

MEMORANDUM

DATE: October 1, 2021
To: Tab Johnson
FROM: Ambarish Mukherjee, P.E., AICP
SUBJECT: Apple Valley Commercial Project Focused Traffic Study (LSA Project No. RDE2101)

LSA has prepared this focused traffic study (TS) to identify potential traffic operational issues associated with the proposed Apple Valley Commercial Project (project) in the Town of Apple Valley (Town). Based on preliminary information received from the Town, the focused TS evaluates potential queuing and traffic operations issues at the intersection of Westmont Drive/Bear Valley Road and the project driveways under existing with project conditions. The project site is located to the east of the Apple Valley Towne Center, northeast of the intersection of Westmont Drive and Bear Valley Road. Figure 1 (all figures, tables, and appendices attached) illustrates the regional and project location. Figure 2 illustrates a conceptual site plan of the proposed project.

PROJECT DESCRIPTION AND BACKGROUND

The proposed project includes a 43,000 square feet (sf) supermarket and 6,995 sf of retail space. As shown in Figure 2, access to the project will be provided via the intersection of Westmont Drive/Bear Valley Road and two existing right-in right-out driveways of Sonic Drive-In and El Pollo Loco, located south of the project.

This focused Traffic Study (TS) has been prepared to address the concerns requested by Town staff. The Levels of Service (LOS) and queuing analysis generally follows the LOS analysis metrics included in the San Bernardino County (County) *Transportation Impact Study Guidelines* (Guidelines, dated July 9, 2019). As such, the TS will evaluate traffic operations at the Westmont Drive/Bear Valley Road intersections and the two existing project-access driveways. The purpose of this study is to identify and address both LOS and queuing concerns when the project is in operation. As such, the following three intersections have been included in this study:

1. Westmont Drive/Bear Valley Road;
2. El Pollo Loco Driveway/Bear Valley Road; and
3. Sonic Driveway/Bear Valley Road.

All study intersections are located in the Town of Apple Valley. Figure 3 illustrates the study intersections.

Traffic operations have been evaluated for weekday a.m. and p.m. peak hour traffic conditions. The a.m. peak hour is defined as the one hour of highest traffic volumes occurring between 7:00 and 9:00 a.m. The p.m. peak hour is the one hour of highest traffic volumes occurring between 4:00 and 6:00 p.m.

VOLUME DEVELOPMENT

Project Trip Generation

The trip generation for the proposed project was developed using rates from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (10th Edition) for Land Uses 850 – “Supermarket” and 820 – “Shopping Center.” Table A summarizes the project trip generation.

Since the existing El Pollo Loco and Sonic Drive-in are connected to the project internally, it is estimated that a certain percentage of trips between the project and these existing fast food joints will be occur internally between these uses. These trips will not utilize the major street system or the study intersections. The internal trips can be made either by walking or by vehicles using internal roadways, and therefore avoiding the external streets. The internal capture rates were obtained using the National Cooperative Highway Research Program (NCHRP 8-51) Internal Trip Capture Estimation Tool. The internal trip capture rate estimated for the project land uses was applied to the respective trip generation to determine the number of internal trips. The internal trips were then subtracted from the total trip generation for the land uses to establish the total external trips. Detailed internal capture worksheets for the project have been included as Appendix A.

Shopping centers and supermarkets typically draw some of their trips from the adjacent street traffic. Therefore, some of the external project trips will come from the adjacent street traffic. These trips are not actually “new” trips added to the surrounding circulation system. These trips are referred to as “pass-by” trips and are made as intermediate stops en route to a destination without diverting from the main route. For the proposed project, pass-by trips would occur on Bear Valley Road en route to a final destination.

The percentage of pass-by trips for each of the two land uses was obtained from the ITE *Trip Generation Handbook* (3rd Edition). The handbook only provides pass-by rates for the PM peak hour for both land uses. Therefore, the AM pass-by rate was considered as 0% and PM peak hour pass-by rate was applied as the daily pass-by rate. The project pass-by trip assignment was developed based on traffic counts collected on the adjacent street system. Figure 4 illustrates the pass-by trip assignment that was developed based on existing traffic volumes.

As summarized in Table A, the project is anticipated to generate 154 net trips in the a.m. peak hour, 241 net trips in the p.m. peak hour, and 2,901 net daily trips.

Project Trip Distribution and Assignment

The distribution of project trips was developed based on the regional roadway network and the locations of residential, employment, and commercial centers in relation to the proposed project. Figure 5 illustrates the trip distribution for the proposed project at the study intersections. The project trip assignment is the product of the project net trip generation and the corresponding trip distribution percentages. Figure 6 illustrates the project net trip assignment at the study intersections.

Traffic Volumes for Existing without and with Project Conditions

Traffic volumes for existing conditions are typically developed using existing count data collected at study intersections. Due to the current school and office closures statewide due to COVID-19, new traffic counts will not reflect realistic traffic conditions at the study intersections. Therefore, LSA consulted traffic counters to obtain historical traffic counts for the study intersections and major intersections

adjacent to the study area. Historic traffic counts (dated May 2015) were obtained for the intersection of Apple Valley Road/Bear Valley Road from Counts Unlimited, Inc. Current 2021 traffic counts were collected at the study intersections and the intersection of Apple Valley Road/Bear Valley Road. Detailed count sheets are included in Appendix B.

