Project Description: *(please use a separate page if necessary)*

The Proposed Master Plan consists of the entire Patrick Henry Campus, the Peterson Middle School Site, and the future use of the existing Laurelwood Elementary School Site. The District's Master Plan includes construction of the new Laurelwood Elementary School, Peterson fields, relocated District storage area, and yet to be determined uses on the closed Patrick Henry Middle School Site; improvements to Peterson Middle School including the new fields and a fieldhouse; relocation of the existing tennis courts; new vehicular and pedestrian access; expanded administration and media center, a new environmental education center, outdoor learning areas and amphitheater. Program improvements will be made to the SCUSD Farm and compost areas.

Note: The State Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g. Notice of Preparation or previous draft document) please fill in.

Notice of Preparation
Draft Environmental Impact Report and
Public Scoping Meeting for the
Santa Clara Unified School District Peterson Laurelwood Master Plan

TO: Agencies, Organizations, and Interested Parties **DATE:** June 27, 2022

The Santa Clara Unified School District (School District) Facility Development and Planning, as the Lead Agency under the California Environmental Quality Act (CEQA), is preparing an Environmental Impact Report (EIR) for the proposed Peterson Laurelwood Master Plan and the existing Laurelwood Elementary School Campus ("Proposed Master Plan"). The School District is requesting identification of environmental issues and information that you or your organization believes should be considered in the EIR. The Proposed Master Plan includes the development of a master plan for the Patrick Henry Campus, Peterson Site (fields, tennis courts, parking lots/drop-off areas, and the environmental center), SCUSD Farm, the new Laurelwood Elementary School and the future programs at the existing Laurelwood Elementary School Campus.

PROJECT LOCATION

The CEQA Plan Area includes the Patrick Henry Campus, Laurelwood Elementary School, SCUSD Farm, and portions of the Peterson Middle School, encapsulating 79.35 acres in the City of Sunnyvale and the City of Santa Clara as shown in **Figure 1, Regional Context**. The Plan Area boundaries include parking to the north of Peterson Middle School and the Farm to south, connected by Peterson fields. The Plan Area is bound to the south by Dunford Way, to the west by a block east of Norman Drive, to the north by Rosalia Avenue and Bryant Way, and to the east by Roadrunner Terrace – connected through Castleton Terrace and Teal Drive (see **Figure 2,** Peterson Laurelwood Master Plan Area). The Plan Area would serve a maximum capacity of 3,375 students.

The existing Laurelwood Elementary School serves grades K-5 and is located at 955 Teal Drive in the City of Santa Clara. The school site fronts on Teal Drive to the west and is bound by Kensington Avenue to the south, and residences to the north, east and along the southwestern corner of the site.

PROJECT DESCRIPTION

In 2018, SCUSD voters approved General Obligation Bond Measure BB which authorized $720 million to fund critically needed safety, modernization ,and new construction projects. Some of Measure BB bond funds will be used to design and build a new Laurelwood Elementary on a portion of the Patrick Henry Campus and new fields at the existing Peterson Middle School. In order to create a plan that encompasses all of the District's assets, the SCUSD is creating a Master Plan for the area within the plan's boundaries.

The Proposed Master Plan consists of the entire Patrick Henry Campus, the Peterson Middle School Site, and the future use of the existing Laurelwood Elementary School Site. The District's Master Plan includes construction of the new Laurelwood Elementary School, Peterson fields, relocated District storage area, and yet to be determined uses on the closed Patrick Henry Middle School Site; improvements to Peterson Middle School including the new fields and a fieldhouse; relocation of the existing tennis courts; new vehicular and pedestrian access; expanded administration and media center, a new environmental education center, outdoor learning areas and amphitheater. Program improvements will be made to the SCUSD Farm and compost areas. It also provides an opportunity for an additional school to be built on the property. The purpose of the Proposed Master Plan is to provide a long-term planning document that provides a visionary site plan to guide future expansion with enhanced student and community access to the sites.

Currently, funding is identified for only the new Laurelwood Elementary School and the Peterson track and field facility. The bleachers, baseball and multiuse fields, tennis courts, and other improvements are not currently funded. The other improvements identified in the Master Plan will be completed as funding is secured. Once the Master Plan is complete in summer 2022, the design of the new Laurelwood Elementary School and the Peterson field facility will begin.

