

## Technical Memorandum

TO: AECOM  
c/o Allie Beauregard

FROM: Terry A. Hayes Associates Inc.

DATE: November 19, 2021

RE: **Energy Resources Impacts Assessment for the Alta Cuvee Mixed Use Project**

### SUMMARY

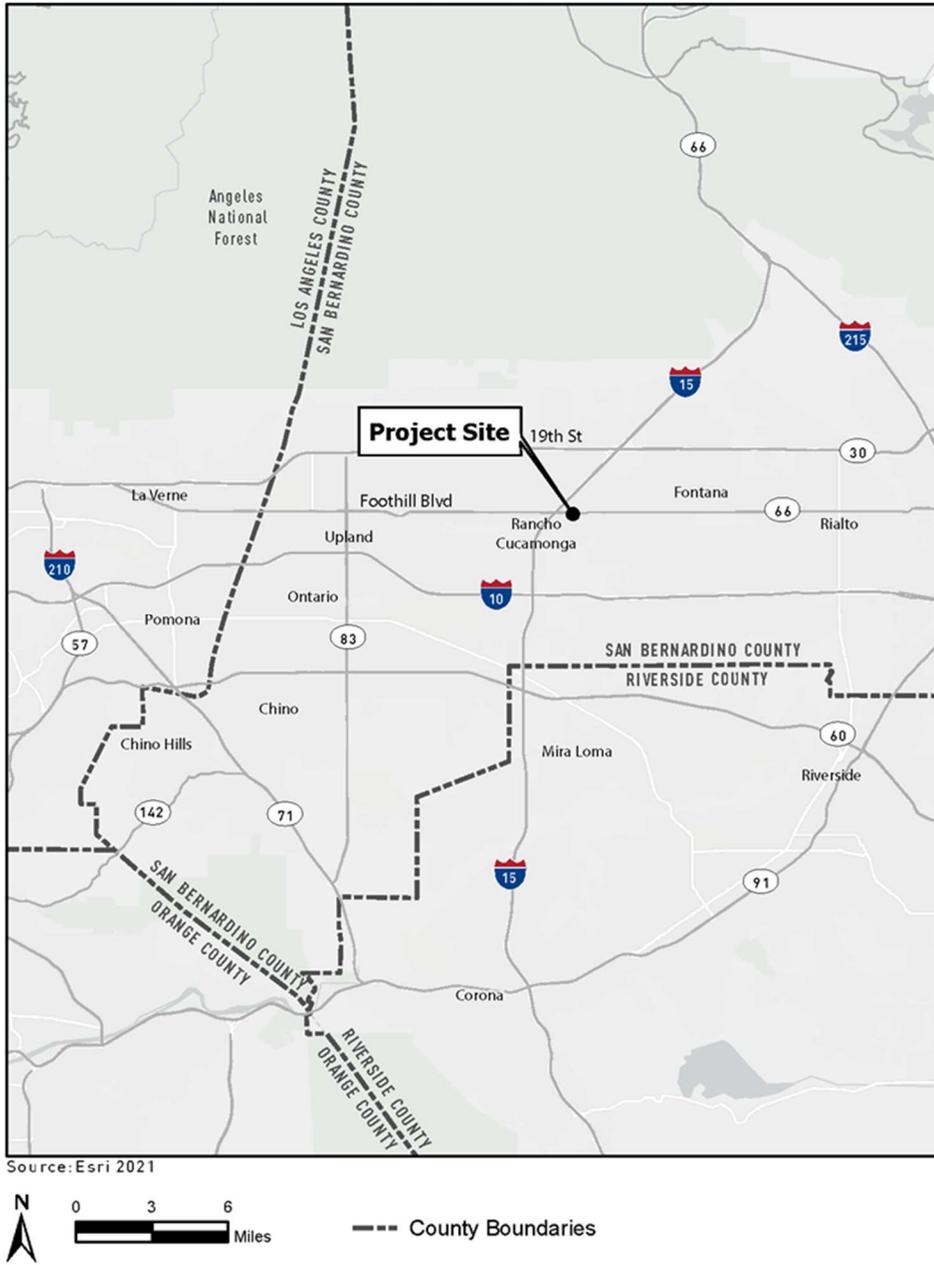

The purpose of this Technical Memorandum is to evaluate potential energy resource impacts in accordance with California Environmental Quality Act (CEQA) requirements for the Alta Cuvee Mixed-Use Project (proposed project). The proposed project would not result in a significant energy resource impact in the context of the Appendix G Environmental Checklist criteria of the CEQA Guidelines during construction or operational activities.