Truck classification counts at the intersections were converted to Passenger Car Equivalent (PCE) volumes. The concept of PCEs accounts for the larger impact of trucks on traffic operations, as compared to the impact of passenger vehicles. It does so by assigning a PCE factor that represents the number of passenger vehicles that could travel through an intersection in the same time that a truck could. PCE volumes at study intersections were computed using a PCE factor of 2.0, consistent with *Highway Capacity Manual – 6th Edition* (HCM 6) methodologies.

An ambient growth rate of 2 percent per annum from 2015 to 2021, was applied to these PCE volumes to obtain existing without project PCE traffic volumes at the Apple Valley Road/Bear Valley Road intersection. The percentage difference in the East Leg volumes of Apple Valley Road/Bear Valley Road for the 2015 + growth volumes and current 2021 counts was applied to the eastbound and westbound through movements at the study intersections. Conservation of flow was then applied along the intersections. Existing peak hour traffic volumes are illustrated in Figure 7.

Existing with project traffic volumes were obtained by adding net project traffic and pass-by trips to the corresponding without project traffic volumes. Existing with project peak hour traffic volumes are illustrated in Figure 8. Detailed volume development worksheets are included in Appendix C.

LEVEL OF SERVICE ANALYSIS

Existing study intersection geometrics and traffic control are illustrated in Figure 9.

As previously stated, traffic operations have been analyzed in terms of LOS and queues. A complete description of the meaning of LOS can be found in the Transportation Research Board Special Report 209, *Highway Capacity Manual*. The HCM establishes LOS A through F for intersections. A description of LOS for intersections is summarized in Table B. Table C shows the LOS criteria for unsignalized and signalized intersections. The LOS analysis was performed based on HCM 6 methodologies using the Synchro (Version 10) software.

All study intersections are under the jurisdiction of the Town of Apple Valley. The Town uses LOS D as the LOS standard for intersections, consistent with the County Guidelines.

Table D summarizes the results of the LOS analysis under existing without and with project conditions. As shown in Table D, all study intersections are forecast to operate at a satisfactory level of service under both existing without and with project conditions.

Detailed level of service worksheets are included in Appendix D.

QUEUEING ANALYSIS

The queuing analysis was conducted using Synchro for the signalized study intersections, and using SimTraffic for the unsignalized study intersections.

Table E summarizes the results of the queuing analysis under existing without and with project conditions. As shown in Table E, all queues do not exceed the available storage lengths at the study intersections.

Detailed queuing analysis sheets are included in Appendix E.

TRUCK ACCESS AT THE PROJECT DRIVEWAY

Based on the land uses being proposed for the Project, it is anticipated that delivery trucks will access the project site at the study intersections. Additionally, it is anticipated that most delivery trucks will be accessing the site from the west via the Bear Valley Road. Therefore, this analysis evaluates the adequacy of truck turning radii at the intersection of Westmont Drive/Bear Valley Road for truck ingress and egress. As a conservative estimate, large semitrailer (WB-62) templates were used to evaluate the adequacy of truck turning radii. The truck template is in accordance with the 2018 Edition of the American Association of State Highway and Transportation Officials (AASHTO) Green Book. Figure 10 illustrates the truck turning template to and from the west along Bear Valley Road. As illustrated in Figure 10, there is adequate roadway width to accommodate both inbound and outbound truck turning radii.

CONCLUSION

The Apple Valley Commercial Project consists of a 43,000 sf supermarket and 6,995 sf of retail space. The project is anticipated to generate 154 net trips in the a.m. peak hour, 241 net trips in the p.m. peak hour, and 2,901 net daily trips. All study intersections are forecast to operate at a satisfactory LOS under both existing without and with project conditions. There is sufficient storage for vehicle queuing at all study intersections under both existing without and with project conditions. There is adequate turning radii for both inbound and outbound truck movements at the intersection of Westmont Drive/Bear Valley Road.

Should you have any questions, please do not hesitate to contact me at (951) 781-9310 or email me at Ambarish.Mukherjee@lsa.net.

¹ Rates from the Institute of Transportation Engineers *Trip Generation Manual* (10th Edition), Land Use 850 - "Supermarket", Setting/Location - "General Urban/Suburban."

² Internal capture rates obtained using the National Cooperative Highway Research Program (NCHRP) 8-51 Internal Trip Capture Estimation Tool.

³ Pass-by rates from the ITE Trip Generation Handbook, 3rd Edition for Land Use 850 - "Supermarket." A pass-by rate of 36% was used for the p.m. peak hour. No a.m. peak and daily pass-by rates are provided; therefore, the p.m. pass-by rate was used as the daily pass-by rate.

⁴ Rates from the Institute of Transportation Engineers *Trip Generation Manual* (10th Edition), Land Use 820 - "Shopping Center", Setting/Location - "General Urban/Suburban."

⁵ Pass-by rates from the ITE Trip Generation Handbook, 3rd Edition for Land Use 820 - "Shopping Center." A pass-by rate of 34% was used for the p.m. peak hour. No a.m. peak and daily pass-by rates are provided; therefore, the p.m. pass-by rate was used as the daily pass-by rate.

Table B – Intersection Level of Service Definitions

LOS	Description
A	Traffic operations with a control delay of 10 seconds per vehicle or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If LOS A is the result of favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.
B	Traffic operations with control delay between 10 seconds per vehicle and 20 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.
C	Traffic operations with control delay between 20 and 35 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of the insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.
D	Traffic operations with control delay between 35 and 55 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.
E	Traffic operations with control delay between 55 and 80 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.
F	Traffic operations with control delay exceeding 80 seconds per vehicle or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.
