorporation of state of the art grey and black water recycling).

Normally the operation of these onsite systems include onsite reuse of the treated grey water to flush toilets and urinals. If due to perceived health concerns UCSF is unwilling to install dual plumbing systems (which would be a mistake not to do in the long run as the additional construction cost of dual plumbing is minimal during initial construction), then UCSF should look to the onsite treatment of the their black and grey water and on site storage of at least 180,000 gallons and reuse in Golden Gate Park (1,000 feet down hill from the Parnassus facility and owned by the City) or pumped to the existing housing complex at the UCSF Parnassus campus to be recycled there.

Thus fresh water demand at the UCSF facility would be dramatically reduced and uncontrolled sewage discharge into the City's sewer system could be essentially eliminated at minimal additional expense to the UCSF campus. The generated wastewater and storm water management resulting from this expansion project on the City's potential for increasing the potential for increasing the magnitude and frequency of violations of the City waste discharge requirements is significant, and these impacts require mitigation. At the very minimum UCSF should agree to be bound by the conditions of the City's Article 12C which requires gray and storm water collection, retention, and recycling for buildings larger than 250,000 square feet in size.

Regards,

Larry L. Russell, Ph.D., P.D., G3
President

AREAS OF EXPERTISE

Applied environmental chemistry and engineering as related to concerns in air, water, soil with special emphasis on water conservation in the food processing industry. Dr. Russell has a strong process background in the area of water management for industry and for the implementation of wastewater recycling in the food processing industry. He has designed over 100 water conservation systems for water systems for municipal and industrial facilities.

Following a nationwide search by the U.S. EPA, Dr. Russell's team was selected to develop the **EPA Process Control Manual for Aerobic Biological Wastewater Treatment Facilities**. The preparation of this report was based on a hands-on survey of the best operated wastewater treatment plants located in each Region of the EPA. as determined by that Region. Following site visits to over 30 treatment plants, Dr. Russell analyzed the data to prepare a comprehensive analysis of what operational and design criteria work well at these best plants. The report was distributed by EPA to every treatment plant in the United States.

The next task in Dr. Russell's career was also the result of a nationwide search for the best team to prepare an evaluation for the Office of Water Research in the U.S. Department of the Interior (DOI) on the subject of **Water Recycling in the Food Processing Industry.** Dr. Russell's team was selected due to their extensive experience with water conservation and recycling in the food processing industry, due in part to his location in the middle of California's food industry with its $6 billion annual turnover. The report addressed all of the food processing facilities in the United States, as identified by the Department of Interior. An evaluation of the water use efficiency of the food processing industry in terms of water usage per ton of product was conducted and the most efficient techniques for minimizing water usage was identified for each segment of the U.S. food industry.

Following the preparation of the water recycling report for the U.S. DOI, Dr. Russell's team was selected to prepare a study on **Water Recycling in California's Food Processing Industry** for the Office of Water Recycling ofthe California State Water Resources Control Board. At the suggestion of Dr. Russell, due in part to the fact that his team had just prepared the comprehensive DOI report and the economic impact of this major segment of the California food industry, the California report was focused on the fruit and vegetable industry segment. The report focused on the members of this industry segment and the potential for reducing water usage in the fruit and vegetables processing segment.

Dr. Larry L. Russell (continued)

As a result, Dr. Russell is one of the foremost experts on the implementation of water conservation and water recycling in the industry, he is also an expert on the process control of

sewage treatment processes, and his personal engineering has resulted in the saving of over 50,000,000 gallons of fresh water per year. He has consulted for more than 100 major food processing companies at over 300 food processing facilities. During his career, he has provide water conservation/wastewater management/recycling for food processing companies including Nestles, Green Giant, Pillsbury, Del Monte Foods, Carnation, C&H Sugar, Spreckels Sugar, Smuckers , Contadina Tri Valley Growers, Hilmar Cheese, Bolthouse Farms, Kernridge Growers, Anheuser Busch, the Clorox Company..

Dr. Russell has conducted forensic evaluations on a wide variety of investigations involving releases from over 100 petroleum storage facilities located though out California and the United States, heavy metal contamination from recycling and military operations, landfills leachate management/treatment, explosive leachates from munitions landfills, perchlorate management from previous explosive, photoflash and rocket manufacturing. Well water pollution/source selection, materials selection and performance, corrosion mitigation, hazardous materials management, management of acid mine ground/surface water drainage management claimed personal injury from chlorine exposure in a wastewater system, water and sanitary and storm sewer system design and the nature of contaminant contribution. These evaluations have resulted in addressing the steps required to clean up as well as assignment of costs in proportion to responsibility, determination of the initial date of contribution and determination of responsibility for the release.

State Ocean Plan Highlights (summarized)

B. Bacterial Characteristics

1. Water-Contact Standards

Both the State Water Board and the California Department of Public Health (CDPH) have established standards to protect water contact recreation in coastal waters from bacterial contamination.

State Water Board Water-Contact Standards(1)Within a zone bounded by the shoreline and a distance of 1,000 feet from the shoreline or the 30-foot depth contour, whichever is further from the shoreline..., ...30-day Geometric Mean The following standards are based on the geometric mean of the five most recent samples from each site:

i. Total coliform density shall not exceed 1,000 per 100 mL;
ii. Fecal coliform density shall not exceed 200 per 100 mL;
iii. Enterococcus density shall not exceed 35 per 100 mL.

Single Sample Maximum:

i. Total coliform density shall not exceed 10,000 per 100 mL;
ii. Fecal coliform density shall not exceed 400 per 100 mL;
iii. Enterococcus density shall not exceed 104 per 100 mL; and
iv. Total coliform density shall not exceed 1,000 per 100 mL when the fecal coliform/total coliform ratio exceeds 0.1.

When a public beach or public water-contact sports area fails to meet these standards, CDPH or the local public health officer may post with warning signs or otherwise restrict use of the public beach or public water-contact sports area until the standards are met.

EXHIBIT 2

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

RESOLUTION No. R2-2016-0021

Amending the Water Quality Control Plan for the San Francisco Bay Basin to Establish a Total Maximum Daily Load and Implementation Plan for Bacteria in San Francisco Bay Beaches

WHEREAS, the California Regional Water Quality Control Board, San Francisco Bay Region (Water Board), finds that:

1. The Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) is the Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State, including surface waters and groundwater. It also includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Water Board and approved by the State Water Resources Control Board (State Water Board), State Office of Administrative Law (OAL) and the United States Environmental Protection Agency (U.S. EPA), where required.

2. The Basin Plan may be amended in accordance with Water Code section 13240, et seq. The proposed Basin Plan amendment complies with this section.

3. Aquatic Park Beach (San Francisco); Jackrabbit, Sunnydale Cove, and Windsurfer Circle beaches (Candlestick Point, San Francisco); Crissy Field Beach (San Francisco); Parkside Aquatic and Lakeshore Park beaches (Marina Lagoon, City of San Mateo); and China Camp and McNears beaches (Marin County) have been identified under federal Clean Water Act section 303(d) as impaired water bodies due to bacteria. These beaches are collectively referred to as San Francisco Bay Beaches herein.

4. Under Clean Water Act section 303(d), the Water Board is required and authorized to establish the total maximum daily load (TMDL) for those pollutants identified as causing impairment of waters on the 303(d) list. Additionally, under Water Code section 13242, the Water Board is authorized to develop an implementation program to achieve water quality objectives.

5. A Basin Plan amendment has been prepared in accordance with Water Code section 13240 that will establish the TMDL and Implementation Plan to reduce bacteria-related risks to humans and protect water contact and non-contact beneficial uses at San Francisco Bay Beaches.

6. The Basin Plan amendment includes requirements to implement wasteload allocations for urban runoff through municipal stormwater NPDES permits. The Water Board intends to establish permit requirements to attain the wasteload allocations through implementation of best management practices in lieu of numeric limits, because the wasteload allocations are not designed to be directly implemented as numeric limits.

7. The Basin Plan amendment, including specifications on its physical placement in the Basin Plan, is set forth in Exhibit A hereto.

8. The scientific basis for the regulatory elements of the proposed Basin Plan amendment was subjected to an independent, external peer review by Professor Patricia Holden and Professor Peter Strom, pursuant to the requirements of Health and Safety Code section 57004.

9. On January 15, 2016, the Water Board publicly noticed the proposed Basin Plan amendment and distributed the proposed Basin Plan amendment, supporting Staff Report, and Environmental Checklist for public review and comment in accordance with applicable State and federal environmental laws and regulations.

10. The process of basin planning has been certified by the Secretary for Resources as exempt from the requirement of the California Environmental Quality Act (CEQA) (Pub. Res. Code § 21080.5) to prepare an Environmental Impact Report or Negative Declaration.

11. The Basin Plan amendment package includes a Staff Report, an Environmental Checklist, an assessment of the potential environmental impacts of the Basin Plan amendment, and a discussion of alternatives and cumulative impacts. The Basin Plan amendment, Environmental Checklist, Staff Report, and supporting documentation serve as a substitute environmental document under the Water Board's certified regulatory program.

12. The Water Board has duly considered the Environmental Checklist, Staff Report, and supporting documentation with respect to environmental impacts and finds that the proposed Basin Plan amendment will not have a significant impact on the environment. The Water Board further finds, based on consideration of the record as a whole, that there is no potential for significant adverse effect, either individually or cumulatively, on wildlife as a result of the proposed Basin Plan Amendment.

13. The Water Board has also considered the environmental analysis in the Staff Report and the Environmental Checklist of the reasonably foreseeable methods of compliance with the Basin Plan amendment, including economic impacts.

14. The Water Board has carefully considered all comments and testimony received, including responses thereto, on the Basin Plan amendment, as well as all of the evidence in the administrative record.

15. The Basin Plan amendment must be submitted for review and approval by the State Water Board, OAL, and U.S. EPA. Once approved by the State Water Board, the amendment is submitted to OAL and U.S. EPA. The Basin Plan amendment will become effective upon approval by OAL and U.S. EPA.

NOW, THEREFORE BE IT RESOLVED THAT:

1. The Water Board adopts the Basin Plan amendment as set forth in Exhibit A hereto.
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Water Board in accordance with the requirements of Water Code section 13245.

3. The Water Board requests that the State Water Board approve the Basin Plan amendment in accordance with the requirements of Water Code sections 13245 and 13246 and forward it to OAL and U.S.EPA for approval.
4. If, during the approval process, Water Board staff, the State Water Board, or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes and shall inform the Water Board of any such changes.
5. Because the Basin Plan amendment will involve no potential for significant adverse effect, either individually or cumulatively, on wildlife, the Executive Officer is directed to sign a CEQA Filing Fee No Effect Determination Form and to submit the exemption in lieu of payment of the California Department of Fish and Wildlife CEQA filing fee.

I, Bruce H. Wolfe, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of a Resolution adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on April 13, 2016.

Exhibit A – Basin Plan Amendment to Establish a Total Maximum Daily Load and Implementation Plan for Bacteria in San Francisco Bay Beaches

EXHIBIT 3

Basin Plan Amendment to Establish a Total Maximum Daily Load and Implementation Plans for Bacteria at San Francisco Bay Beaches

The following text is to be inserted into Chapter 7.2.

7.2.5 San Francisco Bay Beaches Bacteria TMDL

The following sections establish the TMDL for San Francisco Bay beaches impaired by bacteria. The numeric targets, load and waste load allocations, and implementation plan are designed to support and protect the Bay's designated beneficial use of water contact recreation (e.g., swimming and wading).

7.2.5.1 Problem Statement

The waters adjacent to several San Francisco Bay beaches are impaired by indicator bacteria. Bacteriological water quality objectives are exceeded based on elevated indicator bacteria densities, and thus, there is impairment of the water contact recreation (REC-1) beneficial use in these water bodies. Recreating in waters with elevated indicator bacteria densities has long been associated with adverse health effects. Specifically, national epidemiological studies demonstrate a causal relationship between adverse health effects and recreational water quality, as measured by indicator bacteria densities.

This TMDL addresses bacteria impaired beaches in San Francisco Bay east of the Golden Gate Bridge. The impaired beaches include:

- Aquatic Park Beach, San Francisco
- Jackrabbit, Sunnydale Cove, and Windsurfer beaches in Candlestick Point State Recreation Area, San Francisco
- Crissy Field Beach, San Francisco
- Parkside Aquatic and Lakeshore beaches on Marina Lagoon, City of San Mateo
- China Camp Beach, Marin County
- McNears Beach, Marin County

China Camp Beach and McNears Beach are on the list of impaired water bodies because levels of only one bacterial indicator in waters at these beaches, total coliform, exceeds the Basin Plan's water quality objective. Waters at the other beaches exceed the bacterial indicator for Enterococcus and other bacterial indicators.

7.2.5.2 Sources

Bacteria sources are identified based on documentation of inadequately-treated human waste discharges, such as sanitary sewer overflow reports, and the scientific evidence linking land uses in the vicinity of the beaches to elevated bacteria concentrations in urban runoff to the beaches. If not properly managed, the following source categories have the potential to discharge bacteria to San Francisco Bay beaches at levels that cause or contribute to exceedances of water quality objectives: sanitary sewer collection systems, urban runoff, pets at the beaches, vessels, and wildlife. Wet weather discharges from the City of San Francisco's combined sewer system that

are authorized pursuant to U.S. EPA's Combined Sewer Overflow (CSO) Control Policy (see Section 4.9 Wet Weather Overflows) are not considered a significant source of bacteria to these San Francisco beaches.

7.2.5.3 Numeric Targets

This TMDL establishes a desired, or target, condition for water contact recreation use at impaired San Francisco Bay beaches. The numeric targets are the Enterococcus water quality objectives established for water contact recreation uses in marine and estuarine waters (Table 3-1) and on the U.S. EPA's 2012 recommended Enterococcus criteria for water contract recreation in marine and fresh water. The numeric targets for this TMDL are listed in Table 7.2.5-1.

Table 7.2.5-1 Numeric Targets for San Francisco Bay Beaches

Enterococcus	
Geometric mean	< 35 MPN / 100 mL
Single sample maximum	No sample > 104 MPN / 100 mL

7.2.5.4 Total Maximum Daily Loads

The TMDL for San Francisco Bay beaches is equivalent to the Basin Plan's water quality objectives and the numeric target for Enterococcus as shown in Table 7.2.5-1.

7.2.5.5 Load and Waste Load Allocations

Density-based pollutant allocations for bacteria source categories are the same as the numeric targets and the TMDL listed above. Table 7.2.5-2 summarizes the load and wasteload allocations for discharges of bacteria to impaired San Francisco Bay beaches.

Discharges of raw or inadequately-treated human waste are prohibited, and thus sanitary sewer collection systems and vessels have an allocation of zero.

All entities that discharge indicator bacteria or have jurisdiction over such discharges are responsible for meeting these allocations. Discharging entities will not be held responsible for uncontrollable discharges originating from wildlife. If non-nuisance wildlife contributions are found to be the cause of exceedances, the TMDL targets and allocation scheme will be revisited as part of adaptive implementation. Implementing parties shall demonstrate achievement of allocations in the receiving water bodies (i.e., at the beach shoreline water quality monitoring stations).

All implementing parties are required to attain their respective allocations by taking a phased approach in which additional or enhanced actions are required if initial implementation actions do not result in attainment of the TMDL within approximately five years.

Table 7.2.5-2 Load and Wasteload Allocations for San Francisco Bay Beaches		
Pollutant Source Category	**Enterococcus Geometric Mean[a] (MPN/100 mL)**	**Enterococcus Single Sample Maximum (MPN/100mL)**
Sanitary Sewer Collection Systems[b]	0	0
Urban Runoff[c]	< 35	No sample > 104
Vessels (Anchor-outs, recreational, houseboats)	0	0
Wildlife[d]	< 35	No sample > 104

a. Based on a minimum of five consecutive samples equally spaced over a 30-day period.
b. For the City of San Francisco, the wasteload allocation applies only to the collection system portion of the combined sewer system.
c. Wasteload allocation for discharges from municipal separate storm sewer systems (NPDES No. CAS612008, CAS000004 and CAS000003).
d. With the exception of nuisance wildlife, such as geese, wildlife is not a controllable source of bacteria. No management measures will be required for uncontrollable wildlife sources.

7.2.5.6 Implementation Plan

This Implementation Plan builds on management measures required by existing local, regional, and statewide regulations and orders to reduce or eliminate waste discharges from sanitary sewer collection systems, urban runoff, pets at beaches, and vessels. The plan requires actions consistent with existing regulations and orders, including the following:

- Water Board Municipal Regional Stormwater Permit (NPDES No. CAS612008)
- State Water Board NPDES Permit for Small Municipal Separate Storm Sewer Systems (MS4) (NPDES No. CAS000004)
- State Water Board Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (Order No. 2006-0003-DWQ as revised by Order No. 2008-0002-EXEC)
- State Water Board Stormwater Permit for California Department of Transportation (NPDES No. CAS000003)
- Basin Plan Discharge Prohibition No. 15 (Table 4.1), which states: "It shall be prohibited to discharge raw sewage or any waste failing to meet waste discharge requirements to any waters of the Basin."
- Regional Water Board Cease and Desist Order for the City of San Mateo, Town of Hillsborough, and Crystal Springs County Sanitation District Sanitary Sewer Waste Discharges (Order No. R2-2009-0020)
- Regional Water Board NPDES Permit for the City and County of San Francisco Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System (Order No. R2-2013-0029).

The entities responsible for implementing this plan are stated below, as are the regulatory mechanisms by which the Water Board may require that the actions be taken.

Sanitary Sewer Collection Systems

Wasteload allocations for sanitary sewer collection systems will be implemented through the requirements and provisions of the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems and, for Marina Lagoon beaches, Cease and Desist Order No. R2-2009-0020 issued by the Water Board to the City of San Mateo. In the case that further investigation or reduction of pathogen sources related to sanitary sewer collection systems is needed, such actions will be initiated through the Water Board's authorities under the California Water Code.

This TMDL requires no modifications to NPDES permitting of wet weather discharges from the City of San Francisco's combined sewer system, authorized pursuant to U.S. EPA's CSO Control Policy, as they are unnecessary to achieve the TMDL. The wasteload allocation in Table 7.2.5-2 only applies to the collection system portion of San Francisco's combined sewer system.

Urban Runoff

Wasteload allocations for urban runoff (i.e., municipal stormwater runoff and dry weather flows) shall be implemented through the Municipal Regional Stormwater Permit (NPDES No. CAS612008) and the State Water Board NPDES Permit for Small MS4s (NPDES No. CAS000004).

Urban runoff from the California Department of Transportation's (Caltrans') highways has not been found to be a significant source of indicator bacteria, largely because Caltrans' highways comprise a very small area within San Francisco Bay beach watersheds. If during the course of adaptive implementation, Caltrans' facilities are found to be sources of bacteria to San Francisco Bay beaches, wasteload allocations for such discharges will be implemented through the requirements of the State Water Board Stormwater Permit for Caltrans (NPDES No. CAS000003).

Municipal stormwater entities, including national, State, or regional park systems (hereinafter referred to as park authorities), that discharge stormwater to impaired beaches are required to submit a plan to the Water Board that describes current best management practices (BMPs), their current level of implementation, and additional BMPs and/or increased levels of implementation of existing BMPs to reduce discharges of bacteria from their storm drain systems that cause or contribute to exceedance of wasteload allocations. The plan shall include a schedule for implementation of the BMPs and enhanced BMPs.

Municipal stormwater entities and/or park authorities, as applicable, shall implement pet waste control measures to reduce discharges of bacteria at the beach and shall submit a plan to do so to the Water Board, as described above.

The Water Board will establish permit requirements to implement wasteload allocations based on implementation of BMPs. The Water Board will not include numeric limits in NPDES permits if the discharger demonstrates full implementation of technically feasible, effective, and cost efficient BMPs to control all controllable sources to, and discharges from, their storm drain systems.

Vessels

Vessels ranging in size from self-propelled row boats and kayaks to yachts operate in waters adjacent to beaches addressed by this TMDL. In addition to the Basin Plan prohibition on discharge of raw sewage, the California Health and Safety Code (§117475-117500) prohibits

dumping any garbage into navigable waters of the state. Where vessels present a source of bacteria to an impaired beach, the entity with authority over vessels, such as a municipality or park authority or marina owner, shall be responsible for implementing measures to control this bacteria source.

Wildlife

Municipal stormwater entities and park authorities are responsible for control measures for nuisance wildlife, such as resident goose populations. Discharging entities will not be held responsible for uncontrollable discharges originating from wildlife.

Implementation Plan elements that are common to all or most impaired San Francisco Bay beaches are described on Table 7.2.5-3. Tables 7.2.5-4 through 7.2.5-7 list the implementation actions and schedules for the individual impaired beaches identified in 7.2.5.1, Problem Statement. The implementation schedules allow time for the implementing parties to identify and implement measures that are necessary to control bacteria discharges causing impairment.

Table 7.2.5-3 Implementation Plan Elements

Source	Action	Implementing Party	Completion Timeframe
Sanitary Sewer Collection Systems	1. Comply with Statewide General Waste Discharge Requirements for Sanitary Sewer Systems.	Sanitary sewer collection system authority	Ongoing
	2. Submit an enhanced Sewer System Management Plan that prioritizes sewer system inspections and repairs in areas within ¼ mile of the beach or otherwise connected to the beach. Include a diagram of prioritized infrastructure, a time schedule for implementing short- and long-term plans, and, as necessary, a schedule for developing the funds needed for the capital improvement plan. Complete inspections and repairs.	Sanitary sewer collection system authority	6 months 3 years
	3. Determine effectiveness of sewer system repairs: Assess beach monitoring data to determine if targets are met at the beach.	Sanitary sewer collection system authority	5 years
	After five years, begin enhanced implementation if targets not met		
	4. If targets are not met, submit an enhanced Sewer System Management Plan that prioritizes sewer system inspections and repairs in areas within ½ mile of the beach or otherwise connected to the beach. Include a diagram of prioritized infrastructure, a time schedule for implementing short- and long-term plans, and, as necessary, a schedule for developing the funds needed for the capital improvement plan. Complete inspections and repairs.	Sanitary sewer collection system authority	5.5 years 8 years
	5. If private laterals are a likely source of bacteria to the beach, establish and implement a private lateral replacement program.	Sanitary sewer collection system authority, and Municipalities	5 years

Table 7.2.5-3 Implementation Plan Elements			
Source	**Action**	**Implementing Party**	**Completion Timeframe**
Sewer Collection System & Urban Runoff	Establish and implement a protocol to enhance efforts to identify and correct illicit connections to the storm drain system.	Sanitary sewer collection system authority, and Municipal stormwater entity(s)	6 months
Urban Runoff	1. Submit a plan that describes BMPs being implemented and additional BMPs that will be implemented to reduce discharges of bacteria to the beach. Include control of nuisance wildlife if it represents a likely source of bacteria to the beach. The plan shall include a schedule and milestones for implementation.	Municipal stormwater entity(s)	6 months
	2. Determine effectiveness of urban runoff controls: Assess beach monitoring data to determine if targets are met at the beach.	Municipal stormwater entity(s)	5 years
	After five years, begin enhanced implementation if targets not met		
	3. If targets are not met, submit: (a) a plan describing BMPs being implemented and additional BMPs that will be implemented to reduce discharges of bacteria to the beach. The plan shall include an implementation schedule and milestones. and (b) a supplemental monitoring plan (*supplemental to ongoing beach monitoring*) to investigate remaining bacteria sources to the beach. This plan may develop data and a quantitative rationale to support (i) locations and types of enhanced bacteria BMPs, and/or (ii) revision of the numeric targets to reflect bacteria contributions from non-controllable sources. Include an implementation schedule.	Municipal stormwater entity(s)	5.5 years
	4. Where pets at the beach may be a source of bacteria to a beach, establish and implement protocols to control pet waste through such measures as providing bags, trash receptacles, and signage.	Park authority or Municipal stormwater entity(s)	6 months
Vessels	Where vessels represent a potential source of bacteria to the beach, begin or boost “no dumping” education efforts; identify and implement other needed BMPs, such as improving pump outs and other infrastructure.	Port authority, or marina owner	6 months from discovery of source
Wildlife	Where nuisance wildlife represents a potential source of bacteria to the beach, and the beach is managed by a non-municipal park authority, establish and implement protocols to control this source of bacteria.	Park authority, or include in Urban Runoff enhanced BMPs plans	6 months from discovery of source

	3. Determine effectiveness of sewer system repairs: Assess beach monitoring data to determine if targets are met at the beach.	City of San Mateo	5 years
	4. If targets are not met, submit enhanced Infrastructure Renewal and Capacity Assurance Plans, acceptable to the Executive Officer, that prioritize sewer system inspections and repairs in areas within ½ mile of the beach or otherwise connected to the beaches. Include a diagram of prioritized infrastructure, a time schedule for implementing short- and long-term plans, and, as necessary, a schedule for developing the funds needed for the capital improvement plan. Complete inspections and repairs.	City of San Mateo	5.5 years 8 years
	5. If private laterals are a likely source of bacteria to the beach, establish and implement a private lateral replacement program or refocus existing lateral program efforts to address these sources.	City of San Mateo	2 years
Sewer Collection System & Urban Runoff	Establish and implement a protocol to enhance efforts to identify and correct illicit connections to the storm drain system.	City of San Mateo	6 months
Urban Runoff	1. Submit a plan acceptable to the Executive Officer that describes BMPs being implemented and additional BMPs that will be implemented to reduce discharges of bacteria to the beach. Include control of nuisance wildlife. The plan shall include a schedule and milestones for implementation.	City of San Mateo	6 months
	2. Determine effectiveness of urban runoff controls: Assess beach monitoring data to determine if targets are met at the beach.	City of San Mateo	5 years

Table 7.2.5-7 Marina Lagoon Beaches (Parkside Aquatic and Lakeshore) Implementation Plan			
Source	**Action**	**Implementing Party**	**Completion Timeframe[a]**
	3. If targets are not met, submit, acceptable to the Executive Officer: (a) a plan describing BMPs being implemented and additional BMPs that will be implemented to reduce discharges of bacteria to the beach. The plan shall include an implementation schedule and milestones. and (b) a supplemental monitoring plan (*supplemental to ongoing beach monitoring*) to investigate remaining bacteria sources to the beach. This plan may develop data and a quantitative rational to support (i) locations and types of enhanced bacteria BMPs, and/or (ii) revision of the numeric targets to reflect bacteria contributions from non-controllable sources. Include an implementation schedule.	City of San Mateo	5.5 years

[a] Timeframe begins on the effective date of this Basin Plan amendment

7.2.5.7 China Camp and McNears Beaches Implementation

Both China Camp and McNears beaches already meet the numeric targets for Enterococcus, and therefore no further implementation actions are necessary.

7.2.5.8 Water Quality Monitoring

Implementing parties are responsible for developing and implementing a monitoring plan sufficient to assess compliance with the numeric targets at the beaches. At a minimum, implementing parties shall continue monitoring the beaches as required under California Health and Safety Code section 115880 and provide a data evaluation report annually to the Water Board. It is recommended that the implementing parties select a lead entity to assess the monitoring data and compile the annual report.

If, after approximately five years, implementation actions do not result in achievement of numeric targets at a beach, supplemental monitoring (in addition to beach monitoring) is required to investigate and identify bacteria sources in the watershed that could be contributing to the bacteria impairment. This monitoring is intended to answer questions such as:

- Could bacteria sources be reduced by placing enhanced urban runoff BMPs in a certain location?
- Could bacteria sources be reduced by focusing sewer system investigations and repairs in a certain location?
- Are natural sources of bacteria contributing to a significant degree to the impairment at the beach?

Implementing parties need not wait four years if they wish to begin supplemental monitoring earlier. At any time, implementing parties may present data indicating the presence of natural sources of bacteria to the beach, such as non-nuisance wildfowl, to the Executive Officer of the Water Board, and the Water Board may consider developing new allocations that could include a natural source exclusion. Until such action is taken by the Water Board, the implementation requirements and completion dates shall remain in effect.

Beach monitoring and supplemental monitoring requirements are included on Tables 7.2.5-4 through 7.2.5-7.

7.2.5.9 Adaptive Implementation

The Water Board will adapt the TMDL and Implementation Plans to incorporate new and relevant scientific information such that effective and efficient measures can be taken to achieve standards. At approximately six-year intervals, Water Board staff will evaluate new and relevant information from implementation actions, water quality monitoring results, and the scientific literature, including any local reference system studies, U.S. EPA's revised recommended bacteria criteria, or new or revised State bacteria water quality objectives, and assess progress toward attaining the TMDL. Water Board staff will present that information to the Water Board, and the Water Board will consider a Basin Plan amendment that reflects any necessary modifications to the targets, load and wasteload allocations, or implementation plan.

ORDER NO. R2-2009-0062
NPDES NO. CA0037681

WASTE DISCHARGE REQUIREMENTS FOR THE CITY AND COUNTY OF SAN FRANCISCO OCEANSIDE WATER POLLUTION CONTROL PLANT (SOUTHWEST OCEAN OUTFALL) AND COLLECTION SYSTEM, INCLUDING THE WESTSIDE WET WEATHER FACILITIES

The following Discharger is subject to waste discharge requirements as set forth in this Order.

Table 1. Discharger Information

Discharger	City and County of San Francisco
Name of Facility	Oceanside Water Pollution Control Plant and Collection System, Including the Westside Wet Weather Facilities
Facility Address	3500 Great Highway
	San Francisco, CA 94132
	San Francisco County
The U.S. Environmental Protection Agency (USEPA) and the Regional Water Quality Control Board have classified this discharge as a **major** discharge.	

Discharges by the City and County of San Francisco from the discharge points identified below are subject to waste discharge requirements as set forth in this Order.

Table 2. Discharge Location

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
001	Secondary Treated Wastewater, Combined Primary and Secondary Treated Wastewater and Stormwater, and the equivalent of wet weather primary treated combined Wastewater and Stormwater decant flow from a Combined Sewer System	37 º 42' 18" N	122 º 34' 39" W	Pacific Ocean, Offshore

CSD-001	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 42' 55" N	122 ° 30' 16" W	Pacific Ocean (Fort Funston, Ocean Beach)
CSD-002	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 44' 16" N	122 ° 30' 29" W	Pacific Ocean (Vicente St., Ocean Beach)
CSD-003	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 45' 50" N	122 ° 30' 42" W	Pacific Ocean (Lincoln Way, Ocean Beach)
CSD-004	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 47' 5" N	122 ° 30' 37" W	Pacific Ocean (Mile Rock)
CSD-005	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 47' 16" N	122 ° 29' 30" W	Pacific Ocean (China Beach)
CSD-006	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 47' 22" N	122 ° 29' 16" W	Pacific Ocean (Baker Beach)
CSD-007	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater Discharge	37 ° 47' 22" N	122 ° 29' 13" W	Pacific Ocean (Baker Beach)

Table 3. Administrative Information

This Order was adopted by the Regional Water Quality Control Board on:	August 12, 2009
This Order shall become effective on:	October 1, 2009
This Order shall expire on:	September 30, 2014
CIWQS Regulatory Measure	360578
The Discharger shall file a Report of Waste Discharge in accordance with title 23, California Code of Regulations, as application for issuance of new waste discharge requirements no later than:	180 days prior to the Order expiration date

The signatures below certify that the following is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on August 12, 2009, and of a National Pollutant Discharge Elimination System permit issued by the United States Environmental Protection Agency, Region IX, on the date below.

Bruce H. Wolfe, Executive Officer
California Water Quality Control Board
San Francisco Bay Region

Date: 8/12/09

I. FACILITY INFORMATION

The following Discharger is subject to waste discharge requirements as set forth in this Order.

Table 4. Facility Information

Discharger	City and County of San Francisco
Name of Facility	Oceanside Water Pollution Control Plant and Collection System, Including Westside Wet Weather Facilities
Facility Address	3500 Great Highway
	San Francisco, CA 94132
	San Francisco County
Facility Contact, Title, Phone	Tommy Moala, Assistant General Manager, (415) 554-2465
CIWQS Place ID	256498
CIWQS Party ID	39680
Mailing Address	San Francisco Public Utilities Commission/Wastewater Enterprise
	1155 Market Street, 11th Floor
	San Francisco CA 94103
Type of Facility	Publicly Owned Treatment Works (POTW)
Facility Design Flow	<u>Oceanside Plant</u> 43 MGD, maximum dry weather design flow (providing secondary treatment) 65 MGD maximum wet weather design flow (providing secondary treatment for 43 MGD and primary treatment for an additional 22 MGD)
	<u>Westside Wet Weather Facilities</u> Collection system flows greater than 65 MGD and less than 175 MGD receive the equivalent of wet weather primary treatment in the Westside Wet Weather Facilities (storage/transports) and are discharged at the Southwest Ocean Outfall. Flows greater than 175 MGD receive the equivalent of wet weather primary treatment in the Westside Wet Weather Facilities and are discharged at authorized combined sewer overflow discharge points on the shoreline.

II. FINDINGS

The U.S. Environmental Protection Agency (USEPA) and the California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board), find:

A. **Background.** The City and County of San Francisco (hereinafter the Discharger) is currently discharging pursuant to Order No. R2-2003-0073 and National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037681. The Discharger submitted a Report of Waste Discharge, dated March 28, 2008, and applied to renew its NPDES permit to discharge up to 65 MGD of treated wastewater from the Oceanside Water Pollution Control Plant (Plant), through the Southwest Ocean Outfall, and primary treated wet weather flows from the Westside Wet Weather Facilities.

For the purposes of this Order, references to the “discharger” or “permittee” in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. **Facility Description.** The Discharger is the owner and operator of the Oceanside Plant and its associated collection system, a combined sewer system that includes the Westside Wet Weather Facilities. The collection system includes approximately 300 miles of sewer pipes on the westside watershed of the city that covers the areas of Richmond, Sunset, and Lake Merced as well as a small portion of Daly City. The system also includes four all weather pump stations and two wet weather pump stations.

Treatment at the Oceanside Plant, which has a peak secondary treatment capacity of 43 MGD, includes coarse screening at the Westside Pump Station, fine screening and grit removal at the Plant headworks, primary sedimentation, activated sludge treatment by a pure oxygen process, and secondary clarification. Secondary treated wastewater is discharged to the Pacific Ocean between 3.4 and 3.6 nautical miles offshore, at Discharge Point 001 - the Southwest Ocean Outfall. These receiving waters are waters of the United States but are beyond the territorial waters of the State of California, which are three nautical miles from the low water mark at shore. During wet weather periods of high influent flow, the Oceanside Plant can provide primary treatment for an additional 22 MGD of influent flow, which, following treatment, is blended with secondary treated wastewater (i.e., a total treatment capacity of 65 MGD) and discharged at Discharge Point 001.

The Discharger's collection system includes three large storage/transport structures – the Westside Transport, a 49.3 million gallon box-like structure located beneath the Great Highway; the Richmond Transport, a 12 million gallon structure located to the north; and the Lake Merced Transport, a 10 million gallon structure located to the south. The combined storage capacity of these "Westside Wet Weather Facilities" is 73.5 million gallons, which includes 2.2 million gallons of capacity within the sewer lines.

Plant operations depend on rainfall, forecasts, and storage conditions in the Westside, Lake Merced, and Richmond Transport structures. Collection system flows that exceed the Oceanside Plant's treatment capacity of 65 MGD are stored in the Westside Wet Weather Facilities, which provide the equivalent of wet weather primary treatment through solids settling, skimming of floatable solids, and screening at pump stations. Combined wastewater from the storage/transport structures is pumped via the Westside Pump Station to Discharge Point 001, until the pumping capacity of the combined sewer system facilities to the outfall is reached at 175 MGD. Combined wastewater flows greater than 175 MGD also receive treatment in the storage/transport structures (the equivalent of wet weather primary treatment) but are discharged at the seven, near-shore combined sewer overflow discharge (CSOD) structures authorized by this Order. These receiving waters are waters of the United States and territorial waters of the State of California.

To be considered a discrete overflow discharge event, it must be separated by six hours in time from any other combined sewer overflow discharge. For the purposes of this permit, authorized, treated combined sewer overflow discharges from the near-shore discharge structures are referred to as combined sewer overflow discharges (CSODs). Unauthorized, untreated combined sewer overflow discharges from combined sewer systems are referred to as combined sewer overflows (CSOs).

Wastewater solids removed by settling in the Westside Wet Weather Facilities are flushed to the Plant when wet weather flows subside. Primary and secondary solids from the Plant are blended and thickened using gravity belt thickeners, anaerobically digested, dewatered, and beneficially re-used at permitted sites.

Attachment B provides a map of the area around the facility. Attachment C provides a flow schematic of the Plant and the Westside Wet Weather Facilities.

C. **Legal Authorities.** This Order is issued pursuant to federal Clean Water Act (CWA) §402 and the California Water Code (CWC) Chapter 5.5, Division 7 (commencing with §13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to CWC Article 4, Chapter 4, Division 7 (commencing with §13260). Because this Order concerns discharges to waters of the United States, both within and beyond State territorial waters, USEPA and Regional Water Board are jointly issuing the permit.

D. **Background and Rationale for Requirements.** The requirements of this Order are based on information submitted as part of the application, through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F), which contains background information and rationale for the requirements established by the Order, is hereby incorporated by reference into this Order and constitutes part of the Findings for this Order. Attachments A through E, and G through H are also incorporated into this Order by reference.

E. **California Environmental Quality Act (CEQA).** Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA. Similarly, pursuant to CWA §511(c), this action to reissue an NPDES permit does not trigger the requirements of the National Environmental Policy Act [42 U.S.C. 4321 et seq.].

F. **Technology Based Effluent Limitations.** CWA §301(b) and NPDES regulations at 40 CFR 122.44 require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards. Plant discharges authorized by this Order must meet the minimum federal technology-based requirements for POTWs established by USEPA at 40 CFR 133 (Secondary Treatment Regulation). For wet weather discharges, this Order includes technology-based requirements based on USEPA's Combined Sewer Overflow Control Policy. The Fact Sheet contains a discussion on the development of the technology-based effluent limitations and requirements.

