Marine Equipment

Emission Rate Calculation

Emissions calculated on a per hour basis from CARB's CHC Inventory embedded in EMFAC web tool

All are diesel except pushboat, which is 50 hp gasoline outboard

All are based on 2024 CY equipment

					lbs per activity hour (or gallons)										lbs per hour (calculated from fuel)	
			Engines	HP	VOC	NOX	CO	PM10e	PM10d	PM2.5e	PM2.5d	SO2	CO2	Fuel	ch4	n2o

Climate Registry 2022 Efs, per gallon, ships and boats (Table 2.7)

	diesel	gas 4 stroke	
CH4	6.42	2.24	g/gallon
N2O	0.17	0.01	g/gallon
g per lb	453.59		

Fugitive Dust Emission Factors

Daily Paved Road Dust EF[1]

$$E_{ext} = [\ k\ (sL)^{0.91} \times (W)^{1.02}\ ]$$

EF_{paved}	Annual or other long-term average emission factor in the same units as k
k	particle size multiplier for particle size range and units of interest
sL	road surface silt loading (g/m^2)
W	average weight (tons) of all the vehicles raveling the road (2.4 tons)
P	Number of "wet' days with at least 0.254 (0.01 in) of precipitation during the averaging period
N	Number of days in the averaging period (e.g. 365 for annual, 91 for seasonal, 30 for monthly)

Parameters	**PM10**	**PM2.5**
k $(lb/VMT)^2$	0.0022	0.00054
sL (g/m^2)	0.1	0.1
W (tons)	2.4	2.4
EF (lb/mi)	6.61E-04	1.62E-04
EF (g/mi)	0.30	0.07

1. EMFAC OFFROAD OUTPUT

Model Output: OFFROAD2021 (v1.0.3) Emissions Inventory
Region Type: Statewide
Region: California
Calendar Year: 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

1. EMFAC OFFROAD OUTPUT

Model Output: OFFROAD2021 (v1.0.3) Emissions Inventory
Region Type: Statewide
Region: California
Calendar Year: 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Region	Calendar Year	Vehicle Category	Model Year	Horsepower Bin	Fuel	HC_tpd	ROG_tpd	TOG_tpd	CO_tpd	NOx_tpd	CO2_tpd	PM10_tpd	PM2.5_tpd	SOx_tpd	NH3_tpd	Fuel Consumption	Total_Activity_hpy	Total_Population	Horsepower_Hours_hhpy

1. EMFAC OFFROAD OUTPUT

Model Output: OFFROAD2021 (v1.0.3) Emissions Inventory
Region Type: Statewide
Region: California
Calendar Year: 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Region	Calendar Year	Vehicle Category	Model Year	Horsepower Bin	Fuel	HC_tpd	ROG_tpd	TOG_tpd	CO_tpd	NOx_tpd	CO2_tpd	PM10_tpd	PM2.5_tpd	SOx_tpd	NH3_tpd	Fuel Consumption	Total_Activity_hpy	Total_Population	Horsepower_Hours_hhpy

1. EMFAC OFFROAD OUTPUT | **2. CALCULATION OF HOURLY EMISSIONS BY TYPE BY BIN**

Model Output: OFFROAD2021 (v1.0.3) Emissions Inventory
Region Type: Statewide
Region: California
Calendar Year: 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsep

equation:
daily tons x 365 * 2000

ROG = VOC
PM10e = DPM

equation:
annual lbs / annual hours

			lbs per year									lbs per hour								row assignment

1. EMFAC OFFROAD OUTPUT

2. CALCULATION OF HOURLY EMISSIONS BY TYPE BY BIN

Model Output: OFFROAD2021 (v1.0.3) Emissions Inventory
Region Type: Statewide
Region: California
Calendar Year: 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsep

equation:
daily tons x 365 * 2000

ROG = VOC
PM10e = DPM

equation:
annual lbs / annual hours

			lbs per year									lbs per hour								row assignment
Region	Calendar Year	Vehicle Category	VOC	NOX	CO	PM10	PM2.5	SO2	CO2	Fuel (gpy)	Hours	VOC	NOX	CO	PM10	PM2.5	SO2	CO2	Fuel (gph)

Notes about multipliers for lbs/year inputs for ADMRT:

4 muliplier for 3rd tri b/c ADMRT request tons per year, but 3rd tri bin is only 3 months (0.25 of a year). 0.25 duration handled in Risk Analysis - User Defined (0.25 years) portion of ADMRT
0.5 muliplier for 0>2 bin b/c emission estimate is for the entire bin (2 years); dividing by 2 (or multiplying by 0.5) to get the annual input
0.103 (365 days / 3558.75 days) muliplier for 2>16 bin for same reason as 0>2 bin above; because emission estimate is for the entire bin (14 years bin length, but 9.75 years of construction)
10 years assumed for school
School g/s based on "total annual" because only one age bin assumed

 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for   711 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =   3000000.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates PERIOD Averages Only

 **This Run Includes:    711 Source(s);       4 Source Group(s); and    1270
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    711 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191
```

```
 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     8.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      4.1 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   POSD_NASSCO_JUNE2022_URBAN.ERR

 **File for Summary of Results:   POSD_NASSCO_JUNE2022_URBAN.SUM

- - - - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
```

```
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for     8 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   3000000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: TAC

 **Model Calculates  2 Short Term Average(s) of:   1-HR   8-HR
     and Calculates PERIOD Averages

 **This Run Includes:      8 Source(s);       3 Source Group(s); and    1270
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      8 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     8.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0

Marine Habitat Assessment for the General Dynamics-NASSCO Floating Dry Dock Replacement and Waterfront Improvement Project

June 28, 2021 (Revised March 23, 2023)

1 Introduction

Marine Taxonomic Services, Ltd. (MTS) was contracted by Ascent Environmental, Inc (Ascent) to perform an assessment of marine habitats within the NASSCO shipyard leasehold. The goal of the survey was to observe areas below +7.79-feet mean lower low water (MLLW) for the purpose of mapping biological habitats for the proposed Project. This elevation was determined as the high-water line and is the jurisdictional elevation for permitting with the United States Army Corps of Engineers (USACE). The habitat data was used to develop a marine biological assessment presented in this document. This assessment provides an eelgrass map, discusses the habitats and dominant species present, includes an Essential Fish Habitat Assessment (EFH), and evaluates potential Project related impacts and potential mitigation measures.

1-1 Project Location

The NASSCO shipyard is located at 2798 East Harbor Drive in San Diego, California (Figure 1). The project site includes land and on/over water structures (Figure 2). All information relative to the project description, background, project need, and project description are adapted from supplemental information prepared for NASSCO (Anchor QEA 2020).

1-2 Project Description

General Dynamics-NASSCO (NASSCO) is proposing to perform land and waterside improvements under the Floating Dry Dock Replacement and Waterfront Improvement Project (Project; Figure 3). The goal of the proposed Project is to replace NASSCO's existing floating dry dock and supporting infrastructure to comply with current standards and code; improve the existing Repair Complex Wharf to maximize storage and laydown capabilities; repair failed revetment and exposed shoreline throughout the NASSCO leasehold to address damage from wave action and maintain safe operation of the shipyard; and repair and/or replace damaged structural piles throughout the NASSCO shipyard to restore structural integrity, extend service life, and provide safe mooring berths for new construction and repair vessels.

The Project includes removal and replacement of the existing floating dry dock and construction of supporting infrastructure (Figure 3). Improvements to the Repair Complex Wharf includes repair and replacement of piles and overwater expansion of the overall wharf structure. Additionally, repairs will be performed to the quay wall tow of slope along stretches of shoreline throughout the NASSCO leasehold. These repairs will be performed along shoreline segments from Lot 20 to Pier 12, floating dry dock approach pier to Berth 8, Ways to Building Dock, Berth 2 to Berth 3, Berth 4 to Berth 5, and Berth 6 to Navy Base Quay Wall. As-needed structural repair and/or replacement is proposed at selected piles at Berths 2, 3, 4, 5, 6, Pier 12 and the floating dry dock approach pier, and at the Berth 1 Platform.

2 Survey Methods

This report relies on a combination of previously collected data, literature, and observations made during survey work performed by MTS staff Robert Mooney and Hannah Joss on May 12, 2021. A secondary dive survey was performed on May 20, 2021, by Robert Mooney and Grace Teller to verify sonar data and map eelgrass boundaries within the Project site.

Data on intertidal habitats, hard bottom habitats, piles, and soft bottom habitats were collected by swimming within portions of the Project site water area using SCUBA (Figure 2). Piles were evaluated by observing a random subset of structures within the Project site. Intertidal and subtidal hard bottom and soft bottom habitat was evaluated by swimming multiple transects extending from shallow water to deeper water portions within the leasehold. Additional observations were made by performing a zig-zag pattern swim along shallow-water portions within the leasehold where hard bottom habitat transitioned to soft bottom habitat. The primary focus of performing the zig-zag portion of the survey was to confirm the extent of vegetated soft bottom habitat. Where vegetated soft bottom habitat was comprised of eelgrass (*Zostera* sp.). Side-scan sonar images of the seafloor were collected in shallow and deeper water area to complete the eelgrass survey within the Project site. Data from diver transects were also used to provide validation of side-scan sonar data and generally characterize the habitats within the Project site. The survey methods are described below.

2-1 Side-Scan Sonar Survey

To detect and map any eelgrass present, a side-scan sonar survey was performed by navigating a small vessel along a series of track lines through the Project site (Figure 2). The vessel was fitted with a pole-mounted side-scan sonar operating at 450 kHz. The sonar was set to scan 30 meters on both the port and starboard channels for a total scanning swath of 60 meters. Multiple side-scan sonar survey track lines within close proximity to one another were navigated across the Project area. This allowed for complete coverage of the Project area at water depths with potential to be occupied by eelgrass while providing overlapping data that allowed redundancy within the sonar record.

Following the field surveys, the collected side-scan sonar files were geographically registered using the vessel's navigation data collected during the survey. The side-scan files were then compiled to create a contiguous view of the seafloor across the entirety of the survey area. The boundaries of the eelgrass were identified for visual verification and mapping by diver.

2-2 Scuba and Transect Surveys

The SCUBA surveys were implemented to visually verify the sonar data, map eelgrass, and generally characterize habitats within the Project site (Figure 2). During the initial survey, each habitat type in the survey area was visually inspected for qualitative characterization and to document the dominant flora and fauna present. Notes were made on the occurrence, or potential for occurrence of sensitive species that could be impacted by the proposed Project.

The transect data were obtained by swimming multiple transects from shallow water to deep water in the Project site. Within the survey area boundaries, the diver anchored a fiberglass tape measure to the seafloor and used compass navigation to swim across the survey site. While the diver swam along the transect, they towed a buoy mounted with a differential global positioning system (dGPS). The diver was equipped with underwater communication system and was able to communicate within the Project site

to a second MTS staff member, the dive tender, on a small research vessel. The dive tender equipped with mapping software would then connect to the diver towed dGPS and record the location and description of what the diver was communicating. Along each transect, the diver surveyed habitat types including hard bottom, unvegetated soft bottom, vegetated soft bottom, piles, and open water.

On the follow up survey day, eelgrass identified in the sonar imagery was visually verified by diver and the boundary of each eelgrass bed was mapped. Additionally, MTS referenced previously mapped eelgrass (M&A 2019) within the NASSCO facility to confirm the extent of potential eelgrass targets not observed during the initial diver survey or in sonar imagery. MTS mapped eelgrass boundaries using the towed dGPS and mapping software used during the transect survey. When the diver identified eelgrass, they communicated to the dive tender. The diver tender started recording the location of the towed buoy as the diver swam the perimeter of the eelgrass bed. Eelgrass targets smaller than 4 square feet were mapped as a waypoint, the size was approximated and recorded, and later digitized during map development.

2-3 Habitat Characterization

Habitats were categorized by substrate type, vegetation presence or absence, and water depth. Substrate type consisted of hard bottom, piles, unvegetated soft bottom, vegetated soft bottom, and open water. A soft bottom habitat was considered vegetated if eelgrass was observed to be growing on the soft bottom substrate. Habitats were further divided by water depth categories delineated in the San Diego Bay Integrated Natural Resources Management Plan ([INRP]; Tierra Data 2013). Depth categories determined in the INRP were intertidal (+7.8 to -2.2 feet MLLW), shallow subtidal (-2.2 to -12 feet MLLW), moderately deep subtidal (-12 to -20 feet MLLW), and deep subtidal (>-20 feet MLLW).

3 Results

The results below present the findings of the side-scan sonar survey, SCUBA surveys of the marine habitat areas, and the analysis of the essential fish habitat. The depth range of each habitat mapped is provided in Table 1. The aerial extent of each habitat described below is presented in Figure 5.

Table 1. Table of habitat depth ranges within the NASSCO Project site.

HABITAT	Area (m2)
Intertidal (+7.8 - -2.2)	
Vegetated Soft Bottom Intertidal Habitat (eelgrass)	52.0
Unvegetated Soft Bottom Intertidal Habitat	1,120.9
Unvegetated Hard Bottom Intertidal Habitat	5,528.2
Shallow Subtidal (-2.2 - -12.0)	
Vegetated Soft Bottom Shallow Subtidal Habitat (eelgrass)	422.0
Unvegetated Soft Bottom Shallow Subtidal Habitat	6,587.8
Unvegetated Hard Bottom Shallow Subtidal Habitat	1,171.8
Moderately Deep Subtidal (-12.0 - -20.0)	
Vegetated Soft Bottom Moderately Deep Subtidal Habitat (eelgrass)	3.5
Unvegetated Soft Bottom Moderately Deep Subtidal Habitat	13,311.3
Unvegetated Hard Bottom Moderately Deep Subtidal Habitat	363.0
Deep Subtidal (-20.0 - -57.3)	
Unvegetated Soft Bottom Deep Subtidal Habitat	196,331.5

Habitats were considered vegetated only if they supported eelgrass resources. While minor amounts of other algae species were observed over soft bottom and hard substrates, they were still considered to be unvegetated. Eelgrass was only present on soft bottom habitat. Thus, all hard substrate was unvegetated.

3-1 Marine Habitats

The natural and man-made habitats observed and surveyed within the Project site included intertidal and subtidal hard bottom, intertidal and subtidal piles, subtidal unvegetated soft bottom, subtidal vegetated soft bottom, and open water habitats. Each marine habitat is discussed below. Subtidal habitats occurred in shallow, moderately deep, and deep subtidal water depths.

3-1.1 Hard Bottom Habitat

Hard bottom habitats observed throughout the Project site were generally present along the shallow water edges of survey sites and consisted of items used for the purpose of armoring the shoreline. Hard bottom substrate was generally comprised of varying and on occasion multiple types of hard material including riprap rock, stacked concrete blocks, and concrete poured over stacked concrete block.

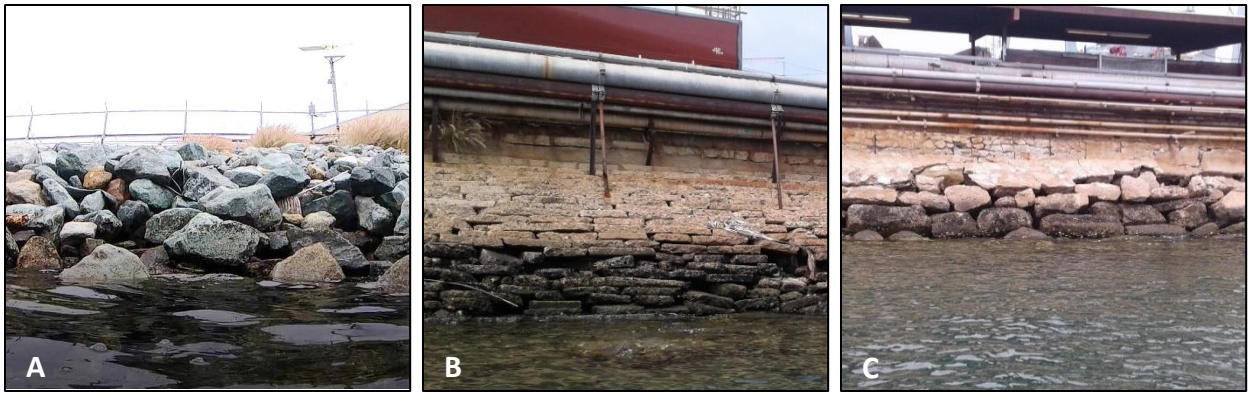

Figure 4. Photos of hard substrate taken within the Project site. (A) riprap rock, (B) stacked concrete block, and (C) concrete poured over staked concrete block.

3-1.1.1 Intertidal Hard Bottom Habitat (+7.8 to -2.2 feet MLLW)

Intertidal hard bottom habitats were present along the shoreline throughout each area surveyed and were generally present throughout the Project site for the purpose of shoreline stabilization. Organisms observed over and within intertidal hard bottom habitat generally included those that are typically associated with biofouling communities present in San Diego Bay. This included Pacific oysters (*Crassostrea gigas*), minor amounts of barnacles (*Chlhamalus* spp.), and filamentous brown algae (*Ectcarpus* sp.) algae. A single juvenile California sargo (*Anistremus davidsonii*) was observed seeking shelter between the rocks near the water's surface.

3-1.1.2 Shallow Subtidal Hard Bottom Habitat (-2.2 to -12 feet MLLW)

Shallow subtidal hard bottom substrate was generally present below areas where intertidal hard bottom substrate was observed. The presence of Pacific oysters increased from intertidal to shallow subtidal hard bottom habitat. Invertebrates also observed in the shallow subtidal areas included sponges (*Halichondria* sp.), bryozoans (*Cellaria mandibulata*), California aglaja (*Navanax intermis*), and tunicates (*Styela plicata*). In addition to filamentous brown algae, occasional occurrences of filamentous red algae (*Polysiphonia* sp.), foliose red algae (*Gelidium* sp., *Gracilaria* sp.), brown algae (*Sargassum muticum, Dictyota* sp., *Colpomenia* sp.), coralline algae (*Corallina officinalis, Lithothrix* spp.), kelp (*Undaria pinnatifida*) were observed. Vertebrate species observed in shallow subtidal hard bottom habitat included opaleye (*Girella nigricans*), kelp bass (*Paralabrax clathratus*), barred sand bass (*Paralabrax nebulifer*), spotted sand bass (*Paralabrax maculatofasciatus*), and California sargo.

3-1.1.3 Moderately Deep and Deep Subtidal Hard Bottom Habitat (-12 to >-20 feet MLLW)

Hard substrate was not consistently present below -12 feet MLLW. However, on occasion small rock or hard debris was present that allowed for the existence of organisms associated with hard substrate. Coralline algae and red algae were observed along with gorgonian corals (*Muricea fruticosa, M. californica*). Additionally, multiple California spiny lobster (*Panulirus interruptus*) were found to be associated with scattered hard substrate below -12 feet MLLW. Evidence of octopus dens were present on occasion near scattered hard substrate. Octopus dens were identified by holes burrowed below hard substrate that were surrounded by large shells and bivalve shells split in half, typically clam and mussel shells. Fish species observed in shallow subtidal hard bottom habitat were also present in moderately deep and deep hard bottom habitat. Barred sand bass, spotted sand bass, and California sargo were commonly seen seeking shelter near scattered rock or hard debris present in deeper subtidal habitat.

