PRELIMINARY HYDROLOGY CALCULATIONS

FOR

HARLEY KNOX COMMERCE CENTER

PREPARED UNDER
THE SUPERVISION OF

REINHARD STENZEL DATE:
R.C.E. 56155
EXP. 12/31/2022

INTRODUCTION

A: PROJECT LOCATION

The project site is located on the west side of Redlands Avenue, north of Nance Street, and south of Harley Knox Boulevard in the City of Perris, California. Please see the following page for a vicinity map.

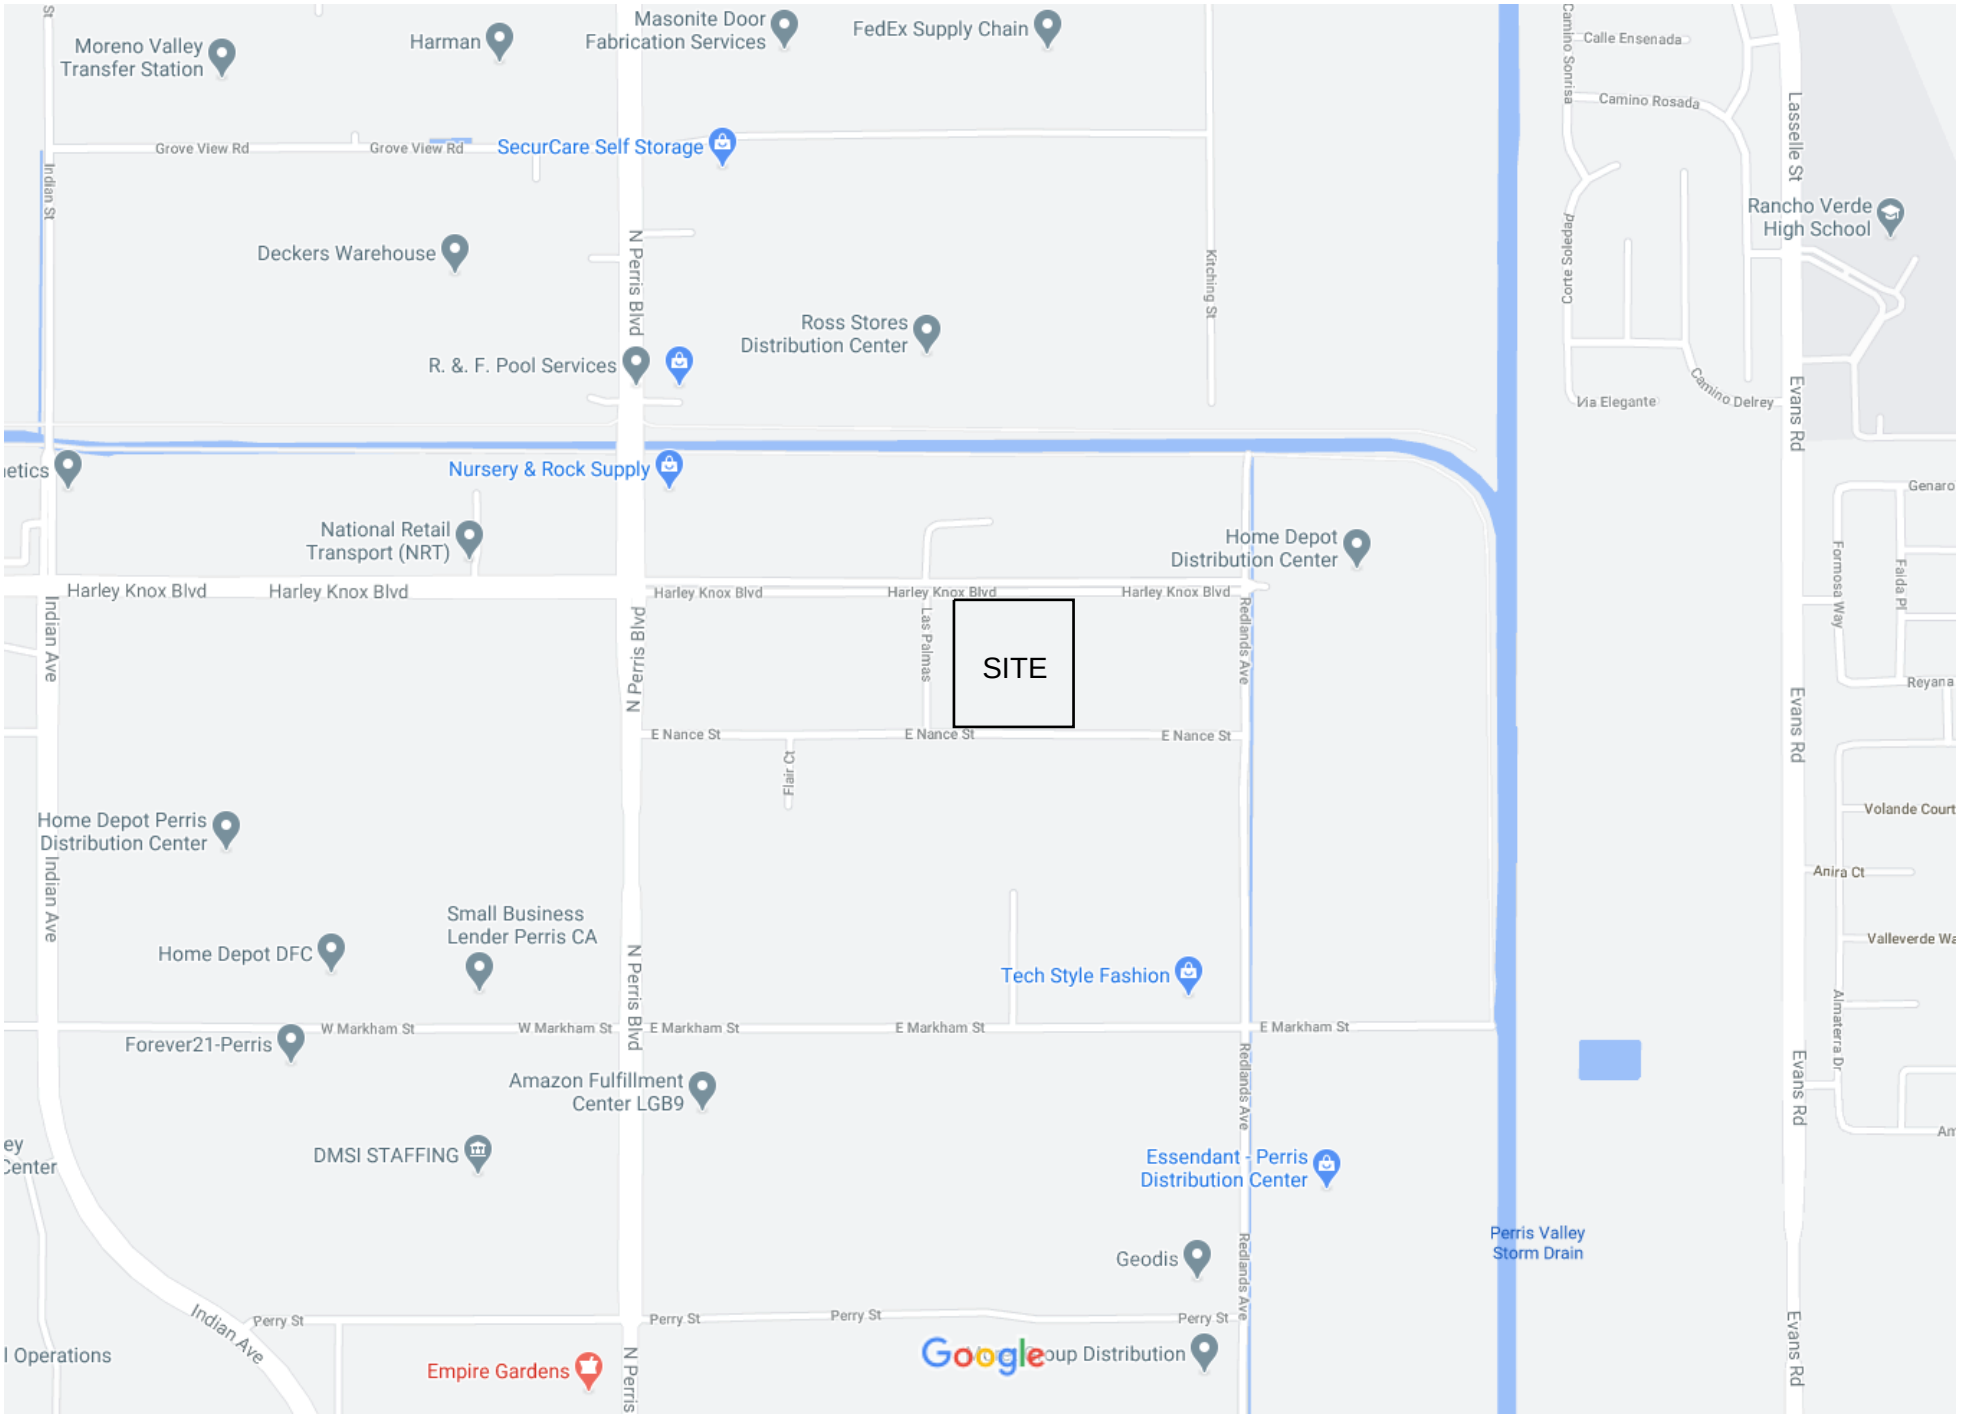
B: STUDY PURPOSE

The purpose of this study is to determine the existing condition and proposed condition 100-year peak flow rates from the project site that drains toward Nance Street.

C: PROJECT STAFF:

Thienes Engineering staff involved in this study include:

Reinhard Stenzel
Brian Weil
Tony Nuñez



Map data ©2021 500 ft

DISCUSSION

Project Description

The project site encompasses approximately 6.45 acres. Proposed improvements to the site include a single commercial/warehouse type building that is approximately 156,094 square feet. There will be a truck dock along the westerly side of the building, vehicle parking will be located west and east of the building, and landscape areas will be street adjacent and throughout the site.

Existing Conditions

Under existing conditions, the site is mostly vacant with natural grasses and sparse vegetation throughout. There are foundations from residential buildings in the southeast and southwest sections of the site. The site generally drains from north to south toward Nance Street. The existing condition 100-year peak flow rates that surface drains to the south is approximately 2.7 cfs from the westerly 2.15 acres (nodes 100-101) and 5.6 cfs from the easterly 4.30 acres (nodes 110-111). The total existing condition 100-year peak flor rate that surface drains to the street is approximately 8.3 cfs (2.7 cfs + 5.6 cfs).