G. **Water Quality Based Effluent Limitations.** CWA §301(b) and NPDES regulations at 40 CFR 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards.

40 CFR 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established

for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using:

- USEPA criteria guidance under CWA §304(a), supplemented where necessary by other relevant information;
- an indicator parameter for the pollutant of concern; or
- a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the State's narrative criterion, supplemented with other relevant information, as provided in 40 CFR 122.44(d)(1)(vi).

H. **Water Quality Control Plans.** The *Water Quality Control Plan for the San Francisco Bay Basin* (the Basin Plan) is the Regional Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State, including surface water and groundwaters, and includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Regional Water Board and approved by the State Water Resources Control Board (State Water Board), USEPA, and the Office of Administrative Law, as required. For the protection of ocean waters of the State, the Basin Plan incorporates by reference provisions of the *Water Quality Control Plan for Ocean Waters of California* (the Ocean Plan).

The Basin Plan implements State Water Board Resolution No. 88-63, which establishes State policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply (MUN). As the total dissolved solids (TDS) levels of marine waters significantly exceed 3,000 mg/L, ocean waters meet an exception to Resolution No. 88-63, and therefore, the MUN designation does not apply. According to Basin Plan Table 2-1, beneficial uses of the Pacific Ocean are as follows.

Table 5. Beneficial Uses

Receiving Water	Basin Plan Beneficial Uses
Territorial waters of the State of California within the Pacific Ocean	• Industrial Service Supply • Ocean, Commercial, and Sport Fishing • Shellfish Harvesting • Marine Habitat • Fish Migration • Preservation of Rare and Endangered Species • Fish Spawning • Wildlife Habitat • Water Contact Recreation • Noncontact Water Recreation • Navigation

Requirements of this Order implement the Basin Plan.

I. **California Ocean Plan.** The State Water Board adopted the *Water Quality Control Plan for Ocean Waters of California* (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005, and it became effective on February 14, 2006. The Ocean Plan applies, in its entirety, to point source discharges to the territorial waters of the State as defined by California law to the extent that these waters are outside of enclosed bays, estuaries, and coastal lagoons. The Ocean Plan identifies the following beneficial uses of ocean waters of the State: Industrial Water Supply; Water Contact and Non-contact Recreation, Including Aesthetic Enjoyment; Navigation; Commercial and Sport Fishing; Mariculture; Preservation and Enhancement of Designated Areas of Special Biological Significance; Rare and Endangered Species; Marine Habitat; Fish Migration; Fish Spawning; and Shellfish Harvesting. To protect beneficial uses, the Ocean Plan establishes water quality objectives and a program of implementation for discharges to State territorial waters.

Discharge Point 001, the Southwest Ocean Outfall, is 3.4 to 3.6 nautical miles offshore in federal waters. The territorial waters of the State end three nautical miles from shore. The Ocean Plan (Appendix 1, Ocean Waters) states, "If a discharge outside the territorial waters of the State could affect the quality of the waters of the State, the discharge may be regulated to assure no violation of the Ocean Plan will occur in ocean waters." For the reasons set forth in the Fact Sheet (Appendix F), the Regional Water Board finds that the discharge at Discharge Point 001 could not affect the quality of the waters of the State during dry weather. During wet weather, the Ocean Plan defers to the Combined Sewer Overflow Control Policy, discussed in Finding K, below. Therefore, this Order does not regulate the discharge at Discharge Point 001 directly through the Water Board's Ocean Plan authorities.

J. **Determination of Unreasonable Degradation of the Marine Environment.** Discharges from the Southwest Ocean Outfall are to waters of the United States beyond the territorial waters of the State of California. Federal regulations at 40 CFR 125.122 require the permitting authority to determine whether a discharge will cause unreasonable degradation of the marine environment. Based on 40 CFR 125.22(b), USEPA conducted a reasonable potential analysis using Ocean Plan objectives and included numeric permit limitations, based on the Ocean Plan's dilution procedures, for toxicity and mercury, the only numeric Ocean Plan objectives for which USEPA found reasonable potential to cause or contribute to an exceedance of water quality standards. USEPA also included narrative receiving water limitations for the Ocean Plan narrative objectives for which it found reasonable potential. For determining reasonable potential for the dioxins, USEPA used recently updated Toxicity Equivalency Factors (TEFs) published by the World Health Organization in 2005, as well as the congener-specific Bioconcentration Equivalency Factors (BEFs) used for the Great Lakes System. The "Bay Area Clean Water Agencies' Draft Dioxin Issue Paper: Expert Panel Response and Recommendations," dated April 4, 2008, proposed using both TEFs and BEFs in developing NPDES permit limits for dioxins. This approach incorporates recent scientific information for dioxins on a congener-specific basis, while continuing to use the Ocean Plan water quality objective for dioxins (TCDD equivalents) and standards implementation procedures. Given the unique issues dioxins present, USEPA has prepared a determination of no unreasonable degradation based on the ten factors under 40 CFR 125.122(a) (Appendix 1 to the Fact Sheet). USEPA has determined that no unreasonable degradation of the marine environment will result from

the discharges of dioxins through the Southwest Ocean Outfall as authorized under this Order, with all the limitations, conditions, and monitoring requirements in effect.

K. **Combined Sewer Overflow Control Policy.** Wet weather flows from combined sewer systems are subject to CWA §301(b)(1)(A) and are not subject to secondary treatment regulations. Wet weather flows from combined sewer systems are addressed by the Combined Sewer Overflow Control Policy (59 Federal Register 18688-18698). The *Wet Weather Water Quality Act of 2000* incorporated this policy into the CWA.

The policy establishes a consistent national approach for controlling discharges from combined sewers to the nation's waters. Using the NPDES permit program, the policy initiates a two-phased process. During the first phase, a discharger is required to implement "nine minimum controls" (e.g., prevent dry weather overflows). These controls constitute the technology-based requirements of the CWA as applied to combined sewer facilities (i.e., best conventional pollutant control technology, BCT, and best available control technology economically achievable, BAT). The controls are intended to provide immediate and relatively low-cost water quality improvements for facilities that, unlike the Discharger, have not implemented a long-term control plan. During the first phase, a discharger is required to initiate development of a long-term control plan to select controls to comply with water quality standards, based on consideration of the discharger's financial capabilities.

The second phase of the process involves implementation of the long-term control plan developed in the first phase. The purpose of this long-term control plan is to comply with CWA water quality requirements. The Discharger's program, which continues to implement the Discharger's long-term plan, is consistent with the policy. This Order implements the policy and is consistent with the Regional Water Board policy on wet weather overflows described in Basin Plan Section 4.9. During wet weather, CSODs from shoreline discharge points CSD-001 through CSD-007 and the Southwest Ocean Outfall are subject to this policy.

L. **Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes [65 FR 24641 (April 27, 2000) (codified at 40 CFR 131.21)]. Under the revised regulation (also known as the Alaska Rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.

M. **Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. The technology-based effluent limitations consist of restrictions on biochemical oxygen demand (BOD), total suspended solids (TSS), and pH. Restrictions on these pollutants are discussed in Section IV.B of the Fact Sheet (Attachment F). This Order's technology-based pollutant restrictions implement the minimum applicable federal technology-based requirements. In addition, this Order contains effluent limitations more stringent than the minimum federal technology-based requirements. The water quality-based limits are

necessary to meet water quality standards. They are not more stringent than required by the CWA.

Water quality-based effluent limitations have been derived to implement water quality objectives that protect beneficial uses. Both beneficial uses and water quality objectives in State waters have been approved pursuant to federal law and are the applicable water quality standards. The procedures used for this Order to calculate individual water quality-based effluent limitations for State waters are based on the California Ocean Plan, which was approved by USEPA on February 14, 2006.

N. **Antidegradation Policy**. NPDES regulations at 40 CFR 131.12 require that State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law and requires that existing quality of waters be maintained unless degradation is justified based on specific findings. Water quality plans implement and incorporate by reference, both the State and federal antidegradation policies. The permitted discharges are consistent with the antidegradation provisions of 40 CFR 131.12 and State Water Board Resolution No. 68-16 because there is no increase in authorized flow and effluent limitations are at least as stringent as in the previous permit.

O. **Anti-Backsliding Requirements.** CWA Sections 402(o)(2) and 303(d)(4) and NPDES regulations at 40 CFR 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. With the exception of acute and chronic toxicity, all effluent limitations in this Order are at least as stringent as the effluent limitations in the previous permit. Compliance with anti-backsliding requirements is discussed in Fact Sheet section IV.C.6.

P. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the federal Endangered Species Act (16 U.S.C.A. sections 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the State. The Discharger is responsible for meeting all requirements of applicable State and federal law pertaining to threatened and endangered species.

Section 7(a)(2) of the federal Endangered Species Act requires USEPA, in reissuing this NPDES permit, to ensure, after consultation with appropriate agencies that discharges at the Southwest Ocean Outfall are not likely to jeopardize the continued existence of any threatened or endangered species or result in the destruction or adverse modification of critical habitat for such species. USEPA has initiated informal consultation with National Oceanic Atmospheric Administration.

Q. **Monitoring and Reporting.** NPDES regulations at 40 CFR 122.48 require that all NPDES permits specify requirements for recording and reporting monitoring results. CWC §13267

and §13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program accompanying this Order (Attachment E) establishes monitoring and reporting requirements to implement federal and State requirements.

R. **Standard and Special Provisions.** Federal Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR 122.42, are provided in Attachment D. The Discharger must comply with all federal standard provisions and with those additional conditions that apply pursuant to 40 CFR 122.42. The Regional Water Board has also included State standard provisions in this Order as Attachment G. The rationale for these special provisions is provided in the Fact Sheet (Attachment F). Where federal standard provisions are duplicative with State standard provisions, the federal standard provisions will apply and any excursion from a duplicative standard provision will not be interpreted as two excursions.

S. **Notification of Interested Parties.** The USEPA and Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe Waste Discharge Requirements for the discharges described herein and has provided them with an opportunity to submit written comments and recommendations. Details of the notification are provided in the Fact Sheet, which accompanies this Order.

T. **Consideration of Public Comment.** The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharges. Details of the public hearing are provided in the Fact Sheet of this Order.

THEREFORE, IT IS HEREBY ORDERED, that this Order supersedes Order No. R2-2003-0073, except for enforcement purposes, and in order to meet the provisions contained in CWC Division 7 (commencing with §13000) and regulations adopted hereunder, and the provisions of the federal CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order.

III. DISCHARGE PROHIBITIONS

A. Discharge of treated wastewater at a location or in a manner different from that described by this Order is prohibited.

B. Discharge from Discharge Point 001 that does not receive an initial dilution of at least 150:1 is prohibited.

C. Bypass of secondary treatment facilities at the Oceanside Plant is prohibited, except during a wet weather day, as defined by this Order (see Definitions, Attachment A), or as provided for by NPDES regulations at 40 CFR 122.41(m)(4) and in Section IV.B of *Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits*, July 2009 (Attachment G).

D. Discharge of wastewater at a location other than Discharge Point 001 is prohibited, except on wet weather days (as defined in Attachment A) when the capacity of the system to discharge to Discharge Point 001 has been exceeded.

E. Discharge of wastewater at Discharge Points CSD-001 through CSD-007 is prohibited, except on wet weather days (as defined in Attachment A) and in accordance with the terms of this Order.

F. Plant discharges shall not exceed 43 MGD at Monitoring Location EFF-001 during dry weather. Compliance with this prohibition shall be based on average dry weather flow determined over three consecutive dry weather months.

G. Any CSO that results in a discharge of untreated or partially treated wastewater to waters of the United States is prohibited. This does not include authorized combined sewer overflow discharges (CSODs).

H. The discharge of municipal and industrial waste sludge directly or indirectly to the ocean, or into a waste stream that discharges to the ocean without further treatment, is prohibited.

I. The discharge of waste to designated Areas of Special Biological Significance, except as provided by Ocean Plan Chapter III.E, is prohibited.

J. Degradation of harvestable shellfish in the area as a result of dry weather discharge from Discharge Point 001 is prohibited.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent Limitations for Dry Weather – Discharge Point 001

The following effluent limitations apply during dry weather days, as defined in Attachment A. Limitations, conditions, and other requirements applicable during wet weather conditions are established in Section VI.C of this Order.

1. Effluent Limitations – Discharge Point 001

a. The Discharger shall comply with the following effluent limitations at Discharge Point 001, with compliance measured at Monitoring Location EFF-001 as described in the attached Monitoring and Reporting Program:

Table 6. Effluent Limitations for Conventional Pollutants, Discharge Point 001

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
BOD_5[(1)] @ 20°C	mg/L	30	45	---	---	---
TSS[(2)]	mg/L	30	45	---	---	---
pH[(3)]	std units	---	---	-9.0--	6.0	9.0

(1) Biochemical Oxygen Demand
(2) Total Suspended Solids
(3) The pH effluent limit of 6.0 shall not apply if the discharger can demonstrate that the addition of inorganic chemicals or industrial sources is not causing the excursion below 6.0. The regulations at 40 CFR 133.102(c) allow the modification or elimination of pH limitations when it can be demonstrated that the addition of inorganic chemicals or industrial sources is not causing an excursion above or below the limits.

b. Percent Removal: The average monthly percent removal of BOD_5 @ 20°C and TSS shall not be less than 85 percent.

2. Effluent Limitations for Toxic Substances – Discharge Point 001

The Discharger shall comply with the following effluent limitations at Discharge Point 001, with compliance measured at Monitoring Location EFF-001 as described in the attached Monitoring and Reporting Program:

Table 7. Effluent Limitations for Toxic Pollutants, Discharge Point 001

Parameter	Units	Effluent Limitations[(1)][(3)]		
		6-month median	Maximum Daily	Instantaneous Maximum
Chronic Toxicity	TUc	N/A	150	N/A
Mercury[(2)]	µg/L	5.9	24	N/A

(1) Limitations apply to the concentration of all samples collected during the period (daily = 24-hour period)

(2) Mercury limitations are expressed as total recoverable metal.

(3) A daily or 6-month median value for a given constituent shall be considered noncompliant with the effluent limitations only if it exceeds the effluent limitation and the Reporting Level (RL) for that constituent. Ocean Plan Appendix II indicates the Minimum Level (ML) upon which the Reporting Level is based for compliance purposes. For mercury this is 0.2 µg/L.

3. Effluent Limits for Disinfectants

The effluent is not disinfected; thus there are no limits on chlorine or other disinfectant residuals.

B. Land Discharge Specifications

Not Applicable.

C. Reclamation Specifications

Not Applicable.

V. RECEIVING WATER LIMITATIONS

A. Surface Water Limitations

Ocean Plan water quality objectives were used to determine the receiving water limitations in this Order. Dry Weather Day discharges authorized by this Order at Discharge Point 001 shall not cause exceedances of the following surface water limitations in ocean receiving waters. As indicated in the Fact Sheet (Attachment F, Section IV.C.6), disinfection to meet bacteria level objectives is not required. Attachment F Section III.C.4 describes an Ocean Plan exception for combined sewer overflows discharges.

1. Floating particulates and grease and oil shall not be visible.

2. The discharge of waste shall not cause aesthetically undesirable discoloration of the ocean surface.

3. Natural light shall not be significantly reduced at any point outside the initial dilution zone as the result of the discharge of waste.

4. The rate of deposition of inert solids and the characteristics of inert solids in ocean sediments shall not be changed such that benthic communities are degraded.

5. The dissolved oxygen concentration shall not at any time be depressed more than 10 percent from that which occurs naturally, as a result of the discharge of oxygen demanding waste material.

6. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally.

7. The dissolved sulfide concentration of waters in and near sediments shall not be significantly increased above that present under natural conditions.

8. The concentration of organic materials in marine sediments shall not be increased to levels that would degrade marine life.

9. Nutrient levels shall not cause objectionable aquatic growths or degrade indigenous biota.

10. Marine communities, including vertebrate, invertebrate and plant species, shall not be degraded.

11. The natural taste, odor, and color of fish, shellfish, or other marine resources used for human consumption shall not be altered.

12. The concentration of organic materials in fish, shellfish, or other marine resources used for human consumption shall not bioaccumulate to levels that are harmful to human health.

B. Groundwater Limitations

Not Applicable

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all Standard Provisions included in **Attachment D** of this Order.

2. The Discharger shall comply with all applicable items of the *Regional Standard Provisions and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits*, July 2009 **(Attachment G)**, including any amendments thereto.

3. If any discrepancies exist between requirements in the Order, the federal standard provisions included in Attachment D, and the Regional Standard Provisions included in Attachment G, the requirements in this Order prevail over requirements in Attachment D, which prevail over requirements in Attachment G.

B. Monitoring and Reporting Program (MRP) Requirements

The Discharger shall comply with the MRP, and future revisions thereto, in Attachment E. The Discharger shall also comply with all applicable items of the *Regional Standard Provisions and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits*, July 2009 **(Attachment G)**.

C. Special Provisions

1. Re-opener Provisions

The Regional Water Board or USEPA, as appropriate, may modify or re-open this Order prior to its expiration date in any of the following circumstances as allowed by law.

a. If present or future investigations demonstrate that a discharge governed by this Order will have, or will cease to have, a reasonable potential to cause or contribute to adverse impacts on water quality or beneficial uses of the receiving waters.

b. If new or revised Water Quality Objectives (WQOs) or TMDLs come into effect for the receiving waters, effluent limitations may be modified as necessary to reflect the updated WQOs and waste load allocations in TMDLs. Adoption of effluent limitations as contained in this Order is not intended to restrict in any way future modifications based on legally adopted WQOs, TMDLs, or as otherwise permitted under regulations governing permit modifications.

c. If translator or other water quality studies provide a basis for determining that a permit condition should be modified.

d. If an administrative or judicial decision on a separate NPDES permit or WDR necessitates modifications of the requirements established by this Order.

e. As otherwise authorized by law.

The Discharger may request permit modification in any of the circumstances described above. Such a request shall include appropriate antidegradation and anti-backsliding analyses.

2. Special Studies, Technical Reports, and Additional Monitoring Requirements

a. Combined Sewer Collection System Overflow Study

The combined sewer system commingles stormwater and domestic and industrial sewage. Heavy storm events can potentially result in flows that exceed the collection system capacity, at least in some areas. The Discharger shall submit a report, for planning purposes, by June 30, 2012, evaluating the potential locations of such system excursions and the primary conditions that result in such events. The report shall evaluate the feasibility and effectiveness of alternatives to minimize these events.

b. Dilution Model Update and Stratification Data Collection

Available ambient data to determine stratification for the purposes of dilution modeling for this discharge is out-dated. The Discharger shall submit with the permit application for the next permit reissuance, ambient data collected during the term of this permit, as well as updated dilution modeling for use during the next permit reissuance. The discharger shall:

(1) Submit a work plan to USEPA and the Regional Water Board for stratification data collection no later than one year after the effective date of this Order. The purpose of the data collection effort is to determine the months of maximum stratification based on actual ocean observations. At a minimum, the work plan shall include the following tasks:

- Collect temperature and salinity data during the months of maximum stratification in the vicinity of the outfall uninfluenced by the waste-field;
- Record data at a minimum of five equally spaced depths and at an appropriate resolution to determine maximum stratification;
- Provide effluent temperature and salinity or density data and flow rate for the time period encompassing the study;
- Describe how the data will be collected, the location(s), sensors, and instruments to be deployed and equipment to be used; and
- Describe appropriate quality assurance protocols to be followed to ensure the data is of adequate quality and representative of actual conditions within the water column.

(2) Upon completion of data collection, the Discharger shall prepare and submit a data report in hard copy and electronic format to USEPA and the Regional Water Board. Records that include large data gaps, errors, or instrument failures may not be used for dilution modeling.

(3) No later than 4 years after the effective date of this Order, the Discharger shall submit a work plan for updated dilution modeling. This work plan shall include models to be used and model inputs and assumptions.

(4) No later than at the time of submittal of the application for permit reissuance, the Discharger shall submit updated dilution modeling runs, with all inputs and outputs presented in hard copy and electronic form.

3. Best Management Practices and Pollution Prevention

a. Pollution Minimization Program

The Discharger shall continue to implement and improve, in a manner acceptable to the Executive Officer, its existing Pollutant Minimization Program (PMP) to reduce pollutant loadings to the combined sewer system, and therefore to the receiving waters.

b. Annual Pollution Prevention Report

The Discharger shall submit an annual report, acceptable to the Executive Officer, no later than February 28th of each calendar year. The annual report shall cover January through December of the preceding year. Each annual report shall include at least the following information.

(1) *Brief description of the treatment plant, treatment plant processes and service area.*

(2) *Discussion of current pollutants of concern.* Periodically, the Discharger shall determine which pollutants are currently a problem and which pollutants may be potential future problems. This discussion shall address why the pollutants were identified as pollutants of concern.

(3) *Identification of sources of pollutants of concern.* This discussion shall address how the Discharger identifies pollutant sources. The Discharger should also identify sources or potential sources not directly within its ability or authority to control, such as pollutants in the potable water supply and air deposition.

(4) *Identification and implementation of measures to reduce the sources of the pollutants of concern.* This discussion shall identify and prioritize tasks to address the Discharger's pollutants of concern. The Discharger may implement the tasks themselves or participate in a regional, State, or national group to address its pollutants of concern whenever it is efficient and appropriate to do so. A time line shall be included for the implementation of each task.

(5) *Outreach to employees.* The Discharger shall inform its employees regarding pollutants of concern, potential sources, and how they might be able to help reduce the discharge of these pollutants. The Discharger may provide a forum for employees to provide input to the program.

(6) *Continuation of Public Outreach Program. The* Discharger shall prepare a public outreach program to communicate pollution minimization measures to its service area. Outreach may include participation in existing community events such as county fairs, initiating new community events such as displays and contests during Pollution Prevention Week, conducting school outreach programs, conducting plant tours, and providing public information in various media. Information shall be specific to target audiences. The Discharger shall coordinate with other agencies as appropriate.

(7) *Discussion of criteria used to measure PMP's and tasks' effectiveness.* The Discharger shall establish criteria to evaluate the effectiveness of its PMP. This discussion shall address specific criteria used to measure the effectiveness of each task identified in provisions VI.C.3.b(3 – 6), above.

(8) *Documentation of efforts and progress.* The Discharger shall describe all its PMP activities for the reporting year.

(9) *Evaluation of PMP's and tasks' effectiveness.* The Discharger shall use the criteria established in b.7, above, to evaluate the Program's and tasks' effectiveness.

(10) *Identification of specific tasks and time schedules for future efforts.* Based on the evaluation of effectiveness, the Discharger shall describe how it will continue or change its PMP tasks to more effectively reduce the loading of pollutants to the treatment plant, and subsequently, in its effluent.

The Discharger shall develop and conduct a PMP as further described below when there is evidence (e.g., sample results reported as DNQ when the effluent limitation is less than the ML, sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, results of benthic or aquatic organism tissue sampling) that a pollutant identified in Table B of the Ocean Plan is present in the effluent above an effluent limitation that is calculated for a constituent contained in Table B of the Ocean Plan and either:

(i) The concentration of the pollutant is reported as DNQ and the effluent limitation is less than the reported ML; or

(ii) The concentration of the pollutant is reported as ND and the effluent limitation is less than the ML, using definitions described in Attachment A and reporting protocols described in MRP section X.B.4.

The PMP shall include, but not be limited to, the following actions and submittals acceptable to the Regional Water Board:

(i) An annual review and semi-annual monitoring of potential sources of the reportable pollutant(s), which may include fish tissue monitoring and other bio-uptake sampling; or alternative measures approved by the Executive Officer when it is demonstrated that source monitoring is unlikely to produce useful analytical data;

(ii) Quarterly monitoring for the reportable pollutant(s) in the influent to the wastewater treatment system; or alternative measures approved by the Executive Officer, when it is demonstrated that influent monitoring is unlikely to produce useful analytical data;

(iii) Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable pollutant(s) in the effluent at or below the effluent limitation;

(iv) Implementation of appropriate cost-effective control measures for the reportable pollutant(s), consistent with the control strategy; and

(v) An annual status report that shall be sent to the Regional Water Board including:

- All PMP monitoring results for the previous year;
- A list of potential sources of the reportable pollutant(s);
- A summary of all actions undertaken pursuant to the control strategy; and
- A description of actions to be taken in the following year.

4. Construction, Operation and Maintenance Specifications

a. Wastewater Facilities, Review and Evaluation, and Status Reports

(1) The Discharger shall operate and maintain its wastewater collection, treatment, and disposal facilities in a manner to ensure that all facilities are adequately staffed, supervised, financed, operated, maintained, repaired, and upgraded as necessary, in order to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

(2) The Discharger shall regularly review and evaluate its wastewater facilities and operation practices in accordance with Section a.(1) above. Reviews and evaluations shall be conducted as an ongoing component of the Discharger's administration of its wastewater facilities.

(3) The Discharger shall provide USEPA and the Regional Water Board, upon request, a report describing the current status of its wastewater facilities and operation practices, including any recommended or planned actions and an estimated time schedule for these actions. The Discharger shall also include, in each annual SMR, a description or summary of its review and evaluation procedures, and wastewater facility programs or capital improvement projects.

b. Operations and Maintenance (O&M) Manual, Review and Status Reports

(1) The Discharger shall maintain an O&M Manual for the Plant and collection system. The O&M Manual shall be maintained in usable condition and be available for reference and use by all personnel.

(2) The Discharger shall regularly review, revise, or update, as necessary, the O&M Manual to ensure that it remains useful and relevant to current equipment and operation practices. The Discharger shall conduct reviews annually, and revise or update the O&M Manual as necessary. For any significant changes in treatment facility equipment or operation practices, the Discharger shall complete any revisions within 90 days.

(3) The Discharger shall provide USEPA and the Regional Water Board, upon request, a report describing the current status of its O&M Manual, including any recommended or planned actions and an estimated time schedule for these actions. The Discharger shall also include, in each annual SMR, a description or summary of review and evaluation procedures and changes to its operations and maintenance manual.

c. Contingency Plan, Review and Status Reports

(1) The Discharger shall maintain a Contingency Plan as prudent in accordance with current municipal facility emergency planning. The discharge of pollutants in violation of this Order when the Discharger has failed to develop

and adequately implement a Contingency Plan will be the basis for considering such a discharge a willful and negligent violation of this Order pursuant to CWC §13387.

(2) The Discharger shall annually review the Contingency Plan and update it, as necessary, so that the plan may remain useful and relevant to current equipment and operation practices.

(3) The Discharger shall provide USEPA and the Regional Water Board, upon request, a report describing the current status of its Contingency Plan review and update. The Discharger shall also include, in each annual SMR, a description or summary of its review and evaluation procedures and any changes to its Contingency Plan.

5. Special Provisions for Municipal Facilities

a. Pretreatment Program

(1) The Discharger shall implement and enforce its approved pretreatment program in accordance with federal Pretreatment Regulations (40 CFR 403), pretreatment standards promulgated under Sections 307(b), 307(c), and 307(d) of the CWA, pretreatment requirements specified under 40 CFR 122.44(j), and the requirements in Attachment H, "Pretreatment Requirements." The Discharger's responsibilities include, but are not limited to:

(i) Enforcement of National Pretreatment Standards of 40 CFR 403.5 and 403.6;

(ii) Implementation of its pretreatment program in accordance with legal authorities, policies, procedures, and financial provisions described in the General Pretreatment regulations (40 CFR 403) and its approved pretreatment program;

(iii) Submission of reports to USEPA, the State Water Board, and the Regional Water Board, as described in Attachment H "Pretreatment Requirements".

(iv) Evaluate the need to revise local limits under 40 CFR 403.5(c)(1), and within the term of this Order, submit a report acceptable to the Executive Officer describing the changes with a plan and schedule for implementation.

(2) The Discharger shall implement its approved pretreatment program and the program shall be an enforceable condition of this Order. If the Discharger fails to perform the pretreatment functions, the Regional Water Board, the State Water Board, or USEPA may take enforcement actions against the Discharger as authorized by the CWA .

b. Sludge Management Practices Requirements

(1) All sewage sludge generated by the discharger shall be disposed in a municipal solid waste landfill that meets the requirements of 40 CFR 258, land applied in accordance with the requirements in 40 CFR 503 Subpart B, or delivered to a composter for treatment and land application in accordance with the requirements in 40 CFR 503 Subpart B. The Discharger shall notify USEPA and the Regional Water Board 60 days prior to any change in use or disposal practices.

(2) Sludge treatment, storage, and disposal or reuse shall not create a nuisance, such as objectionable odors or flies, or result in groundwater contamination.

(3) The Discharger shall take all reasonable steps to prevent or minimize any sludge use or disposal that has a likelihood of adversely affecting human health or the environment.

(4) The discharge of sludge shall not cause waste material to be in a position where it is or can be carried from the sludge treatment and storage site and deposited in waters of the United States.

(5) The sludge treatment and storage site shall have facilities adequate to divert surface runoff from adjacent areas, to protect boundaries of the site from erosion, and to prevent any conditions that would cause drainage from the materials in the temporary storage site. Adequate protection is defined as protection from at least a 100-year storm and protection from the highest possible tidal stage that may occur.

(6) For sludge applied to land, placed on a surface disposal site, or fired in a sludge incinerator as defined in 40 CFR 503, the Discharger shall submit an annual report to USEPA and the Regional Water Board containing monitoring results and pathogen and vector attraction reduction requirements as specified by 40 CFR 503, by February 19 of each year, for the period covering the previous calendar year.

(7) Sludge disposed of in a municipal solid waste landfill shall meet the requirements of 40 CFR 258. In the annual self-monitoring report, the Discharger shall include the amount of sludge disposed of and the landfill to which it was sent.

(8) Permanent on-site sludge storage or disposal activities are not authorized by this Order. A report of Waste Discharge shall be filed and the site brought into compliance with all applicable regulations prior to commencement of any such activity.

(9) Sludge Monitoring and Reporting Provisions of this Order (Attachment G) apply to sludge handling, disposal, and reporting practices.

(10) The USEPA and the Regional Water Board may amend this Order prior to expiration if changes occur in applicable state and federal sludge regulations.

6. Combined Sewer Overflow (CSO) Control Policy Requirements (Wet Weather Controls)

In accordance with the Nine Minimum Controls of the USEPA *Combined Sewer Overflow Control Policy* (1994) and the Discharger's Long Term Control Plan, the Discharger shall maximize flow to the Plant and pollutant removal during wet weather.

a. Combined Sewer Operations and Maintenance Plan. The Discharger shall revise and update its Combined Sewer Operations and Maintenance Plan as necessary to ensure compliance with the Nine Minimum Controls and the Long Term Control Plan requirements of the Combined Sewer Overflow Control Policy. The Discharger shall submit a revised plan to the Regional Water Board by September 30, 2010, and following any subsequent revisions during the term of this Order.

b. Nine Minimum Controls. The Discharger shall continue to implement and comply with the following technology-based requirements.

(1) *Conduct Proper Operations and Regular Maintenance Programs*. The Discharger shall implement its Combined Sewer Operations and Maintenance Plan, which shall include the elements described below. The Discharger shall update the plan to incorporate changes to the system and shall operate and maintain the system according to the plan. The Discharger shall maintain records to document the implementation of the Combined Sewer Operations and Maintenance Plan.

(i) *Designation of a Manager for CSOs.* The Discharger shall designate a person to be responsible for the wastewater collection system and serve as the contact person regarding the operation of the combined sewer system. The Discharger shall notify USEPA and the Regional Water Board within 90 days of the designation of a new contact person.

(ii) *Inspection and Maintenance of the Combined Sewer System.* The Discharger shall:

- Inspect and maintain all overflow structures, regulators, pumping stations, and tide gates to ensure that they are in good working condition and adjusted to minimize overflows and prevent tidal inflow.

- Inspect each overflow outfall at least once per year. The inspection shall include, but not be limited to, entering the regulator structure, if accessible; determining the extent of debris and grit buildup; and removing any debris that may constrict flow, cause blockage, and result in a dry weather CSO. For overflow outfalls that are inaccessible,

the Discharger may perform a visual check of the overflow pipe to determine whether CSOs have occurred or could potentially occur during dry weather flow conditions.

- Record the results of the inspections in a maintenance log.

(iii) *Provision for Trained Staff*. The Discharger shall provide adequate staff to carry out the operation, maintenance, repair, and testing functions required to ensure compliance with the terms and conditions of this Order. Each member of the staff shall receive appropriate training.

(iv) *Allocation of Funds for Operation and Maintenance*. The Discharger shall allocate adequate funds specifically for CSO operation and maintenance activities.

(2) *Maximize Use of the Collection System for Storage.* The Discharger shall continue to maximize the use of the collection system for in-line storage. (Note that this provision refers to the use of collection system piping, not the storage basins/transports, for storage.)

(3) *Review and Modify Pretreatment Program*. The Discharger shall continue to implement selected controls to minimize the impact of non-domestic discharges to its collection system. At three-year intervals, the Discharger shall re-evaluate whether additional modifications to its pretreatment program are feasible or practical. The Discharger shall maintain records to document this evaluation and to document implementation of the selected controls to minimize non-domestic discharges to its collection system.

(4) *Maximize Flow to Plant*. The Discharger shall operate the Plant at maximum treatable flow during wet weather flow conditions. The Discharger shall report rainfall and influent flow data to USEPA and the Regional Water Board with SMRs required by the attached Monitoring and Reporting Program (Attachment E.)

Consistent with the objectives of the Combined Sewer Operations and Maintenance Plan, the Discharger shall ensure that the facility Operation and Maintenance Plan is implemented to maximize the volume of wastewater treated at the Plant and discharged via Discharge Point 001, consistent with the hydraulic capacities of the storage, transport, treatment, and disposal facilities.

(5) *Prohibit CSOs During Dry Weather*. Dry weather CSOs from Discharge Points CSO-001 through CSO-007 or other locations are prohibited. All CSOs must be responded to in accordance with Regional Standard Provisions, and Monitoring, and Reporting Requirements (Section V.E.2) as provided in Attachment G. The Discharger shall document in the inspection log each CSO event, the duration of the event, the cause of the event and the corrective measures taken.

(6) *Control Solid and Floatable Materials in CSODs.* The Discharger shall continue to implement measures to control solid and floatable materials in CSODs. These measures shall include:

(i) ensuring that all the CSO structures are baffled or that other means are used to reduce the volume of floatable materials in CSOs, and

(ii) removing solid or floatable materials captured in the storage/transport system in an acceptable manner prior to discharge to receiving waters.

(7) *Develop and Implement a Pollution Prevention Program*. The Discharger shall continue to implement a Pollution Prevention Program focused on reducing the impact of CSOs on receiving waters. This Pollution Prevention Program is authorized by federal regulations on CSOs. This program shall be developed and implemented in accordance with Provision VI.C.3.

(8) *Notify the Public of Overflows*. The Discharger shall continue to implement a public notification plan to inform citizens of when and where CSOs occur. The process shall include:

(i) a mechanism to alert persons using all receiving waters affected by overflows.

(ii) a system to determine the nature and duration of conditions resulting from overflows that are potentially harmful to users of these receiving waters.

Specifically, warning signs must be posted at beach locations where water contact recreation occurs whenever there is a discharge from the diversion structures. Such warning signs shall be posted on the same days as the overflow events unless the overflow occurs after 4:00 p.m., in which case, signs shall be posted by 8:00 a.m. The Discharger shall maintain records documenting public notification.

(9) *Monitor to Effectively Characterize CSO Impacts and the Efficacy of CSO Controls*. To comply with the Nine Minimum Controls as well as post construction compliance monitoring under the CSO Control Policy, the Discharger shall continue regular monitoring necessary to evaluate CSO controls. The monitoring shall build on the efforts and results of the Discharger described in its August 30, 2007, report, *Westside Study to Effectively Characterize Overflow Impacts and the Efficacy of Combined Sewer Overflow Controls.* The Discharger shall provide a summary report annually and submit a final report to USEPA and the Regional Water Board by September 30, 2014. The report shall include:

(i) Summary of existing data in order to show status and trends;
(ii) Monitoring of wet weather discharges;
(iii) Evaluation of results in order to effectively characterize CSO impacts and efficacy of CSO controls;

(iv) Review of CSO impacts and, if necessary, proposal of revisions to the CSOD control program, including the Nine Minimum Controls;
(v) Recreational use surveys, as described in the MRP, following CSO events, to track changes in uses over time; and
(vi) Summary of post-construction monitoring results and an analysis of CWA compliance with water quality standards and the protection of beneficial uses.

If water quality standards are not being attained, the Discharger shall submit a revised CSO control program that, once implemented, will attain water quality standards. The Discharger may also wish to consider the review and appropriate revision of water quality standards and implementation procedures on CSO-impacted waters.

c. Long-Term Control Plan. The Discharger shall comply with the following provisions:

(1) The Discharger shall optimize the operation of its system to minimize combined sewer discharges and maximize pollutant removal during all wet weather conditions.

(2) The Discharger shall capture for treatment, or storage and subsequent treatment, 100 percent of the combined sewage flow collected in the combined sewage system during precipitation events. Captured combined sewage shall be directed to either the Plant or the storage/transports. All combined sewage captured shall receive a minimum of the following treatment:

- Secondary treatment (at Plant), or
- Primary treatment (at Plant), or
- Flow-through treatment (in storage/transports).

(3) The Discharger shall comply with the following for wet weather Plant operations:

(i) The Plant shall have an influent flow rate of at least 43 MGD prior to initiating decant from the Westside Transport to Discharge Point 001.

(ii) The flow rate at Discharge Point 001 shall be at least 165 MGD within 2 hours of a discharge into the Pacific Ocean from Discharge Point CSD-002 or CSD-003.

(iii) The Sea Cliff Pump Station I shall be operated at maximum capacity prior to an overflow at Discharge Point CSD-005.

(iv) The Sea Cliff Pump Station II shall be operated at maximum capacity prior to an overflow at Discharge Point CSD-007.

(4) The Discharger shall comply with the following after rains subside:

(i) Treatment at the Plant shall continue until the Westside Drainage Basin storage/transports are empty of stormwater flows.