3-1.2 Piles

Piles are generally present throughout the Project site supporting overwater structures of the NASSCO facility. The upper reaches of the piles (approximately +2 to -2-feet MLLW) were generally colonized by a fouling community dominated by Pacific oysters, barnacles, and foliose species of red algae. Moving down the piles, foliose red algae, tunicates (*Styela plicata, Euherdamania claviformis,* compound tunicate species), and Pacific oyster were common. Fish were not observed around the piles, however, California sargo, barred sand bass, kelp bass, spotted sand bass, and opaleye observed elsewhere in the Project site may utilize these structures on occasion.

Figure 5. Habitat map for NASSCO Project site. See Appendix A for map sheets 1 through 4.

3-1.3 Unvegetated Soft Bottom

The majority of the area surveyed within the Project site was unvegetated soft bottom habitat. Unvegetated soft bottom habitat was found across all INRP habitat ranges. Unvegetated soft bottom habitat was generally characterized by sediment grain size of small to fine sand and shell hash. Bioturbation was generally low throughout all soft bottom habitats. In portions of deep subtidal unvegetated habitat moderate bioturbation was observed due to reduced coarseness of sediment and reduced presence of shell hash and shells.

3-1.3.1 Intertidal and Shallow Subtidal Unvegetated Soft Bottom Habitat (+7.8 to -12 feet MLLW)

A narrow section of intertidal and shallow subtidal unvegetated soft bottom habitat was present within the Project site. In addition to sand particulate large shells and shell hash composed much of the sediment this area. Minimal flora was observed in this area, green algae (*Ulva lactuca*) was typically seen in this region. Other algae species were generally associated with a pieces of hard substrate, debris, or rock. Few organisms were observed and consisted of occasional invertebrate organisms including tunicates, dorids (*Doridida*e sp.), and California aglaja. Vertebrate species observed included round stingrays (*Urolophus halleri*), California sargo, spotted sand bass, and barred sand bass.

3-1.3.2 Moderately Deep Subtidal Unvegetated Soft Bottom Habitat (-12 to -20 feet MLLW)

Moderately deep subtidal unvegetated soft bottom habitat was similar to habitat observed in shallow subtidal regions. Substrate was generally composed of sand particulate with shell hash and fewer large shells. However, aggregates of larger shell hash and shells were scattered throughout this depth range. Where these aggregates occurred, they allowed for green and red algae, and coralline algae to persist. On occasion invertebrates including tunicates, dorids, California aglaja, and burrowing anemones (*Pachycerianthus fimbriatus*) were observed. Vertebrate species observed in shallow subtidal unvegetated habitats were generally observed at this depth range.

3-1.3.3 Deep Subtidal Unvegetated Soft Bottom Habitat (>-20 feet MLLW)

Deep subtidal unvegetated habitat composed most of the seafloor within the Project site. Substrate was similar to that observed at moderately deep depths, however fewer shell aggregates were observed, and sediment grain size consisted of more small and fine particles. Where shell aggregates were observed filamentous red algae was observed. Tunicates, burrowing anemones, and bryozoans were observed on occasion in deep subtidal unvegetated soft bottom areas. Round stingrays (*Urolophus halleri*) became common in deep subtidal unvegetated soft bottom habitat where small grain size was present.

3-1.4 Vegetated Soft Bottom

Vegetated soft bottom (i.e., eelgrass) occurs within portions of areas surveyed throughout the Project site (Figure 6). Eelgrass covers a total aerial extent of 478 square meters and unvegetated eelgrass habitat covers 2,788 square meters within the Project site. Unvegetated eelgrass habitat is the area within 5-meters of established eelgrass resources where the beneficial aspects of eelgrass presence extend and influence benthic communities. Eelgrass was typically present in shallow subtidal habitat, occasionally intertidal habitat, and 3 square meters were mapped in moderately deep subtidal habitat. On occasion *Ruppia maritima* was observed growing in areas of eelgrass. Between berths 2 through 6.

The most common invertebrate observed within eelgrass was the cloudy bubble snail (*Bulla gouldiana*). Other common motile invertebrate species included the California aglaja. The soft bottom associated with

eelgrass was generally similar to unvegetated areas with evidence of more burrowing invertebrates, likely including bivalves, burrowing anemones, amphipods, and annelid worms. Fish observed within the eelgrass included round stingrays, barred sand bass, spotted sand bass, kelp bass, and shiner surfperch (*Cymatogaster aggregata*). It is likely that the eelgrass beds support numerous other fish species not observed during the survey.

3-1.5 Open Water

During the time of the survey Topsmelt (*Atherinops affinis*) were observed swimming in open water. It is likely that schooling baitfish frequent the waters of the open Project site, including Topsmelt and anchovy (*Anchoa* spp.) (Pondella and Williams 2009). These fish are important prey items for seabirds that can be expected to forage in the Project site, including brown pelicans (*Pelecanus occidentalis californicus*), double-crested cormorants (*Phalacrocorax auritus*), grebes, and terns. Jellyfish may also be present on occasion and/or seasonally within the Project site (Gavidor 2015). Jellyfish are common prey items for green sea turtles (*Chelonia mydas*) known to take reside in San Diego Bay.

Figure 6. Eelgrass map showing the aerial extent of eelgrass and unvegetated eelgrass habitat within the Project site relative to project components. Eelgrass map sheet set can be found in Appendix B.

4 Sensitive Species

Based on species lists provided by the U.S Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS) (USFWS 2019 and NMFS 2019a), an analysis of the range and habitat preferences of protected, rare, threatened, or endangered species that may occur within, or adjacent to the Project site was conducted. A list of these special status and protected species with potential to occur in the region and within the project site is provided below in Table 2.

Table 2. Special Status and Protected Species with the potential to occur within or near the Project site (USFWS 2019 and NMFS 2019a).

Common Name	Scientific Name	Conservation Status	Potential For Occurrence	
Birds			**San Diego Region**	**Project Site**
California brown pelican	*Pelecanus occidentalis*	Protected	High	Moderate
Least tern	*Sternula antillarum*	Threatened	High	Moderate
Western snowy plover	*Charadrius nivosus nivosus*	Threatened	High	Low
Turtles				
Green turtle	*Chelonia mydas*	Threatened	Moderate	Moderate
Leatherback turtle	*Dermochelys coriacea*	Endangered	Low	Unlikely
Loggerhead turtle	*Caretta caretta*	Threatened	Low	Unlikely
Olive Ridley turtle	*Lepidochelys olivacea*	Threatened	Low	Unlikely
Cetaceans				
Blue Whale	*Balaenoptera musculus*	Endangered	Low	Unlikely
Bottlenose dolphin	*Tursiops truncatus*	Protected	Moderate	Low
Bryde's whale	*Balaenoptera brydei*	Protected	Low	Unlikely
Cuvier's beaked whale	*Ziphius cavirostris*	Protected	Low	Unlikely
Dall's porpoise	*Phocoenoides dalli*	Protected	Low	Unlikely
Fin whale	*Balaenoptera physalus*	Endangered	Low	Unlikely
Gray whale	*Eschrichtius robustus*	Protected	Moderate	Low
Guadalupe fur seal	*Arctocephalus townsendi*	Threatened	Low	Unlikely
Humpback whale	*Megaptera novaeangliae*	Endangered	Low	Unlikely
Long-beaked common dolphin	*Delphinus capensis*	Protected	High	Low
Minke whale	*Balaenoptera acutorostrata*	Protected	Low	Unlikely
Northern right whale dolphin	*Lissodelphis borealis*	Protected	Low	Unlikely
Orca	*Orcinus orca*	Endangered	Low	Unlikely
Pacific white-sided dolphin	*Lagenorhychus obliquidens*	Protected	Low	Unlikely
Risso's dolphin	*Grampus griseus*	Protected	Moderate	Unlikely
Sei whale	*Balaenoptera borealis*	Endangered	Low	Unlikely
Short-beaked common dolphin	*Delphinus delphis*	Protected	High	Low
Short-finned pilot whale	*Globicephala macrorhynchus*	Protected	Low	Unlikely
Sperm whale	*Physeter macrocephalus*	Endangered	Low	Unlikely
Pinnipeds				
California sea lion	*Zalophus californicus*	Protected	High	Moderate
Northern elephant seal	*Mirounga angustrirostris*	Protected	Low	Unlikely
Northern fur seal	*Callorhinus ursinus*	Protected	Low	Unlikely
Pacific harbor seal	*Phoca vitulina*	Protected	Moderate	Low
Steller sea lion	*Eumetopias jubatus*	Endangered	Low	Unlikely

4-1 Birds

The California least tern nests along the west coast of North America, from Baja California, Mexico, north to the San Francisco Bay area. California least terns are seasonal residents of San Diego Bay, typically arriving in mid-to late-April to nest at several colonies adjacent to the Bay and are generally present through mid-August with September 15th marking the end of nesting season. California least terns may have two waves of nesting during this time period (Massey and Atwood 1981). California least terns establish nesting colonies on sandy open space with little vegetation. Along the shores of San Diego Bay and south of the Imperial Beach Oceanfront, California least terns' nest at multiple sites. These nest sites are located at the runway ovals at San Diego International Airport, the airfield tarmac at Naval Air Station (NAS) North Island as well as Delta and Echo Beaches at Naval Amphibious Base (NAB) Coronado, the D Street Fill, the Chula Vista Wildlife Reserve, the South Bay Salt Works levees, and along the beaches of the Tijuana River National Estuarine Research Reserve south of the Imperial beach Oceanfront (Frost 2017). California least terns actively forage for fish in the waters adjacent to nesting colonies in San Diego Bay; foraging also occurs in open ocean waters and along the nearshore waters adjacent to beaches of Silver Strand and Imperial Beach.

Available space for nesting least terns does not occur within the NASSCO Project site, however due to the proximality of the facility relative to known nesting colonies there is moderate potential for least terns to utilize areas of open water within the Project site to actively forage for fish.

The California brown pelican does not nest in San Diego Bay. They nest in colonies at Anacapa and Santa Barbara Islands in the California Channel Islands. They are wide ranging and can be frequently observed loafing and foraging in San Diego Bay. The California brown pelican is a state fully protected species under the California Fish and Game Code.

Although nesting does not occur along the mainland, there is moderate potential for California brown pelican to utilize areas of open water within the Project site to actively forage for fish.

The western snowy plover is a sparrow-sized, white and tan colored shorebird with dark patches on either side of the neck, behind the eyes, and on the forehead. The coastal western snowy plover population is defined as those individuals that nest adjacent to or near tidal waters and includes all nesting colonies on the mainland coast, peninsulas, offshore islands, adjacent bays, and estuaries. The breeding range of the coastal population of the western snowy plover extends along coastal beaches from the southern portion of Washington State to southern Baja California, Mexico. The recognized breading season of the western snowy plover normally extends from March 1 through September 15. In California, earliest nesting is sometimes observed in the first week of March with nesting typically observed by the third week of March. Peak initiation of nesting is observed mid-April through mid-June (USFWS 2007). Western snowy plover nest along similar sandy flat and dunes as California least tern. In San Diego Bay, nesting colonies occur along the beach at NAS North Island; at NAB Coronado, which includes the entire beachfront north of Imperial Beach; and farther south along the Silver Strand Training Complex and the beaches of the Tijuana River National Estuarine Research Reserve. California snowy plovers generally forage for small crustaceans, worms, and insects within exposed sandy beach or mudflat areas (Page et al. 2009).

Like the California least tern, available space for California snowy plovers nesting does not occur within the NASSCO Project site. Additionally, there is minimal habitat exposed at any given tide thus there is low potential for this species to utilize space within the facility for foraging.

4-2 Turtles

Green sea turtles (Chelonia mydas) have been documented in San Diego Bay dating back to the 1800s (Stinson 1984). Green sea turtles in San Diego Bay represent a local foraging population. These individuals do not breed in San Diego. Rather, the San Diego foraging population as well as other regional foraging populations is part of the Mexican breeding population (Eguchi et al. 2010). The nesting sites of the San Diego foraging population may include the Revillagigedo Islands, Tres Maria Islands, and mainland Mexico (Dutton 2003 as cited in Eguchi et al. 2010).

Although documented to historically occupy San Diego Bay, much of the resent research was performed while the South Bay Power Plant was in operation in south San Diego Bay. The warm water effluent associated with the once through cooling of the power plant created a warm water environment that researchers attributed to the abundance of green sea turtles in south San Diego Bay (Stinson 1984; McDonald et al. 1994; Duke Energy South Bay, LLC 2004). While it is likely true that the thermal discharges from the power plant worked to structure the San Diego Bay green sea turtle population, the population has continued to persist after the decommissioning of the power plant. This is likely due in part to the long residence time of south San Diego Bay waters which tend to be warmer than the rest of the bay regardless of the presence of additional thermal input.

The population requirements of green sea turtles in San Diego Bay mean that the animals spend most of their time in the south bay. The potential to observe animals in more northern portions of San Diego Bay and in offshore environments increases in summer months when warmer surface water is present. The decommissioning of the South Bay Power Plant has also been attributed to an increased number of more northern observations (*sensu* Seminoff quoted in Brody 2013). Animals will also leave foraging opportunities in San Diego Bay when they migrate to nesting sites.

There is moderate potential for green sea turtle presents at the NASSCO Project site due to the facility's central location within San Diego Bay. Other sea turtle species have not been observed in San Diego Bay thus it is unlikely for them to be observed within the Project site.

4-3 Cetaceans

Common dolphin's and bottlenose dolphins have widespread distributions and are commonly observed in southern California nearshore environments. They are also often observed in the north San Diego Bay area from the San Diego Bay entrance to approximately Harbor Island (personal observation R. Mooney and refer to NAVFACSW 2016). These animals are often observed either swimming alongshore or bow-riding vessels entering and leaving the bay. Due to the location of the NASSCO Project site, further south and away from the San Diego Bay entrance, the potential for the occurrence of these species is low.

All the remaining cetaceans except for the gray whale, have very low potential for observation along the San Diego coast and are unlikely to occur within the NASSCO Project site. The gray whale performs annual migrations from cooler northern Pacific feeding areas to embayments in Baja California, Mexico for mating and caving. Gray whales migrate south through San Diego coastal waters in fall and early winter and can be observed on their northbound migration in later winter and early spring. Animals have been occasionally observed entering San Diego Bay (personal observation R. Mooney and NAVFACSW 2016); these events are likely accidental and are rare. Should animals enter San Diego Bay there is very low potential for them to travel as far south as the Project site.

4-4 Pinnipeds

Pinnipeds are flipper-footed marine mammals that spend a portion of their time out of the water. Pinnipeds typically spend a portion of their day on dry land resting, sleeping, mating (in season), and giving birth (in season), a behavior called hauling out. Choice of haul out sites is probably related to ease of access, proximity to food resources, protection from waves and predators. Pinnipeds are documented to occupy natural settings: sandy beaches, rocky beaches, boulder beaches, rocks and pinnacles, mud flats, reefs, fallen trees, and rock shelves. California sea lion (*Zalophus californianus*) and occasionally Pacific harbor seal (*Phoca vitulina*) occupy man-made structures (e.g., docks, buoys, landings, breakwaters, boats, barges, and fish ladders). Potential disturbance occurs when these haul-out locations overlap with urbanized areas.

In San Diego Bay, both California sea lion and Pacific harbor seal haul out on natural (e.g., beaches) and man-made structures, forage, raft, and mill throughout the entirety of the bay. California sea lion and harbor seal are not typically found in the same haul out locations due, in part, to their physiology. The California sea lion is able to haul out on steep, rocky habitat because it can rotate its pelvis to use all four limbs to walk. Harbor seal cannot rotate the pelvis and must move on land by undulating the body (NPS 2016). Within San Diego Bay, California sea lion is the dominant and most numerous pinniped observed, whereas harbor seal is more elusive and found in lower numbers. California sea lion haul out in large numbers at the two bait barges that are located near the entrance to San Diego Bay in Point Loma. They also haul out individually or in small groups on buoys, docks, and boats throughout San Diego Bay but are most prevalent in northern portions of San Diego Bay. In addition to the animals that haul out on the buoys, docks, and boats, California sea lion rests in moderate numbers on the rock riprap that forms Zuniga Jetty at the entrance to San Diego Bay (M&A 2008).

On the exposed ocean side of the Point Loma Peninsula, harbor seals have established one of two mainland hauling and rookery sites in San Diego County. As a result, Pacific harbor seals and their pups have been documented in San Diego Bay, mostly at the northern end of the Bay nearest Ballast Point. The harbor seals use a portion of the docks in a restricted area adjacent to the Naval Base Point Loma Submarine docking station to haul out. In addition, harbor seals have been observed to haul out along the shore south of Ballast Point (NAVFACSW 2014).

Other pinnipeds seen in the bay include northern elephant seal (*Mirounga angustrirostris*) and Steller sea lion (*Eumetopias jubatus*). These are rare sightings and—in the case of the elephant seals—they are typically undernourished juveniles that strand on the shore within the bay. Steller sea lions have been recorded hauled out on the bait barge and navy docks, and swimming in the north bay (NAVFACSW 2015).

While the NASSCO Project site is located further from the San Diego Bay entrance and the established natural haul out sites there is potential for these species to travel further into the bay in search of anthropogenic haul out areas and foraging for food. There is potential for California sea lions and harbor seals to transit within the open waters of the NASSCO facility and utilize structures within the facility as haul out sites. Given the overall rarity of sightings of other pinniped species in north San Diego Bay, all other pinniped species are considered to be unlikely to occur within the project area.

5 Essential Fish Habitat Assessment

This section includes an assessment of Essential Fish Habitat Assessment (EFH) located within the designated Project site that could potentially be impacted by the proposed project. The legal background and purpose of the following EFH assessment, managed species and fisheries with the potential to occur within the designated Project site, and Habitat Areas of Particular Concern (HAPCs) known to occurs within the designated Project site are discussed below.

5-1 Essential Fish Habitat Background

The following EFH assessment for the proposed project is provided in accordance with the 1996 amendments to the Magnuson-Stevens Fishery Management and Conservation Act (MSA) (Code of Federal Regulations (CFR) Title 50, Chapter VI, Part 600). The amendments require the delineation of "essential fish habitat" for all managed species. Federal action agencies which fund, permit, or carry out activities that may adversely impact EFH are required to consult with the NMFS regarding the potential effects of their actions on EFH and respond in writing to the NMFS's recommendations.

The MSA defines EFH as "those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity." For the purpose of interpreting the definition of essential fish habitat: "waters" include aquatic areas and their associated physical, chemical, and biological properties that are used by fish and may include aquatic areas historically used by fish where appropriate; "substrate" includes sediment, hard bottom, structures underlying the waters, and associated biological communities; "necessary" means the habitat required to support a sustainable fishery and the managed species' contribution to a healthy ecosystem; and "spawning, breeding, feeding, or growth to maturity" covers a species' full life cycle. A healthy ecosystem is defined under the MSA as, "an ecosystem where ecological productive capacity is maintained, diversity of the flora and fauna is preserved, and the ecosystem retains the ability to regulate itself".

