Existing surrounding uses to the project site include residential, institutional, and commercial uses: the Stonehaven Apartments for student housing to the north; apartments to the northwest; and a mix of church, apartments, and commercial uses to the northeast. Existing uses on Canyon Crest Drive include the mostly undeveloped North District Development area located to the east³; Falkirk Apartments for student housing and a portion of the underground Gage Canal to the south; REACH Leadership STEAM Academy, a church, a portion of the underground Gage Canal to the southwest; and the UCR Baseball Complex and a portion of the underground Gage Canal to the west. No manufacturing activities were identified on the adjacent parcels.

Section 17213 of the California Education Code and Section 21151.8 of the California Public Resources Code prohibit construction of a school upon a current or former hazardous waste disposal site or solid waste disposal

³ The UCR North District Development (NDD) Phase I located at the southeastern portion of the NDD area, which includes approximately 1,500 student beds, was completed Summer 2021. Construction of the future phases of the North District area (e.g., residence hall beds, apartment beds, dining facilities, recreation) will be determined at a later date pending demand and funding.

3. Site History and Background Information

site. Based on information reviewed for preparation of this PEA Report, the proposed school site is not located on a current or former disposal site.

3.3 PAST USAGE OF THE SITE

Past usage of the site was assessed through a review of aerial photographs and topographic maps. Copies of the aerial photographs and topographic maps are included in Appendix B. Based on a review of aerial photographs and historical topographic maps the project site was used for an orchard from approximately 1931 to about 1953. From at least 1931 to 1985, the project site also contained a residential unit and an associated structure. After 1985, the project site has been utilized for an athletic field. Two cell phone towers are located on the northern area of the site. There is a license agreement with T-Mobile and UCR and a license agreement with Sprint and the City.

3.3.1 Aerial Photographs

Aerial photographs for the project site obtained from EDR for the years 1931, 1938, 1949, 1953, 1966, 1968, 1975, 1978, 1985, 1989, 1994, 2005, 2006, 2009, 2010, and 2012 were reviewed for the project site. Copies of the aerial photographs are included in Appendix B.

- 1931 – Site: A residential dwelling was located on the northern portion of the site, and an elongated shed (barn) is located on the northeast corner of the site. Orchards were located on the site.
 - Off-Site: Orchards were located to the north, south, west (after the Gage Canal and narrow strip of vacant land) and northeast of the site. The north-south oriented Gage Canal was an open uncovered canal west of the site. Vacant land was located east of the site. Present day Blaine Street and Canyon Crest Drive appear as dirt roads.
- 1938 – Site: The site appears relatively unchanged in comparison to the 1931 aerial photograph.
 - Off-Site: The portion of Blaine Street west of the Gage Canal appears to be paved and Blaine Street north of the site remains as a dirt road. The rest of the adjoining properties appear relatively unchanged in comparison to the 1931 aerial photograph.
- 1949 – Site: The site appears to be relatively unchanged in comparison to the 1938 aerial photograph.
 - Off-Site: Blaine Street and present-day Canyon Crest Drive appear to be paved. Land to the east of present-day Canyon Crest Drive appears to be under construction for military family housing. The rest of the adjoining properties appear relatively unchanged in comparison to the 1938 aerial photograph.
- 1953 – Site: Most of the orchard on site is no longer apparent. About 10 trees remain from the orchard along the eastern side of the residential property.

3. Site History and Background Information

- Off-Site: The adjoining land to the east across present-day Canyon Crest Drive appears to be used for military family housing. The orchard to the south is no longer apparent east of the Gage Canal. The rest of the adjoining properties appear relatively unchanged in comparison to the 1949 aerial photograph.
- 1966 – Site: The site has no remaining trees from the orchard. The remainder of the site appears to be relatively unchanged in comparison to the 1953 aerial photograph.
 - Off-Site: Orchards are no longer located to the north, northeast and west of the site. A church is located northeast of the site. The rest of the adjoining properties appear relatively unchanged in comparison to the 1953 aerial photograph.
- 1968 – Site: The site appears to be relatively unchanged in comparison to the 1966 aerial photograph.
 - Off-Site: No orchards are left on adjoining land south of the site. The rest of the adjoining properties appear relatively unchanged in comparison to the 1966 aerial photograph.
- 1975 – Site: The elongated shed (barn) is no longer apparent on the northeast corner of the site. The remainder of the site appears to be relatively unchanged in comparison to the 1968 aerial photograph.
 - Off-Site: No orchards are left on adjoining land northwest of the site. The Gage Canal now appears to be underground. The rest of the adjoining properties appear relatively unchanged in comparison to the 1968 aerial photograph.
- 1978 – Site: The site appears to be relatively unchanged in comparison to the 1975 aerial photograph.
 - Off-Site: Multi-family residential dwellings are under construction northwest of the site. A baseball field is located west of the site. The rest of the adjoining properties appear relatively unchanged in comparison to the 1975 aerial photograph.
- 1985 – Site: The residential dwelling is no longer apparent on the site. The site is developed with athletic fields on the north and a parking lot along the southern boundary.
 - Off-Site: Multi-family residential dwellings are apparent south of the site, east of the Gage Canal. The rest of the adjoining properties appear to be relatively unchanged in comparison to the 1978 aerial photograph.
- 1989 – Site: The site appears relatively unchanged in comparison to the 1985 aerial photograph.
 - Off-Site: The surrounding land appears to be relatively unchanged in comparison to the 1985 aerial photograph.
- 1994 – Site: The site appears relatively unchanged in comparison to the 1989 aerial photograph.

3. Site History and Background Information

- Off-Site: The surrounding land appears to be relatively unchanged in comparison to the 1989 aerial photograph.
- 2005 – Site: The site appears relatively unchanged in comparison to the 1994 aerial photograph.
 - Off-Site: Multi-family residential dwellings are apparent north of the site, across Blaine Street. The remaining surrounding land appears to be relatively unchanged in comparison to the 1994 aerial photograph.
- 2006 – The site and adjoining land appear relatively unchanged in comparison to the 2005 aerial photograph.
- 2009 – The site and adjoining land appear relatively unchanged in comparison to the 2006 aerial photograph.
- 2010 – The site and adjoining land appear relatively unchanged in comparison to the 2009 aerial photograph.
- 2012 – The site and adjoining land appear relatively unchanged in comparison to the 2010 aerial photograph.

3.3.2 Historical Topographic Maps

Historical Topographic Maps obtained from EDR for the years 1901, 1938/1942, 1942/1947, 1953/1954, 1967, 1980, and 2012. Copies of the topographic maps are included in Appendix B.

- 1901– The Gage Canal is depicted west of the project site. Blaine Street is depicted, but not labeled.
- 1938/1942 –The project site and surrounding areas appear relatively unchanged in comparison to the 1901 topographic map. The University of California Citrus Experiment Station is located to the southeast of the site.
- 1942/1947 – The project site appears relatively unchanged in comparison to the 1942 topographic map. Canyon Crest Heights is depicted east of the site.
- 1953/1954 – The project site is depicted with orchards and a residential dwelling along Blaine Street. Surrounding areas to the north, south, west and northeast are depicted with orchards. The University of California Citrus Experiment Station is now labeled as the University of California at Riverside. The remaining adjoining areas appear unchanged in comparison with the 1947 topographic map.
- 1967 – The project site is no longer depicted with an orchard. An elongated shed is depicted on the northeast corner of the site. A church is depicted northeast of the project site, and orchards are no longer

3. Site History and Background Information

depicted to the northeast, to the north east of the Gage Canal, to the west, and to the south east of the Gage Canal.

- 1980 – The elongated shed is no longer depicted on the northeast corner of the project site. No orchards are depicted on adjoining land. The remaining areas appear unchanged in comparison to the 1967 topographic map.
- 2012 –The project site and surrounding areas are not depicted with any structures. The remaining areas appear unchanged in comparison to the 1980 topographic map.

3.3.3 Sanborn Maps

EDR indicated that there are no Sanborn Fire Insurance Maps available for the project site and surrounding area. A copy of the Certified Sanborn Map Report is included in Appendix B.

3.4 PAST USAGE OF ADJOINING PROPERTIES

Past usage of the adjoining properties was assessed through a review of aerial photographs, historical topographic maps and site visit. Copies of historical references reviewed are included in Appendix B.

Based on the review and site visit, surrounding uses include residential, institutional, and commercial uses: the Stonehaven Apartments for student housing to the north; apartments to the northwest; and a mix of church, apartments, and commercial uses to the northeast. Existing uses on Canyon Crest Drive include the mostly undeveloped North District Development area located to the east⁴; Falkirk Apartments for student housing and a portion of the Gage Canal to the south; REACH Leadership STEAM Academy, a church, a portion of the Gage Canal to the southwest; and the UCR Baseball Complex and Gage Canal to the west. No manufacturing activities were identified on the adjacent parcels. The surrounding areas of the project site were used for agricultural purposes from at least the 1930s through the 1960s with residential development for the University occurring in the late 1940s.

3.5 HAZARDOUS SUBSTANCE/WASTE MANAGEMENT INFORMATION

3.5.1 Records Review

3.5.2 Site Owner/Operator Records

Site owner/operator records were not reviewed.

⁴ The UCR North District Development (NDD) Phase I located at the southeastern portion of the NDD area, which includes approximately 1,500 student beds, was completed Summer 2021. Construction of the future phases of the North District area (e.g., residence hall beds, apartment beds, dining facilities, recreation) will be determined at a later date pending demand and funding.

3. Site History and Background Information

3.5.3 State of California Geologic Energy Management Division Records

Based on a review of the California Department of Conservation Geologic Energy Management Division (CalGEM) Well Finder website, there are no oil or gas wells within the project site or within 300 feet of the project site (CalGEM 2022). The closest oil well is over 3.9 miles northeast of the project site. The well is identified as a plugged and abandoned well that was advanced by Floyd Amundson. The project site is not located on an oil field.

3.6 SITE INSPECTION RESULTS

A site visit to observe site conditions was conducted by PlaceWorks on October 18, 2022. No weather-related conditions or other conditions that would limit our ability to observe the site occurred during our site reconnaissance.

Summarized below are observations relative to specific physical features identified in the PEA Guidance Manual and site photographs are included as Appendix A.

3. Site History and Background Information

Physical Feature	Observations
Site boundaries:	The project site consists of approximately 6-acres comprised of the eastern portion of the UC Riverside Baseball Sports Complex located on Assessor's Parcel Number [APN] 250-220-003 and 250-220-008 in City of Riverside, Riverside County, CA. The site is bordered by Blaine Street on the north followed by residential housing; Canyon Crest Drive on the east followed vacant land and student housing; student housing to the south and a portion of the underground Gage Canal; REACH Leadership STEAM Academy and a portion of the underground Gage Canal to the southwest; and underground Gage Canal and the baseball stadium on the west followed by parking.
Locations and boundaries of all onsite operations (present and past):	Based on a review of aerial photographs, the project site had been utilized for agricultural purposes from at least 1931 to around 1953. From 1931 to 1985, the project site has also had a residential dwelling unit. From 1985 to the present, the project site has been used as an athletic field consisting of two baseball diamonds, two cell phone towers, and associated parking on the south.
Foundations of former structures:	None noted by PlaceWorks. There are currently no buildings within the proposed project site boundaries. Two cell phone towers are located on the north near Blaine Street that are fenced. There is field lighting for the baseball fields located around the perimeter of the site.
Storage tanks and storage areas:	None noted by PlaceWorks
Odors:	None noted by PlaceWorks.
Pools of liquid:	None noted by PlaceWorks.
Electrical or hydraulic equipment known or likely to contain PCBs:	None noted by PlaceWorks.
Unidentified substance containers (including empty drum storage):	None noted by PlaceWorks
Stained soil and pavement, corrosion, and degradation of floors and walls:	None noted by PlaceWorks.
Drains and Sumps:	None noted by PlaceWorks.
Pits, ponds, and lagoons:	None noted by PlaceWorks.
Surface drainage pathways:	None noted by PlaceWorks.
Stressed vegetation (from other than insufficient water):	None noted by PlaceWorks.
Solid waste and wastewater:	None noted by PlaceWorks.
Wells (including dry wells, irrigation wells, injection wells):	None noted by PlaceWorks.
Septic systems:	None noted by PlaceWorks.
Overhead electrical lines:	None noted by PlaceWorks. Overhead electrical lines are located on the north side of Blaine Street and the far side of Canyon Crest Drive.
High-pressure gas or fuel transmission lines:	No high-pressure gas pipelines were identified as being located on the site based on visual observations, and agency responses.

3.6.1 Prior Assessments/Remediation

No prior assessments or remediation were identified for this PEA by PlaceWorks. Old grading plans were reviewed from the 1970s which showed that soil from the western side of the Riverside Sports Complex was placed on the eastern side of the sports complex including the project site. The grading plan for the sports complex is included in Appendix B.

3. Site History and Background Information

This page intentionally left blank.

4. Regulatory Status

4.1 STANDARD ENVIRONMENTAL RECORDS REVIEW

PlaceWorks utilized the electronic database service EDR to complete an environmental records review for the project site. The database search was used to identify properties that may be listed in the referenced Agency records, located within the American Society for Testing and Materials (ASTM)-specified search radii indicated below:

Database	Approximate Search Distance	Subject Site Listed?	Number of Sites within Search Area
Federal NPL (Superfund) Sites	1 mile	No	0
Federal Delisted NPL Sites	1 mile	No	0
Federal sites subject to CERCLA removals and CERCLA	0.5 mile	No	0
Federal CERCLA sites with NFRAP	0.5 mile	No	1
Federal RCRA facilities undergoing Corrective Action	1 mile	No	1
Federal RCRA TSD facilities	0.5 mile	No	1
Federal RCRA generators	0.25 mile	No	1
Federal institutional controls / engineering controls registries	0.5 mile	No	0
Federal ERNS list	Site and Adjoining	No	6
State- and tribal (Superfund) equivalent sites	1 mile	No	0
State- and tribal hazardous waste facilities	1 mile	No	5
State- and tribal landfills and solid waste disposal facilities	0.5 mile	No	0
State- and tribal leaking storage tanks	0.5 mile	Yes	16
State- and tribal registered storage tanks	0.25 mile	No	02
State- and tribal voluntary cleanup sites	0.5 mile	No	0
State- and tribal brownfield sites	0.5 mile	No	0
Orphan Site List	Site and Adjoining	No	2
HAZNET	Site only	No	1

A review of selected regulatory agency databases for documented environmental concerns on the project site, or in close proximity to the project site, was conducted by EDR Lightbox. A copy of the radius report, dated September 9, 2022 is included in Appendix C. The project site was not identified in any of the databases reviewed by EDR and further discussed below.

4.1.1 Federal NPL (Superfund) Sites

The National Priorities List (NPL) is a list of contaminated sites that are considered the highest priority for clean-up by the EPA.

- The project site is not listed on the NPL database.

4. Regulatory Status

- The database search did not identify any NPL facilities within one mile of the project site.

4.1.2 Federal Delisted NPL Sites

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425 (e), sites may be deleted from the NPL where no further response is appropriate.

- The project site is not listed on the delisted NPL List.
- The database did not identify any delisted NPL sites within a mile radius of the project site.

4.1.3 Federal sites subject to CERCLA removals and CERCLA Sites

The Comprehensive Environmental Response, Compensation, and Liability Act Information System (CERCLIS) list identifies sites which are suspected to have contamination and require additional investigation to assess if they should be considered for inclusion on the NPL.

- The project site is not listed on the CERCLIS database.
- The database search did not identify any CERCLIS listings within a half mile radius of the site.

4.1.4 Federal CERCLA sites with NFRAP

CERCLIS-NFRAP status indicates that a site was once on the CERCLIS List but has No Further Response Actions Planned (NFRAP). Sites on the CERCLIS-NFRAP List were removed from the CERCLIS List in February 1995 because, after an initial investigation was performed, no contamination was found, contamination was removed quickly, or the contamination was not significant enough to warrant NPL status.

- The project site is not listed on the CERCLIS-NFRAP database.
- The database search identified one CERCLIS-NFRAP sites within a half mile of the project site.
 - UCR campus, approximately 0.365-miles south southeast of the project site, is listed due to pesticide impacted soil from the agricultural research station and is listed as under control and that current exposures are under control. The DTSC's EnviroStor page indicates that the site can be considered closed. Based on the details of the case and regulatory status, it is not expected to have an impact on the project site.

4.1.5 Federal RCRA facilities undergoing Corrective Action

The Resource and Conservation Recovery Act (RCRA) CORRACTS Facilities list catalogues facilities that treat, store, or dispose of hazardous waste and have been associated with corrective action activity.

4. Regulatory Status

- The project site is not listed on the RCRA CORRACTS Facilities list.
- The database search identified one RCRA CORRACTS Facilities within one mile of the project site.
 - UCR campus, approximately 0.365-miles south southeast of the project site. The DTSC indicates on the EnviroStor page for the site that the case was not a RCRA site and is considered closed. Based on the details of the case and regulatory status, it is not expected to have an impact on the project site.

4.1.6 Federal RCRA TSD Facilities

The RCRA non-CORRACTS TSD Facilities list tracks facilities which treat, store, or dispose of hazardous waste and are not associated with corrective action activity.

- The project site is not listed on the RCRA non-CORRACTS TSD Facilities list.
- The database search identified one RCRA non-CORRACTS TSD facilities within a half mile radius of the project site.
 - UCR campus, approximately 0.365-miles south southeast of the project site. The DTSC indicates on the EnviroStor page for the site that the case was not a RCRA site and is considered closed. Based on the details of the case and regulatory status, it is not expected to have an impact on the project site.

4.1.7 Federal RCRA Generators

The RCRA Generators list is maintained by the USEPA to track facilities that generate hazardous waste.

- The project site is not listed as a RCRA Generator facility.
- The database search identify one RCRA Generator within a quarter mile radius of the project site.
 - UCR campus, approximately 0.365-mile south southeast of the project site, is listed as a large quantity generator of hazardous waste. A violation in 2014 is noted on the EPA's Enforcement and Compliance History (ECHO) website. The violation is listed as 262.C, which is related to pre-transportation requirements for generators as covered in 40 CFR 262 Subpart C which details packing, labeling, marking, and placarding.

4.1.8 Federal Institutional Control / Engineering Controls

A listing of sites with institutional and/or engineering controls in place is maintained by the EPA. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use

4. Regulatory Status

restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

- The project site is not listed as having an institutional or engineering control.
- The database search did not identify any institutional or engineering control sites within a half mile radius of the site.

4.1.9 Federal ERNS List

The Federal Emergency Response Notification System (ERNS) list tracks information on reported releases of oil and hazardous materials.

- The project site is not listed on the ERNS database.

4.1.10 State-and-tribal equivalent NPL

Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

- The project site is not listed on state- and tribal-equivalent NPL.
- The database search did not identify any state-and tribal equivalent NPL sites within a one-mile radius of the project site.

4.1.11 State-and-tribal Hazardous Waste Facilities

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

- The project site is not listed on the State-and-tribal equivalent CERCLIS List.
- The database identified five state-and tribal-equivalent CERCLIS facilities within a mile radius of the project site.
 - Student Recreation Center Expansion at 900 University Avenue, approximately 0.365-mile south southeast of the project site, is listed as part of the DTSC – Site Cleanup Program due

4. Regulatory Status

to being a former ISD Facility and is listed as being referred to another agency as of June 31, 1998. Based on the regulatory status, it is not expected to have had an impact.

- Valerion Corporation at 2280 Iowa Avenue, approximately 0.570-miles northwest of the project site, is a historical site that is listed as being referred to another agency as of August 12, 1988. Based on the overall distance and its downgradient location from the project site, the facility is not expected to have had an impact on the project site.
- Thermoclad Company at 1541 7th Street, approximately 0.652-miles southwest of the project site, is listed as part of the DTSC – Site Cleanup Program due to historic manufacturing and is listed as inactive needing evaluation as of March 6, 2006. Based on the overall distance and downgradient location from the project site, it is not expected to have had an impact.
- The site at the southwest corner of Watkins Drive and Valencia Hill Drive, approximately 0.767-miles east of the project site., is listed as a site that was evaluated as a proposed school site for the STEM Education Center. The site was eventually removed from consideration. The case is listed as receiving a No Further Action determination as of July 27, 2018. Based on the overall distance and current regulatory status, it is not expected to have had an impact.
- California Spray Chemical Company at 3530 Chicago Avenue, approximately 0.802-miles west southwest of the project site, is listed as part of the DTSC – Site Cleanup Program due to historic manufacturing and is listed as inactive needing evaluation as of March 6, 2006. Based on the overall distance and downgradient location from the project site, it is not expected to have had an impact.

4.1.12 State and Tribal- equivalent Landfill and/or Solid Waste Disposal Sites

The database search did not identify any State Landfills or Solid Waste Disposal Sites within a one-half mile radius of the project site.

- The project site is not listed on state- and tribal- equivalent landfill and/or solid waste disposal site lists.
- The database did not identify any state-and tribal equivalent landfill and/or solid waste disposal site within a half mile radius of the project site.

4.1.13 State and Tribal Leaking Underground Storage Tanks (LUSTs)

The State Water Resources Control Board's Leaking Underground Storage Tank Information System contains an inventory of LUST Incident Reports.

- The project site is not listed on the LUST database.
- The database identified sixteen LUST facilities within a half-mile radius of the project site.

4. Regulatory Status

- UC Riverside Steam Plant at 3401 Watkins Drive, approximately 0.365-miles south southeast of the project site, is listed because of a leak of heating oil/fuel oil reported May 23, 1995. The case is currently listed as completed case closed as of March 18, 1998. Based on the current regulatory status, this facility is not expected to have had an impact on the project site.
- E-Z Serve #070135 at 811 Blaine Street, approximately 0.114-miles northeast of the project site, is listed because of a leak of gasoline reported December 29, 1986. The case is currently listed as completed case closed as of January 14, 1992. Based on the current regulatory status, this facility is not expected to have had an impact on the project site.
 - Alta-Dena Drive in 571 is the same case as E-Z Serve. This case is listed twice in the EDR report.
- Chevron #9-8260 at 1011 University Avenue, approximately 0.368-miles south of the project site, is listed because of a leak of gasoline reported August 20, 1991. The case is currently listed as completed case closed as of May 1, 1992. Based on the current regulatory status, this facility is not expected to have had an impact on the project site.
- Grove 186 at Cole Street, approximately 0.311-miles southwest of the project site, is listed because of a leak of diesel reported August 10, 1988. The case is currently listed as completed case closed as of December 11, 1989. Based on the current regulatory status and its downgradient location, this facility is not expected to have had an impact on the project site.
- Mobil #18-402 at 1147 University Avenue, approximately 0.381-miles southwest of the project site, is listed because of a leak of gasoline reported January 11, 1999. The case is currently listed as completed case closed as of January 13, 2011. Based on the current regulatory status and its downgradient location, this facility is not expected to have had an impact on the project site.
 - Rashid's Inc., DBA University Mobil is the same case as Mobil #18-402. This case is listed twice in the EDR report.
- Texaco Service Station #120593 at 1300 Blaine Street, approximately 0.320-miles west of the project site, is listed because of a leak of gasoline reported June 12, 2002. The case is currently listed as completed case closed as of May 18, 2005. Based on the current regulatory status and its downgradient location, this facility is not expected to have had an impact on the project site.
 - Exxon Service Station #2899 is the same case as Texaco Service Station. This case is listed three times in the EDR report.
- UCR Shell at 3261 Iowa Avenue, approximately 0.320-miles west of the project site, is listed because of a leak of gasoline reported November 17, 2004. The case is currently listed as

4. Regulatory Status

completed case closed as of April 7, 2006. Based on the current regulatory status and its downgradient location, this facility is not expected to have had an impact on the project site.

- Blaine Shell and Shell Iowa Avenue are the same case as UCR Shell. This case is listed three times in the EDR report.
- University of California, Riverside at 1160 University Avenue, approximately 0.428-miles southwest of the project site, is listed because of a leak. The case is currently listed as completed case closed as of March 21, 2018. Based on the current regulatory status and its downgradient location, this facility is not expected to have had an impact on the project site.
- Texaco Service Station at 1221 University Avenue, approximately 0.416-miles southwest of the project site, is listed because of a leak of gasoline reported July 3, 1996. The case is currently listed as completed case closed as of July 28, 1997. Based on the current regulatory status and its downgradient location, this facility is not expected to have had an impact on the project site.
 - Texaco Service Station is listed twice in the EDR report.

4.1.14 State and Tribal Registered Storage Tanks

The State Water Resources Control Board's Hazardous Substance Storage Container Database maintains a list of USTs regulated by the RCRA.

- The project site is not listed on the registered storage tanks database.
- The database identified two registered storage tanks facilities within a quarter mile radius of the project site.
 - Riverside City Radio Repeat at Box Springs Mountain Road, approximately 0.136-miles southwest of the project site, is listed as having a permit with Riverside County. The Facility ID is listed as 639.
 - Quixtop JR Market at 783 W Blaine Street, approximately 0.154-miles east of the project site, is listed as having a permit with Riverside County. The Facility ID is listed as 613.

4.1.15 State and Tribal Voluntary Cleanup Site

The DTSC maintains a list of low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

- The project site is not listed on the state and tribal voluntary cleanup program.

4. Regulatory Status

- The database search did not identify any state and tribal voluntary cleanup program sites within a half mile radius of the project site.

4.1.16 State and Tribal Brownfield Sites

A listing of sites the State Water Resource Control Board considers to be Brownfields since these are sites have come to them through the Memorandum of Agreement (MOA) Process.

- The project site is not listed on the state and tribal brownfield database.
- The database search did not identify any state and tribal brownfield sites within a half mile radius of the project site.

4.1.17 HAZNET

HAZNET contains the data obtained from hazardous waste manifests received by the DTSC for lawful disposal of hazardous materials. A listing on the HAZNET database does not indicate that an environmental concern exists, only that a lawful disposal of materials has occurred.

- The project site is not listed on the HAZNET database.
- The database search did identify one property on the HAZNET database within a quarter mile radius of the project site.
 - The University of California, Riverside at 900 University Avenue, approximately 0.365-miles south southeast of the project site, is identified on the HAZNET database.

4.1.18 Orphan Sites

The EDR database identified two sites that is indicated as being potentially in the area and was not mapped due to incomplete address information.

- UCR Parking Lot 6 is listed as a LUST case that is closed and is over a mile from the project site.
- UCR Pesticide Pit is a facility that is considered closed and undergoing long term monitoring.

Based on a review of the orphan site locations, the project site is not expected to have been impacted.

4.2 ADDITIONAL ENVIRONMENTAL RECORDS REVIEW

In conformance with ASTM inquiry was made with the additional agencies described below.

4. Regulatory Status

4.2.1 Local Brownfield Lists

The DTSC's Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. There were no brownfield sites identified on the EnviroStor database in the radius searched for the site.

4.2.2 Local Lists of Landfill / Solid Waste Disposal Sites

A record search was done of the local lists of landfill / solid waste disposal sites. No facilities were identified within 0.50 miles of the project site.

- The project site was not identified as a landfill or solid waste disposal site.
- The database did not identify any landfill or solid waste disposal facilities within a half-mile radius of the project site.

4.2.3 Local Lists of Hazardous Waste Contaminated Sites

A record search was done on the following databases: Clandestine Drug Labs, HIST Cal-Sites Historical CalSites Database, Toxic Pits Cleanup Act Sites, School Property Evaluation Program records, US Historical Clandestine Laboratory Register, and CERS HAZ Waste records were searched.

- The project site was not identified on the above databases.
- The database identified one CERS HAZ Waste facility within a half-mile radius of the project site.
 - UCR at 3401 Watkins Drive, approximately 0.46-miles southeast of the project site, is listed as a hazardous waste generator. The site ID is listed as 174264 and the CERS ID is 10525672.

4.2.4 Local Lists of Registered Storage Tanks

A record search was done of the local lists of registered storage tanks. Two registered UST facilities were identified within 0.25 miles of the project site.

- UCR at 3401 Watkins Drive is listed as having permits for aboveground petroleum storage tanks with the site ID listed as 1744264 and CERS ID listed as 10525672. The facility also has permits for underground storage tanks with the facility ID 33006882.
- Alta-Dena Drive-In #571 at 811 W Blaine Street is listed as a historical UST facility with the facility ID listed as 00000011198.
 - This facility is listed twice in the EDR

4. Regulatory Status

- Quixtop JR Market at 783 Blaine Street is listed as having a permit for a UST with Riverside County. The facility ID is listed as 613.
 - This facility is listed twice in the EDR

4.2.5 High Risk Historical Records

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, and dry cleaners. There were no historical facilities identified within a quarter mile of the project site.

4.2.6 Vapor Migration

The ASTM 1527-21 standard states that "for the purposes of this practice, "migrate" and "migration" refers to the movement of hazardous substances or petroleum products in any form, including, for example, solid and liquid at the surface or subsurface, and vapor in the subsurface". Thus, this section specifies whether or not we perceive a risk of vapor migration to the project site.

To assess vapor migration risk, a review and analysis of the site-specific environmental database report and other reasonably ascertainable records was implemented to assess whether:

1. Off-site properties have documented chlorinated volatile organic compound (VOC) contamination located within 100 feet of the project property, or
2. Off-site properties have documented volatile petroleum hydrocarbon contamination within 30 feet of the project property.

Based on the records review, it is unlikely that a potential source of vapor migration currently exists beneath the site from off-site properties. No chlorinated VOC contamination was identified within 100 feet of the project site, and no underground storage tanks or petroleum hydrocarbon contamination were identified adjacent or within 30 feet of the project site.

5. Apparent Problem

There is no physical or historic evidence of any site activity that might have caused any environmental impact to the site. However, there are potential environmental issues evaluated in this PEA. The PEA identified the following potential issues at the site:

- The possibility of residual pesticides present in the soil due to historical agricultural use of the site from approximately 1931 to around 1953.
- The possibility of residual lead from lead-based paint and termiticide usage on the project site due to the two historic structures that were identified on the project site from at least 1931 until about 1985.
- Evaluate if fill material identified on the site is clean.

Because the site is for a proposed school, there is a potential for children who will attend the school and adult employees of the school to be exposed to chemicals that may be present in soil. Potential exposure may occur from soil ingestion, dermal exposure to soil, and inhalation of particles. The sampling that was conducted as part of this PEA was directed at addressing these potential chemicals of concern and these potential exposure pathways.

Because of the presence of the above-mentioned concerns, a PEA was initiated for the site.

5. Apparent Problem

This page intentionally left blank.

6. Environmental Setting

This section describes potential exposure pathways and the site geology and hydrogeology.

6.1 FACTORS RELATED TO SOIL EXPOSURE PATHWAYS

6.1.1 Site Topography

The topographic gradient of the project site is to the southwest. Based on a review of the United States Geological Survey (USGS) 7.5-minute Topographic Series, Riverside East, California Quadrangle Map (USGS 2015), surface elevation of the site is approximately 1,030 feet above mean sea level (msl) with a slight slope to the west. Topographic maps are included in Appendix B.

6.1.2 Site Geology and Soil Types

Based on a review of the United States Geological Survey (USGS) 7.5-minute Topographic Series, Riverside East, California Quadrangle Map (USGS 2015), the property is located in the northern part of the Peninsular Ranges Geomorphic Province. The Peninsular Ranges Geomorphic Province extends approximately 900 miles southward from the Los Angeles Basin to Baja California, Mexico and is characterized by elongated northwest-trending mountain ranges separated by sediment-floored valleys (Yerkes et al. 1965). The most dominant structural features of the province are the northwest-trending fault zones, most of which die out, merge with, or are terminated by the steep reverse faults at the southern margin of the San Gabriel Mountains within the Transverse Ranges Geomorphic Province. The site itself sits atop early Pleistocene alluvial fan deposits (Morton and Cox 2001). Topographically, the site gently slopes to the west. Based on a review of the USGS 7.5-minute Topographic Series, Riverside East, California Quadrangle Map (USGS 2015), surface elevation of the site is approximately 1,030 feet above mean sea level (msl).

The site is not within or immediately adjacent (i.e., within a few hundred feet) to an Alquist-Priolo Earthquake Fault Zone (California Geological Survey [CGS] 2019). The nearest Alquist-Priolo Earthquake Fault Zone is located approximately 5.2 miles northeast of the site for the San Jacinto Fault. Based on a review of readily available geologic literature (Morton and Cox 2001; CGS 2000a; CGS 2019; Jennings and Bryant 2010) and the Riverside General Plan (2007), there are no known active faults or geologically hazardous areas on or immediately adjacent to the site.

The United States Department of Agriculture Natural Resources Conservation Services maps the soil beneath the site as Buren fine sandy loam (USDA, 2019). Buren fine sandy loam is classified as soil that has a slow infiltration rate with moderately fine to fine textures. The soil is also classified as moderately well drained.

6. Environmental Setting

6.1.3 Naturally Occurring Asbestos and Radon

Naturally occurring serpentine rock or rock formations—which may contain significant quantities of asbestos—are not located within 10 miles of the project site (Van Gosen and Clinkenbeard 2011). Additionally, based on a review of *A General Location Guide for Ultramafic Rocks in California: Areas More Likely to Contain Naturally Occurring Asbestos* (Department of Conservation, Division of Mines and Geology 2000) and Van Gosen and Clinkenbeard (2011), the site is not located within a 10-mile radius of an area thought to contain naturally occurring asbestos. Therefore, project implementation would not result in the exposure of hazardous materials or naturally occurring hazardous materials on the school site.

The EPA Radon Zone for Riverside County is Zone 2 with indoor average levels greater than 2 pCi/L and less than 4 pCi/L. The U.S. EPA has established their action level for radon at 4.0 pCi/L. The federal radon information for zip code 92507 indicates that 100% of the site tested are less than 4 pCi/L and the state database indicates that maximum result was found to be 1.8 pCi/L. Based on the sites being below 4pCi/L in the area, radon is not considered an issue for the project site.

6.1.4 Site Accessibility

The project site is accessible off of Rustin Avenue to the west, Blaine Street to the north, and Canyon Crest Drive to the east.

6.1.5 Proximity to Nearby Receptors

6.2 FACTORS RELATED TO WATER PATHWAYS

Existing surrounding uses to the project site include residential, institutional, and commercial uses: the Stonehaven Apartments for student housing to the north; apartments to the northwest; and a mix of church, apartments, and commercial uses to the northeast. Existing uses on Canyon Crest Drive include the mostly undeveloped North District Development area located to the east⁵; Falkirk Apartments for student housing and a portion of the Gage Canal to the south; REACH Leadership STEAM Academy, a church, a portion of the Gage Canal to the southwest; and the UCR Baseball Complex and Gage Canal to the west. The following sections describe factors related to potential water pathways.

6.2.1 Groundwater Pathway and Surface Water Information

The site is located in the Riverside-Arlington Subbasin of the Upper Santa Ana Valley Groundwater Basin. Surface water is expected to follow the direction of the ground slope toward the closest open body of water or intermittent stream, in this case, University Wash located about 0.3 mile south of the site. According to the Western-San Bernardino Watermaster Cooperative Well Measuring Program, Spring 2008, the closest well is located about 0.36 mile south-southwest of the site. The well, identified as MW-2, was last measured on May

⁵ The UCR North District Development (NDD) Phase I located at the southeastern portion of the NDD area, which includes approximately 1,500 student beds, was completed Summer 2021. Construction of the future phases of the North District area (e.g., residence hall beds, apartment beds, dining facilities, recreation) will be determined at a later date pending demand and funding.

6. Environmental Setting

22, 2007 with a depth to water of 183 feet below ground surface. Based on the EDR GeoCheck addendum included in Appendix C, groundwater flow in the site vicinity is toward the west. Hydrogeologic investigations were not performed on the site for this investigation; therefore, it is unknown to what extent localized variations in groundwater presence and flow occur on the site.

The City of Riverside provides water services (both potable and recycled water) to the project site and surrounding area, which is supplied from groundwater resources in the San Bernardino, Bunker Hill, and Riverside Basins (Riverside, 2019). Based on an analysis of the topography in the site vicinity, sheet flow runoff from the site during periods of intense or prolonged precipitation would be expected to flow to the south. According to FEMA, the closest 100-year flood plain is located about 0.3 mile south of the site.

6.2.2 Impacted Aquifers from Site Releases

There are no known site releases.

6.3 FACTORS RELATED TO AIR PATHWAYS

The site is classified as being in climate zone 10 by the California Energy Commission. It is an area that is semi-arid with hot, dry summers and mild winters. The Western Regional Climate Center collected data from Riverside from 1893 to 2016. The mean temperature in the area ranges from a low of 48.6° Fahrenheit (°F) in the winter to a high of 79.5°F in the summer. The average annual precipitation is 10.21 inches per year (Western Regional Climate Center 2019).

6. Environmental Setting

This page intentionally left blank.

7. Sampling Activities and Results

This section describes methods and results of the soil sampling activities conducted at the site on October 22, 2019 and May 1, 2020. The second round of sampling was due to a change in site boundary. Figure 4 shows the sampling locations for the project survey area. Table 1 provides a summary of the sampling and analysis program for the PEA. The Health and Safety Plan used for the site is included in Appendix D.

- Soil sampling activities were conducted at the site on October 22, 2019 for the PEA. After sampling was implemented in 2019, the project site boundaries changed to include a portion of the southern parking lot increasing the project to approximately 6 acres plus an additional 0.77 acres of the Gage Canal. Additional soil samples were collected on May 1, 2020 in the parking lot area.
- Soil samples were collected from 25 locations from one to three depths for a total of 65 soil samples collected plus 6 duplicates. For the parking lot area, 11 additional soil samples were collected from 5 locations for a total of 76 soil samples. Samples were labeled with a ‘S’ if they were collected near two former structures, ‘F’ if fill only and ‘B’ for agricultural location. The current site boundaries are approximately 6 acres, and only the six “F” locations are located outside the current site boundaries.
- Sixteen composite soil samples plus two duplicate samples were analyzed for organochlorine pesticides (OCPs) by EPA Method 8081A to assess for potential residual OCPs from historic agricultural operations, imported fill and possible termiticides used on the structures.
- Ten discrete soil samples plus two duplicates were analyzed for CAM-17 metals by EPA Method 6010B/7471A from the fill material. Twelve soil samples plus one duplicate were collected and analyzed for lead and arsenic by EPA 6010B to assess for arsenic from pesticides and lead in soil associated with the former structures.
- Ten discrete soil samples plus two duplicates were collected and analyzed for total petroleum hydrocarbons (TPH) by EPA Method 8015B from the fill material.
- Seven soil samples plus two duplicates were collected and analyzed for PCBs by EPA Method 8082.
- Five discrete soil samples plus two duplicates were collected from the fill material and analyzed for semi volatile organics (SVOCs) by EPA Method 8270SIM.
- Six soil samples plus two duplicates were collected from the fill material and analyzed for asbestos by Polarized Light Microscopy (PLM).

7. Sampling Activities and Results

7.1 UTILITY CLEARANCE

Prior to commencement of field activities, Underground Service Alert (USA) was notified of our intent to conduct subsurface investigations at least 48 hours prior to initiation of intrusive field tasks. USA contacted all utility owners of record within the site vicinity and notified them of our intention to conduct subsurface investigations in proximity to buried utilities. All utility owners of record, or their designated agents, were expected to clearly mark the position of their utilities on the ground surface throughout the area designated for investigation. Subsurface utility maps were also reviewed for site that were provided by UCR.

7.2 SAMPLING PROCEDURES

Soil samples were collected following protocols described in DTSC's PEA Guidance Manual (DTSC 2015), DTSC's Interim Guidance for Sampling Agricultural Properties (Third Revision) (DTSC 2008), and DTSC's Guidance for Evaluating School Sites with Potential Soil Contamination as a result of Lead from Lead-Based Paint, Organochlorine Pesticides from Termiticides, and Polychlorinated Biphenyls from Electrical Transformers (DTSC 2006). The sampling program that was implemented is included in Table 1 and all sampling locations are shown on Figure 4, *Sampling Locations*. A Professional Geologist was on-site to direct and observe all field activities.

7.2.1 Soil Sampling Methods and Procedures

Soil sampling was conducted using a truck-mounted direct push drill rig (Geoprobe™) during the October 22, 2019 sampling event. The Geoprobe™ rig advanced acetate lined sample core barrels sleeves to desired depths using a hydraulic ram or pneumatic hammer system. The inside diameter of the core barrel was 1.5 to 2.0 inches. The sample barrel was retrieved, and the sample interval was observed, logged and preserved. Soil samples were preserved by placing Teflon™ sheeting and polyethylene caps leaving no headspace and placing them in sealable plastic bags. Samples that were collected in the vicinity of the Gage Canal were hand augered and did not extend beyond 0.5 feet bgs. Soil samples that were collected on May 1, 2020 were all collected with a hand auger.