(ii) If the National Weather Service predicts a 30 percent chance of rain within the next 24 hours:

- Pumping shall be maximized from the Westside storage/transport via the Westside Pump Station to the Oceanside Plant and Discharge Point 001 until the level of combined sewage in the East Box is between 5 and 10 feet.

- Pumping shall be maximized from the Westside storage/transport via the Westside Pump Station to the Plant and/or Discharge Point 001 until the level of combined sewage in the West Box is essentially zero.

(iii) If the National Weather Service does not predict rain within the next 24 hours:

- Pumping shall be maximized from the Westside storage and transport until the level of combined sewage in the West Box is zero and total flow to the Oceanside Plant is less than 43 MGD.

7. Sensitive Areas Feasibility Report for Overflows

The Discharger shall submit a report, by December 31, 2011, implementing the "consideration of sensitive areas" section of the Combined Sewer Overflow Control Policy. At a minimum, the Discharger shall assess techniques (including green infrastructure and low impact development) to eliminate or relocate CSODs from sensitive areas and discuss the level of treatment for any remaining CSODs necessary to meet water quality standards.

VII. COMPLIANCE DETERMINATION

Compliance with the effluent limitations contained in section IV of this Order will be determined as specified below:

A. General

Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined in the Monitoring and Reporting Program (Attachment E) and Fact Sheet Section VI. For purposes of reporting and administrative enforcement, the Discharger shall be deemed out of compliance with single-sample effluent limitations if the concentration of the pollutant in the monitoring sample is greater than the effluent limitation. For averaged or median-based effluent limitations, the Discharger shall be deemed out of compliance if the average or median concentration in the data set is greater than the effluent limitation.

B. Multiple Sample Data

When determining compliance with a pollutant limit and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of “Detected, but Not Quantified” (DNQ) or “Not Detected” (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

1. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle, unless one or both of these points are ND or DNQ, in which case the median value shall be the lower of the two data points, where DNQ is lower than a value, and ND is lower than DNQ.

ATTACHMENT A – DEFINITIONS

Acute Toxicity

a. Acute Toxicity (TUa)

Expressed in Toxic Units Acute (TUa)

$$TUa = \frac{100}{96\text{-hr LC } 50\%}$$

b. Lethal Concentration 50% (LC 50)

LC 50 (percent waste giving 50% survival of test organisms) shall be determined by static or continuous flow bioassay techniques using standard marine test species as specified in Ocean Plan Appendix III. If specific identifiable substances in wastewater can be demonstrated by the discharger as being rapidly rendered harmless upon discharge to the marine environment, but not as a result of dilution, the LC 50 may be determined after the test samples are adjusted to remove the influence of those substances.

When it is not possible to measure the 96-hour LC 50 due to greater than 50 percent survival of the test species in 100 percent waste, the toxicity concentration shall be calculated by the expression:

$$TUa = \frac{\log (100 - S)}{1.7}$$

where:

S = percentage survival in 100% waste. If S > 99, TUa shall be reported as zero.

Areas of Special Biological Significance (ASBS)
Those areas designated by the State Water Board as ocean areas requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable. All Areas of Special Biological Significance are also classified as a subset of STATE WATER QUALITY PROTECTION AREAS.

Average Dry Weather Discharge
The average dry weather discharge is the average discharge rate over three consecutive months of dry weather (i.e., a wet weather day has not occurred)

Average Monthly Effluent Limitation (AMEL)
The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)
The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Chlordane
Shall mean the sum of chlordane-alpha, chlordane-gamma, chlordene-alpha, chlordene-gamma, nonachlor-alpha, nonachlor-gamma, and oxychlordane.

Chronic Toxicity
This parameter shall be used to measure the acceptability of waters for supporting a healthy marine biota until improved methods are developed to evaluate biological response.

a. Chronic Toxicity (TUc)

Expressed as Toxic Units Chronic (TUc)

$$TUc = \frac{100}{NOEL}$$

b. No Observed Effect Level (NOEL)

The NOEL is expressed as the maximum percent effluent or receiving water that causes no observable effect on a test organism, as determined by the result of a critical life stage toxicity test listed in Ocean Plan Appendix III.

Combined Sewer System
A combined sewer system (CSS) is a wastewater collection system owned by a State or municipality which conveys sanitary wastewaters (domestic, commercial, and industrial wastewaters) and stormwater through a single-pipe system to a Publicly Owned Treatment Works (POTW) Treatment Plant.

Combined Sewer Overflow
A combined sewer overflow (CSO) is the discharge from a combined sewer system at a point prior to the POTW Treatment Plant.

Combined Sewer Overflow Discharge
A combined sewer discharge (CSOD) is an authorized, treated discharge from the near-shore discharge structures, offshore discharge structures, or treatment facilities during a wet weather day.

Daily Discharge
Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

DDT
Shall mean the sum of 4,4'DDT, 2,4'DDT, 4,4'DDE, 2,4'DDE, 4,4'DDD, and 2,4'DDD.

Degrade
Degradation shall be determined by comparison of the waste field and reference site(s) for characteristic species diversity, population density, contamination, growth anomalies, debility, or supplanting of normal species by undesirable plant and animal species. Degradation occurs if there are significant differences in any of three major biotic groups, namely, demersal fish, benthic invertebrates, or attached algae. Other groups may be evaluated where benthic species are not affected, or are not the only ones affected.

Detected, but Not Quantified (DNQ)
Sample results that are less than the reported Minimum Level, but greater than or equal to the laboratory's MDL.

Dichlorobenzenes
Shall mean the sum of 1,2- and 1,3-dichlorobenzene.

Downstream Ocean Waters
Waters downstream with respect to ocean currents.

Dredged Material
Any material excavated or dredged from the navigable waters of the United States, including material otherwise referred to as "spoil".

Dry Weather Day
Any day that is not a wet weather day. During dry weather, all wastewater collected is treated to secondary levels at the Plant and discharged at Discharge Point 001.

Enclosed Bays
Indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. This definition includes but is not limited to: Humboldt Bay, Bodega Harbor, Tomales Bay, Drakes Estero, San Francisco Bay, Morro Bay, Los Angeles Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay.

Endosulfan
The sum of endosulfan-alpha and -beta and endosulfan sulfate.

Estuaries and Coastal Lagoons are waters at the mouths of streams that serve as mixing zones for fresh and ocean waters during a major portion of the year. Mouths of streams that are temporarily separated from the ocean by sandbars shall be considered as estuaries. Estuarine waters will generally be considered to extend from a bay or the open ocean to the upstream limit of tidal action but may be considered to extend seaward if significant mixing of fresh and salt water occurs in the open coastal waters. The waters described by this definition include but are not limited to the Sacramento-San Joaquin Delta as defined by Section 12220 of the California Water Code, Suisun Bay, Carquinez Strait downstream to Carquinez Bridge, and appropriate areas of the Smith, Klamath, Mad, Eel, Noyo, and Russian Rivers.

Halomethanes shall mean the sum of bromoform, bromomethane (methyl bromide) and chloromethane (methyl chloride).

HCH shall mean the sum of the alpha, beta, gamma (lindane) and delta isomers of hexachlorocyclohexane.

Initial Dilution
The process that results in the rapid and irreversible turbulent mixing of wastewater with ocean water around the point of discharge.

For a submerged buoyant discharge, characteristic of most municipal and industrial wastes that are released from the submarine outfalls, the momentum of the discharge and its initial buoyancy act together to produce turbulent mixing. Initial dilution in this case is completed when the diluting wastewater ceases to rise in the water column and first begins to spread horizontally.

For shallow water submerged discharges, surface discharges, and non-buoyant discharges, characteristic of cooling water wastes and some individual discharges, turbulent mixing results primarily from the momentum of discharge. Initial dilution, in these cases, is considered to be completed when the momentum induced velocity of the discharge ceases to produce significant mixing of the waste, or the diluting plume reaches a fixed distance from the discharge to be specified by the Regional Water Board, whichever results in the lower estimate for initial dilution.

Instantaneous Maximum Effluent Limitation
The highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation
The lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Kelp Beds
For purposes of the bacteriological standards of the Ocean Plan, are significant aggregations of marine algae of the genera Macrocystis and Nereocystis. Kelp beds include the total foliage canopy of Macrocystis and Nereocystis plants throughout the water column.

Mariculture
The culture of plants and animals in marine waters independent of any pollution source.

Material
(a) In common usage: (1) the substance or substances of which a thing is made or composed (2) substantial; (b) For purposes of the Ocean Plan relating to waste disposal, dredging and the disposal of dredged material and fill, MATERIAL means matter of any kind or description which is subject to regulation as waste, or any material dredged from the navigable waters of the United States. See also, DREDGED MATERIAL.

Maximum Daily Effluent Limitation (MDEL)
The highest allowable daily discharge of a pollutant.

Method Detection Limit (MDL)
The minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in title 40 of the Code of Federal Regulations, Part 136, Attachment B.

Minimum Level (ML)
The concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Natural Light
Reduction of natural light may be determined by the Regional Water Board by measurement of light transmissivity or total irradiance, or both, according to the monitoring needs of the Regional Water Board.

Not Detected (ND)
Those sample results less than the laboratory's MDL.

Ocean Waters
The territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. If a discharge outside the territorial waters of the state could affect the quality of the waters of the State, the discharge may be regulated to assure no violation of the Ocean Plan will occur in ocean waters.

PAHs (polynuclear aromatic hydrocarbons)
The sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,12-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[ah]anthracene, fluorene, indeno[1,2,3-cd]pyrene, phenanthrene and pyrene.

PCBs (polychlorinated biphenyls)
The sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254 and Aroclor-1260.

Pollutant Minimization Program (PMP)
PMP means waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the PMP shall be to reduce

all potential sources of pollutants of concern through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board may consider cost effectiveness when establishing the requirements of a PMP. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), shall be considered to fulfill the PMP requirements.

Reported Minimum Level
The ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from Appendix II of the Ocean Plan in accordance with section III.C.5.a. of the Ocean Plan or established in accordance with section III.C.5.b. of the Ocean Plan. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the reported ML.

Satellite Collection System
The portion, if any, of a sanitary sewer system owned or operated by a different public agency than the agency that owns and operates the wastewater treatment facility that a sanitary sewer system is tributary to.

Shellfish
Organisms identified by the California Department of Public Health as shellfish for public health purposes (i.e., mussels, clams and oysters).

Significant Difference
Defined as a statistically significant difference in the means of two distributions of sampling results at the 95 percent confidence level.

Six-Month Median Effluent Limitation
The highest allowable moving median of all daily discharges for any 180-day period.

State Water Quality Protection Areas
Non-terrestrial marine or estuarine areas designated to protect marine species or biological communities from an undesirable alteration in natural water quality. All AREAS OF SPECIAL BIOLOGICAL SIGNIFICANCE (ASBS) that were previously designated by the State Water Board in Resolution Numbers 74-28, 74-32, and 75-61 are now also classified as a subset of State Water Quality Protection Areas and require special protections afforded by the Ocean Plan.

TCDD Equivalents
In this Order, TCDD Equivalents means the sum of the concentrations of chlorinated dibenzodioxins and chlorinated dibenzofurans multiplied by their Toxicity Equivalency Factor

(TEF) and their Bioaccumulation Equivalency Factor (BEF). This is based on 40 CFR Part 132, Appendix F, Procedure 4, Tables 1 and 2.

$(TEC)_{TCDD}$= The sum of $(C)_x(TEF)_x(BEF)_x$

Where $(TEC)_{TCDD}$ = TCDD Equivalents concentration in effluent

$(C)_x$ = concentration of total congener x in effluent

$(TEF)_x$ =TCDD toxicity equivalency factor for congener x

$(BEF)_x$ = TCDD bioaccumulation equivalency factor for congener x

Toxicity Equivalency Factor and Bioaccumulative Equivalency Factors are listed in the table below.

Congener	Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factors (BEF)
2,3,7,8-TCDD	1.0	1.0
1,2,3,7,8-Pe-CDD	0.5	0.9
1,2,3,4,7,8-HxCDD	0.1	0.3
1,2,3.6,7,8-HxCDD	0.1	0.1
1,2,3,7,8,9-HxCDD	0.1	0.1
1,2,3,4,6,7,8-HpCDD	0.01	0.05
OCDD	0.0003	0.01
2,3,7,8-TCDF	0.1	0.8
1,2,3,7,8-PeCDF	0.03	0.2
2,3,4,7,8-PeCDF	0.3	1.6
1,2,3,4,7,8-HxCDF	0.1	0.08
1,2,3,6,7,8-HxCDF	0.1	0.2
2,3,4,6,7,8-HxCDF	0.1	0.7
1,2,3,7,8,9-HxCDF	0.1	0.6
1,2,3,4,6,7,8-HpCDF	0.01	0.01
1,2,3,4,7,8,9-HpCDF	0.01	0.4
OCDF	0.0003	0.02

Toxicity Reduction Evaluation (TRE)
A study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation

of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.)

Waste
As used in the Ocean Plan, waste includes a discharger's total discharge, of whatever origin, i.e., gross, not net, discharge.

Water Reclamation
The treatment of wastewater to render it suitable for reuse, the transportation of treated wastewater to the place of use, and the actual use of treated wastewater for a direct beneficial use or controlled use that would not otherwise occur.

Wet Weather Day
A wet weather day is any day in which one of the following conditions exists as a result of rainfall:

1. Instantaneous influent flow to the Plant exceed 43 MGD; or

2. The average daily influent flow concentration of TSS or BOD is less than 100 mg/L; or

3. The Westside storage/transport flow elevation exceeds 0 feet in the West Box or 18 feet in the East Box. (Flow is decanted to the West Box from the East Box only when the East Box storage level exceeds 18 feet.)

ATTACHMENT D – STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 CFR §122.41(a).)

2. The Discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 CFR §122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order, 40 CFR §22.41(c).

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment, 40 CFR §122.41(d).

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order, 40 CFR §122.41(e).

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 CFR §122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 CFR §122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 CFR §122.41(i); Water. Code, §13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (40 CFR. § 122.41(i)(1));

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (40 CFR §122.41(i)(2));

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (40 CFR §122.41(i)(3)); and

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 CFR §122.41(i)(4).)

G. Bypass

1. Definitions

a. “Bypass” means the intentional diversion of waste streams from any portion of a treatment facility. (40 CFR §122.41(m)(1)(i).)

b. “Severe property damage” means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 CFR §122.41(m)(1)(ii).)

2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 CFR §122.41(m)(2).)

3. Prohibition of bypass. Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 CFR §122.41(m)(4)(i)):

a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 CFR §22.41(m)(4)(i)(A));

b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 CFR §122.41(m)(4)(i)(B)); and

c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 CFR §122.41(m)(4)(i)(C).)

4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above. (40 CFR §122.41(m)(4)(ii).)

5. Notice

a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass. (40 CFR §122.41(m)(3)(i).)

b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). (40 CFR §122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation, 40 CFR §122.41(n)(1).

Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review, 40 CFR §122.41(n)(2).

6. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 CFR §122.41(n)(3)):

a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 CFR §122.41(n)(3)(i));

b. The permitted facility was, at the time, being properly operated (40 CFR §122.41(n)(3)(ii));

c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) (40 CFR §122.41(n)(3)(iii)); and

d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above,. 40 CFR §122.41(n)(3)(iv).

7. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 CFR § 122.41(n)(4).)

II. STANDARD PROVISIONS – PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition,. 40 CFR §122.41(f).

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit,. 40 CFR §122.41(b).

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code, 40 CFR §122.41(l)(3); §122.61.

III. STANDARD PROVISIONS – MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 CFR §122.41(j)(1).)

B. Monitoring results must be conducted according to test procedures under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503 unless other test procedures have been specified in this Order, 40 CFR §122.41(j)(4); §122.44(i)(1)(iv).

IV. STANDARD PROVISIONS – RECORDS

A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by Part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 CFR §122.41(j)(2))

B. Records of monitoring information shall include:

1. The date, exact place, and time of sampling or measurements (40 CFR §122.41(j)(3)(i));

2. The individual(s) who performed the sampling or measurements (40 CFR §122.41(j)(3)(ii));

3. The date(s) analyses were performed (40 CFR §122.41(j)(3)(iii));

4. The individual(s) who performed the analyses (40 CFR §122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 CFR §122.41(j)(3)(v)); and

6. The results of such analyses, 40 CFR §122.41(j)(3)(vi).

C. Claims of confidentiality for the following information will be denied (40 CFR § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 CFR §122.7(b)(1)); and

2. Permit applications and attachments, permits and effluent data. (40 CFR §122.7(b)(2).)

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or USEPA within a reasonable time, any information which the Regional Water Board, State Water Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or USEPA copies of records required to be kept by this Order, 40 CFR §122.41(h); Water Code, §13267.

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 CFR §122.41(k).)

2. All permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA). (40 CFR §122.22(a)(3).).

3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or USEPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above (40 CFR §122.22(b)(1));

b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 CFR §122.22(b)(2)); and

c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 CFR §122.22(b)(3).)

4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 CFR §122.22(c).)

5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware

that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." (40 CFR §122.22(d).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order. (40 CFR §122.22(l)(4).)

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 CFR §122.41(l)(4)(i).)

3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board. (40 CFR §122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 CFR §122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date, 40 CFR §122.41(l)(5).

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 CFR §122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 CFR §122.41(l)(6)(ii)):

a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 CFR §122.41(l)(6)(ii)(A).)

b. Any upset that exceeds any effluent limitation in this Order. (40 CFR §122.41(l)(6)(ii)(B).)

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 CFR §122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 CFR § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in section 122.29(b) (40 CFR §122.41(l)(1)(i)); or

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (40 CFR §122.41(l)(1)(ii).)

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 CFR§ 122.41(l)(1)(iii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements, 40 CFR §122.41(l)(2).

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above, 40 CFR §122.41(l)(7).

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or USEPA, the Discharger shall promptly submit such facts or information, 40 CFR §122.41(l)(8).

VI. STANDARD PROVISIONS – ENFORCEMENT

The Regional Water Board is authorized to enforce the terms of this permit under several provisions of the Water Code, including, but not limited to, sections 13385, 13386, and 13387.

Additional Provisions – Notification Levels

A. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 CFR §122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to sections 301 or 306 of the CWA if it were directly discharging those pollutants (40 CFR §122.42(b)(1)); and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order. (40 CFR §122.42(b)(2).)

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 CFR §122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM

Table of Contents

List of Tables

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

NPDES regulations at 40 CFR 122.48 require that all NPDES permits specify monitoring and reporting requirements. California Water Code (CWC) §13267 and §13383 authorize the Regional Water Quality Control Board (Regional Water Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements, that implement the federal and California regulations.

I. GENERAL MONITORING PROVISIONS

A. The Discharger shall comply with the MRP and *Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits*, July 2009 (**Attachment G**). The MRP may be amended by the Executive Officer pursuant to USEPA regulations 40 CFR122.62, 122.63, and 124.5. If any discrepancies exist between the MRP and the Regional Standard Provisions, the MRP prevails.

B. Sampling is required during the entire year when discharging. All analyses shall be conducted using current USEPA methods, or methods that have been approved by the USEPA Regional Administrator pursuant to 40 CFR 136.4 and 136.5, or if 40 CFR 136 methods are not available, equivalent methods that are commercially and reasonably available. Analytical methods shall provide sufficient quantification of sampling parameters and constituents to evaluate compliance with applicable effluent limits and to perform reasonable potential analyses. Equivalent methods shall be more sensitive than those specified in 40 CFR 136, shall be specified in the permit, and shall be approved for use by the Executive Officer following consultation with the State Water Quality Control Board's Quality Assurance Program.

C. For compliance and reasonable potential monitoring, analyses shall be conducted using commercially available and reasonably achievable detection levels that are lower than applicable water quality objectives or criteria, or the effluent limitations, whichever are lower. The objective is to provide quantification of constituents sufficient to allow evaluation of observed concentrations with respect to the Minimum Levels (MLs).

MLs are the concentrations at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

As shown in Table II-3 of Ocean Plan Appendix II, the test method the Discharger may use for compliance with mercury effluent limitations and reasonable potential monitoring is Cold Vapor Atomic Absorbance with a ML of 0.2 µg/L.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Station Locations

Discharge Point Name	Monitoring Location Name	Monitoring Location Description
--	INF-001	Formerly Sampling Station A-003. At any point in the facility headworks at which all waste tributary to the system is present and preceding any phase of treatment, and exclusive of any return flows or process side streams that would significantly impact the quantity or quality of the influent.
001	EFF-001	Formerly Sampling Station E-007. At any point in the sewerage system following all phases of treatment and prior to contact with the receiving water or any effluent from the Westside Wet Weather Facilities.
CSD-001 through CSD-007	EFF-CSD	A representative monitoring location for the Westside Wet Weather Facilities, previously identified as a point prior to discharge from the Vicente Box, where all waste tributary to the diversion structure is present and treatment is complete.
---	SRF-15 east	Near shore receiving water along Baker Beach, in the surf east of SRF-15
---	SRF-15	Near shore receiving water along Baker Beach, in the surf at the terminus of Lobos Creek
---	SRF-16	Near shore receiving water along Baker Beach, in the surf opposite the Sea Cliff 2 Pump Station
---	SRF-17	Near shore receiving water in the surf along China Beach opposite the Sea Cliff 1 Pump Station
---	SRF-18	Near shore receiving water along Ocean Beach, in the surf at the foot of Balboa Street
---	SRF-19	Near shore receiving water along Ocean Beach, in the surf at the foot of Lincoln Way, opposite the Lincoln Overflow Discharge Structure
---	SRF-20	Near shore receiving water along Ocean Beach, in the surf at the foot of Pacheco Street
---	SRF-21	Near shore receiving water along Ocean Beach, in the surf at the foot of Vicente Street, opposite the Vicente Overflow Discharge Structure
---	SRF-21.1	Near shore receiving water along Ocean Beach, in the surf at the foot of Sloat Blvd
---	SRF-22	Near shore receiving water along Ocean Beach, in the surf at Fort Funston, opposite the Lake Merced Overflow Discharge Structure.

III. INFLUENT MONITORING REQUIREMENTS

The Discharger shall monitor Plant influent at Monitoring Location INF-001 in accordance with the following table.

Table E-2. Influent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Flow rate [1]	MGD	Continuous	Daily	Meter
BOD_5[2]	mg/L	C-24	1/W	[3]
TSS[4]	mg/L	C-24	5/W	[3]
pH	Standard units	Grab	5/W	[3]

[1] For influent flows, the following shall be reported:

Daily: Total Daily Flow Volume (million gallons) plus total daily influent flow originating as effluent/decant from the Westside Transport

Monthly: Minimum, Average, and Maximum Daily Flow (MGD)

Monthly: Total Flow Volume (million gallons) plus total monthly influent flow originating as effluent/decant from the Westside Transport

[2] Biochemical Oxygen Demand

[3] Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136.

[4] Total Suspended Solids

IV. EFFLUENT MONITORING REQUIREMENTS

A. Monitoring Location EFF-001

The Discharger shall monitor effluent at Monitoring Location EFF-001 as follows.

Table E-3. Effluent Monitoring, Monitoring Location EFF-001

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Method
Flow rate [1]	MGD	Cont.	Daily	Meter
BOD_5	mg/L	C-24	1/W	[2]
TSS	mg/L	C-24	5/W	[2]
Grease and Oil [3]	mg/L	C-24	1/Q	[2]
Turbidity	NTU	C-24	1/Q	[2]
pH	Standard Units	Grab	5/W	[2]
Ammonia, total	mg/L N	C-24	1/Q	[2]
Chronic Toxicity [4]	TUc	C-24	1/Q	[2]
Mercury [5]	µg/L	C-24	1/M	[2]
TCDD Equivalents	µg/L	C-24	1/Y	[2]
Table B Inorganic Pollutants [6]	µg/L	C-24	1/Q	[2]
Remaining Table B Pollutants [7]	µg/L	C-24	1/Y	[2]

[1] For effluent flows, the following shall be reported:

Daily: Total Daily Flow Volume (million gallons)

Monthly: Minimum, Average, and Maximum Daily Flow (MGD)

Monthly: Total Flow Volume (million gallons)

(2) Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136. The methods shall meet the lowest minimum levels (MLs) specified in Ocean Plan Appendix II. Where no method is specified for a given pollutant, the method shall be approved by the Regional Water Board. For TCDD congeners, the Discharger shall use USEPA Method 1613 and the MLs shall be as given below. Estimated congener concentrations (below the ML) shall not be included when adding the congener concentrations to calculate TCDD equivalents.

Parameter	Minimum Level
2,3,7,8-TetraCDD	5 pg/L
1,2,3,7,8-PentaCDD	25 pg/L
1,2,3,4,7,8-HexaCDD	25 pg/L
1,2,3,6,7,8-HexaCDD	25 pg/L
1,2,3,7,8,9-HexaCDD	25 pg/L
1,2,3,4,6,7,8-HeptaCDD	25 pg/L
OctaCDD	50 pg/L
2,3,7,8-TetraCDF	5 pg/L
1,2,3,7,8-PentaCDF	25 pg/L
2,3,4,7,8-PentaCDF	25 pg/L
1,2,3,4,7,8-HexaCDF	25 pg/L
1,2,3,6,7,8-HexaCDF	25 pg/L
1,2,3,7,8,9-HexaCDF	25 pg/L
2,3,4,6,7,8-HexaCDF	25 pg/L
1,2,3,4,6,7,8-HeptaCDF	25 pg/L
1,2,3,4,7,8,9-HeptaCDF	25 pg/L
OctaCDF	50 pg/L

(3) Grease and oil samples shall consist of 3 grab samples taken at 8 hour intervals during the sample day, with each grab being collected in a glass container and analyzed separately. Results shall be expressed as a weighted average of the three results, based on the instantaneous flow rates at the time each sample was collected.

(4) Samples for whole effluent toxicity tests shall be collected coincident with routine composite effluent samples. Refer to Section V of this MRP for whole effluent toxicity testing requirements.

(5) The Discharger may, at its option, sample effluent mercury either as grab or as 24-hour composite samples.

(6) The Table B inorganic pollutants are those inorganic constituents listed in Ocean Plan Table B, excluding mercury.

(7) The remaining Table B pollutants are the pollutants listed in Ocean Plan Table B, excluding those pollutants with monitoring requirements established elsewhere in this table (i.e., inorganics, mercury, chronic toxicity, and radioactivity). Because effluent is not chlorinated, chlorine is also excluded.

B. Monitoring Locations EFF-CSD-0xx

1. During each CSOD occurrence, the Discharger shall monitor discharges at the appropriate Monitoring Location EFF-CSD-0xx in accordance with the following elements established by Table E-4. Monitoring is required only during discharge events, which may last for less than one hour or for more than one day. Composite sampling shall commence within one hour after a discharge begins or as soon as

reasonably practicable with due consideration for safety. and shall continue until the discharge stops; however, the compositing period shall not exceed 24 hours.

Table E-4. Effluent Monitoring, Monitoring Location EFF-CSD

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Method
Flow	MGD	Cont.	Continuous during discharge	Meter (1)
BOD_5	mg/L	C-X (2)	1/occurrence	(7)
Total Suspended Solids	mg/L	C-X (2)	1/occurrence	(7)
Ammonia	mg/L N	C-X (2)	1/occurrence	(7)
Grease and Oil	mg/L	C-X (2)	1/occurrence	(7)
pH	Std Units	C-X (2)	1/occurrence	(7)
Table B Inorganics (3)	µg/L	C-X (2)	1/occurrence	(7)
Pesticides and PCBs (4)	µg/L	C-X (2)	1/occurrence	(7)
PAHs (5)	µg/L	C-X (2)	1/occurrence	(7)
Remaining Table B Pollutants (6)	µg/L	C-X (2)	1/year	(7)

(1) Alternately, flow may be estimated using models.

(2) Composite sample of 1 grab sample per hour over X hours, where X = the duration of the discharge but not exceeding 24 hours

(3) The Table B inorganic pollutants are those inorganic constituents listed in Table B of the 2005 Ocean Plan - arsenic, cadmium, hexavalent chromium, copper, lead, mercury, nickel, selenium, silver, zinc, and cyanide.

(4) As identified in EPA Method 608,

(5) As identified by the Ocean Plan and by Attachment A of this Order (Definitions).

(6) The remaining Table B pollutants are those listed in Ocean Plan Table B, excluding those with monitoring requirements established elsewhere in this table, and radioactivity. These pollutants shall be monitored during a CSOD occurrence.

(7) Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136.

2. The Discharger shall record the following information for each combined sewer overflow discharge event from discharge points CSD-001, CSD-002, CSD-003, CSD-005, and CSD-007.

a. Date and time that CSOD started;

b. Frequency, duration, and volume of CSOD;

c. Rainfall intensity and amount (hourly data, aggregated);

d. Data to support discharge volume estimate (if estimated); and

e. Documentation of conformance with the Operation Plan for wet weather facilities.

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

A. Chronic Toxicity Monitoring Requirements

1. *Sampling.* The Discharger shall collect 24-hour composite samples of the effluent for critical life stage toxicity testing as indicated below. For toxicity tests requiring renewals, 24-hour composite samples collected on consecutive days are required.

2. *Test Species.* The Discharger shall utilize the echinoderm embryo development test, with either the sand dollar (*Dendraster excentricus*) or the purple sea urchin (*Strongylocentrotus purpuratus*), such that the test species used is in gravid condition. The Discharger is required to re-screen for the most sensitive species once during the term of this permit and shall submit the chronic toxicity screening report to the Regional Water Board no later than 180 days prior to the Order expiration date with the application for permit reissuance.

3. *Methodology.* Sample collection, handling and preservation shall be in accordance with USEPA protocols. In addition, bioassays shall be conducted in compliance with the most recently promulgated test methods, as shown in **Appendix E-2**. These are "Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms," currently EPA/600/R-95/136, August 1995. Any methodology exceptions must be granted by the Executive Officer and the Environmental Laboratory Accreditation Program (ELAP).

4. *Dilution Series*. The Discharger shall conduct tests at the in-stream waste concentration (IWC), four concentrations bracketing the IWC, and a control.

B. Chronic Toxicity Reporting Requirements

1. Routine Reporting. Toxicity test results for the current reporting period shall include, at a minimum, for each test:

   (i) Sample date(s)

   (ii) Test initiation date

   (iii) Test species

   (iv) End point values for each dilution (e.g., number of young, growth rate, percent survival)

   (v) NOEC value(s) in percent effluent

   (vi) IC15, IC25, IC40, and IC50 values (or EC15, EC25 ... etc.) as percent effluent

   (vii) TUc values (100/NOEC)

(viii) Mean percent mortality (±s.d.) after 96 hours in 100% effluent (if applicable)

(ix) NOEC and LOEC values for reference toxicant test(s)

(x) IC50 or EC50 value(s) for reference toxicant test(s)

(xi) Available water quality measurements for each test (pH, D.O., temperature, conductivity, hardness, salinity, ammonia)

2. Compliance Summary. The results of the chronic toxicity testing shall be provided in the self-monitoring report and shall include a summary table of chronic toxicity data from at least eleven of the most recent samples. The information in the table shall include items listed above under 1 specifically item numbers (i), (iii), (v), (vi) (IC25 or EC25) and (vii).

C. Quality Assurance

1. Concurrent testing with reference toxicants shall be conducted.

2. If either the reference toxicant test or effluent test does not meet all test acceptability criteria as specified in the test method manual, then the Discharger must re-sample and re-test at the earliest time possible.

3. Control and dilution water should be obtained from an unaffected area of the receiving water. If the dilution water used is different from the culture water, a second control using culture water should be used. If it is not practicable to collect samples from the unaffected area of the receiving water then a laboratory prepared control and dilution water should be used.

4. If the effluent sample is significantly different from the control sample, and the minimum significant difference (% MSD) is less than 5%, the Discharger at its option may exclude this result and re-test. If control sample variability in the effluent test exceeds the upper limit of 20% MSD which is the same as the reference toxicant, the Discharger shall re-sample and re-test as soon as possible.

D. Toxicity Reduction Evaluation (TRE)

If monitoring shows a violation of the chronic toxicity effluent limitation, the Discharger shall conduct a TRE and take all reasonable steps to reduce toxicity once the source of toxicity is identified. The Discharger shall initiate a TRE in accordance with the following:

1. ,To be ready to respond to a toxicity event the Discharger shall prepare a generic TRE work plan within 90 days of the effective date of this Order and update it as necessary.

2. Within 60 days of exceeding the effluent limitation for chronic toxicity, the Discharger shall submit to USEPA a TRE work plan that should be the generic work plan revised for this toxicity event after considering discharge data.

3. Within 30 days of the date of completion of the accelerated monitoring tests observed to exceed the effluent limitation, the Discharger shall initiate a TRE in accordance with a TRE work plan that incorporates any and all comments from USEPA. Accelerated monitoring can be achieved by the Discharger conducting six additional toxicity tests using the same species and test method, approximately every two weeks, over a 12 week period. This testing shall begin within 145 days of receipt of test results exceeding the toxicity effluent limit. If none of the additional tests exceed the toxicity limitation, then the Discharger may return to the regular testing frequency.

4. The TRE shall be specific to the discharge and be prepared in accordance with current technical guidance and reference materials, including USEPA guidance materials. The TRE shall be conducted as a tiered evaluation process as summarized below:

a. Tier 1 consists of basic data collection (routine and accelerated monitoring).

b. Tier 2 consists of evaluation of optimization of the treatment process, including operation practices and in-plant process chemicals.

c. Tier 3 consists of a toxicity identification evaluation (TIE).

d. Tier 4 consists of evaluation of options for additional wastewater treatment processes.

e. Tier 5 consists of evaluation of options for modifications of in-plant treatment processes.

f. Tier 6 consists of implementation of selected toxicity control measures, and follow- up monitoring and confirmation of implementation success.

5. The TRE may be ended at any stage if monitoring finds there is no longer consistent toxicity (complying with requirements of Section VI.C.2.a of this Order).

6. The objective of a TIE shall be to identify the substance or combination of substances causing the observed toxicity. All reasonable efforts using currently available TIE methodologies shall be employed.

7. As toxic substances are identified or characterized, the Discharger shall continue the TRE by determining the sources and evaluating alternative strategies for reducing or eliminating the substances from the discharge. All reasonable steps shall be taken to reduce toxicity to levels consistent with the toxicity effluent limitations.

8. Many recommended TRE elements parallel required or recommended efforts of source control, pollution prevention, and stormwater control programs. TRE efforts

should be coordinated with such efforts. To prevent duplication of efforts, evidence of complying with requirements or recommended efforts of such programs may be acceptable to comply with TRE requirements.

9. Chronic toxicity may be episodic and identification of causes of, and reduction of sources of, toxicity may not be successful in all cases. Enforcement action will be based in part on the Discharger's responses and efforts to identify and control or reduce sources of consistent toxicity.

VI. LAND DISCHARGE MONITORING REQUIREMENTS

Not Applicable.

VII. RECLAMATION MONITORING REQUIREMENTS

Not Applicable.

VIII. RECEIVING WATER MONITORING REQUIREMENTS

The Discharger shall conduct routine shoreline monitoring for bacteria at six monitoring locations from Baker Beach along the San Francisco County shoreline perimeter to Sloat Blvd. on Ocean Beach one day per week in accordance with the schedule established in Table E-5, below.

During CSOD events, the Discharger shall post the beach in the vicinity of the CSOD event and shall conduct shoreline monitoring for bacteria at monitoring locations in the vicinity of the CSOD event from Baker Beach along the San Francisco County shoreline perimeter to Fort Funston on Ocean Beach in accordance with the schedule established in Table E-5, below.

During CSOD events, shoreline monitoring shall be initiated as soon as reasonable, with due consideration for safety. (Darkness, tidal conditions and storm related wave activity may prevent samples from safely being collected immediately after initiation of a CSOD event.) Shoreline monitoring shall be conducted at those locations in closest proximity to the CSOD. Daily shoreline monitoring during and following CSOD events and beach posting shall continue until bacteria concentrations in the receiving water at those locations fall below single sample maximum limits.

Table E-5. Receiving Water Surf Monitoring Requirements

Routine Monitoring					
Monitoring Locations	**Bacteria Type**	**Units**	**Minimum Monitoring Frequency**	**Sample Type**	**Analytical Method**
SRF-15 east SRF-15 SRF-17 SRF-18 SRF-19 SRF-21.1	Total Coliform *E. coli* Enterococcus	MPN/100 mLs	Once / week (1)	Grab	Quanti-Tray Method - Colilert 18™ Medium (total coliform and *E. coli*), Enterolert™ Medium (enterococcus)
CSOD Event Monitoring(1)					
SRF-15 east SRF-15 SRF-16 SRF-17 SRF-18 SRF-19 SRF-20 SRF-21 SRF-21.1 SRF-22	Total Coliform *E. coli* Enterococcus	MPN/100 mLs	Daily	Grab	Quanti-Tray Method - Colilert 18™ Medium (total coliform and *E. coli*), Enterolert™ Medium (enterococcus)

(1) Monitoring is only required at those locations in the vicinity of the CSOD.

IX. PRETREATMENT AND BIOSOLIDS MONITORING REQUIREMENTS

The Discharger shall comply with the pretreatment requirements specified in Table E-2 for influent (at Monitoring Location INF-001), effluent (at Monitoring Location EFF-001), and biosolids monitoring.

Table E-6. Pretreatment and Biosolids Monitoring Requirements

Constituents	**Influent INF-001**	**Effluent(3) EFF-001**	**Biosolids(4)**	**Sample Type**	
				INF-001 & EFF-001	**Biosolids(d)**
VOC	1/quarter	1/quarter	2/year	multiple grabs(5a)	grabs
BNA	1/quarter	1/quarter	2/year	multiple grabs(5a)	grabs
Metals(1)	1/month	1/month	2/year	24-hour composite(5b)	grabs
Hexavalent Chromium(2)	1/month	1/month	2/year	multiple grabs(5a)	grabs
Mercury	1/month	1/month	2/year	24-hour composite(5b,5c)	grabs
Cyanide	1/month	1/month	2/year	multiple grabs(5a)	grabs

Legends

VOC	= volatile organic compounds
BNA	= base/neutrals and acids extractable organic compounds
1/month	= once per month
1/quarter	= once per quarter
2/year	= twice per year

Footnotes:

(1) The parameters are arsenic, cadmium, copper, lead, nickel, silver, zinc, and selenium.