ISSUES TO BE ADDRESSED IN THE EIR

Based on the project description and the Lead Agency's understanding of the environmental issues associated with the Proposed Master Plan, it is anticipated that implementation of the Proposed Master Plan has the potential to result in significant environmental effects associated with some or all of the following topics, consistent with Appendix G of the *CEQA Guidelines* and analyzed in detail in the EIR:

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources

- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems
- Wildfire

The EIR will analyze the reasonably foreseeable indirect physical changes to the environment in the above topic areas caused by the Proposed Master Plan. Pursuant to *CEQA Guidelines* Section 15060(d), no initial study was prepared.

Alternatives to be analyzed in the EIR are to be defined and analyzed consistent with the requirements of *CEQA Guidelines*, Section 15126.6. The alternatives to be evaluated in the EIR may include, but are not limited to, the "No Project" Alternative, as required by CEQA and alternative land use configurations.

NOTICE OF PUBLIC SCOPING MEETING

Pursuant to California Public Resources Code Sections 21083.9, 21092.2, and California Code of Regulations, Title 14 (*CEQA Guidelines*) Sections 15082 and 15083, the School District, as the Lead Agency, will conduct a Scoping Meeting for the purpose of soliciting oral and written comments from interested parties requesting notice; responsible agencies; agencies with jurisdiction by law; trustee agencies; and involved federal agencies, including transportation agencies, as to the appropriate scope and content of the EIR.

The Scoping Meeting will be virtual on July 19, 2022 at 6:00 P.M.

RESPONSIBLE AND TRUSTEE AGENCIES

The Santa Clara Unified School District requests your agency's views on the scope and content of the environmental information relevant to your agency's statutory responsibilities in connection with the Proposed Master Plan, in accordance with *CEQA Guidelines* Section 15082(b). Your agency will need to use the EIR prepared by the School District when considering any permits or other project approvals that your agency must issue. As such, your responses to this Notice of Preparation (NOP), at a minimum, should identify: (1) significant environmental issues and reasonable alternatives and mitigation measures that your agency will need to have explored in the EIR.

REVIEW AND RESPONSE PERIOD

In accordance with *CEQA Guidelines* Section 15082, this NOP is being circulated for a 30-day comment period. Responses to this NOP must be provided during this response period as outlined below:

June 27 through July 28, 2022

DOCUMENT AVAILABILITY

The NOP can be viewed on the Santa Clara Unified School District, Facility Development and Planning website at https://www.santaclarausd.org/PetersonLaurelwoodmasterplan. A physical copy of the NOP will also be available at the School District's Facility Development and Planning Department at 3350 Brookdale Drive, Santa Clara, CA 95050. For more information about this EIR, please visit https://www.santaclarausd.org/PetersonLaurelwoodmasterplan.

If you have questions or would like to be added to the listserv for this project, please email PetersonLaurelwoodPlan@scusd.net. If you have previously requested to be on the listserv you will automatically receive all notifications related to the project.

SUBMITTAL OF WRITTEN COMMENTS

The Lead Agency solicits comments regarding the scope, content, and specifics of the EIR from all interested parties requesting notice, responsible agencies, agencies with jurisdiction by law, trustee agencies, and involved agencies. The Santa Clara Unified School District requests that written comment be provided at the earliest possible date, but **no later than July 28, 2022**.

Please submit comments electronically through the project website or send a hard copy via mail (including name and contact information) to the following:

Re: Santa Clara Unified School District Peterson Laurelwood Master Plan Notice of Preparation (NOP) for Draft Environmental Impact Report (DEIR)

Dear Michal Healy:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the Peterson Laurelwood Master Plan Project. We are committed to ensuring that impacts to the State's multimodal transportation system and to our natural environment are identified and mitigated to support a safe, sustainable, integrated and efficient transportation system. The following comments are based on our review of the June 2022 NOP.