### PROJECT DESCRIPTION

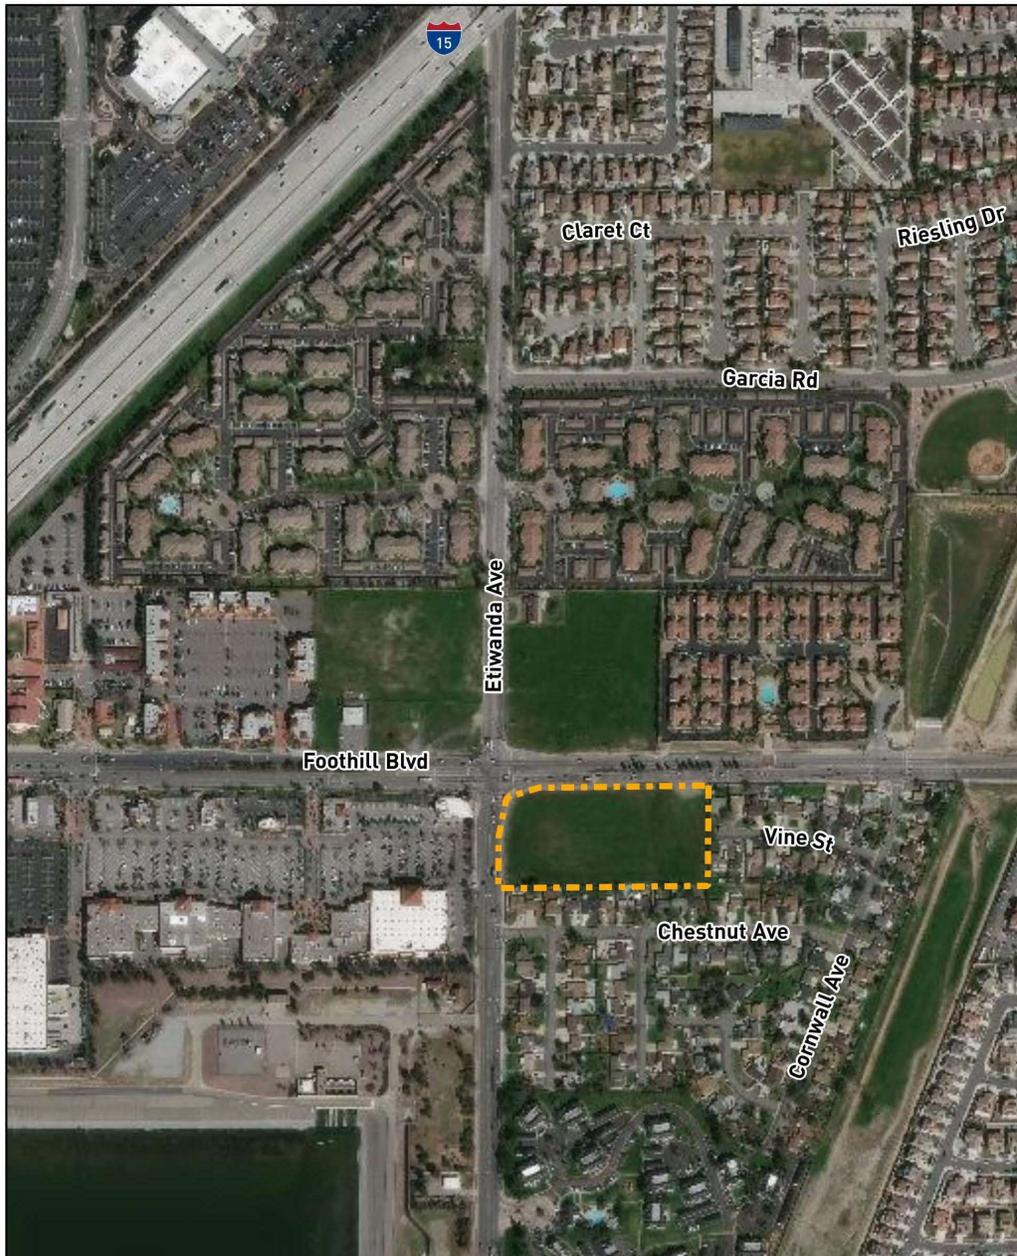

The proposed project involves the construction of two four-story, 260-unit apartment community located at 12901-12939 Foothill Boulevard in the City of Rancho Cucamonga. The project site is bound by Foothill Boulevard, a vacant lot, and condominiums to the north; Etiwanda Avenue and a shopping center to the west; and residential single-family homes to the south and east. The 5.56-acre vacant and undeveloped site is comprised of two parcels (Assessor's Parcel Numbers (APN) 0229-311-14 and 0229-311-15). **Figures 1 and 2** show the Regional Location and the Project Location, respectively. **Figure 3** illustrates the Site Plan.

The proposed project would include two four-story buildings with 259 apartments units (approximately 225,079 square feet) and one live-work unit (approximately 1,570 square feet). The center of the west building would have a courtyard with a pool and spa (comprising approximately 3,572 square feet), and the center of the east building would have a courtyard. The proposed project would also include commercial space totaling 2,436 square feet, and approximately 5,537 square feet of ancillary office and lobby space. Vehicular access to the project site would be provided off Etiwanda Avenue and along eastbound Foothill Boulevard. Both locations would provide access to the surface parking area and to the south-facing entrance/exit of the subterranean garage. The proposed project would provide 465 total parking spaces: 200 surface parking spaces and 265 garage parking spaces. The proposed project would also construct an 11-foot wide and 62-foot long bus bay on eastbound Foothill Boulevard to accommodate the Omnitrans Transit Agency's bus transit Route 66 and other potential future bus service.

**Figure 1: Regional Location**

**Figure 2: Project Location**

 Project Site

Figure 3: Site Plan

Construction of the proposed project is anticipated to begin in March 2022 and take approximately 24 months to complete, concluding in early 2024. Construction activities would occur Monday through Saturday from 7:00 a.m. to 7:00 p.m. The construction period would include excavation and grading activities, installation of building foundations and utilities, and installation of landscaping and hardscape elements. Approximately, 52,010 cubic yards of material would be excavated as part of the proposed project of which approximately 31,770 cubic yards would be hauled away from the project site. Approximately 20,240 cubic yards of material would remain on the project site to be used as backfill.