(2) The Discharger may elect to run total chromium instead of hexavalent chromium. Sample collection for total chromium measurements may also use 24-hour composite sampling.
(3) Effluent monitoring conducted in accordance with Table E-3 can be used to satisfy these pretreatment monitoring requirements.
(4) Since the Discharger operates its solar drying operations only during the dry season, the biosolids monitoring frequency is once per year during those times when it does not stockpile biosolids (i.e., the dry season). However, if and when the Discharger stockpiles biosolids (e.g., during wet weather), it shall report biosolids monitoring results for the stockpile during the wet season monitoring as well (i.e., twice per year).
(5) Sample types:
   a. Multiple grabs samples for VOC, BNA, hexavalent chromium, and cyanide, must be made up of a minimum of four (4) discrete grab samples, collected equally spaced over the course of a 24-hour period, with each grab analyzed separately and the results mathematically flow-weighted or with grab samples combined (volumetrically flow-weighted) prior to analysis.
   b. 24-hour composite sample may be made up discrete grab samples and may be combined (volumetrically flow-weighted) prior to analysis, or they should be mathematically flow-weighted. If automatic compositor is used, 24-hour composite samples must be obtained through flow-proportioned composite sampling.
   c. Automatic compositors are allowed for mercury if either 1) the compositing equipment (hoses and containers) comply with ultra-clean specifications, or 2) appropriate equipment blank samples demonstrate that the compositing equipment has not contaminated the sample. This direction is consistent with the Regional Water Board's October 22, 1999, letter on this subject.
   d. Biosolids collection should comply with those requirements specified in Attachment H, Appendix H-3 of this Order for sludge monitoring. The biosolids analyzed shall be a composite sample of the biosolids for final disposal. The Discharger shall also comply with biosolids monitoring requirements required by 40 CFR 503.

X. OTHER MONITORING REQUIREMENTS

1. **Off-Shore Monitoring Areas**. The Discharger shall continue to monitor the area outside San Francisco Bay between Rocky Point in Marin County and Point San Pedro in San Mateo County to identify any environmental effects of the discharge on receiving waters, sediment, or aquatic life.

2. Frequency of Sampling. The Discharger shall continue the Ocean Outfall Offshore Monitoring Program, sampling annually in the fall, when sediments are least disturbed.

3. **Specific Monitoring Points**. Monitoring locations are identified in Table E-6, below. (The Discharger selected locations using the USEPA's EMAP grid system, with 15 fixed locations and 36 random locations.)

Table E-7. Ocean Outfall Offshore Monitoring Locations

EMAP Station Number	Southwest Ocean Outfall (SWOO) Station Number	Latitude	Longitude
Fixed Locations			
1	---	37º 42' 12.00''	-122º 34' 31.20''

4. **Sediment Sampling**. The Discharger shall collect benthic samples from seven historical fixed locations (1, 2, 4, 6, 25, 28, 31) to maintain time series data, and 30 out of the 36 random locations (R1- R9, R12, R16 – R17, R19 – R40), for a total of 45 samples. Samples shall be collected using a 0.1 m^2 Smith McIntyre grab sampler. Two grabs shall be collected at each station and the top 5 centimeters of sediment shall be composited from each grab prior to analysis. Analysis of the sediment samples shall include:

   - Total volatile solids
   - Total organic carbon
   - Kjeldahl nitrogen
   - Grain size
   - Inorganic toxic pollutants [Al, As, Cd, Cr, Cr(VI), Cu, Fe, Pb, Mn, Hg, Ni, Se, Ag, Zn] [The Discharger may elect to report total chromium in lieu of chromium (VI).].
   - DDT, PCBs, and PAHs

5. **Infaunal Sampling**. One benthic grab sample collected from each of the above locations shall be analyzed for infaunal organisms. This sample shall be passed through a 1.0 mm and a 0.5 mm sieve. Organisms retained on each sieve shall be relaxed and preserved for later enumeration and taxonomic determination to the lowest taxon.

6. **Trawls***.* The Discharger shall conducts trawls once per year in the fall to assess the presence or absence of demersal fish and epibenthic invertebrates in the vicinity of the ocean outfall, and to determine any bioaccumulation of priority pollutants in these organisms.

   A fish community analysis shall be conducted at a minimum of one of four fixed sampling locations (SWOO 1, 2, 25, or 28) and at one reference location outside of the influence of the discharge. Fish and invertebrates shall be collected, identified to the lowest identifiable taxon, and enumerated. The following information shall be recorded.

   - Fish
     - Abnormalities and disease symptoms, such as fin erosion, lesions, or tumors
     - Standard length of all fish specimens; disk width for skates and rays

   - Invertebrates
     - Carapace length and identification of unsexed or gravid females of shrimp
     - Carapace width and sex of crabs

   Tissue samples to assess the bioaccumulation of pollutants shall be composite samples collected at one of four fixed sampling locations (SWOO 1, 2, 25, 28) and at one or more reference locations outside of the influence of the discharge. Three composite samples shall be collected of one fish species and one macroinvertebrate species at each location. Each composite sample shall consist of ten or more organisms of each species, with the preferred species being English sole (*Pleuronectes vetulus)* and dungeness crab (*Cancer magister).* Muscle and liver/hepatopancreas tissues shall be

analyzed for inorganic pollutants (As, Cd, Cr, Cu, Pb, Hg, Se, Ag, and Zn), and DDT, PCBs, and PAHs.

7. **Adaptive Management**. The Discharger shall confer with USEPA and the Regional Water Board regarding any proposed changes to the monitoring program in response to ongoing analyses of monitoring data to maximize the amount of relevant and useful data that can be collected within the five year permit term.

8. **Reporting**. All offshore monitoring data shall be reported to USEPA and the Regional Water Board in an Annual Report submitted by August 30 of the year following sampling to allow for time to make modifications, if necessary, for the following sampling event. The report shall include raw data tables and summaries for each monitoring component. A comprehensive cumulative summary report shall be submitted with the next application for permit reissuance.

XI. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

The Discharger shall comply with all Standard Provisions (Attachment D) and Regional Standard Provisions, and Monitoring Requirements (Attachment G) related to monitoring, reporting, and recordkeeping.

B. Self Monitoring Reports (SMRs)

1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Water Board's California Integrated Water Quality System (CIWQS) Program Web site (http://www.waterboards.ca.gov/ciwqs/index.html) or to any other Internet web site specified by the Regional Water Board or USEPA. Until such notification is given, the Discharger shall submit paper copy SMRs. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.

2. The Discharger shall submit monthly SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order for each calendar month. Monthly SMRs shall be due on the 30th day following the end of each calendar month, covering samples collected during that calendar month; Annual Reports shall be due on February 1 following each calendar year.

3. The Discharger shall comply with the following schedule of monitoring periods and reporting.

Table E-8. Monitoring Periods

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
Continuous	Day after permit effective date	All
Cont./D	Day after permit effective date	All
Daily	Day after permit effective date	(Midnight through 11:59 PM) or any 24-hour period that reasonably represents a calendar day for purposes of sampling.
Weekly	Sunday following permit effective date or on permit effective date if on a Sunday	Sunday through Saturday
5/Week	Sunday following permit effective date or on permit effective date if on a Sunday	Sunday through Saturday
Monthly	First day of calendar month following permit effective date or on permit effective date if that date is first day of the month	1st day of calendar month through last day of calendar month
2/Month	First day of calendar month following permit effective date or on permit effective date if that date is first date of the month	1st day of calendar month through last day of calendar month
Quarterly	Closest of January 1, April 1, July 1, or October 1 following (or on) permit effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31
Annually	January 1 following (or on) permit effective date	January 1 through December 31. July 1 through June 30 for shoreline CSD and other rainfall initiated data.
<X> / Discharge Event	As soon as possible after discharge begins	For the duration of the discharge event

4. The Discharger shall report with each sample result the applicable reported Minimum Level (ML) and the current Method Detection Limit (MDL) as determined by the procedure in Part 136.

The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

a. Sample results greater than or equal to the reported ML shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

b. Sample results less than the ML, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words "Estimated

Concentration" (which may be shortened to "Est. Conc."). The laboratory may, if such information is available, include numeric estimates of the data quality for the reported result. Numeric estimates of data quality may be percent accuracy (± a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

c. Sample results less than the laboratory's MDL shall be reported as "Not Detected" or ND.

d. Dischargers are to instruct laboratories to establish calibration standards so that the ML (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve except in reporting estimated sample results less than the RL, but greater than or equal to the laboratory MDL as stated in 4.b. above.

5. The Discharger shall comply with effluent limitations for reportable pollutants determined using sample reporting protocols defined above and in Attachment A of this Order. For purposes of reporting and administrative enforcement, the Discharger shall be deemed out of compliance with single-sample effluent limitations if the concentration of the reportable pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the ML. For averaged or median-based effluent limitations, the Discharger shall be deemed out of compliance if the average or median concentration in the data set is greater than the effluent limitation

6. The Discharger shall submit SMRs in accordance with the following requirements:

a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that is entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.

b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of this Order; corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations shall include the requirement violated and a description of the violation.

c. If the Discharger wishes to invalidate any measurement, the letter of transmittal shall include identification of the measurement suspected to be invalid and notification of intent to submit a formal request to invalidate the measurement , within 60 days. This request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that supports the invalidation (e.g., laboratory sheet, log entry, test results etc.), and discussion of the corrective actions taken or planned (with time schedule for

completion) to prevent recurrence of the sampling or measurement problem. The invalidation of a measurement by USEPA or Regional Water Board staff will be based solely on the documentation submitted at that time.

d. SMRs must be submitted to the Regional Water Board, signed and certified as required by the Standard Provisions (Attachment D), to the address listed below:

Executive Officer
California Regional Water Quality Control Board
San Francisco Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
ATTN: NPDES Wastewater Division

C. Discharge Monitoring Reports (DMRs)

1. As described in Section X.B.1 above, at any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit SMRs that will satisfy federal requirements for submittal of DMRs. Until such notification is given, the Discharger shall submit DMRs in accordance with the requirements described below.

2. DMRs must be signed and certified as required by the standard provisions (Attachment D). The Discharger shall submit the original DMR and one copy of the DMR to the address listed below:

STANDARD MAIL	FEDEX/UPS/ OTHER PRIVATE CARRIERS
State Water Resources Control Board Division of Water Quality c/o DMR Processing Center PO Box 100 Sacramento, CA 95812-1000	State Water Resources Control Board Division of Water Quality c/o DMR Processing Center 1001 I Street, 15th Floor Sacramento, CA 95814

3. All discharge monitoring results must be reported on the official USEPA pre-printed DMR forms (EPA Form 3320-1). Forms that are self-generated will not be accepted unless they follow the exact same format of EPA Form 3320-1.

APPENDIX E-1
CHRONIC TOXICITY
DEFINITION OF TERMS AND SCREENING PHASE REQUIREMENTS

I. Definition of Terms

A. No observed effect level (NOEL) for compliance determination is equal to IC_{25} or EC_{25}. If the IC_{25} or EC_{25} cannot be statistically determined, the NOEL shall be equal to the NOEC derived using hypothesis testing.

B. Effective concentration (EC) is a point estimate of the toxicant concentration that would cause an adverse effect on a quantal, "all or nothing," response (such as death, immobilization, or serious incapacitation) in a given percent of the test organisms. If the effect is death or immobility, the term lethal concentration (LC) may be used. EC values may be calculated using point estimation techniques such as probit, logit, and Spearman-Karber. EC_{25} is the concentration of toxicant (in percent effluent) that causes a response in 25 percent of the test organisms.

C. Inhibition concentration (IC) is a point estimate of the toxicant concentration that would cause a given percent reduction in a nonlethal, nonquantal biological measurement, such as growth. For example, an IC_{25} is the estimated concentration of toxicant that would cause a 25 percent reduction in average young per female or growth. IC values may be calculated using a linear interpolation method such as USEPA's Bootstrap Procedure.

D. No observed effect concentration (NOEC) is the highest tested concentration of an effluent or a toxicant at which no adverse effects are observed on the aquatic test organisms at a specific time of observation. It is determined using hypothesis testing.

II. Chronic Toxicity Screening Phase Requirements

A. The Discharger shall perform screening phase monitoring:

1. Subsequent to any significant change in the nature of the effluent discharged through changes in sources or treatment, except those changes resulting from reductions in pollutant concentrations attributable to source control efforts, and at least once during the Order term.

2. Screening phase monitoring data shall be included in the NPDES permit application for reissuance. The information shall be as recent as possible, but may be based on screening phase monitoring conducted within 5 years before the permit expiration date.

B. Design of the screening phase shall, at a minimum, consist of the following elements:

1. Use of test species specified in **Appendix E-2**, attached, and use of the protocols referenced in those tables, or as approved by the Executive Officer.

2. Two stages:

a. Stage 1 shall consist of a minimum of one battery of tests conducted concurrently. Selection of the type of test species and minimum number of tests shall be based on **Appendix E-2** (attached).

b. Stage 2 shall consist of a minimum of two test batteries conducted at a monthly frequency using the three most sensitive species based on the Stage 1 test results and as approved by the Executive Officer.

3. Appropriate controls.

4. Concurrent reference toxicant tests.

5. Dilution series should include the IWC, and four concentrations that bracket the IWC, or other concentrations approved by the Executive Officer.

C. The Discharger shall submit a screening phase proposal acceptable to the Regional Water Board. The proposal shall address each of the elements listed above. If within 30 days neither USEPA nor the Regional Water Board staff comments, the Discharger shall commence with screening phase monitoring.

APPENDIX E-2
SUMMARY OF TOXICITY TEST SPECIES REQUIREMENTS
Critical Life Stage Toxicity Tests for Marine and Estuarine Waters

Species	(Scientific Name)	Effect	Test Duration	Reference
Alga	*(Skeletonema costatum)* *(Thalassiosira pseudonana)*	Growth rate	4 days	1
Red alga	*(Champia parvula)*	Number of cystocarps	7–9 days	3
Giant kelp	*(Macrocystis pyrifera)*	Percent germination; germ tube length	48 hours	2
Abalone	*(Haliotis rufescens)*	Abnormal shell development	48 hours	2
Oyster Mussel	*(Crassostrea gigas)* *(Mytilus edulis)*	Abnormal shell development; percent survival	48 hours	2
Echinoderms - Urchins Sand dollar	*(Strongylocentrotus purpuratus, S. franciscanus)* *(Dendraster excentricus)*	Percent fertilization Development test	1 hour 72 hours	2
Shrimp	*(Mysidopsis bahia)*	Percent survival; growth	7 days	3
Shrimp	*(Holmesimysis costata)*	Percent survival; growth	7 days	2
Topsmelt	*(Atherinops affinis)*	Percent survival; growth	7 days	2
Silversides	*(Menidia beryllina)*	Larval growth rate; percent survival	7 days	3

Toxicity Test Requirements for Stage One Screening Phase

Requirements	Receiving Water Characteristics		
	Discharges to Coast	Discharges to San Francisco Bay[2]	
	Ocean	Marine/Estuarine	Freshwater
Taxonomic diversity	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish
Number of tests of each salinity type: Freshwater[1] Marine/Estuarine	0 4	1 or 2 3 or 4	3 0
Total number of tests	4	5	3

[1] The freshwater species may be substituted with marine species if:

(a) The salinity of the effluent is above 1 part per thousand (ppt) greater than 95 percent of the time, or

(b) The ionic strength (TDS or conductivity) of the effluent at the test concentration used to determine compliance is documented to be toxic to the test species.

[2] (a) Marine/Estuarine refers to receiving water salinities greater than 1 ppt at least 95 percent of the time during a normal water year.

(b) Fresh refers to receiving water with salinities less than 1 ppt at least 95 percent of the time during a normal water year.

ATTACHMENT F – FACT SHEET

Table of Contents

List of Tables

ATTACHMENT F – FACT SHEET

As described in section II of this Order, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for dischargers in California. Only those sections or subsections of this Order that are specifically identified as "not applicable" have been determined to not apply to this discharger. Sections or subsections of this Order not specifically identified as "not applicable" are fully applicable to this discharger.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility.

Table F-1. Facility Information

WDID	2 386009001
Discharger	City and County of San Francisco
Name of Facility	Oceanside Water Pollution Control Plant, and Collection System including the Westside Wet Weather Facilities
Facility Address	3500 Great Highway
	San Francisco, CA 94132
	San Francisco County
Facility Contact, Title and Phone	Tommy Moala, Assistant General Manager, Wastewater Enterprise (415) 554-2465
Authorized Person to Sign and Submit Reports	Arleen Navarret, Regulatory Manager, (415) 934-5731
Mailing Address	San Francisco Public Utilities Commission/Wastewater Enterprise 1155 Market St., 11th Floor, San Francisco CA 94103
Billing Address	Same as above
CIWQS Place ID	256498
CIWQS Party ID	39680
Billing Address	Same as above
Type of Facility	Publicly Owned Treatment Works
Major or Minor Facility	Major
Threat to Water Quality	2
Complexity	A
Pretreatment Program	Y
Receiving water	Pacific Ocean
Receiving Water Type	Main discharge starting at about 3.4 nautical miles from shore, CSO discharges at shoreline
Reclamation Requirements	NA
Facility Permitted Flow	43 million gallons per day (MGD), average dry weather
Facility Design Flow	Oceanside Plant 43 MGD, average dry weather design flow (providing secondary treatment) 65 MGD maximum wet weather design flow (providing secondary treatment for 43 MGD, and primary treatment for an additional 22 MGD)

	Westside Wet Weather Facilities Collection system flows greater than 65 MGD and less than 175 MGD receive the equivalent of wet weather primary treatment in the Westside Wet Weather Facilities (storage/transports) and are discharged at the Southwest Ocean Outfall. Flows greater than 175 MGD receive the equivalent of wet weather primary treatment in the Westside Wet Weather Facilities and are discharged at authorized combined sewer overflow discharge (CSOD) points.
Watershed	San Mateo Coastal
Receiving Water	Pacific Ocean
Receiving Water Type	Ocean waters

A. The City and County of San Francisco (hereinafter the Discharger) is the owner and operator of the Oceanside Water Pollution Control Plant (Plant) and Westside Wet Weather Facilities, a publicly owned treatments works (POTW). For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. The facility discharges wastewater to the Pacific Ocean, waters of the United States, and is currently regulated by Order No. R2-2003-0073, which was adopted on August 20, 2003, expiring on September 30, 2008.

C. On March 28, 2008, the Discharger filed a report of waste discharge and submitted an application for renewal of its Waste Discharge Requirements (WDRs) and National Pollutant Discharge Elimination System (NPDES) permit.

II. FACILITY DESCRIPTION

A. Description of Wastewater and Biosolids Treatment or Controls

The Discharger is the owner and operator of the Oceanside Plant and its associated collection system, a combined sewer system that includes the Westside Wet Weather Facilities. The collection system includes approximately 300 miles of sewer pipes on the west side watershed of the city that covers the areas of Richmond, Sunset, and Lake Merced as well as a small portion of Daly City. The system also includes four all weather pump stations, Seacliff #1, Seacliff #2, Pine Lake and Westside and two wet weather pump stations, Seacliff #3 and the Zoo Wet-Weather Lift Station. There are no satellite systems.

Treatment at the Oceanside Plant, which has a peak secondary treatment capacity of 43 MGD, includes coarse screening at the Westside Pump Station, fine screening and grit removal at the Plant headworks, primary sedimentation, activated sludge treatment by a pure oxygen process, and secondary clarification. Secondary treated wastewater is discharged to the Pacific Ocean, 3.4 to 3.6 nautical miles offshore, at Discharge Point 001 - the Southwest Ocean Outfall. These receiving waters are waters of the United States but are beyond the territorial waters of the State of California. During wet weather periods of high influent flow, the Oceanside Plant can provide primary treatment for an additional 22 MGD of influent flow, which, following treatment, is

blended with secondary treated wastewater (i.e., a total treatment capacity of 65 MGD) and discharged at Discharge Point 001.

The Discharger's collection system includes three large storage/transport structures – the Westside Transport, a 49.3 million gallon box-like structure located beneath the Great Highway; the Richmond Transport, a 12 million gallon structure located to the north; and the Lake Merced Transport, a 10 million gallon structure located to the south. The combined storage capacity of these "Westside Wet Weather Facilities" is 73.5 million gallons, which includes 2.2 million gallons of capacity within the sewer lines.

Collection system flows that exceed the Oceanside Plant's treatment capacity of 65 MGD, are stored in the Westside Wet Weather Facilities, which provide the equivalent of wet weather primary treatment through solids settling, skimming of floatable solids, and screening at pump stations. Combined wastewater from the storage/transport structures is pumped via the Westside Pump Station to Discharge Point 001, until the pumping capacity of the combined sewer system facilities to the outfall is reached at 175 MGD. Combined wastewater flows greater than 175 MGD also receive (the equivalent of wet weather primary treatment) treatment in the storage/transport structures but are discharged at the seven, near-shore combined sewer overflow discharge structures, authorized by this Order. These receiving waters are waters of the United States and territorial waters of the State of California. To be considered a discrete combined sewer overflow discharge event, the combined sewer overflow discharge must be separated by six hours in time from any other combined sewer overflow discharge. For the purposes of this permit, authorized treated combined sewer overflow discharges from the near-shore overflow discharge structures are referred to as combined sewer overflow discharges (CSODs). Unauthorized untreated combined sewer overflows from combined sewer systems are referred to as combined sewer overflows (CSOs).

Wastewater solids removed by settling in the Westside Wet Weather Facilities are flushed to the Plant when wet weather flows subside. Primary and secondary solids from the Plant are blended and thickened using gravity belt thickeners, anaerobically digested, dewatered, and beneficially re-used at permitted sites.

Attachment B provides a map of the area around the Plant. Attachment C provides a flow schematic of the Plant.

Based on 70 years of historical rainfall records, the Westside Wet Weather Facilities were designed to achieve a long term average of eight discrete CSOD events per year. State Water Board Order No. WQ 79-16 defines a discrete combined sewer overflow discharge event as one separated from any other combined sewer overflow discharge by at least six hours. CSOD information for the period of January 2007 through December 2007 is summarized in Table F- 2, below.

Table F-2. CSOD Summary 2007

Overflow Discharge Point	CSD-001	CSD-002	CSD-003	CSD-004	CSD-005	CSD-006	CSD-007
CSOD Structure Name	Lake Merced	Vicente St.	Lincoln Way	Mile Rock	Sea Cliff 1	Sea Cliff Sewer	Sea Cliff 2
Days with Rainfall	63	63	63	63	63	63	63
Discharge Events	2	2	2	NA	0	NA	1
Average Duration (hours)	1.64	1.71	2.19	NA	NA	NA	1.1
Average Volume/Event (million gallons.)	5.98	5.83	6.17	NA	NA	NA	7.11

B. Discharge Points and Receiving Waters

The locations of the discharge points and their receiving waters are listed in Table F-3, below.

Table F-3. Outfall Locations

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
001	Secondary Treated Wastewater, Combined Primary and Secondary Treated Wastewater and Stormwater, and the equivalent of wet weather primary treated combined Wastewater and Stormwater decant flow from a combined sewer system.	37 º 42’ 18” N	122 º 34’ 39” W	Pacific Ocean
CSD-001	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 42’ 55” N	122 º 30’ 16” W	Pacific Ocean (Fort Funston, Ocean Beach)
CSD-002	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 44’ 16” N	122 º 30’ 29” W	Pacific Ocean (Vicente St., Ocean Beach)
CSD-003	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 45’ 50” N	122 º 30’ 42” W	Pacific Ocean (Lincoln Way, Ocean Beach)
CSD-004	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 47’ 5” N	122 º 30’ 37” W	Pacific Ocean (Mile Rock)

CSD-005	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 47' 16" N	122 º 29' 30" W	Pacific Ocean (China Beach)
CSD-006	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 47' 22" N	122 º 29' 16" W	Pacific Ocean (Baker Beach)
CSD-007	The equivalent of wet weather Primary Treated Combined Wastewater and Stormwater	37 º 47' 22" N	122 º 29' 13" W	Pacific Ocean (Baker Beach)

Discharge Point 001 is located beginning about 3.4 nautical miles offshore, beyond the three nautical mile limit of the State's territorial waters. CSOD outfalls are located in the nearshore waters of the San Mateo Coastal Watershed.

C. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data

1. Effluent limitations contained in the existing Order for discharges from Discharge Point 001 (formerly Discharge Point 007) and representative monitoring data for Monitoring Location EFF-001 (formerly E-007) from the term of the previous permit are as follows:

Table F-4. Historic Effluent Limitations and Monitoring Data

Parameter	Unit	Effluent Limitation				Monitoring Data (From 12/03 to 12/07)		
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Maximum	Highest Average Monthly Discharge	Highest Average Weekly Discharge	Highest Daily Discharge
BOD_5	mg/L	30	45	---	---	33	40	---
TSS	mg/L	30	45	---	---	19	30	
Grease and Oil	mg/L	25	40	---	75	9.7	9.7	9.7
Turbidity	NTU	75	100	225	---	11	25	38
pH	s.u.	Between 6 and 9 at all times			---	5.7 minimum 8.0 maximum		
Acute Toxicity	TUa	---	---	2.58	---	---	---	1.58
Chronic Toxicity	TUc	---	---	76	---	---	---	50

2. The previous permit contained weekly monitoring requirements for bacteria in the receiving water at several surf stations, and additional surf monitoring requirements for bacteria in response to CSOD events. Requirements of the previous permit included posting notices at beaches with elevated bacteria levels until monitoring indicated bacteria were below water quality objectives. The following table summarizes periods of elevated bacteria levels during the term of the previous permit.

Table F-5. Receiving Water Surf Monitoring Summary

Wet Weather Season	Rainfall (inches)	Number of Discrete[(1)] Combined Sewer Discharges	Total Number of Days Per Year One or More Beaches Were Posted for Elevated Bacteria Counts
2003-2004	18.77	8	33
2004-2005	26.2	12	31
2005-2006	31.83	13	53
2006-2007	14.76	3	12
Average	22.89	9	32.3

(1) Discrete events are separated by at least six hours between discharges, as defined in State Water Board Order No. WQ 79-16.

D. Compliance Summary

1. **Compliance with Numeric Effluent Limitations.** During the term of Order No. R2-2003-0073, the Discharger reported exceedances of effluent limitations for BOD_5 and pH as summarized in Table F-6.

Table F-6. Summary of Effluent Violations

Date of Violation	Parameter	Effluent Limitation	Reported Value
December 31, 2005	BOD_5	30 mg/L	32.5 mg/L
December 31, 2005	BOD_5 Percent Removal	85% Removal Minimum	76% Removal
October 10, 2007	pH	Between 6 and 9 at all times	5.7

Rainfall records for San Francisco indicate that 2.12 inches of rain fell on December 31, 2005, and 0.82 inches fell on the preceding day. This may have been a “wet weather” day, in which case no exceedance occurred. Similarly on October 10, 2007, the reported date of the pH exceedance, the rainfall was 0.18 inches and the rainfall for the preceding day was 0.43 inches. This rainfall could have contributed to the low pH values. Under these circumstances, Regional Water Board staff did not recommend formal enforcement.

2. **Compliance with Permit Provisions.** A list of special activities required by Order No. R2-2003-0073 and the status toward completing those requirements are shown in Table F-7, below.

Table F-7. Permit Provisions Compliance

Provision Number	Requirement	Status of Completion
F.2 [A]	Marine Mammal Report identifying monitoring methodologies to determine presence of pathogens with potential to affect marine mammals.	Report submitted October 28, 2005.
F.4.i	Nine Minimum Controls (A) Study Plan to monitor CSOD Impacts and Controls due December 1, 2003 (B) Annual Status Reports summarizing data, evaluating CSOD impacts and controls, and proposing revisions to nine minimum controls, if necessary, due August 30 annually. (C) Final Report due 1 year prior to permit expiration.	Submitted November 26, 2003 Submitted 2004, 2005, 2006, 2007 Submitted August 30, 2007

[A] In response to concerns expressed by the National Oceanic Atmospheric Administration (NOAA) Fisheries and US Fish and Wildlife Service regarding the potential of stormwater and undisinfected wastewater from the Southwest Ocean Outfall to transmit pathogens to marine mammals, the previous permit required investigation of methods to determine impacts of human pathogens on marine mammals and conveyance of the findings in a Marine Mammal Report. On October 28, 2005, the Discharger submitted a report that concluded that little information is available regarding the environmental occurrence, fate, and transport of *T. gondii*, *S. neurona*, and Morbilliviruses, microbes of concern to marine mammals, in part because methods for detection of these microbes in the environment are insufficient.

E. Planned Changes

No changes are planned

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in the proposed Order are based on the requirements and authorities described in this section.

A. Legal Authorities

This Order is issued pursuant to the federal Clean Water Act (CWA) §402 and implementing regulations adopted by the U.S. Environmental Protection Agency (USEPA) and California Water Code (CWC) Chapter 5.5, Division 7 (commencing with §13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to CWC Article 4, Chapter 4, Division 7 (commencing with §13260). USEPA and the Regional Water Board are jointly issuing this permit. It covers Discharge Point 001, the Southwest Ocean Outfall, which is 3.4 to 3.6 nautical miles offshore in Federal waters. (The territorial waters of the State end three nautical miles from shore.) It also covers Discharge Points CSD-001 through CSD-007, which are near-shore in State waters.

Under Water Code §13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA. Likewise, pursuant to CWA §511(c), this action to reissue an NPDES permit does not trigger the requirements of the National Environmental Policy Act (NEPA) [42 U.S.C. 4321 et seq.].

B. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plans.** The *Water Quality Control Plan for the San Francisco Bay Basin* is the Regional Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State, including surface waters and groundwater. It also includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Regional Water Board and approved by the State Water Board, USEPA, and the Office of Administrative Law where required.

   Beneficial uses established by the Basin Plan for waters within the San Mateo Coastal Watershed are as follows:

Table F-8. Basin Plan Beneficial Uses

Receiving Water	Basin Plan Beneficial Uses
Territorial waters of the State of California within the Pacific Ocean	• Industrial Service Supply • Ocean, Commercial, and Sport Fishing • Shellfish Harvesting • Marine Habitat • Fish Migration • Preservation of Rare and Endangered Species • Fish Spawning • Wildlife Habitat • Water Contact Recreation • Noncontact Water Recreation • Navigation

   Requirements of this Order implement the Basin Plan.

2. **California Ocean Plan.** The State Water Board adopted the *Water Quality Control Plan for Ocean Waters of California* (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005, and it became effective on February 14, 2006. The Ocean Plan applies, in its entirety, to point source discharges to the territorial waters of the State as defined by California law to the extent that these waters are outside of enclosed bays, estuaries, and coastal lagoons. The Ocean Plan identifies the following beneficial uses of ocean waters of the State: Industrial Water Supply; Water Contact and Non-contact Recreation, Including Aesthetic Enjoyment; Navigation; Commercial and Sport Fishing; Mariculture; Preservation and Enhancement of Designated Areas of Special Biological Significance; Rare and Endangered Species; Marine Habitat; Fish Migration; Fish Spawning; and Shellfish Harvesting. To protect beneficial uses, the Ocean Plan establishes water quality objectives and a program of implementation for discharges to state territorial waters.

   Discharge Point 001, the deep water outfall, is 3.4 to 3.6 nautical miles offshore in federal waters. The territorial waters of the State end three nautical miles from shore. The Ocean Plan (Appendix 1, Ocean Waters) states, "If a discharge outside the territorial waters of the State could affect the quality of the waters of the State, the discharge may be regulated to assure no violation of the Ocean Plan will occur in

ocean waters." For the reasons set forth below, the Regional Water Board finds that the discharge at Discharge Point 001 could not affect the quality of the waters of the State during dry weather. During wet weather, the Ocean Plan defers to the Combined Sewer Overflow Control Policy, discussed in Finding K. Therefore, this Order does not regulate the discharge at Discharge Point 001 directly through the Water Board's Ocean Plan authorities.

The Discharger has compiled information demonstrating that the discharge at Discharge Point 001 during dry weather could not affect the quality of the waters of the State ("Assessment of Effects on California State Waters from the Oceanside Southeast Ocean Outfall," September 26, 2008). Regional Water Board staff has supplemented the Discharger's information with independent analysis.

a. **Receiving Water Monitoring.** The Discharger has monitored the receiving waters since the 1970s, before and after the installation of the Southwest Ocean Outfall in 1986. Aquatic biological communities, including benthic communities, do not appear to be any different near the outfall than at reference locations. Sediment quality appears to be similar as well. Since the discharge does not appear to affect water quality in the vicinity of the outfall, there is no evidence that it could affect the quality of State waters.

b. **Dilution.** This Order uses a minimum initial dilution of effluent from Discharge Point 001 of 150:1. The Discharger has submitted a study indicating that initial dilution could be over 170:1 ("Dilution Modeling for the San Francisco Southwest Ocean Outfall," City and County of San Francisco, June 2007). Substantial additional dilution occurs between the outfall and State waters, which are 0.36 nautical miles (2,200 feet) away. A worst-case estimate of this far-field dilution is over 400:1. Regional Water Board staff has concluded that such highly diluted effluent from the deep water outfall could not affect the quality of State waters.

c. **Ocean Currents.** Ocean currents at the Southwest Ocean Outfall typically move parallel to the coast, not toward State waters.

d. **Effluent Toxicity Monitoring.** The Discharger routinely monitors acute and chronic toxicity in the effluent to ensure that it complies with effluent limitations. This monitoring has never indicated a violation of toxicity limitations at the outfall. Therefore, the discharge could not cause toxicity in State waters 0.36 nautical miles away. Receiving water sediment toxicity test results corroborate this conclusion.

e. **Bacteria Monitoring.** In the 1980s, the Discharger completed an extensive study to determine how discharging primary treated effluent from the deep water outfall was affecting receiving water bacteria levels (*Wastefield Transport and Bacteriological Compliance Studies of the San Francisco Ocean Outfall CH2MHill March 1989*). The Discharger now treats its wastewater to secondary treatment standards during dry weather. Regional Water Board staff used data from that study representing primary treatment to estimate the potential effects of discharging secondary-treated effluent (staff memorandum, October 10, 2008). Estimated bacteria levels in federal waters were below Ocean Plan water quality

objectives. Therefore, the deep water discharge could not affect bacteria levels in State waters.

3. **Determination of Unreasonable Degradation of the Marine Environment.** Discharges from the Southwest Ocean Outfall are to waters of the United States beyond the territorial waters of the State of California. Federal regulations at 40 CFR 125.122 require the permitting authority to determine whether a discharge will cause unreasonable degradation of the marine environment. Based on 40 CFR 125.22(b), USEPA conducted a reasonable potential analysis using Ocean Plan objectives and included numeric permit limitations, based on the Ocean Plan's dilution procedures, for toxicity and mercury, the only numeric Ocean Plan objectives for which USEPA found reasonable potential to cause or contribute to an exceedance of water quality standards. USEPA also included narrative receiving water limitations for the Ocean Plan narrative objectives for which it found reasonable potential. For determining reasonable potential for the dioxins, USEPA based its analysis on 40 CFR 125.122(a) and used recently updated Toxicity Equivalency Factors (TEFs) published by the World Health Organization in 2005, as well as the congener-specific Bioconcentration Equivalency Factors (BEFs) used for the Great Lakes System. The "Bay Area Clean Water Agencies' Draft Dioxin Issue Paper: Expert Panel Response and Recommendations," dated April 4, 2008 recommended the use of TEFs and BEFs to develop NPDES permit limits for dioxins. This approach incorporates recent scientific information for dioxins on a congener-specific basis, while continuing to use the Ocean Plan water quality objective for dioxins (TCDD equivalents) and standards implementation procedures. Given the unique issues dioxins present, USEPA has prepared a determination of unreasonable degradation for the ten factors under 40 CFR 125.122(a) (Appendix 1 of this Fact Sheet). USEPA has determined that no unreasonable degradation of the marine environment will result from the discharges of dioxins through the Southwest Ocean Outfall as authorized under this Order, with all the limitations, conditions, and monitoring requirements in effect.

4. **Combined Sewer Overflow Control Policy.** Wet weather flows from combined sewer systems are subject to CWA §301(b)(1)(A) and are not subject to secondary treatment regulations. Wet weather flows from combined sewer systems are addressed by the Combined Sewer Overflow Control Policy (59 Federal Register 18688-18698). The *Wet Weather Water Quality Act of 2000* incorporated this policy into the CWA.

   The policy establishes a consistent national approach for controlling discharges from combined sewers to the nation's water. Using the NPDES permit program, the policy initiates a two-phased process. During the first phase, the Discharger is required to implement "nine minimum controls" (e.g., prevent dry weather overflows). These controls constitute the technology-based requirements of the Clean Water Act as applied to combined sewer facilities (i.e., best conventional pollutant control technology, BCT, and best available control technology economically achievable, BAT). The controls are intended to provide immediate and relatively low-cost water quality improvements for facilities that, unlike the Discharger, have not implemented a long-term control plan. During the first phase, the Discharger is required to initiate development of a long-term control plan to select controls to comply with water quality standards, based on consideration of the Discharger's financial capabilities.

The second phase of the process involves implementation of the long-term control plan developed in the first phase. The purpose of this long-term control plan is to comply with the CWA water quality requirements. The Discharger's program, which continues to implement the Discharger's long-term plan, is consistent with the policy. This Order implements the policy and is consistent with the Regional Water Board policy on wet weather overflows described in Basin Plan Section 4.9. During wet weather, CSODs from shoreline discharge points CSD-001 through CSD-007 and the Southwest Ocean Outfall are subject to this policy.