Observations pertaining to the soil type were described by the field geologist. Each soil sample was labeled with the sample number, sample depth, and the date and time the sample was collected. Samples were immediately placed in an ice-filled cooler and listed on a chain-of-custody form. Any observation pertaining to potential soil contamination or soil source was recorded. The chain-of-custody forms are included in Appendix E.

7.3 QUALITY CONTROL SAMPLING PROCEDURES

Field quality control samples associated with the sampling program included duplicate soil samples, equipment blanks, and soil matrix spike/matrix spike duplicate (MS/MSD) samples, in accordance with the DTSC PEA Guidance Manual (DTSC 2015). Duplicate soil samples were collected and analyzed and are listed on Table 1 for soil samples.

7. Sampling Activities and Results

Field duplicate samples were collected and analyzed to evaluate sampling and analytical precision. Field duplicates for soil samples were collected at a rate of approximately 10% of the samples collected. The duplicate samples were analyzed for all laboratory analyses requested for the primary samples collected. In addition, equipment blanks were collected using distilled water passed through sampling equipment following each sampling event. The Quality Assurance Project Plan (QAPP) is included in Appendix F.

7.4 DECONTAMINATION PROCEDURES

All equipment that came into contact with the soil was decontaminated consistently to assure the quality of samples collected. Decontamination was conducted prior to and after each use of a piece of equipment. All sampling devices used were decontaminated using the following procedures:

- Non-phosphate detergent and distilled water wash, using a brush; and
- A double deionized/distilled water rinse.

7.5 INVESTIGATIVE-DERIVED WASTE MANAGEMENT

In the process of collecting environmental samples during the field-sampling program, different types of potentially contaminated investigation-derived wastes (IDW) were generated that include the following:

- Used personal protective equipment (PPE);
- Disposable sampling equipment;
- Soil cuttings; and
- Decontamination fluids.

The EPA's National Contingency Plan requires that management of IDW comply with all applicable or relevant and appropriate requirements to the extent practicable. The sampling plan followed the Office of Emergency and Remedial Response Directive 9345.3-02 dated May 1991, which provides the guidance for the management of IDW. In addition, other legal and practical considerations that may affect the handling of IDW will be considered.

Listed below are the procedures that were followed for handling the IDW:

- Used PPE and disposable equipment were double bagged and placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill.
- Soil cuttings were returned to their original borehole.

7. Sampling Activities and Results

7.6 ANALYTICAL RESULTS

Organochlorine pesticide results in soil are summarized in Table 2. Table 3 is a summary of CAM-17 metal results. Table 4 is a summary of TPH, Table 5 is a summary of SVOCs, Table 6 is a summary of PCBs and asbestos results are summarized on Table 7 Laboratory summary reports for all analytes are included in Appendix E.

7.7 DISCUSSION OF RESULTS

7.7.1 Soil Description

Descriptions of the soils encountered and collected during the investigation were recorded by a field geologist. Fill soils were described as massive loose to medium dense dark brown to brown silt with medium to fine sand with occasional gravel, which is composed of concrete and/or asphalt fragments (in the instances of S-7 and S-8). Fill thickness ranged from 0.5 feet to 4 feet thick across the site. The thickness of fill encountered is listed on Table 1.

Native soils were described as laminated medium dense strong brown to reddish yellow silty medium sand. No staining, unusual odors, or visual signs of contamination were observed by the field geologist.

7.7.2 Soil Results

7.7.2.1 ORGANOCHLORINE PESTICIDES

Sixteen composite soil samples plus two duplicate samples were analyzed OCPs by EPA Method 8081A to assess for potential residual OCPs from historic agricultural operations, imported fill and possible termiticides used on the structures. Three OCPs were detected in the composite soil samples (4,4'-DDE, 4,4'-DDT, and dieldrin) collected and analyzed.

- 4,4'-DDE was detected in nine out of the 18 composite samples analyzed in concentrations ranging from a minimum of 0.002 mg/kg in the 2:1 composite sample F4, F5 @ 0.5' bgs, collected in the fill, to a maximum concentration of 0.027 mg/kg in the 4:1 composite sample S1, S2, S3, S4 @ 4.5' bgs, which was collected in the native soil. EPA Region 9 Regional Screening Levels (RSLs) for 4,4'-DDE adjusted for 2:1 composite sample is 1 mg/kg and for a 4:1 composite sample is 0.50 mg/kg. The levels of 4,4'-DDE detected are below the adjusted RSLs. 4,4'-DDE was detected in the fill material and native soil at similar concentrations.
- 4,4'-DDT was detected in one 4:1 composite sample S1, S2, S3, S4 @ 4.5' bgs at a concentration of 0.0024 mg/kg. The sample was collected from native soil near the former structure. The RSL for 4,4'-DDT adjusted for a 4:1 composite sample is 0.48 mg/kg. The concentration of 4,4'-DDT detected is below the RSL.

7. Sampling Activities and Results

- Dieldrin was detected in the 4:1 composite sample S1, S2, S3, S4 @ 4.5' bgs at a concentration of 0.0057 mg/kg. The sample was collected from native soil near the former structure. The RSL for dieldrin adjusted for a 4:1 composite sample is 0.0085 mg/kg. The concentration of dieldrin detected is below the RSL.

Table 2 is a summary of the organochlorine pesticides detected at the site and their EPA Region 9 RSLs. Appendix E contains the laboratory reports.

7.7.2.2 CAM-17 METALS

Ten soil samples plus two duplicate samples were collected from the fill material and analyzed for CAM-17 metals by EPA Method 6010B/7471A. An additional twelve soil samples plus a duplicate sample were collected and analyzed for lead and arsenic from the native soil to evaluate if there were residual concentrations of potential arsenate pesticides that may have been used at the site prior to the construction of the baseball field and if the former structures may have used lead-based paint that impacted the site.

Arsenic was detected in two out of 22 soil samples plus four duplicates analyzed with the highest concentration of arsenic detected at 1.94 mg/kg found in soil sample B8 @ 0.5', collected from fill. The Department of Toxic Substance Control (DTSC) Screening Level (SL) for arsenic is 12 mg/kg. The levels of arsenic detected are below the DTSC SL for residential exposure⁶. Table 3 summarizes CAM-17 metal results. Laboratory reports for arsenic analysis are included in Appendix E.

Lead was detected in all 22 soil samples and three duplicate soil samples analyzed for lead. Lead concentrations ranged from a minimum of 1.76 mg/kg to a maximum concentration of 58.1 mg/kg. All lead concentrations are below the DTSC screening level of 80 mg/kg for residential exposure.

Maximum concentrations for the remaining CAM-17 metals were within typical background levels for the area and are below residential screening levels. The background data set for metals used was from another Riverside Unified School District PEA (PlaceWorks 2019). The background data set was collected from a similar alluvial fan on the north side of the Box Springs Mountains. The Buren fine sandy loam of the project site is similar in texture to the Greenfield sandy loam of the background data set, and both sites have had historical agriculture (USDA 2018; PlaceWorks 2019). Antimony, beryllium, cadmium, mercury, molybdenum, selenium, silver and thallium were not detected in any of the samples analyzed. CAM-17 metal results and screening levels are summarized on Table 3 and laboratory reports for metal analysis are included in Appendix E.

7.7.2.3 TOTAL PETROLEUM HYDROCARBONS

Ten soil samples plus two duplicate soil samples collected from the fill material were analyzed for TPH by EPA Method 8015B. TPH was not detected in the C4-C12 (gasoline) fraction, in the C13-C22 (diesel) fraction, or in the C23-C44 (motor oil) fraction. TPH results and screening levels are summarized on Table 4 and laboratory reports for TPH analysis are included in Appendix E.

⁶ Department of Toxic Substance Control (DTSC) requires the residential land use scenario be used to evaluate school sites as it is the most conservative assessment.

7. Sampling Activities and Results

7.7.2.4 SEMIVOLATILE ORGANIC COMPOUNDS

Five soil samples plus two duplicate soil samples collected from the fill material were analyzed for SVOCs by EPA Method 8270SIM. SVOCs were not detected in any of the soil samples analyzed. SVOC results showing laboratory reporting levels and screening levels are summarized on Table 5 and laboratory reports for SVOC analysis are included in Appendix E.

7.7.2.5 POLYCHLORINATED BIPHENYLS (PCBS)

Seven soil samples plus two duplicate soil samples collected from the fill material were analyzed for PCBs by EPA Method 8082. PCBs were not detected in the soil samples analyzed. PCB results showing laboratory reporting levels are summarized on Table 6 and laboratory reports for PCB analysis are included in Appendix E.

7.7.2.6 ASBESTOS

Six soil samples plus two duplicate soil samples collected from the fill material were analyzed for asbestos by Polarized Light Microscopy (PLM), EPA Method 600/R-93/116. Asbestos was not visible in the soil samples analyzed. Asbestos results are summarized on Table 7 and laboratory reports for asbestos analysis are included in Appendix E.

8. Human Health Screening Evaluation

A human health screening assessment was conducted to evaluate the potential threat to human health at the project site. The established PEA screening process was used to determine if there are levels of contamination at the site that may cause a concern about effects on human health. This evaluation uses the conservative risk assessment screening method presented in the PEA Guidance Manual and in DTSC's Human Health Risk Assessment (HHRA) Notes 3 and 4 (DTSC 2022a and 2022b). The purpose of the human health risk screening evaluation was to assess whether levels of contaminants in soil at the site could pose a threat to human health under conservative (health-protective) exposure assumptions. The PEA requires a residential land use scenario regardless of current use and zoning.

A screening level human health risk assessment provides a general indication of whether there is potential risk to human health and helps identify areas of concern at a site where a release of hazardous chemicals has occurred. It normally uses established risk-based screening levels such as U.S. EPA RSLs and DTSC-SLs to estimate the cancer risks and noncancer hazards and is intended to be a health-protective preliminary evaluation of potential risk and hazard (DTSC 2015). If a site fails the screening level risk assessment, e.g., cancer risks are greater than 1×10^{-6} and/or noncancer hazards are greater than 1, then further investigation and/or a more site-specific baseline risk assessment may be necessary to evaluate the potential risk to all receptors.

DTSC has developed modified screening levels (SLs) based on EPA Regional Screening Levels (RSLs) for use in the human health risk assessment process. In this screening level human health risk assessment, the hierarchy recommended by the DTSC was used. DTSC-SLs provided in Note 3 were used in preference to RSLs. RSLs were used for potential Chemicals of Concern (COCs) for which a DTSC-SL value in Note 3 were not available.

8.1 CONCEPTUAL SITE MODEL

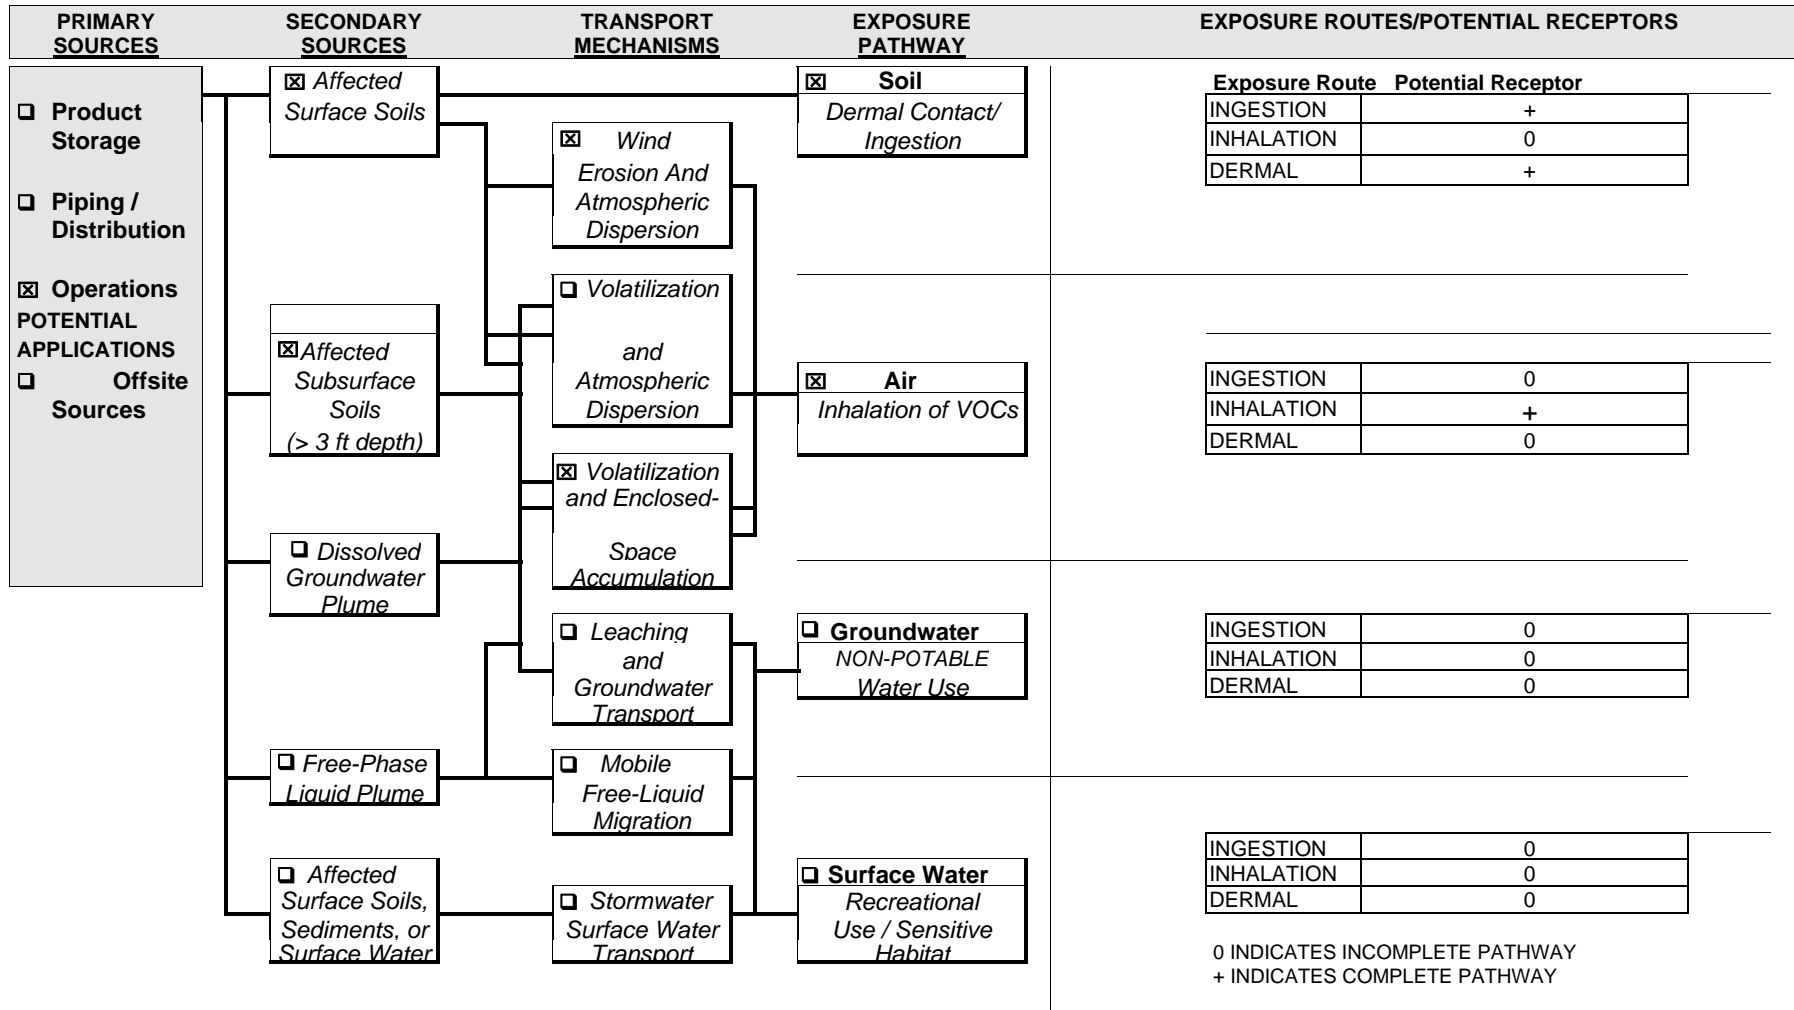

The potentially complete soil exposure pathways include soil ingestion, dermal exposure to soil, and inhalation of particulates and volatile organics. Potentially exposed populations for the site include on-site school age children and employees based on future land use plans. In addition, consistent with DTSC guidance, future unrestricted/residential land use was considered as the most health-protective and conservative land use for the assessment and hypothetical future onsite residents were also evaluated. In order to estimate what the potential exposures may be under current and future land use plans; risk calculations were conducted using the data that were collected for this investigation.

Figure 5 is the conceptual site model for the site. The primary sources of chemicals of concern for the site are from the historic land uses discussed in Section 3. The exposure assumptions for the residential land use exposure scenario assumes that exposure will occur 24 hours per day for seven days a week for 350 days per year for 26 years. This exposure scenario is very health protective for a school site where teachers, students and staff may occupy the site for a maximum of 250 days per year for eight to nine hours per day.

8. Human Health Screening Evaluation

**STEM Education Center
Riverside Unified School District
Riverside, California**

8. Human Health Screening Evaluation

This page intentionally left blank.

8. Human Health Screening Evaluation

8.2 CHEMICALS OF CONCERN SELECTION

The chemicals of concern (COCs) for the site that were evaluated in the PEA screening risk assessment have been identified based on-site history, sampling results, DTSC guidance and protocol. Three OCPs were detected in the composite soil samples (Table 2). Because multiple OCPs were detected in the soil at the site, a screening level risk analysis was implemented following Human Health Risk Assessment (HHRA) Note 3 (DTSC 2022a).

Metals were not included as COCs because all detected concentrations were not detected above background concentrations, above RSLs or were below DTSC's risk management levels for schools (Table 3). TPH, SVOCs, and PCBs were not detected in any of the soil samples analyzed from the site and were not included in the human health risk assessment.

8.3 SOIL EVALUATION FOR ORGANOCHLORINE PESTICIDES

The concentrations of the three pesticides detected in the soil samples do not exceed the EPA Region 9 RSLs or DTSC SLs. A summary table is provided below showing the highest reported pesticide concentration at the site and the corresponding cancer endpoint EPA Region 9 RSL or DTSC SL. The cancer risk was calculated by determining the quotients of the maximum concentration of each pesticide by their corresponding RSL and then multiplying the sum total of the quotients by 1 E-06.

Carcinogenic Risk Residential Exposure Using Maximum Concentrations in Soil

Chemical	Maximum Concentration mg/kg	Number of Samples in Composite	RSL mg/kg	RSL adjusted for number of samples in composite	Conc./RSL
Dieldrin	0.0057	4	0.034	0.0085	0.67
4,4'-DDE	0.027	4	2	0.5	0.054
4,4'-DDT	0.0024	4	1.9	0.475	0.005
Total Risk					7.3E-07

The estimated cancer risk for the site using the maximum detected concentrations of the OCPs screened using adjusted RSLs based on the number of samples that comprised the composite and assuming a residential land use exposure scenario is 7.3E-07, below the level of concern of 1.0E-06.

Hazard Index Residential Exposure Using Maximum Concentrations in Soil

Chemical	Maximum Concentration mg/kg	Number of Samples in Composite	RSL for Noncancer Risk mg/kg	RSL adjusted for composite	Conc./RSL
Dieldrin	0.0057	4	3.2	0.8	0.0071
4,4'-DDE	0.027	4	23	5.75	0.0047
4,4'-DDT	0.0024	4	37	9.25	0.00026
Total Hazard					0.012

8. Human Health Screening Evaluation

The cumulative hazard index (HI) for noncarcinogenic risk for exposure to organochlorine pesticides in soil was significantly less than 1 using the maximum concentration for a residential exposure scenario. A total HI of 1 or less indicates that there is no cause of concern for adverse noncarcinogenic health effects.

The concentrations of the pesticides at the site do not pose a significant health risk to future users of the site under the most conservative assumptions using a residential land use exposure scenario and maximum reported concentrations reported. The pesticides were reported infrequently, and the risk analysis conservatively assumes that the highest reported concentrations are located throughout the site.

8.4 UNCERTAINTY ANALYSIS

The data collected are subject to uncertainty associated with sampling and analysis. These data are presented in other parts of the PEA. In the analysis it was assumed that samples collected were representative of conditions to which various populations may be exposed. However, the collected samples may not be completely representative due to biases in sampling and to random variability of samples. In general, sampling was biased toward areas of known and suspected elevated chemical concentrations, which will lead to an overestimation of risk when these results are assumed to represent a larger area. The placement of soil borings was in part, purposely biased to detect and characterize potential hot spots of soil based on historical site use. This type of sampling approach is likely to overestimate the chemical concentrations to which a receptor would be exposed and the potential health impact to the receptors evaluated.

Samples were analyzed using California State Certified Laboratory procedures and were subjected to limited review, to obtain data suitable for decision-making. However, it should be understood that sample analysis is subject to uncertainties associated with precision, accuracy and detection of chemicals at low concentrations.

9. Ecological Screening Evaluation

9.1 SITE CHARACTERIZATION

Based on visual observations during the site visit and information provided by the District, the site is currently used as an open recreational field with two baseball diamonds, surface parking, and contains the Sprint Cell Tower and T-Mobile Cell Tower and had been used for agricultural purposes from at least 1931 to around 1953. From 1931 to 1985 a residential dwelling and associated structures occupied a portion of the northern area of the project site. The area is disturbed and does not support wildlife habitats.

9.2 BIOLOGICAL CHARACTERIZATION

The site is a disturbed area that has been developed and does not support wildlife habitats.

9.3 ECOLOGICAL PATHWAY ASSESSMENT

No assessment of potential exposures to sensitive ecological receptors is necessary based on the low concentrations of pesticides detected and the lack of other COCs on the site.

9.4 ECOLOGICAL SCREENING EVALUATION SUMMARY

An ecological screening evaluation was not conducted for the site because of the lack of wildlife habitats and because of the low concentrations of pesticides and other chemicals of concern were not reported for the site.

9. Ecological Screening Evaluation

This page intentionally left blank.

10. Quality Assurance/Quality Control (QA/QC) Implementation

The QA/QC Program was implemented in accordance with the DTSC PEA Guidance Manual (DTSC 2015). The primary quality control features of the QA/QC program include the collection and analysis of field quality control samples and the data validation. The Quality Assurance Project Plan is included as Appendix F.

Quality control samples collected in the field included duplicate samples and equipment rinseate blanks as described in Section 7. The data for these quality control samples were reviewed as part of the data validation process, along with results from laboratory quality control analyses. Data validation was performed in compliance with DTSC's PEA Guidance Manual, using protocols consistent with the USEPA National Functional Guidelines (DTSC 2015). Each sample was analyzed for the specified suite of analyses presented in Section 7. Data from each of the analyses were evaluated with respect to the quality control criteria listed below. Data for the project as a whole were evaluated in terms of completeness.

- Holding times;
- Field blanks;
- Laboratory method and calibration blanks;
- Initial and continuing calibrations;
- System monitoring compounds (surrogates - organic analyses only);
- Laboratory control samples (LCS) and LCS duplicate samples (LCSD) - as applicable;
- Matrix spikes (MS)/Matrix spike duplicates (MSD);
- Field replicates/confirmatory samples; and
- Compound identification and quantitation.

Data quality for the project is very good, and the data collected are of acceptable quality for use in the screening evaluation.

Results from the field duplicate samples indicate appropriate sample collection and handling procedures were implemented, and that laboratory analytical precision was also acceptable.

10. Quality Assurance/Quality Control (QA/QC) Implementation

Data validation qualifier flags have been added to those data that did not meet acceptance criteria as defined in School Quality Assurance Project Plans. Results of the validation indicate that all samples collected and analyzed are useful in characterizing the site and assessing the human health and ecological risks for the site. No detectable concentrations were qualified as rejected (R) or were considered to be unusable based on the validation evaluation. Data qualified as estimated (J/UJ) exhibited some bias during analysis and should be considered as an approximate measure of the respective analyte concentration. Qualified data are presented along with the data results in the analytical summary tables provided in this report.

Field activities were observed to be conducted in a manner consistent with the QA/QC procedures presented in the DTSC PEA Guidance Manual (DTSC 2015). No findings were identified that significantly affect the quality of the samples collected or the resulting data evaluation.

10.1 DATA VALIDATION

Data validation was performed for all samples submitted as part of PlaceWorks' evaluation of soil. A&R Laboratories, Inc. was the lead laboratory for the PEA and performed the required soil analyses.

Validation was performed in accordance with the general guidance provided in the USEPA Functional Guidelines for Evaluating Inorganic Analyses (USEPA 1994) and in accordance with the professional judgment of the validation team. Validation was performed to assess analytical performance in terms of the DQOs accuracy, precision, sensitivity, and completeness. Comparability and representativeness DQOs for the samples collected are addressed by the correct implementation of the procedures defined in the sampling and analysis plan.

A summary of the validation program, in terms of the DQOs listed above, is provided in the following sections. Data qualifiers assigned to results, if required, were as follows:

- A. Result is estimated due to failure to meet one of the DQO criteria associated with the sample result or associated sample batch. Results reported at concentrations below standard laboratory reporting limits, but above method detection limits, were flagged "J" by the laboratory, or "B" in the case of metals. These data are validated as J/estimated because they are below the reliable quantitation limits determined by the laboratory.
- U. Result is qualified as not detected at the reported value. This qualifier is used when results from blank analyses indicate that detections in associated samples may be biased high due to potential contaminant conditions in the field or laboratory.
- UJ. Result is qualified as not detected at the reported value, and the value is determined to be estimated. This qualifier commonly results when quality control failures are associated with analytes that are not detected, or when detections are qualified "U" due to blank contamination combined with a "J" qualifier resulting from another QC problem.
- R. Result is rejected due to severe QC failure, or due to multiple lessor QC problems that are determined to be additive.

10. Quality Assurance/Quality Control (QA/QC) Implementation

10.2 ACCURACY

Accuracy was evaluated by assessing the results of holding times, field and laboratory blanks, initial and continuing calibrations, surrogate spike recoveries (organic analyses), LCS recoveries, MS analyses, and interference check samples (metals by inductively coupled plasma).

Frequency and control criteria for initial and continuing calibration verifications were met. The method blank data showed non-detectable levels for all constituents. MS and MSD were performed at the required frequencies. All recoveries were within acceptable limits. LCS analysis was performed at required frequencies and all recoveries were within acceptable limits. Surrogate recoveries for all samples were within acceptable control limits.

10.3 PRECISION

Precision was evaluated by assessing the results between MS and MSD analyses, LCS and LCSD analyses, between laboratory duplicate analyses. The precision DQO was generally satisfied for the samples collected during the project. Precision was evaluated as the relative percent difference (RPD) between control sample results. RPD criteria reported by the laboratory were used to assess precision. RPDs were within the appropriate control limits and precision is considered acceptable.

10.4 SENSITIVITY

Sensitivity was addressed by ensuring that the reporting limits provided by the laboratories met those as requested in the workplans and task orders provided to the laboratory. Data were qualified in cases where results were reported at concentrations below standard laboratory reporting limits, but above the method detection limits that may have been required to meet the sensitivity requirements for the project. Such results were flagged by the laboratory as either J or B qualified data. These data retain a J/estimated qualifier due to potential decreased reliability at low concentration levels.

10.5 COMPLETENESS

Completeness is an evaluation of the overall sampling program with respect to data generated that is usable versus data that may have been rejected. No data was rejected during the data validation process for this project. The completeness objectives (minimum 90 percent) for this project are therefore considered to be satisfied for all analyses.

10.6 DATA VALIDATION CHART

The following table is a summary of pertinent quality indicators that were verified during the data validation process.

10. Quality Assurance/Quality Control (QA/QC) Implementation

ACCEPTABILITY		
QUALITY INDICATOR	SOIL	SOIL
	EPA Method 6010	EPA Method 8081A
	Target Analyte: Arsenic	Target Analyte: 4,4'-DDT
Completeness of Laboratory Reports (e.g., laboratory, client, and sample identifications; ELAP certification number, project name, sample matrix, sample collection, preservation, preparation, extraction, analysis dates; analytical methods; analytes; reporting units and limits; dilution factors; report page numbering system; designated title and signatures)	Y See discussion above	Y See discussion above
Reporting Limit (RL)	Y 1 mg/kg for ARL	Y 0.0020 mg/kg for ARL
Chain of Custody	Y	Y
Sample Containers and Conditions	Y	Y
Holding Time (<28 days)	Y	Y
Sample Preservation	Y	Y
Equipment Rinsate Blanks	Y	Y
Field Duplicates	Y	Y
Field QC Samples – Others	NA	NA
Surrogate Recoveries	NA	NA
Method Blanks	Y	Y
LCS % Recovery	Y	Y
MS/MSD % Recovery	See discussion above	See discussion above
MS/MSD % RPD	See discussion above	See discussion above
Laboratory Duplicates	See discussion above	See discussion above
Laboratory QC Samples – Others	NA	NA
Compound Identification	Y	Y
Compound Quantitation	Y	Y
Dilution Factors	Y	Y
Data Qualifiers	Y	Y
Confirmation of Positive Samples	NA	NA
Observations of Significance	NA	NA
Case Narrative	Y	Y
Instrument Tuning	NA	NA
Initial Calibration	Lab	Lab
Calibration Verification	Lab	Lab
Interference Check Standard	NA	NA
Others	NA	NA

NOTES:

Y = acceptable or in compliance

NA = not applicable

Lab = responsible by the Laboratory

11. HASP Implementation

PlaceWorks prepared a site-specific HASP pursuant to Health and Safety Code 1910.120. The plan addressed the following:

- Identification and description of potentially hazardous substances that may be encountered during field operations;
- PPE and clothing for site activities; and
- Measures that need to be implemented in the event of an emergency.

PlaceWorks field personnel reviewed the HASP prior to commencing fieldwork. Prior to initiation of field activities each day, a site safety briefing was conducted to identify potential physical and chemical hazards and measures to be taken in event of an emergency. All on-site personnel were required to sign the site safety briefing form.

During field activities, all personnel within the exclusion zone wore appropriate level D PPE. A copy of the HASP is contained in Appendix D.

11. HASP Implementation

This page intentionally left blank.

12. Field Variances

Soil sampling was conducted on the project survey area in general accordance with the DTSC PEA Guidance Manual (DTSC 2015), and Interim Guidance for Sampling Agricultural Properties (Third Revision) (DTSC 2008). Sampling depths were adjusted based on the amount of fill encountered at each sampling location as shown on Table 1. Sampling depths were adjusted to target the approximate middle of the fill for samples targeting fill material, and depths for native soil were adjusted based on the depth of the fill/native soil horizon.

12. Field Variances

This page intentionally left blank.

13. Evaluations of Applicable or Relevant Laws and Regulations Pertaining to School Sites

State of California Department of Education Code Section 17213 and Public Resources Code 21151.8 prohibit the approval of a project involving the purchase of a school site or the construction of a new elementary or secondary school by a school district unless the district first determines whether the site is:

- The site of a current or former hazardous waste disposal site or solid waste disposal site and, if so, whether the wastes have been removed.
- A hazardous substance release site identified by the State Department of Health Services in a current list adopted pursuant to Section 25356 for removal or remedial action pursuant to Chapter 6.8 (commencing with Section 25300) of Division 20 of the Health and Safety Code.
- A site which contains one or more pipelines, situated underground or aboveground, which carries hazardous substance, acutely hazardous materials or hazardous wastes, unless the pipeline is a natural gas line which is used only to supply natural gas to that school or neighborhood.
- In addition, the school district must contact the local air pollution control district to identify any facilities located within ¼-mile of the proposed school site that might reasonably be anticipated to emit hazardous emissions or handle hazardous materials, substances or waste. If any facilities exist within the ¼-mile the district must be able to make a written finding that:
 - a) The health risks from the facilities do not and will not constitute an actual or potential endangerment of public health to persons who attend or are employed at the proposed school; or
 - b) If potential hazards exist and have been identified, corrective measures can be implemented that mitigate air emissions to levels that do not constitute an actual potential endangerment of public health to persons who would attend or be employed at the proposed school.

For this proposed school site, a records search of any hazardous waste/substance storage, treatment, or disposal activities at the site and within a ¼-mile of the site was conducted. No evidence of the site being used as a solid waste or hazardous waste disposal site was found. There were no indications that aboveground or underground pipelines are located on the school site.

13. Evaluations of Applicable or Relevant Laws and Regulations Pertaining to School Sites

This page intentionally left blank.

14. Conclusions and Recommendations

After reviewing and analyzing the analytical and human health screening evaluation results of this PEA, PlaceWorks concludes the following with respect to the site:

- Soil sampling activities were conducted at the site on October 22, 2019 for the PEA. After sampling was implemented in 2019, the project site boundaries changed to include a portion of the southern parking lot increasing the project area to approximately 6 acres plus an additional 0.77 acres of the Gage Canal. Additional soil samples were collected on May 1, 2020 in the parking lot area.
- Soil samples were collected from 25 locations from one to three depths for a total of 65 soil samples collected plus 6 duplicates. For the parking lot area, 11 additional soil samples were collected from 5 locations for a total of 76 soil samples. Samples were labeled with a 'S' if they were collected near two former structures, 'F' if fill only, and 'B' for agricultural location. The current site boundaries are approximately 6 acres, and only the six "F" locations are outside the current site boundaries.
- Sixteen composite soil samples plus two duplicate samples were analyzed for organochlorine pesticides (OCPs) by Environmental Protection Agency (EPA) Method 8081A to assess for potential residual OCPs from historic agricultural operations, imported fill and possible termiticides used on the structures.
- Ten discrete soil samples plus two duplicates were analyzed for CAM-17 metals by EPA Method 6010B/7471A from the fill material. Twelve soil samples plus one duplicate were collected and analyzed for lead and arsenic by EPA 6010B to assess for arsenic from pesticides and lead in soil associated with the former structures.
- Ten discrete soil samples plus two duplicates were collected and analyzed for total petroleum hydrocarbons (TPH) by EPA Method 8015B from the fill material.
- Seven soil samples plus two duplicates were collected and analyzed for PCBs by EPA Method 8082.
- Five discrete soil samples plus two duplicates were collected from the fill material and analyzed for semi volatile organics (SVOCs) by EPA Method 8270SIM.
- Six soil samples plus two duplicates were collected from the fill material and analyzed for asbestos by Polarized Light Microscopy (PLM).

The results of the field program are summarized below:

14. Conclusions and Recommendations

- Three OCPs were detected in the composite soil samples (4,4'- dichlorodiphenyldichloroethylene [DDE], 4,4'- dichlorodiphenyltrichloroethane [DDT], and dieldrin) collected and analyzed.
 - 4,4'-DDE was detected in concentrations ranging from a minimum of 0.0023 milligrams per kilogram (mg/kg) in the 3:1 composite sample B4, B5, B6 @ 1.5'/2.0' below ground surface (bgs), collected in the native soil, to a maximum concentration of 0.027 mg/kg in the 4:1 composite sample S1, S2, S3, S4 @ 4.5' bgs, which was collected in the native soil. The EPA Region 9 Regional Screening Levels (RSLs) for 4,4'-DDE adjusted for a 2:1 composite sample is 1 mg/kg and for a 4:1 composite sample the RSL is 0.50 mg/kg. The levels of 4,4'-DDE detected are below the RSLs.
 - 4,4'-DDT was detected in one 4:1 composite sample S1, S2, S3, S4 @ 4.5' bgs at a concentration of 0.0024 mg/kg. The RSL for 4,4'-DDT adjusted for a 4:1 composite sample is 0.48 mg/kg. The concentration of 4,4'-DDT detected at the site is below the RSL.
 - Dieldrin was only detected in the 4:1 composite sample S1, S2, S3, S4 @ 4.5' bgs at a concentration of 0.0057 mg/kg. The RSL for dieldrin adjusted for a 4:1 composite sample is 0.0085 mg/kg. The concentration of dieldrin detected is below the RSL.
- Arsenic was detected in two out of 22 soil samples plus four duplicates analyzed with the highest concentration of arsenic detected at 1.94 mg/kg found in soil sample B8 @ 0.5', collected from fill. The Department of Toxic Substance Control (DTSC) Screening Level (SL) for arsenic is 12 mg/kg. The levels of arsenic detected are below the DTSC SL for residential exposure⁷.
- Lead was detected in all 22 soil samples and three duplicate soil samples analyzed for lead. Lead concentrations ranged from a minimum of 1.76 mg/kg to a maximum concentration of 58.1 mg/kg. All lead concentrations are below the DTSC screening level of 80 mg/kg for residential exposure.
- All other metals were within typical background levels and were within screening levels and did not exceed EPA RSLs or DTSC SLs respectively.
- TPHs were not detected in any of the soil samples analyzed.
- SVOC were not detected in any of the soil samples analyzed.
- PCBs were not detected in any of the soil samples analyzed.
- Asbestos was not detected in the soil samples analyzed.

⁷ Department of Toxic Substance Control (DTSC) requires the residential land use scenario be used to evaluate school sites as it is the most conservative assessment.

14. Conclusions and Recommendations

- The human health risk screening showed that chemical concentrations would not be a risk to human health or the environment under an unrestricted residential land use scenario.
- Laboratory data obtained were validated to assure that Data Quality Objectives (DQOs) were met and the data were suitable for use in a human health and ecological screening evaluation.

RECOMMENDATIONS

The results of the PEA support the following conclusions and recommendations:

Based on the PEA objectives, the environmental quality goals of the District, and the results of the PEA investigation, PlaceWorks has determined that no further assessment is required for the site. Per California Education Code Section 17213.1, Section 3, PlaceWorks concludes that no further assessment of the site is necessary and is requesting an approval of the PEA.

14. Conclusions and Recommendations

Description:

View of drilling activities at S4 looking east.

Client Name: Riverside Unified School District
Site Location: STEM Education Center
Project No.: RIV-36.0

Photo No: 3
Date: 10/22/2019

Description:

View of central portion of the site looking east.

Photo No: 4
Date: 10/22/2019

Description:

View of work notice posted on the northwest corner of the site, looking east.

Client Name: Riverside Unified School District
Site Location: STEM Education Center
Project No.: RIV-36.0

Photo No: 5	Date: 10/18/2022
-----------------------	----------------------------

Description:

View of western portion of the site looking north. Two cell phone towers are located along the northern portion of the site adjacent to Blaine Street.

Photo No: 6	Date: 10/18/2022
-----------------------	----------------------------

Description:

View of the site looking southwest.

Client Name: Riverside Unified School District
Site Location: STEM Education Center
Project No.: RIV-36.0

Photo No: 7	Date: 10/18/2022
-----------------------	----------------------------

Description:

View of southern portion of the site looking west.

Photo No: 8	Date: 10/18/2022
-----------------------	----------------------------

Description:

View of the entrance to Lot 26 from Canyon Crest Drive looking northeast.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by PlaceWorks were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDR's Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property. Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information

EXECUTIVE SUMMARY

that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/25/2022 has revealed that there are 4 ENVIROSTOR sites within approximately 1 mile of the target property.

Lists of state and tribal registered storage tanks

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 2 UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/20/2022 has revealed that there are 8 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

DRYCLEANERS: A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaners' agents; linen supply; coin-operated laundries and cleaning; drycleaning plants except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

A review of the DRYCLEANERS list, as provided by EDR, has revealed that there is 1 DRYCLEANERS site within approximately 0.25 miles of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>
UNIV 4 HR CLEANERS Database: DRYCLEAN SOUTH COAST, Date of Government Version: 05/20/2022	765 BLAINE ST	ENE 1/8 - 1/4 (0.230 mi.)	46	374

HIST CORTESE: The sites for the list are designated by the State Water Resource Control Board [LUST], the Integrated Waste Board [SWF/LS], and the Department of Toxic Substances Control [CALSITES]. This listing is no longer updated by the state agency.

A review of the HIST CORTESE list, as provided by EDR, and dated 04/01/2001 has revealed that there are 5 HIST CORTESE sites within approximately 0.5 miles of the target property.