Project Understanding
The Proposed Master Plan consists of the entire Patrick Henry Campus, the Peterson Middle School Site, and the future use of the existing Laurelwood Elementary School Site. The District's Master Plan includes construction of the new Laurelwood Elementary School, Peterson fields, relocated District storage area, and yet to be determined uses on the closed Patrick Henry Middle School Site; improvements to Peterson Middle School including the new fields and a fieldhouse; relocation of the existing tennis courts; new vehicular and pedestrian access; expanded administration and media center, a new environmental education center, outdoor learning areas and amphitheater.

Travel Demand Analysis
With the enactment of Senate Bill (SB) 743, Caltrans is focused on maximizing efficient development patterns, innovative travel demand reduction strategies, and multimodal improvements. For more information on how Caltrans assesses

Transportation Impact Studies, please review Caltrans' Transportation Impact Study Guide (*link*).

If the project meets the screening criteria established in the District's adopted Vehicle Miles Traveled (VMT) policy to be presumed to have a less-than-significant VMT impact and exempt from detailed VMT analysis, please provide justification to support the exempt status in alignment with the District's VMT policy. Projects that do not meet the screening criteria should include a detailed VMT analysis in the DEIR, which should include the following:

- VMT analysis pursuant to the District's guidelines. Projects that result in automobile VMT per capita above the threshold of significance for existing (i.e. baseline) city-wide or regional values for similar land use types may indicate a significant impact. If necessary, mitigation for increasing VMT should be identified. Mitigation should support the use of transit and active transportation modes. Potential mitigation measures that include the requirements of other agencies such as Caltrans are fully enforceable through permit conditions, agreements, or other legally-binding instruments under the control of the District.

- A schematic illustration of walking, biking and auto conditions at the project site and study area roadways. Potential traffic safety issues to the State Transportation Network (STN) may be assessed by Caltrans via the Interim Safety Guidance (*link*).

- The project's primary and secondary effects on pedestrians, bicycles, travelers with disabilities and transit performance should be evaluated, including countermeasures and trade-offs resulting from mitigating VMT increases. Access to pedestrians, bicycle, and transit facilities must be maintained.

- Clarification of the intensity of events/receptions to be held at the location and how the associated travel demand and VMT will be mitigated.

Transportation Impact Fees
Please identify project-generated travel demand and estimate the costs of transit and active transportation improvements necessitated by the proposed project; viable funding sources such as development and/or transportation impact fees should also be identified. We encourage a sufficient allocation of fair share contributions toward multi-modal and regional transit improvements to fully mitigate cumulative impacts to regional transportation. We also strongly support measures to increase sustainable mode shares, thereby reducing VMT.

Construction-Related Impacts
Potential impacts to the State Right-of-Way (ROW) from project-related temporary access points should be analyzed. Mitigation for significant impacts due to construction and noise should be identified. Project work that requires movement of

oversized or excessive load vehicles on State roadways requires a transportation permit that is issued by Caltrans. To apply, visit: https://dot.ca.gov/programs/traffic-operations/transportation-permits. Prior to construction, coordination may be required with Caltrans to develop a Transportation Management Plan (TMP) to reduce construction traffic impacts to the STN.

Lead Agency
As the Lead Agency, the Santa Clara Unified School District is responsible for all project mitigation, including any needed improvements to the STN. The project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully discussed for all proposed mitigation measures.

Equitable Access
If any Caltrans facilities are impacted by the project, those facilities must meet American Disabilities Act (ADA) Standards after project completion. As well, the project must maintain bicycle and pedestrian access during construction. These access considerations support Caltrans' equity mission to provide a safe, sustainable, and equitable transportation network for all users.

Encroachment Permit
Please be advised that any permanent work or temporary traffic control that encroaches onto Caltrans' ROW requires a Caltrans-issued encroachment permit. As part of the encroachment permit submittal process, you may be asked by the Office of Encroachment Permits to submit a completed encroachment permit application package, digital set of plans clearly delineating Caltrans' ROW, digital copy of signed, dated and stamped (include stamp expiration date) traffic control plans, this comment letter, your response to the comment letter, and where applicable, the following items: new or amended Maintenance Agreement (MA), approved Design Standard Decision Document (DSDD), approved encroachment exception request, and/or airspace lease agreement. Your application package may be emailed to D4Permits@dot.ca.gov.

