CA BOND EXP. PLAN:

Reponsible Party:	RWQCB REFERRAL SITE
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	The Intersil/Siemens site is being proposed for the NPL. The RWQCB will continue to have lead responsibility for monitoring the RPs' remedial activities. Until such time as the RWQCB refers the site to DHS for follow-up using Bond funds, no money will be budgeted from the fund for this site.
Site Description:	A manufacturer of microwave electronic equipment has been in operation at the site since 1963. Manufacturing processes included use of acids and solvents. Contamination at the site appears to be primarily associated with a neutralization sump and a chemical storage shed. The facility is located within the Hillview Porter Region.
Hazardous Waste Desc:	Soil contaminants detected to date include trichloroethene (TCE), dichloroethene (DCE), trichloroethane (TCA) and chlorobenzenes. Ground water contaminants include TCE at 910 parts per billion (ppb), 1,1,-DCE at 92 ppb, chloroform at 100 ppb and Freon at 63 ppb.
Threat To Public Health & Env:	There are seven private wells and a creek downgradient of the site. The maximum level of TCE detected in the creek to date is 18 ppb. There are two backup municipal supply wells within 1 1/2 miles of the site. Inhabitants of the residential area downgradient from the site are potential receptors for ground water and surface water contamination.
Site Activity Status:	Releases of chemicals occurred at both Companies' underground waste handling

INTERSIL/SIEMENS (Continued) **S105960443**

facilities. The data available indicate that the contaminants in the ground water may be moving offsite. Current activities required of Intersil and Siemens were outlined by the RWQCB Waste Discharge Requirements dated June, 1986. They include: 1) installation of onsite interim remediation of VOCs in the soil and Aquifer A; 2) participation in further characterization and remediation of the combined chemical plumes; and 3) evaluation of possible conduits connecting the shallow and deep aquifers. Due to disagreement over the source of contamination in the B Aquifers, Intersil is not cooperating in investigations nor remediation of that contamination. However, the RWQCB has determined that contamination from both sites has migrated to the B and C aquifers.

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: AB 389 Response Plan
Completed Date: 02/24/2014
Comments: The response action selected in the Response Plan is continued operation of the existing soil vapor extraction system that is on the Site. The system was installed as part of a pilot test. The Response Plan established both residential and commercial cleanup goals for tetrachloroethylene in subsurface and sub-slab soil vapor. PCE in soil vapor will be reduced to the extent practicable. A Land Use Covenant will be put in place to restrict any portion of the Site where the residential or unrestricted use cleanup goals are not achieved.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Fact Sheets
Completed Date: 10/03/2011
Comments: Fact sheet informing local community about upcoming pilot testing of a soil vapor extraction (SVE) system at the Cupertino Village Cleaners Site (Site), located at 10989 Wolfe Road in Cupertino, CA, within the Cupertino Village Shopping Center.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pilot Study/Treatability Workplan
Completed Date: 09/23/2011
Comments: SVE Pilot Work Plan approved.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pilot/Treatability Study Report
Completed Date: 05/07/2012
Comments: The Status Report was prepared to document the installation and initial operation of the soil vapor extraction (SVE) pilot system installed at the Site to determine remediation technology appropriateness. The Status Report summarizes the performance of the SVE system during the initial three months of operation.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported

CUPERTINO VILLAGE CLEANERS (Continued) **S108054446**

Completed Document Type: Well Installation Workplan
Completed Date: 04/12/2013
Comments: Work Plan outlines procedures for the installation of soil vapor monitoring probes at the Former Cupertino Village Cleaners, located at 10989 North Wolfe Road, Cupertino, California.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Public Notice
Completed Date: 12/26/2013
Comments: The public notice announces the public comment period for the Draft Response Plan, which runs from January 6, 2014 through February 5, 2014. The Draft Response Plan proposes the continued operation of the pilot test soil vapor extraction system as the final response action for the Site. The public notice is scheduled to run in the Cupertino Courier on January 3, 2014.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pilot/Treatability Study Report
Completed Date: 03/03/2014
Comments: The report documents the implementation of the Soil Vapor Extraction (SVE) System Pilot Test Work Plan, and describes the SVE system design and installation, describes the startup monitoring results, describes the pilot testing procedures, and presents the results and conclusions of the pilot testing program . DTSC agreed in its approval letter that soil vapor extraction is a feasible technology for the Site and directed that it be the remedy proposed in a Draft Response Plan.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 09/22/2014
Comments: The Report summarizes the interim results of rebound testing being implemented to determine if the operation of the soil vapor extraction (SVE) system from November 2011 to March 2014 effectively remediated the subsurface volatile organic compound (VOC) contamination. The rebound test sampling results showed a generally increasing concentration trend for tetrachloroethylene across the Site, but soil gas concentrations continued to be below the site-specific commercial cleanup goals. The increasing VOC concentrations indicated that equilibrium has not been reached and rebound testing is to continue. The SVE system may need to be restarted if an increasing concentration trend is observed during the next sampling event.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 09/03/2015
Comments: Report summarizes the results of rebound testing performed during shutdown of the soil vapor extraction (SVE) system according to 2014 Response Plan for the former Cupertino Village Cleaners Site located at 10989 North Wolfe Road, Cupertino, California.

Completed Area Name: PROJECT WIDE

CUPERTINO VILLAGE CLEANERS (Continued) **S108054446**

Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Implementation Workplan
Completed Date: 04/26/2016
Comments: Cupertino Village LP plans to restart the soil vapor extraction (SVE) system due to high concentrations of tetrachloroethylene in soil gas after rebound testing. The Work Plan describes the procedures to reconnect and restart the SVE system; the operation, maintenance, and monitoring of the SVE system; and the rebound testing and reporting of results. The SVE system will operate for three months and system monitor will occur monthly. Following 3 months of SVE system operation, the system will be shut down for rebound testing with soil gas sampling at 1, 2, and 3 month intervals.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 05/13/2019
Comments: The Report documents the implementation of the Soil Vapor Extraction System Restart Work Plan; and summarizes results of 18-months of soil vapor extraction (SVE) "pulse" operation and maintenance, including soil vapor monitoring and statistical analysis of analytical results since restart of the SVE system in 2017. DTSC concurred with the Report’s recommendation to continue operation of the SVE system on a "pulse" operation mode for an additional six months, with soil vapor sampling on a bimonthly frequency basis, from January 2019 through July 2019.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 04/29/2021
Comments: Soil Vapor Extraction Extended Pulse Operation Report (Report) summarizes results of sampling and analysis of a soil vapor extraction treatment system installed at the Former Cupertino Village Cleaners site, between January 2019 and December 2020. Report recommends continuing the approved rebound test program in accordance with the March 14, 2014 Reponses Action Plan, the April 11, 2016 Soil Vapor Extraction System Restart Work Plan and the requirement set forth by the Department of Toxic Substances Control (DTSC) on December 9, 2020 regarding the November 16, 2020 Cupertino Village Cleaners Extended Pulse SVE operation Interim Data Submittal

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Technical Report
Completed Date: 12/09/2020
Comments: DTSC concurs with Cupertino Village Cleaners recommendations to shutting down the soil vapor extraction (SVE) system and initiating a rebound assessment in accordance with the approved Soil Vapor Extraction System Restart Work Plan (Northgate, 2016), and recommendations provided in the DTSC s Proven Technologies and Remedies Guidance - Remediation of Chlorinated Volatile Organic Compounds in Vadose Zone Soil (DTSC, 2010). The purpose of the rebound assessment is to evaluate whether the Cupertino Village Cleaners site s soil gas remedial action objectives (RAOs) have been achieved.

CUPERTINO VILLAGE CLEANERS (Continued) **S108054446**

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 02/05/2021
Comments: The Technical Memorandum discuss the presence of tetrahydrofuran (THF) in soil vapor samples collected from soil vapor monitoring points and its association with the soil vapor extraction (SVE) system s polyvinyl chloride (PVC) piping off-gassing or a potential subsurface source at the Site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Technical Report
Completed Date: 12/08/2020
Comments: The Technical Memorandum summarizes the accessibility and current condition of existing soil vapor monitoring points (SMPs) at the Site. DTSC concurs with the Technical Memorandum s recommendations of inclusion of SMPs VMW-1A and VMP-1AA as part of the Cupertino Village soil vapor extraction rebound testing program.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Plan
Completed Date: 12/08/2021
Comments: The Revised Final Work Plan provides the sampling methodology of indoor air quality (IAQ) sampling activities to be conducted at two commercial buildings (Buildings) located in the vicinity of the Site. One building is currently occupied by the 99 Ranch Market and the other by Good Samaritan United Methodist Church and associated Pre-School (Church Facility).

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: AB 389 Response Plan
Completed Date: 02/24/2014
Comments: The response action selected in the Response Plan is continued operation of the existing soil vapor extraction system that is on the Site. The system was installed as part of a pilot test. The Response Plan established both residential and commercial cleanup goals for tetrachloroethylene in subsurface and sub-slab soil vapor. PCE in soil vapor will be reduced to the extent practicable. A Land Use Covenant will be put in place to restrict any portion of the Site where the residential or unrestricted use cleanup goals are not achieved.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Fact Sheets
Completed Date: 10/03/2011
Comments: Fact sheet informing local community about upcoming pilot testing of a soil vapor extraction (SVE) system at the Cupertino Village Cleaners Site (Site), located at 10989 Wolfe Road in Cupertino, CA, within the Cupertino Village Shopping Center.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pilot Study/Treatability Workplan
Completed Date: 09/23/2011
Comments: SVE Pilot Work Plan approved.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pilot/Treatability Study Report
Completed Date: 05/07/2012
Comments: The Status Report was prepared to document the installation and initial operation of the soil vapor extraction (SVE) pilot system installed at the Site to determine remediation technology appropriateness. The Status Report summarizes the performance of the SVE system during the initial three months of operation.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported

CUPERTINO VILLAGE CLEANERS (Continued) **S108054446**

Completed Document Type: Well Installation Workplan
Completed Date: 04/12/2013
Comments: Work Plan outlines procedures for the installation of soil vapor monitoring probes at the Former Cupertino Village Cleaners, located at 10989 North Wolfe Road, Cupertino, California.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Public Notice
Completed Date: 12/26/2013
Comments: The public notice announces the public comment period for the Draft Response Plan, which runs from January 6, 2014 through February 5, 2014. The Draft Response Plan proposes the continued operation of the pilot test soil vapor extraction system as the final response action for the Site. The public notice is scheduled to run in the Cupertino Courier on January 3, 2014.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Pilot/Treatability Study Report
Completed Date: 03/03/2014
Comments: The report documents the implementation of the Soil Vapor Extraction (SVE) System Pilot Test Work Plan, and describes the SVE system design and installation, describes the startup monitoring results, describes the pilot testing procedures, and presents the results and conclusions of the pilot testing program . DTSC agreed in its approval letter that soil vapor extraction is a feasible technology for the Site and directed that it be the remedy proposed in a Draft Response Plan.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 09/22/2014
Comments: The Report summarizes the interim results of rebound testing being implemented to determine if the operation of the soil vapor extraction (SVE) system from November 2011 to March 2014 effectively remediated the subsurface volatile organic compound (VOC) contamination. The rebound test sampling results showed a generally increasing concentration trend for tetrachloroethylene across the Site, but soil gas concentrations continued to be below the site-specific commercial cleanup goals. The increasing VOC concentrations indicated that equilibrium has not been reached and rebound testing is to continue. The SVE system may need to be restarted if an increasing concentration trend is observed during the next sampling event.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 09/03/2015
Comments: Report summarizes the results of rebound testing performed during shutdown of the soil vapor extraction (SVE) system according to 2014 Response Plan for the former Cupertino Village Cleaners Site located at 10989 North Wolfe Road, Cupertino, California.

Completed Area Name: PROJECT WIDE

CUPERTINO VILLAGE CLEANERS (Continued) **S108054446**

Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Implementation Workplan
Completed Date: 04/26/2016
Comments: Cupertino Village LP plans to restart the soil vapor extraction (SVE) system due to high concentrations of tetrachloroethylene in soil gas after rebound testing. The Work Plan describes the procedures to reconnect and restart the SVE system; the operation, maintenance, and monitoring of the SVE system; and the rebound testing and reporting of results. The SVE system will operate for three months and system monitor will occur monthly. Following 3 months of SVE system operation, the system will be shut down for rebound testing with soil gas sampling at 1, 2, and 3 month intervals.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 05/13/2019
Comments: The Report documents the implementation of the Soil Vapor Extraction System Restart Work Plan; and summarizes results of 18-months of soil vapor extraction (SVE) "pulse" operation and maintenance, including soil vapor monitoring and statistical analysis of analytical results since restart of the SVE system in 2017. DTSC concurred with the Report's recommendation to continue operation of the SVE system on a "pulse" operation mode for an additional six months, with soil vapor sampling on a bimonthly frequency basis, from January 2019 through July 2019.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 04/29/2021
Comments: Soil Vapor Extraction Extended Pulse Operation Report (Report) summarizes results of sampling and analysis of a soil vapor extraction treatment system installed at the Former Cupertino Village Cleaners site, between January 2019 and December 2020. Report recommends continuing the approved rebound test program in accordance with the March 14, 2014 Reponses Action Plan, the April 11, 2016 Soil Vapor Extraction System Restart Work Plan and the requirement set forth by the Department of Toxic Substances Control (DTSC) on December 9, 2020 regarding the November 16, 2020 Cupertino Village Cleaners Extended Pulse SVE operation Interim Data Submittal

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Technical Report
Completed Date: 12/09/2020
Comments: DTSC concurs with Cupertino Village Cleaners recommendations to shutting down the soil vapor extraction (SVE) system and initiating a rebound assessment in accordance with the approved Soil Vapor Extraction System Restart Work Plan (Northgate, 2016), and recommendations provided in the DTSC s Proven Technologies and Remedies Guidance - Remediation of Chlorinated Volatile Organic Compounds in Vadose Zone Soil (DTSC, 2010). The purpose of the rebound assessment is to evaluate whether the Cupertino Village Cleaners site s soil gas remedial action objectives (RAOs) have been achieved.

CUPERTINO VILLAGE CLEANERS (Continued) **S108054446**

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 02/05/2021
Comments: The Technical Memorandum discuss the presence of tetrahydrofuran (THF) in soil vapor samples collected from soil vapor monitoring points and its association with the soil vapor extraction (SVE) system s polyvinyl chloride (PVC) piping off-gassing or a potential subsurface source at the Site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Technical Report
Completed Date: 12/08/2020
Comments: The Technical Memorandum summarizes the accessibility and current condition of existing soil vapor monitoring points (SMPs) at the Site. DTSC concurs with the Technical Memorandum s recommendations of inclusion of SMPs VMW-1A and VMP-1AA as part of the Cupertino Village soil vapor extraction rebound testing program.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Plan
Completed Date: 12/08/2021
Comments: The Revised Final Work Plan provides the sampling methodology of indoor air quality (IAQ) sampling activities to be conducted at two commercial buildings (Buildings) located in the vicinity of the Site. One building is currently occupied by the 99 Ranch Market and the other by Good Samaritan United Methodist Church and associated Pre-School (Church Facility).

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 01/25/2022

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 02/28/2022
Date Data Arrived at EDR: 03/02/2022
Date Made Active in Reports: 03/17/2022
Number of Days to Update: 15

Data Release Frequency: Quarterly

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 02/28/2022

Data Release Frequency: Quarterly

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners
EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 11/11/2021

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

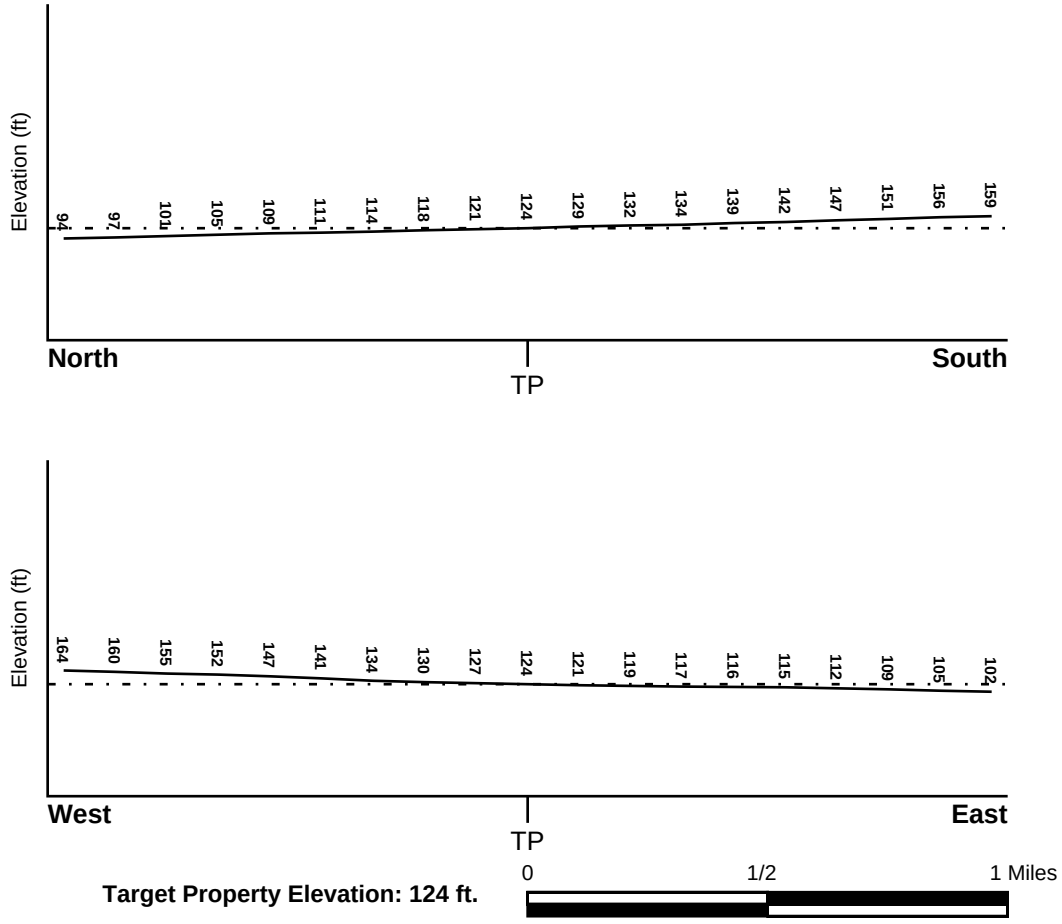
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06085C0207H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06085C0226H	FEMA FIRM Flood data
06085C0209H	FEMA FIRM Flood data
06085C0228H	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CUPERTINO	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/2 - 1 Mile South
Site Name:	Siemens Component
Site EPA ID Number:	CAD980884217
Groundwater Flow Direction:	NOT AVAILABLE.
Inferred Depth to Water:	75 feet.
Hydraulic Connection:	The surficial and lower aquifers are hydraulically connected.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information is inferred in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	BOTELLA
Soil Surface Texture:	clay loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	MODERATE
Depth to Bedrock Min:	> 60 inches
Depth to Bedrock Max:	> 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	9 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.30 Min: 5.60
2	9 inches	41 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60
3	41 inches	76 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: No Other Soil Types

Surficial Soil Types: No Other Soil Types

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: No Other Soil Types

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon
Source: Department of Public Health
Telephone: 916-210-8558
Radon Database for California

PHYSICAL SETTING SOURCE RECORDS SEARCHED

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by ARCADIS U.S., Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

k. Any rights of the parties in possession of a portion of, or all of, said Land, which rights are not disclosed by the public records.

The Company will require, for review, a full and complete copy of any unrecorded agreement, contract, license and/or lease, together with all supplements, assignments and amendments thereto, before issuing any policy of title insurance without excepting this item from coverage.

The Company reserves the right to except additional items and/or make additional requirements after reviewing said documents.

l. Any easements not disclosed by the public records as to matters affecting title to real property, whether or not said easements are visible and apparent.

m. Matters which may be disclosed by an inspection and/or by a correct ALTA/ACSM Land Title Survey of said Land that is satisfactory to the Company, and/or by inquiry of the parties in possession thereof.

n. The Company will require the following documents for review prior to the issuance of any title insurance predicated upon a conveyance or encumbrance by the corporation named below.

Name of Corporation: Santa Clara Union High School District of Santa Clara County

a. A Copy of the corporation By-laws and Articles of Incorporation.

b. An original or certified copy of a resolution authorizing the transaction contemplated herein.

c. If the Articles and/or By-laws require approval by a ‘parent’ organization, a copy of the Articles and By-laws of the parent.

The Company reserves the right to add additional items or make further requirements after review of the requested documentation.

SCHEDULE B
(continued)

o. The Company will require the following documents for review prior to the issuance of any title insurance predicated upon a conveyance or encumbrance by the corporation named below.

Name of Corporation: Jefferson Union School District of Santa Clara County

a. A Copy of the corporation By-laws and Articles of Incorporation.

b. An original or certified copy of a resolution authorizing the transaction contemplated herein.

c. If the Articles and/or By-laws require approval by a 'parent' organization, a copy of the Articles and By-laws of the parent.

The Company reserves the right to add additional items or make further requirements after review of the requested documentation.

p. Please be advised that our search did not disclose any open Deeds of Trust of record. If you should have knowledge of any outstanding obligation, please contact the Title Department immediately for further review prior to closing.

4. THE FOLLOWING MATTERS ARE DISCLOSED BY NAME ONLY AND THE COMPANY, WITHOUT ADDITIONAL INFORMATION, IS UNABLE TO DETERMINE WHETHER ANY OR ALL OF THESE MATTERS ARE DEFECTS, LIENS OR ENCUMBRANCES AGAINST THE INTEREST:

a. None

END OF SCHEDULE B

EXCLUSIONS FROM COVERAGE

Except as expressly provided by the assurances in Schedule A, the Company assumes no liability for loss or damage by reason of the following:

(a) Defects, liens, encumbrances, adverse claims or other matters affecting the title to any property beyond the lines of the Land.

(b) Defects, liens, encumbrances, adverse claims or other matters, whether or not shown by the Public Records (1) that are created, suffered, assumed or agreed to by one or more of the Assureds; or (2) that result in no loss to the Assured.

(c) Defects, liens, encumbrances, adverse claims or other matters not shown by the Public Records.

(d) The identity of any party shown or referred to in any of the schedules of this Guarantee.

(e) The validity, legal effect or priority of any matter shown or referred to in any of the schedules of this Guarantee.

(f) (1) Taxes or assessments of any taxing authority that levies taxes or assessments on real property; or (2) proceedings by a public agency which may result in taxes or assessments, or notices of such proceedings, whether or not the matters excluded under (1) or (2) are shown by the records of the taxing authority or by the Public Records.

(g) (1) Unpatented mining claims; (2) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (3) water rights, claims or title to water, whether or not the matters excluded under (1), (2) or (3) are shown by the Public Records.

GUARANTEE CONDITIONS

1. DEFINITION OF TERMS

The following terms when used in the Guarantee mean:

(a) the "Assured": the party or parties named as the Assured in Schedule A, or on a supplemental writing executed by the Company.

(b) "Land": the Land described or referred to in Schedule A, and improvements affixed thereto which by law constitute real property. The term "Land" does not include any property beyond the lines of the area described or referred to in Schedule A, nor any right, title, interest, estate or easement in abutting streets, roads, avenues, alleys, lanes, ways or waterways.

(c) "Mortgage": mortgage, deed of trust, trust deed, or other security instrument.

(d) "Public Records": those records established under California statutes at Date of Guarantee for the purpose of imparting constructive notice of matters relating to real property to purchasers for value and without knowledge.

(e) "Date of Guarantee": the Date of Guarantee set forth in Schedule A.

(f) "Amount of Liability": the Amount of Liability as stated in Schedule A.

2. NOTICE OF CLAIM TO BE GIVEN BY ASSURED

The Assured shall notify the Company promptly in writing in case knowledge shall come to the Assured of any assertion of facts, or claim of title or interest that is contrary to the assurances set forth in Schedule A and that might cause loss or damage for which the Company may be liable under this Guarantee. If prompt notice shall not be given to the Company, then all liability of the Company shall terminate with regard to the matter or matters for which prompt notice is required; provided, however, that failure to notify the Company shall in no case prejudice the rights of the Assured under this Guarantee unless the Company shall be prejudiced by the failure and then only to the extent of the prejudice.

3. NO DUTY TO DEFEND OR PROSECUTE

The Company shall have no duty to defend or prosecute any action or proceeding to which the Assured is a party, notwithstanding the nature of any allegation in such action or proceeding.

4. COMPANY'S OPTION TO DEFEND OR PROSECUTE ACTIONS; DUTY OF ASSURED TO COOPERATE

Even though the Company has no duty to defend or prosecute as set forth in Paragraph 3 above:

(a) The Company shall have the right, at its sole option and cost, to institute and prosecute any action or proceeding, interpose a defense, as limited in Paragraph 4 (b), or to do any other act which in its opinion may be necessary or desirable to establish the correctness of the assurances set forth in Schedule A or to prevent or reduce loss or damage to the Assured. The Company may take any appropriate action under the terms of this Guarantee, whether or not it shall be liable hereunder, and shall not thereby concede liability or waive any provision of this Guarantee. If the Company shall exercise its rights under this paragraph, it shall do so diligently.

(b) If the Company elects to exercise its options as stated in Paragraph 4 (a) the Company shall have the right to select counsel of its choice (subject to the right of the Assured to object for reasonable cause) to represent the Assured and shall not be liable for and will not pay the fees of any other counsel, nor will the Company pay any fees, costs or expenses incurred by an Assured in the defense of those causes of action which allege matters not covered by this Guarantee.

(c) Whenever the Company shall have brought an action or interposed a defense as permitted by the provisions of this Guarantee, the Company may pursue any litigation to final determination by a court of competent jurisdiction and expressly reserves the right, in its sole discretion, to appeal from an adverse judgment or order.

(d) In all cases where this Guarantee permits the Company to prosecute or provide for the defense of any action or proceeding, the Assured shall secure to the Company the right to so prosecute or provide for the defense of any action or proceeding, and all appeals therein, and permit the Company to use, at its option, the name of the Assured for this purpose. Whenever requested by the Company, the Assured, at the Company's expense, shall give the Company all reasonable aid in any action or proceeding, securing evidence, obtaining witnesses, prosecuting or defending the action or lawful act which in the opinion of the Company may be necessary or desirable to establish the correctness of the assurances set forth in Schedule A or to prevent or reduce loss or damage to the Assured. If the Company is prejudiced by the failure of the Assured to furnish the required cooperation, the Company's obligations to the Assured under the Guarantee shall terminate.

(continued)

5. PROOF OF LOSS OR DAMAGE

(a) In the event the Company is unable to determine the amount of loss or damage, the Company may, at its option, require as a condition of payment that the Assured furnish a signed proof of loss. The proof of loss must describe the defect, lien, encumbrance, or other matter that constitutes the basis of loss or damage and shall state, to the extent possible, the basis of calculating the amount of the loss or damage.

(b) In addition, the Assured may reasonably be required to submit to examination under oath by any authorized representative of the Company and shall produce for examination, inspection and copying, at such reasonable times and places as may be designated by any authorized representative of the Company, all records, books, ledgers, checks, correspondence and memoranda, whether bearing a date before or after Date of Guarantee, which reasonably pertain to the loss or damage. Further, if requested by any authorized representative of the Company, the Assured shall grant its permission, in writing, for any authorized representative of the Company to examine, inspect and copy all records, books, ledgers, checks, correspondence and memoranda in the custody or control of a third party, which reasonably pertain to the loss or damage. All information designated as confidential by the Assured provided to the Company pursuant to this paragraph shall not be disclosed to others unless, in the reasonable judgment of the Company, it is necessary in the administration of the claim. Failure of the Assured to submit for examination under oath, produce other reasonably requested information or grant permission to secure reasonably necessary information from third parties as required in the above paragraph, unless prohibited by law or governmental regulation, shall terminate any liability of the Company under this Guarantee to the Assured for that claim.

6. OPTIONS TO PAY OR OTHERWISE SETTLE CLAIMS: TERMINATION OF LIABILITY

In case of a claim under this Guarantee, the Company shall have the following additional options:

(a) To pay or tender payment of the Amount of Liability together with any costs, attorneys' fees, and expenses incurred by the Assured that were authorized by the Company up to the time of payment or tender of payment and that the Company is obligated to pay.

(b) To pay or otherwise settle with the Assured any claim assured against under this Guarantee. In addition, the Company will pay any costs, attorneys' fees, and expenses incurred by the Assured that were authorized by the Company up to the time of payment or tender of payment and that the Company is obligated to pay; or

(c) To pay or otherwise settle with other parties for the loss or damage provided for under this Guarantee, together with any costs, attorneys' fees, and expenses incurred by the Assured that were authorized by the Company up to the time of payment and that the Company is obligated to pay.

Upon the exercise by the Company of either of the options provided for in 6 (a), (b) or (c) of this paragraph the Company's obligations to the Assured under this Guarantee for the claimed loss or damage, other than the payments required to be made, shall terminate, including any duty to continue any and all litigation initiated by the Company pursuant to Paragraph 4.

7. LIMITATION OF LIABILITY

(a) This Guarantee is a contract of Indemnity against actual monetary loss or damage sustained or incurred by the Assured claimant who has suffered loss or damage by reason of reliance upon the assurances set forth in Schedule A and only to the extent herein described, and subject to the Exclusions From Coverage of this Guarantee.

(b) If the Company, or the Assured under the direction of the Company at the Company's expense, removes the alleged defect, lien, or encumbrance or cures any other matter assured against by this Guarantee in a reasonably diligent manner by any method, including litigation and the completion of any appeals therefrom, it shall have fully performed its obligations with respect to that matter and shall not be liable for any loss or damage caused thereby.

(c) In the event of any litigation by the Company or with the Company's consent, the Company shall have no liability for loss or damage until there has been a final determination by a court of competent jurisdiction, and disposition of all appeals therefrom.

(d) The Company shall not be liable for loss or damage to the Assured for liability voluntarily assumed by the Assured in settling any claim or suit without the prior written consent of the Company.

8. REDUCTION OF LIABILITY OR TERMINATION OF LIABILITY

All payments under this Guarantee, except payments made for costs, attorneys' fees and expenses pursuant to Paragraph 4 shall reduce the Amount of Liability under this Guarantee pro tanto.

9. PAYMENT OF LOSS

(a) No payment shall be made without producing this Guarantee for endorsement of the payment unless the Guarantee has been lost or destroyed, in which case proof of loss or destruction shall be furnished to the satisfaction of the Company.

(b) When liability and the extent of loss or damage has been definitely fixed in accordance with these Conditions, the loss or damage shall be payable within thirty (30) days thereafter.

10. SUBROGATION UPON PAYMENT OR SETTLEMENT

Whenever the Company shall have settled and paid a claim under this Guarantee, all right of subrogation shall vest in the Company unaffected by any act of the Assured claimant.

The Company shall be subrogated to and be entitled to all rights and remedies which the Assured would have had against any person or property in respect to the claim had this Guarantee not been issued. If requested by the Company, the Assured shall transfer to the Company all rights and remedies against any person or property necessary in order to perfect this right of subrogation. The Assured shall permit the Company to sue, compromise or settle in the name of the Assured and to use the name of the Assured in any transaction or litigation involving these rights or remedies.

If a payment on account of a claim does not fully cover the loss of the Assured the Company shall be subrogated to all rights and remedies of the Assured after the Assured shall have recovered its principal, interest, and costs of collection.

(continued)

11. ARBITRATION

Either the Company or the Assured may demand that the claim or controversy shall be submitted to arbitration pursuant to the Title Insurance Arbitration Rules of the American Land Title Association ("Rules"). Except as provided in the Rules, there shall be no joinder or consolidation with claims or controversies of other persons. Arbitrable matters may include, but are not limited to, any controversy or claim between the Company and the Assured arising out of or relating to this Guarantee, any service of the Company in connection with its issuance or the breach of a Guarantee provision, or to any other controversy or claim arising out of the transaction giving rise to this Guarantee. All arbitrable matters when the amount of liability is Two Million And No/100 Dollars ($2,000,000) or less shall be arbitrated at the option of either the Company or the Assured. All arbitrable matters when the amount of liability is in excess of Two Million And No/100 Dollars ($2,000,000) shall be arbitrated only when agreed to by both the Company and the Assured. Arbitration pursuant to this Guarantee and under the Rules shall be binding upon the parties. Judgment upon the award rendered by the Arbitrator(s) may be entered in any court of competent jurisdiction.

12. LIABILITY LIMITED TO THIS GUARANTEE; GUARANTEE ENTIRE CONTRACT

(a) This Guarantee together with all endorsements, if any, attached hereto by the Company is the entire Guarantee and contract between the Assured and the Company. In interpreting any provision of this Guarantee, this Guarantee shall be construed as a whole.

(b) Any claim of loss or damage, whether or not based on negligence, or any action asserting such claim, shall be restricted to this Guarantee.

(c) No amendment of or endorsement to this Guarantee can be made except by a writing endorsed hereon or attached hereto signed by either the President, a Vice President, the Secretary, an Assistant Secretary, or validating officer or authorized signatory of the Company.

13. SEVERABILITY

In the event any provision of this Guarantee, in whole or in part, is held invalid or unenforceable under applicable law, the Guarantee shall be deemed not to include that provision or such part held to be invalid, but all other provisions shall remain in full force and effect.

14. CHOICE OF LAW; FORUM

(a) Choice of Law: The Assured acknowledges the Company has underwritten the risks covered by this Guarantee and determined the premium charged therefor in reliance upon the law affecting interests in real property and applicable to the interpretation, rights, remedies, or enforcement of Guaranties of the jurisdiction where the Land is located.

Therefore, the court or an arbitrator shall apply the law of the jurisdiction where the Land is located to determine the validity of claims that are adverse to the Assured and to interpret and enforce the terms of this Guarantee. In neither case shall the court or arbitrator apply its conflicts of law principles to determine the applicable law.

(b) Choice of Forum: Any litigation or other proceeding brought by the Assured against the Company must be filed only in a state or federal court within the United States of America or its territories having appropriate jurisdiction.

15. NOTICES, WHERE SENT

All notices required to be given the Company and any statement in writing required to be furnished the Company shall include the number of this Guarantee and shall be addressed to the Company at:

Fidelity National Title Insurance Company
P.O. Box 45023
Jacksonville, FL 32232-5023

TRACT Nº 622

I. & R. CASTELLO TRACT

UNIT Nº 1

BEING A PORTION OF THE QUITO RANCHO
SANTA CLARA COUNTY, CALIFORNIA. MARCH. 1949
SURVEYED BY FRANK E. PISANO - CIVIL ENGINEER
SCALE — 1 IN. = 100 FT.

OWNERS CERTIFICATE

This is to certify that we are the owners of or have some right, title, or interest in and to the real property included within the subdivison shown upon this map within the blue border, and that we are the only persons whose consent is necessary to pass a clear title to said real property, and we consent to the making of said map and subdivison; and we hereby dedicate to public use all the avenues, ways, roads and alleys shown upon said map within said subdivison. We also hereby dedicate for the use of public utilities an easement over those certain strips of land designated on said map as "Reserved for Public Utilities", we hereby dedicate for public use those certain strips of land designated as "Reserved for future public road, being 1 foot in width across the end of Ham Ave, Rosalia Ave, Bryant Way and public Alley, reserved exclusively for the owners of Lots in said subdivision, until an additional strip of land adjoining it for the extension of said avenues etc. is accepted by the Board of Supervisors of the County of Santa Clara.

Ignazio Castello — Signature
Rosolia Castello — Signature

State of California } S.S.
County of Santa Clara }

On this 29th day of APRIL 1949 before me JAMES V. SERGI, a Notary Public in and for the County of Santa Clara, State of California, residing therein duly commissioned and sworn, personally appeared Ignazio Castello and Rosolia Castello, known to me to be the persons that executed the within instrument, and acknowledged to me that they executed the same.

In witness whereof, I have hereunto set my hand and affixed my official seal, the day and year in this certificate first above written.

James V. Sergi
Notary Public in and for the County of Santa Clara, State of California.

CERTIFICATE OF ENGINEER

I hereby certify that I am a Registered Civil Engineer, that this map, consisting of one sheet, correctly represents a survey made by me in March, 1949; that the survey is true and complete as shown; that all stakes, pipes and monuments are of the character and occupy the positions indicated, and are sufficient to enable the survey to be re-traced.

Frank E. Pisano
Registered Civil Engineer Nº 6296

BASIS OF BEARING AND NOTES:

The bearing of the El Camino Real or State Highway, Route 5-A. was taken as the basis of bearings shown upon this map.

The blue border indicates the boundary of the subdivision as shown hereon

All distances are shown in feet and decimals thereof.

I.P. indicates iron pipe as set

2"x3" Redwood stakes set at all lot corners, and curve extremities, unless otherwise shown.

CERTIFICATE OF CLERK OF BOARD OF SUPERVISORS

It is hereby ordered that the map of Tract Nº 622 Castello Tract, Unit Nº 1, be and the same is hereby approved; that all the streets, lanes, alleys, roads and other parcels of land shown on said map and therein offered for dedication be and the same are Not hereby accepted for the purposes for which the same are offered for dedication.

The Clerk of this Board is directed to endorse upon the face of said map a copy of this order authenticated by the seal of the Board of Supervisiors at a meeting of said Board held May 9, ——1949.

Albert J. Newlin, County Clerk and Ex-Officio Clerk of the Board of Supervisors of the County of Santa Clara, State of California.

By Richard Olson
Deputy

CERTIFICATE OF COUNTY SURVEYOR

This is to certify that I have examined the final map of Tract Nº 622, I & R. Castello Tract, Unit Nº 1, and that the subdivison as shown thereon is substantially the same as it appeared on the tentative map thereof with any approved alterations; that all provisions of the 1937 Map Act and any local ordinances applicable at the time of approval of the tentative map, have been complied with; and that I am satisfied that said map is technically correct. Robert B. Chandler, County Surveyor of Santa Clara County, California.

By this instrument dated March 1, 1960, for a valuable consideration,

FRANK L. TERESI and PEARL TERESI, his wife,
SALVATORE TERESI, JR. and PAULINE TERESI, his wife,

hereby GRANTS to JEFFERSON UNION SCHOOL DISTRICT of Santa Clara County

The following described Real Property in the State of California, County of Santa Clara,

A parcel of land situate in the City of Sunnyvale, County of Santa Clara, State of California, being more particularly described as follows:

BEGINNING at a point in the Westerly line of that certain 79.01 acre parcel conveyed by Arguello to England by Deed recorded in Book 17 of Deeds at page 22, Santa Clara County Records, said Westerly line also being the Easterly line of that certain 75.04 acre tract conveyed to Wilcox by Deed recorded in Book 50 of Deeds at page 445, Santa Clara County Records, said point being the Westerly corner common to the 20.00 acre tract conveyed to Hayslip by Deed recorded in Book 218 of Deeds at page 62 and that certain 21.741 acre tract conveyed to Williams, et al., by Deed recorded in Book 441 of Deeds at page 345, Santa Clara County Records; thence from said point of beginning North 89° 37' 50" East 918.00 feet along the line dividing said 20.00 acre and said 21.741 acre tracts to a point; thence North 0° 32' 40" West 566.97 feet to the Northerly boundary of said 20.00 acre tract; thence along said Northerly boundary South 89° 37' 33" West 777.46 feet to a 1-1/2 inch iron pipe found in a Northwesterly corner thereof; thence along a Westerly boundary of said 20.00 acre parcel South 0° 02' 35" East 31.95 feet to an angle point therein; thence along a Northerly boundary of said parcel South 89° 57' 25" West 139.58 feet to a redwood stake set in the Easterly boundary of the hereinabove mentioned 75.04 acre tract and the Westerly boundary of said 20.00 acre parcel; thence along said Westerly boundary South 0° 02' 35" East 535.74 feet to the point of beginning, containing 11.817 acres and being a portion of the Quito Rancho.

Reserving and excepting therefrom an easement ten feet in width for the purpose of installation, maintenance and repair of an irrigation pipe line under, on or over that certain parcel of land situate in the City of Sunnyvale, County of Santa Clara, State of California, the Northerly and Easterly lines of said easement being more particularly described as follows:

BEGINNING at the Southwesterly corner of that certain 7.95 acre parcel conveyed by Albert E. Buhot, et ux, to Frank L. Teresi, et al, by Deed recorded in Book 1196 at page 407, Santa Clara County Official Records, said Southwesterly corner being in the Northerly line of that certain 20.00 acre tract conveyed to Hayslip by Deed recorded in Book 218 of Deeds at page 62, Santa Clara County Records; thence from said point of beginning along the line dividing said 20.00 acre tract and said 7.95 acre parcel North 89° 37' 33" East 212.88 feet; thence leaving said dividing line South 0° 32' 40" East 566.97 feet to the Southerly line of said 20.00 acre tract.

Said easement to remain in existence for so long as a water supply is necessary for the agricultural use and development of the remaining property of the grantors, and which said easement shall expire ipso facto without further action at such time as subdivision or other development of the grantor's remaining property changes its use from that of agriculture to some other use.

****

$7.00 U. S. INT. REV. STAMP CANCELLED

THIS INDENTURE, Made the 28th day of April, in the year of our Lord, nineteen hundred and sixteen, Between Mrs. C. E. Mallette, also called Mary A. Mallette, and C. E. Mallette, her husband, J. B. Johnson and Catherine Johnson, his wife, Mrs. Richard Atherton, also called Kittie L. Atherton, and Richard Atherton, her husband, Chas. W. Johnson and Pearl Johnson, his wife, Cora A. Johnson, W. R. Johnson and Eliza C. Johnson, his wife, the parties of the first part, and Elizabeth E. Williams and Edward A. Williams, of the County of Santa Clara, State of California, the parties of the second part;

WITNESSETH, That the said parties of the first part, for and in consideration of the sum of Ten Dollars Gold Coin of the United States of America, to them in hand paid by the said parties of the second part, the receipt whereof is hereby acknowledged, do by these presents grant, bargain, sell, convey and confirm unto the said

parties of the second part, and to their heirs and assigns forever all that certain lot, piece or parcel of land, situate, lying and being in the County of Santa Clara, State of California, and bounded and particularly described as follows, to-wit:

Beginning at a point in the Northerly line of a private roadway 19 feet wide running Westerly from the Saratoga and Alviso Road, said point of beginning being 20 feet North of the Southerly line of a tract of 79.10 acres conveyed by S. O. De Arguello et al to Beverly A. England by deed dated February 23, 1867, and recorded same day in Liber X of Deeds at page 206, et seq., in the office of the County Recorder of said Santa Clara County, California, and North 87° 48' West 1287.3 feet from the center line of the said Saratoga and Alviso Road, said point of beginning being also the South Westerly corner of the 10.23 acre tract of land conveyed by W. R. Johnson and wife to J. B. Johnson by deed dated March 17, 1916, and recorded same date in Liber 442 of Deeds, page 93, in the office of the County Recorder of said Santa Clara County, California, from said point of beginning running North 663.6 feet to the South line of land now or formerly of Ellison Hayslip; thence along the Southerly line of said land of Hayslip South 89 1/2° West 1508.7 feet to the West line of the original 79.10 acre tract conveyed by Arguello et al to England; thence South and along said Westerly line of the original England Tract 592.5 feet to the Northerly line of said 19 foot private roadway, said point being 20 feet North of a stake marked Z.9. set for the South Westerly corner of said England Tract; thence along the Northerly line of said 19 foot private roadway, South 87° 48' East 1514 feet to the point of beginning.

EXCEPTING from the above described tract of land all that portion thereof described as follows, to wit:

Commencing at a point in the Northerly side of the private roadway above described, running between the lands now or formerly of W. R. Johnson and lands above described on the North and lands now or formerly of Perriman on the South, said point of beginning being Westerly 676 feet distant from the South Westerly corner of the land now or formerly of said W. R. Johnson; running thence Northerly at right angles to said private roadway 10 feet; thence Westerly and parallel to said private roadway 40 feet; thence Southerly 10 feet to the Northerly line of said private roadway; thence Easterly along the Northerly line of said private roadway 40 feet to the place of beginning. Containing 0.009 acres.

The premises hereby conveyed containing 21.741 acres and being a part of the original England Tract in the Quito Rancho.

ALSO a right of way over that certain private roadway Nineteen feet wide extending Westerly from the Westerly line of the Saratoga and Alviso Road to the Westerly line of the said original England Tract, said 19 foot private roadway being bounded on the North by the 21.741 acres above described and land now or formerly of W. R. Johnson and on the South by a strip of land 1 foot wide adjoining the Southerly line of the original England Tract on the South.

TOGETHER with all and singular the tenements, hereditaments and appurtenances thereunto belonging or in any wise appertaining.

TO HAVE AND TO HOLD, all and singular the said premises, together with the appurtenances, unto the said parties of the second part, and to their heirs and assigns forever.

IN WITNESS WHEREOF, the said parties of the first part have hereunto set

their hands the day and year first above written.

GRANT OF RIGHT OF WAY
FOR ELECTRIC TRANSMISSION LINE

Vlaho Kresalja, of the County of Santa Clara, State of California hereinafter called the "grantor" for and in consideration of the sum of one dollar ($1.00) in lawful money of the United States of America paid by the Pacific Gas and Electric Company, a corporation duly organized and existing under and by virtue of the laws of the State of California, hereinafter called the "Grantee" the receipt whereof is acknowledged, does hereby grant unto the said grantee, its successors, or assigns, the right and privilege of erecting, maintaining and using, for the transmission and distribution of electricity and for all purposes connected therewith, a single line of poles and wires suspended thereon and all necessary and proper guys, cross-arms and braces and other fixtures for use in connection therewith, and also a right of way along said line of poles, together with the right of ingress thereto and egress therefrom along said line, over and across the grantor's land situate in the County of Santa Clara, State of California, and more particularly described as follows:

That certain 21.741 acre tract of land conveyed by Antone Vitkovich to Vlaho Kresalja by deed dated November 15, 1927 and recorded in the office of the County Recorder of Santa Clara County, State of California in Book 360 of Official Records at page 140; being situated westerly from the Saratoga-Alviso or Lawrence Road, and southerly from the San Francisco-San Jose State Highway.

The route of said line of poles and wires across said land shall be as follows:

Beginning at a point in the southerly boundary line of said tract of land north 87 degrees 48 minutes west 560.0 feet distant from the southeasterly corner thereof and running thence north parallel to the easterly boundary line of said tract of land to the land now or formerly owned by B. Matasci.

The grantee is also hereby granted the right to trim any trees along said line of poles and wires whenever considered by it necessary for the complete enjoyment of the rights hereby granted.

IN WITNESS WHEREOF, the grantor has executed these presents this 30th day of March 1931.

The following notice is pursuant to Subdivision (b) of Section 12956.1 of the California Government Code

Notice

If this document contains any restriction based on race, color, religion, sex, gender, gender identity, gender expression, sexual orientation, familial status, marital status, disability, genetic information, national origin, source of income as defined in subdivision (p) of Section 12955, or ancestry, that restriction violates state and federal fair housing laws and is void, and may be removed pursuant to Section 12956.2 of the Government Code. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

Amended January 1, 2012

BOOK 1786 PAGE 200

DECLARATION OF RESTRICTIONS

THIS DECLARATION made and dated this 10th day of May, 1949 by Ignazio Castello and Rosalia Castello, his wife.

WHEREAS, said parties are the owners of a certain tract of land situate in the County of Santa Clara, State of California, described as follows:

Lots 1 to 44 inclusive as shown upon that certain map entitled, Tract No. 622 I. & R. Castello Tract Unit No. 1, which Map was filed for record in the office of the recorder of the County of Santa Clara, State of California, on May 9, 1949, in Book 22 of Maps, at page 50, to which said Map and the said record thereof, reference is hereby made, and

WHEREAS, said parties are about to sell Lots 1 to 44 inclusive shown on said Map, which they desire to subject to certain restrictions, conditions, covenants, and agreements between themselves and the purchasers of said property, as hereinafter set forth:

NOW THEREFORE, said parties declare that Lots 1 to 44 inclusive shown on the Map of Tract No. 622 is held and shall be conveyed subject to restrictions, conditions, covenants, charges and agreements set forth in the Declaration, to-wit:

DEFINITION: The word "Lot" as herein used refers to one of the numbered lots as delineated upon the original recorded Map of the Tract within which the above described real property is located.

The word "Plots" as herein used refers to an individual site for a residence, together with the grounds in connection therewith, whether composed of one or more "lots" or portions or combinations thereof, as said "Lots" are above defined.

a. All of the Lots, Plots and Parcels hereinbefore described are declared to be residential in character and no structure shall be erected on any building plot other than one detached single family dwelling, not to exceed two stories in height, with a private garage and other out-buildings incident to the residential use of the plot, except that multiple family dwellings may be erected on Lots 1, 2, 3, 4, 5, 6, 7 and 8.

b. No dwelling shall be erected on any building plot which contains an area of less than 9000 square feet, nor a width or frontage of less than 73 feet.

c. No dwelling shall be erected on any building plot nearer than Twenty-five (25) feet to the front property line nor nearer than Twelve and one-half (12½) feet to a side street line. No dwelling or structure shall be erected nearer than five (5) feet to any property line.

d. All of said lots are held and owned and shall be conveyed subject to the express condition that said real property shall not be used or occupied by any person of African, Japanese, Chinese, Mongolian or Malay descent, provided however, that said restrictions shall not be construed as prohibiting persons of such descent from residing upon said property while in the employment as servants of the persons occupying the said property.

e. No trailers, basement, tent, shack, garage, barn or other out-buildings shall at any time be used as a residence, temporarily or permanently, nor shall any structure of a temporary character be permitted.

f. No dwelling house having a ground floor area of less than 800 square feet, exclusive of garage, open porches, terraces and other appurtenances, shall be erected upon any building plot within the area subject to these restrictions.

g. No commercial or manufacturing enterprise shall be carried on upon any plot nor shall anything be done which may be or become an annoyance or nuisance to the neighborhood.

h. No livestock rabbits nor creatures of any kind shall be kept or bred upon any lot for commercial purposes. Nothing herein contained shall be construed as restricting the right to keep household pets upon said premises.

i. No structure shall be moved onto any building plot without prior approval in writing by the subdivider's, their heirs or assigns.

j. All of the restrictions, conditions, covenants and agreements shall affect all of the lots as hereinabove set forth and are made for the direct and reciprocal benefit thereof, and in furtherance of a general plan for the improvement of said Tract, and the covenants shall attach to and run with the land. Said restrictions, conditions and covenants shall be binding on all parties and all persons claiming under them until June 1, 1969 at which time they shall be automatically extended for successive periods of five years, provided, however that such restrictions, conditions, covenants and agreements, or any of them, may be changed, rescinded or annulled in any or all particulars at any time by a majority of the then individual property owners in said Tract, evidenced by an instrument in writing executed by the said owners in the manner provided by law for the conveyance of real property, and duly recorded in the office of the Recorder aforesaid, and upon such recordation shall be valid and binding upon the Sellers and owners of the said lots in said tract, and upon all other persons.

k. If the parties hereto, or their successors or assigns shall violate or attempt to violate any of the covenants herein before June 1, 1969, or during any of the extended periods for which they are in force, it shall be lawful for any person owning any real property subject thereto, to prosecute any proceedings at law or in equity against the person or persons violating or attempting to violate any such covenants, and either to prevent him or them from so doing or to recover damages or other dues for such violation.

l. It is further provided that a breach of any of the conditions contained herein or of any re-entry by reason of such breach, shall not defeat or render invalid the lien of any Mortgage or Deed of Trust made in good faith and for value as to said premises or any part thereof; but said conditions shall be binding upon and effective against any owner of said premises whose title thereto is acquired by foreclosure, trustee's sale or otherwise.

m. Invalidation of any one or more of these covenants by judgment or court order shall in no wise affect any of the other provisions which shall remain in full force and effect.

IN WITNESS WHEREOF, the undersigned has hereunto set their hands and seals the day and year first hereinabove written.

EXHIBIT A

The land referred to herein is situated in the State of California, County of Santa Clara, City of Sunnyvale (and is described as follows:)

PARCEL ONE:

BEGINNING at a point in the Westerly line of that certain 79.01 acre parcel conveyed by Arguello to England by Deed recorded in Book 17 of Deeds at page 22, Santa Clara County Records, said Westerly line also being the Easterly line of that certain 75.04 acre tract conveyed to Wilcox by Deed recorded in Book 50 of Deeds at page 445, Santa Clara County Records, said point being the Westerly corner common to the 20.00 acre tract conveyed to Hayslip by Deed recorded in Book 218 of Deeds at page 62 and that certain 21.741 acre tract conveyed to Williams, et al., by Deed recorded in Book 441 of Deeds at page 345, Santa Clara County Records; thence from said point of beginning North 89° 37' 50" East 918.00 feet along the line dividing said 20.00 acre and said 21.741 acre tract to a point; thence South 0° 32' 40" East 661.39 feet to the Southerly line of the 79.01 acre tract hereinabove mentioned; thence along said Southerly line North 87° 43' 25" West 243.34 feet to an iron pipe at the Northeasterly corner of tract No. 1830 La Linda Meadows, Unit No. 2, the map of said tract being recorded in Book 84 of Maps at pages 28 and 29, Santa Clara County Records; thence along a Northerly boundary of said tract North 87° 39' 25" West 681.75 feet to a corner in said boundary; thence along an Easterly boundary of said tract North 0° 26' 35" East 11.88 feet to the Northeasterly terminus of Quail Avenue, as said Avenue is shown upon said Map, said Northeasterly terminus being in the Westerly boundary of the 79.01 acre tract hereinabove mentioned; thence along said Westerly boundary North 0° 02' 35" West 605.75 feet to the point of beginning, being a portion of the Quito Rancho.

PARCEL TWO:

BEGINNING at a point in the Westerly line of that certain 79.01 acre parcel conveyed by Arguello to England by Deed recorded in Book 17 of Deeds at page 22, Santa Clara County Records, said Westerly line also being the Easterly line of that certain 75.04 acre tract conveyed to Wilcox by Deed recorded in Book 50 of Deeds at page 445, Santa Clara County Records, said point being the Westerly corner common to the 20.00 acre tract conveyed to Hayslip by Deed recorded in Book 218 of Deeds at page 62 and that certain 21.741 acre tract conveyed to Williams, et al., by Deed recorded in Book 441 of Deeds at page 345, Santa Clara County Records; thence

EXHIBIT A

from said point of beginning North 89° 37' 50" East 918.00 feet along the line dividing said 20.00 acre and said 21.741 acre tract to a point; thence North 0° 32' 40" West 566.97 feet to the Northerly boundary of said 20.00 acre tract; thence along said Northerly boundary South 89° 37' 33" West 777.46 feet to a 1 1/2 inch iron pipe found in a Northwesterly corner thereof; thence along a Westerly boundary of said 20.00 acre parcel South 9° 02' 35" East 31.95 feet to an angle point therein; thence along a Northerly boundary of said parcel South 89° 57' 25" West 135.58 feet to a redwood stake set in the Easterly boundary of the hereinabove mentioned 75.04 acre tract and the Westerly boundary of said 20.00 acre parcel; thence along said Westerly boundary South 0° 02' 35" East 535.74 feet to the point of beginning, being a portion of the Quito Rancho.

Excepting from Parcels One and Two above the following:

Beginning at the Southeasterly corner of that certain 25.340 acre parcel as shown upon that certain Map entitled, "Record of Survey, Being a portion of Quito Rancho", recorded in Book 123 of Maps at page 51, in the office of the Recorder of said County; thence North 87° 32' 00" West, along the Southerly boundary of said 25.340 acre parcel, 243.33 feet to an iron pipe; thence North 87° 28' 00" West, continuing along said Southerly boundary, 681.75 feet to the Westerly boundary of said 25.340 acre parcel; thence North 0° 38' 00" East, along said Westerly boundary, 11.88 feet to an iron pipe; thence North 0° 10' 05" East, continuing along said Westerly boundary, 19.14 feet to a line running parallel with and distant 31.00 feet Northerly, measured at right angles from said Southerly boundary; thence South 87° 28' 00" East, along said parallel line, 682.92 feet; thence South 87° 32' 00" East, continuing along said parallel line 189.74 feet to the beginning of a tangent curve to the left; thence along said curve, having a radius of 20.00 feet, a central angle of 92° 49' 15", an arc length of 32.40 feet, tangent to a line bearing North 0° 21' 15" West; thence North 0° 21' 15" West, along a line running parallel wiht and distant 31.00 feet Westerly, measured at right angles from the Easterly boundary of said 25.340 parcel, 1174.60 feet to the Northerly boundary at said 25.340 parcel; thence North 89° 48' 58" East, along said Northerly boundary 31.00 feet to the said Easterly boundary; thence South 0° 21' 15" East, along said Easterly boundary, 1228.08 feet to the point of beginning.

Approved Conditions for Use Permit Number 2003-0634 located at 1095 Dunford Avenue per City Council on January 6, 2004.

In addition to complying with all applicable City, County, State and Federal Statutes, Codes, Ordinances, Resolutions and Regulations, Permittee expressly accepts and agrees to comply with the following conditions of approval of this Permit:

1. Obtain Building Permits prior to construction.
2. The conditions of approval shall be reproduced on the cover page of the plans submitted for a Building permit for this project.
3. The Use Permit shall expire if the use is discontinued for a period of one year.
4. The Use Permit shall return to City Council for review in the Fall 2005 prior to the 2006 season.
5. Obtain a business license from the City of Sunnyvale Revenue Division prior to commencement of use.
6. Submit a detailed recycling and solid waste disposal plan to the Director of Community Development for approval.
7. All recycling and solid waste shall be confined to approved receptacles and enclosures.
8. Signs require a separate sign permit.
9. Secure canvas tent at all times to prevent noise. Monitor tent canopy during windy weather.
10. Prepare a landscape plan, which will address the area around the tent site and tree species shall be at the recommendation of the City Arborist. The landscape plans shall be reviewed and approved by the Director of Community Development prior to issuance of building permits.
11. The Sabercats shall meet with the neighbors to address neighborhood concerns.
12. Install a camouflage screen over the tent, southern elevation along Dunford Avenue

EXECUTIVE SUMMARY

1.0 INTRODUCTION

The Remedial Investigation (RI) report describes the results of past and current remedial investigations undertaken at the former Intersil facility and property located in Cupertino, California (the Property). Intersil conducted these investigations under the direction of the California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB), which manages the cleanup of the property as the lead agency under a formal agreement with the U.S. Environmental Protection Agency (EPA). The remedial investigations were performed in accordance with Site Cleanup Requirements Order No. 89-038 issued by the RWQCB on 15 March 1989, applicable sections of the California Health & Safety Code, and the U.S. EPA's guidance document entitled "Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA." The EPA proposed that the Property and the neighbouring Siemens Components, Inc., Optoelectronics Division (Siemens) facility (together identified ad the Intersil/Siemens Proposed Superfund Site) be listed on the National Priorities List (NPL) under the Federal Superfund Program in June 1988, although to date, no final action has been taken.

The information presented in the RI report -- for example, the nature and extent of chemical compounds in soil and groundwater beneath the Property; the existing and potential pathways of chemical migration; and the magnitude and probability of potential harm to human health and the environment posed by conditions at the Property -- has been used to prepare a Feasibility Study (FS) report. The FS report develops and evaluates various remedial alternatives for the Property.

In addition to the RI and FS reports, Intersil has also prepared a Proposed Plan, which summarizes the important features of the RI and FS, briefly analyzes the remedial alternatives under consideration, identifies the preferred alternative, and informs members of the public how to best participate in the remedy selection process.

2.0 PROPERTY BACKGROUND

Intersil formerly operated its facility as a silicon wafer fabrication plant and office building from 1967 until 1988. From 1967 to date, Intersil has leased the property from Vallco Park, Ltd.

In connection with its semiconductor wafer fabrication operations, Intersil used inorganic etching solutions (such as acids) and large amounts of water. Intersil's processes used more acid and water than volatile organic compounds (VOCs); fabrication operations therefore required the use of only one in-ground vaulted waste solvent tank. Acid and water-based process wastewater was directed through five in-ground wastewater neutralization systems and sumps before being discharged pursuant to a permit into the sanitary sewer.

3.0 HISTORY OF PREVIOUS INVESTIGATIONS

Intersil initiated its investigations of the Property in 1983. Initial investigations conducted between 1983 and 1986 involved drilling soil borings and installing groundwater monitoring wells, and resulted in the detection of low concentrations of trichloroethene (TCE) (up to 3.30 mg/kg) in soil beneath the northern and central portions of the Property, and low concentrations of TCE (up to 33.0 mg/L), tetrachlorethene (PCE) (up to 0.150 mg/L) and 1,1,1-trichloroethane (1,1,1-TCA) (up to 0.450 mg/L) in groundwater beneath the northern portion of the Property.

Subsequent phases of Intersil's investigations, both on the Property and adjacent to the Property, were undertaken to determine the lateral and vertical distribution of VOCs in the subsurface, and to design and implement interim remedial measures. With respect to the distribution of VOCs, Intersil's investigations conducted between November 1986 and October 1988 revealed that VOC-affected soils were restricted to the northern portion of the Property, and the central area of the Property near the former inactive east neutralization system. Interim remedial measures included the removal of the inactive east neutralization system and vaulted 250-gallon waste solvent tank (in 1986), the design and installation of groundwater and soil vapour extraction and treatment systems (in 1987), and

the removal of the remaining wastewater treatment facilities (the north and east neutralization systems, and the north and east scrubber sumps), and the former above-ground chemical and hazardous waste storage area (in 1988).

4.0 SCOPE OF REMEDIAL INVESTIGATION

In order to collect additional information necessary to thoroughly characterize the location of potential sources, and the respective identities and distributions of chemicals in the soil and groundwater at the Property, between June 1989 and January 1990 Intersil performed the following tasks:

- drilled 32 additional borings, collected and analyzed 283 soil samples, and performed further soil gas surveys;
- installed an additional piezometer to evaluate the effectiveness of the groundwater extraction and treatment system;
- collected groundwater samples from all Intersil monitoring wells, and analyzed each sample for VOCs, semi-VOCs and Priority Pollutant metals (results indicated that neither semi-VOCs nor metals require remediation); and
- further evaluated the effectiveness of the groundwater extraction and treatment system using water-level data from the new piezometer and existing wells, and the effectiveness of the vapour extraction system using the results of a soil gas pumping test.

5.0 RESULTS OF REMEDIAL INVESTIGATION

Analysis of all of the data collected and analyzed during investigations conducted at the Property has resulted in the complete characterization of chemical identities and distributions in soil and groundwater at the Property. Intersil's investigations have also resulted in the identification of two potential near-surface source areas of VOCs in soil.

Vadose Zone Investigation

The VOCs most commonly detected in soil samples were toluene, TCE, PCE, 1,1,1-TCA and Freon 113. Of these compounds, only TCE was detected in concentrations that exceeded 1.0 mg/kg. Representative concentrations of the other VOCs detected in soil samples were each less then 0.1 mg/kg. Shallow soil samples (to a depth of 55 feet) containing greater than 1.0 mg/kg of TCE were clustered in two areas: in the vicinity of the former inactive east neutralization system, and in the vicinity of well W18B. In deeper samples (taken from between 55 feet and 85 feet below the surface), the pattern of samples containing TCE was more disperse, but was for the most part confined to the northernmost 100 feet of the Property.

Based on the elevated concentrations of TCE observed in soil samples, the area around the former east neutralization system has been identified as a possible source of TCE. The relatively low (less than 3.5 mg/kg) concentrations of TCE detected in nearby soil samples support this conclusion, in that the concentrations are consistent with those that would result from leakage of water that contained relatively low concentrations of dissolved TCE. This conclusion is also consistent with the fact that the former inactive east neutralization system handled facility wastewater that contained dissolved, not pure TCE.

Elevated concentrations of TCE from soil samples collected from boring W18B suggest that a shallow source of TCE may exist in the vicinity of well W18B as well. Soil samples from this area also contained relatively low levels of TCE (not exceeding 6.70 mg/kg). These concentrations are similarly consistent with concentrations associated with the leakage of water that contained relatively low concentrations of dissolved TCE.

Thus, Intersil's investigations have identified two suspected source areas of chemicals at the Property: the former inactive east neutralization system and the area surrounding well W18B. In addition, concentrations of TCE detected in soil samples collected from these two suspected source areas indicate that TCE entered the soil as a dissolved constituent in water, not as a pure solvent. Data collected from adjacent soil borings have provided complete vertical and horizontal

characterization; therefore, no additional data concerning the distribution of the VOCs of concern at the Property are required.

Saturated Zone Investigation

Concentrations of VOCs detected in groundwater samples taken from on-site wells did not exceed 33 ppm. The highest concentrations were measured in groundwater samples from A-zone wells W1A, W9A, W10A, W12A and E17A. Each of these wells is located in the northern portion of the Property. Of all the samples of B-zone groundwater collected and analyzed, those samples collected from the B-zone groundwater in the northern portion of the Property were also found to contain the maximum concentrations of VOCs. These concentrations were generally found to be one to two orders of magnitude lower than the maximum VOC concentrations measured in the A-zone.

6.0 CHEMICAL FATE AND TRANSPORT

Chemical fate and transport refers to the processes affecting the physical movement of VOCs in the subsurface beneath the Property (transport), and the chemical interactions and transformations that occur during transport (fate). The RI report discusses the fate and transport of chemicals at the Property in two sections. The first section presents a model of local groundwater flow that outlines the major pathways followed by dissolved VOCs that have infiltrated and are migrating in the subsurface. The second section summarizes the directions and rates of VOC transport, and the chemical processes that have occurred along their path of migration.

In the conceptual model of local groundwater flow, groundwater recharge generally moves vertically downward in the vadose zone until encountering either perched conditions or the water table. In the perched zone, groundwater moves laterally until the clay lens ends and more permeable conditions are encountered, and then resumes flowing in a downward direction. The direction of movement within a given perched zone will depend on the slope of the free water surface in that zone.

Because of the variability of the topography of this surface, groundwater flow within each perched zone on the Property can be highly irregular.

Once groundwater containing dissolved VOCs encounters fully saturated conditions, groundwater flow becomes primarily lateral through the higher-hydraulic conductivity sediments that comprise the A-, B- and C-zones. Groundwater may also move vertically through the lower-hydraulic conductivity aquitards (A/B aquitard, B/C aquitard), but where movement occurs, it is at a significantly lower velocity. Between the C-zone and the Deeper Aquifers, relatively little groundwater movement occurs because of the thick, continuous nature of the Regional Aquitard.

In the vadose zone, processes such as sorption onto soil particles and volatilization into the soil gas phase effectively remove a portion of the VOCs from the infiltrating groundwater. As a result, VOC molecules dissolved in migrating groundwater will move at a slower rate than the groundwater.

The distribution of VOCs in the vadose zone suggests that vapour diffusion has been primarily responsible for lateral transport of VOCs in the vadose zone. However, the relatively high amount of organic carbon associated with the soils at the Property have caused the bulk of VOCs that were migrating through the vadose zone to be immobilized through sorption, and as a result, these VOCs have never reached the water table.

7.0 EVALUATION OF INTERIM REMEDIAL MEASURES

Four soil vapour extraction wells, installed as part of Intersil's interim remedial activities, are already treating vadose zone soil in the vicinity of the two suspected source areas outlined above. Testing of the soil gas extraction system has shown that the zone of capture created by the extraction wells extends at least 150 feet in all directions from the extraction wells. Further, the zone of capture in the deep vadose zone is even greater than in the shallow zone. Tests have demonstrated that this zone extends throughout the central and entire north end of the Property,

and beyond. The area of capture created by the operation of the vapour extraction system encompasses all areas of the vadose zone where Intersil has measured concentrations of TCE in soil greater than 1.0 mg/kg. Between May 1988 (initial start-up date) and December 1989 the soil gas extraction and treatment system has removed approximately 2300 pounds (1045 kg) of TCE from the unsaturated zone beneath the property. It is estimated that the total amount of VOCs remaining in the unsaturated zone and yet to be remediated by the VES is roughly 180 pounds (80 kg). The coarser-grained layers are able to conduct vapour more rapidly than the finer-grained layers and, therefore will be more quickly remediated by the vapour extraction system. Since VOC transport out of the more fine-grained units occurs in response to the concentration gradient which exists between relatively clean, coarse-grained materials which surround the clays, effective clean-up these more fine-grained units will only commence once the system has been in operation for some time and the more highly conductive materials have been remediated. The time required to fully remediate the vadose zone, including the finer-grained layers was estimated in the FS using a model of transport processes in the vadose zone. The model indicated that once the more permeable layers had been remediated, an additional 2 years would be required to fully remediate the less permeable clay layers.

Since 1987, perched and A-zone groundwater beneath the Property has been remediated by extracting and treating groundwater from wells W4A, W5A, W10A, W12A and E17A. An evaluation of the effectiveness of the groundwater extraction system using six months of operation data indicated that the capture zone of the groundwater extraction system has historically extended beyond the Property in all directions in the A-zone. More recent evaluations of the system indicate that due to an overall drop in the A-zone water-level, and a corresponding decrease in the groundwater extraction rate, it may be necessary to enhance the system and thereby increase the groundwater extraction rate in order to ensure that the capture zone continues to extend beyond the Property.

As of March 1990, the groundwater extraction system has removed a total of approximately 42 pounds (19.1 kg) of TCE. Concentrations of VOCs have decreased by several orders of magnitude since extraction began. Calculations

performed using very conservative estimates of the size and representative total VOC concentration of the zone of VOC-bearing groundwater indicate that approximately 44 pounds (20 kg) of VOCs are yet to be remediated by the groundwater extraction system.

8.0 SUMMARY OF THE BASELINE PUBLIC HEALTH EVALUATION

On behalf of the RWQCB, Clement Associates, Inc. (Clement), conducted a Baseline Public Health Evaluate (BPHE) to evaluate risks associated with the Intersil/Siemens Proposed Superfund Site (Intersil/Siemens site) (which includes the Property and the Siemens Components, Inc., Optoelectronics Division (Siemens) facility directly to the north of the Property). Risks were evaluated based on the assumption that no further remedial action would be undertaken at the Property.

Clement identified chemicals of concern (COCs) for the Intersil/Siemens site and off-site area. Based on Clement's findings and on investigations conducted at the Property, the following COCs have been identified for the Property:

- groundwater: chloroform, 1,1-DCE, Freon 113, PCE, toluene, 1,1,1-TCA and TCE;
- soil: none.

The BPHE identified currently existing and potential future routes of human exposure to chemicals from the Property. Levels of carcinogenic risks estimated to result from these exposures indicate that current exposures present no risks that exceed EPA target values. Among potential future routes of exposure, only the unlikely use of A-zone groundwater for private domestic consumption presents risks exceeding EPA target values. Thus, the BPHE did not identify any present risks to human health.

9.0 CONCLUSION

Through its remedial investigation, Intersil has identified the source areas of VOCs detected in soil and groundwater at the Property, and has thoroughly and completely characterized the distribution of VOCs at the Property as well. As a result, no further investigation is warranted.

The BPHE found no present risk to public health as a result of VOCs detected in soil and groundwater at the Property. With respect to potential future risks, the BPHE did associate certain risks with the potential, though unlikely, future use of shallow groundwater that might occur if no remedial action is undertaken. Based on this assessment, Intersil has designed its preferred remedial alternative to remove VOCs from soil, and to contain and remove VOCs from groundwater, through expansion of its existing remedial system. This alternative is consistent with remedial objectives and their focus on the removal of VOCs from soil and from groundwater in the A- and B-zones. Vacuum extraction of soil is particularly effective in attaining these objectives since the bulk (in terms of mass) of VOCs detected at the Property is present in soil, and treatment of that medium will serve to eliminate VOC-bearing soils as a source of VOCs to groundwater.

1.0 INTRODUCTION

This Remedial Investigation (RI) report has been prepared on behalf of Intersil, Inc. (Intersil) to comply with provisions in Site Cleanup Requirements (SCR) Order No. 89-038, issued to Intersil, Siemens Components, Inc. (Siemens), and Vallco Park, Ltd. (Vallco Park) on 15 March 1989 by the California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB). This report summarizes previous and recent remedial investigations undertaken to develop a Feasibility Study (FS) and Proposed Plan for the former Intersil facility at 10900 North Tantau Avenue in Cupertino, California (the Property). The RWQCB requested that an RI/FS be performed in part because the U.S. Environmental Protection Agency (EPA) has proposed placing both Intersil's former 10900 North Tantau Avenue facility and Siemens' adjacent 19000 Homestead Road facility on the National Priorities List (NPL). The RWQCB manages the cleanup of this proposed Superfund site as the lead agency under a formal agreement with the EPA.

This RI report describes the results of investigations conducted prior to, and in accordance with, the Second Revised RI/FS Workplan for the Property, prepared by Geomatrix Consultants, Inc. (Geomatrix) and submitted to the RWQCB on 7 April 1989 (Geomatrix, 1989e). The SCR, issued to Intersil, Siemens and Vallco Park on 15 March 1989, required that the scopes of work described in Intersil's and Siemens' RI/FS Workplans be implemented as proposed, and also outlined additional work to be conducted by Intersil and Siemens.

The SCR required that three RI/FS reports be prepared to address the following three areas: 1) "Siemens vadose zone and A-zone on-site areas;" 2) "Intersil vadose zone and A-zone on-site areas;" and 3) "Siemens B-zone and deeper zones on-site areas and B-zone and deeper zones off-site down gradient areas, Intersil B-zone and deeper zones on-site areas and B-zone and deeper zones off-site down gradient areas, and Intersil and Siemens off-site A-zone." Intersil and Siemens agreed to conduct separate investigations at their individual facilities, and jointly retained Levine-Fricke to conduct the off-site investigation on behalf of both companies. This report presents a description of the RI work conducted at the Property. Two

additional RI reports, one each for the Siemens property and the off-site area, will be submitted by Levine-Fricke under separate cover.