Ocean Plan Section III.A.4 acknowledges, "Not withstanding any other provisions in this plan, discharges from the City of San Francisco's combined sewer system are subject to the USEPA's Combined Sewer Overflow Policy." In large part, this acknowledgement is a response to State Water Board Order No. WQ 79-16 (March 23, 1979), which granted an exception from the Ocean Plan for wet weather discharges from the Discharger's diversion structures in the western-most portion of the Discharger's combined sewer system. The exception was necessary because CSODs are inherently inconsistent with certain Ocean Plan standards. In accordance with Ocean Plan procedures for granting exceptions, the State Water Board found that there were unusual circumstances not anticipated at the time of the plan's adoption (the Ocean Plan had failed to address CSODs), that beneficial uses would be protected, and that the public interest would be served. Of particular importance to the State Water Board in granting the exception was the Discharger's proposal to improve its wet weather facilities to allow only an average of eight CSODs per year. The exception was subject to several conditions, including:

- The Discharger needed self-monitoring in accordance with Regional Water Board specifications (this Order requires this in Attachment E),

- Beaches and shellfish harvesting areas potentially affected by CSODs needed to be posted (this Order requires this in Section VI.C.6.b(8)),

- To the greatest extent practical, the Discharger needed to design, construct, and operate wet weather facilities to comply with Ocean Plan requirements (this Order requires this in Section VI.C.4),

- Aside from the average of eight CSOD events per year, all other storm water runoff needed to be contained, and the discharge of all other untreated waste to waters of the State was to be prohibited (this Order requires this in Section III; the provision for eight overflow events per year is the design basis of the effluent treatment system).

5. **Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes [65 Fed. Reg. 24641 (April 27, 2000), codified at 40 CFR §131.21]. Under the revised regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards

already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.

6. **Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. This Order's technology-based pollutant restrictions implement the minimum applicable federal technology-based requirements. In addition, this Order contains effluent limitations more stringent than the minimum federal technology-based requirements. The water quality-based limits are necessary to meet water quality standards. They are not more stringent than required by the CWA.

   Water quality-based effluent limitations have been derived to implement water quality objectives that protect beneficial uses. Both beneficial uses and water quality objectives in State waters have been approved pursuant to federal law and are the applicable federal water quality standards. The procedures used for this Order to calculate individual water quality-based effluent limitations for State waters are based on the California Ocean Plan, which was approved by USEPA on February 14, 2006.

7. **Antidegradation Policy.** NPDES regulations at 40 CFR§131.12 require that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16, which incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. Water quality plans implement, and incorporate by reference, both the State and federal antidegradation policies. The permitted discharge is consistent with the antidegradation provision of 40 CFR§131.12 and State Water Board Resolution No. 68-16 because there is no increase in authorized flow and effluent limitations are at least as stringent as in the previous permit.

8. **Anti-Backsliding Requirements.** CWA Sections 402(o)(2) and 303(d)(4) and NPDES regulations at 40 CFR §122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. With the exception of acute and chronic toxicity, all effluent limitations in this Order are at least as stringent as the effluent limitations in the previous permit. Compliance with anti-backsliding requirements is discussed in section IV.C.6.

9. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the federal Endangered Species Act (16 U.S.C.A. sections 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the State. The Discharger is responsible for meeting all

requirements of applicable State and federal law pertaining to threatened and endangered species.

§7(a)(2) of the federal Endangered Species Act requires USEPA, in reissuing this NPDES permit, to ensure, after consultation with appropriate agencies, that discharges at the Southwest Ocean Outfall are not likely to jeopardize the continued existence of any threatened or endangered species or result in the destruction or adverse modification of critical habitat for such species. USEPA has initiated informal consultation with National Oceanic Atmospheric Administration (NOAA).

C. Impaired Water Bodies on CWA 303(d) List

On November 30, 2006, USEPA approved a revised list of impaired water bodies prepared by the State [hereinafter referred to as the 303(d) list] pursuant to CWA section 303(d), which requires identification of specific water bodies where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. Receiving waters for discharges from CSOD outfalls authorized by this Order are listed as impaired for indicator organisms at Baker Beach, specifically at the mouth of Lobos Creek.

1. Total Maximum Daily Loads

The Regional Water Board plans to adopt Total Maximum Daily Loads (TMDLs) for pollutants on the 303(d) list within ten years. Future review of the 303(d) list may provide schedules or result in revision of schedules for adoption of TMDLs.

2. Waste Load Allocations

The TMDLs will establish waste load allocations (WLAs) for point sources and load allocations for non-point sources, which will result in achieving the water quality standards for waterbodies. Future water quality-based effluent limitations for 303(d) listed pollutants will be based on WLAs contained in the respective TMDLs. If a TMDL is developed and WLAs are established independently for discharges of stormwater and wastewater, these WLAs may be combined to be met collectively by the wastewater and stormwater effluent loads.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the Code of Federal Regulations: section 122.44(a) requires that permits include applicable technology-based limitations and standards; and section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

A. Discharge Prohibitions

1. **Discharge Prohibition III.A**. (No discharge other than that described in this Order). This prohibition is retained from the previous permit and is based on CWC §13260, which requires filing a Report of Waste Discharge before discharges can occur. Discharges not described in the Report of Waste Discharge, and subsequently in the Order, are therefore prohibited.

2. **Discharge Prohibition III.B**. (No discharge from Discharge Point 001 that does not receive an initial dilution of at least 150:1). This prohibition is retained from the previous permit. In addition, the Order accounts for dilution of 150:1 in the reasonable potential analysis and calculation of WQBELs. The limitations in this Order may not be protective of water quality if the discharge were to not actually achieve a 150:1 initial dilution.

3. **Discharge Prohibition III.C**. (Bypass of secondary treatment is prohibited except as described by the Order on wet weather days or as provided in 40 CFR §122.41(m)(4) and in Regional Standard Provisions, and Monitoring and Reporting Requirements [Attachment G]). This prohibition is retained from the previous permit and is based on NPDES regulations at 40 CFR §122.41(m)(4).

4. **Discharge Prohibition III.D**. (Discharge at a location other than Discharge Point 001 is prohibited except for wet weather days). This prohibition is retained from Order No. R2-2003-0073 and reflects a principle objective of USEPA's *Combined Sewer overflow Control Policy* (1994) to ensure that, if CSODs occur, they are only a result of wet weather and such discharges only occur at specified locations.

5. **Discharge Prohibition III.E**. (Discharge at Discharge Points CSOD-001 through CSOD-007 is prohibited except on wet weather days). This prohibition is retained from the previous permit and reflects a principle objective of USEPA's *Combined Sewer Overflow Control Policy* (1994) to ensure that, if CSODs occur, they are only a result of wet weather.

6. **Discharge Prohibition III.F**. (Average dry weather flow not to exceed 43 MGD). This prohibition is retained from the previous permit, and is based on the design treatment capacity of the Plant. Exceedance of the design capacity may result in lowering the reliability of achieving compliance with effluent limitations.

7. **Discharge Prohibition III.G**. (CSOs are prohibited). CSOs, as opposed to CSODs, are unauthorized discharges from the combined sewer system. This prohibition is necessary because CSOs result in the release of untreated sewage.

8. **Discharge Prohibition III.H**. (Discharge of municipal or industrial sludge to the ocean is prohibited). This prohibition implements Ocean Plan discharge prohibition III.H.3.

9. **Discharge Prohibition III.J**. (Degradation of harvestable shellfish resulting from dry weather discharges is prohibited). This prohibition is retained from the previous permit and implements Ocean Plan discharge prohibition II.B.2.

B. Technology-Based Effluent Limitations

1. Scope and Authority

a. CWA section 301(b) requires USEPA to develop secondary treatment standards for publicly owned wastewater treatment facilities. These standards implement the level of effluent quality attainable through application of secondary or equivalent treatment. USEPA promulgated technology-based effluent guidelines for POTWs at 40 CFR §133. These Secondary Treatment Regulations include the following minimum requirements, which apply to the Plant during dry weather.

Table F-9. Secondary Treatment Requirements

Parameter	30-Day Average Limitation	7-Day Average Limitation
BOD_5 (1)	30 mg/L	45 mg/L
$CBOD_5$ (2)	25 mg/L	40 mg/L
TSS (1)	30 mg/L	45 mg/L
pH	6.0 – 9.0	

(1) The 30-day average percent removal shall not be less than 85 percent.

(2) At the option of the permitting authority, these effluent limitations for $CBOD_5$ may be substituted for BOD_5 limitations.

b. The USEPA Combined Sewer Overflow Control Policy establishes the technology based requirements for combined sanitary sewer systems, which requires implementation of the Nine Minimum Controls. Related requirements are included in section VI.C.6.b. of this Order.

2. Applicable Technology-Based Effluent Limitations

This Order retains the following technology-based effluent limitations, applicable to discharges at Discharge Point 001 during dry weather, as determined at Monitoring Location EFF-001.

a.. **Compliance with limits.** The Discharger shall comply with the following effluent limitations shown in Table F-10.

Table F-10.Technology-based Effluent Limitations – Discharge Point 001

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
BOD_5 @ 20°C	mg/L	30	45	---	---	---
TSS[(1)]	mg/L	30	45	---	---	---
pH	Standard units	---	---	9.0	6.0	9.0

The pH requirement is retained from the previous permit and is established by USEPA's Secondary Treatment Regulations at 40 CFR Part 133 and by Ocean Plan Table A.

b. Percent Removal. Based on Secondary Treatment Regulation at 40 CFR §133.102 and 133.103 and previous permit limits the average monthly percent removal of BOD_5 at 20°C and TSS shall not be less than 85%.

C. Water Quality-Based Effluent Limitations (WQBELs)

1. Scope and Authority

CWA section 301(b) and section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards. This Order contains requirements, expressed as a technology equivalence requirement, more stringent than secondary treatment requirements that are necessary to meet applicable water quality standards.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in the Ocean Plan.

2. Minimum Initial Dilution

In accordance with the Ocean Plan, water quality-based effluent limits reflect the minimum initial dilution of the effluent as it reaches the receiving water. The minimum initial dilution can be estimated by experimental observation and computer

simulation. The reasonable potential calculation for this Order is based on a dilution ratio of 150:1. This is based on an updated dilution model submitted by the Discharger that averaged UM3 and NRFIELD results and utilized averaged oceanographic data from 1988. If the Discharger provides new information to use with new dilution modeling (see provision VI.C.2.b of this Order), any new results based on updated oceanographic data may be considered for the next permit reissuance.

3. Determining the Need for WQBELs

This Order is based on a reasonable potential analysis based on procedures described in Ocean Plan Section III.C and Ocean Plan Appendix VI to determine the need for WQBELs. In general, the procedure is a statistical method that evaluates an effluent data set while taking into account the averaging period of water quality objectives, the long term variability of pollutants in the effluent, limitations associated with sparse data sets, and uncertainty associated with censored data sets. The procedure assumes a lognormal distribution of the effluent data set and compares the 95th percentile concentration at 95 percent confidence for each pollutant in Ocean Plan Table B, accounting for dilution, to the applicable water quality criterion in Ocean Plan Table B. The reasonable potential analysis results in one of three endpoints.

Endpoint 1 – There is “reasonable potential,” and a WQBEL and monitoring are required.

Endpoint 2 – There is no “reasonable potential.” A WQBEL is not required, but monitoring may be required.

Endpoint 3 – The analysis is inconclusive. There are less than 3 detects or more than 80% of samples are non-detect. Any existing WQBEL is retained, and monitoring is required.

The Ocean Plan reasonable potential analysis involves five paths:

a. First Path

If available information about the receiving water or the discharge supports a finding of reasonable potential without analysis of effluent data, the permitting authority may decide that WQBELs are necessary after a review of such information. Such information may include the facility or discharge type, solids loading, lack of dilution, history of compliance problems, potential toxic effects, fish tissue data, 303(d) status of the receiving water, presence of threatened or endangered species or their critical habitat, or other information.

b. Second Path

If any pollutant concentration, adjusted to account for dilution, is greater than the most stringent applicable water quality criterion, there is reasonable potential for

that pollutant to cause or contribute to exceedances of water quality standards, and a WQBEL is required.

c. Third Path

If the effluent data contains three or more detected and quantified values (i.e., values that are at or above the Minimum Level [ML]), and all values in the data set are at or above the ML, a parametric reasonable potential analysis is conducted to project the range of possible effluent values. The 95th percentile concentration is determined at 95 percent confidence for each pollutant, and compared to the most stringent applicable criterion to determine reasonable potential. A parametric analysis assumes that the range of possible effluent values is distributed lognormally. If the 95th percentile value is greater than the most stringent applicable criterion, there is reasonable potential for that pollutant to cause or contribute to exceedances of water quality standards and a WQBEL is required.

d. Fourth Path

If the effluent data contains three or more detected and quantified values (i.e., values that are at or above the ML), but at least one value in the data set is less than the ML, a parametric reasonable potential analysis is conducted according to the following steps.

(1) If the number of censored values (those expressed as a “less than” value) account for less than 80 percent of the total number of effluent values, calculate the M_L (the mean of the natural log of transformed data) and S_L (the standard deviation of the natural log of transformed data) and conduct a parametric reasonable potential analysis, as described above for the Third Path.

(2) If the number of censored values account for 80 percent or more of the total number of effluent values, conduct a non-parametric reasonable potential anlaysis, as described below for the Fifth Path. (A non-parametric analysis becomes necessary when the effluent data are limited, and no assumptions can be made regarding its possible distribution.)

e. Fifth Path

A non-parametric reasonable potential analysis is conducted when the effluent data set contains less than three detected and quantified values, or when the effluent data set contains three or more detected and quantified values but the number of censored values account for 80 percent or more of the total number of effluent values. A non-parametric analysis is conducted by ordering the data, comparing each result to the applicable criterion, and accounting for ties. The sample number is reduced by one for each tie, when the dilution-adjusted method detection limit (MDL) is greater than the criterion. If the adjusted sample number, after accounting for ties, is greater than 15, the pollutant has no reasonable potential to exceed the water quality standards. If the sample number

is 15 or less, the analysis is inconclusive, monitoring is required, and any existing effluent limits in the expiring permit are retained.

4. Reasonable Potential Analysis

Table F-11 presents results of the reasonable potential analysis. Data used for this analysis are from October 2003 to December 2007 for most inorganics, and from November 2003 to November 2007 for most organics. A dilution of 150:1 was assumed as explained above. The analysis was performed in accordance with Ocean Plan procedures. The endpoint for each criterion is identified. Results show "reasonable potential" for mercury, and as a result, this Order establishes an effluent limitation for mercury. An effluent limit is retained for chronic toxicity because monitoring under the previous permit showed toxicity levels close to the limit.

As shown in the table, the reasonable potential analysis commonly resulted in Endpoint 3, meaning that the analysis is inconclusive, when a majority of the effluent data is reported as ND (not detected). In these circumstances, the "inconclusive" result is an indication of no concern for a particular pollutant; however, continued monitoring is required during the term of the permit.

a. TCDD Equivalents. The calculations to complete a reasonable potential analysis for TCDD equivalents were more complicated than the analysis for other individual pollutants since each sample is analyzed for 16 congeners (Attachment E Section IV.A). For each of the 18 samples (collected between March 2003 and November 2007) the TCDD equivalent of each congener was calculated. When a congener was identified as DNQ (detected but not quantified), then the detection limit value was used in determining the TCDD equivalent for that sample. For each congener in each sample, the TCDD equivalent was calculated using the TEF and BEF as described in Attachment A TCDD equivalents. To determine the TCDD equivalent for each sample, the TCDD equivalents of each congener in that sample were summed.

The State Water Board has developed a reasonable potential calculator (RPcalc 2.0) for use with the Ocean Plan. The use of this program is described at http://www.waterboards.ca.gov/water_issues/programs/ocean/docs/trirev/stakeholder050505/rphelp20.pdf The calculator is available at the State Water Board's web site: www.waterboards.ca.gov/plnspols/docs/oplans/rpcalc.zip. The calculator was used to determine the need for TCDD equivalents limits in this Order.

To determine the upper 95th upper confidence bound for the 95th percentile the TCDD equivalent value for the set of 18 samples, the TCDD equivalent value for each sample, or zero for samples with no congeners detected, was entered into the RPcalc program. The results, using a dilution ratio of 76:1, showed no reasonable potential for TCDD equivalents. Therefore, there would also be no reasonable potential assuming 150:1 dilution.

b. Chronic Toxicity. The reasonable potential analysis shown in Table F-11 does not show reasonable potential for chronic toxicity when accounting for at least 150:1 dilution; however, USEPA finds reasonable potential by the first path identified above because monitoring data collected during the term of the previous permit showed chronic toxicity at levels close to the limit and because similar excursions could occur in the future.

c. Total Chlorine Residual. On May 17, 1989, the Regional Water Board adopted Order No. 89-71, amending Order No. 88-106 to delete disinfection requirements for the effluent. The Regional Water Board action was based on the Discharger's technical report dated April 3, 1989, *Wastefield Transport and Bacteriological Compliance Studies of the San Francisco Ocean Outfall*. The studies were conducted in 1987 and 1988. The findings indicated that the non-disinfected wastewater discharge from the Discharge Point 001 did not violate the Ocean Plan bacteriological body-contact standards. There is no disinfection of the effluent and thus no potential for disinfectant residuals or by-products, for example from chlorine, to impact the effluent.

Table F-11. Reasonable Potential Analysis Results for the Discharge Point 001

Table B Pollutant	Most Stringent WQO (µg/L)[1]	No. of Samples	No. of Non-Detects	Max Effluent Conc. (µg/L)	Result, Comment

Table notes

(1) Ocean Plan Table B Water Quality Objectives limiting concentrations are 6-month median values.
(2) Chronic toxicity is based on a daily maximum.
(3) Measured in pCi/L, radioactivity not to exceed limits specified in Title 17, Division 1, Chapter 5, Subchapter 4, Group 3, Article 3, Section 30253 of the CCR§30253.
(4) Reasonable Potential was not found by calculation but was an issue in the previous permit and effluent limits retained, also monitoring is required in the Ocean Plan (Section III.C.c.(4))
(5) Chlorine is not added to the effluent for disinfection, or any other purpose, and there is no monitoring for residual chlorine
(6) The Ocean Plan does not require monitoring for acute toxicity and previous monitoring did not show reasonable potential.

- NA indicates that effluent data is not available.
- ND indicates that the pollutant was not detected.

5. WQBEL Calculations

As described by Section III. C of the Ocean Plan, Effluent limits for Table B pollutants that show reasonable potential are calculated according to the following equation.

$$Ce = Co + Dm (Co – Cs)$$

Where

Ce = the effluent limitation (µg/L)

Co = the concentration (the water quality objective) to be met at the completion of initial dilution (µg/L).

Cs = background seawater concentration (µg/L)

Dm = minimum probable initial dilution expressed as parts seawater per part wastewater

a. **Mercury**

The reasonable potential analysis showed reasonable potential for mercury because the maximum monthly average mercury concentration in the effluent was 12 µg/L, which when accounting for dilution of 150:1, results in a concentration of 0.08 µg/L, which is above the six-month median water quality objective of 0.04 µg/L. Therefore, this Order establishes mercury WQBELs as described below:

Co (6-month median) = 0.04 µg/L
Co (daily maximum) = 0.16 µg/L
Dm = 149 (based on a dilution of 150:1)
Cs = 0.0005 µg/L (based on Ocean Plan Table C)

Ce (6-month median) = Co (6-month median) + Dm (Co – Cs) = 5.9 µg/L
Ce (daily maximum) = Co (daily maximum) + Dm (Co – Cs) = 24 µg/L

b. **Chronic Toxicity**

The reasonable potential analysis using the Ocean Plan calculation method did not show reasonable potential for chronic toxicity (accounting for at least 150:1 dilution); however, USEPA finds reasonable potential because monitoring under the previous permit showed chronic toxicity at levels close to the limit and since similar excursions may occur that limit is retained in this Order. A chronic toxicity WQBEL may be calculated as follows:

Co (daily maximum) = 1.0 TUc
Dm = 149 (based on a dilution of 150:1)
Cs = 0 TUc (based on Ocean Plan Table C)
Ce (daily maximum) = Co (daily maximum) + Dm (Co – Cs) = 150 TUc

6. Anti-Backsliding/Antidegradation

Most effluent limitations established by this Order are at least as stringent as limitations in the previous permit; and therefore, CWA anti-backsliding requirements are not triggered. As for acute toxicity, monitoring required under the previous permit did not show any reasonable potential. Also, the Ocean Plan does not require acute toxicity limits for this type of discharge, but does require monitoring and an effluent limit for chronic toxicity. Thus, this permit does not contain an acute toxicity limit but does require continued monitoring, and it imposes a chronic toxicity limit.

As for chronic toxicity, the new limit is higher than the limit in the previous permit; however, this is permissible under anti-backsliding regulations. Although the permittee did not exceed the chronic toxicity limit in the previous permit, the previous permit allowed the removal of ammonia prior to chronic toxicity testing. This Order does not allow removal of ammonia prior to toxicity testing because ammonia may contribute to toxicity in the receiving water. Accordingly, the Discharger's toxicity monitoring requirements have been modified. Data provided by the Discharger

indicate that a chronic toxicity limit of 76 cannot consistently be met without ammonia removal. Therefore, this Order applies the new dilution factor of 150:1 to calculate the chronic toxicity limit and relies on the backsliding exceptions under CWA Sections 402(o)(2)(B)(i) and 402(o)(2) (E), and 40 CFR 122.44(l)(2)(b)(1) and 122.44(l)(2)(i)(E).

Because this Order does not authorize an increased rate of discharge or increased pollutant loadings to receiving waters, the antidegradation requirements of 40 CFR 131.13 and State Water Board Resolution No. 68-16 are also satisfied.

D. Land Discharge Specifications

Not Applicable.

E. Reclamation Specifications

Not Applicable.

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

This Order is designed to minimize the influence of the discharge on the receiving water. Ocean Plan Section II serves as the basis for the receiving water limitations specified in Section V.A of the Order. These limits are needed to ensure that the receiving water complies with Ocean Plan water quality objectives and therefore protects beneficial uses.

VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

NPDES regulations at 40 CFR 122.48 require that all NPDES permits specify requirements for recording and reporting monitoring results. CWC §13267 and §13383 authorize the Regional Water Board to require technical and monitoring reports. In addition, the Ocean Discharge Criteria (40 CFR Part 125, subpart M) authorize actions necessary to prevent unreasonable degradation of the marine environment. The Monitoring and Reporting Program (MRP), Attachment E, establishes monitoring and reporting requirements to implement federal and State requirements. The rationale for the monitoring and reporting requirements contained in the MRP for this facility is presented below.

A. Influent Monitoring

In general, influent monitoring requirements are unchanged from the previous permit. Influent monitoring requirements for BOD_5 and TSS are necessary to determine compliance with this Order's 85 percent removal requirement. Influent monitoring for tributyltin and TCDD equivalents are no longer required because previous monitoring has provided for characterization of these pollutants in influent wastewater.

The influent monitoring location remains unchanged, but this Order revises its name for consistency with other NPDES permits in California.

B. Effluent Monitoring

In general, effluent monitoring requirements for discharges from Discharge Point 001 are retained from the previous permit, with the following exceptions:

- Monitoring for toxic pollutants has been updated to reflect the most recent list of pollutants in Ocean Plan Table B.
- Monitoring for mercury is required one time per month to determine compliance with new mercury effluent limitations.
- The monitoring frequency for chronic toxicity has been set at once per quarter. Monitoring data collected each month during the term of the previous permit showed results consistently below effluent limitations.

The effluent monitoring location for Discharge Point 001 has not changed; however, its name has been changed from E-007 to EFF-001, for consistency with other NPDES permits in California.

Monitoring requirements for discharges at a representative CSOD outfall are retained from the previous permit. However, this Order establishes an additional requirement to monitor for the Table B pollutants not currently monitored at this outfall to further characterize these discharges for future reasonable potential analysis.

C. Whole Effluent Toxicity Testing Requirements

The Discharger is required to conduct chronic toxicity tests as described in the MRP (Attachment E) using the Echinoderm Embryo Development test in accordance with the USEPA approved method in 40 CFR 136 (currently *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms*, August 1995).

The Discharger performed a screening phase study prior to the expiration of the previous permit for the most sensitive West Coast marine species. The results of this study indicated that the giant kelp germination and growth test was the most sensitive, but suggested the test was variable in part due to the availability and quality of field-collected organisms, and suggested the use of the echinoderm embryo development test because gravid species of two alternate echinoderms, the sand dollar and the purple urchin, could alternately be obtained year-round.

This Order retains the requirement to conduct chronic toxicity monitoring with the echinoderm embryo development test and requires the Discharger to re-screen for the most sensitive species once during the term of this Order.

D. Receiving Water Monitoring

Receiving water monitoring is necessary to ensure compliance with the receiving water limits specified in Section V.A of the Order. Requirements to monitor bacteria in shoreline receiving waters and to conduct recreational use surveys, in the Provisions of

the Order, Section VI.6.(9), during and immediately after CSOD events are retained from the previous permit. The monitoring requirements in MRP (Attachment E) sections IV, VIII, and X are sufficient to characterize receiving water quality.

E. Other Monitoring Requirements

Requirements of the Southwest Ocean Outfall Offshore Monitoring Program are retained from the previous permit to determine the effect of the discharge on sediment quality in the vicinity of the outfall and to determine whether pollutants are bioaccumulating in fauna. The program includes monitoring at 45 locations, including 24 reference locations that are unaffected by the discharge. Monitoring includes chemical and physical analysis of sediment, analysis of the benthic (bottom) community, and analysis of fish and macroinvertebrate species collected by trawling.

1. Offshore Monitoring Program History

In 1986, the Southwest Ocean Outfall was completed to transport primary treated wastewater from the Richmond-Sunset Plant, which was replaced in 1993 by the Oceanside Plant. Monitoring conducted from 1986 to 1996 indicated that a single reference location was inadequate to fully characterize background conditions and to determine whether observed differences between monitoring locations were attributable to natural variation or to the discharge. These early studies also showed that the season or time of year had the greatest impact on study results, and that the relatively close proximity of the Southwest Ocean Outfall to the mouth of the San Francisco Bay confounded interpretation of monitoring results due to the effects of outflow near the Golden Gate.

Following collaboration between the Discharger and USEPA, when the Discharger's permit was reissued in 1997, the study area was expanded to include multiple reference sites, and monitoring frequency was reduced to once per year, in the Fall. In the permit, seven fixed monitoring sites were retained, and an additional 40 monitoring locations were added using USEPA's Environmental Monitoring Assessment Program (EMAP) random sample site selection process. The expanded study area included reference locations in the Gulf of the Farallones and the Monterey Bay National Marine Sanctuaries.

In 2002, additional benthic monitoring locations, south of the discharge pipe, were included in the program to investigate whether the pipe structure itself was affecting benthic infauna abundance through an induced reef affect. When the Discharger's permit was reissued in 2003, the number of required trawls was reduced from eight to two, following observation of no differences among mobile organisms between outfall and reference locations, and in an effort to reduce mortality of collected organisms. At that time, some sediment monitoring locations were also removed from the program because they were found to be inconsistent with the rest of the study area.

As stated in Order No. R2-2003-0073, "This program will be implemented dynamically to maximize the amount of relevant and useful data that can be gathered within the five-year permit life by allowing the EPA, the Regional Water Board, and the City and

County of San Francisco to agree to program corrections in response to ongoing analyses of monitoring data."

2. Monitoring Results from Previous Permit

In January 2006, the Discharger submitted the most recent summary report covering the years from 1997 through 2004. The report indicates no adverse trends in sediment characteristics as a result of the discharge. The mean particle sizes at the outfall area have not changed since pre-construction and pre-discharge periods, which suggests that the Southwest Ocean Outfall does not affect sediment grain size distribution. Additional data collected in 2005 and 2006 show that the outfall area continues to reflect pre-construction and pre-discharge sediment grain size distribution.

Chemical analysis for total solids; total volatile solids; total organic carbon; total Kjeldahl nitrogen; organic pollutants, such as PAHs, PCBs, and DDTs; and trace metals were used to assess the chemical quality of the sediment. Total volatile solvent measurements correlated with areas with high fractions of silt and clay, while total organic carbon and total Kjeldahl nitrogen results correlated with areas of fine sand. All three parameters are historically highest in the northern reference region, indicating little influence of the Southwest Ocean Outfall discharge on these parameters. Sediment chemical quality data collected in 2005 and 2006 indicate that reference stations exceeded tolerance bounds derived from previous monitoring data for percent silt and clay and total organic carbon, but outfall areas were within tolerance bounds for all constituents.

PAH contaminants were present in the sediments prior to discharge and, over the 8 years of measurements, appear to be transitory and affected by sediment movement via currents and winter storms. Concentrations were compared to the Effects Range Medium (ERM) of Sediment Quality Guidelines, which are concentrations of individual compounds that demonstrate the 50% probability of toxic effects. No ERM values for any individual PAH, PCB, or DDT were exceeded during the eight year period. Trace metal analysis of the sediment resulted in consistent exceedances of the ERM values for nickel during the eights years of monitoring; however, nickel occurs naturally in large amounts in the San Francisco Bay area. Overall, the sediment data for the eight years between 1997 an 2004 indicate that the Southwest Ocean Outfall discharge has not negatively affected sediment quality. In 2005, concentrations of 18 PAHs and three PCBs were detected throughout the study area, and total DDTs were detected at three stations. One DDT and 18 PAH compounds were detected in the sediment in 2006. Cadmium, nickel, zinc, and selenium were significantly lower at outfall stations in 2005 over the 2004 results, while nickel concentrations were elevated at all stations in the study area in 2005 and 2006, similar to previous years. Arsenic, selenium, and silver were significantly higher at outfall stations in 2006 versus 2005, while aluminum and mercury were significantly lower at outfall stations in 2006 versus 2005.

The trend of the benthic community analysis over the eight year period indicated that community abundance was more affected by climate than by the discharge, because decreases in abundance correlated with reduced upwelling of the California Current, associated with oceanographic events like El Niño. Analyses of demersal fish and

epibenthic invertebrate communities for the eight year period did not indicate any apparent effects related to the Southwest Ocean Outfall and observed differences in species composition and abundance correlated with El Niño and La Niña events. Benthic infauna community abundance decreased in 2005 and 2006 to the lowest documented overall abundance for the previous ten years. The local upwelling index in 2004 through 2006 was lower than normal, and the sequential years of decreased summer current upwelling occurrences may be related to an overall increase in infauna abundance. Trawl organisms collected in 2005 and 2006 represented a general assortment of native species common to central California near-shore communities; however, the demersal fish community measures of abundance and diversity were at or below the lower tolerance bounds for the outfall location in 2006. Physical anomalies of collected species were similar in all the 2004, 2005, and 2006 sample events.

Samples were screened for physical anomalies, and tissues were analyzed for bioaccumulative substances. Overall organism conditions were similar between the outfall locations and reference locations. The English sole and the Dungeness crab were species selected for bioaccumulation analysis. Three DDTs, 11 PAHs, and 31 PCB congeners were detected in the liver and hepatopancreas tissues. PCB concentrations were statistically significantly higher in the livers of fish collected from the outfall area over those of fish collected in the reference area throughout the study years, and total PAHs frequently exceeded the screening value in all tissue types in organisms from both the reference and outfall areas. There were not any statistically significant trends in bioaccumulation in any organism from either the reference or outfall areas, nor any trends between organism tissue and sediment concentrations. Mercury levels in fish muscle and zinc concentrations in the fish liver at the outfall area were significantly greater than those sampled in the reference area; however, all concentrations were below the mercury screening value the Discharger chose for the purposes of the study (mercury 0.5 ppm wet weight, and zinc 1500 ppm wet weight). Total PAH concentrations above the screening value were detected in every tissue type (except for fish liver) at both the reference and outfall locations in 2005, and were detected above the screening value in fish liver in 2006. Trace metal concentrations in 2005 and 2006 were similar to previous years and were similar to California coastal organisms in other studies.

VII. RATIONALE FOR PROVISIONS

A. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in Attachment D to the Order.

Section 122.41(a)(1) and (b) through (n) establish conditions that apply to all State issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in the Order. Section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with section 123.25, this Order omits federal conditions that address enforcement authority specified

in sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

B. Monitoring and Reporting Program

The rationale for these requirements is described in Section VI, above and in Attachment G, Regional Standard Provisions and Monitoring Requirements for NPDES Wastewater Discharge Permits, July 2009.

C. Special Provisions

1. Reopener Provisions

These provisions are based on 40 CFR Part 123 and allow future modification of this Order and its effluent limitations as necessary.

2. Special Studies, Technical Reports and Additional Monitoring Requirements

a. Combined Sewage Collection System Overflow Study

The combined sewer system commingles storm water and domestic and industrial sewage. Heavy storm events can potentially result in flows that exceed the collection system capacity, at least in some areas. Although all overflows would be captured by the collection system at another point and not be discharged to surface waters, the presence of storm water and sewage on and around streets and sidewalks where human exposure could occur would constitute a nuisance as defined by CWC §13050. Such nuisances are prohibited by Regional Standard Provisions, and Monitoring and Reporting Requirements for NPDES Wastewater Discharge Permits (Attachment G). The purpose of this study is to determine whether nuisance conditions occur during wet weather and, if so, the extent to which they occur and what can be done to minimize or eliminate them.

b. Dilution Model Update and Stratification Data Collection

The available ambient data to determine stratification for the purposes of dilution modeling for this discharge is out-dated and incomplete. This provision requires the Discharger to submit updated data during the next permit reissuance to support new findings related to the most appropriate dilution allowance.

3. Best Management Practices and Pollution Prevention

The provision to continue implementation of a Pollutant Minimization Program is retained from the previous permit and is based on Ocean Plan Section C.9. The provision for pollution prevention is also required as one of the Nine Minimum Controls for combined sewer systems, described in under item 6, below.

4. Construction, Operation, and Maintenance Specifications

a. Wastewater Facilities, Review and Evaluation, and Status Reports

This provision is retained from the previous permit.

b. Operations and Maintenance (O&M) Manual, Review and Status Reports

This provision is based on 40 CFR Part 122 and is retained from the previous permit.

c. Contingency Plan, Review, and Status Reports

This provision is required by Regional Water Board Resolution No. 74-10 and 40 CFR Part 122, and is retained from the previous permit.

5. Special Provisions for Municipal Facilities

a. Pretreatment Program Requirements. This provision requires the Discharger to implement and enforce its approved pretreatment program in accordance with federal pretreatment regulations at 40 CFR Part 403.

b. Sludge Management Practices Requirements. This provision is based on the Basin Plan Chapter IV, Section 14.17, and 40 CFR Parts 257 and 503.

6. Combined Sewer Overflow Control Policy Requirements

The requirements of this provision specify performance criteria for operating the Combined Sewer System under wet weather controls, and are retained from the previous permit. The USEPA *Combined Sewer Overflow Control Policy* (59 FR 18688) regulates the operation of combined sewer systems. The Discharger has designed, constructed, and implemented control and treatment strategies that effectively address wet weather flow conditions, including treatment for 100% of the combined effluent.

The requirements of the USEPA *Combined Sewer Overflow Control Policy* are summarized below:

a. CSO Operation Plan. The Operation Plan is required as part of the Nine Minimum Controls and is revised as necessary to include the long term controls implemented in the long term control plan. This Order retains a provision to revise and update this Plan.

b. Nine Minimum Controls. The Combined Sewer Overflow Control Policy requires "Nine Minimum Controls" to satisfy the CWA technology-based requirements regarding CSOs. These are specifically stated in the provisions of this Order (Section VI.C.6.b) and described generally below .

(1) Conduct proper operations and regular maintenance programs. This control includes a requirement for continuing development and implementation of an Operations Plan.

(2) Maximize use of the collection system for storage. This control refers specifically to the sewer lines, which provide 2.2 million gallons of storage.

(3) Review and modify pretreatment program. This control is intended to minimize the impacts of non-domestic discharges.

(4) Maximize flow to the Plant. Maximizing flow to the Plant maximizes the volume of combined sewer flow treated.

(5) Prohibit CSOs during dry weather. The CWA prohibits CSOs during dry weather, and that prohibition is implemented as one of the Nine Minimum Controls.

(6) Control solid and floatable materials in the CSOs. The control of solids and floatable material is implemented via a baffle system within the combined sewer system and removal of the collected solids captured in the storage/transports.

(7) Develop and implement a Pollution Prevention Program. The Discharger is required to implement a Pollution Prevention Program, as described in section VI.C.3.a. of this Order.

(8) Notify the public of overflows. The Discharger's current notification process fulfills these requirements. The process includes permanent information signs at all beach locations around the perimeter of San Francisco. These signs inform the public in English, Spanish, and Chinese that international NO SWIMMING signs will be posted when it is unsafe to enter the water, and they warn users that bacteria concentrations may be elevated during periods of heavy rainfall. NO SWIMMING signs are posted at beach locations whenever an overflow occurs in the vicinity. These signs remain posted until water sampling indicates that bacteria concentrations have dropped below the level of concern for water contact recreation. Both signs reference the Discharger's toll-free water quality hotline (1-877-SFBEACH), which is updated weekly or whenever beach conditions change. The Discharger also provides color coded indicators (green/open; red/posted) of beach water quality conditions on the Internet (http://beaches.sfwater.org).

(9) Monitor to effectively characterize overflow impacts and the efficacy of CSOD controls. Monitoring requirements established by this Order include all of the Ocean Plan Table B toxic pollutants to better characterize the potential impacts of CSODs on the receiving water.

c. Long-Term Control Plan. In conformance with the *Combined Sewer Overflow Control Policy*, the Discharger developed a long-term control plan to select CSOD controls to comply with water quality standards, based on consideration of the Discharger's financial capability. The purpose of the long-term control plan is to fulfill the water quality-based requirements of the Clean Water Act. The Discharger's program is consistent with the USEPA *Combined Sewer Overflow Control Policy* Presumptive Approach, which presumes that an adequate level of

control is provided to meet the water quality requirements of the CWA contingent upon the satisfaction of any of the following criteria: (1) no more than an average of four overflow events per year, provided that the permitting authority may allow up to two additional overflow events per year (for the purpose of this criterion, an overflow event is one or more CSOs as a result of a precipitation event that does not receive the minimum treatment provided below); (2) the elimination or capture for treatment of no less than 85 percent by volume of the combined sewage collected in the system during precipitation events on a system-wide annual average basis; or (3) the elimination or removal of no less than the mass of pollutants, identified as causing water quality impairment through the sewer system characterization, monitoring, and modeling effort, for the volumes that would be eliminated or captured for treatment under (2) above. Combined sewer overflow treatment shall be a minimum of primary clarification for removal of floatables and settleable solids, solids and floatables disposal, and if necessary to meet water quality standards, disinfection.