Please note that Caltrans is in the process of implementing an online, automated, and milestone-based Caltrans Encroachment Permit System (CEPS) to replace the current permit application submittal process with a fully electronic system, including online payments. The new system is expected to be available during 2022. To obtain information about the most current encroachment permit process and to download the permit application, please visit https://dot.ca.gov/programs/traffic-operations/ep/applications.

Thank you again for including Caltrans in the environmental review process. Should you have any questions regarding this letter, or for future notifications and requests for review of new projects, please email LDR-D4@dot.ca.gov.

Sincerely,

Mark Leong

APPENDIX 2.0-1

SCUSD Board Resolution 22-39

Santa Clara Unified School District
Rendering Zoning Ordinances Inapplicable to the Construction of Building Projects Funded from General Obligation Bond Measure BB
Board Resolution #22-39

WHEREAS, Government Code sections 53094 authorizes the governing board of a school district, by a vote of two-thirds of its members, to render a city's zoning ordinances inapplicable to any proposed design and construction upon and use of property by a school district for classroom facilities if the facilities are physically located within the geographical jurisdiction of the school district; and

WHEREAS, the registered voters within the boundary of the Santa Clara Unified School District (District) approved General Obligation Bonds, Measure BB in 2018; and

WHEREAS, the properties ("Properties") are owned by District; and

WHEREAS, District intends to construct new buildings on District owned sites; and

WHEREAS, the Properties are located within the geographical jurisdiction of the City of Santa Clara, the City of Sunnyvale and the City of San Jose; and

WHEREAS, the District has a statutory right and power of exemption from local zoning ordinances applicable to the Properties for design, construction and operations of classroom facilities; and

WHEREAS, the Board of Trustees of the District deems it advisable to exercise the statutory right and power of exemption from local zoning ordinances applicable to the Properties for the expeditious construction of classroom facilities to better serve the students, staff and families who are part of the District.

NOW THEREFORE, BE IT RESOLVED, the Santa Clara Unified School District shall render zoning ordinances inapplicable from any and all zoning ordinances of the City of Santa Clara, the City of Sunnyvale and the City of San Jose in California otherwise applicable to the Property and the District's proposed construction of classroom facilities; and

BE IT FURTHER RESOLVED, the District shall notify the City of Santa Clara, the City of Sunnyvale and the City of San Jose in California of its resolution to render inapplicable the zoning ordinances for the purpose of school use at the Property within ten (10) days of this Resolution.

This Resolution was:

PASSED AND ADOPTED this 25th day of August 2022, by the following vote:

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	11.6	annual days of extreme heat
Extreme Precipitation	3.80	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	1	0	0	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	1	1	1	2
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	16.8
AQ-PM	16.8
AQ-DPM	51.0
Drinking Water	38.5
Lead Risk Housing	41.1
Pesticides	0.00
Toxic Releases	43.2
Traffic	82.5
Effect Indicators	—
CleanUp Sites	85.0
Groundwater	93.2
Haz Waste Facilities/Generators	46.4

Impaired Water Bodies	23.9
Solid Waste	0.00
Sensitive Population	—
Asthma	3.29
Cardio-vascular	7.22
Low Birth Weights	47.4
Socioeconomic Factor Indicators	—
Education	12.0
Housing	20.3
Linguistic	64.1
Poverty	1.43
Unemployment	26.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	90.86359553
Employed	87.36045169

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	16.0
Healthy Places Index Score for Project Location (b)	94.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health and Equity Evaluation Scorecard not completed.

8. User Changes to Default Data

Screen	Justification
Land Use	Laurelwood Elementary lot acreage estimated at 12.7 acres. Track and Field acreage estimated at 6.3 acres. Total acreage is 19.0 acres. Building sq. ft. based on project description. Landscape areas include Laurelwood play area field (103,000 sq. ft.) and the Peterson track and field area (estimated 100,000 sq. ft.).
Construction: Construction Phases	Construction phase estimates based on project description.
Construction: Off-Road Equipment	Equipment list Peterson track and field site based on default equipment lists for a 6.3 acre site. Equipment list for Laurelwood site based on default equipment list for a 12.7 acre site.