In addition to addressing the requirements set forth in the SCR, this document has also been prepared in accordance with Subpart F of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (40 CFR Part 300), Section 25356.1(c) of the California Health and Safety Code, and guidelines set forth in the EPA draft guidance document entitled "Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA" (EPA, 1988).

1.1 Purpose and Report Organization

The purposes of the Remedial Investigation are as follows:

a) to assess the nature and extent of chemical compounds in soil and groundwater underlying and adjacent to the Property;

b) to identify existing and potential migration pathways, including the direction, rate, and dispersion of chemical migration;

c) to assess the magnitude and probability of actual and potential harm to public health and welfare and to the environment by the threatened or actual release of chemicals at the property; and

d) to collect the information necessary to conduct a Feasibility Study and to prepare a Proposed Plan for remediation of the Property.

A Baseline Public Health Evaluation was performed by Clement Associates, Inc. (Clement) under contract with the RWQCB (Clement, 1990). This RI report contains a brief summary of the findings of the Baseline Public Health Evaluation.

This RI report describes the results of all investigations conducted at the Property and is organized in accordance with the format set forth in the EPA guidance document entitled "Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA" (U.S. EPA, 1988). The first volume of the RI report contains the text, figures and tables. The text is presented as follows:

- Section 1.0 describes the site and includes a history of operations;
- Section 2.0 includes a summary of previous soil and groundwater investigations conducted at the Property;
- Section 3.0 describes the most recent work conducted during the RI, as outlined in Intersil's Second Revised RI/FS Workplan and as required in Provision C.3 of the SCR;
- Section 4.0 describes the physical characteristics of the Property, the surface features, meteorology, surface hydrology, geology, and hydrogeology;
- Section 5.0 contains the geochemical results of the investigations in terms of potential source locations, and current soil and groundwater quality;
- Section 6.0 presents an evaluation of chemical fate and transport;
- Section 7.0 presents a description and evaluation of interim remedial measures underway at the Property;
- Section 8.0 presents a brief summary of the Baseline Public Health Evaluation;
- Section 9.0 contains a summary of the RI with conclusions and recommended remedial action objectives; and
- Section 10.0 contains references.

The second volume of the RI contains supporting appendices. In addition to other information compiled in support of the technical arguments presented in this report, the laboratory analytical data and QA/QC evaluation results for analyses performed in October and November 1989 in accordance with Intersil's Second Revised RI/FS Workplan are included in the appendices.

1.2 Property Background

1.2.1 Setting

The Property is situated in the Santa Clara Valley in Cupertino, California, approximately 7.5 miles south of San Francisco Bay (Figure 1.1). A number of electronics manufacturing facilities are located in the vicinity of the Property. These facilities include Siemens to the north, Hewlett-Packard to the west, the former AMI facility to the northeast, and the Tandem Computer facility to the east. A residential neighbourhood is located north of the Siemens facility, and orchards are located one block to the east (Marchese No. 1) and three blocks to the northeast (Marchese No. 2). Calabazas Creek is located approximately 1,500 feet east of the Property and flows north-northeast toward San Francisco Bay.

1.2.2 Property Description and History

The former Intersil facility is located at 10900 North Tantau Avenue between Homestead Road and Pruneridge Drive in Cupertino, California (Figure 1.1). Intersil leased the 4.5-acre property from Vallco Park (10050 North Wolfe Road, Cupertino) beginning in 1967. Intersil developed the northern portion of the property in 1967. In 1970, the building was expanded to the south and in approximately 1973, the parking lot was extended to the southern property line. Prior to the development of the property, the region was used primarily for agriculture.

The facility was operated continuously as a wafer fabrication plant and office building from 1967 until it was closed in February 1988. A site plan of the facility, as it existed in 1986, is presented as Figure 1.2. The single-story portion of the building, located at the northern end of building T2 depicted on Figure 1.2, comprises approximately 13,000 square feet and was originally constructed in 1967. It contained both a wafer fabrication operation and an office area. The two-story southern portion of the building, comprising approximately 43,000 square feet, was built as an expansion in 1970. In this part of the building, wafer fabrication, testing and assembly facilities were located on the first floor and office space was located on the second floor.

1.2.3 Chemical Use and Waste Management Practices at the Property

At the Property, Intersil fabricated the following: (1) integrated circuits, including watch chips, microprocessor memories and linear and analog devices; and (2) discrete devices, such as individual transistors, diodes, and other semiconductor devices. Because Intersil purchased polished silicon wafers from outside vendors, the processes of cutting and then polishing both sides of wafers, which require the use of large amounts of chlorinated solvents, were not conducted on the Property. Instead, Intersil's processes used inorganic etching solutions (such as acids) and large amounts (up to 100,000 gallons per day) of water. Because Intersil's processes were acid- and water-intensive, rather than solvent-intensive, the facility had five in-ground wastewater neutralization systems and sumps and only one in-ground vaulted waste solvent tank (Figure 1.3).

During the wafer fabrication process, sulphuric, hydrochloric, hydrofluoric, phosphoric, nitric, chromic and acetic acids were used to etch and clean wafers. Xylenes and n-butyl acetate were used as carrying agents for photoresist or as developers. More recently, Freon 113, isopropyl alcohol and acetone were used to clean wafers and equipment. Prior to approximately 1979, trichloroethene (TCE) was used on a limited basis as a cleaning agent. Very small quantities of 1,1,1-trichloroethane (TCA) were used until the closure of the facility in February 1988. Negative photoresist chemicals employed at the Property included n-butyl acetate, xylenes and limited amounts of ethylbenzene. Other chemicals used or produced during the fabricating process included phosphates, caustics, metals, fluorides, phenols, soaps and detergents. Quantities of chemicals used and waste chemicals generated are unknown.

The waste chemicals were handled in several different ways. Process wastewater, which contained acids and other etching and cleaning compounds, was discharged to the process wastewater system and was processed through in-ground acid neutralization systems to adjust pH. The neutralized wastewater was then discharged to the municipal sanitary sewer system according to applicable local regulations. Records from Intersil's self-monitoring program indicate that between 1984 and 1986, the following compounds were detected in the facility wastewater at the concentrations noted:

COMPOUNDS DETECTED IN FACILITY WASTEWATER
Concentrations in milligrams per litre (mg/L)

Constituent	10/84	2/85	8/85	11/85	2/86
Bromochloromethane	0.002	ND	ND	ND	ND
Chloroform	0.004	ND	ND	ND	0.012
Dichlorobenzene	0.003	0.012	ND	ND	ND
1,1-Dichloroethene	0.004	ND	ND	ND	ND
Tetrachlorobenzene	0.001	0.046	ND	ND	ND
1,1,1-Trichloroethane	0.16	ND	ND	ND	ND
Trichlorobenzene	ND	ND	ND	0.012	0.004
Methylene Chloride	ND	ND	14	ND	ND
Toluene	ND	ND	0.092	ND	ND
Ethylbenzene	ND	0.18	ND	ND	ND
Naphthalene	ND	ND	0.52	ND	0.036
Acetone	0.26	0.82	ND	ND	ND
bis (2-Ethylhexyl) Phthalate	0.05	0.031	ND	ND	ND
Diethyl Phthalate	0.001	ND	ND	ND	ND
Chromium, total	NA	0.11	0.06	NA	0.9
Fluoride	NA	250	8.3	NA	9
Phenolics	NA	0.02	NA	NA	0.02

ND = not detected
NA = not analyzed

From 1980 to 1986, certain waste solvents were stored in a 250-gallon, vaulted, in-ground waste solvent tank. This is the only in-ground unit at the Property that handled waste solvents that had not been mixed with very large quantities of water. This tank was located within the vault of the east neutralization system and was visible for inspection on the bottom and all sides. The tank reportedly received xylenes, ketones, alcohol, and n-butyl acetate. When in operation, wastes in the tank were pumped out monthly by California Solvent Recycling Corporation

for processing and disposal according to federal and state hazardous waste control laws. This tank was taken out of service and removed in July 1986. The tank appeared intact at the time of removal (Geomatrix, 1986a).

Other bulk wastes, including metals, fluorides, phenols and solvents, were collected in 55-gallon drums for storage and then transported by a certified hauler to licensed recycling or disposal facilities. The drums were stored in three separate, double-contained storage units that were secured, placarded, fire protected and segregated according to National Fire Protection Association (NFPA) classifications. The former above-ground waste storage area, located as shown on Figure 1.3, was fenced and placarded. The area could be observed from a security post that was staffed 24 hours per day.

A discussion of the development and operation of Intersil's in-ground acid neutralization systems and related wastewater handling units, based on available facility drawings, is presented below. The former locations of these systems and associated piping are shown on Figure 1.3.

- 1967 - Initial occupation of the Property by Intersil. Facility wastewater was treated in what is now referred to as the north scrubber sump, a 500-gallon, epoxy-lined, concrete sump.

- 1970 - Two-story southern addition constructed. Facility wastewater from the southern addition drained to what is now referred to as the east scrubber sump, also a 500-gallon, epoxy-lined, concrete sump, which was then a lift station that pumped wastewater to the north scrubber sump. Later, the east scrubber sump was converted to a neutralization system.

- 1972 - East neutralization system constructed, consisting of five 1,000-gallon concrete tanks with polypropylene liners and one 1,000-gallon, steel, gravity separator tank lined with epoxy.

- 1973 - Vaulted north neutralization system constructed, consisting of five 1,000-gallon, plastic tanks within two separated concrete vaults.

- 1975 - Plastic tanks within the north neutralization system replaced with two stainless steel, compartmented tanks with a total capacity of approximately 8,500 gallons.

- 1976 -Existing east neutralization system removed from service and new east neutralization system constructed to the east, consisting of an 8,500-gallon, stainless steel compartmented tank within a concrete vault.

- 1980 - A 250-gallon steel waste solvent storage tank was placed within the concrete vault of the new east neutralization system.

- 1986 - Inactive east neutralization system removed and 250-gallon waste solvent tank removed.

- 1988 - Facility closed, all remaining in-ground treatment systems (east and north neutralization systems and east and north scrubber sumps) removed.

2.0 HISTORY OF STUDY AREA INVESTIGATIONS

Hydrogeologic studies and soil investigations were initiated at the Property in 1983. Cooper Engineers (Cooper) conducted investigations for Intersil from 1983 until 1986. Geomatrix conducted investigations from 1986 through March 1989. In April 1990 Intersil retained Beak Consultants, Ltd. (BEAK) to manage the RI activities with Geomatrix and McCulley, Frick & Gilman, Inc. (MF&G) as subconsultants. A summary of the work conducted previously at the site, the consultants responsible for the studies and corresponding report references are presented in Table 2.1. The locations of all monitoring wells and soil borings resulting from these investigations are shown on Figure 2.1.

Three phases of investigation were conducted by Cooper between 1983 and 1986 (Table 2.1). These investigations included drilling nine soil borings and drilling and installing seven groundwater monitoring wells. The results of these investigations indicated the presence of TCE at low concentrations (up to 3.30 mg/kg) in soil beneath the northern and central portions of the site, and low concentrations of TCE (up to 33.0 mg/L), PCE (up to 0.150 mg/L), and 1,1,1-TCA (up to 0.450 mg/L) in groundwater beneath the northern portion of the site. Summaries of the results of analyses of soil samples and groundwater samples collected during these early phases are included in Tables 2.2 through 2.6, which present summaries of all geochemical analyses of soil and groundwater samples collected during investigations of the Property.

Based on the results of these investigations, the RWQCB issued Waste Discharge Requirements Order (WDR) No. 86-49 to Intersil in June 1986. This order provided, in part, that Intersil institute a comprehensive sampling and analysis program to determine the lateral and vertical distribution of VOCs in the subsurface, implement a quarterly groundwater monitoring program, and design and implement interim remedial measures.

Geomatrix conducted subsequent phases of investigation at the site and on adjacent properties, including drilling and installing eleven on-site groundwater monitoring wells and six off-site groundwater monitoring wells at the adjacent

Hewlett-Packard Company facility to the west (one well), the adjacent Siemens facility to the north (four wells), and the adjacent Tandem Computers, Inc. facility to the east (one well) (Figure 2.2). During drilling of these wells, soil samples were collected and analyzed for volatile organic compounds (VOCs). The results of these analyses, presented in Table 2.2a supported the findings of previous investigations and indicated that VOC-affected soils were restricted to the northern portion of the facility and the area near the former inactive east neutralization system (Figure 1.3). Geomatrix conducted monthly water-level measurements, quarterly groundwater quality monitoring, and quarterly reporting as required in the WDR. Results of the quarterly monitoring analyses are included in Tables 2.3 through 2.6 which summarize the results of all geochemical analyses performed on groundwater samples collected from the Property. These quarterly monitoring data are used to interpret the extent of the zone of VOC-bearing groundwater (Section 5.2.2) and evaluate the effectiveness of the interim remedial measures currently underway at the Property (Section 7.3).

An Interim Remedial Action Plan for the site was prepared and submitted to the RWQCB on 17 April 1987 (Geomatrix, 1987b). In July 1986, as an interim remedial measure, Intersil removed the inactive east neutralization system and the vaulted 250-gallon waste solvent tank (Geomatrix, 1986a). In September 1988, the north and east neutralization systems, the north and east scrubber sumps, and the above-ground chemical and hazardous waste storage area were removed (Figure 1.3). No visible signs of leakage were observed during removal of the waste storage and treatment units.

Groundwater and soil vapour extraction and treatment systems were designed and installed in 1987 (Geomatrix, 1988b). In the groundwater extraction and treatment system, groundwater is pumped from four A-zone wells through buried double-contained pipelines to a groundwater treatment plant, located near the centre of the Property (Figure 2.3). Groundwater is also extracted from one perched-zone well and stored in a 250-gallon above-ground holding tank which is periodically drained to the treatment plant. In the soil vapour extraction and treatment system, vapour is pumped from four extraction wells through buried pipelines to a carbon adsorption treatment system, located adjacent to the

groundwater treatment plant at the centre of the site (Figure 2.3). Six vent wells, located along the northern property boundary, serve as passive recharge wells to the soil vapour extraction system. The groundwater and soil vapour extraction and treatment systems, described in greater detail in Section 7.0, began full operation in December 1987 and May 1988, respectively, and have been operating on a nearly continuous basis since that time (Geomatrix, 1990).

In September 1987, the RWQCB issued Cleanup and Abatement Order (CAO) No. 87-133 to Intersil, Siemens and Vallco Park. This order required that Intersil and Siemens install two additional off-site monitoring wells and perform additional investigation of the quality of water in the region's deep aquifers. Siemens and Intersil installed the two additional wells, reviewed results of completed surveys of public and private wells in the area (completed by Intersil, Siemens, and others) (Geomatrix, 1987a; Geomatrix, 1988c; Woodward-Clyde Consultants (WCC), 1987d; Weiss Associates, 1986), and installed four deep aquifer monitoring wells (BK-1, BK-2, BK-3 and BK-4). Both Siemens and Intersil submitted reports to the RWQCB that documented well installation, contained sampling and chemical analysis results, and set forth the conclusion that no further evaluation of the deep aquifers was warranted.

In a letter dated 24 June 1988, the RWQCB requested that Siemens and Intersil submit an RI/FS Workplan for the two facilities (RWQCB, 1988). Intersil and Siemens submitted separate RI/FS Workplans to the RWQCB on 21 October 1988 (Geomatrix, 1988e; Levine-Fricke, 1988). After receiving comments by the RWQCB and EPA, Revised RI/FS Workplans were submitted to the RWQCB on 17 January 1989 (Geomatrix, 1989a; Levine-Fricke, 1989a). Additional RWQCB comments were incorporated in the Second Revised RI/FS Workplans, submitted to the RWQCB on 7 April 1989 by Intersil (Geomatrix, 1989e), and on 10 March 1989 by Siemens (Levine-Fricke, 1989b).

3.0 SCOPE OF REMEDIAL INVESTIGATION

The investigative tasks conducted at the Property were designed to provide the information necessary to satisfy the purposes of the RI listed in Section 1.1. The list of investigative tasks includes those tasks conducted prior to submittal of the RI/FS Workplan, tasks outlined in Intersil's Second Revised RI/FS Workplan (Geomatrix, 1989e) and those additional tasks required by SCR Order No. 89-038, issued by the RWQCB on 15 March 1989. The first group of investigations are termed "previous", or "historic" investigations and were discussed in the previous Section (Section 2.0). The second and third groups of tasks are termed the "recent" RI tasks. A summary of the recent RI tasks performed and reports recently-submitted as part of the RI is presented in Table 3.1. All of the information collected during the execution of all of the investigative tasks was collectively evaluated to satisfy the objectives of the RI listed in Section 1.1.

The tasks outlined in the Second Revised RI/FS Workplan and the work subsequently performed in connection with those tasks include the following:

- Task 1 - Project Operation Plans - This task included preparation of a Health and Safety Plan and a Sampling and Analysis Plan (SAP), which included a Field Sampling Plan (FSP) and a Quality Assurance Project Plan (QAPP). These reports were prepared by Geomatrix and submitted to the RWQCB on 17 January 1989 (Geomatrix, 1989b and c).

- Task 2 - Additional Study Area Characterization - This task included the following four subtasks:

  1 - Additional Source Characterization - Under this subtask, 32 additional borings were drilled, 283 soil samples were collected and analyzed, and soil gas surveys were performed.

  2 - Additional Piezometer Installation - One piezometer (23P) was installed to help evaluate the effectiveness of the interim groundwater extraction system.

  3 - Groundwater Sampling and Analysis - Groundwater samples were collected from all Intersil monitoring wells. Samples were analyzed

for VOCs, semi-volatile organic compounds (semi-VOCs), and Priority Pollutant metals (metals).

4 - Evaluation of Interim Remedial Measures - This task included further evaluation of the effectiveness of the groundwater extraction system using water-level data from the new piezometer and existing wells and performing a long-term recovery test of well W10A, and evaluation of the vapour extraction system by performing a soil gas pumping test.

- Task 3 - Baseline Risk Assessment - This task was performed by Clement under contract to the RWQCB.

- Task 4 - Remedial Investigation Report - This task included preparation of a draft RI report and includes preparation of this final RI report incorporating RWQCB and EPA comments.

- Task 5 - Progress Reports - Monthly progress reports have been submitted to the RWQCB by BEAK on behalf of Intersil. These reports contain documentation of progress on RI tasks and projections for additional work and scheduling.

- Task 6 - Meetings - On an as needed basis, Intersil and its consultants met with RWQCB staff to discuss Intersil's progress on the RI tasks.

Additional tasks required by the SCR include the following:

- Task 7 - Administrative Record - A technical report containing a proposal for developing the Administrative Record for the Intersil and Siemens sites was submitted to the RWQCB on 28 April 1989 and a revised index was submitted to the RWQCB on 12 April 1990. A copy of the revised index is attached as Appendix F.

- Task 8 - Additional Report Preparation - The RWQCB required the submittal of technical reports documenting additional remedial investigations prior to submittal of the RI report. Interim results of these additional investigations were reported to the RWQCB in a report by Geomatrix, dated 17 April 1989, and in reports by BEAK dated 26 June 1989 and 22 August 1989 (Geomatrix, 1989f; BEAK, 1989a and 1989b).

The following section contains a discussion of the scope of work conducted by Geomatrix and BEAK to complete the additional study area characterization outlined in Task 2 above.

3.1 Additional Source Characterization

Additional investigation of potential sources of the chemicals detected in soil and groundwater at the Property was divided into two parts. First, those locations previously identified as potential sources were further investigated. These areas included the north and east neutralization systems, the north and east scrubber sumps, the inactive east neutralization system, and the above-ground waste storage area. In these areas, additional soil borings were drilled and soil samples were collected and chemically analyzed. Second, a soil gas survey was performed to identify any additional potential source areas. These areas were further investigated by drilling borings and collecting soil samples for chemical analysis.

3.1.1 Soil Investigation at Potential Source Areas

The vertical and lateral distributions of VOCs in soil at previously identified potential source areas were established by collecting and analyzing soil samples from 16 borings drilled in April and May 1989. Eleven borings were drilled to a depth of about 100 feet, including five (borings RI-5, RI-8, RI-9, RI-10, and RI-11) to assess the vertical extent of chemicals at the locations of former in-ground sumps and neutralization systems, four (borings RI-1, RI-2, RI-3, and RI-4) to assess the lateral extent of chemicals at the northern and western property boundaries, and two (borings RI-6 and RI-7) to assess the lateral extent of chemicals associated with the area near well W18B. Five borings (RI-12, RI-13, RI-14, RI-15, and RI-16) were drilled to a depth of 30 feet to assess the quality of near-surface soils at the former above-ground waste storage area. The locations of all of these borings are shown on Figure 2.1.

Soil samples were collected at approximately 10-foot intervals from all 16 borings and analyzed for VOCs using EPA Method 8240. Additional samples were collected from depths of approximately 10, 20, and sometimes 30 feet from each of

these borings and analyzed for semi-VOCs (using EPA Method 8270), Priority Pollutant Metals (Ag, As, Be, Cd, Cr, Cu, Hg, Ni, Pb, Sb, Se, Tl, Zn) using EPA Methods 6010, 7060, 7471, and 7740 and cyanide using EPA Method 9010. No semi-VOCs were detected in any of the recently-collected (since June 1989) soil samples. Results of the other soil sample analyses are presented in Tables 2.2a, and c, which summarize the results of all VOC, and Priority Pollutant Metal and cyanide analyses performed on soil samples collected from the Property, respectively. These geochemical data were used investigate the existence of any additional potential sources of VOCs and further delineate their extent in the vadose zone at the Property. Detailed discussions of the relevance of these soil chemistry data with respect to the investigative objectives outlined above are presented in the BEAK report entitled "Completion of Piezometer, Soil Borings and Additional Soil Gas Survey", dated 26 June 1989 (BEAK, 1989a). These discussions are summarized in Sections 5.1.3 (Investigation of Potential Sources) and 5.1.4 (Investigation of Extent of VOCs in the Vadose Zone) of this report.

To facilitate adequate lithologic description and hydrogeologic characterization, the borings were all continuously cored using the hollow-stem auger drilling method. Details of the soil boring program and lithologic logs of the borings are presented in the BEAK report entitled "Completion of Piezometer, Soil Borings, and Additional Soil Gas Survey," dated 26 June 1989 (BEAK, 1989a). The lithologic data obtained during this investigation and presented in the BEAK report of 26 June 1989 (BEAK, 1989a) was used to complete the interpretation of site geology presented in Section 4.2.2 (Site Geology) of this report.

3.1.2 Soil Gas Investigation

The presence of additional potential sources was investigated by collecting and analyzing soil gas samples from the 85 locations shown on Figure 3.1. The soil gas sample locations were positioned in a regular grid that covered the entire site except for the area beneath the buildings. The 85 soil gas locations yielded 109 soil gas samples which were analyzed for VOCs in the field, and in the laboratory using modified EPA Method 8010. Results of the soil gas sample analyses, conducted between March and May 1989, are presented in Table 3.2. The results of the soil gas investigation and discussions of their significance can be found in

the Geomatrix report entitled "Results of Soil Gas Investigation," dated 17 April 1989 (Geomatrix, 1989f) and the BEAK report titled "Completion of Piezometer, Soil Borings, and Additional Soil Gas Survey," dated 26 June 1989 (BEAK, 1989a). These discussions are summarized in Section 5.1.3.3 (Soil Gas Survey) of this report.

3.1.3 Additional Soil Investigation

Additional soil boring programs were conducted in July and November 1989 to further delineate the lateral extent of VOCs in soil at the Property. Fourteen additional soil borings were drilled in July 1989 at the locations shown on Figure 2.1. Thirteen of these borings (RI-18 through RI-30) were drilled to a maximum depth of 45 feet directly beneath the former Intersil building to investigate whether a wastewater pipeline beneath the building may have been a source of VOCs. One boring (RI-17) was drilled to a depth of 100 feet in the central portion of the Property to investigate the distribution of VOCs near an entrance to the former Intersil building where VOCs were detected in soil gas samples. Soil samples were collected for chemical analysis (EPA Method 8240) at approximate 5- to 10-foot intervals from these borings. Results of these analyses are included in Table 2.2a. A detailed discussion of the results of the investigation is presented in the BEAK report entitled "Completion of Additional Soil Borings," dated 22 August 1989 (BEAK, 1989b). This discussion is recapped in Sections 5.1.3.2 (Other Near-Surface Soils) and 5.1.4 (Investigation of Extent of VOCs in the Vadose Zone) of this report.

Two additional borings (RI-31 and RI-32) were drilled at the site in November 1989 (Figure 2.1) for the purpose of collecting soil samples for fraction of organic carbon (FOC) and moisture-density analyses and for additional VOC analyses (EPA Method 8240). These borings were drilled to an approximate depth of 100 feet to evaluate the lateral extent of VOCs east of the north scrubber sump and east of the area near well W18B. Results of the FOC and moisture-density analyses are presented in Table 3.3. Summaries of the results of the VOC analyses are included in Table 2.2a and discussed in Sections 5.1.3.2 (Other Near-Surface Soils) and 5.1.4 (Investigation of Extent of VOCs in the Vadose Zone) of this report. Copies of

lithologic logs of these two borings and copies of laboratory analytical reports are presented in Appendix A.

3.2 Additional Piezometer Installation

Piezometer 23P (Figure 2.1) was installed to provide additional water-level data northeast of Intersil's interim groundwater extraction system for further evaluation of the system's effectiveness (Section 7.3.1). The piezometer was installed in the A-zone sediments to a depth of approximately 117 feet. Details regarding drilling, installation and development of the piezometer are presented in the BEAK report entitled "Completion of Piezometer, Soil Borings, and Additional Soil Gas Survey," dated 26 June 1989 (BEAK, 1989a).

3.3 Groundwater Sampling and Analysis

In March 1989, groundwater samples were collected from all Intersil wells as part of the quarterly self-monitoring program. In addition to the normal analytical protocol, which includes VOC analysis using EPA Method 8240, selected groundwater samples were analyzed for semi-VOCs using EPA Method 8270, and metals using various EPA Methods (6010, 7060, 7471, and 7740). The results of these analyses were presented and discussed in Intersil's Quarterly Self-Monitoring Report, Calendar Quarter January - March 1989, dated 15 April 1989 (Geomatrix, 1989h). For completeness, these results and the results of all other quarterly groundwater analyses are presented in this report in Tables 2.3 through 2.6. The results of these and all other analyses of groundwater samples are used to delineate the extent of the zone of VOC-bearing groundwater beneath the Property and evaluate the effectiveness of the interim remedial measures currently underway. These discussions are contained in Sections 5.2.2 (Groundwater Chemistry) and 7.3.1 of this report, respectively.

3.4 Evaluation of Interim Remedial Measures

The effectiveness of interim remedial measures at the site was evaluated as outlined in Intersil's Second Revised RI/FS Workplan (Geomatrix, 1989e). The capture area of the groundwater extraction system was evaluated using groundwater flow modeling techniques and observed water-level data, and groundwater quality was monitored on a quarterly basis. Analysis of data collected during a long-term recovery test of Well 10A provided an additional estimate of the transmissivity of the A-zone (Appendix B). This aquifer parameter was necessary for the utilization of the groundwater flow model. For the vapour extraction system, the capture area was evaluated using data generated during a pumping test, and soil vapour quality was monitored on a monthly basis. Discussions of the methods and results of these evaluations are presented in Section 7.0 of this report.

4.0 PHYSICAL CHARACTERISTICS OF THE STUDY SITE

4.1 Site Description

4.1.1 Surface Features

The Property is predominantly flat and slopes gently toward the north. A maximum drop in elevation from south to north of 7 feet across the property results in a northward slope of about one percent. The majority of the 4.5-acre site is covered by buildings and asphalt. A 30-foot wide planting strip, primarily covered by grass and trees, bounds the Property on the west; a 30-foot wide planting strip, transected by driveways and covered by shrubs and trees, bounds the Property on the north. Numerous small planter boxes with mature trees are present in the parking lot (Figure 1.2).

4.1.2 Meteorology

Cupertino has a mediterranean climate with warm, dry summers and cool, wet winters. Climatological data compiled for six weather stations located in the San Francisco mid-peninsula and south bay areas are presented in Table 4.1.

The mean annual rainfall in the Cupertino area is approximately 14 inches, with most of the rainfall occurring between October and April. The mean annual temperature for the area is approximately 60 degrees Fahrenheit, and the average wind speed is approximately 5 miles per hour. Prevailing winds are generally from the northwest, although winds from the south and southwest are common in December and January.

4.1.3 Surface Water Hydrology

Surface runoff at the site is directed via swales in the pavement to numerous catch basins and storm drains located around the parking lot. Surface runoff in the region is directed via municipal storm drains to Calabazas Creek, located approximately 1000 feet east of the property boundary. The location of the storm drain outfall at Calabazas Creek is shown on Figure 1.1.

4.1.4 Ecology

Wetlands and Nature Reserves - Sensitive environments within the Santa Clara Valley and San Francisco Bay Regions include wetlands and nature reserves, neither of which were identified at the Property. Salt marshes located along Alviso and Guadalupe sloughs as they approach San Francisco Bay (6 to 7 miles to the north of the Property) are the vegetated wetlands nearest to the Property. Barren intertidal wetlands used as salt evaporators are found approximately 5.5 miles to the north of the Property, along the edge of San Francisco Bay.

The San Francisco Bay National Wildlife Refuge, located approximately 7 miles to the north, is the nearest nature reserve to the Property.

Critical Habitats and Endangered Species - Two endangered species, the California clapper rail (*Rallus longirostris*) and the salt marsh harvest mouse (*Reithrodontomys raviventris*), are known to inhabit the tidal marshes at South San Francisco Bay and the bayshore (WCC, 1987c). The endangered California brown pelican is occasionally observed in the South San Francisco Bay Area, but does not nest there (WCC, 1987c). The ranges of the American peregrine falcon and southern bald eagle, both of which are endangered species, are known to include the South San Francisco Bay area. These species do not, however, use bay and bayshore habitats (WCC, 1987c). None of the species discussed above use any portion of the Property for habitat.

4.2 Geology

4.2.1 Regional Geology

The Property is located in the southern part of the San Francisco Bay area in a physiographic region known as the West Side Alluvial Apron (California Department of Water Resources, 1967). This region consists of coalescing alluvial fans that fill part of the structural trough between the Santa Cruz Mountains to the west and southwest and the Diablo Range to the east and northeast. The axis of this structural trough probably underlies San Francisco Bay, a drowned river valley that stood above sea level during Pleistocene glacial stages. San Francisco

Bay lies approximately 7 miles northeast of the site. The alluvial sediments generated by erosion of the Santa Cruz Mountains highlands have gradually filled the portion of the structural trough underlying the site region.

The alluvial fan deposits can be separated into semiconsolidated and unconsolidated units. The semiconsolidated unit, known as the Santa Clara Formation, dips to the east-northeast. The unconsolidated alluvium unconformably overlies the Santa Clara Formation and may extend to a depth of approximately 1,000 feet below the Property. Interbedded and interlensing mixtures of gravel, sand, silt and clay comprise the Santa Clara Formation and unconsolidated alluvial deposits.

The interbedded and interlensing nature of the gravel, sand, silt and clay deposits results from the alternating depositional and erosional processes which occur in alluvial environments. Down-cutting of alluvial channels into previously deposited layers and subsequent filling of these channels by coarse-grained deposits typically occur in one part of the area, while continued deposition of fine-grained sediments occurs at another part. Because alluvial channels migrate laterally through time as a response to changes in sediment supply, uplift rate of the Santa Cruz Mountains, or base level change in the streams, many of the individual beds in the alluvial deposits underlying the study area are lenticular, and pinch out or interfinger with beds of differing lithologies. There are, however, relatively thick laterally continuous layers of fine-grained sediments interlayered with multilayered fine and coarse-grained material beneath the site region. These layers reflect major shifts in orientation of the main active channel systems through time.

4.2.2 Site Geology

Lithologic and geophysical logs of borings provided the basis to develop stratigraphic relationships beneath the Property. The information obtained from the continuous coring of the RI borings suggests that several strata may be laterally correlated across the site. Generalized Cross Sections A-A', B-B', C-C' and D-D' (Figures 4.1a and 4.1b) illustrate the stratigraphic conditions in the vicinity of the Property. Figure 4.1c shows the locations of these cross sections.

In most of the borings, samples from the upper 5 to 10 feet consisted of sandy or silty clay. Underlying these clayey soils and extending to a depth of approximately 40 feet, the samples consisted primarily of relatively thinly bedded mixtures of clay, silt, sand and gravel. Between depths of approximately 40 and 60 feet, samples consisted primarily of mixed sand and gravel. Below this level, samples from many of the boreholes indicated a 2- to 5-foot thick layer of fine-grained sediments consisting of clay, silt and sand mixtures. Between depths of approximately 65 and 80 feet, samples consisted primarily of sand and gravel. Samples from beneath this level consisted primarily of fine-grained sediments in layers up to 10 feet thick.

Deposits below a depth of approximately 90 feet and extending to a depth of approximately 115 feet are characterized by interlayered lenticular beds of coarse-grained sediments, consisting primarily of sand, and fine-grained sediments consisting primarily of silt. Beneath these interlayered beds, samples indicate a fine-grained unit consisting of clay, silt and sand mixtures. This unit is generally found in samples collected from depths extending to approximately 130 feet, although the thickness of the unit varies across the site and vicinity. Samples of deposits below a depth of approximately 130 feet and extending to a depth of approximately 150 feet are characterized primarily by sand and gravel, with minor fine-grained lenses. Below a depth of 150 feet and extending to a depth of approximately 180 feet, samples indicate another unit of fine-grained sediments consisting primarily of clay and silt. Below this fine-grained unit, samples indicate another coarse-grained unit consisting primarily of sand and gravel with minor fine-grained lenses and extending to a depth of approximately 210 feet.

4.3 Hydrogeology

4.3.1 Regional Hydrogeology

Groundwater occurs in the unconsolidated alluvial deposits in the region under both unconfined and confined conditions. Throughout the vicinity of the Property, these deposits are generally saturated below depths of 100 to 110 feet, which correspond to approximate elevations at the Property of 40 to 50 feet (National

Geodetic Vertical Datum of 1929 (NGVD)). Locally, perched groundwater zones occurring under unconfined conditions are found at higher elevations.

Within the upper approximately 210 feet of sediments, four relatively permeable, saturated, water-bearing zones have been identified. These zones, termed the "Shallow Water-Bearing Units," are illustrated on Figure 4.2 and are discussed in detail in Section 4.3.2. There are no confirmed present uses of groundwater from the Shallow Water-Bearing Units in the vicinity of the Property for either domestic, municipal, agricultural or industrial water supply. The Shallow Water-Bearing Units are underlain by a thick, low hydraulic conductivity unit termed the "Regional Aquitard", which separates them from the "Deeper Aquifers" (Figure 4.2). The deeper aquifers are found at depths of approximately 300 feet or more in the region. Groundwater in the Deeper Aquifers below the Regional Aquitard is pumped for municipal and agricultural supply.

4.3.2 Hydrogeology of the Property and Vicinity

Beneath the Property and vicinity, the four zones comprising the Shallow Water-Bearing Units, designated locally as "perched groundwater", "A-zone", "B-zone", and "C-zone", extend to a depth of approximately 210 feet. The configuration of these zones is illustrated schematically on Figure 4.3. The Regional Aquitard has been identified in the Property vicinity between approximate depths of 210 feet and 300 feet. Beneath the Regional Aquitard, the Deeper Aquifers have been investigated to an approximate depth of 500 feet in the Property vicinity. (It should be noted that correlations between depth and elevation values cited in this section apply to the Property only. Because the land surface slopes to the north, these correlations cannot be applied beyond the Property to the north.) A conceptual groundwater flow model for the Property and vicinity and the hydrogeologic properties of each of these zones are described in the following sections.

4.3.2.1 Conceptual Groundwater Flow Model

A conceptual flow model is described here to help illustrate the general movement of groundwater in the Property vicinity (Figure 4.3). Groundwater recharge in the Property vicinity is principally the result of irrigation and rainfall on pervious areas (lawns, fields, vacant land), and infiltration of surface runoff in Calabazas Creek. This groundwater recharge moves vertically downward in the vadose (unsaturated) zone until it is intercepted by either a perched groundwater zone or the A-zone. In a perched zone, groundwater spreads laterally until it reaches a boundary or until a balance between inflowing and outflowing water is achieved, and the groundwater then resumes its downward vertical transit. To maintain the continuity of groundwater recharge moving through the vadose zone, a saturated (perched) unit will form allowing groundwater to spread laterally over a larger area. The direction of groundwater movement in a particular perched unit is governed by the slope of the free surface of that perched unit, which can also be influenced by the slope of the underlying low hydraulic conductivity interface. Where the perched groundwater spreads laterally to the edge of a low hydraulic conductivity unit, it can drain vertically, and unsaturated conditions will resume. In this manner, a particular parcel of groundwater recharge may be offset laterally from the overlying area where it infiltrated the near-surface deposits. This stair-stepping process is independent of the local A-zone groundwater flow direction.

In the A-zone, most of the groundwater moves laterally in the general direction of the hydraulic gradient, while some groundwater moves vertically downward through the aquitard separating the A- and B-zones (Figure 4.3). The absence of this aquitard facilitates the downward vertical movement of groundwater between the A- and B-zones. Groundwater movement within and between the B- and C-zones is similar to that in the A-zone. Although the potential for groundwater movement between the C-zone and the Deeper Aquifers is downward, relatively little groundwater movement occurs because of the thick and continuous nature of the Regional Aquitard (Figure 4.10). In the deeper aquifers, the direction of groundwater movement is influenced by pumping from municipal and agricultural wells, which is the principal component of groundwater discharge from these units. Most groundwater movement in the deeper aquifers is expected to be lateral; however, groundwater also moves vertically downward between the sand and gravel layers that comprise the deeper aquifers.

4.3.2.2 Perched Groundwater

The uppermost water-bearing zone within the Shallow Water-Bearing Units, termed perched groundwater (Figure 4.3), occurs under unconfined conditions. Perched groundwater is defined as a saturated hydrogeologic unit that exists above the water table and is underlain by unsaturated deposits. It is a local zone of saturation within the vadose zone. Perched groundwater occurs where there is ample groundwater recharge and a bed of relatively low hydraulic conductivity that impedes the downward movement of groundwater in the vadose zone.

The lenticular geometry of the stratigraphic units beneath the Property and vicinity contributes to the formation and discontinuous nature of perched groundwater. Perched groundwater was encountered near the western boundary of the Property, at an approximate depth of 74 feet below ground surface (bgs) (elevation of 66 feet NGVD) and is monitored by well W4A. Lawn irrigation in this area is thought to contribute to this perched groundwater condition. As part of the interim remedial measures performed at the Property, groundwater has been extracted from well W4A since December 1987 (Section 7.0). The yield of this well is very low.

A water-level hydrograph for the perched well at the Property is illustrated in Figure 4.4. The hydrograph of a typical A-zone monitoring well, W2A, is presented in the same figure to exhibit how the characteristic pattern exhibited by the perched well hydrograph differs from that of an A-zone well. Water level elevations in the perched well W4A are approximately 20 feet higher than those measured in the A-zone well. Additionally, the hydrograph of the perched well is notably more flat when compared to that of the A-zone well whose water level oscillates by approximately three feet during the course of a year. The two hydrographs are similar in that the average water levels in both the perched- and A-zone well have gradually decreased since February 1986.

4.3.2.3 A-Zone

The A-zone is the uppermost, laterally continuous zone of saturation, and is historically encountered between depths of about 90 and 115 feet beneath the Property and vicinity. It consists of a heterogeneous assemblage of lenticular deposits with varying lithologies, but is comprised primarily of sand and silt. Beneath the Property, the A-zone presently extends from the top of the zone of saturation (water table), at an approximate depth of 100 feet bgs (elevations of 40 to 46 feet NGVD (National Geodetic Vertical Datum of 1929)), to the top of a sandy clay and silty clay layer at approximate depth of 115 feet bgs (elevations between 25 and 30 feet NGVD).

Groundwater in the A-zone occurs under unconfined conditions and is generally brackish. Nitrate concentrations generally exceed the primary drinking water standard (maximum measured = 27 milligrams per litre (mg/L) as N; standard = 10 mg/L as N), and the specific conductance generally exceeds the recommended secondary drinking water standard of 900 micromhos per centimetre at 25 degrees Celsius (Geomatrix Consultants, 1986b).

The saturated thickness of the A-zone varies seasonally as the water table fluctuates, as illustrated in the water-level hydrographs for selected A-zone wells (Figure 4.5). The thickness of the A-zone also apparently varies in response to yearly rainfall variations. A-zone water levels in non-pumping wells at the Property have declined approximately 4 feet between 1986 and 1989 (Figure 4.5). This decline was likely a consequence of below-average rainfall during the last two of these years and groundwater extraction from the A-zone at the Property since December 1987 (Section 7.0).

Water-level measurements collected in 1986 and 1987 indicate that, prior to starting groundwater extraction from A-zone wells on the Property, the elevation of the potentiometric surface in the A-zone at the Property has ranged from about 39 to 50 feet NGVD. Pumping water levels in groundwater extraction wells at the Property (W5A, W10A, W12A and E17A) have been as low as approximately 30 feet NGVD (Geomatrix, 1990). In any one monthly water-level measurement period, the difference in A-zone water levels between the upgradient and downgradient parts of the Property has ranged from approximately 6 to 8 feet.

The interlayered nature of the fine-grained and coarse-grained deposits which comprise the A-zone sediments result in large local variations in hydraulic conductivity. Laboratory permeameter tests conducted on selected A-zone soil samples provide hydraulic conductivity estimates at discrete sampling locations, while aquifer tests (pumping tests and recovery tests) conducted on A-zone extraction wells provide hydraulic conductivity estimates of a larger zone in the vicinity of the tested well.

The results of laboratory permeameter tests conducted on soil samples collected from A-zone depths in borings B8A and B9 beneath the Property are summarized in Table 4.2. These samples were classified in the field at the time of drilling as sandy clay to gravelly silty sand. The hydraulic conductivities of these samples ranged from approximately 2×10^{-8} centimetres per second (cm/s) (5.7×10^{-5} feet per day (ft/d)) to 2×10^{-6} cm/s (5.7×10^{-3} ft/d).

The hydraulic conductivity of the A-zone was also estimated from aquifer pumping and recovery tests performed on well W10A by Geomatrix (Geomatrix, 1987c and Appendix B). Using two methods of type-curve analysis of the pumping test, which was conducted prior to startup of the interim groundwater extraction system, hydraulic conductivity values of 1.9×10^{-2} to 2.6×10^{-2} cm/s (55 to 75 ft/d) were estimated for the coarse-grained deposits found between depths of 102 and 111 feet in the vicinity of well W10A. However, drawdown in the pumping well increased dramatically after 57 hours of pumping, indicating that the coarse-grained deposits have a limited lateral extent. Geomatrix recently conducted an aquifer recovery test in well W10A to assess the hydraulic conductivity of deeper, fine-grained A-zone sediments in the vicinity of this well. It is these finer grained sediments that will continue to transmit water during the continued operation of the A-zone groundwater extraction system at the Property. The methods and results of this test are presented in Appendix B. The results of this test suggest that the deeper sediments within the A-zone have a much lower hydraulic conductivity (2.2×10^{-3} to 2.8×10^{-3} cm/s (6.2 to 8.0 ft/d)) than that calculated from drawdown data collected during the initial, pumping and recovery tests conducted on well W10A.

The lateral direction of movement of groundwater in the A-zone has been inferred from the gradients exhibited by its potentiometric surface. Potentiometric surface maps compiled from monthly water-level data collected since 1986 are presented in Intersil's Second Revised Remedial Investigation/Feasibility Study Workplan (Geomatrix, 1989e) and in Intersil's Quarterly Self-Monitoring Program reports (Geomatrix, 1989g; 1989h; 1989i; 1989j; and 1990).

Representative features of the A-zone potentiometric surface at the Property are illustrated by the potentiometric surface maps for three of these monthly monitoring periods, which are provided in Figures 4.6a, b and c. Two of these maps (Figures 4.6a and 4.6b), for 07 November 1986 and 02 July 1987, illustrate the configuration of the A-zone potentiometric surface before groundwater extraction from A-zone wells on the Property began. The third map (Figure 4.6c), for 05 September 1989, is representative of recent times when A-zone groundwater extraction wells at the Property were pumping.

The potentiometric surface of the A-zone as interpreted is relatively complex, and a single direction of A-zone groundwater movement does not predominate at the Property. Because Intersil has been pumping groundwater from A-zone extraction wells, and because the geologic materials underlying the site are naturally heterogeneous, flow patterns in the A-zone appear to be irregular.

Prior to A-zone groundwater extraction on the Property, A-zone groundwater moved northeastward in the western part of the site; the magnitude of the lateral hydraulic gradient in this area was about 0.02 foot per foot (ft/ft) (Figures 4.6a and 4.6b). A-zone groundwater moved north-northeastward beneath the southern and central parts of the Property; the magnitude of the lateral hydraulic gradient in this area was approximately 0.01.

Since the commencement of extraction of A-zone groundwater from beneath the Property (December 1987), A-zone groundwater beneath most of the site south of the extraction wells (W5A, W10A, W12A and E17A) has been moving north and north-northeastward toward the extraction wells. The magnitude of the lateral hydraulic gradient under these pumping conditions ranges from about 0.02 to 0.04

under most of the site, although the hydraulic gradient probably is even greater near the extraction wells.

4.3.2.4 A/B Aquitard

The lower boundary of the A-zone is delineated beneath the site by sandy clay and occasionally silty clay deposits, termed the "A/B-aquitard." The A/B aquitard is found between approximate depth of 115 feet bgs (elevations of 25 to 30 feet NGVD) and 130 feet bgs (elevations of 10 to 15 feet NGVD). All borings on the Property that penetrated to these depths encountered this clayey hydrogeologic unit. The thickness of the A/B aquitard beneath the Property ranges between approximately 7 and 25 feet. The A/B aquitard appears to be continuous throughout the Property; in contrast, well E-8B in the eastern part of the AMI site reveals a possible conduit between the A- and B-zones (EMCON, 1989).

A downward vertical hydraulic gradient is measured between the A-zone and the B-zone in the Property vicinity. The magnitude of the vertical hydraulic gradient varies both laterally and with seasonal water-level fluctuations. Gradients calculated over a two-year period within the Property have ranged from 0.03 to 0.85 ft/ft (Geomatrix, 1989d). The average magnitude of the vertical hydraulic gradient between the A- and B-zones at the location of wells W11B and W12A, drilled adjacent to one another and completed in the B-zone and the A-zone, respectively, is approximately 0.21, for the 12-month period from September 1986 to September 1987, the month when groundwater extraction from well W12A at the Property began.

4.3.2.5 B-Zone

The B-zone is a saturated, laterally continuous zone of coarse-grained deposits, primarily sand and gravel, with minor fine-grained lenses (Figures 4.1a and 4.1b). Beneath the Property, the B-zone has been encountered between depths of approximately 130 and 150 feet (approximate elevations of 10 and -10 feet NGVD). Borings advanced to sufficient depths to encounter the B-zone indicate that the B-zone ranges in thickness from approximately 5 to 20 feet. The bottom of the B-zone ranges between approximate elevations of -5 and -10 feet NGVD; the top of the B-zone ranges between approximate elevations of 5 and 10 feet NGVD.

Groundwater in the B-zone occurs under confined conditions and generally meets the primary and secondary drinking water standards for nitrate and specific conductance (Geomatrix, 1986b).

The elevation of the potentiometric surface of the B-zone has varied seasonally by up to 10 feet, as illustrated by the water-level hydrographs for selected B-zone wells located at the Property (Figure 4.7). B-zone water levels in non-pumping wells at the Property have declined approximately three to six feet between 1987 and 1989. This decline is likely the consequence of below-average rainfall during the last two of these years and groundwater extraction from B-zone wells since March 1988.

Water-level measurements collected in 1986, 1987, 1988 and 1989 indicate that elevations of the potentiometric surface of the B-zone at the Property have ranged from 26 to 39 feet (NGVD). These elevations are noted to be approximately 15 to 30 feet above the top of the B-zone. The B-zone potentiometric surface beneath the Property has been relatively flat in all months of record, which results in a low lateral hydraulic gradient. In any one monthly water level measurement period, the difference in B-zone water levels between the upgradient and downgradient parts of the Property generally has been less than 0.6 foot and, in certain periods, has been as low as 0.2 foot.

The hydraulic conductivity of the B-zone deposits beneath the Property has not been measured directly. The B-zone hydraulic properties were estimated based on the results of several pumping tests of potential groundwater extraction wells performed by Siemens (Levine-Fricke, 1990). The B-zone wells that were tested (3-EB, H-3B, H-5B and LQ-2B) are located at the Siemens facility and in the off-site area to the north (Figure 2.2). The hydraulic conductivity of the B-zone deposits is estimated to range from approximately 2.8×10^{-3} to 1.0×10^{-2} cm/s (8 to 30 ft/d).

The lateral direction of groundwater movement in the B-zone has been inferred from the gradients of its potentiometric surface. Potentiometric surface maps

compiled from monthly water-level data collected since 1986 are presented in Intersil's Second Revised Remedial Investigation/Feasibility Study Workplan and in Intersil's Quarterly Self-Monitoring Program reports.

Representative features of the B-zone potentiometric surface at the Property are illustrated by the potentiometric surface maps for three of these monthly monitoring periods, which are provided in Figures 4.8a, b and c. Two of these maps (Figures 4.8a and 4.8b), for 02 September 1986 and 01 April 1987, illustrate the configuration of the B-zone potentiometric surface before groundwater extraction from off-site B-zone wells began. The third map (Figure 4.8c), for 05 September 1989, is representative of recent times when off-site B-zone groundwater extraction wells were pumping.

During some months when water-level monitoring was performed by Intersil, the lateral hydraulic gradient for the B-zone beneath the Property was generally northward and northwestward. The potentiometric surface map for 01 April 1987 (Figure 4.8b) illustrates these conditions. The magnitude of the lateral hydraulic gradient beneath the Property for this monitoring period ranged from about 0.0007 to 0.001 (ft/ft).

However, periodically the B-zone lateral hydraulic gradient beneath the northern part of the Property has indicated that groundwater in the B-zone moved from north to south (Figures 4.8a and 4.8c). These gradient reversals occurred during the summer and fall months, approximately June through October, in 1986 and 1987, and are thought to have been caused by responses to a seasonal decrease in water-levels. The magnitude of the lateral hydraulic gradient beneath the northern part of the Property for these monitoring periods ranged from about 0.0008 to 0.002. The effect of these gradient reversals on VOC migration between the Property and the Siemens facility is difficult to quantify; however, it is thought that VOC migration rates would be decreased.

Since March 1988, B-zone groundwater beneath most of the Property has been moving generally northward toward the extraction wells. Some southward groundwater movement at the northern portion of the Property may still be

occurring. The B-zone potentiometric surface at the Property under these conditions is, however, very flat indicating that the lateral hydraulic gradients are very low.

4.3.2.6 B/C Aquitard

A clayey unit termed the B/C-aquitard is found between approximate depths of 150 and 180 feet bgs (elevations of -10 and -40 feet NGVD) at the Property and vicinity. All borings at the Property that penetrated to these elevations encountered this clayey hydrogeologic unit.

A downward vertical hydraulic gradient is measured between the B-zone and the C-zone in the Property vicinity. The magnitude of this vertical hydraulic gradient for two recent months (July 1989 and September 1989) ranged from approximately 0.02 to 0.06 for five B-zone and C-zone well "pairs" located north of the Property. The mean vertical gradient was 0.04, with a standard deviation of 0.01. These data are presented in Table 4.3. The vertical hydraulic gradient appears to vary slightly among the various well pairs in the Property vicinity.

4.3.2.7 C-Zone

Based on the findings of boring B9 drilled on the Property, the B/C-aquitard is underlain by sand and gravel deposits that are interbedded with minor fine-grained deposits. This zone, designated the C-zone, is found beneath the Property at depths between approximately 180 and 210 feet bgs, which correspond to approximate elevations of -40 to -70 feet NGVD. Thicknesses of sand and gravel deposits in the C-zone range from approximately 10 to 30 feet.

Groundwater in the C-zone occurs under confined conditions and generally meets the recommended secondary drinking water standard for specific conductance (WCC, 1987a).

The elevation of the potentiometric surface in C-zone wells north of the Property has ranged from approximately 15 to 33 feet (NGVD) in measurements collected in 1986, 1987, 1988 and 1989. These elevations have generally been about 50 feet or more above the top of the C-zone. In any one monthly water-level measurement

period, the difference in C-zone water levels between the upgradient and downgradient wells has been approximately 4 feet.

The potentiometric surface of the C-zone has varied seasonally by up to about 12 feet, as illustrated by the water-level hydrographs of selected C-zone monitoring wells (Figure 4.9). C-zone water levels have declined approximately 2 to 3 feet between 1987 and 1989. This decline is probably the result of below-average rainfall during the last two of these years.

Measurements of the hydraulic conductivity of the C-zone deposits at the Property have not been performed.

Groundwater in the C-zone moves generally to the northeast, as inferred from the shape of its potentiometric surface. A representative potentiometric surface map for the C-zone, for 05 September 1989, is presented in Figure 4.10. The magnitude of the lateral hydraulic gradient for the C-zone was approximately 0.001 ft/ft for this monthly monitoring period.

4.3.2.8 Regional Aquitard

Drillers' logs for irrigation and municipal wells in the area (Geomatrix, 1987a; 1988a) and the lithologic logs of deep aquifer wells BK-1, BK-2, BK-3 and BK-4 (WCC, 1987d; Geomatrix, 1988c) show a laterally continuous, interbedded sequence of fine-grained deposits below the C-zone (Figure 4.2). These relatively low hydraulic conductivity deposits beneath the C-zone correspond to the Regional Aquitard and are at least approximately 75 feet thick. The thickness of this unit, and its laterally continuous nature and low hydraulic conductivity greatly impede the downward movement of groundwater from the Shallow Water-Bearing Units into the Deeper Aquifers used for water supply.

4.3.2.9 Deeper Aquifers

Four separate coarse-grained units, consisting primarily of sand and gravel mixtures and separated by fine-grained units of variable thickness, have been identified between depths of 300 and 500 feet bgs in the vicinity of off-site wells BK-1 through BK-4. The locations of these wells are shown on Figure 2.2. These

wells were installed to investigate the quality of groundwater in water-bearing zones screened by the former Marchese Well No. 2 (Figure 1.1). Santa Clara Municipal Well No. 24, located approximately 1 mile northeast of the Property (Figure 1.1), is reportedly screened between depths of 300 and 700 feet bgs, suggesting that the Deeper Aquifers extend to a depth of at least 700 feet (Geomatrix, 1987a).

5.0 GEOCHEMICAL RESULTS OF THE REMEDIAL INVESTIGATION

5.1 Vadose Zone

5.1.1 Introduction

VOCs formerly used at the Property are relatively immiscible in water, generally having solubilities less than 1,800 mg/L (Table 5.1). Because of the relatively low solubilities of these compounds, only a small quantity of the chemical will dissolve in water. If an excess of the compound is added to the VOC/water mixture, a separate phase consisting essentially of pure VOC will exist. The water in this "two phase" (VOC and water) mixture would be saturated with respect to the VOC. In other words, the concentration of the VOC in the water would be roughly equal to its solubility.

VOCs can be released to the subsurface in three liquid forms:

- as a pure VOC (pure meaning that it contains no separate water phase, although the liquid may contain small quantities of co-dissolved immiscible VOCs);
- as part of a two-phase liquid mixture that contains both pure VOC and water with dissolved VOCs; and/or
- as a dissolved constituent in a release of wastewater.

The difference between the environmental impacts of releases of the three liquid forms listed above is dramatic. Soils through which pure VOCs have migrated characteristically contain up to about 100,000 mg/kg of that VOC, whereas soils which have been in contact only with water that contains dissolved VOCs should contain less than about 100 mg/kg of the VOC (detailed calculations of theoretical phase partitioning of pure and dissolved VOCs in soils from the Property are presented in Appendix C).

The wastewater treatment units and piping that were used at the former Intersil facility transferred and treated process wastewater containing the third form of

VOCs (dissolved VOCs) (refer to Section 1.2.2). Any uncontrolled releases of dissolved phase VOCs from any of these units should therefore have resulted in 10's to 100's of mg/kg of VOCs in the soils directly beneath the point of postulated system failure . If higher concentrations of VOCs were observed, this would indicate that the chemical was likely released either as a pure VOC (or a mixture of VOCs which contained virtually no water) or as part of a two-phase mixture of VOC and water. For example, a release of pure phase VOC from the vaulted 250-gallon waste solvent storage tank located in the vicinity of the former east neutralization system would have resulted in 1,000's to 100,000's of mg/kg of VOCs in the soils directly beneath the unit. However, as the following discussion illustrates, none of the soil samples analyzed had concentrations of VOCs greater than 10 mg/kg. Therefore, the results of investigations at the Property suggest that the VOCs detected at the Property likely resulted from the third form of release, VOCs dissolved in facility wastewater.

5.1.2 Results of Investigation of Vadose Zone Chemistry

The chemistry of the vadose zone soils and groundwater at the Property was investigated using several techniques. Soil quality was evaluated using chemical data from approximately 529 soil samples (455 on site and 74 off site) collected from 64 borings drilled during previous and more recent investigations . Chemical analyses of these soil samples included: EPA Methods 8010, 8020 and 8240 for VOCs; EPA Method 8270 for semi-VOCs; EPA methods 6010, 7060, 7471 and 7740 for Priority Pollutant Metals, and EPA Method 9010 for cyanide (Section 3.0). Selected samples were additionally analyzed for fraction of organic carbon (FOC) and moisture content and density. The results of all chemical analyses performed on soil samples collected from the Property are summarized in Tables 2.2a, b, and c (results of VOC, semi-VOC, and metals and cyanide analyses, respectively) and 3.3 (results of moisture content, density and FOC analyses). The results of the soil chemistry data are discussed in Sections 5.1.3 (Investigation of Potential Sources) and 5.1.4 (Investigation of Extent of VOCs in the Vadose Zone) of this report.

Soil gas samples were collected during the RI to evaluate the quality of near-surface soils, specifically in the vicinities of suspected source areas. Soil gas samples were analyzed for selected VOCs most frequently detected in soil sample

analyses. The results of soil gas sample analyses are compiled in Table 3.2 and presented on Figures 5.1a through 5.1f. Because a soil gas survey is relatively inexpensive and easy to conduct, it is often used as a screening tool to give an indication of the locations of potential areas of shallow VOC-bearing soil (potential source areas) at a site. This information concerning the VOC content of the shallow soils is considered to be indirect; the actual VOC content of the soils must therefore be confirmed by analyses of samples collected within the soil gas anomaly. The soil gas data are discussed in Subsection 5.1.3.3 (Soil Gas Survey) of Section 5.1.3 (Investigation of Potential Sources) of this report.

The quality of perched groundwater in the vadose zone beneath the Property was evaluated by collecting and analyzing samples from perched well W4A. Samples from this well were collected on a quarterly basis and analyzed for VOCs using EPA Method 8240. The results of these chemical analyses of perched groundwater (collected from well W4A) from beneath the site are presented in Table 2.3. Selected samples from this well were also analyzed for semi-VOCs using EPA Method 8270, and for Priority Pollutant Metals using EPA methods 6010, 7060, 7471 and 7740. No semi-VOCs, Priority Pollutant Metals were detected in any of the samples collected from perched well W4A. The results of VOC analyses of perched groundwater at the Property are discussed in Section 5.1.5 (Perched Water Chemistry in the Vadose Zone) of this report.

5.1.3 Investigation of Potential Sources

Wastewater treatment tanks and transfer lines constitute the primary potential subsurface sources of chemicals at the Property. Any leakage of these systems or accidental spillage of chemicals onto the ground surface would have resulted in elevated concentrations of chemicals in soils near the ground surface. To assess whether these facilities acted as sources or whether any other sources of chemicals existed at the Property, data characterizing the concentrations of priority pollutant metals, cyanide, and semi-VOCs in soil samples from the upper 20 feet, and VOCs in soil samples collected from the upper 35 feet of borings drilled directly beneath the former wastewater treatment facilities and at other locations at the Property were evaluated. The results of this evaluation are discussed below in Sections

5.1.3.1 (Near Surface Soils at Former Wastewater Treatment Facilities) and 5.1.3.2 (Other Near-Surface Soils) of this report.

Soil gas chemistry data, which describe the VOC content of shallow (5 to 20 feet) soil gas at 85 points spaced in a grid-like fashion across the study site, were evaluated together with soil chemistry data to determine whether any additional sources of VOCs not identified during the soil boring program existed at the Property. The results of this evaluation are discussed below in Section 5.1.3.3 (Soil Gas Survey) of this report.

5.1.3.1 Near-Surface Soils at Former Wastewater Treatment Facilities

Soil borings B2A, B3A, B6A, B7A, W2A, RI-5, RI-8, RI-9 and RI-11 were drilled and sampled at each of the former wastewater treatment facilities to assess whether any of these treatment units acted as sources of chemicals at the Property. Results of these investigations were presented and discussed in reports describing previous investigations (Geomatrix, 1989e) and interim reports of the RI (BEAK, 1989a; 1989b). The conclusions of these reports are summarized below.

Semi-Volatile Organic Compounds - With one minor exception, none of the samples collected from any of the borings drilled and sampled at the Property to investigate the former wastewater treatment units contained detectable concentrations of semi-VOCs. The exception consists of two detections of semi-VOCs in the 81-foot sample collected from boring B7A by Cooper in 1986. In this sample, 0.5 mg/kg of benzo(a)pyrene and approximately 20 mg/kg (semi-quantified) of an unidentified hydrocarbon were detected.

Priority Pollutant Metals and Cyanide - Neither cadmium nor selenium was detected in soil samples collected from the upper 20 feet of these borings. Concentrations of arsenic, beryllium, chromium, copper, mercury, nickel, lead, antimony, and zinc measured in these soil samples are within the range of background concentrations for soils in the San Francisco Bay Area as reported by Shacklette and Boergen (1984) (BEAK, 1989a). Local background concentrations of silver, thallium, and cyanide are not available.

Volatile Organic Compounds - TCE, toluene, 1,1,1-TCA, PCE, benzene and xylenes were each detected in one of the soil samples from the upper 35 feet of at least one of the borings drilled to investigate the former waste treatment facilities. Only TCE and xylenes were detected in concentrations exceeding 1.0 mg/kg.

A concentration of 1.80 mg/kg of xylenes was measured in the soil sample collected from 9.5 feet bgs in boring W2A. Since both of the samples collected directly above this sample and both of the samples collected directly below this sample contained no detectable xylenes, this data point is not considered to indicate the presence of a source of xylenes at this location.

The concentrations of TCE measured in all of the soil samples collected from depths less than 35 feet bgs are presented in Figures 5.2a, 5.2b and 5.2c. Figures 5.2a and 5.2b indicate that none of the soil samples collected from the upper 25 feet from borings in the vicinities of the former waste treatment facilities contained greater than 1.0 mg/kg TCE. The 26-foot and 31-foot depth soil samples from boring B7A contained 3.30 mg/kg and 2.00 mg/kg of TCE while the 31.5 foot sample from boring W2A contained 2.30 mg/kg of TCE. These three data points indicate that a source of TCE may have existed in the shallow subsurface in the vicinity of the former inactive east neutralization system. It is, however, important to note that the concentrations of TCE exhibited by these samples are relatively low (much less than 10 mg/kg) and consistent with concentrations that would be expected to result from leakage of water that contained relatively low concentrations of dissolved TCE (Appendix C). Since the former inactive east neutralization system handled wastewater which may have contained dissolved concentrations of TCE, not pure TCE, the interpretation of the data is consistent with the nature of this potential source that was known to exist in the vicinity of soil borings B7A and W2A.

5.1.3.2 Other Near-Surface Soils

All of the soil chemistry data collected from the upper 35 feet of soil borings other than those drilled expressly to investigate the former waste treatment facilities were evaluated to determine whether any additional sources of chemicals exist at the Property. Results of these investigations are presented and discussed in

reports describing previous investigations (Geomatrix, 1989e) and interim reports of the RI (BEAK, 1989a; 1989b). The conclusions of these reports are summarized below.

Semi-Volatile Organic Compounds - In addition to the single sample collected from the borings drilled and sampled expressly to investigate the former wastewater treatment facilities which contained measurable concentrations of two semi-VOCs, only one of the samples collected from any of the other borings drilled at the property contained any semi-VOCs. Specifically, in 1986, 0.5 mg/kg of benzo(a)pyrene was detected in the sample from a depth of 13.5 feet in boring B8A.

Priority Pollutant Metals and Cyanide - Concentrations of arsenic, beryllium, chromium, copper, mercury, nickel, lead, antimony, and zinc measured in samples collected from the upper 20 feet of borings drilled to investigate unidentified source areas are within the range of background concentrations for soils in the San Francisco Bay Area as reported by Shacklette and Boergen (1984) (BEAK, 1989a). Local background concentrations of silver, thallium, and cyanide are not available. Neither cadmium nor selenium was detected in any of the soil samples analyzed.

Volatile Organic Compounds - TCE, toluene, 1,1,1-TCA, PCE, Freon 113, benzene, xylenes and dichlorobenzenes were each detected in at least one of the 177 soil samples collected from the upper 35 feet of borings other than those drilled to investigate the former waste treatment facilities. Only one sample contained any VOCs in concentrations exceeding 1.0 mg/kg (the 10.9-foot sample from boring W18B contained 1.5 mg/kg of TCE). This data point, which is illustrated on Figure 5.2a (the level plan which shows ranges of the concentrations of TCE in all samples collected at depths less than 15 feet bgs) indicates that a source of TCE may have existed in the shallow subsurface in the vicinity of boring W18B. It is once again important to note, however, that the concentration of TCE exhibited by this sample is relatively low (much less than 10 mg/kg) and consistent with concentrations that would be expected to result from leakage of water which contained relatively low concentrations of dissolved TCE.

5.1.3.3 Soil Gas Survey

A soil gas survey was conducted in two phases in the shallow soils at the Property. These data were evaluated in conjunction with the shallow soil chemistry data to assess whether previously unidentified sources of VOCs existed. The results of the investigations, illustrated on Figures 5.1a through 5.1f, were presented to the RWQCB and interpreted in two interim RI reports (Geomatrix, 1989f; BEAK, 1989a). The conclusions presented in these reports are summarized below.

Several areas of the study site yielded soil gas samples which contained measurable concentrations of VOCs. The locations of these areas and the compounds detected are summarized as follows:

- Low concentrations (up to 9.0 ug/L) of Freon 113 and 1,1,1-TCA, and higher concentrations (up to 160 ug/L) of PCE and TCE were detected at soil gas locations A030 and SG17 located near the northwest corner of building T2. Concentrations of TCE measured in soil gas samples collected from this area ranged from 25 ug/L to 90 ug/L.

- Concentrations of TCE in soil gas samples collected from an elongate area centred on soil gas sample locations E020 and SG3, near well W18B, and extending southwest toward the former north scrubber sump, ranged from 25 ug/L to 180 ug/L.

- Concentrations of TCE measured in soil gas samples collected from a fairly circular area approximately 80 feet in diameter and centred at sample locations SG6 and D050, located along the east side of building T2 near the centre of the Property, ranged from 25 ug/L to 110 ug/L.

- Concentrations of TCE in the soil gas samples collected in the vicinity of the former north neutralization system ranged up to 20 ug/L.

Soil VOC data from borings situated within or immediately adjacent to these areas were evaluated to assess whether the elevated concentrations of VOCs observed in soil gas accurately reflect the geochemistry of the subsurface and, if so, the extent of the area of elevated VOCs in the soils.

None of the shallow soil samples collected from borings RI-1, RI-2, RI-24 and RI-25, all located near the northwest corner of the Property, contained greater than 1.0 mg/kg of TCE. The apparent near-surface source of VOCs at this location is therefore not substantiated by soil chemistry data. It is possible, however, that a very small release of VOCs to the subsurface may have occurred in the vicinity of the northwest corner of the site. This would explain the presence of a small amount of VOCs in the soil gas while the soil chemistry data in adjacent soil borings shows low or non-detectable concentrations of VOCs.

The second area of TCE in soil gas listed above is in the vicinity of well W18B. This area had previously been recognized as a potential source of TCE at the Property (Section 5.1.3.2). The extent of its effects in the subsurface will be discussed in Section 5.1.4.

Boring RI-17 was drilled and sampled to investigate the soil chemistry in the vicinity of the third area of TCE in soil gas listed above. Concentrations of TCE in soil samples collected from less than 30 feet bgs in this boring were all significantly less than 1.0 mg/kg, with a maximum of 0.096 mg/kg. For this reason this area is not considered to represent a source of VOCs at the Property.

Shallow soil samples from boring RI-5, located in the vicinity of the former north neutralization system, just southwest of the last area of TCE in soil gas listed above, did not contain detectable concentrations of TCE. Because the concentrations of TCE in soil gas are relatively low and because the shallow soil samples from adjacent boring RI-5 contained no detectable TCE, this area, in the vicinity of the former north neutralization system, is not considered to represent a source of VOCs at the Property.

In conclusion, the only area in which soil gas samples indicated a potential surface source of VOCs, and soil chemistry data also indicated a surface source, was at the area at the Property located near well W18B.

5.1.4 Investigation of Extent of VOCs in the Vadose Zone

The purpose of investigating the vadose zone chemistry was to define the vertical and lateral extent of VOCs in the vadose zone soils at the former Intersil facility. This information allows estimation of VOC distribution and total mass, which are necessary to evaluate remedial alternatives and design an effective remedial system.

All soil VOC data have been evaluated to determine whether the vertical and lateral extent of VOCs of concern beneath the Property have been adequately characterized. The results of the investigations and the detailed interpretation of the data (with the exception of those data collected from borings RI-31 and RI-32 drilled in August 1989) are presented in reports describing previous investigations (Geomatrix, 1989e) and interim RI reports (BEAK, 1989a; 1989b). The conclusions presented in these reports are summarized briefly below.

Toluene (detected in 261/455 samples), TCE (detected in 241/455 samples), PCE (detected in 38/455 samples), 1,1,1-TCA (detected in 14/455 samples) and Freon 113 (detected in 9/455 samples) are the VOCs that were most commonly detected in soil samples collected from the Property. Greater than about 90 percent of the VOC content of soils in the vadose zone at the Property is represented by these compounds. Of the compounds listed above, only TCE and total xylenes have been detected in concentrations that exceed 1.0 mg/kg in any soil sample from the Property. Concentrations of xylenes greater than 0.001 mg/kg were measured in 9 of the 455 on-site soil samples that have been collected from the Property. With the exception of samples from 9.5 foot depth and 26.5 foot depth from boring W2A, which contained 1.80 and 1.10 mg/kg of total xylenes respectively, none of the concentrations measured were greater than 0.370 mg/kg.

The distributions and concentrations of each of the commonly detected VOCs in all soil samples collected from the Property are presented in three-dimensional isometric projections in Figures 5.3a through 5.8b. The distributions of toluene, Freon 113, 1,1,1-TCA and PCE may be summarized as follows:

- The source of toluene appears to be widespread because the concentrations of toluene observed throughout the site are uniformly low (all less than 0.68 mg/kg) and the extent of toluene includes areas unaffected by other compounds. These data indicate that activities at the Property probably are not the source of toluene to the subsurface beneath the site.

- The maximum concentration of Freon 113 measured in soils from the site was 0.052 mg/kg. Freon 113 was detected in 9 of 455 on-site soil samples collected. Most of the soil samples in which Freon 113 was detected were collected from the northeast corner of the Property. The vertical and lateral extent of Freon 113 in this portion of the Property has been fully delineated (BEAK, 1989b). The other soil samples in which Freon 113 was detected are completely enveloped by an area of the vadose zone containing elevated concentrations of TCE and will therefore be considered with TCE.

- The maximum concentration of 1,1,1-TCA measured in soils from the site was 0.25 mg/kg. 1,1,1-TCA was detected in 14 of 455 on-site soil samples collected. As with Freon 113, most of the samples in which 1,1,1-TCA was detected were collected from the northeast corner of the site. The vertical and lateral extent of this VOC has been fully delineated in this area (BEAK, 1989b). Other samples containing 1,1,1-TCA are fully enveloped by an area of the vadose zone containing elevated concentrations of TCE.

- The maximum concentration of PCE measured in soils from the site was 0.28 mg/kg. PCE was detected in 38 of 455 on-site soil samples collected. The samples containing PCE can be grouped into three areas: (1) an area near the east scrubber sump; (2) an area northeast of building T2; and (3) the northeast corner of the site. The vertical and lateral extent of PCE near the east scrubber sump has been fully delineated (BEAK, 1989b). The area of detectable PCE in soil in the second area which is situated to the northeast of building T2 is enveloped by an area of elevated TCE and for which remedial operations are currently underway (Section 7.0). Like Freon 113 and 1,1,1-TCA, elevated concentrations of PCE were also detected in soil samples from an area in the northeast corner of the site. The vertical and lateral extent of PCE in this area is fully delineated (BEAK, 1989b).

Next to toluene, which was detected in low concentrations over most of the Property and is therefore not considered to be the result of activities at the former Intersil facility, TCE was the VOC most commonly detected. With the exception of two early detections of xylenes, TCE was the only VOC to be measured in concentrations exceeding 1.0 mg/kg; the maximum concentration measured was 10.0 mg/kg. With the exception of the area near the northeast corner of the Property, which contains measurable concentrations of Freon 113, 1,1,1-TCA and PCE and no significant levels of TCE, areas of the vadose zone containing elevated concentrations of TCE envelope all areas of the vadose zone containing measurable concentrations of all other VOCs detected at the site. Consequently, if remedial measures are established based on the extent of TCE, all other VOCs of concern at the site will also be treated coincidentally. For this reason the distribution of TCE will be considered in more detail than those of the other VOCs mentioned above.