The purpose of this EFH assessment is to comprehensively identify and analyze EFH occurring within the designated study area, so that federal agencies can best determine whether or not the proposed project would adversely affect designated EFH, and identify possible conservation measures to avoid, minimize, or otherwise offset potential adverse effects to EFH. The MSA requires consultation for all federal agency actions that may adversely affect EFH. EFH consultation with NMFS is required by federal agencies undertaking, permitting, or funding activities that may adversely affect EFH, regardless of its location. Under Section 305(b)(4) of the MSA, NMFS is required to provide EFH conservation and enhancement recommendations to federal and state agencies for actions that adversely affect EFH. As such, the following EFH assessment, which includes an analysis of species managed by the Pacific Fishery Management Council (PFMC) that are known to utilize EFH within the study area, and an analysis of potential HAPCs within the study area, will provide all of the information necessary for NMFS to conduct any future EFH consultations for the proposed project.

5-2 Managed Fisheries with EFH occurring within the Project Site

To adequately address EFH within the study area, fish species managed by the PFMC that are known to either occur within the study area, have historically occurred within the study area, or depend upon those marine habitats that are known to occur within study area, were identified. This was accomplished through a thorough evaluation of both fish species identified during previously conducted fisheries inventories within the study area (Pondella and Allen 2000), and by reviewing species distribution lists of species managed under Pacific Fishery Management Council Fishery Management Plan (FMPs; NOAA Fisheries 2019). In all, 28 species managed by the PFMC were identified, including species managed under

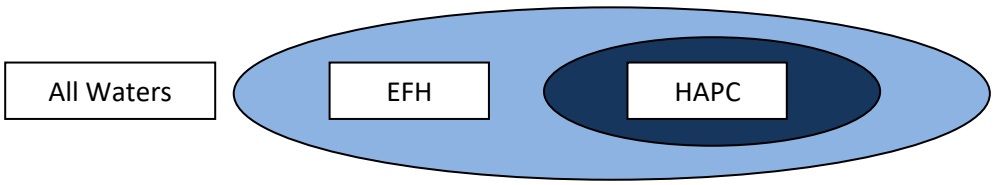
the Coastal Pelagic Species FMP, the Highly Migratory Species FMP, and the Pacific Groundfish FMP (Table 3).

Table 3. Fish species managed under the Coastal Pelagic Species FMP, Highly Migratory Species FMP, and Pacific Coast Groundfish FMP with designated EFH occurring within the study area.

Common Name	Species Name
Coastal Pelagic Species FMP	
Jack Mackerel	*Trachurus symmetricus*
Krill	*Euphausia Pacifica & Thysanoessa Spinifera*
Market Squid	*Loligo opalescens*
Northern Anchovy	*Engraulis mordax*
Pacific Mackerel	*Scomber japonicas*
Pacific Sardine	*Sardinops sagax*
Highly Migratory Species FMP	
Albacore Tuna	*Thunnus Alalunga*
Bigeye Tuna	*Thunnus obesus*
Blue Shark	*Prionace glauca*
Broadbill Swordfish	*Xiphias gladius*
Common Thresher Shark	*Alopias vulpinus*
Dorado	*Coryphaena hippurus*
Northern Bluefin Tuna	*Thunnus thynnus*
Shortfin Mako Shark	*Isurus oxyrinchus*
Skipjack Tuna	*Katsuwonus pelamis*
Striped Marlin	*Kajikia audax*
Yellowfin Tuna	*Thunnus albacares*
Pacific Coast Groundfish FMP	
Black and Yellow Rockfish	*Sebastes chrysomelas*
Blue Rockfish	*Sebastes mystinus*
Boccaccio	*Sebastes paucispinis*
Big Skate	*Raja binoculata*
Cabezon	*Scorpaenichthys marmoratus*
Calico Rockfish	*Sebastes dalli*
California Scorpionfish	*Scorpaena guttata*
California Skate	*Raja inornate*
Canary Rockfish	*Sebastes pinniger*
Chilipepper Rockfish	*Sebastes phillipsi*
Copper Rockfish	*Sebastes caurinus*
Cowcod	*Sebastes levis*
Curlfin Sole	*Pleuronichthys decurrens*
Spiny Dogfish	*Squalus acanthias*
Dover Sole	*Microstomus pacificus*
English Sole	*Parophrys vetulus*
Gopher Rockfish	*Sebastes carnatus*
Grass Rockfish	*Sebastes rastrelliger*
Green-Spotted Rockfish	*Sebastes chlorostictus*
Honeycomb Rockfish	*Sebastes umbrosus*
Kelp Rockfish	*Sebastes atrovirens*
Leopard Shark	*Triakis semifasciata*
Petrale sole	*Eopsetta jordani*
Pacific Sanddab	*Citharichthys sordidus*

5-3 Habitat Areas of Particular Concern (HAPCs) Observed within the Project Area

HAPC were observed within the Project site. HAPCs are a discreet subset of EFH (as illustrated below *) that are distinguished by characteristics including their high ecological value and vulnerability to anthropogenic stressors.



(Adapted from NMFS 2019b)

Area within designated EFH can also be designated as a HAPC based on one or more of the following characteristics: 1) The importance of the ecological function provided by the habitat, 2) Its sensitivity to human-induced environmental degradation, 3) The extent of threats posed by development of the habitat, or 4) The rarity of the habitat type (NMFS 2019b). HAPCs are considered high priority areas for conservation, management, or research because they are rare, sensitive, stressed by development, or important to ecosystem function (NMFS 2019b). The HAPC designation does not necessarily mean additional protections or restrictions upon an area, but the help to prioritize and focus conservation efforts (NMFS 2019b). Although these habitats are particularly important for healthy fish populations, other EFH area that provide suitable habitats are also necessary to support and maintain sustainable fisheries and a healthy ecosystem (NMFS 2019b). Current HAPC types are estuaries, canopy kelp, seagrass, and rocky reefs. Rocky reefs are defined by NMFS as submerged rock outcrops with varying relief, creating refuges for juvenile and smaller fishes and surface areas for colonization of algae and invertebrates.

Based on this definition, a review of mapping NMFS mapping data for pacific Coast HAPCs (NOAA Fisheries 2019), and confirmation obtained from side-scan sonar and visual SCUBA survey observation from this biological assessment, 478 square meters of eelgrass (*Zostera marina*), seagrass habitat, were identified within the Project site and can be classified as a HAPC (Figure 5, Figure 6).

Seagrass habitats present within waters of the Project site performed functions and contributions to ecological processes, summarized by Mooney and Woodfield (2009).

Eelgrass plays many important roles in estuarine systems. It clarifies water through sediment trapping and stabilization (de Boer 2007). It also provides the benefits of nutrient transformation and water oxygenation (Yarbro and Carlson 2008). Eelgrass serves as a primary producer in detritus-based food webs (Thresher et al. 1992) and is further directly grazed upon by invertebrates, fish, and birds (Valentine and Heck 1999), thus contributing to eco-system health at multiple trophic levels. Additionally, it provides physical structure in the form of habitat to the community and supports epiphytic plants and animals, which are in turn grazed upon by other invertebrates, fish, and birds. Eelgrass is also a nursery area for many commercially and recreationally important finfish and shellfish (Heck et al. 2003), including both those that are resident within the bays and estuaries, as well as oceanic species that enter the estuaries to breed or spawn. Among recreationally important species, sand basses and lobster make use of eelgrass beds as habitat. Besides providing important habitat for fish, eelgrass and associated invertebrates provide important food resources, supporting migratory birds during critical life stages, including migratory periods.

6 Laws and Regulations

6-1 Federal

6-1.1 Coastal Zone Management Act of 1972

The Coastal Zone Management Act of 1972 is administered by the National Oceanic and Atmospheric Administration's (NOAA) Office of Ocean and Coastal Resource Management, provides for management of the nation's coastal resources and balances economic development with environmental conservation.

The Coastal Zone Management Act outlines two national programs. The National Coastal Zone Management Program includes 34 coastal programs. The goal of the programs are to balance competing land and water issues in the coastal zone. The National Estuarine Research Reserve System creates field laboratories that provide a greater understanding of estuaries and how humans affect them. The overall program objectives of the act are to "preserve, protect, develop, and where possible, to restore or enhance the resources of the nation's coastal zone."

The Coastal Zone Management Act ensures that development projects in coastal areas are designed and permitted in a manner that is consistent with coastal zone land uses, maximizes public health and safety, and ensures that biological resources (e.g., wetlands, estuaries, beaches, and fish and wildlife and their habitat) within the coastal zone are protected. The California Coastal Commission enforces the Coastal Zone Management Act by certifying that any proposed project is consistent with the California Coastal Act of 1976 (as amended). The enforceable policies of the Coastal Zone Management Act are found in Chapter 3 of the California Coastal Act.

6-1.2 Rivers and Harbors Act (Section 10)

The USACE is authorized to regulate any activity within or over any navigable water of the United States pursuant to Section 10 of the Rivers and Harbors Act. Rivers and Harbors Act Section 10 jurisdiction is defined as "those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use, to transport interstate or foreign commerce" (33 Code of Federal Regulations 322). The San Diego Bay is considered a traditional navigable water regulated under Section 10 of the Rivers and Harbors Act.

6-1.3 Endangered Species Act of 1973

Species listed as endangered and/or threatened by the USFWS are protected under Section 9 of the federal Endangered Species Act, which forbids any person to "take" an endangered or threatened species. Take is defined in Section 3 of the act as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." The U.S. Supreme Court ruled in 1995 that the term "harm" includes destruction or modification of habitat. Sections 7 and 10 of the Act may authorize "incidental take" for an otherwise lawful activity (a development project, for example) if it is determined that the activity would not jeopardize survival or recovery of the species. Section 7 applies to projects where a federally listed species is present and there is a federal nexus, such as a federal Clean Water Act (CWA) Section 404 permit (e.g., impacts on waters of the U.S.) that is required. Section 10, requiring an incidental take permit, applies when a federally listed species is present, but there is no federal nexus.

6-1.4 Magnuson-Stevens Fishery Management and Conservation Act, as amended 1996 (Public Law 104-267)

Federal agencies must consult with NOAA Fisheries on actions that may adversely affect EFH. EFH is defined as those "waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity." NOAA Fisheries encourages streamlining the consultation process using review procedures under the National Environmental Policy Act, Fish and Wildlife Coordination Act, the CWA, and/or the federal Endangered Species Act (ESA) provided that documents meet requirements for EFH assessments under Section 600.920(g). EFH assessments must include (1) a description of the proposed action, (2) an analysis of effects, including cumulative effects, (3) the federal agency's views regarding the effects of the action on EFH, and (4) proposed mitigation, if applicable. The EFH is discussed in Section 5 of this report.

6-1.5 Marine Mammal Protection Act of 1972

The Marine Mammal Protection Act (MMPA) of 1972 prohibits, with certain exceptions, the take of marine mammals in U.S. waters and by U.S. citizens on the high seas, and the importation of marine mammals and marine mammal products into the United States. Congress passed the MMPA based on the following findings and policies: (1) some marine mammal species or stocks may be in danger of extinction or depletion as a result of human activities, (2) these species of stocks must not be permitted to fall below their optimum sustainable population level (depleted), (3) measures should be taken to replenish these species or stocks, (4) there is inadequate knowledge of the ecology and population dynamics, and (5) marine mammals have proven to be resources of great international significance.

The MMPA was amended substantially in 1994 to provide for: (1) certain exceptions to the take prohibitions, such as for Alaska Native subsistence, and for permits and authorizations for scientific research; (2) a program to authorize and control the taking of marine mammals incidental to commercial fishing operations; (3) preparation of stock assessments for all marine mammal stocks in waters under U.S. jurisdiction; and (4) studies of pinniped-fishery interactions. Additionally, under the 1994 amendments to the MMPA, harassment is statutorily defined as any act of pursuit, torment, or annoyance that:

- Has the potential to injure a marine mammal or marine mammal stock in the wild (Level A harassment); or
- Has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavior patterns, including, but not limited to migration, breathing, nursing, breading, feeding, or sheltering but which does not have the potential to injure a marine mammal or marine mammal stock in the wild (Level B harassment).

NOAA Fisheries and USFWS administer the MMPA. The proposed project must be analyzed to ensure that marine mammals protected under the MMPA would not be harassed or injured as a result of future activities in or adjacent to San Diego Bay. Any future project activities that may result in Level A or B harassment, injury, or mortality would require consultation with NOAA Fisheries and USFWS under the MMPA.

6-1.6 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) was enacted in 1918 to prohibit the killing or transport of native migratory birds, or any part, nest, or egg of any such bird, unless allowed by another regulation adopted in accordance with the MBTA. Under the MBTA, "take" means to kill, directly harm, or destroy individuals, eggs, or nests or to otherwise cause failure of an ongoing nesting effort. Migratory bird species that are

protected by the MBTA is maintained by USFWS, which regulates most aspects of the taking, possession, transportation, sale, purchase, barter, exportation, and importation of migratory birds. The USFWS does not issue permits for "incidental take" of migratory birds that results from otherwise lawful activities such as construction of development projects.

6-1.7 Clean Water Act

The major federal legislation governing water quality is the Federal Water Pollution Control Act Amendments of 1972, commonly known as the CWA (33 United States Code [USC] 1251–1376), as amended by the Water Quality Act of 1987. The intention of the CWA is to "restore and maintain the chemical, physical, and biological integrity of the nation's waters." Discharges into waters of the United States (WoUS) are regulated under CWA Section 404 and includes (1) all navigable waters (including all waters subject to the ebb and flow of the tide); (2) all interstate waters and wetlands; (3) all other waters, such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sand flats, wetlands, sloughs, or natural ponds; (4) all impoundments of waters mentioned above; (5) all tributaries to waters mentioned above; (6) the territorial seas; and (7) all wetlands adjacent to waters mentioned above. Important applicable sections of the CWA are discussed below.

- **Section 401** requires any federal permit applicant that proposes an activity that may result in a discharge into WoUS to obtain certification from the state that the discharge will comply with the CWA. A 401 certification is provided by the Regional Water Quality Control Board (RWQCB) assigned to the project's region. A Section 401 certification from the San Diego RWQCB would be required this project if a Section 404 permit and Rivers and Harbor Act (Section 10) permit is required.

- **Section 404** certification is required where USACE issues permits for discharge of dredged or fill material into WoUS. These permits typically include conditions to minimize impacts on water quality. Common conditions include: (1) USACE review and approval of sediment quality analysis before dredging; (2) a detailed pre- and post-construction monitoring plan that includes disposal site monitoring; and (3) requiring compensation for loss of WoUS.

6-1.8 California Eelgrass Mitigation Policy

Eelgrass, *Zostera* spp., is protected under the CWA as a habitat forming species and the resource is managed locally under the California Eelgrass Mitigation Policy (CEMP) as developed by NOAA fisheries (NMFS 2014). Additionally, due to the high ecological value of eelgrass as essential fish habitat, eelgrass is also designated as a habitat of particular concern (HAPC) by NOAA Fisheries. The CEMP requires that an eelgrass survey be performed prior to construction to evaluate the presence of eelgrass and or potential eelgrass habitat.

NMFS has provided this policy to other state and federal agencies, including the California Department of Fish and Wildlife (CDFW), as guidance for handling project-related impacts on eelgrass habitat.

6-2 State

6-2.1 California Coastal Act of 1976

California ports, harbors, and coastline beaches are recognized as primary economic and coastal resources and as essential elements of the national maritime industry by the California Coastal Act of 1976. Decisions to undertake specific development projects are to be based on consideration of alternative locations and

designs in order to minimize any adverse environmental impacts. The California Coastal Act is implemented by the California Coastal Commission (CCC).

6-2.2 California Endangered Species Act; Fully Protected Species

The California Endangered Species Act (CESA) establishes the policy of the State to conserve, protect, restore, and enhance threatened or endangered species and their habitats. Projects that would jeopardize the continued existence of threatened or endangered species if reasonable and prudent alternatives are available should not be approved according to the CESA. For projects that affect both a state- and federally listed species, compliance with the federal ESA will satisfy the CESA if the CDFW determines that the federal incidental take authorization is consistent with the CESA under California Fish and Game Code Section 2080.1. Also, California Fish and Game Code Sections 3511, 4700, 5050, and 5515 prohibit take or possession of fully protected species.

6-2.3 California Fish and Game Code

Other sections of the California Fish and Game Code establish the Fish and Game Commission, as authorized by Article IV, Section 20, of the Constitution of the State of California. Under Sections 200-221 the Fish and Game Commission is responsible for regulating the take of fish and game, not including the taking, processing, or use of fish, mollusks, crustaceans, kelp, or other aquatic plants for commercial purposes. The Fish and Game Commission does regulate aspects of commercial fishing, including fish reduction; shellfish cultivation; take of herring, lobster, sea urchins, and abalone; kelp leases; leases of state water bottoms for oyster allotments; and aquaculture operations. The resource protection is responsible for setting recreational and commercial limits on species collection, collection method, and determines the conditions under which permits, or licenses may be issued or revoked by CDFW. The Fish and Game Commission also oversees the establishment of wildlife areas and ecological reserves and regulates their use and sets policy for CDFW.

CDFW is a lead state agency that manages native fish, wildlife, plant species, and natural communities for their ecological value and their benefits to people. CDFW oversees the management of marine species through several programs, some in coordination with NMFS and other agencies.

6-2.4 Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act is the California or state equivalent of the federal CWA. It provides for statewide coordination of water quality regulations through the establishment of the State Water Resources Control Board (SWRCB) and nine separate RWQCBs that oversee water quality on a day-to-day basis at the regional/local level. The RWQCB regulates actions involving “discharging waste, or proposing to discharge waste, within any region that could affect the water of the state” (Water Code Section 13260(a)), pursuant to provisions of the Porter-Cologne Act. Waters of the state (WoS) are defined as “any surface water or groundwater, including saline waters, within the boundaries of the state” (Water Code Section 13050 (e)).

The RWQCB regulates WoS under Section 401 of the CWA. This requires states to certify that federally authorized activities comply with state water quality standards. A Water Quality Certification or a waiver must be obtained from the RWQCB if an activity requiring a Section 404 permit would affect WoS. Additionally, the RWQCB issues waste discharge requirements for discharges to WoS for fill of wetlands and other waters that are not regulated by Section 404 of the federal CWA.

6-3 Local

6-3.1 San Diego Bay Integrated Natural Resources Management Plan

The INRP is a long-term strategy sponsored by the U.S. Navy and the District. Its intent is to provide direction for the good management of natural resources while also supporting the ability of the Navy and District to meet their missions and continue functioning within San Diego Bay. The main strategies of the plan are to (1) manage and restore habitats, populations, and ecosystem processes; (2) plan and coordinate projects and activities so that they are compatible with natural resources; (3) improve information sharing, coordination, and dissemination; (4) conduct research and long-term monitoring that supports decision-making; and (5) put in place a Stakeholder's Committee and Focus Subcommittees for collaborative, ecosystem-based problem-solving in pursuit of the goal and objectives.

7 Project Impact Analysis

7-1 Thresholds of Significance

The following significance criteria are based on Appendix G of the State of California Environmental Quality Act (CEQA) Guidelines and provide the basis for determining the significance of biological resource impacts resulting from the proposed Project. The determination of whether a biological resource impact would be significant is based on the threshold described below and the professional judgment and recommendations of qualified MTS personnel.