SCUSD Peterson Laurelwood Phase 2 Construction Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	SCUSD Peterson Laurelwood Phase 2 Construction
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	32.8
Location	37.349245031623326, -122.00789539133385
County	Santa Clara
City	Sunnyvale
Air District	Bay Area AQMD
Air Basin	San Francisco Bay Area
TAZ	1765
EDFZ	1
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Parking Lot	87.8	1000sqft	10.7	0.00	0.00	0.00	—	—

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	11.6	annual days of extreme heat
Extreme Precipitation	3.80	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	1	0	0	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	1	1	1	2
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	16.8
AQ-PM	16.8
AQ-DPM	51.0
Drinking Water	38.5
Lead Risk Housing	41.1
Pesticides	0.00
Toxic Releases	43.2
Traffic	82.5
Effect Indicators	—
CleanUp Sites	85.0
Groundwater	93.2
Haz Waste Facilities/Generators	46.4
Impaired Water Bodies	23.9
Solid Waste	0.00
Sensitive Population	—
Asthma	3.29
Cardio-vascular	7.22
Low Birth Weights	47.4
Socioeconomic Factor Indicators	—
Education	12.0
Housing	20.3

Linguistic	64.1
Poverty	1.43
Unemployment	26.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	90.86359553
Employed	87.36045169
Education	—
Bachelor's or higher	91.08174002
High school enrollment	100
Preschool enrollment	74.06646991
Transportation	—
Auto Access	62.47914795
Active commuting	50.58385731
Social	—
2-parent households	71.4744001
Voting	88.28435776
Neighborhood	—
Alcohol availability	41.28063647
Park access	53.36840755
Retail density	56.16578981
Supermarket access	76.37623508
Tree canopy	79.94353907
Housing	—

Homeownership	51.39227512
Housing habitability	84.79404594
Low-inc homeowner severe housing cost burden	95.56011805
Low-inc renter severe housing cost burden	77.50545361
Uncrowded housing	53.4838958
Health Outcomes	—
Insured adults	87.18080328
Arthritis	94.7
Asthma ER Admissions	97.8
High Blood Pressure	91.8
Cancer (excluding skin)	57.8
Asthma	98.2
Coronary Heart Disease	94.7
Chronic Obstructive Pulmonary Disease	97.7
Diagnosed Diabetes	94.1
Life Expectancy at Birth	91.4
Cognitively Disabled	80.8
Physically Disabled	76.0
Heart Attack ER Admissions	93.8
Mental Health Not Good	97.3
Chronic Kidney Disease	95.6
Obesity	97.2
Pedestrian Injuries	59.5
Physical Health Not Good	98.0
Stroke	95.7
Health Risk Behaviors	—
Binge Drinking	75.2

Current Smoker	96.7
No Leisure Time for Physical Activity	91.2
Climate Change Exposures	—
Wildfire Risk	0.0
SLR Inundation Area	0.0
Children	31.0
Elderly	39.7
English Speaking	44.1
Foreign-born	82.0
Outdoor Workers	86.4
Climate Change Adaptive Capacity	—
Impervious Surface Cover	50.7
Traffic Density	60.3
Traffic Access	58.3
Other Indices	—
Hardship	9.8
Other Decision Support	—
2016 Voting	89.6

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	16.0
Healthy Places Index Score for Project Location (b)	94.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health and Equity Evaluation Scorecard not completed.

8. User Changes to Default Data

Screen	Justification
Land Use	Estimate of Phase 2 lot area.
Construction: Construction Phases	Conceptual construction schedule for Phase 2.

SCUSD Peterson Laurelwood Construction Phase 3 Detailed Report

Table of Contents

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	SCUSD Peterson Laurelwood Construction Phase 3
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	32.8
Location	37.349208508337384, -122.00798000565118
County	Santa Clara
City	Sunnyvale
Air District	Bay Area AQMD
Air Basin	San Francisco Bay Area
TAZ	1765
EDFZ	1
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Elementary School	7.35	1000sqft	0.33	7,350	0.00	0.00	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	11.6	annual days of extreme heat
Extreme Precipitation	3.80	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	1	0	0	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	1	1	1	2
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	16.8
AQ-PM	16.8
AQ-DPM	51.0
Drinking Water	38.5
Lead Risk Housing	41.1
Pesticides	0.00
Toxic Releases	43.2
Traffic	82.5
Effect Indicators	—
CleanUp Sites	85.0
Groundwater	93.2
Haz Waste Facilities/Generators	46.4
Impaired Water Bodies	23.9
Solid Waste	0.00
Sensitive Population	—
Asthma	3.29
Cardio-vascular	7.22
Low Birth Weights	47.4
Socioeconomic Factor Indicators	—
Education	12.0
Housing	20.3