Figures illustrating the distribution of TCE in the vadose zone beneath the Property are presented to demonstrate that the distribution of TCE beneath the Property has been fully characterized. Level plans showing the concentrations of TCE in all of the soil samples collected at the Property are presented in Figures 5.2a through 5.2i. Each figure shows the boring locations and concentrations of TCE measured in discrete samples collected from within the depth interval specified in the figure title. The position of each boring is shown by a cross on the figure. The concentration of TCE measured in each sample is depicted using circles of different sizes around the boring locations. To simplify the process of evaluating the data, all concentrations of TCE are divided into two classes; greater than or equal to 1.0 mg/kg, and less than 1.0 mg/kg. These figures can be used to establish the three-dimensional extent of areas of the subsurface containing greater than 1.0 mg/kg of TCE and are useful for designing remedial activities.

As discussed previously, the first three figures in the series (Figures 5.2a, 5.2b and 5.2c) show the concentration of TCE in all soil samples collected from depths of less than 35 feet bgs in all of the borings drilled. These figures clearly indicate that only two potential near-surface sources of VOCs existed at the Property; one in the vicinity of the former inactive east neutralization system and one in the

vicinity of the boring for well W18B. The level plans illustrating the distribution of TCE in the deeper soils are used to delimit the effects of primarily downward VOC migration from these two shallow source areas.

In the vicinity of the former inactive east neutralization system, TCE was consistently detected at concentrations greater than 1.0 mg/kg at depths between 25 and 65 feet bgs. Down to a depth of 55 feet bgs the lateral extent of this zone of elevated TCE concentrations is well-defined in all directions by data collected from the adjacent borings. From depths of 55 feet to 65 feet bgs, the lateral extent of this zone is well defined to the west, south, east, and north by data collected from borings RI-9, RI-10, RI-11 and RI-17, respectively. Therefore, no additional data are required to characterize the distribution of TCE in the subsurface in the vicinity of the former inactive east neutralization system.

In the vicinity of well W18B, TCE was consistently detected at concentrations greater than 1.0 mg/kg but less than 7.0 mg/kg at depths between 35 and 95 feet bgs, as illustrated in Figures 5.2c through 5.2i. Down to a depth of 55 feet bgs, the lateral extent of this zone of elevated TCE concentration is very small and well-defined in all directions by data collected from adjacent borings RI-6 (north), RI-7 (south), RI-32 (east), and W10A (west). From depths of 55 feet to 95 feet bgs, the zone of TCE-bearing soils is enlarged to the west. The lateral extent of this zone is well-defined to the south, east and west on the Property using data collected from borings W13A, RI-32, and RI-2 respectively. This area of elevated TCE is confined to a band which parallels and extends approximately 100 feet to the south of Forge Drive. While it is possible that the elevated TCE concentrations in these soils to the west of W18B have resulted from failure of the north neutralization system, the relative absence of TCE in shallow soil samples collected from borings directly beneath (boring RI-5) and within 20 feet of the system (borings 2A and RI-18) (concentrations in samples from depths less than 30 feet are all less than 0.5 mg/kg), and the relatively low concentrations of TCE (up to 26 ug/L) measured in the soil gas samples collected in this area suggest that this is likely not the case. Because the zone of TCE-bearing soils is close to the northern property boundary, the property line is taken to define the northern extent of VOCs in the subsurface

beneath the Property. Additional data concerning the distribution of TCE in the subsurface around existing well W18B are therefore not required.

In summary, only a small percentage of soil samples collected from the Property exhibited concentrations of any VOC other than TCE that exceeded 1.0 mg/kg. In fact, with the exception of two concentrations of xylenes measured in previous samples (1.80 and 1.10 mg/kg in two samples collected and analyses by Cooper in 1986), no concentration of any other VOC detected in vadose zone soil samples exceeded 1.0 mg/kg . Representative concentrations for each of the other VOCs detected at the Property are all less than 0.1 mg/kg. With one exception, these VOCs were detected in areas where elevated concentrations of TCE have also been defined and where interim remedial measures are either currently underway or likely to be instituted in the future. The exception concerns the detection of small concentrations of Freon 113, 1,1-DCE, 1,1,1-TCA, and PCE (all less than 0.100 mg/kg) in the subsurface below the northeast corner of the site. The mixture of VOCs detected at this corner is unique, having not been observed at other areas on the Property. The remote location of these compounds and the unique mixture of compounds detected disassociate this area from other known areas of elevated VOC concentrations in soils beneath the Property. Additional data concerning the distribution of these compounds in the subsurface are not required, because their extent in on-site soils has been delineated.

All areas of the vadose zone that contain elevated concentrations of VOCs have been delineated using the results of VOC analyses of soil samples collected during the RI and previous investigations.

5.1.5 Perched Water Chemistry in the Vadose Zone

Perched groundwater was sampled at the Property from well W4A, the only location where perched groundwater was identified. The concentration of TCE measured in groundwater from this well has decreased from 3.8 mg/L in March 1986 to 0.5 mg/L in September 1989 (Geomatrix, 1990). Historically, PCE (max. = 0.006 mg/L), Freon 113 (max. = 0.05 mg/L), chloroform (max. = 0.009 mg/L), and toluene (max. = 0.002 mg/L) have each been detected in more than one sample from this well (Table 2.3). No 1,1,1-TCA, 1,1-DCE or semi-VOCs were detected

in perched groundwater from this well. During September 1989, Freon 113 (0.002 mg/L) and TCE (0.5 mg/L) were the only compounds detected in the groundwater sample from this well (Table 2.3). Remedial activities are currently underway at this well.

5.2 Saturated Zone

5.2.1 Results of Investigation of Saturated Zone Chemistry

The quality of groundwater in the saturated zones has been evaluated using data collected on a quarterly basis from on-site and off-site monitoring wells. For the A-zone and B-zone, water quality data are available from the on-site and off-site wells shown on Figure 2.2. The results of VOC analyses of groundwater samples from all A-zone and B-zone wells installed by Intersil are presented in Tables 2.4a and 2.5, respectively. For the C-zone and deeper aquifers, water quality data are available from wells located downgradient (north and northeast) of the Property. The locations of these wells are shown on Figure 2.2, and results of VOC analyses of groundwater samples from these wells are presented in Table 2.6. The results of all semi-VOC and inorganic chemical analyses performed on samples from selected perched- and A-zone wells installed by Intersil are summarized in Tables 2.4b and 2.4c, respectively.

5.2.2 Groundwater Chemistry

VOCs were detected in groundwater samples from the on-site wells at concentrations ranging up to 33 mg/L. The highest concentrations of VOCs were detected in groundwater samples collected from A-zone wells W1A, W9A, W10A, W12A and E17A which are all located in the northern portion of the site. Maximum VOC concentrations detected in B-zone groundwater beneath the site are generally one to two orders of magnitude lower than those in the A-zone. In the off-site area, VOCs have been detected at low levels in C-zone wells and at trace levels in deeper aquifer monitoring wells. The following sections present more detailed discussion of the distribution of VOCs in each hydrogeologic zone.

A-Zone Chemistry - The compound detected most frequently in on-site A-zone groundwater samples was TCE. Other compounds detected more than once include 1,1,1-TCA, PCE, Freon 113, 1,1-DCE, 1,2-DCE, 1,1-DCA, chloroform and toluene. Table 2.4a presents a complete list of VOCs detected in groundwater samples from Intersil's A-zone wells since sampling began in 1985. The historical maximum concentrations of these compounds in A-zone groundwater are:

Compound	Concentration (mg/L)	Well	Date Collected
TCE	33	W1A	8/85
1,1,1-TCA	0.61	W12A	9/86
PCE	1.2	W10A	8/87
Freon 113	0.065	W1A	8/87
1,1-DCE	0.049	W12A	6/87
1,2-DCE	0.008	E17A	9/88
1,1-DCA	0.019	W1A	9/85
chloroform	0.014	W1A	9/85
toluene	0.003	W10A	6/89

Intersil's A-zone groundwater extraction and treatment system has operated continuously since December 1987. During this time, the concentration of each of the compounds in samples from A-zone wells has greatly decreased. To demonstrate the decrease in VOC concentrations, the following table presents the maximum concentrations of the same compounds listed above for the samples collected in September 1989:

Compound	Concentration (mg/L)	Well
TCE	1.1	W10A
1,1,1-TCA	0.009	W10A
PCE	0.002	W10A
Freon 113	0.005	W10A
1,1-DCE	0.002	W10A
1,2-DCE	<0.001	-
1,1-DCA	<0.001	-
chloroform	<0.001	-
toluene	<0.001	-

An illustration of the distribution of historical maximum and recent VOC concentrations in A-zone groundwater is presented in Figure 5.9. The distribution of TCE in the A-zone has been contoured in Figure 5.10. As these figures illustrate, the distribution of VOCs in the A-zone beneath the Property has been delineated on-site, and off-site to the west, south and east.

Historically, the highest concentrations of VOCs in A-zone groundwater beneath the Property have been detected in groundwater samples from wells at the northern portion of the site. Non-detectable to very low levels of VOCs were measured in samples from A-zone wells in the southern and central portions of the site, and in samples from off-site wells W15A to the west and W16A to the east. In samples from well W7A, located at the southwestern corner of the site, Freon 113 was the only VOC detected with concentrations ranging up to 0.006 mg/L. In samples from well W14A, located at the southeastern corner of the site, Freon 113, 1,1,1-TCA, chloroform and TCE have been detected at concentrations of 0.005 mg/L or less. In the central area of the site (wells W2A and W13A), TCE, Freon 113 and chloroform were detected at maximum concentrations of 0.17, 0.05 and 0.003 mg/L, respectively.

In summary, the distribution of VOCs in A-zone groundwater beneath the Property has been delineated. VOCs are generally restricted to the north-central and northeastern portions of the site. VOC concentrations have decreased by up to two

orders of magnitude in on-site A-zone well samples since the implementation of on-site groundwater extraction and treatment.

B-Zone Chemistry - The concentrations of volatile organic compounds detected in groundwater samples from the on-site B-zone wells are considerably less than those detected in groundwater samples from the A-zone wells. The compound detected most frequently in on-site B-zone groundwater samples was TCE. Other compounds detected more than once include 1,1,1-TCA, Freon 113, 1,1-DCE, 2-butanone, chloroform and toluene. Table 2.5 presents a complete list of VOCs detected in groundwater samples from Intersil's B-zone wells since sampling began in 1986. The historical maximum concentrations of these compounds in on-site B-zone groundwater are:

Compound	Concentration (mg/L)	Well	Date Collected
TCE	0.95	W11B	12/86
1,1,1-TCA	0.10	W11B	12/86
Freon 113	0.11	W6B	8/87
1,1-DCE	0.003	W11B	12/86
2-butanone	0.031	W11B	9/88
chloroform	0.003	W14B	9/86
toluene	0.450	W11B	9/88

The concentration of each of the VOCs in samples from B-zone wells has decreased since monitoring began, most likely as a result of natural attenuation. To demonstrate the decrease in VOC concentrations, the following table presents the maximum concentrations of the same compounds listed above for the samples collected in September 1989:

Compound	Concentration (mg/L)	Well
TCE	0.25	W18B
1,1,1-TCA	0.003	W18B
Freon 113	0.057	W18B
1,1-DCE	<0.001	-
2-butanone	<0.001	-
chloroform	<0.001	-
toluene	0.007	W11B

An illustration of the distribution of historical maximum and recent VOC concentrations in B-zone groundwater is presented in Figure 5.11. The distribution of TCE in the B-zone has been contoured in Figure 5.12. As the figures illustrate, the distribution of VOCs in the B-zone beneath the Property has been delineated on site, and off site to the west, south and east with respect to the distribution of VOCs.

The distribution of chemicals in on-site B-zone groundwater is similar to that in the A-zone, with highest concentrations of VOCs at the north portion of the Property and low or non-detectable concentrations at the central and southern portions of the Property. In samples from well W6B, located in the central portion of the Property, the only VOCs detected at concentrations greater than 0.002 mg/L were toluene (detected in three samples with concentrations ranging from 0.003 to 0.024 mg/L) and Freon 113 (detected in 19 samples with concentrations ranging from 0.020 to 0.110 mg/L). In samples from well W14B in the southern portion of the site, except for an initial sample in which chloroform was detected at 0.003 mg/L, the only VOC detected was Freon 113 (detected in 11 samples with concentrations ranging from 0.003 to 0.011 mg/L).

In summary, the distribution of VOCs in B-zone groundwater beneath the Property has been delineated. VOCs are generally restricted to the north-central and northeastern portions of the site and VOC concentrations have decreased considerably in on-site B-zone well samples.

C-zone Chemistry - The predominant compounds detected in groundwater samples from off-site C-zone monitoring wells are TCE, 1,1,1-TCA, Freon 113, and toluene. Table 2.6 presents a complete list of VOCs detected in groundwater samples from all C-zone wells since sampling began in 1986. The historical maximum concentrations of these compounds in C-zone groundwater are:

Compound	Concentration (mg/L)	Well	Date Collected
TCE	0.059	RK-2C	12/88
1,1,1-TCA	0.062	RK-2C	12/87
Freon 113	0.026	LR-3C	9/88
toluene	0.032	PL-2C	3/88

The maximum concentrations of the compounds listed above detected in samples collected in September 1989 are:

Compound	Concentration (mg/L)	Well
TCE	0.050	RK-2C
1,1,1-TCA	0.025	RK-2C
Freon 113	0.004	RK-2C
toluene	0.007	LH-1C

An illustration of the distribution of historical maximum and recent VOC concentrations in off-site C-zone groundwater is presented in Figure 5.13. The distribution of TCE in the C-zone groundwater is contoured in Figure 5.14. As the figures illustrate , the distribution of VOCs in the C-zone has been delineated to the north, south, east and west. The extent of VOCs in the C-zone does not appear to encompass the Intersil site.

Deeper Aquifer Chemistry - The chemistry of deeper aquifer groundwater is monitored by Intersil using off-site monitoring wells BK-1, BK-2, BK-3, and BK-4. The results of analyses of groundwater samples from these wells are summarized in Table 2.6. Since installation, only trace levels of VOCs have been sporadically detected in samples from these wells. The only VOCs detected more than once at concentrations exceeding detection limits are TCE, 1,1,1-TCA, Freon 113 and toluene. The historical maximum concentrations of these compounds in groundwater samples from the deeper aquifer wells are:

Compound	Concentration (mg/L)	Well	Date Collected
TCE	0.001	BK-1	6/88
1,1,1-TCA	0.005	BK-3	6/89
Freon 113	0.010	BK-4	9/88
toluene	0.042	BK-2	3/89

Intersil continues to monitor these wells to assess trends in VOC concentrations. The extent of VOCs in the deeper aquifers does not appear to encompass the Intersil site.

6.0 CHEMICAL FATE AND TRANSPORT

The transport and fate of VOCs in the vadose and saturated zones beneath the Property are discussed in this section with respect to the processes contributing to their physical movement (transport) and the chemical interactions and transformations that may occur during transport (fate). The discussion of chemical fate and transport is divided into two sections: (1) the vadose zone, which includes the unsaturated soils and perched water from the ground surface to about 100 feet below ground surface; and (2) the saturated zone, which includes all of the hydrogeologic units of interest below the water table.

The discussion is presented in this manner because the processes affecting the liquid transport of chemicals in the vadose zone are considerably different from those that operate in the saturated zone. For example, the principal direction of chemical transport in the vadose zone is vertically downward under the influence of gravity, whereas the directions of liquid chemical transport in the saturated zones vary considerably depending on the direction of the hydraulic gradient, which is known to change considerably at the site over space and time. Also, the division between the two zones is appropriate, given that the vadose zone is composed of three phases (solid, liquid and gas), whereas the saturated zone is composed of only two phases (solid and liquid). Because of the tendency for VOCs to vaporize, the gas phase must be considered in the discussion of chemical fate and transport both in the unsaturated zone and at its interface with the saturated zone.

To design an effective and efficient remedial system, it is important to understand both the distribution of chemicals of concern in the subsurface and the processes responsible for the observed distribution. The importance of a working knowledge of the processes involved in transport of the chemicals in the subsurface must not be undervalued, as these processes will be employed to remove the chemicals from the subsurface during site remediation. The discussion of chemical fate and transport, therefore, is intended to: (1) identify the potential processes responsible for the observed distribution of chemicals in the subsurface; and (2) compare the relative rates of migration between these various processes.

It is especially important that an effective remedial system be designed and implemented in the vadose zone for three reasons:

(1) Chemicals in the vadose zone act as a continuing source to the groundwater;

(2) The performance of the interim remedial systems has shown that the mass of TCE removed to date via the vapour extraction system is about 50 times greater than the mass removed by the groundwater extraction system (Geomatrix, 1990). Because the vapour extraction system is comparatively effective, it is advantageous to remove the VOCs from the subsurface before they reach the saturated zone; and

(3) The concentrations of chemicals in the vadose zone are generally much greater than those observed in the saturated zone. This indicates that the majority of the mass of VOCs in the subsurface at the study site is in the vadose zone.

6.1 Transport in the Vadose Zone

The transport processes occurring in the vadose zone at the Property govern the migration of VOCs from an area of near-surface release to the water table. As indicated in Section 5.1.1, VOCs can be released to the subsurface in one of three forms: (1) as pure VOC; (2) as part of an immiscible mixture of VOC and water; or (3) dissolved in water. The soil chemistry data collected during the site investigation have been used to identify two areas where releases of the third type, VOCs dissolved in water, are suspected to have occurred (Section 5.1.3). These two areas are located in the vicinity of the former inactive east neutralization system and well W18B. The detection of these relatively low concentrations of VOCs, indicating a release of dissolved VOCs, is consistent with the type of waste handled by the wastewater treatment system. That is, a release from the wastewater treatment system would result in concentrations of VOCs in soils which are similar to those observed in the vicinity of the former inactive east neutralization system.

Dissolved VOCs migrating at the Property would move primarily downwards in the vadose zone under the force of gravity. The rate of downward flow would depend

primarily on the hydraulic conductivity of the soils, which is generally higher for the coarse-grained geologic deposits. At the interface between an overlying coarse-grained deposit and an underlying fine-grained deposit, the rate of downward flow in the underlying fine-grained unit might be too small to allow the water to pass through the lower unit as quickly as it is supplied. Under these conditions, a zone of perched water would develop. The perched groundwater forms into the shape of a mound which causes the perched water to spread laterally along the interface between the geologic layers in addition to the vertical flow through the underlying fine-grained unit. The direction of groundwater movement in a particular perched unit depends on the thickness of the perched water layer and the slope of the underlying fine-grained unit. Where the perched groundwater spreads laterally to the edge of a fine-grained unit, it can drain vertically, and unsaturated conditions will resume. In this manner, VOCs dissolved in water may migrate laterally from the original source area.

VOC molecules dissolved in water would move at a slower rate than the water molecules because the VOCs tend to adhere (sorb) to the natural organic matter in the soils and also tend to vaporize into the surrounding soil gas. Transport of VOCs can occur in the gas phase either by advection or diffusion. In the absence of any engineered systems (such as the vapour extraction system), diffusion is expected to be the dominant vapour transport mechanism. Vapour diffusion causes spreading of vapours in all directions away from the location of highest concentrations. The rate of vapour migration depends strongly on the porosity, moisture content and fraction of organic carbon (FOC) of the soils. If the porosity is high and the moisture content and organic carbon contents are low, the rate of vapour diffusion will be highest.

Calculations of the effect of vapour diffusion have been performed for the conditions at the site and are presented in Appendix D. The results indicate that in coarse-grained deposits, vapour diffusion is likely to have affected soils within an approximate radius of about 100 to 125 feet from dissolved VOC source areas. This is consistent with the distribution of the highest VOC concentrations observed in coarse-grained deposits, which, at a depth of approximately 60 feet, extends to distances of up to 200 feet laterally from the two identified source areas.

6.2 Transport in the Saturated Zone

Advection is the dominant process whereby VOCs migrate in the saturated zone. Groundwater carrying dissolved VOCs will tend to follow the paths of least resistance in the geologic deposits. Within relatively permeable units, such as the lenticular beds of sand and gravel found discontinuously in the A-zone and as a more continuous stratum in the B-zone (Section 4.3), groundwater will move laterally in the general direction of the lateral hydraulic gradient. Within units of relatively low permeability, such as the silty clay and sandy clay deposits that comprise the A/B aquitard (Section 4.3), groundwater will tend to move vertically at a slow rate in response to the vertical hydraulic gradient between the A- and B-zones.

The solubilities of the various VOCs identified in soil and groundwater beneath the Property are listed in Table 5.1. Because the measured concentrations of VOCs in groundwater beneath the Property are significantly less than their solubilities, these chemicals are assumed to have been transported in the saturated zone as dissolved constituents.

Sorption and chemical or biological transformation tend to retard the movement of groundwater. Chemical reactions and transformations can result in degradation of VOCs into other compounds (Section 6.3). For practical purposes, the term transformation is also used to account for loss of VOCs by volatilization from groundwater into a gaseous phase in the unsaturated zone.

6.2.1 A-Zone

VOCs likely enter the A-zone dissolved in groundwater recharging from areas of the vadose zone that contain VOCs (Section 5.1). Once in the A-zone, VOCs move laterally in the direction of the lateral hydraulic gradient. In the vicinity of the Property, this direction varies, as illustrated by the lateral hydraulic gradient on potentiometric surface maps (Figures 4.6a, b, and c). The direction of groundwater flow in the A-zone generally has been north to northeast.

The rates of groundwater movement in the A-zone were calculated using Darcy's Law and estimated values of hydraulic conductivity, hydraulic gradient and effective porosity. Calculations are shown in Appendix E. In the deposits of relatively high hydraulic conductivity, such as those evaluated during the 1987 pumping test of well W10A (Section 4.3), the calculated rate of A-zone groundwater movement ranges from about 2 to 5 feet/day (ft/d). The flow rate calculated from recent recovery test data from well W10A ranges from approximately 0.3 to 1 ft/d. Because the hydraulic conductivity of the lenticular and interbedded deposits comprising the A-zone ranges from relatively low (sandy clay) to relatively high (gravelly sand), the average rate of groundwater movement in the A-zone is probably one or more orders of magnitude less than in the relatively high hydraulic conductivity deposits.

Calculated rates of movement of VOCs in the variable hydraulic conductivity deposits of the A-zone range from approximately 0.1 to 3 ft/d, which accounts for retardation of VOCs due to sorption (Appendix E).

6.2.2 A/B Aquitard

The distributions of VOCs in the A- and B-zones beneath the Property indicate that some of the A-zone groundwater which contains dissolved VOCs may have moved downward from the A-zone to the B-zone through the A/B aquitard. The rate at which groundwater moves downward is controlled by the thickness of the aquitard, the vertical hydraulic conductivity of the deposits comprising the aquitard, and the vertical hydraulic gradient (Section 4.3).

The calculated rate of groundwater movement through the A/B aquitard in the vicinity of monitoring wells W11B and W12A, in the northeastern part of the Property, ranges from 0.006 to 0.01 ft/d (2 to 4 feet per year (ft/y)). The aquitard is estimated to be 13 feet thick at this location and composed mainly of silty clay. Calculated rates of movement of VOCs through these deposits range from approximately 0.002 to 0.007 ft/d, which accounts for retardation of VOCs due to sorption (Appendix E). Downward movement of VOCs is facilitated in locations where the A/B aquitard is very thin or not present.

6.2.3 B-Zone

VOCs dissolved in groundwater that has entered the B-zone have moved laterally in several directions, as illustrated by the lateral hydraulic gradient on potentiometric surface maps (Figures 4.8a, b, and c). Groundwater movement in the B-zone has been generally northward from the southern part to the central part of the Property. Groundwater movement in the central to northern parts of the Property has been northward in some months (Figure 4.8b) and southward in other months (Figure 4.8a).

Potentiometric surface maps, from the time period before off-site B-zone groundwater extraction began, illustrate that groundwater has moved southward at the northern part of the Property (Figure 4.8a). The months of record that illustrate this southward groundwater movement are September 1986 (Figure 4.8a) and June 1987 through October 1987 (Geomatrix, 1989e). The months of record that illustrate this southward apparent gradient are February 1988, May 1988, August 1988, October through December 1988, June 1989 and September 1989 (Geomatrix, 1989e; 1989g; 1989i; and 1989j).

The rates of groundwater movement in the B-zone were calculated using Darcy's Law and estimated values of hydraulic conductivity, hydraulic gradient and effective porosity. Calculations are shown in Appendix E. The hydraulic conductivity values used to estimate these rates were calculated using the results of the pumping tests of B-zone wells in the off-site area (WCC, 1987b; WCC, 1988; Levine-Fricke, 1990). The calculated rates of groundwater movement in the B-zone range from about 0.03 to 0.2 ft/d (10 to 70 ft/y).

Calculated rates of movement of VOCs in the B-zone range from approximately 0.01 to 0.1 ft/d, which accounts for retardation of VOCs due to sorption (Appendix E).

6.2.4 B/C Aquitard

The downward hydraulic gradient measured between the B-zone and the C-zone (Table 4.3) in the off-site area and vicinity indicates that VOCs dissolved in groundwater in the B-zone would be transported downward through the B/C

aquitard. The very low hydraulic conductivities exhibited by the sediments that comprise the aquitard cause this rate of vertical migration to be very slow.

A representative magnitude of the vertical hydraulic gradient across the B/C aquitard is approximately 0.06, based on water-level data from five B-zone and C-zone monitoring well pairs north of the Property (Table 4.3). Based on data gathered from boring B9 in the southern part of the Property, the B/C aquitard is approximately 25 feet thick and composed mainly of silty clay and sandy clay (Section 4.3.2).

The calculated rate of vertical groundwater movement through the B/C aquitard ranges from 0.002 to 0.003 ft/d (0.06 to 1 ft/y). Calculated rates of movement of VOCs through these deposits range from approximately 0.0001 to 0.002 feet per day, which accounts for retardation of VOCs due to sorption (Appendix E).

6.2.5 C-Zone

Groundwater in the C-zone is generally moving to the north-northeast, as illustrated by the potentiometric surface map of the C-zone (Figure 4.10). Although this potentiometric surface map is for the off-site area north of the Property, movement of groundwater in the C-zone beneath the Property is assumed to be in a similar direction.

The lateral hydraulic gradient in the C-zone is approximately 0.001, which is similar to that observed in the B-zone.

Rates of groundwater movement in the C-zone ranging from 0.06 to 0.1 ft/d (20 to 40 ft/y) were calculated using the values of hydraulic conductivity and effective porosity estimated for the B-zone (Appendix E). Calculated rates of movement of VOCs in these deposits range from approximately 0.02 to 0.08 ft/d, which accounts for retardation of VOCs due to sorption (Appendix E).

6.2.6 Deeper Aquifers

The investigations of possible transport mechanisms performed to date have identified no transport pathways between the shallow A-, B- and C-zones to the

deeper aquifers found at depths of approximately 300 feet or more below the ground surface in the study area. The Regional Aquitard in the vicinity of the Property appears to be at least approximately 75 feet thick (Section 4.3). Conduit studies performed by Intersil and others have not located conduits at the Property (Geomatrix, 1988e).

6.3 Chemical Fate

Chemical reactions and transformations can result in degradation of VOCs into other compounds. Microorganisms can degrade VOCs under anaerobic and denitrifying conditions, a process referred to as biotransformation.

There are two major mechanisms by which biodegradation of TCE can occur in the subsurface; 1) sequential reductive dehalogenation (i.e. sequential elimination of the chlorine atoms and their replacement with hydrogen atoms); 2) oxidation via epoxidation. Microorganisms responsible for the aerobic biodegradation of TCE do not gain either carbon or energy from the reaction, thus they require a cometabolite (which serves as the primary energy and carbon source for the microorganism, and induces enzymes that can degrade other carbon compounds). Methane-oxidizing bacteria have been documented to be responsible for the biodegradation of TCE while they grow on propane and/or methane.

Dehalogenation typically occurs under strongly reducing (anaerobic) conditions which favour the growth of the methanogenic bacteria. Under methanogenic conditions TCE is dechlorinated as shown below.

TCE $\rightarrow$ DCE $\rightarrow$ vinyl chloride (VC)

The *cis*-1,2-DCE isomer is favoured over the *trans*-1,2-DCE isomer, whereas 1,1-DCE is not the result of biological activity. VC is dehalogenated only slowly under anaerobic conditions and thus usually accumulates. Neither 1,2-DCE nor VC were detected at the site, therefore it is concluded that anaerobic transformation of TCE is not occurring. However, there is laboratory evidence that VC can be further

dechlorinated, forming ethylene, or ethane or be completely converted to CO_2. The analysis for these and other breakdown products are not routinely performed on samples, thus, there is no conclusive evidence that TCE biodegradation is not occurring.

Some VOCs can also be transformed by abiotic, chemical processes, such as hydrolysis and elimination. Published evidence for abiotic transformation of TCE is not conclusive. The limited laboratory experiments that have been conducted indicate that abiotic transformation of TCE, if it does occur, will be considerably slower than biotransformation (Dilling et al., 1975; Pearson and McConnell, 1975). Results of laboratory experiments indicate that 1,1,1-TCA does degrade abiotically to 1,1-DCE and probably to acetic acid (Vogel and McCarty, 1987).

The experimental data outlined above are supported by the observed chemical distributions at the Property. In general, degradation products of TCE have not been detected in groundwater beneath the Property; however, 1,1-DCE has been detected in groundwater beneath the property, indicating that abiotic transformation is occurring at the Property.

7.0 EVALUATION OF INTERIM REMEDIAL MEASURES

7.1 Summary of Operating Interim Remedial Measures

Three interim remedial measures have been implemented at the Property. These include:

- removal of all wastewater treatment and storage units;
- installation and operation of a groundwater extraction and treatment system for perched and A-zone groundwater; and
- installation and operation of a soil gas extraction and treatment system for the vadose zone.

The removal operations for the in-ground units are documented in reports submitted to the RWQCB in September 1986 (Geomatrix 1986b) and November 1988. The design and construction of the groundwater and soil gas extraction and treatment systems are documented in reports submitted to the RWQCB in April 1987 (Geomatrix, 1987b), April 1988 (Geomatrix, 1988a) and November 1987 (Geomatrix, 1987c).

Intersil's groundwater extraction and treatment system consists of five groundwater extraction wells, pipelines and an air stripping tower treatment system (Figure 2.3). Groundwater is pumped from four A-zone wells (Wells W5A, W10A, W12A and E17A) located along the northern and eastern portions of the Property, and from one perched zone well (Well W4A) located along the western side of the Property. Groundwater extracted from the four A-zone wells is pumped through buried, double-contained pipelines to the groundwater treatment plant (Geomatrix, 1988b). Groundwater extracted from Well W4A is stored in an above-ground, double-contained holding tank of approximately 250 gallons located near that well. The tank is drained on a regular basis to the groundwater treatment system.

The groundwater treatment system is located within an existing enclosure located near the centre of the Property. Volatile organic compounds are removed from the extracted groundwater in the air stripping tower and the treated groundwater is discharged to the storm drain system under an NPDES permit (CA002962, RWQCB Order No. 87-139). No emission controls are required on the air stripping tower by the Bay Area Air Quality Management District (BAAQMD) permit because the total organic compound emissions are less than 1 pound per day and the estimated carcinogenic risk attributable to the emissions is less than one in one million.

The groundwater extraction and treatment system began operation on 07 November 1987 (Geomatrix, 1988b). During the first month of operation, the system was occasionally shut down for modifications and adjustments. Long-term operation of the extraction and treatment system began during the first week in December 1987. The system has been operating on a nearly continuous basis since that time.

Intersil's soil gas extraction and treatment system consists of four vapour extraction wells, six vent wells, pipelines and a carbon adsorption treatment system (Figure 2.3). Three extraction wells (VE-1, VE-3 and VE-4), installed in July 1987, and one existing well (VE-2, formerly W1A) are used to remove soil gas containing volatile organic compound vapours from the vadose zone. The vapour extraction wells were placed in the northern and central portions of the former Intersil facility where concentrations of VOCs in the vadose zone were expected to be highest (Geomatrix, 1987b). The vent wells (V-1S, V-1D, V-2S, V-2D, V-3S and V-3D) were designed to allow the influx of atmospheric air into the subsurface at six locations along the northern boundary of the Property and thereby facilitate the circulation of soil gas to the gas extraction wells. Operation of the VES commenced in May 1988 (Geomatrix, 1990).

The vapour extraction and vent wells were drilled in clusters of two - one deep and one shallow (Geomatrix, 1988b). The deep wells are screened between depths of approximately 70 and 100 feet bgs. The shallow wells are screened from depths

of about 10 feet bgs to depths between about 60 and 70 feet bgs. The deep and shallow wells were installed in separate boreholes to preclude downward migration of contaminants through the well casing or borehole annulus.

7.2 Methods of Evaluation

The interim groundwater and soil gas extraction and treatment systems have been evaluated using the following criteria:

- the effectiveness with which they collect fluids containing VOCs from the subsurface; and

- the effectiveness with which the VOCs are removed from the collected fluids.

The absolute effectiveness of the groundwater extraction system in removing VOCs from the aquifer was assessed by evaluating the change in VOC content of the A-zone groundwater since pumping was initiated. Groundwater quality data collected from each of the Intersil wells on a quarterly basis (as part of the quarterly monitoring program) was particularly well suited to this evaluation.

7.2.1 Groundwater Extraction and Treatment System

The effectiveness of the groundwater extraction system has been evaluated using five main sources of information:

- aquifer testing programs conducted to measure the hydraulic properties of the A-zone;

- monthly monitoring of the water levels to record the response of the groundwater to pumping;

- interpretation of the flow directions based on the available water-level data and technical judgement;

- comparison between the interpreted flow directions and the results of an analytical groundwater flow model used to simulate the areal zone of capture of the extraction wells; and

- results of quarterly groundwater quality monitoring.

The aquifer testing programs consisted of step-drawdown tests on Wells W5A, W10A, W12A and E17A, a 57-hr constant-discharge test on well W10A, and a long-term recovery test on well W10A. The data from the step-drawdown test were analyzed to estimate the sustainable discharge for the extraction wells. The data from the constant discharge test were analyzed to estimate the transmissivity and storage coefficient. Two different methods were used to analyze the constant discharge test data, one that assumes an isotropic confined aquifer (Theis method) and one that assumes an anisotropic unconfined aquifer with vertical drainage (Stallman method) (Lohman, 1972). Both analyses gave very similar results, although the analyses illustrated heterogeneity of the deposits in the A-zone. The step-drawdown and constant discharge aquifer test results are described in the November 1987 "Technical Memorandum, A-Zone Aquifer Testing Program" (Geomatrix, 1987c). The methods and results of the recent long-term recovery test of well W10A are presented in Appendix B.

After six months of operation, the effectiveness of the interim groundwater extraction system was evaluated. The monthly monitoring of water levels in the A-zone wells was used to prepare potentiometric surface maps from which the lateral groundwater flow directions were interpreted. The potentiometric surface maps were presented in Intersil's quarterly self-monitoring reports (see also Figures 4.6.a, b, and c). The groundwater extraction system was deemed to be effective if the interpreted flow directions for the A-zone groundwater beneath the Property are towards the extraction wells.

The overall effectiveness of the groundwater remediation system was also evaluated using water quality data which was collected on a quarterly basis from each of the wells installed by Intersil. The system was deemed to be effective if the concentrations of VOCs in wells within the radius of influence of the extraction

system decreased, indicating that the total mass of VOCs in the groundwater was decreasing as a result of the operation of the system.

Finally, the effectiveness of the groundwater treatment system was evaluated by monitoring the concentrations of VOCs in the effluent from the groundwater treatment system. The influent, effluent and receiving water concentrations are monitored monthly and reported quarterly in accordance with the NPDES permit (Permit No. CA00029262, RWQCB Order No. 87-139). The concentrations are measured by a laboratory certified to perform wastewater analysis by the California Department of Health Services using EPA test methods 601, 602 and 624, subject to the quality control and quality assurance procedures outlined in the Quality Assurance Project Plan (Geomatrix, 1989b). The groundwater treatment system is deemed to be effective if the effluent concentrations are less than or equal to the criteria specified in the NPDES permit.

7.2.2 Soil Gas Extraction and Treatment System

The effectiveness of the soil gas extraction system was evaluated by testing the performance of the gas extraction system in the field. Since the response of pressure in the soil gas to pumping is very rapid compared to groundwater, it was possible to investigate the effect of the vapour extraction system using four pumping or recovery tests of relatively short duration. The tests consisted of measuring the vapour pressure change in selected vent wells during shut-down or start-up of the gas extraction system, using procedures analogous to groundwater pumping and recovery tests. The soil gas extraction system is deemed to be effective if the pressure influences extend to the portions of the Property where elevated concentrations of VOCs have been measured in the vadose zone.

The field testing program to test the effectiveness of the soil gas extraction system consisted of four tests:

- a recovery test consisting of pressure measurements in the shallow vent wells V-1S, V-2S, and V-3S, and monitoring well W9A immediately following the shut-down of the gas extraction system for a period of 120 minutes;

- a pumping test consisting of pressure measurements in the shallow vent wells V-1S, V-2S, and V-3S, and monitoring well W9A immediately following the start-up of the gas extraction system for a period of 75 minutes;

- a recovery test consisting of pressure measurements in the deep vent wells V-1D, V-2D, and V-3D, and monitoring well W9A immediately following the shut-down of the gas extraction system for a period of 60 minutes; and

- a pumping test consisting of pressure measurements in both shallow and deep vent wells V-1S, V-1D, V-2S and V-2D immediately following the start-up of gas extraction from only the deep gas extraction well VE-2 for a period of 50 minutes.

The pressure of the gas phase in the monitoring wells was measured relative to atmospheric pressure using progressively inclined manometers with a minimum sensitivity of about 0.001 inch of water head (in. H_2O). Wind gusts appeared to affect the readings in both directions at times on the order of about 0.01 in. H_2O. Because numerous manometer readings were taken, the effects of these fluctuations were minimized. The manometers were levelled and zeroed before each test, and the zero was read at the end of each test to determine whether there had been any significant instrument drift.

The pressure changes measured in the gas monitoring wells from the beginning to the end of each test are presented in Table 7.1. Each of the recorded pressure changes is significantly larger than the fluctuations caused by wind gusts. The direction of the change in each case was consistent with the test method used, increasing for the recovery tests and decreasing for the pumping tests. The change in pressure as a function of time behaved in much the same fashion as would be expected from the tests conducted, changing most rapidly at the beginning of each test, then gradually approaching a steady-state condition. The measured pressure changes can therefore be attributed to the operation of the gas extraction system.

The effectiveness of the soil gas treatment system has been evaluated by monitoring the concentrations of VOCs in the influent and effluent of the carbon adsorption unit. The concentrations are measured weekly in the field using a portable photoionization detector and monthly by submitting a sample to an independent laboratory for analysis by gas chromatography. The soil gas treatment system is deemed to be effective if the removal of VOCs is 90% or more according to criteria established by the BAAQMD.

7.3 Results of Evaluation

7.3.1 Groundwater Extraction System

An analysis of the estimated extent of hydraulic containment of Intersil's A-zone groundwater extraction system was performed prior to operation of the system. Aquifer parameters measured during the 1987 aquifer test program were utilized in the modeling exercise. A groundwater flow model was used to simulate the water levels in the A-zone that would result from groundwater extraction given the hydraulic properties determined from the aquifer testing. The flow model was verified by demonstrating that it could reasonably predict the drawdown values observed during the aquifer test. Simulations were then performed to estimate the long-term drawdown values that would result from pumping of the four A-zone groundwater extraction wells. These drawdown values were then superimposed onto a representative potentiometric surface map of the A-zone under non-pumping conditions to predict the corresponding zone of capture of the extraction system. The results of the simulations are described in a Geomatrix report entitled "Report on Evaluation of Hydraulic Containment-Groundwater Extraction Systems" (Geomatrix, 1988d). Briefly, the simulated zone of capture encompassed the entire Property and beyond, including the southwestern portion of the AMI facility as shown in Figure 7.1. The zone of capture actually observed during the operation of the wells was developed by interpreting flow directions from a map of the potentiometric surface under pumping conditions. The boundary of the estimated zone of capture observed on 01 March 1988, shown on Figure 7.2, runs in a roughly west-southwest/east-northeast direction from the corner of North Tantau Avenue

and Forge Drive. This interpreted zone of capture is very similar to that simulated using the groundwater flow model, encompassing the entire former Intersil facility and extending onto the southern portion of the Siemens facility and the southwestern portion of the AMI facility.

The monthly A-zone potentiometric surface maps show some variation over time but the general trend shows a depression in the potentiometric surface around the north portion of the Property which is attributable to the extraction of groundwater from wells W5A, W10A, W12A and E17A (Geomatrix, 1989e; 1989g; 1989h; 1989i; 1989j; and 1990). The current capture zone for the groundwater extraction system is interpreted from the potentiometric surface measured on 05 September 1989 in Figure 7.3. This capture zone is determined to extend beyond the Intersil property in all directions in the A-zone. The temporal variations are thought to be at least partially attributable to the fact that the pumps in the extraction wells operate on a cyclic basis, which leads to fluctuating water levels in the extraction wells and therefore some degree of difficulty in obtaining reproducible water-level measurements in those wells.

The groundwater extraction system has been operating on an essentially continuous basis since November 1987 (Geomatrix, 1988b). The measured influent concentration of TCE was initially 8.4 mg/L and has decreased to 0.55 mg/L as of September 1989 (Geomatrix, 1990). The average flow rate began at 1.8 gallons per minute (gpm), increased to a maximum of 4.2 gpm in March and April of 1988 and has since decreased to about 1.5 gpm. The cumulative mass of TCE removed as of March 1990 was about 42 pounds. Figure 7.4 illustrates the rate of TCE removal over time.

Further demonstrating the effectiveness of the interim remedial measures, the concentrations of VOCs in wells at the Property have decreased quite dramatically since the initiation of pumping of the perched- and A-zone groundwater. Historical maximum and recent VOC concentrations in perched-, A-, and B-zone groundwater are illustrated on Figures 5.9 (perched- and A-zone) and 5.10 (B-zone). As the figures illustrate, TCE concentrations in all site wells have decreased at least one

order of magnitude. For example, the TCE concentration measured in extraction well W10A has decreased from 25 mg/L in July 1987 to 1.3 mg/L in September 1989.

The decrease in the average flow rate of the extraction system is the result of a lack of available water in the A-zone. The extraction of water from the A-zone, combined with the reduction in the amount of rainfall over the past few years, has led to a gradual lowering of the water table to the point where the available drawdown in the extraction wells has been significantly reduced. The pumps have been designed to cycle automatically, shutting off when the water level drops to near the pump intake and turning on again after the water level has risen a few feet. The recent dewatering of the A-zone appears to have had an adverse effect on the zone of capture of the groundwater extraction system, as evidenced by recent rising water levels in well F1A, the closest downgradient monitoring well. Future water-level monitoring and interpretations of flow directions will confirm whether the zone of capture continues to encompass the Intersil facility. The Feasibility Study discusses the options considered for modifying the groundwater extraction system to make remediation of the A-zone groundwater more efficient.

7.3.2 Groundwater Treatment System

The concentrations of VOCs in samples of the effluent water from the groundwater treatment system have consistently been less than the detection limit of 0.1 ug/L. The groundwater treatment system is therefore considered to be effective at removing VOCs from the extracted groundwater. It should be noted that all discharges from the groundwater treatment plant have been in full compliance with the parameters set forth in the NPDES permit.

7.3.3 Soil Gas Extraction System

The results of the first test of the VES (recovery for 120 min) showed that small, but significant, pressure changes occurred at distances exceeding 200 feet from the extraction well (Table 7.1). Well W9A had a pressure change about one order of magnitude greater than the shallow vent wells. The results of the second test (pumping for 75 min) showed pressure changes similar to the first test except that

the pressures in the wells decreased instead of increased, as would be expected for pumping conditions. This provides additional evidence that the measured effects were the result of the gas extraction system. The magnitude of the pressure changes for the second test were somewhat less than the first test. This is reasonable since the duration of the second test was shorter. The results of the third test (recovery for 60 minutes) showed pressure increases in all three deep vent wells that were considerably greater than the corresponding changes in the shallow vent wells during the first test. This indicates that the VES has a stronger effect on the soil gas in the deeper half of the vadose zone. The results of the fourth test (pumping from only the deep extraction well VE-2 for 50 min) showed that the deep gas extraction well affects the gas pressure in the shallow vent wells to some extent. The magnitude of this influence is difficult to predict for normal pumping conditions because the pumping rate for the fourth test was higher than the normal operating conditions of the vapour extraction system.

The pressure changes measured during the four gas extraction tests demonstrate that the gas extraction system influences the flow of soil gas in the vadose zone at distances of at least 200 feet from extraction wells at the Property, although the effect is likely to extend to much greater distances in the highly permeable geologic units and may be restricted to shorter distances in the lower permeability units. For geologic units that are less affected by gas advection, VOCs would still be expected to be removed by gas diffusion. There may also be some tendency for the pressure changes to propagate at different rates in different directions, though anisotropy is expected to be essentially negligible. Pumping the gas extraction system induces large pressure changes in the deep vent wells and smaller but measurable changes in the shallow vent wells. As expected, the induced pressure drop under pumping conditions generally decreases with increasing distance away from the gas extraction wells. The pressure gradient towards the extraction wells causes the soil gas to flow toward the wells.

The induced pressure change in the deep zone was very large in all of the wells monitored. Since the induced pressure change is relatively large at the farthest monitoring well from the extraction well (located approximately 200 feet away), the

effect of the gas extraction system is expected to extend for considerable distances beyond the Property. Because the induced pressure change propagated over considerable distances in a relatively short time, it appears that the soil gas is able to flow with relatively little resistance through some or all of the deep portion (60 to 100 feet bgs) of the vadose zone. The induced pressure gradients in the deep vadose zone are considerably larger than would be expected under natural conditions. The gas extraction system is therefore deemed to be effective at removing soil gas containing VOCs from the deep portion of the vadose zone beneath the northern and central portions of the Property.

The induced pressure change in the shallow part of the vadose zone is much smaller than in the deeper vadose zone. This may be attributable to the influx of air from the atmosphere which would reduce the imposed pressure gradients. The pressure change imposed by the gas extraction system is nonetheless measurable at each of the three vent wells and therefore the pressure change is expected to cause flow towards the gas extraction system over distances of at least 200 feet in the shallow vadose zone. The shallow gas extraction wells are located much closer than 200 feet to the two areas where elevated concentrations of VOCs have been measured in the shallow vadose zone, well W18B and near the former inactive east neutralization system (Figures 1.3, 2.1, and 2.3). The gas extraction system is therefore deemed to be effective at removing soil gas containing VOCs from the shallow portions of the vadose zone that have been shown to contain elevated concentrations of VOCs.

The gas extraction system tests provide information on the effects of the system at the northern portion of the Property. From the current understanding of the geologic conditions at the site, it is reasonable to assume that gas extraction from wells VE-3 and VE-4 has comparable effects, except that the flow rate in well VE-4 is considerably lower than in well VE-2. The reduced effectiveness of well VE-4 for removing soil gas from the deep vadose zone is not considered problematic because the extent of VOCs in the vadose zone near well VE-4 appears to be confined to soil above a depth of approximately 60 feet bgs (Section 5.1.4 and

Figure 5.2a through 5.2i) and, thus, can be remediated via well VE-3 (the shallow well).

The soil gas extraction system has been operating on a nearly continuous basis since May 1988 (Geomatrix, 1990). The initial influent concentrations of TCE ranged between 161 and 590 parts per million dry volume (ppmv) and have decreased to between 17 and 110 ppmv as of December 1989. The average flow rates for wells VE-1, VE-2, and VE-3 have varied between 17 and 30 standard cubic feet per minute (scfm). The flow rate for VE-4 has been less than the minimum rate which can be measured with the available instrumentation and therefore, the TCE concentration from VE-4 has not been measured. The cumulative mass of TCE removed as of March 1990 was just over 2300 pounds. A graph showing the mass of VOCs removed from the soil gas in the vadose zone vs. time is presented in Figure 7.5. This figure clearly indicates that, while the vapour extraction system has been very effective in removing VOCs from the vadose zone, the rate of mass removal has also been steadily decreasing with time. As discussed in Appendix B of the FS report, the more permeable layers of the subsurface can conduct vapour more quickly and will therefore be more readily cleaned up than the lower hydraulic conductivity clays. The rapid rate of mass removal that occurred during the first year of operation of the vapour extraction system likely resulted from the relatively rapid flux of VOCs out of the sandy and gravelly layers beneath the Property. The lower rate of flux more recently observed probably represents the removal of VOCs from the more clayey materials. Transport of VOCs out of a clay lens occurs primarily by vapour diffusion in response to the concentration difference between the VOC-bearing clay and the adjacent (relatively-cleaner) sand and gravel which has already been remediated by the VES. The time required to fully remediate the vadose zone, including the finer-grained layers was estimated in the FS using a model of transport processes in the vadose zone. The rate-limiting step in the overall remediation process was represented by the time necessary to remediate a 10-foot thick clay layer (the thickest impermeable layer encountered at the Property) which contained 10 mg/kg of TCE (a concentration which is greater than the maximum concentration of TCE measured in any sample from the Property). The model indicated that once the

more permeable layers had been remediated (a process that would take on the order of five years), an additional two years would be required to fully remediate the less permeable lenses.

7.3.4 Soil Gas Treatment System

The carbon adsorption system consists of two adsorber units in series. When the effluent concentrations from the first scrubber reach one-half the influent concentration, the first unit is replaced with the second unit and the second unit is replaced with a new unit. This procedure has consistently resulted in effluent gas that contains no detectable concentrations of VOCs (Geomatrix, 1990). The soil gas treatment system is therefore deemed to be effective. In addition, the system has consistently operated in compliance with conditions of the Property's BAAQMD Permit to Operate.

8.0 SUMMARY OF BASELINE PUBLIC HEALTH EVALUATION

A Baseline Public Health Evaluation (BPHE) was prepared for the RWQCB by Clement (Clement, 1990). The BPHE evaluated and selected chemicals of concern (COCs) for the entire Intersil/Siemens Proposed Superfund Site (Intersil/Siemens site), evaluated current and future exposure pathways and conducted a screening-level evaluation of risks due to those exposure pathways judged to be complete (Clement, 1990).

To select COCs for the Intersil/Siemens site, Clement reviewed the results of chemical analyses for soil and soil gas samples collected in 1989 and for groundwater samples collected between March 1987 and May 1989. Clement also reviewed a limited number of inorganic analytical results from soil samples collected and analyzed in 1982 and 1983. Clement selected COCs according to the following criteria:

- the chemical was detected at a frequency greater than 5%;
- the chemical was detected at concentrations significantly exceeding background concentrations;
- the chemical was detected in samples at concentrations exceeding the concentrations detected in corresponding field blanks by a factor of five (except chemicals which are common laboratory artifacts for which a factor of ten was used);
- the chemical is a known or potential human carcinogen; and
- the chemical is or was used at the site.

Using these criteria, Clement selected the following COCs for the Intersil/Siemens site for the media indicated:

- groundwater:

  zinc, acetone, benzene, 2-butanone, chloroform, 1,1-DCE, 1,2-DCE, Freon 113, methylene chloride, PCE, toluene, 1,1,1-TCA, TCE, xylenes,

benzo(b)fluoranthene, bis-2-ethylhexyl phthalate, butyl benzyl phthalate and 1,4-dichlorobenzene;

- soil:

  arsenic, beryllium, copper, cyanide, gallium, silver, thallium, acetone, benzene, 2-butanone, 1,1-DCE, 1,2-DCE, ethyl benzene, Freon 113, methylene chloride, PCE, toluene, 1,1,1-TCA, TCE, xylenes, 1,2-dichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2,4-trichlorobenzene, and isopropyl alcohol;

- soil gas:

  carbon tetrachloride, chloroform, 1,2-DCE, PCE, toluene, 1,1,1-TCA, and TCE.

Clement presumed that VOCs present in the other media listed would also be present in air and, therefore, selected all of the VOCs selected for the other media as COCs for air.

8.1 Screening of Potential Chemicals of Concern

Because the BPHE was performed for both the Intersil and Siemens facilities, and potential COCs were identified by Clement using data from both facilities, a further screening of the potential COCs identified by Clement was conducted to determine the COCs specific to the Property. This screening was necessary to focus on the Property and to develop the appropriate remedial action objectives and alternatives for the Property. Geomatrix screened the potential COCs in a similar manner to Clement. Potential COCs were screened out if:

- the chemical is part of a pathway that for an average exposure scenario has a carcinogenic risk less than 10^{-6} and a hazard index less than one;

- the concentrations detected are demonstrated to be within background ranges;

- the chemical was detected once or twice and repeated nondetections have occurred subsequently; or

- the detection is demonstrated to be a laboratory or sampling artifact.

In accordance with the BPHE, only recent data were considered in the screening. Data used by Clement in the BPHE and by Geomatrix in the screening included soil data for organic chemicals obtained in 1989 with some inorganic data collected in 1982 and 1983, and groundwater data collected from March 1987 to May 1989. The following sections discuss the screening in detail, and Tables 8.1a and 8.1b summarize the results of the screening.

8.1.1 Groundwater

Clement identified 18 potential COCs in groundwater beneath the Siemens/Intersil site. In the following paragraphs, these chemicals are further screened according to the above criteria to determine the COCs specific to the Property. A summary of the screening is presented in Table 8.1a.

Acetone - This compound was only detected once (December 1988) out of 186 groundwater samples collected from the Property and analyzed for VOCs. Because acetone was only detected once and not detected in subsequent sampling, it is not considered a COC for the Property.

Benzene - This compound was not detected in any of the 186 groundwater samples collected from the Property and analyzed for aromatic compounds. Because benzene was not detected, it is not considered a COC for the Property.

Benzo(b)fluoranthene - This compound was not detected in any of the 21 groundwater samples collected from the Property and analyzed for semivolatile organic compounds. Therefore, benzo(b)fluoranthene is not considered a COC for the Property.

Bis-2-ethylhexylphthalate - This compound was not detected in any of the 21 groundwater samples collected from the Property and analyzed for semivolatile organic compounds. Therefore, bis-2-ethylhexylphthalate is not considered a COC for the Property.

2-Butanone - This compound was detected in seven out of 186 groundwater samples collected at the Property and analyzed for VOCs. All seven detections were in samples collected from B-zone wells during two consecutive sampling periods (September 1988 and March 1989). The method used to collect B-zone samples was subsequently changed, and 2-butanone was not detected in subsequent sampling from these wells. Since 2-butanone was not detected in any A-zone groundwater samples and was not detected after the B-zone sampling methodology was changed, it is believed that the presence of this compound in September 1988 and March 1989 was an artifact of the sampling method. Therefore, 2-butanone is not considered a COC for the Property.

Butylbenzylphthalate - This compound was not detected in any of the 21 groundwater samples collected from the Property and analyzed for semivolatile organic compounds. Since butylbenzylphthalate was not detected, it is not considered a COC for the Property.

1,4-Dichlorobenzene - This compound was not detected in any of the 21 groundwater samples collected from the Property and analyzed for semivolatile organic compounds. Therefore, 1,4-dichlorobenzene is not considered a COC for the Property.

1,2-Dichloroethene (cis/trans) - This compound was only detected twice out of 186 groundwater samples collected from the Property and analyzed for VOCs. These detections occurred in September and December 1988. Since 1,2-DCE was only detected twice and was not detected in subsequent sampling, it is not considered a COC for the Property.

Methylene chloride - This compound was not detected in any of the 186 groundwater samples collected from the Property and analyzed for VOCs. Therefore, methylene chloride is not considered a COC for the Property.

Xylenes - Xylenes were not detected in any of the 186 groundwater samples collected from the Property and analyzed for this chemical. Therefore, xylenes are not considered a COC for the Property.

Zinc - Zinc was detected in all of the four groundwater samples collected from the Property and analyzed for this element. The maximum concentration detected was 0.8 mg/L. This concentration is within background concentrations in the South San Francisco Bay (0.0057 - 3 mg/L; DWR, 1975). Since the maximum concentration detected at the Property is within background concentrations, zinc is not considered a COC for the Property.

Seven chemicals remain after the screening. These chemicals are chloroform, 1,1-DCE, Freon 113, PCE, toluene, 1,1,1-TCA, and TCE. These chemicals are considered the Property-specific COCs for groundwater.

8.1.2 Soil

Clement identified 26 potential chemicals of concern in soil for the Siemens/Intersil site. In the following paragraphs, these chemicals are further screened according to the above criteria to determine the COCs specific to the Property. A summary of the screening is presented in Table 8.1b.

Acetone - This compound was not detected in any of the 268 samples soil collected at the Property and analyzed for VOCs. Therefore, acetone is not considered a COC at the Property.

Arsenic - Arsenic was detected in 76 of the 80 soil samples collected at the Property and analyzed for this element. The soil samples at the Property had a maximum concentration of 40 mg/kg. This maximum concentration is within background concentrations of arsenic in the western United States (6 to 65 mg/kg; Shacklette and Boerngen, 1984). Since the maximum concentration of arsenic detected at the

Property is within background concentrations, it is not considered a COC for the Property.

Beryllium - Beryllium was detected in only 1 of the 41 soil samples collected at the Property and analyzed for this element at a concentration of 0.65 mg/kg. The background concentration of beryllium ranges from less than 1 to 12 mg/kg in the western United States (Connor and Shacklette, 1975). Since beryllium was only detected once and the detected concentration is within background concentrations, it is not considered a COC for the Property.

Copper - Copper was detected in all of the 41 soil samples collected at the Property and analyzed for this element at a maximum concentration of 70.3 mg/kg. The background concentration of copper in soil ranges from 30 to 500 mg/kg in the western United States (Shacklette and Boerngen, 1984). Since the maximum concentration detected is within background concentrations, copper is not considered a COC for the Property.

1,2-Dichlorobenzene - This compound was only detected twice in 268 soil samples collected from the Property and analyzed for VOCs including dichlorobenzenes. Because of the low frequency of detection, and the repeated non-detections that followed, 1,2-dichlorobenzene is not considered a COC at the Property.

1,3-Dichlorobenzene - This compound was not detected in any of the 268 soil samples collected at the Property and analyzed for VOCs including dichlorobenzenes. Therefore, 1,3-dichlorobenzene is not considered a COC at the Property.

1,4-Dichlorobenzene - This compound was only detected once in 268 soil samples collected from the Property and analyzed for VOCs including dichlorobenzenes. Because of the low frequency of detection, 1,4-dichlorobenzene is not considered a COC at the Property.

1,1-Dichloroethene - This compound was not detected in any of the 268 soil samples collected at the Property and analyzed for VOCs. Therefore, 1,1-DCE is not considered a COC at the Property.

1,2-Dichloroethene (cis/trans) - This compound was only detected twice in 268 soil samples collected from the Property and analyzed for VOCs. Because of the low frequency of detection, 1,2-DCE is not considered a COC at the Property.

Ethylbenzene - This compound was only detected once in 268 soil samples collected from the Property and analyzed for VOCs. Because of the low frequency of detection, ethylbenzene is not considered a COC at the Property.

Freon 113 - This compound was not detected in any of the 268 soil samples collected from the Property and analyzed for VOCs. Therefore, Freon 113 is not considered a COC at the Property.

Gallium - Gallium was not detected in any of the 41 soil samples collected at the Property and analyzed for this element. Therefore, gallium is not considered a COC at the Property.

Isopropanol - This compound was not detected in any of the 268 soil samples collected at the Property and analyzed for VOCs. Therefore, isopropanol is not considered a COC at the Property.

Methylene Chloride - This compound was not detected in any of the 268 soil samples collected at the Property and analyzed for VOCs. Therefore, methylene chloride is not considered a COC at the Property.

Thallium - Thallium was detected in 33 of the 41 soil samples analyzed for this element at a maximum concentration of 9.7 mg/kg. The background concentration of thallium in soil ranges from 3.8 to 30.8 mg/kg in the western United States (Boerngen and Shacklette, 1981). Since the maximum concentration detected at the Property is well within background concentrations, thallium is not considered a COC for the Property.

1,2,4-Trichlorobenzene - This compound was not detected in any of the 43 soil samples collected at the Property and analyzed for semivolatile organic compounds. Therefore, 1,2,4-trichlorobenzene is not considered a COC at the Property.

1,1,1-Trichloroethane - This compound was not detected in any of the 268 soil samples collected at the Property and analyzed for VOCs. Therefore, 1,1,1-TCA is not considered a COC at the Property.

Xylenes - Xylenes have only been detected once out of 268 soil samples collected at the Property and analyzed for aromatic organic compounds. Because of the low frequency of detection, xylenes are not considered a COC for the Property.

Zinc - Zinc was detected in all of the 80 samples analyzed for this element at a maximum concentration of 207 mg/kg. The background concentration of zinc in soil ranges from 120 to 400 mg/kg in the western United States (Shacklette and Boerngen, 1984). Since the maximum concentration detected at the Property is within background concentrations, zinc is not considered a COC for the Property.

Seven chemicals remain after the screening. These chemicals are benzene, 2-butanone, cyanide, silver, PCE, toluene, and TCE. These chemicals were considered potential Property-specific COCs for soil. However, results of the BPHE indicate that average exposures to soil for a child result in a hazard index less than one and a carcinogenic risk of 3×10^{-6}. The calculations in the BPHE indicate that the majority of the carcinogenic risk is due to arsenic. As discussed in the above section, the maximum concentration of arsenic is within background concentrations. Therefore, the majority of the carcinogenic risk is actually background risk due to exposure to background concentrations at the Property and not risk due to past activities at the Property (PCE, toluene, and TCE). If the calculations are changed to reflect only the incremental risk due to past activities at the Property, the carcinogenic risks are less than 1×10^{-9}. Therefore, the potential chemicals of concern for soil as identified by Clement are not considered COCs for the Property because exposure to soil results in incremental carcinogenic risks less than 10^{-6} and hazard indices less than one. It should be noted that PCE, toluene, and TCE remain as COCs for groundwater and that remediation of these

chemicals in soil will be considered for protection of groundwater in the Feasibility Study Report.

8.1.3 Air

Because air samples have not been collected at the Siemens/Intersil site, Clement identified all volatile organic chemicals detected at the Siemens/Intersil site as potential COCs for air. Risks due to exposure to these chemicals in air were calculated by Clement (Clement, 1990). Carcinogenic risks were much lower than 10^{-6} and hazard indices were much less than one for both the average and plausible maximum exposure scenarios. Because of the low risks associated with exposure to these chemicals in air, the potential COCs for air as identified by Clement are not considered COCs for the Property.

8.2 Evaluation of Exposure Pathways

Clement evaluated pathways by which the various environmental media might carry the COCs to a point at which humans might be exposed. From this evaluation they identified three pathways that are currently complete, i.e., exposures that are presently occurring. The pathways identified are: (1) contact with chemicals in the groundwater from Municipal Well No. 24; (2) inhalation of vapours in the soil gases emanating from the sites; and (3) off-site inhalation of vapours emanating from the off-site groundwater. The latter pathway was dismissed as insignificant by Clement and was not evaluated for risk. Clement also identified five pathways which could be complete in the future if the Intersil/Siemens site was converted to residential use and domestic water supply wells were installed in the shallow aquifers to serve these residents. The possible future pathways identified were: (1) ingestion and inhalation of chemicals from the groundwater in the shallow aquifers; (2) inhalation and ingestion of chemicals in the Deeper Aquifers at the location of the BK wells; (4) direct contact with the on-site soils; and (5) on-site inhalation of vapours in the soil gases.

For those pathways judged complete or possible in the future, Clement conducted screening-level evaluations of both carcinogenic and non-carcinogenic risks. In

conformance with the custom for a screening-level evaluation, where necessary, Clement used conservative estimates and assumptions which actually overestimate risk. Clement also prepared a semi-quantitative evaluation of the magnitude of under- or overestimation of risk, which suggests that risks may be overestimated by a factor of 10^4.

For each exposure, two exposure concentrations were evaluated. One concentration, termed the "average" exposure concentration, was derived from the spatial and temporal geometric mean of all detections reported for each chemical. The highest concentration reported for each chemical was used as the other exposure concentration, termed the "plausible maximum." However, the highest reported concentrations do not represent appropriate plausible maximums. The hazards evaluated are all for chronic exposures. Because chronic exposures are inherently averages over time, more appropriate plausible maximum concentrations for groundwater would be obtained from temporal average concentrations in the well with the highest concentration. For soil, the appropriate plausible maximum would be derived from the highest spatial average over any 5000-square-foot area (a typical residential lot size) at the site.

For those pathways judged to be currently complete, Clement evaluated four exposure scenarios. For exposure to carcinogens, two scenarios, off-site inhalation of vapours in the soil gases from the Siemens site and from the Property, have estimated risks less than the EPA target value range, 10^{-4} to 10^{-6}. The remaining two exposure scenarios involved contact with water from Municipal Well No. 24. Because no carcinogens were reported in water from Municipal Well No. 24, no risks were assigned to these two scenarios. For non-carcinogenic risks, all scenarios have hazard index values less than one. In summary, no present risks to public health were identified.

For those pathways which might be complete in the future, Clement evaluated twelve possible exposure scenarios. Carcinogenic risks less than 10^{-6} were estimated for inhalation of vapours in the soil gases from the Property and vicinity; and for direct contact with soil by adults gardening. Carcinogenic risks greater than 10^{-6} and less than 10^{-4} were estimated for direct contact with soil by children,

ingestion of Deeper Aquifer groundwater, inhalation of vapours from Deeper Aquifer groundwater, ingestion of A-zone groundwater, ingestion of B-zone groundwater, ingestion of C-zone groundwater and inhalation of vapours from B-zone groundwater. Carcinogenic risks exceeding 10^{-4} were estimated for inhalation of vapours from A-zone groundwater. Inhalation of vapours from C-zone groundwater was assigned a risk of 3 X 10^{-4} by Clement; however this value was based on a 1,1-DCE maximum concentration of 41 ug/l detected in a matrix spike, which Clement mistook for a C-zone groundwater sample. When the actual maximum 1,1-DCE concentration in C-zone groundwater is used (5.5 ug/l), the calculated risk is well below 10^{-4}. For non-carcinogenic risks, a hazard index value of one was exceeded for ingestion of A-zone groundwater. Estimated non-carcinogenic risks were equal to one for ingestion of B-zone groundwater. For all other scenarios and exposures, the estimated non-carcinogenic hazard index was less than one.

The results of Clement's screening-level evaluation divide the exposure scenarios into three categories: (1) those which are below 10^{-6} or a hazard index value less than one and thus require no further consideration or action; (2) those within the range of 10^{-4} and 10^{-6} or with a hazard index value equal to one for which a more detailed evaluation may be performed to confirm that the risks are within this range; and (3) those which exceed 10^{-4} or a hazard index value greater than one for which a more detailed evaluation should be performed to establish cleanup goals.

Based on the evaluations described above, Clement concluded that no present risk to human health exists at the Intersil/Siemens site. Only ingestion of A-zone groundwater, a possible future risk scenario, had estimated risks higher than 10^{-4}. The water in the A-zone contains dissolved salts and nitrates at levels which exceed the federal Primary Drinking Water Standards (40 CFR 141.11). It is, therefore, highly improbable that the A-zone groundwater would be used for potable water. If it were used, it would require prior treatment.

9.0 CONCLUSIONS OF THE REMEDIAL INVESTIGATION AND RECOMMENDATIONS

9.1 Summary and Conclusions

9.1.1 Location of Potential Source Areas and Nature and Extent of Chemicals

The locations of potential sources, and the identities and distributions of chemicals in the subsurface at the Property have been thoroughly characterized using data collected during investigations conducted from 1983 to September 1989. A total of 64 soil borings (from which 529 samples were collected and analyzed (455 on site and 74 off site)) and 25 groundwater monitoring wells and piezometers were drilled and/or installed during the investigations. Additionally, 109 shallow soil gas samples were collected from 85 locations and analyzed during recent investigations.

The results of analyses of soil samples collected from directly beneath the former wastewater transfer lines and treatment facilities, and the above- and in-ground chemical storage areas were assessed to determine whether chemicals were released to the subsurface at any of these previously-identified potential source areas. Geochemical data collected from borings drilled at the north and east scrubber sumps, the north and east neutralization systems, the inactive east neutralization system (which together comprise the wastewater treatment system and the in-ground waste chemical storage area), and the above-ground waste chemical storage area (Figure 1.3) were used specifically for this purpose. Results of analyses of soil gas samples were used to identify any potential source areas that were not encountered in the soil boring program. Soil chemistry data from adjacent borings were used to determine whether an actual source of VOCs existed in the vicinity of any soil gas chemistry anomaly. Additional soil borings were drilled and sampled as necessary to complete this evaluation of the soil gas chemistry data. Other soil borings were drilled to help delineate the three dimensional extent of chemicals in the subsurface.

Conclusions concerning the location and nature of the sources and the distribution of chemicals of concern identified in the subsurface at the Property have been discussed in detail in Sections 5.1.3 and 5.1.4 of this report. The primary conclusions pertaining to the vadose zone and the saturated zone are summarized in the following two sections.

9.1.1.1 Locations of Suspected Source Areas and the Nature and Extent of Chemicals in the Vadose Zone

Soil samples collected from borings drilled at the Property have been analyzed for Priority Pollutant Metals, cyanide, semi-VOCs, and VOCs. None of the samples collected from borings drilled during recent investigations contained detectable concentrations of semi-VOCs.

Many of the soil and soil gas samples that were collected and analyzed contained measurable concentrations of several VOCs. Toluene, TCE, PCE, 1,1,1-TCA and Freon 113 are the VOCs that were most commonly detected in soil samples from the Property. Of the compounds listed, only TCE has been detected in concentrations that exceed 1.0 mg/kg in any sample collected during the investigations. Representative concentrations of each of the other VOCs are all less than 0.1 mg/kg. A total of 28 of the 455 on-site soil samples analyzed from the Property contained TCE at concentrations greater than or equal to 1.0 mg/kg. The shallow (ground surface to 55-foot depth) soil samples that contained greater than 1.0 mg/kg of TCE are clustered in two areas: around the former inactive east neutralization system, and in the vicinity of well W18B. The locations of the deeper (55 to 85 feet bgs) samples containing TCE at concentrations greater than 1.0 mg/kg were more disperse, but were usually confined to the northernmost 100 feet of the Property.

Elevated concentrations of TCE observed in soil samples collected from shallow depths in borings drilled to investigate the former inactive east neutralization system indicate that a source of TCE may have existed at this location. The relatively low (less than 3.5 mg/kg) concentrations of TCE measured in the affected soil samples are consistent with concentrations that would be expected to result

from leakage of water that contained relatively low concentrations of dissolved TCE. Since the former inactive east neutralization system handled facility wastewater that contained dissolved concentrations of TCE, not pure solvent, the interpretation of the data is consistent with the nature of the potential source that was known to exist in this area.

In the vicinity of the former inactive east neutralization system, TCE was consistently detected at concentrations greater than 1.0 mg/kg at depths between 25 and 65 feet bgs. This zone of elevated TCE was fully delineated in three dimensions using soil chemistry data collected from the adjacent borings. It is estimated that the area of the subsurface that is affected by TCE has the rough shape of an upright cylinder, centred between borings W2A and B7, that is approximately 40 feet in height (extending from 25 to 65 feet below ground surface) with a radius of less than 100 feet.

One of the shallow soil samples (less than 35 feet bgs) and several of the deeper soil samples collected from the boring for well W18B also contained greater than 1.0 mg/kg of TCE. These data suggest that a source of TCE may have existed in the shallow subsurface in the vicinity of well W18B. It is once again important to note that the concentrations of TCE exhibited by soil samples collected from this area of elevated TCE in soils are relatively low and are consistent with concentrations that would be expected to result from leakage of water which contained relatively low concentrations of dissolved TCE.

The areal extent of the zone of elevated TCE in soils from 35 to 55 feet bgs in the vicinity of well W18B has been fully delineated using data from the adjacent borings, located less than 50 feet to the north, south, east, and west. The area of elevated TCE which extends from depths of 55 to 95 feet bgs is confined to a band which parallels and extends approximately 100 feet to the south of Forge Drive.

The former inactive east neutralization system and the area surrounding well W18B constitute the only two suspected sources of chemicals identified at the Property. The concentrations of TCE measured in the soil samples collected from these suspected source areas indicate that TCE likely entered the subsurface at

each of these two zones as a dissolved constituent in water, not as a pure solvent. The three-dimensional extents of the two zones of elevated TCE in soil have been fully delineated using the data collected from adjacent soil borings. Therefore, no additional data concerning the distribution of VOCs at the Property are required.

As part of the interim remedial measures underway at the Property, soil gas is extracted from four gas extraction wells. Two wells, one shallow and one deep, are situated in very close proximity to each of the two suspected source areas outlined above. Testing of the soil gas extraction system has demonstrated that the radius of the zone of capture in the shallow zone created by soil vapour removal from the four extraction wells extends approximately 150 feet in all directions from the two wells. The zone of capture observed in the deep zone is much larger than its shallow counterpart, extending throughout the central and entire northern end of the Property (and beyond). These zones of capture encompass all of the areas of the vadose zone where greater than 1.0 mg/kg of TCE has been detected in soils. The effectiveness of the soil gas extraction and treatment system is further evidenced by the fact that approximately 2200 lbs of TCE has been removed from the vadose zone over the 20 months (May 1988 through December 1989) during which the system has been in operation.

9.1.1.2 Nature and Extent of Chemicals in the Saturated Zone

The concentrations of inorganic chemicals measured in groundwater samples from the on-site A-and B-zone wells were within the range expected under natural conditions. No semi-volatile chemicals were detected in samples from the on-site wells. VOCs, including primarily TCE, 1,1,1-TCA, and 1,1-DCE, were detected in groundwater samples from the on-site wells at concentrations ranging up to 33 ppm. The highest concentrations of VOCs were detected in groundwater samples collected from A-zone wells W1A, W9A, W10A, W12A and E17A which are all located in the northern portion of the Property. Maximum VOC concentrations detected in B-zone groundwater beneath the Property are generally one to two orders of magnitude lower than those in the A-zone, and are also found beneath the northern portion of the Property. In the off-site area, VOCs have been detected at low levels in C-zone wells and at trace levels in Deeper Aquifer monitoring wells.