Waste Description: O-CRESOL

Waste Code: D024
Waste Description: M-CRESOL

Waste Code: D025
Waste Description: P-CRESOL

Waste Code: D027
Waste Description: 1,4-DICHLOROBENZENE

Waste Code: D028
Waste Description: 1,2-DICHLOROETHANE

Waste Code: D031
Waste Description: HEPTACHLOR (AND ITS EPOXIDE)

Waste Code: D038
Waste Description: PYRIDINE

Waste Code: F002
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F004
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: CRESOLS, CRESYLIC ACID, AND NITROBENZENE; AND THE STILL BOTTOMS FROM THE RECOVERY OF THESE SOLVENTS; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS

CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code:	F027
Waste Description:	DISCARDED UNUSED FORMULATIONS CONTAINING TRI-, TETRA-, OR PENTACHLOROPHENOL OR DISCARDED UNUSED FORMULATIONS CONTAINING COMPOUNDS DERIVED FROM THESE CHLOROPHENOLS. (THIS LISTING DOES NOT INCLUDE FORMULATIONS CONTAINING HEXACHLOROPHENE SYNTHESIZED FROM PREPURIFIED 2,4,5-TRICHLOROPHENOL AS THE SOLE COMPONENT.)
Waste Code:	LABP
Waste Description:	LAB PACK
Waste Code:	P001
Waste Description:	2H-1-BENZOPYRAN-2-ONE, 4-HYDROXY-3-(3-OXO-1-PHENYLBUTYL)-, & SALTS, WHEN PRESENT AT CONCENTRATIONS GREATER THAN 0.3% (OR) WARFARIN, & SALTS, WHEN PRESENT AT CONCENTRATIONS GREATER THAN 0.3%
Waste Code:	P003
Waste Description:	2-PROPENAL (OR) ACROLEIN
Waste Code:	P004
Waste Description:	1,4,5,8-DIMETHANONAPHTHALENE, 1,2,3,4,10,10-HEXA-CHLORO-1,4,4A,5,8,8A,-HEXAHYDRO-, (1ALPHA, 4ALPHA, 4ABETA, 5ALPHA, 8ALPHA, 8ABETA)- (OR) ALDRIN
Waste Code:	P005
Waste Description:	2-PROPEN-1-OL (OR) ALLYL ALCOHOL
Waste Code:	P010
Waste Description:	ARSENIC ACID H3ASO4
Waste Code:	P012
Waste Description:	ARSENIC OXIDE AS2O3 (OR) ARSENIC TRIOXIDE
Waste Code:	P014
Waste Description:	BENZENETHIOL (OR) THIOPHENOL
Waste Code:	P018
Waste Description:	BRUCINE (OR) STRYCHNIDIN-10-ONE, 2,3-DIMETHOXY-
Waste Code:	P020
Waste Description:	DINOSEB (OR) PHENOL, 2-(1-METHYLPROPYL)-4,6-DINITRO-
Waste Code:	P022
Waste Description:	CARBON DISULFIDE
Waste Code:	P023
Waste Description:	ACETALDEHYDE, CHLORO- (OR) CHLOROACETALDEHYDE
Waste Code:	P024
Waste Description:	BENZENAMINE, 4-CHLORO- (OR) P-CHLORANILINE
Waste Code:	P030

SPENT SOLVENT MIXTURES.

Waste Code:	F005
Waste Description:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste Code:	F027
Waste Description:	DISCARDED UNUSED FORMULATIONS CONTAINING TRI-, TETRA-, OR PENTACHLOROPHENOL OR DISCARDED UNUSED FORMULATIONS CONTAINING COMPOUNDS DERIVED FROM THESE CHLOROPHENOLS. (THIS LISTING DOES NOT INCLUDE FORMULATIONS CONTAINING HEXACHLOROPHENE SYNTHESIZED FROM PREPURIFIED 2,4,5-TRICHLOROPHENOL AS THE SOLE COMPONENT.)
Waste Code:	LABP
Waste Description:	LAB PACK
Waste Code:	P001
Waste Description:	2H-1-BENZOPYRAN-2-ONE, 4-HYDROXY-3-(3-OXO-1-PHENYLBUTYL)-, & SALTS, WHEN PRESENT AT CONCENTRATIONS GREATER THAN 0.3% (OR) WARFARIN, & SALTS, WHEN PRESENT AT CONCENTRATIONS GREATER THAN 0.3%
Waste Code:	P003
Waste Description:	2-PROPENAL (OR) ACROLEIN
Waste Code:	P004
Waste Description:	1,4,5,8-DIMETHANONAPHTHALENE, 1,2,3,4,10,10-HEXA-CHLORO-1,4,4A,5,8,8A,-HEXAHYDRO-, (1ALPHA, 4ALPHA, 4ABETA, 5ALPHA, 8ALPHA, 8ABETA)- (OR) ALDRIN
Waste Code:	P005
Waste Description:	2-PROPEN-1-OL (OR) ALLYL ALCOHOL
Waste Code:	P010
Waste Description:	ARSENIC ACID H3ASO4
Waste Code:	P012
Waste Description:	ARSENIC OXIDE AS2O3 (OR) ARSENIC TRIOXIDE
Waste Code:	P014
Waste Description:	BENZENETHIOL (OR) THIOPHENOL
Waste Code:	P018
Waste Description:	BRUCINE (OR) STRYCHNIDIN-10-ONE, 2,3-DIMETHOXY-
Waste Code:	P020
Waste Description:	DINOSEB (OR) PHENOL, 2-(1-METHYLPROPYL)-4,6-DINITRO-
Waste Code:	P022
Waste Description:	CARBON DISULFIDE

Environmental Interest/Information System:

AIR EMISSIONS CLASSIFICATION UNKNOWN
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Eval Type: Other, not routine, done by local agency
Eval Notes: Inspector C. Adams. Met with Heidi Barrios from Environmental Health for a CalOES complaint in regards to 55 gallon drums of oil or oil like substance. It was an anonymous complaint and Heidi took the lead with paperwork and questions due to it being waste in nature. We walked the different areas she had determined with Gary who is the Hazardous Materials Safety Officer. Nothing was found and we completed a search of all the labs and all the greenhouses. Heidi closed the case and completed paperwork.

Quarterly Update:	This was an ISD facility that closed without getting an operating permit. The units consisted of container storage unit and waste pile (per part A application). The container storage unit clean closed on 2/4/92. Waste pile which seemed to be part of the Pesticides waste pits may have been referred to site mitigation see site Mit Envirostor database for more info. Corrective action events in the database could not be confirmed. Update 11/5/07: Spoke with Greg Holmes, PM of Site Mit, he does not believe Pesticides waste pits were ever RCRA units. Therefore, the waste piles may not be part of this pesticide pit cleanup. The pesticide pits were closed under site Mit and are under long term monitoring. 06/20/2018- Used 11/3/1989 Site Investigation Agreement to refer wastepile unit, which was a part of the pesticide waste pit, to cleanup for closure. Because of the annual groundwater report & Land Use Covenant, the facility can be considered closed. PM, Greg Shaffer, confirmed this information. Used

Case Worker: YR
RB Case Number: 083303453T
Local Agency: RIVERSIDE COUNTY LOP
File Location: Local Agency Warehouse
Local Case Number: 9914834
Potential Media Affect: Aquifer used for drinking water supply
Potential Contaminants of Concern: Gasoline
Site History: The station currently maintains five double-walled, fiberglass gasoline underground storage tanks (USTs). There are two 8,000-gallon capacity tanks, one 12,000-gallon capacity tank, one 10,000-gallon capacity tank, and one 6,000-gallon capacity tank. Several phases of investigations and remediation have been conducted at the Site since October 1998. In October 1998, compliance soil sampling (D1 through D8) was performed at the Site during piping upgrades (Kleinfelder, 1998). Hydrocarbon-affected soil was encountered adjacent to the western (D7 and D8) and east-central (D3) dispenser islands. In November 1999 to January 2000, five soil borings (B-1 through B-5) were drilled at the Site to total depths ranging between 65 feet below ground surface (bgs) and 85 feet bgs (Kleinfelder, 2000). Benzene was detected at concentrations above the laboratory reporting limit in soil samples collected from borings B-1, B-3 and B-4. Methyl tertiarybutyl ether (MtBE) was detected at concentrations above the laboratory reporting limit in soil samples collected from borings B-1, B-3, B-4, and B-5, located in the area surrounding the western-most dispenser island and near the east-central dispenser island. Fuel oxygenates, including diisopropyl ether (DIPE), ethyl tertiary-butyl ether (EtBE), tertiary-amyl methyl ether (tAME), and tertiary-butyl alcohol (tBA) were not detected above laboratory reporting limits in soil samples collected from the borings. In June 2001, one groundwater monitoring well (MW-4), three SVE wells (SVE-1 [B-7], SVE-2 [B-6], and SVE-3 [B-8]), and three soil borings (B-9, B-10, and B-11), were completed at the Site (Kleinfelder, 2001). Soil borings and SVE wells were drilled to total depths ranging from 95 feet bgs to 195 feet bgs. Total petroleum hydrocarbons as gasoline (TPH-g) was reported at a maximum concentration of 17 milligrams per kilogram (mg/kg) in a sample from MW-4 at 20 feet bgs. Benzene was reported in one soil sample, collected from MW-4 at 70 feet bgs, at a concentration of 26 micrograms per kilogram (µg/kg). MtBE was reported above the laboratory reporting limit in soil samples collected from borings SVE-1, SVE-3, B-9, and MW-4, with a maximum concentration of 820 µg/kg (MW-4 at 70 feet bgs). Fuel oxygenates DIPE, EtBE, tAME, and tBA were not detected above laboratory reporting limits in the soil samples analyzed. From May to July 2002, Kleinfelder supervised the completion of one SVE well (SVE-4), two groundwater monitoring wells (MW-1 and MW-2), and one soil boring (B-13) (Kleinfelder, 2002b). The soil boring and wells were drilled to total depths ranging from 150 feet bgs to 197 feet bgs. The maximum TPH-g concentration was 12,000 mg/kg in the sample collected from boring SVE-4 at 10 feet bgs. Benzene was detected in only one soil sample, SVE-4 at 15 feet bgs, at a concentration of 540 µg/kg. MtBE was reported in soil samples collected from borings SVE-4, MW-1, MW-2, and B-13, with a maximum concentration of 330 mg/kg (SVE-4 at 50 feet bgs). In April 2002, Kleinfelder performed a soil remediation feasibility evaluation for the Site (Kleinfelder, 2002a). For this

MAP FINDINGS

MOBIL #18-402 (Continued)

S100275475

evaluation, the primary constituents of concern at the Site were identified as benzene and MtBE. Hydrocarbon-affected soil was located in two areas: the vicinity of the western dispenser island (Area One); and the vicinity of the east-central dispenser island (Area Two). It was estimated that Area One had approximately 4,187 cubic yards (yd³) of soil containing hydrocarbons. Based on the average TPH-g concentrations, it was estimated that soil within Area One contained approximately 19,000 pounds (lbs) of hydrocarbons, of which MtBE represented an estimated 19 lbs, and benzene represented an estimated 4 lbs. It was estimated that Area Two had approximately 1,832 yd³ of hydrocarbon-affected soil. Based on the average TPH-g concentrations, it was estimated that soil within Area Two contained approximately 430 lbs of hydrocarbons, of which MtBE represented an estimated 0.2 lbs. The mass of benzene in the soil could not be calculated since benzene concentrations in soil samples collected in Area Two have historically been below laboratory reporting limits. In July 2002, Kleinfelder began groundwater monitoring and sampling from three on-Site groundwater monitoring wells (MW-1, MW-2, and MW-4). Following a decline in hydrocarbon groundwater concentrations during Fourth Quarter 2003, Kleinfelder proposed that groundwater monitoring frequency be reduced from quarterly to semiannually (Kleinfelder, 2004). In a letter dated February 26, 2004, RCDEH approved the semi-annual groundwater monitoring schedule (RCDEH, 2004). Concentrations of dissolved-phase TPH-g and benzene have been below laboratory reporting limits since January 2002. Dissolved-phase MtBE was last reported in October 2007 at a concentration of 0.69 J (J = estimated value) micrograms per liter ("g/L) in a sample collected from MW-2 (Kleinfelder, 2010). On August 2002, Kleinfelder performed SVE feasibility testing at the Site (Kleinfelder, 2002c). Based on the results of SVE step testing, performed as part of the feasibility testing, high vapor flow appeared to be attainable at the Site with relatively low vacuum and an SVE radius of influence (ROI) for the Site was approximately 65 feet. Based on results of the feasibility testing, Kleinfelder proposed that SVE be performed on well SVE-4. It was proposed that a SVE system operate until vapor concentrations display asymptotic conditions (diminishing returns), after which the SVE system effectiveness would be evaluated by pulse testing the system for vapor rebound concentrations. Additional details of the soil remediation feasibility study and the feasibility testing are described in Kleinfelders Corrective Action Plan, dated September 30, 2002 (Kleinfelder, 2002c), and Addendum to Corrective Action Plan, dated January 15, 2003 (Kleinfelder, 2003). A SVE system was installed at the Site and began operation on October 14, 2003. The SVE system was a VR Systems Internal Combustion Engine (ICE) that extracted soil vapors from vapor extraction well SVE-4. By June 1, 2005, the system had extracted and treated approximately 10,086 lbs of hydrocarbons, and influent vapor concentrations displayed asymptotic reductions in hydrocarbon concentrations (diminishing returns). To confirm asymptotic levels had been achieved, Kleinfelder requested that pulsing of the system, for one month on and one month off cycles, be initiated and continued for a four month period, as part of a vapor rebound test (Kleinfelder, 2005a). The RCDEH approved the request to begin pulsing of the SVE system (RCDEH, 2005). A summary of system operation data and a request to cease remediation at the Site was presented in Kleinfelders Soil Vapor Extraction Rebound Test Report and Site Closure Request (Kleinfelder, 2005b). The RCDEH approved the request to cease SVE operations in February

MOBIL #18-402 (Continued)

S100275475

2006 (RCDEH, 2006). In March and April 2006, Kleinfelder supervised the advancement of four confirmation soil borings (CB-1 through CB-4) at the Site as part of a post remediation assessment for support of case closure (Kleinfelder, 2006). Borings CB-1 through CB-3 were drilled and sampled to 140 feet bgs, and boring CB-4 was advanced to 126.5 feet bgs. Boring CB-4 could not be advanced deeper than 126.5 feet bgs due to refusal at that depth. Concentrations of TPH-g were reported in three soil borings and ranged from 0.095 J mg/kg (CB-3 at 10 feet bgs) to 1,200 mg/kg (CB-4 at 25 feet bgs). Benzene was reported in one soil sample (CB-1 at 90 feet bgs) at a concentration of 0.55 J "g/kg. Toluene was reported at concentrations ranging from 0.61 J "g/kg to 81 "g/kg. In March and April 2006, Kleinfelder supervised the advancement of four confirmation soil borings (CB-1 through CB-4) at the Site as part of a post remediation assessment for support of case closure (Kleinfelder, 2006). Borings CB-1 through CB-3 were drilled and sampled to 140 feet bgs, and boring CB-4 was advanced to 126.5 feet bgs. Boring CB-4 could not be advanced deeper than 126.5 feet bgs due to refusal at that depth. Concentrations of TPH-g were reported in three soil borings and ranged from 0.095 J mg/kg (CB-3 at 10 feet bgs) to 1,200 mg/kg (CB-4 at 25 feet bgs). Benzene was reported in one soil sample (CB-1 at 90 feet bgs) at a concentration of 0.55 J "g/kg. Toluene was reported at concentrations ranging from 0.61 J "g/kg to 81 "g/kg. In March and April 2006, Kleinfelder supervised the advancement of four confirmation soil borings (CB-1 through CB-4) at the Site as part of a post remediation assessment for support of case closure (Kleinfelder, 2006). Borings CB-1 through CB-3 were drilled and sampled to 140 feet bgs, and boring CB-4 was advanced to 126.5 feet bgs. Boring CB-4 could not be advanced deeper than 126.5 feet bgs due to refusal at that depth. Concentrations of TPH-g were reported in three soil borings and ranged from 0.095 J mg/kg (CB-3 at 10 feet bgs) to 1,200 mg/kg (CB-4 at 25 feet bgs). Benzene was reported in one soil sample (CB-1 at 90 feet bgs) at a concentration of 0.55 J "g/kg. Toluene was reported at concentrations ranging from 0.61 J "g/kg to 81 "g/kg. Ethylbenzene was reported at concentrations ranging from 0.78 J "g/kg to 3,000 "g/kg, and total xylenes were reported at concentrations ranging from 0.56 J "g/kg to 103,000 B "g/kg (B = analyte was detected in an associated method blank). The reported concentrations of toluene, ethylbenzene, and total xylenes were predominantly located in samples collected from CB-4, drilled in the vicinity of the eastern dispenser island. Concentrations of MtBE were reported to range from 1.0 J "g/kg to 33 "g/kg, with the maximum concentration of MtBE reported in the sample collected from CB-3 at 75 feet bgs. On February 8, 2007, Kleinfelder met with the RCDEH to discuss case closure. The attendees present were Ms. Sharon Boltinghouse from RCDEH, and Mssrs. Brad McCardell, Jeremy Whitcomb, and Hiram Garcia from Kleinfelder. The proposed scope of work as agreed to at the meeting included drilling three additional soil confirmation borings (CB-5, CB-6, and CB-7) to assess the effectiveness of SVE near previous borings CB-2, CB-3, and CB-4 in support of case closure with the RCDEH. Each proposed soil confirmation boring was to be advanced to approximately 40 feet bgs. The RCDEH prepared a letter dated March 1, 2007 confirming the scope of work (RCDEH, 2007). The details of this investigation are presented below. In March 2007, three soil confirmation borings (CB-5, CB-6, and CB-7) were advanced to 40 feet bgs to assess the effectiveness of SVE near previous borings CB-2, CB-3, and CB-4 in support of case closure with the RCDEH (Kleinfelder, 2007a). Soil

MOBIL #18-402 (Continued)

S100275475

encountered during drilling generally consisted of silty sand with intermittent lenses of well-graded sand to the total depth explored (40 feet bgs). Soil samples collected from boring CB-7, near the eastern dispenser island, were reported to contain detectable concentrations of petroleum hydrocarbons and oxygenates. TPH-g concentrations were reported in samples collected from boring CB-7, ranging from 2.3 mg/kg (30 feet bgs) to 740 mg/kg (25 feet bgs). Benzene and toluene concentrations were below laboratory reporting limits in soil samples collected from borings CB-5, CB-6, and CB-7. Ethylbenzene was reported at concentrations ranging from 280 µg/kg to 1,800 µg/kg, and total xylenes were reported at concentrations ranging from 19,000 µg/kg to 99,000 µg/kg. Concentrations of ethylbenzene and total xylenes were reported in samples collected from CB-7 at depths of 20 and 25 feet bgs in the vicinity of the eastern dispenser island. MtBE concentrations were below laboratory reporting limits in the soil samples collected from borings CB-5, CB-6, and CB-7. In August 2007, two SVE wells (SVE-5 and SVE-6) were installed at depths of 30 and 35 feet bgs, respectively (Kleinfelder, 2007b). TPH-g was detected in soil samples collected from boring SVE-6, at a maximum concentration of 1,200 mg/kg (25 feet bgs). TPH-g was not detected in soil samples collected from boring SVE-5. Benzene, toluene, MtBE, DIPE, EtBE, tAME, and tBA were not detected above laboratory reporting limits in soil samples collected from borings SVE-5 and SVE-6. Ethylbenzene and total xylenes were detected in soil samples collected from boring SVE-6 at maximum concentrations of 510 µg/kg (25 feet bgs) and 30,000 µg/kg (25 feet bgs), respectively. Ethylbenzene and total xylenes were not detected above laboratory reporting limits in soil samples collected from boring SVE-5. Between February 29, 2008 and May 22, 2009, SVE operations were initiated on SVE-5 and SVE-6 for the purpose of primarily recovering trimethylbenzene concentrations (detected in soil confirmation boring CB-7). An estimated 270 pounds of VOCs as hexane, an estimated 1,292 pounds of VOC based on FID readings, an estimated 15.1 pounds of 1,2,4-TMB, and an estimated 9.8 pounds of 1,3,5-TMB were extracted from the subsurface. Due to low mass recovery rates (less than one pound per day) and the SCAQMD permit moratorium, the system was shut down on May 22, 2009. During the three SVE events, the system operated for a total of 21,600 hours and an estimated 10,407 pounds VOCF, 10,538 pounds of VOCs as hexane, 3.2 pounds benzene, 404 pounds toluene, 113 pounds ethylbenzene, 744 pounds xylenes, 29.2 pounds 1,2,4-TMB, and 17.9 pounds 1,3,4-TMB were removed from the subsurface. Vapor concentrations were reduced from 10,500 to 66 ppmV for VOCs as hexane, from 990 to 0.09 ppmV for toluene, from 570 to 1.2 ppmV for xylenes, from 120 to 0.012 ppmV for ethylbenzene, from 20 ppmV to non-detect for MTBE, and from 31 to 2.7 ppmV for 1,2,4-TMB. Other VOCs were less than 20 ppm at the beginning of operations and decreased to below 2 ppm prior to shutdown. On May 20, 2010, two confirmation borings (CB-8 and CB-9) were advanced in the vicinity of well SVE-6 to assess the effectiveness of remedial activities at the Site. Based upon laboratory analytical results of soil samples collected from boring SVE-6 in 2007 and CB-8 and CB-9 in 2010, constituent concentrations in soil near SVE-6 appear to have been reduced by SVE operations. Maximum TPH-g concentrations in soil have been reduced from 1,200 mg/kg (SVE-6 at 25 feet bgs) to 47 mg/kg (CB-9 at 30 feet bgs). BTEX constituents and MtBE were not detected above laboratory reporting limits in soil samples collected from borings CB-8 and CB-9. Groundwater monitoring and sampling commenced

in July 2002, utilizing three on-site groundwater monitoring wells (MW-1, MW-2, and MW-4). Following a decline in groundwater hydrocarbon concentrations the RCDEH approved a reduced, semi-annual, groundwater monitoring schedule. Concentrations of dissolved-phase TPH-g and benzene have been below laboratory reporting limits since January 2002. Dissolved-phase MTBE was last reported in December 2007 in a sample collected from MW-2 at an estimated concentration of 0.69 J a%g/L. During First Quarter 2010, TPH-g, benzene, toluene, ethylbenzene, and fuel oxygenates are no longer present in samples above laboratory reporting limits. A low concentration of xylenes (1.3 a%g/L) was reported in the February 3, 2010 groundwater sample collected from monitoring well MW-4. RWQCB and RCDEH concur with closure. 01/13/2011 NFA/closure letter issued by RCDEH.

Violation Date: 01-05-2022
Citation: 23 CCR 16 2712(b)(1)(G) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2712(b)(1)(G)
Violation Description: Failure to comply with one or more of the following overfill prevention equipment requirements: Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. Install/retrofit overfill prevention equipment that does not use flow restrictors on vent piping to meet overfill prevention equipment requirements when the overfill prevention equipment is installed, repaired, or replaced on and after October 1, 2018. For USTs installed before October 1, 2018, perform an inspection by October 13, 2018 and every 36 months thereafter. For USTs installed on and after October 1, 2018, perform an inspection at installation and every 36 months thereafter. Inspected within 30 days after a repair to the overfill prevention equipment. Inspected using an applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Inspected by a certified UST service technician. Maintain records of overfill prevention equipment inspection for 36 months.

Environmental Interest/Information System:

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

requirements: Be performed by an ICC certified DO. Inspect monthly alarm history report, check that alarms are documented and responded to appropriately, and attach a copy. Inspect for the presence of liquid/debris in spill containers. Inspect for the presence of liquid/debris in under dispenser containment (UDC) and ensure that the monitoring equipment is positioned correctly. Inspect for liquid or debris in containment sumps where an alarm occurred with no service visit. Check that all testing and maintenance has been completed and documented. Verify that all facility employees have been trained in accordance with 23 CCR 2715(c). For designated operator (DO) 30 day inspections conducted on and after October 1, 2018, failure to conduct the designated UST operator visual inspection at least once every 30 days.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 07/26/2022	Source: EPA
Date Data Arrived at EDR: 08/02/2022	Telephone: N/A

	Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 06/20/2022	Source: Environmental Protection Agency

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 06/20/2022	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/21/2022	Telephone: (415) 495-8895

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/20/2022	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/21/2022	Telephone: (415) 495-8895

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

CERS HAZ WASTE: CERS HAZ WASTE

List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, and RCRA LQ HW Generator programs.

Date of Government Version: 04/18/2022	Source: CalEPA
Date Data Arrived at EDR: 04/19/2022	Telephone: 916-323-2514
Date Made Active in Reports: 07/12/2022	Last EDR Contact: 07/18/2022
Number of Days to Update: 84	Next Scheduled EDR Contact: 10/31/2022
	Data Release Frequency: Quarterly

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 04/30/2022	Source: Drug Enforcement Administration
Date Data Arrived at EDR: 05/24/2022	Telephone: 202-307-1000

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006	Source: Environmental Protection Agency

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

USGS TOPOGRAPHIC MAP

Target Property Map:	12014858 RIVERSIDE EAST, CA
Version Date:	2018

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General West

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Flood Plain Panel at Target Property</u>	<u>FEMA Source Type</u>
06065C0727G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u>	<u>NWI Electronic Data Coverage</u>
NOT AVAILABLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: BUREN

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	11 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:
2	11 inches	27 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:
3	27 inches	37 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:
4	37 inches	57 inches	cemented	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 2

Soil Component Name: HANFORD

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	7 inches	coarse sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 5.6
2	7 inches	40 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 5.6
3	40 inches	59 inches	stratified loamy sand to coarse sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 5.6

Soil Map ID: 3

Soil Component Name: ARLINGTON

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

1. Applicable Standards and Goals

1.1 GENERAL

This Health and Safety Plan (HASP) was prepared by PlaceWorks for Riverside Unified School District (the District). This HASP provides an overview of current conditions at the site and describes the safety procedures to be employed and the rationale for their selection. The HASP has been prepared to ensure proper precautions are taken to protect human health and safety while work is being performed at the site. During the development of this HASP, consideration was given to current safety standards as defined by the U.S. Environmental Protection Agency (EPA), the Occupational Health and Safety Administration (OSHA), and the National Institute of Occupational Safety and Health (NIOSH). This HASP was prepared in accordance with guidelines set forth in Title 8 of the California Code of Regulations, Section 5192 (8 CCR 5192). In addition, this HASP also describes the health effects and standards for known contaminants and the procedures designed to account for the potential for exposure to unknown substances.

1.2 SCOPE AND APPLICABILITY OF THE HEALTH AND SAFETY PLAN

The purpose of this HASP is to define the requirements and designate protocols to be followed by the onsite personnel during the field activities. Site conditions, identified sources, and previous work elements implemented at the site are described in the Workplan. This HASP is applicable to all employees, government employees, contractors, subcontractors, and visitors to the site. This HASP will be used to ensure that adequate site safety practices are used during sample collection activities.

All personnel working at the site must review the HASP and sign an agreement to comply with its requirements and to signify their familiarity with all aspects of the HASP before entering an exclusion zone or a contamination reduction zone. A copy of the HASP Certification is provided in Section 19. All personnel working at the site will be briefed daily by the Site Safety Officer (SSO) and will be required to become familiar with the following sections of this plan:

- Directions to Hospital - Section 17 and Page 3 (map);
- Safety Rules and Personal Hygiene - Appendix A;
- Field Standard Operating Procedures for Use and Decontamination of Personal Protective Equipment (PPE) - Appendix B;
- Heat Stress and Heat Stress Monitoring - Appendix C.

1. Introduction

Figure 1 **Hospital Route Map**

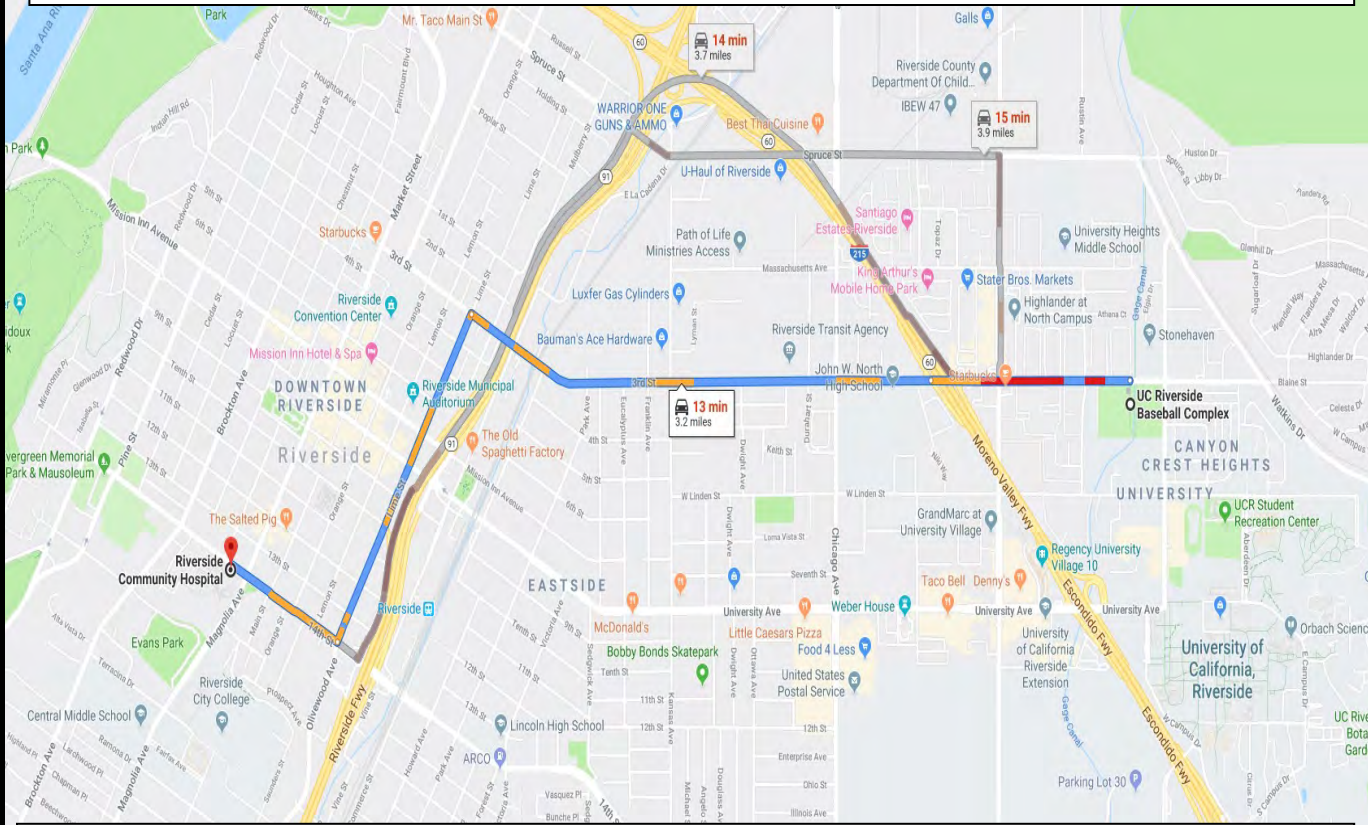

FIGURE 1 HOSPITAL ROUTE MAP

Starting from: 900 University Avenue, Riverside, Riverside County, CA

**Arriving at: Riverside Community Hospital Emergency Room
4445 Magnolia Avenue, Riverside, Riverside County, CA**

Distance: 3.2 miles

Approximate Travel Time: 13 minutes

Directions	Mile
1. Head west on Blaine Street toward Rustin Avenue	0.6
2. Continue onto 3 rd Street	1.4
3. Turn left onto Lime Street	0.8
4. Turn right onto 14 th Street	0.4
5. Destination will be on the left	

**Proposed Blaine STEM Academy
900 University Avenue
Riverside Unified School District
Health and Safety Plan - #RIV-26.0**

1. Applicable Standards and Goals

This page intentionally left blank.

2. Site Description

2.1 SITE IDENTIFICATION

The site has been identified by the District as the proposed Preserve Elementary School.

2.2 SITE LOCATION

The site is located at the UC Riverside Baseball Complex, Riverside, Riverside County, California.

2.3 CURRENT AND HISTORICAL LAND USES

2.3.1 Property Ownership

The University of California Riverside currently owns the project site.

2.3.2 Business/Manufacturing Activities

Based on a review of historical documents, no manufacturing activities have occurred on the site. The site is occupied by the UC Riverside Baseball Complex.

2.3.3 Site Climatological Setting

The site is classified as being in climate zone 10 by the California Energy Commission. It is an area that is semi-arid with hot, dry summers and mild winters. The Western Regional Climate Center collected data from Riverside from 1893 to 2016. The mean temperature in the area ranges from a low of 48.6° Fahrenheit (°F) in the winter to a high of 79.5°F in the summer. The average annual precipitation is 10.21 inches per year.

2. Site Description

This page intentionally left blank.

3. Roles and Responsibilities

A number of roles are required for the safe and efficient operation of a field team. These roles include Project Director, Project Manager, PlaceWorks Health and Safety Manager, Site Manager, SSO and field personnel. A team member may take on more than one role, but the roles must be clearly assigned and must cover all positions required. The personnel assigned to the various roles and their phone numbers are listed below:

<u>Assignment</u>	<u>Name</u>	<u>Phone Number</u>
Project Director	Dr. Denise Clendening	(909) 989-4449
Project Manager	Dr. Denise Clendening	(909) 989-4449
Health & Safety Manager	Mike Watson	(909) 989-4449
Site Manager	Mike Watson	(909) 989-4449
Site Safety Officer	Mike Watson	(909) 989-4449
Field Personnel	Mike Watson	(909) 989-4449

The following guidelines outline assignment of responsibilities of the field team members.

3.1 PROJECT DIRECTOR

The Project Director is responsible for the overall operation of the project, including safety during field activities. Specific responsibilities include organization of all project work assignments, assigning personnel to specific duties, ensuring that the field team follows health and safety procedures approved by the PlaceWorks Health and Safety Manager, and overall quality assurance/quality control of the project.

3.2 PROJECT MANAGER

The Project Manager will be responsible for the day-to-day progress of the project and will hold review and planning meetings as necessary with all technical staff, during which the current progress, problems encountered, and future direction will be discussed.

3.3 PLACEWORKS HEALTH AND SAFETY MANAGER

The PlaceWorks Health and Safety Manager is responsible for the design and, with assistance from the Project Manager on personnel issues, implementation of the health and safety program for this project. This includes developing a site HASP, ensuring that all onsite workers have met the necessary health and safety training requirements and are knowledgeable about the work they will perform, assigning a qualified SSO to the field team, verifying compliance with all applicable safety and health requirements, and updating equipment and procedures based on new information gathered during the course of work.

3. Roles and Responsibilities

3.4 SITE MANAGER

The Site Manager is responsible for the operation of the field team. Responsibilities include organization of field activities, compliance with the provisions of the site Workplan, field documentation and record keeping, quality control of field activities, and communication with the site's correspondent. The Site Manager, along with the SSO, must also ensure that subcontractors and outside observers comply with the HASP.

3.5 SITE SAFETY OFFICER

The SSO works closely with the Site Manager to enforce the provisions of the HASP during field activities. The SSO is responsible for implementing the procedures stipulated in the HASP:

- Evaluating and amending the HASP daily to remedy deficiencies and post entry briefings;
- Determining the levels of personal protection based on observations or changing field conditions;
- Controlling site entry and exit;
- Briefing the field team on the health and safety decontamination procedures required for various field activities;
- Monitoring the field team for signs of stress or exposure;
- Initiating emergency procedures, if necessary;
- Verifying that field team members have met the health and safety requirements for field activities;
- Being available to document and respond to any concerns or complaints made by personnel onsite;
- Documenting unsafe work practices or conditions;
- Documenting any accidents or incidents that result in illness or injury to personnel; and
- Issuing stop work notices if site conditions become unsafe, with conference with the Project Director and/or the PlaceWorks Health and Safety Manager.

3.6 FIELD TECHNICIANS

The field technicians are responsible for complying with the HASP, notifying the SSO of hazardous or potentially hazardous conditions, and carrying out specialized tasks during field operations. These tasks include inspecting, calibrating, maintaining, and using field equipment; performing site characterization activities; maintaining decontamination stations; preparing and decontaminating sampling equipment; collecting and preserving samples; and packaging and shipping samples according to proper chain-of-custody procedures.

3. Environmental Analysis

3.7 FIELD TEAM SIZE

The size of the field team is determined by the nature of the field activities, the characteristics of the site, the safety hazards involved, and the prescribed levels of safety protection. The field team must be large enough to ensure onsite activities are conducted safely, but not so large as to sacrifice efficiency. PlaceWorks personnel shall be present during all phases of the field activities.

3. Roles and Responsibilities

This page intentionally left blank.

4. Training and Medical Monitoring Requirements

Staff and subcontractors participating in the fieldwork must have completed a 40-hour health and safety training course (8 CCR 5192(e), 29 CFR 1910.120(e)(2)) as appropriate for their particular tasks and have annual refresher training. Before personnel arrive onsite, each employer will be responsible for certifying that its employees meet the OSHA training requirements.

Each employee will be familiar with the requirements of the site safety and health plan, and will participate in site activity and safety briefings. Medical surveillance is conducted as a routine program, which meets the requirements of 8 CCR 5192 (f); the medical surveillance program is detailed in Appendix D. There will not be any special medical tests or examinations required for staff involved in this project.

All personnel will be trained to operate their respective equipment, including respiratory protection if site conditions exist where respirators are needed. Under no circumstance will untrained or unqualified personnel operate equipment.

4. Training and Medical Monitoring Requirements

This page intentionally left blank.

5. Description of Field Work

The following subsections describe tasks to be performed during the field activities and the hazards associated with each task. Some of the protective measures to be implemented during completion of those operations are also identified.

5.1 SOIL SAMPLING ACTIVITIES

5.1.1 Soil Sampling

Soil samples will be collected following protocols described in the Workplan and the following guidance: DTSC's *Interim Guidance for Sampling Agricultural Properties (Third Revision)* (DTSC 2008). Soil will be collected in glass jars.

5.1.2 Sampling Methods and Procedures

Soil sampling will be conducted using a hand auger. The hand auger will be advanced to the desired depths and the barrel will be retrieved. Observations pertaining to the soil type will be recorded by a field geologist. The soil will be decanted into a pre-cleaned glass jar. Each sample will be labeled with the sample number, sample depth, and the date and time sampled. Samples will be immediately placed in an ice-filled cooler and listed on a chain-of-custody form. Any observation pertaining to potential soil contamination or soil source will be recorded.

Hazards associated with this task include dermal contact with and accidental ingestion of contaminated soil and inhalation of dusts and vapors (i.e. VOCs), noise and lifting. Some of the protective measures to be implemented during soil sampling include the use of chemical-resistant gloves to reduce the hazards associated with soil sampling. Level D PPE will be used when sampling is initiated, but will be upgraded as necessary. The use of a PID for air monitoring will be used (as necessary) primarily for the detection of VOCs and not organochlorine pesticides or metals, which are not detectable with a PID.

Previous surveys indicate that heavy equipment such as drilling or excavation equipment may produce continuous and impact noise at or above the action level of 85 dBA. All site personnel within 25 feet of operating equipment, or near an operation that creates noise levels high enough to impair conversation, shall wear hearing protective devices (either muffs or plugs). All PlaceWorks personnel are in the PlaceWorks Hearing Conservation Program and have had baseline and, where appropriate, annual audiograms. Personnel will wash their hands with soap and water prior to inserting earplugs to avoid initiating ear infections.

The following guidelines will be followed whenever lifting equipment such as portable generators, coolers filled with samples, any other objects that are of odd size or shape, or that weigh over 40 pounds.

- Get help when lifting heavy loads. Portable generators will only be lifted using a two-person lift.

5. Description of Field Work

- When moving heavy objects such as drums or containers, use a dolly or other means of assistance.
- Plan the lift. If lifting a heavy object, plan the route and where to place the object. In addition, plan communication signals to be used (i.e., “1, 2, 3, lift,” etc.).
- Wear sturdy shoes in good condition that supply traction when performing lifts.
- Keep your back straight and head aligned during the lift and use your legs to lift the load – do not twist or bend from the waist. Keep the load in front of you – do not lift or carry objects from the side.
- Keeping the heavy part of the load close to your body will help maintain your balance.

6. Chemical Hazards

The presence of chemical hazards at the site has not been confirmed; however, the primary suspected potential constituents of concern associated with the site are metals and organochlorine pesticides. The list of chemicals of concern for the site will be reassessed, as more data becomes available. Brief toxicological profiles of the major constituents of concern are included in Appendix E. Chemical and physical characteristics of these compounds are presented in Table 1.

Potential exposures to these chemicals during field activities include the following:

- Dermal contact with and accidental ingestion of potentially contaminated rinsate and residue during decontamination and sampling; and
- Splash hazards during decontamination.