## **ENERGY TOPICAL INFORMATION**

### **Transportation Fuels**

California was the fourth largest producer of crude oil among the 50 states in 2017, after Texas, North Dakota, and Alaska, and, as of January 2018, third in oil refining capacity after Texas and Louisiana. In 2018, California produced approximately 169,166 thousand barrels of crude oil.<sup>1</sup> In California, approximately 16.3 billion gallons of gasoline and 4.3 billion gallons of diesel, including off-road diesel were sold and consumed in 2018. Approximately 97 percent of all gasoline consumed in California is utilized by light-duty cars, pickup trucks, and sport utility vehicles. Nearly all heavy-duty trucks, delivery vehicles, buses, trains, ships, boats and barges, farm, construction, and heavy-duty military vehicles have diesel engines.<sup>2</sup>

### **Electricity Supply**

California consumed approximately 201,784,204 megawatt hours (mWh) of electricity in 2019.<sup>3</sup> Approximately 35 percent of electricity was consumed by residential users and 45 percent by commercial users. Industrial users consumed approximately 19 percent of electricity and approximately one percent was used to power vehicles. Electricity to the project site will be provided by Rancho Cucamonga Municipal Utility (RCMU). RCMU's energy portfolio is made up of approximately 70.0 percent unspecified sources of power (electricity from transactions that are not traceable to specific generation sources), 23.7 percent renewables (wind, solar, eligible hydroelectric, and geothermal), and 6.3 percent large hydroelectric.<sup>4</sup>

### **Natural Gas**

California consumed approximately 2,136,907 million cubic feet of natural gas in 2018.<sup>5</sup> Approximately 37 percent of natural gas was consumed by industrial users, followed by 30 percent for electric power generation, 20 percent for residential, 12 percent for commercial, and one percent for vehicle fuel in 2018.<sup>6</sup> Natural gas is provided and distributed to the project area by the Southern California Gas Company (SoCalGas). According to the 2018 California Gas Report, SoCalGas is expected to provide an average of 5,738 million metric cubic feet (MMcf) per day by 2022. SoCalGas anticipates total gas demand to decline at an annual rate of 0.5 percent from 2018 to 2035. This decline in throughput demand can be attributed to modest economic growth, California Public Utilities Commission (CPUC) energy efficiency standards mandates and programs, tighter standards created by revised Title 24 Codes and Standards, renewable

electricity goals, the decline in commercial and industrial demand, and conservation savings linked to Advanced Metering Infrastructure.<sup>7</sup>

## REGULATORY FRAMEWORK

The following provides a brief summary of energy regulations and policies. This is a not an exhaustive list of all regulations and policies.

### Federal

**Federal Energy Policy and Conservation Act.** In 1975, Congress enacted the Federal Energy Policy and Conservation Act, which established the first fuel economy standards for on-road motor vehicles in the United States. Pursuant to the Act, the National Highway Traffic Safety Administration is responsible for establishing additional vehicle standards. In 2012, new fuel economy standards for passenger cars and light trucks were approved for model years 2017 through 2021 (*77 Federal Register* 62624–63200). Fuel economy is determined based on each manufacturer’s average fuel economy for the fleet of vehicles available for sale in the United States.

**Energy Independence and Security Act of 2007.** On December 19, 2007, the Energy Independence and Security Act of 2007 (EISA) was signed into law. In addition to setting increased Corporate Average Fuel Economy standards for motor vehicles, the EISA includes the following provisions related to energy efficiency:

- Renewable Fuel Standard (RFS) (Section 202)
- Appliance and Lighting Efficiency Standards (Sections 301–325)
- Building Energy Efficiency (Sections 411–441)

This federal legislation requires ever-increasing levels of renewable fuels to replace petroleum. The U.S. Environmental Protection Agency (USEPA) is responsible for developing and implementing regulations to ensure that transportation fuel sold in the United States contains a minimum volume of renewable fuel. The RFS program regulations were developed in collaboration with refiners, renewable fuel producers, and many other stakeholders.

The RFS program was created under the Energy Policy Act of 2005 and established the first renewable fuel volume mandate in the United States. As required under the Act, the original RFS program (RFS1) required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012. Under the EISA, the RFS program was expanded in several key ways that lay the foundation for achieving significant reductions in greenhouse gas (GHG) emissions from the use of renewable fuels, reducing imported petroleum, and encouraging the development and expansion of the renewable fuels sector in the United States. The updated program is referred to as “RFS2” and includes the following:

- EISA expanded the RFS program to include diesel, in addition to gasoline.
- EISA increased the volume of renewable fuel required to be blended into transportation fuel from nine billion.
- EISA established new categories of renewable fuel, and set separate volume requirements for each one.
- EISA required the USEPA to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces.

---

<sup>7</sup>California Gas and Electric Utilities, *2018 California Gas Report*, 2018.

Additional provisions of the EISA address energy savings in government and public institutions, research for alternative energy, additional research in carbon capture, international energy programs, and the creation of “green” jobs.

## State

**Warren-Alquist Act.** The California Legislature passed the Warren-Alquist Act in 1974. The Warren-Alquist Act created the California Energy Commission (CEC). The legislation also incorporated the following three key provisions designed to address the demand side of the energy equation:

- It directed the CEC to formulate and adopt the nation’s first energy conservation standards for both buildings constructed and appliances sold in California.
- The Act removed the responsibility of electricity demand forecasting from the utilities, which had a financial interest in high-demand projections, and transferred it to a more impartial CEC.
- The CEC was directed to embark on an ambitious research and development program, with a particular focus on fostering what were characterized as non-conventional energy sources.