The on-site extent of VOCs in the perched, A-, and B-zones has been adequately delineated. In addition, due to interim remedial activities and natural chemical degradation, the concentrations of VOCs in these zones have decreased considerably. Approximately 42 pounds of VOCs have been removed by the existing A-zone groundwater extraction and treatment system.

The extent of VOCs in the C-zone and Deeper Aquifers have been adequately defined by data from off-site wells. These zones do not require on-site remedial efforts.

9.1.2 Fate and Transport of Chemicals

The discussion of the fate and transport of chemicals at the Property is subdivided into two major sections. The conceptual model of local groundwater flow (originally presented in Section 4.3.2.7), which outlines the dominant pathways followed by dissolved VOCs that have infiltrated and migrated in the subsurface, is recapped in the first section. The second section summarizes the rates and directions of VOC transport, and the chemical processes which are likely to be causing the transformation of VOCs along their path of migration in the subsurface at the Property.

9.1.2.1 Conceptual Model of Groundwater Flow

Infiltrating groundwater recharge generally moves in a downward direction in the vadose zone until either perched conditions or the water table (A-zone) is encountered. In a perched zone the groundwater moves laterally until the conditions responsible for the perched saturated conditions end. At that point the groundwater resumes its downward vertical transit until another perched zone or the watertable is encountered. The direction of groundwater movement within a perched zone is governed by the slope of the free surface of the water in that zone. Because the topography of this surface can be highly variable over short distances, the resulting direction of groundwater flow within each perched zone can be highly irregular and consequently unpredictable.

Once fully saturated conditions are encountered (at the watertable), groundwater moves in a primarily lateral direction through the more permeable zones (A-zone,

B-zone, C-zone), and, at a significantly lower velocity, vertically through the lower-hydraulic conductivity aquitards (A/B-aquitard, B/C-aquitard). Although the potential for groundwater movement between the C-zone and the Deeper Aquifers is downward, relatively little groundwater movement occurs because of the thick and continuous nature of the Regional Aquitard.

9.1.2.2 Summary of the Fate and Transport of Chemicals Identified at the Property

The physical, chemical and biological processes which govern the physical movement (transport), or result in the transformation of chemicals as they migrate in the subsurface (fate) are summarized in this section. The summary is divided into two sections that deal separately with fate and transport processes of importance in: (1) the vadose zone, and (2) the saturated zone. This division is necessary because the processes that govern the fate and transport of chemicals are considerably different in each of the two zones.

Fate and Transport in the Vadose Zone - As discussed above, VOCs which have been identified at the Property are likely to have been released to the subsurface as constituents dissolved in water. Consequently, the primary pathway of VOC migration in the vadose zone is parallel to that followed by the infiltrating groundwater recharge. This pathway is outlined in the conceptual model of groundwater flow at the Property summarized above. Briefly, groundwater in the vadose zone moves in a primarily vertically downward direction toward the watertable. Local lateral flow in many directions may occur when perched conditions are encountered. Processes such as sorption onto soil particles and volatilization into the soil gas phase will effectively remove a portion of the VOCs from the infiltrating groundwater. For this reason VOCs molecules dissolved in migrating groundwater will move at a slower rate than the groundwater.

While the VOCs that are sorbed onto the soil are immobilized for a period of time, those VOCs that volatilize may continue to migrate by either advection or diffusion through the soil gas phase. The lack of significant perched zones at the Property, combined with the distribution of VOCs in the vadose zone suggests that vapour diffusion, not vapour advection or lateral groundwater flow in perched zones, has been the primary mechanism of lateral VOC transport in the vadose zone.

Processes such as sorption and dissolution into the soil moisture effectively remove VOCs from the gas phase in the vadose zone.

The quantity of VOCs that are removed from the groundwater or the soil gas through sorption is dependent on the porosity, moisture content and the amount of organic carbon that is associated with the soils (FOC). The relatively high FOC values measured in soil samples collected from the site cause a significant portion of the VOCs that are either migrating in groundwater or diffusing through the soil gas to be sorbed onto the stationary soil mass. Significant quantities of VOCs are removed from the groundwater as it migrates vertically to the water table via this process. For this reason, it is believed that the bulk of the VOCs originally migrating in the vadose zone at the Property were immobilized through sorption onto the soil phase, and consequently never reached the watertable.

Fate and Transport in the Saturated Zone - Those VOCs that reach the water table are transported through the saturated zone primarily by advection. Groundwater carrying dissolved VOCs will tend to follow the paths of least resistance in the geologic deposits. Within relatively permeable units, such as the lenticular beds of sand and gravel found discontinuously in the A-zone and as a more continuous stratum in the B-zone, groundwater will move laterally in the general direction of the lateral hydraulic gradient. At the Property and vicinity, the directions of the lateral hydraulic gradients in the A- and B-zones are highly variable; therefore, it is difficult to accurately define the exact locations of sources of chemicals detected in the saturated zones.

Within units of relatively low permeability, such as the silty clay and sandy clay deposits that comprise the A/B aquitard, groundwater will tend to move vertically at a slow rate in response to the vertical hydraulic gradient between the A- and B-zones.

Rates of VOC movement through the various hydrogeologic units identified at the Property were calculated based on estimated hydraulic properties of these units, FOC data from soil sample analyses, and octanol-water partitioning coefficient

values for TCE from the literature. These calculated rates are summarized as follows:

Hydrogeologic Unit	Calculated Groundwater Flow Rate (ft/d)	Calculated VOC Flow Rate (ft/d)
A-zone	0.3 to 5	0.1 to 0.5
A/B aquitard	0.006 to 0.01	0.002 to 0.006
B-zone	0.03 to 0.2	0.01 to 0.1
B/C aquitard	0.002 to 0.003	0.001 to 0.002
C-zone	0.06 to 0.1	0.02 to 0.06

9.2 Recommendations

9.2.1 Recommendations for Future Investigation

Investigation of the sources and distribution of VOCs, and characterization of the physical properties of the affected media at the Property are judged to be complete: therefore, no further remedial investigation is warranted.

9.2.2 Recommended Remedial Action Objectives

The results of the Baseline Public Health Evaluation indicate no present risk to public health as a result of VOCs in soil and groundwater at the Property. However, potential future risks associated with the potential though unlikely future use of shallow groundwater were identified, assuming that no remedial action is performed. Therefore, remedial action designed to remove VOCs from soil, and to contain and remove groundwater containing VOCs, is recommended. Because the bulk of the mass of VOCs is present in soil rather than in groundwater, and because these VOC-containing soils continue to act as a source of VOCs to groundwater, remedial efforts that focus on removing VOCs from soil will be most effective, especially when those efforts are combined with extraction and treatment of groundwater.

TABLE 2.2.a (concluded)
SUMMARY OF SOIL CHEMISTRY DATA - VOLATILE ORGANIC ANALYSES[1]
Concentrations in milligrams per kilogram (mg/kg or ppm)

Notes:
1 All analyses performed by EPA Test Methods 8010, 8020 and/or 8240.
2 Well W1A has been converted to vapor extraction well VE-2.
3 1,1-dichloroethylene (1,1-DCE) detected at 0.0002 ppm, chloroform detected at 0.0002 ppm.
4 1,1-DCE detected at 0.0015 ppm, chloroform detected at 0.0008 ppm.
5 1,1-DCE detected at 0.01 ppm.
6 Wells installed at Siemens by Intersil
7 Methylene chloride detected at 0.02 ppm.
8 Ethyl benzene detected at 0.07 ppm.
9 1,1-DCE detected at 0.87 ppm.
10 Samples were analyzed 1 to 21 days over the prescribed holding time
11 Ethyl benzene detected at 0.10 ppm.
12 2-butanone detected a 0.052 ppm.
13 2-butanone detected a 0.05 ppm.
14 2-butanone detected a 0.036 ppm.
15 2-butanone detected a 0.035 ppm.
16 2-butanone detected a 0.042 ppm.
17 2-butanone detected a 0.065 ppm.
18 Ethyl benzene detected at 0.07 ppm
19 1,2-DCE detected at 0.01 ppm.
20 1,2-DCE detected at 0.006 ppm.
21 2-butanone detected at 0.047 ppm.
22 2-butanone detected at 0.030 ppm.
23 Unknown compound (scan #1062) detected at an estimated concentration of 10 ppb.

SE = east sump
ENS = east neutralization system
SN = north sump
NNS = north neutralization system
INS = inactive neutralization system (removed in July 1986)

TABLE 2.2.b
SUMMARY OF SOIL CHEMISTRY DATA - SEMI-VOLATILE ORGANIC ANALYSES[1]
Concentrations in milligrams per kilogram (mg/kg or ppm)

Investigation Phase	Boring ID	Sample Depth (ft.)	Dichloro-benzenes	Phenols (total)	Trichloro-benzenes	Other

NA = Not analyzed
ND = Not detected.

Note Cadmium and selenium were not detected in any of the RI borings

1 Analyses performed by U.S. EPA Test Methods 6010, 7060, 7470, 7740 and 9010.
2 9.5 ppm ammonia detected, 1.4 ppm fluoride detected, 11 ppm nitrate detected, 28 ppm sulfate detected.
3 5.6 ppm ammonia detected, 1.4 ppm fluoride detected, no nitrate detected, 47 ppm sulfate detected.

TABLE 2.3
SUMMARY OF PERCHED GROUNDWATER CHEMISTRY DATA -
VOLATILE ORGANIC ANALYSES[1]
Concentrations in milligrams per litre (mg/L or ppm)

INVESTIGATION PHASE	WELL ID	COLLECT DATE	TCE	PCE	FREON 113	CHLORO-FORM

Notes:
1 All analyses performed by EPA Test Methods 601, 602, 624, or 8240.
2 Total hydrocarbons (C10-28) detected at 1.0 ppm (semi-quantified), toluene detected at 0.002 ppm.
3 Toluene detected at 0.002 ppm.

Notes

1 All analyses performed by EPA Test Methods 601, 602, 624, or 8240.
2 1,2-DCE detected at 0.004 ppm, 1,1-DCA detected at 0.019 ppm
3 Chlorohexanol detected at 0 070 ppm, dichlorocyclohexane detected at 0.1 ppm, trichloropropane detected at 0.040 ppm, unknown chlorinated compound detected at 0 02 ppm
4 Carbon tetrachloride detected at 0.0004 ppm, methylene chloride detected at 0 0016 ppm, 2-butanone detected at 0.007 ppm, 1,2-DCE detected at 0 0009 ppm, 1,1-DCA detected at 0 0063 ppm, acetone detected at 0.018 ppm.
5 1,2-DCE detected at 0.0005 ppm, acetone detected at 0 019 ppm
6 Tetrahydrofuran detected at 0 003 ppm (semi-quantified)
7 Tetrahydrofuran detected at 0.020 ppm

TABLE 2.4.a (concluded)
SUMMARY OF A-ZONE GROUNDWATER CHEMISTRY DATA - VOLATILE ORGANIC ANALYSES[1]
Concentrations in milligrams per litre (mg/L or ppm)

Notes (cont'd):

8 Total hydrocarbons (C10-C28) detected at 3.0 ppm (semi-quantified).
9 Acetone detected at 0 018 ppm.
10 Total hydrocarbons (C10-C30) detected at 0.6 ppm (semi-quantified)
11 Chloromethane detected at 2.400 ppm, chloroethane detected at 0.8 ppm.
12 Toluene detected at 0.001 ppm.
13 Chloromethane detected at 0.028 ppm, 2-butanone detected at 0.026 ppm, cis-1,3-dichloropropene detected at 0.003 ppm, tetrahydrofuran tentatively detected at 1.100 ppm, toluene detected at 0.003 ppm.
14 1,2-DCE detected at 0.008 ppm.
15 1,2-DCE detected at 0.002 ppm
16 1,2-DCE detected at 0.001 ppm.
17 1,2-DCE detected at 0.001 ppm.
18 Toluene detected at 0.002 ppm

a = Well installed at Hewlett-Packard by Geomatrix
b = Well installed at Tandem by Geomatrix
c = Well installed at Siemens by Geomatrix.

TABLE 2.4.b
SUMMARY OF GROUNDWATER CHEMISTRY DATA - SEMI-VOLATILE ORGANIC ANALYSES[1]
Concentrations in milligrams per litre (mg/L or ppm)

Investigation Phase	Well ID	Collect Date	Dichloro-benzenes	Phenols (total)	Trichloro-benzenes	Other
Perched and A-zone						
Phase II, Cooper, Oct. 1985	Well 1A	08/29/85	NA	NA	NA	Dichlorocyclohexane - 0.10[2] Chlorohexanol - 0.07[2] Trichloropropene - 0.04[2]

TABLE 2.5 (concluded)
SUMMARY OF B-ZONE GROUNDWATER CHEMISTRY DATA - VOLATILE ORGANIC ANALYSES[1]
Concentrations in milligrams per litre (mg/L or ppm)

Notes:

1 All analyses performed by US EPA Test Methods 601, 602, 624, or 8240.
2 Benzene detected at 0.001 ppm, xylene detected at 0.004 ppm.
3 Tetrahydrofuran detected at 0.040 ppm (semi-quantified)
4 Tetrahydrofuran detected at 0.260 ppm (semi-quantified)
5 Tetrahydrofuran detected at 0.030 ppm (semi-quantified).
6 2-butanone detected at 0.027 ppm, 4-methyl-2-pentanone detected at 0.002 ppm.
7 2-butanone detected at 0.012 ppm.
8 2-butanone detected at 0.008 ppm.
9 2-butanone detected at 0.031 ppm, 2-methyl-2-propenoic acid tentatively detected at 0.003 ppm.
10 2-butanone detected at 0.006 ppm.
11 Chloroform detected at 0.003 ppm.
12 2-butanone detected at 0.007 ppm.
13 2-butanone detected at 0.005 ppm.
14 2-butanone detected at 0.010 ppm.
15 Chloroform detected at 0.001 ppm.

a Well installed at Siemens by Geomatrix.

Notes:
1 All analyses performed by US EPA Test Methods 601, 602, 624, 8010, 8020, 8240.
2 Acetone detected at 0.032 ppm.
3 1,2-DCA detected at 0.0005 ppm.
4 1,2-DCA detected at 0.0038 ppm.
5 1,2-DCA detected at 0.0025 ppm, 1,2-DCE detected at 0.001 ppm
6 Xylenes detected at 0.0007 ppm.
7 Xylenes detected at 0.010 ppm.
8 Benzene detected at 0.001 ppm.
9 Ethyl benzene detected at 0.001 ppm.
10 Acetone detected at 0.050 ppm.
11 1,2-DCA detected at 0.012 ppm.
12 Benzene detected at 0.012 ppm
13 PCE detected at 0.0064 ppm.
14 1,2-DCE detected at 0.006 ppm.

a No laboratory reports provided.

TABLE 3.1

SUMMARY OF WORK PERFORMED UNDER THE REMEDIAL INVESTIGATION
10900 North Tantau Avenue
Cupertino, California
April 1989 - January 1990

Report References	Wells Installed	No. Soil Borings	No. Groundwater Samples Analyzed	No. Soil Samples Analyzed	No. Soil Gas Samples Analyzed	Predominant Organic Compounds Detected	Comments
Geomatrix Consultants 17 April 1989	-	-	25	-	-	-	Quarterly monitoring report for the calendar of quarter Jan.-March
Geomatrix Consultants 17 April 1989	-	-	16	-	-	-	NPDES self-monitoring report for the calendar quarter of Jan.-March
Geomatrix Consultants 17 April 1989	-	-	-	-	86	TCE, Toluene	Report on soil gas investigation
Beak Consultants June 1989	-	16	-	151	20	TCE, Toluene	Report on completion of piezometers, soil borings and additional soil gas survey
Geomatrix Consultants 17 July 1989	-	-	9	-	-	TCE	Quarterly monitoring report for the calendar quarter of April-June
Geomatrix Consultants 17 July 1989	-	-	9	-	-	TCE	NPDES self-monitoring report for the calendar quarter of April-June
Beak Consultants August 1989	-	14	-	112	-	TCE	Report on completion of additional soil borings
Geomatrix Consultants 16 October 1989	-	-	9	-	-	TCE	Quarterly monitoring report for the calendar quarter of July-Sept.
Geomatrix Consultants 16 October 1989	-	-	9	-	-	TCE	NPDES self-monitoring report for the calendar quarter of July-Sept.
Geomatrix Consultants 15 January 1990	-	-	9	-	-	TCE	Quarterly monitoring report for the calendar quarter of Oct-Dec.
Geomatrix Consultants 15 January 1990	-	-	9	-	-	TCE	NPDES self-monitoring report for the calendar quarter of Oct-Dec.
This report	-	2	-	19	-	TCE	Additional RI borings

TABLE 7.1

PRESSURE CHANGE IN GAS MONITORING WELLS
FROM START TO END OF GAS EXTRACTION TESTS

Test	Pressure Change (inches of water head)						
	V1S	V1D	V2S	V2D	V3S	V3D	W9A
Recovery for 120 minutes	+0.091	NR	+0.090	NR	+0.064	NR	+0.80
Pumping for 75 minutes at approx. 20 ft^3/min.	-0.084	NR	-0.082	NR	-0.031	NR	-0.54
Recovery for 60 minutes	NR	+0.62	NR	+0.32	NR	+0.24	+0.53
Pumping VE2 only for 50 minutes at approx. 36 ft^3/min.	-.024	-0.95	-0.083	-0.41	NR	NR	NR

NR = not recorded

Notes: A positive pressure change is defined as an increase in the gas phase pressure in the well over the duration of the test.

The pressure readings in the vent wells approached steady values at the end of each test with some fluctuation resulting from wind gusts. Average pressure values were used to calculate the pressure change before compiling this table. The pressure in W9A did not stabilize by the end of each test, however, the magnitude of the change for each test clearly indicate that the gas extraction system has a strong influence at W9A.

TABLE 8.1a
SCREENING OF POTENTIAL CHEMICALS OF CONCERN IN GROUNDWATER

Potential Chemical of Concern[1]	Frequency of Detection[2]	Maximum Conc.[3]	Background Conc.[3]	COC	Comments
Acetone	1/186	0.019			Low frequency
Benzene	0/186				Not detected
Benzo(b)fluoranthene	0/21				Not detected
Bis-2-ethylhexylphthalate	0/21				Not detected

Executive Summary

This is the sixth Five-Year Review of the Intersil Inc./Siemens Components Superfund Site (Site) located in Cupertino, Santa Clara County, California. The purpose of this Five-Year Review is to review information to determine if the remedy is and will continue to be protective of human health and the environment.

The California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB) and the U.S. Environmental Protection Agency (EPA) worked together to select the final remedy for the Site, which was presented in the Final Site Cleanup Requirements Board Order No. 90-119, on August 15, 1990. The September 27, 1990 Record of Decision (ROD) incorporated the Final Site Cleanup Requirements Board Order No. 90-119 and provided a summary of the selected final remedy, documented comments and questions received during remedial planning, and required further investigation in the Study Area located downgradient from the two source properties described below. The selected final cleanup remedy consisted of modifications to two existing groundwater extraction and treatment (GWET) systems and two soil vapor extraction and treatment (SVET) systems. The following three areas that include the two source properties are associated with the Site:

- Former Intersil, Inc. (Intersil) facility, located at 10900 North Tantau Avenue, Cupertino, California.
- Former Siemens Components, Inc. (Siemens) facility, located at former 10950 North Tantau Avenue (currently 19000 Homestead Road), Cupertino, California.
- Off-Property Study Area, located north of, and hydraulically downgradient from, the former Intersil and Siemens facilities, which extends into Sunnyvale, California.

The goal of the selected final cleanup remedy is to restore groundwater to beneficial use. The selected remedy addressed the principal threats posed by the Site. Contaminants removed from both soil and groundwater were captured and permanently destroyed, significantly reducing the toxicity, mobility, and volume of the hazardous substances in both media. Both SVET systems were shut down following a rise in groundwater levels and following subsequent shutdown approval by the RWQCB. Further soil vapor extraction would have resulted in relatively insignificant reductions in contaminants due to asymptotic mass removal. Both GWET systems continue to operate, containing the groundwater contaminant plumes and removing contaminants in groundwater from the Site.

Land use and exposure pathways have not changed since the last Five-Year Review. Land use covenants as deed restrictions are in place for the former Intersil and former Siemens properties, effectively preventing land use changes that would result in contaminant exposure to Site contaminants. Multiple vapor intrusion assessments have been completed for buildings within the Site and vapor intrusion was shown to not pose an unacceptable current human health risk.

The remedy, including the past soil excavation, past soil vapor extraction, and ongoing groundwater extraction and treatment are functioning as designed. TCE concentrations above ROD cleanup standards are present in the furthest downgradient wells to the north for the Upper Aquifer water-bearing A and B zones, TCE concentrations are decreasing in the majority of monitoring wells and the plume is decreasing overall. Decreasing TCE concentration trends are due, in part, to additional methods of alternative

remediation that Siemens has implemented in recent years as part of pilot study activities. The Site contaminants are not above the California drinking water Maximum Contaminant Level (MCL) standards in the C Zone.

Some of the highest TCE concentrations in groundwater at the Site have been detected within the A Zone Resaturated Interval along Forge Drive between the former Intersil and former Siemens properties. This may indicate relatively shallow contamination in this location and may be a continuing source of contamination downgradient. Without an understanding of the magnitude of contamination within the Resaturated Interval south of Forge Drive on the former Intersil property site, analysis for understanding of when cleanup timeframes will be met under the current methods of remediation may be incomplete.

The remedy at the Intersil Inc./Siemens Components Superfund Site currently protects human health and the environment by maintaining capture of the contaminant plume and eliminating on- and off-property exposure pathways. Institutional controls eliminate exposure pathways on the former Intersil and Siemens properties. In order for the remedy to be protective in the long-term, additional delineation of the Resaturated Interval of the A Zone should be completed.

1. Introduction

The purpose of a five-year review is to evaluate the implementation and performance of a remedy in order to determine if the remedy will continue to be protective of human health and the environment. The methods, findings, and conclusions of reviews are documented in five-year review reports. In addition, Five-Year Review reports identify issues found during the review, if any, and document recommendations to address them.

The U.S. Environmental Protection Agency (EPA) is preparing this Five-Year Review pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act Section 121, 40 Code of Federal Regulations Section 300.430(f)(4)(ii) of the National Contingency Plan and EPA policy.

This is the sixth Five-Year Review for the Intersil Inc./Siemens Components Superfund Site (Site). The triggering action for this policy review is the completion date of the previous Five-Year Review. This Five-Year Review has been prepared due to the fact that hazardous substances, pollutants, or contaminants currently remain at the site above levels that allow for unlimited use and unrestricted exposure, and cleanup levels have not yet been achieved.

The California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB) is the lead agency for implementing the Site's remedy. The EPA has reviewed all supporting documentation and provided input during the Five-Year Review process. The Site consists of three distinct areas in the city of Cupertino, California. The first area is the former Intersil Inc. (Intersil) property, located at 10900 North Tantau Avenue. The second area, the former Siemens Components, Inc. (Siemens) property, lies immediately north at 19000 Homestead Road (former 10950 North Tantau Ave). Those two areas have comingled plumes of volatile organic compounds (VOCs) in both groundwater and vadose zone soils. This plume extends north from the source properties to an adjacent residential area of Sunnyvale, California which is the third area within the Site, referred to as the Off-Property Study Area.

The Intersil Inc./Siemens Components Superfund Site Five-Year Review was led by Roger Papler of the RWQCB and Michael Schulman of the EPA. Participants included Cynthia Wetmore, EPA Region 9 Superfund Five-Year Review Coordinator, and from the U.S. Army Corps of Engineers, Seattle District, Daniel J. Carlson, physical scientist; Lisa Scott, hydrogeologist; and Benino McKenna, geologist. The review began on October 2, 2019.

Table 1. Five-Year Review Summary Form

SITE IDENTIFICATION		
Site Name: Intersil Inc./Siemens Components Superfund Site		
EPA ID: CAD041472341		
Region: 9	**State:** CA	**City/County:** Cupertino / Santa Clara
SITE STATUS		
National Priorities List Status: Final		
Multiple Operable Units? No	**Has the site achieved construction completion?** Yes	
REVIEW STATUS		
Lead agency: State ***[If "Other Federal Agency", enter Agency name]*:**		
Author names (State and Federal Project Managers): Roger Papler and Michael Schulman		
Author affiliations: San Francisco Bay Regional Water Quality Control Board (RWQCB) and United States Environmental Protection Agency		
Review period: 10/2/2019 – 9/30/2020		
Date of site inspection: 2/6/2020		
Type of review: Policy		
Review number: 6		
Triggering action date: 9/30/2015		
Due date *(five years after triggering action date)*: 9/30/2020		

1.1. Background

Former Intersil Facility

From 1967 to 1988, Intersil operated as a silicon wafer fabrication plant and office building. In connection with these activities, Intersil used inorganic etching solutions (i.e., acids) and large amounts of water (up to 100,000 gallons per day). Trichloroethylene (TCE), an industrial solvent, was used as a cleaning agent prior to 1979. This was replaced with 1,1,1-trichloroethane (1,1,1-TCA), which was used until closure of the facility in 1988. Because Intersil's processes were acid- and water-intensive, rather than solvent-intensive, the facility had multiple in-groundwater wastewater neutralization systems and sumps, with the acids processed in the North and East Neutralization Systems.

The East and North Neutralization Systems consisted of five 1,000-gallon subsurface vaulted concrete tanks with polypropylene liners, five in-ground vaulted 1,000-gallon plastic tanks (later replaced by two stainless steel compartment tanks), and one 1,000-gallon steel gravity separator tank. The neutralized wastewater was then discharged to the municipal sanitary sewer system. In 1976, the East Neutralization System was moved further to the east and installed as a 8,500-gallon, stainless steel compartment tank within subsurface concrete vaults. In 1980, a 250-gallon, steel waste solvent storage task was added to the East Neutralization System concrete vault. Wastes from the 250-gallon waste tank were pumped out monthly by a recycling company. Other wastewater treatment handling areas included the North and East scrubber sumps that consisted of 500-gallon, epoxy-lined concrete sumps.

Intersil conducted investigations of the property between 1983 and 1988, which involved drilling soil borings and installing groundwater monitoring wells. The investigations revealed the presence of TCE in soil and groundwater beneath the central and northern portions of the property. The impact of groundwater contaminants was limited to the upper aquifer. Groundwater samples collected from the deeper aquifer indicated that it had not been significantly impacted.

Initial response actions included the removal of inactive industrial systems components in 1986 and 1988. Furthermore, a groundwater extraction and treatment system (GWET) was installed in 1987 and a soil vapor extraction and treatment system (SVET) was installed in 1988.

General Electric is the successor to Intersil, Inc. and retains responsibility for the operation and maintenance of the GWET system. The former Intersil property is now occupied by Panasonic Corporation and Apple, Inc.

Former Siemens Facility

From approximately 1970 to 1982, Litronix used the facility for semiconductor manufacturing operations. In 1978 Litronix was purchased by Siemens, and from 1982 to 1995 Siemens used the facility for semiconductor manufacturing operations to produce light emitting diode products using a variety of organic and inorganic solutions and compressed gasses. The solvents TCE and 1,1,1-TCA were used for cleaning of the bulk and wafer fabrication processes to remove a wax coating that were used to hold the wafer in place for polishing. The bulk use of TCE and 1,1,1-TCA were phased out through 1980 to 1983

with the elimination of wax from the polishing process. To store liquid wastes, five underground storage tanks were installed between 1971 and 1974, which were removed by 1982. From 1982 until closure of facility operations in 1986, liquid wastes were temporarily stored on site in 55-gallon drums for later off-site disposal or recycling.

Investigations began in 1982 after the discovery of contaminants during the removal of the underground storage tanks. Investigations performed between 1982 and 1989 indicated that releases of mostly chlorinated VOCs and semi-volatile organic compounds had occurred and impacted soil and groundwater at levels requiring remediation. The groundwater contamination from Siemens comingled with the contamination from the former Intersil property.

Initial response actions included the installation of a SVET system in 1983 and a GWET system in 1986. The purpose of the GWET system was to provide hydraulic control and remediation of the affected groundwater.

The building on the former Siemens property is now occupied by Kaiser Permanente.

Off-Property Study Area

Intersil and Siemens initiated the investigation of the Off-Property Study Area in 1986. The Off-Property Study Area has no known history of manufacturing activities and is almost entirely developed for residential use. During the 1980s investigations, groundwater in the uppermost zone of the Upper Aquifer (A Zone; see Hydrology in Section 1.3) in this area was not found to be impacted and remediation was not required under RWQCB Order 90-119 (Order). The off-property investigation indicated that the B Zone of the Upper Aquifer was the most contaminated. The C Zone of the Upper Aquifer had much lower levels of contamination than the B Zone, and concentrations are below California drinking water Maximum Contaminant Level (MCL) standards.

Initial response actions included the installation of three groundwater extraction wells and incorporating them into the GWET system on the former Siemens property.

1.2. Physical Characteristics

The former Intersil facility is located at 10900 North Tantau Avenue and the former Siemens facility is located at 19000 Homestead Road, formerly 10950 North Tantau Avenue, in Cupertino, California (Figure 1). The Off-Property Study Area is located north of and hydraulically downgradient from, the former Intersil and Siemens facilities and extends into the City of Sunnyvale. Cupertino has a population of approximately 60,000, is located on the west side of Santa Clara Valley in Santa Clara County, and is part of the San Francisco Bay Metropolitan Region.

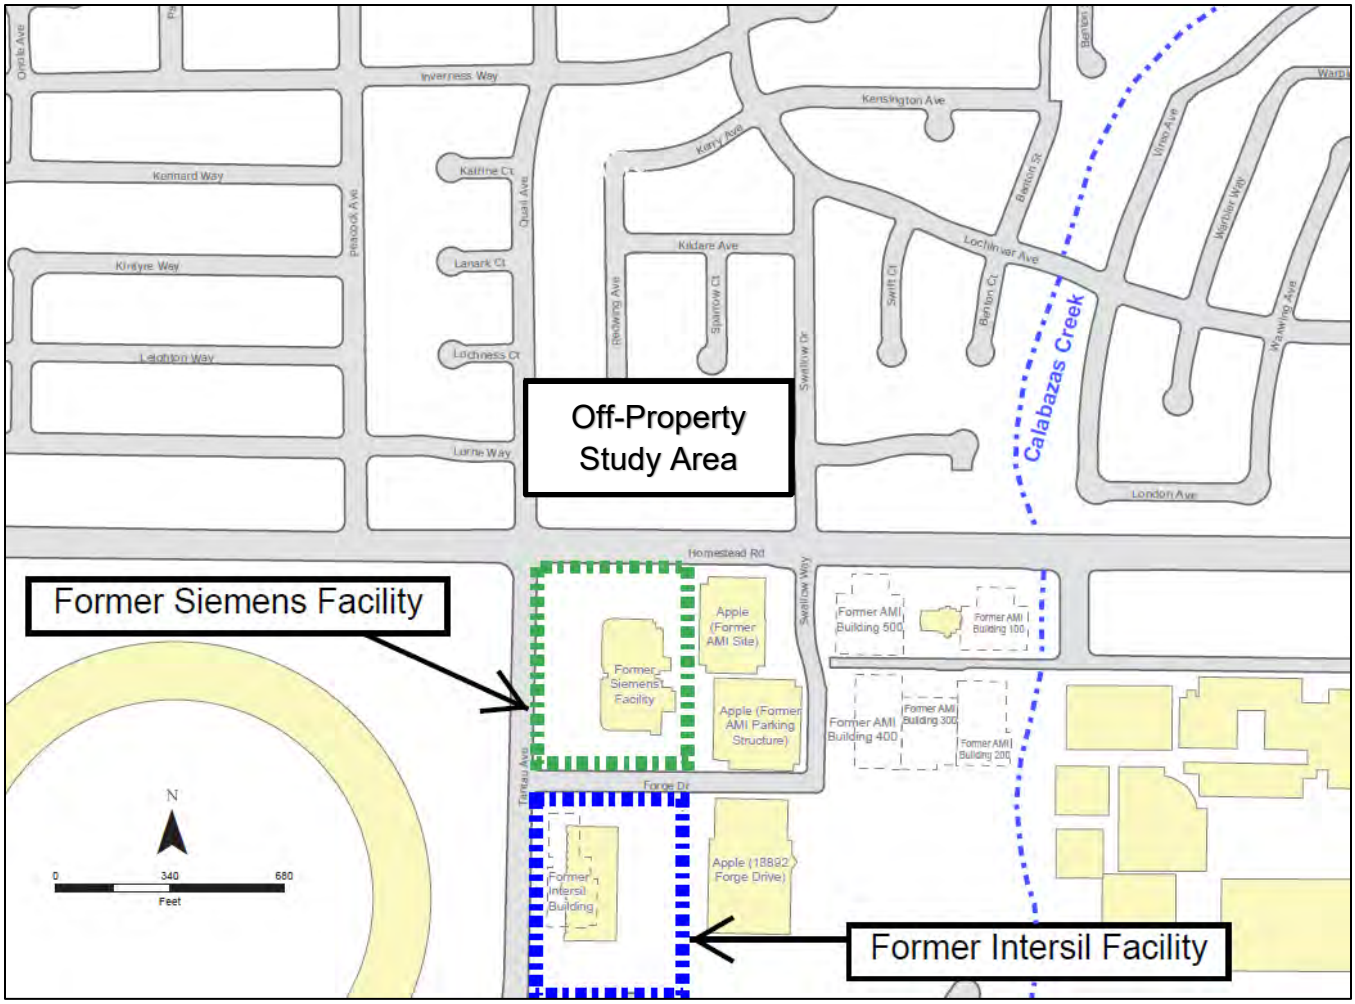

Figure 1. Detailed Site Map

The buildings at the former Intersil facility were demolished in the 1990s and the property was sold several times. In 2007, Tantau Investments, LLC., purchased the property and constructed a two-story, 51,750 square foot commercial office building with a vapor barrier beneath the building foundation. The building on the former Siemens property is used for commercial purposes and land use in the Off-Property Study Area is residential.

The former American Microsystems, Inc. (AMI) site is located northeast of the former Intersil facility and adjacent to and east of the former Siemens facility. The AMI site contains VOCs in groundwater and is managed under a separate Board Order than the Site. The Board Order and initial remedial investigations of the AMI site do not cite the immediately adjacent AMI property to the west of the AMI site as a source of VOC contamination.

The Site overlies the Santa Clara Valley Basin, groundwater from which provides up to 50 percent of the municipal drinking water for over 1.9 million residents of the Santa Clara County, as of 2018. Within the Santa Clara Subbasin, the Site overlies the Santa Clara Plain Confined Area. Approximately 99 percent of groundwater pumped from the Santa Clara Plain is used for municipal and industrial purposes. Drinking

water for Cupertino residents and businesses is supplied by either San Jose Water Company or California Water Service. Some of the Off-Property Study Area falls within the City of Sunnyvale; the City of Sunnyvale Department of Public Works supplies drinking water to city residents and businesses. No private wells exist on properties located within the Off-Property Study Area. There are five active municipal wells within a 1-mile radius of the Site. The nearest downgradient municipal supply wells are City of Santa Clara Wells No. 24 and No. 17-02, respectively located approximately 3,700 feet north-northeast and 3,900 feet east-northeast from the northern border of the former Siemens property. Both wells are active municipal groundwater supply wells for domestic supply as of April 2020, producing approximately 1,500 gallons per minute (gpm) from Well # 24 and 2,000 gpm from Well #17-02.

Calabazas Creek is approximately 1,100 feet east of the Site and flows north-northeast approximately 7 miles into San Francisco Bay.

1.3. Hydrology

The Site is located in Northern California, along the southern edge of the San Francisco Bay within the Santa Clara Valley. The Santa Clara Valley is a gently northward sloping alluvial plain, flanked by the Diablo Range to the northeast, and the Santa Cruz Mountains to the southwest. The geologic setting at the Site consists of coarse-grained sand and gravel interbedded with fine grained silt and clay, representing alluvial stream channel and associated overbank deposits. The Remedial Investigation Reports for Intersil (Beak Consultants, 1990) and for Siemens (Levine-Fricke, 1990) present an overview of the geology, hydrogeology, groundwater quality for the Site. The hydrology of the Site is composed of two primary water-bearing units, the Upper Aquifer (A, B and C Zones) and the Deep Aquifer.

Historically and in current analyses, the Upper Aquifer is divided into three water-bearing zones which are generally separated by fine-grained sediments that act as semi-confining aquitards, as follows:

Upper Aquifer Water-Yielding Zones:

- A Zone (top of the groundwater table to 115 to 125 feet below ground surface [bgs])
- B Zone (approximately 130 to 150 feet bgs)
- C Zone (approximately 180 to 210 feet bgs)

The Deep Aquifer (the regional aquifer) is a confined aquifer that exists at depths of approximately 300 to 500 feet bgs and is separated from the C Zone by an approximately 80- to 150–foot-thick aquitard of fine-grained sediments (Levin-Fricke, 1990; AMEC Geomatrix and ARCADIS, 2011). The groundwater flow direction in the A, B, and C Zones and the regional aquifer is generally northward to northeast beneath the former Intersil and Siemens facilities, generally towards the Off-Property Study Area and San Francisco Bay (Beak Consultants, 1990).

The groundwater elevations rose approximately 50 to 55 feet between 1993 and 1998 due to reductions in agricultural pumping. The rise in groundwater from historical groundwater levels at approximately 100 feet bgs created the originally designated Upper Aquifer Resaturated Interval in the A Zone that extended from 45 to 90 bgs. At the former Siemens property, the Resaturated Interval was divided into two intervals: the Upper Resaturated Interval that extends from approximately 45 to 60 feet bgs, and the

Lower Resaturated Interval that extends from approximately 60 to 90 feet bgs. The Resaturated Interval was later divided into four depth intervals, A1 through A4 (see below).

The Hydrogeologic Framework Report (AMEC Geomatrix and ARCADIS, 2011) discussed and reclassified the A Zone into the four depth zones: A1, A2, A3, and A4 to clarify the hydrogeologic relationship between the two source properties. Former vadose zone wells in the Resaturated Interval are now designated as A1, A2, or A3 Zone wells based on the depths of their screened intervals. The former saturated A Zone is now referred to as the A4 Zone (see Table 2). The A1 through A4 Zones are interconnected and not separate groundwater bearing zones; however, the finer-grained A2 Zone tends to function like an aquitard between the A1 and A3 Zones and is not evaluated as a water bearing zone. In some locations, the A1 Zone does not produce enough water to collect groundwater samples or extract groundwater. The depth ranges for the A1, A2, A3, and A4 Zones at the former Intersil and Siemens facilities are shown below in Table 2.

Table 2. A Zone Subdivided Depth Intervals

Water-Bearing Zone	Former Intersil Facility Approximate Depth (feet bgs)	Former Siemens Facility Approximate Depth (feet bgs)
A1	38 to 58-60	40 to 58-60
A2	58-60 to 69-74	58-60 to 70-74
A3	69-74 to 80-90	70-74 to 90
A4	80-90 to 125	90 to 125

The groundwater plume originating from the former Siemens and former Intersil properties is managed as one commingled plume by SMI Holding, LLC (Siemens) and General Electric, the successor to Intersil. The groundwater plume in the A Zone extends approximately 800 feet downgradient to the north of the former Siemens property and east of Swallow Way. The groundwater plume in the B Zone extends approximately 1,400 feet downgradient to the north into the Off-Property Study Area.

2. Remedial Actions Summary

2.1. Basis for Taking Action

In the 1980s, the municipal water supply well City of Santa Clara Well No. 24 (located approximately 3,700 feet downgradient of the former Siemens property) showed signs of minor impact from chemical releases of Freon-113 and 1,1,1-TCA into soil and groundwater from the Site. The primary threats to human health were future risks posed by ingestion of groundwater and inhalation of volatilized chemicals, should residential development occur on the Site or if untreated shallow zone groundwater was used for human consumption.

2.2. Remedy Selection

The RWQCB and the EPA worked together to select the final remedy for the Site, which was presented in the Final Site Cleanup Requirements Board Order No. 90-119, on August 15, 1990. The September 27, 1990 Record of Decision (ROD) incorporated the Final Site Cleanup Requirements Board Order No. 90-119, provided a summary of the selected final remedy, and required further off-property investigation. The selected final cleanup remedy consists of the following elements:

- Former Intersil property: Expanding pre-existing groundwater and soil vapor extraction and treatment systems by adding three groundwater extraction wells, with two converted from groundwater monitoring wells, and four soil vapor extraction wells.
- Former Siemens property: Expanding the pre-existing groundwater and soil vapor extraction and treatment systems by adding one groundwater extraction well and 12 soil vapor extraction wells, and the excavation of approximately 40 cubic yards of contaminated soil.
- Off-Property Study Area: Installing groundwater extraction wells and connecting them to the Siemens property groundwater extraction and treatment systems.

The ROD stated that the goal of the remedy is to restore groundwater to its beneficial use based on California drinking water MCL standards. The ROD also stated that continued monitoring of groundwater and soil would be conducted to verify containment of the contaminated groundwater and attainment of cleanup levels.

Table 3. ROD Soil Cleanup Standards

Chemical	Former Intersil Facility Cleanup Standards (mg/kg)	Former Siemens Facility Cleanup Standards (mg/kg)	Basis of Cleanup
Total VOCs	1	1	Not specified*
Semivolatile Organic Compounds	None	10	Not specified*

Notes: mg/kg = milligrams per kilogram; ***** The Final Site Cleanup Requirements Board Order No. 90-119 states within the remedy selection rationale that soil is remediated to a level that will protect groundwater from future solvent contamination.

Table 4. ROD Groundwater Cleanup Standards

Chemical*	Former Intersil and Former Siemens Facilities Cleanup Standards (µg/L)	Basis of Cleanup
TCE	5	CA MCL
Tetrachloroethylene (PCE)	5	CA MCL
1,1-Dichloroethylene	6	CA MCL
cis-1,2-Dichloroethylene (cis-DCE)	6	CA MCL
trans-1,2-Dichloroethylene (trans-DCE)	10	CA MCL
1,1,1-TCA	200	CA MCL
Freon-113	1,200	CA MCL
Toluene	100	CA RDWAL

Notes: µg/L = micrograms per liter; CA MCL = California Department of Health Services Maximum Contaminant Level
CA RDWAL = California Department of Health Services Recommended Drinking Water Action Levels; The ROD states that "the goal of this remedial action is to restore groundwater to its beneficial use"; therefore, cleanup standards apply to all contaminants resulting from the Site with applicable standards, including TCE breakdown products such as vinyl chloride.

2.3. Remedy Implementation

Former Intersil Facility

The ROD, issued in 1990, mandated that the two major systems operating at the Site continue to operate, and in some cases, be expanded. The SVET system was subsequently expanded to twelve wells, and the GWET was expanded to seven wells. The SVET system operated from 1988 to 1993, when system approached asymptotic conditions (conditions in which diminished decreases of contaminants may be expected). The GWET system continues to operate today. Extracted soil vapor was treated using carbon adsorption in granular activated carbon vessels. Groundwater was treated using air strippers, although these were replaced by granular activated carbon vessels in 2007.

Former Siemens Facility

Siemens expanded the pre-ROD remediation systems at the former Siemens property to twelve SVET wells and seven GWET wells. The remedy also included excavating approximately 40 cubic yards of contaminated soil on the property. The SVET system operated from 1983 to 2005 when the system approached asymptotic conditions. Groundwater was treated using air strippers that were replaced by granular activated carbon vessels in 2007.

Off-Property Study Area

The remedy implemented at the Off-Property Study Area included extracting groundwater from the three existing extraction wells and regular groundwater monitoring, similar to the monitoring required for the former Siemens property.

2.4. Operation and Maintenance

The remedy for the former Intersil property, former Siemens property, and Off-Property Study Area requires operating and modifying the existing GWET systems at each property. Regular groundwater and soil vapor monitoring is also required for each system. Monitoring requirements include groundwater monitoring of the Upper Aquifer A, B, and C Zones, and additional delineation of the contaminant plume if monitoring results show evidence of plume migration.

Upgrades and modifications have been made to each GWET system for adapting to changes in site conditions, including the 50-foot rise in groundwater that occurred between 1993 and 1998, and for performance optimizations. Upgrades and modifications continue to be made to each GWET system to optimize remedy performance.

Treated effluent from both the GWET systems are discharged to Calabazas Creek under a National Pollutant Discharge Elimination System (NPDES) general permit. General Electric and Siemens continue monitoring groundwater conditions, operating the GWET systems, and reporting to the RWQCB in accordance with the August 15, 1990 Board Order No. 90-119 and the January 2013 amended Board Order R2-2013-0002.

3. Progress Since the Last Five-Year Review

3.1. Previous Five-Year Review Protectiveness Statement and Issues

The protectiveness statement from the 2015 Five-Year Review for the Intersil Inc./Siemens Components Superfund Site stated the following:

> *The remedy at the Intersil Inc,/Siemens Components Superfund Site, including the former Intersil property, former Siemens Property, and Off-Property Study Area, currently protects human health and the environment because all exposure pathways and scenarios are being controlled, including the vapor intrusion pathway. In order for the remedy to be protective in the long-term, additional evaluations of the A Zone in the Off-Property Study Area must be conducted, the groundwater remedy needs to be optimized so as to be more effective, or an alternative remedy selected, and 1,4-dioxane should be analyzed in future site sampling to determine its distribution and whether it should be considered a Site contaminant of concern.*

The 2015 Five-Year Review included three issues and recommendations.

Table 5. Status of Recommendations from the 2015 Five-Year Review

Issue	Recommendation	Current Status	Current Implementation Status Description	Completion Date (if applicable)
The boundary of the TCE plume in the Off-Property Study Area has not been sufficiently defined.	Install more monitoring wells in the Off-Property Study Area and further evaluate and define TCE concentrations across the A Zone.	Ongoing	Groundwater investigations were completed in the Off-Property Study Area in 2015 and 2016 (ERM, 2016c). Detected VOCs were below MCLs within the A1 and A4 Zones downgradient of the former Siemens property; however, TCE was detected above MCLs and not defined in the A3 Zone to the northeast of the Siemens Site, to the east of the roads Swallow Drive and Swift Court.	N/A

Issue	Recommendation	Current Status	Current Implementation Status Description	Completion Date (if applicable)
In the former Siemens property, a minor increasing trend was observed in three B Zone wells [PL-1B, H-3B, W18B] and a stable trend above cleanup standards was observed in two A Zone wells [S-1A, F-1A] and one B Zone well [KR-1B]. Increasing trends may preliminarily indicate a lack of full control of the TCE plume by the selected remedy (extraction wells) and stable trends may preliminarily indicate ineffectiveness of the current remedy in achieving cleanup standards.	Improve the efficiency of the current groundwater remediation and/or develop alternative methods of remediation.	Ongoing	In the former Siemens property, three phases of enhanced reductive dechlorination (ERD) pilot studies have been completed to explore additional remediation options. ERD pilot study mitigation measures included targeted Soil Vapor Extraction (SVE) and chemical oxidant injections completed in April 2019 to address vinyl chloride in groundwater and support ongoing remediation enhancement efforts. Performance monitoring for the 2017 Phase III ERD pilot study and mitigation measures are ongoing. For the former Intersil property, no wells are screened in the A1 Zone and only a paired groundwater extraction well and monitoring well are located within the A3 Zone and therefore the statistical evaluation of TCE concentration trends for the Intersil property could not be conducted. The delineation of TCE impacts in the A1 and A3 Zones as a source area is currently not defined. Since the 2015 Five-Year Review no improvements to the current groundwater remediation have been made nor development of alternative methods of remediation.	N/A
Research has shown that 1,4-dioxane is an emerging contaminant that can be found at sites where 1,1,1-TCA is a contaminant of concern. However, there is no information regarding the presence and distribution of 1,4-dioxane in the subsurface.	Add 1,4-dioxane to the list of contaminants to be monitored for in regular groundwater sampling and assess whether it should be considered a Site contaminant of concern.	Completed	Thirteen wells from the former Intersil, former Siemens, and Off-Property Study Area were sampled for 1,4-dioxane in October 2018. Only one well (4BP) on the former Siemens property was slightly above the California drinking water notification level[1] indicating that there was not a significant source or release from the former Intersil/Siemens properties.	October 2018

[1] Notification levels are health-based advisory levels established by the California Division of Drinking Water for chemicals in drinking water that lack MCLs. The notification level is not an enforceable regulatory cleanup standard.

3.2. Work Completed at the Site During this Five-Year Review Period

Former Intersil Property

The GWET system at the former Intersil property extracted from four extraction wells during this Five-Year Review period; one within the A3 Zone of the Resaturated Zone and three within the A4 Zone. The wells pumped a total volume of approximately 58 million gallons of groundwater and removed approximately 34 pounds of VOCs between 2015 and 2019. The system was occasionally shut down to facilitate maintenance activities but was operating approximately 99 percent of the time.

At the RWQCB's request, General Electric collected samples for sulfate analysis in 2018 to evaluate discharge of sulfate to Calabazas Creek by the GWET system. Samples were collected from on-property groundwater wells, from GWET system effluent, and from outfall piping downgradient of the system that discharges to Calabazas Creek. The sulfate concentrations were within the allowable sulfate ranges under the NPDES general permit (Wood, 2018).

Former Siemens Property

GWET system: The GWET system at the former Siemens property extracted from five on-property Upper Aquifer extraction wells; three within the A3 Zone, one within the A4 Zone, and one within the B Zone. The wells pumped a total volume of approximately 134 million gallons of groundwater and removed approximately 110 pounds of VOCs between 2015 and 2019. Off-property wells pumped as part of the GWET system are discussed in the Off-Property Study Area subsection. Two on-property extraction wells were not operated during this Five-Year Review period due to ongoing ERD pilot study activities. The GWET system was occasionally shut down to facilitate maintenance activities but operated approximately 99 percent of the time. Upgrades to the GWET system included installing a new remote accessible totalizer that provided real-time system flow data. Additional upgrade and maintenance activities included installing a human-machine interface, replacement of failing equipment (e.g., extraction pumps, transfer pump), and redevelopment of several extraction wells. This has reportedly increased the system runtime in recent years (Appendix G).

Phase III ERD: In February and March 2017, Phase III ERD pilot study activities included injecting a carbon/zero valent iron product and emulsified vegetable oil into groundwater. in February, June, July, and August 2018, the pilot study also included injecting KB-1 ® Primer and/or emulsified vegetable oil (ERM, 2018a). In April 2019, subsequent mitigation measures included targeted SVE and injecting potassium permanganate to address the increased vinyl chloride in groundwater on the north side of the former Siemens property and to support ongoing remediation enhancement efforts (ERM, 2019d). Groundwater, soil vapor, and extraction well performance monitoring associated with the 2017 Phase III ERD pilot study and mitigation measures are ongoing.

Vapor Extraction Investigation: In April 2018, a soil vapor investigation evaluated potential residual VOC sources in deep vadose soil under the building and the potential impact of those VOCs on the pace of groundwater restoration. Existing soil vapor extraction wells on one side of the building were

pressurized with tracer gas (helium) and subsequently vented to allow atmospheric airflow underneath the building to corresponding extraction wells on the opposite side. A trailer-mounted SVET system was used to implement and measure induced flow of soil vapor under the building. Air samples were collected for VOCs upon detection of the tracer gas and confirmation that lateral transport underneath the building had occurred. This study concluded that an insignificant residual VOC source likely exists beneath the building (ERM, 2018b).

Well Evaluation: In April and July 2018, a well evaluation survey in April 2018 verified screen depth and total well depth on select wells and updated well construction datasets. In February and June 2018, a water level logging study involved single-well pumping tests at extraction wells on the former Siemens property. Changes in groundwater elevation were monitored in the A, B, and C Zones of the upper aquifer using water level data loggers on the former Siemens property and in the Off-Property Study Area. The results of those data extraction wells performance and guided future remedy enhancements.

TOC Evaluation: In 2018, a total organic carbon (TOC) data study from A1 Zone wells within the former Siemens property and from B Zone Off-Property Study Area wells gathered additional data to support potential remedial activities. The A1 Zone was found to have higher total organic carbon than the B Zone aquifer (Wood and ERM, 2019).

Residual Source Evaluation: In May and June 2018, a sub-building investigation evaluated residual VOCs beneath the building on the former Siemens property. Direct-push borings equipped with a membrane interface probe and hydraulic profiling tool were advanced at 11 locations and standard direct-push borings were advanced at four locations. After reviewing the data, this study concluded that significant residual VOCs are not present beneath the on-property building (ERM, 2019b).

Monitoring Well Installation: In January and February 2019, 14 additional monitoring wells were installed, mostly along Forge Drive between the former Intersil and Siemens properties, as well as within the Off-Property Study Area (see below) within Swallow Way and Tantau Avenue south and east of the former Siemens facility (six wells in each of the A1 and A3 depth intervals, one well in the A4 depth interval, and one well in the B Zone) (ERM, 2018c). Soil and groundwater samples were collected during the well installation process. TCE was detected in groundwater above MCLs in the A1 and A3 Zones (ERM, 2019a).

Shallow Soil and Groundwater Investigation: A well evaluation survey was conducted in April 2018 with a down-well camera used to verify screen depth and total well depth on select wells. Another camera survey was completed in July 2018 to update well construction datasets. A water level logging study was conducted between February and June 2018, which involved single-well pumping tests at extraction wells on the former Siemens property. Changes in groundwater elevation were monitored in the A, B, and C Zones of the upper aquifer using water level data loggers on the former Siemens property and in the Off-Property Study Area. The results of those data were used to optimize extraction wells performance and guide future remedy enhancements.

A shallow soil and groundwater investigation was completed at the southern portion of the former Siemens property in June and July 2019 to determine the extent of chlorinated VOCs within the

unsaturated zone and shallow A1 Zone of the Upper Aquifer (ERM, 2019c). Direct-push borings using a membrane interface probe and hydraulic profiling tool were advanced at three locations. Standard direct-push borings were advanced at nine locations and soil and grab groundwater samples were collected from those borings. Chlorinated VOCs were not detected in the upper soils, only in soils in periodic contact with groundwater at depths 30 feet bgs or greater. All groundwater samples contained chlorinated VOCs, with TCE as the predominant contaminant.

Off-Property Study Area

GWET System: In addition to the on-property wells, the GWET system at the former Siemens property extracted from two B-Zone extraction wells in the Off-Property Study Area. The wells pumped a total volume of approximately 124 million gallons of groundwater and removed approximately 67 pounds of VOCs from those two wells.

Groundwater Investigation: In November 2015, a groundwater investigation further characterized the extent of Site contaminants in groundwater in the Resaturated Interval (ERM, 2016b) by advancing Membrane interface probe/cone penetration test borings at seven locations within the A3 Zone. Samples were not collected within the A1 Zone due to absence of a water-bearing zone. Groundwater levels decreased significantly across all areas of the Site since 2011, with some wells screened in the Resaturated Interval going dry (see also Section 4.2.1). Elevated VOCs were encountered in borings near the intersections of Swallow Way and Homestead Road, and Swallow Way and Lorne Way. The RWQCB requested that General Electric and Siemens attempt to collect groundwater samples from the A1 Zone following the rainy season and to further investigate the A3 Zone northeast of borings that contained elevated VOCs.

Additional Groundwater Investigation: In 2016, an additional groundwater investigation further defined VOC contamination in the Resaturated Interval northeast of the 2015 investigation area by advancing membrane interface probe/cone penetration test borings within the A1, A3, and A4 Zones (ERM, 2016c). Groundwater samples were also collected from three AMI monitoring wells adjacent to the Off-Property Study Area. Elevated concentrations of VOCs were found in the A3 Zone north of the western side of the former AMI properties located east of and adjacent to the former Siemens property (see also Appendix C for additional data review). A groundwater sample could not be collected from the 55 to 60 feet bgs interval from MIP-OS-16 in 2015 and 2016. However, a grab groundwater sample was collected from the A1 Zone in 2016 from MIP-OS-28 at 55 to 60 feet bgs located approximately 500 feet northeast of MIP-OS-16. A boring log was not available to review soil type at the bottom of the borehole. The A1 Zone is as between 38 to 60 feet bgs between the former Intersil and Siemens properties; however, it was not defined in the Off-Property Study Area.

Sitewide Work

GWET System: Due to the shutdown of three extraction wells on the former Siemens property in 2014 to facilitate the ERD pilot studies, there was a significant reduction in total VOC mass removed from the two GWET systems between the 2015 and 2020 Five-Year Review periods (422 pounds VOCs removed over 2010-2015 versus 211 pounds VOCs removed over 2015-2020) relative to the smaller reduction in

VOC mass between the 2010 and 2015 Five-Year Review periods (471 pounds VOCs removed over 2005-2010 versus 422 pounds VOCs removed over 2010-2015).

Nuclear Magnetic Resonance and Passive Flux Meter Study: In February and April 2019, nuclear magnetic resonance and passive flux meter study evaluated potential preferential pathways of groundwater flow within the Upper Aquifer A though C zones. The study also evaluated contaminant transport and contaminant storage zones. The investigation results assessed groundwater flow direction, where TCE mass is the most mobile, and evaluated optimization of the groundwater extraction remedy (ERM, 2020).

1,4-Dioxane Study: A1,4-dioxane study evaluated 1,4-dioxane in groundwater from wells within the former Intersil and Siemens properties, the Off-Property Study Area, and for effluent and influent samples collected from the two GWET systems. All results were below the California drinking water notification level for 1,4-dioxane of 1 µg/L (see also Table 5, above) with the exception of one groundwater sample from the former Siemens property (well 4BP), within which 1,4-dioxane was detected at 1.8 µg/L (Wood and ERM, 2019).

4. Five-Year Review Process

4.1. Community Notification, Involvement and Site Interviews

The *Cupertino Courier* published a public notice on March 13, 2020. It stated the RWQCB and the EPA were conducting a five-year review and invited the public to submit any comments to the EPA. The results of the review and the report will be available at the Sunnyvale Public Library, located at 665 West Olive Avenue, Sunnyvale, California 94086, and at the RWQCB, located at 1515 Clay Street, Suite 1400, Oakland, California 94612.

During the Five-Year Review process, the U.S. Army Corp of Engineers (USACE) conducted interviews with Wood PLC and ERM, consultants for General Electric and Siemens, respectively. General Electric is responsible for the former Intersil property and Siemens is responsible for the former Siemens property. The purpose of the interviews was to document the Site's perceived status and any perceived problems or successes with the phases of the remedy that have been implemented to date. Wood PLC and ERM submitted written responses to interview questions via email on March 10, 2020.

The overall impression of the interviewees at both properties was that the remedy is functioning as designed and continues to provide hydraulic containment and some mass removal of VOC-impacted groundwater. Due to significant reductions in mass removal rates since the GWET's startup, the interviewees recommended determining whether GWET cessation and changing the remedy to monitored natural attenuation would also be protective of human health and the environment.

4.2. Data Review

4.2.1. Ground Water

Groundwater levels decreased significantly over the last several years since 2011 and probably impacted the GWET effectiveness, affected Site contaminant concentrations, and influenced vertical contaminant migration. The decreased groundwater levels are probably related to the severe drought in California from December 2011 to March 2019. Between 2011 and 2016, water levels decreased by approximately 17 feet in the A4 Zone, 10 feet in the B Zone, and 12 feet in the C Zone. Additionally, several wells became dry within the Resaturated Interval (A1 and A3 Zone wells). Groundwater levels decreased significantly across all areas of the Site since approximately 2011, with certain permanent wells screened in the Resaturated Interval going dry. During increased rainfall during the winter of 2018-2019, decreasing groundwater levels reversed and groundwater levels increased approximately 5 feet in the Resaturated Interval, 6 feet in the A4 Zone, 7 feet in the B Zone, and 10 feet in the C Zone. Groundwater gradients are still generally to the north.

For this Five-Year Review, USACE conducted a groundwater-TCE trend analysis to evaluate increasing, decreasing, stable, or no trend using the nonparametric (i.e., data does not Mann-Kendall statistical analysis). In total, 19 monitoring locations where selected as good lateral and vertical representatives of Site TCE concentrations. Groundwater data for TCE over the previous 5-year period (2015 through 2019) were used. The Mann-Kendall analysis can demonstrate the statistical existence of an increasing, decreasing, stable, or no trend for each monitoring location. The trends combined with the locations of monitoring wells within a plume can be used for interpreting plume stability (expanding, stable, or decreasing). For example, decreasing trends at the downgradient extent of a plume generally indicate a decreasing plume. Plume stability can then be used as part of evaluating the effectiveness of remedial action. Mann-Kendall, while a powerful statistical tool, may not account for long time-periods initial increasing trends followed by a long-period of declining trends, or vice versa (e.g., the test may determine an increasing trend, despite a recent long-period of declining concentration trends).

The trend analyses indicate that the TCE plume is decreasing overall at the Site. The Mann-Kendall analysis results are summarized on Table 6 and calculations are presented in Appendix C. Eight wells show decreasing trends, one well shows a probably decreasing trend, three wells show stable trends, six wells show no trends, and one well shows an increasing trend. The comparison of trend analyses for those 12 wells shows that most wells that previously had either stable or increasing trends now have decreasing trends. Median concentrations are displayed for reference in relation to the trends. In general, monitoring wells with very low constituent concentrations may exhibit a trend through Mann-Kendall analysis that is not necessarily indicative of true plume behavior, but instead a product of the natural variability of the sampling and testing procedures.

Table 6. Summary of Mann-Kendall Trend Analysis

TCE Mann-Kendall Analysis			2015-2019			2004-2014 (previous Five-Year Review)	
Well	Zone	Location in Plume	Median TCE Conc. (µg/L)	Trend	Confidence	Trend	Confidence
VM-3S	A1	Mid-Plume Well (On-Property)	0.65	No Trend	75.8%	Mann-Kendall not completed	
LF-13A	A1	Mid-Plume Well (On-Property)	5.3	Decreasing	99.5%	Mann-Kendall not completed	
MW-OS-3A1	A1	Furthest Downgradient Toe Well (Off-Property)	13	No Trend	87.5%	Mann-Kendall not completed (Well installed in 2014)	
MW-05A3	A3	Mid-Plume Well (On-Property)	67	Stable	76.5%	Mann-Kendall not completed (Well installed in 2016)	
VM-3D	A3	Mid-Plume Well (On-Property)	14	**Increasing**	99.6%	Mann-Kendall not completed	
MW-OS-5A3	A3	Furthest Downgradient Toe Well (Off-Property)	8	Decreasing	99.5%	Mann-Kendall not completed (Well installed in 2014)	
F-1A	A4	Plume Source Area Well (On-Property)	670	No Trend	76.5%	Stable	58.0%
H-XA-S	A4	Mid-Plume Well (On-Property)	150	Decreasing	97.2%	Decreasing	99.8%
S-1A	A4	Downgradient Toe Well (Off-Property)	1.6	Decreasing	99.2%	Stable	68.4%
MW-OS-4A4	A4	Furthest Downgradient Toe Well (Off-Property)	9.7	No Trend	80.1%	Mann-Kendall not completed (Well installed in 2014)	
W18B	B	Upgradient Toe Well (On-Property)	17	Stable	71.9%	**Increasing**	97.0%
H-3B	B	Mid-Plume Well (On-Property)	29	Decreasing	99.5%	**Increasing**	98.7%
KR-1B	B	Mid-Plume Well (Off-Property)	32	Decreasing	96.5%	Stable	89.1%
LQ-2B*	B	Mid-Plume Well (Off-Property)	56	Probably Decreasing	93.3%	Decreasing	99.7%
PL-1B	B	Side gradient / Downgradient Toe Well (Off-Property)	16	No Trend	80.9%	**Probably Increasing**	94.9%
IQ-1B	B	Furthest Downgradient Toe Well (Off-Property)	0.775	No Trend	58.0%	Decreasing	99.9%
LR-3C	C	Mid-Plume Well (Off-Property)	4	Stable	59.2%	No Trend	77.7%
RK-2C	C	Downgradient Toe Well (Off-Property)	0.64	Decreasing	95.8%	Stable	56.0%
S-4C	C	Furthest Downgradient Toe Well (Off-Property)	0.86	Decreasing	99.2%	Decreasing	97.5%

Upgradient or downgradient well within the outer extent of the plume for the aquifer Zone; *Extraction well

TCE Plume Evaluation: TCE concentrations for wells within the Resaturated Interval 1990s (A1 and A3 Zones) have generally decreased within the last five years and downgradient wells to the north show decreasing or no trends, especially within the former Siemens site along Homestead Rd where ERD pilot studies have been conducted.

However, on the northern side of the former Intersil property, the TCE plume is not fully delineated within the Resaturated Interval A zones. In January 2019, five new A1 Zone wells (MW-OS-08A1 through MW-OS-12A1) were installed on the former Siemens property along Forge Drive at the boundary of the former Intersil property. Currently, there are no wells screened within the A1 or A2 zones on the former Intersil property. Elevated TCE concentrations detected in the five newly installed wells, suggests the plume is not fully delineated upgradient in the A1 Zone for the former Intersil property. The five new wells had the some of highest TCE concentrations of all former Intersil/Siemens property wells (excluding the Off-Property Study Area) in the A1 zone, ranging up to 370 µg/L. Additional evidence of a shallow localized contaminant mass on the former Intersil property was documented in the 2011 Hydrogeologic Framework Report, which identified a single, high concentration of TCE (9,000 µg/L) in a grab groundwater sample from the A3 Zone on the former Intersil property close to Forge Drive. These TCE concentrations within the Resaturated Interval along Forge Drive suggests that there may be a shallow contaminant mass present on the former Intersil property; however, it is unclear if this TCE mass is a previously undefined source, or is a result of historic groundwater extraction pulling groundwater contamination from the former Siemens property south to the current location along Forge Drive.

During the ERD Phase III Pilot Study in the north portion of the Siemens property, TCE concentrations decreased in the Resaturated Interval (A1 and A3 Zones), while TCE degradation daughter products increased, particularly vinyl chloride. The daughter products were addressed with additional remedy during the mitigation measures with targeted SVE and injections of potassium permanganate that took place subsequent to the ERD Phase III Pilot Study, but their effectiveness in reducing the concentrations of daughter products is inconclusive.

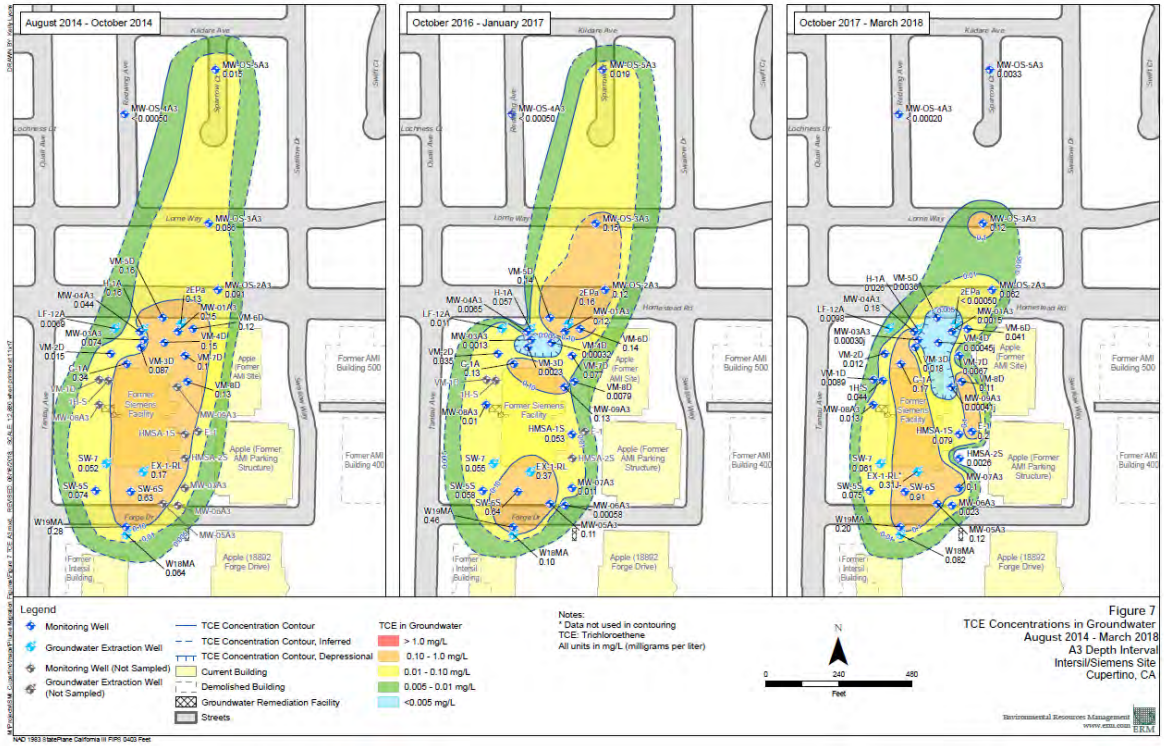
TCE concentrations within the ROD-defined A4 Zone decreased within the last five years and the plume decreased slightly. Decreasing or no trends in downgradient and mid-plume wells show that the A4 Zone plume is not migrating further downgradient into the Off-Property Study Area.

B Zone TCE mostly decreased in the last five years. The plume size is the same and the plume is not migrating further downgradient into the Off-Property Study Area. TCE shows no trend in downgradient wells. B-Zone TCE has been non-detectable in one of the wells relatively low in the other.

C Zone TCE concentrations from sampled wells over the last five years have been nondetectable or below the MCL, indicating the that plume has either decreased or stabilized.

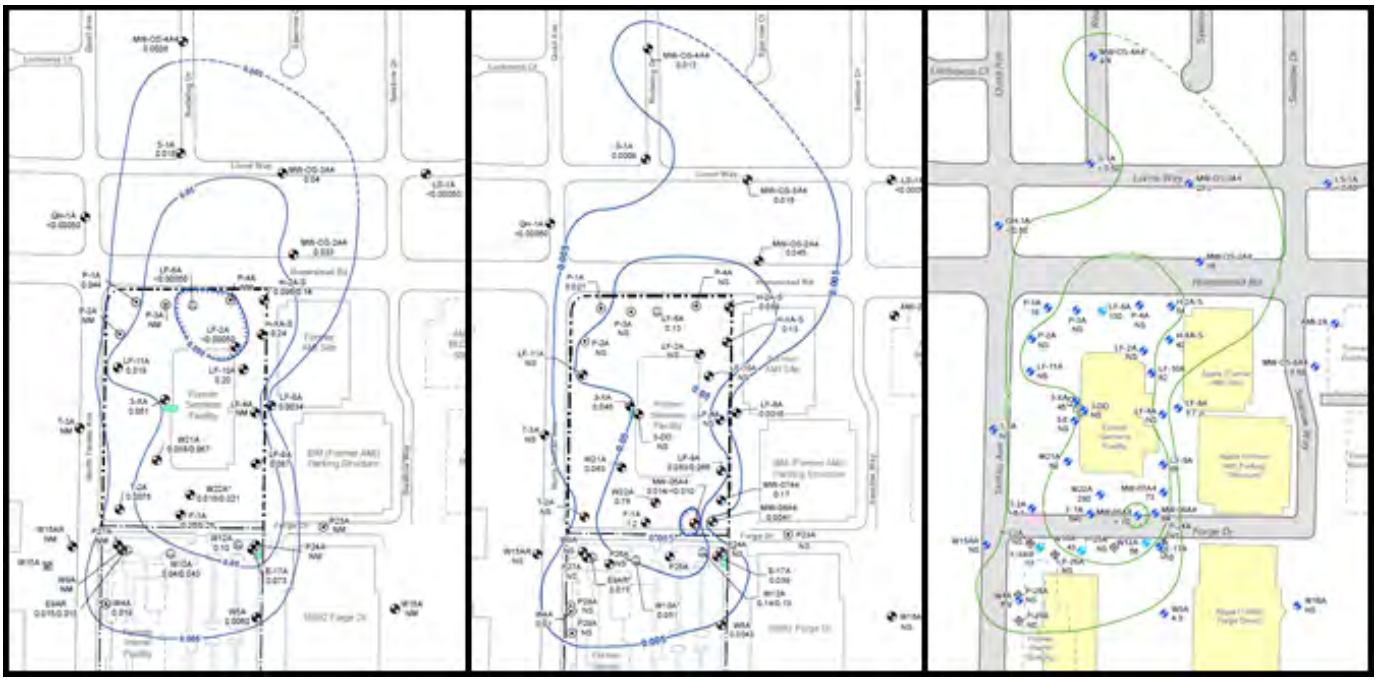
Note: Concentration units change [2015 (mg/L), 2018 (mg/L), and 2019 (µg/L)]

Figure 2. Resaturated Zone (A1/A2) TCE Concentrations Comparison 2014 to 2019



Note: Concentration units change [2015 (mg/L), 2018 (mg/L), and 2019 (µg/L)]

Figure 3. Resaturated Zone (A3) TCE Concentrations Comparison 2014 to 2019



Note: Concentration units change [2015 (mg/L), 2018 (mg/L), and 2019 (µg/L)]

Figure 4. A4 Zone TCE Concentrations Comparison 2015 to 2019

Regression Analysis: USACE performed a regression analysis using groundwater-TCE data from 2009-2019 for select wells currently above TCE ROD cleanup level of 5 µg/L. The timeframe to reach the cleanup level for wells with decreasing concentrations of TCE ranged from approximately 9 to 23 years. Not all wells have decreasing trends, however. Wells F-1A and W18B (located at the southern border of the former Siemens property and the northern border of the former Intersil property, respectively) have stable or no trend based on the Mann-Kendall analysis, but have a positive slope, and thus increasing trends based on the regression analysis.