The Discharger will continue to implement the Long-Term Control Plan and will characterize combined sewer discharges and the efficacy of the Long-Term-Control-Plan controls through combined sewer discharge monitoring, a requirement that is carried over from the previous permit.

The CSODs are consistent with the requirements of the Presumptive Approach because the Discharger captures and provides treatment to 100 percent of the combined sewer flow, which is greater than the minimum treatment requirement of 85 percent specified under the Presumptive Approach, and results in zero untreated CSOs per year. The effluent is not disinfected because State Water Board Order No.79-16 concluded that allowing an average of eight CSODs per year from Ocean Plan requirements would serve the public interest and would not compromise beneficial uses of the receiving waters.

7. Sensitive Areas Feasibility Report for Overflows

Under the Combined Sewer Overflow Control Policy, the combined sewer discharge points for the Oceanside plant are located in a sensitive area where primary contact recreation occurs. Section II. C. 3 of the Combined Sewer Overflow Control Policy, “Consideration of Sensitive Areas,” states that the Discharger’s long-term combined sewer overflow control plan should:

a. Prohibit new or significantly increased overflows;

b. (1) Eliminate and relocate overflows that discharge to sensitive areas wherever physically possible and economically achievable, except where elimination or relocation would provide less environmental protection than additional treatment.

(2) Where elimination or relocation is not physically possible and economically achievable, or would provide less environmental protection than additional treatment, provide the level of treatment for remaining

overflows deemed necessary to meet WQS for full protection of existing and designated uses. In any event, the level of control should not be less than those described in Evaluation of Alternatives below; and

c. Where elimination or relocation has been proven not to be physically possible and economically achievable, permitting authorities should require, for each subsequent permit term, a reassessment based on new or improved techniques to eliminate or relocate, or on changed circumstances that influence economic achievability."

The Discharger is to submit a report, no later than two years after the effective date of this Order, implementing the "consideration of sensitive areas" section of the Combined Sewer Overflow Control Policy. At a minimum, the discharger is to assess techniques to eliminate or relocate CSODs to sensitive areas, and discuss the level of treatment for any remaining CSODs necessary to meet water quality standards.

VIII. PUBLIC PARTICIPATION

The Regional Water Board is considering the issuance of waste discharge requirements (WDRs) that will serve as a National Pollutant Discharge Elimination System (NPDES) permit for City and County of San Francisco Oceanside Water Pollution Control Plant and Collection System, including the Westside Wet Weather Facilities. As a step in the WDR adoption process, Regional Water Board staff has developed tentative WDRs. The Regional Water Board encourages public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and has provided an opportunity to submit their written comments and recommendations. Notification was provided through a public notice in the San Francisco Recorder during the time period June 8 to June 14, 2009.

Staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments must be submitted either in person or by mail or email to

Derek Whitworth
San Francisco Bay Regional Water Quality Control Board
1515 Clay St., Suite 1400
Oakland, CA 994612

Phone: 510 622 2349
Email: DWhitworth@waterboards.ca.gov

Written comments must be received at the Regional Water Board offices by 5:00 p.m. on July 6, 2009, to be given full consideration and to be fully responded to by Regional Water Board staff.

B. Public Hearings

The Regional Water Board will hold a public hearing on the tentative WDRs during its regular meeting on the following date and time and at the following location:

Date: August 12, 2009
Time: 9:00 a.m.
Location: Elihu Harris State Office Building
1515 Clay Street, 1st Floor Auditorium
Oakland, CA 94612

Interested persons are invited to attend. At this public hearing, the Regional Water Board will hear testimony, if any, on this Tentative Order.. Oral testimony will be heard; however, for accuracy of the record, important testimony should be in writing.

The Order may then be adopted by the Regional Water Board and USEPA at the subsequent hearing to be held on September 9, 2009, at the same time and place.

Please be aware that dates and venues may change. One can access the current agenda for any changes at: www.waterboards.gov/sanfranciscobay.

C. Waste Discharge Requirements Petitions

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Water Board regarding the final WDRs. The petition must be submitted within 30 days of the Regional Water Board's action to the following address:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

D. Information and Copying

The Report of Waste Discharge, related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Copying of documents may be arranged by calling 510-622-2300.

E. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this facility, and provide a name, address, and phone number.

F. Additional Information

Requests for additional information or questions regarding this order should be directed to Derek Whitworth at 510-622-2349 or email DWhitworth@waterboards.ca.gov.

Appendix 1

Ocean Discharge Criteria Evaluation
NPDES Permit CA0037681
City and County of San Francisco
Oceanside Water Pollution Control Plant (Southwest Ocean Outfall)
Prepared by EPA, Region 9 Water Division
April 27, 2009

Background and Purpose

The purpose of this analysis is to provide supporting documentation for the EPA's evaluation of unreasonable degradation of the marine environment under Section 403 of the Clean Water Act (CWA) for the City and County of San Francisco's Oceanside draft permit. This draft permit is jointly proposed by the EPA and the State of California's San Francisco Bay Regional Water Quality Control Board (Water Board). This analysis applies to the discharge to Federal waters from the Southwest Ocean Outfall.

EPA Region 9 is proposing to comply with the CWA evaluation of unreasonable degradation for this discharge by applying State water quality standards contained in the California Ocean Plan (COP) to the discharge from the Southwest Ocean Outfall, with the exception of the pollutant TCDD equivalents (dioxin). In calculating NPDES permit limitations and conditions for dioxin for this discharge, EPA is using the COP numeric criterion for this pollutant, as well as the COP standard implementation procedures, such as dilution procedures. However, we are proposing to use additional, more recent scientific information that has not yet been considered for inclusion in the COP water quality standards, based on EPA's ocean discharge criteria regulations at 40 CFR 125.122(a). For the calculation of NPDES permit limitations for dioxin, we are proposing to use recently updated toxicity equivalency factors (TEFs), published by the World Health Organization in 2005, as well as the congener-specific bioconcentration equivalency factors (BEFs) used for the Great Lakes System. This approach to developing NPDES permit limits for dioxin was recommended in the "Bay Area Clean Water Agencies' Draft Dioxin Issue Paper: Expert Panel Response and Recommendations," dated April 4, 2008. It incorporates recent scientific information for dioxins on a congener-specific basis, while continuing to use the COP criterion and standards implementation procedures. Region 9's use of the TEFs and BEFs in the draft permit at this time does not constitute EPA endorsement of this approach in other situations.

Because we are proposing to supplement the State water quality standards with some additional information for dioxin, we have developed an analysis of the 10 factors under 40 CFR 125.122(a) to determine unreasonable degradation of the marine environment. The definition of unreasonable degradation of the marine environment in 40 CFR 125.121(e) states:

Unreasonable degradation of the marine environment means:

(1) Significant adverse changes in ecosystem diversity, productivity and stability of the biological community within the area of discharge and surrounding biological communities,
(2) Threat to human health through direct exposure to pollutants or through consumption of exposed aquatic organisms, or
(3) Loss of esthetic, recreational, scientific or economic values which is unreasonable in relation to the benefit derived from the discharge.

The remainder of this evaluation discusses each of the 10 factors and describes our conclusion that the discharge of dioxin will not cause unreasonable degradation of the marine environment under the Federal regulations.

Evaluation of the Ten Ocean Discharge Criteria under 40 CFR 125.122(a)(1)-(10)

Factor 1: Quantities, Composition, and Potential for Bioaccumulation or Persistence of Pollutants to be Discharged

The quantities and composition of the discharge reflect the main source of dioxins to the plant influent, which appears to be stormwater collected in the combined sewer system. In addition to effluent monitoring, the prior NPDES permit for the Southwest Ocean Outfall required a sampling program to assess dioxin in the City's wastewater discharged to the ocean, and the discharger completed a City-wide dioxin monitoring and assessment report in 2000 (Rourke et. al., 2000). The City's combined sewer system commingles wastewater from homes and businesses with stormwater. The sampling results show that stormwater has significantly higher concentrations of dioxins than dry weather wastewater influent flowing to the plant.

Because all of the City's stormwater receives some level of treatment prior to discharge, the discharge of dioxin to the environment is less than would be expected in a similar community with separate storm sewers. In fact the City's monitoring report (Rourke et. al., 2000) estimated that the wastewater control facilities remove more than 80% of dioxin contained in all stormwater runoff from the City. Communities with separate storm sewers are not categorically required to provide treatment and therefore generally remove no dioxin from their stormwater.

According to the discharger's report, influent to the City's Southeast plant was significantly higher in dioxin on wet weather days than the influent to the Oceanside plant. The sampling report attributed this result to the fact that the service area for the Southeast plant is primarily industrial, so the eastern side of the City would be expected to have a heavier loading due to emissions from diesel engines and other combustion sources. Influent to the Southeast plant during wet weather was on average 35 pg/l TEQ. The report measured average untreated dry weather influent to the Oceanside plant as 1.3 pg/l TEQ, while the average influent during wet weather was 16 pg/l TEQ. At the Oceanside Plant, wet weather effluent (primary/secondary blend) averaged 1.7 pg/l TEQ, while dry weather effluent was less than 0.06 pg/l.

The quantities and composition of the dioxin discharge from the Southwest Ocean Outfall are fairly well characterized, as the discharger has monitored Southwest Ocean Outfall effluent for the dioxin congeners specified in the COP for over 10 years. However, because the detection levels for available quantitation methods (EPA method 1613 is typically used) are often one or more orders of magnitude higher than the water quality criterion, there is some scientific

uncertainty associated with the analysis. Of the 18 sample points used to develop this draft permit, the sample taken on February 13, 2007 contained the highest measured level of TCDD equivalents at 1.35x10-7ug/l with the BEFs and TEFs applied, and 1.0x10-6 ug/l with only TEFs applied. On this day, 6 dioxin congeners were detected: 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 2,3,4,6,7,8-HxCDF, OCDD, and OCDF. The most toxic congener, 2,3,7,8-TCDD, was not detected on any of the days. On most days, most of the congeners were not detected, with the exception of OCDD, which is the most commonly detected congener in the effluent.

Results from the dry weather effluent monitoring data required as a condition of the previous NPDES permit show levels of dioxin consistent with dry weather data from other wastewater treatment plants. Using EPA method 1613, the samples shows a majority of non-detect values, with the congener OCDD most commonly detected. The Water Board and EPA applied COP reasonable potential procedures to the dry weather effluent data, with the addition of updated TEF values and the use of the default Great Lakes BEF values. The result of the analysis was no reasonable potential for the discharge of dioxin to cause or contribute to a water quality exceedance, and thus a water quality-based effluent limitation for TCDD equivalents is not required.

Factor 1 also includes the potential for bioaccumulation or persistence. Dioxin is a bioaccumulative and persistent pollutant. The COP water quality criterion was developed to take this into account, and the BEFs quantify the bioaccumulative properties of each congener regulated under the COP. EPA and the Water Board appropriately considered the bioaccumulative properties of the dioxin congeners in the development of the proposed NPDES permit provisions. Additionally, the location of the outfall along with the diffuser ensures that mixing and dispersion occur, and thus it is unlikely that dioxin in the water column or sediments will build to levels expected to threaten human health due to the consumption of exposed aquatic organisms.

In summary, because the main source of dioxin to the Southwest Ocean Outfall discharge appears to be stormwater and because all the stormwater receives treatment, EPA believes the discharge of dioxin to the environment is less than that from other similar communities with separate storm sewers. While the introduction of dioxins continues to be of concern on a global scale, the dioxin contribution from the Southwest Ocean Outfall discharge is not likely to be a significant source in comparison to that from other urban communities.

Factor 2: Potential for Biological, Physical, or Chemical Transport

Biological transport could occur through the bioaccumulative properties of dioxin. This is taken into account by the COP criterion, as human health impacts through the consumption of aquatic organisms are the bases for the most limiting COP criterion for dioxin relevant to this discharge.

As is the case for many organic pollutants in wastewater, dioxin is associated with effluent suspended solids. Thus, physical transport can occur through the movement of sediment, as well as through the water column. The Westside Wet Weather Facilities treatment, which

consists of solids settling, is effective in removing some dioxin from the discharge (Rourke et. al., 2000).

Because dioxins are persistent compounds that remain stable in the environment, chemical transport is not significant.

The Southwest Ocean Outfall discharges 3.4 to 3.6 nautical miles from the shore, which provides dilution, mixing, and dispersion of pollutants into the open ocean environment. These processes decrease the likelihood that dioxin concentrations in the water column or in sediment would build to levels of concern. The San Francisco Bay is listed as impaired for dioxins under section 303(d) of the CWA, but the receiving waters for the Southwest Ocean Outfall are not listed as impaired. The San Francisco Bay is surrounded by urban development, with more sources of dioxins and fewer opportunities for dispersion into the ocean than the Southwest Ocean Outfall discharge. A comparison of data from the San Francisco Bay's Regional Monitoring Program to sediment and fish tissue data collected as part of the prior NPDES permit's Southwest Ocean Outfall receiving water monitoring requirements concludes that organic pollutants in fish and sediments from San Francisco Bay were higher than those in fish and sediments on the coast (Melwani, undated).

Although the Southwest Ocean Outfall receiving water monitoring does not directly measure dioxins in the sediment and fish tissue of the receiving waters, analysis of bioaccumulative compounds such as mercury and PCBs, including dioxin-like PCBs, was conducted. Based on data collected over ten years, the discharger's analysis did not find any upward trends in the levels of bioaccumulative pollutants in sediments or fish tissue, or any differences between the outfall stations and the reference stations that would indicate an outfall effect (SFPUC, 2006). Thus, EPA does not believe the potential for biological, physical, or chemical transport will cause unreasonable degradation of the ocean environment.

Factor 3: Composition and Vulnerability of Biological Communities

The discharger has conducted benthic infauna community monitoring as well as trawl studies. Fishes collected in the study area represent a general assortment of native species common to central California near-shore waters, with occasional occurrences of species from warmer, southern waters. The biological communities in the vicinity of the discharge appear to be similar to those in other sandy bottom ocean environments off the coast of central California. Federally-listed species under the Endangered Species Act as well as Essential Fish Habitat species under the Magnuson-Stevens Fishery Conservation and Management Act occur in the vicinity of the discharge. EPA is in the process of informal consultation with NOAA Fisheries for this permit reissuance. EPA received a "not likely to adversely affect" determination from NOAA Fisheries for the last two re-issuances of this NPDES permit. Accordingly, EPA is unaware of any specific concerns regarding dioxin for species of concern in the vicinity of the discharge.

Factor 4: Importance of the Receiving Water to the Surrounding Biological Community

EPA is unaware of any unique habitat in the area of the discharge, such as spawning sites, kelp beds, or "hauling out" sites for marine mammals.

Factor 5: Existence of Special Aquatic Sites

The Monterey Bay National Marine Sanctuary (MBNMS) is located in the vicinity of the discharge. However, the Southwest Ocean Outfall discharge itself is not located within the sanctuary boundary. Instead, it is located within an exclusion zone that extends from off the north coast of San Mateo County and the City and County of San Francisco between Point Bonita and Point San Pedro (NOAA 1992, 1999a). Accordingly, the discharge from the Southwest Ocean Outfall is not expected to have a significant adverse effect on the MBNMS.

Factor 6: Potential Impacts on Human Health

As described in factor 10 below, the proposed NPDES permit is based on a water quality criterion for dioxin TEQ developed for the COP which considers the risk to human health from consuming fish and shellfish. Because dioxin congeners are persistent, bioaccumulative pollutants, the discharger will continue to monitor Southwest Ocean Outfall effluent for the presence of dioxin congeners. However, the reasonable potential analysis conducted using reasonable potential procedures developed for COP water quality objectives indicate that dioxin in the Southwest Ocean Outfall effluent has no reasonable potential to cause or contribute to the exceedance of the receiving water quality standard for dioxin.

Factor 7: Recreational and Commercial Fisheries

Recreational and commercial fishing is common in the Pacific Ocean right outside the San Francisco Bay. For this reason, the discharger has been monitoring sediments and fish tissue for bioaccumulative pollutants for over 10 years as part of the Southwest Ocean Outfall monitoring program. No significant outfall effects or upward trends in pollutant concentrations have been found.

Factor 8: Coastal Zone Management Plan

The California Coastal Zone Management Plan (CZMP) incorporates the COP. Because the COP implements water quality standards for dioxin in the Southwest Ocean Outfall discharge, the COP contains the most relevant and specific CZMP requirements. As previously stated, this draft permit proposes to implement the COP criteria and policies, including the policy on dilution, with the addition of the application of TEFs and BEFs for determining reasonable potential for dioxin under the NPDES program.

The Coastal Zone Management Act requires that states make consistency determinations for any federally licensed or permitted activity affecting the coastal zone of a state with an approved CZMP. California's Coastal Management Program was approved in 1978 and established the California Coastal Commission (CCC) as lead agency for program implementation. However, CCC staff has stated that the CCC does not conduct consistency reviews for wastewater treatment plants that operate at secondary treatment levels and thus the CCC will not be providing a consistency determination for the proposed permit

Factor 9: Other Factors Relating to Effects of the Discharge

EPA is proposing to include additional, more recent scientific information that has not yet been considered for inclusion in the COP water quality standards, based on EPA's ocean discharge criteria regulations at 40 CFR 125.122(a). For the calculation of NPDES permit limitations for dioxin, we are proposing to use recently updated toxicity equivalency factors (TEFs), published by the World Health Organization in 2005, as well as the congener-specific bioconcentration equivalency factors (BEFs) used for the Great Lakes System. As explained above, this approach for developing NPDES permit limits for dioxin was recommended in the "Bay Area Clean Water Agencies' Draft Dioxin Issue Paper: Expert Panel Response and Recommendations," dated April 4, 2008, and it incorporates updated scientific information for dioxins on a congener-specific basis, while continuing to use the COP criterion and standards implementation procedures. While Region 9 has the discretion to use these factors under the ocean discharge regulations, Region 9's use of the TEFs and BEFs in the draft permit at this time does not constitute EPA endorsement of this approach in other situations.

Factor 10: Marine Water Quality Criteria Under CWA 304(a)(1)

The current recommended EPA marine water quality criteria for dioxin are 5.1E-09 ug/l for consumption of organisms only, and 5.0E-09 ug/l for consumption of water and organisms. These recommended criteria are based on a carcinogenicity of 10-6 risk. The water quality criteria adopted for dioxin in the COP is 3.9E-09 ug/l for TCDD equivalents on a 30 day average basis. Applying the TEFs and BEFs as well as a conservative 76:1 dilution, under the COP reasonable potential (RP) procedure, which closely parallels the RP procedure in "EPA's Technical Support Document for Water Quality-Based Toxics Control (TSD, USEPA 1991)," EPA and the Water Board conclude the discharge does not have RP for dioxin, and thus the draft permit contains no numeric limits for dioxin. Because the COP criterion for dioxin is more stringent than the EPA recommended criteria, this discharge would not be expected to cause exceedances of the EPA criteria.

Conclusion: Determination of No Unreasonable Degradation of the Marine Environment

Based on consideration of the ten factors discussed above, Region 9 has determined that no unreasonable degradation of the marine environment will result from the discharges of dioxin through the Southwest Ocean Outfall as proposed under NPDES permit CA003768, with all the limitations, conditions, and monitoring requirements in effect.

EPA recognizes that bioaccumulative pollutants such as dioxin are of concern in the receiving waters of the Pacific Ocean, as commercial and recreational fishing takes place in these waters. However, monitoring over a 10 year period has not shown increasing concentrations of bioaccumulative substances in sediment or fish tissue in the vicinity of the discharge. Further, EPA expects that the contribution of dioxins from the Southwest Ocean Outfall discharge is lower than in other urban areas of similar size, due to the City's stormwater treatment facilities and residential service area which, unlike industrial areas, is expected to generate fewer dioxins. The proposed NPDES permit will require continued effluent monitoring for dioxin congeners. The Southwest Ocean Outfall monitoring program will continue to monitor for selected bioaccumulative pollutants in sediment and fish tissue, including dioxin-like PCBs. Finally, because stormwater is significantly higher in dioxin than dry-weather flows, the

proposed permit requirement that the discharger develop options to reduce pollutant loading in stormwater, such as green infrastructure efforts, is expected to reduce dioxin loading to the receiving water.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS (SUPPLEMENT TO ATTACHMENT D)

FOR

NPDES WASTEWATER DISCHARGE PERMITS

APPLICABILITY

This document applies to dischargers covered by a National Pollutant Discharge Elimination System (NPDES) permit. This document does not apply to Municipal Separate Storm Sewer System (MS4) NPDES permits.

The purpose of this document is to supplement the requirements of Attachment D, Standard Provisions. The requirements in this supplemental document are designed to ensure permit compliance through preventative planning, monitoring, recordkeeping, and reporting. In addition, this document requires proper characterization of issues as they arise, and timely and full responses to problems encountered. To provide clarity on which sections of Attachment D this document supplements, this document is arranged in the same format as Attachment D.

I. STANDARD PROVISIONS - PERMIT COMPLIANCE

A. Duty to Comply – Not Supplemented

B. Need to Halt or Reduce Activity Not a Defense – Not Supplemented

C. Duty to Mitigate – This supplements I.C. of Standard Provisions (Attachment D)

1. **Contingency Plan -** The Discharger shall maintain a Contingency Plan as originally required by Regional Water Board Resolution 74-10 and as prudent in accordance with current municipal facility emergency planning. The Contingency Plan shall describe procedures to ensure that existing facilities remain in, or are rapidly returned to, operation in the event of a process failure or emergency incident, such as employee strike, strike by suppliers of chemicals or maintenance services, power outage, vandalism, earthquake, or fire. The Discharger may combine the Contingency Plan and Spill Prevention Plan into one document. Discharge in violation of the permit where the Discharger has failed to develop and implement a Contingency Plan as described below will be the basis for considering the discharge a willful and negligent violation of the permit pursuant to California Water Code Section 13387. The Contingency Plan shall, at a minimum, contain the provisions of a. through g. below.

    a. Provision of personnel for continued operation and maintenance of sewerage facilities during employee strikes or strikes against contractors providing services.

b. Maintenance of adequate chemicals or other supplies and spare parts necessary for continued operations of sewerage facilities.

c. Provisions of emergency standby power.

d. Protection against vandalism.

e. Expeditious action to repair failures of, or damage to, equipment and sewer lines.

f. Report of spills and discharges of untreated or inadequately treated wastes, including measures taken to clean up the effects of such discharges.

g. Programs for maintenance, replacement, and surveillance of physical condition of equipment, facilities, and sewer lines.

2. **Spill Prevention Plan** - The Discharger shall maintain a Spill Prevention Plan to prevent accidental discharges and minimize the effects of such events. The Spill Prevention Plan shall:

   a. Identify the possible sources of accidental discharge, untreated or partially treated waste bypass, and polluted drainage;

   b. Evaluate the effectiveness of present facilities and procedures, and state when they became operational; and

   c. Predict the effectiveness of the proposed facilities and procedures, and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational.

   This Regional Water Board, after review of the Contingency and Spill Prevention Plans or their updated revisions, may establish conditions it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of the permit upon notice to the Discharger.

D. Proper Operation & Maintenance – This supplements I.D of Standard Provisions (Attachment D)

1. **Operation and Maintenance (O&M) Manual** - The Discharger shall maintain an O&M Manual to provide the plant and regulatory personnel with a source of information describing all equipment, recommended operational strategies, process control monitoring, and maintenance activities. To remain a useful and relevant document, the O&M Manual shall be kept updated to reflect significant changes in treatment facility equipment and operational practices. The O&M Manual shall be maintained in usable condition and be available for reference and use by all relevant personnel and Regional Water Board staff.

2. **Wastewater Facilities Status Report** - The Discharger shall regularly review, revise, or update, as necessary, its Wastewater Facilities Status Report. This report shall document how the Discharger operates and maintains its wastewater collection, treatment, and disposal facilities to ensure that all facilities are adequately staffed, supervised, financed, operated,

maintained, repaired, and upgraded as necessary to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

3. **Proper Supervision and Operation of Publicly Owned Treatment Works (POTWs) -** POTWs shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Division 4, Chapter 14, Title 23 of the California Code of Regulations.

E. Property Rights – Not Supplemented

F. Inspection and Entry – Not Supplemented

G. Bypass – Not Supplemented

H. Upset – Not Supplemented

I. Other – This section is an addition to Standard Provisions (Attachment D)

1. Neither the treatment nor the discharge of pollutants shall create pollution, contamination, or nuisance as defined by California Water Code Section 13050.

2. Collection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater, except in cases where excluding the public is infeasible, such as private property. If public contact with wastewater could reasonably occur on public property, warning signs shall be posted.

3. If the Discharger submits a timely and complete Report of Waste Discharge for permit reissuance, this permit continues in force and effect until a new permit is issued or the Regional Water Board rescinds the permit.

J. Storm Water – This section is an addition to Standard Provisions (Attachment D)

These provisions apply to facilities that do not direct all storm water flows from the facility to the wastewater treatment plant headworks.

1. **Storm Water Pollution Prevention Plan (SWPP Plan**)

The SWPP Plan shall be designed in accordance with good engineering practices and shall address the following objectives:

a. To identify pollutant sources that may affect the quality of storm water discharges; and

b. To identify, assign, and implement control measures and management practices to reduce pollutants in storm water discharges.

The SWPP Plan may be combined with the existing Spill Prevention Plan as required in accordance with Section C.2. The SWPP Plan shall be retained on-site and made available upon request of a representative of the Regional Water Board.

2. Source Identification

The SWPP Plan shall provide a description of potential sources that may be expected to add significant quantities of pollutants to storm water discharges, or may result in non-storm water discharges from the facility. The SWPP Plan shall include, at a minimum, the following items:

a. A topographical map (or other acceptable map if a topographical map is unavailable), extending one-quarter mile beyond the property boundaries of the facility, showing the wastewater treatment facility process areas, surface water bodies (including springs and wells), and discharge point(s) where the facility's storm water discharges to a municipal storm drain system or other points of discharge to waters of the State. The requirements of this paragraph may be included in the site map required under the following paragraph if appropriate.

b. A site map showing the following:

1) Storm water conveyance, drainage, and discharge structures;

2) An outline of the storm water drainage areas for each storm water discharge point;

3) Paved areas and buildings;

4) Areas of actual or potential pollutant contact with storm water or release to storm water, including but not limited to outdoor storage and process areas; material loading, unloading, and access areas; and waste treatment, storage, and disposal areas;

5) Location of existing storm water structural control measures (i.e., berms, coverings, etc.);

6) Surface water locations, including springs and wetlands; and

7) Vehicle service areas.

c. A narrative description of the following:

1) Wastewater treatment process activity areas;

2) Materials, equipment, and vehicle management practices employed to minimize contact of significant materials of concern with storm water discharges;

3) Material storage, loading, unloading, and access areas;

4) Existing structural and non-structural control measures (if any) to reduce pollutants in storm water discharges; and

5) Methods of on-site storage and disposal of significant materials.

d. A list of pollutants that have a reasonable potential to be present in storm water discharges in significant quantities.

3. Storm Water Management Controls

The SWPP Plan shall describe the storm water management controls appropriate for the facility and a time schedule for fully implementing such controls. The appropriateness and priorities of controls in the SWPP Plan shall reflect identified potential sources of pollutants. The description of storm water management controls to be implemented shall include, as appropriate:

a. Storm water pollution prevention personnel

Identify specific individuals (and job titles) that are responsible for developing, implementing, and reviewing the SWPP Plan.

b. Good housekeeping

Good housekeeping requires the maintenance of clean, orderly facility areas that discharge storm water. Material handling areas shall be inspected and cleaned to reduce the potential for pollutants to enter the storm drain conveyance system.

c. Spill prevention and response

Identify areas where significant materials can spill into or otherwise enter storm water conveyance systems and their accompanying drainage points. Specific material handling procedures, storage requirements, and cleanup equipment and procedures shall be identified, as appropriate. The necessary equipment to implement a cleanup shall be available, and personnel shall be trained in proper response, containment, and cleanup of spills. Internal reporting procedures for spills of significant materials shall be established.

d. Source control

Source controls include, for example, elimination or reduction of the use of toxic pollutants, covering of pollutant source areas, sweeping of paved areas, containment of potential pollutants, labeling of all storm drain inlets with “No Dumping” signs, isolation or separation of industrial and non-industrial pollutant sources so that runoff from these areas does not mix, etc.

e. Storm water management practices

Storm water management practices are practices other than those that control the sources of pollutants. Such practices include treatment or conveyance structures, such as drop inlets, channels, retention and detention basins, treatment vaults, infiltration galleries, filters, oil/water separators, etc. Based on assessment of the potential of various sources to contribute pollutants to storm water discharges in significant quantities, additional storm water management practices to remove pollutants from storm water discharges shall be implemented and design criteria shall be described.

f. Sediment and erosion control

Measures to minimize erosion around the storm water drainage and discharge points, such as riprap, revegetation, slope stabilization, etc., shall be described.

g. Employee training

Employee training programs shall inform all personnel responsible for implementing the SWPP Plan. Training shall address spill response, good housekeeping, and material management practices. New employee and refresher training schedules shall be identified.

h. Inspections

All inspections shall be done by trained personnel. Material handling areas shall be inspected for evidence of, or the potential for, pollutants entering storm water discharges. A tracking or follow up procedure shall be used to ensure appropriate response has been taken in response to an inspection. Inspections and maintenance activities shall be documented and recorded. Inspection records shall be retained for five years.

i. Records

A tracking and follow-up procedure shall be described to ensure that adequate response and corrective actions have been taken in response to inspections.

4. Annual Verification of SWPP Plan

An annual facility inspection shall be conducted to verify that all elements of the SWPP Plan are accurate and up-to-date. The results of this review shall be reported in the Annual Report to the Regional Water Board described in Section V.C.f.

K. Biosolids Management – This section is an addition to Standard Provisions (Attachment D)

Biosolids must meet the following requirements prior to land application. The Discharger must either demonstrate compliance or, if it sends the biosolids to another party for further treatment or distribution, must give the recipient the information necessary to ensure compliance.

1. Exceptional quality biosolids meet the pollutant concentration limits in Table III of 40 CFR Part 503.13, Class A pathogen limits, and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8). Such biosolids do not have to be tracked further for compliance with general requirements (503.12) and management practices (503.14).

2. Biosolids used for agricultural land, forest, or reclamation shall meet the pollutant limits in Table I (ceiling concentrations) and Table II or Table III (cumulative loadings or pollutant concentration limits) of 503.13. They shall also meet the general requirements (503.12) and management practices (503.14) (if not exceptional quality biosolids) for Class A or Class B pathogen levels with associated access restrictions (503.32) and one of the 10 vector attraction reduction requirements in 503.33(b)(1)-(b)(10).

3. Biosolids used for lawn or home gardens must meet exceptional quality biosolids limits.

4. Biosolids sold or given away in a bag or other container must meet the pollutant limits in either Table III or Table IV (pollutant concentration limits or annual pollutant loading rate limits) of 503.13. If Table IV is used, a label or information sheet must be attached to the biosolids packing that explains Table IV (see 503.14). The biosolids must also meet the Class A pathogen limits and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8).

II. STANDARD PROVISIONS – PERMIT ACTION – Not Supplemented

III. STANDARD PROVISIONS – MONITORING

A. Sampling and Analyses – This section is a supplement to III.A and III.B of Standard Provisions (Attachment D)

1. Use of Certified Laboratories

Water and waste analyses shall be performed by a laboratory certified for these analyses in accordance with California Water Code Section 13176.

2. Use of Appropriate Minimum Levels

Table C lists the suggested analytical methods for the 126 priority pollutants and other toxic pollutants that should be used, unless a particular method or minimum level (ML) is required in the MRP.

For priority pollutant monitoring, when there is more than one ML value for a given substance, the Discharger may select any one of those cited analytical methods for compliance determination provided the ML is below the effluent limitation and the water quality objective. If no ML value is below the effluent limitation and water quality objective, then the Regional Water Board will assign the lowest ML value indicated in Table C, and its associated analytical method for inclusion in the MRP. For effluent monitoring, this alternate method shall also be U.S. EPA-approved (such as the 1600 series) or one of those listed in Table C. All monitoring instruments and equipment shall be properly calibrated and maintained to ensure accuracy of measurements.

3. Frequency of Monitoring

The minimum schedule of sampling analysis is specified in the MRP portion of the permit.

a. Timing of Sample Collection

i. The Discharger shall collect samples of influent on varying days selected at random and shall not include any plant recirculation or other sidestream wastes, unless otherwise stipulated by the MRP.

ii. The Discharger shall collect samples of effluent on days coincident with influent sampling unless otherwise stipulated by the MRP or the Executive Officer. The Executive Officer may approve an alternative sampling plan if it is demonstrated to be representative of plant discharge flow and in compliance with all other permit requirements.

iii. The Discharger shall collect grab samples of effluent during periods of day-time maximum peak effluent flows (or peak flows through secondary treatment units for facilities that recycle effluent flows).

iv. Effluent sampling for conventional pollutants shall occur on at least one day of any multiple-day bioassay test the MRP requires. During the course of the test, on at least one day, the Discharger shall collect and retain samples of the discharge. In the event a bioassay test does not comply with permits limits, the Discharger shall analyze these retained samples for pollutants that could be toxic to aquatic life and for which it has effluent limits.

1) The Discharger shall perform bioassay tests on final effluent samples; when chlorine is used for disinfection, bioassay tests shall be performed on effluent after chlorination-dechlorination; and

2) The Discharger shall analyze for total ammonia nitrogen and calculate the amount of un-ionized ammonia whenever test results fail to meet the percent survival specified in the permit.

b. Conditions Triggering Accelerated Monitoring

i. If the results from two consecutive samples of a constituent monitored in a 30-day period exceed the monthly average limit for any parameter (or if the required sampling frequency is once per month and the monthly sample exceeds the monthly average limit), the Discharger shall, within 24 hours after the results are received, increase its sampling frequency to daily until the results from the additional sampling shows that the parameter is in compliance with the monthly average limit.

ii. If any maximum daily limit is exceeded, the Discharger shall increase its sampling frequency to daily within 24 hours after the results are received that indicate the exceedance of the maximum daily limit until two samples collected on consecutive days show compliance with the maximum daily limit.

iii. If final or intermediate results of an acute bioassay test indicate a violation or threatened violation (e.g., the percentage of surviving test organisms of any single acute bioassay test is less than 70 percent), the Discharger shall initiate a new test as soon as practical, and the Discharger shall investigate the cause of the mortalities and report its findings in the next self-monitoring report (SMR).

iv. The Discharger shall calibrate chlorine residual analyzers against grab samples as frequently as necessary to maintain accurate control and reliable operation. If an effluent violation is detected, the Discharger shall collect grab samples at least every 30 minutes until compliance with the limit is achieved, unless the Discharger monitors chlorine residual continuously. In such cases, the Discharger shall continue to conduct continuous monitoring as required by its permit.

v. When any type of bypass occurs, the Discharger shall collect samples on a daily basis for all constituents at affected discharge points that have effluent limits for the duration of the bypass, unless otherwise stipulated by the MRP.

c. Storm Water Monitoring

The requirements of this section only apply to facilities that are not covered by an NPDES permit for storm water discharges and where not all site storm drainage from process areas (i.e., areas of the treatment facility where chemicals or wastewater could come in contact with storm water) is directed to the headworks. For storm water not directed to the headworks during the wet season (October 1 to April 30), the Discharger shall:

i. Conduct visual observations of the storm water discharge locations during daylight hours at least once per month during a storm event that produces significant storm water discharge to observe the presence of floating and suspended materials, oil and grease, discoloration, turbidity, and odor, etc.

ii. Measure (or estimate) the total volume of storm water discharge, collect grab samples of storm water discharge from at least two storm events that produce significant storm water discharge, and analyze the samples for oil and grease, pH, TSS, and specific conductance.

The grab samples shall be taken during the first 30 minutes of the discharge. If collection of the grab samples during the first 30 minutes is impracticable, grab samples may be taken during the first hour of the discharge, and the Discharger shall explain in the Annual Report why the grab sample(s) could not be taken in the first 30 minutes.

iii. Testing for the presence of non-storm water discharges shall be conducted no less than twice during the dry season (May 1 to September 30) at all storm water discharge locations. Tests may include visual observations of flows, stains, sludges, odors, and other abnormal conditions; dye tests; TV line surveys; or analysis and validation of accurate piping schematics. Records shall be maintained describing the method used, date of testing, locations observed, and test results.

iv. Samples shall be collected from all locations where storm water is discharged. Samples shall represent the quality and quantity of storm water discharged from the facility. If a facility discharges storm water at multiple locations, the Discharger may sample a reduced number of locations if it establishes and documents through the monitoring program that storm water discharges from different locations are substantially identical.

v. Records of all storm water monitoring information and copies of all reports required by the permit shall be retained for a period of at least three years from the date of sample, observation, or report.

d. Receiving Water Monitoring

The requirements of this section only apply when the MRP requires receiving water sampling.

i. Receiving water samples shall be collected on days coincident with effluent sampling for conventional pollutants.

ii. Receiving water samples shall be collected at each station on each sampling day during the period within one hour following low slack water. Where sampling during lower slack water is impractical, sampling shall be performed during higher slack water. Samples shall be collected within the discharge plume and down current of the discharge point so as to be representative, unless otherwise stipulated in the MRP.

iii. Samples shall be collected within one foot of the surface of the receiving water, unless otherwise stipulated in the MRP.