**State of California Energy Action Plan.** The CEC and CPUC approved the first State of California Energy Action Plan in 2003. The plan established shared goals and specific actions to ensure that adequate, reliable, and reasonably priced electrical power and natural gas supplies are provided, and identified policies, strategies, and actions that are cost-effective and environmentally sound for California’s consumers and taxpayers. In 2005, a second Energy Action Plan was adopted by the CEC and CPUC to reflect various policy changes and actions of the prior two years.

At the beginning of 2008, the CEC and CPUC determined that it was not necessary or productive to prepare a new energy action plan. This determination was based, in part, on a finding that the state’s energy policies have been significantly influenced by the passage of Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006 (discussed below). Rather than produce a new energy action plan, the CEC and CPUC prepared an “update” that examines the state’s ongoing actions in the context of global climate change.

**Senate Bills 1078 (2002), 107 (2006), X1-2 (2011), 350 (2015), and 100 (2018).** Senate Bill (SB) 1078 established the California Renewables Portfolio Standard (RPS) Program and required that a retail seller of electricity purchase a specified minimum percentage of electricity generated by eligible renewable energy resources as defined in any given year, culminating in a 20-percent standard by December 31, 2017. These retail sellers include electrical corporations, community choice aggregators, and electric service providers. The bill also required the CEC to certify eligible renewable energy resources, design and implement an accounting system to verify compliance with the RPS by retail sellers, and allocate and award supplemental energy payments to cover above-market costs of renewable energy. SB 107 accelerated the RPS established by SB 1078 by requiring that 20 percent of electricity retail sales be served by renewable energy resources by 2010 (not 2017). Additionally, SB X1-2 requires all California utilities to generate 33 percent of their electricity from eligible renewable energy resources by 2020. Specifically, SB X1-2 sets a three-stage compliance period: by December 31, 2013, 20 percent had to come from renewables; by December 31, 2016, 25 percent had to come from renewables; and by December 31, 2020, 33 percent will come from renewables.

SB 350 expanded the RPS because it requires retail seller and publicly owned utilities to procure 50 percent of their electricity from eligible renewable energy resources by 2030, with interim goals of 40 percent by 2024 and 45 percent by 2027.

SB 100 accelerated and expanded the standards set forth in SB 350 by establishing that 44 percent of the total electricity sold to retail customers in California per year by December 31, 2024, 52 percent by December 31, 2027, and 60 percent by December 31, 2030 be secured from qualifying renewable energy sources. SB 100 also states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100 percent of the retail sales of electricity to California. This bill requires that the achievement of 100 percent zero-carbon electricity resources does not increase the carbon emissions elsewhere in the western grid and that the achievement not be achieved through resource shuffling.

Consequently, utility energy generation from non-renewable resources is expected to be reduced based on implementation of the 60-percent RPS in 2030. Therefore, any project's reliance on non-renewable energy sources would also be reduced.

**Assembly Bill 1007 (2005).** Assembly Bill (AB) 1007 required the CEC to prepare a statewide plan to increase the use of alternative fuels in California (State Alternative Fuels Plan). The CEC prepared the plan in partnership with the California Air Resources Board (CARB) and in consultation with other state agencies, plus federal and local agencies. The State Alternative Fuels Plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing significant degradation of public health and environmental quality.

**Assembly Bill 32 (2006) and Senate Bill 32 (2016).** In 2006, the State Legislature enacted AB 32, the California Global Warming Solutions Act of 2006. AB 32 requires California to reduce its GHG emissions to 1990 levels by 2020. In 2016, the Legislature enacted SB 32, which extended the horizon year of the state's codified GHG reduction planning targets from 2020 to 2030, requiring California to reduce its GHG emissions to 40 percent below 1990 levels by 2030. In accordance with AB 32 and SB 32, CARB prepares scoping plans to guide the development of statewide policies and regulations for the reduction of GHG emissions. Many of the policy and regulatory concepts identified in the scoping plans focus on increasing energy efficiencies, using renewable resources, and reducing the consumption of petroleum-based fuels (such as gasoline and diesel). As such, the state's GHG emissions reduction planning framework creates co-benefits for energy-related resources.

**California Building Energy Efficiency Standards (Title 24, Part 6).** The California Building Energy Efficiency Standards for Residential and Nonresidential Buildings (California Code of Regulations, Title 24, Part 6) were adopted to ensure that building construction and system design and installation achieve energy efficiency and preserve outdoor and indoor environmental quality. The 2019 Title 24 Standards went into effect on January 1, 2020. The 2019 Title 24 Standards represent "challenging but achievable design and construction practices" that represent a major step towards meeting the Zero Net Energy (ZNE) goal." Homes built with the 2019 standards will use about 7 percent less energy due to energy efficiency measures versus those built under the 2016 standards. Once rooftop solar electricity generation is factored in, homes built under the 2019 standards will use about 53 percent less energy than those built under the 2016 standards. The California Building Code is updated triennially and is expected to become more energy efficient with each update.

**California Green Building Standards (Title 24, Part 11).** The California Green Building Standards Code (California Code of Regulations, Title 24, Part 11), commonly referred to as the CALGreen Code, includes mandatory measures related to energy efficiency, water efficiency and conservation, material conservation, resource efficiency, and environmental quality. Compliance with the CALGreen Code is enforced through the building permit process.