Impacts are considered if the proposed Project would result in any of the following.

Threshold 1: Have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, pr special-status species in local or regional plans, policies, or regulations, or by CDFW and USFWS.

Threshold 2: Have substantial adverse effects on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by CDFW, NMFS, or USFWS.

7-2 Project Impacts and Mitigation Measures

The proposed Floating Dry Dock Replacement and Waterfront Improvement Project is summarized by the following elements:

- Replacement of the existing floating dry dock and construction of supporting infrastructure.
- Improvements to the Repair Complex Wharf.
- Repairs to the quay wall toe of slope along stretches of shoreline throughout the NASSCO leasehold, which includes shoreline segments Lot 20 to Pier 12, floating dry dock approach pier to Berth 8, Ways to Building Dock, Berth 2 to Beth 3, Berth 4 to Berth 5, and Berth 6 to Navy Base Quay Wall.
- As-needed structural repair and/or replacement of selected piles at Berths 2, 3, 4, 5, 6, at Pier 12, and the floating dry dock approach pier, and at the Berth 1 Platform.

Total permanent overwater coverage would increase 4,170 square feet. Additionally, a total of 300 square feet of overwater coverage would be temporarily present during use of the floating dry dock's removable brow. A more detailed description of proposed work elements can be sourced from Anchor QEA 2020. Implementation of the Project would not expand the existing use of the site or result in changes of any operations.

7-2.1 Threshold 1 - Marine Resources

Threshold 1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW and USFWS.

In general, construction activities from implementation of the proposed Project would potentially cause construction-induced noise, increases in turbidity, increase in overwater coverage, and release of particulates and chemicals of concern into U.S. and State waters. A discussion of each of these potential construction- and operational-related impacts is provided below. Note that the impacts and mitigation measures provided in this assessment are intended to support the development of impacts and mitigation measures in the Project's Environmental Impact Report (EIR). The numbering of impacts and mitigation

measures may be different in the EIR and the level of development of the measures may vary as they are incorporated into the EIR.

7-2.1.1 Construction Noise Impacts on Marine Resources

The use of large machinery for construction and demolition as well as pile driving could result in construction-induced noise impacts that could alter the behavior of protected species. These impacts could occur from construction activities such as hammering, drilling, operation of heavy construction equipment, or unloading building materials. Additionally, the temporary installation of new overwater berthing structures (i.e., dry docks) would also have the potential to result in similar impacts on protected species from in-water construction activities such as pile driving. Construction-induced noise impacts from landside construction activity and overwater construction activities such as pile driving could disrupt the foraging behavior of the California least tern if construction occurs during the California least tern nesting season. Other sensitive fish-foraging avian species such as brown pelican can similarly be impacted. This would be considered a significant impact without mitigation (**Impact-1**). Construction noise can also impact species protected under the Migratory Bird Treaty Act and California Fish and Game Code. For instance, marine dependent avian species such as the black-crowned night heron nest in trees near shore where their nesting activities could be disturbed by construction noise. Disturbance can cause nesting birds to abandon nest sites or alter nesting behavior in ways that lower nesting success. This would be considered a significant impact without mitigation (**Impact-2**).

In-water construction associated with proposed construction could generate enough underwater noise to physically injure marine mammals, sea turtles, and fishes should impact hammer or vibratory pile driving occur during construction. Any noise related impacts would be dependent on the type of activity being performed, the proximity to marine waters, and the biology of the considered species. In-water impact hammer or vibratory pile driving activity could potentially generate enough underwater noise to injure (Level A Harassment) or alter behavior (Level B Harassment) for marine mammals, green sea turtles, and fishes. Impacts are therefore considered significant without mitigation (**Impact-3**).

7-2.1.2 Construction Noise Mitigation Measures for Marine Resources

Mitigation measures for reducing noise related impacts on foraging California least tern and other sensitive fish feeding avian predators during nesting season (**Impact-1**) include construction monitoring during the nesting season (**Mitigation-1**). If pile driving activities occur during the nesting season (April 1 – September 15), a qualified biologist approved by the District would monitor during pile driving activities. The monitor would have the ability to reduce or temporarily stop noise producing activities if those activities were believed to impact or otherwise alter foraging behavior of sensitive avian species during the nesting season. The project applicant shall take specific actions, as approved by the District, to reduce or temporarily stop noise-producing activities if the qualified biologist identifies that the activities are impacting the foraging behavior of sensitive avian species. These actions shall include, but not be limited to the installation of sound barriers, reducing intensity of pile driving, and restricting pile driving to periods when sensitive avian species are not present. Implementation of **Mitigation-1** would reduce impacts to foraging California least terns and other sensitive fish feeding avian predators during the nesting season to less than significant by minimizing the effects of noise producing activities that could alter foraging behavior.

While disturbance of nesting marine dependent avian species (**Impact-2**) is not anticipated due to the lack of nesting habitat within the Project site, disturbance can be minimized by ensuring that nesting bird behavior is not modified during construction activities that generate loud noises. Project proponents would be required to retain a qualified biologist to perform a nesting bird survey within 500 feet of the

noise generating activity one week prior to the start of construction utilizing heavy equipment, and if nests are found, survey once per week during construction until use of heavy equipment ceases (**Mitigation-2**). If noise levels are anticipated to be 10dBA or greater above ambient background noise levels within the vicinity of an active nest, the qualified biologist shall monitor noise levels daily and establish a no-disturbance buffer around each nest site. Distance from the nest would be determined by the qualified biologist based on the species nesting and the noise acceptability exhibited by the bird. If noise effects cannot be minimized, construction shall be altered, to the extent necessary and as approved by the District to ensure that impacts to the nesting species are negligible. Implementation of **Mitigation-2** would reduce impacts on nesting marine dependent avian species to less than significant by implementing the measures to minimize noise impacts on active nests.

Potential impacts on marine mammals and green sea turtles (**Impact-3**) can be minimized by implementing the various measures required under mitigation measure **Mitigation-3**. This mitigation measure requires development of a marine mammal monitoring plan and subsequent monitoring of hauled out marine mammals whenever noise generating activities are in excess of 90 dB root mean square (RMS) for harbor seals and 100 dB RMS for non-harbor seals (sea lions) at the haul out locations or if the haul out is within 500 feet of the noise source. These criteria are established by NOAA NMFS as noise levels for a Level B harassment (behavior alteration) of marine mammals when those mammals are hauled out. Protecting marine mammals against Level B harassment when hauled out also ensures protection against Level A harassment (injury). If marine mammals are hauled out within the zone where sound thresholds are exceeded, then the biological monitor will notify the contractor to halt or alter the noise generating activity such that construction noise is at or below 90 dB RMS or 100 dB RMS for harbor seals and non-harbor seals, respectively. The zones of influence to thresholds for harassment of hauled out marine mammals is provided in I&R 2022. The noise study performed by I&R (2022) is included as an appendix to the EIR.

For portions of the proposed project that generate in water noise such as impact and vibratory pile driving, the biological monitor will monitor for marine mammals when those animals are in the water within isopleth distances calculated (I& R 2022) to be within the range of sound thresholds established by NOAA NMFS for Level A and Level B harassment of marine mammals (NMFS 2018). Like monitoring for hauled out animals, the biological monitor will have the authority to halt or modify work based on animal observations relative to monitoring isopleths. Green sea turtles will be monitored using the maximum calculated isopleth for Level B harassment of marine mammals; there is no specific guidance for sea turtles, but they are often monitored alongside marine mammals to ensure their protection.

In addition, Project activities where impact hammer and vibratory pile driving occurs shall utilize a soft start for pile driving. This generally means performance of three pile strikes at reduced (approximately 50%) force, then waiting 30 seconds. This is repeated three times before starting pile driving at full force. This measure provides time for marine mammals, green sea turtles, and fishes to disperse from the sound source area in the event the sound is a source of stress for the animal. Implementation of **Mitigation-3** would reduce impacts to less than significant.

7-2.1.3 Construction Water Quality Impacts on Marine Resources

Construction activities associated with structural pile repair and replacement, quay wall toe of slope repairs, and repair complex wharf improvement could increase levels of turbidity in waters within the Bay in the absence of regulations. This could occur either during activities such as pile driving, incidentally during vessel contact with bottom substrate, and by propeller wash in shallower water.

Increases in turbidity in water may occur as a result of displaced sediment from construction activities. In general, increased turbidity could limit the ability of California least terns and other sensitive fish-foraging avian species to locate prey. Construction activities could potentially result in impacts on protected species by the inadvertent introduction of pollutants such as fuel, oil, and/or other industrial and mechanical fluids into waters of the U.S., either from construction equipment, landside construction vehicles, construction vessels, and from partially completed overwater structures. Additionally, disruption to eelgrass can occur due to increased turbidity. Prolonged increases in turbidity can reduce primary productivity associated with eelgrass because turbid water prevents sunlight from reaching this primary producer and sensitive species. These impacts would be considered a significant impact without mitigation (**Impact-4**)

7-2.1.4 Construction Water Quality Mitigation Measures on Marine Resources

Turbidity generated by in water construction activities (**Impact 4**) can be reduced by implementing various measures required under **Mitigation-4**. These measures include contractor education. Vessel operators shall be instructed regarding the impacts of propeller wash with regards to erosion of sediment and suspension of fine particulates; this will allow vessel operators to adjust operations, when possible, in ways that lessen impact. All vessels would be required to use depth sounders which are routinely checked to ensure vessels are positioned to avoid shallow water areas to the extent practical. Finally, when construction involves necessary bottom disturbance such as dredging or pile driving, silt curtains would be in place around the activity to limit the spread of any turbidity generated during the bottom disturbing activity. As such, **Mitigation-4** would reduce impacts to less than significant. Potential impacts associated with turbidity and bottom disturbance that might reduce the extent of eelgrass is identified under Threshold 2 (**Impact-6**) and the associated mitigation measures are provided as **Mitigation-6**.

7-2.1.5 Operational Overwater Cover and Shading Impacts on Marine Resources

The operational impacts associated with overwater cover are introduced by the temporary dry dock structures and the repair complex wharf improvement. The installation and use of overwater structures would result in temporary and permanent reduction of potential open water foraging habitat for California least tern and other sensitive fish-foraging species. The overwater coverage also leads to lower eelgrass productivity due to shading if the overwater structure is above eelgrass. Additionally, solar aspect and structure height will influence the level of impact. Structures that face the sun to the south with water to the north will result in a greater temporal impact from shading. The lost eelgrass productivity impacts all higher trophic levels due to the lost production of organic carbon. The impacts to California least tern associated with overwater coverage are considered a significant impact (**Impact 5**). Potential impacts associated with overwater cover and shading that might reduce the extent of eelgrass is identified under Threshold 2 (**Impact-6**) and the associated mitigation measures are provided as **Mitigation-6**.

7-2.1.6 Operational Overwater Cover Mitigation Measures for Marine Resources

Overwater cover from permanent structures can be mitigated in-kind if feasible, or out-of-kind if in-kind options are not available. Mitigation measure **Mitigation-5** includes a variety of suitable options for mitigating impacts associated with **Impact-5**. These options can be implemented either individually or in combination, as may be required through consultation with applicable resource agencies during permitting processes, including but not limited to, NMFS, USFWS, RWQCB, and/or USACE, to offset impacts from permanent overwater coverage. The in-kind option includes removal of existing overwater coverage at a 1:1 mitigation ratio at other locations within the Project site. Out-of-kind mitigation could include creation or restoration of eelgrass habitat at a 1:1 mitigation ratio to improve fisheries and associated wildlife beneficial uses in consultation with regulatory agencies identified above, and/or

contribution to an approved mitigation bank. Implementation of **Mitigation-5** would reduce the potential permanent overwater coverage impacts (**Impact-5**) to less than significant.

7-2.2 Threshold 2 – Marine Resources

Threshold 2: Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by CDFW, NMFS, or USFWS.

7-2.2.1 Construction Related Impacts to Marine Resources

Eelgrass beds are both the primary biologically important habitat associated with submerged soft-bottom substrate in the Project site and are managed by NMFS as EFH. In addition, the Magnuson-Stevens Fishery Management and Conservation Act designates HAPC that provide notable contributions to ecological processes.

Proposed construction activities have the potential to have a substantial adverse effect on sensitive marine habitats such as eelgrass. These activities include temporary new placement of the dry dock structure, structural pile repair and replacement, quay wall tow of slope repairs, and repair complex wharf improvements. Construction related impacts that could result from these proposed activities could result from increased turbidity from support vessels, equipment, installation of structures and piles, and shading from support vessels, barges, and relocation of the dry dock structure. The operation of vessels over shallow water during construction can decrease light to the seafloor by increasing turbidity from propeller wash or direct contact with the seafloor. Suspended particles reduce water clarity and can reduce the light reaching plant and algae cells. When suspended particles settle on primary producers such as periphyton, macroalgae, and eelgrass, they can further continue to prevent light from reaching the plant cells. Additionally, any contact with the seafloor where eelgrass occurs could directly dislodge and remove eelgrass and other vegetation. Although **Mitigation-4** provides for measures to reduce and restrict turbidity, in some cases eelgrass may occur within the footprint where construction vessels and turbidity curtains are placed during construction. In such cases, the contained turbidity may still impact eelgrass that is within the limits of the silt curtains and construction activity. In some locations where quay wall tow of slope repair is proposed, eelgrass is immediately adjacent to repair activities and may be impacted by placement and/or removal of material at those select locations. Additionally, extended temporary placement of the dry dock, construction support vessels, and barges could impede eelgrass growth depending on the location, height of structure, and sun angle during the presence of each structure. The construction related impacts would be significant (**Impact-6**).

The mitigation measures to reduce construction turbidity impacts to eelgrass beds are the same as those proposed under **Mitigation-4**. Impacts associated with reduced growth and cover of eelgrass or direct removal of eelgrass during construction would be mitigated by mitigation measures identified under **Mitigation-6**. **Mitigation-6** would follow guidelines set by the CEMP (NMFS 2014). Pre- and post-construction eelgrass surveys would be required at the construction site and a suitable reference area. The final calculation of mitigation requirements should occur after the post-construction monitoring. Should losses to eelgrass occur, mitigation should be carried out in accordance with the CEMP at or before the time of impact in a manner that conservatively mitigates for all potential impacts to eelgrass. Mitigation by replanting or restoring eelgrass should follow the CEMP's eelgrass restoration ratio of 1.2:1. Any implemented eelgrass mitigation site shall be monitored for 5 years to ensure successful eelgrass establishment in accordance with the CEMP. **Mitigation-4** and **Mitigation-6** would reduce potential temporary water quality, eelgrass shading, or direct removal impacts to eelgrass (**Impact-6**) to less than significant.

7-3 Impacts and Mitigation Summary

The below summary is a brief synopsis of the impacts and mitigation measures identified above. The summary below and the text above detailing the impacts and mitigation measures are intended to inform the EIR. Through the development of the EIR, the mitigation measures may be expanded and further developed.

7-3.1 Summary

Impact-1: Construction-induced noise impacts disrupting foraging behavior of California least tern and other fish-foraging avian species.
Mitigation-1: Implement construction measures to eliminate noise impacts to California least tern.

Impact-2: Construction noise impacts on nesting behavior of marine dependent species protected under the Migratory Bird Treaty Act and California Fish and Game Code.
Mitigation-2: Implement construction noise measures to eliminate noise impacts on sensitive nesting avian species.

Impact-3: In-water pile driving activity could generate noise levels that could injure (Level A harassment) or alter the behavior of (Level B harassment) marine mammals, green sea turtles, and fishes.
Mitigation-3: Implement a marine mammal and green sea turtle monitoring program during pile installation activities.

Impact-4: Increased water turbidity from disturbance of submerged sediments during in-water construction would limit the ability of protected fish-foraging avian species to locate prey and can disrupt eelgrass productivity.
Mitigation-4: Implement construction measures to eliminate water quality impairment impacts on California least tern, other sensitive fish-foraging avian species, and eelgrass.

Impact-5: Permanent overwater coverage from new overwater structures would reduce available open water foraging space for protected avian species and depress primary production of eelgrass.
Mitigation-5: Implement overwater coverage mitigation in coordination with the appropriate resource agencies to compensate foe loss of open water habitat.

Impact-6: Temporary water quality and sedimentation impacts to eelgrass beds during project construction.
Mitigation-6: Implementation eelgrass mitigation and monitoring in compliance with the California Eelgrass Mitigation Policy.

7-3.2 Level of Significance After Mitigation

Implementation of **Mitigation-1** would reduce potential noise related impacts on foraging California least tern and other sensitive fish feeding avian predators during the nesting season (**Impact-1**) to less than significant by requiring construction monitoring during the nesting season by a qualified biological monitor. The monitor would have the ability to reduce or temporarily stop noise producing construction activities if those activities were believed to impact or otherwise alter the foraging behavior of sensitive avian species during the nesting season.

Impacts associated with disturbance of nesting marine dependent avian species (**Impact-2**) would be reduced to less than significant by **Mitigation-2**, which requires preconstruction surveys and, if nests are detected, noise monitoring to ensure that noise levels do not exceed 10 dBA above ambient levels. In the event noise exceedances occur or disruption of nesting behavior is observed, **Mitigation-2** provides for actions that can be taken to protect nesting marine dependent avian species from the noise generating activity and the nest.

Implementation of **Mitigation-3** would reduce impacts on marine mammals, green sea turtles, and fishes (**Impact-3**) to less-than-significant levels by identifying when the species are approaching or within the designated isopleth for Level B harassment and halting in-water pile driving activities until the species has left the construction area.

Implementation of **Mitigation-4** would reduce impacts associated with **Impact-4** to less than significant levels by requiring implementation of training and construction measures, such as silt curtains, which will protect the foraging behavior of sensitive avian species from turbidity impacts. The measures would also prevent water quality impacts to eelgrass in areas surrounding the activity.

Implementation of **Mitigation-5** would reduce **Impact-5** to less-than-significant levels by requiring implementation of any combination of the following mitigation options at a 1:1 ratio for no net increase in overwater coverage per the CWA: removing overwater coverage within the Project site or restoring or creating eelgrass habitat at a suitable mitigation site of equivalent size and value within San Diego Bay. Implementation of **Mitigation-5** would reduce **Impact-5** to less-than-significant levels

Implementation of **Mitigation-6** would monitor for impacts associated with **Impact-6** to confirm less than significant levels of impact or to monitor for potential significant levels of impact. **Mitigation-6** would require monitoring and mitigation in accordance with the CEMP for impacts associated with **Impact-6**.

8 Discussion

The biological communities present within the designated study area are typical of the bays and shorelines in the region, and are not notably diverse, unique, or sensitive, with one exception being the eelgrass HAPC mapped in primarily intertidal and shallow subtidal vegetated habitat regions. Fish and invertebrate species that were observed during SCUBA surveys throughout the study area are generally considered common through the bays and shorelines of the region and would generally not be put at risk by activities such as those proposed by this Project.