B. Biosolids Monitoring – This section supplements III.B of Standard Provisions (Attachment D)

When biosolids are sent to a landfill, sent to a surface disposal site, or applied to land as a soil amendment, they must be monitored as follows:

1. Biosolids Monitoring Frequency

Biosolids disposal must be monitored at the following frequency:

Metric tons biosolids/365 days	**Frequency**
0-290	Once per year
290-1500	Quarterly
1500-15,000	Six times per year
Over 15,000	Once per month

(Metric tons are on a dry weight basis)

2. Biosolids Pollutants to Monitor

Biosolids shall be monitored for the following constituents:

Land Application: arsenic, cadmium, chromium, copper, mercury, molybdenum, nickel, lead, selenium, and zinc

Municipal Landfill: Paint filter test (pursuant to 40 CFR 258)

Biosolids-only Landfill or Surface Disposal Site (if no liner and leachate system): arsenic, chromium, and nickel

C. Standard Observations – This section is an addition to III of Standard Provisions (Attachment D)

1. Receiving Water Observations

The requirements of this section only apply when the MRP requires standard observations of the receiving water. Standard observations shall include the following:

a. *Floating and suspended materials* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence, source, and size of affected area.

b. *Discoloration and turbidity*: description of color, source, and size of affected area.

c. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

d. *Beneficial water use*: presence of water-associated waterfowl or wildlife, fisherpeople, and other recreational activities in the vicinity of each sampling station.

e. *Hydrographic condition*: time and height of corrected high and low tides (corrected to nearest National Oceanic and Atmospheric Administration location for the sampling date and time of sample collection).

f. *Weather conditions*:

1) Air temperature; and

2) Total precipitation during the five days prior to observation.

2. Wastewater Effluent Observations

The requirements of this section only apply when the MRP requires wastewater effluent standard observations. Standard observations shall include the following:

a. *Floating and suspended material of wastewater origin* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence.

b. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

3. Beach and Shoreline Observations

The requirements of this section only apply when the MRP requires beach and shoreline standard observations. Standard observations shall include the following:

a. *Material of wastewater origin*: presence or absence, description of material, estimated size of affected area, and source.

b. *Beneficial use*: estimate number of people participating in recreational water contact, non-water contact, or fishing activities.

4. Land Retention or Disposal Area Observations

The requirements of this section only apply to facilities with on-site surface impoundments or disposal areas that are in use. This section applies to both liquid and solid wastes, whether confined or unconfined. The Discharger shall conduct the following for each impoundment:

a. Determine the amount of freeboard at the lowest point of dikes confining liquid wastes.

b. Report evidence of leaching liquid from area of confinement and estimated size of affected area. Show affected area on a sketch and volume of flow (e.g., gallons per minute [gpm]).

c. Regarding odor, describe presence or absence, characterization, source, distance of travel, and wind direction.

d. Estimate number of waterfowl and other water-associated birds in the disposal area and vicinity.

5. Periphery of Waste Treatment and/or Disposal Facilities Observations

The requirements of this section only apply when the MRP specifies periphery standard observations. Standard observations shall include the following:

a. *Odor*: presence or absence, characterization, source, and distance of travel.

b. *Weather conditions*: wind direction and estimated velocity.

IV. STANDARD PROVISIONS – RECORDS

A. Records to be Maintained – This supplements IV.A of Standard Provisions (Attachment D)

The Discharger shall maintain records in a manner and at a location (e.g., wastewater treatment plant or Discharger offices) such that the records are accessible to Regional Water Board staff. The minimum period of retention specified in Section IV, Records, of the Federal Standard Provisions shall be extended during the course of any unresolved litigation regarding the subject discharge, or when requested by the Regional Water Board or Regional Administrator of USEPA, Region IX.

A copy of the permit shall be maintained at the discharge facility and be available at all times to operating personnel.

B. Records of monitoring information shall include – This supplements IV.B of Standard Provision (Attachment D)

1. Analytical Information

Records shall include analytical method detection limits, minimum levels, reporting levels, and related quantification parameters**.**

2. Flow Monitoring Data

For all required flow monitoring (e.g., influent and effluent flows), the additional records shall include the following, unless otherwise stipulated by the MRP:

a. Total volume for each day; and

b. Maximum, minimum, and average daily flows for each calendar month.

3. Wastewater Treatment Process Solids

a. For each treatment unit process that involves solids removal from the wastewater stream, records shall include the following:

1) Total volume or mass of solids removed from each unit (e.g., grit, skimmings, undigested biosolids) for each calendar month or other time period as appropriate, but not to exceed annually; and

2) Final disposition of such solids (e.g., landfill, other subsequent treatment unit).

b. For final dewatered biosolids from the treatment plant as a whole, records shall include the following:

1) Total volume or mass of dewatered biosolids for each calendar month;

2) Solids content of the dewatered biosolids; and

3) Final disposition of dewatered biosolids (disposal location and disposal method).

4. Disinfection Process

For the disinfection process, these additional records shall be maintained documenting process operation and performance:

a. For bacteriological analyses:

1) Wastewater flow rate at the time of sample collection; and

2) Required statistical parameters for cumulative bacterial values (e.g., moving median or geometric mean for the number of samples or sampling period identified in this Order).

b. For the chlorination process, when chlorine is used for disinfection, at least daily average values for the following:

1) Chlorine residual of treated wastewater as it enters the contact basin (mg/L);

2) Chlorine dosage (kg/day); and

3) Dechlorination chemical dosage (kg/day).

5. **Treatment Process Bypasses**

A chronological log of all treatment process bypasses, including wet weather blending, shall include the following:

a. Identification of the treatment process bypassed;

b. Dates and times of bypass beginning and end;

c. Total bypass duration;

d. Estimated total bypass volume; and

e. Description of, or reference to other reports describing, the bypass event, the cause, the corrective actions taken (except for wet weather blending that is in compliance with permit conditions), and any additional monitoring conducted.

6. **Treatment Facility Overflows**

This section applies to records for overflows at the treatment facility. This includes the headworks and all units and appurtenances downstream. The Discharger shall retain a chronological log of overflows at the treatment facility and records supporting the information provided in section V.E.2.

C. Claims of Confidentiality – Not Supplemented

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information – Not Supplemented

B. Signatory and Certification Requirements – Not Supplemented

C. Monitoring Reports – This section supplements V.C of Standard Provisions (Attachment D)

1. Self-Monitoring Reports

For each reporting period established in the MRP, the Discharger shall submit an SMR to the Regional Water Board in accordance with the requirements listed in this document and at the frequency the MRP specifies. The purpose of the SMR is to document treatment performance, effluent quality, and compliance with the waste discharge requirements of this Order.

a. Transmittal letter

Each SMR shall be submitted with a transmittal letter. This letter shall include the following:

1) Identification of all violations of effluent limits or other waste discharge requirements found during the reporting period;

2) Details regarding violations: parameters, magnitude, test results, frequency, and dates;

3) Causes of violations;

4) Discussion of corrective actions taken or planned to resolve violations and prevent recurrences, and dates or time schedule of action implementation (if previous reports have been submitted that address corrective actions, reference to the earlier reports is satisfactory);

5) Data invalidation (Data should not be submitted in an SMR if it does not meet quality assurance/quality control standards. However, if the Discharger wishes to invalidate any measurement after it was submitted in an SMR, a letter shall identify the measurement suspected to be invalid and state the Discharger's intent to submit, within 60 days, a formal request to invalidate the measurement. This request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that supports invalidation [e.g., laboratory sheet, log entry, test results, etc.], and discussion of the corrective actions taken or planned [with a time schedule for completion] to prevent recurrence of the sampling or measurement problem.);

6) If the Discharger blends, the letter shall describe the duration of blending events and certify whether blended effluent was in compliance with the conditions for blending; and

7) Signature (The transmittal letter shall be signed according to Section V.B of this Order, Attachment D – Standard Provisions.).

b. Compliance evaluation summary

Each report shall include a compliance evaluation summary. This summary shall include each parameter for which the permit specifies effluent limits, the number of samples taken during the monitoring period, and the number of samples that exceed applicable effluent limits.

c. Results of analyses and observations

1) Tabulations of all required analyses and observations, including parameter, date, time, sample station, type of sample, test result, method detection limit, method minimum level, and method reporting level, if applicable, signed by the laboratory director or other responsible official.

2) When determining compliance with an average monthly effluent limitation and more than one sample result is available in a month, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of detected but not quantified (DNQ) or nondetect (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

i. The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

ii. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

If a sample result, or the arithmetic mean or median of multiple sample results, is below the reporting limit, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation and the Discharger conducts a Pollutant Minimization Program, the Discharger shall not be deemed out of compliance.

3) Dioxin-TEQ Reporting: The Discharger shall report for each dioxin and furan congener the analytical results of effluent monitoring, including the quantifiable limit (reporting level), and the method detection limit, and the measured concentration. Estimated concentrations shall be reported for individual congeners, but shall be set equal to zero in determining the dioxin-TEQ value. The Discharger shall multiply each measured or estimated congener concentration by its respective toxicity equivalency factor (TEF) shown in Table A and report the sum of these values.

Table A: Toxic Equivalency Factors for 2,3,7,8-TCDD Equivalents

Congener	**TEF**
2,3,7,8-TetraCDD	1
1,2,3,7,8-PentaCDD	1.0
1,2,3,4,7,8-HexaCDD	0.1
1,2,3,6,7,8-HexaCDD	0.1
1,2,3,7,8,9-HexaCDD	0.1
1,2,3,4,6,7,8-HeptaCDD	0.01
OctaCDD	0.0001
2,3,7,8-TetraCDF	0.1
1,2,3,7,8-PentaCDF	0.05
2,3,4,7,8-PentaCDF	0.5
1,2,3,4,7,8-HexaCDF	0.1
1,2,3,6,7,8-HexaCDF	0.1
1,2,3,7,8,9-HexaCDF	0.1
2,3,4,6,7,8-HexaCDF	0.1
1,2,3,4,6,7,8-HeptaCDF	0.01
1,2,3,4,7,8,9-HeptaCDF	0.01
OctaCDF	0.0001

d. Data reporting for results not yet available

The Discharger shall make all reasonable efforts to obtain analytical data for required parameter sampling in a timely manner. Certain analyses require additional time to complete analytical processes and report results. For cases where required monitoring parameters require additional time to complete analytical processes and reports, and results are not available in time to be included in the SMR for the subject monitoring period, the Discharger shall describe such circumstances in the SMR and include the data for these parameters and relevant discussions of any observed exceedances in the next SMR due after the results are available.

e. Flow data

The Discharger shall provide flow data tabulation pursuant to Section IV.B.2.

f. Annual self-monitoring report requirements

By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

1) Annual compliance summary table of treatment plant performance, including documentation of any blending events;

2) Comprehensive discussion of treatment plant performance and compliance with the permit (This discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices.);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater;

4) List of approved analyses, including the following:

(i) List of analyses for which the Discharger is certified;

(ii) List of analyses performed for the Discharger by a separate certified laboratory and copies of reports signed by the laboratory director of that laboratory shall not be submitted but retained onsite;

(iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all storm water to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs to:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format

The Discharger has the option to submit all monitoring results in an electronic reporting format approved by the Executive Officer. If the Discharger chooses to submit SMRs electronically, the following shall apply:

1) *Reporting Method*: The Discharger shall submit SMRs electronically via a process approved by the Executive Officer (see, for example, the letter dated December 17, 1999, "Official Implementation of Electronic Reporting System [ERS]" and the progress report letter dated December 17, 2000).

2) *Monthly or Quarterly Reporting Requirements*: For each reporting period (monthly or quarterly as specified in the MRP), the Discharger shall submit an electronic SMR to the Regional Water Board in accordance with the provisions of Section V.C.1.a-e, except for requirements under Section V.C.1.c(1) where ERS does not have fields for dischargers to input certain information (e.g., sample time). However, until USEPA approves the electronic signature or other signature technologies, Dischargers that use ERS shall submit a hard copy of the original transmittal letter, an ERS printout of the data sheet, and a violation report (a receipt of the electronic transmittal shall be retained by the Discharger). This electronic SMR submittal suffices for the signed tabulations specified under Section V.C.1.c(1).

3) *Annual Reporting Requirements*: Dischargers who have submitted data using the ERS for at least one calendar year are exempt from submitting the portion of the annual report required under Section V.C.1.f(1) and (3).

D. Compliance Schedules – Not supplemented

E. Twenty-Four Hour Reporting – This section supplements V.E of Standard Provision (Attachment D)

1. Spill of Oil or Other Hazardous Material Reports

a. Within 24 hours of becoming aware of a spill of oil or other hazardous material that is not contained onsite and completely cleaned up, the Discharger shall report by telephone to the Regional Water Board at (510) 622-2369.

b. The Discharger shall also report such spills to the State Office of Emergency Services [telephone (800) 852-7550] only when the spills are in accordance with applicable reporting quantities for hazardous materials.

c. The Discharger shall submit a written report to the Regional Water Board within five working days following telephone notification unless directed otherwise by Regional Water Board staff. A report submitted electronically is acceptable. The written report shall include the following:

1) Date and time of spill, and duration if known;

2) Location of spill (street address or description of location);

3) Nature of material spilled;

4) Quantity of material involved;

5) Receiving water body affected, if any;

6) Cause of spill;

7) Estimated size of affected area;

8) Observed impacts to receiving waters (e.g., oil sheen, fish kill, water discoloration);

9) Corrective actions taken to contain, minimize, or clean up the spill;

10) Future corrective actions planned to be taken to prevent recurrence, and schedule of implementation; and

11) Persons or agencies notified.

2. Unauthorized Discharges from Municipal Wastewater Treatment Plants[1]

The following requirements apply to municipal wastewater treatment plants that experience an unauthorized discharge at their treatment facilities and are consistent with and supercede requirements imposed on the Discharger by the Executive Officer by letter of May 1, 2008, issued pursuant to California Water Code Section 13383.

a. Two (2)-Hour Notification

For any unauthorized discharges that result in a discharge to a drainage channel or a surface water, the Discharger shall, as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the State Office of Emergency Services (telephone 800-852-7550), the local health officers or directors of environmental health with jurisdiction over the affected water bodies, and the Regional Water Board. The notification to the Regional Water Board shall be via the Regional Water Board's online reporting system at www.wbers.net, and shall include the following:

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

1) Incident description and cause;

2) Location of threatened or involved waterway(s) or storm drains;

3) Date and time the unauthorized discharge started;

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on); and

6) Identity of the person reporting the unauthorized discharge.

b. 24-hour Certification

Within 24 hours, the Discharger shall certify to the Regional Water Board, at www.wbers.net, that the State Office of Emergency Services and the local health officers or directors of environmental health with jurisdiction over the affected water bodies have been notified of the unauthorized discharge.

c. 5-Day Written Report

Within five business days, the Discharger shall submit a written report, via the Regional Water Board's online reporting system at www.wbers.net, that includes, in addition to the information required above, the following:

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

2) Efforts implemented to minimize public exposure to the unauthorized discharge;

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;

4) Corrective measures taken to minimize the impact of the unauthorized discharge;

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges; and

7) Quantity and duration of the unauthorized discharge, and the amount recovered.

d. Communication Protocol

To clarify the multiple levels of notification, certification, and reporting, the current communication requirements for unauthorized discharges from municipal wastewater treatment plants are summarized in Table B that follows.

F. Planned Changes – Not supplemented

G. Anticipated Noncompliance – Not supplemented

H. Other Noncompliance – Not supplemented

I. Other Information – Not supplemented

VI. STANDARD PROVISIONS – ENFORCEMENT – Not Supplemented

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS – Not Supplemented

Table B

Summary of Communication Requirements for Unauthorized Discharges[1] from Municipal Wastewater Treatment Plants

Discharger is required to:	Agency Receiving Information	Time frame	Method for Contact
1. Notify	State Office of Emergency Services (OES)	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Telephone – (800) 852-7550 (obtain a control number from OES)
	Local health department	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Depends on local health department
	Regional Water Board	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Electronic[2] www.wbers.net
2. Certify	Regional Water Board	As soon as possible, but not later than **24 hours** after becoming aware of the unauthorized discharge.	Electronic[3] www.wbers.net
3. Report	Regional Water Board	Within **5 business days** of becoming aware of the unauthorized discharge.	Electronic[4] www.wbers.net

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

[2] In the event that the Discharger is unable to provide online notification within 2 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the notification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the notification information into the Regional Water Board's online system in electronic format.

[3] In most instances, the 2-hour notification will also satisfy 24-hour certification requirements. This is because the notification form includes fields for documenting that OES and the local health department have been contacted. In other words, if the Discharger is able to complete all the fields in the notification form within 2 hours, certification requirements are also satisfied. In the event that the Discharger is unable to provide online certification within 24 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the certification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the certification information into the Regional Water Board's online system in electronic format.

[4] If the Discharger cannot satisfy the 5-day reporting requirements via the Regional Water Board's online reporting system, it shall submit a written report (preferably electronically in pdf) to the appropriate Regional Water Board case manager. In cases where the Discharger cannot satisfy the 5-day reporting requirements via the online reporting system, it must still complete the Regional Water Board's online reporting requirements within 15 calendar days of becoming aware of the unauthorized discharge.

VIII. DEFINITIONS – This section is an addition to Standard Provisions (Attachment D)

More definitions can be found in Attachment A of this NPDES Permit.

1. Arithmetic Calculations

   a. Geometric mean is the antilog of the log mean or the back-transformed mean of the logarithmically transformed variables, which is equivalent to the multiplication of the antilogarithms. The geometric mean can be calculated with either of the following equations:

   $$\text{Geometric Mean} = Anti\log\left(\frac{1}{N}\sum_{i=1}^{N} Log(C_i)\right)$$

   or

   $$\text{Geometric Mean} = (C_1 * C_2 * \ldots * C_N)^{1/N}$$

   Where "N" is the number of data points for the period analyzed and "C" is the concentration for each of the "N" data points.

   b. Mass emission rate is obtained from the following calculation for any calendar day:

   $$\text{Mass emission rate (lb/day)} = \frac{8.345}{N}\sum_{i=1}^{N} Q_i C_i$$

   $$\text{Mass emission rate (kg/day)} = \frac{3.785}{N}\sum_{i=1}^{N} Q_i C_i$$

   In which "N" is the number of samples analyzed in any calendar day and "Q_i" and "C_i" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" grab samples that may be taken in any calendar day. If a composite sample is taken, "C_i" is the concentration measured in the composite sample and "Q_i" is the average flow rate occurring during the period over which the samples are composited. The daily concentration of a constituent measured over any calendar day shall be determined from the flow-weighted average of the same constituent in the combined waste streams as follows:

   $$C_d = \text{Average daily concentration} = \frac{1}{Q_t}\sum_{i=1}^{N} Q_i C_i$$

   In which "N" is the number of component waste streams and "Q" and "C" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" waste streams. "Q_t" is the total flow rate of the combined waste streams.

   c. Maximum allowable mass emission rate, whether for a 24-hour, weekly 7-day, monthly 30-day, or 6-month period, is a limitation expressed as a daily rate determined with the

formulas in the paragraph above, using the effluent concentration limit specified in the permit for the period and the specified allowable flow.

d. POTW removal efficiency is the ratio of pollutants removed by the treatment facilities to pollutants entering the treatment facilities (expressed as a percentage). The Discharger shall determine removal efficiencies using monthly averages (by calendar month unless otherwise specified) of pollutant concentration of influent and effluent samples collected at about the same time and using the following equation (or its equivalent):

Removal Efficiency (%) = 100 × [1-(Effluent Concentration/Influent Concentration)]

2. Biosolids means the solids, semi-liquid suspensions of solids, residues, screenings, grit, scum, and precipitates separated from or created in wastewater by the unit processes of a treatment system. It also includes, but is not limited to, all supernatant, filtrate, centrate, decantate, and thickener overflow and underflow in the solids handling parts of the wastewater treatment system.

3. Blending is the practice of recombining wastewater that has been biologically treated with wastewater that has bypassed around biological treatment units.

4. Bottom sediment sample is (1) a separate grab sample taken at each sampling station for the determination of selected physical-chemical parameters, or (2) four grab samples collected from different locations in the immediate vicinity of a sampling station while the boat is anchored and analyzed separately for macroinvertebrates.

5. Composite sample is a sample composed of individual grab samples collected manually or by an automatic sampling device on the basis of time or flow as specified in the MRP. For flow-based composites, the proportion of each grab sample included in the composite sample shall be within plus or minus five percent (+/-5%) of the representative flow rate of the waste stream being measured at the time of grab sample collection. Alternatively, equal volume grab samples may be individually analyzed with the flow-weighted average calculated by averaging flow-weighted ratios of each grab sample analytical result. Grab samples comprising time-based composite samples shall be collected at intervals not greater than those specified in the MRP. The quantity of each grab sample comprising a time-based composite sample shall be a set of flow proportional volumes as specified in the MRP. If a particular time-based or flow-based composite sampling protocol is not specified in the MRP, the Discharger shall determine and implement the most representative sampling protocol for the given parameter subject to Executive Officer approval.

6. Depth-integrated sample is defined as a water or waste sample collected by allowing a sampling device to fill during a vertical traverse in the waste or receiving water body being sampled. The Discharger shall collect depth-integrated samples in such a manner that the collected sample will be representative of the waste or water body at that sampling point.

7. Flow sample is an accurate measurement of the average daily flow volume using a properly calibrated and maintained flow measuring device.

8. Grab sample is an individual sample collected in a short period of time not exceeding 15 minutes. Grab samples represent only the condition that exists at the time the wastewater is collected.

9. Initial dilution is the process that results in the rapid and irreversible turbulent mixing of wastewater with receiving water around the point of discharge.

10. Overflow is the intentional or unintentional spilling or forcing out of untreated or partially treated wastes from a transport system (e.g., through manholes, at pump stations, and at collection points) upstream from the treatment plant headworks or from any part of a treatment plant facility.

11. Priority pollutants are those constituents referred to in 40 CFR Part 122 as promulgated in the Federal Register, Vol. 65, No. 97, Thursday, May 18, 2000, also known as the California Toxics Rule, the presence or discharge of which could reasonably be expected to interfere with maintaining designated uses.

12. Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.

13. Toxic pollutant means any pollutant listed as toxic under federal Clean Water Act section 307(a)(1) or under 40 CFR 401.15.

14. Untreated waste is raw wastewater.

15. Waste, waste discharge, discharge of waste, and discharge are used interchangeably in the permit. The requirements of the permit apply to the entire volume of water, and the material therein, that is disposed of to surface and ground waters of the State of California.

Table C

List of Monitoring Parameters and Analytical Methods

CTR No.	Pollutant/Parameter	Analytical Method[1]	Minimum Levels[2] (µg/l)											
			GC	GCMS	LC	Color	FAA	GFAA	ICP	ICP MS	SPGFAA	HYD RIDE	CVAA	DCP
1.	Antimony	204.2					10	5	50	0.5	5	0.5		1000
2.	Arsenic	206.3				20		2	10	2	2	1		1000
3.	Beryllium						20	0.5	2	0.5	1			1000
4.	Cadmium	200 or 213				10	0.5	10	0.25	0.5				1000
5a.	Chromium (III)	SM 3500												
5b.	Chromium (VI)	SM 3500				10	5							1000
6.	Copper	200.9					25	5	10	0.5	2			1000
7.	Lead	200.9					20	5	5	0.5	2			10,000
8.	Mercury	1631 (note)[3]												
9.	Nickel	249.2					50	5	20	1	5			1000
10.	Selenium	200.8 or SM 3114B or C						5	10	2	5	1		1000
11.	Silver	272.2					10	1	10	0.25	2			1000
12.	Thallium	279.2					10	2	10	1	5			1000
13.	Zinc	200 or 289					20		20	1	10			
14.	Cyanide	SM 4500 CN^- C or I				5								
15.	Asbestos (only required for dischargers to MUN waters)[4]	0100.2 [5]												
16.	2,3,7,8-TCDD and 17 congeners (Dioxin)	1613												
17.	Acrolein	603	2.0	5										
18.	Acrylonitrile	603	2.0	2										
19.	Benzene	602	0.5	2										
33.	Ethylbenzene	602	0.5	2										

[1] The suggested method is the USEPA Method unless otherwise specified (SM = Standard Methods). The discharger may use another USEPA-approved or recognized method if that method has a level of quantification below the applicable water quality objective. Where no method is suggested, the Discharger has the discretion to use any standard method.

[2] Minimum levels are from the *State Implementation Policy*. They are the concentration of the lowest calibration standard for that technique based on a survey of contract laboratories. Laboratory techniques are defined as follows: GC = Gas Chromatography; GCMS = Gas Chromatography/Mass Spectrometry; LC = High Pressure Liquid Chromatography; Color = Colorimetric; FAA = Flame Atomic Absorption; GFAA = Graphite Furnace Atomic Absorption; ICP = Inductively Coupled Plasma; ICPMS = Inductively Coupled Plasma/Mass Spectrometry; SPGFAA = Stabilized Platform Graphite Furnace Atomic Absorption (i.e., U.S. EPA 200.9); Hydride = Gaseous Hydride Atomic Absorption; CVAA = Cold Vapor Atomic Absorption; DCP = Direct Current Plasma.

[3] The Discharger shall use ultra-clean sampling (USEPA Method 1669) and ultra-clean analytical methods (USEPA Method 1631) for mercury monitoring. The minimum level for mercury is 2 ng/l (or 0.002 ug/l).

[4] MUN = Municipal and Domestic Supply. This designation, if applicable, is in the Findings of the permit.

[5] *Determination of Asbestos Structures over 10 [micrometers] in Length in Drinking Water Using MCE Filters*, U.S. EPA 600/R-94-134, June 1994.

ATTACHMENT H

Pretreatment Program Provisions

1. The Discharger shall implement all pretreatment requirements contained in 40 CFR 403, as amended. The Discharger shall be subject to enforcement actions, penalties, and fines as provided in the Clean Water Act (33 USC 1351 et seq.), as amended. The Discharger shall implement and enforce its Approved Pretreatment Program or modified Pretreatment Program as directed by the Regional Water Board's Executive Officer or the USEPA. The USEPA and/or the State may initiate enforcement action against an industrial user for noncompliance with applicable standards and requirements as provided in the Clean Water Act.

2. The Discharger shall enforce the requirements promulgated under Sections 307(b), 307(c), 307(d) and 402(b) of the Clean Water Act. The Discharger shall cause industrial users subject to Federal Categorical Standards to achieve compliance no later than the date specified in those requirements or, in the case of a new industrial user, upon commencement of the discharge.

3. The Discharger shall perform the pretreatment functions as required in 40 CFR Part 403 and amendments or modifications thereto including, but not limited to:

   i) Implement the necessary legal authorities to fully implement the pretreatment regulations as provided in 40 CFR 403.8(f)(1);

   ii) Implement the programmatic functions as provided in 40 CFR 403.8(f)(2);

   iii) Publish an annual list of industrial users in significant noncompliance as provided per 40 CFR 403.8(f)(2)(vii);

   iv) Provide for the requisite funding and personnel to implement the pretreatment program as provided in 40 CFR 403.8(f)(3); and

   v) Enforce the national pretreatment standards for prohibited discharges and categorical standards as provided in 40 CFR 403.5 and 403.6, respectively.

4. The Discharger shall submit annually a report to USEPA Region 9, the State Water Board and the Regional Water Board describing its pretreatment program activities over the previous twelve months. In the event that the Discharger is not in compliance with any conditions or requirements of the Pretreatment Program, the Discharger shall also include the reasons for noncompliance and a plan and schedule for achieving compliance. The report shall contain, but is not limited to, the information specified in Appendix A entitled, "Requirements for Pretreatment Annual Reports," which is made a part of this Order. The annual report is due on the last day of February each year.

5. The Discharger shall submit semiannual pretreatment reports to USEPA Region 9, the State Water Board and the Regional Water Board describing the status of its significant industrial users (SIUs). The report shall contain, but not is limited to, the information specified in Appendix B entitled, "Requirements for Semiannual Pretreatment Reports," which is made part of this Order. The semiannual reports are due July 31st (for the period January through June) and January 31st (for the period July through December) of each year. The Executive Officer may exempt a Discharger from the semiannual reporting requirements on a case by case basis subject to State Water Board and USEPA's comment and approval.

6. The Discharger may combine the annual pretreatment report with the semiannual pretreatment report (for the July through December reporting period). The combined report shall contain all of the information requested in Appendices A and B and will be due on January 31st of each year.

7. The Discharger shall conduct the monitoring of its treatment plant's influent, effluent, and sludge as described in Appendix C entitled, "Requirements for Influent, Effluent and Sludge Monitoring," which is made part of this Order. The results of the sampling and analysis, along with a discussion of any trends, shall be submitted in the semiannual reports. A tabulation of the data shall be included in the annual pretreatment report. The Executive Officer may require more or less frequent monitoring on a case by case basis.

APPENDIX A

REQUIREMENTS FOR PRETREATMENT ANNUAL REPORTS

The Pretreatment Annual Report is due each year on the last day of February. [If the annual report is combined with the semiannual report (for the July through December period) the submittal deadline is January 31st of each year.] The purpose of the Annual Report is 1) to describe the status of the Publicly Owned Treatment Works (POTW) pretreatment program and 2) to report on the effectiveness of the program, as determined by comparing the results of the preceding year's program implementation. The report shall contain at a minimum, but is not limited to, the following information:

1) Cover Sheet

The cover sheet must contain the name(s) and National Pollutant Discharge Elimination Discharge System (NPDES) permit number(s) of those POTWs that are part of the Pretreatment Program. Additionally, the cover sheet must include: the name, address and telephone number of a pretreatment contact person; the period covered in the report; a statement of truthfulness; and the dated signature of a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for overall operation of the POTW (40 CFR 403.12(j)).

2) Introduction

The Introduction shall include any pertinent background information related to the Discharger, the POTW and/or the industrial user base of the area. Also, this section shall include an update on the status of any Pretreatment Compliance Inspection (PCI) tasks, Pretreatment Performance Evaluation tasks, Pretreatment Compliance Audit (PCA) tasks, Cleanup and Abatement Order (CAO) tasks, or other pretreatment-related enforcement actions required by the Regional Water Board or the USEPA. A more specific discussion shall be included in the section entitled, "Program Changes."

3) Definitions

This section shall contain a list of key terms and their definitions that the Discharger uses to describe or characterize elements of its pretreatment program.

4) Discussion of Upset, Interference and Pass Through

This section shall include a discussion of Upset, Interference or Pass Through incidents, if any, at the POTW(s) that the Discharger knows of or suspects were caused by industrial discharges. Each incident shall be described, at a minimum, consisting of the following information:

a) a description of what occurred;
b) a description of what was done to identify the source;
c) the name and address of the IU responsible
d) the reason(s) why the incident occurred;
e) a description of the corrective actions taken; and
f) an examination of the local and federal discharge limits and requirements for the purposes of determining whether any additional limits or changes to existing requirements may be necessary to prevent other Upset, Interference or Pass Through incidents.

5) Influent, Effluent and Sludge Monitoring Results

This section shall provide a summary of the analytical results from the "Influent, Effluent and Sludge Monitoring" as specified in Appendix C. The results should be reported in a summary matrix that lists monthly influent and effluent metal results for the reporting year.

A graphical representation of the influent and effluent metal monitoring data for the past five years shall also be provided with a discussion of any trends.

6) **Inspection and Sampling Program**

This section shall contain at a minimum, but is not limited to, the following information:

a) Inspections: the number of inspections performed for each type of IU; the criteria for determining the frequency of inspections; the inspection format procedures;
b) Sampling Events: the number of sampling events performed for each type of IU; the criteria for determining the frequency of sampling; the chain of custody procedures.

7) **Enforcement Procedures**

This section shall provide information as to when the approved Enforcement Response Plan (ERP) had been formally adopted or last revised. In addition, the date the finalized ERP was submitted to the Regional Water Board shall also be given.

8) **Federal Categories**

This section shall contain a list of all of the federal categories that apply to the Discharger. The specific category shall be listed including the subpart and 40 CFR section that applies. The maximum and average limits for the each category shall be provided. This list shall indicate the number of Categorical Industrial Users (CIUs) per category and the CIUs that are being regulated pursuant to the category. The information and data used to determine the limits for those CIUs for which a combined waste stream formula is applied shall also be provided.

9) **Local Standards**

This section shall include a table presenting the local limits.

10) **Updated List of Regulated SIUs**

This section shall contain a complete and updated list of the Discharger's Significant Industrial Users (SIUs), including their names, addresses, and a brief description of the individual SIU's type of business. The list shall include all deletions and additions keyed to the list as submitted in the previous annual report. All deletions shall be briefly explained.

11) **Compliance Activities**

a) **Inspection and Sampling Summary:** This section shall contain a summary of all the inspections and sampling activities conducted by the Discharger over the past year to gather information and data regarding the SIUs. The summary shall include:

(1) the number of inspections and sampling events conducted for each SIU;

(2) the quarters in which these activities were conducted; and

(3) the compliance status of each SIU, delineated by quarter, and characterized using all applicable descriptions as given below:

(a) in consistent compliance;

(b) in inconsistent compliance;

(c) in significant noncompliance;

(d) on a compliance schedule to achieve compliance, (include the date final compliance is required);

(e) not in compliance and not on a compliance schedule;

(f) compliance status unknown, and why not.

b) **Enforcement Summary:** This section shall contain a summary of the compliance and enforcement activities during the past year. The summary shall include the names of all the SIUs affected by the following actions:

(1) Warning letters or notices of violations regarding SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements. For each notice, indicate whether it was for an infraction of a federal or local standard/limit or requirement.

(2) Administrative Orders regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements. For each notice, indicate whether it was for an infraction of a federal or local standard/limit or requirement.

(3) Civil actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements. For each notice, indicate whether it was for an infraction of a federal or local standard/limit or requirement.

(4) Criminal actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements. For each notice, indicate whether it was for an infraction of a federal or local standard/limit or requirement.

(5) Assessment of monetary penalties. Identify the amount of penalty in each case and reason for assessing the penalty.

(6) Order to restrict/suspend discharge to the POTW.

(7) Order to disconnect the discharge from entering the POTW.

12) **Baseline Monitoring Report Update**

This section shall provide a list of CIUs that have been added to the pretreatment program since the last annual report. This list of new CIUs shall summarize the status of the respective Baseline Monitoring Reports (BMR). The BMR must contain all of the information specified in 40 CFR 403.12(b). For each of the new CIUs, the summary shall indicate when the BMR was due; when the CIU was notified by the POTW of this requirement; when the CIU submitted the report; and/or when the report is due.

13) **Pretreatment Program Changes**

This section shall contain a description of any significant changes in the Pretreatment Program during the past year including, but not limited to: legal authority, local limits, monitoring/ inspection program and frequency, enforcement protocol, program's administrative structure, staffing level, resource requirements and funding mechanism. If the manager of the pretreatment program changes, a revised organizational chart shall be included. If any element(s) of the program is in the process of being modified, this intention shall also be indicated.

14) **Pretreatment Program Budget**

This section shall present the budget spent on the Pretreatment Program. The budget, either by the calendar or fiscal year, shall show the amounts spent on personnel, equipment, chemical analyses and any other appropriate categories. A brief discussion of the source(s) of funding shall be provided.

15) **Public Participation Summary**

This section shall include a copy of the public notice as required in 40 CFR 403.8(f)(2)(vii). If a notice was not published, the reason shall be stated.

16) **Sludge Storage and Disposal Practice**

This section shall have a description of how the treated sludge is stored and ultimately disposed. The sludge storage area, if one is used, shall be described in detail. Its location, a description of the containment features and the sludge handling procedures shall be included.

17) **PCS Data Entry Form**

The annual report shall include the PCS Data Entry Form. This form shall summarize the enforcement actions taken against SIUs in the past year. This form shall include the following information: the POTW name, NPDES Permit number, period covered by the report, the number of SIUs in significant noncompliance (SNC) that are on a pretreatment compliance schedule, the number of notices of violation and administrative orders issued against SIUs, the number of civil and criminal judicial actions against SIUs, the number of SIUs that have been published as a result of being in SNC, and the number of SIUs from which penalties have been collected.

18) **Other Subjects**

Other information related to the Pretreatment Program that does not fit into one of the above categories should be included in this section.

Signed copies of the reports shall be submitted to the Regional Administrator at USEPA, the State Water Board and the Regional Water Board at the following addresses:

Regional Administrator
United States Environmental Protection Agency
Region 9, Mail Code: WTR-7
Clean Water Act Compliance Office
Water Division
75 Hawthorne Street
San Francisco, CA 94105

Pretreatment Program Manager
Regulatory Unit
State Water Resources Control Board
Division of Water Quality
1001 I Street
Sacramento, CA 95814

Pretreatment Coordinator
NPDES Permits Division
SF Bay Regional Water Quality Control Board
1515 Clay Street, Suite 1400
Oakland, CA 94612

APPENDIX B:

REQUIREMENTS FOR SEMIANNUAL PRETREATMENT REPORTS

The semiannual pretreatment reports are due on July 31st (for pretreatment program activities conducted from January through June) and January 31st (for pretreatment activities conducted from July through December) of each year, unless an exception has been granted by the Regional Water Board's Executive Officer. The semiannual reports shall contain, at a minimum, but is not limited to, the following information:

1) **Influent, Effluent and Sludge Monitoring**

The influent, effluent and sludge monitoring results shall be included in the report. The analytical laboratory report shall also be included, with the QA/QC data validation provided upon request. A description of the sampling procedures and a discussion of the results shall be given. (Please see Appendix C for specific detailed requirements.) The contributing source(s) of the parameters that exceed NPDES limits shall be investigated and discussed. In addition, a brief discussion of the contributing source(s) of all organic compounds identified shall be provided.

The Discharger has the option to submit all monitoring results via an electronic reporting format approved by the Executive Officer. The procedures for submitting the data will be similar to the electronic submittal of the NPDES self-monitoring reports as outlined in the December 17, 1999 Regional Water Board letter, Official Implementation of Electronic Reporting System (ERS). The Discharger shall contact the Regional Water Board's ERS Project Manager for specific details in submitting the monitoring data.