**Integrated Energy Policy Report.** The CEC is responsible for preparing integrated energy policy reports that identify emerging trends related to energy supply, demand, conservation, public health and safety, and maintenance of a healthy economy. The CEC’s Integrated Energy Policy Report discusses the state’s policy goals of decarbonizing buildings, doubling energy efficiency savings, and increasing flexibility in the electricity grid system to integrate more of renewable energy. Specific to the decarbonizing of building energy, the goal would be achieved by designing future commercial and residential buildings to source their energy almost entirely from electricity in place of natural gas. Regarding the increase in renewable energy flexibility, the goal would be achieved through increases in energy storage capacity within the state, increases in energy efficiency, and adjusting energy use to the time of day when the most amount of renewable energy is being generated. Over time as they are implemented, these policies and trends would serve to beneficially reduce the GHG emissions profile and energy consumption from projects. The latest version of the report was published in March 2021 and is titled *Final 2020 Integrated Energy Policy Report Update*.

**State Vehicle Standards.** In response to the transportation sector accounting for more than half of California’s carbon dioxide (CO<sub>2</sub>) emissions, AB 1493 was enacted in 2002. AB 1493 required CARB to set GHG emissions standards for passenger vehicles, light-duty trucks, and other vehicles determined by CARB to be vehicles whose primary use is noncommercial personal transportation in the state. The bill required that CARB set GHG emissions standards for motor vehicles manufactured in 2009 and all subsequent model years. The 2009-2012 standards resulted in a reduction in approximately 22 percent of GHG emissions compared to emissions from the 2002 fleet, and the 2013-2016 standards resulted in a reduction of approximately 30 percent.

In 2012, CARB approved a new emissions-control program for model years 2017 through 2025. The program combines the control of smog, soot, and global-warming gases with requirements for greater numbers of zero-emissions vehicles into a single package of standards called Advanced Clean Cars. By 2025, when the rules would be fully implemented, new automobiles would emit 34 percent fewer global-warming gases and 75 percent fewer smog-forming emissions. Although the focus of the state’s vehicle standards is on the reduction of air pollutants and GHG emissions, one co-benefit of implementation of these standards is a reduced demand for petroleum-based fuels.

**Sustainable Communities Strategy.** The Sustainable Communities and Climate Protection Act of 2008, or SB 375, coordinates land use planning, regional transportation plans, and funding priorities to help California meet its GHG emissions reduction mandates established in AB 32. As codified in California Government Code Section 65080, SB 375 requires metropolitan planning organizations (MPOs; e.g., the Southern California Association of Governments [SCAG]) to include a Sustainable Communities Strategy (SCS) in their Regional Transportation Plan (RTP). The main focus of the SCS is to plan for growth in a fashion that will ultimately reduce GHG emissions, but the strategy is also part of a bigger effort to address other development issues, including transit and vehicle miles traveled, which influence the consumption of petroleum-based fuels.

## **Regional**

**Southern California Association of Governments (SCAG) 2020–2045 Regional Transportation Plan/ Sustainable Communities Strategy (RTP/SCS).** The SCAG Regional Council formally adopted the *Connect SoCal 2020–2045 RTP/SCS* (Connect SoCal) on September 3, 2020. Rooted in the 2008 and 2012 RTP/SCS plans, Connect SoCal’s “Core Vision” focuses on maintaining and enhancing management of the transportation network while also expanding mobility choices by creating hubs that connect housing, jobs, and transit accessibility. The “Core Vision” of Connect SoCal is organized into six key focus areas that expand upon progress made in the 2016 RTP/SCS: Sustainable Development, System Preservation and Resilience, Demand & System Management, Transit Backbone, Complete Streets, and Goods Movement.

Connect SoCal incorporates a range of best practices for increasing transportation choices, reducing dependence on personal automobiles, further improving air quality and reducing GHG emissions, and encouraging growth in walkable, mixed-use communities with convenient access to transit infrastructure and employment.

**San Bernardino Regional Greenhouse Gas Reduction Plan.** In response to State initiatives, an informal project partnership, led by the San Bernardino Council of Government, compiled a GHG emissions inventory and an evaluation of reduction measures that could be adopted by the 25 Partnership Cities of San Bernardino County. The Regional Reduction Plan forecasts each city's emissions to the year 2030, including for the City of Rancho Cucamonga,. In addition to city-specific GHG emissions inventory, the Regional Reduction Plan includes a comprehensive list of measures applicable to the region and presented to each city to identify measures that would be feasible for implementation locally. Partnership cities provided a selection of potential GHG reduction strategies that were used to identify the level of reduction that would be achieved locally toward achieving a 2030 emissions reduction target.

Through the Regional Reduction Plan, the City selected a goal to reduce community GHG emissions to a level 40 percent below 2016 GHG emissions by 2030. Through policies in the City's 2010 General Plan and reduction measures identified in the Regional Reduction Plan, GHG emissions in the city would be reduced through implementation of the following general strategies:

- Promoting sustainable development that reduces environmental impacts;
- Working towards a sustainable jobs-housing balance;
- Implementing land use patterns and policies that incorporate smart growth practices;
- Reducing operational energy requirements through sustainable and complementary land use patterns;
- Promoting pedestrian-friendly development; and
- Supporting development projects that are designed to facilitate convenient access for pedestrians, bicycles, transit, and automobiles.