The regression analysis is complicated by Siemens completing ERD pilot study activities and mitigation measures in recent years, which have accelerated TCE destruction and the lowering of TCE concentrations. The cleanup timeframes therefore do not strictly evaluate the number of years until meeting cleanup levels near the Siemens property. Furthermore, the regression analysis was only performed for TCE concentrations. The ERD pilot study activities on the former Siemens property also addresses relatively higher concentrations of TCE daughter products such as cis-1,2-dichloroethylene and vinyl chloride, which are being addressed under the pilot study.

4.3. Site Inspection

USEPA, USACE, and the RWQCB conducted a Site inspection on February 6, 2020. Michael Schulman (EPA), Roger Papler (RWQCB), Benino McKenna (USACE), Matt Scheeline (ERM), and Harold Rush and Grey Melgard (Wood Group) attended the inspection. The purpose of the inspection was to assess the protectiveness of the remedy.

The agencies found the remedy components on both the former Intersil and former Siemens properties to be in adequate condition and functioning as intended. GWET system components and extraction wells are inspected biweekly at former Intersil and weekly at former Siemens. GWET treatment vessels are changed out annually at the Intersil Site, and every two months at the Siemens Site. Minor corrosion was noted on the bag filtration units for the Siemens GWET system. At the time of the Site inspection, several extraction wells at the former Siemens property were temporarily shut down due to ongoing ERD pilot testing. The agencies observed that the off-property extraction wells in the Study Area were operating. Trip Report and photos of the Site are included in Appendix H.

5. Technical Assessment

5.1. Question A: Is the remedy functioning as intended by the decision documents?

Yes, the remedy is functioning as intended. The initial soil excavation and soil vapor extraction worked as intended to significantly reduce the contaminant mass in soil at the Site. Since then, the GWET systems deployed in both the former Intersil and former Siemens properties have continued to contain the TCE groundwater plume and reduce contaminant concentrations in groundwater. The GWET systems are generally operating and functioning as designed.

The ROD recognized that the use of the GWET remedy may not be able reduce Site contaminants to cleanup levels. It states that "If it becomes apparent, during implementation or operation of the system, that contaminant levels have ceased to decline and are remaining constant at levels higher than the remediation goal, that goal and the remedy may be reevaluated." The ROD goes on to state that "The selected remedy will include groundwater extraction for a period of 45 to 85 years, during which the system's performance will be carefully monitored on a regular basis and adjusted as warranted by the performance data collected during operation."

Groundwater extraction began in 1986 at the former Siemens property and 1987 at the former Intersil property with projected groundwater extraction timeframes respectively spanning from 2031 to 2071 and 2032 to 2072. The extraction efficiencies of the GWET systems have decreased dramatically since they were first started, which was expected. Asymptotic conditions have been documented in previous Five-Year Reviews and within Annual Self-Monitoring Reports. Some monitoring wells evaluated within the current Five-Year Review period show increasing, stable, or no trend for TCE with concentrations above the ROD cleanup level, but most wells show decreasing trends (many of which had shown stable or increasing trends during the previous Five-Year Review period). The positive change to more decreasing trends of TCE on the former Siemens property is due, at least in part, to the alternative in-situ ERD remediation being pilot tested by Siemens.

Monitoring wells installed in 2019, at Forge Drive in the A Zone Resaturated Interval (i.e., A1 and partially A3), contain TCE concentrations ranging up to 370 µg/L (MW-OS-10A1, MW-OS-9A1). Additionally, higher TCE concentrations within the A4 Zone are also located at the former Intersil and

Siemens property boundary at concentration of 590 µg/L (F-1A). Based on historic and current groundwater TCE sample concentration results, this suggests that there may be a contaminant mass present at the former Intersil property. Additional evidence of a relatively shallow localized contaminant mass on the former Intersil property is documented in the 2011 Hydrogeologic Framework Report, which identified a high concentration of TCE (9,000 µg/L) in a grab groundwater sample from the A3 Zone on the northern portion of the former Intersil property south of Forge Drive. Without knowing the magnitude of contamination within the Resaturated Interval, estimated cleanup timeframes using current remedial methods may be unreliable.

In general, current operating procedures are maintaining the remedy's effectiveness. Both GWET systems are inspected regularly and have remote monitoring systems, which ensure the systems remain running and any repairs are completed in a timely fashion. The GWET system on the former Siemens property needs to have the carbon treatment vessels replaced more frequently due to rapid corrosion, which contributes to slightly higher costs and more frequent maintenance but does not indicate a potential remedy problem.

Although the ROD did not initially identify institutional controls as part of the remedy, deed restrictive covenants have been recorded for both the former Intersil and former Siemens properties (Appendix E). These deed restrictions restricted the use of the properties to industrial, commercial, office space, and recreational uses. No residences or sensitive land use facilities can be located on the properties and groundwater use is restricted throughout the Site. The institutional controls are effective in preventing exposure.

5.2. Question B: Are the exposure assumptions, Toxicity Data, Cleanup Levels, and Remedial Action Objectives (RAOs) Used at the Time of Remedy Selection Still Valid?

Yes. The current and future exposure pathways identified in the ROD are still valid. Extensive vapor intrusion assessments have concluded that there is no unacceptable indoor air risk on any areas of the Site, including the residential Off-Property Study Area. There have been no changes in land use since the last Five-Year Review and deed restrictions have been put in place that limit future use to prevent exposure.

Toxicity data and cleanup levels are still valid. Vinyl chloride, a degradation byproduct of TCE, is not listed as a Site contaminant within the ROD. However, vinyl chloride is regularly monitored in groundwater at the Site and concentrations are compared to its respective MCL.

The remedial action objective is still valid. The remedial action objective for the Site is to "restore groundwater to its beneficial use." The Site lies within the Santa Clara Valley Subbasin, which is designated for municipal beneficial use (municipal and domestic water supply) by the RWQCB. The beneficial use designation is considered unlikely to change given the importance of groundwater to local water supplies.

There have been no changes to cleanup standards or Applicable or Relevant and Appropriate Requirements that have affected the protectiveness of the remedy since the time of remedy selection (Appendix D).

5.3. Question C: Has Any Other Information Come to Light That Could Call Into Question the Protectiveness of the Remedy?

The Site was identified in an October 2019 report by the U.S. Government Accountability Office to be located within an area with high flood hazard potential.

The Site is located in a seismically active region with high earthquake potential. An earthquake may cause damage to infrastructure that could affect operation of the GWET systems. A facility emergency action contingency plan is warranted under this scenario.

No other information has come to light that could call into question the protectiveness of the remedy.

6. Issues/Recommendations

Table 7. Issues and Recommendations Identified in the Five-Year Review

Issues and Recommendations Identified in the Five-Year Review:				
Operable Unit(s): 1	**Issue Category: Monitoring**			
	Issue: The contaminant plume is not fully delineated within the A1 and A3 Zones of the Resaturated Interval south of Forge Ave Drive within the former Intersil Property, where the magnitude of potential source contamination needs to be further understood for determining if cleanup timeframes will be met under the current methods of remediation.			
	Recommendation: Install additional monitoring wells to delineate groundwater contamination within the A1 and A3 Zones of the Resaturated Interval, south of Forge Drive within the former Intersil property.			
Affect Current Protectiveness	**Affect Future Protectiveness**	**Party Responsible**	**Oversight Party**	**Milestone Date**
No	Yes	PRP	State	12/30/2024

6.1. Other Findings

The GWET system on the former Intersil property is not currently optimized to treat groundwater within the Resaturated Interval A1 Zone and possibly the A3 of the A Zone. GWET system optimization or alternative methods of remediation may be warranted, if the magnitude of remaining contamination effects projected cleanup timeframes.

Groundwater investigations were completed in the Off-Property Study Area in 2015 and 2016. Detected VOCs were below MCLs within the A1 and A4 Zones downgradient of the former Siemens property; however, TCE was detected above MCLs and not defined in the A3 Zone to the northeast of the Siemens Site, to the east of the roads Swallow Drive and Swift Court. Further investigation should be completed.

7. Protectiveness Statement

Table 8. Protectiveness Statement

Protectiveness Statement(s)		
Operable Unit: OU-1	*Protectiveness Determination:* Short-term Protective	*Planned Addendum Completion Date:* Click here to enter a date
Protectiveness Statement: The remedy at the Intersil Inc,/Siemens Components Superfund Site currently protects human health and the environment by maintaining capture of the contaminant plume and eliminating off-property exposure pathways. Institutional controls eliminate exposure pathways on the former Intersil and Siemens properties. In order for the remedy to be protective in the long-term, additional delineation of the Resaturated Interval of the A Zone should be completed.		

8. Next Review

The next five-year review report for the Intersil Inc./Siemens Components Superfund Site is required five years from the completion date of this review.

Appendix B: Site Chronology

Event	Date
Former Intersil Facility	
Intersil used solvents during fabrication of integrated circuits, transistors, diodes, and other semiconductor devices at the former Intersil property	1967-1988
Intersil initiated investigations and removed in-ground waste handling units	1983-1986
California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB) issued Waste Discharge Requirements/Site Cleanup Requirements (SCR), Order No. 86-49	1986
RWQCB issued Cleanup and Abatement Order No. 87-133	1987
Intersil started groundwater extraction and treatment (GWET) system, consisting of four A Zone wells	1987
Intersil removed in-ground waste handling units and ceased operation at facility and started soil vapor extraction and treatment (SVET) system	1988
RWQCB issued SCR Order No. 89-038	1989
RWQCB issued SCR Order No. 90-119 (Final SCR) and EPA included site on final listing on National Priorities List and issued the Record of Decision (ROD) based on Final SCR	1990
The final remedy included expanding the GWET system with the addition of one A Zone extraction well and one B Zone extraction well and expanding the SVET system to four well pairs.	1991
General Electric (GE), parent company of Intersil, purchased the property from Vallco Park, Ltd.	1992
Groundwater levels rose approximately 50 feet, reducing the vadose zone to the interval from surface level to 45 feet below ground surface (bgs)	1993-1998
GE decommissioned the SVET system with RWQCB approval; the long-screened SVET wells were then used as groundwater monitoring wells	1993
RWQCB and EPA complete first Five-Year Review, which includes all 3 properties	1995
Manufacturing building demolished	1997
RWQCB and EPA completed second Five-Year Review, which includes all 3 properties	2000
RWQCB and EPA completed third Five-Year Review, which includes all 3 properties	2005
GE filed a Covenant and Environmental Restriction, including a Soil Management Plan	2005
Soil vapor survey conducted; only benzene, TCE, and 1,3-butadiene were detected above California Environmental Screening Levels or Human Health Screening Levels for commercial/industrial land use	2006
Air strippers replaced by granular activated carbon treatment vessels	2007
Four monitoring wells were abandoned, after showing consistently low concentrations of Site contaminants	2007
Tantau Investments constructed a commercial building on the property, including a 15-milliliter vapor barrier	2008
Membrane interface probe subsurface investigation conducted to assess residual VOC concentrations and detected trichloroethene levels up to 9,000 micrograms per liter in one of the resaturated A Zones.	2008

Event	Date
RWQCB and EPA completed fourth Five-Year Review, which includes all 3 properties	2010
Hydrogeologic Framework Report written	2011
Second supplemental groundwater investigation conducted, concluding that VOC-impacted groundwater in the A1, A2, and A3 Zones along the northern boundary of the former Intersil property and in Forge Drive is captured by the current extraction well network	2011-2012
Off-Property residential soil vapor intrusion evaluation conducted	2013-2014
Evaluation of discharge of sulfate to Calabazas Creek by the GWET was completed. Sulfate concentrations were within allowable sulfate ranges under NPDES general permit	2018

Former Siemens Facility	
Litronix used solvents during fabrication of semiconductor devices	1970-1995
Litronix stopped using trichloroethene (TCE)	1980
Litronix removed underground storage tanks (USTs), began soil and groundwater investigation, and discovered groundwater contamination. Siemens purchased property from Litronix	1982
Siemens installed and started up SVET system with one soil vapor extraction (SVE) well	1983
Siemens expanded SVET with two additional SVE wells.	1985
Siemens installed and started up GWET system with air stripping towers, expanded SVET system with one additional SVE well, and removed inactive neutralization system	1986
Siemens conducted soil vapor sampling and hydraulic testing of the three groundwater zones	1987
EPA listed the Site on the National Priorities List under the Federal Superfund program; Siemens performed additional soil vapor sampling, vapor extraction testing, and soil investigation to 105 feet bgs	1989
Siemens started remedial investigation	1990
RWQCB issued SCR Order No. 90-119 (Final SCR) and EPA included Site on final listing on National Priorities List and issued the ROD based on Final SCR	1990
Siemens expanded the SVET system with 16 SVE wells and the GWET system to include 13 On-Property extraction wells	1991
Siemens excavated soil where former underground storage tanks were located	1991
Siemens reduced the SVET system to four SVE wells	1995
Siemens curtailed groundwater extraction from Well W21A with RWQCB approval	1999
Siemens sold property to Tantau Partners, LLC. Siemens performed indoor air quality evaluation that did not reveal indoor air vapor intrusion	2000
Primary treatment of extracted groundwater was changed from an air stripper to granular activated carbon.	2002
Tantau Partners sold the property to Inland Western Cupertino Tantau, LLC. Siemens shut down the SVET system and started rebound study	2005
Siemens voluntarily initiated an initial Enhanced Reductive Dechlorination (ERD) Pilot Study, expanded GWET system with two wells, and permanently shut down the SVET system after completing rebound study. The draft pilot study report concluded that a northeast-trending preferential pathway exists in the Upper Resaturated Zone, currently designated as the A1 and A2 Zones	2006

Event	Date
Current Siemens property occupant Kaiser Permanente conducted indoor air quality investigation and risk assessment indicating ambient and indoor levels of PCE slightly above, and TCE below, RWQCB commercial/industrial Environmental Screening Levels (ESLs). The study concluded that the PCE detections were probably from indoor sources.	2007
Siemens conducted membrane interface probe investigation	2007
Siemens postponed supplemental ERD Pilot Study due to decline in groundwater level elevations in the A1 Zone of the Upper Resaturated Interval	2008
Deed Restriction recorded by SMI Holding, LLC (Siemens) and Tantau Partners, LLC	2009
Hydrogeologic Framework Report written	2011
Northside groundwater investigation conducted and confirmed the northeast-trending preferential pathway in the A1 and A2 Zones.	2011
Potential vapor intrusion evaluation at the Former Siemens Facility completed	2014
Phase II ERD Pilot Study initiated	2014
Phase III ERD Pilot Study initiated, which included injecting carbon-zero valent iron product and emulsified vegetable oil into groundwater	2017
Phase III ERD Pilot Study additional injections into groundwater of KB-1 ® Primer and/or emulsified vegetable oil were completed	2018
Soil vapor investigation under the building at the former Siemens property completed and concluded insignificant residual VOC source likely exists beneath the building.	2018
Well evaluation and data logger survey was conducted	2018
Nuclear magnetic resonance and passive flux meter data collected from existing monitoring wells in both the former Siemens property and Off-Property Study Area	2019
Mitigation measures (targeted SVE and injections of potassium permanganate) for the ERD Phase III Pilot Study were completed in April 2019 to address increases of vinyl chloride in groundwater and support ongoing remediation enhancement efforts.	2019
Sub-building investigation - completed beneath the building on the former Siemens property - determined that significant residual VOCs are not present beneath building.	2019
Shallow soil and groundwater investigation completed at the southern portion of the former Siemens property. Elevated TCE concentrations discovered in the A1 and A3 Zones for groundwater.	2019

Off-Property Study Area	
GE and Siemens began groundwater investigations	1986
GE and Siemens began groundwater extraction from two B Zone wells	1990
RWQCB issued SCR Order No. 90-119 (Final SCR) and EPA included Site on final listing on National Priorities List and issued the ROD based on Final SCR	1990
GE and Siemens expanded the GWET system from two B Zone wells to three B Zone wells	1991
GE and Siemens reduced the GWET system from three B Zone wells to two B Zone wells	2004
Membrane interface probe and additional groundwater investigation conducted	2011
Vapor intrusion indoor air evaluation conducted	2013-2014
Off-property monitoring well installation completed	2014

Event	Date
Follow-up off-property monitoring well installation workplan approved.	2015
Groundwater investigation conducted to further delineate groundwater contaminants in A1 and A3 Zones. Included advancement of membrane interface probe/cone penetration test borings.	2015
Additional groundwater investigation conducted to further delineate groundwater contaminants in the A1 and A3 Zones. Included advancement of membrane interface probe/cone penetration test borings.	2016
Twelve additional monitoring wells were installed in the A and B Zones. Soil and groundwater samples were collected.	2019

Appendix C: Data Review

The groundwater elevation measurements for A, B, and C Zones showed very little groundwater directional change throughout the entire year and are consistent with historical observations.

- The groundwater for the A1 Zone flows slightly to the northeast of the former Intersil and Siemens properties.
- The groundwater for the A3 Zone flows slightly to northwest of the former Intersil and Siemens properties.
- The groundwater for the A4 Zone flows to northwest of the former Intersil and Siemens properties.
- The groundwater for the B Zone flows to north of the former Intersil and Siemens properties, however, highly influenced by the extraction well pumping.
- The groundwater for the C Zone flows to north of the former Intersil and Siemens properties.

For this Five-Year Review, the U.S. Army Corps of Engineers conducted a trend analysis (using Mann-Kendall statistical analysis tool) of TCE concentrations on 19 monitoring locations that were good lateral and vertical representatives. The groundwater analytical data used for the Mann-Kendall analyses was taken from the Annual Self-Monitoring Reports, between 2015 through 2019. Estimated values were included for the analyses. If a sample had a field duplicate, the value for the field duplicate was used if it was higher. Half of the laboratory method detection limit was used for non-detect values, unless half of the non-detect value was more than other values used in the analysis, in which case the non-detect value was excluded from the analysis. Some wells had more data than others due to either a less frequent sampling schedule, the well-being dry during sampling, the well having been installed recently within the Five-Year Review period or having non-detect values excluded from the analysis.

The Mann-Kendall statistic (S) is a non-parametric statistical procedure that is well suited for analyzing increasing or decreasing trends in data over time. Positive values indicate an increase in contaminant concentrations over time, whereas negative values indicate a decrease in contaminant concentrations over time. The Mann-Kendal Analysis results are summarized on Table 6 and calculations are presented in this appendix (Calcs 1-5).

Calc. 5: Mann-Kendall Trend Analysis C Zone Wells RK-2C, S-4C, & LR-3C

A1 Zone

TCE isoconcentration contours for the A1 Zone of the Resaturated Interval show that the downgradient portion of the TCE plume decreased in concentrations between 2015 and 2019 (Figure C-1). While the furthest off-property downgradient well (MW-OS-3A1) shows no trend for TCE, TCE decreased in wells upgradient closer to the former Siemens property and the ERD remedy pilot studies. It is worth noting though that while the spatial distribution of monitoring wells down and side gradient into the Off-Property Study Area for each of the Resaturated Intervals A1 and A3 Zones, the A Zone has a whole as presented in the ROD is reasonably delineated. This is partially supported by a 2016 TCE groundwater grab sample collected from the A1 Zone and A4 Zone for boring MIP-OS-28 downgradient of AMI, which had a TCE concentration of 1.8 µg/L. It should also be noted that during a November 2015 investigation, grab groundwater samples in the Off-Property Study Area collected from MIP-OS-16 and MIP-OS-17 were dry to 60 feet bgs, indicating that the A1 Zone in the Off-Property Study Area may not be widespread.

In January 2019, five additional A1 Zone wells (MW-OS-8A1 through MW-OS-12A1) were installed between the former Siemens property and the former Intersil property along Forge Drive (ERM 2019a). Prior to the well installations, there were no upgradient wells from the former Siemens property in the A1 Zone of the Resaturated Interval. These new wells had some of the highest current concentrations of all the wells in the A1 zone, ranging up to 370 µg/L. The elevated TCE concentrations detected in these newly installed wells suggests the plume may not be fully delineated upgradient in the A1 Zone.

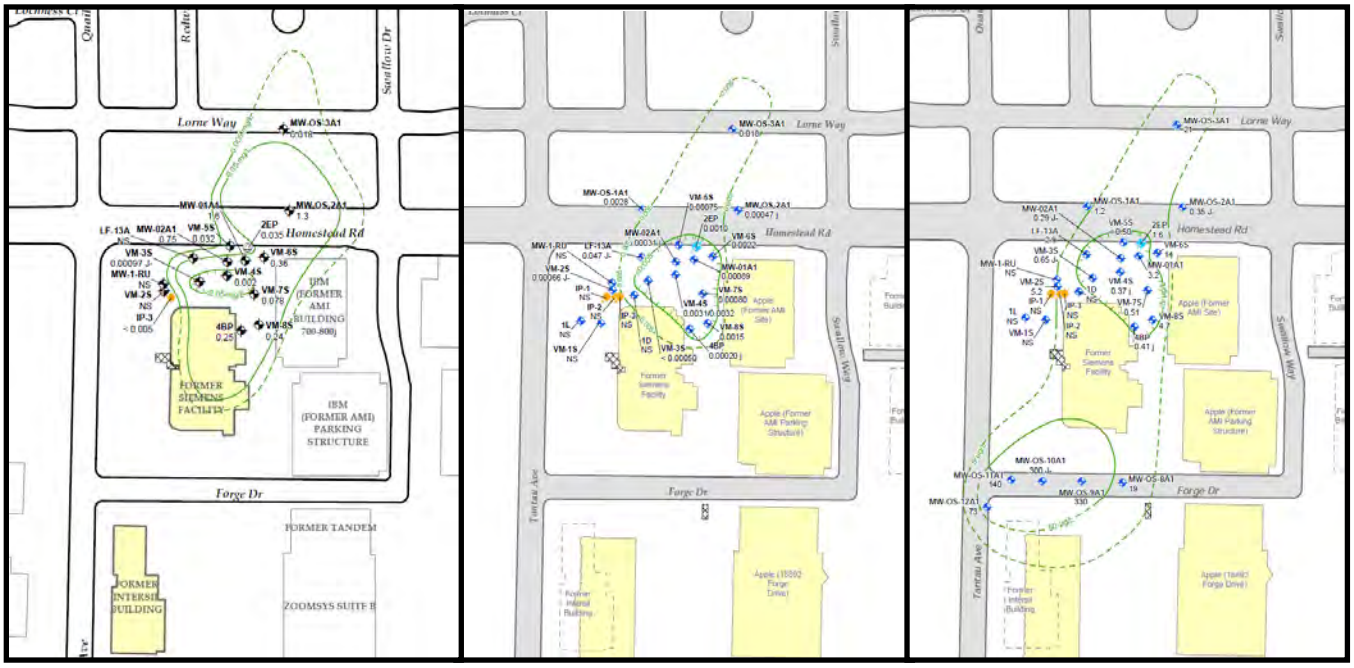

Figure C-1. Comparison A-1 zone. TCE plume 2015(mg/L), 2018(mg/L) and 2019(µg/L) (Left to Right) (AMEC Foster Wheeler and ERM, 2016; Wood and ERM, 2019 & 2020); isoconcentration images are in different units, however, the contours are equivalent (0.05 mg/L=50 µg/L). Note, TCE concentrations on the Siemens site were treated during ERD pilot studies.

A3 Zone

TCE isoconcentration contours for the A3 Zone of the Resaturated Interval show that the TCE plume decreased in concentrations in the mid- to downgradient portions of the plume from 2015 to 2019. These concentrations declines are supported by the ERD pilot study remedies in the northern portion of the Siemens site. The furthest downgradient well at the northern tip of plume (MW-OS-5A3), shows a decreasing concentration trend for TCE, indicating full capture of the contamination plume downgradient to the north. One mid-plume well has an increasing trend for TCE (VM-3D), with concentrations increasing to 50 µg/L in 2019.

In February 2019, additional A3 Zone wells (MW-OS-8A3, MW-OS-10A3, MW-OS-11A3, and MW-OS-12A3) were installed between the former Siemens property and the former Intersil property along Forge Drive in the A3 Zone (ERM 2019a). TCE groundwater concentrations in these wells ranged from 20 to 270 µg/L. Similar to the A1 zone, elevated TCE concentrations indicate there may be a larger plume upgradient of the former Siemens property (i.e., to the south of Forge Drive) that is not fully delineated.

In 2015 and 2016 a membrane interface probe (MIP) groundwater investigation was conducted in the Off-Property Study Area and grab groundwater samples were also collected. The grab groundwater data results indicate that TCE concentrations north of the AMI property at the intersection of Swallow Drive and Lorne Way were elevated, ranging from 120 µg/L to 170 µg/ L. However, further downgradient of Lorne Way, grab groundwater samples results were typically less than MCL values, indicating that the A3 Zone in the Off-Property Study Area is largely delineated, with the exception of MIP-OS-28 (bounded by MIP-OS-23 and MIP-OS-25) with a grab groundwater TCE sample result of 120 µg/L. It is noted that grab groundwater samples from borings are not as accurate as groundwater samples collected from established monitoring wells.

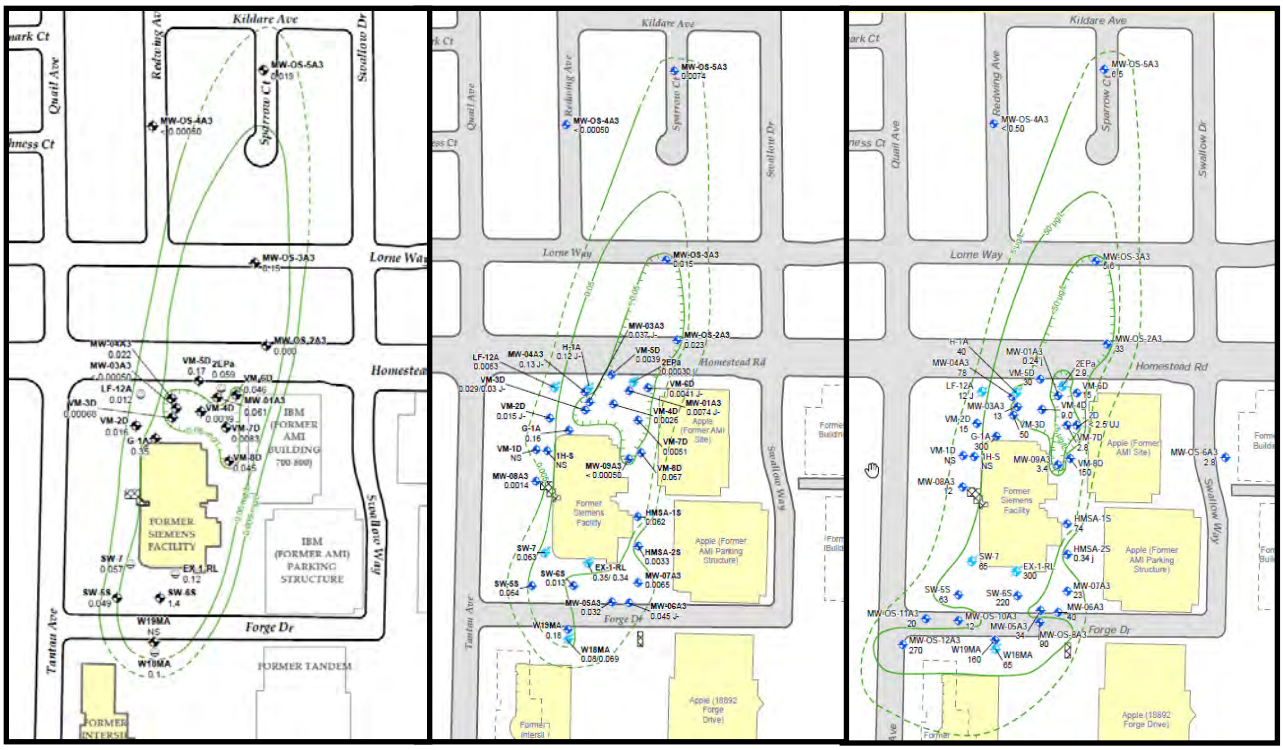

Figure C-2. TCE Plume in A3 Z**one**; 2015(mg/L), 2018(mg/L) and 2019(µg/L) (Left to Right) **(AMEC Foster Wheeler and ERM, 2016; Wood and ERM, 2019 & 2020);** isoconcentration images are in different units, however, the contours are equivalent (0.05 mg/L=**50 µg/L).**

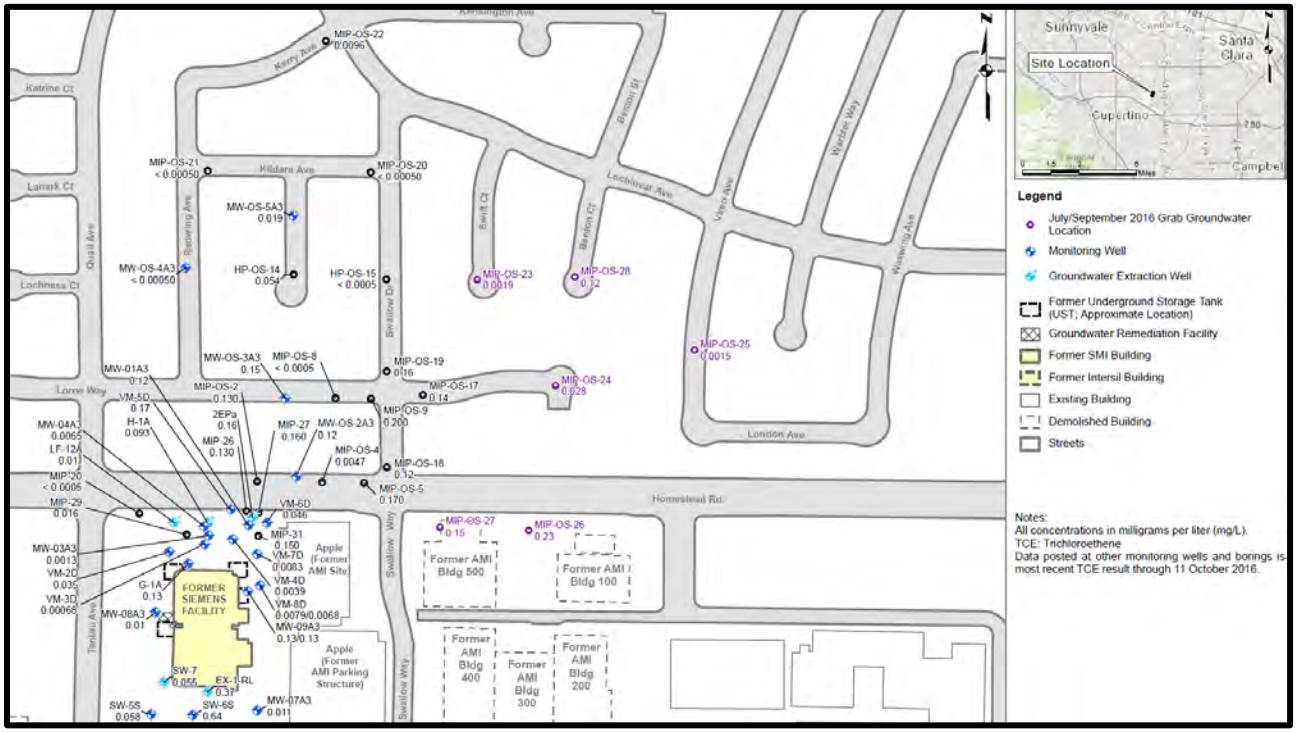

Figure C-3. 2015 **and 2016 Off-Property Study Area Groundwater TCE Concentrations in the A3 Zone** (ERM, 2016c)

A4 Zone

TCE isoconcentration contours for the A4 Zone show that the TCE plume decreased in concentrations in the mid- to downgradient portions of the plume, to the north and northwest, from 2015 to 2019 (Figure C-4). The furthest downgradient well at the northern tip of plume (MW-OS-4A4), shows no trend, with concentrations ranging between 3.6 and 14 µg/L during the current Five-Year Review period. Well S-1A, just upgradient of MW-OS-4A4, shows a significant decreasing trend, indicating capture of the contamination plume downgradient to the north.

Trend analysis for the last 5 years, shows no trend in the source zone area well F-1A, located near the center of the southern border of the former Siemens property on the north edge of Forge Drive. TCE analytical results have varied in F-1A during this Five-Review Period, with concentrations as low as 320 µg/L (October 2014) and as high as 1,300 µg/L (October 2017). TCE concentrations dropped down to 590 µg/L by October 2019. It is unclear if the changes in concentration may be related to changes in the GWET system pumping.

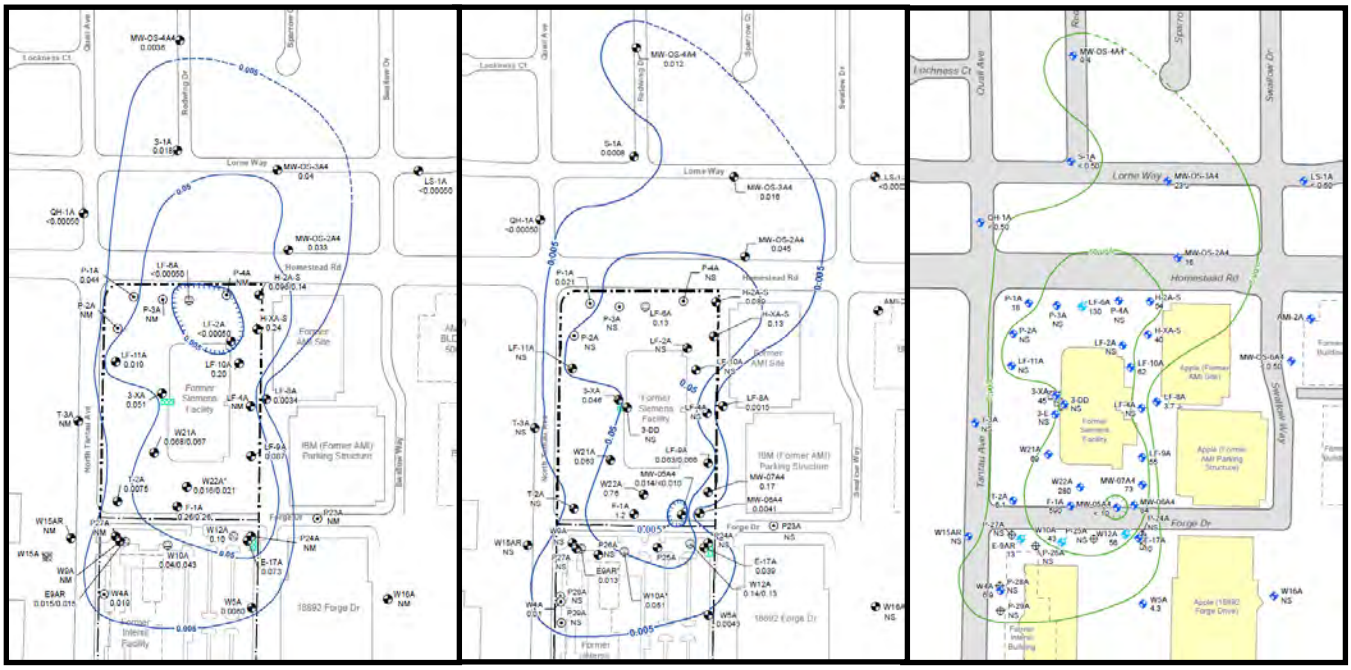

Figure C-4. Comparison A-4 zone. TCE plume 2015 (mg/L), 2018 (mg/L) and 2019 (µg/L) (Left to Right) (AMEC Foster Wheeler and ERM, 2016; Wood and ERM, 2019 & 2020); isoconcentration images are in different units, however, they contours are equivalent (0.05 mg/L=50 µg/L).

B Zone

The lateral extent of the TCE plume and concentrations within the B Zone plume have remained approximately the same in the last five years (Figure C-5). Wells within the plume show decreasing, probably decreasing, stable, and no trend for TCE concentrations. Within the last decade, TCE concentrations at the downgradient end of the B Zone plume in well IQ-1B have typically been non-detect, with minor fluctuations in 2016 to 2018 into single digit concentrations near the MCL cleanup level of 5 µg/L, and estimated concentrations of TCE above the MCL in 2017. Despite the fluctuation in TCE concentration, there is no trend for the TCE concentration in IQ-1B according to the Mann-Kendall, and it should be considered stable below detection limits since it typically has been non-detect over the last decade (Figure C-6).

The highest concentration of TCE is in the B Zone plume is in well H-5B, which decreased in concentration from 160 to 130 µg/L during the Five-Year Review period. Since the groundwater monitoring started in 1987, the TCE concentration in H-5B has declined an order of magnitude from a maximum concentration of 5,080 µg/L to 130 ug/L.

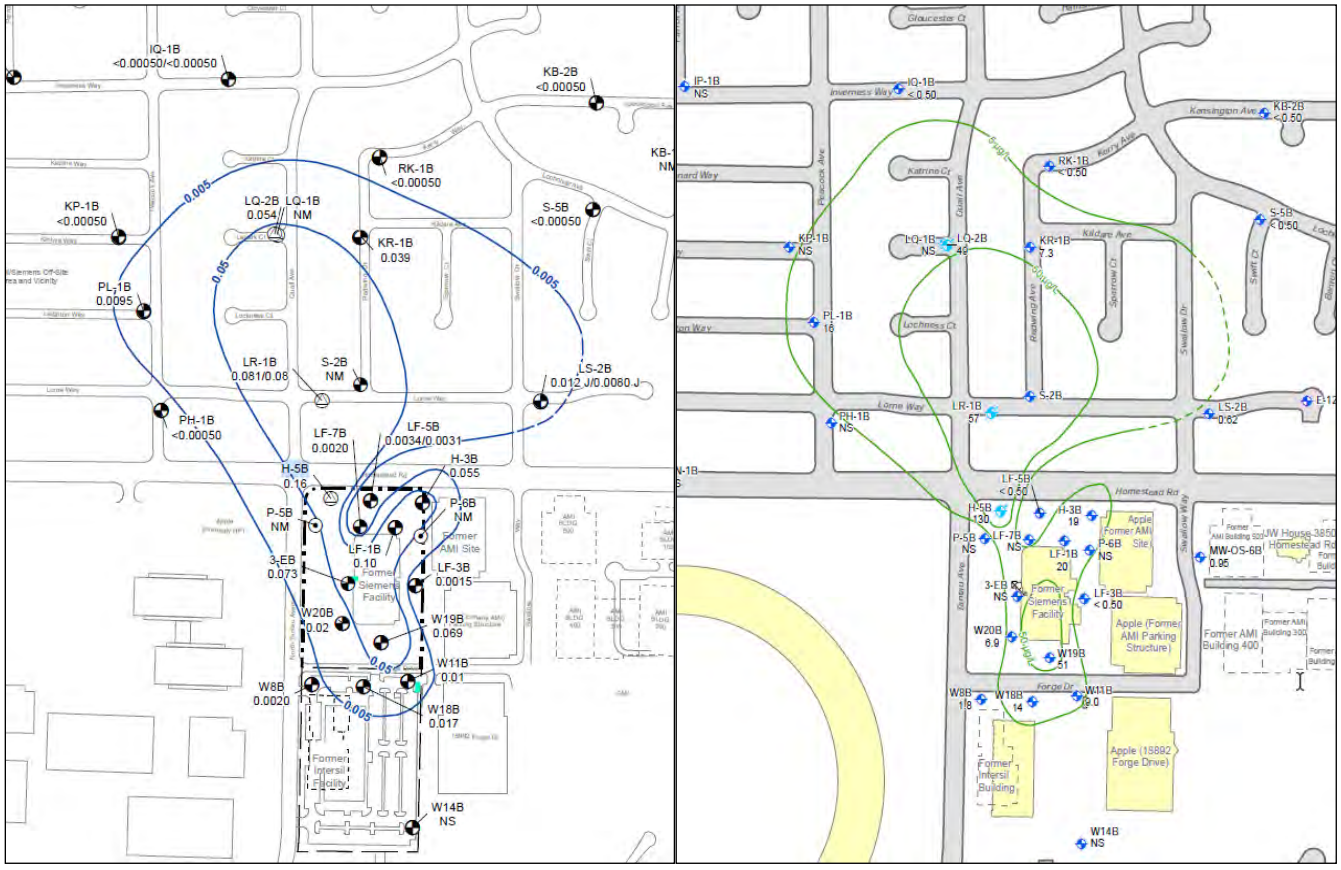

Figure C-5. Comparison **B zone. TCE plume 2015 (mg/L) and 2019 (µg/L) (Left to Right)** (AMEC Foster Wheeler and ERM, 2016; Wood and ERM, 2020); isoconcentration images are in different units, however, they contours are equivalent (0.05mg/L=50 µg/L).

Table C-2: Summary of System Flow Rates Jan-Dec 2019 (Wood and ERM, 2020)

	January–March 2019	April–June 2019	July–September 2019	October–December 2019
Former Intersil Facility Groundwater Extraction and Treatment System[1]				
Average Quarterly Flow Rate (gallons per minute)	31	32	31	29
Total Volume Extracted (gallons)	3,862,700	4,065,600	4,075,300	3,987,200
Estimated VOC Mass Removed (pounds)	2.3	2.1	2.3	1.7
Former Siemens Facility Groundwater Extraction and Treatment System[2]				
Average Quarterly Flow Rate (gallons per minute)	38	62	65	58
Total Volume Extracted (gallons)	4,808,532	7,193,288	7,425,924	6,786,976
Estimated VOC Mass Removed (pounds)[4]	4.1	5.8	5.8	4.9
Off-Site Study Area Groundwater Extraction and Treatment System[3]				
Average Quarterly Flow Rate (gallons per minute)	30	52	52	51
Total Volume Extracted (gallons)	3,816,478	6,054,525	5,899,752	5,999,088
Estimated VOC Mass Removed (pounds)[5]	1.4	3.4	3.0	3.0

Notes:

1. *Former Intersil facility groundwater extraction and treatment system included extraction wells E9AR, W10A, W12A, and W18MA.*
2. *Former Siemens facility groundwater extraction and treatment system includes on-site extraction wells 2EP, 2EPa, H-1A, H-5B, LF-6A, LF-12A, EX-1-RL, and SW-7. Note that 2EP, 2EPa and H-1A were shut down in September/October/November 2014 facilitate the Phase II ERD Pilot Study.*
3. *Off-Site Study Area groundwater extraction system includes wells LR-1B and LQ-2B.*
4. *VOC mass removed from the former Siemens facility is calculated by subtracting the VOC mass removed from the Off-Site Study Area from the total mass removed by the treatment system. The total mass removed by the treatment system is calculated using the influent VOC concentrations and the total combined volume of groundwater extracted from the on-site and off-site extraction wells.*
5. *VOC mass removed from the Off-site Study Area is calculated by using VOC concentrations and groundwater extraction volume for the individual off-site wells.*

Abbreviations:
ERD = enhanced reductive dechlorination
VOC = volatile organic compound

Appendix D: Applicable or Relevant and Appropriate Requirements Assessment

Section 121(d)(1)(A) of the Comprehensive Environmental Response, Compensation, and Liability Act requires that remedial actions at Superfund sites attain (or justify the waiver of) any federal or state environmental standards, requirements, criteria, or limitations that are determined to be legally applicable or relevant and appropriate requirements (ARARs). Federal ARARs may include requirements promulgated under any federal environmental laws. State ARARs may only include promulgated, enforceable environmental or facility-siting laws of general application that are more stringent or broader in scope than federal requirements and that are identified by the state in a timely manner. ARARs are identified on a site-specific basis from information about the chemicals at the site, the physical characteristics of the site, and other appropriate factors. ARARs include only substantive, not administrative, requirements and pertain only to onsite activities. There are three general categories of ARARs: chemical-specific, location-specific, and action-specific.

Chemical-specific ARARs for groundwater are identified in Section 18 of Board Order No. 90-115 and are referenced in the 1990 ROD. The chemical-specific ARARs are evaluated for this Five-Year Review (Table 11). Achieving drinking water quality is an ARAR for this site.

Table D-1. Summary of Chemical-Specific ARARs

Contaminants of Concern	1990 ROD Cleanup Standard (mg/L)	Basis	Current Regulation (mg/L)		ARARs Changed since 1990 ROD?
			Federal MCL[1]	State MCL[2]	
Trichloroethene (TCE)	0.005	Federal / State	0.005	0.005	No
Tetrachloroethene (PCE)	0.005	Federal / State	0.005	0.005	No
1,1-dichloroethene	0.006	State	0.007	0.006	No
cis-1,2-dichloroethene	0.006	State	0.07	0.006	No
trans-1,2-dichloroethene	0.01	State	0.1	0.01	No
1,1,1-trichloroethane (1,1,1-TCA)	0.2	Federal / State	0.2	0.2	No
1,1,2-Trichloro-1,2,2-trifluoroethane (Freon 113)	1.2	State	None	1.2	No
Toluene	0.15[3]	State	1.0	0.15	Yes[3]

Notes:
MCL – Maximum contaminant level
mg/L = milligrams per liter
[1] Federal MCL (*National Primary Drinking Water Regulations: Maximum Contaminant Levels and Maximum Residual Disinfectant Levels*; 40 C.F.R. §§ 141.60 – 141-66). Last amendment October 12, 2018.

[2] California Maximum Contaminant Levels (*Maximum Contaminant Levels – Organic Chemicals*; C.C.R., Title 22, Division 4, Chapter 15, Article 5.5, § 64444). Last amendment December 14, 2017.

[3] The groundwater cleanup standard for toluene was listed in Board Order No. 90-115 as the California State Recommended Drinking Water Action Level at the time of 0.1 mg/L. A footnote provided for this cleanup level stated that "If the State of California proposes or adopts a MCL for toluene, the MCL shall at that time become the cleanup standard to toluene at this Site." The cleanup standard is therefore considered as the current California MCL.

Federal and State laws and regulations, other than the chemical-specific ARARs, that are still pertinent to the Site but have not changed in the past five years are listed below. The list does not include those ARARs identified in the ROD that no longer apply. For example, ARARs that are related to remedial design and construction are no longer pertinent if they do not continue into long-term operations, monitoring, and maintenance. There have been no revisions to the following laws and regulations that affect the protectiveness of the remedy:

- Safe Drinking Water Act, 40 Code of Federal Regulations (C.F.R.) 141
- Clean Air Act, 42 U.S. Code 85
- Clean Water Act, 40 C.F.R. Part 122-125
- Porter-Cologne Water Quality Control Act, Division 7 of the California Water Code
- California Regulations Related to Drinking Water, Title 22 California Code of Regulations (C.C.R.) § 64444
- California Hazardous Waste Control Regulations, Title 22 C.C.R., Division 4.5
- State Water Resources Control Board Resolution 68-16
- Water Quality Control Plan for the San Francisco Bay Basin
- Bay Area Quality Management District, Reg 8, Rule 47
- Bay Area Quality Management District, Reg 8, Rule 40
- EPA's Office of Solid Waste and Emergency Response dir. 9355.0-28

Appendix E: Institutional Control Assessment

No institutional controls were mandated by the original 1990 ROD or by the RWQCB Order 90-119, and the RAO of the ROD was to restore the groundwater to its beneficial use.

However, deed restrictions were filed subsequent to the ROD and RWQCB order, and these remain in place for both the former Intersil and former Siemens properties. In 2005, General Electric recorded a deed restriction that limited the future use of the former Intersil property. The property cannot be used for residential development, hospitals, schools, or day cares, and no excavation can occur on the property.

Similarly, in 2010 Siemens recorded a deed restriction for the former Siemens portion of the Site with virtually the same restrictions and limitations as the former Intersil property.

Table E-1. Institutional Control Summary Table – Former Intersil Property

Media	Impacted Parcel(s)	Institutional Control Objective	Instrument in Place	Notes
Ground water	Portions of 3 parcels as described in Exhibit A of the 2005 Covenant and Environmental Restriction	Prevent exposure to groundwater contaminants through direct contact or ingestion	Covenant and Environmental Restriction on Property, Article III Section 3.1.i: Prohibits use of groundwater with exception of for existing monitoring or remediation	On property only
Indoor Air		Prevent exposure to soil vapor through indoor air vapor intrusion	Covenant and Environmental Restriction on Property, Article III Section 3.1.g: Prohibits construction of new buildings without evaluating for vapor intrusion and taking mitigation measures as needed	
Soil		Prevent exposure to soil contaminants through direct contact or ingestion	Covenant and Environmental Restriction on Property, Article III Section 3.1.f: Prohibits soil excavation without notifying the Regional Water Board	

Table E-2. Institutional Control Summary Table – Former Siemens Property

Media	Impacted Parcel(s)	Institutional Control Objective	Instrument in Place	Notes
Ground water	Portions of 2 parcels as described in Exhibit A of the 2009 Covenant and Environmental Restriction	Prevent exposure to groundwater contaminants through direct contact or ingestion	Covenant and Environmental Restriction on Property, Article III Section 3.1.h: Prohibits use of groundwater with exception of for existing monitoring or remediation	On property only
Indoor Air		Prevent exposure to soil vapor through indoor air vapor intrusion	Covenant and Environmental Restriction on Property, Article III Section 3.1.f(2): Prohibits construction of new buildings without evaluating for vapor intrusion and taking mitigation measures as needed	
Soil		Prevent exposure to soil contaminants through direct contact or ingestion	Covenant and Environmental Restriction on Property, Article III Section 3.1.f(1): Prohibits soil excavation without notifying the Regional Water Board

PUBLIC NOTICE

U.S. EPA BEGINS FIVE-YEAR REVIEW OF INTERSIL INC./SIEMENS COMPONENTS SUPERFUND SITE CLEANUP

The CalEPA California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board) and the U.S. Environmental Protection Agency (EPA) began the sixth Five-Year Review of cleanup actions completed at the Intersil Inc./Siemens Components Superfund site (site) located in Cupertino, CA. The review evaluates whether cleanup work at the site continues to protect human health and the environment.

The site includes two properties at 10900 and 10950 North Tantau Avenue and a groundwater plume that extends to the north. From 1967 to 1995 the two properties were used for semiconductor manufacturing. The semiconductor manufacturing involved the use of various chemicals, which were released to soil and groundwater from localized spills and from leaking underground storage tanks and piping.

Five-Year Review Process:
According to the Superfund law, if a cleanup takes more than five years to complete or hazardous wastes remain on the site, the cleanup will be reviewed every five years. The last Five-Year Review, completed in 2015, found the remedy for the site still protected human health and the environment. It also had a recommendation to improve the performance of the remedy and to improve EPA's understanding of the movement of the contaminated groundwater plume.

The 2020 Five-Year Review report will be finished no later than September 30, 2020 and will be available online and at the information repositories listed below. The Five-Year Review process continues every five years until the site has been cleaned up to allow unrestricted use. The next Five-Year Review will be done in 2025.

As part of the review, the Regional Water Board and EPA will review:
- the movement and breakdown of remaining chemicals at the site;
- the operation of the groundwater treatment systems;
- the application and monitoring of the deed restrictions; and
- the changes in scientific knowledge about the site contaminants.

Cleanup Plan (Remedy):
In the 1980s the Regional Water Board's underground storage tank leak detection program found contamination in the soil on- and off-site. The primary site contaminant of concern is trichloroethene (TCE), which was used as a degreasing solvent. The cleanup included the removal of all tanks and structures and contaminated soils, installation of a subsurface vapor extraction network system to remove TCE vapors from soil, and the operation of a groundwater extraction system with a granular activated carbon filtration system to remove and treat contaminated groundwater. The treated groundwater is discharged under a Regional Water Board permit to Calabazas Creek.

How to Get Involved:
The Regional Water Board and EPA are interested in hearing from the public through interviews how the cleanup has been working. Please contact Roger Papler, Regional Water Board project manager, at roger.papler@waterboards.ca.gov or 510-622-2435. You may also contact Michael Schulman, EPA project manager, at schulman.michael@epa.gov or 415-972-3064. Please contact either Mr. Papler or Mr. Schulman **no later than April 30, 2020**.

For a copy of reports and other site documents, please visit the Regional Water Board's website at https://geotracker.waterboards.ca.gov/profile_report.asp?global_id=SL721101218 (Siemens site) and https://geotracker.waterboards.ca.gov/profile_report.asp?global_id=SL720641214 (Intersil Inc. site). From each site link, then click on the tab "Site Maps / Documents", and then scroll down to the section: "Site Documents". You can also visit EPA's webpage at http://www.epa.gov/superfund/intersil-siemens. An information repository that contains the site's Administrative Records, project reports, documents, fact sheets and other reference material is located at:

Summary of Conversation

What is your overall impression of the project?

The former Intersil facility (Site) groundwater extraction and treatment system (GWETS) has been operating since November 1987 and is functioning as designed and continues to provide hydraulic containment and some mass removal of VOC-impacted groundwater.

Is the remedy functioning as expected? How well is the remedy performing?

Yes, the remedy is functioning as expected and as designed. The GWETS removed an estimated 8.41 pounds of VOCs in 2019 with an extracted groundwater volume of 15.9 million gallons.

What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?

Yearly average TCE concentrations in wells W12A and W18B have decreased over 90% since system start up, from approximately 300 µg/L to 20 µg/L as described in the annual self-monitoring report for 2019. More information regarding decreasing concentrations of COCs in extraction and monitoring wells can be found in the historic annual groundwater and semiannual GETS reports.

Is there a continuous O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspections and activities.

There is no continuous on-site O&M presence, but the site is remotely monitored with an alarm notification system to engineers and technicians and alarms are responded to promptly. On-site visits are conducted on a biweekly basis. The system uptime has exceeded 99 percent on an annual basis.

Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines in the last five years? If so, do they affect protectiveness of the remedy? Please describe changes and impacts.

There have not been any significant changes in the O&M requirements for the site in the last 5 years. In order to renew the permitted monitoring exemptions for the Site under the old National Pollution Discharge Elimination System permit [(NPDES Permit) Order R2-2012-0012], additional sampling for influent containments was conducted at the beginning of 2019. All results from these additional samples were non-detect and the monitoring exemptions were reinstated for the new NPDES Permit [Order R2-2017-0048] for the Site. Monthly sampling for the effluent stream now includes volatile organic compounds (VOCs), turbidity, and total dissolved solids (TDS).

What are the annual operating costs for your organization's involvement with the site?

The 2019 annual operating and monitoring costs were approximately $300,000.

Have there been unexpected O&M difficulties or costs at the site in the last five years? If so, please give details.

There have not been any unexpected O&M difficulties or costs at the site.

Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

Following the approval of influent monitoring exemptions for the Site under the new NPDES Permit [Order R2-2017-0048], there is an expected estimated $15,000 in annual savings. These savings include laboratory analytical costs, on-site labor charges for sample collection, and off-site labor for monthly data validation and QA/QC evaluation activities.

Intersil conducted groundwater quality investigations of the property from 1983 through 1988, which included the installation and sampling of groundwater monitoring wells. Under the 1990 Water Board Site Cleanup Requirements (SCR) and Record of Decision (ROD), quarterly and semiannual groundwater monitoring was required. The sampling frequency was amended in 1993 to semiannual and annual monitoring and again in 2000 to annual and biennial sampling. No changes to sampling frequency have been made in the last five years.

Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the remedy?

Wood is not aware of any changes in applicable laws and regulations that would impact the protectiveness of the remedy.

Do you have any comments, suggestions, or recommendations regarding the project?

Since 1986, site remediation has consisted of:

1. A soil vapor extraction (SVE) system operated from May 1988 to August 1993, when it was decommissioned with Water Board approval. The SVE system removed approximately 3,000 pounds of VOCs, based on the findings described in the May 1993 *Proposal to Curtail Soil Vapor Extraction* prepared by Geomatrix Consultants, Inc.
2. Groundwater extraction and treatment has removed approximately 600 pounds of VOCs since system startup and achieved significant reduction in VOC concentrations. Over time, the influent concentrations and mass removal rates have decreased significantly. To provide for a more sustainable remediation approach, we recommend assessing if cessation of the extraction and treatment system and changing the remedy to monitored natural attenuation would also be protective of human health and the environment.

Five-Year Review Interview Record

Summary of Conversation

1) What is your overall impression of the project?

The former Siemens facility (Site) groundwater extraction and treatment (GWET) system has been operating since 1986, is functioning as designed, and continues to provide hydraulic containment and mass removal of VOC-impacted groundwater.

2) Is the remedy functioning as expected? How well is the remedy performing?

Yes, the remedy is functioning as expected and as designed. The GWET system removed an estimated 31.4 pounds of VOCs in 2019 with an extracted groundwater volume of 48 million gallons (from the former Siemens facility and the Intersil/Siemens Off-Site Study Area).

3) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?

Monitoring data for TCE concentrations (the primary COC monitored for the site) indicated a stable or decreasing trend for the majority of wells in 2019. More information regarding concentrations of COCs in extraction and monitoring wells is presented in the annual groundwater and semiannual NPDES reports.

4) Is there a continuous O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspections and activities.

There is no continuous on-site O&M presence, but the site is remotely monitored with an alarm notification system to engineers and technicians, and alarms are responded to promptly. On-site visits are typically conducted on a weekly basis. The system uptime is typically approximately 99 percent on an annual basis in recent years.

5) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines in the last 5 years? If so, do they affect protectiveness of the remedy? Please describe changes and impacts.

A new National Pollution Discharge Elimination System (NPDES) permit (General Waste Discharge Requirements for the Discharge or Reclamation of Extracted and Treated Groundwater Resulting from the Cleanup of Groundwater Polluted by Volatile Organic Compounds, Fuel Leaks, Fuel Additives, and Other Related Wastes [VOC and Fuel General Permit] under Order No. R2-2017-0050, NPDES No. CAG912002, which was adopted by the RWQCB on 14 November 2018) became effective on 1 January 2019 and is an amendment of VOC and Fuel General Permit Order R2-2017-0048, which was adopted by the RWQCB on 13 December 2017. Additional sampling for influent contaminants applies. The protectiveness of the remedy is not affected, and NPDES Reports are submitted to RWQCB semiannually.

A new totalizer was installed in November 2018. The totalizer is remote-accessible and provides real-time system flow data. Additional activities include installation of an HMI, replacement of failing equipment (e.g., extraction pumps, transfer pump), and redevelopment of several extraction wells. This has increased the system runtime in recent years.

6) What are the annual operating costs for the organization's involvement with the site?

The 2019 annual operating and monitoring costs were approximately $630,000.

7) Have there been unexpected O&M difficulties or costs at the site in the last 5 years? If so, please give details.

The GWET system consists of two 5,000-pound carbon vessels in series. The vessels were upgraded/replaced in December 2014 (lead vessel) and June 2015 (other vessel). Various other upgrades (extraction well redevelopment) and replacement activities (transfer pump, extraction well pumps) have taken place over the past 5 years.

8) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

Siemens is in the process of optimizing the site remedy and has conducted several phases of pilot testing (using EHC in the NE portion of the site where the GWET system has reduced effectiveness in the shallow zones). Several extraction wells are temporarily shut down while pilot testing is ongoing.

9) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the remedy?

ERM is not aware of any changes in applicable laws and regulations that would impact the protectiveness of the remedy.

10) Do you have any comments, suggestions, or recommendations regarding the project?
Groundwater extraction and treatment has removed over 3,700 pounds of VOCs since system startup and achieved significant reduction in VOC concentrations. Over time, the influent concentrations and mass removal rates have decreased. To provide for a more sustainable remediation approach, we recommend assessing if cessation of the extraction and treatment system and changing the remedy to monitored natural attenuation would also be protective of human health and the environment.

2. SUMMARY

A site visit to the combined Intersil-Siemens Superfund Site was conducted on 6 February 2020. All participants met on site for preliminary briefings and health and safety check in. The Intersil site is currently comprised of commercial business office buildings and customer parking. The Siemens site is currently comprised of a hospital building and customer parking. The Off property study area consists of a residential neighborhood north of the sites. The Active groundwater extraction and remediation is currently being conducted on all sites. Participants toured the site and observed the remediation compounds, groundwater treatment systems and extraction well networks.

3. DISCUSSION

On 3 February, Ben McKenna flew to San Jose, California to meet with multiple parties for five Year Review Site Visits at multiple sites. On 6 February Ben McKenna met the Intersil-Siemens participants at the site. The weather was sunny and cool (temperature approximately 58° F). The site is accessed from Interstate 280 West and North Wolfe Road and is located approximately 6.5 miles west of downtown San Jose.

Mr. McKenna arrived at the site at 1030 and did a preliminary walk around the site to note the locations of the remediation compounds and existing wells in the parking lots. The other participants arrived at 1100 and met at the Intersil remediation compound. USEPA gave an overview of the objectives of the site visit and the representing consultants provided a health and safety briefing.

After the briefing the team proceeded to inspect the Intersil groundwater extraction and treatment (GWET) system. Extracted groundwater is passed through a bag filtration unit and then treated via two granular activated carbon (GAC) vessels. Treated groundwater is then discharged to

Calabazas Creek under an existing National Pollutant Discharge Elimination System (NPDES) permit. All components of the GWET system were operational and appeared in good condition. After viewing the Intersil GWET system the participants proceeded to inspect the onsite groundwater extraction well network. All existing wells were secured, locked and in good condition.

After inspecting the remedy components for the Intersil Site the participants proceeded to inspect the Siemens GWET system. Extracted groundwater is passed through two 50-micron bag filtration units and then treated via two GAC vessels. Treated groundwater is then discharged to Calabazas Creek under an existing NPDES permit. All components of the GWET system were operational and appeared in good condition. Minor corrosion was noted on the bag filtration units. After viewing the Siemens GWET system the participants proceeded to inspect the onsite groundwater extraction well network. All existing wells were secured, locked and in good condition.

After inspecting the Siemens extraction well network participants walked to the adjacent Off Site Study Area to document the extraction wells for this area. Extraction wells installed along Lorne Way for the Off Site Study Area supply groundwater to the Siemens GWET system. Participants viewed extraction well LR-1B and all observable components appeared in good condition.

After viewing the Off Site Study Area the site inspection was concluded and the representing consultants left the site by 1330. USACE, EPA and Regional Water Board participants elected to remain at the site for additional discussions.

4. ACTIONS

The USACE will incorporate information obtained from the site visit into the Five Year Review report.

Subject: Annual Self-Monitoring Report, January 1 through December 31, 2019, Intersil/Siemens Site, Cupertino, California, Site Cleanup Requirements Order No. 90-119

Dear Mr. Papler:

Enclosed is a copy of the report titled "Annual Self-Monitoring Report, January 1 through December 31, 2019, Intersil/Siemens Site, Cupertino, California," dated January 30, 2020, and prepared by ERM-West, Inc. (ERM), and Wood Environment & Infrastructure, Inc. (Wood) on the joint behalf of SMI Holding LLC (SMI; formerly Siemens) and General Electric Company (GE; formerly Intersil, Inc.).

This self-monitoring report presents results of groundwater sampling activities conducted from January 1 through December 31, 2019 at the Intersil/Siemens Site, which is located in Cupertino, California. This annual report is for the following three areas: the former Intersil facility, the former Siemens facility, and the Off-Site Study Area. This report is submitted pursuant to the requirements of the California Regional Water Quality Control Board, San Francisco Bay Region (Water Board), Site Cleanup Requirements (SCR) Order No. 90-119, dated August 15, 1990, and amended by Order R2-2013-0002 on January 9, 2013. SMI performs sampling at the former Siemens facility; GE performs sampling at the former Intersil facility; and SMI and GE jointly perform monitoring activities conducted in the Off-Site Study Area.

Pursuant to the requirements of Section G.4 (a) of the SCR Self-Monitoring Program, GE and SMI note that no violations of the SCR occurred during this reporting period. The

groundwater treatment system was shut down for approximately two (2) days during the annual reporting period. These shutdowns were necessary to perform equipment adjustments, conduct analytical testing, optimize the efficiency and operation of the systems, change carbon vessels, replace system totalizers, and repair extraction well vaults.

We certify under penalty of law that this document and all attachments are prepared under our direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on our inquiry of the person or persons who managed the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of our knowledge and belief, true, accurate, and complete. We are aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

1. INTRODUCTION

This *Annual Self-Monitoring Report* has been prepared for the Intersil/Siemens site by ERM-West, Inc. (ERM) and Wood Environment and Infrastructure Solutions, Inc. (Wood E&IS) on behalf of SMI Holding LLC (SMI) and General Electric Company (GE). This annual report is for the following three areas in Cupertino, California (Figure 1):

- The former Intersil, Inc. (Intersil) facility (Figure 2) at 10900 North Tantau Avenue
- The former Siemens Components, Inc. (Siemens) facility (Figure 3) at 19000 Homestead Road
- The Off-Site Study Area (Figure 4), north of and hydraulically downgradient from the two former facilities

This report presents annual self-monitoring results for 1 January through 31 December 2019 (the reporting period) in accordance with the Site Cleanup Requirements (SCR) Order No. 90-119 issued by the California Regional Water Quality Control Board, San Francisco Bay Region (Water Board) to Siemens Components, Inc. (now SMI), Intersil (now GE), and Vallco Park, Ltd., on 15 August 1990, and amended by Order R2-2013-0002 on 9 January 2013. Order 90-119 was amended by Order R2-2013-0002 and is referred to herein as the SCR.

The current sampling schedule (Table 1) was approved by the Water Board in a letter dated 20 December 2000 (2000b). The schedule was subsequently modified as follows:

- Include off-site extraction wells LQ-2B and LR-1B in the semiannual sampling event conducted in April of each year, and exclude wells W2A, W3A, W13A, and W6B at the former Intersil facility after they were destroyed with Water Board approval on 27 July 2007.
- Include the 10 monitoring wells installed in the Off-Site Study Area in August 2014. These wells were sampled semiannually following installation in October 2014. However, with Water Board approval in emails dated 13 April 2017 and 5 April 2018, the sampling frequency of these wells was reduced to annual, with the exception of wells MW-OS-1A1, MW-OS-2A1, and MW-OS-5A3, for which sampling will continue semiannually.
- Include the 13 monitoring wells installed in 2014 and 2016 at the former Siemens facility to support ongoing characterization and pilot study activities. As stated in the previous Annual Self-Monitoring Report, these wells are sampled annually.
- Include 12 new monitoring wells installed in January/February 2019 within Forge Drive (7), Tantau Avenue (2), and on the former AMI site (3). These wells are currently sampled semiannually.

As required by the SCR, this report contains the following information for this annual sampling period:

- Summary of the activities performed to comply with the SCR
- Quarterly groundwater level data for wells on the former Intersil (Section 2) and Siemens (Section 3) facilities, and the Intersil/Siemens Off-Site Study Area (Section 4)
- Sampling and chemical analysis data from groundwater monitoring wells designated for sampling at the former Intersil (Section 2) and Siemens (Section 3) facilities, and the Intersil/Siemens Off-Site Study Area (Section 4)
- Summary of the treatment system quarterly groundwater extraction rate, total volume extracted, and mass removed for the former Intersil (Section 2) and Siemens (Section 3) facilities, and the Intersil/Siemens Off-Site Study Area (Section 4)

- Annual compliance summaries for the former Intersil (Section 2) and Siemens (Section 3) facilities, and the Intersil/Siemens Off-Site Study Area (Section 4)
- Quarterly potentiometric surface maps of the A1, A3, and A4 depth intervals; B zone; and C zone

Historically, the shallow saturated sediments at the site were divided into three water-yielding zones: the A zone (from the top of the groundwater table to 120 feet below ground surface [bgs]), the B zone (from approximately 130 to 150 feet bgs), and the C zone (from approximately 180 to 210 feet bgs). Regional groundwater elevations rose approximately 50 to 55 feet between 1993 and 1998 from a historical depth of approximately 100 feet bgs. Based on recent water level measurements in monitoring wells screened across the water table, groundwater is first encountered beneath the site at depths ranging from approximately 40 to 74 feet bgs.

Because water levels rose approximately 50 feet during the 1990s, the A zone was further subdivided into A1, A2, A3, and A4 depth intervals. Former vadose zone wells that became saturated are now designated as A1, A2, or A3 depth interval wells based on the depths of their screened intervals. The depth ranges for the A1, A2, A3, and A4 depth intervals at the former Intersil and Siemens facilities are shown below:

Depth Interval	Former Intersil Facility Approximate Depth (feet bgs)	Former Siemens Facility Approximate Depth (feet bgs)
A1 depth interval	38 to 56	40 to 60
A2 depth interval	58 or 60 to 69	58 or 60 to 70
A3 depth interval	69 or 74 to 80 or 90	70 or 74 to 90
A4 depth interval	80 or 90 to 125	90 to125

Groundwater levels have decreased significantly over the last several years. From 2011 to 2016, several A1 through A3 depth interval wells became dry, and water levels decreased approximately 17 feet in the A4 depth interval, 10 feet in the B zone, and 12 feet in the C zone. In 2018 and 2019, water levels increased approximately 3 feet in the A1 depth interval, 2 feet in the A3 zone, 6 feet in the A4 depth interval, 7 feet in the B zone, and 10 feet in the C zone relative to 2017.

2. FORMER INTERSIL FACILITY

Tantau Cupertino Development One LLC currently owns the former Intersil facility property; however, GE retains responsibility for operation and maintenance of the groundwater extraction and treatment system (GWETS).

A soil vapor extraction (SVE) system operated at the former Intersil facility from May 1988 to August 1993. Following review of soil data collected to confirm that the system had achieved remedial objectives, the Water Board approved shutdown. The system consisted of seven vapor extraction wells and eight vent wells. The SVE system removed approximately 3,000 pounds of volatile organic compounds (VOCs) from the vadose zone, which at that time extended to approximately 100 feet bgs.

2.1 Groundwater Monitoring

Wood E&IS and subcontractor Blaine Tech Services, Inc., performed the annual groundwater sampling and collected water level measurements on 1 and 3 October 2019. Locations of monitoring and extraction wells at 10900 North Tantau Avenue are shown on Figure 2.

2.1.1 Groundwater-Level Measurements

Groundwater levels were measured with an electric sounder in January, April, July, and October (Table 2), in wells at the former Intersil facility (Figure 2), in accordance with the Sampling Plan (Geomatrix Consultants Inc. [Geomatrix] 1994a).

Figures 6, 11, 16, and 21 show the groundwater potentiometric surface of the A3 depth interval, for January, April, July, and October, respectively. These figures also illustrate the estimated extent of hydraulic containment (capture zone) in the A3 depth interval provided by on-site extraction wells. Figures 7, 12, 17, and 22 show the groundwater potentiometric surface of the A4 depth interval, for January, April, July, and October, respectively. These figures also illustrate the estimated extent of hydraulic containment (capture zone) in the A4 depth interval provided by on-site extraction wells. Figures 8, 13, 18, and 23 show the groundwater potentiometric surface of the B zone beneath the former Intersil facility for January, April, July, and October, respectively. Groundwater potentiometric contours were drawn based on interpolation of groundwater levels in the 22 on-site wells and piezometers and incorporate judgment based on the hydrogeologic setting. The groundwater potentiometric surfaces, contours, and capture zones in the A4 depth interval and B zone are consistent with historical observations.

2.1.2 Groundwater Sampling and Analysis

2.1.2.1 Sampling and Analysis

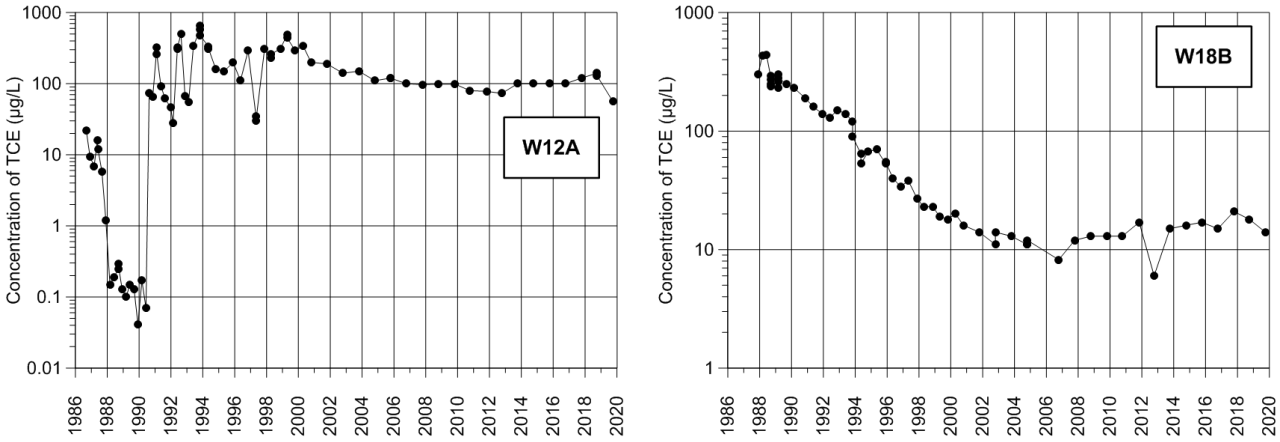
Annual samples shown in Table 3 were collected using HydraSleeves or from extraction well sample ports in accordance with the Sampling Plan and the Technical and Regulatory Guidance. HydraSleeves were initially installed in monitoring wells on 4 September 2014 and are replaced in the well during each sampling event. Groundwater samples were collected using sampling methods in accordance with *Standard Operating Procedure 2 – Groundwater Sampling Rev. 2* (Appendix A).

Eurofins TestAmerica of Pleasanton, California (TestAmerica), a state-certified laboratory, performed the analyses of groundwater samples in accordance with the specifications in the *Quality Assurance Project Plan* (QAPP; Geomatrix 1994b) prepared for the former Intersil facility. TestAmerica analyzed samples, blanks, and spikes in accordance with United States Environmental Protection Agency (USEPA) Method 8260B (8010 list) for purgeable VOCs.