The marine habitat within the Project site is generally composed of intertidal and shallow subtidal hard bottom, subtidal unvegetated soft bottom, and intertidal and shallow subtidal vegetated soft bottom habitat (eelgrass). Flora and fauna observed within the Project site were typical of species likely to occur

within San Diego Bay. Neither sensitive nor unique species were observed during the survey. However, commercially, and recreationally important California lobster was observed throughout the Project site associated with hard bottom habitat and scattered rock and debris items beyond the hard bottom habitat mapped in Figure 5.

The proposed Project would consist of construction and operational activities in marine environments. Construction related impacts on marine resources that could occur from this Project include construction-induced noise impacts, increases in turbidity, increase in overwater coverage, and release of particulates and chemicals of concern into U.S. or State waters.

Construction-induced noise impacts from overwater and in water construction activities such as pile driving could disrupt the foraging behavior of the California least tern and other sensitive fish-foraging avian species (**Impact-1**). Construction noise can also impact marine dependent species protected under the MBTA and California Fish and Game Code by causing nesting birds to abandon nest sites or alter nesting behavior in ways that lower nesting success (**Impact-2**). Furthermore, in-water construction activities could generate enough underwater noise to physically injure marine mammals, sea turtles, and fish should impact hammer or vibratory pile driving occur during construction (**Impact-3**). However, the implementation of **Mitigation-1** through **Mitigation-3** would reduce these project level impacts to less than significant. In-water construction activities that involve bottom sediment disturbance would also potentially result in temporary increases in turbidity, which could limit the ability of California least terns and other sensitive fish-foraging avian species to locate prey (**Impact-4**). However, this Project level impact would be reduced to less than significant with implementation of **Mitigation-4**, which requires implementation of various construction measures to reduce turbidity and its effects on foraging. Additionally, the increase of overwater structures would result in increased overwater coverage, which can impact foraging opportunities for sensitive fish-foraging species and lowered primary productivity due to shading (**Impact-5**). However, overwater cover from permanent structures can be mitigated in-kind if feasible, or out-of-kind if in-kind options are not available as required by **Mitigation-5**. Implementation of **Mitigation-5** would reduce the Project level impact to less than significant.

Construction of the proposed Project has the potential to have adverse effects on sensitive marine habitats such as eelgrass (**Impact-6**). The placement of the proposed drydock occurs over subtidal unvegetated soft bottom habitat where no sensitive species or unique habitats were observed. Impacts from the placement of drydocks may occur indirectly by altering the sunlight attenuation to the seafloor through reduced available sun angle. Where dry docks occur offshore of eelgrass beds late afternoon sun would be reduced by the drydock structure blocking light during certain hours of the day when sunrays are coming from the west. The overall impact from drydock placement is negligible because it does not occur near eelgrass beds.

Similar to the placement of proposed drydocks, repair complex wharf improvements are proposed over unvegetated soft bottom habitat and do not occur near eelgrass resources. Permanent impacts are likely to occur from shading to the seafloor caused by wharf improvement where the wharf and fender system extend beyond the current footprint. However, eelgrass resources were not found within the proposed wharf expansion or near the location of proposed wharf expansion. As a result, it is unlikely that repair complex wharf improvements would impact eelgrass resources within the Project site.

Structural pile repair and replacement and quay wall toe of slope repairs occurs near eelgrass habitat within the Project site. Eelgrass is present along the tow of hard substrate present in areas west of berth 10, east of berth 8, and between berths 2 through 6. In these regions indirect impacts to eelgrass are

possible. The degree to which eelgrass could be impacted in these areas cannot yet be determined. Given the potential for unpredictable impacts to eelgrass implementation of mitigation measures **Mitigation-4** and **Mitigation-6** would reduce Project related impacts from potential temporary eelgrass shading or direct removal (**Impact-6**) to less than significant.

In general, the Project should seek to avoid impacting eelgrass during construction. Indirect impacts may arise due to disturbance by construction vessels, pile installation, quay wall toe of slope repairs, or increased turbidity. To avoid these impacts, Project implementation should minimize shading associated with staging of vessels or dock structures. Construction crews should incorporate techniques that avoid suspension of sediment that could reduce light transmittance through the water or settle on eelgrass directly. This includes the use of silt curtains to contain suspended sediments during pile installation and quay wall repairs. The proposed Project may result in potentially significant impacts on marine resources; however, all impacts may be reduced to less than significant with implementation of the mitigation measures described above.

It is not anticipated that the green sea turtle and other sensitive species noted above would be significantly impacted by the proposed improvement or construction activities. The potential loss of foraging habitat (eelgrass) is a concern relative the green sea turtles, but that loss is likely minimal and would be mitigated for according to the CEMP. However, the pile driving associated with structural pile replacement and repair complex wharf components may produce noise levels that can cause behavioral disruption of marine mammals and green sea turtles.

Many species of pacific coast groundfish, coastal pelagic, and estuarine species utilize eelgrass habitat at some life stage. The eelgrass surveyed within the Project site contained a moderate diversity of marine vertebrate and invertebrate species, indicating that they function to some degree of importance to marine species persisting in the area and/or migrating through the area. Additionally, eelgrass (seagrass) is listed as an HAPC and as such is a protected and monitored resource.

The purpose of this assessment was to determine whether proposed Project activities would have any effect to the surrounding marine environment, or to the marine flora and fauna reliant on the resources provided by this marine environment. Based on the analyses previously described in this assessment, it has been determined that any potential impacts caused by the Project to the marine environment, sensitive species, and marine mammals can be reduced to less than significant and impacts would be reduced if mitigation measures are followed.

INTRODUCTION

This study is an assessment of potential sound levels generated by planned construction of the NASSCO Floating Drydock and Waterfront Improvement Project (NASSCO) at the Port of San Diego in San Diego, California. The proposed project involves replacing a floating dock that has reached the end of its useful life and completing waterfront improvements, such as repairing, replacing, and expanding specific infrastructure to improve functionality and operational safety within the NASSCO leasehold, which is located at 2798 East Harbor Drive. The project site is located within the Harbor Drive Industrial Subarea of Planning District 4 (Tenth Avenue Marine Terminal) of the certified Port Master Plan. Specific project elements include the following:

- Removal and replacement of the existing floating drydock and construction of supporting infrastructure;

- Improvements to the Repair Complex Wharf;

- Repairs to the quay wall toe of slope along stretches of shoreline throughout the NASSCO leasehold, which includes shoreline segments Lot 20 to Pier 12, floating dry dock approach pier to Berth 8, Ways to Building Dock, Berth 2 to Berth 3, Berth 4 to Berth 5, and Berth 6 to Navy Base Quay Wall; and

- As-needed structural repair and/or replacement of selected piles at Berths 2, 3, 4, 5, 6, and 12 and the Floating Drydock Approach Pier, and the Berth 1 Platform.

Attachment 1 shows the Existing and Proposed Improvements.

This report includes the prediction of underwater sound levels calculated based on the results of measurements for similar projects. Predicted underwater sound levels are compared against interim thresholds that have been accepted by the National Oceanic and Atmospheric Administration (NOAA). The estimated number of strikes for impact driving was provided by the applicant. The duration of vibratory driving for the installation and removal of each pile was estimated based on experience with other projects.

UNDERWATER SOUNDS FROM PILE DRIVING ACTIVITIES

Fundamentals of Underwater Noise

When a pile driving hammer strikes a pile, a pulse is created that propagates through the pile and radiates sound into the water, the ground, and the air. Sound pressure pulse as a function of time is referred to as the waveform. In terms of acoustics, these sounds are described by the peak pressure, the root-mean-square pressure (RMS), and the sound exposure level (SEL). The peak pressure is the highest absolute value of the measured waveform and can be a negative or positive pressure peak. For pile driving pulses, RMS level is determined by analyzing the waveform and computing the average of the squared pressures over the time that comprises that portion of the

waveform containing the sound energy.[1] The pulse RMS has been approximated in the field for pile driving sounds by measuring the signal with a precision sound level meter set to the "impulse" RMS setting and is typically used to assess impacts to marine mammals. Another measure of the pressure waveform that can be used to describe the pulse is the sound energy itself. The total sound energy in the pulse is referred to in many ways, most commonly as the "total energy flux."[2] The "total energy flux" is equivalent to the un-weighted sound exposure level (SEL) for a plane wave propagating in a free field, a common unit of sound energy used in airborne acoustics to describe short-duration events. The unit used is dB re 1 μPa^2-sec. In this report, peak pressures levels are expressed in decibels re 1 µPa; however, in other literature they can take varying forms such as a Pascals or pounds per square inch. The total sound energy in an impulse accumulates over the duration of that pulse. How rapidly the energy accumulates may be significant in assessing the potential effects of impulses on fish. Figure 1 illustrates the acoustical characteristics of an underwater pile driving pulse. Table 1 includes the definitions of terms commonly used to describe underwater sounds.

The variation of instantaneous pressure over the duration of a sound event is referred to as the waveform. The waveform can provide an indication of rise time or how fast pressure fluctuates with time; however, rise time differences are not clearly apparent for pile driving sounds due to the numerous rapid fluctuations that are characteristic to this type of impulse. A plot showing the accumulation of sound energy over the duration of the pulse (or at least the portion where much of the energy accumulates) illustrates the differences in source strength and rise time. An example of the underwater acoustical characteristics of a typical pile driving pulse is shown in Figure 1.

SEL is an acoustic metric that provides an indication of the amount of acoustical energy contained in a sound event. For pile driving, the typical event can be one pile driving pulse or many pulses such as pile driving for one pile or for one day of pile driving. Typically, SEL is measured for a single strike and a cumulative condition. The cumulative SEL associated with the driving of a pile can be estimated using the single strike SEL value and the number of pile strikes through the following equation:

$$SEL_{cumulative} = SEL_{single-strike} + 10log(\#of\ pile\ strikes)$$

For example, if a single strike SEL for a pile is 165 dB and it takes 1000 strikes to drive the pile, the cumulative SEL is 195 dBA (165 dB + 30 dB = 195 dB), where 10 * $Log_{10}(1000) = 30$.

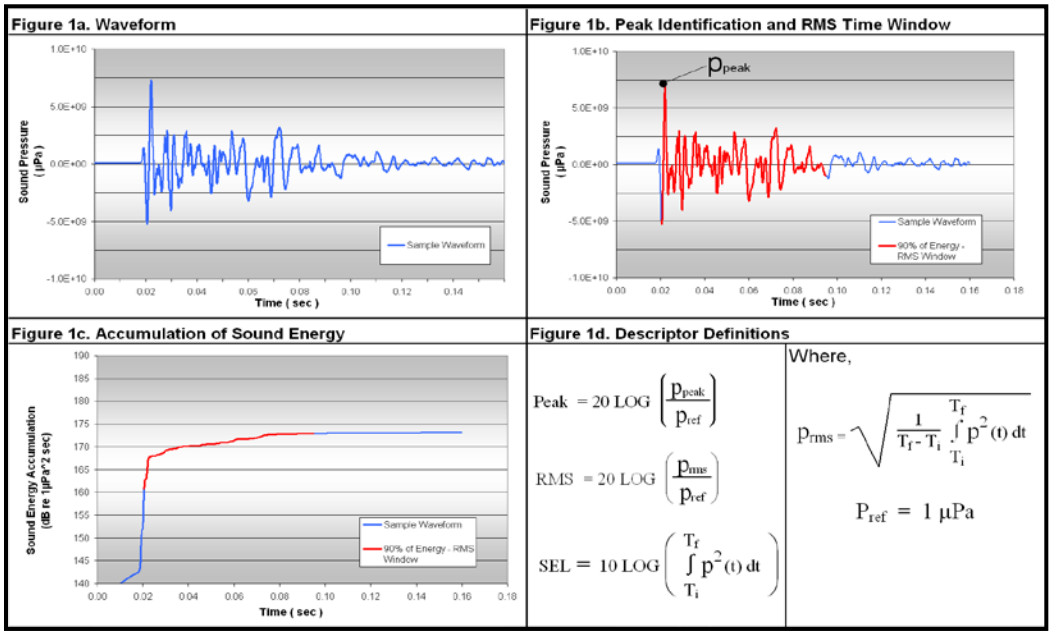
TABLE 1 Definition of Underwater Acoustical Terms

Term	Definition
Peak Sound Pressure, unweighted (dB)	Peak sound pressure level based on the largest absolute value of the instantaneous sound pressure. This pressure is expressed in this report as a decibel (referenced to a pressure of 1 µPa) but can also be expressed in units of pressure, such as µPa or PSI.
Root-Mean-Square (RMS) Sound Pressure Level, (NMFS Criterion) dB re 1µPa	The square root of the average of the squared pressures over the time that comprise that portion of the waveform containing 90 percent of the sound energy for one pile driving impulse.[3] This measure is typically used to assess acoustical impacts to marine mammals.
Sound Exposure Level (SEL), dB re 1 µPa^2-sec	Proportionally equivalent to the time integral of the pressure squared and is described in this report in terms of dB re 1 µPa^2-sec over the duration of the impulse. Similar to the unweighted Sound Exposure Level (SEL) standardized in airborne acoustics to study noise from single events.
Cumulative SEL	Measure of the total energy received through a pile-driving event (here defined as pile driving that occurs with a day).
Waveforms, µPa over time	A graphical plot illustrating the time history of positive and negative sound pressure of individual pile strikes shown as a plot of µPa over time (i.e., seconds).
Frequency Spectra, dB over frequency range	A graphical plot illustrating the distribution of sound pressure vs. frequency for a waveform, dimension in rms pressure and defined frequency bandwidth.

FIGURE 1 Underwater Acoustical Characteristics of a Pile Driving Pulse



[3] The underwater sound measurement results obtained during the Pile Installation Demonstration Project indicated that most pile driving impulses occurred over a 50 to 100 millisecond (msec) period. Most of the energy was contained in the first 30 to 50 msec. Analysis of that underwater acoustic data for various pile strikes at various distances demonstrated that the acoustic signal measured using the standard "impulse exponential-time-weighting" (35-msec rise time) correlated to the RMS (impulse) level measured over the duration of the impulse.

Underwater Sound Thresholds

Fish

A Fisheries Hydroacoustic Workgroup (FHWG) that consisted of transportation officials, resources agencies, the marine construction industry (including Ports), and experts was formed in 2003 to address the underwater sound issues associated with marine construction. The first order of business was to document all that was clearly known about the effects of sound on fish. The result of this effort was a report prepared by Dr. Mardi Hastings and Dr. Arthur Popper, titled Effects of Sound on Fish.[4] This report provided recommended preliminary guidance to protect fish. Research to further investigate the effects of pile driving sounds on fish was also recommended in this report. Some of these recommendations were taken up in an ongoing National Cooperative Highway Research Program (NCHRP 25-28). This NCHRP study is intended to develop guidelines for the prediction and mitigation of the impacts on fish from underwater sound pressure and particle motion caused by pile driving.

To provide additional explanation of the injury criteria recommended in the "Effects of Sound on Fish" and to provide a practical means to apply the criteria, Caltrans commissioned Dr. Popper and other leading experts to prepare a subsequent report. This report is entitled "Interim Criteria for Injury of Fish Exposed to Pile Driving Operations: A White Paper," (*White Paper*).[5] This *White Paper* recommended a dual criterion for evaluating the potential for injury to fish from pile driving operations. The dual approach considered that a single pile strike with high enough amplitude, as measured by zero to peak (either negative or positive pressure) could cause injury. To account for the energy in a single strike, the SEL metric proposed by Hastings and Popper[4] was included as the second part of the dual criteria.

On June 12, 2008, NOAA's National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service, California, Oregon, and Washington Departments of Transportation, California Department of Fish and Game and the U.S. Federal Highway Administration agreed in principle to interim criteria to protect fish from pile driving activities (Table 2).

TABLE 2 Adopted Fish Criteria

Interim Criteria for Injury	Sound Levels Agreed in Principle
Peak	206 dB re: 1μPa (for all size of fish)
Cumulative SEL	187 dB re: 1μPa^2-sec – for fish size of 2 grams or greater 183 dB re: 1μPa^2-sec – for fish size of less than 2 grams

The primary difference between the adopted criteria and previous recommendations is that the single strike SEL was replaced with a cumulative SEL over a day of pile driving. NMFS does not consider sound that produce a SEL per strike of less than 150 dB to accumulate and cause injury.

[4] Hastings, M and A. Popper. 2005. Effects of Sound on Fish. Prepared for the California Department of Transportation. January 28 (revised August 23).

[5] Popper, A., Carlson, T., Hawkins, A., Southall, B., and Gentry, R. 2006. Interim Criteria for Injury of Fish Exposed to Pile Driving Operations: A White Paper. May 15.

Thus, where underwater pile driving noise exceeds 206 dB or cumulatively exceeds 187 dB SEL it can cause injury to fish in that location. All fish species of concern for this project are assumed to be two grams or larger.

The adopted criteria listed in Table 2 are for pulse-type sounds (e.g., pile driving) and does not address sound from vibratory driving. The SEL criteria are not applied to vibratory driving sounds.

Marine Mammals

Under the Marine Mammal Protection Act, NMFS has defined levels of harassment for marine mammals. Level A harassment is defined as "Any act of pursuit, torment, or annoyance which has the potential to injure a marine mammal or marine mammal stock in the wild." Level B harassment is defined as "Any act of pursuit, torment, or annoyance which has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including but not limited to migration, breathing, nursing, breeding, feeding or sheltering."

Table 3 below outlines the current adopted Level A and Behavioral harassment (Level B) criteria. The application of the threshold for vibratory pile driving can sometimes be problematic because this threshold level can be above the ambient noise level of certain locations. The U.S. Navy has conducted ambient underwater sound measurements in the area that characterize the sound environment at 129.2 dB[6]. For continuous sounds, NMFS Northwest Region has provided guidance for reporting RMS sound pressure levels. RMS levels are based on a time-constant of 10 seconds; RMS levels should be averaged across the entire event. For impact pile driving, the overall RMS level should be characterized by integrating sound for each acoustic pulse across 90 percent of the acoustic energy in each pulse and averaging all the RMS for all pulses.

NMFS has provided marine mammal acoustic technical guidance for predicting onset of permanent threshold shift (PTS) and temporary threshold shifts (TTS) in marine mammal hearing from sound sources.[7] For this project location, the functional hearing groups are low-frequency cetaceans (humpback and gray whales), high-frequency cetaceans (harbor porpoises), phocid pinnipeds (harbor seals) and otariid pinnipeds (Stellar and California sea lions and northern elephant seals). For impact pile driving, the majority of the acoustic energy is confined to frequencies below 2 kilohertz (kHz) and there is very little energy above 20 kHz. Similarly, for much of the acoustic energy for vibratory driving is in the frequency range below 2.5 kHz. The underwater acoustic criteria for marine mammals are shown in Table 3. Table 4 shows a summary of the functional hearing groups and their hearing ranges as defined by the NMFS guidance.