To protect workers from eye and skin contact, skin absorption, and accidental ingestion of airborne dust, PPE will be used as outlined in Section 8.0.

6.1 HAZARD ASSESSMENT

A literature review was conducted to find ionization potentials (IPs), exposure limits, and concentrations immediately dangerous to life and health (IDLH) for the constituents of concern in environmental media at the site. Exposure limit data are expressed as 8-hour time-weighted averages (TWAs). TWAs promulgated in OSHA regulations are referred to as permissible exposure limits (PELs). The American Conference of Governmental and Industrial Hygienists adopts values for exposure limits that are referred to as threshold limit values.

Exposure limits and the IDLH for the constituents of concern are depicted in Table 1. These data are also used to establish action levels to determine when personnel should upgrade from Level D PPE (i.e., no respiratory protection) to Level C PPE (i.e., full-face air-purifying respirator) and to select the appropriate types of outer garments, gloves, and respirator cartridges. Action levels triggering an upgrade in respiratory protection from Level D to Level C are established by examining exposure limit data and selecting compounds with the lowest PEL.

Site work will be initiated in Level D protection. If unusual odors or symptoms are noted in the field, and engineering controls cannot reduce potential hazards in the breathing zone, the level of protection will be upgraded to Level C. If an upgrade to Level B is required, field activities will stop and the site will be evacuated. If Level B is required, the project will be stopped and the current operating procedures will be assessed by the SSO, the Health and Safety Officer, and the Health and Safety Committee. If it is determined that Level B PPE is required, a subcontractor will be retained to conduct this supervised work.

6. Chemical Hazards

The potential for injuries inherent in operating heavy equipment presents additional hazards, especially because the operator may be wearing restrictive clothing. The use of heavy equipment creates the potential for contact with active utility lines. These utility lines will be located before intrusive activities are conducted and avoided.

7. Physical Hazards

Potential physical hazards associated with this project include, but are not limited to, working around heavy equipment, electrocution, slippery terrain, noise, weather conditions, and heat stress.

7.1 HEAVY EQUIPMENT

It is important that personnel be aware of all operations that are occurring at a work location as well as physical hazards, such as excavations, trenches, or open pits. Personnel will be aware of the position and movement of equipment by identified operational areas. Special precautions, with regard to layout of equipment traffic patterns associated with other vehicles and buildings, will be carefully considered before beginning field activities. Traffic barriers and/or caution barrier tape will be used to delineate the layout and assist in directing traffic flow to reduce risk of vehicle injury. Employees will be notified during daily meetings as to the established traffic patterns of heavy equipment. Whenever heavy equipment operations are conducted in a congested site area, a traffic coordinator designated by the SSO will direct movement of heavy equipment and pedestrians. For non-essential persons, pedestrian traffic will be prohibited where heavy excavation equipment is in operation. Operators will be tasked to watch for employees that might stray into the restricted entry area; site personnel will be required to wear orange safety vests in the vicinity of heavy equipment operation.

7.2 ELECTROCUTION

Electrical power lines above (overhead) and below ground will be identified at the site before to the start of any activities to prevent electrocution. Minimum safe distance will be established by the SSO in areas of overhead and underground power lines. Subcontracted utility locating services will be used as necessary to locate or confirm the presence of suspected underground utilities at drilling or boring locations.

7.3 SLIPPERY TERRAIN, SLIPS, TRIPS, AND FALLS

Slippery and uneven terrain is common and may increase the risk of injuries. Personnel shall wear the appropriate foot protection while onsite. The SSO will monitor site work surfaces for potential trip and fall hazards. Overhead hazards consist of potential contact with falling objects, rigging equipment, or other items in use at the site. Hard hats are required at all times when at the site.

7.4 NOISE

Noise levels around the equipment may exceed a comfortable range; therefore earplugs or equivalent hearing protection devices are required when equipment is operating.

7. Physical Hazards

7.5 HEAT STRESS

The potential for heat stress is high given the warm southern California climate and use of protective garments. Heat stress and heat stress monitoring are discussed in Appendix C.

8. Personal Protective Equipment (PPE)

It is anticipated that Level D PPE will be used, with Level C PPE available on stand-by. Level D PPE will consist of the following equipment:

- Long pants and long-sleeved or short-sleeved shirts;
- Steel-toed work boots;
- Nitrile gloves;
- Hard hats, required when heavy equipment is being used and an overhead hazard exists;
- Safety glasses; and
- Hearing protection during heavy equipment operation.

Damaged PPE will be replaced immediately. Backup equipment will be kept onsite for replacement as necessary.

At a minimum, the following PPE will be discarded and replaced daily:

- Nitrile gloves; and
- Disposable type ear plugs.

New gloves will be used to collect each sample. Procedures for using PPE are given in Appendix B.

The level of protection provided by PPE selection may be upgraded or downgraded by the SSO, in conference with the PlaceWorks Health and Safety Manager and/or the Project Director, based on changes in site conditions. When a significant change occurs, the hazards will be reassessed. Some indicators of the need for reassessment are as follows:

- A change in weather conditions;
- Encountering contaminants other than those previously identified;
- A change in ambient levels of contaminants; and
- A change in work scope that affects the degree of contact with contaminants.

Level C PPE will consist of the following equipment:

8. Personal Protective Equipment (PPE)

- Dual-canister full-face air-purifying respirator (NIOSH approved);
- Organic vapor/P100 combination cartridges;
- Tyvek or Saranex-coated coveralls;
- Steel-toed work boots;
- Double layer nitrile;
- Hard hats, required when heavy equipment is being used; and
- Safety glasses.

Particulate respirator cartridges should be changed out when the wearer has difficulty breathing through the cartridges. Chemical gas or vapor respirator cartridges will be changed out at least daily.

- Proper inspection of PPE includes several levels of inspection depending on specific articles of PPE and its frequency of use. The different levels of inspection are as follows:
- Inspection of equipment received from the factory or distributor;
- Inspection of equipment as it is issued to workers;
- Inspection after use or training;
- Periodic inspection of stored equipment; and
- Periodic inspection when a question arises concerning the appropriateness of the selected equipment or when problems with similar equipment arise.

The primary inspection of PPE in use for activities at the site will occur before use and will be conducted by the user. This ensures that the device or article has been inspected by the user and the user is familiar with its use. The SSO will periodically review field technicians' knowledge and execution of inspection guidelines for the various types of PPE in use at the site.

9. Illumination

Nighttime work activities are not anticipated; however, if nighttime work becomes necessary, illumination at the site will be supplemented in order to ensure safe working conditions. Supplemental lighting will be provided by mobile generator powered units.

9. Illumination

This page intentionally left blank.

10. Standard Operating Procedures

The standards regarding Safety Rules and Personal Hygiene and Use and Decontamination of PPE are detailed in Appendices A and B, respectively.

Standard operating procedures (SOPs) for equipment will be presented in the Addendum.

10.1 DAILY SAFETY MEETINGS

The SSO will conduct a daily safety meeting to discuss any changes in safety status, safety violations and administrative actions, work assignments, or modifications of procedures with all onsite field personnel. This safety meeting will be scheduled as the first activity of each day. An alternate person may be designated to conduct the briefing at the discretion of the SSO. All personnel present will sign the Daily Attendance sheet.

10.2 DAILY DEBRIEFING MEETINGS

At the end of each workday at the site, the SSO will discuss with the Site Manager or the Project Director, daily progress, technical problems, administrative resolution of disciplinary actions, and monitoring and analytical findings.

In the event that an emergency occurs or other accident that requires immediate attention, and additional safety meeting may be conducted. Non-routine meetings will address any site changes that have safety implications, which must be immediately addressed before work can continue.

10.3 ADMINISTRATIVE ACTION

Observed violations of safety procedures can result in immediate removal of the violator from the site. The Project Director will take administrative action on each violation. In the event of a violation, the nature of the violation, the past record of the violator, and any extenuating circumstances will be reviewed. The SSO and Health and Safety Officer will provide a recommendation to the Project Director regarding administrative actions such as retraining and reassignment, change in clearance status, or permanent dismissal from the site.

10. Standard Operating Procedures

This page intentionally left blank.

11. Confined Spaces

No confined space entry is anticipated at the site. A confined space protocol will be developed for Agency review and approval should conditions at the site change.

11. Confined Spaces

This page intentionally left blank.

12. Noise Monitoring

Noise may be monitored using a sound level meter (General Radio model 1565B) in areas where heavy equipment is being utilized. Hearing protection devices (HPDs) will be available onsite at all times. Use of HPDs will be required whenever the noise level equals or exceeds 85 dBA; in general, they will be used whenever equipment is operated. Field technicians will be informed on the proper use, maintenance and storage of HPDs. Engineering controls will be utilized as necessary to ensure that noise levels generated by work do not impact residences adjacent to the site.

12. Noise Monitoring

This page intentionally left blank.

13. Description of Site Work Zones

The various work zones may be established at the site before commencing any field activities.

Exclusion Zone

All workers who enter the contaminated work area will wear the correct level of protection. The number of workers in this zone will be kept at a minimum.

Contamination Reduction Zone (CRZ)

Decontamination areas for field personnel and heavy equipment will be designated in the CRZ adjacent to the exclusion zone.

Support Zones

The administrative and break areas shall be located in the support zone outside the CRZ and the overall work zone. The support zone will be located upwind from the overall work zone as permitted by site meteorological conditions.

The work areas and site shall be cleared and secured at the end of each workday.

13. Description of Site Work Zones

This page intentionally left blank.

14. Decontamination

Decontamination of PPE will take place in the decontamination area identified onsite. Before starting field activities, a decontamination station will be set with one bucket or tub containing a clean water and soap mixture and another bucket or tub containing clean water. All workers and PPE will be decontaminated to prevent the spread of potentially hazardous substances. All workers will wash their hands, arms, and face after removing PPE and before leaving the site. The volume and concentration of the decontamination fluid will be sufficiently low to allow disposal at the site. The water (and water with detergent) will be poured onto the ground or into a storm drain. Disposable items will be placed in trash bags for disposal along with other wastes removed from the property. Support vehicles are to be left, to the extent practical, outside the exclusion area so that decontamination will not be necessary. Decontamination procedures are outlined in Appendix B.

14. Decontamination

This page intentionally left blank.

15. Emergency Supplies

15.1 FIRE EXTINGUISHERS

A fire extinguisher will be available onsite during field activities. Field technicians will be informed on the proper use of fire extinguishers.

15.2 SPILL CONTROL EQUIPMENT

Accidental spills will be contained with sandbags or commercially available absorbent materials especially designed for spill containment or cleanup.

15. Emergency Supplies

This page intentionally left blank.

16. Emergency Contact Information

Emergency response shall be addressed according to the requirements of T8 CCR 5192. If it is determined that the emergency could threaten human health or the environment, the incident will be reported to the proper agencies:

Police/Fire 911

Department of Toxic Substances Control (714) 484-5300

5796 Corporate Avenue

Cypress, California 90630

Fax: (714) 484-5302

Department of Health Services (916) 445-4171

714/744 P Street

Sacramento, California 95814

The closest hospital is: (951) 788-3000

Riverside Community Hospital

4445 Magnolia Avenue

Riverside, California 92501

16. Emergency Contact Information

This page intentionally left blank.

17. Directions to the Hospital

Directions (See Figure 1): Head west on Blaine Street toward Rustin Avenue. Continue onto 3rd Street and then turn left onto Lime Street. Turn right onto 14th Street and the hospital will be on the left. Distance is 3.2 miles and estimated travel time is 13 minutes.

17. Directions to the Hospital

This page intentionally left blank.

18. Authorized Changes to the Health and Safety Plan

Changes to the HASP are to be documented by completing a Modification of Site Health and Safety Plan form. This completed form must be signed by the Site Safety Officer, the Health and Safety Manager, and the Project Director. A copy of each completed form is to be included with each copy of the HASP and made a part of the project files.

18. Authorized Changes to the Health and Safety Plan

This page intentionally left blank.

19. Certification

This HASP has been reviewed and approved by the PlaceWorks Health and Safety Manager. The plan satisfies the requirements of the Occupational Safety and Health Act 1910.120 as implemented by the Health and Safety Committee for hazardous waste site activities.

All PlaceWorks site personnel have read the HASP and are familiar with its provisions.

Appendices

Appendix A

Safety Rules and Personal Hygiene

1. Remove all facial hair that interferes with a satisfactory fit of respiratory protective equipment.
2. Do not wear contact lenses while wearing full-face respirators.
3. Do not take prescribed drugs unless specifically approved by a physician. Notify the SSO that prescription medication is being taken.
4. In the work zone, do not eat, drink, smoke, chew gum or tobacco, or engage in any other practice that increases the probability of hand-to-mouth transfer or ingestion of material.
5. Wash hands and face thoroughly after leaving the work area and before eating, drinking, or any other activities.
6. Thoroughly wash entire body as soon as possible after removing Level C protective garments.
7. Whenever possible, avoid contact with contaminated or suspected contaminated surfaces.

Appendix B

Field Standard Operating Procedures for Use and Decontamination of Personal Protective Equipment

1. Park vehicles outside the site boundaries.
2. During the pre-work safety meeting, the SSO will provide the following information:
 - A. a description of the site and known problem areas
 - B. the level of protection required
 - C. emergency medical information
 - D. the locations of the first aid kit and fire extinguisher
3. Use the nearest lavatory.
4. Lay out and check safety gear.
5. Check and don Level D PPE.
6. For work in Level C PPE, put on safety gear in the following order:
 - A. Coveralls
 - B. Steel-toed work boots
 - C. Connect suit and boots with tape
 - D. Outer booties, if used
 - E. Air purifying respirators (APRs), if required
7. For work in Level C PPE, put on APRs as follows:
 - A. Inspect.
 - (1) Inspect before each use to ensure that they have been cleaned adequately.
 - (2) Check material conditions for signs of pliability, deterioration, or distortion.
 - (3) Examine cartridges and ensure that they are the correct type for the intended use, that the expiration date has not passed, and that they have not been opened or used previously.
 - (4) Check face shields for cracks or fogginess.
 - B. Loosen all harness strap adjustments.
 - C. Place chin in chin cup and draw back evenly on strap adjustments - the two bottom straps first, then the two top straps, and the center top strap last.
 - D. Check that the respirator is centered evenly on the face and that the straps are not uncomfortably tight.

- E. Check for leaks or proper facial seals.
 - (1) To conduct a negative-pressure test, close the inlet part with the palm of the hand so it does not pass air, and gently inhale for about 10 seconds. Any inward rush of air indicates a poor fit. Note that a leaking facepiece may be drawn tightly to the face to form a good seal, giving a false indication of adequate fit.
 - (2) To conduct a positive-pressure test, gently exhale while covering the exhalation valve to ensure that a positive pressure can be built up. Failure to build a positive pressure indicates a poor fit.

- 8. Put on the rest of the gear in the following order:
 - A. Raise hood
 - B. Hard hat, if necessary
 - C. Surgical gloves
 - D. Outer gloves
 - E. Connect gloves and suit with tape

- 9. Select a buddy to act as a safety backup.

- 10. Check your buddy's equipment and have your buddy check yours for rips, tears, or malfunctions. Pay special attention to respirators, making sure that seals are good and that cartridges are securely in place.

- 11. If any equipment or gear gets damaged or if your suit tears badly, GO BACK.

- 12. If you experience physical discomfort, breathing difficulties, light-headedness, dizziness, or other abnormalities, GO BACK.

- 13. When you return, have your buddy check for external accumulation of contamination and remove it. Also check gear for damage.

- 14. Decontamination will be performed in steps as follows (as appropriate for the PPE being utilized):

Step 1 - Segregated Equipment Drop: Deposit equipment used onsite (tools, sampling devices and containers, monitoring instruments, clipboards, etc.) in different containers with plastic liners. Each may be contaminated to a different degree. Segregation at the drop reduces the probability of cross-contamination. This equipment may be reused if properly decontaminated.

Equipment: various sizes of containers
 plastic drop cloths

Step 2 - Boot Cover and Outer Glove Wash and Rinse: (Optional - will be used at the Site Safety Officer's discretion.)

Equipment: spray bottle/container with nozzle
 two wash basins or tubs
 scrub brush
 water
 Liqui-nox nonphosphate soap solution (1%)

Step 3 - Tape Removal: Remove tape around boots and gloves, and deposit in container with plastic liner. Remove boot covers, then outer gloves, and place them in the container.

Equipment: container (30-50 gallons)
 plastic liners
 folding chairs

Step 4 - Safety Boot Wash and Rinse: (Optional - will be used at discretion of field team members.)

Equipment: two wash basins or tubs
 scrub brush
 water
 Liqui-nox solution (1%)

Step 5 - Protective Coverall Removal: With the assistance of a helper, remove protective coverall. Deposit in container with plastic liner.

Equipment: container (30-50 gallons)
 folding chairs
 plastic liners

Step 6 - Respirator Removal: Remove facepiece. Avoid touching face with gloves. If work is completed for the day, discard cartridges in lined container, and wash and rinse respirator.

Equipment: container (30-50 gallons)
 plastic liners

Step 7 - Inner Glove Removal: Remove inner gloves and deposit in container with plastic liner.

Equipment: container (20-30 gallons)
 plastic liners

15. Respirators will be cleaned daily by hand washing with MSA cleaner-sanitizer solution followed by a thorough rinse and air drying. NEVER ALLOW A RESPIRATOR TO DRY WITH THE STRAPS PLACED FORWARD ACROSS THE FACESHIELD BECAUSE THIS MAY CAUSE CHANGES IN THE FACE-TO-RESPIRATOR SEAL SURFACE. The specific procedures to be employed are as follows:

A. Remove all cartridges (canisters) and filters plus gaskets and seals not

permanently affixed to their seats.

- B. Loosen harness adjustment straps.
 - C. Remove exhalation valve cover.
 - D. Remove inhalation and exhalation valves.
 - E. Remove protective faceshield cover.
 - F. Wash facepiece in MSA cleaner/sanitizer powder mixed with warm water, preferably at a temperature of 120° F. Wash components separately from facepiece. Heavy soil may be removed from the facepiece surface using a medium-soft handbrush.
 - G. Remove all parts from the wash solution, and rinse twice in clean, warm water.
 - H. Air dry all parts in a designated clean area.
 - I. Pat facepieces, valves, and seats to remove any remaining soap residue, water, or other foreign material with a clean, damp, lint-free cloth.
 - J. Reassemble respirator.
 - K. Place respirator in a plastic bag and the respirator box or otherwise store the respirator to prevent exposure to dust, moisture, sunlight, damaging chemicals, extreme temperatures, and impact.
16. Investigation-derived waste material will be handled as follows:
- A. Used PPE and disposable equipment will be double bagged and placed in a municipal refuse dumpster on site. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment that is to be disposed of which can still be reused will be rendered inoperable before disposal in the refuse dumpster.
 - B. Wash and rinse waters from personal and equipment decontamination will be poured onto the ground or into a storm drain.
 - C. Soil cuttings generated during the subsurface sampling will be placed back into the soil borings from which the samples were obtained. Any remaining soil cuttings will be spread around the sampling location.

Appendix C

Heat Stress and Heat Stress Monitoring

Heat is one of the most common (and potentially serious) illnesses at hazardous waste sites where PPE is worn; therefore, regular monitoring and other preventive precautions are vital. Shelter from the sun will be provided during rest periods. Below is a list of the signs and symptoms of heat stress. Initial work schedules will be approximately 90 minutes of work followed by 15 minutes of rest. Work intervals will be adjusted to shorter periods based on the assessment of the SSO. Monitoring for heat stress will be conducted by visual observation by the individual team members.

Signs and Symptoms of Heat Stress

- **Heat rash** may result from continuous exposure to heat or humid air.
- **Heat cramps** are caused by heavy sweating with inadequate electrolyte replacement. Signs and symptoms include:
 - muscle spasms
 - pain in the hands, feet, and abdomen
- **Heat exhaustion** occurs from increased stress on various body organs, including inadequate blood circulation caused by cardiovascular insufficiency or dehydration. Signs and symptoms include:
 - pale, cool, moist skin
 - heavy sweating
 - dizziness
 - nausea
 - fainting
- **Heat stroke** is the most serious form of heat stress. Temperature regulation fails, and the body temperature rises to critical levels. Immediate action must be taken to cool the body before serious injury and death occur. Competent medical help must be obtained. Signs and symptoms include:
 - red, hot, usually dry skin
 - lack of or reduced perspiration
 - nausea
 - dizziness and confusion
 - strong, rapid pulse
 - coma

First-aid remedies for heat stress and heat stroke includes removing the worker to a cool place, providing cool water or a commercial sport drink, loosen tight clothing, and call for an ambulance if victim vomits or starts to lose consciousness.

Appendix D

Medical Monitoring Program

The workers most likely to be exposed to contaminated materials at the site are sampling and inspection personnel. These personnel are included in this Medical Monitoring Program.

The purposes of the Medical Monitoring Program are to identify any illness or problem that would put an employee at an unusual risk from exposures; to ensure that each employee can use negative-pressure respirators safely and withstand heat or cold stress; and to establish and maintain a medical data base for employees to monitor any abnormalities that may be related to work exposure and that could increase injury risk for the employee or others in the performance of job functions. The Medical Monitoring Program includes:

- A baseline physical examination;
- A medical determination of fitness of duty, including work restrictions after any job-related injury or illness or non job-related absence lasting more than three working days;
- The review of each site-specific Health and Safety Plan and potential exposure list to determine the need for specific biological and medical monitoring; and
- Annual and exit physical examinations with attention given to specific exposures or symptoms.

Baseline Physical Examination

A Baseline Physical Examination will be performed on each employee engaged in hazardous waste activities. The purposes of this examination are to identify any illness or problem that would put an employee at unusual risk from certain exposures; to certify the safe use of negative-pressure respirators (OSHA Safety and Health Standard 29 CFR 1910.134); and to develop a database for the assessment of exposure-related events detected through periodic medical monitoring. Variable data, such as age, sex, race, smoking, prior employment, and exposure history, that may have a bearing on the occurrence of subsequent events after employment begins will be gathered.

The content of the Baseline Physical Examination will include:

- Medical, occupational, and fertility histories;
- A physical examination, stressing neurological, cardiopulmonary, musculoskeletal, and skin systems;
- An electrocardiogram;
- PA and lateral chest x-rays;
- A pulmonary function test (FEV₁, FVC, FEV₂₅₋₇₅);

- An audiogram;
- A multi-chemistry blood panel, including kidney and liver function tests, CBC with differential, and urinalysis;
- Tests deemed necessary by symptoms or exposure history;
- A red blood cell cholinesterase; and
- Physical parameters, including blood pressure and visual acuity testing.

Annual Physical Examination

An examination and updated occupational history will be performed on an annual basis during the anniversary month of the baseline physical examination. The Annual Physical Examination serves to identify and prevent illness caused by cumulative exposure to toxic substances.

The Annual Physical Examination will include:

- A personal work history (based on specific project histories);
- A physical examination, stressing neurological, cardiopulmonary, musculoskeletal, and skin systems;
- Pulmonary function test (FEV1, FVC, FEV 25-75);
- A multi-chemistry blood panel, including kidney and liver function test;
- An audiogram;
- Tests deemed necessary by symptoms or exposure history; and
- An optional wellness profile.

Return to Work Examination

Any job-related illness or injury will be followed by a medical examination to determine fitness for duty or possible job restrictions based on the physical findings of the medical examiner. A similar examination will be performed following three missed workdays caused by a non job-related illness or injury requiring medical intervention.

Exit Physical Examination

The content of the Exit Physical Examination will include:

- a personal work history (based on specific project histories);
- medical, exposure, and fertility histories;
- a physical examination, stressing neurological, cardiopulmonary, musculoskeletal, and skin systems;
- a pulmonary function test (FEV1, FVC, FEV 25-75);
- an electrocardiogram;
- PA and lateral chest x-rays;
- an audiogram;
- a multi-chemistry blood panel, including kidney and liver function tests, CBC with differential, and urinalysis;
- tests deemed necessary by symptoms or exposure history;
- a red blood cell cholinesterase; and
- physical parameters, including blood pressure and visual acuity testing.

Appendix E

Properties of Materials and Toxicological Profiles

Chromium (Cr III and Cr VI)

The permissible exposure limit (PEL) for chrome is 0.5 mg/m^3 , which is also the recommended exposure limit (REL) established by the National Institute for Occupational Safety and Health (NIOSH). The Immediately Dangerous to Life or Health (IDLH) concentration for this substance is 25 mg/m^3 .

The appearance and odor of this substance varies depending on the type of chrome compound. Symptoms of exposure to chrome may include irritation of the skin and eyes. If splashed in the eyes, irrigate immediately. For dermal exposure, wash with soap and water immediately. If swallowed, immediately seek medical attention. If victim stops breathing after exposure to vapors, begin artificial respiration.

Arsenic

The PEL for arsenic is 0.010 mg/m^3 . NIOSH has established an REL, based on a 15-minute exposure period, of 2 mg/m^3 . The IDLH concentration for this substance is 5 mg/m^3 .

The appearance and odor of arsenic varies depending upon the specific organic arsenic compound. Routes of exposure include inhalation, ingestion, and contact. The skin, respiratory system, kidneys, central nervous system (CNS), liver, GI tract, and reproductive system are all target organs or chronic exposure.

Lead

The PEL for lead is 0.050 mg/m^3 . NIOSH has established an REL of 0.100 mg/m^3 . The IDLH concentration for this substance is 100 mg/m^3 .

A heavy, ductile, soft, gray solid, lead is also known as lead metal and plumbum. A person can be exposed to lead contamination by inhalation, ingestion, or contact. The target organs for lead include eyes, GI tract, CNS, blood, and gingival tissue.

Symptoms of lead exposure include weakness, lassitude, insomnia; facial pallor; pal eye, anorexia, weight loss, malnutrition; constipation, abdominal pain, colic; anemia; gingival lead line; tremor; ankle or wrist paralysis, encephalopathy; kidney disease; irritated eyes; and hypotension. If eye contact occurs, the eyes should be washed immediately with large amounts of water. For dermal contact, remove any penetrated clothing and immediately flush the contaminated skin with soap and water. If this chemical is inhaled in large quantities, move to fresh air at once. Perform mouth-to-mouth resuscitation if breathing has stopped. Keep the person warm and resting. For any of the above or if the chemical has been swallowed, seek medical attention promptly.

Dichlorodiphenyltrichloroethane (DDT)

The PEL for DDT is 1 mg/m³. NIOSH has established an REL of 0.5 mg/m³. The IDLH concentration for this substance is 500 mg/m³.

Routes of exposure include inhalation, ingestion, absorption, and contact. Symptoms of exposure to DDT include irritation to eyes and skin, paresthesia of the tongue, lips, and face, tremor, apprehension, dizziness, confusion, malaise, headache, fatigue, convulsions, and vomiting. If eye contact occurs, the eyes should be washed immediately with large amounts of water. For dermal contact, remove any penetrated clothing and immediately flush the contaminated skin with soap and water. If this chemical is inhaled in large quantities, move to fresh air at once. Perform mouth-to-mouth resuscitation if breathing has stopped. Keep the person warm and resting. For any of the above or if the chemical has been swallowed, seek medical attention promptly.

Aldrin

The PEL for aldrin is 0.25 mg/m³. NIOSH has established an REL of 0.25 mg/m³. The IDLH concentration for this substance is 25 mg/m³.

Routes of exposure include inhalation, ingestion, absorption, and contact. Symptoms of exposure to aldrin include headache, dizziness, nausea, vomiting, malaise, and coma. If eye contact occurs, the eyes should be washed immediately with large amounts of water. For dermal contact, remove any penetrated clothing and immediately flush the contaminated skin with soap and water. If this chemical is inhaled in large quantities, move to fresh air at once. Perform mouth-to-mouth resuscitation if breathing has stopped. Keep the person warm and resting. For any of the above or if the chemical has been swallowed, seek medical attention promptly.

Toxaphene

The PEL for toxaphene is 0.5 mg/m³. The IDLH concentration for this substance is 200 mg/m³.

Routes of exposure include inhalation, ingestion, absorption, and contact. Symptoms of exposure to toxaphene include nausea, confusion, agitation, tremor, convulsions, dry, red skin, and unconsciousness. If eye contact occurs, the eyes should be washed immediately with large amounts of water. For dermal contact, remove any penetrated clothing and immediately flush the contaminated skin with soap and water. If this chemical is inhaled in large quantities, move to fresh air at once. Perform mouth-to-mouth resuscitation if breathing has stopped. Keep the person warm and resting. For any of the above or if the chemical has been swallowed, seek medical attention promptly.

Dieldrin

The PEL for dieldrin is 0.25 mg/m³. NIOSH has established an REL of 0.25 mg/m³. The IDLH concentration for this substance is 50 mg/m³.

Routes of exposure include inhalation, ingestion, absorption, and contact. Symptoms of exposure to dieldrin include headache, dizziness, nausea, vomiting, sweat, and coma. If eye contact occurs, the eyes should be washed immediately with large amounts of water. For dermal contact, remove any penetrated clothing and immediately flush the contaminated skin with soap and water. If this chemical is inhaled in large quantities, move to fresh air at once. Perform mouth-to-mouth resuscitation if breathing has stopped. Keep the person warm and resting. For any of the above or if the chemical has been swallowed, seek medical attention promptly.

Appendix F

Site Safety Officer Responsibilities

An SSO will be designated. The responsibilities of the SSO will include the following:

- briefing personnel on the hazards at the site, the standard operating procedures to be employed, and emergency procedures;
- conducting onsite health monitoring;
- coordinating access control and site security, including responsibility for protection of third parties, such as visitors or the surrounding community;
- monitoring work practices and decontamination to ensure that required procedures are being followed;
- being available to document and respond to any concerns or complaints made by onsite personnel;
- documenting unsafe work practices or conditions;
- documenting any accidents or incidents that result in illness or injury to personnel; and
- evaluating and amending the HASP daily to remedy deficiencies and post entry briefings.

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
 B1 = BOD dilution water is over specifications . The reported result may be biased high.
 D = Surrogate recoveries are not calculated due to sample dilution.
 E = Estimated value; Value exceeds calibration level of instrument.
 H = Analyte was prepared and/or analyzed outside of the analytical method holding time
 I = Matrix Interference.
 J = Analyte concentration detected between RL and MDL.
 Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
 S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
 RL = Reporting Limit, Adjusted by DF
 MDL = Method Detection Limit, Adjusted by DF
 Qual = Qualifier
 Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.

For any feedback concerning our services, please contact Jenny Jiang, Project Manager at 951.779.0310. You may also contact Ken Zheng, President at office@arlaboratories.com.

LA Testing recommends that soil samples reported as "ND" be tested by the EPA Screening Method/Qualitative. The above report relates only to the items tested. This report may not be reproduced, except in full, without written approval by LA Testing, Inc. The above test must not be used by the client to claim product endorsement by NVLAP nor any agency of the United States Government. Samples received in good condition unless otherwise noted.

Samples analyzed by LA Testing Huntington Beach, CA

Sample Acceptance Checklist

CLIENT: Placeworks

WORK ORDER NUMBER: 1910-151

Temperature: (Criteria: 0.0°C-6.0°C)
 Sample Temp. (w/CF) °C(w/CF) 4.3°C

Sample(s) outside temperature criteria: PM contacted by : _____
 Sample(s) outside temperature criteria, but received on ice/chilled on same day of sampling.
 Sample(s) received at ambient temperature; placed on ice for transport by courier.
 Ambient Temperature Air Filter

CUSTODY SEAL:

Cooler Present and Intact Present and Not Intact Not Present
 Sample(s) Present and Intact Present and Not Intact Not Present

Sample Condition:	Yes	No	N/A
Was a COC received	<input checked="" type="checkbox"/>		
Were sample IDs present?	<input checked="" type="checkbox"/>		
Were sampling dates & times present?	<input checked="" type="checkbox"/>		
Was a relinquished signature present?	<input checked="" type="checkbox"/>		
Were the tests required clearly indicated?	<input checked="" type="checkbox"/>		
Were all samples sealed in plastic bags?		<input checked="" type="checkbox"/>	
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were correct containers used for the tests required?	<input checked="" type="checkbox"/>		
Was a sufficient amount of samples sent for tests indicated?	<input checked="" type="checkbox"/>		
Was there headspace in VOA vials?			<input checked="" type="checkbox"/>
Were the containers labeled with correct preservatives?	<input checked="" type="checkbox"/>

Ken Zheng - Lab Director

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
 B1 = BOD dilution water is over specifications . The reported result may be biased high.
 D = Surrogate recoveries are not calculated due to sample dilution.
 E = Estimated value; Value exceeds calibration level of instrument.
 H = Analyte was prepared and/or analyzed outside of the analytical method holding time
 I = Matrix Interference.
 J = Analyte concentration detected between RL and MDL.
 Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
 S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
 RL = Reporting Limit, Adjusted by DF
 MDL = Method Detection Limit, Adjusted by DF
 Qual = Qualifier
 Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.

For any feedback concerning our services, please contact Jenny Jiang, Project Manager at 951.779.0310. You may also contact Ken Zheng, President at office@arlaboratories.com.

LA Testing recommends that soil samples reported as "ND" be tested by the EPA Screening Method/Qualitative. The above report relates only to the items tested. This report may not be reproduced, except in full, without written approval by LA Testing, Inc. The above test must not be used by the client to claim product endorsement by NVLAP nor any agency of the United States Government. Samples received in good condition unless otherwise noted.

Analysis	Result	Qual	Units	Method	DF	RL	Date	Tech
----------	--------	------	-------	--------	----	----	------	------

Respectfully Submitted:

Ken Zheng - Lab Director

QUALIFIERS

- B = Detected in the associated Method Blank at a concentration above the routine RL.
- B1 = BOD dilution water is over specifications . The reported result may be biased high.
- D = Surrogate recoveries are not calculated due to sample dilution.
- E = Estimated value; Value exceeds calibration level of instrument.
- H = Analyte was prepared and/or analyzed outside of the analytical method holding time
- I = Matrix Interference.
- J = Analyte concentration detected between RL and MDL.
- Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
- S = Customer provided specification limit exceeded.

ABBREVIATIONS

- DF = Dilution Factor
- RL = Reporting Limit, Adjusted by DF
- MDL = Method Detection Limit, Adjusted by DF
- Qual = Qualifier
- Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.

For any feedback concerning our services, please contact Jenny Jiang, Project Manager at 951.779.0310. You may also contact Ken Zheng, President at office@arlaboratories.com.

1. Introduction

This Quality Assurance Project Plan (QAPP) has been prepared by PlaceWorks on behalf of Riverside Unified School District (District) to address quality assurance (QA) and quality control (QC) policies associated with the collection of environmental data at the proposed Blaine STEM Academy (site), in Riverside, California. This QAPP presents the plan for sampling and analysis as part of the investigation. U.S. Environmental Protection Agency (USEPA) policy requires a QAPP for all environmental data collection projects mandated or supported by the USEPA through regulations or other formalized means (USEPA 1998a). The purpose of this QAPP is to identify the methods to be employed to establish technical accuracy, precision, and validity of data that is generated at the site.

This QAPP contains general and specific details regarding field sampling, laboratory, and analytical procedures that apply to investigation activities. It provides field and laboratory personnel with instructions regarding activities to be performed before, during, and after field investigations. These instructions will ensure data collected for use in project decisions will be of the type and quality required to meet the data quality objectives (DQOs) for the project.

Guidelines followed in the preparation of this QAPP are described in EPA Requirements for Quality Assurance Plans for Environmental Data Operations, External Review Draft Final, EPA QA/R-5 (USEPA 1998a) and EPA Guidance for Quality Assurance Project Plans, EPA QA/G-5 (USEPA 1998b). Other documents that have been referenced in this plan include, Guidance for the Data Quality Objectives Process, EPA QA/G-4 (USEPA 1994a) and Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (USEPA SW-846, Third Edition, 1996).

1.1 PROJECT HISTORY AND OBJECTIVES

The project site is approximately 7-acres located on the eastern portion of the existing Riverside Sports Center, including a portion of Lot 26, which is currently utilized by the University of California, Riverside (UCR) under a license agreement with the City of Riverside. The project site is located on assessor parcel number (APN) 250-220-002, -003, -008 and a portion of -006. The project site is in Section 19 of Township 2 South, Range 4 West of the San Bernardino Base Line and Meridian.

Past usage of the site was assessed through an interview, historical aerial photographs, topographic maps and databases. Copies of historical information reviewed are included in Appendix B. Based on a review of historical information; the project site was utilized for agricultural purposes from at least 1931 to around 1966. From 1931 to 1985, the project site has also had a residential dwelling unit. From 1985 to the present, the project site has been used as an athletic field.

1. Introduction

This page intentionally left blank.

2. Project Description

This section presents information concerning the proposed sampling activities, selected analytical parameters, data quality objectives, and the resulting project decisions.

2.1 ANALYTICAL SCOPE

The planned sampling effort includes the sampling and analysis of shallow soils for a list of potential hazardous substances. Soil samples will be collected on the project area in accordance with the protocols detailed in the DTSC's PEA Guidance Manual (DTSC 1999).

The appropriate analyses selected for this field program, and the rationale for selection of these parameters, will be further provided in the Workplan. A&R Laboratories, Inc. (ARL), located in Ontario, California, will perform testing of soil samples.

2.2 DATA USE

Decisions to be made based upon the planned sampling and analysis effort will be determined by the data compiled from the sampling and analysis program. It is intended that data collected through implementation of this QAPP will satisfy federal, state, and local data quality requirements. These data may be used to characterize the nature and extent of contamination, support risk assessment, support the evaluation of corrective/remedial action, and/or assist in determination of additional actions.

The presence of environmental contaminants will be determined by the extent of valid detectable concentrations of the constituents discussed above. If the data associated with any detections of chemicals of potential concern (COPCs) are confirmed, the data will be used to assess risk using accepted methods for determining potential carcinogenic and non-carcinogenic exposures. If results from the risk screening evaluations indicate no risks of exposure with respect to the use of the property, then the District will use the data to support No Further Action consent from DTSC, and the proposed development may continue without modification. If the evaluation indicates unacceptable risks of exposure, then the data can be used by District for further consideration of action.

2. Site Description

This page intentionally left blank.

3. Project Organization

This section provides a description of the organizational structure and responsibilities of the individual positions for this project. This description defines the lines of communication and identifies key personnel assigned to various activities for the project.

3.1 RIVERSIDE UNIFIED SCHOOL DISTRICT

Nadia Zeien is the designated contact person for the District. Ms. Zeien will be responsible for the directional decisions, as well as budget control, and for work conducted at the school site. Ms. Zeien, or designee, may perform document review of related work plans, reports, and drawings for activities associated with this project.

3.2 PLACEWORKS

The investigation contractor has responsibility for assigned phases of investigation and reporting. Together the management team (Project Manager and Field Manager) will be responsible for the technical planning and implementation of the work. The QA staff has responsibility for effective planning, verification and management of QA activities associated with the assigned project.

Dr. Denise Clendening is the PlaceWorks Project Manager and will serve as the primary contact with the DTSC and the District. Her responsibilities include strategy development, budget control, document control, project management, risk assessment and document review.

Mr. Michael Watson of PlaceWorks is a Professional Geologist in the State of California. Mr. Watson's responsibilities include field activities and preparation of required reports and data validation including quality assurance/quality control.

3.3 LABORATORY

The primary offsite laboratory is anticipated to be ARL in Ontario, California. ARL will perform analytical testing for soil samples collected for this investigation. The laboratory's project manager will report to the PlaceWorks Field Manager on all aspects of the sample analysis. In addition, the PlaceWorks QA Manager will be advised of any matters related to data quality during the course of the investigation.

3. Project Organization

This page intentionally left blank.

4. Data Quality Objectives

DQOs have been specified for each data collection activity. The project work will be conducted and documented so that the data collected are of sufficient quality for their intended use (USEPA 1998). DQOs specify the data type, quality, quantity, and uses needed to make decisions, and are the basis for designing data collection activities. The DQOs have been used to design the data collection activities that will be presented in the Workplan. The DQOs for the project are discussed in the following sections.

4.1 DATA QUALITY OBJECTIVES

The project DQOs developed specifically for the planned sampling and analysis program have been determined based on USEPA's seven-step DQO process (USEPA 1994a). The Project Manager will evaluate the DQOs to determine if the quantitative and qualitative needs of the sampling and analysis program have been met. The project definition associated with each step of the DQO process can be summarized as follows:

State the problem: The purpose of the sampling program is to determine if the proposed site is acceptable for the development of a new educational facility. Although the proposed development of the site will result in asphalt or concrete surfacing over the majority of the site, exposed soils will exist in landscaped areas where students could come into contact. Previous investigations have not performed a complete evaluation of potential contamination based on historical use of the property.