2.1.2.2 Analytical Results

Table 3 presents results of the chemical analyses performed on the annual groundwater samples collected during October. Additional results are found in Appendix B. The primary VOC detected is trichloroethene (TCE). This year, the highest TCE concentrations detected were 160 micrograms per liter (µg/L) in W19MA in the A3 depth interval, 56 µg/L in extraction well W12A (a 97.3 percent reduction since extraction began) in the A4 depth interval, and 14 µg/L in well W18B in the B zone. Analytical results from these sampling rounds are consistent with historical trends, as shown below for wells W12A and W18B. Laboratory analytical reports are maintained with the project files.

TCE Concentration over Time in Wells W12A and W18B



TCE concentrations for the site are also shown on Figures 25 through 29 for the A1, A3, and A4 depth intervals and B and C zone groundwater. Isoconcentration contours are not shown for the C zone because there are insufficient sitewide data to draw contours.

2.1.2.3 Quality Assurance/Quality Control

Wood E&IS follows established procedures for quality assurance and quality control (QA/QC) at the former Intersil facility. Protocols followed by Wood E&IS, as well as by the analytical laboratory, are detailed in the former Intersil facility's *Sampling Plan* and QAPP (Geomatrix 1994a, b). These procedures are part of Wood E&IS's standard practice during hydrogeologic investigations and remedial action activities, and are followed to obtain data that are representative of field conditions. During the sampling event, trip blanks and duplicate samples were collected for QA/QC purposes.

Tables 4 and 5 summarize sampling and analytical QA/QC, respectively. The data generated meet the requirements of precision, accuracy, and completeness as described in the QAPP. No VOCs were detected in the field equipment and trip blanks for the sampling events. A detailed description of the protocol followed by the analytical laboratory to achieve the precision, accuracy, and completeness goals for analysis of samples collected by Wood E&IS is presented in the former Intersil facility's QAPP.

Data precision is estimated by comparing analytical results from duplicate samples and calculating the relative percent difference (RPD). Duplicate samples were generated by the laboratory and by Wood E&IS during the annual reporting period. The RPDs for all constituents meet the QA goal of plus or minus 25 percent.

Data accuracy is evaluated based on recoveries, expressed as the percent of the true or known concentration. Recoveries may be calculated from laboratory matrix spikes, matrix spike duplicates, and

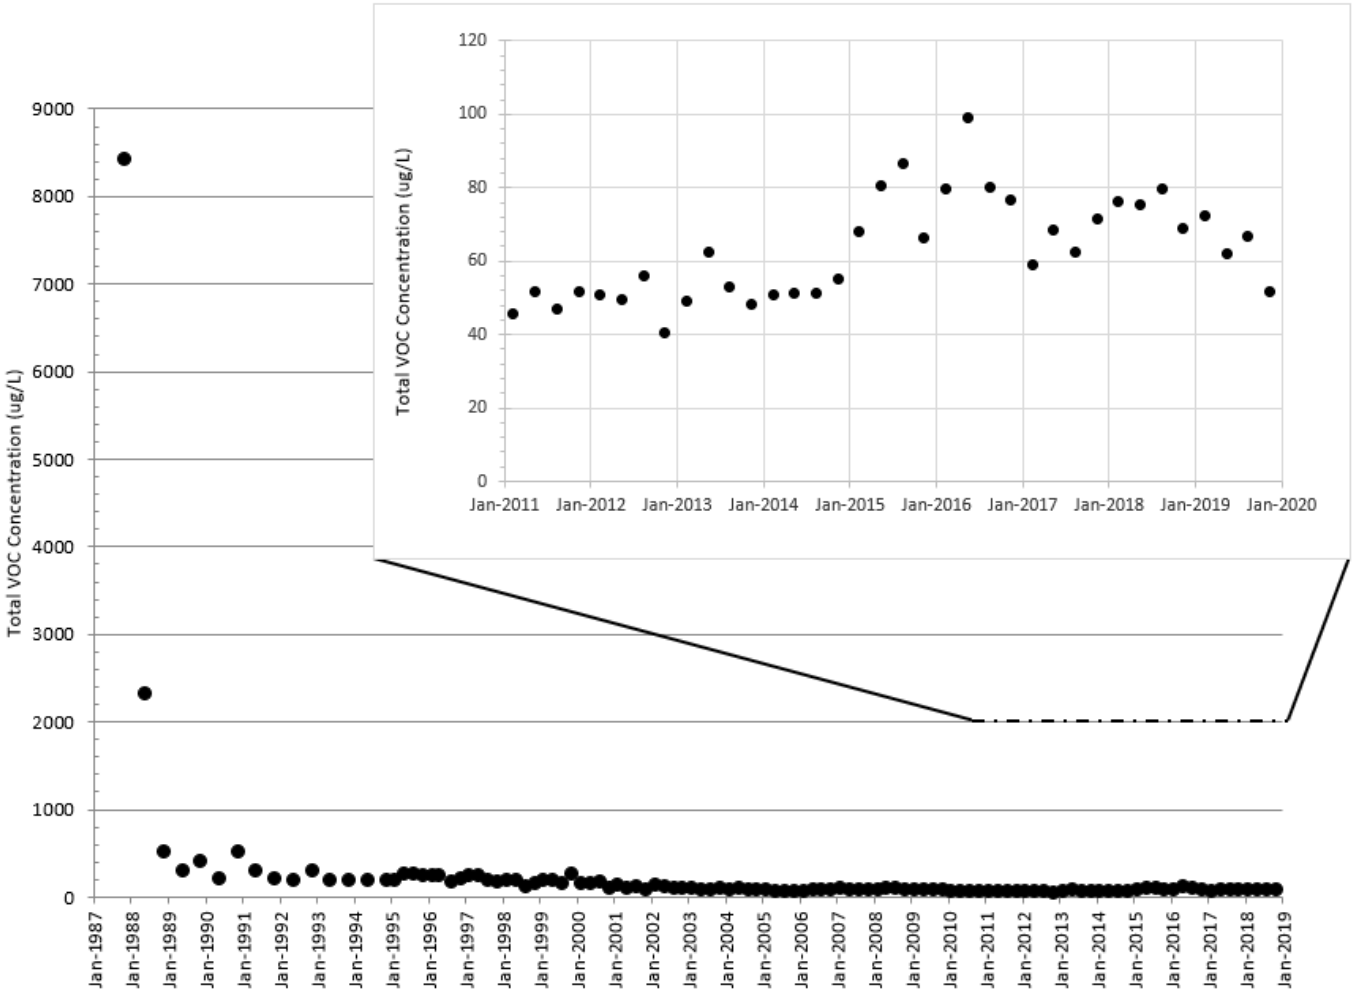
calibration standards generated as QA/QC samples by the analytical laboratory. The equation for calculating percent recovery is presented in the QAPP. The percent recovery of cis-1,2-dichloroethene (DCE) was above control limits in the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) from batch 720-274276. Detections of cis-1,2-DCE in wells E17A and W12A were qualified with J+ to indicate that the associated concentrations were approximate, biased high. The average percent recoveries from other analyses of spiked samples, using USEPA Method 8260B, for this annual period meet the current QA goal.

2.2 Groundwater Extraction and Treatment System Operation

The GWETS at the former Intersil facility has been operating since November 1987. The system currently includes extraction wells E9AR, W10A, W12A, and W18MA. A granular activated carbon treatment system replaced the former air stripping treatment system in 2007.

Average quarterly flow rates, total volume extracted, and estimates of chemical mass removed are presented in Table 6. During the annual reporting period, the total volume of groundwater pumped was approximately 16 million gallons (the average pumping rate was 31 gallons per minute [gpm]), and a total of approximately 8.41 pounds of VOCs were removed. As shown in the following graph, VOC influent concentrations have generally reached asymptotic conditions.

Total VOCs over Time in Treatment Plant Influent



During this annual reporting period, occasional shutdowns occurred for periods of less than 24 hours to perform equipment adjustments and design modifications to improve or maintain the efficiency and operation of the system. There were no unscheduled shutdowns during the reporting period.

Detailed information on the operation of the groundwater extraction system is presented in the semiannual National Pollutant Discharge Elimination System (NPDES) reports for the facility.

2.3 Additional Work Conducted During the Annual Reporting Period

During this reporting period, a carbon change out for two GAC vessels was performed on 30 September 2019. Additionally, the totalizer for E9AR was replaced on 17 December 2019.

3. FORMER SIEMENS FACILITY

SMI, as successor by merger to Siemens Microelectronics, Inc., sold the property to Tantau Investments, LLC, Partners in 2000. The property has been through multiple acquisitions since 2000. 19000 Homestead Associates, LLC, and Firewish 19000, LLC, are the current owners of the property, which they lease to Kaiser Permanente. SMI maintains the responsibility of implementing remedial actions at the former Siemens facility.

SMI and its predecessor operated an SVE system at the former Siemens facility beginning in 1983. The system was shut down on 16 December 2005 after removing approximately 17,310 pounds of VOCs from the vadose zone. A VOC rebound study conducted in 2006 showed no significant rebound in VOC concentrations compared to the baseline samples. With Water Board approval (Water Board 2005), the system was permanently shut off in August 2006 following the sampling for the rebound study.

3.1 Groundwater Monitoring

During the annual reporting period, SMI measured groundwater elevations and collected groundwater samples at the former Siemens facility, in compliance with the SCR and the schedule approved by the Water Board in a letter dated 20 December 2000 (Water Board 2000b; Table 1). Although not required by the 20 December 2000 Water Board letter, additional groundwater samples were collected from select A1 through A3 depth interval wells, in accordance with the schedule proposed in the *Annual Self-Monitoring Report, January 1 through December 31, 2000* (LFR 2001). Additional groundwater samples were also collected from:

- Select A1 and A3 well locations to support the Phase III Enhanced Reductive Dechlorination (ERD) Pilot Study. Samples were collected in March, May, July, and October 2019 as part of the ERD performance monitoring, and in May, July, and October 2019 to evaluate the status of mitigation measures conducted. ERD performance monitoring data is included in Appendix C.

3.1.1 Groundwater Level Measurements

Groundwater elevation levels in the extraction and monitoring wells and piezometers were measured with an electric water-level sounder quarterly on 14-16 January, 8 April, 8 July, and 1 October 2019 (Table 2) as part of the self-monitoring program. Locations of former Siemens facility groundwater monitoring wells and piezometers are shown on Figure 3.

From these data, a groundwater potentiometric surface map of the A1, A3, and A4 depth intervals, and B and C zones was constructed for each calendar quarter of 2019, as illustrated on Figures 5 through 24. Groundwater potentiometric contours were drawn by interpolating the groundwater levels between groundwater measurement locations and incorporated judgment that was based upon knowledge of the local hydrogeologic setting.

Figures 5 (January), 10 (April), 15 (July), and 20 (October) present the groundwater potentiometric surface for the A1 depth interval. A1 depth interval extraction well 2EP was offline during collection of water levels as part of the ERD Pilot Study. Figures 6 (January), 11 (April), 16 (July), and 21 (October) present the groundwater potentiometric surface for the A3 depth interval and the estimated zone of capture induced by the extraction from on-site extraction wells in the A3 depth interval: LF-12A, SW-7, and EX-1 RL. A3 depth interval extraction wells 2EPa and H-1A were offline during collection of water levels as part of the ERD Pilot Study.

Figures 7 (January), 12 (April), 17 (July), and 22 (October) present the groundwater potentiometric surface for the A4 depth interval and the estimated zone of capture induced by extraction from the on-site extraction well in the A4 depth interval well, LF-6A, and from the on-site extraction wells in other zones in

the area, LF-12A and H-5B. Figures 8 (January), 13 (April), 18 (July), and 23 (October) present the groundwater potentiometric surface for the B zone and estimated zone of capture induced by the extraction from the on-site B zone extraction well, H 5B. Figures 9 (January), 14 (April), 19 (July), and 24 (October) present the groundwater potentiometric surface for the C zone.

3.1.2 Groundwater Sampling and Analysis

3.1.2.1 Sampling and Analysis

Between 1 and 9 October 2019, groundwater samples were collected in accordance with the current sampling and analysis schedule (Table 1) from 47 wells located at the former Siemens facility. Samples were collected from all the wells on the schedule. Groundwater samples were also collected from additional former Siemens facility wells, as discussed in Section 3.3.

During this annual event, groundwater samples from the on-site monitoring wells were collected using either HydraSleeves or low-flow purging and sampling methods in accordance with *Standard Operating Procedure 2 – Groundwater Sampling Rev. 2* (Appendix A). HydraSleeves were deployed into the monitoring wells, allowed to equilibrate in each well for a minimum of 2 days, and retrieved on 2, 3, 4, and 9 October 2019. The samples collected to support the ERD Pilot Study were collected utilizing low-flow purge and sample methods. Groundwater samples from the active extraction wells were collected from the sampling port located at each wellhead.

All groundwater samples for the annual event and QA/QC samples were submitted to TestAmerica of Pleasanton, California, for purgeable VOC analyses, using USEPA Method 8260B (8010 list).

3.1.2.2 Analytical Results

Table 3 presents the results of VOC analysis of samples from groundwater monitoring wells at the former Siemens facility for the annual reporting period. The primary VOC detected in all groundwater zones at the former Siemens facility is TCE. The following VOCs that have historically been reported were also detected during the annual reporting period: 1,1,1-trichloroethane; 1,1,2-trichloro-1,2,2-trifluoroethane (Freon 113); 1,1-DCE; cis-1,2-DCE; tetrachloroethene; trans-1,2-DCE. In addition, the following VOCs were detected during the reporting period: 1,1-dichloroethane; 1,2-dichloroethane; 4-isopropyltoluene, acetone, benzene, 2-butanone; carbon disulfide; chloroethane; chloroform; dibromochloromethane; methyl ethyl ketone; toluene; and vinyl chloride.

Groundwater analytical results for the annual reporting period are generally similar to historical results or slightly lower within the A3 depth interval, A4 depth interval, and B zone. The concentrations within the A1 and A3 depth intervals continue to show a decrease in TCE, cis-1,2-DCE, and trans-1,2-DCE concentrations at most of the wells in the vicinity of the Phase III ERD Pilot Study. Further discussion regarding the results within the Phase III ERD Pilot Study Area is provided in Section 3.3. TCE concentrations for the site are shown on Figures 25 through 29 for the A1, A3, and A4 depth intervals, and B and C zone groundwater.

Toluene was detected in the May 2017 sample event at 780 µg/L in inactive extraction well 2EPa (A3 depth interval). Toluene was previously non-detect at this well. This was documented in the 2017 Annual Report with a notation that ERM would investigate the potential for a surface spill to have occurred in this area. The concentrations of toluene decreased at this well in subsequent sample events: August 2017 (530 µg/L), October 2017 (610 µg/L), March 2018 (25 µg/L), and October 2018 through October 2019 (non-detect). SMI will continue to monitor toluene concentrations at 2EPa and downgradient wells.

3.1.2.3 Quality Assurance/Quality Control

The quality of the October 2019 data was assessed following the *USEPA National Functional Guidelines for Organic Superfund Methods Data Review*, January 2017. Data quality assessment for 2019 sampling events prior to the annual event were provided in separate documentation. Tables 7 and 8 present a QA/QC review of former Siemens facility groundwater sampling and analytical results for VOCs, and are provided in lieu of raw data such as field data sheets, laboratory data sheets, QA/QC data, and chain-of-custody forms. In accordance with the Water Board's letter dated 20 December 2000 (Water Board 2000b), this report does not include such raw data; however, these data are kept on file at ERM's office in Walnut Creek, California.

QA/QC measures were implemented for the purpose of maintaining data quality, and documenting data precision and accuracy. QA/QC procedures included collecting trip blank and sampling equipment rinsate blank samples. As presented in Table 7, the case narratives for some data reports described headspace as a bubble greater than 6 millimeters in diameter. Due to the headspace greater than that established in USEPA guidelines (2017), the non-detect results for these samples have been qualified as estimates (J-/UJ), and if samples did not agree or historical data were not available, the results were rejected (R). As noted in Table 8, several samples reported a pH greater than 2 for VOC analysis; however, no qualifications were necessary. As noted in Table 8, several samples were analyzed outside the 7-day holding time. Where results were in agreement with historical data, the samples were qualified as estimated (J-/UJ).

The quality of all data generated during this investigation are acceptable for the preparation of technically defensible documents.

3.2 Groundwater Extraction and Treatment System Operation

SMI and its predecessor have operated a GWETS at the former Siemens facility since July 1986. The GWETS treats groundwater from extraction wells at the former Siemens facility. Since 20 July 1990, the GWETS has also treated groundwater from extraction wells in the Intersil/Siemens Off-Site Study Area, which are the joint responsibility of SMI and GE. The operation of Off-Site Study Area groundwater extraction wells is also discussed in Section 4.2. Between 1986 and 2002, the primary treatment method was air stripping with two towers in series. In March 2002, four 2,000-pound carbon vessels were installed in place of the air stripping towers. The GWETS was upgraded in February 2004 to replace the existing carbon vessels with two 5,000-pound carbon vessels in series. In December 2014, the lead carbon vessel was replaced, followed by replacement of the other carbon vessel in June 2015.

Figure 3 shows locations of former Siemens facility groundwater extraction wells and groundwater treatment facilities. The groundwater extraction wells located at the former Siemens facility are wells 2EP, 2EPa, LF-6A, H-5B, LF-12A, SW-7, EX-1-RL, and H-1A, with the following notes:

- 2EP (A1 depth interval extraction well) has been offline since 23 September 2014 due to a decrease in water elevation (causing the well to become dry) and in accordance with the Phase II ERD Pilot Study Work Plan (ERM, 2014)
- H-1A and 2EPa (A3 depth interval extraction wells) have been offline since 8 October and 25 November 2014, respectively, to facilitate the ERD Pilot Study
- EX-1-RL was offline between 19 December 2018 and 29 March 2019 due to damage to an underground conveyance line. After excavation and installation of a new vault, the well was brought back on line.

During this annual reporting period, occasional shutdowns occurred for periods of less than 5 hours to perform equipment maintenance, with the following exception:

- The system was offline periodically between 8 February and 1 March 2019 for system testing and maintenance, which included repair of the extraction well vault at EX-1-RL. The system was restarted for continuous operation on 1 March 2019 following carbon vessel change-out.

Detailed information on GWETS operation is presented in the semiannual NPDES reports for the facility.

During the annual reporting period, there were no permit effluent limitation exceedances. There was an individual effluent sample that exceeded the Monthly Average limit concentration for total zinc on 6 November 2019; however, a second effluent sample was collected on 21 November 2019 and the average zinc concentration of the two samples was below the Monthly Average limit concentration. Both zinc samples were below the permitted Daily Maximum value.

During the annual reporting period, the GWETS removed an estimated 31.4 pounds of VOCs and extracted a total of approximately 48.0 million gallons of groundwater from the former Siemens facility and the Intersil/Siemens Off-Site Study Area (Table 6). Of this, approximately 20.6 pounds of VOCs and 26.2 million gallons of groundwater was extracted from the former Siemens facility. Sampling and analytical results for the GWETS are included in separate Self-Monitoring Reports, as required by the General Permit.

3.3 Additional Work Completed During the Annual Reporting Period

Additional work conducted during the reporting period included:

- Enhanced Reductive Dechlorination (ERD) Pilot Study activities
- An investigation beneath the on-site buildings
- A shallow soil and groundwater (A1 depth interval) investigation at the southern end of the former Siemens facility

These activities are summarized in the sections below.

3.3.1 Enhanced Reductive Dechlorination Pilot Study Activities

The groundwater extraction and treatment systems at the Intersil/Siemens site have been reducing concentrations of VOCs in groundwater and hydraulically controlling the plume (RWQCB 2010); although the amount of VOC mass being removed has declined and the VOC concentrations have stabilized at concentrations above groundwater restoration goals. In response to declining mass removal, SMI has conducted three phases of ERD Pilot Studies since March 2006 to evaluate the feasibility and effectiveness of ERD in the shallow groundwater to improve both the rate and efficiency of VOC mass removal as compared to the groundwater extraction and treatment system. The most recent evaluation, Phase III ERD Pilot Study, was implemented in 2017 with performance monitoring continuing since that time.

The Phase III ERD Pilot Study included a Mitigation Plan to be implemented if vinyl chloride or other undesirable pilot study end products exhibited the potential for off-site migration. Mitigation Plan measures include increased monitoring, bioaugmentation, EHC® treatment, and groundwater extraction responses. Throughout 2019, ERM performed the following sampling and activities to support the Pilot Study:

- March 2019 – 14 wells (2EP, 2EPA, 4BP, MW-01A1, MW-02A1, MW-OS-1A1, MW-OS-2A1, MW-OS-3A1, MW-OS-2A3, VM-5S, VM-5D, VM-6S, VM-6D, and VM-7S) were sampled for VOCs.
- April 2019 – The following mitigation measures were conducted in accordance with the RWQCB conditionally-approved *Final Mitigation Measure Work Plan, Former Siemens Facility,*

Intersil/Siemens Site, Cupertino, California (ERM, 30 January 2019). The Work Plan was approved by the Water Board in a 5 February 2019 email. The complete summary and results for the activities and associated performance monitoring are provided in *Mitigation Measures Summary Report, Intersil/Siemens Site, Cupertino, California* (ERM, 29 October 2019).

- Chemical oxidant batch injection was conducted along the northern property line of the former Siemens property to address potential migration of vinyl chloride in the shallow groundwater from the property boundary. The injection activities included borehole drilling; potassium permanganate solution preparation/on-site mixing; and injection of potassium permanganate. The injection points were spaced approximately 30 to 40 feet apart at five locations near the intersection of the northern and eastern property lines within the A1 depth interval. A total of 3,087 pounds of permanganate was injected between these five injection points.

  Performance monitoring for the potassium permanganate injection activities included baseline sampling of groundwater prior to initiation of the batch injection and three regular events following completion of the injections (May, July, and October 2019). In addition, performance monitoring included collection of soil vapor samples from two existing soil vapor probes (SVP-4 and SVP-5) near the northern property line to support a better understanding of the response of soil vapor just outside the boundary of the ERD Pilot Study (baseline conditions) and changes that may occur because of the chemical oxidation. Samples were collected from SVP-4 and SVP-5 and submitted for VOC analysis on a monthly basis for a period of 3 months following injection.

  The field observations, field parameters, VOC data, and general chemistry data were inconclusive on the effectiveness of chemical oxidation in the treatment area to reduce by-product (cis-1,2-DCE and vinyl chloride) concentrations in the A1 depth interval. The vinyl chloride concentrations in the treatment area wells increased in concentration. The vinyl chloride at A1 wells located off site and downgradient of the ERD treatment area (MW-OS-1A1, MW-OS-2A1, and MW-OS-3A1) remain below MCLs. Through the 3-month sample event, the detected TCE; cis-1,2-DCE; and vinyl chloride were generally low and remained constant during the performance monitoring. SMI will continue to monitor the cis-1,2-DCE and vinyl chloride concentrations in the downgradient wells and the treatment area wells.

- SVE and treatment around SVP-7 was performed to remove VOC and methane mass as a mitigation measure for soil vapor and to increase air flow in the area. Existing SVE wells and a trailer-mounted SVE system were used to conduct the SVE mitigation measure test. The test was conducted over a 5-day testing period utilizing existing wells VM-7S and VM-8S and monitoring was conducted at other nearby monitoring/former SVE wells and soil vapor probes SVP-6 and SVP-7. An estimated 0.19 and 0.02 pound of TCE and vinyl chloride, respectively, were removed during operation of the SVE mitigation measure.

  Following completion of the SVE test, monthly soil vapor samples were collected from SVP-6 and SVP-7 for 3 months. Generally, the concentrations at SVP-6 remained the same during the 3 months of performance monitoring. The VOC concentrations detected in SVP-7 did rebound slightly following completion of the test period, but the concentrations are lower than the 2018 detected values. SMI continues to monitor VOCs in soil vapor at SVP-7 on a quarterly basis to evaluate the increasing trends at SVP-7, and SMI will continue to evaluate the data collected and evaluate options in accordance with the Mitigation Plan.

- October 2019 – 15 wells (2EP, 2EPA, 4BP, MW-01A1, MW-01A3, MW-02A1, MW-OS-1A1, MW-OS-2A1, MW-OS-2A3, MW-OS-3A1, VM-5S, VM-5D, VM-6S, VM-6D, VM-7D, and VM-8D) were sampled for VOCs as the 6-month performance monitoring following the April 2019 chemical injections. Generally, the cis-1,2-DCE and vinyl chloride concentrations were consistent or lower than the previous 3-month sample event.

- December 2019 – Soil vapor samples were collected from SVP-5 and SVP-7 (along the property line) in December 2019 as part of the quarterly evaluation.

Plots of concentration versus time and molar ratios prepared for key monitoring wells in the Phase III ERD Pilot Study treatment area, upgradient/cross-gradient of the treatment area, and downgradient of the treatment area have been updated to include the 2019 VOC data (Appendix C). Appendix C also includes the analytical data collected for the Phase II and III ERD Pilot Studies.

As noted in the *Mitigation Measures Summary Report, Intersil/Siemens Site, Cupertino, California,* the VOC concentrations detected in SVP-7 did rebound slightly following completion of the test period, but the concentrations are lower than the 2018 detected values. The December 2019 concentration was slightly higher than July 2019 data. SMI will continue to monitor VOCs in soil vapor at SVP-7 on a quarterly basis to evaluate the increasing trends at SVP-7. SMI will continue to evaluate the data collected and evaluate options in accordance with the Mitigation Plan.

3.3.2 Sub-Building Investigation (May-June 2019)

In addition to the ERD Pilot Studies, SMI is considering other remedy technologies to enhance VOC removal at the former Siemens facility. Identifying significant residual VOCs beneath the building, if present, will support determining an appropriate path towards closure. Therefore, SMI proposed to collect samples beneath the existing building to evaluate if residual VOCs exist to indicate that a previously unknown source is present in shallow soil beneath the on-site buildings within *Final On-site Sub-Building Soil Investigation Work Plan* (Work Plan) submitted on 5 April 2019 (ERM 5 April 2019). The Work Plan was approved by the Water Board in a 16 April 2019 email.

Borings were advanced in May and June 2019 using a limited-access, direct-push drilling rig equipped with the membrane interface probe and hydraulic profiling tool (MiHPT) to total depths ranging from 26 to 40 feet bgs at 11 locations. Data were recorded continually within each borehole using the MiHPT, including a halogen specific detector (XSD), photoionization detector (PID), and flame ionization detector (FID).

Soil borings were advanced to total depths ranging from 13 to 40 feet bgs at four locations using direct-push drilling techniques. The soil column at each drilling location was field-screened using a PID at a minimum of 2-foot intervals. Soil samples were collected based on field observations and monitoring of organic vapors using a handheld PID.

MiHPT data indicate that elevated chlorinated VOCs are not present beneath the on-site buildings, with the exception of detections at 26 to 28 and 37 to 38.5 feet bgs in one location (SB-309 in the northwestern portion of the southern building). However, these detections were unable to be verified using soil samples analyzed at a laboratory, as the co-located soil boring SB-310 encountered refusal at 13 feet bgs.

Soil sample data indicate that elevated chlorinated VOCs are not present beneath the on-site buildings, with the exception of detections at 15 and 20 feet bgs in boring SB-317 (northeastern portion of the northern building) and at 25, 30, and 40 feet bgs in boring SB-318 (northwestern portion of the northern building). However, these detections were not confirmed using the XSD- and PID-combined data results from co-located MiHPT borings SB-302 and SB-301, respectively, and it should be noted these soil borings are near several historical tanks.

Evaluation of the MiHPT and soil boring results indicates no evidence of a shallow unknown contaminant source beneath the on-site buildings. Based on these results, additional investigation work beneath the

on-site buildings was not proposed. The complete results for this investigation are provided in the *On-site Sub-Building Soil Investigation Summary Report* (ERM 2019c).

3.3.3 Shallow Soil and Groundwater Investigation at Southern Portion of Former Siemens Facility (June-July 2019)

The primary objective of this shallow soil and groundwater investigation was to collect VOC data to determine the extent of chlorinated VOC concentrations within the unsaturated zone and shallow (A1 depth interval) groundwater in the southern portion of the former Siemens facility. The scope of work was proposed in the *Shallow Soil and Groundwater Investigation Work Plan* (Work Plan) submitted on 13 June 2019 (ERM 2019).

Borings were advanced using a limited-access, direct-push drilling rig equipped with MiHPT at three locations (MIP-322, MIP-323, and MIP-328) to total depths ranging from 21 to 41.5 feet bgs. Data were recorded continually to the total depth of each borehole using the MiHPT, which included rate of penetration; temperature; electrical conductivity; XSD, electron capture detector, PID, and FID readings; and hydraulic profiling tool pressure and flow. Soil borings were advanced using direct-push drilling techniques at nine locations to total depths ranging from 52 to 60 feet bgs. Soil samples were collected from each borehole based on field observations and monitoring of organic vapors using a handheld PID.

The MiHPT data showed no presence of chlorinated VOCs in the soil for the depths reached. The MiHPT results correlate well with the associated non-detect soil sample results from co-located soil borings. Soil sample data indicated that chlorinated VOCs are not present in the southern portion of the former Siemens facility within the top 25 feet bgs, and this lack of detections was confirmed by the results from co-located or nearby MiHPT borings.

VOCs were detected in soil samples at depths between 30 and 50 feet bgs (water table logged at depths that ranged between 49 and 52 feet bgs) at concentrations that ranged from 4.0 to 120 micrograms per kilogram, with the highest detections in the deeper samples collected in the central portion of the southern area. These soil concentrations are consistent with previous soil investigations.

Chlorinated VOCs, primarily TCE, were detected in grab groundwater samples from all nine borings (water table logged at depths ranging between 49 and 52 feet bgs and samples collected at depths ranging from 52 to 53 feet bgs) at concentrations ranging from 29 to 270 µg/L. The highest groundwater concentrations were detected in the central portion (laterally) of the investigated area (which is where TCE was also detected in the deeper soil samples) and in the new wells located in Forge Drive.

The highest detections of TCE in soil samples were generally reported in the deepest sample collected just above or within the shallow groundwater surface (logged at depths ranging between 49 and 52 feet bgs), and grab groundwater sample results correlated well with relative soil concentrations. No additional characterization activities for the southern portion of the former Siemens property were proposed by SMI. The summary and complete results for this investigation are provided in the *Shallow Soil and Groundwater Investigation Summary Report, Southern Portion of Former Siemens Property* (ERM 2019d).

4. OFF-SITE STUDY AREA

4.1 Groundwater Monitoring

Wood E&IS and Blaine Tech Services, Inc., performed semiannual groundwater monitoring on 14 through 16 April 2019 in accordance with the 20 December 2000 and 15 October 2004 Water Board letters (2000b; 2004). ERM and Blaine Tech Services, Inc., performed annual groundwater sampling on 1 through 9 October 2019 at Off-Site Study Area wells.

4.1.1 Groundwater-Level Measurements

During the annual reporting period, groundwater levels were measured in January, April, July, and October in wells and piezometers in the Off-Site Study Area using an electric well sounder. Locations of off-site monitoring and extraction wells are shown on Figure 4. Groundwater level data for the annual monitoring period are presented in Table 2.

Figures 5 through 24 show the groundwater potentiometric surface of the A1, A3, and A4 depth intervals, and the B and C zones, and illustrate the estimated extent of hydraulic containment (capture zone) provided by the off-site B zone extraction wells, LQ-2B and LR-1B. Groundwater potentiometric contours were drawn using interpolation of groundwater levels between measured groundwater levels and judgment based on the hydrogeologic setting. The groundwater potentiometric surfaces are generally consistent with historical observations.

4.1.2 Groundwater Sampling and Analysis

4.1.2.1 Sampling and Analysis

During this groundwater monitoring period, semiannual and annual samples were collected in accordance with the sampling schedule in Table 1. Semiannual samples were collected on 9 March 2019 (12 newly installed wells) and 8 April 2019, and annual samples were collected 2 through 9 October 2019. Groundwater samples were collected using a HydraSleeve, via low-flow purging and sampling methods, or from an extraction well sampling port in accordance with the Sampling Plan (Geomatrix Consultants Inc., 1994a) and the Technical and Regulatory Guidance (Interstate Technology & Regulatory Council, 2007) and/or *Standard Operating Procedure 2 – Groundwater Sampling Rev. 2* (Appendix A).

Groundwater samples were analyzed using USEPA Method 8260B (8010 list). As specified in the SCR, samples from two monitoring wells (S-3B and LR-3C) also were analyzed for aromatic VOCs using USEPA Method 8260B. TestAmerica analyzed groundwater samples, blanks, and spikes in accordance with the specifications in the QAPP (Geomatrix 1994b) prepared for the former Intersil facility.

4.1.2.2 Analytical Results

Table 3 presents the results of chemical analyses performed on groundwater samples collected during the semiannual and annual monitoring events. Groundwater analytical results were similar to those obtained in previous sampling events, with a few exceptions. TCE concentrations for the site are shown on Figures 25 through 29 for the A1, A3, and A4 depth intervals and B and C zone groundwater.

Analytical results for groundwater samples collected from nine of the new A1 and A3 depth interval wells installed in 2014 have been similar and consistent in concentration since the August 2014 baseline event following well installation, with the exception of the wells associated with the ERD Pilot Study (MW-OS-1A1, MW-OS-2A1, and MW-OS-5A3). These three wells will still be monitored semiannually. The 12 new wells installed in 2019 as described in Section 4.3.1, were sampled after installation in March

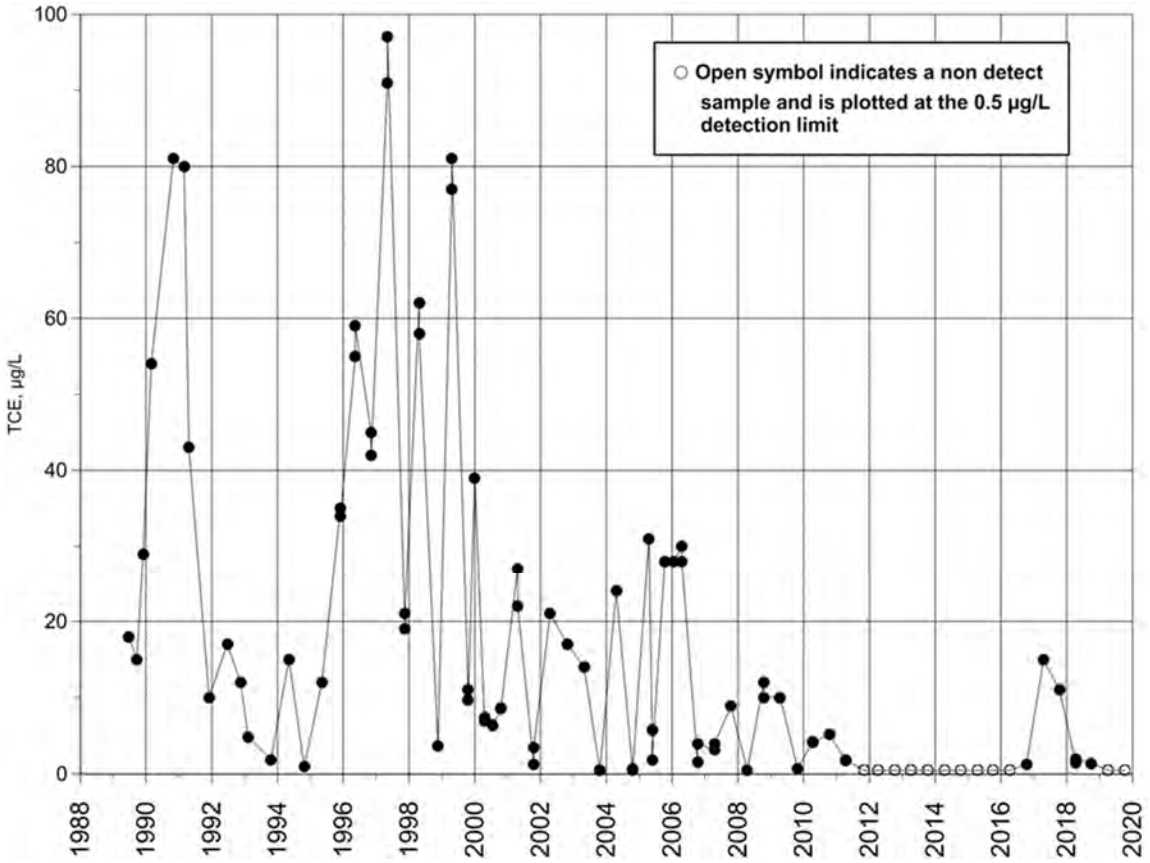
2019 and during the annual sampling event in October 2019. These wells will continue to be monitored semiannually.

Historically, concentrations of TCE in well S-1A, at the northwestern corner of the intersection of Lorne Way and Ringwood Avenue, were below the laboratory detection limit of 0.5 µg/L. However, the concentration of TCE in well S-1A increased from 2.7 µg/L in October 1999 to 58 µg/L in October 2005. Although the groundwater near well S-1A is within the calculated extent of containment provided by pumping from off-site extraction wells LR-1B and LQ-2B, SMI increased pumping by a total of approximately 7 to 9 gpm in November 2005 from its on-site wells LF-6A, LF-12A, and H-1A. These wells have been pumping at their maximum pump capacity, except for well H-1A, which was taken offline in 2014 for the ERD Pilot Study at the former Siemens facility. Although TCE concentrations in well S-1A have fluctuated the past few years (from a maximum TCE concentration of 49 µg/L in 2013 to non-detect in 2019), TCE concentrations have generally decreased.

As noted in previous annual reports, TCE concentrations in well IQ-1B appear to be influenced by seasonally fluctuating groundwater levels. In April 2005, the TCE concentration increased to 31 µg/L. Because this concentration appeared to be an outlier based on recent trends, the well was resampled on 24 May 2005. TCE concentrations in this sample and a duplicate sample were 5.8 and 1.8 µg/L, respectively. In October 2005, the TCE concentration was 28 µg/L, with the duplicate sample reporting the same concentration.

Because the TCE concentration exceeded 20 µg/L in downgradient well IQ-1B for two consecutive semiannual monitoring events, in accordance with the Water Board 15 October 2004 letter, pumping was increased on 25 October 2005 in well LQ-2B from approximately 17 to 40 gpm, which was the average pumping rate before flow rates were reduced in December 2004. In October 2017, TCE was detected for the fourth time since 2012 in well IQ-1B (1.3 µg/L in October 2016, 15 µg/L in April 2017, 11 µg/L in October 2017, and 1.5 µg/L in October 2018). IQ-1B was non-detect for TCE in October 2019. A time-series graph of TCE concentrations in well IQ-1B, shown below, illustrates the fluctuating TCE concentrations, but with a mostly deceasing trend over the last 10-plus years.

TCE Concentration Over Time in Well IQ-1B



Concentrations of TCE in groundwater in the C zone in the Off-Site Study Area are consistent with historical trends.

4.1.2.3 Quality Assurance/Quality Control

Wood E&IS and ERM followed the same QA/QC procedures in the Off-Site Study Area as those for work at the former Intersil and Siemens facilities. During the sampling event, equipment, field, and trip blanks and duplicate samples were collected for QA/QC purposes.

Tables 7 and 8 summarize sampling and analytical QA/QC, respectively. The data generated meet the requirements of precision, accuracy, and completeness as described in the QAPP. Several samples were analyzed with sample container headspace described as a bubble greater than 6 millimeters in diameter. Due to the headspace greater than USEPA guidelines, the non-detect results for these samples have been qualified as estimates (J-/UJ), and if samples did not agree or if historical data were not available, the results were rejected (R).

Data precision is estimated by comparing analytical results from duplicate samples and calculating the RPD. Duplicate samples were generated by the laboratory and by Wood E&IS and ERM during the annual reporting period. ERM calculated the RPD between detected results. The USEPA has not established control criteria for field duplicate samples; therefore, sample data are not qualified on the basis of field duplicate imprecision.

Data accuracy is evaluated based on recoveries, expressed as the percent of the true or known concentration. Recoveries may be calculated from laboratory matrix spikes, matrix spike duplicates, and

calibration standards generated as QA/QC samples by the analytical laboratory. The average percent recoveries from analyses of spiked samples using USEPA Method 8260B for this annual period met the current QA goal.

4.2 Groundwater Extraction and Treatment System Operation

As discussed in Section 3.2, the groundwater extracted from B zone wells located in the Intersil/Siemens Off-Site Study Area (wells LR-1B and LQ-2B) is piped to the former Siemens facility GWETS.

During this annual reporting period, occasional shutdowns occurred for periods of less than 24 hours to perform equipment maintenance with the following exceptions:

- Well LQ-2B was offline from 19 December 2018 until 10 January 2019 while the flow meter in the extraction vault was replaced.
- Well LQ-2B was offline for a total of approximately 28 hours from 16 to 18 July 2019 during aquifer testing activities.
- The system operated intermittently from 8 February to 1 March 2019 due to system testing and maintenance, which included repair of the extraction well vault at EX-1-RL. The system was restarted for continuous operation on 1 March 2019 following carbon change-out.

During the annual reporting period, the system removed an estimated 10.8 pounds of VOCs and extracted a total of approximately 21.8 million gallons of groundwater from the Intersil/Siemens Off-Site Study Area (Table 6). The extraction system is operating as designed in remediating VOCs in B zone groundwater in the Off-Site Study Area. Sampling and analytical results for the groundwater treatment system are included in separate semiannual NPDES reports.

4.3 Additional Work Completed During the Annual Reporting Period

Additional work conducted during the reporting period included:

- Installation of 12 additional monitoring wells
- A nuclear magnetic resonance and groundwater contaminant flux assessment

These tasks are described in the subsections below.

4.3.1 Installation of Additional Monitoring Wells (January-February 2019)

In January and February 2019, 12 new monitoring wells (six wells in each of the A1 and A3 depth intervals, one well in the A4 depth interval, and one well in the B Zone) were installed. Three wells (MW-OS-6A3/-6A4/-6B) were installed on the former AMI site/east of the former Siemens property, seven wells (MW-OS-8A1/-8A3, MW-OS-9A1, MW-OS-10A1/-10A3, and MW-OS-11A1/-11A3) were installed along Forge Drive between the former Siemens and Intersil facilities, and two wells (MW-OS-12A1/-12A3) were installed along Tantau Avenue west of the former Intersil property.

The wells were installed for the following purposes:

- Tracking and monitoring VOCs in groundwater
- Filling potential data gaps in the A zone (A1, A3, and A4 depth intervals) and B zone for specific areas
- Collecting soil and groundwater samples for the purpose of bench test analysis
- Performing bench-scale testing of *in situ* chemical reduction compounds

During initial sample collection, the following constituents exceeded Maximum Contaminant Levels (MCLs):

- A1 depth interval – TCE was detected in groundwater samples from all five wells at concentrations ranging from 62 micrograms per liter (µg/L) (MW-OS-8A1) to 370 µg/L (MW-OS-9A1 and MW-OS-10A1). Tetrachloroethene was also detected at two locations; detections ranged from 0.45 µg/L (MW-OS-9A1) to 6.5 µg/L (MW-OS-10A1).
- A3 depth interval – TCE was detected in groundwater samples from all five wells at concentrations ranging from 23 µg/L (MW-OS-6A3) to 350 µg/L (MW-OS-12A3).
- A4 depth interval – No constituents were detected above MCLs from the one well (MW-OS-6A4) in the A4 depth interval.
- B Zone – No constituents were detected above MCLs from the one well (MW-OS-6B) in the B Zone.

The complete results for soil and groundwater samples collected are provided in *Monitoring Well Installation Summary Report* (ERM 2019a). Results from bench testing analyses will be presented to the Water Board under separate document cover.

4.3.2 Nuclear Magnetic Resonance (February 2019) and Groundwater and Contaminant Flux Assessment (April 2019)

Nuclear Magnetic Resonance (NMR) and Passive Flux Meter (PFM) data were collected to evaluate potential preferential pathways of groundwater flow, contaminant transport, and contaminant storage zones to further evaluate:

- Potential enhancements to the groundwater extraction systems to improve performance and accelerate the cleanup process
- Identify areas with the greatest contaminant flux for potential future remedy enhancements

The Water Board was notified of this scope of work via email on 14 February 2019.

NMR logs were collected from 10 existing wells in February 2019. NMR measurements within the various depth intervals and stratigraphic zones at these locations indicate strong correlation with the generalized lithology and hydrology in the Conceptual Site Model. Increased mobile groundwater was detected in the A1, A3, and A4 depth intervals, B zone, and C zone groundwater-bearing zones and, to a lesser extent, the A2 depth interval locally. These groundwater-bearing zones appear to be contiguous across the study area in most areas. Groundwater velocities were consistently high in these zones, but appear to decrease to the north of the former Siemens facility and to the east by Swallow Way. Hydraulic conductivities were measured to be on average in the 10's of feet per day based on NMR results.

Based on the NMR logs, stratigraphy, groundwater data, monitoring well locations, contaminant plume extents, and monitoring well screen intervals, 16 PFMs were deployed/retrieved at 14 existing wells in April 2019. The PFM sample analysis provided data on groundwater velocity, contaminant concentration, and contaminant flux in the study area. TCE flux values calculated from the investigation data indicate that TCE flux is relatively high in the A1 depth interval along Forge Drive, but decreases to the north. This same decrease in TCE flux from Forge Drive to the north was also detected in the A4 depth interval. TCE flux values were similar in the A3 depth interval from Forge Drive to the north.

The investigation results appear helpful in assessing where TCE mass is the most mobile and, therefore, support optimization of the groundwater extraction remedy. It can also be used to identify where potential

remedy enhancements, such as *in situ*-based remedial alternatives using injection technologies, may be more effective to address secondary sources. The complete results for the NMR and PFM studies will be presented to the Water Board under separate document cover during the first quarter of 2020.

NM - Not Monitored.
1) Groundwater elevations in feet above mean sea level.
2) Groundwater elevation contours are based on wells screened at approximately 70 or 74 to 90 feet below ground surface.
3) Data Sources: Wells located at the off-site study area and along Forge Drive and Tantau Avenue were measured by Wood Environment & Infrastructure Solutions, Inc. and wells located at the former Siemens facility were measured by ERM.
4) H-1A and 2EPa were offline during the measurement of water levels in April 2019, to accomodate the Pilot Study started in October 2014. As a result, the capture zone depicted on this figure is not consistent with typical conditions experienced when these wells are pumping.

Notes:
1) Groundwater elevations in feet above mean sea level.
2) Groundwater elevation contours are based on wells screened at approximately 180 to 210 feet below ground surface.
3) Data Sources: Wells located at the former Siemens facility and off-site study area were measured by ERM.
4) Groundwater elevation data for the American Microsystems, Inc. (AMI) site well (shown in this figure without data) is presented in AMI's respective self-monitoring report.

Notes

1. *Schedule approved by the Water Board in letters dated December 20, 2000, October 15, 2004, and July 26, 2007. Selected A2 and A3 depth interval wells located at the former Siemens facility are monitored in accordance with the schedule schedule proposed in the Annual Report for the reporting year 2000 for the former Siemens facility (LFR, 2001).*
2. *Water level measurements will be collected quarterly, in January, April, July, and October.*
3. *Annual groundwater samples are collected in October.*
4. *Wells maintained and monitored by Wood Environment & Infrastructure, Inc.*
5. *Wells W2A, W3A, W13A and W6B were destroyed in September and October 2007 with the Water Board's July 27, 2007 approval.*
6. *Wells maintained and monitored by ERM. A-zone groundwater monitoring wells located at the former Siemens facility are further classified as A1 depth interval (approximately 45 to 60 feet below ground surface [bgs]), A3 depth interval (approximately 60 to 90 feet bgs), and A4 depth interval (approximately 90 to 120 feet bgs).*
7. *Wells EX-1-RL and SW-7 were added to the GWETS on May 2, 2006.*
8. *Wells installed in April 2002.*
9. *Former groundwater monitoring Well 1-1D was abandoned in July 2001 because this former extraction well was screened in multiple groundwater zones. This well was replaced with Well P-1A on the sampling schedule. Groundwater quality in the downgradient vicinity of this well is assessed by monitoring groundwater extraction Well LF-6A and Well P-1A.*
10. *It is recommended that these wells be analyzed annually in the future because VOC concentrations have been consistent.*
11. *This well is not sampled with Water Board approval dated March 22, 2005.*
12. *Well installed to support Enhanced Reductive Dechlorination Pilot Study activities.*
13. *Well installed to support additional characterization activities at former Siemens facility.*

Notes:

1. Elevations in feet, North American Vertical Datum of 1988 (NAVD88).

2. Water levels for the former Siemens facility were measured by ERM, unless otherwise noted. Water levels for the former Intersil Facility and Intersil/Siemens Off-Site Study Area were measured by Wood Environment & Infrastructure, Inc., unless otherwise noted.

3. Water levels for the former Siemens facility and Intersil/Siemens Off-Site Study Area were measured by ERM, unless otherwise noted. Water levels for the former Intersil Facility were measured by Wood Environment & Infrastructure, Inc., unless otherwise noted.

Abbreviations:

** indicates groundwater extraction well*

'-- = no measurement available

NA = not available; well not accessible

MDL = Maximum Detectable Limit

Table 6
Summary of System Flow Rates,
Volume Extracted, and VOC Mass Removed
Intersil/Siemens Site
Cupertino, California

	January–March 2019	April–June 2019	July–September 2019	October–December 2019
Former Intersil Facility Groundwater Extraction and Treatment System[1]				
Average Quarterly Flow Rate (gallons per minute)	31	32	31	29
Total Volume Extracted (gallons)	3,862,700	4,065,600	4,075,300	3,987,200
Estimated VOC Mass Removed (pounds)	2.3	2.1	2.3	1.7
Former Siemens Facility Groundwater Extraction and Treatment System[2]				
Average Quarterly Flow Rate (gallons per minute)	38	62	65	58
Total Volume Extracted (gallons)	4,808,532	7,193,288	7,425,924	6,786,976
Estimated VOC Mass Removed (pounds)[4]	4.1	5.8	5.8	4.9
Off-Site Study Area Groundwater Extraction and Treatment System[3]				
Average Quarterly Flow Rate (gallons per minute)	30	52	52	51
Total Volume Extracted (gallons)	3,816,478	6,054,525	5,899,752	5,999,088
Estimated VOC Mass Removed (pounds)[5]	1.4	3.4	3.0	3.0

Notes:

1. *Former Intersil facility groundwater extraction and treatment system included extraction wells E9AR, W10A, W12A, and W18MA.*
2. *Former Siemens facility groundwater extraction and treatment system includes on-site extraction wells 2EP, 2EPa, H-1A, H-5B, LF-6A, LF-12A, EX-1-RL, and SW-7. Note that 2EP, 2EPa and H-1A were shut down in September/October/November 2014 facilitate the Phase II ERD Pilot Study.*
3. *Off-Site Study Area groundwater extraction system includes wells LR-1B and LQ-2B.*
4. *VOC mass removed from the former Siemens facility is calculated by subtracting the VOC mass removed from the Off-Site Study Area from the total mass removed by the treatment system. The total mass removed by the treatment system is calculated using the influent VOC concentrations and the total combined volume of groundwater extracted from the on-site and off-site extraction wells.*
5. *VOC mass removed from the Off-site Study Area is calculated by using VOC concentrations and groundwater extraction volume for the individual off-site wells.*

Abbreviations:
ERD = enhanced reductive dechlorination
VOC = volatile organic compound

Were chain-of-custody forms completed for all samples?	☐ Yes	☑ No
Were field parameters stabilized prior to taking sample?	☑ Yes	☐ No
For VOC samples, was there zero head space in sample containers?	☐ Yes	☑ No
Were samples preserved according to analytical method?	☑ Yes	☐ No
Were required QA/QC samples taken?	☑ Yes	☐ No
For any questions above answered with "No", please provide an explanation:		

Data entered by PO. Quality Assurance/Quality Control (QA/QC) by SM.

Notes:
There were a few issues between the Chain of Custody forms (COCs) and the laboratory report. Report 720-95398-1's MW-OS-10A3-10032019 sample was listed as MW-OS-10A3 in the COC. The laboratory also has a sample listed as "MW-05-10A3" in the narrative, but "MW-OS-10A3-10032019" in the report. The sample also had a discrepancy between the COC and the label on the sample container; the label listed the time as 07:55, whereas the COC listed the time as 07:56. The job narrative also noted that the Sample 720-95398 #05 received unpreserved containers with "FF" written on the labels. It was unclear if there was a difference in two of the HNO_3 bottles received. The J95379-1 report's job narrative also noted that the COC lists a sample "SW-7-10012019", while the container listed a sample labelled as "SW-7-10022019", though the COC attached the report lists "SW-7-10022019" as the sample name.

Report 720-95419-1 has a sample listed in the COC as "MW-OS1-A1-10042019", but the laboratory report lists it as "MW-OS-1A1-10042019." Also, "DUP-1-10042019", "DUP-2-10042019", "DUP-3-10042019", and "DUP-4-10042019" are not included in the COCs. The samples for the duplicates were received without times listed on the labels.

All of the discrepancies on the COCs listed above were resolved through communication with the lab and is included in the analytical laboratory reports.

Additionally, three samples were submitted with significant headspace (>6mm). The results were compared to historical data. If data were in agreement with historical or a field duplicate, then results were qualified as estimated (J/UJ). If results were not in agreement, or if historical data were not available, the results were rejected (R).

Is the lab state-certified for the above analytical method(s)?	☑ Yes	☐ No
Was analysis performed according to standard methods?	☑ Yes	☐ No
Were sample holding times met?	☐ Yes	☑ No
Were all reported analytical results values above MDLs?	☑ Yes	☐ No
Were QA/QC samples (i.e. blanks, field replicates, spikes, and surrogates) analyzed in accordance and consistent with the analytical method?	☑ Yes	☐ No
Did QA/QC results meet all acceptance criteria?	☑ Yes	☐ No
Are QA/QC results and acceptance criteria on file?	☑ Yes	☐ No
For any questions above answered with "No", please provide an explanation: *		

Data entered by PO. QA/QC by SM.

**The explanation should describe any modifications to standard methods and whether approved by RWQCB staff, and describe corrective actions taken in response to any QA/QC results that fall outside acceptance criteria.*

Several samples from reports 720-95379-1, 72095398-1, and 720-95419-1 reported a pH greater than 2 for volatile organic compound (VOC) analysis. This means that the 8260B holding time is 7 days for unpreserved samples. Several samples from reports 720-95379-1 720-95398-1, and 720-95419-1, were analyzed outside the 7 day holding time. Results were compared to historical data. Where results were in agreement, the samples were qualified as estimated (J-/UJ). If samples did not agree or if historical data were not available, the results were rejected (R).

APPENDIX A STANDARD OPERATING PROCEDURE NO. 2 – GROUNDWATER SAMPLING, FORMER SIEMENS FACILITY

Standard Operating Procedure No. 2
Groundwater Sampling
Rev. 2 (December 2017)

TABLE OF CONTENTS

LIST OF FIGURES

LIST OF TABLES

1.0 INTRODUCTION

This Standard Operation Procedure (SOP) has been developed for the former Siemens facility to direct field personnel in the sampling of monitoring wells during groundwater investigation activities and groundwater remediation activities at the site.

1.1 OVERVIEW

This SOP will be implemented in accordance with the following documents:

- 15 August 1990, California Regional Water Quality Control Board, San Francisco Bay Region, *Site Cleanup Requirements Order No. 90-119*, as amended by the 9 January 2013 Order R2-2013-002.
- *Health and Safety Plan*, which will identify risks to human health and the environment associated with known and potential chemical impacts at the site and the applicable technologies presented herein.

Investigation and remedial design rationale; scope of work; boring, well, and/or injection point locations; and sampling frequency will be submitted to SMI for approval in a separate document.

The relevant operational documents that cover the use of substrate are:

- Work Plan, Sampling and Analysis Plan, or equivalent; and
- Health and Safety Plan.

1.2 PURPOSE AND OBJECTIVES

The purpose of this SOP is to present the methodologies for sampling and collection of groundwater samples from site monitoring and remediation wells. The objective of the SOP is to provide procedures, methods, and considerations to be used and observed by field personnel to obtain groundwater samples that meet acceptable standards of accuracy, precision, comparability, representativeness, and completeness.

This SOP describes equipment, field procedures, sample containers, decontamination, documentation, storage, holding times, and field quality assurance/quality control (QA/QC) procedures necessary to develop

existing groundwater monitoring wells and to collect water samples from the site wells.

2.0 EQUIPMENT AND SUPPLIES

Sample bottles will be obtained from the analytical laboratory for collecting and testing. Trip blanks for volatile organic compounds will also be obtained from the analytical laboratory.

Typical equipment and forms for well evacuation and sampling include:

- Personal protective equipment, including nitrile or powderless surgical gloves and safety glasses;
- Multi-parameter water quality meter, with flow-through cell (250 milliliters [mL] or less capacity) and calibration standards, capable of collecting the following parameters:
    - pH;
    - Specific conductivity;
    - Oxidation reduction potential;
    - Dissolved oxygen; and
    - Temperature.
- Water level meter;
- Tubing (Teflon, polyethylene, Tygon, and/or medical-grade silicone);
- Non-dedicated pumps:
    - 2-inch bladder pump with variable flow controller; and
    - Peristaltic pump.
- Power source (e.g., gas generator, electric compressor, carbon dioxide);
- Flow measurement device (e.g., 1-liter graduated cylinder);
- Calibration Logsheet (Figure 1);
- Groundwater Sampling Forms (Figure 2);
- Data recording sheets;
- Field notebook;
- Chain-of-Custody (COC) forms (Figure 3);
- Labels (Figure 4);
- Appropriate sample containers;
- Self-sealing plastic bags;

- Ice chest or cooler;
- Ice or frozen ice packs;
- Spray bottle for deionized water;
- Deionized water; and
- 55-gallon drums or other type of portable storage container.

Equipment used during decontamination:

- Liquinox, Alconox detergent (or equivalent);
- Deionized water; and
- Containers, brushes, paper towels, and plastic sheeting.

3.0 GROUNDWATER MONITORING PROCEDURE

3.1 PRE-PURGING AND SAMPLING ACTIVITIES

The following subsections present tasks that should be conducted prior to any purging and sampling activities.

3.1.1 New and Decontaminated Equipment

All equipment that will come in contact with the groundwater should be either new (tubing, sample containers, Hydrasleeve™ samplers, etc.) or decontaminated (water level probes, pumps, etc.). Decontamination procedures are presented in Section 5.0.

3.1.2 Groundwater Level Measurement

Prior to purging and sampling activities, groundwater level measurements will be collected. Depth to water will be measured at one time (over the course of a day or two) using a hand-held, electronic water level indicator graduated to 0.01-foot increments and recorded on field data sheets. The depth to water will be measured from the northern side of the top of the well casing.

3.1.3 Calibration of Multi-Parameter Instrument

If groundwater will be sampled using low-flow collection methods, the multi-parameter instrument must be calibrated at the beginning of each day per the manufacturer's specifications. If field measurements fall outside anticipated values, a calibration check (conducted in measurement mode) must be conducted and the instrument should be re-calibrated in the event the instrument is out of range. A calibration check shall also be completed at the end of each day to verify the instrument has remained in calibration throughout the day. Daily calibration shall be documented on a calibration logsheet and kept with the instrument in the field. Specific instructions for calibrating the instruments are presented as Attachment A. An example calibration logsheet is presented as Figure 1.

3.2 SAMPLE COLLECTION

3.2.1 Sample Collection using HydraSleeve™ Sampler

3.2.1.1 HydraSleeve™ Sampling Procedure

When sampling groundwater using HydraSleeve™ samplers, the HydraSleeve™ will be deployed/lowered to the mid-point of the screened interval immediately following water level measurement. The sampler is slim and displaces very little water during deployment; therefore, it does not disturb the water column to the point at which long equilibration times are necessary to ensure recovery of a representative sample. The HydraSleeve™ SOP (GeoInsight Inc. 2010), included in Attachment B, contains diagrams illustrating the steps required for HydraSleeve™ sampler deployment, retrieval, and sample recovery.

3.2.1.2 HydraSleeve™ Sampler Assembly/Deployment

The following steps will be taken when deploying the HydraSleeve™ sampler:

1. Remove the sampler from the packaging and crease the reinforced fins outward to open the top of the sampler.
2. Attach a calibrated tether to one of the holes at the top of the sampler.
3. Fold the bottom of the sampler, aligning the two holes, and attach the weight using the stainless-steel clip.
4. Lower the weighted sampler to the desired depth of the boring or well screen interval.
5. Secure the sampler at the top of the well by attaching the tether to the well cap. Once the sampler is secure at the surface, the well will be given a minimum of 24 hours to equilibrate before the groundwater sample is collected.

3.2.1.3 HydraSleeve™ Sampler Retrieval/Sample Collection

The following steps will be taken when collecting a groundwater sample using the HydraSleeve™ sampler:

1. The sampler will fill as it is pulled upward (out of the well) at a rate of 1 to 2 feet per second.
2. Once the sampler is at the surface, it will be grabbed just below the top to expel water resting on top of the check valve.

3. Using the appropriate tubing, the sampler will be punctured approximately 3 to 4 inches below the white reinforcing strips located at the top of the sampler.
4. Water will be decanted from the sampler through the discharge tube into the appropriate containers for desired laboratory analysis.
5. Any excess water from the HydraSleeve™ will be collected from designated areas, properly characterized, and either shipped offsite or treated through the existing onsite system in accordance with all regulatory requirements.

3.2.2 Sample Collection Using Low Flow Purging and Sampling

3.2.2.1 Low Flow Purging and Sampling Procedure

When sampling groundwater using low flow purging and sampling methods, sampling will be conducted as follows:

- Place equipment on clean portable table or a plastic sheet to prevent the ground surface from coming in contact with purging and sampling equipment.
- Remove the well cover and unlock cap.
- Evacuate any standing water within the well box prior to removing the inner well cap(s), as necessary.
- Remove the inner well cap and perform head space analysis using a photoionization detector.
- Measure and record the depth to static water level from the measuring point on the PVC inner well casing. Repeat the measurement process until values agree within +/- 0.01 feet. Indicate the time of measurement.
- Record the total depth of well (measured during water level measurement process); lower the probe into the well as slow as possible and make a note if the bottom is "soft" (indicating sediment may be present). Total depth cannot be measured on wells containing dedicated pump systems (extraction wells); therefore, record the total depth of the well from the well construction table.
- For wells in which a non-dedicated submersible pump is to be utilized, slowly lower (to minimize the disturbance of the water column) the pump, tubing, power source line, and safety line into the well to a pre-determined depth within the screen interval. If possible, the pump

should remain at least 2 feet above the bottom of the well to minimize mobilization of any particulates settled on the bottom of the well.

- Minimize tubing lengths on the ground surface to reduce exposure of the groundwater to sunlight and ambient air temperatures.
- Begin purging at a flow rate of 100 to 500 mL per minute. Attempt to match pumping rate used during previous sampling event(s).
- Decrease flow, as required, to keep drawdown to less than 0.3 foot. The initial purging time should be spent adjusting flow to minimize drawdown.
- If drawdown is greater than 0.3 foot, with the pump at lowest setting (100 mL per minute) and stabilizes, calculate the volume of the water between the initial water level and stabilized water level. Add the volume of water within the tubing to this calculation. This combined volume of water needs to be purged from the well after the water level has stabilized, but before samples are collected.
- If the drawdown continues to decrease with the pump at its lowest setting, contact the Project Manager for additional guidance.
- Record the depth to water, flow rate, and stabilization parameters (pH, electrical conductivity, temperature, dissolved oxygen, and oxidation/reduction potential) every 3 to 5 minutes (or as appropriate) on the low flow sample logsheet (Figure 2). Stabilization parameters will be measured within a flow-through cell with a volume of 250 mL or less to minimize retention time. Note visual description of the turbidity on the field sheet, if any color other than clear is observed, and if any detectable odor is observed.
- Stabilization is considered to be achieved when three consecutive readings, taken at 3- to 5-minute intervals, are within the following limits:
    - Dissolved oxygen (in milligrams per liter) – 10 percent;
    - Specific Conductance (in MicroSiemens per centimeter) – 3 percent;
    - Temperature (in degrees Celsius) – 3 percent;
    - pH – +/- 0.1 unit; and
    - Oxidation/reduction potential (in millivolts) – +/- 10 millivolts.
- Sampling may begin upon stabilization, or after 1 hour of purging, whichever occurs first. Prior to sampling, the tubing must be disconnected from the flow cell and clean nitrile gloves must be donned. Regardless of the sampling equipment utilized, groundwater

samples will be collected in a manner free of entrapped air bubbles throughout the entire sampling assembly.

- Replace the well cap, close the well cover, and lock the well.

4.0 SAMPLING INSTRUCTIONS

4.1 CONTAINERS, PRESERVATION, AND HOLDING TIMES

Certified clean sample containers and trip blanks will be obtained from the contract analytical laboratory. The bottles will be labeled to indicate the type of analysis to be performed, and necessary preservatives will be present in the bottles when received from the laboratory.

Table 1 summarizes the sampling containers, preservation, and holding times for the various types of analyses.

4.2 SAMPLE TRACKING

Documents for tracking the samples are generated in the field. This documentation includes field notes, sample labeling, and COC forms.

4.2.1 Sample Labeling

Each sample will be labeled prior to collection. The sample label (Figure 4) will be filled out with waterproof ink. Each sample label contains the following information:

- Project number;
- Company name;
- Site/project name;
- Sample number (well location);
- Parameters for analysis;
- Date and time of collection;
- Preservative; and
- Sampler's signature (or initials).

Information pertinent to field survey measurements and sampling will be recorded on the field forms and/or in the field notebook.

4.2.2 Chain-of-Custody Forms

A COC form (Figure 3) will be filled out in the field and will accompany every shipment of samples to the analytical laboratory. The purpose of the

COC form is to document possession of a sample from the time of collection in the field to its final disposal by the laboratory.

The laboratory will enter the following information on the form:

- Name of persons receiving the sample;
- Date of sample receipt; and
- Sample condition.

All corrections to the COC record will be initialed and dated by the person making the corrections.

Each COC form will include signatures of the appropriate individuals indicated on the form.

4.3 SAMPLES FOR ASSESSING QUALITY ASSURANCE/QUALITY CONTROL

To identify potential errors, four types of QC samples may be included for analysis. All QC samples shall be labeled and sent to the laboratory along with the actual samples for analysis. QC sample frequencies are summarized below. The three types of QC samples are as follows:

4.3.1 Trip Blanks

Trip blanks check for contamination due to handling, transport, contact with other samples during storage, or laboratory error. A Volatile Organic Analysis (VOA) bottle set is filled with deionized water by the laboratory. This set is taken to the field; labeled with company name, date, and cooler ID; and stored with the other samples until they are delivered for analysis to the laboratory. Trip blanks are opened by laboratory personnel only. One trip blank set is sent per cooler of samples for volatiles analysis per day.

4.3.2 Field Duplicates

Sometimes referred to as a split or replicate, a field duplicate is a check on field and laboratory precision. Two samples from a single HydraSleeve™ sampler or consecutive samples collected by means of a bladder pump are filled at the same sampling location. One is labeled as the actual well sample and the other is labeled as a duplicate sample. Preservation and shipping of samples and their duplicates is identical. One duplicate will

be submitted per 10 samples, or one per sampling event if fewer than 10 samples are collected.

4.3.3 Rinsate Samples

Bailer or sampling equipment rinsate blanks verify that chemicals are not being carried from one sample to the next via the bladder pump or other equipment used in the transfer of water samples. Rinsate field blanks will be taken after sampling the wells known to historically contain the highest chemical concentrations for the group of wells sampled. The bladder pump and/or other equipment are first decontaminated with deionized water. Deionized water is then poured from the bladder pump (and/or other equipment) into sample bottles labeled with a QC number. One rinsate sample will be submitted per 20 samples collected with a bladder pump.

Rinsate samples will not be collected for wells to which specific or disposable sampling equipment (HydraSleeve™ sampler or dedicated pump) has been dedicated, as no likelihood of transferring chemicals to other samples exists.

5.0 EQUIPMENT DECONTAMINATION

Decontamination will be performed on all non-dedicated sampling equipment that may contact potentially contaminated water, including water level meters, bladder pumps, and other sampling equipment. Clean nitrile gloves or powderless surgical gloves are to be worn during decontamination.

An equipment decontamination station will be centrally located onsite. Each piece of sampling equipment will be decontaminated before each sampling period and between each well. Plastic sheeting will be laid down around each well during sampling to protect decontaminated equipment from contact with the ground surface. The decontamination procedure for most equipment will be as follows:

- Wash equipment in an Alconox (or equivalent) and water solution using a brush or clean cloth to ensure removal of all contaminants;
- Rinse equipment in fresh tap water;
- Rinse again with deionized water; and
- Dry equipment with paper towel and place in clean plastic, if appropriate.

The effectiveness of these decontamination procedures will be verified by vigorous QA/QC protocols, including blanks and duplicates.

Decontamination water will be collected from designated areas, properly characterized, and either shipped offsite or treated through the existing onsite system in accordance with all regulatory requirements.

6.0 DOCUMENTATION

Thorough documentation in the field is required to ensure proper labeling and tracking of samples, identify potential sources of error, and maintain accountability among field personnel.

6.1 FIELD NOTES AND DATA COLLECTION FORMS

Field notes shall be kept in a bound notebook. The following information will be included in the field notes and/or on data collection forms:

General Information:

- Names of personnel;
- Weather;
- Date and time of sampling;
- Location and well number;
- Condition of the well;
- Times that procedures and measurements are completed;
- Calibration of meters at start of day;
- Decontamination times; and
- Initial static water level and total well depth.

Sampling Information:

- Volume of water evacuated before sampling;
- General description of sample procedures, or reference the SOP;
- Time of sample collection;
- Number of samples collected;
- Sample identification numbers;
- Preservation and storage of samples;
- Record of any QC samples from site;
- Any irregularities or problems that may have a bearing on sampling quality; and
- Type of sampling equipment.

ATTACHMENT A
INSTRUMENT CALIBRATION INSTRUCTIONS

STANDARD OPERATING PROCEDURE – CALIBRATION OF THE YSI DISSOLVED OXYGEN PROBE

The following procedure calibrates the dissolved oxygen (DO) probe for the YSI Multi-Parameter Instrument:

1. Place approximately 3 millimeter (mm) (1/8 inch) of water in the bottom of the calibration cup.

2. Place the probe end of the sonde into the cup.

3. Make certain that the DO and temperature probes are not immersed in water.

4. Engage only 1 or 2 threads of the calibration cup to insure the DO probe is vented to the atmosphere.

5. Wait approximately 10 minutes for the air in the calibration cup to become water saturated and for the temperature to equilibrate.

6. From the calibration menu, select **Dissolved Oxy**, then the **1-DO** % to access the DO percent calibration procedure.

7. Enter the current barometric pressure in mm of mercury (Hg). (Inches of Hg x 25.4 = mm Hg).

8. Press **Enter** and the current values of all the enabled sensors will appear on the screen and change with time as they stabilize.

9. Observe the readings under DO%. When they show no significant change for approximately 30 seconds, press **Enter**.

10. The screen will indicate that the calibration has been accepted and prompt you to press **Enter** again to return to the Calibrate menu.

The following procedure calibrates the oxidation reduction potential (ORP) probe for the YSI Multi-Parameter Instrument:

1. Rinse the probe with deionized water and dry.
2. Prepare the Zobell solution, with a known ORP value, according to the manufacturer's instructions.
3. Fill a clean and dry calibration cup with the Zobell solution.
4. Carefully immerse the probe end of the sonde into the Zobell solution. The level of the ORP solution should be of sufficient height to cover at least one-half inch of the ORP probe and the temperature sensor.
5. From the Main sonde menu, select **2-Calibrate**. The calibrate menu will be displayed.
6. Select **5-ISE2 ORP** to calibrate the ORP sensor.
7. Enter the ORP value of the Zobell solution.
8. Press **Enter** and monitor the stabilization of the ORP and temperature readings.
9. After no change has occurred for approximately 30 seconds, press **Enter** to confirm the calibration.

ORP readings for the same solution can vary up to 100 millivolts (mV) depending on the temperature. However, no standard compensation algorithms exist for this parameter. This should be factored into account when reporting ORP values and sensor calibrations. For the Zobell solution, consult the following chart.

Temperature (Celsius)	Zobell Solution Value (mV)
-5	270
0	263.5
5	257
10	250.5
15	244
20	237.5
25	231
30	224.5
35	218
40	211.5
45	205
50	198.5

The following procedure calibrates the pH probe for the YSI Multi-Parameter Instrument:

1. Fill a clean and dry calibration cup with the pH 7 buffer standard.

2. Carefully immerse the probe end of the sonde into the pH 7 buffer standard. The level of the buffer solution should be of sufficient height to cover at least 1 inch of the pH probe.

3. Enter the Calibrate menu, select **pH** to access the pH calibration choices, and then press **3- 3-Point**.

4. Press **Enter** and input the value of the buffer (7 in this case) at the prompt.

5. Press **Enter** and the current values of all enabled sensors will appear on the screen and change with time as they stabilize in the solution.

6. Observe the readings under the pH, and when they show no significant change for approximately 30 seconds, press **Enter**.

7. The display will indicate that the calibration is accepted. After the pH 7 calibration is complete, press **Enter** again, as instructed on the screen, to continue.