**Resilient IE.** Western Riverside Council of Governments (WRCOG) in partnership with the SBCOG/SBCTA developed the Resilient IE program to support regional and local efforts to prepare for and mitigate risks associated with climate adaptation and transportation infrastructure. The Resilient IE program includes six primary components:

- Establish a regional climate collaborative, referred to as the Inland Southern California Climate Collaborative (ISC3);
- Revise WRCOG's community vulnerability assessment and establish a vulnerability assessment for San Bernardino County;
- Develop city-level, climate-related transportation hazards and evacuation maps;
- Develop a climate resilient transportation infrastructure guidebook;
- Prepare a regional climate adaptation and resiliency general plan element template; and
- Serve as a pilot project to assess the community cost of downed or damaged transportation assets.

Through the development of the San Bernardino County Vulnerability Assessment and Adaptation Strategies, the Resilient IE program includes a vulnerability assessment that summarizes projected climate change—related hazards that would affect the county and cities within it. The project also includes a summary of climate change adaptation measures developed through a regional context for consideration by local agencies to implement in their own general plans or other planning documents.

## Local

**City of Rancho Cucamonga 2010 General Plan.** The 2010 General Plan addresses the impact of communitywide activities on global warming and climate change within the Public Health and Safety chapter. Further, the 2010 General Plan Environmental Impact Report Climate Change section analyzes GHG emissions and climate change impacts associated with the implementation of the City's General Plan. The 2010 General Plan includes goals and policies to address vehicle trip reduction, energy conservation, water conservation, and reduction in solid waste generation. Motor vehicles represent the major source of regional emissions throughout the South Coast Air Basin and the City. Transportation and energy production (i.e., electricity generation) are the primary local activities associated with the generation of GHGs. The 2010 General Plan goals and policies for Public Health and Safety are designed to guide long-range planning decisions and daily activities to reduce emissions of GHGs and reduce the impact of local activities on climate change. Many actions identified in the 2010 General Plan undertaken by the City would also directly or indirectly reduce GHG emissions. These actions include building residential units near the Metrolink station, pursuing mixed-use development, supporting transit use, developing bicycle routes and trails, and supporting the use of alternative fuel vehicles in the City's vehicle fleet.

**Rancho Cucamonga Sustainable Community Action Plan.** As discussed previously, the City adopted the Sustainable Community Action Plan in 2017. The SAP uses the inventory and forecasts prepared through the Regional Reduction Plan to aspire to reduce GHG emissions 15 percent below 2008 levels by 2020. The City's SAP is a visionary document that identified a menu of goals and actions the City could take locally to reduce citywide GHG emissions in key areas, including transportation and mobility, land use and open space, energy efficiency and renewables, green building performance, water and wastewater, waste and recycling.

**Greenhouse Gas Emissions and Climate Change Vulnerability Assessment Exiting Conditions Report.** The City of Rancho Cucamonga has taken several steps to begin addressing climate change and reduce communitywide GHG emissions. These efforts include partnerships with regional agencies, including the SBCOG/SBCTA, to prepare the San Bernardino Regional Greenhouse Gas Reduction Plan and the City's Sustainable Community Action Plan, which identify strategies for reducing GHG emissions. Similarly, the Resilient IE program, developed through a partnership between WRCOG and SBCOG/SBCTA, identifies regional adaptation measures to assist cities in building resilience and adapting to anticipated climate change impacts. SBCOG/SBCTA is currently in the process of preparing an updated GHG inventory for the region for the year 2016.

The City's Greenhouse Gas Emissions and Climate Change Vulnerability Assessment includes two chapters. Chapter 1, Greenhouse Gas Emissions, includes a summary of climate change science and existing guidance for setting communitywide reduction targets, and developing plans for GHG reduction. Further, the chapter acknowledges the City's communitywide GHG emissions inventory. The inventory will provide an accounting of communitywide GHG emissions from activities within the city for a single year, forecast GHG emissions into the future consistent with State milestone years and the General Plan Update horizon year, and set emissions reduction targets consistent with State goals. Chapter 2, Climate Change Vulnerability Assessment, summarizes current and potential future climate-related impacts that may affect the City, evaluates how these impacts would potentially affect the community's populations, assets, and functions, and prioritizes how the City should address each vulnerability through the General Plan Update and Local Hazard Mitigation Plan.

## **EXISTING CONDITIONS**

California contains abundant sources of nonrenewable and renewable energy. Nonrenewable resources include large crude oil and natural gas deposits that are located within six geological basins in the Central Valley and along the coast. Much of these reserves are concentrated in the southern San Joaquin Basin. Regarding renewable resources, the State leads the nation in net electricity generation from solar, geothermal, and biomass. California has considerable solar potential, especially in the southeastern deserts and several of the world's largest solar thermal plants are located in California's Mojave Desert. Although California's wind power potential is widespread, especially along the eastern and southern mountain ranges, much of the State is excluded from development of this resource because it is in wilderness areas, parks, or urban areas. The transportation sector is responsible for the most energy consumption of any sector within the State. More motor vehicles are registered in California than in any other state, and commute times in California rank among some of the longest in the country.

The project area is characterized by low-rise single and multi-family residential structures with various commercial uses located along busier roadways in the neighborhood. The NRG Etiwanda Generating Station, a gas-fired power plant located approximately 0.9 mile south of the project site, was retired from operations on June 1, 2018. No other electricity or natural gas facilities have been identified that may be affected by the project. Electricity at the project site would be provided by RCMU and natural gas by SoCalGas.