Identify the Decision: The data obtained from the sampling and testing activities will be used to evaluate if releases of hazardous substances from historical uses have occurred at the site. The investigative results will be further evaluated to determine to what extent any contamination identified will result in risk of exposure. The results will be compiled and used to assess the relative threat associated with any contamination identified, through a baseline risk assessment. Based on the calculation of human health and ecological risks for the site, the suitability of the property for its intended development will be determined.

Identify Inputs to the Decision: Inputs to the decision will include results of analytical testing of soil gas samples, and shallow soils from selected locations on the site. Each of these matrices will be tested for the specified analytes discussed in Section II.

Define the Study Boundaries: The boundaries of the field sampling and analysis program will be the perimeter of the site as discussed above and detailed in the Workplan.

Develop a Decision Rule: Decisions will be based upon laboratory results for the target constituents presented in Tables 1 through 3 for each respective matrix tested. If no valid detectable concentrations of target compounds are reported for the given samples, then a decision will be made that the site is fully characterized with respect to the compounds tested and no further sampling will be required as part of this

4. Data Quality Objectives

investigation. If target constituents are detected in the samples tested, then the data will be compiled for use in calculating the human health and ecological risk of exposure. The results of the risk evaluation will be used by the District to support a No Further Action consent from DTSC, if the data indicate risk is acceptable.

Specify Limits on Decision Error: The results of all analytical testing will be subjected to data validation specified in Section 7.3. Data are determined to be valid if the specified DQOs for precision, accuracy, representativeness, comparability and completeness are achieved. The results of any detected target constituents will be considered in evaluating the need for additional sampling of soil gas and/or site soil, and assessing the necessity for reducing any risks posed by the potential contamination.

Optimize the Design: The field sampling program has been designed to provide the type and quantity of data needed to satisfy each of the aforementioned objectives. A separate Workplan provides the specifications for the data collection activities, including the numbers of samples, respective locations, and sampling techniques. The quality of the data will be assessed through the procedures further described in this QAPP.

4.2 PRECISION, ACCURACY, REPRESENTATIVENESS, COMPARABILITY AND COMPLETENESS

The basis for assessing the elements of data quality is discussed in the following subsections. In the absence of laboratory specific precision and accuracy limits, the QC limits listed in this section must be met.

4.2.1 Precision

Precision measures the reproducibility of repetitive measurements. It is strictly defined as the degree of mutual agreement among independent measurements as the result of repeated application of the sample process under similar conditions.

Analytical precision is a measurement of the variability associated with duplicate or replicate analyses of the same sample in the laboratory. Precision is assessed by analysis of the results between laboratory quality control sample pairs. These include laboratory control sample (LCS) and LCS duplicates, matrix spike (MS) and MS duplicates (MSD), or sample duplicates. If the recoveries of analytes in the specified control samples pairs are comparable within established control limits, then precision criteria are satisfied.

Total precision is a measurement of the variability associated with the entire sampling and analytical process. It is determined by analysis of duplicate (two) or replicate (more than two) field samples, and measures variability introduced by both the laboratory and field operations. Field duplicate samples are analyzed to assess combined field and analytical precision.

Duplicate results are assessed using the relative percent difference (RPD) between duplicate measurements. If the RPD for laboratory quality control samples exceeds 30 percent, data will be qualified as described in the applicable validation procedure. If the RPD between primary and duplicate field samples exceeds 100 percent for soil or soil gas, data will be qualified as described in the applicable validation procedure.

4. Data Quality Objectives

The RPD is calculated as the difference between the two sample results (absolute value) divided by the average of the two sample results. The equation can be expressed as follows:

$$\%RPD = 200 \times ((x_2 - x_1) / (x_2 + x_1))$$

4.2.2 Accuracy

Accuracy is a statistical measurement of correctness of a measured value, and includes components of random error (variability due to imprecision) and systematic error. It reflects the total error associated with a measurement. A measurement is accurate when the value reported does not differ from the true value of a known concentration, spike, or standard.

Accuracy of laboratory analyses will be assessed by LCS recoveries, surrogate standard recoveries, MS spike recoveries, and initial and continuing calibrations of instruments. Laboratory accuracy is expressed as the percent recovery (%R). Accuracy limits are statistically generated by the laboratory or required by specified USEPA methods. If the percent recovery is determined to be outside of acceptance criteria, data will be qualified as described in the applicable validation procedure. The calculation of percent recovery is provided below:

$$\% R = 100 \times (X_s - X) / T$$

where X_s is the measured value of the spiked sample, X is the measured value of the unspiked sample, and T is the true value of the spike solution added.

Accuracy is also assessed by the analysis of laboratory and field blanks. Assessment of blank results provides information regarding potential bias imparted to analytical results from measurement systems and/or field conditions. Field accuracy will be assessed through the analysis of field equipment blanks. Analysis of field blanks documents bias associated with the sampling process, field contamination, sample preservation, and sample handling. The DQO for field equipment and trip blanks is that all values are less than the reporting limit for each target constituent. If contamination is reported in the field equipment or trip blanks, data will be qualified as described in the applicable validation procedure.

4.2.3 Representativeness

Representativeness is the degree to which data accurately and precisely represent selected characteristics of the media sampled. Representativeness of data collection is addressed by careful preparation of sampling and analysis programs. This QAPP addresses representativeness by specifying sufficient and proper numbers and locations of samples; incorporating appropriate sampling methodologies; specifying proper sample collection techniques and decontamination procedures; selecting appropriate laboratory methods to prepare and analyze soil and soil gas; and establishing proper field and laboratory QA/QC procedures.

4.2.4 Completeness

Completeness is the measure of valid data obtained compared to the amount that was expected under ideal conditions. The number of valid results divided by the number of possible results, expressed as a percentage,

4. Data Quality Objectives

determines the completeness of the data set. The objective for completeness is to obtain at least 90 percent of the planned data to support evaluation and assessment efforts. Specifically, for background samples, a completeness requirement of 100 percent is mandated. The formula for calculation of completeness is presented, as follows:

$$\% \text{ Completeness} = 100 \times \frac{\text{number of valid results}}{\text{number of expected results}}$$

4.2.5 Comparability

Comparability is an expression of confidence with which one data set can be compared to another. The objective of comparability is to ensure that data developed during the investigation are comparable with data previously collected (i.e., methods of analysis are comparable), and that the methods used adequately address applicable criteria or standards established by the USEPA and California Department of Health Services (CADHS). This QAPP addresses comparability by specifying laboratory methods that are consistent with the current standards of practice as approved by the USEPA and CADHS. Field methods will be discussed in the Workplan.

5. Quality Control Elements

This section presents QC requirements relevant to analysis of environmental samples that will be followed during all project analytical activities. The purpose of the QC program is to produce data of known quality that satisfy the project objectives and that meet or exceed the requirements of the standard methods of analysis. This program provides a mechanism for ongoing control and evaluation of data quality measurements through the use of QC materials.

5.1 QUALITY CONTROL ELEMENTS

The chemical data to be collected for this effort will be used to determine that the extent of contamination is properly evaluated. As such, it is critical that the chemical data is documented to be of the highest confidence and quality. Consequently, strict QA/QC procedures will be adhered to. These procedures include:

- Adherence to protocols for field sampling and decontamination procedures;
- Collection and laboratory analysis of appropriate field and equipment blanks to monitor for contamination of samples in the field or the laboratory;
- Collection and laboratory analysis of site-specific matrix spike, matrix spike duplicate, and blind duplicate samples to evaluate precision and accuracy; and
- Attainment of completeness goals.

5.1.1 Equipment Decontamination

Non-dedicated equipment will be decontaminated before and after each sample is collected. The equipment will be washed in a non-phosphate detergent and potable water, rinsed in potable water, and then double rinsed in distilled water. A description of the specific methodologies to be followed to maximize proper decontamination of non-dedicated sampling equipment is provided in the Workplan.

5.1.2 Standards

Standards used for calibration or to prepare samples will be certified by National Institute of Standards and Technology (NIST), USEPA, or other equivalent source. The standards will be current. The expiration date will be established by the manufacturer, or based on chemical stability, the possibility of contamination, and environmental and storage conditions. Standards will be labeled with expiration dates and will reference primary standard sources if applicable. Expired standards will be discarded.

5. Quality Control Elements

5.1.3 Supplies

All supplies will be inspected prior to their use in the field or laboratory. The descriptions for sample collection and analysis contained in the methods will be used as a guideline for establishing the acceptance criteria for supplies. A current inventory and appropriate storage system for these materials will assure their integrity prior to use.

5.1.4 Holding Time Compliance

Sample preparation and analysis will be completed within the required method holding times (Table 1). Holding time begins at the time of sample collection. If holding times are exceeded, and the analyses are performed, the associated results will be qualified as described in the applicable validation procedure. The following definitions of extraction and analysis compliance are used to assess holding times:

- Preparation or extraction completion - completion of the sample preparation process as described in the applicable method, prior to any necessary extract cleanup.
- Analysis completion - completion of all analytical runs, including dilutions, second-column confirmations, and any required re-analyses.

5.1.5 Preventative Maintenance

The Field Manager for PlaceWorks is responsible for documenting the maintenance of all field equipment prescribed in the manufacturer's specifications. Scheduled maintenance will be performed by trained personnel. Procedures specific to the calibration, use and maintenance of field equipment are presented in the Workplan. The analytical laboratory is responsible for all analytical equipment calibration and maintenance as described in their laboratory QA Plan. Subcontractors are responsible for maintenance of all equipment needed to carry out subcontracted duties

5.2 QUALITY ASSURANCE AND QUALITY CONTROL (QA/QC) SAMPLES

The purpose of this QA/QC program is to produce data of known quality that satisfy the project objectives and that meet or exceed the requirements of the standard methods of analysis. This program provides a mechanism for ongoing control and evaluation of data quality measurements through the use of QC materials. Quality assurance and quality control samples will be collected as part of the overall QA/QC program.

5.2.1 Laboratory Reagent Blanks

A laboratory reagent blank is de-ionized, distilled water that is extracted by the laboratory and analyzed as a sample. Analysis of the reagent blank indicates potential sources of contamination from laboratory procedures (e.g., contaminated reagents, improperly cleaned laboratory equipment, or persistent contamination due to presence of certain compounds in the ambient laboratory air). A reagent blank will be analyzed at least once each day for each method utilized by the laboratory for that day.

5. Quality Control Elements

5.2.2 Field Equipment Blanks

A field equipment blank is a sample that is prepared in the field by pouring de-ionized, distilled water into cleaned sampling equipment. The water is then collected and analyzed as a sample. Field equipment blanks are typically blind (given a fictitious name so that the laboratory will not recognize it as a blank). The field equipment blank gives an indication of contamination from field procedures (e.g., improperly cleaned sampling equipment, cross-contamination). Field equipment blanks will be collected at a minimum frequency of at least one per day when non-dedicated equipment is utilized. The field equipment blanks should be analyzed using the same analyses requested for the associated primary samples collected.

5.2.3 Trip Blanks

The primary purpose of trip blanks is to detect potential additional sources of contamination that could potentially influence contaminant values reported in field samples, both quantitatively and qualitatively. Trip blanks serve as a mechanism of control for sample bottle preparation, blank water quality and sample handling. They are generally submitted to the laboratory for analysis of VOCs. If VOCs are detected with the PID at or above 1 part per million, trip blanks will included as part of the sampling program.

5.2.4 Matrix Spike Samples

Matrix spikes are performed by the analytical laboratory to evaluate the efficiency of the sample extraction and analysis procedures, and are necessary because matrix interference (interferences from non-target compound in the sample matrix, water or soil) may have a widely varying impact on the accuracy and precision of the extraction analysis. The matrix spike is prepared by the addition of known quantities of target compounds to a sample. The sample is extracted and analyzed. The results of the analysis are compared with the known additions and a matrix spike recovery is calculated giving an evaluation of the accuracy of the extraction and analysis procedures. Matrix spike recoveries are reviewed to check that they are within acceptable range. However, the acceptable ranges vary widely with both sample matrix and analytical method. Matrix spikes and matrix spike duplicates will be analyzed by the laboratory at a frequency of at least one per twenty, or 5 percent of the primary field samples. Typically, matrix spikes are performed in duplicate in order to evaluate the precision of the procedures as well as the accuracy. Precision objectives (represented by agreement between matrix spike and matrix spike duplicate recoveries) and accuracy objectives (represented by matrix spike recovery results) are based on statistically generated limits established annually by the analytical laboratory. It is important to note that these objectives are to be viewed as goals, not as criteria. If matrix bias is suspected, the associated data will be qualified and the direction of the bias indicated in the data validation report.

5.2.5 Field Duplicate Samples

Field duplicate samples will be collected and analyzed to evaluate sampling and analytical precision. Field duplicates are collected and analyzed in the same manner as the primary samples. Agreement between duplicate sample results will indicate good sampling and analytical precision. Specific locations will be designated for collection of field duplicates prior to the start of field activities. Field duplicates will be collected at a frequency of 10 percent of the primary samples collected. The duplicate sample will be

5. Quality Control Elements

analyzed for all laboratory analyses requested for the primary sample collected. The precision goal for field duplicates analyses will be plus or minus 50 percent relative percent difference for aqueous samples and plus or minus 100 percent relative percent difference for soil, or air samples. Results for samples exceeding these goals will be qualified as estimated. Professional judgement will be used to determine if all samples in the associated batch will be qualified as well.

5.2.6 Performance Evaluation Samples

Double blind performance evaluation (PE) samples may be submitted to the analytical laboratory during any site investigation. These samples may be of water or soil matrix, and are used to assess the accuracy of analytical procedures employed for a given sample set. PE samples will be used if questionable data quality is suspected as determined during laboratory audits or data validation.

If used, double blind PE samples will be prepared by Environmental Resources Standards, or similar supplier, in similar sample containers as the project field samples and shipped from the field to the laboratory for analysis.

Double blind PE samples will be prepared using NIST and/or A2LA certified standards. The project-specific PE samples will contain known concentrations of the analytes of interest. Laboratory results will be evaluated against the original Certificates of Analyses for precision and accuracy. PE samples may be submitted for analysis as part of the laboratory pre-qualification process, or as part of a given sampling event. Results will be reported to the laboratory and presented with associated field sample results

6. Sampling Procedures

The defensibility of data is dependent on the use of well defined, accepted sampling procedures. This section describes the sampling and handling procedures that will be followed for each sampling event.

6.1 SAMPLING PROCEDURES

Collection of high integrity environmental samples is important to the quality of chemical data to be generated. To this end, detailed field procedures have been developed to guide sample collections during each phase of the field investigation. These procedures are contained in the Workplan.

6.1.1 Sample Containers, Preservation and Holding Times

Table 1 lists the required sample containers, preservatives, and recommended maximum holding times for samples. Sample containers provided by the laboratory will be new, and purchased commercially from I-Chem, Eagle Pitcher, or other equivalent validated sources.

6.1.2 Sample Handling and Storage

In the field, each sample container will be marked with the sampling location number, and date and time of sample collection. All sample containers will be wiped with paper towels and securely packed, in a cooler on ice, in preparation for delivery to the laboratory.

Upon receipt of the samples, the laboratory will immediately notify the Field Manager if conditions or problems are identified which require immediate resolution. Such conditions include container breakage, missing or improper chain-of-custody, exceeded holding times, improper preservation, missing or illegible sample labeling, or temperature excursions.

6.1.3 Sample Custody

For each sample that is submitted to the laboratory for analysis, an entry will be made on a chain-of-custody form supplied by the laboratory. The information to be recorded includes the sampling date and time, sample identification number, matrix type, requested analyses and methods, preservatives, and the sampler's name. Sampling team members will maintain custody of the samples until they are relinquished to laboratory personnel or a professional courier service. The chain-of-custody form will accompany the samples from the time of collection until received by the laboratory. Each party in possession of the samples (except the professional courier service) will sign the chain-of-custody form signifying receipt.

The chain-of-custody form will be placed in a plastic bag and shipped with samples inside the cooler. After the samples, ice, and chain-of-custody forms are packed in the coolers, the cooler will be appropriately sealed before it is relinquished to the courier. A copy of the original completed form will be provided by the

6. Sampling Procedures

laboratory along with the report of results. Upon receipt, the laboratory will inspect the condition of the sample containers and report the information on chain-of-custody or similar form.

7. Analytical Procedures

The analytical methods used for this project are primarily USEPA approved methods and are listed in Tables 1 through 3. Specific analytical method procedures are detailed in the laboratory QA Plan and standard operating procedures (SOPs) of the selected laboratory. These documents may be reviewed by PlaceWorks quality assurance staff during laboratory audits to ensure that project specifications are met. Laboratory audits are discussed in Section 9.2.

7.1 INTERNAL STANDARDS

Internal standards are measured amounts of method-specified compounds added after preparation, or extraction, of a sample. Internal standards are added to samples, controls, and blanks in accordance with method requirements to identify column injection losses, purging losses, or viscosity effects.

Acceptance limits for internal standard recoveries are set forth in the applicable method. If the internal standard recovery falls outside of acceptance criteria, the instrument will be checked for malfunction and reanalysis of the sample will be performed after any problems are resolved.

7.2 RETENTION TIME WINDOWS

Retention time windows will be established as described in SW-846 Method 8000A for applicable analyses of organic compounds. Retention time windows are used for qualitative identification of analytes and are calculated based on multiple, replicated analyses of a respective standard.

Retention times will be checked on a daily basis. Acceptance criteria for retention time windows are established in the referenced method. If the retention time falls outside the respective window, actions will be taken to correct the problem. The instrument must be re-calibrated after any retention time window failure and the affected samples must be reanalyzed.

7.3 METHOD DETECTION LIMITS

The method detection limit (MDL) is the minimum concentration of an analyte, or compound, that can be measured and reported with 99 percent confidence that the concentration is greater than zero. MDLs are established for each method, matrix and analyte, and for each instrument used to analyze project samples. MDLs are derived using the procedures described in 40CFR 136 Appendix B (USEPA 1990a). USEPA requires that MDLs be established on an annual basis. MDLs must be less than applicable reporting limits for each target analyte presented in Tables 2 and 3.

7. Analytical Procedures

7.4 INSTRUMENT CALIBRATION

Analytical instruments will be calibrated in accordance with the procedures specified in the applicable method. All analytes that are reported shall be present in the initial and continuing calibrations, and these calibrations must meet the acceptance criteria specified in the reference method. Records of standard preparation and instrument calibration will be maintained. Records shall unambiguously trace the preparation of standards and their use in calibration and quantitation of sample results. Calibration records will be traceable to standard materials as described in Section 5.2.

At the onset of analysis, instrument calibrations will be checked using all of the analytes of interest. This applies equally to multi-response analytes. At a minimum, calibration criteria will satisfy method requirements. Analyte concentrations can be determined with either calibration curves or response factors, as defined in the method. Guidance provided in SW-846 should be considered to determine appropriate evaluation procedures.

8. Data Reporting

This section presents reporting requirements relevant to the data produced during all project analytical activities.

8.1 FIELD DATA

Data measured by field instruments will be recorded in field notebooks, laptops, and/or on required field forms. Units of measure for field analyses are identified on the field forms. The field data will be reviewed by the Project or Field Manager to evaluate completeness of the field records and appropriateness of the field methods employed. All field records will be retained in the project files.

8.2 LABORATORY DATA

Analytical data will contain the necessary sample results and quality control data to evaluate the data quality objectives defined for the project. Documentation requirements for laboratory data are defined in USEPA Region IX Laboratory Documentation Requirements for Data Validation (USEPA 1990b). The laboratory reports will be consistent with USEPA Level III documentation and include the following data and summary forms:

- Narrative, cross-reference, chain-of-custody, and method references;
- Analytical results;
- Surrogate recoveries (as applicable);
- Calibration summary;
- Blank results;
- Laboratory control sample recoveries;
- Duplicate sample results or duplicate spike recoveries;
- Sample spike recoveries;
- Instrument tuning summary;
- Associated raw data; and
- Magnetic tape or equivalent upon request.

8. Data Reporting

Data validation criteria are derived from the USEPA Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review (USEPA 1994b and 1994c). The Functional Guidelines provide specific data validation criteria that can be applied to data generated for this investigation.

The laboratory data will be reviewed for compliance with the applicable method and the quality of the data reported. The following summarizes the areas of data validation.

- Holding Times;
- Calibrations;
- Blanks;
- Laboratory Control Samples;
- Matrix Spike/Matrix Spike Duplicates;
- Surrogates/Internal Standards (as applicable);
- Field Quality Control Samples; and
- Compound Identification and Quantification.

The application of data validation criteria is a function of project-specific DQOs. The QA/QC Manager will determine if the data quality objectives for the analytical data have been met. Results of the data validation review will be documented and summarized in the investigation.

8.3 PROCEDURES FOR DATA VALIDATION

Procedures for performing data validation for the types of analyses to be performed for this investigation are documented in the National Functional Guidelines. Data validation will be documented in a manner consistent with the functional guidelines. The results of the data validation will be included in a Data Validation Memorandum. This documentation will be maintained by PlaceWorks in the project files.

8.3.1 Data Qualifiers

The data validation procedures were designed to review each data set and identify biases inherent to the data and determine its usefulness. Data validation flags are applied to those sample results that fall outside of specified tolerance limits, and, therefore, did not meet the program's quality assurance objectives described in Section 3.2. Data validation flags to be used for this project are defined in the National Functional Guidelines. Data validation flags will indicate if results are considered quantitative, estimated, or rejected. Only rejected data are considered unusable for decision-making purposes; however, other qualified data may require further verification.

8. Data Reporting

8.3.2 Project Data Management

Data management is the process of organizing, maintaining, and applying a variety of data to provide a useful and coherent view of the site conditions. Data collected for this investigation include sample collection data, field measurement data, onsite laboratory analytical data, and offsite laboratory analytical data. The data management resources include staff to review and maintain project data, a computerized data management system, and a documentation filing system. The project database management system has the capability to maintain the relationship between sampling locations, samples collected, and filed and laboratory analytical results.

8. Data Reporting

This page intentionally left blank.

9. Performance and System Audits

Audit programs are established and directed by PlaceWorks quality assurance staff to ensure that field and laboratory activities are performed in compliance with project controlling documents. This section describes responsibilities, requirements and methods for scheduling, conducting and documenting audits of field and laboratory activities.

9.1 FIELD AUDITS

Field audits focus on appropriateness of personnel assignments and expertise, availability of field equipment, adherence to project controlling documents for sample collection and identification, sample handling and transport, use of QA samples, chain of custody procedures, equipment decontamination and documentation. Field audits are not required, but may be performed in the event significant discrepancies are identified that warrant evaluation of field practices.

9.2 LABORATORY AUDITS

Laboratory audits include reviews of sample handling procedures, internal sample tracking, SOPs, analytical data documentation, QA/QC protocols, and data reporting. Any selected mobile or offsite laboratory will be licensed by the State of California as a certified testing laboratory. If no previous audit has been conducted by PlaceWorks, a scheduled audit will be conducted by the quality assurance staff during the course of this project to ensure the integrity of sample handling and processing by the laboratory.

9.3 DATA AUDITS

Data audits will be performed on analytical results received from the laboratories. These audits will be accomplished through the process of data validation as described in Section 8.3, or may involve a more detailed review of laboratory analytical results. Data audits require the laboratory to submit complete raw data files to PlaceWorks for validation. PlaceWorks chemists will perform a review of the data consistent with the level of effort described in the National Functional Guidelines (USEPA 1994 b and c). This level of validation consists of a detailed review of sample data, including verification of data calculations for calibration and quality control samples to assess if these data are consistent with method requirements. Upon request, the laboratory will make available all supporting documentation in a timely fashion.

9.4 REPORTS TO MANAGEMENT AND RESPONSIBILITIES

Upon completion of any audit, the auditor will submit to the Project Manager and Field Manager a report or memorandum describing any problems or deficiencies identified during the audit. It is the responsibility of the Project Manager to determine if the deviations will result in any adverse effect on the project conclusions. If it is determined that corrective action is necessary, procedures outlined in Section 9.5 will be followed.

9. Performance and System Audits

9.5 CORRECTIVE ACTION

Corrective actions will be initiated whenever data quality indicators suggest that DQOs have not been met. Corrective actions will begin with identifying the source of the problem. Potential problem sources include failure to adhere to method procedures, improper data reduction, equipment malfunctions, or systemic contamination. The first level of responsibility for identifying the problems and initiating corrective action lies with the analyst/field personnel. The second level of responsibility lies with any person reviewing the data. Corrective actions may include more intensive staff training, equipment repair followed by a more intensive preventive maintenance program, or removal of the source of systemic contamination. Once resolved, the corrective action procedure will be fully documented, and if DQOs were not met, the samples in question must be recollected and/or reanalyzed utilizing a properly functioning system (USEPA 1998).

Model CSSB-2 Construction Site Sound Blankets

129 Penn St, Westfield, IN 46074
Phone 888.213.4711 Fax 317-774-1911

Product Features:

- Weatherproof
- Outdoor use/Sheds water
- 2" thick, quilted exterior rated facing
- Grommets for easy attachment to a fence
- STC-21, estimated 10-20 decibel reduction
- In-stock option for quick ship

eNoise Control's Construction Site Sound Blankets are used to block noise on construction sites, drilling sites, compressor stations, and other outdoor noise sources. Our Model CSSB-2 consists of a UV resistant, heavy duty 10 ounce per square yard vinyl coated polyester (VCP) facing on both sides of a nominal 2" thick quilted fiberglass. Sound Blankets are constructed with grommets and sewn with Gore Tenara exterior grade thread for maximum longevity. The sound blankets can simply be zip-tied to your existing chain link perimeter fence, wood fence, jersey barrier fencing, or support framing.

Specification:

Supply weatherproof, exterior-rated quilted sound blankets for sound barrier and visual barrier at construction site perimeter. Material shall be nominal 2" thick, diamond stitched UV resistant 10 ounce per square yard vinyl coated polyester (VCP) faced both sides. Sewn using exterior-rated Gore Tenara thread. Grommets integrated into blankets for securing to job site fencing. Minimum STC-21 rating. Minimum NRC-0.75 rating. Secure blankets with no visual gaps at joints and tight to ground level, complying to manufacturers installation guidelines. Use Model CSSB-2, Construction Site Sound Blanket manufactured by eNoise Control, 129 Penn St, Westfield, IN 46074, 888.213.4711, info@enoisecontrol.com.

Technical Data:

Facing	UV resistant, weather proof VCP both sides
Thickness	Nominal 2.00" [1.5" post fabrication]
Standard Width	48"
Weight	0.50 lb-psf
Temperature Range	-40° to +180°F

QuietCurb™

What is QuietCurb™ ?

An innovative "Quiet Comfort" option

The **QuietCurb™** is an acoustically-engineered roof curb product which further enhances the Trane IntelliPak by **reducing operating sound power levels**. In some sizes, the Trane rooftop, with the **QuietCurb** accessory, is as much as 18 NC lower than the equivalent size competitive model! Read on and COMPARE.

TRANE

Unitary Products Group

QuietCurb™

How Does it Work?

Addresses the Three Major Components of Rooftop Generated Sound

The curb prevents regenerated noise (vibratory noise resulting from the transmission of sound from a turbulent fluid or mechanical source) through the use of an integral spring-vibration isolation rail. [Installer's Guide](#)

High frequency components of rooftop noise are absorbed by the High density insulation lining the interior of the curb.

QuietCurb™

Low frequency noise is reduced / eliminated through the use of a unique air flow path-plenum design which reduces air turbulence and permits the low frequency noise to "break out" above the roof line before entering the building.

What products can QuietCurb™ be applied to?

IntelliPak™ Packaged Rooftops

The entire line of 20 - 130 ton IntelliPak packaged rooftops and roof-mounted air handling products which have the extended ("X-casing") design, i.e. all SX (extended casing-cooling only), SF (cooling with gas heat), SS (cooling with steam heat), SL (cooling with hot water heat), and SE (cooling with electric heat) models. The curb is not available for SA models (this is because the SA model rooftops should never be chosen for applications where noise is a concern - they are typically up to 6 dB louder than the equivalent extended-casing model)

TRANE

Global Unitary Systems

QuietCurb™

Features & Benefits

Up to 18 NC quieter than competitive offerings.

Easy and quick to install curb ships fully assembled.

Spring isolated curb with special air flow plenum design addresses all major components of rooftop generated noise.

Seismic option available to meet seismic criteria in most regions of the U.S.

Applicable to IntelliPak packaged rooftops and air handlers and, C & E-style units which are design sequence "P" and "H" or higher respectively.

Quick production cycle curb cycle is 2 - 4 weeks.

Product Positioning

Sound Sensitive Applications - always apply QuietCurb.

Potentially Sound Sensitive Applications - QuietCurb is strongly recommended with extended casing models (SE, SF, SL, SS & SX) should be utilized.

Sound is Not a Concern - the lower cost SA model may be bid

TRANE

Global Unitary Systems

QuietCurb™

in lieu of an SX. Keep in mind that utilization of the SA usually results in about 6 dB sound penalty - versus an SX.

Selling Strategy

Actual Test Results - confirm that QuietCurb is a real solution producing real quiet comfort results.

Octave Band Sound Power Level Data - is provided to document the acoustical performance of QuietCurb.

Factory Assembly - minimizes field labor time and expense and assures the customer that he/she will get consistent, repeatable results each time QuietCurb is applied.

Patent Pending Design - QuietCurb is a unique development in quiet comfort technology which is easily differentiable from field-fabricated/other competitive solutions.

QuietCurb™

How Do I Order the QuietCurb

QuietCurb model numbers and pricing are available through the LYNX™ Productivity Suite. The curbs are build-to-order and have a 2-4 week production cycle

WHEN ENTERING THE ORDER YOU MUST INCLUDE THE PRODUCT CODE (394), QUANTITY, AND ASSOCIATED SPECIFIC CURB MODEL NUMBER(S).

The QuietCurb model number nomenclature is shown on the following page.

Stock or Build-to-order (BTO)?

Note: Curbs are **build-to-order** items only, just as the large rooftop products are. However, the curbs will be available on a shorter 2-4 week production cycle.

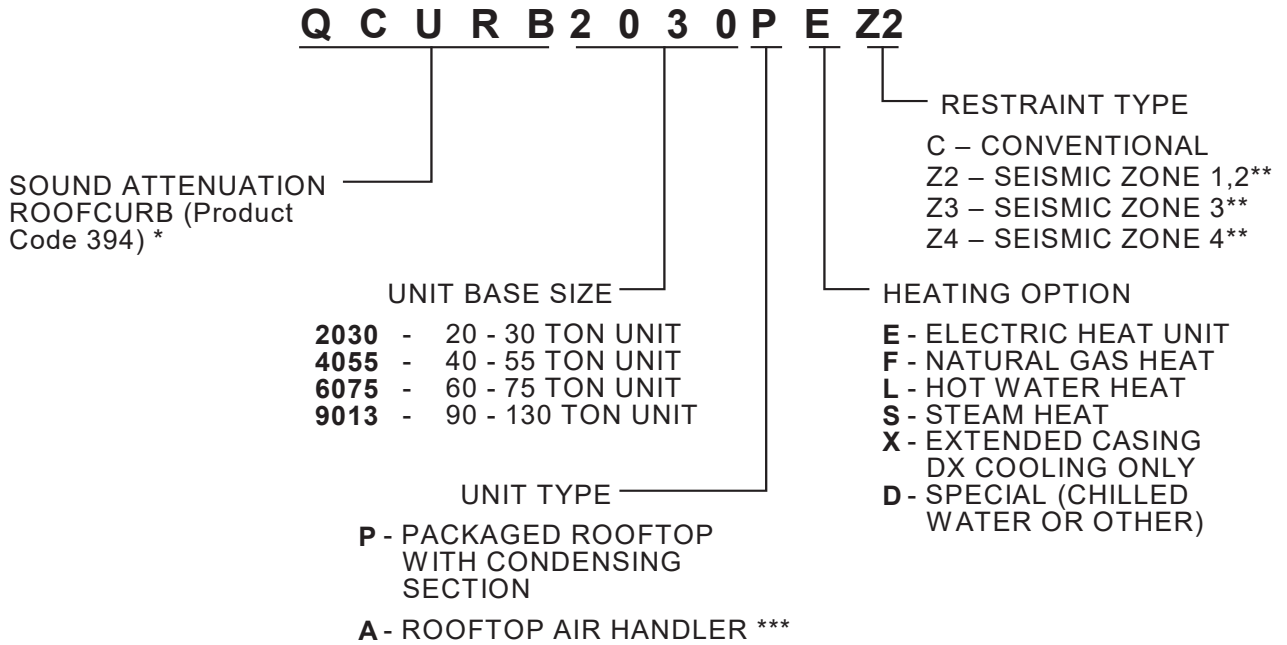

Call the Customer Service-Order Entry team at 1-800-235-9226 for assistance.

TRANE

Global Unitary Systems

QuietCurb™

** A full set of stamped calculations that are prepared by professional engineers for a specific project, in its specific seismic region, may be obtained by adding a "J" as the last digit of the ordering number. (Example: QCURB2030ADZ2J for a zone 2 seismic curb with job specific calculations). For more information, contact ThyBar Corp. at 1-800-666-CURB.

*** If a chilled water air handler is ordered the complete model number must be provided to identify coil type chosen / coordinate thru-the-curb piping locations.

QuietCurb™ Applications

Frequency Inverters

Variable Frequency Drives (VFD) or frequency inverters are recommended for air flow modulation (versus inlet guide vanes or discharge dampers) where noise is a concern. Testing on the 40 ton unit has shown that inverters modulate air flow more quietly than damper controls. On the 40 ton unit, NC levels dropped as low as NC-26 - well below normal background noise when an inverter was applied.

Flexible Connections

When applying the **QuietCurb™** it is of utmost importance that all rigid connections to the unit (i.e hot water piping, chilled water piping, steam piping, natural gas piping, electrical conduit...etc.) integrate a flexible loop or coupling connector to allow the spring isolators in the curb to "free float". Any rigid connections to the unit will negate the benefit of the spring curb causing it to "short circuit" transmitting vibration through the rigid connections to the building structure.

USE FLEXIBLE TRANSITIONS OR COUPLINGS AT THE ROOFTOP TO AVOID REGENERATED NOISE PROBLEMS.

2.01 MANUFACTURERS

A. Provide Trane QuietCurb™ or approved alternate by Custom Curb Inc. or Micro Metl. Alternates must include high density sheathing in the base of the curb, spring-vibration isolation rail, low velocity air flow patterning, and be lined internally with minimum 4" insulation containing a perforated liner backing. The curb must comply with the sound power level performance and features specified herein and as indicated on the contract documents.

OR

A. Manufacturer of rooftop units [rooftop air handlers] shall provide acoustical curbs to form a complete and matched rooftop system with documented octave band sound power performance.

OR

* A. Provide Trane QuietCurb™.

2.02 ROOFCURBS

A. Roofcurb shall be prefabricated, non-combustible construction with sealing gasket around perimeter members to insure air/water tight integrity. The curb shall be constructed of minimum 14 ga. galvanized steel structural members with minimum 20 ga. galvanized steel flashing with overlapping continuous rubber counterflashing. Curb shall be furnished with a 2" X 2" nailer strip for attaching roofing felts. The base of the curb shall contain acoustically non-conductive floor pans with the supply and return air openings framed for duct attachment (duct must be supported independent of curb and flex connected).

B. Curb shall incorporate integral spring-vibration isolation rail with adjustable 1" deflection isolators, properly sized and selected for unit point loading. Spring isolators shall have a minimum of 90% isolation efficiency.

C. Roofcurb shall be shipped [fully assembled from the manufacturing site] [and] seismically isolated with [vertically stabalized] spring isolators [incorporating vertical limit stops].

The following paragraph applies to packaged rooftops only - not roof mounted air handling units

- # D. The curb shall be designed to provide pedestal support for an open (no base pan constructed) condensing section. Full perimeter supported condensing sections shall not be permitted.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install the roofcurb in accordance with manufacturer's recommendations and as shown on the construction documents.
- B. Coordinate piping and power entry locations with other trades. Supporting structural framing shall be sized and installed as indicated on the construction documents. Submit shop drawings to the Architect, with point loadings and curb layout, for approval, prior to beginning work.

END OF SECTION

+++++ SPEC BRIEF +++++ >>>>>DELETE FROM DOCUMENT <<<<<<

1.03, B.

2.01, A.

Requiring published sound data to document performance of the roofcurb-rooftop "system" eliminates the guesswork involved to engineer a quiet job for the customer. Vendor products which cannot provide documentation for the real world performance of the combination curb-unit should not be allowed.

2.01, A.

"QuietCurb" is a proprietary feature THAT WORKS producing up to 18 NC reductions in sound power levels (depending on size). Let the OWNER make the buying decision based upon unprecedented performance in quiet comfort!

2.02, C.

QuietCurb™ is unique in that the product is shipped fully assembled from the manufacturing point directly to the job site. This feature is beneficial for jobs with tight schedules or replacement opportunities that have been plagued with poor acoustic performance.

2.02, D.

Manufacturer's which do not have open (no base pan constructed) condensing sections should not be allowed to bid. If allowed, the base pan in the condensing section can resonate, amplifying compressor noise. Designs without the base pan eliminate the "drum head" potential and allow compressor noise to break out above the roof line. Whereas, full perimeter base pan designs radiate and reflect the noise directly into the ceiling space below.

Executive Summary

Fehr & Peers has completed a transportation impact analysis (TIA) for the University of California, Riverside (UC Riverside) and Riverside Unified School District (RUSD) for the Science, Technology, Engineering, and Mathematics (STEM) Education Center Project (Project) in Riverside, California. The Project would employ approximately 60 faculty and staff and is expected to serve a capacity of approximately 800 students at any given time (400 full-time and 800 part-time students who split morning and afternoons, resulting in approximately 800 full time equivalent students), who are pursuing their interests and aptitudes in STEM. Students would travel to and from the Project site via bussing, student drivers, and parent pick-up and drop-off.

As part of the TIA, and consistent with the California Environmental Quality Act (CEQA) requirements for the study of Vehicle Miles Traveled (VMT) for the determination of significant transportation impacts, the following scenarios were analyzed:

- Baseline – The baseline 2022 condition for the VMT analysis was developed using the Base Year 2018 Riverside County Transportation Model (RIVCOM) model and interpolation to develop the 2022 condition.
- Baseline Plus Project – Project traffic from the addition of the proposed student enrollment and faculty/staff was added to the Baseline conditions to develop Baseline Plus Project conditions.
- Cumulative Without Project – The Cumulative Without Project 2045 conditions were developed using the Future Year RIVCOM model.
- Cumulative Plus Project – Project traffic from the addition of the proposed student enrollment and faculty/staff was added to the Cumulative Without Project conditions to create the Cumulative Plus Project conditions.

Analysis

This study considered the effect of the Project as it relates to VMT. As a result of Senate Bill 743 (SB 743) and the current CEQA guidelines for determining transportation impacts, this study considered VMT as the metric for evaluating the Project's environmental impacts on the transportation system.

Findings

Based on methodology used by UC Riverside for determining VMT impacts, the Project is eligible for screening from VMT analysis based on the local-serving use criteria. Local-serving is defined by the City of Riverside in the *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (July 2020) as a project which would decrease the number of trips or the distance those trips travel to access the development. Within the list of projects defined as local-serving by the City of Riverside, local-serving K-12 schools are identified. In October 2021, RUSD decided that students only who reside inside

of RUSD boundaries would be eligible to attend the existing RUSD STEM Academy (STEM Academy) beginning with the 2022-2023 5th grade cohort and going forward for the following school years¹. As a result, assuming the Project opens in 2028, there may only be two remaining grades (11th and 12th grade) which could include students from outside the RUSD boundary, and the Project would have no students from outside the RUSD boundary in 2030 and beyond. By only serving students within the RUSD boundaries, the Project could be considered local-serving to RUSD. Therefore, this Project meets the requirements of a local-serving project and can be presumed to have a less-than-significant impact on transportation.

Because the Project meets the requirements of a local-serving project and can be presumed to have a less than significant impact, there is no requirement to conduct a VMT analysis for the Project. Therefore, the VMT analysis conducted in this TIA is for informational purposes.

VMT generated by the Project was analyzed under Baseline (2022) and Cumulative (2045) conditions. The baseline Project-generated VMT per Service Population does not exceed the threshold of 15 percent below Western Riverside Council of Governments (WRCOG) VMT per Service Population. The Cumulative Project-generated VMT per Service Population also does not exceed the threshold of 15 percent below WRCOG VMT per Service Population. Furthermore, the Project effect on VMT per Service Population does not cause total VMT for the WRCOG region to exceed the future forecast from the Southern California Association of Governments Regional Transportation Plan/Sustainable Communities Strategy (SCAG RTP/SCS).