8. Rinse the sonde in deionized water and dry before proceeding.

9. Repeat steps 4 through 8 for pH 4 and pH 10 buffer solutions.

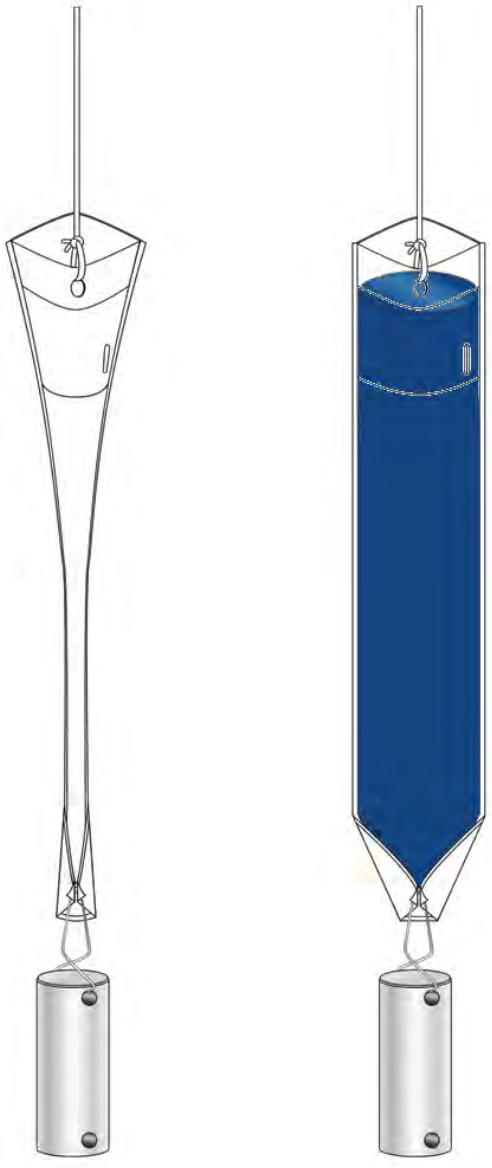
THE HYDRASLEEVE™
STANDARD OPERATING PROCEDURE

HYDRASleeve™

Simple by Design

US Patent No. 6,481,300; No. 6,837,120 others pending

Standard Operating Procedure: Sampling Ground Water with a HydraSleeve



This Guide should be used in addition to field manuals appropriate to sampling device (i.e., HydraSleeve or Super Sleeve).

Find the appropriate field manual on the HydraSleeve website at http://www.hydrasleeve.com.

For more information about the HydraSleeve, or if you have questions, contact: GeoInsight, 2007 Glass Road, Las Cruces, NM 88005, 1-800-996-2225, info@hydrasleeve.com.

Table of Contents

Introduction

The HydraSleeve is classified as a no-purge (passive) grab sampling device, meaning that it is used to collect ground-water samples directly from the screened interval of a well without having to purge the well prior to sample collection. When it is used as described in this Standard Operating Procedure (SOP), the HydraSleeve causes no drawdown in the well (until the sample is withdrawn from the water column) and only minimal disturbance of the water column, because it has a very thin cross section and it displaces very little water (<100 ml) during deployment in the well. The HydraSleeve collects a sample from within the screen only, and it excludes water from any other part of the water column in the well through the use of a self-sealing check valve at the top of the sampler. It is a single-use (disposable) sampler that is not intended for reuse, so there are no decontamination requirements for the sampler itself.

The use of no-purge sampling as a means of collecting representative ground-water samples depends on the natural movement of ground water (under ambient hydraulic head) from the formation adjacent to the well screen through the screen. Robin and Gillham (1987) demonstrated the existence of a dynamic equilibrium between the water in a formation and the water in a well screen installed in that formation, which results in formation-quality water being available in the well screen for sampling at all times. No-purge sampling devices like the HydraSleeve collect this formation-quality water as the sample, under undisturbed (non-pumping) natural flow conditions. Samples collected in this manner generally provide more conservative (i.e., higher concentration) values than samples collected using well-volume purging, and values equivalent to samples collected using low-flow purging and sampling (Parsons, 2005).

Applications of the HydraSleeve

The HydraSleeve can be used to collect representative samples of ground water for all analytes (volatile organic compounds [VOCs], semi-volatile organic compounds [SVOCs], common metals, trace metals, major cations and anions, dissolved gases, total dissolved solids, radionuclides, pesticides, PCBs, explosive compounds, and all other analytical parameters). Designs are available to collect samples from wells from 1” inside diameter and larger. The HydraSleeve can collect samples from wells of any yield, but it is especially well-suited to collecting samples from low-yield wells, where other sampling methods can’t be used reliably because their use results in dewatering of the well screen and alteration of sample chemistry (McAlary and Barker, 1987).

The HydraSleeve can collect samples from wells of any depth, and it can be used for single-event sampling or long-term ground-water monitoring programs. Because of its thin cross section and flexible construction, it can be used in narrow, constricted or damaged wells where rigid sampling devices may not fit. Using multiple HydraSleeves deployed in series along a single suspension line or tether, it is also possible to conduct in-well vertical profiling in wells in which contaminant concentrations are thought to be stratified.

As with all groundwater sampling devices, HydraSleeves should not be used to collect groundwater samples from wells in which separate (non-aqueous) phase hydrocarbons (i.e., gasoline, diesel fuel or jet fuel) are present because of the possibility of incorporating some of the separate-phase hydrocarbon into the sample.

Description of the HydraSleeve

The HydraSleeve (Figure 1) consists of the following basic components:

- A suspension line or tether (A.), attached to the spring clip or directly to the top of the sleeve to deploy the device into and recover the device from the well. Tethers with depth indicators marked in 1-foot intervals are available from the manufacturer.
- A long, flexible, 4-mil thick lay-flat polyethylene sample sleeve (C.) sealed at the bottom (this is the sample chamber), which comes in different sizes, as discussed below with a self-sealing reed-type flexible polyethylene check valve built into the top of the sleeve (B.) to prevent water from entering or exiting the sampler except during sample acquisition.
- A reusable stainless-steel weight with clip (D.), which is attached to the bottom of the sleeve to carry it down the well to its intended depth in the water column. Bottom weights available from the manufacturer are 0.75" OD and are available in three sizes: 5 oz. (2.5" long); 8 oz. (4" long); and 16 oz. (8" long). In lieu of a bottom weight, an optional top weight may be attached to the top of the HydraSleeve to carry it to depth and to compress it at the bottom of the well (not shown in Figure 1);
- A discharge tube that is used to puncture the HydraSleeve after it is recovered from the well so the sample can be decanted into sample bottles (not shown).
- Just above the self-sealing check valve at the top of the sleeve are two holes which provide attachment points for the spring clip and/or suspension line or tether. At the bottom of the sample sleeve are two holes which provide attachment points for the weight clip and weight.

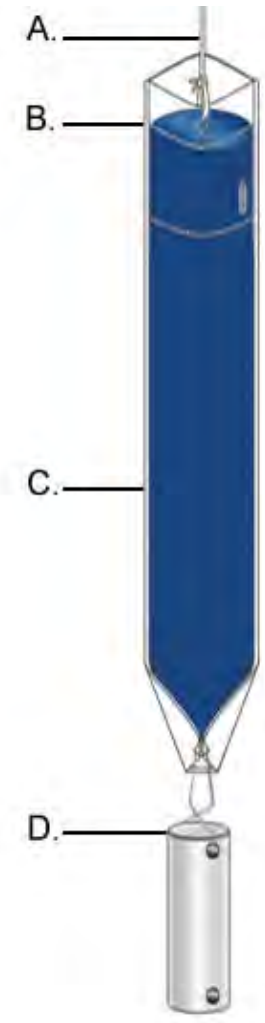


Figure 1. HydraSleeve components.

Note: The sample sleeve and the discharge tube are designed for one-time use and are disposable. The spring clip, weight and weight clip may be reused after thorough cleaning. Suspension cord is generally disposed after one use although, if it is dedicated to the well, it may be reused at the discretion of the sampling personnel.

Selecting the HydraSleeve Size to Meet Site-Specific Sampling Objectives

It is important to understand that each HydraSleeve is able to collect a finite volume of sample because, after the HydraSleeve is deployed, you only get one chance to collect an undisturbed sample. Thus, the volume of sample required to meet your site-specific sampling and analytical requirements will dictate the size of HydraSleeve you need to meet these requirements.

The volume of sample collected by the HydraSleeve varies with the diameter and length of the HydraSleeve. Dimensions and volumes of available HydraSleeve models are detailed in Table 1.

Table 1. Dimensions and volumes of HydraSleeve models.

Diameter	Volume	Length	Lay-Flat Width	Filled Dia.
2-Inch HydraSleeves				
Standard 625-ml HydraSleeve	625 ml	< 30”	2.5”	1.4”
Standard 1-Liter HydraSleeve	1 Liter	38”	3”	1.9”
1-Liter HydraSleeve SS	1 Liter	36”	3”	1.9”
2-Liter HydraSleeve SS	2 Liters	60”	3”	1.9”
4-Inch HydraSleeves				
Standard 1.6-Liter HydraSleeve	1.6 Liters	30”	3.8”	2.3”
Custom 2-Liter HydraSleeve	2 Liters	36”	4”	2.7”

HydraSleeves can be custom-fabricated by the manufacturer in varying diameters and lengths to meet specific volume requirements. HydraSleeves can also be deployed in series (i.e., multiple HydraSleeves attached to one tether) to collect additional sample to meet specific volume requirements, as described below.

If you have questions regarding the availability of sufficient volume of sample to satisfy laboratory requirements for analysis, it is recommended that you contact the laboratory to discuss the minimum volumes needed for each suite of analytes. Laboratories often require only 10% to 25% of the volume they specify to complete analysis for specific suites of analytes, so they can often work with much smaller sample volumes that can easily be supplied by a HydraSleeve.

HydraSleeve Deployment

Information Required Before Deploying a HydraSleeve

Before installing a HydraSleeve in any well, you will need to know the following:

- The inside diameter of the well
- The length of the well screen
- The water level in the well
- The position of the well screen in the well
- The total depth of the well

The inside diameter of the well is used to determine the appropriate HydraSleeve diameter for use in the well. The other information is used to determine the proper placement of the HydraSleeve in the well to collect a representative sample from the screen (see HydraSleeve Placement, below), and to determine the appropriate length of tether to attach to the HydraSleeve to deploy it at the appropriate position in the well.

Most of this information (with the exception of the water level) should be available from the well log; if not, it will have to be collected by some other means. The inside diameter of the well can be measured at the top of the well casing, and the total depth of the well can be measured by sounding the bottom of the well with a weighted tape. The position and length of the well screen may have to be determined using a down-hole camera if a well log is not available. The water level in the well can be measured using any commonly available water-level gauge.

HydraSleeve Placement

The HydraSleeve is designed to collect a sample directly from the well screen, and it fills by pulling it up through the screen a distance equivalent to 1 to 1.5 times its length. This upward motion causes the top check valve to open, which allows the device to fill. To optimize sample recovery, it is recommended that the HydraSleeve be placed in the well so that the bottom weight rests on the bottom of the well and the top of the HydraSleeve is as close to the bottom of the well screen as possible. This should allow the sampler to fill before the top of the device reaches the top of the screen as it is pulled up through the water column, and ensure that only water from the screen is collected as the sample. In short-screen wells, or wells with a short water column, it may be necessary to use a top-weight on the HydraSleeve to compress it in the bottom of the well so that, when it is recovered, it has room to fill before it reaches the top of the screen.

Example

2" ID PVC well, 50' total depth, 10' screen at the bottom of the well, with water level above the screen (the entire screen contains water).

Correct Placement (figure 2): Using a standard HydraSleeve for a 2" well (2.6" flat width/1.5" filled OD x 30" long, 650 ml volume), deploy the sampler so the weight (an 8 oz., 4"-long weight with a 2"-long clip) rests at the bottom of the well. The top of the sleeve is thus set at about 36" above the bottom of the well. When the sampler is recovered, it will be pulled upward approximately 30" to 45" before it is filled; therefore, it is full (and the top check valve closes) at approximately 66" (5 ½ feet) to 81" (6 ¾ feet) above the bottom of the well, which is well before the sampler reaches the top of the screen. In this example, only water from the screen is collected as a sample.

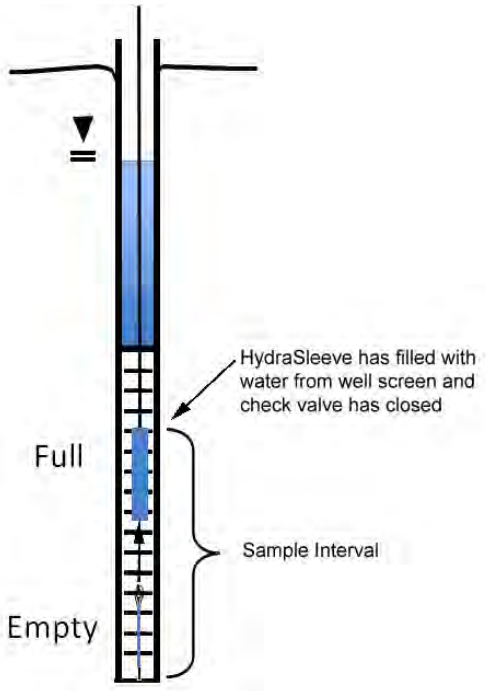

Figure 2. Correct placement of HydraSleeve.

Incorrect Placement (figure 3): If the well screen in this example was only 5' long, and the HydraSleeve was placed as above, it would not fill before the top of the device reached the top of the well screen, so the sample would include water from above the screen, which may not have the same chemistry.

The solution? Deploy the HydraSleeve with a top weight, so that it is collapsed to within 6" to 9" of the bottom of the well. When the HydraSleeve is recovered, it will fill within 39" (3 ¼ feet) to 54" (4 ½ feet) above the bottom of the well, or just before the sampler reaches the top of the screen, so it collects only water from the screen as the sample.

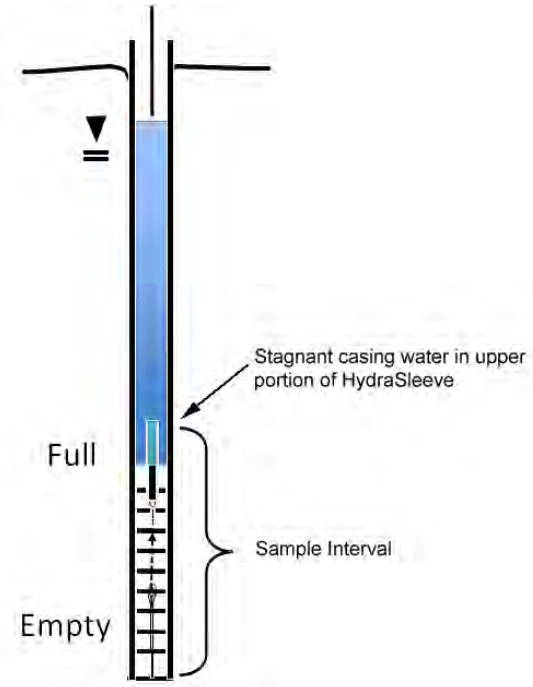

Figure 3. Incorrect placement of HydraSleeve.

This example illustrates one of many types of HydraSleeve placements. More complex placements are discussed in a later section.

Procedures for Sampling with the HydraSleeve

Collecting a ground-water sample with a HydraSleeve is a simple one-person operation.

Note: Before deploying the HydraSleeve in the well, collect the depth-to-water measurement that you will use to determine the preferred position of the HydraSleeve in the well. This measurement may also be used with measurements from other wells to create a ground-water contour map. If necessary, also measure the depth to the bottom of the well to verify actual well depth to confirm your decision on placement of the HydraSleeve in the water column.

Measure the correct amount of tether needed to suspend the HydraSleeve in the well so that the weight will rest on the bottom of the well (or at your preferred position in the well). Make sure to account for the need to leave a few feet of tether at the top of the well to allow recovery of the sleeve

Note: Always wear sterile gloves when handling and discharging the HydraSleeve.

I. Assembling the HydraSleeve

1. Remove the HydraSleeve from its packaging, unfold it, and hold it by its top.

2. Crimp the top of the HydraSleeve by folding the hard polyethylene reinforcing strips at the holes.

3. Attach the spring clip to the holes to ensure that the top will remain open until the sampler is retrieved.

4. Attach the tether to the spring clip by tying a knot in the tether.

Note: Alternatively, attach the tether to one (NOT both) of the holes at the top of the Hydrasleeve by tying a knot in the tether.

5. Fold the flaps with the two holes at the bottom of the HydraSleeve together and slide the weight clip through the holes.

6. Attach a weight to the bottom of the weight clip to ensure that the HydraSleeve will descend to the bottom of the well.

II. Deploying the HydraSleeve

1. Using the tether, carefully lower the HydraSleeve to the bottom of the well, or to your preferred depth in the water column

   During installation, hydrostatic pressure in the water column will keep the self-sealing check valve at the top of the HydraSleeve closed, and ensure that it retains its flat, empty profile for an indefinite period prior to recovery.

Note: Make sure that it is not pulled upward at any time during its descent. If the HydraSleeve is pulled upward at a rate greater than 0.5'/second at any time prior to recovery, the top check valve will open and water will enter the HydraSleeve prematurely.

2. Secure the tether at the top of the well by placing the well cap on the top of the well casing and over the tether.

Note: Alternatively, you can tie the tether to a hook on the bottom of the well cap (you will need to leave a few inches of slack in the line to avoid pulling the sampler up as the cap is removed at the next sampling event).

III. Equilibrating the Well

The equilibration time is the time it takes for conditions in the water column (primarily flow dynamics and contaminant distribution) to restabilize after vertical mixing occurs (caused by installation of a sampling device in the well).

- Situation: The HydraSleeve is deployed for the first time or for only one time in a well

  The HydraSleeve is very thin in cross section and displaces very little water (<100 ml) during deployment so, unlike most other sampling devices, it does not disturb the water column to the point at which long equilibration times are necessary to ensure recovery of a representative sample.

  In most cases, the HydraSleeve can be recovered immediately (with no equilibration time) or within a few hours. In regulatory jurisdictions that impose specific requirements for equilibration times prior to recovery of no-purge sampling devices, these requirements should be followed.

- Situation: The HydraSleeve is being deployed for recovery during a future sampling event

  In periodic (i.e., quarterly or semi-annual) sampling programs, the sampler for the current sampling event can be recovered and a new sampler (for the next sampling event)

deployed immediately thereafter, so the new sampler remains in the well until the next sampling event.

Thus, a long equilibration time is ensured and, at the next sampling event, the sampler can be recovered immediately. This means that separate mobilizations, to deploy and then to recover the sampler, are not required. HydraSleeves can be left in a well for an indefinite period of time without concern.

IV. HydraSleeve Recovery and Sample Collection

1. Hold on to the tether while removing the well cap.

2. Secure the tether at the top of the well while maintaining tension on the tether (but without pulling the tether upwards)

3. Measure the water level in the well.

4. In one smooth motion, pull the tether up between 30” to 45” (36” to 54” for the longer HydraSleeve) at a rate of about 1’ per second (or faster).

   The motion will open the top check valve and allow the HydraSleeve to fill (it should fill in about 1 to 1.5 times the length of the HydraSleeve). This is analogous to coring the water column in the well from the bottom up.

   When the HydraSleeve is full, the top check valve will close. You should begin to feel the weight of the HydraSleeve on the tether and it will begin to displace water. The closed check valve prevents loss of sample and entry of water from zones above the well screen as the HydraSleeve is recovered.

5. Continue pulling the tether upward until the HydraSleeve is at the top of the well.

6. Decant and discard the small volume of water trapped in the Hydrasleeve above the check valve by turning the sleeve over.

V. Sample Collection

Note: Sample collection should be done immediately after the HydraSleeve has been brought to the surface to preserve sample integrity.

1. Remove the discharge tube from its sleeve.

2. Hold the HydraSleeve at the check valve.

3. Puncture the HydraSleeve just below the check valve with the pointed end of the discharge tube

4. Discharge water from the HydraSleeve into your sample containers.

Control the discharge from the HydraSleeve by either raising the bottom of the sleeve, by squeezing it like a tube of toothpaste, or both.

5. Continue filling sample containers until all are full.

Measurement of Field Indicator Parameters

Field indicator parameter measurement is generally done during well purging and sampling to confirm when parameters are stable and sampling can begin. Because no-purge sampling does not require purging, field indicator parameter measurement is not necessary for the purpose of confirming when purging is complete.

If field indicator parameter measurement is required to meet a specific non-purging regulatory requirement, it can be done by taking measurements from water within a HydraSleeve that is not used for collecting a sample to submit for laboratory analysis (i.e., a second HydraSleeve installed in conjunction with the primary sample collection HydraSleeve [see Multiple Sampler Deployment below]).

Alternate Deployment Strategies

Deployment in Wells with Limited Water Columns

For wells in which only a limited water column exists to be sampled, the HydraSleeve can be deployed with an optional top weight instead of a bottom weight, which collapses the HydraSleeve to a very short (approximately 6” to 9”) length, and allows the HydraSleeve to fill in a water column only 36” to 45” in height.

Multiple Sampler Deployment

Multiple sampler deployment in a single well screen can accomplish two purposes:

- It can collect additional sample volume to satisfy site or laboratory-specific sample volume requirements.
- It can accommodate the need for collecting field indicator parameter measurements.
- It can be used to collect samples from multiple intervals in the screen to allow identification of possible contaminant stratification.

It is possible to use up to 3 standard 30" HydraSleeves deployed in series along a single tether to collect samples from a 10' long well screen without collecting water from the interval above the screen.

The samplers must be attached to the tether at both the top and bottom of the sleeve. Attach the tether at the top with a stainless-steel clip (available from the manufacturer). Attach the tether at the bottom using a cable tie. The samplers must be attached as follows (figure 4):

- The first (attached to the tether as described above, with the weight at the bottom) at the bottom of the screen
- The second attached immediately above the first
- The third (attached the same as the second) immediately above the second

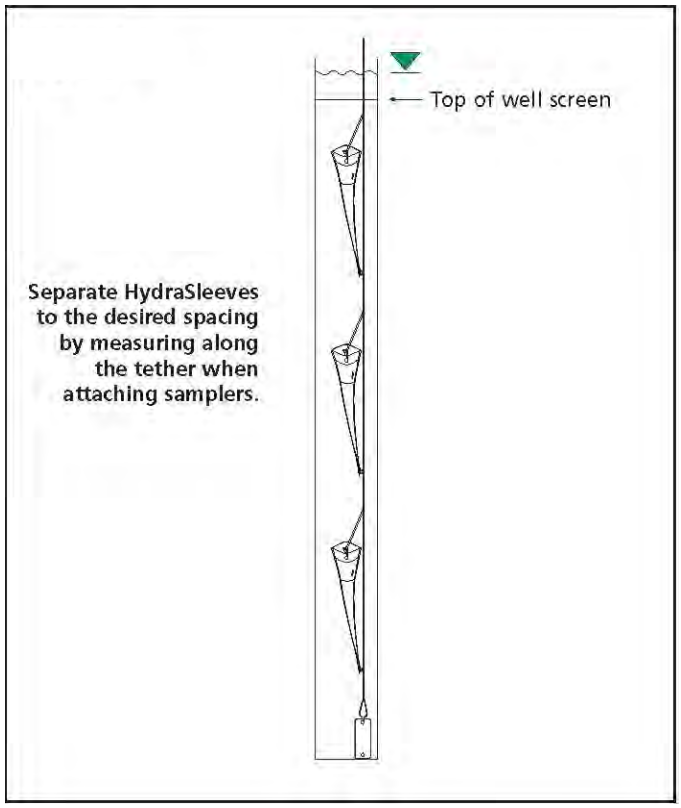

Figure 4. Multiple HydraSleeve deployment.

Alternately, the first sampler can be attached to the tether as described above, a second attached to the bottom of the first using a short length of tether (in place of the weight), and the third attached to the bottom of the second in the same manner, with the weight attached to the bottom of the third sampler (figure 5).

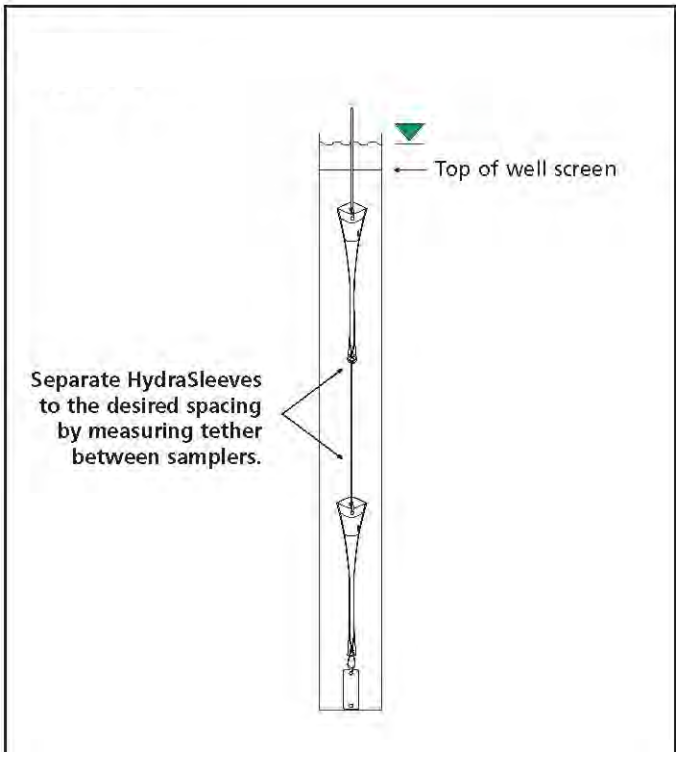

Figure 5. Alternative method for deploying multiple HydraSleeves.

In either case, when attaching multiple HydraSleeves in series, more weight may be required to hold the samplers in place in the well than would be required with a single sampler. Recovery of multiple samplers and collection of samples is done in the same manner as for single sampler deployments.

Post-Sampling Activities

The recovered HydraSleeve and the sample discharge tubing should be disposed as per the solid waste management plan for the site. To prepare for the next sampling event, a new HydraSleeve can be deployed in the well (as described previously) and left in the well until the next sampling event, at which time it can be recovered.

The weight and weight clip can be reused on this sampler after they have been thoroughly cleaned as per the site equipment decontamination plan. The tether may be dedicated to the well and reused or discarded at the discretion of sampling personnel.

Notes:
Concentrations reported in micrograms per liter (µg/L).
< = Compound not detected. Reportable detection limit shown.
Bolded values indicate concentrations above the Reportable Detection Limit.
FD = Field Duplicate Sample
N = Normal Environmental Sample
-- = Not analyzed

ERM Qualifiers:
J = The analyte was positively identified; the associated numerical value is the approximate concentration.
J- = The analyte was positively identified; the associated numerical value is the approximate concentration, biased low.
R = Result rejected during validation due to QA/QC failure.
UJ = The result was not detected above the reported sample quantitation limit, however the quantitation limit is approximate.

Laboratory Qualifier:
j = The analyte was positively identified; the concentration was between the laboratory reporting limit and the method detection limit.

Abbreviation
1,1,1-TCA = 1,1,1-Trichloroethane
1,1,2-TCA = 1,1,2-Trichloroethane
1,1-DCA = 1,1-Dichloroethane
1,1-DCE = 1,1-Dichloroethene
1,2-DCA = 1,2-Dichloroethane
1,2-DCP = 1,2-Dichloropropane
2-BUT = 2-Butanone
2-HEX = 2-Hexanone
4-ISPT = 4-Isopropyltoluene
ACE = Acetone
BDCM = Bromodichloromethane
BZ = Benzene
CDSD = Carbon disulfide
CE = Chloroethane
CF = Chloroform
cis-1,2-DCE = cis-1,2-Dichloroethene
DBCM = Dibromochloromethane
DCM = Methylene chloride
EB = Ethylbenzene
Freon 113 = Freon 113
NAP = Naphthalene
PCE = Tetrachloroethene
STY = Styrene
TCE = Trichloroethene
TOL = Toluene
trans-1,2-DCE = trans-1,2-Dichloroethene
VA = Vinyl acetate
VC = Vinyl chloride
XYL = Xylenes

Notes and Key:

< = Compound not detected. Reportable detection limit shown.
deg C = degrees Celsius
FD = Field duplicate sample
mg/L = milligrams per liter
millivolts = millivolts
mS/cm = milliSiemens per centimeter
N = Normal Environmental Sample
NA = not analyzed
NM = not measured
NTU = Nephelometric turbidity units

Notes and Key:
Concentrations reported in micrograms per liter (µg/L).
Bolded values indicate concentrations above the Reportable Detection Limit.
FD = Field Duplicate Sample
N = Normal Environmental Sample
NA = Not analyzed
< = Compound not detected. Reportable detection limit shown.

Laboratory Qualifiers
j = Result is less than the reporting limit but greater than or equal to the method detection limit, and the concentration is an approximate value.

Data Validation Qualifiers
J = Detected sample result is qualified as estimated.
J- = Detected sample result is qualified as estimated and biased low.
J+ = Detected sample result is qualified as estimated and biased high.
U = Compound not detected based on quality assurance review.
UJ = Nondetected sample result qualified as estimated.

Notes and Key:
Concentrations reported in micrograms per liter (µg/L).
Bolded values indicate concentrations above the Reportable Detection Limit
Shaded values indicate concentrations above the standard
CALDPH MCL = California Department of Public Health Maximum Contaminant Level
FD = Field Duplicate Sample
N = Normal Environmental Sample
NA = Not analyzed
< = Compound not detected. Reportable detection limit shown

Laboratory Qualifiers
j = Result is less than the reporting limit but greater than or equal to the method detection limit, and the concentration is an approximate value

Data Validation Qualifiers
J = Detected sample result is qualified as estimated.
J- = Detected sample result is qualified as estimated and biased low.
J+ = Detected sample result is qualified as estimated and biased high.
R = Rejected
U = Compound not detected based on quality assurance review
UJ = Nondetected sample result qualified as estimated.

Notes and Key:
Concentrations reported in Gene Copies per liter (gene copies/L).
Bolded values indicate concentrations above the Reportable Detection Limit.
Shaded values indicate concentrations greater than 10^7 considered as indicative of strong potential for complete reductive dechlorination.
NA = Not analyzed
< = Compound not detected. Reportable detection limit shown.

Qualifiers:
J = The analyte was positively identified; associated numerical value is the
U = Compound not detected based on quality assurance review.

Notes and Key:
Bolded values indicate concentrations above the Reportable Detection Limit.
µg/m^3 = Micrograms per cubic meter
% = Percent
FD = Field duplicate sample
N = Normal Environmental Sample
NA = Not analyzed
NS = No Standard
< = Compound not detected. Reportable detection limit shown.

Data Validation Qualifiers
J = Detected sample result is qualified as estimated.
UJ = Nondetected sample result qualified as estimated.

With Arcadis – 21 years

PROFESSIONAL REGISTRATIONS

Geologist – California, USA

Engineer – Nevada and California, USA; British Columbia, Canada

Mr. Goldstein has successfully directed and implemented projects in Canada, USA, Mexico, Nicaragua, Colombia, Venezuela, Ecuador, Chile, Brazil, and Argentina. He has broad experience in regulatory agency interaction, construction supervision, environmental and health and safety compliance, hazardous waste investigations, soil and groundwater characterization and remediation, and environmental permitting. He has prepared feasibility studies, cleanup plans, engineering design plans and specifications, and waste and stormwater management plans; supervised construction and operations and maintenance activities; and assisted clients in meeting permit requirements and securing liability/risk management insurance products. He has designed and implemented numerous remediation and environmental construction projects in support of the redevelopment of industrial facilities and military installations affected by solvents, petroleum hydrocarbons, polychlorinated biphenyls, and metals. In addition to his technical experience, he is a proven project manager for the on-time and on-budget delivery of complex projects involving multi-disciplinary teams in various countries and languages.

Project Experience

Environmental Due Diligence Assessments

Project manager and principal engineer for Environmental Site Assessments (ESAs) to meet ASTM criteria. Conducting all phases of ESAs including site reconnaissance, interviews with site personnel, record searches, evaluation of database search results, and interpretation of aerial photographs, regulatory agency file reviews, and report preparation. Performed numerous ESA at industrial sites located in USA, Mexico, Colombia, Ecuador, Brazil, and Argentina.

On-Site Environmental Compliance Assistance

Project manager and principal engineer for onsite environmental compliance assistance for industrial facilities and construction projects. Responsible for overseeing air permit compliance (completion of all permit requirements including recordkeeping, reporting, and operation documentation), completion of stormwater inspections, assisted with waste disposal (new facilities approved, profiled new waste streams, and collected waste data for minimization ideas), updated the spill response and stormwater plans, supported Asset Team in general environmental issues (corporate support, air, water, waste, and incident reporting), responsible for understanding various environmental regulations and

Project Experience Continued

corporate programs, implement internal compliance procedures, responsible for preparing (or in some cases oversight of) environmental permit applications, negotiating with agencies on permit conditions, monitoring compliance, preparing routine reports and emergency notifications, and assist corporate with environmental training.

Multi-Site Environmental Compliance Audit Programs

Program Manager and technical reviewer for international environmental compliance/management systems auditing programs for a manufacturer of automobile parts, biotechnology company, and mining companies. The corporate program components addressed compliance, company requirements, management systems, and good management practices. Perform audits in South America and USA.

Litigation Support

Project geologist/engineer for litigation support projects. Review and interpret site characterization data, including hydrogeologic information, fate and transport models, and chemical testing results to support legal counsel. Prepare depositions and cost-to-closure estimates in support of litigation and mediation.

Environmental Construction

Construction manager for environmental construction projects. Responsible for design and implementation of various at-risk and agency environmental construction projects. Projects include construction of groundwater extraction and treatment systems, relocation of utilities, closure of above- and below-ground storage tanks, and demolition and closure of industrial facilities. Assist with negotiation of contracts with clients, subconsultants, and legal counsel. Support construction projects at sites located in USA, Canada, Mexico, and Colombia.

Permitting and Environmental Compliance

Project engineer for permitting and environmental compliance projects. Responsible for interfacing and obtaining work plan approvals and/or permits to operate from various federal, state, and municipal regulatory agencies. Obtain permits to operate and discharge from various publicly owned treatment works (POTW). Assist clients in meeting United States National Pollutant Discharge Elimination System (NPDES) and stormwater pollution prevention plan (SWPPP) requirements.

General Environmental Consulting

Project manager/engineer for environmental consulting support for the redevelopment of brownfields and former military installations. Prepare and interpret risk/soil management plans. Prepare design drawings and specifications for environmental construction projects; prepare waste soil and groundwater handling sections for civil infrastructure projects. Coordinate environmental activities with ongoing construction and future site development. Prepare remediation cost estimates ranging up to $70 million in support of real estate negotiations and environmental insurance procurement.

PROFESSIONAL REGISTRATIONS

OSHA 40-Hour Hazardous Waste Operations and Emergency Response (HAZWOPER) since 2015

First Aid CPR AED Trained since 2016

Ms. Mehta is an environmental scientist with more than five years of experience in environmental due diligence, compliance assessments, product stewardship, and toxicology. She has coordinated and performed numerous Phase I Environmental Site Assessments (Phase I ESAs) in support of asset and real estate transactions. Ms. Mehta has conducted Phase I ESA's for a range of facilities including pharmaceutical manufacturing, medical device manufacturing, biotechnology manufacturing, small- and large-scale manufacturing, commercial retail, and banking properties. She has performed several Limited Compliance Assessments to evaluate facility compliance with both local and national regulations including hazardous waste storage, materials storage, air emissions, and stormwater permitting. She has provided product stewardship support to evaluate compliance of laboratory reagents and biological products with chemical and biological regulations in several countries including, among others, New Zealand and Thailand. Ms. Mehta has also provided toxicological support to large capitalization pharmaceutical clients to develop aquatic exposure guidelines for wastewater discharge.

Project Experience

Environmental Assessments

Phase I Environmental Site Assessments

Pharmaceutical Production Facilities

Ms. Mehta was responsible for report writing and site visits for pharmaceutical production facilities in California, Massachusetts, New Hampshire, and Pennsylvania. Tasks for the assessment included a walk-through of the facilities and a review of materials storage, hazardous waste generation, wastewater generation, and air emissions. Ms. Mehta reviewed historical documents (i.e. aerial photography) as well as state and federal databases to assess environmental impacts from on and off-site operations. The findings from the assessment were utilized to evaluate environmental risk and potential liability for historical on and off-site activities.

Phase I Environmental Site Assessments

Medical Device Manufacturing Facilities

Ms. Mehta was responsible for report writing and site visits for medical device manufacturing facilities in California, Massachusetts, and New Hampshire. Tasks for the assessment included a walk-through of the facilities and a review of materials storage, hazardous waste generation, wastewater generation, and air emissions. Ms. Mehta reviewed historical documents (i.e. aerial photography) as well as state and federal databases

Project Experience Continued

to assess environmental impacts from on and off-site operations. The findings from the assessment were utilized to evaluate environmental risk and potential liability for historical on and off-site activities.

Phase I Environmental Site Assessments
Biotechnology Manufacturing Facilities

Ms. Mehta was responsible for report writing and site visits for medical device manufacturing facilities in California and New Hampshire. Tasks for the assessment included a walk-through of the facilities and a review of materials storage, hazardous waste generation, wastewater generation, and air emissions. Ms. Mehta reviewed historical documents (i.e. aerial photography) as well as state and federal databases to assess environmental impacts from on and off-site operations. The findings from the assessment were utilized to evaluate environmental risk and potential liability for historical on and off-site activities.

Phase I Environmental Site Assessments
Manufacturing Facilities

Ms. Mehta was responsible for report writing and site visits for both small- and large-scale manufacturing facilities in Arkansas, California, Kansas, Kentucky, Louisiana, Massachusetts, Michigan, Missouri, Nevada, and New Hampshire. Tasks for the assessment included a walk-through of the facilities and a review of materials storage, hazardous waste generation, wastewater generation, and air emissions. Ms. Mehta reviewed historical documents (i.e. aerial photography) as well as state and federal databases to assess environmental impacts from on and off-site operations. The findings from the assessment were utilized to evaluate environmental risk and potential liability for historical on and off-site activities.

Phase I Environmental Site Assessments
Bank and Retail Properties

Ms. Mehta was responsible for report writing and site visits for both bank and commercial retail properties in California, Colorado, Kansas, Michigan, Minnesota, Missouri, New Hampshire, North Carolina, Ohio, Pennsylvania, and Washington. Tasks for the assessment included a walk-through of the facilities and a review of materials storage, hazardous waste generation, wastewater generation, and air emissions. Ms. Mehta reviewed historical documents (i.e. aerial photography) as well as state and federal databases to assess environmental impacts from on and off-site operations. The findings from the assessment were utilized to evaluate environmental risk and potential liability for historical on and off-site activities.

Compliance Reviews

Limited Compliance Assessments
Manufacturing Facilities

Ms. Mehta was responsible for limited compliance reviews for manufacturing facilities in Arkansas, California, Colorado, Canada, Michigan, and the UK. The assessment was conducted to evaluate the facility's compliance with local and national regulations pertaining to materials storage, hazardous waste storage, air emissions, and stormwater permitting. These assessments were primarily conducted for buy-side transactions to evaluate current and future environmental liability.

Project Experience Continued

Limited Compliance Assessments
Transport Vehicle Maintenance Facilities

Ms. Mehta was responsible for two limited compliance reviews for transport vehicle maintenance facilities in Arkansas and Louisiana. The assessment was conducted to evaluate the facility's compliance with local and national regulations pertaining to materials storage, hazardous waste storage, air emissions, and stormwater permitting. These assessments were primarily conducted for buy-side transactions to evaluate current and future environmental liability.

Product Stewardship Support

Regulatory Analysis Summaries
Confidential Client, Global

Ms. Mehta generated regulatory analysis summaries for an international client to assess compliance with national chemical and biological regulations. Products evaluated included analytical chemical laboratory reagents and biological products. She conducted these assessments for products in several countries including, among others, New Zealand and Thailand.

Toxicology Support

Development of Predicted No-Affect Concentrations Exposure Guidelines for Active Pharmaceutical Ingredients Used in Human Healthcare Products
Confidential Client, Global

Ms. Mehta developed predicted no-affect concentrations (PNECs) for 25 human health active pharmaceutical ingredients (APIs). The PNECs were generated for human health, environmental, and anti-microbial resistance. The PNEC values were derived primarily based on published values (i.e. AMR Industry Alliance) as well as acute and chronic toxicology data.

Development of Aquatic Exposure Guidelines for Active Pharmaceutical Ingredients Used in Animal Healthcare Products
Confidential Client, Global

Ms. Mehta developed aquatic exposure guidelines (AEGs) for 35 veterinary APIs using risk-based approaches. This work was performed to support the client's product stewardship and risk-management objectives. AEGs were determined using regulatory approaches applicable to waters of the United States and Europe. Data collection relied on toxicological, microbiological, and physical-chemical property information provided directly by the client as well as *de novo* literature searches.

STEPHEN R. DALY, CHMM

PROJECT ENVIRONMENTAL SCIENTIST

EDUCATION

BS Resource Development, Soil & Water Resources, University of Rhode Island 1996

Graduate Certificate, Occupational Safety & Health, University of Connecticut 2019

YEARS OF EXPERIENCE

Total – 24 years

PROFESSIONAL REGISTRATIONS

Certified Hazardous Materials Manager (CHMM)

PROFESSIONAL ASSOCIATIONS

OSHA 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) Training

OSHA 30-hour Construction Awareness Training

Resource Conservation Recovery Act (RCRA) and U.S. Department of Transportation (DOT) training

Mr. Daly's environmental experience encompasses a variety of due diligence, compliance and environmental services at industrial, commercial, residential, and municipal sites throughout the United States. His responsibilities have included, Phase I environmental site assessments, limited environmental compliance reviews, health and safety plans, spill prevention control & countermeasure (SPCC) plans, and stormwater pollution prevention plan (SWPPP) preparation.

Stephen has also served in planning and oversight roles for the remediation of several sites throughout the northeast United States. He has completed various large scale remediation projects, including task management, procurement, subcontractor oversight, waste characterization, final reporting, and client and government relations.

Project Experience

Phase I Environmental Site Assessments

Various Sites – United States

Stephen has completed in excess of 200 Phase I ESAs throughout the United States as per the requirements of ASTM E1527-13 and E2247-16. The Sites have consisted of commercial and industrial properties, including car dealerships, medical office buildings, assisted living facilities, manufacturing facilities, municipal sites, and vacant land. The assessments would also include additional client requirements, such as a Limited Environmental Compliance Review, a Health and Safety Audit, a Phase II ESA, or a determination of the applicability of state requirements pertaining to property transfers.

SPCC and SWPPP Plans

Various Sites – United States

Stephen served as the author of SPCC and SWPPP Plans. Examples of past projects include:

- SPCC Plans for electrical substation properties for the United Illuminating Company throughout southwestern Connecticut.
- SPCC and SWPPP Plans for the Nucor Steel site in Wallingford, Connecticut
- SPCC Plan for an assisted living facility in New Jersey

Project Experience Continued

Project Manager
Global Foundries, East Fishkill, New York

Served as the consultant for a construction company completing a building expansion project in an area with soil contamination. Stephen's activities included the development of a project-specific health and safety plan, monitoring equipment procurement, coordinating staffing needs for on-site air monitoring, ensuring compliance with owner's training requirements, and maintaining client relations.

Project Manager
Dunn Paper, East Hartford, Connecticut

Served as the project manger for the assessment and remediation of a paper products manufacturing facility. Project tasks included a Phase I ESA, a Phase III ESA, the development of a Remedial Action Plan, the design, coordination, and reporting of corrective action at the Site, and the development of documents to be provided to the Connecticut Department of Energy and Environmental Protection as part of the requirement of the Connecticut Property Transfer Act.

Field Scientist
Hooker-Ruco Superfund Site, Hicksville, New York

Served as the field scientist for the remediation of a groundwater plume consisting of chlorinated solvents in Long Island, New York. The remedial design included the installation of a biosparge groundwater treatment system. Stephen served as the owner's representative to oversee the installation of deep injection wells, the subsurface utilities, and the construction of a control building. The operation of the treatment system has resulted in a significant reduction of the chlorinated solvent concentrations at the site.

Project Coordinator
Confidential Client, Needham, Massachusetts

Served as the project coordinator for remediation of a plume of groundwater impacted with chlorinated solvents in Needham, Massachusetts for a confidential client. Activities included the remedial design, subcontractor procurement, scheduling, client relations, public notifications, and reporting. The investigation included the installation of monitoring wells, completion of a pilot study, soil mixing at the source area, a soil vapor study in area buildings, and the injection of in-situ chemicals for the remediation of the downgradient groundwater plume. At the conclusion of the project, a Temporary Solution per the Massachusetts Contingency Plan was achieved.

Project Coordinator – Manufactured Gas Plant Site
Southern Connecticut Gas Company, Bridgeport, Connecticut

Served as the project coordinator for the remediation of a former manufactured gas plant site that was under a Consent Order from the Connecticut Department of Energy and Environmental Protection. Activities included the construction of a groundwater treatment system, and the construction of an engineered cover system. Stephen coordinated treatment system upgrades, including new pumps, control equipment, and treatment equipment and served as the alternate treatment plant operator. Stephen also completed monthly reporting requirement, including status reports, discharge monitoring report, and aquatic toxicity reports. To address the soil impacts at the site, Stephen was the on-site representative during the construction of the engineered cover system, which included characterization and

Project Experience Continued

disposal of impacted soil, installation of utilities, site grading, and the installation of a layer of clean fill and asphalt pavement on the entire site. Stephen was also the coordinator for the recording of an Environmental Land Use Restriction to complete the requirements of the Consent Order.

Field Scientist – Former Copper Refinery

Confidential Client, Maspeth, Queens, New York

Served as a field scientist for the remediation of a former copper refinery in New York City. Activities included the characterization and disposal of soils impacted with PCBs, metals, and petroleum hydrocarbons. Additional tasks included the removal of an underground storage tank, the execution of a community air monitoring program, subcontractor management, government regulator relations and reporting, groundwater monitoring, stormwater monitoring, and assistance with the construction and operation of a groundwater treatment system.

Appendix G

User Questionnaire

ASTM E1527-13
User Questionnaire

Site Name and Address: Patrick Henry Site 1095 Dunford Way, Sunnyvale, CA 94807

1. **Environmental liens that are filed or recorded against the property (40 CFR 312.25)**
   Did a search of recorded land title records (or judicial records where appropriate) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?

   ☐ Yes ☐ No If yes, provide explanation: _____

2. **Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.2(a)(1)(v) and (vi))**
   Did a search of recorded land title records (or judicial records where appropriate) identify any activity and use limitations, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?

   ☐ Yes ☐ No If yes, provide explanation: _____

3. **Specialized knowledge or experience of the person seeking to qualify for the landowner liability protections (40 CFR 312.28)**
   Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

   ☐ Yes ☐ No If yes, provide explanation: _____

4. **Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29)**
   Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

   ☐ Yes ☐ No If no, provide explanation: District has owned the property for many years

5. **Commonly known or reasonably ascertainable information about the property (40 CFR 312.30)**
   Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example,

   a. Do you know the past uses of the property?
      ☐ Yes ☐ No If yes, provide explanation: orchard, middle school, leased to other schools, chiropractic school

   b. Do you know of specific chemicals that are present or once were present at the property?
      ☐ Yes ☐ No If yes, provide explanation: _____

   c. Do you know of spills or other chemical releases that have taken place at the property?
      ☐ Yes ☐ No If yes, provide explanation: _____

   d. Do you know of any environmental cleanups that have taken place at the property?
      ☐ Yes ☐ No If yes, provide explanation: _____

6. **The degree of obviousness of the presence of likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31)**
   Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of contamination at the property?

   ☐ Yes ☐ No If yes, provide explanation: None, other than identified above (orchard/school)

TABLES

FIGURES

APPENDICES

1 Introduction

This Preliminary Environmental Assessment (PEA) work plan ("the PEA work plan") has been prepared by Arcadis, U.S., Inc., (Arcadis) on behalf of the Santa Clara Unified School District (SCUSD) for a portion of the Santa Clara County Assessor's Parcel Number (APN) 31310004, excluding the Peterson Middle School structures (subject property, **Figure 1**). The subject property includes a portion of the Peterson Middle School (specifically, a current parking lot), the Patrick Henry School Campus (including recreational fields), and the SCUSD Farm located at 1380 Rosalia Avenue, 1095 Dunford Way, and 1055 Dunford Way, respectively, in Sunnyvale, California. APN 31310004 has a total area of 71 acres, which encompasses the subject property. The subject property includes an area of approximately 54-acres.

The PEA work plan presents a background due diligence assessment of the subject property (2022 Phase I ESA; Appendix A) and a scope of work to evaluate potential areas of concern (PAOC) found during the background due diligence.

Arcadis understands that the SCUSD plans to redevelop the subject property as a new school. Following redevelopment, the subject property will be served by public utilities for drinking water, irrigation water and sewage disposal. The existing on-site structures on the Patrick Henry Campus will be demolished as part of redevelopment. The subject property location is shown on **Figure 1**, a subject property plan is shown on **Figure 2**, the subject property vicinity is shown on **Figure 3**, and a proposed sampling map is shown on **Figure 4**.

1.1 Purpose and Qualifications

The SCUSD requested that Arcadis conduct a background due diligence assessment of the subject property and prepare a scope of work to evaluate potential areas of concern found during the background due diligence. The Phase I Environmental Site Assessment (ESA) conducted as part of the background due diligence assessment was performed in general accordance with the ASTM International (ASTM) Standard E1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-21), including the limitations outlined in the standard. The purpose of the background due diligence is to identify recognized environmental conditions (RECs), controlled recognized environmental conditions (CRECs), and historical recognized environmental conditions (HRECs) associated with the subject property. A REC is defined in ASTM E1527-21 as "the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment"; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment. A CREC is defined in ASTM E1527-21 as "recognized environmental condition affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of required controls (for example, activity and use limitations or other property use limitations)." An HREC is defined in ASTM E1527-21 as "a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable

regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations)."

This PEA Work Plan has been prepared in accordance with the 2009 California Education Code and DTSC's requirements for the environmental assessment of the subject property, so that the subject property may be approved for the construction of the new proposed school buildings and recreational areas.

A scope of work to evaluate potential areas of concern at the subject property found during the background due diligence is also presented in this PEA work plan. This PEA work plan was prepared and will be implemented in general accordance with the guidelines of the DTSC, as detailed in the PEA Guidance Manual ("the DTSC PEA Guidance Manual"; DTSC 2015). Prior to implementation of this PEA work plan, Arcadis will prepare a site-specific Health and Safety Plan (HASP) which will be kept on-site during the proposed field activities at the Site. Site findings will be presented in a PEA report following implementation of this PEA work plan.

1.2 Scope of Work

The scope of work for this assessment included the following:

- Conducting a reconnaissance-level survey of the subject property and a review of site history to obtain evidence of past releases of hazardous materials, if any, and to assess the potential for on-site releases of hazardous materials
- Evaluating land use in the vicinity of the subject property including the presence of underground storage tanks (USTs), above ground storage tanks (ASTs), hazardous air emitters, and electrical transmission lines within the radii specified by California and ASTM regulations
- Evaluating historical information regarding the past use, storage, disposal, or release of hazardous wastes/substances at the subject property
- Preparing a scope of work in a work plan for further assessment of on-site areas of potential concern during the PEA
- Completing a checklist of hazards as described in California Code of Regulations, Title 5 (Section 14001) used by the California Department of Education (CDE) School Facilities Planning Division staff for site-review purposes

1.3 Significant Assumptions

Arcadis assumes that the information provided by the SCUSD, regulatory database provider, and regulatory agencies is true and reliable.

1.4 Limitations and Exceptions

Site-specific activities performed by Arcadis and the information collected during these activities are summarized in the following sections.

The opinions and recommendations presented in this report are based upon the scope of services, information obtained through the performance of the services, and the schedule as agreed upon by Arcadis and the original party for whom this report was prepared. This report is an instrument of professional service and was prepared in accordance with the generally accepted standards and level of skill and care under similar conditions and circumstances established by the environmental consulting industry. To the extent that Arcadis relied upon any information prepared by other parties not under contract to Arcadis, Arcadis makes no representation as to the accuracy or completeness of such information.

Only the party for whom this report was originally prepared, and other specifically named parties, may make use of and rely upon the information in this report, in its entirety, for a period not to exceed 180 days in accordance with ASTM E1527-21. After 180 days and prior to using the information contained herein, the report should be updated in accordance with ASTM Standards and Federal regulations.

The findings presented in this report apply solely to site conditions existing at the time when Arcadis's assessment was performed. It must be recognized, however, that a Phase I ESA is intended for the purpose of evaluating the potential for contamination through limited research and investigative activities and in no way represents a conclusive or complete site characterization. Conditions in other parts of the project site may vary from those at the locations where data were collected. Arcadis's ability to interpret investigation results is related to the availability of the data and the extent of the investigation activities. As such, 100 percent confidence in the Phase I ESA conclusions cannot reasonably be achieved.

Arcadis, therefore, does not provide any guarantees, certifications, or warranties (express or implied) that a property is free from environmental contamination. Furthermore, nothing contained in this document shall relieve any other party of its responsibility to abide by contract documents and all applicable laws, codes, regulations, or standards.

1.5 User Reliance

This report is for the exclusive use of the SCUSD, its agents, and assignees. Use of this report by any other party shall be at such party's sole risk.

1.6 Data Gaps

The following data gaps were identified during this assessment:

- Arcadis was unable to inspect the interiors of all Conex boxes and storage sheds present at the subject property. The containers are completely enclosed and Arcadis observed a representative sample of the containers during the subject property reconnaissance.

- One former well is identified in the EDR Radius Map Report and the California Department of Water Resources (DWR) Website in the former recreational soccer field north of the Patrick Henry School Campus. No records were available from the DWR or Santa Clara Valley Water District (SCVWD) regarding this well. A second well was mapped on the SCVWD website along the eastern boundary of the subject property; however, records from the SCVWD indicate that this historical well was located approximately 25 feet east of Teal Drive and east-adjacent to the subject property. Arcadis requested a copy of the abandonment report for the well in the former recreational soccer field to assess the abandonment methods and procedures; however, no records are available. This does not represent a REC but is considered a data gap until the abandonment can be confirmed. The well was not observed on the subject property during the due diligence site walk.

2 Subject Property Setting

2.1 Subject Property Location

The approximate 54-acre subject property is located northwest of the intersection of Dunford Way and Teal Drive in Sunnyvale, Santa Clara County, California (**Figure 1**). The subject property comprises a portion of one parcel identified by the Santa Clara County Assessor's Office as APN 31310004. The SCUSD currently owns the subject property. A subject property plan depicting the configuration of the buildings and exterior features of the subject property is included as **Figure 2**. The subject property and surrounding vicinity are shown on the surrounding property map (**Figure 3**).

The approximate geographic coordinates of the Site are 37° 20' 49.38" north latitude and minus 122° 0' 20.01" west longitude, according to information obtained from Environmental Data Resources, Inc. (EDR) of Milford, Connecticut.

According to information obtained from the U.S. Geological Survey (USGS) 7.5 Minute Series Topographic Map of the Cupertino and San Jose West, California quadrangles dated 2018, the subject property is at an approximate elevation of 124 feet above mean sea level and is generally flat with a slight slope to the northeast. The topography of the surrounding area is also flat with a general topographic gradient to the northeast.

2.2 Geology and Hydrogeology

2.2.1 Regional and Local Geology

No previous environmental investigation reports were available for the subject property; therefore, property-specific geology information was not available. Geologic information in the EDR Report, included in the 2022 Phase I ESA (Appendix A; EDR Report), specifies that the sediments beneath the subject property have been identified as part of the Quaternary Series of the Quaternary System of the Cenozoic Era. According to the United States Department of Agriculture (USDA) Soil Conservation Service, the subject property is underlain by the Botella soil component, which has a surface soil texture of clay loam and exhibits moderate infiltration rates.

According to a well completion report provided by the California Department of Water Resources (DWR) for a nearby public supply well, shallow soils in the subject property area consist of gravel, sand, and clay from approximately 0 to 23 feet below ground surface (bgs). Deeper soils are a mix of gravel and coarse sands, hard clay, and sandy clays.

According to a 2007 Geologic Map of the Cupertino and San Jose West quadrangles, Santa Clara, and Santa Cruz Counties, California presented in the United States Geological Survey MapView Database ("the database"), the subject property is underlain by alluvial sand, fine-grained, silt, and gravel. Where differentiated, these surficial sediments represent alluvial fan deposits at the base of slopes and the outer edge of fan areas. According to the database, the subject property is located approximately 7 miles northeast of the nearest serpentine rock deposits. Given that the outcrops of the serpentine rock deposits are within the 10-mile radius established by the Interim Guidance for Naturally Occurring Asbestos (NOA) at School Sites (DTSC 2004), the potential presence of NOA is a PAOC for the subject property.

2.2.2 Regional and Local Surface and Groundwater Hydrology

According to the EDR Report and the DWR Website, a former well was located in the current soccer field in the northern portion of the subject property. The well was historically used as a water supply well and was last sampled in May and September 1949. No evidence of the well was visible during site reconnaissance. Arcadis submitted a records request to the DWR and no records were available. According to the SCVWD mapping database, a second well is mapped along the eastern boundary of the subject property. According to records provided by the SCVWD, the well was historically located 25 feet east of Teal Drive and is located at the east-adjoining residential neighborhood. No information was available from the SCVWD regarding the well reported in the EDR Report and the DWR Website. Based on the absence of this information, the well is a noteworthy condition for the subject property. It is unclear if the well was properly abandoned because Arcadis could not review a well abandonment report, which is considered a data gap. The data gap is not considered a REC.

Arcadis reviewed documents associated with the former Panasonic, Intersil, and Siemens facilities that are located approximately 3,000 feet south (hydraulically upgradient) of the subject property. Several groundwater monitoring wells have been installed associated with these offsite facilities to evaluate the extent of chlorinated solvents in groundwater. According to a 1990 Phase II Investigation conducted by Beak Consultants Limited (Beak) and the most recent 5-Year Report conducted in September 2020 for the Intersil Inc. and Siemens Facility, regional groundwater underlying the area south of the subject property consists of the shallow water-bearing zones and the deep aquifer. The shallow water bearing unit has been divided into three main zones: A-zone, B-zone, and C-zone groundwater. According to the most recent 5-Year Report, the A-zone was found to extend from the top of the groundwater table at approximately 40 feet bgs to 115 to 125 bgs, B-zone groundwater was found from 130 to 150 feet bgs, and C-zone groundwater was found from 180 to 210 feet bgs. The deep aquifer was separated from the C-zone groundwater by a thick aquitard and extends from approximately 300 to 500 feet bgs. Groundwater flow for the shallow water-bearing zones flows to the north and northeast. The four closest groundwater monitoring wells to the south of the subject property are PG-1B, S-3B, S-4C, LH-1C (**Figure 3**).These wells were most recently sampled in 2019 and trichloroethylene (TCE) and other chlorinated solvents were either not detected or were not detected above the 2019 groundwater vapor intrusion Regional Water Quality Control Board Environmental Screening Levels (RWQCB ESLs) for

either the residential or commercial/industrial scenario. This investigation is discussed further in Section 5.1.2.

2.3 Subject Property Vicinity

At the time of the site reconnaissance, the subject property was bordered to the north by Bryant Way, beyond which are residences; to the east by Teal Drive, beyond which are residences; to the south by electrical transmission lines, beyond which are Dunford Way and residences; and to the west by residences, beyond which is Norman Way. In general, the subject property adjacent vicinity consisted of residential, school, and church properties.

2.4 Designated SCUSD Contact Person and Mailing Address

Ms. Melissa Kersh
Project Manager for Facility Development and Planning
Santa Clara Unified School District
1889 Lawrence Road
Santa Clara, California, 95050
Telephone Number: 408.423.2148
Email address: mkersh@scusd.net

3 Subject Property History

The following items regarding the subject property were provided by the SCUSD or obtained by Arcadis on behalf of the SCUSD. Arcadis provided Ms. Michal Healy, the Director of Facility Development and Planning for the SCUSD, with a questionnaire on the environmental status of the property. Ms. Healy completed the questionnaire on May 15, 2022. A copy of the questionnaire is included in **Appendix A** and is summarized below.

3.1 Title Record

Arcadis reviewed a title record prepared for the subject property and adjoining portions of the Peterson Middle School on February 12, 2016. A summary of information presented in the title record report is provided in **Appendix A**.

3.2 Environmental Liens or Activity and Use Limitations

Arcadis did not provide a questionnaire to past subject property owners; however, we submitted a questionnaire to the SCUSD requesting information pertaining to specialized knowledge they may have of the subject property. The following questions and responses were obtained from the questionnaire completed by the SCUSD:

- ***Question:*** Did a search of recorded land title records (or judicial records where appropriate) identify any environmental liens filed or recorded against the property under federal, tribal, state, or local law?
  Response: No.

- ***Question:*** Did a search of recorded land title records (or judicial records where appropriate) identify any activity or land use limitations, such as engineering controls, land use restrictions, or institutional controls, that are in place at the property and/or have been filed or recorded in a registry under federal, tribal, state, or local law?
  Response: No.

Arcadis obtained an Environmental Lien Search Report from EDR (EDR Project Number 6951305.7S, dated April 25, 2022) for the subject property. No environmental liens associated with the subject property APN was found during their review of public information according to information provided by EDR. A copy of EDR's Environmental Liens Search Report is provided in Appendix C.

3.3 Specialized Knowledge

The following responses to Arcadis's questions were obtained from the SCUSD as part of the assessment:

- ***Question:*** Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former

occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?
Response: No.

- ***Question:*** Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?
Response: No.

3.4 Commonly Known or Reasonably Ascertainable Information

Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example:

- ***Question:*** Do you know the past uses of the property?
Response: Yes. Ms. Healy noted that the subject property has been used as an orchard, middle school, leased to other schools, and a chiropractic school.

- ***Question:*** Do you know of specific chemicals that are present or once were present at the property?
Response: No.

- ***Question:*** Do you know of spills or other chemical releases that have taken place at the property?
Response: No.

- ***Question:*** Do you know of any environmental cleanups that have taken place at the property?
Response: No.

- ***Question:*** Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of contamination at the property?
Response: None, other than identified above (orchard/school).

3.5 Owner, Property Manager, and Occupant Information

According to the Santa Clara County Assessor's office, the subject property is owned by the Santa Clara Unified School District. No further information was available regarding historical ownership of the subject property.

4 Subject Property and Surrounding Area Reconnaissance

4.1 Subject Property Reconnaissance

On April 16th and April 25th, Ms. Divya Mehta of Arcadis conducted a site walk at the subject property to photograph general site conditions. Ms. Mehta was met at the subject property by Ms. Michal Healy and Ms. Angeline Ruiz of the SCUSD. Ms. Healy conducted a site walk of the asphalt-paved parking lot in the northern portion of the subject property on May 24, 2022. At the time of the assessment, the subject property comprised an approximately 54-acre area that was improved with the following permanent buildings within the Patrick Henry School campus that are summarized on **Table 1**. Structures in the remaining portions of the subject property included small sheds, Conex boxes, and temporary portable classrooms and trailer buildings that will be removed prior to construction.

Table 1. On-property Buildings

Current Building Name (Historical Building Name)	Building Size (square feet)	Purpose
Building E/Building 800 (Building A)	13,328	Former Classroom Building and Conference Room
Building 600 (Building B)	4,223	Former Classroom Building and Storage Area
Building B/Building 500 (Building C)	16,685	Appleseed Montessori and SCUSD Classrooms
Building C (Building D)	12,054	Silicon Valley Academy
Building D (Building E)	12,758	New Concept Chinese School and SCUSD Administrative Offices
Building 300 (Building F)	9,395	Auditorium and Storage Area
Building G	5,170	SCUSD Print Shop/Music Instrument Storage

The buildings listed above are wooden-frame buildings with a plaster exterior that are present in the eastern portion of the subject property. Other than current administrative operations in Building D and the SCUSD Print Shop in Building G, the remaining portions of the Patrick Henry School Campus buildings consist of vacant classrooms, an auditorium used for storage, and utility rooms. A pad-mounted transformer was observed on a concrete pad north of Building G with several large cables emanating from subgrade areas beneath the transformer pad. A pole-mounted transformer is also located south of the Patrick Henry School campus along the southern boundary of the subject property on Dunford Way. No labeling was visible regarding the polychlorinated biphenyl (PCB) content of oil within the unit and no staining or evidence of corrosion was noted on or around the units. The western portion of the Patrick Henry Campus consists of a gravel-paved storage area for Conex boxes, vehicle

storage, and miscellaneous machinery and equipment storage. The Conex boxes are used for furniture storage and miscellaneous storage for the SCUSD maintenance staff. Arcadis observed five polyethylene tanks in the northeastern portion of the storage yard that were used off-site at a nearby high school for pool cleaning products. According to Mr. Maes, a Maintenance Lead for SCUSD, the tanks were emptied prior to storage at the subject property. Arcadis noted that the tanks appeared to be partially filled with accumulated stormwater. De minimis amounts of staining were observed on the gravel in the storage yard that was attributed to minor leaks and spills from automobile parking. The stains were observed underneath and around cars that were stored in the yard. The remaining portions of the Patrick Henry School Campus consisted of play areas, asphalt-paved parking lots north and south-adjacent to the school buildings, and landscaped and grassy areas east of the school.

The northeastern portion of the subject property along Teal Drive consists of a former soccer field, and small storage sheds that were most recently rented by a recreational soccer league. According to information reported in the EDR Radius Map Report and the SCVWD, there are two former agricultural wells that have been abandoned at the subject property in the soccer field area and along the eastern boundary with Teal Drive.

The far northern portion of the subject property consists of an asphalt-paved parking lot for the Peterson Middle School, a temporary construction office building, recreational courts, and storage area for the SCUSD. According to Ms. Healy, the office is not currently in use and will be removed. De minimis amounts of hydrocarbon staining was observed on the asphalt-paved parking lot that was attributed to minor leaks and spills from automobiles.

The central portion of the subject property consists of a large grassy football field, track, and bleacher area with a corrugated metal storage building for concession and sports equipment. No areas of concern or staining were observed in this portion of the subject property.

The southwestern portion of the subject property encompasses the SCUSD Farm. The farm consists of mulch and compost storage areas in the eastern portion of the farm, small storage buildings, sheds, and orchard land in the northern portion of the farm, row crops and a storage barn in the central and southern portions of the farm, and a covered patio area and storage building in the western portion of the farm.

4.2 Subject Property Vicinity Reconnaissance

At the time of Arcadis's site reconnaissance, surrounding area properties consisted primarily of residential properties located along Dunford Way (south of the subject property), Teal Drive (east of the subject property), Norman Drive (west of the subject property), Bryant Way (north of the subject property), and Roadrunner Terrace (northeast of the subject property). Raynor Park Christian Church and the Raynor/Stratford School were located south-adjacent to the subject property across Dunford Way.

A Pacific Gas & Electric (PG&E) distribution line is located in an easement along the southern boundary of the subject property on Dunford Way. According to the PG&E online mapping database, this distribution line is listed as Feeder Name WOLFE 1106 (Feeder Number 083671106) with a nominal circuit voltage of 12 kilovolts (kV). The distribution line is not reported as a high voltage power line by PG&E.

A municipal water well is located approximately 100 feet south of the subject property at the Raynor/Stratford School that was installed on March 17, 1982. A diesel aboveground storage tank (AST) was also observed approximately 100 feet south of the subject property at the Raynor/Stratford School property that appeared to be located within a secondary containment structure and fuels an emergency generator unit. The volume of the diesel AST is unknown. The AST appeared to be in good condition with no indications of leaks or spills.

According to the Bay Area Air Quality Management District, there are five properties within a quarter mile of the subject property that are registered with air permits. These air permits are associated with commercial properties including the City of Sunnyvale Environmental Services (emergency generator), Saigon Cleaners (drycleaning operations), Sunnyvale Volkswagen (spray booth), Belmond Village Sunnyvale Tenant LLC (building construction), and Carl's Junior (restaurant operations).

5 Public Record Review

5.1 Environmental

An environmental database report prepared by EDR was reviewed for local, state, and federal listings for properties within the site area. Included in EDR's report are regulatory database lists, which were reviewed by EDR for cases pertaining to leaking USTs and ASTs, hazardous waste sites, and abandoned sites within ASTM-specified radii (**Table 2**). EDR also reviewed selected database lists generated by the United States Environmental Protection Agency (U.S. EPA). Explanations of the regulatory agency database lists reviewed and acronyms used by EDR are presented in EDR's report included in **Appendix A**.

Table 2. Regulatory Agency Databases/Lists Reviewed

Search Radius	Agency	Database	Type of Records in Database
1 mile	U.S. EPA	NPL	Sites designated for Superfund cleanup by the U.S. EPA
	U.S. EPA	CORRACTS	Resource Conservation and Recovery Act facilities undergoing "corrective actions"
	DTSC	AWP (SPL)	Sites prioritized by the state for cleanup
	IWMB	SWIS	Sites included in the Solid Waste Information System database
0.5 mile	U.S. EPA	CERCLIS	Sites under review by the U.S. EPA
	U.S. EPA	TSD	Facilities that treat, store, and/or dispose of hazardous waste
	DTSC and RWQCB	SLIC/Toxics	Sites with solvents/toxics contamination
	RWQCB	LUST	Sites with leaking USTs (LUSTs)
	IWMB	SWLF/SWAT	Sites permitted as solid waste landfills, incinerators, or transfer stations
	OEP, OHM	CORTESE	Sites on state index of properties with spills
Site/Adjoining Properties Only	U.S. EPA	RCRA Generator	Sites that generate large or small quantities of hazardous waste
	DTSC	Cal-Sites (SCL)	Sites under review by the state

Search Radius	Agency	Database	Type of Records in Database
Site/Adjoining Properties Only	OES, Fire Department	ERNS	Sites with reported accidental releases of oil and hazardous substances
	SWRCB	UST/AST	Sites with registered USTs or ASTs
	U.S. EPA	CERCLIS – NFRAP	CERCLIS sites with no further remedial actions planned at time of report
	U.S. EPA	FINDS	Sites included on the facility inventory database

Notes:
DTSC=Department of Toxic Substances Control NPL=National Priority List
RCRA=Resource Conservation and Recovery Act OES = Office of Emergency Services
FINDS=Facility Inventory Database System SWRCB=State Water Resources Control Board
RWQCB=Regional Water Quality Control Board SWIS=Solid Waste Information System
IWMB=Integrated Waste Management Board SWLF=Solid Waste Landfills
LUST=Leaking Underground Storage Tank
OEP, OHM = Office of Emergency Planning, Oil and Hazardous Material
CERCLIS = Comprehensive Environmental Response, Compensation and Liability Information System

5.1.1 Subject Property Listings

The subject property is listed in the DTSC Haznet and Hazardous Waste Tracking (HWTS) databases for hazardous waste generation. According to listings in the Haznet and HWTS databases, the subject property is listed in the databases in 2001 for the disposal of asbestos-containing building materials (ACBMs). The Palmer College Chiro/West facility is also listed in the Haznet and HWTS databases for the generation of laboratory waste chemicals (California Waste Code 551), and metal sludge (California Waste Code 171) in 1993. No violations were noted.

The Peterson Middle School Campus at 1380 Rosalia Avenue is also listed in the EDR database as a Resource Conservation and Recovery Act Non-Generator/No Longer Report (RCRA NonGen/NLR) in 2018 and 2019 as a universal waste generator. No further information was available regarding hazardous waste codes and no violations or evaluations were noted. This listing likely pertains to storage areas at the main campus located west of the northern portion of the subject property.

5.1.2 Off-site Properties

According to the EDR database, there are two adjoining residential properties (Gerald Cummings [1054 Castleton Way], Katie Bessette [1486 Teal Drive]) that are listed in the RCRA NonGen/NLR database in 2021. No further information was available regarding hazardous waste generation at the facilities and no violations or evaluations were noted.

There are numerous off-site properties that are listed in the EDR Radius Map Report. Based on the distance to the subject property and the presumed groundwater flow to the north-northeast, two

properties were evaluated to determine if they are likely to represent a concern of environmental impairment to the subject property.

Panasonic, Intersil, and Siemens at 10900 North Tantau Avenue, Cupertino, California

Panasonic, Intersil, and Siemens operated at a facility that is located approximately 3,000 feet south and hydraulically upgradient to the subject property. The facility is listed in several databases that are summarized below. Database listings that pertain to compliance and are not independently indicative of an environmental concern (e.g., stormwater permitting) are not discussed further.

Intersil Inc. is listed in the RCRA Small Quantity Generator (RCRA-SQG) database in September 1996. The facility was historically listed as a RCRA Large Quantity Generator (RCRA-LQG) in 1980 and 1992 and historically operated as a semiconductor. No further information was available regarding hazardous waste codes and no violations were noted. Panasonic is listed in the Haznet database for generation of laboratory waste chemicals (California Waste Code 551), halogenated solvents (California Waste Code 211), asbestos containing waste (California Waste Code 151), other inorganic solid waste (California Waste Code 181), other empty containers 30 gallons or more (California Waste Code 512) liquids with hexavalent chromium greater than or equal to 500 miligram per liter (mg/L; California Waste Code 723), other organic solids (California Waste Code 352), unspecified solvent mixture and (California Waste Code 214) from 1988 to 1994. Intersil is listed in the HWTS database for hazardous waste generation between 1982 and 1994. No violations were noted.