TABLE 3 Adopted Underwater Acoustic Criteria for Marine Mammals

Species	Underwater Noise Thresholds (dB re: 1µPa)				
	Vibratory Pile Driving Disturbance Threshold (*Level B Harassment*)	Impact Pile Driving Disturbance Threshold (*Level B Harassment*)	Marine Mammal Hearing Group (see Table 4)	PTS SEL_{cum} Threshold Peak – dB re: 1µPa SEL_{cum} – dB re: 1µPa^2-sec	
				Impulsive (*Impact Pile Driving*)	Non-Impulsive (*Vibratory Pile Driving*)
Cetaceans	129.2 dB RMS*	160 dB RMS	Low Frequency	219 dB Peak 183 dB SEL_{cum}	199 dB SEL_{cum}
			Mid Frequency	230 dB Peak 185 dB SEL_{cum}	198 dB SEL_{cum}
			High Frequency	202 dB Peak 155 dB SEL_{cum}	173 dB SEL_{cum}
Pinnipeds	129.2 dB RMS*	160 dB RMS	Phocid	218 dB Peak 185 dB SEL_{cum}	201 dB SEL_{cum}
			Otariid	232 dB Peak 203 dB SEL_{cum}	219 dB SEL_{cum}

*Threshold is 120 dB or ambient level, whichever is highest. Ambient levels were measured by the U.S. Navy at 129.2 dB in the Project area.

TABLE 4 Definition of Marine Mammal Hearing Group

Marine Mammal Hearing Groups	
Functional Hearing Group	**Functional Hearing Range**
Low Frequency Cetaceans – gray whales	7 Hz to 35 kHz
Mid Frequency Cetaceans – dolphins, toothed whales, beaked whales, bottlenose whales	150 Hz to 160 kHz
High Frequency Cetaceans – true porpoises, *kogia*, river dolphins, cehalorhynchid, *lagenorhynchus cruciger* & *L. australis*	275 Hz to 160 kHz
Phocid Pinnipeds – true seals, including harbor seals	50 Hz to 86 kHz
Otariid Pinnipeds – sea lions and fur seals	60 Hz to 39 kHz

Green Sea Turtles

For sea turtles, the Navy established a threshold for injury from vibratory pile driving and impact driving at 190 dB RMS. Behavioral effects thresholds were noted to be more complex to establish than injury, as there is limited data on turtle behavioral response to sound. Turtles exhibit a low frequency hearing range, typically below 2 kHz. As a result, the potential for behavioral response to sound is further limited to sounds at both elevated intensity and low frequency. While there are no widely adopted behavioral thresholds for sound impacts to turtles, the proposed project would include RMS criteria for Green Sea Turtles, which are summarized in Table 5.

TABLE 5 Adopted Underwater Acoustic Criteria for Green Sea Turtles

Level of Effect	Underwater Noise Thresholds (dB re: 1µPa)	
	Vibratory Pile Driving Disturbance Threshold	Impact Pile Driving Disturbance
Adaptive action trigger for impulsive noise exposure	--	160 dB RMS
Potential harassment take from exposure	--	166 dB RMS

Injury from sound exposures	190 dB RMS	190 dB RMS

Underwater Sound-Generating Activities

The primary source of underwater sound will be the vibratory and impact installation of the piles. Table 6 summarizes the proposed pile driving activities, the number of piles anticipated per day, and the number of strikes per pile for impact events. All impact events will use an APE Model D46-32 hammer (or similar), and all vibratory events will use an APE Model 200 hammer (or similar).

For pile installation with an impact hammer, the initial 20 to 25 feet will be jetted to depth, and an impact hammer will be used for the remaining five to 10 feet. The blow counts in Table 6 are conservative estimates. In addition to the pile installations summarized in Table 6, 20-inch concrete piles, round timber piles, round timber piles encased with a concrete jacket, steel H-piles, and concrete filled steel pipe piles will be removed as part of the proposed project with vibratory hammers. Temporary piles will ultimately be part of the proposed project. Based on previous Berth 6 and 7 Bulkhead Project, temporary pin piles were utilized to establish a template along the bulkhead to properly set sheet piles and king piles prior to driving. Similar techniques may be used for the proposed project.

TABLE 6 Pile Driving Activities for the Proposed Project

Project Element	Project Feature	Pile Type & Size	Total No. of Piles	No. of Piles per Day	No. of Strikes per Pile
Floating Drydock	Catwalk and Removable Brow	16-inch round or square precast concrete	2	10	1,000
	West Aft Dolphin	24-inch octagonal precast concrete	56	10	1,000
	East Aft Dolphin	24-inch octagonal precast concrete	56	10	1,000
	West Forward Dolphin	24-inch octagonal precast concrete	22	10	1,000
	East Forward Dolphin	24-inch octagonal precast concrete	22	10	1,000
	West Aft Dolphin Fender	HP14 x 89	18	10	1,000
	East Aft Dolphin Fender	HP14 x 89	18	10	1,000
	West Forward Dolphin Fender	HP14 x 89	15	10	1,000
	East Forward Dolphin Fender	HP14 x 89	15	10	1,000
	Approach Pier Fender	HP14 x 89	19	10	1,000
Repair Complex Wharf	Repair Complex Wharf Sheet pile wall and backfill	Steel sheet piles	128	5	--[a]
	Repair Complex Wharf (concrete pad)	24-inch octagonal precast concrete piles	34	10	1,000
		18-inch square precast concrete piles	24	10	1,000
	Repair Complex Wharf (fender system)	HP14 x 89 fender	20	10	1,000

[a] The sheet piles will be driven with a vibratory hammer only.

Structure pile repairs and replacement at Berths 2, 3, 4, 5, 6, and Pier 12, and the floating drydock approach pier and the Berth 1 Platform would address deficiencies in steel pipe piles, steel-jacketed concrete piles, concrete-filled steel, and steel H-piles. Approximately 100 piles would be repaired or replaced per year with a total construction duration lasting approximately 10 years. The distribution may change based on the need at the facility, but the total number would not exceed 100 per year. If condition of the structural piles is beyond repair, the piles would be replaced in kind with the same dimension and material. Table 7 summarizes the pile driving information for this project element.

TABLE 7 Pile Driving Activities for the Proposed Floating Drydock and Associated Infrastructure

Project Element	Project Feature	Pile Type & Size	Total No. of Piles	No. of Piles per Day	No. of Strikes per Pile
Structure pile repairs and replacement at Berths 2, 3, 4, 5, 6, and Pier 12, and the floating drydock approach pier and the Berth 1 Platform	Drydock Approach Pier	20-inch square precast concrete	76	10	1,000
	Berth 2 Extension	16-inch square precast concrete	19	10	1,000
		16-inch octagonal precast concrete	60	10	1,000
		13-inch steel pipe	12		--[a]
	Berths 3/4	16-inch octagonal precast concrete	195	10	1,000
	Platform Extension to Berths 3/4	13-inch steel pipe	14		--[a]
	Berths 5/6	16-inch octagonal precast concrete	96	10	1,000
		18-inch octagonal precast concrete	246	10	1,000
		14-inch steel H-piles	2	10	1,000
	Hatch Platform at Berth 5	14-inch steel H-piles	12	10	1,000
	Drydock Mooring Dolphin	20-inch square precast concrete	37	10	1,000
	Pier 12	12-inch square precast concrete	56	10	1,000
		12-inch steel pipe	119		--[a]
		12-inch square precast concrete piles	8	10	1,000
		12-inch steel H-piles	5	10	1,000

[a] Driven with a vibratory hammer

Underwater Sound Levels from Construction

This assessment predicts underwater sound levels associated with the different piling activities that are anticipated. Piling activities include the vibratory installation of steel pipe piles and steel sheet piles and the impact driving of concrete piles. The prediction of sound levels associated with this activity are based on measurements from similar activities.

In October 2020, Caltrans published the updated *Technical Guidance for Assessment and Mitigation of the Hydroacoustic Effects of Pile Driving on Fish* (referred to as the Caltrans Compendium).[8] The appendices of this document contain measurement data for numerous pile driving activities. The prediction of sound levels from pile driving activities proposed for this project relies on data collected from other sites with similar conditions. The following studies were identified to aid in predicting underwater noise levels, as well as for calculating the different distances to threshold for fishes, marine mammals and sea turtles discussed later in the report. Note that the U.S. Navy has published a compendium of sound levels associated with piling and demolition activities in San Diego Bay[9]. However, these data are only reported as the maximum levels observed, while NMFS computations typically use the median SEL and RMS sound levels or mean levels when median levels are not available. For example, use of the maximum SEL per pile strike level would greatly overestimate the accumulated SEL which assumes a equal energy hypothesis. These data were not used in this assessment. Compendium levels are summarized in *Attachment 2*.

Underwater Sound Levels from Project Pile Driving

Data in the Caltrans Compendium were reviewed for the various piling activities summarized in Table 8. The compendium provides summary data by piling activity, type, and size. Detailed information on the measurements that make up these levels are summarized in the compendium.

Much of the underwater sound impacts would be associated with impact driving of concrete piles. The U.S. Navy has published a compendium of underwater and airborne sound levels for piling and in-water demolition activities that occurred in San Diego Bay. The underwater sound levels for 24-inch concrete piles reported in this compendium are significantly louder than all other available data sets that are summarized in the Caltrans Compendium and other compendiums published by the U.S. Navy[8,10]. The reported sound levels for those activities in San Diego Bay were over 10 to 15 dB higher than other data. Therefore, this data is considered an outlier and not used in this assessment.

TABLE 8 Measured Levels for Piling Activities

Driving Method	Pile Type	Size	Sound Pressure Level Measured in dB re: 1µPa at 10 meters			Notes
			Peak	RMS	SEL	
Impact	Concrete	12-in. Round or Square	190	172	160	Average of 2 different similar projects (16- to 20-in. dia.). Note available measurements for 12- and 14-inch piles are limited and in very shallow water.
Impact	Concrete	14-in. Round or Square				
Impact	Concrete	16-in. Round or Square				
Impact	Concrete	18-in. Round or Square				
Impact	Concrete	20-in. Round or Square	187	175	167	Averaged of 6 different similar projects (24-in. dia.). Note outlier low measurements not used
Impact	Concrete	24-in. Octagonal				
Impact	Steel H (HP 12x89)	12-in.	200	178	166	Used 12-in. H pile impact data for Parsons Slough that had higher levels than reported 14-in piles.
Impact	Steel H (HP 14x89)	14-in.				
Vibrate	Steel Pipe	13-in.	172	160	--	Used one project (Mad River Slough)
Vibrate	Steel Sheet	--	177	163	--	Average of 3 projects in deeper water for 24-in AZ sheet piles

Prediction of Underwater Sound Levels from Project Pile Driving

Table 9 shows the sound levels expected at 10-meter distances from different pile driving activities expected from the project (as shown in Table 6). Included are the unattenuated sound levels (Peak, RMS, SEL) expected, also at a distance of 10 meters from the piles. This table also shows levels corresponding to a 5 dB attenuation owing to different attenuation mechanisms like bubble curtains, isolation casing etc. that may be used during the pile driving activities. These levels have been taken from past projects that give a good estimate of the levels one can expect from the different pile driving activities proposed for the project. Impacts to fishes, marine mammals and turtles are then calculating using these levels (both unattenuated and attenuated).

TABLE 9 Sound levels used for analyzing marine mammal impacts for different pile types and sizes as per project requirements

Driving Method	Pile Type	Size	Sound Pressure Level (dB re: 1µPa at 10 meters)			Sound Pressure Level (dB re: 1µPa at 10 meters)		
			UNATTENUATED			ATTENUATED[1]		
			Peak	RMS	SEL	Peak	RMS	SEL
Impact	Concrete	12-in. Round or Square	190	172	160	185	167	155
Impact	Concrete	14-in. Round or Square						
Impact	Concrete	16-in. Round or Square						
Impact	Concrete	18-in. Round or Square						
Impact	Concrete	20-in. Round or Square	187	175	167	182	170	162
Impact	Concrete	24-in. Octagonal						
Impact	Steel H (HP 12x89)	12-in.	200	178	166	195	173	161
Impact	Steel H (HP 14x89)	14-in.

Vibrate	Steel Sheet	--	177	163	--	172	158	--

[1] Attenuated condition assumes 5-dB lower sounds

Predicted Impacts to Fishes

Table 10 shows the anticipated distances to the various adopted interim fish thresholds. Distances are shown for both unattenuated and attenuated piles (5 dB attenuation). Also, when the piles are installed with a vibratory hammer, the cumulative SEL thresholds for fish do not apply and the 150 RMS acts as a threshold. The distance to each threshold was computed using the transmission loss coefficient of 15 times the Log_{10} of the distance, as recommended by NMFS when there is no site-specific information for the area. Cumulative SEL was computed by adding 10 times the Log_{10} of the number of impact pile strikes to the median SEL for a single strike. Attachment 3 shows the NMFS spreadsheets used for calculating impacts to fishes.

TABLE 10 Distance to the Various Adopted Fish Thresholds for all piles

Driving Method	Pile Type	Size	Piles installed per day	No. of strikes per pile	Condition[1]	Distance to various adopted fish thresholds (in meters)			
						Peak 206 dB[2]	RMS 150 dB[2]	Cumulative SEL 187 dB[3]	Cumulative SEL 183dB[3]
Impact	Concrete	12-18 in. Round or Square	10	1,000	Unattenuated	<1	293	46	46
					Attenuated	<1	136	22	22
Impact	Concrete	20-24 in. Round or Square	10	1,000	Unattenuated	<1	464	136	136
					Attenuated	<1	215	63	63

					Attenuated	<1	34	N/A	N/A

[1] Attenuated condition assumes 5-dB lower sounds. [2] dB : re 1 µpa [3] dB : re 1 µpa^{2}sec

Predicted Impacts to Marine Mammals

The following threshold distances were computed to assess impacts to marine mammals:

- Distance to onset PTS Isopleth for each hearing group
  - Unattenuated
  - Attenuated
- Distance for unweighted 120 dB vibratory and 160 dB Impulse Behavior Isopleth
  - Unattenuated
  - Attenuated

The NMFS Companion User Spreadsheet (Version 2.2 [2020]) to the *National Marine Fisheries Service (NMFS): Technical Guidance for Assessing the Effects of Anthropogenic Noise on Marine Mammal Hearing: Underwater Acoustic Thresholds for Onset of Permanent and Temporary Threshold Shifts* was used to predict zones where the onset of Permanent Threshold Shift to marine mammal hearing could occur. A spreading loss calculation is included in the spreadsheet to predict the distance to the onset PTS from accumulated SEL and Peak sound pressure. The spreadsheet incorporates a frequency weighting function that accounts for sensitivity for different hearing groups when computing accumulated SEL. These are referred to as weighting frequency adjustments (WFAs). The default frequency WFA of 2 kHz for impact pile driving and 2.5-kHz for vibratory driving were used. Since the onset of PTS based on SEL_{cum} is computed as further from the pile than it would be using Peak sound pressure computations, the onset of PTS is based

on SEL computations; therefore, the onset of PTS based on peak sound levels is not provided in this assessment.

The extent of Level B zone calculations were made using the 10-meter sound levels and applying a transmission loss coefficient of 15 times the Log_{10} of the distance, as recommended by NMFS when there is no site-specific information for the area.

Table 11 shows the anticipated distances to the various adopted Marine Mammal thresholds (Level A and Level B zones). When the piles are installed with a vibratory hammer, the cumulative SEL thresholds do not apply and the Peak PTS Thresholds that apply to marine mammals will not be reached. Distances are shown for both unattenuated and attenuated pile driving activities expected from the project. Attachment 4 shows the NMFS spreadsheets used for calculating impacts to marine mammals.

TABLE 11 Distance to the Adopted Marine Mammal Thresholds for different Pile Driving activities – Level A & B zones (meters)

Driving Method	Pile Type	Size	Piles per day	No. of strikes per pile	Condition[1]	Level A injury zone (meters) (using SEL_{cum} Threshold)					Level B harassment zone (meters)

[1] Attenuated condition assumes 5-dB lower sounds.

Predicted Impacts to Green Sea Turtles

Table 12 shows the predicted distances to the adopted 160 dB RMS for impact driving and 190 dB RMS for vibratory driving Green Sea Turtle thresholds (as mentioned in Table 5). These distances have been calculated for all the different types of pile driving activities and their respective levels expected from the project using the $15Log_{10}$ transmission loss coefficient. Attachment 3 shows the NMFS spreadsheets used for calculating impacts to green sea turtles.

TABLE 12 Distance to the Adopted Green Sea Turtle thresholds for different Pile Driving activities (meters)

Driving Method	Pile Type	Size	Piles installed per day	No. of strikes per pile	Condition[1]	Distance to adopted Green Sea Turtle threshold (meters)
						160 dB RMS (Impact) 190 dB RMS (Vibratory)
Impact	Concrete	12-18 in. Round or Square	10	1,000	Unattenuated	63
					Attenuated	29

[1] Attenuated condition assumes 5-dB lower sounds.

Summary of Underwater Sound Level Impacts

Based on the above calculations (Tables 10 to 12), construction of the NASSCO Floating Drydock and Waterfront Improvement Project would result in the generation of significant underwater sounds that could affect fishes, marine mammals and sea turtles that may be present in waters at or near the project. Impact and vibratory pile driving activities are expected to have potential impacts that extend out to around 740 meters as per the adopted fish thresholds. Pile installation activities are predicted to have potential Level A marine mammal impacts that extend out to 474 meters each day, depending on the types of activity and animal species. The range of level B impact would be much greater, extending out to 1.8 kilometers during vibratory pile driving. For most activities involving impact driving only, Level B zones would be less than 160 meters. It should be noted that the prediction that sounds extending out 1.8 kilometers would be to waters that have clear line of sight to the construction activity. The distances to the PTS thresholds for vibratory driving would be small when compared to the impact driving distances. The Level B harassment zones would however be much larger with the vibratory installation of the pile compared to impact driving. The maximum distance to adopted Green Sea Turtle thresholds is

expected to be up to 160 meters from the impact pile driving activities. Level B zones for vibratory driving with respect to adopted Green Sea Turtle thresholds are expected to be less than 10 meters.

AIRBORNE NOISE LEVELS FROM PROJECT PILE DRIVING

Fundamentals of Airborne Noise

Airborne sound is treated slightly different that underwater sound. For example, the decibel scale used to express airborne sounds reference an acoustic pressure of 20 µPa rather than 1µPa, as 20µPa is the threshold of healthy human hearing. Sound transmission in air from a single source (i.e., a "point" source) radiates uniformly outward in a more spherical pattern as it travels away from the source since the propagating field is less bounded. The sound level attenuates (or drops off) at a rate of 6 dBA for each doubling of distance. Usually, the noise path between the source and the observer is very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the rate of attenuation. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is done for simplification only; for distances of less than 300 feet, prediction results based on this scheme are sufficiently accurate. For acoustically "hard" sites (i.e., sites with a reflective surface, such as a smooth body of water, between the source and the receiver), no excess ground attenuation is assumed.

Sounds generated from construction activities are considered point sources, rather than a line source such as a freeway or roadway. The marine environment around the project site is mostly water and would be considered a "hard" site. The TL drop off rate of sound is represented by spherical spreading loss (a $20Log_{10}$ function). This equates to a 6-dB reduction in sound per doubling distance. The formula for calculating the drop off is the source level plus $20*Log_{10}(D_1/D_2)$, where D_1 is the reference position and D_2 is the receiver position.