## **SIGNIFICANCE THRESHOLDS**

This assessment was undertaken to determine whether construction or operation of the proposed project would have the potential to result in significant environmental impacts related to Energy Resources in the context of the Appendix G Environmental Checklist criteria of the CEQA Statute and Guidelines. Implementation of the proposed project may result in a significant environmental impact related to Energy Resources if the proposed project would:

- a) Result in potentially significant environment impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation; and/or
- b) Conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

## **METHODOLOGY**

Appendix F of the CEQA Guidelines states that the goal of conserving energy implies the wise and efficient use of energy, to be achieved by decreasing overall per capita energy consumption; decreasing reliance on natural gas and oil; and increasing reliance on renewable energy resources. To assure energy implications are considered in project decisions, CEQA requires that environmental impact reports include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful and unnecessary consumption of energy. The air quality analysis prepared for the proposed project, included in the appendix for the environmental documentation, includes a quantification of construction-related carbon dioxide (CO<sub>2</sub>) emissions using the California Emissions Estimator Model (CalEEMod, Version 2016.3.2). These emissions were used to estimate construction energy from CO<sub>2</sub> emission factors derived for the CARB GHG emissions inventory. The 2018 Climate Registry indicates that for gasoline fuel, approximately 8.78 kilograms of CO<sub>2</sub> are generated per gallon combusted, and for diesel fuel, approximately 10.21 kilograms of CO<sub>2</sub> are generated per gallon combusted. The fuel consumption was estimated from the equipment and vehicles that would be employed in construction activities. Diesel engines are installed in heavy-duty off-road construction equipment and on-road haul trucks. Gasoline engines are typically found in passenger vehicles that would be used for construction worker daily commutes.

## IMPACT ASSESSMENT

- a) *Would the proposed project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation? (Less-than-Significant Impact)*

### Electricity

**Construction.** Construction of the proposed project would require electricity for security lighting, construction trailers, and operation of electrically powered hand tools. Consumption of electricity for construction would be minimal as the majority of construction equipment would be powered by diesel fuel rather than the electrical grid. Low-level safety lighting does not consume substantial electricity and trailers would be occupied intermittently during the construction process. The proposed project would facilitate the construction of housing that would meet the needs of the City and electricity used during the construction process is not considered to be a wasteful, inefficient, or unnecessary consumption of electricity. Therefore, construction of the proposed project would result in a less-than-significant impact regarding electricity consumption.

**Operation.** Operation of the proposed project would require electricity for indoor and outdoor lighting, appliances, elevators, and powering other equipment typically associated with multi-family housing. Maintenance activities during operations, such as landscape maintenance, would involve the use of electric or gas-powered equipment. In addition to on-site energy use, the proposed project would result in transportation energy use associated with vehicle trips generated by multi-family residential uses. The proposed project is estimated to consume 1,594,787 kWh of electricity per year. Compliance with all State and federal regulations, including the 2019 Title 6 California Energy Code and California Green Building Standards, would reduce and/or minimize the operational energy demands of the proposed project. The proposed project is comparable to other multi-family residential developments of similar size and does not involve any characteristics or uses that would require more intensive electricity consumption, nor involve the use of equipment that would not conform to current emissions standards and related fuel efficiencies. Therefore, operation of the proposed project would result in a less than significant impact related to wasteful, inefficient, or unnecessary consumption of electricity.

### Natural Gas

**Construction.** Construction activities typically do not require the consumption of natural gas to power equipment or heavy machinery. Natural gas to the project site would be provided by SoCalGas. Natural gas that would be consumed during construction would be negligible and would not result in a significant drain on natural gas resources. Therefore, construction of the proposed project would result in a less than significant impact related to wasteful, inefficient, or unnecessary consumption of natural gas.

**Operation.** SoCalGas reports a declining use in natural gas per meter for residential customers due to conservation measures, Title 24 standards, improved building and appliance standards, aggressive energy efficiency programs, and demand reductions anticipated. Natural gas use associated with operation of the proposed project would be typical of multi-family residential uses, including heating, ventilation, and air conditioning, machinery, appliances, and more. The proposed project is estimated to consume 3.77 million British Thermal Units (MMBTUs) per year of natural gas. The proposed project would comply with all regional, State, and federal regulations related to natural gas consumption efficiency, and the proposed project does not involve any uses that would require more intensive natural gas consumption than comparable activities or would lead to wasteful natural gas consumption. Therefore, operation of the proposed project would not result in a significant impact related to wasteful, inefficient, or unnecessary consumption of natural gas.

**Petroleum**

**Construction.** Petroleum would be consumed during the demolition, excavation, and construction phases of the proposed project by heavy-duty equipment, which is usually diesel powered. Construction of the proposed project would result in an increased consumption of gasoline and diesel fuels associated with haul trucks, deliveries, and worker commute trips. **Table 1** shows that a one-time expenditure of approximately 193,255 gallons of diesel fuel and 98,858 gallons of gasoline would be needed to construct the proposed project. The proposed project would use best practices to eliminate the potential for the wasteful consumption of petroleum. Exported materials (e.g., demolition debris and soil hauling) would be disposed of at the closest facility that accepts such materials, and the proposed project would be required to comply with CARB’s Airborne Toxics Control Measure, which restricts heavy-duty diesel vehicle idling time to five minutes. Compliance with State and federal regulations would reduce and/or minimize short-term petroleum consumption during the project’s construction to the extent feasible, and project construction would not result in a wasteful or inefficient use of petroleum. Therefore, because petroleum use would be minimized to the extent feasible, construction of the proposed project would result in a less than significant impact related to wasteful, inefficient, or unnecessary consumption of petroleum-based fuels.