Linguistic	64.1
Poverty	1.43
Unemployment	26.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	90.86359553
Employed	87.36045169
Education	—
Bachelor's or higher	91.08174002
High school enrollment	100
Preschool enrollment	74.06646991
Transportation	—
Auto Access	62.47914795
Active commuting	50.58385731
Social	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	16.0
Healthy Places Index Score for Project Location (b)	94.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health and Equity Evaluation Scorecard not completed.

8. User Changes to Default Data

Screen	Justification
Land Use	Estimated phase 3 lot size.
Construction: Construction Phases	Conceptual construction schedule for Phase 3.

SCUSD Peterson Laurelwood Phase 4 Construction Detailed Report

Table of Contents

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	—	annual days of extreme heat
Extreme Precipitation	—	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	—	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	16.8
AQ-PM	16.8
AQ-DPM	51.0
Drinking Water	38.5
Lead Risk Housing	41.1
Pesticides	0.00
Toxic Releases	43.2
Traffic	82.5
Effect Indicators	—
CleanUp Sites	85.0
Groundwater	93.2
Haz Waste Facilities/Generators	46.4
Impaired Water Bodies	23.9
Solid Waste	0.00
Sensitive Population	—
Asthma	3.29
Cardio-vascular	7.22
Low Birth Weights	47.4
Socioeconomic Factor Indicators	—
Education	12.0
Housing	20.3
Linguistic	64.1
Poverty	1.43

Unemployment	26.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	—
Employed	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	16.0
Healthy Places Index Score for Project Location (b)	—
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	59,697	19,899	—

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Site Preparation	—	—	15.0	0.00	—
Grading	—	—	21.0	0.00	—

Paving	0.00	0.00	0.00	0.00	0.00

5.6.2. Construction Earthmoving Control Strategies

Non-applicable. No control strategies activated by user.

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
High School	0.00	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2027	0.00	204	0.03	< 0.005
2028	0.00	204	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	11.6	annual days of extreme heat
Extreme Precipitation	3.80	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	1	0	0	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	1	1	1	2
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	16.8
AQ-PM	16.8
AQ-DPM	51.0
Drinking Water	38.5
Lead Risk Housing	41.1
Pesticides	0.00
Toxic Releases	43.2
Traffic	82.5
Effect Indicators	—
CleanUp Sites	85.0
Groundwater	93.2
Haz Waste Facilities/Generators	46.4
Impaired Water Bodies	23.9
Solid Waste	0.00
Sensitive Population	—
Asthma	3.29
Cardio-vascular	7.22
Low Birth Weights	47.4
Socioeconomic Factor Indicators	—
Education	12.0
Housing	20.3

Linguistic	64.1
Poverty	1.43
Unemployment	26.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	90.86359553
Employed	87.36045169
Education	—
Bachelor's or higher	91.08174002
High school enrollment	100
Preschool enrollment	74.06646991
Transportation	—
Auto Access	62.47914795
Active commuting	50.58385731
Social	—
2-parent households	71.4744001
Voting	88.28435776

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	16.0
Healthy Places Index Score for Project Location (b)	94.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health and Equity Evaluation Scorecard not completed.