Introduction

Fehr & Peers has completed a transportation impact analysis (TIA) for the University of California, Riverside (UC Riverside) and Riverside Unified School District (RUSD) for the Science, Technology, Engineering, and Mathematics (STEM) Education Center Project (Project) in Riverside, California. This report summarizes the methodology, findings, and conclusions of the analysis, including identification of recommended mitigation measures necessary for Project impacts, where feasible. This chapter outlines the geographic scope of the transportation impact analysis, including the study area.

Project Description

The Project is a three-story RUSD STEM Education Center to support students in grades 9 through 12. The Project would employ approximately 60 faculty and staff and is expected to serve a capacity of approximately 800 students at any given time (400 full-time and 800 part-time students who split mornings and afternoons, resulting in approximately 800 full-time equivalent students), who are pursuing their interests and aptitudes in STEM subject areas. The Project site plan is shown on **Figure 1**. Student travel to and from the Project site would be managed with the use of bussing, student drivers, and parent pick-up and drop-off. Students taking the bus to the Project would be picked up from and dropped off at the other existing high schools in RUSD.

The Project site is located at the southwest corner of Canyon Crest Drive and Blaine Street. **Figure 2** identifies the location of the Project site in the study area. The Project would have two driveways on Canyon Crest Drive and one driveway on Blaine Street. The main driveway would be located off Canyon Crest Drive and would lead vehicles into the parking lot area. This main driveway would be signalized to allow for protected turns into and out of the project site. A school pick-up and drop-off lane would be provided by the front (south side) of the main building, accessible from the main driveway.

A second driveway would be located off Canyon Crest Drive, approximately 80 feet south of the main driveway. The second driveway would be accessible to school buses, emergency and first responders, and service vehicles only (including UCR vehicles), and circulation for the buses and service vehicles would proceed in one direction by entering from the Canyon Crest Drive driveway and exiting from the Blaine Street driveway (located in the northwest corner of the Project site). Enforcement of the allowable vehicles could be conducted by school faculty and staff.

The Blaine Street driveway would be for exit only. This second driveway would be controlled by a stop sign for exiting vehicles. The UCR vehicles may enter off Canyon Crest Drive and may either exit from the Blaine Street driveway or may proceed west to Parking Lot 26 through an access controlled gate to connect to the UCR Baseball Complex and then exit off Rustin Avenue.

Project construction is anticipated to be completed as early as 2028 for student use in the 2028 – 2029 academic year. The Project is intended to replace grades 9 through 12 at the existing STEM Academy at 4466 Mt. Vernon Avenue in Riverside, California. The existing STEM Academy has a student population for grades 9 through 12 of approximately 238 full-time students.

The existing STEM Academy student enrollment consists mainly of students from the RUSD service area as well as some students from nearby communities such as Moreno Valley and Corona. However, at the October 7, 2021 RUSD board meeting, it was unanimously decided that there would be no allocation of attendance eligibility at the existing STEM Academy for students who are residing outside of RUSD boundaries beginning with the 2022-2023 5th grade and going forward for the following school years. This change would also affect the student enrollment for the Project because the 2022-2023 5th grade class would be the 2029-2030 12th grade class, and the Project would have no students from outside the RUSD boundary in 2030 and beyond.

Figure 2

Study Area

Geographic Scope

The geographic scope of the Vehicle Miles Traveled (VMT) analysis utilized the geographic boundaries provided in the Riverside County Transportation Model (RIVCOM) model. The RIVCOM model includes the geographic area of Riverside County and the Southern California Association of Governments (SCAG) area (Ventura, Los Angeles, Orange, San Bernardino, Riverside, and Imperial Counties) in the traffic modeling analysis. While the RIVCOM model is used for projects located in the WRCOG region, the VMT analysis accounts for trips in the larger SCAG area.

Analysis Scenarios

To identify potential California Environmental Quality Act (CEQA) significant transportation impacts associated with VMT, the following scenarios were analyzed:

- Baseline – The baseline condition for the VMT analysis was developed using the Base Year 2018 RIVCOM model and interpolation to develop the 2022 condition.
- Baseline Plus Project – Project traffic from the addition of the student enrollment and faculty/staff was added to the Baseline conditions to develop Baseline Plus Project conditions.
- Cumulative Without Project – The Cumulative Without Project conditions were developed using the Future Year 2045 RIVCOM model.
- Cumulative Plus Project – Project traffic from the addition of the student enrollment and faculty/staff was added to the Cumulative Without Project conditions to create the Cumulative Plus Project conditions.

Analysis Methodology

This chapter discusses the analysis methodology and assumptions in this analysis.

Vehicle Miles Traveled

On September 27, 2013, Governor Jerry Brown signed Senate Bill 743 (SB 743) into law and started a process to fundamentally change transportation impact analysis conducted as part of CEQA compliance. The Governor's Office of Planning and Research (OPR) was charged with developing new guidelines for evaluating transportation impacts under CEQA using methods that no longer focus on measuring automobile delay and level of service (LOS). This change at the state level recognizes the unintended consequences of using LOS as an impact metric, which results in understating potential transportation impacts in greenfield areas and discouraging more sustainable infill projects and active transportation projects. SB 743 directed OPR to develop new guidelines that use a transportation performance metric that would help promote the reduction of greenhouse gas emissions, the development of multimodal networks, and a more sustainable diversity of land uses.

OPR issued proposed updates to the CEQA Guidelines in support of these goals in November 2017² and a supporting Technical Advisory in December 2018.³ The updates establish VMT as the primary metric for evaluating a project's environmental impacts on the transportation system. The changes to CEQA Guidelines Section 15064.3 to implement SB 743 were approved by the State in December of 2018 and went into effect in July 2019.

The VMT analysis reflects the number of vehicle trips generated by the Project and the expected distance that vehicles would travel to/from the Project site for their work/school trips as well as other trips generated by school visitors. The Project-generated VMT was calculated for each scenario based on operational characteristics of the Project and zip code data for students and faculty/staff at the existing STEM Academy. The metric utilized for the transportation analysis is Total VMT per Service Population, which represents the daily VMT generated by the Project divided by the number of employees and total students at the Project site. These VMT measurements and associated calculations of VMT per Service Population were used to evaluate the VMT impact of the Project.

VMT Screening Criteria

As part of the VMT analysis, lead agencies may choose to use an impact screening method to streamline project review for VMT impacts. If a project does not pass an initial screening test, then a full VMT impact analysis is warranted. Three screening criteria have been identified by UCR/RUSD and include local-

² State of California, Governor's Office of Planning and Research, *Proposed Updates to the CEQA Guidelines, Final*, November 2017.

³ State of California, Governor's Office of Planning and Research, *Technical Advisory on Evaluating Transportation Impacts in CEQA*, December 2018.

serving projects, projects in Transit Priority Areas (TPA),⁴ and low VMT areas. Based on the operational characteristics of the Project and changes in the location of future student enrollment boundaries, the local-serving screening criteria was identified as a potential method to screen the Project from VMT analysis.⁵

The local-serving project screening is a valid screening criterion because certain project types may be presumed to have a less than significant impact absent substantial evidence to the contrary. Local-serving is defined by the City of Riverside in the *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (July 2020) as a project which would decrease the number of trips or the distance those trips travel to access the development. Within the list of projects defined as local-serving by the City of Riverside, local-serving K-12 schools are identified. Local-serving K-12 schools can be presumed to have a less than significant impact (absent substantial evidence to the contrary) because their use is limited to a local area if only students that reside locally in the boundary of the applicable school district will attend.

Thresholds of Significance

Although the Project may be eligible for screening from VMT analysis, a review of the VMT generated by the Project was prepared to fully understand the Project's effect on VMT. OPR provided VMT threshold guidance in its Technical Advisory for implementing SB 743. Consistent with that guidance, one of the thresholds for project-generated VMT is whether the project would result in a VMT per Service Population that is 15 percent below the Existing Conditions VMT per Service Population for a region. As explained in OPR's Technical Advisory⁶ prepared for Implementing SB 743:

Based on OPR's extensive review of the applicable research, and in light of an assessment by the California Air Resources Board (CARB) quantifying the need for VMT reduction in order to meet the State's long-term climate goals, OPR recommends that a per capita or per employee VMT that is 15 percent below that of existing development may be a reasonable threshold. [¶] Fifteen percent reductions in VMT are achievable at the project level in a variety of place types.⁷ [¶]

⁴ A TPA is defined as a half mile area around an existing major transit stop or an existing stop along a high-quality transit corridor per the definitions below.

Pub. Resources Code, § 21064.3 - 'Major transit stop' means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.

Pub. Resources Code, § 21155 - For purposes of this section, a 'high-quality transit corridor' means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.

⁵ State of California, Governor's Office of Planning and Research, *Technical Advisory on Evaluating Transportation Impacts in CEQA*, December 2018.

⁶ State of California, Governor's Office of Planning and Research, *Technical Advisory on Evaluating Transportation Impacts in CEQA*, p. 10 -11 December 2018.

⁷ CAPCOA (2010) Quantifying Greenhouse Gas Mitigation Measures, p. 55, available at

<http://www.aqmd.gov/docs/default-source/ceqa/handbook/capcoa-quantifying-greenhouse-gas-mitigation-measures.pdf>

Moreover, a 15 percent reduction is consistent with SB 743's direction to OPR to select a threshold that would help the State achieve its climate goals. As described above, section 21099 states that the criteria for determining significance must "promote the reduction in greenhouse gas emissions." In its document, California Air Resources Board 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals,⁸ CARB assesses VMT reduction per capita consistent with its evidence-based modeling scenario that would achieve State climate goals of 40 percent GHG emissions reduction from 1990 levels by 2030 and 80 percent GHG emissions reduction levels from 1990 by 2050. Applying California Department of Finance population forecasts, CARB finds per-capita light-duty vehicle travel would need to be approximately 16.8 percent lower than existing, and overall per-capita vehicle travel would need to be approximately 14.3 percent lower than existing levels under that scenario. Below these levels, a project could be considered low VMT and would, on that metric, be consistent with 2017 Scoping Plan Update assumptions that achieve climate state climate goals... [¶] In summary, achieving 15 percent lower per capita (residential) or per employee (office) VMT than existing development is both generally achievable and is supported by evidence that connects this level of reduction to the State's emissions goals.

The following thresholds of significance were used to determine VMT impacts associated with the Project:

- A project would result in a significant project-generated VMT impact if either of the following conditions are satisfied:
 - The Baseline Plus Project generated VMT per Service Population exceeds 15 percent below the WRCOG baseline VMT per Service Population
 - The Cumulative Plus Project generated VMT per Service Population exceeds 15 percent below the WRCOG baseline VMT per Service Population
- The project's effect⁹ on VMT would be considered significant if it resulted in the following condition being satisfied:

⁸ California Air Resources Board (Jan. 2019) California Air Resources Board 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals, available at <https://ww2.arb.ca.gov/resources/documents/carb-2017-scoping-plan-identified-vmt-reductions-and-relationship-state-climate>.

⁹ This methodology is also described by OPR as an "Absolute" VMT metric. More specifically, OPR's Technical Advisory suggests that (1) "Projects that decrease [total] vehicle miles traveled in the project area compared to existing conditions should be presumed to have a less than significant transportation impact." (CEQA Guidelines § 15064.3(b)(1).) (2) "Transportation projects that reduce, or have no impact on, vehicle miles traveled should be presumed to cause a less than significant transportation impact." ((CEQA Guidelines § 15064.3(b)(2).) (3) "Where development decreases [total] VMT, lead agencies should consider the impact to be less than significant," (OPR Technical Advisory, p. 16.), (4) "Where a project replaces existing VMT-generating land uses, if the replacement leads to a net overall decrease in VMT, the project would lead to a less-than-significant transportation impact." (OPR Technical Advisory, p. 17.)

- The cumulative link-level boundary¹⁰ WRCOG region VMT per Service Population increases under the Cumulative Plus Project condition compared to Cumulative (2045) conditions

The Project proposes to house only RUSD students and employ new faculty and staff independent of the existing STEM Academy. While all of these population components are responsible for an increase in trips and VMT generated by the Project, management of trip generation has been found to help the State reach emissions goals. The methodology utilized in the VMT analysis accounts for student and employee VMT as well as additional VMT generated by visitors. The VMT threshold used in this study of 15 percent below the WRCOG baseline demonstrates that UC Riverside and RUSD manage VMT and help the State achieve emission goals in connection with the proposed Project.

Riverside County Transportation Model (RIVCOM)

The Riverside County Transportation Model (RIVCOM) was used to develop VMT forecasts for this study.¹¹ The current RIVCOM uses a 2018 base year, a 2045 future year, and Socio-Economic Data (SED) consistent with the Southern California Association of Governments (SCAG) 2020 SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

Socio-Economic Data (SED)

As part of SED review of future year projections in the WRCOG model, a list of approved and pending developments was requested from the City of Riverside (City), County of Riverside, City of Moreno Valley, and UC Riverside. These lists were then reviewed with land use assumptions in the future year model to ensure that all reasonably foreseeable projects within a 15-mile radius of the Project site were accounted for in the land uses assumed in the model under cumulative conditions. A list of all approved and pending developments in the City, County of Riverside, City of Moreno Valley, and UC Riverside is provided in

Appendix A.

Roadway Network

As part of the RIVCOM review, both the base year and future year roadway networks were examined for consistency with existing conditions and planned roadway improvements. The future year roadway network was compared to the 2020 SCAG RTP/SCS to verify that only projects planned to be in place before 2045 were assumed in the network under cumulative conditions. One project listed in the Constrained RTP Project List that is planned to be complete prior to 2045 is the widening of Iowa Avenue from four lanes to six lanes from Blaine Street to the north city limit of Riverside; this Project has an estimated opening year of 2026.

¹⁰ Link-level boundary analysis is the sum of all weekday VMT on a roadway network within a designated boundary divided by service population.

¹¹ The RIVCOM model was developed by the Western Riverside Council of Governments in 2020. WRCOG is the current manager of the RIVCOM model and requests for a copy of the RIVCOM model can be submitted to WRCOG staff.

VMT Estimates

VMT was estimated for the WRCOG region using the Origin/Destination (OD) method. The OD method for calculating VMT sums all weekday VMT generated by trips with at least one trip end in the study area. The OD Method is completed after the fifth and final loops of assignment processing in the travel demand model are finished. Origins are all vehicle trips that start in a specific traffic analysis zone (TAZ), and destinations are all vehicle trips that end in a specific TAZ. The OD Method also accounts for external trips that have one trip end outside of the model boundary (IX-XI trips).

The OD Method calculation was completed by multiplying the OD trip tables and the final assignment skim matrices from the RIVCOM model. The OD tables provided the number of trips between each TAZ, and the skim matrices provided the distance on the roadway network, or trip length, between each TAZ. The full length of all trips with an origin or destination in a TAZ are used to estimate the VMT for that TAZ, and likewise the full length of all trips with an origin or destination in any of the TAZs representing the WRCOG region were used to estimate the WRCOG VMT. RIVCOM input and output files are available upon request.

Due to the unique nature of the Project operating conditions, such as a variety of full-time and part-time students, varying bus usage, off-peak pick-up and drop-off, and varying trip lengths for students, a manual calculation of VMT for the Project was conducted. The VMT calculation used the daily trip generation estimates presented below multiplied by the average trip length for the various types of trips.

Project Traffic Volumes

The methodology used to estimate changes traffic volumes associated with the Project is described below.

Project Trip Generation

While *Trip Generation, 11th Edition* (Institute of Transportation Engineers [ITE], 2021) provides trip generation rates for grades 9-12 school land use, Project trip generation estimates for the off-ramp queuing analysis were estimated using a combination of student enrollment projections, proposed programmatic operations regarding full-time and part-time students, and anticipated travel patterns, as presented in **Table 1**. The proposed student enrollment and staff/faculty employment along with the operational characteristics of students, faculty, and staff traveling to and from the school is expected to generate an estimated new external 1,864 daily trips with 840 trips (470 inbound/370 outbound) during the AM peak hour (7:00 AM to 9:00 AM), 780 trips (370 inbound/410 outbound) during the midday peak hour (2:00 PM to 4:00 PM), and 60 trips (0 inbound/60 outbound) during the PM peak hour (4:00 PM to 6:00 PM). In addition to these time periods, a morning and afternoon part-time student transfer period will occur between 11:00 AM and 1:00 PM. This period will accommodate morning students leaving the Project site to go to other existing high schools and afternoon students arriving at the Project site from other existing high-schools. Buses will be the primary source of transporting these students. This time period was not analyzed as part of the off-ramp queuing analysis do the lower trip generation of the

school arrival and departure and due to its occurrence outside of the typical AM and PM peak hour traffic periods. A credit for the grades 9-12 trips at the existing STEM Academy was not taken for the trip generation estimate of the Project due to the different locations for each facility.

Notes: AVO = Average Vehicle Occupancy

Based on information provided by RUSD and STEM Academy Principal, the following was assumed:

- [a]: 25 percent bussing assumed for full-time students.
- [b]: 75 percent bussing assumed during school arrival and departure, and 95 percent bussing assumed during part-time student transfer.
- [c]: 5 percent student drive alone assumed for full-time and part-time students.
- [d]: 70 percent student drop-off assumed for full-time students.
- [e]: 20 percent student pick-up/drop-off assumed for part-time students during school arrival and departure.

[f]: The number of visitors to the STEM Education Center was assumed to reflect approximately 5 percent of the student population and not travel during the peak hours of school operation.

[g]: During the transfer of part-time students, 10 buses enter and exit the Project site to drop-off and pick-up bused part-time students. This occurs outside of these identified peak hours of school operation.

[h]: During the transfer of part-time students, 20 students enter the campus driving alone and 20 students exit the campus driving alone. This occurs outside of these identified peak hours of school operation.

[i]: Deliveries to the Project site are expected to occur outside the peak hours of school operation.

Project Trip Distribution

The Project trip distribution reflects the distribution of the existing grades 9 through 12 students and the staff/faculty at the existing STEM Academy. Anonymous zip code data for students, faculty, and staff from the existing STEM Academy for the 2021 academic year was reviewed to determine the starting and ending location for trips to and from the school. Although this data would shift each year the proposed school is in operation, the existing zip code data for the students, faculty, and staff reflects the best available information at this time, and future trip distribution for the Project should generally reflect a similar trip distribution.

Students taking the bus to the Project site would be picked-up and dropped-off at the other existing high schools within the RUSD boundaries.

Existing Conditions

This chapter summarizes the Existing conditions in the study area, including the roadway, transit, bicycle, and pedestrian networks, to document the current travel against which the Project would be assessed.

Existing Roadway Facilities

Regional Roads

Regional roads in the Project site vicinity include:

- Interstate 215/State Route 60 Freeway (I-215/SR 60): The I-215/SR 60 freeway is an interstate highway in Southern California. As a combined route, it runs as I-215/SR 60 in the north/south direction from Moreno Valley to Riverside. The I-215/SR 60 freeway diagonally bisects the UC Riverside campus. Near the Project study area, it is generally an eight-lane facility (four lanes in each direction). Access to the I-215/SR 60 freeway near the Project study area is provided at Blaine Street/3rd Street, University Avenue, Martin Luther King Boulevard, and Central Avenue.

Local Access Roads

Local access roads in the Project site vicinity include:

- Iowa Avenue: Iowa Avenue is a north-south four-lane facility that bisects portions of the UC Riverside West Campus. Iowa Avenue is designated as an arterial by the City of Riverside General Plan¹². It has a speed limit of 45 miles per hour (mph).
- Canyon Crest Drive: Canyon Crest Drive is a north-south facility that widens from a 66-foot (ft) two-lane collector into an 88-ft four-lane arterial. Canyon Crest Drive bisects portions of the UC Riverside East Campus and provides access to the UC Riverside campus core, and to the Project site. It has a variable speed limit ranging between 25 and 40 mph.
- Watkins Drive: Watkins Drive is a north-south two-lane facility along the eastern edge of the UC Riverside East Campus. Watkins Drive is designated as an arterial by the City of Riverside General Plan¹³. It has a variable speed limit ranging between 35 and 45 mph.
- Blaine Street/3rd Street: Blaine Street/3rd Street is an east-west four-lane facility along the northern edge of the UC Riverside East Campus and the northern boundary of the Project site. It is designated as an arterial in the City of Riverside General Plan¹² and has a speed limit of 40 mph.

¹² https://riversideca.gov/cedd/sites/riversideca.gov/cedd/files/pdf/planning/general-plan/12_Circulation_&_Community%20Mobility_Element_with%20maps.pdf

Bicycle Facilities

Bicycle facilities in the City of Riverside are classified as follows:

Class I Bikeways (Bike Paths)

Class I bicycle facilities are bicycle trails or paths that are off-street and separated from automobiles. They are a minimum of eight feet in width for two-way travel and include bike lane signage and designated street crossings where needed. A Class I Bike Path may parallel a roadway (within the parkway) or may be a separate right-of-way that meanders through a neighborhood or along a flood control channel or utility right-of-way.

Class II Bikeways (Bike Lanes)

Class II bicycle facilities are striped lanes that provide bike travel and can be either located next to a curb or parking lane. If located next to a curb, a minimum width of five feet is recommended. However, a bike lane adjacent to a parking lane can be four feet in width. Bike lanes are exclusively for the use of bicycles and include bike lane signage, special lane lines, and pavement markings.

Class III Bikeways (Bike Routes)

Class III Bikeways are streets providing for shared use by motor vehicles and bicyclists. While bicyclists have no exclusive use or priority, signage both by the side of the street and stenciled on the roadway surface alerts motorists to bicyclists sharing the roadway space and denotes that the street is an official bike route.

Class IV Bikeways (Cycle Tracks)

Class IV bicycle facilities, sometimes called cycle tracks or separated bikeways, provide a right-of-way designated exclusively for bicycle travel adjacent to a roadway and are protected from vehicular traffic via separations (e.g., grade separation, flexible posts, inflexible physical barriers, on-street parking). California Assembly Bill 1193 (AB 1193) legalized and established design standards for Class IV bikeways in 2015.

Existing Bicycle Facilities

According to the City of Riverside Bicycle Master Plan Updated: Addendum (City of Riverside, March 2012), there is a total of 101.5 miles of existing bike lanes.

Near or within the study area, the following existing Class II bike facilities are provided:

- Iowa Avenue: Bike lanes are provided north of University Avenue on both sides of the street.
- Canyon Crest Drive: Bike lanes are provided north of University Avenue on both sides of the street.

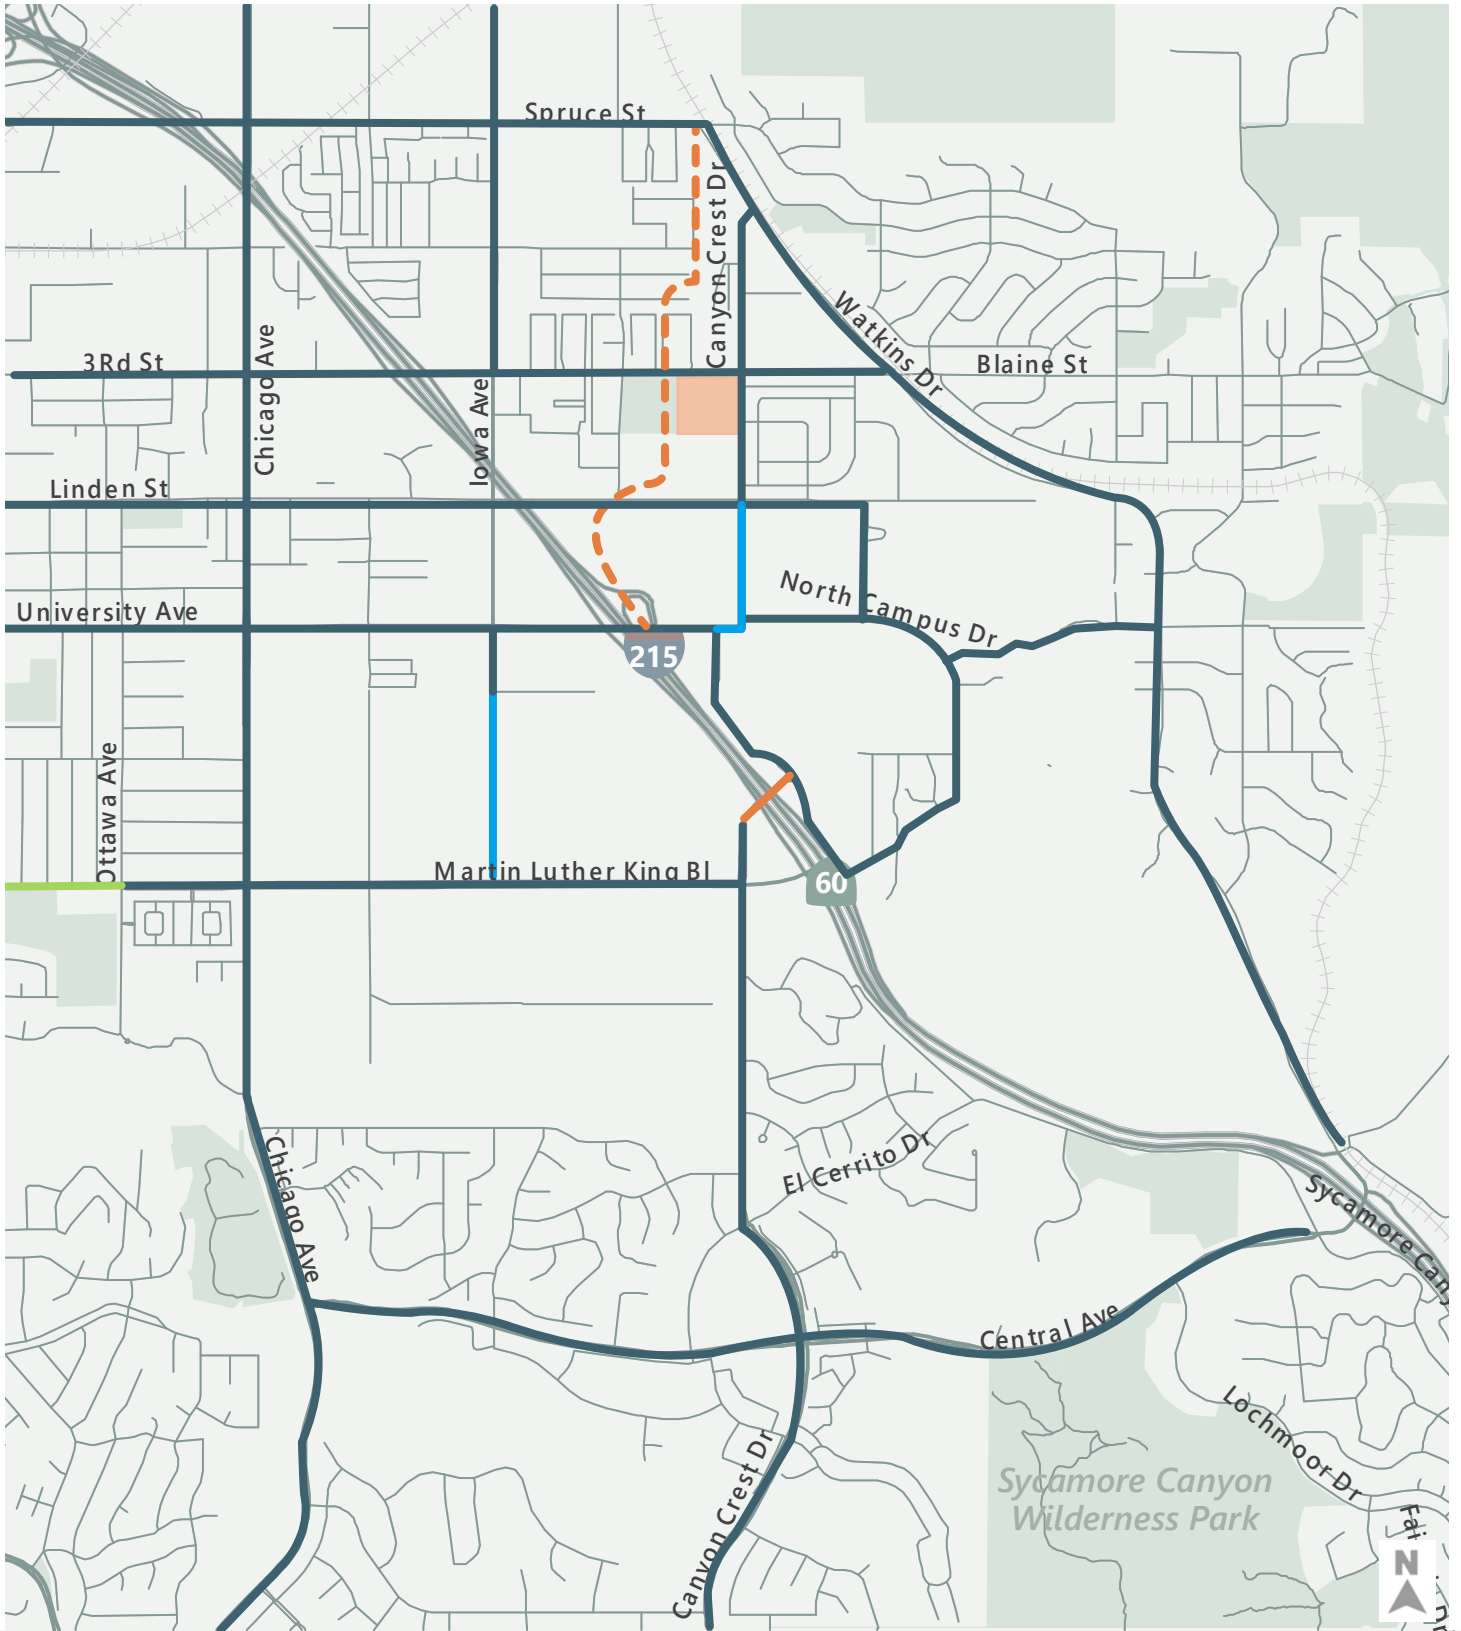

- Watkins Drive: Bike lanes are provided between Spruce Street and the I-215/SR 60 freeway on both sides of the street.
- Blaine Street/3rd Street: Bike lanes are provided between Valencia Hills Drive and Market Street on both sides of the street.
- West Linden Street: Bike lanes are provided between Aberdeen Drive and Niki Way on both sides of the street. A bike lane is provided in the westbound direction between Chicago Avenue and Niki Way.
- University Avenue: Bike lanes are provided between Canyon Crest Drive and Lime Street on both sides of the street.
- Big Springs Road: Bike lanes are provided between Campus Drive and Mt. Vernon Avenue on both sides of the street.
- Martin Luther King Boulevard: Bike lanes are provided between Canyon Crest Drive and Chicago Avenue.
- Aberdeen Drive: Bike lanes are provided between West Linden Street and Campus Drive.
- Campus Drive: Bike lanes are provided on the campus loop road between the Parking Lot 1 Driveway and Aberdeen Drive.

Near the study area, the following Class IV bike facilities are provided:

- University Avenue: A protected two-way cycle track is provided on the south side of University Avenue between Campus Drive and Canyon Crest Drive.
- Canyon Crest Drive: A two-way cycle track is provided on the east side of Canyon Crest Drive between University Avenue and W. Linden Avenue.
- Iowa Avenue: A two-way cycle track is provided on the east side of Iowa Avenue between Everton Place and Martin Luther King Boulevard.

Figure 3 identifies the existing bicycle facilities in and around the study area.

Figure 3
Bicycle Facilities

Pedestrian Facilities

Interconnectivity of land uses, coupled with the provision of adequate pedestrian and bicycle facilities, is an important component of the City's future circulation network. The City seeks to expand pedestrian and bike path network to provide connections between schools, activity centers, parks, and residential areas. A comprehensive trails system is intended to link residential areas, schools, parks, and commercial centers so residents can travel within the community without driving (City of Riverside General Plan, 2012).

Near or within the Project study area, sidewalks are generally provided on the following streets:

- Iowa Avenue
- Canyon Crest Drive
- Watkins Drive
- Blaine Street/3rd Street
- W. Linden Street

The major streets that provide access to the Project include Blaine Street and Canyon Crest Drive. These roadways have well-connected and maintained sidewalk networks near the Project site. These streets currently provide access for pedestrians to the bus stops located near the Project site along Canyon Crest Drive and Blaine Street.

Transit Facilities

The transit facilities provided in the City are described below.

Metrolink

Commuter train service in the City is provided by Metrolink, which operates seven commuter rail lines throughout Southern California. The UC Riverside/Riverside Hunter Park Metrolink Station is located northwest of the intersection between Marlborough Avenue and Rustin Avenue, approximately 1.1 miles north of the Project site. The UC Riverside/Riverside Hunter Park Metrolink Station is served by the 91/Perris Valley Line, which links Perris-South to LA Union Station on weekdays and weekends.

The Downtown Riverside Metrolink Station is located on Vine Street between University Avenue and 14th Street, approximately 2.2 miles west of the Project site. The Downtown Riverside Metrolink Station is served by the 91/Perris Valley Line, which links Perris-South to LA Union Station on weekdays and weekends; the Riverside Line, which links Downtown Riverside to LA Union Station on weekdays; and the Inland Empire-Orange County Line, which links San Bernardino Downtown to Oceanside on weekdays and weekends.

Bus Transit

Riverside Transit Agency (RTA) provides fixed route, commuter, and dial-a-ride bus service within western Riverside County, including the cities of Riverside, Corona, Norco, Jurupa, Grand Terrace, Loma Linda, Moreno Valley, Perris, San Jacinto, Hemet, Lake Elsinore and Temecula. American with Disabilities Act

(ADA) services within the City are provided by the City's Special Services. All buses on fixed routes are equipped with bike racks that hold two bicycles.

RTA routes that serve areas closest to the Project site include Routes 1, 10, 13, 14, 16, and 204. **Figure 4** shows the transit routes in and near the study area, and the 2022 schedule information is provided below.

Route 1 (UC Riverside – Downtown Riverside – Corona) – This route runs from UC Riverside Bannockburn to the West Corona Metrolink Station. Near the Project site, it operates on weekdays from 4:34 AM to 11:31 PM with 20-minute headways. It operates on weekends from 6:54 AM to 10:07 PM with 30-minute headways.

Route 10 (Big Springs & Watkins – Downtown Riverside – Galleria at Tyler) – This route runs from Galleria at Tyler to the intersection between Big Springs Road and Watkins Drive. Near the Project site, it operates on weekdays from 8:18 AM to 8:35 PM with 60-minute headways. It operates on weekends from 9:14 AM to 7:41 PM with 90-minute headways.

Route 13 (Hunter Park/UC Riverside Metrolink Station – Downtown Riverside – Galleria at Tyler) – This route runs from Galleria at Tyler to the Hunter Park/UC Riverside Metrolink Station. Near the Project site, it operates on weekdays from 7:25 AM to 6:22 PM with 60-minute headways. It operates on weekends from 7:20 AM to 5:34 PM with 60-minute headways.

Route 14 (Galleria at Tyler – Downtown Riverside – Loma Linda VA hospital) – This route runs from Galleria at Tyler to the Veterans Affairs Hospital at Loma Linda. Near the Project site, it operates on weekdays from 7:27 AM to 7:29 PM with 60-minute headways. It operates on weekends from 8:11 AM to 5:31 PM with 60-minute headways.

Route 16 (Moreno Valley Mall – UC Riverside) – This route runs from the Moreno Valley Mall to UC Riverside Bannockburn. Near the Project site, it operates on weekdays from 5:35 AM to 10:15 PM with 15-minute headways. It operates on weekends from 7:30 AM to 10:13 PM with 45-minute headways.

Route 204 (UC Riverside – Downtown Riverside – Ontario Mills Mall – Montclair Transit Center) – This route runs from UC Riverside Bannockburn to the Montclair Transit Center. Near the Project site, it operates on weekdays from 6:33 AM to 8:47 PM with 60-minute headways.

Vehicle Miles Traveled

RIVCOM was used to estimate the baseline VMT per Service Population for the WRCOG region using the OD method. **Table 2** presents the VMT per Service Population for the WRCOG region, which would be used for the VMT impact analysis.

Table 2 – Baseline Vehicles Miles Traveled

	VMT	SERVICE POPULATION	VMT PER SERVICE POPULATION
WRCOG Region	90,203,331	2,762,109	32.66

Note: Service population includes employees residents and grades 9 – 12 students.

VMT = Vehicle Miles Traveled.

Vehicle Miles Traveled Impact Analysis

VMT Screening

For purposes of SB 743, a VMT analysis should be conducted for land use projects that have the potential to produce VMT per service population above the WRCOG boundary average. As discussed above, a project's VMT analysis should be guided by the results of its screening criteria evaluation. Based on the operational characteristics of the Project and change in the location of future student enrollment boundaries, the local-serving screening criterion was identified as a potential method to screen the Project.

As documented in the project description, the existing STEM Academy student enrollment consists mainly of students from the RUSD service area as well as some students from nearby communities such as Moreno Valley and Corona. However, at the October 7, 2021 RUSD board meeting, it was unanimously decided that there would be no allocation of attendance eligibility at the existing STEM Academy for students who are residing outside of RUSD boundaries beginning with the 2022-2023 5th grade and going forward for the following school years. This change would also affect the student enrollment for the Project because the 2022-2023 5th grade class would be the 2029-2030 12th grade class, and the Project would have no students from outside the RUSD boundary in 2030 and beyond.

Therefore, by the time the Project opens for its first academic year and within two years to follow, the Project would only be serving students from the RUSD boundaries, which would be considered local in the context of the City. Local-serving is defined by the City of Riverside in the *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (July 2020) as a project which would decrease the number of trips or the distance those trips travel to access the development. Within the list of projects defined as local-serving by the City of Riverside, local-serving K-12 schools are identified. Therefore, this Project meets the requirements of local serving project and can be presumed to have a less-than-significant VMT impact.

Project Generated VMT

Because the Project meets the requirements of a local-serving project and can be presumed to have a less than significant impact on VMT, there is no requirement to conduct a VMT analysis for the Project. However, a VMT analysis was conducted in this TIA for informational purposes.

Due to the unique nature of the Project operating conditions such as a variety of full-time and part-time students, varying bus usage, off-peak pick-up and drop-off, and varying trip lengths for students, a manual calculation of VMT for the Project was conducted.

VMT for the Project was calculated by multiplying the daily trip generation estimates by the associated average trip lengths for the various types of trips. These trip types include:

- Bus
- Students dropped off at the local high school for bussing
- Students driving alone
- Students dropped off at the STEM Education Center
- Faculty and staff
- Visitors
- Deliveries

The average trip length of students riding the bus was based on the average distance from the Project site to all the other RUSD high school locations. The Project would consolidate bussing for full-time and part-time students by picking up and dropping off at the RUSD high schools. For the VMT analysis, the full-time student bus riders are considered to create additional VMT by traveling to and from the local high school for bussing. It is assumed that full-time students would not have made the trip to the local high school if not for taking the bus to the Project site. Part-time student bus riders are not considered to make additional VMT by traveling to the local school because they would have to make the trip to their local high school to complete the other part of their school curriculum held there.

The average trip lengths for students driving alone, students picked up/dropped off, and visitors were estimated based on anonymous zip code data for students, faculty, and staff from the existing STEM Academy for the 2021 academic year. Although this data would shift each year the proposed school is in operation, the existing zip code data for the enrolled students reflects the best available information at this time and should generally reflect a similar or higher trip length than what would be expected by year 2045 due to the proposed change of limiting school enrollment for the proposed STEM Education Center to students residing in the RUSD boundary.

The average trip length for faculty and staff were estimated based anonymous zip code data for faculty and staff at the existing STEM Academy. Although this data would shift based on future hiring, this information reflects the best available information at this time and should generally reflect a similar trip length as would be expected by year 2045.

The average trip length for delivery vehicles was based on the distance to the nearest RUSD high school (John W. North High School) because it was assumed that deliveries to the Project site would be made as an extension of current deliveries already occurring to the other high schools.

The VMT for each type of trip was combined and divided by the service population (sum of all employees and students at the Project site) to develop the Project VMT per Service Population for comparison with the WRCOG region.

Table 3 presents the calculation for the VMT per Service Population for the Project.