If the monitoring results are submitted electronically, the analytical laboratory reports (along with the QA/QC data validation) should be kept at the discharger's facility.

2) **Industrial User Compliance Status**

This section shall contain a list of all Significant Industrial Users (SIUs) that were not in consistent compliance with all pretreatment standards/limits or requirements for the reporting period. The compliance status for the previous reporting period shall also be included. Once the SIU has determined to be out of compliance, the SIU shall be included in the report until consistent compliance has been achieved. A brief description detailing the actions that the SIU undertook to come back into compliance shall be provided.

For each SIU on the list, the following information shall be provided:

a. Indicate if the SIU is subject to Federal categorical standards; if so, specify the category including the subpart that applies.

b. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard.

c. Indicate the compliance status of the SIU for the two quarters of the reporting period.

d. For violations/noncompliance occurring in the reporting period, provide (1) the date(s) of violation(s); (2) the parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters and (3) a brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

3) **POTW's Compliance with Pretreatment Program Requirements**

This section shall contain a discussion of the Discharger's compliance status with the Pretreatment Program Requirements as indicated in the latest Pretreatment Compliance Audit (PCA) Report, Pretreatment Compliance Inspection (PCI) Report or Pretreatment Performance Evaluation (PPE) Report. It shall contain a summary of the following information:

a. Date of latest PCA, PCI or PPE and report.
b. Date of the Discharger's response.
c. List of unresolved issues.
d. Plan and schedule for resolving the remaining issues.

The reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Publicly Owned Treatment Works (POTW) (40 CFR 403.12(j)). Signed copies of the reports shall be submitted to the Regional Administrator at USEPA, the State Water Board and the Regional Water Board at the following addresses:

Regional Administrator
United States Environmental Protection Agency
Region 9, Mail Code: WTR-7
Clean Water Act Compliance Office
Water Division
75 Hawthorne Street
San Francisco, CA 94105

Pretreatment Program Manager
Regulatory Unit
State Water Resources Control Board
Division of Water Quality
1001 I Street
Sacramento, CA 95814

Pretreatment Coordinator
NPDES Permits Division
SF Bay Regional Water Quality Control Board
1515 Clay Street, Suite 1400
Oakland, CA 94612

APPENDIX C

REQUIREMENTS FOR INFLUENT, EFFLUENT AND SLUDGE MONITORING

The Discharger shall conduct sampling of its treatment plant's influent, effluent and sludge at the frequency as shown in Table E-5 of the Monitoring and Reporting Program (MRP, Attachment E).

The monitoring and reporting requirements of the POTW's Pretreatment Program are in addition to those specified in Table E-2 (influent) and Table E-3 (effluent) of the MRPTable 1 of the SMP. Any subsequent modifications of the requirements specified in Tables E-2 and E-3 shall be adhered to and shall not affect the requirements described in this Appendix unless written notice from the Regional Water Board is received. When sampling periods coincide, one set of test results, reported separately, may be used for those parameters that are required to be monitored by both Tables E-2 and E-3 in the Pretreatment Program. The Pretreatment Program monitoring reports shall be sent to the Pretreatment Program Coordinator.

1. **Influent and Effluent Monitoring**

The Discharger shall monitor for the parameters using the required test methods listed in Table E-5 (the pretreatment table) Any test method substitutions must have received prior written Regional Water Board approval. Influent and Effluent sampling locations shall be the same as those sites specified in the MRP.

2. **Influent and Effluent Monitoring**

The Discharger shall monitor for the parameters using the required test methods listed in Table E-5 (the pretreatment table) of the MRP. Any test method substitutions must have received prior written Regional Water Board approval. Influent and Effluent sampling locations shall be the same as those sites specified in the MRP.

The influent and effluent sampled should be taken during the same 24-hour period. All samples must be representative of daily operations. Grab samples shall be used for volatile organic compounds, cyanide and phenol. In addition, any samples for oil and grease, polychlorinated biphenyls, dioxins/furans, and polynuclear aromatic hydrocarbons shall be grab samples. For all other pollutants, 24-hour composite samples must be obtained through flow-proportioned composite sampling. Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 CFR Part 136 and amendments thereto. For effluent monitoring, the reporting limits for the individual parameters shall be at or below the minimum levels (MLs) as stated in the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (2000) [also known as the State Implementation Policy (SIP)]; any revisions to the MLs shall be adhered to. If a parameter does not have a stated minimum level, then the Discharger shall conduct the analysis using the lowest commercially available and reasonably achievable detection levels.

The following standardized report format should be used for submittal of the influent and effluent monitoring report. A similar structured format may be used but will be subject to Regional Water Board approval. The monitoring reports shall be submitted with the Semiannual Reports.

A. Sampling Procedures – This section shall include a brief discussion of the sample locations, collection times, how the sample was collected (i.e., direct collection using vials or bottles, or other types of collection using devices such as automatic samplers, buckets, or beakers), types of containers used, storage procedures and holding times.

Include description of prechlorination and chlorination/dechlorination practices during the sampling periods.

B. Method of Sampling Dechlorination – A brief description of the sample dechlorination method prior to analysis shall be provided.

C. Sample Compositing – The manner in which samples are composited shall be described. If the compositing procedure is different from the test method specifications, a reason for the variation shall be provided.

D. Data Validation – All quality assurance/quality control (QA/QC) methods to be used shall be discussed and summarized. These methods include, but are not limited to, spike samples, split samples, blanks and standards. Ways in which the QA/QC data will be used to qualify the analytical test results shall be identified. A certification statement shall be submitted with this discussion stating that the laboratory QA/QC validation data has been reviewed and has met the laboratory acceptance criteria. The QA/QC validation data shall be submitted to the Regional Water Board upon request.

E. A tabulation of the test results shall be provided.

F. Discussion of Results – The report shall include a complete discussion of the test results. If any pollutants are detected in sufficient concentration to upset, interfere or pass through plant operations, the type of pollutant(s) and potential source(s) shall be noted, along with a plan of action to control, eliminate, and/or monitor the pollutant(s). Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

3. **Sludge Monitoring**

Sludge should be sampled in the same 24-hour period during which the influent and effluent are sampled except as noted in (C) below. The same parameters required for influent and effluent analysis shall be included in the sludge analysis. The sludge analyzed shall be a composite sample of the sludge for final disposal consisting of:

A. Sludge lagoons – 20 grab samples collected at representative equidistant intervals (grid pattern) and composited as a single grab, or

B. Dried stockpile – 20 grab samples collected at various representative locations and depths and composited as a single grab, or

C. Dewatered sludge- daily composite of 4 representative grab samples each day for 5 days taken at equal intervals during the daily operating shift taken from a) the dewatering units or b) from each truckload, and shall be combined into a single 5-day composite.

The USEPA manual, POTW Sludge Sampling and Analysis Guidance Document, August 1989, containing detailed sampling protocols specific to sludge is recommended as a guidance for sampling procedures. The USEPA manual Analytical Methods of the National Sewage Sludge Survey, September 1990, containing detailed analytical protocols specific to sludge, is recommended as a guidance for analytical methods.

In determining if the sludge is a hazardous waste, the Dischargers shall adhere to Article 2, "Criteria for Identifying the Characteristics of Hazardous Waste," and Article 3, "Characteristics of Hazardous Waste," of Title 22, California Code of Regulations, Sections 66261.10 to 66261.24 and all amendments thereto.

Sludge monitoring reports shall be submitted with the appropriate Semiannual Report. The following standardized report format should be used for submittal of the report. A similarly structured form may be used but will be subject to Regional Water Board approval.

A. Sampling procedures – Include sample locations, collection procedures, types of containers used, storage/refrigeration methods, compositing techniques and holding times. Enclose a map of sample locations if sludge lagoons or stockpiled sludge is sampled.

B. Data Validation – All quality assurance/quality control (QA/QC) methods to be used shall be discussed and summarized. These methods include, but are not limited to, spike samples, split samples, blanks and standards. Ways in which the QA/QC data will be used to qualify the analytical test results shall be identified. A certification statement shall be submitted with this discussion stating that the laboratory QA/QC validation data has been reviewed and has met the laboratory acceptance criteria. The QA/QC validation data shall be submitted to the Regional Water Board upon request.

C. Test Results – Tabulate the test results and include the percent solids.

D. Discussion of Results – The report shall include a complete discussion of test results. If the detected pollutant(s) is reasonably deemed to have an adverse effect on sludge disposal, a plan of action to control, eliminate, and/or monitor the pollutant(s) and the known or potential source(s) shall be included. Any apparent generation and/or destruction of pollutants attributable to chlorination/ dechlorination sampling and analysis practices shall be noted.

The Discharger shall also provide any influent, effluent or sludge monitoring data for nonpriority pollutants that the permittee believes may be causing or contributing to Interference, Pass Through or adversely impacting sludge quality.

ORDER No. R2-2019-0028
NPDES No. CA0037681

WASTE DISCHARGE REQUIREMENTS AND NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT FOR CITY AND COUNTY OF SAN FRANCISCO OCEANSIDE WATER POLLUTION CONTROL PLANT, WASTEWATER COLLECTION SYSTEM, AND WESTSIDE RECYCLED WATER PROJECT

The following Discharger is authorized to discharge from the locations listed in Table 2 in accordance with the waste discharge requirements (WDRs) and federal National Pollutant Discharge Elimination System (NPDES) permit requirements set forth in this Order:

Table 1. Discharger Information

Discharger	City and County of San Francisco
Facility Name	Oceanside Water Pollution Control Plant, Wastewater Collection System, and Westside Recycled Water Project
Facility Address	3500 Great Highway San Francisco, CA 94132 San Francisco County
CIWQS Place Number	256498

Table 2. Discharge Locations

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
001	Treated effluent, including the following: ● Secondary-treated effluent from Oceanside Water Pollution Control Plant (dry weather); ● Primary- and secondary-treated effluent from Oceanside Water Pollution Control Plant (wet weather); ● Equivalent-to-primary-treated effluent from Westside Transport/Storage Structure (wet weather); and ● Reverse osmosis concentrate from Westside Recycled Water Project, when operational (dry and wet weather).	37.70500	-122.57750	Pacific Ocean, Offshore
CSD-001	Equivalent-to-primary-treated effluent (wet weather)	37.71528	-122.50444	Pacific Ocean (Fort Funston, Ocean Beach)

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
CSD-002	Equivalent-to-primary-treated effluent (wet weather)	37.73778	-122.50806	Pacific Ocean (Vicente St., Ocean Beach
CSD-003	Equivalent-to-primary-treated effluent (wet weather)	37.76389	-122.51167	Pacific Ocean (Lincoln Way, Ocean Beach)
CSD-004	Equivalent-to-primary-treated effluent (wet weather)	37.78472	-122.51028	Pacific Ocean (Mile Rock)
CSD-005	Equivalent-to-primary-treated effluent (wet weather)	37.78778	-122.49167	Pacific Ocean (China Beach)
CSD-006	Equivalent-to-primary-treated effluent (wet weather)	37.78944	-122.48778	Pacific Ocean (Baker Beach)
CSD-007	Equivalent-to-primary-treated effluent (wet weather)	37.78944	-122.48694	Pacific Ocean (Baker Beach)

Table 3. Administrative Information

The U.S. Environmental Protection Agency, Region IX, issued this Order on:	
The San Francisco Bay Regional Water Quality Control Board adopted this Order on:	September 11, 2019
This Order shall become effective on:	November 1, 2019
This Order shall expire on:	October 31, 2024
The Discharger shall file a Report of Waste Discharge as an application for reissuance of WDRs in accordance with California Code of Regulations, title 23, and an application for reissuance of a National Pollutant Discharge Elimination System (NPDES) permit no later than:	February 1, 2024
This discharge is classified as follows:	Major

The signatures below certify that this Order with all attachments is a full, true, and correct copy of the Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on the date indicated above, and an NPDES permit issued by the U.S. Environmental Protection Agency, Region IX, on the date above.

7/12/2019

I. FACILITY INFORMATION

Information describing the Oceanside Water Pollution Control Plant, Wastewater Collection System, and Westside Recycled Water Project (collectively, the Facility) is summarized in Table 1 and in Fact Sheet (Attachment F) sections I and II.

II. FINDINGS

The California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board), and the U.S. Environmental Protection Agency (U.S. EPA) find:

A. Legal Authorities. This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as a National Pollutant Discharge Elimination System (NPDES) permit authorizing the Discharger to discharge into waters of the United States as listed in Table 2 subject to the WDRs and NPDES permit requirements in this Order.

B. Background and Rationale for Requirements. The Regional Water Board and U.S. EPA developed the requirements in this Order based on information the Discharger submitted as part of its application, information obtained through monitoring and reporting programs, and other available information. The Fact Sheet contains background information and rationale for the requirements in this Order and is hereby incorporated into and constitutes findings for this Order. Attachments A through E, G, and H are also incorporated into this Order.

C. Notification of Interested Parties. The Regional Water Board and U.S. EPA notified the Discharger and interested agencies and persons of their intent to jointly issue WDRs and NPDES permit requirements, and provided an opportunity to submit written comments and recommendations. The Fact Sheet provides details regarding the notification.

D. Consideration of Public Comment. The Regional Water Board, in a public meeting, heard all comments pertaining to the discharge. The Fact Sheet provides details regarding the public hearing. The Regional Water Board and U.S. EPA considered all comments pertaining to the discharge.

THEREFORE, IT IS HEREBY ORDERED that Order No. R2-2009-0062 (previous order) is rescinded upon the effective date of this Order, except for enforcement purposes, and in order to meet the provisions of Water Code division 7 (commencing with § 13000) and regulations adopted thereunder and the provisions of the CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order. The Regional Water Board intends that joint issuance of this Order with U.S. EPA will serve as its certification under CWA section 401 that discharges pursuant to this Order comply with 33 U.S.C. sections 1311, 1312, 1313, 1316, and 1317. This action in no way prevents the Regional Water Board or U.S. EPA from taking enforcement action for past violations of the previous order.

III. DISCHARGE PROHIBITIONS

A. Discharge of treated wastewater at a location or in a manner different than described in this Order is prohibited.

B. Bypass of untreated or partially-treated wastewater to waters of the United States is prohibited, except as provided for in Attachment D section I.G. Combined sewer discharges during wet weather (as defined in Attachment A) authorized by this Order are not subject to this prohibition.

Blended wastewater is biologically-treated wastewater blended with wastewater diverted around biological treatment units at the Oceanside Water Pollution Control Plant. These anticipated discharges are approved under the bypass conditions when (1) the Discharger's instantaneous wet weather influent flow exceeds the capacity of the biological treatment units of 43 MGD, (2) all wet weather flows passing the headworks of the plant receive at least primary treatment, and (3) the discharge complies with the applicable effluent and receiving water limitations contained in this Order. Furthermore, the Discharger shall operate its Facility as designed and in accordance with the Operation and Maintenance Manual for the Facility. This means it shall optimize storage and use of equalization units and shall fully utilize the biological treatment units. The Discharger shall report incidents of blended effluent discharges in monthly self-monitoring reports and shall conduct monitoring of this discharge as specified in the attached Monitoring and Reporting Program (MRP) (Attachment E).

C. Discharge at Discharge Point No. 001 is prohibited when the discharge does not receive a minimum initial dilution of at least 148:1 (parts seawater per part wastewater), as modeled assuming no currents. Compliance shall be achieved by proper operation and maintenance of the discharge outfall to ensure that it (or its replacement, in whole or part) is in good working order and is consistent with, or can achieve better mixing than, 148:1. The Discharger shall describe measures taken to ensure compliance in its Report of Waste Discharge and application for permit reissuance.

D. Discharge to a water of the United States from any location other than Discharge Point No. 001 is prohibited, except from Discharge Point Nos. CSD-001, CSD-002, CSD-003, CSD-004, CSD-005, CSD-006, and CSD-007 during wet weather (as defined in Attachment A) in accordance with the requirements in this Order.

E. Average dry weather Oceanside Water Pollution Control Plant influent flow in excess of 43 MGD is prohibited. Average dry weather influent flow shall be determined from three consecutive dry weather months each year, with compliance measured at Monitoring Location INF-001A as described in the MRP.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Technology-Based Effluent Limitations

1. Oceanside Water Pollution Control Plant

During dry weather, the Discharger shall comply with the following effluent limitations for discharges from the Oceanside Water Pollution Control Plant, with compliance measured at Monitoring Location EFF-001A as described in the MRP, as follows:

Table 4. Effluent Limitations - Oceanside Water Pollution Control Plant

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Carbonaceous Biochemical Oxygen Demand, 5-day @ 20°C ($CBOD_5$)	mg/L	25	40	---	---	---
Total Suspended Solids (TSS)	mg/L	30	45	---	---	---
$CBOD_5$ Removal [1]	%	85 (minimum)	---	---	---	---
TSS Removal [1]	%	85 (minimum)	---	---	---	---
pH [2]	s.u.	---	---	---	6.0	9.0

Abbreviations:

mg/L = milligrams per liter
s.u. = standard units
% = percent

Footnotes:

[1] The arithmetic mean of $CBOD_5$ and TSS, by concentration, of effluent samples collected at Monitoring Location EFF-001A as described in the MRP shall not exceed 15 percent of the arithmetic mean of the $CBOD_5$ and TSS, by concentration, of influent samples collected at Monitoring Location INF-001A as described in the MRP, at approximately the same times during the same periods.

[2] If the Discharger monitors pH continuously, pursuant to 40 C.F.R. § 401.17 the Discharger shall be in compliance with this pH limitation provided that both of the following conditions are satisfied: (i) the total time during which the pH is outside the required range shall not exceed 7 hours and 26 minutes in any calendar month; and (ii) no individual excursion from the required pH range shall exceed 60 minutes.

During wet weather, the Discharger shall comply with the narrative technology-based effluent limitations contained in Provision VI.C.5.a (Nine Minimum Controls).

2. Westside Recycled Water Project

When recycled water is being produced, the Discharger shall comply with the following effluent limitations for discharges from the Westside Recycled Water Project, with compliance measured at Monitoring Location EFF-001R as described in the MRP, as follows:

Table 5. Effluent Limitations - Westside Recycled Water Project

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
TSS	mg/L	60	---	---	---	---
pH [1]	s.u.	---	---	---	6.0	9.0
Oil and Grease	mg/L	25	40	---	---	75
Settleable Solids	mL/L	1.0	1.5	---	---	3.0
Turbidity	NTU	75	100	---	---	225

Abbreviations:

mg/L = milligrams per liter
mL/L = milliliters per liter
NTU = nephelometric turbidity units
s.u. = standard units

Footnote:

[1] If the Discharger monitors pH continuously, pursuant to 40 C.F.R. § 401.17 the Discharger shall be in compliance with this pH limitation provided that both of the following conditions are satisfied: (i) the total time during which the pH is outside the required range shall not exceed 7 hours and 26 minutes in any calendar month; and (ii) no individual excursion from the required pH range shall exceed 60 minutes.

B. Water Quality-Based Effluent Limitations

During dry weather, the Discharger shall comply with the following effluent limitation for discharges at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001C as described in the MRP, as follows:

Table 6. Effluent Limitations - Discharge Point No. 001

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Chronic Toxicity [1]	Pass or Fail	---	---	Pass	---	---

Footnote:

[1] MRP section V sets forth chronic toxicity monitoring requirements. The discharge is subject to determination of "Pass" or "Fail" from a single chronic toxicity test conducted at the in-stream waste concentration (IWC) defined in MRP section V.A.2 using the Test of Significant Toxicity (TST) statistical approach (Welch's t-test) in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010), Appendix A, Figure A-1 and Table A-1, and Appendix B, Table B-1.

The TST null hypothesis shall be the following:

Mean discharge IWC response ≤ 0.75 × Mean control response

A test result that rejects this null hypothesis shall be reported as "Pass." A test result that does not reject this null hypothesis shall be reported as "Fail." The relative "Percent Effect" at the discharge IWC shall also be reported as:

([Mean control response - Mean discharge IWC response] ÷ Mean control response) × 100

During wet weather, the Discharger shall comply with the narrative water quality-based effluent limitations contained in Provision VI.C.5.c (Long-Term Control Plan) for the Discharge Points in Table 2.

V. RECEIVING WATER LIMITATIONS

Discharge shall not cause or contribute to a violation of any applicable water quality standard (with the exception set forth in State Water Board Order No. WQ 79-16) for receiving waters adopted by the Regional Water Board, State Water Resources Control Board (State Water Board), or U.S. EPA as required by the CWA and regulations adopted thereunder. If more stringent water quality standards are promulgated or approved pursuant to CWA section 303, or amendments thereto, the Regional Water Board and U.S. EPA may revise or modify this Order in accordance with the more stringent standards.

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all "Standard Provisions" included in Attachment D. In Attachment D, references to "Regional Water Board" shall be interpreted as "Regional Water Board and U.S. EPA," and references to "Regional Water Board Executive Officer" shall be interpreted as "Regional Water Board Executive Officer and U.S. EPA."

2. The Discharger shall comply with all applicable provisions of the "Regional Standard Provisions, and Monitoring and Reporting Requirements" (Attachment G), except as follows:

a. Attachment G section V.C.1.d.iv (Dioxin-TEQ). The Discharger shall calculate and report dioxin-TEQs using the definition of TCDD Equivalents in Attachment A, which supersedes the definition in Attachment G.

b. Attachment G section III.A.2 (Minimum Levels). The Discharger shall comply with the minimum levels listed in Ocean Plan Appendix II in lieu of those listed in Attachment G Table B.

c. Attachment G section III.A.3.b.v(b) (Approved Wet Weather Bypasses). The Discharger shall comply with the monitoring requirements for wet weather secondary bypasses in MRP Table E-5 (Monitoring Location EFF-001B) in lieu of those listed in Attachment G section II.A.3.b.v(b).

In Attachment G, references to "Regional Water Board" shall be interpreted as "Regional Water Board and U.S. EPA," and references to "Regional Water Board Executive Officer" shall be interpreted as "Regional Water Board Executive Officer and U.S. EPA."

B. Monitoring and Reporting

The Discharger shall comply with the MRP, and future revisions thereto, and applicable sampling and reporting requirements in Attachments D and G.

C. Special Provisions

1. Reopener Provisions

The Regional Water Board or U.S. EPA may modify or reopen this Order prior to its expiration date in any of the following circumstances, as allowed by law:

a. If present or future investigations demonstrate that the discharges governed by this Order have or will have a reasonable potential to cause or contribute to, or will cease to have, adverse impacts on water quality or beneficial uses of the receiving waters.

b. As new or revised water quality standards or total maximum daily loads (TMDLs) come into effect for surface waters of the State (whether statewide, regional, or site-specific). In such cases, effluent limitations in this Order may be modified as necessary to reflect updated water quality standards and wasteload allocations in TMDLs. Adoption of effluent limitations contained in this Order is not intended to restrict in any way future modifications based on legally adopted water quality objectives, TMDLs, or as otherwise permitted under federal regulations governing NPDES permit modifications.

c. If translator, dilution, or other water quality studies provide a basis for determining that a permit condition should be modified.

d. If State Water Board precedential decisions, new policies, new laws, or new regulations are adopted.

e. If an administrative or judicial decision on a separate NPDES permit or WDRs addresses requirements similar to this discharge.

f. If combined sewer system discharge controls fail to meet water quality standards or protect designated uses.

g. Or as otherwise authorized by law.

The Discharger may request a permit modification based on any of the circumstances above. With any such request, the Discharger shall include antidegradation and anti-backsliding analyses.

2. Effluent Characterization Study and Report

a. Study Elements. The Discharger shall characterize and evaluate the dry weather discharge from Discharge Point No. 001 to verify that the reasonable potential analysis conclusions of this Order remain valid and to inform the next permit reissuance. The Discharger shall monitor Ocean Plan Table 1 pollutants as described in the MRP and evaluate on an annual basis whether concentrations of any Ocean Plan Table 1 pollutants significantly increase over past performance. The Discharger shall investigate the cause of any such increases. The investigation may include, but need not be limited to, increasing the monitoring frequency, monitoring internal process streams, and monitoring of influent sources. The Discharger shall establish remedial measures addressing any increases resulting in reasonable potential to cause or contribute to an exceedance of

applicable water quality objectives (see Fact Sheet Tables F-9 and F-10 for the objectives). This requirement to establish remedial measures may be satisfied through identification of the constituent as a "pollutant of concern" in the Discharger's Pollutant Minimization Program, described in Provision VI.C.3.

b. Reporting Requirements

i. Routine Reporting. The Discharger shall, within 45 days of receipt of analytical results, report the identity of any Ocean Plan Table 1 pollutant detected at or above the applicable water quality objective to the Regional Water Board and U.S. EPA.

ii. Annual Reporting. The Discharger shall summarize the annual data evaluation and source investigation in its annual self-monitoring report (see MRP § VIII.B).

3. Pollutant Minimization Program

a. The Discharger shall continue to improve its Pollutant Minimization Program to promote minimization of pollutant loadings to the sewer system and therefore to the receiving waters.

b. The Discharger shall submit an annual report no later than February 28 each year. Each annual report shall include at least the following information:

i. Brief description of treatment plant. The description shall include the service area and treatment plant processes.

ii. Discussion of current pollutants of concern. Periodically, the Discharger shall analyze its circumstances to determine which pollutants are currently a problem and which pollutants may be potential future problems. This discussion shall include the reasons for choosing the pollutants. At a minimum, the Discharger shall consider copper and zinc as pollutants of concern.

iii. Identification of sources for pollutants of concern. This discussion shall include how the Discharger intends to estimate and identify pollutant sources. The Discharger shall include sources or potential sources not directly within the ability or authority of the Discharger to control, such as pollutants in the potable water supply and air deposition.

iv. Identification of tasks to reduce the sources of pollutants of concern. This discussion shall identify and prioritize tasks to address the Discharger's pollutants of concern. The Discharger may implement the tasks by itself or participate in group, regional, or national tasks that address its pollutants of concern. The Discharger is strongly encouraged to participate in group, regional, or national tasks that address its pollutants of concern whenever it is efficient and appropriate to do so. An implementation timeline shall be included for each task.

v. Outreach to employees. The Discharger shall inform employees about the pollutants of concern, potential sources, and how they might be able to help reduce the

discharge of these pollutants of concern into the Facility. The Discharger may provide a forum for employees to provide input.

vi. **Continuation of Public Outreach Program.** The Discharger shall continue a pollution prevention public outreach program for its service area. Outreach may include participation in existing community events, such as county fairs; initiating new community events, such as displays and contests during Pollution Prevention Week; conducting school outreach programs; conducting plant tours; and providing public information in newspaper articles or advertisements, radio or television stories or spots, newsletters, utility bill inserts, or web sites. Information shall be specific to target audiences. The Discharger shall coordinate with other agencies as appropriate.

vii. **Discussion of criteria used to measure Pollutant Minimization Program and task effectiveness.** The Discharger shall establish criteria to evaluate the effectiveness of its Pollutant Minimization Program. This discussion shall identify the specific criteria used to measure the effectiveness of each task in Provisions VI.C.3.b.iii, iv, v, and vi.

viii. **Documentation of efforts and progress.** This discussion shall detail all of the Discharger's Pollutant Minimization Program activities during the reporting year.

ix. **Evaluation of Pollutant Minimization Program and task effectiveness.** The Discharger shall use the criteria established in Provision VI.C.3.b.vii to evaluate the program and task effectiveness.

x. **Identification of specific tasks and timelines for future efforts.** Based on the evaluation, the Discharger shall explain how it intends to continue or change its tasks to more effectively reduce the amount of pollutants flowing to the Facility, and subsequently in its effluent.

c. The Discharger shall develop and conduct a Pollutant Minimization Program as further described below when there is evidence that a priority pollutant is present in the effluent above an effluent limitation (e.g., sample results reported as detected but not quantified [DNQ] when the effluent limitation is less than the method detection limit [MDL], sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, or results of benthic or aquatic organism tissue sampling) and either:

i. A sample result is reported as DNQ and the effluent limitation is less than the Reporting Level (RL); or

ii. A sample result is reported as not detected (ND) and the effluent limitation is less than the MDL using definitions in Attachment A and reporting protocols described in the MRP.

d. If triggered by the reasons set forth in Provision VI.C.3.c, the Discharger's Pollutant Minimization Program shall include, but not be limited to, the following actions and submittals:

i. Annual review and semiannual monitoring of potential sources of the reportable pollutant, which may include fish tissue monitoring and other bio-uptake sampling, or alternative measures when source monitoring is unlikely to produce useful analytical data;

ii. Quarterly monitoring for the reportable pollutant in treatment plant influent. The Regional Water Board Executive Officer and U.S. EPA may approve alternative measures when influent monitoring is unlikely to produce useful analytical data;

iii. Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable pollutant in the effluent at or below the effluent limitation;

iv. Implementation of appropriate cost-effective control measures for the reportable pollutant, consistent with the control strategy; and

v. Inclusion of the following within the annual report required by Provision VI.C.3.b:

(a) All Pollutant Minimization Program monitoring results for the previous year;
(b) List of potential sources of the reportable pollutant;
(c) Summary of all actions undertaken pursuant to the control strategy; and
(d) Description of actions to be taken in the following year.

4. Special Provisions for Publicly-Owned Treatment Works (POTWs)

a. Sludge and Biosolids Management. The Discharger shall manage its sludge and biosolids in accordance with federal regulations (40 C.F.R. parts 258 and 503) and Attachment H.

i. Sludge and biosolids treatment and storage shall not create a nuisance, such as objectionable odors or flies, or result in groundwater contamination.

ii. Sludge and biosolids treatment and storage facilities shall be adequate to divert surface runoff from adjacent areas, to protect site boundaries from erosion, and to prevent conditions that would cause drainage from stored materials. Adequate protection is defined as protection from at least a 100-year storm and the highest possible tidal state that may occur.

iii. This Order does not authorize permanent onsite sludge or biosolids storage or disposal. A Report of Waste Discharge shall be filed and the site brought into compliance with applicable regulations prior to commencement of any such activity.

b. Pretreatment Program. The Discharger shall implement and enforce its approved pretreatment program in accordance with federal pretreatment regulations (40 C.F.R. part 403); pretreatment standards promulgated under CWA sections 307(b), 307(c), and 307(d); pretreatment requirements specified under 40 C.F.R. section 122.44(j); and the requirements in Attachment H, "Pretreatment Requirements." The Discharger's responsibilities include, but are not limited to, the following:

i. Enforcement of the National Pretreatment Standards of 40 C.F.R. sections 403.5 and 403.6;

ii. Implementation of its pretreatment program in accordance with legal authorities, policies, procedures, and financial provisions described in the National Pretreatment Program (40 C.F.R. part 403);

iii. Submission of reports to the State Water Board, the Regional Water Board, and U.S. EPA as described in Attachment H; and

iv. Evaluation of the need to revise local limits as required under 40 C.F.R. sections 122.44(j)(2)(ii) and 403.5(c)(1) and, by November 1, 2020, submission of a report describing the changes to local limits with a plan and schedule for implementation, or the rationale for making no changes to local limits.

c. Anaerobically-Digestible Material. If the Discharger receives hauled-in anaerobically-digestible material for injection into an anaerobic digester, the Discharger shall notify the Regional Water Board and develop and implement Standard Operating Procedures for this activity. The Standard Operating Procedures shall be developed prior to initiation of hauling. The Standard Operating Procedures shall address material handling, including unloading, screening, or other processing prior to anaerobic digestion; transportation; spill prevention; spill response; avoidance of the introduction of materials that could cause interference, pass through, or upset of the treatment processes; avoidance of prohibited material; vector control; odor control; operation and maintenance; and the disposition of any solid waste segregated from introduction to the digester. The Discharger shall train its staff on the Standard Operating Procedures and maintain records for a minimum of three years for each load received, describing the hauler, waste type, and quantity received. In addition, the Discharger shall maintain records for a minimum of three years for the disposition, location, and quantity of cumulative pre-digestion segregated solid waste hauled offsite.

d. Separate Sanitary Sewer Systems. The Discharger shall properly operate and maintain its separate sanitary collection systems (see Attachments D and G, section I.D), report any noncompliance with respect to its separate sanitary collection systems (see Attachments D and G, sections V.E.1 and V.E.2), and mitigate any discharges in violation of this Order associated with its separate sanitary collection systems (see Attachments D and G, section I.C).

State Water Board Order No. 2006-0003-DWQ, Statewide General Waste Discharge Requirements for Sanitary Sewer Systems, as amended by State Water Board Order No. WQ 2013-0058-EXEC (statewide WDRs), contains requirements for operation and maintenance of collection systems and for reporting and mitigating sanitary sewer overflows. The statewide WDRs clearly and specifically stipulate requirements for operation and maintenance and for reporting and mitigating sanitary sewer overflows. Implementing the requirements for operation and maintenance and mitigation of sanitary sewer overflows set forth in the statewide WDRs (and any subsequent order updating those requirements) shall satisfy the corresponding federal NPDES requirements

specified in Attachments D and G of this Order for the separate sanitary collection systems. Following the reporting requirements set forth in the statewide WDRs (and any subsequent order updating these requirements) shall satisfy the NPDES reporting requirements for sanitary sewer overflows specified in Attachments D and G.

5. Combined Sewer System

a. Nine Minimum Controls. The Discharger shall implement the following nine minimum controls:

i. Control No. 1: Conduct Proper Operations and Maintenance Program. The Discharger shall implement an operations and maintenance program that establishes operation, maintenance, and inspection procedures to ensure that the combined sewer system is operated and maintained in a manner that complies with the requirements of this Order. The program shall include the elements listed below:

(a) Organizational Structure. The Discharger shall maintain an up-to-date directory of operations and maintenance staff, and a designated primary contact person for the Facility. The Discharger shall notify the Regional Water Board and U.S. EPA within 90 days of designating a new primary contact person.

(b) Budget. The Discharger shall allocate sufficient funds and personnel for routine operations and maintenance, and to provide for possible emergencies.

(c) Critical Facilities and Major System Components. The Discharger shall maintain a written inventory of critical facilities and major system components (i.e., those facilities and system components that affect the performance of the combined sewer system). The inventory shall include force mains, pump stations, major treatment plant units, transport/storage structures, combined sewer discharge outfalls, Discharge Point No. 001 outfall, tide gates, overflow weirs, and baffles. The Discharger shall include the following information for each critical facility and major system component in the inventory:

(1) Physical description (e.g., capacity, dimensions, age) and location;
(2) Status (e.g., elements out of service or planned to be taken out of service); and
(3) Description of preventative maintenance planned and completed.

At a minimum, the Discharger shall review and update the inventory once every 12 months. The Discharger may combine the inventory and the Wastewater Facilities Status Report (see Attachment G section I.D.2) into one document.

(d) Procedures for Routine Maintenance. The Discharger shall document procedures for routine maintenance and timely repair of the critical facilities and major system components listed in the inventory required by Provision VI.C.5.a.i(c). Routine maintenance shall focus on preventative maintenance to avoid failures during critical times.

(e) Non-Routine Maintenance and Emergency Situations. The Discharger shall develop and implement an emergency response plan for each critical facility to

minimize the likelihood and adverse impacts of failure to the maximum extent practicable. The emergency response plan shall be consistent with the Contingency Plan required by Attachment G section I.C.1.

(f) Inspections. The Discharger shall conduct an inspection program of the combined sewer system to provide reasonable assurance that unpermitted discharges, obstructions, and damage will be discovered. At a minimum, the Discharger shall do the following:

(1) Inspect each critical facility and major system component identified in accordance with Provision VI.C.5.a.i(c), above, at least once every 12 months to ensure they are in good working condition. The inspection shall include, but not be limited to, entering the regulator structure, if accessible; determining the extent of any structural defects or debris and grit buildup; removing any debris that may constrict flow, cause blockage, or result in a prohibited discharge; and adjusting tide gates to minimize combined sewer discharges and to prevent tidal inflow.

(2) Record all inspection results, including the date and time of the inspection, the inspection findings, and description of any corrective actions taken.

(g) Training. The Discharger shall provide training to operations and maintenance staff regarding operation and maintenance duties and standard operation procedures. Training shall be consistent with the Discharger's Operation and Maintenance Manual required by Attachment G section I.D.1 (Operation and Maintenance Manual).

(h) Operation and Maintenance Program Review. The Discharger shall review and modify its operations and maintenance program as necessary and in accordance with sections I.C (Duty to Mitigate) and I.D (Proper Operation and Maintenance) of Attachments D and G. At a minimum, the Discharger shall review and update the Operation and Maintenance Manual required by Attachment G section I.D.1 (Operation and Maintenance Manual) once per calendar year.

ii. Control No. 2: Maximize Use of Collection System for Storage

(a) The Discharger shall maximize use of the combined sewer system for in-line storage to reduce the magnitude, frequency, and duration of combined sewer discharges. At a minimum, the Discharger shall implement the following controls:

(1) Prevent intrusion of receiving waters into the combined sewer system;

(2) Use all facilities, including any inoperative or unused treatment facilities, to store or treat wet weather flows to the maximum extent practicable; and

(3) Implement programs to remove and prevent flow obstructions in the combined sewer system, including but not limited to catch basin cleaning; gravity sewer cleaning; fats, oils and grease control; gravity sewer condition assessment;

gravity sewer rehabilitation and replacement; and disconnection of illegal connections.

(b) The Discharger shall notify and report sewer overflows from the combined sewer system by implementing the following within six months of the effective date of this Order:

(1) The Discharger shall complete the CIWQS Online Collection System Questionnaire, as required by the CIWQS system, and enter information regarding all sewer overflows from the combined sewer system into the CIWQS Online SSO Database, including all required database fields. The Discharger's Legally Responsible Official, as required by the CIWQS system, shall certify all information submitted. The Discharger shall update and certify the Collection System Questionnaire at least every 12 months.

(2) For sewer overflows from the combined sewer system with volumes 1,000 gallons or greater, the Discharger shall submit draft reports through the CIWQS Online SSO database within 3 business days of becoming aware of the sewer overflow from the combined sewer system and certify the reports within 15 calendar days of the end date of the sewer overflow from the combined sewer system.