8. User Changes to Default Data

Screen	Justification
Land Use	Estimated lot acreage for Phase 5
Construction: Construction Phases	Conceptual construction schedule for Phase 5

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	11.6	annual days of extreme heat
Extreme Precipitation	3.80	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	1	0	0	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	1	1	1	2
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2

Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	16.8
AQ-PM	16.8
AQ-DPM	51.0
Drinking Water	38.5
Lead Risk Housing	41.1
Pesticides	0.00
Toxic Releases	43.2
Traffic	82.5

Executive Summary

In November 2021, Impact Sciences, Inc. (Impact Sciences) on behalf of the Santa Clara Unified School District (SCUSD) contracted with Albion Environmental, Inc. (Albion) and Dogtrot Historical Consulting, LLC (Dogtrot) to conduct a cultural resources inventory and architectural resources evaluation for the proposed Peterson Laurelwood Master Plan and the existing Laurelwood Elementary School Campus Project, encapsulating 79.35 acres in the City of Sunnyvale and the City of Santa Clara (Proposed Master Plan). The Proposed Master Plan includes the development of a master plan for the Patrick Henry Campus, Marian A. Peterson Site, SCUSD Farm, new Laurelwood Elementary School, and future programs at the existing Laurelwood Elementary School Campus. In order to create a plan that encompasses all of the District's assets, the SCUSD is creating a master plan for the area within the plan's boundaries. At the time of the current study, details about proposed construction elements or the maximum depth of disturbance is unknown and anticipated to vary among Project elements.

Albion's and Dogtrot's study was conducted to comply with requirements under the California Environmental Quality Act (CEQA) (Public Resources Code 21000 et seq.). This study included: (1) archival and background research; (2) a search of records at the Northwest Information Center (NWIC); (3) an archaeological pedestrian survey of the proposed Project Area; (4) an architectural survey of buildings, structures, circulation systems, and landscaping within the proposed Project Area; and (5) a report of findings and recommendations.

A search of records at the NWIC indicated that no cultural resource studies have been conducted within the Project Area, and five cultural resource studies have been conducted within a $^1/_4$-mile radius of the Project Area. Additionally, the record search indicated that no cultural resources have been recorded within the Project Area or within a $^1/_4$-mile radius of the Project Area. Historic aerial photography and archival research illustrates that the Project Area was a part of Mexican Rancho landscapes and by the early to mid-20th century consisted of orchards that were owned and operated by Italian immigrant families. The property was sold in segments to the Jefferson School District in 1955 and 1960 and developed into the Patrick Henry Campus and Marian A. Peterson Middle School. After reviewing the records search results, Albion and Dogtrot conducted a full-coverage, intensive pedestrian survey of the Project Area, on January 17, 2022. Constraints during the survey included poor surface visibility due to dense grasses and vegetation, pavement, and standing architecture obscuring approximately 50% of the Project Area. The archaeological pedestrian survey yielded positive results, as one historic-era isolated cultural resource was observed on the surface (Iso 1). The architectural survey consisted of photographing buildings, structures, circulation systems, and landscaping and taking field notes of observations.

It is our assessment that there is a moderate-high potential for buried precolonial archaeological resources to be located within the Project Area. The soils are hypothesized to be from the Holocene, and these soils are located in a flat alluvial fan with slopes less than 9 degrees and are less than 200 meters (656 feet) from a water course (Byrd et al. 2017; Meyer et al. 2010; Rosenthal and Meyer 2004). Our visual inspection of the Project Area ground surface determined that soils encountered

are consistent with what is mapped in the area with no evidence of culturally produced stratigraphy, and we did not identify any evidence of in-tact precolonial archaeological deposits. However, due to the moderate-high potential of the Project Area to contain precolonial archaeological deposits, Albion recommends that, once the Project elements and depths of impact have been designed, an additional archaeological subsurface study be conducted within the areas and to the depth of Project impacts, to further test for the presence or absence of precolonial archaeological resources. This is especially important for Project elements that extend further than 2 feet below ground surface, as the first two feet of soil is likely disturbed by the modern environment.

In addition, it is our professional opinion that there is a low potential for any buried historic-era archaeological resources to be located within the Project Area. The first documented historic-era development of the project consisted of agricultural fields during the 20th century. Further, our visual inspection of the Project Area ground surface did not identify any evidence of in-tact historic-era archaeological deposits. Therefore, it is our assessment that the proposed Project is not likely to impact any subsurface historic-era cultural resources.