Airborne Noise Thresholds

In-air acoustic impacts are only considered for marine mammals that would haul out of the water. Therefore, pinnipeds (seals and sea lions) are considered but cetaceans (whales, dolphins, and porpoises) are not. Current in-air acoustic thresholds provided by NMFS for marine mammals are 90 dB RMS for Level B take of harbor seals and 100 dB RMS for Level B take of non-harbor seal pinnipeds. It is noted that thresholds are currently only provided for Level B take (behavioral disruption) and that no threshold are currently established for Level A take (injury). Because injury is a more severe effect than behavioral disruption it follows that Level A take would occur at higher noise levels than those associated with Level B take. Therefore, although no specific threshold has been established for Level A take (injury) it can be concluded that avoidance of Level B take would also avoid Level A take. It is noted that the thresholds in Table 13 are all established using unweighted decibels (dB) (also sometimes referred to as "flat" or "Z" weighted), as opposed to A-weighted decibels (dBA) which are typically used for assessing environmental noise impacts on humans. When a sound is measured using both unweighted decibels and A-weighted decibels, the values are rarely the same. The unweighted (dB) level will be higher than the A-weighted (dBA) level, especially for sounds with substantial low frequency acoustic energy. The difference between the two values depends on the frequency content (spectrum) of the sound.

TABLE 13 Airborne noise thresholds

Criterion	Criterion Definition	Threshold
Level A	PTS (injury) conservatively based on TTS	None established
Level B	Harbor seals (Level B – behavioral disruption) exposure	90 dBA RMS
Level B	Non-harbor seal pinnipeds (Level B – behavioral disruption) exposure	100 dBA RMS

Sound Levels for Pile Driving

The U.S. Navy reports airborne sounds from pile driving[11,12]. These impact pile driving levels are for steel piles, which are considered to generate more noise than concrete piles. The Navy reports maximum unweighted airborne sound levels at 112 dB (L_{max}) for impact and 95 to 97 dB for Vibratory (36in piles). FHWA's RCNM v2.0 (Roadway Construction Noise Model) is commonly used to documented A-weighted levels for evaluating impacts to people. Impact pile driving is predicted at 104 dBA at 50 feet (15 meters). However, these are A-weighted levels. Table 14 provides the L_{max} and L_{eq} levels[13] measured while driving relatively small diameter steel shell piles (24- to 36-inch diameter) at the Navy Test Pile Program project in Bangor, Washington.

TABLE 14 Airborne Noise Levels from Driving of Steel Piles Measured at 50 feet (15 meters)

Sound Descriptor	Sound Level, dBA[1]	
	Vibratory Hammer	Impact Hammer
L_{max}	102	112
L_{eq}	97	103

[1] dB re: 20 µPa

Airborne Impacts from Vibratory Pile Driving

Measured sound levels from vibratory pile driving used in this analysis are based on measurements made during the Navy Test Pile Project. The maximum measured unweighted L_{max} was 102 dB and the average L_{eq} was 97 dB at 50 feet or 15 meters. The $20\log_{10}$ attenuation rate was used to calculate the distances to the various NMFS thresholds that are presented in Table 15. The distances shown are based on the L_{max} levels. We believe the NMFS criterion are based on average levels, so these distances likely overestimate impacts.

[11] NAVFAC 2015. *Proxy Source Sound Levels and Potential Bubble Curtain Attenuation for Acoustic Modeling of Nearshore Marine Pile Driving at Navy Installations in Puget Sound*. January. Available at http://www.nbkeis.com/_Docs/FEIS/AppendixH_Navy%202015%20Noise%20Analysis.pdf . Accessed June 25, 2021

12 Navy (U.S. Department of the Navy). 2012. *Acoustic monitoring report Test Pile Program. Prepared for Naval Base Kitsap at Bangor*, WA. Prepared by Illingworth and Rodkin, Inc., April 27, 2012

[13] L_{max} level is the typical maximum RMS sound level measured with a Sound Level Meter set to the "fast" response (or $1/8^{th}$ second response time). The Leq is the energy average sound level measured over a driving event.

TABLE 15 Distance to Thresholds for Vibratory Driving

Threshold	Distance (meters)	
	100 dB	90 dB
L_{max}	20	60
L_{eq}	<10	35

Airborne Impacts from Impact Pile Driving

Measured sound levels from impact pile driving used in this analysis are also based on measurements made during the Navy Test Pile Project. The maximum measured unweighted L_{max} was 112 dB and the average L_{max} was 103 dB at 50 feet (15 meters). The $20\log_{10}$ attenuation rate was used to calculate the distances to the various NMFS thresholds that are presented in Table 16. The levels shown are the L_{max} levels. Again, these distances likely overestimate impact areas since they are based on the maximum levels.

TABLE 16 Distance to Thresholds for Impact Driving

Threshold	Distance (meters)	
	100 dB	90 dB
L_{max}	200 feet (60 meters)	630 feet (190 meters)
L_{eq}	70 feet (20 meters)	225 feet (70 meters)

Table A-2. Summary of Applicable Caltrans Compendium Data

Pile type	Diameter	Project	Location	Hammer type	Water Depth	Measured Sound Levels (dB re : 1 µPa)				Comments
						Distance	Peak	RMS	SEL	
Concrete	12-inch square	Noyo Harbor Mooring Basin Dock Project	Fort Bragg, CA Noyo Harbor	Diesel Impact	2-3m	10m	183	157	146	
Concrete	16-inch sqaure	Pier 2, Concord NWS	Concord, CA - Carquinez Straits	Drop Steam-Powered	10m	10m	184	173	--	Piles driven using steam-powered drop hammer that included a cushion block. Hammer energies were 48,000 to 60,000 ft-lbs
Concrete	18-inch octagonal	Berkeley Marina	Berekely, CA San Francisco Bay	Diesel D-30	2-4m	10m	185	166	154	
Concrete	20-inch square	Pier 12 attenuation device test	Honolulu, Hawaii	Junttan Hydraulic impact hammer Model HHS9	4-10m	10m	188	177	164	
Concrete	24-inch octagonal	Berth 22 Reconstruction, Port of Oakland	Oakland, CA - San Francisco Bay	Diesel Impact(Delmag D62-22)	10-15m	10m	188	176	166	Piles installed using D62-22 Delmag impact hammer with cushion block. Hammer energies up to 165,000 ft-lbs (224 kilo joules). Fish exposure study conducted during measurements
Steel H Pile	12-inch	Noyo River Bridge	Fort Bragg, CA	Diesel Impact	2m	30m	179	165	NA	Temporary trestle piles. Piles driven using small diesel impact hammer. Piles installed in shallow water.
Steel H Pile	14-inch	Parson Slough	Montrery, CA Parson Slough	Diesel Impact APE19-42	4m	10m	200	178	166	Small diesel hammer in deep water
Steel Pipe	13-inch	Mad River Slough Pipeline	Mad River Slough, Arcata, CA	Vibratory Hammer	5m	10m	171	155	155	Piles driven in tidal river slough. Piles were first vibrated, then driven with a drop hammer.
AZ Steel Sheet	24-inch AZ	Berth 35/37, Port of Oakland (Dutra)	Oakland, CA - San Francisco Bay	Vibratory (APE 600B Super Kong)	15m	10m	177	163	163	Vibratory installation of sheet piles for deep-water berth, as described above. Sound levels of some driving events exceeded 185 dB peak and 165 dB SEL for very short periods

Attachment 3 – NMFS Fish and Sea Turtle calculation sheets

Title	**21-047 NASSCO Port of San Diego**
Description	12-18 in round or square concrete impact piles
Assumptions	

Instructions:

Input: Fill in the green colored cells

B1: Enter a descriptive title for the analysis.
B2: Enter complete information about the pile driving operation, including the type of pile, size of pile, pile driver type, noise attenuation, hours of operation, etc.
B3: Enter any assumptions you need to make about the choice of parameter values, project methods, environment, etc.
B26: Enter the number of strikes required to drive a single pile to final depth (from the Action Agency's description or from the No. Strikes per Pile Data tab)
B27: Enter the maximum number of piles to be installed in a single day (from the Action Agency's description of the project)
For the next 6 values, use the information on the Pile Driving Noise Data tab if possible, otherwise request information from the Action Agency or search the internet for another source.
B32: Enter the estimated single strike peak pressure (dB re: 1µPa)
B33: Enter the distance (m) from the pile where B7 was measured
B34: Enter any noise reduction (from unattenuated noise levels) due to noise abatement methods. See the Noise Abatement Data Tab.
C32: Enter the estimated single strike SEL (dB re: 1µPa²s). If no direct measurement is available, use peak pressure minus 25 dB
C33: Enter the distance (m) from the pile where C9 was measured
D32: Enter the estimated single strike RMS pressure (dB re: 1µPa). If no direct measurement is available, use peak pressure minus 15 dB
D33: Enter the distance (m) from the pile where D9 was measured
B38: Enter the transmission loss constant (attenuation with distance), which depends on the model used:
For deep water (depth is greater than the cSEL radius of effect) use the spherical model attenuation constant = 20
For shallow water use a cylindrical model attenuation constant = 10 to 15; use 15 if unknown.
If you use an attenuation constant that was reported with the noise data, be sure that the depth profile and bottom type of your project is similar to the project that generated the data.

Output: Read the values in the blue cells in the Calculated Distances Table

Map Index Number: 53057
EO Index: 53057
Key Quad: Imperial Beach (3211751)
Element Code: AAABF02020
Occurrence Number: 273
Occurrence Last Updated: 2019-01-07

Scientific Name: *Spea hammondii*
Common Name: western spadefoot

Listing Status: **Federal:** None
State: None
Rare Plant Rank:

CNDDB Element Ranks: **Global:** G2G3
State: S3
Other Lists: BLM_S-Sensitive
CDFW_SSC-Species of Special Concern
IUCN_NT-Near Threatened

General Habitat:

OCCURS PRIMARILY IN GRASSLAND HABITATS, BUT CAN BE FOUND IN VALLEY-FOOTHILL HARDWOOD WOODLANDS.

Micro Habitat:

VERNAL POOLS ARE ESSENTIAL FOR BREEDING AND EGG-LAYING.

Last Date Observed: 1999-11-02
Occurrence Type: Natural/Native occurrence
Last Survey Date: 1999-11-02
Occurrence Rank: Unknown
Owner/Manager: DPR-BORDER FIELD SP
Trend: Unknown
Presence: Presumed Extant

Location:

BORDERFIELD STATE PARK, SOUTH OF THE TIJUANA RIVER, ABOUT 0.9 MI NORTH OF THE INTERNATIONAL BORDER.

Detailed Location:

SITE NAME: TIJUANA ESTUARY NATIONAL WILDLIFE REFUGE. THIS SITE IS PART OF THE MSCP PLANNING AREA. PIT-FALL TRAP ARRAY 2.

Ecological:

AUTHOR NOTED THIS WAS ONE OF THE LAST REMAINING SAND-DUNE SPADEFOOT POPULATIONS IN COASTAL CALIFORNIA. MARITIME SUCCULENT SCRUB, SALT MARSH AND COASTAL SAGE SCRUB. SUBSTANTIAL FOOT TRAFFIC THROUGHOUT THE AREA.

Threats:

General:

1 INDIVIDUAL CAPTURED BETWEEN 5 FEB 1998 AND 6 OCT 1998, AND 1 BETWEEN 2 FEB AND 2 NOV 1999.

PLSS: T19S, R02W, Sec. 06 (S)
Accuracy: 80 meters
Area (acres): 0

Occurrence Number: 601

EO Index: 113791
Element Code: AAABF02020
Occurrence Last Updated: 2019-02-19

Scientific Name: *Spea hammondii*
Common Name: western spadefoot

Listing Status: **Federal:** None
State: None

CNDDB Element Ranks: **Global:** G2G3
State: S3

Rare Plant Rank:

Other Lists: BLM_S-Sensitive
CDFW_SSC-Species of Special Concern
IUCN_NT-Near Threatened

General Habitat:

OCCURS PRIMARILY IN GRASSLAND HABITATS, BUT CAN BE FOUND IN VALLEY-FOOTHILL HARDWOOD WOODLANDS.

Micro Habitat:

VERNAL POOLS ARE ESSENTIAL FOR BREEDING AND EGG-LAYING.

Last Date Observed: 2003-XX-XX
Last Survey Date: 2003-XX-XX
Owner/Manager: PVT
Presence: Possibly Extirpated

Occurrence Type: Natural/Native occurrence
Occurrence Rank: None
Trend: Unknown

Location:

ON NORTHSIDE OF MAST BLVD, ABOUT 0.4 MI W OF MEDINA DR INTERSECTION, WEST OF SANTEE, NORTHEAST SAN DIEGO.

Detailed Location:

NORTH OF WEST HILLS HIGH SCHOOL. MAPPED TO MAP LOCATION PROVIDED.

Ecological:

BACCHARIS-DOMINATED COASTAL SAGE SCRUB.

Threats:

PROPOSED DEVELOPMENT; DEVELOPMENT OCCURRING IN 2017 GOOGLEMAPS STREET VIEW.

General:

SPADEFOOT DETECTED IN 2003.

PLSS: T15S, R01W, Sec. 19, SE (S)

Location:
VICINITY OF SHARP MEMORIAL HOSPITAL, SIERRA MESA, SAN DIEGO.

Detailed Location:
GIVEN LOCATION "KEARNY MESA NEAR SHARP HOSPITAL," MAPPED TO VICINITY OF SHARP MEMORIAL HOSPITAL, LOCATED ON SOUTHSIDE OF KERNY MESA.

Ecological:
SPECIFIC AREA WAS UNDEVELOPED IN 1952, THOUGH NEW DEVELOPMENT WAS NEARBY. THE HOSPITAL WAS BUILT BY 1963, AND I-805 CONSTRUCTED THROUGH MURRAY CANYON BY 1975.

Threats:
AREA HAS BEEN HEAVILY DEVELOPED SINCE THE TIME OF COLLECTION.

General:
COLLECTED ON 4 MAY 1958.

Location:
POINT LOMA COMMUNITY PARK, POINT LOMA, SAN DIEGO.

Detailed Location:
GIVEN LOCATION "LOMA PORTAL LITTLE LEAGUE FIELD." POINT LOMA LITTLE LEAGUE FIELD IS LOCATED AT POINT LOMA COMMUNITY PARK.

Ecological:
PARK IS SURROUNDED BY RESIDENTIAL DEVELOPMENT. AERIAL IMAGERY FROM 1975 SHOWS A LARGER PATCH OF HABITAT ON EASTERN SIDE OF PARK. PARK FEATURES HAVE BEEN EXPANDED SINCE TIME OF COLLECTION. POSSIBLY EXTIRPATED.

Threats:
DEVELOPMENT.

General:
COLLECTED ON 8 APR 1976. NEEDS MORE MODERN FIELDWORK AND REPORTING TO DETERMINE STATUS.

PLSS: T17S, R04W, Sec. 1, SE (S)
Accuracy: 1/5 mile

State: Delisted
Rare Plant Rank:

CNDDB Element Ranks: **Global:** G4T3T4
State: S3

Other Lists: BLM_S-Sensitive
CDFW_FP-Fully Protected
USFS_S-Sensitive

General Habitat:

COLONIAL NESTER ON COASTAL ISLANDS JUST OUTSIDE THE SURF LINE.

Micro Habitat:

NESTS ON COASTAL ISLANDS OF SMALL TO MODERATE SIZE WHICH AFFORD IMMUNITY FROM ATTACK BY GROUND-DWELLING PREDATORS. ROOSTS COMMUNALLY.

Last Date Observed: 2000-09-13
Occurrence Type: Natural/Native occurrence
Last Survey Date: 2000-09-13
Occurrence Rank: Excellent
Owner/Manager: DOD-NAVY, DOD-COE
Trend: Unknown
Presence: Presumed Extant

Location:

ZUNIGA POINT, SAN DIEGO BAY MOUTH.

Detailed Location:

ROOST NUMBER SD 3.5. BIRDS PREFER THE BREAKWATER BUT WILL ALSO USE CONCRETE JETTY & ROCKS ON MAINLAND POINT IF BREAKWATER IS UNAVAILABLE OR CROWDED.

Ecological:

BREAKWATER AND JETTY. PELICAN USE IS LIMITED BY TIDAL HEIGHT AS MUCH OF THE BREAKWATER IS SUBMERGED AT HIGH TIDES.

Threats:

General:

DAY & NIGHT ROOST. THIS IS 3RD LARGEST ROOST ON SOUTHERN CALIFORNIA COAST. 193-245 BIRDS COUNTED BETWEEN DUSK ON 12 SEP & DAWN ON 13 SEP 2000. SUMMARY OF 1986-87, 1992-93 & 1998-2000 DIURNAL COUNTS: RANGE 0-700 BIRDS, MEAN 158.2 BIRDS.

General Habitat:

COLONIAL NESTER IN MARSHLANDS AND BORDERS OF PONDS AND RESERVOIRS WHICH PROVIDE AMPLE COVER.

Micro Habitat:

NESTS USUALLY PLACED LOW IN TULES, OVER WATER.

Last Date Observed: 2007-07-17
Occurrence Type: Natural/Native occurrence
Last Survey Date: 2007-07-17
Occurrence Rank: Fair
Owner/Manager: UNKNOWN
Trend: Unknown
Presence: Presumed Extant

Location:

SYCAMORE CANYON, AT THE NORTH END OF SANTEE LAKES REGIONAL PARK, SANTEE.

Detailed Location:

NESTS FOUND IN TYPHA STANDS.

Ecological:

HABITAT CONSISTS OF A SERIES OF 7 LAKES THAT EXTEND SOUTH TO NORTH; NESTING OCCURS ON THE 6TH AND 7TH LAKES (ON THE NORTH END OF THE SERIES). LAKES ARE SURROUNDED BY A NARROW RIPARIAN STRIP TO THE WEST AND RESIDENCES ON ALL SIDES.

Threats:

THREATENED BY VEGETATION CLEARING, MANAGEMENT OF HABITAT FOR HUMAN RECREATIONAL, & PREDATION BY RACCOONS.

General:

2 ADULTS FLEDGED 3 CHICKS ON LAKE #6; CHICKS NOT SEEN AFTER 14 JUL 2006. ADULTS AND A NEST WITH 2 EGGS WAS FOUND ON LAKE #7 ON 2 JUL; NEST HAD FAILED BY 3 JUL 2006. ADULT MALE OBSERVED ON LAKE #6 AND 3 JUVENILES ON LAKE #7 ON 17 JUL 2007.

Scientific Name: *Pandion haliaetus* **Common Name:** osprey

Listing Status: **Federal:** None **Rare Plant Rank:**

State: None **Other Lists:** CDF_S-Sensitive
CDFW_WL-Watch List
IUCN_LC-Least Concern

CNDDB Element Ranks: **Global:** G5

State: S4

General Habitat:

OCEAN SHORE, BAYS, FRESHWATER LAKES, AND LARGER STREAMS.

Micro Habitat:

LARGE NESTS BUILT IN TREE-TOPS WITHIN 15 MILES OF A GOOD FISH-PRODUCING BODY OF WATER.