<b>TABLE 1: CONSTRUCTION PETROLEUM DEMAND</b>			
<b>Source</b>	<b>CO<sub>2</sub> (kg)</b>	<b>Gallons/kgCO<sub>2</sub></b>	<b>Gallons</b>
<b>DIESEL</b>

**Operation.** Petroleum consumption during operation of the proposed project would be related to vehicle trips for residents and employees to driving to and from the project site. Operational activities would generate approximately 1,503 daily vehicle trips producing 16,382.7 daily vehicle miles traveled. The project site is located within 0.5 mile of a stop on the Omnitrans Route 66 alignment which provides 15-minute headways along Foothill Boulevard during commute periods. Due to the 15-minute headways, Foothill Boulevard is classified as a high-quality transit corridor, and the proposed project is located within a Transit Priority Area (TPA). The land use growth assumed in the RTP/SCS includes an increase in multi-family housing units in the project location greater than the number of multi-family housing units proposed, which indicates the project is consistent with the RTP/SCS. There are no unusual project characteristics or processes that would require more intensive petroleum consumption than is used for comparable multi-family residential projects, or the use of equipment that would not conform to current emissions standards and related fuel efficiencies. In addition, the proposed project includes 15 electric vehicle charging stations in the subterranean parking garage, which would lessen long-term petroleum consumption. Implementation of the proposed project would not require the development of additional petroleum fuels infrastructure or supply. Therefore, operation of the proposed project would not result in a significant impact related to wasteful, inefficient, or unnecessary consumption of petroleum.

**Mitigation Measures**

No mitigation measures are required.

***b) Would the proposed project conflict with or obstruct a State or local plan for renewable energy or energy efficiency? (Less-than-Significant Impact)***

There is no potential for the proposed project to conflict with renewable energy or energy efficiency plans. Electricity will be provided from the RCMU system, and RCMU must comply with the State mandate (SB 100) to provide 60 percent renewable energy by 2030 and 100 percent carbon free electricity by 2045. Interim SB 100 targets include 44 percent renewable power sources by the end of 2024 and 52 percent by the end of 2027. It is reasonable to assume that 40 percent of the RCMU power mix would be sourced from renewables by the time the proposed project is operational.

Additionally, the proposed project would implement sustainable design features to enhance building energy efficiency and conserve energy, including, but not limited to:

- The proposed project would be designed to exceed the 2019 Title 24 energy efficiency standards by approximately 7.2 percent in one building and by approximately 2.5 percent in the other.
- The proposed project would also feature enhanced wall and window insulation to improve energy efficiency and reduce ambient heat flow across the building envelop.
- Water- and energy- efficient mechanical equipment and electric appliances (i.e., heating, ventilation, and air conditioning [HVAC], water heaters, kitchen appliances, and plumbing fixtures) that require less usage intensity for operation and comply with the CALGreen Code.
- Water-efficient landscaping and irrigation systems in compliance with California State law regarding water conservation measures.
- Installation of 15 electric vehicle charging stations in the subterranean parking garage.

The proposed Project would be consistent with the existing Mixed-Use land use designation in the City's General Plan thereby ensuring consistency with RCMU long-term plans for renewable energy and energy efficiency. Regarding natural gas use, SoCalGas would provide natural gas to the project site, and SoCalGas forecasts that a declining per meter consumption rate across Southern California will secure adequate future capacity. The 2020-2045 RTP/SCS includes various policies and recommendations related to energy efficiency. As described above, the proposed project would exceed the minimum building energy efficiency standards of Title 24. The proposed project would also be consistent with RTP/SCS goals to reduce petroleum use by being locating in a TPA. The proposed project would not conflict with the RTP/SCS.

Therefore, the proposed project would result in a less than significant impact related to energy plans and energy efficiency.

**Mitigation Measures**

No mitigation measures are required.

Off-road Equipment -

Off-road Equipment - Project Inventory provided by Applicant.

"Site Preparation" = East Grading

Off-road Equipment - Project Inventory provided by Applicant.

Off-road Equipment - Project Inventory provided by Applicant.

Trips and VMT - Max 60 haul loads per day during excavation/trenching.

Assume 20 vendor deliveries per day during construction.

Approximately 50-300 workers on-site during construction.

Grading - 31,770 total exported

Architectural Coating - SCAQMD Rule 1113 Compliance for Building Envelope and residential coatings - 50 g/L

Vehicle Trips - 1,420 daily residential trips/259 apartments = 5.483 trips/du

83 daily shopping trips/2.436 ksf = 34.08trips/ksf

Woodstoves - No Fireplaces in units per Project Design

1 Outdoor Fireplace Included

Area Coating - SCAQMD Rule 1113 Compliance for Building Envelope coatings: 50 g/L

Energy Use - Updated to 2019 Title 24 Energy Factors (CAPCOA, 2020)

Water And Wastewater - MND Estimated Project Water Use: Residential: 66,560 gal/day; Non-residential: 8,164 gal/day

Alta Cuvee Mixed-Use Project - San Bernardino-South Coast County, Annual

Solid Waste - Waste Generation from MND Calculations: 12.23 lb/DU/day x 260 DU x 365 days/yr = 580.3135 tons solid waste

Construction Off-road Equipment Mitigation - Best management practices to comply with SCAQMD Rule 403 include watering exposed areas thrice daily.

Mobile Land Use Mitigation - Electric Vehicle Charging Provided (Not Quantified)

Area Mitigation - SCAQMD Rule 1113 Compliance for Building Envelop  
 Project Design does not include hearths/fireplaces in units, only 1 outdoor fireplace.

Energy Mitigation - High-Efficiency Appliances.

Water Mitigation -

Fleet Mix - Residential Trips