Table 3 – Project Vehicle Miles Traveled

TRIP TYPE	TOTAL TRIPS	TRIP LENGTH	VMT
Bus	60	6.20	372
Students dropped off at local high school for bus	200	5.00	1,000
Students driving alone	120	7.39	887
Students dropped off	1440	7.39	10,642
Faculty and Staff	120	11.43	1,372
Visitors	120	7.39	887
Deliveries	4	1.00	4
Total VMT			15,164
Service Population			1,260
VMT per Service Population			12.03

Note: Service population includes employees residents and grades 9 – 12 students.
VMT = Vehicle Miles Traveled.

Baseline Plus Project

The WRCOG VMT per Service Population was calculated for the baseline condition using the RIVCOM model to establish the regional threshold. **Table 4** presents the Baseline VMT per Service Population for the Project and WRCOG region.

Table 4 – Baseline Vehicles Miles Traveled Analysis

	VMT	SERVICE POPULATION	VMT PER SERVICE POPULATION
Project	15,164	1,260	12.03
WRCOG Region	90,203,331	2,762,109	32.66

Note: Service population includes employees, residents, and grades 9 – 12 students.
VMT = Vehicle Miles Traveled.

As shown in **Table 6**, the baseline Project generated VMT per Service Population is 63 percent below the WRCOG VMT per Service Population [$1 - (12.03/32.66) = 0.63$] and therefore does not exceed the identified threshold.

Cumulative Plus Project

The Baseline Plus Project VMT analysis included above is also sufficient to serve as the Cumulative Plus Project VMT impact analysis. As discussed under OPR’s Technical Advisory, “metrics such as VMT per

capita or VMT per employee, i.e., metrics framed in terms of efficiency (as recommended below for use on residential and office projects), cannot be summed because they employ a denominator. A project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice versa.” (OPR Technical Advisory p. 6.) Nevertheless, additional cumulative analysis has been performed.

The WRCOG VMT per Service Population was calculated for the cumulative condition using the RIVCOM model to establish the regional threshold. **Table 5** presents the Cumulative VMT per Service Population for the Project and WRCOG region.

A threshold of 15 percent below the baseline WRCOG VMT per Service Population was used to identify Project-generated impacts.

As shown in **Table 5**, the cumulative Project generated VMT per Service Population is 62 percent below the WRCOG VMT per Service Population [$1 - (12.03/31.34) = 0.62$] and therefore would not exceed the identified threshold.

Table 5 – Cumulative Vehicles Miles Traveled Analysis

	VMT	SERVICE POPULATION	VMT PER SERVICE POPULATION
Project	15,164	1,260	12.03
WRCOG Region	120,042,276	3,830,117	31.34

Note: Service population includes employees, residents, and grade 9 – 12 students.
 VMT = Vehicle Miles Traveled.

Project Effect on VMT

Project effect on regional VMT was estimated using the boundary method on the future RIVCOM model. This was completed by selecting all roadway segments in the RIVCOM model within the WRCOG boundary and multiplying the number of trips on each roadway segment by the length of that roadway segment and dividing by service population to get the link-level regional VMT per service population.

Project effect on VMT is a measure of the potential effects of a project because it captures the combined effect of new VMT, shifting of existing VMT to/from other neighborhoods, and/or shifts in existing VMT to alternate travel routes or modes. Projects that have a positive effect on VMT result in a decrease in the regional VMT per Service Population. Conversely, projects that have a negative effect on VMT increase regional VMT per Service Population. A positive effect on VMT (i.e., a decrease in regional VMT per Service Population) is seen as improving VMT efficiency and is better for the region as a whole.

As shown in **Table 6**, the WRCOG VMT per Service Population under the “with Project” condition does not exceed the cumulative WRCOG region, as identified under the SCAG RTP/SCS, condition.

Table 6 – WRCOG Region Cumulative Project Effect on Vehicles Miles Traveled Analysis

	VMT	SERVICE POPULATION	VMT PER SERVICE POPULATION
WRCOG Region With Project	62,585,391	3,831,377	16.335
WRCOG Region	62,570,221	3,830,117	16.336

Note: Service population includes employees, residents, and grade 9 – 12 students.
 VMT = Vehicle Miles Traveled.

Access and Circulation

This chapter provides an overview of the Project site related to internal and external circulation for the Project. Considerations include site access, parking, and on-site circulation.

On-Site Circulation

On-site circulation would be provided by internal roadways and parking lot drive aisles. Pedestrian paths would connect the buildings located on the Project site to the internal parking facilities and adjacent street network.

Emergency Vehicle Access

Another consideration related to the site plan review is the provision of adequate emergency vehicle access. Providing adequate emergency vehicle access ensures that these vehicles can quickly respond to service calls. Direct emergency access would be provided to all buildings. Emergency access would be provided by the surrounding streets (e.g., Canyon Crest Drive, Blaine Street). All parking lots and internal roadways would be designed to meet the requirements for emergency vehicle access.

Pedestrian Access

The Project site provides pedestrian access to buildings and parking areas through a system of walkways to create a pedestrian friendly environment.

Bicycle Access

Bicycle access to the Project site from surrounding streets is provided with on-street bike lanes on the adjacent roadways of Blaine Street and Canyon Crest Drive. The Project will provide bicycle parking on site.

Transit Access

Transit facilities are located near the Project site along Canyon Crest Drive and Blaine Street. The removal of transit stops is not proposed as part of the Project.

Parking

A surface parking lot is proposed on the southern half of the Project site and would contain approximately 153 spaces for faculty and staff, visitors, and students use. This parking supply should accommodate the number of vehicles expected to park on the Project site based on number of students and faculty expected to drive based on the trip generation estimates.

Non-Vehicular Impact Analysis

This chapter reviews Project related impacts on the transit system and bicycle, pedestrian, and roadway networks in the study area. Potential impacts to pedestrians, bicycles, and transit include disruptions to existing facilities. This chapter also discusses potential interference with planned facilities and conflicts with adopted plans, guidelines, policies, or standards.

Pedestrian Network

The existing pedestrian network infrastructure around the Project site would remain with implementation of the proposed Project.

Disruptions to Existing Facilities

Significance Criterion

The following significance criterion was applied:

A significant impact occurs if a project substantially disrupts existing pedestrian facilities. This can include adding new vehicular, pedestrian, or bicycle traffic at locations experiencing pedestrian safety concerns such as an adjacent crosswalk or school, particularly if the added traffic reduces the number of pedestrian acceptable gaps at an unsignalized crossing or causes queues to spillback through pedestrian crossings.

Project Impact

A review of the Project per the significance criteria described indicates that there are no conflicts with existing pedestrian facilities. Therefore, less than significant impacts would occur.

Interference with Planned Pedestrian Facilities

The Project would not conflict with any planned pedestrian facilities. The Project would not encroach on or interfere with the City's planned Gage Canal Multipurpose Recreational Trail, which would travel adjacent to the Gage Canal from Palmyrita Street to the Riverside Sports Complex located on and adjacent to the project site, just north of Blaine Street (City of Riverside 2021b).

Conflicts with Pedestrian System Plans, Guidelines, Policies, or Standards

Development of the Project would include a continued investment in improving the quality, safety, and character of the pedestrian experience and ensuring it is developed with the principle of universal access in mind. The Project would reconstruct pedestrian infrastructure at the site access points to maintain existing access while following the City's requirements and therefore not conflict with the City's requirements.

Bicycle Network

The existing bicycle network infrastructure around the Project site would remain with implementation of the proposed Project.

Disruptions to Existing Facilities

Significance Criterion

The following significance criterion was applied:

A significant impact occurs if a project substantially disrupts existing bicycle facilities.

Project Impact

As noted in the review of existing facilities, there are several bicycle routes within the study area. It is anticipated that the Project would not affect the operation of any of these existing facilities. Therefore, less than significant impacts would occur.

Project Interference with Planned Bicycle Facilities

The Project would not conflict with any planned bicycle facilities including development of the Gage Canal Multi-purpose trail.

Project Conflicts with Adopted Bicycle System Plans, Guidelines, Policies, or Standards

Development of the Project would include a continued investment in improving the quality, safety, and character of the bicycling experience and ensuring it is developed with the principle of universal access in mind. The Project would reconstruct bicycle infrastructure at the site access points to maintain existing access while following the City's requirements and therefore not conflict with the City's requirements.

Transit System

The existing transit network infrastructure around the Project site would remain with implementation of the proposed Project.

Disruptions to Existing Transit Service

Significance Criterion

The following significance criterion was applied:

A significant impact occurs if a project disrupts existing transit services or facilities. This includes disruptions caused by proposed project driveways on transit streets, impacts to transit stops/shelters, and impacts to transit operations from traffic improvements proposed or resulting from a project.

Project Impact

As noted in the review of existing transit routes, there are several routes adjacent to the Project site. The Project does not propose changes that would significantly disrupt any of the existing transit routes. Therefore, less than significant impacts would occur.

Interference with Planned Transit Services

The Project would not conflict with any planned transit services.

Project Conflicts with Adopted Transit System Plans, Guidelines, Policies, or Standards

Development of the Project would include a continued investment in providing transit service at the existing stops near the Project site. The Project would maintain or reconstruct any transit stops that are affected by development of the Project while following the City's requirements and therefore not conflict with the City's requirements.

Construction Analysis

Historically, construction trips at UC Riverside have been managed to minimize the effect construction-related traffic has on the university and surrounding neighborhoods. The management of construction-related traffic has been accomplished through the implementation of policies in the UC Riverside 2021 Long Range Development Plan Environmental Impact Report (EIR) and would continue to be implemented for campus projects including the proposed Project. These include the following:

- Construction parking must be configured to minimize traffic interference.
- Temporary traffic controls, such as a flag person, are provided during all phases of construction to maintain smooth traffic flow.
- Dedicated turn lanes are provided for movement of construction trucks and equipment on- and off-site.
- Construction activities that affect traffic flow on the arterial system are scheduled during off-peak hours, to the extent practicable.
- Improvements to traffic flow by signal synchronization are implemented, to the extent feasible.
- Vehicles and equipment are required to be properly tuned and maintained according to manufacturer's specifications.
- Construction trucks are rerouted away from congested streets or sensitive receptor areas, to the extent feasible.

Many jurisdictions in Southern California have regarded construction-related traffic as causing adverse but not significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary. Depending on the size of the facility under construction and the associated labor needs, many projects can be constructed without exceeding the 110 daily trip screening criterion established by OPR for small projects that may generally be assumed to cause a less-than-significant VMT impact.

While there may be periods of time in which the daily construction trips exceed the 110 daily trip threshold, these periods of time would be temporary and can be managed with the continued best practices and UCR standard conditions during construction activities.

To: THPO Consulting
Subject: AB 52 Consultation - RUSD STEM Education Center on UCR Campus
Attachments: STEM AB52_NoticeLtr_ACBCI_4-13-22.pdf

Good morning,

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center, proposed project) on the UCR campus. The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

UCR received your request for formal notification of proposed projects within the Agua Caliente Band of Cahuilla Indians Traditional Use Area. The attached letter is intended as formal notification of the proposed project pursuant to AB 52.

Please let me know if you have any questions, would like a hard copy of the attached letter, or would like to initiate consultation. Thank you for your interest on projects at UCR.

Respectfully,

Stephanie Tang

Subject: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center), Riverside County, California

Dear Ms. Garcia:

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center Project (referred to as STEM Ed Center or proposed project) in the northeastern portion of the UCR campus, in the City of Riverside, Riverside County, California. The project site is approximately 6 acres and is located within an urbanized area on the southwest corner of the intersection of Blaine Street and Canyon Crest Drive, adjacent to the UCR Baseball Complex. The project site is located within portions of Section 19 (Township 2 South; Range 4 West) of the USGS Riverside East, CA 7.5 Minute Quadrangle (refer to Exhibit 1 and Exhibit 2, attached).

The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

Assembly Bill 52 (AB 52) requires lead agencies to consult with California Native American Tribes that request such consultation in writing for any project for which a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), or notice of a Mitigated Negative Declaration (MND) or Negative Declaration (ND) is filed on or after July 1, 2015. UCR received your request for formal notification of proposed projects within the Agua Caliente Band of Cahuilla Indians Traditional Use Area. This letter is intended as formal notification of the proposed project pursuant to AB 52.

Your participation in this local planning process is important. A request for the Sacred Lands File Search (SLF) was submitted to the Native American Heritage Commission (NAHC) for the proposed project and results are pending response back from the NAHC. If you possess any information or knowledge regarding Native American Sacred Lands or other tribal cultural resources in and around the project site, and wish to consult with UCR regarding these resources or mitigation measures to reduce impacts of the

proposed project, please direct your email to stephanie.tang@ucr.edu or any correspondence on this matter to:

Re: AB52 STEM Ed Center

Dear Ms. Stephanie Tang,

The Agua Caliente Band of Cahuilla Indians (ACBCI) appreciates your efforts to include the Tribal Historic Preservation Office (THPO) in the STEM Ed Center project. The project area is not located within the boundaries of the ACBCI Reservation. However, it is within the Tribe's Traditional Use Area. For this reason, the ACBCI THPO requests the following:

*A copy of the records search with associated survey reports and site records from the information center.

*Copies of any cultural resource documentation (report and site records) generated in connection with this project.

Again, the Agua Caliente appreciates your interest in our cultural heritage. If you have questions or require additional information, please call me at (760)883-1327. You may also email me at ACBCI-THPO@aguacaliente.net.

Cordially,

Arysa Gonzalez Romero

Hi Arysa,

Thank you for your response to UCR's STEM's AB 52 notice. The NAHC SLF PDF is attached for your reference. Due to the number of files and file size, please click on the following link for the https://o365ucr-my.sharepoint.com/:f:/g/personal/stephant_ucr_edu/EuMnHKkLaChLj3bQekNpx_oB2n-BBRdo1Qxhpc0ruMAYmg?e=akRntK.

The project is still in its preliminary planning stage so no grading plans or geotechnical report has been prepared.

Please review the provided files and let me know if the tribe wishes to consult on this project.

Thank you.

Subject: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center), Riverside County, California

Dear Mr. Salas:

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center Project (referred to as STEM Ed Center or proposed project) in the northeastern portion of the UCR campus, in the City of Riverside, Riverside County, California. The project site is approximately 6 acres and is located within an urbanized area on the southwest corner of the intersection of Blaine Street and Canyon Crest Drive, adjacent to the UCR Baseball Complex. The project site is located within portions of Section 19 (Township 2 South; Range 4 West) of the USGS Riverside East, CA 7.5 Minute Quadrangle (refer to Exhibit 1 and Exhibit 2, attached).

The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

Assembly Bill 52 (AB 52) requires lead agencies to consult with California Native American Tribes that request such consultation in writing for any project for which a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), or notice of a Mitigated Negative Declaration (MND) or Negative Declaration (ND) is filed on or after July 1, 2015. Since RUSD received your request for formal notification of proposed RUSD projects, this letter is intended as formal notification of the proposed project pursuant to AB 52.

Your participation in this local planning process is important. The Sacred Lands File Search (SLF) was submitted to the Native American Heritage Commission (NAHC) for the proposed project and results are pending response back from the NAHC. If you possess any information or knowledge regarding Native American Sacred Lands or other tribal cultural resources in and around the project site, and wish to consult with UCR regarding these resources or mitigation measures to reduce impacts of the proposed project, please direct your email to stephanie.tang@ucr.edu or any correspondence on this matter to:

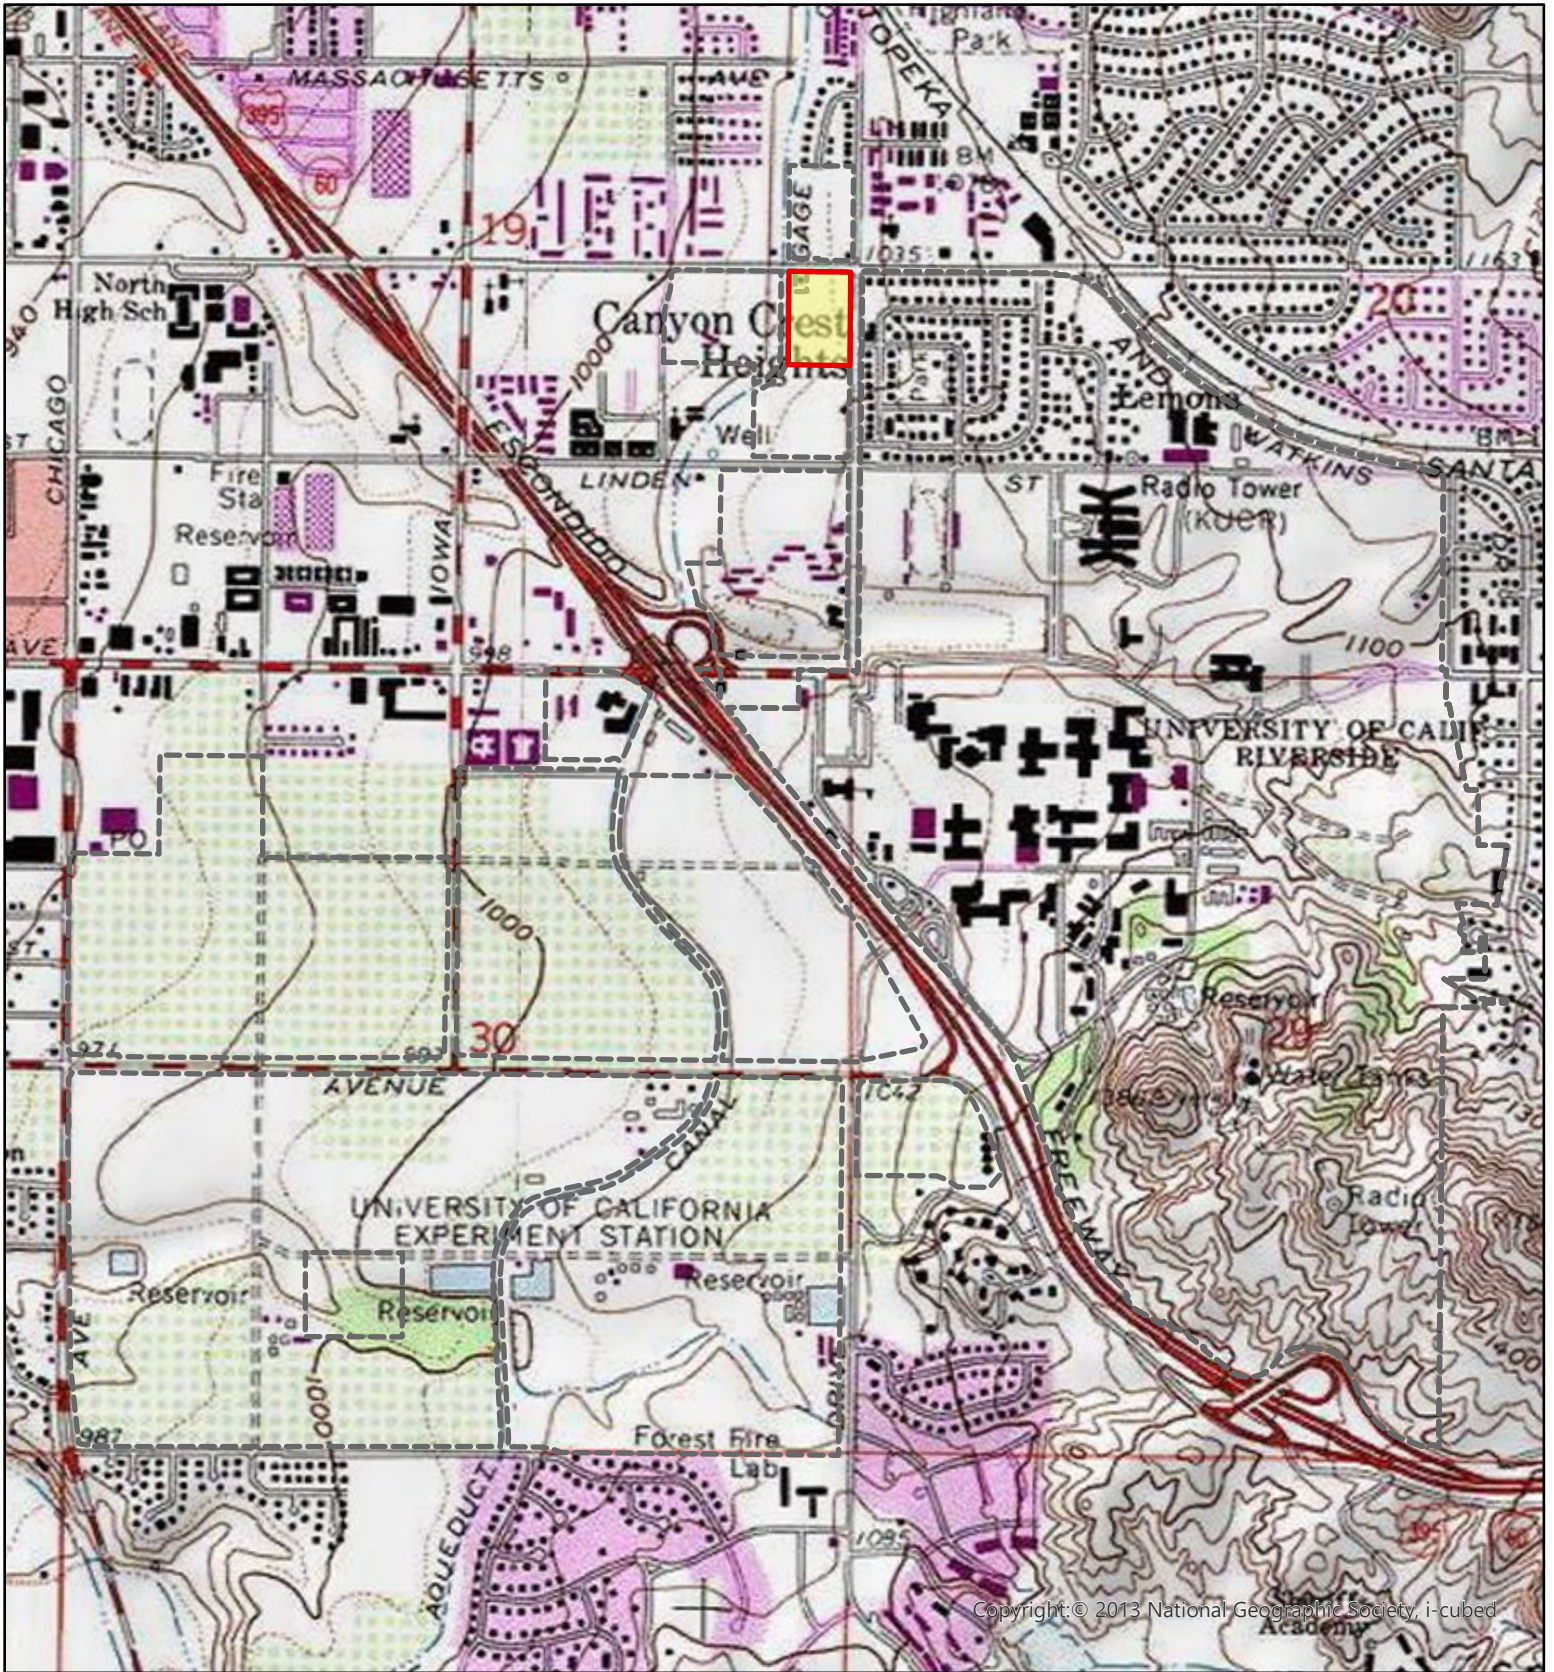

Stephanie Tang
Campus Environmental Planner

Good morning Mr. Salas,

It's been a while and hope everything has been going well on your end. Since the Tribe concluded AB 52 consultation based on our October 2022 call, I wanted to provide an AB 52 notice update re: the Riverside Unified School District (RUSD) STEM Education Center Project on UCR Campus. The purpose of this email is to provide an updated AB 52 notice (attached) and graphic below that shows the project site more clearly with the location of the proposed STEM Education Center, T-Mobile Cell Tower Relocation Area, Electrical Feeder Line Upgrade Alignment, and associated improvements area (where the underground Gage Canal is located) (also included as Exhibit 2 in the attached updated AB 52 notice).

Please let me know if you have additional questions or would like to set up a zoom meeting to go over the above and attachments by **May 31, 2023**, or we would assume AB 52 has concluded. **If you would like to set up a zoom meeting, please let me know what dates/times the Tribe would be available to consult.**

Subject: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center), Riverside County, California

Dear Ms. Ozdil:

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center Project (referred to as STEM Ed Center or proposed project) in the northeastern portion of the UCR campus, in the City of Riverside, Riverside County, California. The project site is approximately 6 acres and is located within an urbanized area on the southwest corner of the intersection of Blaine Street and Canyon Crest Drive, adjacent to the UCR Baseball Complex. The project site is located within portions of Section 19 (Township 2 South; Range 4 West) of the USGS Riverside East, CA 7.5 Minute Quadrangle (refer to Exhibit 1 and Exhibit 2, attached).

The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

Assembly Bill 52 (AB 52) requires lead agencies to consult with California Native American Tribes that request such consultation in writing for any project for which a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), or notice of a Mitigated Negative Declaration (MND) or Negative Declaration (ND) is filed on or after July 1, 2015. UCR received your request for formal notification of proposed campus projects. This letter is intended as formal notification of the proposed project pursuant to AB 52.

Your participation in this local planning process is important. The Sacred Lands File Search (SLF) was submitted to the Native American Heritage Commission (NAHC) for the proposed project and results are pending response back from the NAHC. If you possess any information or knowledge regarding Native American Sacred Lands or other tribal cultural resources in and around the project site, and wish to consult with UCR regarding these resources or mitigation measures to reduce impacts of the proposed project, please direct your email to stephanie.tang@ucr.edu or any correspondence on this matter to:

Hi Juan/Ebru,

Thank you for your response to UCR's STEM's AB 52 notice. An EIR is currently being prepared for the STEM project. The tribe will be included in the distribution list and will be notified prior to the Regent's hearing. At this time, the NAHC SLF PDF is attached for your reference. Due to the number of files and file size, please click on the following link for the [Confidential - CHRIS Records Search](#).

The project is still in its preliminary planning stage so no grading plans or geotechnical report has been prepared.

Please review the provided files and let me know when the tribe wishes to consult on this project. If you could provide a few dates/timeframes of the tribe's availability.

Thank you.

Respectfully,

Stephanie Tang

Subject: Pechanga Tribe AB52 Comments on RUSD STEM Ed. Center Project

Dear Stephanie Tang,

This letter is written on behalf of the Pechanga Band of Indians (hereinafter, "the Tribe") a federally recognized Indian tribe and sovereign government in response to the AB 52 notice provided by the University of California, Riverside (UCR).

This email serves as the Tribe's formal request to begin consultation under AB 52 for this Project. Per AB 52, we intend to assist UCR in determining the type of environmental document that should be prepared for this Project (i.e. EIR, MND, ND); with identifying

potential tribal cultural resources (TCRs); determining whether potential substantial adverse effects will occur to them; and to develop appropriate preservation, avoidance and/or mitigation measures, as appropriate. CEQA, as amended by AB 52, requires the UCR to avoid damaging effects to the significance of a tribal cultural resource. As such, the preferred TCR mitigation is complete avoidance and the Tribe requests that all efforts to preserve sensitive TCRs be made as early in the development process as possible.

Please add the Tribe to your distribution list(s) for public notices and circulation of all documents, including environmental review documents, archaeological reports, development plans, conceptual grading plans (if available), and all other applicable documents pertaining to this Project. The Tribe further requests to be directly notified of all public hearings and scheduled approvals concerning this Project, and that these comments be incorporated into the record of approval for this Project.

The Pechanga Tribe asserts that the Undertaking is a part of ‘*Atáaxum* (Luiseño) territory, and therefore the Tribe’s aboriginal territory as evidenced by the existence of cultural features associated with religious practice and an extensive artifact record in the vicinity of the Project. This culturally sensitive area is affiliated with the Pechanga Band of Luiseño Indians because of the Tribe's cultural ties to this area as well as our extensive history with the UCR and other projects within the area.

As you know, the AB 52 consultation process is ongoing and continues until appropriate mitigation has been agreed upon for the TCRs that may be impacted by the Project. As such, under both AB 52 and CEQA, we look forward to working closely with the UCR on ensuring that a full, comprehensive environmental review of the Project's impacts is completed.

In addition to those rights granted to the Tribe under AB 52, the Tribe reserves the right to fully participate in the environmental review process, as well as to provide further comment on the Project's impacts to cultural resources and potential mitigation for such impacts.

The Pechanga Tribe looks forward to working together with the University of California, Riverside in protecting the invaluable Pechanga cultural resources found in the Project area. The formal contact person for this Project will be Ebru Ozdil. Please contact her at 951-770-6313 or at eozdil@pechanga-nsn.gov within 30 days of receiving this consultation request so that we can begin the consultation process. Thank you.

Subject: RE: RUSD STEM Center at UCR - AB 52 Consultation

Hi Stephanie,

Thank you for your email and updated notification. We will like to consult on this project and either Juan or Molly will reach out to schedule a zoom call with you.

Thanks

Ebru

Subject: RUSD STEM Center at UCR - AB 52 Consultation

Good morning Ebru,

It’s been a while and hope everything has been going well on your end. I wanted to provide an AB 52 notice update re: the Riverside Unified School District (RUSD) STEM Education Center Project on UCR Campus. I have attached the last email communication we had dated August 16, 2022, providing the NAHC SLF as well as

the CHRIS records search results per the Tribe's request. The purpose of this email is to provide an updated AB 52 notice (attached) and graphic below that shows the project site more clearly with the location of the proposed STEM Education Center, T-Mobile Cell Tower Relocation Area, Electrical Feeder Line Upgrade Alignment, and associated improvements area (where the underground Gage Canal is located) (also included as Exhibit 2 in the attached updated AB 52 notice).

Please let me know if you have additional questions or would like to set up a zoom meeting to go over the above and attachments by **May 31, 2023**, or we would assume AB 52 has concluded. **If you would like to set up a zoom meeting, please let me know what dates/times the Tribe would be available to consult.**

Respectfully,

Stephanie Tang

Assistant Director of Campus Planning

Hi Molly and Paul,

I hope this email finds you both well and you all are staying cool during these triple digit weather. I wanted to follow up on the AB 52 consultation we had on May 24, 2023 for the Riverside Unified School District (RUSD) STEM Education Center Project on UCR Campus. The below graphic shows the project site with the location of the proposed STEM Education Center, T-Mobile Cell Tower Relocation Area, Electrical Feeder Line Upgrade Alignment, and associated improvements area (where the underground Gage Canal is located) (also included as Exhibit 2 in the attached updated AB 52 notice previously sent to the Tribe). Additionally, per the Tribe's request during the AB 52 consultation, I have included the following:

- Conceptual rough grading plans.
- Copy of the NAHC SLF.

In regards to reviewing the draft Cultural and TCR sections, those sections will be provided to the public including the Tribe during the Draft EIR public review period. However, I have provided the draft Mitigation Measures for the Tribe's input:

- **Unanticipated Discovery of Archaeological Resources.** If previously undiscovered archaeological resources are identified during construction, all ground disturbing activities within 100 feet of the resource shall halt, UCR Planning, Design & Construction staff shall be notified, and the find shall be evaluated by a qualified archaeologist meeting the Secretary of the Interior standards to determine whether it is a unique archaeological resource, as defined by CEQA. If the find is not a unique archaeological resource, work may resume. If the find is determined to be a unique archaeological resource, the archaeologist shall make recommendations to UCR Planning, Design & Construction staff on the measures that shall be implemented, including, but not limited to, preservation in place, excavation, relocation, and further evaluation of the discoveries pursuant to CEQA. Preservation in place (i.e., avoidance) is the preferred method of mitigation for impacts to archaeological resources. If UCR determines that preservation in place is not feasible, the archaeologist shall design and implement a treatment plan, prepare a report, and salvage the material, as appropriate. Any important artifacts recovered during monitoring shall be cleaned, catalogued, and analyzed, with the results presented in a report of findings that meets professional standards. Work on-site may commence upon completion of any fieldwork components of the treatment plan.
- **Unanticipated Discovery of Tribal Cultural Resources.** If previously undiscovered cultural resources of Native American origin are identified during construction, all ground disturbing activities within 100 feet of the resource shall halt, UCR Planning, Design & Construction staff shall be notified, and a tribal representative shall be given notice and opportunity within 24 hours of discovery to determine in consultation with UCR whether it is a TCR, as defined by CEQA. If the find is not a TCR, work may resume. If the find is determined to be a TCR, the tribal representative shall be given the opportunity to make recommendations to UCR Planning, Design & Construction

staff on the measures that shall be implemented, including, but not limited to, preservation in place, excavation, relocation, and further evaluation of the discoveries pursuant to CEQA. Preservation in place (i.e., avoidance) is the preferred method of mitigation for impacts to TCRs. If UCR determines that preservation in place is not feasible, UCR shall design and implement a treatment plan in consultation with local Native American group(s) and, if applicable, a qualified archaeologist; prepare a report; and salvage the material, as appropriate. Any important artifacts recovered during monitoring shall be cleaned, catalogued, and analyzed, with the results presented in a report of findings that meets professional standards. Work on-site may commence upon completion of any fieldwork components of the treatment plan.

- **Tribal Cultural Resources Monitoring and Construction Worker Training.** UCR shall give notice and opportunity to a locally affiliated Tribe to provide a qualified Native American monitor to observe all ground-disturbing activities within native soils on the project site (i.e., those soils encountered at greater than four feet in depth). Notice shall be given no less than five (5) days prior to commencement of ground-disturbing activities within areas known or expected to contain native soils. The on-site monitoring shall end when project-related ground disturbing activities within native soils are completed, or, in consultation with the lead agency and Tribe(s) as appropriate and based on observed conditions, monitoring may be reduced or eliminated prior to completion of ground-disturbing activities, when the monitor(s) has indicated that the project site has a low potential to encounter tribal cultural resources. Consolidated monitoring efforts (e.g., tribal cultural and paleontological monitoring) may occur if the individual monitor meets the applicable qualifications. The Native American monitor shall also be given notice and opportunity to provide preconstruction training for all earthmoving construction personnel prior to the start of any ground disturbing activities. The training shall include instruction on how to recognize the types of tribal cultural resources that may be encountered, and appropriate actions to be taken by the construction personnel in the event of an unanticipated discovery of a tribal cultural resource. The Native American monitor shall also be given the opportunity to provide a fact sheet conveying this information for distribution to all contractors, their employees, and other personnel involved with construction of the project. All employees shall sign a form provided by the Native American monitor documenting they attended the worker training and understand the information presented. If new construction personnel are added to the project, the crew foreman shall ensure the new personnel receive the worker training fact sheet before starting work. The UCR Planning, Design & Construction Project Manager/contractor shall retain documentation showing when training of personnel was completed.

Please let me know if you have additional questions and look forward to any input on the proposed draft mitigation measures. Requesting this feedback by **July 28, 2023**.

Subject: AB 52 Consultation - RUSD STEM Education Center on UCR Campus
Attachments: STEM AB52_NoticeLtr_Rincon_4-13-22.pdf; RE: RUSD STEM Center at UC Riverside

Good morning,

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center, proposed project) on the UCR campus. The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

UCR received your request for formal notification of proposed campus projects. The attached letter is intended as formal notification of the proposed project pursuant to AB 52. The Tribe has provided comments during the Notice of Preparation review period for the proposed project and requested to initiate consultation.

Please let me know the Tribe's availability and I will schedule a zoom call. Thank you for your interest on projects at UCR.

Respectfully,

Stephanie Tang

Subject: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center), Riverside County, California

Dear Ms. Madrigal:

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center Project (referred to as STEM Ed Center or proposed project) in the northeastern portion of the UCR campus, in the City of Riverside, Riverside County, California. The project site is approximately 6 acres and is located within an urbanized area on the southwest corner of the intersection of Blaine Street and Canyon Crest Drive, adjacent to the UCR Baseball Complex. The project site is located within portions of Section 19 (Township 2 South; Range 4 West) of the USGS Riverside East, CA 7.5 Minute Quadrangle (refer to Exhibit 1 and Exhibit 2, attached).

The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

Assembly Bill 52 (AB 52) requires lead agencies to consult with California Native American Tribes that request such consultation in writing for any project for which a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), or notice of a Mitigated Negative Declaration (MND) or Negative Declaration (ND) is filed on or after July 1, 2015. UCR received your request for formal notification of proposed campus projects. This letter is intended as formal notification of the proposed project pursuant to AB 52.

Your participation in this local planning process is important. The Sacred Lands File Search (SLF) was submitted to the Native American Heritage Commission (NAHC) for the proposed project and results are pending response back from the NAHC. If you possess any information or knowledge regarding Native American Sacred Lands or other tribal cultural resources in and around the project site, and wish to consult with UCR regarding these resources or mitigation measures to reduce impacts of the proposed project, please direct your email to stephanie.tang@ucr.edu or any correspondence on this matter to:

Re: Request for AB52 Consultation on the RUSD STEM Center at the University of California, Riverside

Dear Ms. Tang,

This letter is written on behalf of the Rincon Band of Luiseño Indians (“Rincon Band” or “Tribe”), a federally recognized Indian Tribe and sovereign government. We have received your notification regarding the above-mentioned project and we request consultation to assess potential impacts to cultural resources. The identified location is within the Traditional Use Area (TUA) of the Luiseño people and within the Rincon Band’s specific Area of Historic Interest (AHI). As such, the Rincon Band is traditionally and culturally affiliated to the project area.

We kindly ask to be provided with copies of existing documents pertaining to the project such as the cultural survey including the archaeological site records, shape files, archaeological record search results, geotechnical report, and the grading plans. Upon receipt and review, the Tribe would like to consult on the project in order to learn more about any potential impacts to cultural resources.

If you have additional questions or concerns, please do not hesitate to contact our office at your convenience at (760) 749 1092 ext. 323 or via electronic mail at cmadrigal@rincon-nsn.gov. Thank you for the opportunity to protect and preserve our cultural assets.

Sincerely,

Cheryl Madrigal
Tribal Historic Preservation Officer
Cultural Resources Manager

Hi Cheryl,

Thank you for your response letter to the UCR STEM AB 52 notice. Attached, please find the NAHC SLF. Due to the number of files and file size, please click on the following link for the [Confidential - CHRIS Records Search](#).

The project is still in it's preliminary planning stage so no grading plans or geotechnical report has been prepared.

Please review the provided files and let me know when the tribe wishes to consult on this project. If you could provide a few dates/timeframes of the tribe's availability.

Thank you.

Respectfully,

Stephanie Tang

Good morning, Stephanie,

Thank you for providing the NAHC SLF. I would like to schedule a consultation but would prefer to see the project plans and Geotech prior.

When are you expecting to be able to provide additional project information?

Thanks,

Cheryl

Re: RUSD STEM Center at UC Riverside

Dear Ms. Tang,

This letter is written on behalf of the Rincon Band of Luiseño Indians (“Rincon Band” or “Tribe”), a federally recognized Indian Tribe and sovereign government. Thank you so much for consulting with the Tribe on the RUSD STEM Center at UC Riverside.

As per our ongoing consultation, this is a follow-up to yesterday’s virtual meeting with UCR, RUSD, and the Tribe would like to reiterate concerns and comments the Tribe has regarding this project. As stated in the CEQA guiding documents published through the website of the Governor’s Office, the CEQA “process is intended to: (1) inform government decisionmakers and the public about the potential environmental effects of proposed activities; (2) identify the ways that environmental damage can be avoided or significantly reduced; (3) prevent significant, avoidable environmental damage by requiring changes in projects, either by the adoption of alternatives or imposition of mitigation measures; and (4) disclose to the public why a project was approved if that project has significant environmental impacts that cannot be mitigated to a less than significant level”.¹

CEQA 21060.5. further clarifies that the “Environment means the physical conditions that exist within the area which will be affected by a proposed project, including, land, air, water, minerals, flora, fauna, noise, or objects of historic or aesthetic significance.”

During our ongoing consultation, we were informed by UCR and RUSD that the conceptual drawing as provided to the Tribe via email on August 30, 2022, is currently the only document available regarding the expected construction. We believe the conceptual drawing is insufficient for an assessment of the project’s impacts to tribal cultural resources, and we ask to be provided with the following information:

- Preliminary grading plans
These plans are important to identify areas of expected ground disturbance. The plans are also essential to identify number and size of equipment including expected depth of ground disturbance.

¹ https://opr.ca.gov/ceqa/docs/20210809-CEQA_101.pdf

- Staging areas
These areas could potentially impact the environment including impacts to tribal cultural resources. We ask to be provided with any information regarding staging areas.
- Off-site improvements
It is unclear at this time if any off-site improvements are planned as neither UCR nor RUSD was able to confirm off-site improvements or was able to state that none were going to happen. As no information has been provided to the Tribe regarding off-site improvements, which could include any additional sidewalks, road widenings, bus stations, etc., we are asking to receive a map that will identify off-site improvements. If none are planned, please let us know.
- Soil import and/or export
It is of particular interest to the Tribe to learn if soil will be exported and or imported. As any ground disturbing activities hold potential to unearth cultural materials, the extent including depth of the ground disturbing activities need to be considered when avoidance and mitigation measures are being developed.