Last Date Observed:	2018-07-09	**Occurrence Type:**	Natural/Native occurrence
Last Survey Date:	2018-07-09	**Occurrence Rank:**	Unknown
Owner/Manager:	SAN DIEGO UNIFIED PORT DIST	**Trend:**	Unknown
Presence:	Presumed Extant		

Location:

CHULA VISTA WILDLIFE RESERVE, ABOUT 0.7 MI WSW OF BAY BLVD AT L ST IN CHULA VISTA.

Detailed Location:

MAPPED TO COORDINATES GIVEN FOR OSPR-07 & OSPR-08 IN 2018 REPORT. EBIRD SIGHTINGS "ON PLATFORM ACROSS THE BAY (FROM BAYFRONT PARK) AT THE CHULA VISTA WILDLIFE RESERVE" & "ON TOP OF THE BAY TOWER TO THE S (OF BAYFRONT PARK)" ATTRIBUTED HERE.

Ecological:

NESTS ON MANMADE STRUCTURES (NEST PLATFORM, TOWER, BUOY) IN AREA WITH INDUSTRIAL LAND USE ADJACENT TO PROTECTED WATERFRONT. BUOY WITH NEST IN 2014 WAS REMOVED IN 2017.

Threats:

NEST REMOVAL.

General:

NESTS DETECTED IN VICINITY IN 2014, 2015 AND 2016. BUOY NEST REMOVED IN 2017. 1 ACTIVE NEST OBSERVED IN 2018, OSPR-07 FLEDGED 1 YOUNG.

Map Index Number: A3968
EO Index: 105633
Key Quad: La Jolla (3211772)
Element Code: ABNME03041
Occurrence Number: 58
Occurrence Last Updated: 2017-07-26

Scientific Name: *Laterallus jamaicensis coturniculus*
Common Name: California black rail

Listing Status: **Federal:** None
State: Threatened
Rare Plant Rank:

CNDDB Element Ranks: **Global:** G3G4T1
State: S1
Other Lists: BLM_S-Sensitive
CDFW_FP-Fully Protected
IUCN_NT-Near Threatened
NABCI_RWL-Red Watch List
USFWS_BCC-Birds of Conservation Concern

General Habitat:

INHABITS FRESHWATER MARSHES, WET MEADOWS AND SHALLOW MARGINS OF SALTWATER MARSHES BORDERING LARGER BAYS.

Micro Habitat:

NEEDS WATER DEPTHS OF ABOUT 1 INCH THAT DO NOT FLUCTUATE DURING THE YEAR AND DENSE VEGETATION FOR NESTING HABITAT.

Last Date Observed: 1908-06-22
Occurrence Type: Natural/Native occurrence
Last Survey Date: 1908-06-22
Occurrence Rank: None
Owner/Manager: UNKNOWN
Trend: Unknown
Presence: Possibly Extirpated

Location:

AREA JUST NW OF I-5 AND I-8 INTERCHANGE, 2.4 MI SSW OF I-5 AT BALBOA AVE, MISSION BAY.

Detailed Location:

LOCATION DESCRIBED AS "FALSE BAY" IN WHAT IS CURRENT DAY MISSION BAY. MAPPED GENERALLY USING A HISTORIC USGS MAP FOR LA JOLLA (1903, 1:62500).

Ecological:

MARSH. BASED ON HISTORIC USGS MAP THE SE PART OF BAY APPEARS TO HAVE HAD MARSHES. FALSE/MISSION BAY HAS BEEN MODIFIED SINCE TIME OF DETECTION. POTENTIAL HABITAT WITHIN THE SNA DIEGO RIVER MOUTH CHANNEL. EXTIRPATED AS BREEDER BY 1950S.

Threats:

DEVELOPMENT OF SURROUNDING UPLANDS AND INFILLING OF BAY AND MARSHES SINCE 1908. EXTIRPATED AS A BREEDER BY 1950S.

General:

1 OBSERVED CROUCHED IN THE MUD A FEW FEET FROM THE BANK ON 22 JUN 1908, RAIL "STOOD PERFECTLY STILL, WITH HEAD LOWERED, AS IF EXPECTING TO BE OVERLOOKED." RAIL WAS SHOT & COLLECTED BY F. STEPHENS. ANOTHER BIRD FLUSHED OUT A FEW DAYS LATER.

Location:

POINT LOMA, SAN DIEGO.

Detailed Location:

1876 LOCATION DESCRIBED AS "THE POINT LOMA LIGHT, NEAR SAN DIEGO." THIS IS PRESUMABLY IN REFERENCE TO THE OLD POINT LOMA LIGHTHOUSE (ACTIVE FROM 1855-1891, ATTACHED TO A HOUSE). 1908 LOCATION DESCRIBED ONLY AS "POINT LOMA."

Ecological:

EXACT LOCATION OF RAILS UNKNOWN. MAPPED GENERALLY TO THE OLD POINT LOMA LIGHTHOUSE. POTENTIALLY OCCUPIED MARSH EXISTED FUTHER NE NEAR CURRENT DAY SAN DIEGO INTERNATIONAL AIRPORT. EXTIRPATED AS A BREEDER FROM THE AREA AROUND THE 1950S.

Threats:

General:

ONE COLLETED ON 4 AUG 1876; BIRD HAD STRUCK THE LIGHT HOUSE, POSSIBLY A MIGRATING BIRD. ONE COLLECTED ON 22 JUN 1908; THIS RECORD IS LIKELY NOT REPRESENTATIVE OF A NESTING LOCALITY.

Location:

VICINITY OF THE MOUTH OF THE TIJUANA RIVER, SOUTH OF IMPERIAL BEACH.

Detailed Location:

1908 LOCATION DESCRIBED AS "NEAR MOUTH OF TIJUANA RIVER." EXACT LOCATION UNKNOWN. AREA EXPLORED BY L. HUEY & F. STEPHENS IN NOV 1908; HUNTED MARSHES AT HIGH TIDE. LOCATIONS OF 1965-66 DETECTION UNK & THEREFORE ATTRIBUTED TO THIS OCCURRENCE.

Ecological:

BLACK RAIL GENERALLY LISTED AS AN OCCUPANT OF THE TIJUANA RIVER ESTUARINE SANCTUARY IN THE 1981 ENVIRONMENTAL IMPACT STATEMENT FOR THE PROPOSED ESTUARINE SANCTUARY GRANT AWARD. MAY BE EXTIRPATED AS A BREEDER FROM SAN DIEGO CO.

Threats:

General:

1 COLLECTED ON 8 NOV 1908. GENERALLY LISTED AS AN OCCUPANT IN THE 1981 REPORT. 2 DETECTIONS REPORTED IN "FRESH WATER IN THE TIJUANA RIVER VALLEY" ON 24 APR 1965 AND 5 SEP 1966 BY G. MCCASKI; SITE COULD BE FURTHER TO THE EAST.

Last Survey Date: 1929-08-30
Occurrence Rank: Unknown
Owner/Manager: CITY OF SAN DIEGO
Trend: Unknown
Presence: Presumed Extant

Location:

ABOUT 0.9 MI WSW OF HWY 94 AT COLLEGE AVE, 2.6 MI NE OF HWY 94 AT I-805, 2 MI N OF ESCANTO, E OF SAN DIEGO.

Detailed Location:

BIRD WAS LOCATED "NEAR THE TOWERS OF THE U.S. NAVAL RADIO STATION JUST EAST OF SAN DIEGO." MAPPED TO THE PRESUMED LOCATION OF THE HISTORIC CHOLLAS HEIGHTS NAVAL RADIO STATION ROUGHLY 6 MILES EAST OF SAN DIEGO PROPER.

Ecological:

A FRESHWATER POND AND CATTAILS IN ADJACENT CANYONS NOTED IN 1929. MUCH OF THE SURROUNDING AREA HAS BEEN DEVELOPED. CHOLLAS HEIGHTS RESERVOIR STILL A POTENTIAL SOURCE OF WATER.

Threats:

General:

1 FEMALE COLLECTED ON 30 AUG 1929; SENT TO THE O'ROURKE ZOOLOGICAL INSTITUTE OF SAN DIEGO. IT WAS NOTED THAT THIS RAIL WAS LIKELY IN MIGRATION WHEN LOCATED BASED ON ITS DISTANCE FROM MORE LIKELY SUITABLE SALT MARSH HABITAT TO THE WEST.

PLSS: T16S, R02W, Sec. 35 (S)
Accuracy: 3/5 mile
Area (acres): 776
UTM: Zone-11 N3622244 E493957
Latitude/Longitude: 32.738 / -117.0645
Elevation (feet): 434

County Summary:

San Diego

Element Code: ABNME03041
Occurrence Last Updated: 2017-07-27

Scientific Name: *Laterallus jamaicensis coturniculus*
Common Name: California black rail

Listing Status: **Federal:** None
State: Threatened

CNDDB Element Ranks: **Global:** G3G4T1
State: S1

Rare Plant Rank:

Other Lists: BLM_S-Sensitive
CDFW_FP-Fully Protected
IUCN_NT-Near Threatened
NABCI_RWL-Red Watch List
USFWS_BCC-Birds of Conservation Concern

General Habitat:

INHABITS FRESHWATER MARSHES, WET MEADOWS AND SHALLOW MARGINS OF SALTWATER MARSHES BORDERING LARGER BAYS.

Micro Habitat:

NEEDS WATER DEPTHS OF ABOUT 1 INCH THAT DO NOT FLUCTUATE DURING THE YEAR AND DENSE VEGETATION FOR NESTING HABITAT.

Last Date Observed: 1902-11-16
Last Survey Date: 1902-11-16
Owner/Manager: UNKNOWN
Presence: Possibly Extirpated

Occurrence Type: Natural/Native occurrence
Occurrence Rank: None
Trend: Unknown

Location:

ABOUT 0.7 MI W OF I-5 AT HWY 75, 1 MI SE OF HARBOR DR AT MARKET ST, SAN DIEGO.

Detailed Location:

LOCATION DESCRIBED AS "THE RAILROAD TRACK NEAR THE FOOT OF 14TH STREET...AT THIS PLACE THE RAILROAD TRACKS CROSS A TIDE MARSH." MAPPED USING HISTORIC USGS TOPO MAPS FOR SAN DIEGO (1904 AND 1930) NEAR THE S END OF 14TH STREET AT RR TRACK.

Ecological:

MARSH. AREA WHERE RAIL ROAD TRACKS CROSSED THE MARSH BEGAN BEING FILLED CIRCA 1909 AND NOW IS THE TENTH AVENUE MARINE TERMINAL.

Threats:

DEVELOPMENT OF MARSH SINCE 1909.

General:

1 BLACK RAIL CAUGHT BY HAND ON 16 NOV 1902; BIRD WAS CAUGHT AT A RAIL ROAD TRACK CROSSING A TIDE MARSH AT HIGH TIDE. THIS BIRD WAS GIVEN TO F. STEPHENS. EXTIRPATED AS A BREEDER FROM THE SAN DIEGO AREA SINCE ABOUT THE 1950S.

PLSS: T17S, R03W, Sec. 13 (S)
Accuracy: 2/5 mile
Area (acres): 280

Occurrence Number:	27	**Occurrence Last Updated:**	2006-04-05

Scientific Name: *Rallus obsoletus levipes*

Common Name: light-footed Ridgway's rail

Listing Status: **Federal:** Endangered
State: Endangered

CNDDB Element Ranks: **Global:** G3T1T2
State: S1

Rare Plant Rank:

Other Lists: CDFW_FP-Fully Protected
NABCI_RWL-Red Watch List

General Habitat:

FOUND IN SALT MARSHES TRAVERSED BY TIDAL SLOUGHS, WHERE CORDGRASS AND PICKLEWEED ARE THE DOMINANT VEGETATION.

Micro Habitat:

REQUIRES DENSE GROWTH OF EITHER PICKLEWEED OR CORDGRASS FOR NESTING OR ESCAPE COVER; FEEDS ON MOLLUSCS AND CRUSTACEANS.

Last Date Observed:	2005-04-13	**Occurrence Type:**	Natural/Native occurrence
Last Survey Date:	2005-04-13	**Occurrence Rank:**	Fair
Owner/Manager:	UNKNOWN	**Trend:**	Unknown
Presence:	Presumed Extant		

Location:

SWEETWATER RIVER FLOOD CONTROL CHANNEL, S OF THE I-805/HWY 54 INTERCHANGE, NEAR BONITA GOLF COURSE, SWEETWATER VALLEY.

Detailed Location:

1997: EAST OF I-805. 2002: NEAR & EAST OF I-805. 2003: EAST & WEST OF I-805. 2004: PAIR EAST OF I-805. 2005: FEMALE WEST & MALE EAST OF I-805.

Ecological:

HABITAT CONSISTS OF FRESHWATER/BRACKISH MARSH WITHIN THE FLOOD CONTROL CHANNEL (TYPHA, SCIRPUS), WITH SCATTERED CLUSTERS OF SALIX GOODDINGII, SALIX LASIOLEPIS, AND SALIX EXIGUA. DOMINANT EXOTIC PLANT IS TAMARIX SP.

Threats:

THREATENED BY URBANIZATION, VEGETATION SUCCESSION, INVASIVE PLANT SPECIES, VEGETATION/SOIL MOISTURE STRESS.

General:

2-4 CLAPPER RAILS DETECTED MAY-JUNE 1997. 1-2 ADULTS DETECTED ON 29 MAR & 12 APR 2002. 2 MALES ADVERTISING ON 28, 31 MAR, 8, 29 APR & 19 MAY 2003. PAIR OBS 18 MAR & 1 APR 2004. 1 FEMALE & 1 MALE OBS 29 MAR, 5 & 13 APR 2005.

Scientific Name: *Charadrius nivosus nivosus*
Common Name: western snowy plover

Listing Status: **Federal:** Threatened
State: None
Rare Plant Rank:
Other Lists: CDFW_SSC-Species of Special Concern
NABCI_RWL-Red Watch List
USFWS_BCC-Birds of Conservation Concern

CNDDB Element Ranks: **Global:** G3T3
State: S2

General Habitat:

SANDY BEACHES, SALT POND LEVEES & SHORES OF LARGE ALKALI LAKES.

Micro Habitat:

NEEDS SANDY, GRAVELLY OR FRIABLE SOILS FOR NESTING.

Last Date Observed: 2015-09-14
Occurrence Type: Natural/Native occurrence
Last Survey Date: 2015-09-14
Occurrence Rank: Unknown
Owner/Manager: DOD-CORONADO NAVAL AMPH BASE
Trend: Unknown
Presence: Presumed Extant

Location:

FROM ABOUT 0.1 MI NW OF CROWN COVE, NORTH TO DELTA BEACH, NAVAL AMPHIBIOUS BASE CORONADO, SAN DIEGO.

Detailed Location:

"US NAVY'S NAVAL AMPHIBIOUS BASE. WESTERN SNPL BREEDING AREAS INCLUDED ALL BEACH ON THE OCEAN SIDE (NAVAL AMPHIBIOUS BASE NORTH AND SOUTH) AND ONE FENCED BEACH ON THE BAY SIDE (DELTA BEACH SOUTH)."

Ecological:

OPEN SAND BEACH AND DUNES WITH ~30% VEGETATIVE COVER; PRIMARILY IN ICE PLANT (CARPOBROTUS EDULIS), SAND VERBENA (ABRONIA UMBELLATA), SEA ROCKET (CAKILE MARITIMA) AND OTHER NATIVE AND NON-NATIVE DUNE PLANTS.

Threats:

DISTURBANCE FROM MILITARY TRAINING & RECREATION.

General:

BREEDING COLONY OF ABOUT 54 ADULTS AND 140 JUVENILES MONITORED FROM 2 MAR TO 14 SEP 2015. AREA ALSO USED BY WINTERING FLOCKS.

NESTS ALONG THE COAST FROM SAN FRANCISCO BAY SOUTH TO NORTHERN BAJA CALIFORNIA.

Micro Habitat:

COLONIAL BREEDER ON BARE OR SPARSELY VEGETATED, FLAT SUBSTRATES: SAND BEACHES, ALKALI FLATS, LAND FILLS, OR PAVED AREAS.

Last Date Observed:	1988-XX-XX	**Occurrence Type:**	Natural/Native occurrence
Last Survey Date:	1988-XX-XX	**Occurrence Rank:**	Unknown
Owner/Manager:	DOD-NAVAL TRAINING CENTER	**Trend:**	Fluctuating
Presence:	Presumed Extant		

Location:

U.S. NAVAL TRAINING CENTER, JUST WEST OF THE SAN DIEGO INTERNATIONAL AIRPORT.

Detailed Location:

NESTING COLONY IS LOCATED ON A 10-ACRE SITE IN THE NE PORTION OF THE "SOUTH FORTY ACREAGE." PREVIOUSLY, THE TERNS NESTED SOUTH OF THIS LOCATION, JUST OFF HARBOR DRIVE.

Ecological:

NESTING HABITAT CREATED IN 1987 BY PLACING SANDY DREDGE MATERIAL ON THE SITE AND GRADING IT TO SIMULATE SANDY BEACH CONDITIONS. A 6-INCH HIGH CHICK BARRIER WAS INSTALLED AROUND THE SITE TO PREVENT CHICKS FROM ENTERING UNPROTECTED AREAS.

Threats:

THE MAIN THREATS ARE PREDATION BY FERAL CATS AND NATURAL AVIAN PREDATORS.

General:

35-40 PAIRS FLEDGED 25 YOUNG IN 1977; 8-12 PAIRS FLEDGED 5 IN 1978; NO NESTING 1979-1985; 6 PAIRS FLEDGED 6 IN 1986; 11 NESTING PAIRS NOTED IN 1987, BUT NO FLEDGLINGS WERE PRODUCED; IN 1988, ONE PAIR PRODUCED ONE FLEDGLING.

Listing Status: **Federal:** Endangered
State: Endangered
Rare Plant Rank:
Other Lists: CDFW_FP-Fully Protected
NABCI_RWL-Red Watch List

CNDDB Element Ranks: **Global:** G4T2T3Q
State: S2

General Habitat:

NESTS ALONG THE COAST FROM SAN FRANCISCO BAY SOUTH TO NORTHERN BAJA CALIFORNIA.

Micro Habitat:

COLONIAL BREEDER ON BARE OR SPARSELY VEGETATED, FLAT SUBSTRATES: SAND BEACHES, ALKALI FLATS, LAND FILLS, OR PAVED AREAS.

Last Date Observed: 1979-XX-XX
Occurrence Type: Natural/Native occurrence
Last Survey Date: 1979-XX-XX
Occurrence Rank: None
Owner/Manager: PVT
Trend: Unknown
Presence: Extirpated

Location:

CROWN ISLAND (=CROWN ISLE), CORONADO CAYS, SAN DIEGO.

Detailed Location:

MAPPED TO CROWN ISLAND, NOW LOEWS CORONADO BAY RESORT.

Ecological:

CROWN ISLE CREATED FROM FILL ~1978; USED FOR NESTING & POST-BREEDING STAGING AREA; ORIGINAL SITE BELIEVED LOST TO DEVELOPMENT IN 1980.

Threats:

DEVELOPMENT.

General:

IN 1978, 8-10 PAIRS FLEDGED 10 YOUNG. IN 1979, 38-40 PAIRS FLEDGED 7 YOUNG. SITE WAS LOST TO DEVELOPMENT BEFORE THE 1980 BREEDING SEASON.