See Appendix "B" for the existing condition hydrology calculations and Appendix "C" for an existing condition hydrology map.

Offsite Hydrology

The site may accept offsite runon from a portion of the neighboring site to the west. Potential runon from the west will continue to surface drain onto the project site along the westerly property line, join the onsite system, and discharge from the site via a proposed storm drain system.

Proposed Conditions

In the proposed condition, runoff from the westerly portion of the building, the truck yard, and the southwesterly and northwesterly parking lots will surface drain to several catch basins located within the truck yard (nodes 100-132). Flow from the easterly portion of the building and the parking lot to the east will surface drain to two catch basins within the parking lot (nodes 140-152). Proposed storm drain systems, Lines A and B, will convey stormwater to the south and discharge into a proposed public storm drain system in Nance Street. The southerly and northerly street adjacent landscaping will surface drain directly into the respective street (nodes 160 and 170, respectively). The total proposed condition 100-year peak flow rate is approximately 22.0 cfs (15.6 cfs from the westerly truck yard + 4.6 cfs from the easterly parking lot + 0.9 cfs from the southerly landscaping + 0.9 cfs from the northerly landscaping).

The project site and the westerly neighboring site are modeled as commercial and tabled to an existing 54" RCP, Lateral D-3, in Redlands Avenue per the Hydrology and Hydraulic Analysis report dated August 2013 by Albert A. Webb Associates (WEBB). A proposed public storm