As previously stated, the Tribes asks to be provided with the cultural resources assessment, biological survey, and any soils analysis that was conducted at this time. Upon receipt and review, the Rincon Band would like to further consult on the project to discuss any potential impacts to cultural resources.

If you have additional questions or concerns, please do not hesitate to contact our office at your convenience at (760) 749 1092 ext. 323 or via electronic mail at cmadrigal@rincon-nsn.gov. Thank you for the opportunity to protect and preserve our cultural assets.

Sincerely,

Cheryl Madrigal
Tribal Historic Preservation Officer
Cultural Resources Manager

Good morning Cheryl,

It's been a while and hope everything has been going well on your end. I wanted to touch base with you on the Tribe's letter (attached) dated October 7, 2022 for the Riverside Unified School District (RUSD) STEM Education Center Project on UCR Campus. The below graphic shows the project site more clearly with the location of the proposed STEM Education Center, T-Mobile Cell Tower Relocation Area, Electrical Feeder Line Upgrade Alignment, and associated improvements area (where the underground Gage Canal is located) (also included as Exhibit 2 in the attached updated AB 52 notice). The below text includes the Tribe's request for additional information and UCR's response.

- Tribe's request: Preliminary grading plans
 - UCR Response: Please see attached the conceptual rough grading plans for your reference.
- Tribe's request: Identifying staging areas
 - UCR Response: The attached conceptual rough grading plans notes the construction staging and laydown area.
- Tribe's request: Identifying off-site improvements
 - UCR Response: Please refer to the graphic below that shows the electrical feeder line upgrade alignment and the associated improvements area. Work within the associated improvements area would be limited to the removal of existing bleachers, lighting, and the baseball diamond; installation of replacement landscaping or conditions similar to that of the existing Gage Canal portion north of Blaine Street; and replacement or relocation of an existing water utility line that runs below the Gage Canal. No modifications to the Gage Canal itself would occur, and no heavy equipment would be utilized on top of the Gage Canal to complete these improvements.
- Tribe's request: Soil import and/or export
 - UCR Response: Grading would be balanced and would not require export or import of cut or fill material.
- Tribe's request: Provide the cultural resources assessment, biological survey, and any soils analysis that was conducted at this time.
 - UCR response: As part of the Draft EIR public review, the cultural resources assessment, biological assessment, and report that provides soils information will be included in the applicable Draft EIR section and/or appendices and be made available during the Draft EIR public review. I want to note that the NAHC SLF search was negative and the draft cultural resources memo that was prepared concluded that no archaeological resources were identified during the field survey. It should be noted that native soils was encountered at 4

feet and therefore, the following proposed Cultural/TCR mitigation measure(s) is included in the Draft EIR:

- **Unanticipated Discovery of Archaeological Resources.** If previously undiscovered archaeological resources are identified during construction, all ground disturbing activities within 100 feet of the resource shall halt, UCR Planning, Design & Construction staff shall be notified, and the find shall be evaluated by a qualified archaeologist meeting the Secretary of the Interior standards to determine whether it is a unique archaeological resource, as defined by CEQA. If the find is not a unique archaeological resource, work may resume. If the find is determined to be a unique archaeological resource, the archaeologist shall make recommendations to UCR Planning, Design & Construction staff on the measures that shall be implemented, including, but not limited to, preservation in place, excavation, relocation, and further evaluation of the discoveries pursuant to CEQA. Preservation in place (i.e., avoidance) is the preferred method of mitigation for impacts to archaeological resources. If UCR determines that preservation in place is not feasible, the archaeologist shall design and implement a treatment plan, prepare a report, and salvage the material, as appropriate. Any important artifacts recovered during monitoring shall be cleaned, catalogued, and analyzed, with the results presented in a report of findings that meets professional standards. Work on-site may commence upon completion of any fieldwork components of the treatment plan.

- **Unanticipated Discovery of Tribal Cultural Resources.** If previously undiscovered cultural resources of Native American origin are identified during construction, all ground disturbing activities within 100 feet of the resource shall halt, UCR Planning, Design & Construction staff shall be notified, and a tribal representative shall be given notice and opportunity within 24 hours of discovery to determine in consultation with UCR whether it is a TCR, as defined by CEQA. If the find is not a TCR, work may resume. If the find is determined to be a TCR, the tribal representative shall be given the opportunity to make recommendations to UCR Planning, Design & Construction staff on the measures that shall be implemented, including, but not limited to, preservation in place, excavation, relocation, and further evaluation of the discoveries pursuant to CEQA. Preservation in place (i.e., avoidance) is the preferred method of mitigation for impacts to TCRs. If UCR determines that preservation in place is not feasible, UCR shall design and implement a treatment plan in consultation with local Native American group(s) and, if applicable, a qualified archaeologist; prepare a report; and salvage the material, as appropriate. Any important artifacts recovered during monitoring shall be cleaned, catalogued, and analyzed, with the results presented in a report of findings that meets professional standards. Work on-site may commence upon completion of any fieldwork components of the treatment plan.

- **Tribal Cultural Resources Monitoring and Construction Worker Training.** UCR shall give notice and opportunity to a locally affiliated Tribe to provide a qualified Native American monitor to observe all ground-disturbing activities within native soils on the project site (i.e., those soils encountered at greater than four feet in depth). Notice shall be given no less than five (5) days prior to commencement of ground-disturbing activities within areas known or expected to contain native soils. The on-site monitoring shall end when project-related ground disturbing activities within native soils are completed, or, in consultation with the lead agency and Tribe(s) as appropriate and based on observed conditions, monitoring may be reduced or eliminated prior to completion of ground-disturbing activities, when the monitor(s)

has indicated that the project site has a low potential to encounter tribal cultural resources. Consolidated monitoring efforts (e.g., tribal cultural and paleontological monitoring) may occur if the individual monitor meets the applicable qualifications. The Native American monitor shall also be given notice and opportunity to provide preconstruction training for all earthmoving construction personnel prior to the start of any ground disturbing activities. The training shall include instruction on how to recognize the types of tribal cultural resources that may be encountered, and appropriate actions to be taken by the construction personnel in the event of an unanticipated discovery of a tribal cultural resource. The Native American monitor shall also be given the opportunity to provide a fact sheet conveying this information for distribution to all contractors, their employees, and other personnel involved with construction of the project. All employees shall sign a form provided by the Native American monitor documenting they attended the worker training and understand the information presented. If new construction personnel are added to the project, the crew foreman shall ensure the new personnel receive the worker training fact sheet before starting work. The UCR Planning, Design & Construction Project Manager/contractor shall retain documentation showing when training of personnel was completed.

- UCR Response: The biological resources analysis concluded no significant impacts. Mitigation measures have been included to avoid impacts to nesting bird avoidance, bird strike avoidance, and bat preconstruction survey.

Please let me know if you have additional questions or would like to set up a zoom meeting to go over the above and attachments by **May 31, 2023**, or we would assume AB 52 has concluded. **If you would like to set up a zoom meeting, please let me know what dates/times the Tribe would be available to consult.**

Subject: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center), Riverside County, California

Dear Ms. Madrigal:

Please note that updates to the AB 52 notice is provided below in ~~strikeout text~~ and underline text. Additionally, Exhibit 2 has been updated to depict the electrical feeder line upgrade alignment, associated site improvements, existing cell towers, and T-Mobile Cell Tower Relocation Area.

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center Project (referred to as STEM Ed Center or proposed project) in the northeastern portion of the UCR campus, in the City of Riverside, Riverside County, California. The project site is approximately 7 acres ~~6 acres~~ and is located within an urbanized area on the southwest corner of the intersection of Blaine Street and Canyon Crest Drive, adjacent to the UCR Baseball Complex. The project site is located within portions of Section 19 (Township 2 South; Range 4 West) of the USGS Riverside East, CA 7.5 Minute Quadrangle (refer to Exhibit 1 and Exhibit 2, attached).

The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

Assembly Bill 52 (AB 52) requires lead agencies to consult with California Native American Tribes that request such consultation in writing for any project for which a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), or notice of a Mitigated Negative Declaration (MND) or Negative

Declaration (ND) is filed on or after July 1, 2015. UCR received your request for formal notification of proposed campus projects. This letter is intended as formal notification of the proposed project pursuant to AB 52.

Your participation in this local planning process is important. The Sacred Lands File Search (SLF) was submitted to the Native American Heritage Commission (NAHC) for the proposed project and results are ~~negative. pending response back from the NAHC.~~ If you possess any information or knowledge regarding Native American Sacred Lands or other tribal cultural resources in and around the project site, and wish to consult with UCR regarding these resources or mitigation measures to reduce impacts of the proposed project, please direct your email to stephanie.tang@ucr.edu or any correspondence on this matter to:

Stephanie Tang

Subject: AB 52 Consultation - RUSD STEM Education Center on UCR Campus
Attachments: STEM AB52_NoticeLtr_TMDCI_4-13-22.pdf

Good morning,

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center, proposed project) on the UCR campus. The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

UCR received your request for formal notification of proposed projects within the Torres Martinez Desert Cahuilla Indians Traditional Use Area. The attached letter is intended as formal notification of the proposed project pursuant to AB 52.

Please let me know if you have any questions, would like a hard copy of the attached letter, or would like to initiate consultation. Thank you for your interest on projects at UCR.

Good morning,

I received a bounce back email from Michael Mirelez and called the tribe's office to confirm Michael is no longer with the tribe. The tribe's office noted that I can forward you the AB 52 notice and email chain below to see who this should be redirected to.

I am following up on my email on April 13, 2022 regarding the UCR STEM AB 52. The University has not heard from the tribe whether the tribe would like to consult on the STEM project.

I have attached the STEM AB 52 notice again for your reference. Please kindly let me know by August 31, 2022 if the tribe would like to consult on this project otherwise I will assume the tribe does not wish to consult.

Thank you so much.

Respectfully,

Stephanie Tang

Subject: AB 52 Consultation - RUSD STEM Education Center on UCR Campus

Good morning,

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center, proposed project) on the UCR campus. The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

UCR received your request for formal notification of proposed projects within the Torres Martinez Desert Cahuilla Indians Traditional Use Area. The attached letter is intended as formal notification of the proposed project pursuant to AB 52.

Please let me know if you have any questions, would like a hard copy of the attached letter, or would like to initiate consultation. Thank you for your interest on projects at UCR.

Respectfully,

Stephanie Tang

Subject: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center), Riverside County, California

Dear Altrena:

Please note that updates to the AB 52 notice is provided below in ~~strikeout text~~ and underline text. Additionally, Exhibit 2 has been updated to depict the electrical feeder line upgrade alignment, associated site improvements, existing cell towers, and T-Mobile Cell Tower Relocation Area.

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center Project (referred to as STEM Ed Center or proposed project) in the northeastern portion of the UCR campus, in the City of Riverside, Riverside County, California. The project site is approximately 7 acres ~~6 acres~~ and is located within an urbanized area on the southwest corner of the intersection of Blaine Street and Canyon Crest Drive, adjacent to the UCR Baseball Complex. The project site is located within portions of Section 19 (Township 2 South; Range 4 West) of the USGS Riverside East, CA 7.5 Minute Quadrangle (refer to Exhibit 1 and Exhibit 2, attached).

The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

Assembly Bill 52 (AB 52) requires lead agencies to consult with California Native American Tribes that request such consultation in writing for any project for which a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), or notice of a Mitigated Negative Declaration (MND) or Negative Declaration (ND) is filed on or after July 1, 2015. UCR received your request for formal notification of

proposed projects within the Torres Martinez Desert Cahuilla Indians Traditional Use Area. This letter is intended as formal notification of the proposed project pursuant to AB 52.

Your participation in this local planning process is important. The Sacred Lands File Search (SLF) was submitted to the Native American Heritage Commission (NAHC) for the proposed project and results are ~~negative. pending response back from the NAHC.~~ If you possess any information or knowledge regarding Native American Sacred Lands or other tribal cultural resources in and around the project site, and wish to consult with UCR regarding these resources or mitigation measures to reduce impacts of the proposed project, please direct your email to stephanie.tang@ucr.edu or any correspondence on this matter to:

Stephanie Tang
~~Campus Environmental Planner~~
Assistant Director of Campus Planning
University of California, Riverside
Planning, Design & Construction
1223 University Avenue, Suite 240
Riverside, CA 92507

Please let me know if you have any questions or would like to discuss this proposed project. I can be reached by phone at (951) 827-1484. Thank you for your interest on projects at UCR.

Respectfully,

Stephanie Tang

Thank you for your email, Abraham. I will be sure to update our AB 52 notification list to direct communications to you and Bennae. I have included all those you have included in your response unless you do prefer just to email just you and Bennae (just let me know the Tribe's preference). I have attached the updated Riverside Unified School District (RUSD) STEM Education Center Project AB 52 notice that was sent to the Tribe on May 1st.

The result of the NAHC SLF is also attached as well as the CHRIS records search in the provided link: https://o365ucr-my.sharepoint.com/:f/g/personal/stephant_ucr_edu/EuMnHKkLaChLj3bQekNpx_oB2n-BBRdo1Qxhpc0ruMAYmg?e=akRntK. The purpose of sending an updated AB 52 notice (attached) and graphic below is to show the project site more clearly with the location of the proposed STEM Education Center, T-Mobile Cell Tower Relocation Area, Electrical Feeder Line Upgrade Alignment, and associated improvements area (where the underground Gage Canal is located) (also included as Exhibit 2 in the attached updated AB 52 notice).

As part of the Draft EIR public review, the cultural resources assessment will be included in the applicable Draft EIR section and/or appendices and be made available during the Draft EIR public review. the draft cultural resources memo that was prepared concluded that no archaeological resources were identified during the field survey. It should be noted that native soils may be encountered at 4 feet and therefore, the following proposed Cultural/TCR mitigation measure(s) is included in the Draft EIR:

1. **Unanticipated Discovery of Archaeological Resources.** If previously undiscovered archaeological resources are identified during construction, all ground disturbing activities within 100 feet of the resource shall halt, UCR Planning, Design & Construction staff shall be notified, and the find shall be evaluated by a qualified archaeologist meeting the Secretary of the Interior standards to determine whether it is a unique archaeological resource, as defined by CEQA. If the find is not a unique archaeological resource, work may resume. If the find is determined to be a unique archaeological resource, the archaeologist shall make recommendations to UCR Planning, Design & Construction staff on the measures that shall be implemented, including, but not limited to, preservation in place, excavation, relocation, and further evaluation of the discoveries pursuant to CEQA. Preservation in place (i.e.,

avoidance) is the preferred method of mitigation for impacts to archaeological resources. If UCR determines that preservation in place is not feasible, the archaeologist shall design and implement a treatment plan, prepare a report, and salvage the material, as appropriate. Any important artifacts recovered during monitoring shall be cleaned, catalogued, and analyzed, with the results presented in a report of findings that meets professional standards. Work on-site may commence upon completion of any fieldwork components of the treatment plan.

2. **Unanticipated Discovery of Tribal Cultural Resources.** If previously undiscovered cultural resources of Native American origin are identified during construction, all ground disturbing activities within 100 feet of the resource shall halt, UCR Planning, Design & Construction staff shall be notified, and a tribal representative shall be given notice and opportunity within 24 hours of discovery to determine in consultation with UCR whether it is a TCR, as defined by CEQA. If the find is not a TCR, work may resume. If the find is determined to be a TCR, the tribal representative shall be given the opportunity to make recommendations to UCR Planning, Design & Construction staff on the measures that shall be implemented, including, but not limited to, preservation in place, excavation, relocation, and further evaluation of the discoveries pursuant to CEQA. Preservation in place (i.e., avoidance) is the preferred method of mitigation for impacts to TCRs. If UCR determines that preservation in place is not feasible, UCR shall design and implement a treatment plan in consultation with local Native American group(s) and, if applicable, a qualified archaeologist; prepare a report; and salvage the material, as appropriate. Any important artifacts recovered during monitoring shall be cleaned, catalogued, and analyzed, with the results presented in a report of findings that meets professional standards. Work on-site may commence upon completion of any fieldwork components of the treatment plan.
3. **Tribal Cultural Resources Monitoring and Construction Worker Training.** UCR shall give notice and opportunity to a locally affiliated Tribe to provide a qualified Native American monitor to observe all ground-disturbing activities within native soils on the project site (i.e., those soils encountered at greater than four feet in depth). Notice shall be given no less than five (5) days prior to commencement of ground-disturbing activities within areas known or expected to contain native soils. The on-site monitoring shall end when project-related ground disturbing activities within native soils are completed, or, in consultation with the lead agency and Tribe(s) as appropriate and based on observed conditions, monitoring may be reduced or eliminated prior to completion of ground-disturbing activities, when the monitor(s) has indicated that the project site has a low potential to encounter tribal cultural resources. Consolidated monitoring efforts (e.g., tribal cultural and paleontological monitoring) may occur if the individual monitor meets the applicable qualifications. The Native American monitor shall also be given notice and opportunity to provide preconstruction training for all earthmoving construction personnel prior to the start of any ground disturbing activities. The training shall include instruction on how to recognize the types of tribal cultural resources that may be encountered, and appropriate actions to be taken by the construction personnel in the event of an unanticipated discovery of a tribal cultural resource. The Native American monitor shall also be given the opportunity to provide a fact sheet conveying this information for distribution to all contractors, their employees, and other personnel involved with construction of the project. All employees shall sign a form provided by the Native American monitor documenting they attended the worker training and understand the information presented. If new construction personnel are added to the project, the crew foreman shall ensure the new personnel receive the worker training fact sheet before starting work. The UCR Planning, Design & Construction Project Manager/contractor shall retain documentation showing when training of personnel was completed.

I look forward to consulting with the Tribe once you have reviewed the attachments and email. Let me know if May 10th at 10AM would still be ok to consult with the Tribe.

Good Morning Ms. Tang,

We have a Cultural Committee and our Tribal Councilmember Gary Resvaloso serves on the Cultural Committee and Tribal Council, along with Chairman Tortez. Here are upcoming Tribal Council meetings on May 10th at 10am and May 24th at 3pm. We do a hybrid Tribal Council meeting in person and Zoom, please let me know which date you prefer and if you prefer Zoom or in person. Should you prefer Zoom I will send you a Zoom invite. Depending on Councilman Resvaloso's direction you may have to meet with the Cultural Committee first before coming to Tribal Council. I have included both Chairman Tortez and Councilman Resvaloso on this email.

Subject: AB 52 Consultation - RUSD STEM Education Center on UCR Campus

Good morning,

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center, proposed project) on the UCR campus. The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex.

The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

UCR received your request for formal notification of proposed projects within the Torres Martinez Desert Cahuilla Indians Traditional Use Area. The attached letter is intended as formal notification of the proposed project pursuant to AB 52.

Please let me know if you have any questions, would like a hard copy of the attached letter, or would like to initiate consultation. Thank you for your interest on projects at UCR.

Respectfully,

Subject: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center), Riverside County, California

Dear Ms. Mauck:

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center Project (referred to as STEM Ed Center or proposed project) in the northeastern portion of the UCR campus, in the City of Riverside, Riverside County, California. The project site is approximately 6 acres and is located within an urbanized area on the southwest corner of the intersection of Blaine Street and Canyon Crest Drive, adjacent to the UCR Baseball Complex. The project site is located within portions of Section 19 (Township 2 South; Range 4 West) of the USGS Riverside East, CA 7.5 Minute Quadrangle (refer to Exhibit 1 and Exhibit 2, attached).

The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

Assembly Bill 52 (AB 52) requires lead agencies to consult with California Native American Tribes that request such consultation in writing for any project for which a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), or notice of a Mitigated Negative Declaration (MND) or Negative Declaration (ND) is filed on or after July 1, 2015. UCR received your request for formal notification of proposed campus projects on East Campus, which includes the proposed project site. This letter is intended as formal notification of the proposed project pursuant to AB 52.

Your participation in this local planning process is important. The Sacred Lands File Search (SLF) was submitted to the Native American Heritage Commission (NAHC) for the proposed project and results are pending response back from the NAHC. If you possess any information or knowledge regarding Native American Sacred Lands or other tribal cultural resources in and around the project site, and wish to

consult with UCR regarding these resources or mitigation measures to reduce impacts of the proposed project, please direct your email to stephanie.tang@ucr.edu or any correspondence on this matter to:

Stephanie Tang
Campus Environmental Planner
University of California, Riverside
Planning, Design & Construction
1223 University Avenue, Suite 240
Riverside, CA 92507

Please let me know if you have any questions or would like to discuss this proposed project. I can be reached by phone at (951) 827-1484. Thank you for your interest on projects at UCR.

Respectfully,

A handwritten signature in cursive script that reads "Stephanie Tang".

Subject: RE: AB 52 Consultation - RUSD STEM Education Center on UCR Campus

Hello Stephanie,

Thank you for contacting the San Manuel Band of Mission Indians (SMBMI) regarding the above referenced project. SMBMI appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on Wednesday April 14th, 2022, pursuant to CEQA (as amended, 2015) and CA PRC 21080.3.1. The proposed project area exists within Serrano ancestral territory and, therefore, is of interest to the Tribe. However, due to the nature and location of the proposed project, and given the CRM Department's present state of knowledge, SMBMI does not have any concerns with the project's implementation, as planned, at this time. As a result, SMBMI requests that the following language be made a part of the project/permit/plan conditions:

CUL MMs

1. In the event that cultural resources are discovered during project activities, all work in the immediate vicinity of the find (within a 60-foot buffer) shall cease and a qualified archaeologist meeting Secretary of Interior standards shall be hired to assess the find. Work on the other portions of the project outside of the buffered area may continue during this assessment period. Additionally, the San Manuel Band of Mission Indians Cultural Resources Department (SMBMI) shall be contacted, as detailed within TCR-1, regarding any pre-contact and/or historic-era finds and be provided information after the archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regards to significance and treatment.
2. If significant pre-contact and/or historic-era cultural resources, as defined by CEQA (as amended, 2015), are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to SMBMI for review and comment, as detailed within TCR-1. The archaeologist shall monitor the remainder of the project and implement the Plan accordingly.
3. If human remains or funerary objects are encountered during any activities associated with the project, work in the immediate vicinity (within a 100-foot buffer of the find) shall cease and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5 and that code enforced for the duration of the project.

TCR MMs

1. The San Manuel Band of Mission Indians Cultural Resources Department (SMBMI) shall be contacted, as detailed in CR-1, of any pre-contact and/or historic-era cultural resources discovered during project implementation, and be provided information regarding the nature of the find, so as to provide Tribal input with regards to significance and treatment. Should the find be deemed significant, as defined by CEQA (as amended, 2015), a cultural resources Monitoring and Treatment Plan shall be created by the archaeologist, in coordination with SMBMI, and all subsequent finds shall be subject to this Plan. This Plan shall allow for a monitor to be present that represents SMBMI for the remainder of the project, should SMBMI elect to place a monitor on-site.
2. Any and all archaeological/cultural documents created as a part of the project (isolate records, site records, survey reports, testing reports, etc.) shall be supplied to the applicant and Lead Agency for dissemination to SMBMI. The Lead Agency and/or applicant shall, in good faith, consult with SMBMI throughout the life of the project.

Note: San Manuel Band of Mission Indians realizes that there may be additional tribes claiming cultural affiliation to the area; however, San Manuel Band of Mission Indians can only speak for itself. The Tribe has no objection if the agency, developer, and/or archaeologist wishes to consult with other tribes in addition to SMBMI and if the Lead Agency wishes to revise the conditions to recognize additional tribes.

Please provide the final copy of the project/permit/plan conditions so that SMBMI may review the included language. This communication concludes SMBMI's input on this project, at this time, and no additional consultation pursuant to CEQA is required unless there is an unanticipated discovery of cultural resources during project implementation. If you should have any further questions with regard to this matter, please do not hesitate to contact me at your convenience, as I will be your Point of Contact (POC) for SMBMI with respect to this project.

Respectfully,
Ryan Nordness

Subject: AB 52 Consultation - RUSD STEM Education Center on UCR Campus

Good morning,

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center, proposed project) on the UCR campus. The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

UCR received your request for formal notification of proposed campus projects on the UCR East Campus, which includes the proposed project site. The attached letter is intended as formal notification of the proposed project pursuant to AB 52.

Please let me know if you have any questions, would like a hard copy of the attached letter, or would like to initiate consultation. Thank you for your interest on projects at UCR.

Respectfully,

Stephanie Tang

Subject: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside

Hello Stephanie,

Thank you for contacting the Yuhaaviatam of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians) regarding the above referenced project. YSMN appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on April 13th, pursuant to CEQA (as amended, 2015) and CA PRC 21080.3.1. The proposed project area exists within Serrano ancestral territory and, therefore, is of interest to the Tribe. However, due to the nature and location of the proposed project, and given the CRM Department's present state of knowledge, YSMN does not have any concerns with the project's implementation, as planned, at this time. As a result, YSMN requests that the following language be made a part of the project/permit/plan conditions:

CUL MMs

1. In the event that cultural resources are discovered during project activities, all work in the immediate vicinity of the find (within a 60-foot buffer) shall cease and a qualified archaeologist meeting Secretary of Interior standards shall be hired to assess the find. Work on the other portions of the project outside of the buffered area may continue during this assessment period. Additionally, the Yuhaaviatam of San Manuel Nation Cultural Resources Department (YSMN) shall be contacted, as detailed within TCR-1, regarding any pre-contact and/or historic-era finds and be provided information after the archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regards to significance and treatment.
2. If significant pre-contact and/or historic-era cultural resources, as defined by CEQA (as amended, 2015), are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to YSMN for review and comment, as detailed within TCR-1. The archaeologist shall monitor the remainder of the project and implement the Plan accordingly.
3. If human remains or funerary objects are encountered during any activities associated with the project, work in the immediate vicinity (within a 100-foot buffer of the find) shall cease and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5 and that code enforced for the duration of the project.

TCR MMs

1. The Yuhaaviatam of San Manuel Nation Cultural Resources Department (YSMN) shall be contacted, as detailed in CR-1, of any pre-contact and/or historic-era cultural resources discovered during project implementation, and be provided information regarding the nature of the find, so as to provide Tribal input with regards to significance and treatment. Should the find be deemed significant, as defined by CEQA (as amended, 2015), a cultural resources Monitoring and Treatment Plan shall be created by the archaeologist, in coordination with YSMN, and all subsequent finds shall be subject to this Plan. This Plan shall allow for a monitor to be present that represents YSMN for the remainder of the project, should YSMN elect to place a monitor on-site.
2. Any and all archaeological/cultural documents created as a part of the project (isolate records, site records, survey reports, testing reports, etc.) shall be supplied to the applicant and Lead Agency for dissemination to YSMN. The Lead Agency and/or applicant shall, in good faith, consult with YSMN throughout the life of the project.

Note: Yuhaaviatam of San Manuel Nation realizes that there may be additional tribes claiming cultural affiliation to the area; however, Yuhaaviatam of San Manuel Nation can only speak for itself. The Tribe has no objection if the agency, developer, and/or archaeologist wishes to consult with other tribes in addition to YSMN and if the Lead Agency wishes to revise the conditions to recognize additional tribes.

Please provide the final copy of the project/permit/plan conditions so that YSMN may review the included language. This communication concludes YSMN's input on this project, at this time, and no additional consultation pursuant to CEQA is required unless there is an unanticipated discovery of cultural resources during project implementation. If you should have any further questions with regard to this matter, please do not hesitate to contact me at your convenience, as I will be your Point of Contact (POC) for YSMN with respect to this project.

Respectfully,
Ryan Nordness

To: Ryan Nordness
Subject: RE: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside
Attachments: RE: AB 52 Consultation - RUSD STEM Education Center on UCR Campus

Good morning Ryan,

Thank you for your email in response to UCR's STEM's AB 52 notice. There were two emails sent (one dated April 14, 2022 and the other dated May 10, 2022 noting the tribe's updated contact: Yuhaaviatam of San Manuel Nation. UCR appreciates the tribe's review and feedback on this project.

UCR prepared a Long Range Development Plan (LRDP) and an associated EIR which was certified November 2021. The mitigation measures for Cultural Resources/TCRs from the LRDP EIR is noted below and will be included as applicable in the STEM Cultural/TCR EIR sections (still in progress).

MM CUL-2 Tribal Cultural Resources/Archaeological Monitoring. Prior to commencement of ground disturbing activities into an area with a medium or high potential to encounter undisturbed native soils including Holocene alluvium soils, as determined by UCR, UCR shall hire a qualified archaeological monitor meeting the Secretary of the Interior's Professional Qualification Standards for archaeology (National Park Service 1983) to identify archaeological resources and cultural resources of potential Native American origin. Where development occurs in the southeastern quadrant of campus, and in areas containing Val Verde Pluton geologic features considered highly sensitive to prehistoric archaeological resources, UCR shall hire a qualified archaeologist and a Native American monitor to reduce impacts to potential archaeological and/or tribal cultural resources. The monitor(s) shall be on-site during any construction activities that involve ground disturbance. The onsite monitoring shall end when project-related ground disturbing activities are completed, or, in consultation with the lead agency and tribes as appropriate and based on observed conditions, monitoring may be reduced or eliminated prior to completion of ground-disturbing activities, when the monitor(s) has indicated that the project site has a low potential to encounter tribal cultural resources (TCR)/archaeological resources. Consolidated monitoring efforts (e.g., archaeological monitoring/tribal cultural/paleontological monitoring) may occur if the individual monitor meets the applicable qualifications, except for development in the southeastern quadrant as detailed above.

MM CUL-3 Construction Worker Training. For projects requiring TCR/archaeological monitoring, the monitor shall provide preconstruction training for all earthmoving construction personnel prior to the start of any ground disturbing activities, regarding how to recognize the types of TCRs and/or archaeological resources that may be encountered and to instruct personnel about actions to be taken in the event of a discovery. UCR Planning, Design & Construction Project Manager/contractor shall retain documentation showing when training of personnel was completed.

MM CUL-4 Unanticipated Discovery of Tribal Cultural Resources/Archaeological Resources. If previously undiscovered TCRs and/or archaeological resources are identified during construction, all ground disturbing activities within 100 feet of the resource shall halt, UCR Planning, Design & Construction staff shall be notified, and the find shall be evaluated by a qualified archaeologist meeting the Secretary of the Interior standards to determine whether it is a unique archaeological resource, as defined by CEQA. If the discovery appears to be Native American in origin, a tribal representative will be contacted within 24 hours of discovery to determine whether it is a TCR, as defined by CEQA. If the find is neither a unique archaeological resource nor a TCR, work may resume. If the find is determined to be a unique archaeological resource or TCR, the archaeologist and the tribal representative, as appropriate, shall make recommendations to UCR Planning, Design & Construction staff on the measures that will be implemented, including, but not limited to, preservation in place, excavation, relocation, and further evaluation of the discoveries pursuant to

CEQA. Preservation in place (i.e., avoidance) is the preferred method of mitigation for impacts to TCRs/archaeological resources. If UCR determines that preservation in place is not feasible, the archaeologist shall design and implement a treatment plan, prepare a report, and salvage the material, as appropriate. Any important artifacts recovered during monitoring shall be cleaned, catalogued, and analyzed, with the results presented in a report of findings that meets professional standards. Work on-site may commence upon completion of any fieldwork components of the treatment plan.

In regards to human remains: California law recognizes the need to protect Native American human burials, skeletal remains, and items associated with Native American burials from vandalism and inadvertent destruction. The procedures for the treatment of Native American human remains are contained in California Health and Safety Code Sections 7050.5 and 7052 and California PRC Section 5097. If human remains are discovered during any construction activities, potentially damaging ground-disturbing activities in the area of the remains and a 100-foot-buffer area shall be halted immediately, and UCR shall notify the Riverside County Coroner and the NAHC immediately, according to PRC Section 5097.98 and Section 7050.5 of California's Health and Safety Code. If the remains are determined by the NAHC to be Native American, the guidelines of the NAHC shall be adhered to in the treatment and disposition of the remains. Following the Coroner's findings, UCR and the NAHC-designated most likely descendant shall recommend the ultimate treatment and disposition of the remains and take appropriate steps to ensure that additional human interments are not disturbed. The responsibilities for acting upon notification of a discovery of Native American human remains are identified in California PRC Section 5097.94. Compliance with California Health and Safety Code Sections 7050.5 and 7052 and California PRC Section 5097 would provide an opportunity to avoid or minimize the disturbance of human remains, and to appropriately treat any remains that are discovered. This discussion would be included in the Cultural Resources section.

Please review and let me know if you have any questions or would like to discuss further.

Thank you in advance for your review and have a good day!

Respectfully,

Stephanie Tang

Subject: Assembly Bill 52 (AB 52) Consultation (Public Resources Code §21080.3.1) – Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center (STEM Ed Center), Riverside County, California

Dear Ms. Mauck:

Please note that updates to the AB 52 notice is provided below in ~~strikeout text~~ and underline text. Additionally, Exhibit 2 has been updated to depict the electrical feeder line upgrade alignment, associated site improvements, existing cell towers, and T-Mobile Cell Tower Relocation Area.

The University of California, Riverside (UCR) is the lead agency, pursuant to the California Environmental Quality Act (CEQA), for the proposed Riverside Unified School District (RUSD) Science, Technology, Engineering, and Mathematics Education Center Project (referred to as STEM Ed Center or proposed project) in the northeastern portion of the UCR campus, in the City of Riverside, Riverside County, California. The project site is approximately 7 acres ~~6 acres~~ and is located within an urbanized area on the southwest corner of the intersection of Blaine Street and Canyon Crest Drive, adjacent to the UCR Baseball Complex. The project site is located within portions of Section 19 (Township 2 South; Range 4 West) of the USGS Riverside East, CA 7.5 Minute Quadrangle (refer to Exhibit 1 and Exhibit 2, attached).

The project site is currently developed with open recreational field with two baseball diamonds. Two cellular network towers currently leased to Sprint and T-Mobile are located in the northwest corner of the project site. The Sprint cell tower would be decommissioned and removed from the site. The T-Mobile cell tower would be removed from the project site and relocated to the northern portion of the adjacent UCR Baseball Complex. The existing open recreational fields (two baseball diamonds) would be removed with the construction of the proposed STEM Ed Center and associated site improvements.

Assembly Bill 52 (AB 52) requires lead agencies to consult with California Native American Tribes that request such consultation in writing for any project for which a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), or notice of a Mitigated Negative Declaration (MND) or Negative Declaration (ND) is filed on or after July 1, 2015. UCR received your request for formal notification of

proposed campus projects on East Campus, which includes the proposed project site. This letter is intended as formal notification of the proposed project pursuant to AB 52.

Your participation in this local planning process is important. The Sacred Lands File Search (SLF) was submitted to the Native American Heritage Commission (NAHC) for the proposed project and results are ~~negative. pending response back from the NAHC.~~ If you possess any information or knowledge regarding Native American Sacred Lands or other tribal cultural resources in and around the project site, and wish to consult with UCR regarding these resources or mitigation measures to reduce impacts of the proposed project, please direct your email to stephanie.tang@ucr.edu or any correspondence on this matter to:

Stephanie Tang
~~Campus Environmental Planner~~
Assistant Director of Campus Planning
University of California, Riverside
Planning, Design & Construction
1223 University Avenue, Suite 240
Riverside, CA 92507

Please let me know if you have any questions or would like to discuss this proposed project. I can be reached by phone at (951) 827-1484. Thank you for your interest on projects at UCR.

Respectfully,

Stephanie Tang

Subject: RUSD STEM Center at UCR - AB 52 Consultation
Attachments: STEM AB52_Updated NoticeLtr_Yuhaaviatam of San Manuel Nation_5-1-23.pdf

Good morning Ryan,

It's been a while and hope everything has been going well on your end. I wanted to provide an AB 52 notice update re: the Riverside Unified School District (RUSD) STEM Education Center Project on UCR Campus. The below graphic shows the project site more clearly with the location of the proposed STEM Education Center, T-Mobile Cell Tower Relocation Area, Electrical Feeder Line Upgrade Alignment, and associated improvements area (where the underground Gage Canal is located) (also included as Exhibit 2 in the attached updated AB 52 notice). Additionally, the below text includes the Draft EIR Cultural/TCR mitigation measures for the proposed project:

- **Unanticipated Discovery of Archaeological Resources.** If previously undiscovered archaeological resources are identified during construction, all ground disturbing activities within 100 feet of the resource shall halt, UCR Planning, Design & Construction staff shall be notified, and the find shall be evaluated by a qualified archaeologist meeting the Secretary of the Interior standards to determine whether it is a unique archaeological resource, as defined by CEQA. If the find is not a unique archaeological resource, work may resume. If the find is determined to be a unique archaeological resource, the archaeologist shall make recommendations to UCR Planning, Design & Construction staff on the measures that shall be implemented, including, but not limited to, preservation in place, excavation, relocation, and further evaluation of the discoveries pursuant to CEQA. Preservation in place (i.e., avoidance) is the preferred method of mitigation for impacts to archaeological resources. If UCR determines that preservation in place is not feasible, the archaeologist shall design and implement a treatment plan, prepare a report, and salvage the material, as appropriate. Any important artifacts recovered during monitoring shall be cleaned, catalogued, and analyzed, with the results presented in a report of findings that meets professional standards. Work on-site may commence upon completion of any fieldwork components of the treatment plan.
- **Unanticipated Discovery of Tribal Cultural Resources.** If previously undiscovered cultural resources of Native American origin are identified during construction, all ground disturbing activities within 100 feet of the resource shall halt, UCR Planning, Design & Construction staff shall be notified, and a tribal representative shall be given notice and opportunity within 24 hours of discovery to determine in consultation with UCR whether it is a TCR, as defined by CEQA. If the find is not a TCR, work may resume. If the find is determined to be a TCR, the tribal representative shall be given the opportunity to make recommendations to UCR Planning, Design & Construction staff on the measures that shall be implemented, including, but not limited to, preservation in place, excavation, relocation, and further evaluation of the discoveries pursuant to CEQA. Preservation in place (i.e., avoidance) is the preferred method of mitigation for impacts to TCRs. If UCR determines that preservation in place is not feasible, UCR shall design and implement a treatment plan in consultation with local Native American group(s) and, if applicable, a qualified archaeologist; prepare a report; and salvage the material, as appropriate. Any important

artifacts recovered during monitoring shall be cleaned, catalogued, and analyzed, with the results presented in a report of findings that meets professional standards. Work on-site may commence upon completion of any fieldwork components of the treatment plan.

- **Tribal Cultural Resources Monitoring and Construction Worker Training.** UCR shall give notice and opportunity to a locally affiliated Tribe to provide a qualified Native American monitor to observe all ground-disturbing activities within native soils on the project site (i.e., those soils encountered at greater than four feet in depth). Notice shall be given no less than five (5) days prior to commencement of ground-disturbing activities within areas known or expected to contain native soils. The on-site monitoring shall end when project-related ground disturbing activities within native soils are completed, or, in consultation with the lead agency and Tribe(s) as appropriate and based on observed conditions, monitoring may be reduced or eliminated prior to completion of ground-disturbing activities, when the monitor(s) has indicated that the project site has a low potential to encounter tribal cultural resources. Consolidated monitoring efforts (e.g., tribal cultural and paleontological monitoring) may occur if the individual monitor meets the applicable qualifications. The Native American monitor shall also be given notice and opportunity to provide preconstruction training for all earthmoving construction personnel prior to the start of any ground disturbing activities. The training shall include instruction on how to recognize the types of tribal cultural resources that may be encountered, and appropriate actions to be taken by the construction personnel in the event of an unanticipated discovery of a tribal cultural resource. The Native American monitor shall also be given the opportunity to provide a fact sheet conveying this information for distribution to all contractors, their employees, and other personnel involved with construction of the project. All employees shall sign a form provided by the Native American monitor documenting they attended the worker training and understand the information presented. If new construction personnel are added to the project, the crew foreman shall ensure the new personnel receive the worker training fact sheet before starting work. The UCR Planning, Design & Construction Project Manager/contractor shall retain documentation showing when training of personnel was completed.

Please let me know if you have additional questions or would like to set up a zoom meeting to go over the above and attachments by **May 31, 2023**, or we would assume AB 52 has concluded. **If you would like to set up a zoom meeting, please let me know what dates/times the Tribe would be available to consult.**

Respectfully,

Stephanie Tang