Intersil Inc./Siemens Components are listed in the National Priority List (NPL), Superfund Enterprise Management System (SEMS), US Engineering Controls, Envirostor, Cleanup Program Sites – Spills, Leaks, Investigations, and Cleanups (CPS-SLIC), Historical Cal-Sites, Record of Decision (ROD), Potentially Responsible Party (PRP), Enforcement (ENF), and the California Environmental Reporting System (CERS) databases for an investigation that began at the facility in 1983. Soil and groundwater sampling was conducted that identified chlorinated solvents in soil and groundwater primarily in the northern and central portions of the facility. Groundwater extraction systems were implemented in 1987 that have been addressing chlorinated solvent concentrations in groundwater. Prior investigations have been conducted that indicated that groundwater flow in the area is to the north-northeast (from the facility towards the subject property). Groundwater sampling has been conducted through the present to evaluate off-site impacts to groundwater. There are four groundwater monitoring wells (PG-1B, S-3B, S-4C, LH-1C) that have been advanced approximately 1,000 feet south and southeast of the subject property. According to the most recent 2019 Groundwater Monitoring Report and 2020 Five-Year Report (Appendix E), trichloroethylene (TCE) was detected at 0.25 microgram per liter (µg/L) at well PG-1B and 0.5 µg/L at well S-4C in October 2019. These concentrations do not exceed the current 2019 RWQCB Environmental Screening Level (ESL) for groundwater vapor intrusion (1.2 µg/L for residential scenarios, 7.5 µg/L for commercial/industrial facilities). TCE was not detected at well S-3B and LH-1C was not sampled. No other volatile organic compounds (VOCs) were detected in the most recent groundwater sampling event in these aforementioned wells. According to the 2019 Groundwater Monitoring Event and 2020 Five-Year Report, the northernmost shallow groundwater monitoring well in the A-zone (A1; well MW-OS-3A1) is located approximately 2,500 feet south of the subject property. The well was installed in 2014 and had a concentration of 21 µg/L that exceeds both the residential and commercial/industrial groundwater vapor intrusion ESLs for TCE. No further wells have been delineated through the present downgradient of the well and according to the 2020 Five-Year Report, the groundwater plume in Zone A only extends 800 feet north (approximately 2,200 feet south of the

subject property) and the groundwater plume in the B-zone extends 1,400 feet north (approximately 1,600 feet south of the subject property) of the source areas. Groundwater monitoring wells upgradient of the well have generally indicated decreasing trends and concentrations in A-zone wells. In addition, TCE has not been detected in sampling events between 2015 and 2021 at the Raynor/Stratford well located south-adjacent to the subject property. Given the decreasing trends in groundwater at the facilities and off-site areas, the distance from the subject property, the depth to groundwater, the extent of the plume as reported in the most recent 2020 Five Year Report; the off-site groundwater VOC plume emanating from the facility is not a REC for the subject property.

EMCON Associates and American Microsystems Inc. at 3800 Homestead Road

American Microsystems Inc. (AMI) is located approximately 2,900 feet south of the subject property. The facility is listed in the Response, Envirostor, Leaking Underground Storage Tank (LUST), CPS-SLIC, Deed, Cortese, ENF, Historical Cortese, and CERS databases for an investigation that began in 1987. The facility is located east-adjacent to the former Siemens and Intersil properties and prior investigations have identified elevated concentrations of chlorinated solvents in soil and groundwater at the facility. According to the most recent 2021 Groundwater Monitoring Report for the facility, groundwater monitoring wells have been advanced northeast of the facility and east of groundwater monitoring wells for the Siemens/Intersil Facility. TCE is the primary constituent of concern in groundwater and was measured at low concentrations at groundwater monitoring wells located downgradient of the former AMI facility. The closest groundwater monitoring wells are E-28A and A-27A, which are approximately 1,300 and 1,800 feet southeast of the subject property, respectively. TCE was not detected at the two wells during 2017 and they were not re-sampled during the most recent sampling events. TCE concentrations at wells located upgradient to the two wells were also found to have low concentrations of TCE that ranged from 0.9 to 2.5 µg/L. The highest concentration at the wells was found to exceed the residential groundwater vapor intrusion ESL, but not the commercial scenario ESL. Given the low concentrations of TCE in groundwater and the distance from the subject property, the investigation is not a REC for the subject property.

5.2 Historical

Arcadis obtained historical information for the subject property and subject property vicinity that are summarized in **Table 3** below.

Table 3. Historical Information Sources

Type of Record	Dates of Information	Source
Aerial photographs and satellite imagery	1939, 1948, 1950, 1956, 1963, 1968, 1974, 1982, 1991, 1993, 1998, 2006, 2009, 2012, 2016	The EDR Aerial Photo Decade Package

5.2.1 Subject Property

The subject property appeared in topographic maps as developed with four structures in the central portion of the subject property from as early as 1897 through at least 1902. By 1939, these structures had been demolished and the subject property had been redeveloped as part of a larger tract of orchard land. No significant changes were evident until 1960, when the eastern portion of the subject property was cleared and appeared to be under construction. Buildings A through E were constructed in 1960 and Buildings F and G were constructed in 1962. By 1963, the Patrick Henry Campus buildings, an asphalt-paved parking lot in the southeastern portion of the campus, garden and orchard areas in the central and northern portions of the school campus, and recreational court areas north of the building were visible in aerial photography. The area surrounding Building G in the western portion of the campus appeared to be under construction with areas of concrete or building materials. The area north of the school campus was cleared and the western portion of the subject property remained developed with orchards.

By 1968, a small structure was constructed north of Building G in the footprint of the current transformer pad in the western portion of the school campus and the orchard areas in the remaining portions of the subject property had been cleared. The central portion of the subject property was redeveloped with the

current football field and track and the western portion was developed with two baseball fields. The far northern portion of the subject property was cleared and appeared to be used for automobile parking. By 1974, bleachers had been constructed along the western portion of the football field and track and several small, cleared areas were visible in the field north of the school campus. The far northern portion of the subject property was further developed with the current asphalt-paved parking lot for the adjoining Peterson Middle School. No significant changes were evident until 1982, when the current corrugated metal shed building was visible north of the bleachers in the central portion of the subject property and a large, cleared area was visible in the footprint of the former baseball field in the southern portion of the subject property. No changes were visible until 1991, when multiple small buildings were visible south of Building G and north of the football field and a rectangular building or Conex box was visible in the far northern portion of the subject property. No changes were evident until 1998, when a new practice field for the San Jose Saber Cats (arena football)was constructed north of Building G. By 2000, the large rectangular structure north of the building was visible as an enclosed recreational court and by 2002, a new structure had been constructed west of Building G. No changes were evident until 2005, when the area northwest of Building G was used for parking and additional Conex boxes and storage equipment were visible in this area beginning in 2007. By 2008, the southwestern portion of the subject property had been developed with the Full Circle Farm run by the Sustainable Community Gardens and associated buildings and the area northwest of the farm had been cleared and appeared to be used for Conex box or portable classroom storage. By 2013, the current solar panels were constructed in the western portion of the subject property. No changes were evident until 2016, when the practice field for the San Jose Saber Catsand two structures west and northwest of Building G were removed. These areas were further developed as storage areas with portable classroom buildings in the northwestern portion of the subject property and Conex boxes and vehicle storage in the northwestern portion of the Patrick Henry Campus through the present.

Prior owners of the subject property include the Pacific Manufacturing Company who sold the land to A.H. Buehren on March 3, 1899 as well as Ignasio Rosalia Castello; Dokenic, Lena, Salvtaore, and Rosie Cirrincione; and Frank L., Pearl, Salvatore, and Pauline Teresi who sold portions of the subject property to the Jefferson Union High School District of Santa Clara County, a former operating name for the SCUSD, between 1955 and 1962. The Patrick Henry School Campus was historically referred to as Patrick Henry Junior High School as of August 1960. The campus was operated as a middle school in the 1960s and 1970s. In 1979, the Patrick Henry School was closed and the school campus was used for administrative office space. Portions of the campus were also rented out to other private schools including the Palmer College of Chiropractic West, who used Building G for cadaver storage for their anatomy and physiology labs. Other tenants at the school have included AppleSeed Academy, Christian Church Scholars, River of Life, Silicon Valley School, New Concept Chinese School, Mount Bell Academy, and Dynasty Academy. With the exception of the SCUSD administrative office space in Building D and a District print shop and music instrument storage area in Building G, the school is currently vacant. The remaining portions of the subject property have been historically developed with orchards, recreational fields (soccer, baseball), and the SCUSD Farm.

5.2.2 Subject Property Vicinity

The subject property area appeared as developed with multiple small structures and roads nearby from as early as 1889. Calabazas and Campbell Creek were depicted east and southeast of the subject

property by 1897 with the Southern Pacific Railroad tracks depicted far north. No changes were evident until 1939, when the subject property area had been developed with orchards, agricultural row crop areas, and associated residential and commercial buildings. No significant changes were evident until 1956, when the area west-adjacent to the subject property had been redeveloped with a large residential neighborhood and the Raynor School south of the subject property was under construction. The area north-adjacent to the subject property was also developed with row crop land and associated smaller buildings. By 1963, the Raynor School south of the subject property had been constructed and multiple residences had been constructed south and east-adjacent to the subject property. By 1968, the remaining areas of orchard land west and north had been redeveloped with the current Peterson Middle School and residential neighborhoods. The surrounding area continued to be further developed with courts and buildings within the Peterson Middle School campus and residential homes north and east of the subject property. By 2008, the adjoining and surrounding properties appeared to be in a configuration generally consistent with the current property uses.

5.2.3 Subject Property Vicinity

Regulatory agency files and records requested and/or reviewed for the subject property and surrounding properties are summarized in the following table:

Table 4. Regulatory Agency File and Records Requests

Agency	Method of Request	Date of Request	Response
USEPA	Online request; Online database review (Envirofacts, ECHO)	April 22, 2022	No records available
Regional Water Quality Control Board	Email request; Online database review (Geotracker)	April 22, 2022	No records available for the subject property. See Section 5.1.2 for records reviewed for surrounding area properties.
Department of Toxic Substances Control	Email request; Online database review (Envirostor)	April 22, 2022	No records available
National Pipeline Mapping System (NPMS)	Online database review (NPMS Viewer)	April 22, 2022	No records available
California Department of Water Resources	Email request; Online database review	May 5, 2022	Records available (see Section 2.4.2 and 2.4.4)
Santa Clara County Department of Environmental Health	Online request	April 22, 2022	No records available

Agency	Method of Request	Date of Request	Response
Santa Clara County Department of Agriculture	Online and telephone request	May 5, 2022	No records available for the subject property.
Santa Clara Valley Water District (SCVWD)	Online request; Online database review	May 5, 2022	Records available (see Section 2); however, a copy of the supply well abandonment reports have not yet been received (data gap).
Bay Area Air Quality Management District	Online Request	May 5, 2022	No records available
City of Sunnyvale	Online Request	April 22, 2022	No records available
Pacific Gas & Electric	Telephone Request Online database and mapping system review	May 5, 2022	No response provided

5.2.4 Previous Site Investigations

Arcadis reviewed the following environmental reports for the subject property:

***Six-Month Surveillance Asbestos Hazard Emergency Response Act (AHERA) Report*, prepared by Hazmat Doc (Hazmat), dated June 12, 2020.**

Hazmat conducted an asbestos survey at the Patrick Henry School Campus in June 2020. This survey was an update to prior surveys conducted between May 2015 and November 2019 in accordance with federal AHERA requirements. Prior surveys identified numerous suspect ACBMs at the school including vinyl floor and associated mastic, floor tiles and associated mastic, caulking, ceiling tiles and associated mastic, plaster wall surfacing, fire door core insulation, and carpet mastic. The survey identified the following conditions:

- Numerous suspect ACBMs have been identified at the building through surveys conducted between 2015 and 2020; however, it does not appear that these materials have been sampled.
- Multiple tile, adhesive, and mastic samples were observed in fair condition; however, no abatement was done. Hazmat recommended that these materials be a managed in place; however, Arcadis noted that recommendations later in the report stated that damaged materials should be replaced.

Additional details regarding the specific locations and conditions of ACBMs identified at the Patrick Henry Campus are summarized in the survey report. The subject property address is listed in the DTSC Haznet database and Hazardous Waste Tracking System (HWTS) databases in 2001 for the removal of asbestos containing waste (California Waste Code 151). No further information was available from SCUSD regarding the materials removed during this abatement work. The historical use of ACBMs in

buildings within the Patrick Henry School Campus are a noteworthy condition under ASTM 1527-21 for the subject property. It is Arcadis' understanding that the onsite buildings will be properly surveyed and abated for hazardous materials, including ACBMs, prior to demolition.

***Soil Report*, prepared by Soil Control Lab, dated April 16, 2022.**

SCUSD provided a copy of soil analysis that was conducted for the SCUSD Farm. Soil samples were collected and analyzed for multiple metals and soil health parameters (e.g., ammonia, nitrate, available nitrogen) to support agricultural purposes and not for environmental purposes. Arcadis noted that the metals reported in the report were not detected above the applicable 2019 RWQCB ESLs or the 2022 DTSC screening levels. No screening levels were available for soil health parameter constituents.

6 Additional Research Data

Arcadis conducted additional research in accordance with DTSC Guidance (DTSC 2001), California Code of Regulations Title 22 Section 69104, and the State of California General Education Code Provisions, Division 1, Part 10.5, Chapter 1, Article 1.

6.1 Agricultural Use

The subject property was developed as part of a larger agricultural tract of land from at least 1939 through 1960, when the Patrick Henry School campus was constructed. The southern portion of the subject property was more recently redeveloped within the SCUSD Farm from 2008 through the present.

Based on the use of the subject property as cultivated farmland and orchard land, agricultural chemicals such as pesticides, herbicides, and fertilizers may have been used at the subject property. Provided that the chemicals have been applied in accordance with manufacturer recommendations, residuals remaining in subject property soils and/or groundwater are expected to be similar to other area properties. There were no Division of Agriculture historical pesticide use permits for the subject property that are available for review. According to representatives of the office, records are only available for the past two years and no records have been reported for current agricultural use. Based on the historical orchards observed on the subject property, the application of agricultural chemicals is a potential REC for the subject property in accordance with the June 2006 DTSC Interim Guidance.

6.2 Mines

Arcadis has found no evidence during the course of this assessment to suggest that the subject property was formerly or is currently located in the vicinity of abandoned/inactive mines, mine wastes, and/or unusual environmental conditions resulting from past mining, milling, and/or smelting operations.

6.3 Governmental Use or Ownership

Arcadis has found no evidence during the course of this assessment to suggest that the subject property is or was formerly owned or used by the following U.S. Governmental agencies: Departments of the Army, Air Force, Navy, Defense or Energy, or Formerly Used Defense Sites. In addition, the Site is not built upon a property which has the potential for the presence of unexploded ordnance.

6.4 Illegal Drug Manufacturing

Arcadis has found no evidence during the course of this assessment to suggest that the Site was a location of previous law enforcement or DTSC cleanup activities for illegal drug laboratories.

6.5 Debris, Stockpiles, or Fill Material

Arcadis did not observe evidence during the course of this assessment of debris, stockpiles, or fill material present at the subject property. Arcadis observed small piles of compost and mulch that are stored in the eastern portion of the SCUSD Farm that are used on-site, as needed.

6.6 Polychlorinated Biphenyls

PCBs are a group of organic chemicals that were used historically in a variety of industrial and chemical applications, including transformers, ballasts, other electrical equipment, and hydraulic oils, among many other products. PCBs were manufactured in the United States from 1929 until 1979, when PCB manufacturing was banned due to the toxicity of PCBs. Arcadis observed one pad-mounted electrical transformer north of Building G within a larger concrete pad and one pole-mounted transformer along the southern portion of the subject property on Dunford Way. No labels were present to indicate the PCB content of the transformer and no information was available regarding historical transformers in use at the property. Given the age of the buildings, it is possible that the transformers contain PCBs. The potential presence of PCBs at the subject property is a REC in accordance with the June 2006 DTSC Interim Guidance.

6.7 Lead-Based Paint

Lead-based paint was commonly used for a variety of purposes, until 1978 when federal regulations banned consumer uses of lead-containing paint, though exceptions applied for certain commercial and other paints. Federal regulations require certain disclosures regarding lead-based paint for housing constructed prior to 1978. The buildings at the subject property were constructed in 1960 and 1962, which pre-dates the ban on consumer uses of lead-containing paint. Painted surfaces were observed throughout the Patrick Henry Campus and several buildings had chipped, peeling, and deteriorating paint areas along the sides of the structures. No information was available regarding lead sampling conducted at the school site. It is Arcadis' understanding that the onsite buildings will be properly abated prior to demolition.

Based on the construction dates of the building and the condition of the paint at the school, the historical use of lead-based paint on site structures and peeling off the structure and contacting surficial soil is a potential REC for soil for the subject property in accordance with the June 2006 DTSC Interim Guidance.

6.8 Asbestos-Containing Materials

ACMs have historically been used in a variety of building materials and other products. Between 1973 and 1978, under the asbestos National Emission Standard for Hazardous Air Pollutants (NESHAP), the USEPA banned spray-applied surfacing ACM. In 1989, the USEPA issued a final rule under Section 6 of the Toxic Substances Control Act (TSCA) banning most asbestos-containing products; however, in 1991, the rule was vacated and remanded by the Fifth Circuit Court of Appeals. Only the bans on corrugated paper, rollboard, commercial paper, specialty paper, flooring felt, and any new uses of asbestos remain banned under the 1989 rule. In addition, the Occupational Safety and Health Act

defines presumed ACM (PACM) as thermal system insulation (TSI) and surfacing material found in buildings constructed no later than 1980.

The buildings at the Patrick Henry Campus were constructed in 1960 and 1962. Based on the construction dates and prior surveys that have been conducted at the Patrick Henry Campus between 2015 and 2020, ACMs are present at the subject property and represent a noteworthy condition. It is Arcadis' understanding that the onsite buildings will be properly abated prior to demolition.

6.9 Naturally Occurring Hazardous Materials

6.9.1 Radon

Radon is a radioactive gas and a product of the natural decay of uranium. Radon can migrate from soil gas into buildings, accumulate in confined spaces, and become a health hazard.

According to the USEPA, the subject property is located in Radon Zone 2, which comprises counties with predicted average indoor radon screening levels from 2 to 4 picocuries per Liter (pCi/L) of air. Federal Area Radon Information from USGS summarizes radon test results at 2 locations in ZIP Code 94087, which average 2.45 pCi/L in first floor living areas. The California Radon database summarizes radon test results for 64 locations in ZIP Code 94087 in Santa Clara with 8 locations that had radon levels greater than 4 pCi/L.

No property-specific radon test data were available.

6.9.2 Naturally Occurring Asbestos (NOA)

Asbestos deposits, which are located in many parts of California, are commonly associated with serpentine and can be either asbestiform (fibrous) or non-asbestiform (platy). Chrysotile, crocidolite, amosite, tremolite, actinolite, and anthophyllite are the principal forms of asbestos. Chrysotile breaks into curly fibers, while the remaining types tend to have a thin needle-like appearance.

Serpentinite is rock composed almost entirely of serpentine and is the most common host rock for chrysotile. Generally, chrysotile and amphibole asbestos varieties occur in areas where the original rock has metamorphosed under elevated temperatures and pressures. Serpentinite and its parent material, ultramafic rock, are present in California's Sierra Nevada Foothills. Typically, the asbestos content of these rocks ranges from less than 1 percent to about 25 percent, with higher concentrations sometimes found.

Disturbance of asbestos-containing rock and soil can result in a release of asbestos fibers to the air. This disturbance can be caused by driving over roads or driveways surfaced with these materials, construction activities (ripping of outcrops and bedrock), and/or weathering and erosion processes. Once released into the air, asbestos fibers are relatively stable and can remain airborne for long periods of time.

Asbestos fibers that have become airborne can be inhaled deep into the lungs where they can remain for extended periods of time or be translocated to other parts of the body. Once inhaled, asbestos fibers can result in health problems. The potential for developing health problems from asbestos exposure

depends on the length and intensity of the exposure. Asbestos is classified as a known human carcinogen by state and federal agencies. Diseases related to asbestos exposure include asbestosis, lung cancer, and mesothelioma.

According to a 2007 Geologic Map of the Cupertino and San Jose West quadrangles, Santa Clara, and Santa Cruz Counties, California presented in the United States Geological Survey MapView Database, the subject property is located approximately 7 miles northeast of the nearest serpentine rock deposits. Given that the outcrops of the serpentine rock deposits are within the 10-mile radius established by the Interim Guidance for NOA at School Sites (DTSC 2004), the potential presence of NOA is a PAOC for the subject property and was identified as a noteworthy condition for the Phase I ESA **(Appendix A).**

6.10 Petroleum Deposits

Arcadis found no evidence through this assessment of petroleum deposits currently or historically present at the subject property. No soil or gas wells were identified in the EDR Radius Map Report or during a review of the California Department of Conservation Division of Oil, Gas, & Geothermal Online Mapping System databases. In addition, no pipelines were identified at the subject property on the National Pipeline Management System (NPMS) Viewer. The closest pipeline is a natural gas pipeline operated by PG&E that is located approximately 1,800 feet east of the subject property along Lawrence Expressway.

6.11 Railroad Use or Easements

Arcadis has found no evidence through the course of this assessment to suggest that the subject property is located within 1,500 feet of an active railroad.

6.12 Utility Easements

According to a title record report for the subject property, utility easements have been granted to the City of Sunnyvale for municipal utility access at the subject property. An easement was also granted to PG&E since 1933 for electric lines along the southern boundary of the subject property.

6.13 Residential Use

Arcadis found no evidence through the course of this assessment to suggest historical residential use at the subject property.

6.14 Surface Drainage Pathways

Stormwater runoff sheet flows to grated inlets located in the paved parking areas at the subject property. The drains are routed to the municipal stormwater system. A stormwater sump pump is also present in the Building D boiler room that pumps accumulated stormwater to the sanitary sewer system.

6.15 Termiticide Application

Organochlorine pesticides (OCPs) were historically used as insecticides for termite controls around wooden structures. Chlordane was used in the United States from 1948 until 1988, when it was banned by the USEPA. The buildings at the Patrick Henry School Campus were constructed in 1960 and 1962 and are wood-framed buildings with plaster exteriors. Based on the construction dates, it is possible that termiticides may have been used at the subject property, which is considered a PAOC for the subject property and was identified as a noteworthy condition for the Phase I ESA **(Appendix A)**.

6.16 Regulated Hazardous Waste or Release Site

As noted in Section 5.1.1, the subject property is listed in the DTSC Haznet and HWTS databases for historical hazardous waste generation of ACBMs. The Patrick Henry School or former tenants are not currently listed as active hazardous waste generators.

Arcadis found no evidence during the course of this assessment to suggest that the subject property was formerly or is currently built upon a hazardous substance release site.

6.17 Hazardous Air Emissions

As noted in Section 4.2, there are five facilities located within a 0.25-mile radius of the subject property that are registered with the BAAQMD with an air permit. These facilities are commercial properties and not anticipated to emit hazardous air emissions or to handle hazardous or acutely hazardous materials, substances, or waste.

Arcadis found no evidence during the course of this assessment to suggest that the subject property is located within 500 feet of a busy freeway or traffic corridor.

6.18 Proximity to Active Runways

Arcadis found no evidence through the course of this assessment to suggest that the subject property is located within a 2-mile radius of an active runway. The closest active runway is the Norman Y. Mineta San Jose International Airport that is located approximately 3.7 miles northeast of the subject property.

7 Findings

The following sections present the conclusions and recommendations of the background due diligence noted above and in the 2022 Phase I ESA **(Appendix A)** to provide the rational to evaluate PAOCs at the subject property.

7.1 Findings and Opinion

Arcadis performed a Phase I ESA of the subject property in conformance with the scope and limitations of ASTM Practice E1527-21 for Phase I ESAs. This assessment revealed the following RECs, CRECs, HRECs, de minimis conditions, and noteworthy conditions. A copy of the complete 2022 Phase I ESA is included in **Appendix A**.

7.1.1 Recognized Environmental Conditions

The following RECs were identified in connection with the subject property:

Agricultural Land and Orchard Use: The subject property was developed as part of a larger agricultural tract of land from at least 1939 through 1960, when the Patrick Henry School Campus was constructed. The southern portion of the subject property was more recently redeveloped as the SCUSD Farm from 2008 through the present.

Based on the use of the subject property as historical orchard, the application of agricultural chemicals is a potential REC for the subject property in accordance with the August 2008 DTSC Interim Guidance.

Lead-based Paint: Lead-based paint was commonly used for a variety of purposes, until 1978 when federal regulations banned consumer uses of lead-containing paint, though exceptions applied to certain commercial and other paints. Federal regulations require certain disclosures regarding lead-based paint for housing constructed prior to 1978. The buildings at the subject property were constructed in 1960 and 1962, which pre-dates the ban on consumer uses of lead-containing paint. Painted surfaces were observed throughout the Patrick Henry Campus and several buildings had chipped, peeling, and deteriorating paint areas along the sides of the structures. No information was available regarding lead sampling conducted at the school site. It is Arcadis' understanding that the onsite buildings will be properly abated prior to demolition and a sampling plan is not included.

Based on the construction dates of the building and the condition of the paint at the school, the potential historical use of lead-based paint on site structures and peeling off the structure and contacting surficial soil is a potential REC in soil for the subject property in accordance with the June 2006 DTSC Interim Guidance.

Polychlorinated Biphenyls: PCBs are a group of organic chemicals that were used historically in a variety of industrial and chemical applications, including cooling oil in transformers prior to 1979. PCBs were manufactured in the United States from 1929 until 1979, when PCB manufacturing was banned due to the toxicity of PCBs.

One pad-mounted electrical transformer was observed north of Building G within a larger concrete pad. No labels were present to indicate the PCB content of the transformer and no information was available

regarding historical transformers in use at the property. In addition, a pole-mounted transformer is located along the southern boundary of the subject property on Dunford Way. Given the age of the buildings, it is possible that the transformers contain PCBs. The potential presence of PCBs in soil adjacent to the transformers at the subject property is a potential REC in accordance with the June 2006 DTSC Interim Guidance.

Termiticide Application: OCPs were historically used as insecticides for termite controls around wooden structures. The buildings at the Patrick Henry School campus were constructed in 1960 and 1962 and are wood-framed buildings with plaster exteriors. Based on the construction dates, the potential presence of termiticides in soil adjacent to the structures at the subject property is a potential REC in accordance with the June 2006 DTSC Interim Guidance.

7.1.2 Controlled Recognized Environmental Conditions

No CRECs were identified in connection with the subject property.

7.1.3 Historical Recognized Environmental Conditions

No HRECs were identified in connection with the subject property.

7.1.4 De Minimis Conditions

The following de minimis condition was identified in connection with the subject property:

Staining: Arcadis observed multiple areas of de minimis amounts of staining on concrete floors within utility rooms at the Patrick Henry Campus that was attributed to poor housekeeping. De minimis staining was also observed on ceiling tiles and portions of concrete that were attributed to minor leaks from the ceiling. De minimis amounts of staining was also observed near floor drains within the restrooms that was attributed to poor housekeeping. The flooring materials in these areas were in fair condition with no indications of leaks or spills.De minimis staining was also observed on the asphalt-paved parking lot that was attributed to minor leaks and spills from automobiles. As a result, this staining is a de minimis condition.

7.1.5 Noteworthy Conditions

The following noteworthy conditions were identified in connection with the subject property:

Asbestos Containing Building Materials: The buildings at the Patrick Henry Campus were constructed in 1960 and 1962. Based on the construction dates and prior surveys that have been conducted at the school, ACBMs are likely present at the subject property and represent a noteworthy condition. It is Arcadis' understanding that the onsite buildings will be properly abated prior to demolition and an ACBM sampling plan is not included.

Naturally Occurring Asbestos: According to a 2007 Geologic Map of the Cupertino and San Jose West quadrangles, Santa Clara, and Santa Cruz Counties, California, the subject property is located approximately 7 miles northeast of the nearest serpentine rock deposits. Given that the outcrops of the serpentine rock deposits are within the 10-mile radius established by the Interim Guidance for NOA at

School Sites, the potential presence of NOA is a noteworthy condition for the subject property. It is important to note that NOA is not identified as a REC in the Phase I ESA as naturally-occurring rock deposits do not constituent a REC under CERCLA and therefore are not a REC under ASTM. A NOA sampling plan is included in this assessment.

Historical Vehicle Storage Operations: The area west of Building G has been used for automobile and equipment storage since at least 2007. During site reconnaissance, Arcadis observed multiple vehicles stored in this area including damaged vehicles. Small amounts of staining were observed on the gravel near or under cars within this area that was attributed to minor leaks and spills. As such, the vehicle storage in this area is a noteworthy condition for the subject property. Additional sampling is proposed in the PEA.

Historical Water Supply Well(s): According to the EDR Radius Map Report database and the DWR database, one former agricultural well was located in the current soccer field in the northern portion of the subject property (**Figure 4**). The well was historically used as a water supply well and was last sampled in May and September 1949. According to the SCVWD, a second agricultural well is currently located in the eastern portion of the subject property. However, according to records provided by the SCVWD, this well is located approximately 25 feet east of Teal Drive and off-site.

Arcadis requested a copy of the abandonment reports to assess the location and abandonment methods and procedures; however, no further information was provided by the DWR or SCVWD. This does not represent a REC but is considered a data gap until the abandonment methods and procedures can be confirmed. Surveys and potential destruction of the wells are proposed in the PEA.

7.1.6 Data Gaps

The following data gaps were identified during the background due diligence:

- Arcadis was unable to inspect the interiors of all Conex boxes and storage sheds present at the subject property. The containers are completely enclosed and this data gap does not appear to be significant as a representative number of containers were observed, the containers are used for furniture storage, and the exterior of the containers and buildings appeared to be in good condition with no indications of staining or corrosion indicating a release from the contents of the buildings.

- One former well is identified in the EDR Radius Map Report and the California Department of Water Resources (DWR) Website in the former recreational soccer field north of the Patrick Henry School Campus. No records were available from the DWR or SCVWD regarding this well. A second well was mapped on the SCVWD website along the eastern boundary of the subject property; however, records from the SCVWD indicate that this historical well was located approximately 25 feet east of Teal Drive and east-adjacent to the subject property. Arcadis requested a copy of the abandonment report for the well in the former recreational soccer field to assess the abandonment methods and procedures; however, no records are available. This does not represent a REC but is considered a data gap until the abandonment can be confirmed. The well was not observed on the subject property during the due diligence site walk.

No significant data gaps were identified during this assessment.

7.1.7 Conclusions and Recommendations

Based on the results of Arcadis's subject property history research and site reconnaissance, a sampling and analysis program is recommended to be performed during the PEA to evaluate the following:

- The potential presence of metals (e.g. lead and arsenic) and OCPs in shallow soil associated with historical agricultural and orchard use throughout the subject property.
- The possible presence of lead in shallow soil associated with historical use of lead-based paint on the buildings (excluding recent portable buildings and Conex boxes) at the subject property.
- The possible presence of termiticides in soil associated with the historical use with wood-framed buildings.
- The possible presence of PCBs in shallow soil near a pad-mounted transformer north of Building G and a pole-mounted transformer along the southern boundary of the subject property on Dunford Way (**Figure 2**).
- The potential presence of metals, petroleum hydrocarbons, and volatile organic compounds (VOCs) in shallow soil within the gravel-paved storage yard in the western portion of the Patrick Henry School campus (**Figure 2**).
- The potential presence of NOA in shallow soils throughout the subject property.
- If the historical water supply wells reportedly "abandoned" wells were properly abandoned per Well Standards or if they were improperly abandoned (e.g. covered up or paved over).

8 PEA Scope and Objectives

The California Department of Education (CDE) has adopted an environmental policy requiring that, if applicable, ambient air, subsurface soils, and shallow groundwater at school sites will be evaluated. A "No Further Action" and/or "partial site approval" designation from the DTSC must be obtained before the CDE can approve a school district for the acquisition and/or construction of a new school site.

The acreage of the school campus for which the SCUSD is seeking approval is approximately 54 acres.

The PEA is intended to identify whether a release or threatened release of hazardous substances exists at the subject property and to evaluate the potential risk to human health or the environment before the DTSC issues a "No Further Action" designation.

The overall objectives of the PEA include the following:

- evaluate historical information regarding the past use, storage, disposal, or release of hazardous wastes/substances at the subject property
- conduct a field sampling and analysis program to characterize the nature, concentration, and extent of hazardous wastes/substances present in soil
- estimate the potential threat to public health and/or the environment posed by known hazardous constituents at the Site using a residential land use scenario

Using information developed during the PEA and the conservative human and ecological risk evaluation to be conducted using the DTSC PEA Guidance Manual, the DTSC will make an informed decision regarding potential risks, if any, posed by the subject property.

Possible outcomes of the PEA decision include the following:

- The requirement for further assessment through the remedial investigation/feasibility study process if the Site is found to be significantly affected by hazardous substances
- The need to perform a removal action for areas where localized impacts by hazardous substances release(s) are found
- Issuance of a "No Further Action" finding if the Site is found not to be affected or if risks to human health and the environment are found to be within acceptable levels based on the conservative screening-level risk assessment

8.1 Conceptual Site Model (CSM)

A CSM presents potential sources of contamination, transport mechanisms, and exposure pathways for potential human receptors that is presented on **Figure 5**. The purpose of the CSM is to evaluate the potential risks to public health and the environment and to help develop the PEA sampling plan.

8.2 Constituents of Potential Concern

Suspect constituents of potential concern (COPCs) identified for the subject property during the background due diligence includes California Assessment Manual (CAM)-17 and CCR Title 22 metals, PCBs, OCPs, total petroleum hydrocarbons (TPH), and volatile organic compounds (VOCs).

8.3 Data Quality Objectives (DQO)

The DQOs are measures of the data quality control and are criteria established to assess data gathering, sampling, and analysis.

Sensitivity is defined by detection limits for all analytes or COPCs for all analyses and are expressed in terms of method detection limits (MDLs) or reporting limits (RLs). The MDLs and RLs are acceptable for use in the PEA and do not exceed applicable reporting limits. A summary of the MDLs and RLs are presented in **Table 5**.

8.4 Sampling Strategy

The following subsections outline the proposed sampling plan to address each REC or PAOC identified in the Phase I ESA. Proposed sampling locations are shown on **Figure 4**, and the quantification limits and sampling and analysis summary are presented in **Tables 5 and 6**, respectively.

8.4.1 Patrick Henry School Campus

There are currently seven buildings at the Patrick Henry School campus that were constructed between 1960 and 1962. Based on the construction dates, soils collected near the buildings will be analyzed for metals and OCPs to evaluate potential historical use of lead-based paint and termiticide use.

8.4.1.1 Pre-Demolition Sampling for CAM-17 Metals and OCPs

In accordance with DTSC guidance (DTSC 2006), a minimum of four discrete surface soil samples will be collected from each side of Buildings B, C, D, and E, at depth intervals of 0-0.5 ft bgs and 2-2.5 ft bgs. A minimum of two samples will be collected at smaller buildings within the campus (Building 300, Building 600, and Building G). Discrete surface soil samples will be analyzed for lead and other CAM-17 metals by USEPA Method 6010B.

Where possible, soil samples will be collected from the nearest unpaved area where associated runoff may collect. If no nearby unpaved soil sampling area is available, a discrete soil sample will be collected from below the concrete or asphalt pavement along the side of the building.

Four surface (0-0.5 foot [ft] bgs) and subsurface (2-2.5 ft bgs) samples will be collected for OCP analysis by USEPA Method 8081A. Up to four adjacent discrete surface and subsurface samples will be composited for analysis of OCPs (e.g. two composite samples per building). Subsurface samples will be placed on hold pending analysis of the surface sample.

8.4.1.2 Post-Demolition Sampling for CAM-17 Metals and OCPs

In accordance with DTSC Guidance (DTSC 2006), a minimum of two sets of six perimeter locations will be collected if the foundation is still present prior to demolition at Buildings B, C, D, and E at depth intervals of 0-0.5 ft bgs and 2-2.5 ft bgs. The first set of samples will be collected within two feet of the of the foundation and a second set at the extent of soil disturbed by debris removal. If soil is exposed within the footprint of the former structure, four interior samples will be collected within the footprint of the former structure. Discrete surface soil samples will be analyzed for lead and other CAM-17 metals by USEPA Method 6010B. Surface and subsurface samples will also be analyzed for OCP analysis by USEPA Method 8081A. Up to three samples from the same depth and sample set will be composited for analysis of OCPs (e.g. four composite samples per building). Subsurface samples will be placed on hold pending analysis of the surface sample.

If sampling is conducted following the demolition of the buildings and foundations and grading work, a minimum of six samples (0-0.5 ft bgs) will be collected surrounding and within the footprint of the former building. Up to four samples from the same depth and sample set will be composited for analysis of OCPs (e.g. four composite samples per building). Subsurface samples will be placed on hold pending analysis of the surface sample.

8.4.1.3 Sampling for PCBs

In accordance with DTSC Guidance (DTSC 2006), a minimum of two discrete surface (0-0.5 ft bgs) and subsurface (2-2.5 ft bgs) samples will be collected near the pad-mounted transformer and one discrete surface and subsurface sample will be taken at the base of the pole-mounted transformer. Surface and subsurface samples will be analyzed for PCB analysis by USEPA Method 8082A. Subsurface samples will be placed on hold pending analysis of the surface sample.

8.4.1.4 Sampling for TPH and VOCs

During the Phase I site reconnaissance, Arcadis observed limited areas of surface staining in the storage yard area that was attributed to minor leaks and spills from vehicle and equipment storage. SCUSD representatives noted that existing vehicles would be removed prior to demolition or construction activities at the subject property. Four surface soil (0-0.5 ft bgs) and subsurface soil (2-2.5 ft bgs) samples will be collected from the yard near areas of staining. Soil samples will be analyzed for TPH as gasoline, TPH as diesel, and TPH as motor oil using USEPA Method 8015M with silica gel cleanup. Subsurface samples will be placed on hold pending analysis of the surface sample.

8.4.1.5 Sampling for NOA

In accordance with DTSC Guidance (DTSC 2004), a minimum of one soil boring will be advanced for every 2 acres. Two samples should be collected at the surface (0-0.5 ft bgs) and at 1 foot below the deepest point of any potential excavation. If the proposed school is anticipated to remain within the footprint of the current Patrick Henry School Campus (12 acres), 6 soil borings will be advanced and a total of 12 surface and subsurface samples will be collected and analyzed for Asbestos by USEPA Method Polarized Light Microscopy (PLM) 600/R-93/116 within the Patrick Henry School Campus.

8.4.2 Recreational Fields

There are currently three recreational field areas at the subject property with baseball fields in the western portion, a football field and track in the central portion, and a former soccer field in the northeastern portion that total approximately 25 acres. These areas have been continuously developed as recreational fields since the 1960s following historical use as orchard land.

8.4.2.1 Sampling for OCPs and Metals

In accordance with DTSC Guidance (DTSC 2008), a minimum of 35 borings should be advanced in these three areas. A minimum of 9 surface soil samples (0-0.5 ft bgs) should be collected from these borings and analyzed for arsenic and other CAM-17 Metals by USEPA Method 6010B/7471A. A minimum of 9 surface soil samples (0-0.5 ft bgs) should be collected and composited for OCP analysis by USEPA Method 8081A.

A total of 36 borings will be advanced in these three areas. A total of 9 discrete surface soil samples will be collected and analyzed for arsenic and other CAM-17 Metals. A total of 9 composite surface soil samples will be analyzed for OCPs from the 36 boring locations (4 discrete samples for one composite sample).

8.4.2.2 Sampling for NOA

In accordance with DTSC Guidance (DTSC 2004), a minimum of one soil boring should be advanced for every 2 acres. Two samples should be collected at the surface (0-0.5 ft bgs) and at 1 foot below the deepest point of any potential excavation. A total of 12 soil borings will be advanced and a total of 24 surface and subsurface samples will be collected and analyzed for Asbestos by PLM 600/R-93/116.

8.4.3 SCUSD Farm

According to a review of historical records, the southwestern portion of the subject property was developed with orchard land until the 1960s, when it was redeveloped with a baseball field. In 2008, this area was redeveloped and run by Full Circle Farms until 2018. The farm has been managed by SCUSD since 2018. encompasses an approximately 12-acre portion of the subject property.

8.4.3.1 Sampling for OCPs and Metals

In accordance with DTSC Guidance (DTSC 2008), a minimum of 22 borings should be advanced at the SCUSD Farm. A minimum of 6 surface soil samples (0-0.5 ft bgs) should be collected from these borings and analyzed for arsenic and other CAM-17 Metals by USEPA Method 6010B/7471A. A minimum of 6 surface soil samples (0-0.5 ft bgs) should be collected and composited for OCP analysis by USEPA Method 8081A. Samples will also be collected near the storage buildings in the northeastern portion of the SCUSD Farm as well as near the barn storage building in the southern portion of the farm.

A total of 22 borings will be advanced at the SCUSD Farm. A total of 6 discrete surface soil samples will be collected and analyzed for arsenic and other CAM-17 Metals. A total of 6 composite surface soil samples will be analyzed for OCPs from the 22 boring locations.

8.4.3.2 Sampling for NOA

In accordance with DTSC Guidance (DTSC 2004), a minimum of one soil boring should be advanced for every 2 acres. Two samples should be collected at the surface (0-0.5 ft bgs) and at 1 foot below the deepest point of any potential excavation. Six soil borings will be advanced and a total of 12 surface and subsurface samples will be collected and analyzed for Asbestos by USEPA Method Polarized Light Microscopy (PLM) 600/R-93/116 within the SCUSD Farm.

8.4.4 Peterson Middle School Parking Lot

The northern portion of the subject property consists of an approximately 3-acre asphalt-paved parking lot that is used for parking, recreational courts, and a portable office building for the adjacent Peterson Middle School Campus buildings.

8.4.4.1 Sampling for OCPs and Metals

In accordance with DTSC Guidance (DTSC 2008), a minimum of 2 surface soil (0-0.5 ft bgs) and 2 subsurface samples (2.0-2.5 ft bgs) will be collected at the parking lot and analyzed for CAM-17 Metals. The surface and subsurface samples will be collected and composited for OCP analysis by USEPA Method 8081A.

8.4.4.2 Sampling for NOA

In accordance with DTSC Guidance (DTSC 2004), a minimum of one soil boring should be advanced for every 2 acres. Two samples should be collected at the surface (0-0.5 ft bgs) and at 1 foot below the deepest point of any potential excavation. One soil boring be advanced and a total of 4 surface and subsurface samples will be collected and analyzed for Asbestos by USEPA Method Polarized Light Microscopy (PLM) 600/R-93/116.

8.5 Sample Analysis Summary

Table 6 presents a summary of the proposed samples, sample depths, and analysis methods by sample location areas for the PEA Work Plan. Samples will be collected in laboratory-supplied containers and submitted to Enthalpy Analytical, a California Department of Health Services-certified laboratory under appropriate chain-of-custody protocols (or similar California certified laboratory). **Table 5** presents a summary of the laboratory-provided MDLS and RLs.

8.6 Pre-Field Activities

Prior to implementation of this PEA work plan, Arcadis will prepare a site-specific Health and Safety plan (HASP) which will be kept on-site during the proposed field activities at the subject property. The HASP documents the potential hazards to worker health and safety at the subject property during the proposed field activities and specifies the appropriate means to mitigate or control these hazards. The HASP will address the potential for exposure to hazardous constituents and describes general safety procedures. Fieldwork will be monitored to ensure that appropriate health and safety procedures are followed.

Before fieldwork begins, Arcadis will coordinate clearance of proposed sampling locations for underground utilities with Underground Service Alert (USA). A private utility-locating subcontractor may also be used. USA will be notified at least 48 hours in advance of sampling activities.

A notice describing the proposed work and schedule will be distributed by the SCUSD to occupants of properties within line-of-sight of the subject property at least 72 hours prior to commencement of fieldwork

8.7 Field Activities

Arcadis's sampling strategy was prepared in accordance with the following:

- DTSC – *Interim Guidance for Naturally Occurring Asbestos (NOA) at School Sites*, dated September 24, 2004.
- DTSC – *Interim Guidance Evaluation of School Sites with Potential Soil Contamination as a Result of Lead from Lead-Based Paint, Organochlorine Pesticides from Termiticides, and Polychlorinated Biphenyls from Electrical Transformers*, dated June 9, 2006. Revised September 12, 2006.
- DTSC – *Interim Guidance for Sampling Agricultural Properties (Third Revision),* dated August 7, 2008.
- DTSC – *Preliminary Environmental Assessment Guidance Manual*, dated January 1994. Revised October 2015.
- DTSC – *Advisory: Active Soil Gas Investigations*, dated July 2015.

As required by the DTSC, a dedicated field notebook or field sampling information forms will be maintained by Arcadis's representative for the Site.

9 Field Operations

9.1 Sampling Methods

Arcadis will collect soil samples using a direct-push sampling rig or hand-sampling (hand auger) equipment. If a direct-push sampling rig is used, 1.5-inch-diameter acetate sample tubes will be advanced beneath the subsurface inside a stainless-steel sample probe. Upon recovery from the sample probe, retrieved soil samples will be cut to a desired length (6 to 8 inches). Samples will be collected in 1.5- to 2.5-inch-diameter, 6-inch-long brass or stainless-steel tubes if hand-sampling equipment is used at the Site.

After recovery of the acetate, brass, or stainless--steel tubes, the tubes will be capped on both ends with Teflon® and plastic caps, and labeled properly. After labeling, the soil samples will be sealed in plastic bags and placed in an ice-chilled cooler for transportation to the laboratory under proper chain-of-custody protocols. Analytical methods, types of containers, preservation methods, and holding times are summarized in **Table 7**.

9.2 Decontamination

Equipment will be decontaminated in a pre-designated area over plastic sheeting. Cleaned bulky equipment will be stored on plastic sheeting in uncontaminated areas. Cleaned small equipment will be stored in plastic bags. Materials to be stored more than a few hours will also be covered.

Re-usable equipment that comes into contact with potentially contaminated soil or groundwater will be decontaminated and rinsed with distilled water before use at each sampling location to ensure the integrity of samples collected. Disposable equipment intended for one-time use will be packaged for appropriate disposal and will not be reused. Drilling and sampling devices used will be decontaminated using high-pressure hot water (steam cleaned) or by the following procedures:

- Laboratory-grade detergent and tap water or deionized water wash, in a 5-gallon plastic bucket, using a brush
- Initial tap water, distilled water, or deionized water rinse, in a 5-gallon plastic bucket
- Final distilled water or deionized water rinse, in a 5-gallon plastic bucket

9.3 Waste Management

Soil and/or wastewater generated from sampling activities will be stored in U.S. Department of Transportation (DOT) approved 55-gallon steel drums. The containers will be labeled and identified with the generator's name and the date the waste was generated. The containers will be secured on site pending characterization and disposal.

Waste Soil. Analytical data generated from the soil investigations will be used to classify the waste soil at the disposal facility for the soil containers, and that additional profiling of the waste soils will not be necessary.

Wastewater. If wastewater is generated during implementation of this work plan, one drum characterization water sample will be collected from the aqueous storage containers. If multiple wastewater containers are used, a drum composite sample of the multiple drums will be collected. The sample will be submitted to a California-certified laboratory for appropriate analysis.

If the waste is classified as hazardous, SCUSD will secure a U.S. EPA identification number from the DTSC for proper management of the hazardous waste. The transportation contractor and disposal facility will comply with the DTSC and DOT requirements of hazardous waste transportation and disposal. The hazardous waste will be transported by a registered hazardous waste hauler under a uniform hazardous waste manifest.

The SCUSD shall make the final determination for such disposal and shall direct Arcadis to make such disposal accordingly

9.4 Sample Handling

9.4.1 Sample Containers, Volumes, and Preservation Requirements

Samples collected will be collected in laboratory-supplied containers and submitted to Enthalpy under appropriate chain-of-custody protocols. A summary of the volumes and preservation requirements are summarized in **Table 7**.

9.4.2 Sample Identification

Samples will be numbered using the sample location followed by the sample depth interval. A summary of the proposed sample identification information is presented on **Table 6.**

9.4.3 Field Quality Control

Quality assurance/quality control (QA/QC) samples will be analyzed as noted in **Table 6**. QA/QC procedures will be employed in both the field and the laboratory. QA/QC samples include equipment rinsate samples, field blank samples, and field duplicate samples.

The following field QA/QC procedures will be performed at the Site:

- Chain-of-custody forms will be used when submitting samples to the laboratory.
- Daily information regarding soil sample collection will be recorded in a field logbook or on field sampling information forms. Sample types, soil descriptions, sample identification numbers, and sample times will be collected and recorded on field sampling information forms and/or in field logbooks. Pages will be numbered, dated, and signed by the person recording the field data.

Field QA/QC samples will be collected and submitted for analysis along with the discrete soil samples, using the following sampling frequency:

- Field duplicate samples: one for every 10 discrete samples per sample media
- Equipment rinsate blanks: one per field day that includes collection of samples by non-disposable (reusable) sampling equipment
- Field blanks: one per field day that includes collection of samples by reusable sampling equipment (when an equipment rinsate blank sample is collected

9.4.3.1 Ambient Blank

Ambient blank samples consist of a sample of the distilled water or deionized water used to wash sampling equipment during equipment cleaning activities. The purpose of the ambient blank sample is to evaluate the distilled water or deionized water for the presence of chemicals for which environmental samples are being analyzed. An ambient blank sample will be collected by pouring distilled water or deionized water into the appropriate sample container.

Arcadis will collect an ambient blank sample for each work week at the subject property. The ambient blank(s) will be analyzed for the sample analyte using the same analytical methods as for the sample collected using the reusable equipment and analytical methods used for samples collected during the field day.

9.4.3.2 Equipment Blank

An equipment rinsate blank will be collected from the final water rinsed over equipment after cleaning activities have been performed. The equipment rinsate blank will be collected from non-disposable (reusable) sampling equipment such as soil sampling tools and sampling equipment. To collect an equipment rinsate blank sample, distilled water will be poured over or through the recently cleaned equipment, and carefully collected directly into an appropriate sample container held over a bucket. Equipment rinsate blank samples will be stored and processed in the same manner as the other samples.

Arcadis will collect an equipment blank sample for each work day at the subject property. The equipment rinsate blank(s) will be analyzed for the sample analyte using the same analytical methods as for the samples collected using the reusable equipment and analytical methods used for samples collected during the field day.

9.4.3.3 Field Duplicates

Duplicate samples will be collected to evaluate the analytical procedures and methods employed by the laboratory. The duplicate soil sample will be collected immediately below the depth interval where the original soil sample is collected from the boring. One field duplicate sample will be collected for every 10 soil samples collected. Proposed duplicate samples are summarized on **Table 6**.

9.4.4 Sample Custody

Chain-of-custody records are used to document sample collection and shipment to a laboratory for analysis. A chain-of-custody record will accompany the sample shipments for analyses. Forms will be completed and sent with the samples for each laboratory and each shipment. If multiple coolers are sent to a single laboratory on a single day, individual chain-of-custody forms will be completed and sent with the samples in each cooler.

Generally, a sample is considered to be in someone's custody if it is either in someone's physical possession, in someone's view, locked up, or kept in a secured area that is restricted to authorized personnel. Until receipt by the laboratory, the custody of the samples will be the responsibility of the sample collector.

9.5 Record Keeping and Surveying

Logging will be performed using continuous core samples for proposed borings (not including the surface soil sample locations). The boring log will contain the following information:

- borehole number and location

- sample depth(s)
- sediment color
- sediment grain size
- descriptive comments
- estimated moisture content
- depth at which groundwater was encountered, if applicable
- permit number, if applicable
- drilling method
- sampling method
- photoionization detector (PID) measurements, if applicable
- depth where groundwater stabilized, if applicable
- blow counts, if applicable
- field geologist/engineer's name

An Arcadis Professional Geologist will review and sign the final lithologic logs. Copies of the field logs will be included in the PEA report. Arcadis will approximate each boring location using a handheld global positioning system unit, survey flags, and/or marking paint and shown on a figure in the PEA report.

9.6 Laboratory QA/QC Procedures

Laboratory QA/QC procedures include the following:

- Laboratory analyses will be performed within the required holding time for samples submitted for initial analysis and samples being held for analysis based on the results of the initial analyses.
- Appropriate minimum reporting limits will be used for each analysis. The reporting limits will be lower than the corresponding screening levels presented in the DTSC Human Health and Ecological Risk Office (DTSC HERO) Note 3 or the USEPA Regional Screening Levels (RSLs) for residential use.
- The laboratory will report the following information for each sample delivery group as follows:
  - a discussion of how the QA/QC criteria were met by the laboratory
  - a discussion of hold times
  - matrix spike/matrix spike duplicate results
  - relative percent difference
  - method blank data
  - surrogate recovery, instrument tuning, and calibration data

- exceptions
- signed laboratory reports, including the sample designation, date of sample collection, date of sample analysis, laboratory analytical method employed, sample volume, and the minimum reporting limit (any discrepancies will be detailed in a letter provided by the laboratory)

Arcadis will use a California-certified environmental testing laboratory for the sample analyses. Proposed laboratory reporting limits are summarized in **Table 5** and analytical methods, container types, and preservatives are summarized in **Table 7**.

10 Data Evaluation

10.1 Human Health Screening Evaluation

A human health screening evaluation will be performed in accordance with the protocols detailed in the DTSC PEA Guidance Manual. The human health screening evaluation will include a Human Health Risk Assessment (HHRA). The purpose of the HHRA is to estimate adverse human health effects by qualitatively and quantitatively addressing possible routes of exposure associated with the subject property. The scope of work will include the specific tasks listed below.

10.1.1 Data Evaluation and Selection of COPCs

The datasets to be evaluated include soil and soil gas sample results from the proposed sampling for the PEA. Past known land use and current site operations indicate that detectable concentrations of COPCs are suspected to exist adjacent and in close proximity to the subject property. The suspect COPCs include:

- PCBs
- OCPs
- VOCs
- Petroleum Hydrocarbons
- CAM 17 Metals/CCR Title 22 Metals

For the purposes of the HHRA, detected chemicals from samples collected during the PEA will be selected as COPCs for evaluation in the HHRA.

10.1.2 Exposure Assessment

The exposure assessment (including fate and transport modeling) will follow U.S. EPA and DTSC risk assessment guidelines and use the reasonable maximum exposure methods recommended by the U.S. EPA. The objective of the exposure assessment is to identify potential exposure pathways to individuals who may come in contact with the COPCs originating at the subject property, to characterize potentially exposed populations, and to estimate the extent of exposure.

The proposed future land use for the subject is a school campus, education support facilities, and recreational areas. The anticipated populations to be evaluated would include hypothetical students, full-time school workers, and maintenance/utility workers. However, for purposes of this HHRA, the land use of the subject property will be assumed to be residential in accordance with the DTSC PEA Guidance Manual.

The exposure pathways assumed applicable under the residential land use include:

- incidental ingestion of soil
- direct dermal contact with soil
- inhalation of particulates
- inhalation of vapors in indoor air

Potential direct soil contact (i.e., incidental soil ingestion, inhalation of particulates, dermal contact with soil) and indirect soil and groundwater contact (i.e., inhalation of airborne dust) will be evaluated using maximum detected concentrations of identified COPCs in soil and groundwater as exposure point concentrations for estimating potential chronic health hazards associated with COPCs at the subject property. The potential exposure pathways are presented on **Figure 5**.

10.1.3 Toxicity Assessment

The toxicity assessment section will provide a list of available toxicity values and the potential adverse health effects attributable to each of the COPCs included in the HHRA. The toxicity assessment considers the types of adverse health or environmental effects associated with individual and multiple chemical exposures; the relationship between magnitude of exposures and adverse effects; and related uncertainties such as the weight of evidence for a COPC's potential carcinogenicity and other deleterious health effects on humans.

The HHRA will use constituent-specific toxicity values to evaluate potential non-carcinogenic and carcinogenic effects presented in the DTSC Human and Ecological Risk Office (HERO) Note 10. In the absence of California-specific toxicity values, sources of toxicological information and toxicity values, in order of preference consistent with USEPA (2003) guidance, include:

- Tier 1 - Integrated Risk Information System (IRIS) (USEPA 2022a). IRIS is an internet database containing current information on human health effects that may result from exposure to chemicals in the environment and has received internal and external scientific review.
- Tier 2 - Provisional Peer-Reviewed Toxicity Values (PPRTV) (USEPA 2022b). PPRTVs were developed by the USEPA Office of Research and Development/National Center for Environmental Assessment/Superfund Health Risk Technical Support Center and are available as chemical-specific issue papers.
- Tier 3 - Additional USEPA and non-USEPA sources of toxicity information, including but not limited to the California Environmental Protection Agency (CalEPA) Office of Environmental Health Hazard Assessment's chronic reference exposure levels and cancer potency values (CalEPA 2019), the Agency for Toxic Substances and Disease Registry (ATSDR) minimal risk levels (ATSDR 2022),

and toxicity values published in the USEPA Health Effects Summary Tables (HEAST) (USEPA 1997).

10.1.4 Risk Characterization

Quantitative estimates of the noncarcinogenic and carcinogenic risk to identified human receptor populations will be presented for the COPCs at the Site. Estimates of risk are obtained by integrating information developed during the exposure and toxicity assessments to characterize potential or actual risks. Noncarcinogenic and carcinogenic risk estimates for individual chemicals will be assumed across all pathways and separately for each exposure scenario to obtain total estimated noncarcinogenic hazard index and carcinogenic risk.

The total estimated noncarcinogenic hazard index will be compared to the U.S. EPA and DTSC acceptable hazard index of 1. The total estimated carcinogenic risk will be compared to the Cal-EPA acceptable incremental lifetime cancer risk level of 1×10^{-6}.

10.2 Ecological Screening Evaluation

A detailed ecological screening evaluation will not be performed during this PEA since the Site is located within a developed area. For this project, the ecological screening evaluation will be limited to one or two paragraphs, describing the site area and the presence or absence of suitable habitat for ecological receptors of concern.

11 Community Involvement

The DTSC and SCUSD will prepare and implement a plan to establish the procedures and protocols for informing the community surrounding the subject property of the PEA evaluation according to the requirements of the California Education Code.

12 PEA Report Preparation and Schedule

12.1 PEA Report

A PEA Report presenting the results of the overall investigation will be prepared and submitted to the DTSC. The PEA report will be prepared in accordance with the DTSC PEA Guidance Manual (DTSC 2015). The report will include site background and environmental setting information, field procedures, presentation of field observations including boring logs, and analytical results including laboratory report sheets and a table summarizing the analytes, detection limits, minimum concentrations, maximum concentrations, 95 percent upper concentration limits (if appropriate), and exposure point concentrations.

The PEA report will also include a summary of the public participation activities implemented and the human health and ecological screening evaluation. Electronic files with the field data, laboratory data,

and at least one geo-referenced figure will be submitted to the DTSC at the time of submission of the PEA report.

Based on the human health and ecological screening evaluation, the summary and conclusions section of the PEA report will address four main questions:

- Have current or past practices resulted in a release or threat of a release at the subject property?
- If a release has occurred or a threatened release exists, does it pose a significant threat to public health or the environment and, if not, why not?
- Does a release pose an immediate potential hazard to health or the environment so as to necessitate an emergency removal action and, if so, why?
- What further specific information and/or removal/remediation actions are necessary to better assess or mitigate health/environmental threats posed by the subject property?

Recommendations will be made regarding the need for additional action to further assess conditions at the subject property, or for limited removal action(s), if appropriate, based on site investigative findings and the screening risk evaluation. If further action is recommended, the PEA report will identify additional investigations and/or remediation needs and strategies. The PEA report will also include recommendations for expedited response actions necessary to mitigate immediate potential hazards to public health or the environment, if needed. No Further Action recommendations will be made if levels of detected contamination are assessed to be below risk-based screening levels.

Arcadis recommends coordinating the DTSC's review of the draft PEA report with the 30-day public comment period for the PEA.

12.2 PEA Report Schedule

Upon approval of this PEA work plan, Arcadis estimates that four to six weeks will be required to schedule the proposed fieldwork, pending potential permitting or weather delays. A draft PEA report is planned to be submitted to the DTSC approximately 60-days after Arcadis' receipt and review of the validated analytical data from the laboratory. This anticipated schedule precludes conditions beyond the control of Arcadis that would affect the schedule (e.g., barriers to site access, permitting, and/or subcontractor/laboratory availability).

Abbreviations and Acronyms:
DTSC = Department of Toxic Substances Control
MDL = method detection limit
mg/kg = milligram per kilogram
RL = reporting limit
RSL = Regional Screening Level
USEPA = United States Environmental Protection Agency

Notes:
1. All values reported in mmg/kg.
2. These values are the minimum of the residential cancer and non-cancer screening levels presented in DTSC HERO Note 3 (June 2022).
3. These values are the residential screening levels presented in the May 2022 USEPA RSL Generic Tables (Target Risk=1x10^{-6}, Target Hazard Quotient=1).
4. The MDL and RL for arsenic are screened against the regional background concentration of 12 mg/kg for properties within the San Francisco Bay area.

Acronyms and Abbreviations
CAM= California Assessment Manual
ID = Identification
NOA = Naturally Occuring Asbestos
PCB = Polychlorinated Biphenyls
SCUSD = Santa Clara Unified School District
TPH = Total Petroleum Hydrocarbons
VOC = Volatile Organic Compounds

Notes
1. CAM 17 Metals will be analyzed using USEPA Method 6010B.
2. OCPs will be analyzed using USEPA Method 8081A.
3. Asbestos will be analyzed using USEPA Method Polarized Light Microscopy (PLM) 600/R-93/116.
4. PCBs will be analyzed using USEPA Method 8082A.
5. TPH will be analyzed using USEPA Method 8015M.
6. VOCs will be analyzed using USEPA Method 8260B.
7. One field and equipment blank will be used each day of work assuming reusable equipment is used.

Noise and Vibration Technical Data

NOISE MONITORING FIELD REPORT

Site Map

Project Name: Peterson Laurelwood Master Plan

Monitoring Location: Norman Dr./ Elizabeth Way

Date: 07/26/2022 Site Number: 1

Measured By: Raul Castillo

Measurement Start Time: 10:20 a.m.

Measurement End Time: 10:35 p.m.

Total Measurement Time: 15 min.

Noise Meter Model: Larson Davis Soundtrack LxT Calibration: 94.0 (dBA)

Meter Setting: A-Weighted Sound Level (SLOW)

Session File Name: LxT_Data.154

Primary Noise Sources: Traffic, Minor Roadway Construction

Data Summary

Noise Scale	Noise Level (dBA)
L_{eq}	53.4
L_{max}	77.7
L_{min}	40.8

Other Noise Sources During Monitoring

Phase II
Model Run Date: 08/09/2022

Receptor #1 – Residences to west along Norman Dr.

Construction Phase: Demolition

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Excavator	1	80.7	40	25
Dozer	1	81.7	40	25
Concrete Saw	1	89.6	20	25

1-Hour Leq: 90.6

Construction Phase: Grading

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Grader	1	85.0	40	25
Excavator	1	80.7	40	25
Tractor	1	84.0	40	25
Scraper	1	83.6	40	25
Dozer	1	81.7	40	25

1-Hour Leq: 92.3

Construction Phase: Building Construction / Architectural Coating

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Backhoe	1	77.6	40	25
Generator	1	80.6	50	25
Crane	1	80.6	16	25
Welder/Torch	1	74.0	40	25
Tractor	1	84.0	40	25
Compressor (air)	1	77.7	40	25

1-Hour Leq: 89.7

Receptor #2 – Raynor Park Church/BASIS School

Construction Phase: Demolition

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Excavator	1	80.7	40	470
Dozer	1	81.7	40	470
Concrete Saw	1	89.6	20	470

1-Hour Leq: 65.1

Construction Phase: Grading

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Grader	1	85.0	40	470
Excavator	1	80.7	40	470
Tractor	1	84.0	40	470
Scraper	1	83.6	40	470
Dozer	1	81.7	40	470

1-Hour Leq: 66.8

Construction Phase: Building Construction / Architectural Coating

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Backhoe	1	77.6	40	470
Generator	1	80.6	50	470
Crane	1	80.6	16	470
Welder/Torch	1	74.0	40	470
Tractor	1	84.0	40	470
Compressor (air)	1	77.7	40	470

1-Hour Leq: 64.2

Receptor #3 – Residences to south along Dunford Way

Construction Phase: Demolition

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Excavator	1	80.7	40	700
Dozer	1	81.7	40	700
Concrete Saw	1	89.6	20	700

1-Hour Leq: 61.7

Construction Phase: Grading

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Grader	1	85.0	40	700
Excavator	1	80.7	40	700
Tractor	1	84.0	40	700
Scraper	1	83.6	40	700
Dozer	1	81.7	40	700

1-Hour Leq: 63.4

Construction Phase: Building Construction / Architectural Coating

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Backhoe	1	77.6	40	700
Generator	1	80.6	50	700
Crane	1	80.6	16	700
Welder/Torch	1	74.0	40	700
Tractor	1	84.0	40	700
Compressor (air)	1	77.7	40	700

1-Hour Leq: 60.7

Receptor #4 – Residences to east across Teal Dr.

Construction Phase: Demolition

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Excavator	1	80.7	40	70
Dozer	1	81.7	40	70
Concrete Saw	1	89.6	20	70

1-Hour Leq: 81.7

Construction Phase: Grading

Equipment	Quantity	*Noise Level at 50 Feet (dBA L_{max})*	*Estimated Usage Factor (%)*	Distance to Receptor (ft)
Grader	1	85.0	40	70

APPENDIX 3.16-1

Focused VMT Analysis

Hexagon Transportation Consultants, Inc.

Memorandum

Date:	July 14th, 2022
To:	Santa Clara Unified School District
From:	Brett Walinski, T.E
Subject:	Focused VMT Analysis for the Peterson Middle School, Laurelwood Elementary School, and District Farm Master Plan

Hexagon Transportation Consultants, Inc. has completed this focused vehicle-miles traveled (VMT) analysis for the proposed Peterson Middle School, Laurelwood Elementary School, and District Farm Master Plan. The proposed Master Plan would include various improvements to Peterson Middle School (such as new sports fields) as well as the relocation of Laurelwood Elementary School to the nearby Peterson Middle School site (to be located at the southeast portion of the site adjacent to Teal Drive and Dunford Way). The project would not expand the enrollment capacity of either school. This memorandum also provides trip generation data for the full occupancy of Laurelwood Elementary school and daily traffic count information on Dunford Way to assist the project environmental team with noise and air quality analyses.

VMT Analysis

Senate Bill (SB) 743 has changed the primary metric for identifying transportation impacts under the California Environmental Quality Act (CEQA). Whereas the metric had been vehicle level of service (LOS), it's now daily vehicle-miles travelled (VMT). Because the project is public school-specific, the Santa Clara Unified School District (SCUSD), as the lead agency for this CEQA document, is responsible for approving its own analysis. However, the District has not adopted VMT guidelines. Accordingly, the State Office of Planning and Research (OPR) VMT guidelines were used for this analysis, with supporting evidence provided from the City of Sunnyvale VMT guidelines. This analysis includes VMT screening analyses for two sites associated with the proposed Master Plan – Peterson Middle School and the relocation of Laurelwood Elementary School to Dunford Way and Teal Drive (adjacent to Peterson Middle School).

Peterson Middle School

The proposed Master Plan does not propose an increase in enrollment for the Peterson Middle School site. The proposed uses at this location are supportive of the existing student population, including new loading and parking improvements, track and field improvements, classroom modernization, new baseball and softball fields, new tennis courts, and a new nature center. The proposed changes would not materially change the vehicular trip generation or VMT from the site, and therefore, would not result in any adverse significant impacts to VMT.

Relocation of Laurelwood Elementary School to Dunford Way and Teal Drive

As part of the project, Laurelwood Elementary School, which is currently located east of Teal Drive near Inverness Way, would be relocated approximately 700 feet to the north to a parcel that is bounded by Dunford Way to the south and Teal Drive to the east. In the past, the relocation site (at Teal Drive/Dunford Way) has been occupied by SCUSD offices, Sunnyvale

Soccer Complex, DRC Montessori School, and Patrick Henry Intermediate School. With the relocation of Laurelwood Elementary School, its enrollment capacity would not change and remain 800 students.

State guidelines allow for screening of projects that are local serving. According to OPR's *Technical Advisory on Evaluating Transportation Impacts in CEQA*, for local-serving retail projects "…lead agencies generally may presume such development creates a less-than-significant transportation impact." This finding is based on the observation that, "By adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT." OPR guidelines also recognize the right of lead agencies to define local-serving uses:

> "Because lead agencies will best understand their own communities and the likely travel behaviors of future project users, they are likely in the best position to decide when a project will likely be local-serving."

The new Laurelwood Elementary School would be located within the City of Sunnyvale. The *City of Sunnyvale Transportation Analysis Guidelines for Vehicle Miles Traveled and Local Transportation Analysis* recognize the benefits of local serving uses. It states:

> "… when evaluating a potential development that is neither residential nor office (employment), land uses such as retail generate vehicular trips to support residential neighborhoods and/or office developments. Therefore, if a project does not specifically fall into the residential, office or retail category, assessing the land use for its ability to reduce VMT by convenient location will help define the appropriate classification for VMT analysis. In other words, if a land use can be classified as an errand or daily activity, it may be classified as retail for the purpose of VMT analysis."

The proposed Laurelwood Elementary School would be local serving, supportive of residential uses, and a daily activity. In addition, City of Sunnyvale guidelines state that schools that are "…shown to primarily serve the immediate community can be considered local serving uses, and therefore can be potentially screened out from further VMT analysis." The guidelines also specifically reference that "Schools not regulated by a Public School District" may not qualify for a VMT exemption if they are expected to attract from a broader area, implying that schools regulated by the District are exempt. Laurelwood Elementary School, upon relocation, would continue to serve the students from the surrounding neighborhoods, and would not attract students from a broader area.

Aside from public schools being a local-serving use, the proposed relocation would be in the same neighborhood as the existing school. The distance between the existing site and proposed site is approximately 700 feet. Both locations would share access to Teal Drive. Most of the existing trips headed to and from the existing Laurelwood Elementary School would therefore use the same neighborhood streets to access the relocated school. At the existing Laurelwood Elementary School, upon exit from the existing student loading area on Teal Drive, most loading traffic is currently routed northbound on Teal Drive towards the proposed relocation site. Thus, the proposed relocation project would not significantly alter travel patterns outside of the immediate vicinity of the school sites.

Last, there are existing uses on the relocation site (at Dunford Way/Teal Drive), which would be replaced by the relocated Laurelwood Elementary School. The existing site was originally occupied by Patrick Henry Intermediate School and then subsequently occupied by other institutional and school uses (such as the DCR Montessori School). Thus, even if the District did not choose to relocate Laurelwood Elementary School to this site, the District would retain the right to re-occupy the Dunford Way/Teal Drive site with other school or institutional-related uses.

Reoccupation of the Dunford Way/Teal Drive site could generate substantial traffic on the surrounding streets, potentially without requiring CEQA clearance.

When all of these factors are considered, it can be concluded that the proposed relocation of Laurelwood Elementary School would not result in adverse impacts to VMT. This conclusion is based on evidence that (1) OPR guidelines allow for VMT exemptions for local-serving uses and acknowledge that lead agencies have the authority to define which uses are local-serving, (2) City of Sunnyvale VMT guidelines imply that public schools are local-serving, (3) the proposed school relocation would continue to serve the surrounding neighborhoods and would not draw student traffic from a broader area, (4) the relocated school would be only 700 feet away from the existing school and would not significantly alter travel patterns outside of the immediate school vicinity, and (5) the existing Dunford Way/Teal Drive buildings could potentially be reoccupied by school and institutional uses without additional CEQA clearance.

Laurelwood Elementary School Trip Generation

The trip generation estimates for the proposed 800-student Laurelwood Elementary School were based on rates obtained from the Institute of Transportation Engineers' (ITE) publication *Trip Generation*, 11th Edition. Because ITE data for public elementary schools include surveys from sites which have student bussing, the trip generation rates used for this analysis were based on ITE data presented for private schools (which mostly do not offer bussing).[1] Based on prior studies conducted by Hexagon in the Bay Area, private school rates are more representative of actual traffic generation for Bay Area public elementary schools.

It was estimated that Laurelwood Elementary School would generate 3,288 trips per day, with 808 trips occurring during the AM commute hour (7:00 AM to 9:00 AM), 480 trips occurring during the school PM peak hour (2:00 PM to 4:00 PM), and 208 trips occurring during the PM commute hour (4:00 PM and 6:00 PM). These trip generation estimates are shown in Table 1. The "peak hour" and "commute hour" represent the highest 60-minute interval of traffic for a given time period (for example, the highest 60-minute period between 4:00 PM and 6:00 PM).

Table 1
Trip Generation Estimates

	ITE			Daily		AM Commute Hour				School PM Peak Hour				PM Commute Hour			
Land Use	Code	Size		Rate[1]	Trips	Rate	Total	In	Out	Rate	Total	In	Out	Rate	Total	In	Out
Elementary School	530	800	students	4.11	3,288	1.01	808	452	356	0.60	480	226	254	0.26	208	96	112

[1]based on rates from Institute of Transportation Engineers (ITE), *Trip Generation*, 11th Edition

It should be noted that most, if not all, of the trips described above are already on the roadway network during the school year. So while these trips may be "new" from the relocated Laurelwood Elementary School at the Dunford Way/Teal Drive site loading areas, a significant portion of them occur now on Dunford Way, Teal Drive and other neighborhood streets from the existing Laurelwood Elementary School

[1] Note that use of private school rates were for trip generation purposes only and intended to represent a conservative estimate of public school driveway traffic. These rates would apply to the existing Laurelwood Elementary School site as well. Once relocated, the distribution and assignment of Laurelwood Elementary School traffic would remain consistent with that of a public school.

Dunford Way Traffic Counts

Daily traffic counts were conducted on Dunford Way to establish baseline street traffic levels without any school activity. The traffic counts were conducted on Tuesday, June 28th through Thursday, June 30th. The counts showed that, on average, Dunford Way, adjacent to the Dunford Way/Teal Drive school site, currently averages 2,480 daily trips. The counts are included in the attached Appendix.

Conclusions

The VMT impacts of the proposed project were evaluated in accordance with State of California OPR guidelines published in its *Technical Advisory on Evaluating Transportation Impacts in CEQA*. Based on this analysis, it was determined that the project would result in a less than significant impact to vehicle-miles traveled. In addition, it was estimated that the relocated Laurelwood Elementary School would generate 3,288 trips per day. However, most, if not all, of these trips are already on the roadway network during the school year. So while these trips may be "new" from the relocated Laurelwood Elementary School at the Dunford Way/Teal Drive site loading areas, a significant portion of them occur now on Dunford Way, Teal Drive and other neighborhood streets from the existing Laurelwood Elementary School.