drain system in Nance Street will convey stormwater from the site and ultimately discharge to Lateral D-3. The public storm drain system will be sized to adequately convey runoff from the project site and the future development of the adjacent property to the west. The storm drain will convey flows the project site to the east and connect to an existing 54" R.C.P. in Redlands Avenue. A catch basin is proposed in Nance Street along with street improvements for the development of the project site. The proposed onsite and the master plan storm drain facilities are designed for a 100-year storm frequency and do not negatively affect downstream facilities.

See Appendix "B" for the proposed condition hydrology calculations and Appendix "C" for a proposed condition hydrology map.

Methodology

Hydrology calculations were computed using Riverside County rational method program (by AES software). The soil type is "C" per Riverside County Hydrology Manual.

See Appendix "A" for referenced materials.

Water Quality

The project proposes to use underground retention facilities. Roof and surface runoff will sheet flow into inlets where stormwater will be intercepted and diverted into the perforated CMPs for water quality treatment. These systems will utilize infiltration as their primary form of treatment. These systems store stormwater runoff until it gradually exfiltrates into the underlying soil. Pollutant removal occurs through the infiltration of runoff and the adsorption of pollutants into the soil. This practice has high pollutant removal efficiency and can also help recharge groundwater, thus helping to maintain low flows in stream systems. See separate WQMP report, prepared by Thienes Engineering, for more information.