The Marian A. Peterson Middle School campus and the Patrick Henry Intermediate School campus were evaluated for eligibility for listing on the California Register of Historical Resources (CRHR), using the criteria outlined in California PRC section 5024.1. It has been determined that neither property is associated with events that have made a significant contribution to the broad patterns of history; is associated with the lives of persons important to history; or embodies the distinctive characteristics of a type, period, region, or method of construction. Furthermore, neither is likely to yield important information about architectural design or construction. Because neither is eligible for the CRHR, neither is a historical resource for the purposes of CEQA. No further action is required.

Additionally, since many important cultural resources, such as tribal cultural resources/traditional cultural properties, do not necessarily leave an archaeological footprint or have physically identifiable manifestations, it is vital to seek out information regarding the possible presence of these important resources and their locations through consultation with local tribal members. Under the authority of Assembly Bill 52, the District, is responsible for collecting and incorporating Tribal information into the environmental review process.

Introduction 1

PROJECT LOCATION

The proposed Peterson Laurelwood Master Plan and the existing Laurelwood Elementary School Campus Project (Proposed Master Plan), encapsulates 79.35 acres in the City of Sunnyvale and the City of Santa Clara (Appendix A: Figures A-1 and A-2). The Project Area consists of three school sites: the Patrick Henry Campus and a portion of the Marian A. Peterson Middle School Site in the Northwest, and the Laurelwood Elementary School Site in the Southeast. The Patrick Henry Campus and Peterson Middle School Site is bound on the north by Bryant Way, on the east by Teal Drive, on the south by Dunford Way, and on the west by residential housing. The Laurelwood Elementary School Site is bound on the north and east by residential housing, on the south by Kensington Avenue, and on the west by Teal Drive. The entirety of the Project Area is owned and developed by the Santa Clara Unified School District (SCUSD) as the Patrick Henry Campus, Peterson Middle School Campus, the SCUSD Farm, and existing Laurelwood Elementary School Campus.

PROJECT DESCRIPTION

The Proposed Master Plan includes the development of a master plan for the Patrick Henry Campus, Peterson Middle School, SCUSD Farm, and new Laurelwood Elementary School, and future programs as the existing Laurelwood Elementary School Campus. The SCUSD proposes to build a new Laurelwood Elementary on a portion of the Patrick Henry Campus, relocate District storage areas, yet to be determined uses of the closed Patrick Henry Middle School, program improvements at the SCUSD Farm and compost areas, and improvements at the existing Peterson Middle School. Developments at the existing Peterson Middle School include new fields and a fieldhouse, relocation of the existing tennis courts, new vehicular and pedestrian access, expanded administration and media center, a new environmental education center, outdoor learning areas, and an amphitheater. The SCUSD also may build a new school on the property. In order to create a plan that encompasses all of the District's assets, the SCUSD is creating a master plan for the area within the plan's boundaries. At the time of the current study, details about proposed construction elements or the maximum depth of disturbance is unknown and anticipated to vary among Project elements.

REGULATORY FRAMEWORK

Section 15064.5(a)(2-3) of the California Environmental Quality Act (CEQA) Guidelines require that state and local public agencies evaluate the potential for historical resources to be impacted by discretionary activities, using the criteria outlined in California Public Resources Code (PRC) section 5024.1. PRC 5042.1 established the California Register of Historical Resources (CRHR). The CRHR is an authoritative guide in California to be used by state and local agencies, private groups, and citizens

to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from the substantial adverse change.

Cultural resources are defined as any tangible evidence of past human activity, regardless of significance, found in association with a geographic location. Cultural resources include tangible properties possessing intangible cultural values. Five classes of cultural resources are generally recognized including buildings, structures, objects, sites, and districts. Classes encompass a range of resource types including prehistoric archaeological sites, historic archaeological sites, the built environment, and Traditional Cultural Properties.

In accordance with CEQA, cultural resources encountered during the Project shall be evaluated to determine if the resource is a historical resource, meeting the criteria for inclusion in the CRHR (CEQA Guidelines, Section 15064.5 [a]). Sites determined not eligible are further assessed to determine if they meet the definition of a "Unique Archaeological Resource" under Section 21083.2 of the Public Resources Code. Cultural resource evaluations then assess potential Project impacts on these resources.

Cultural resources included in or eligible for the California Register of Historical Resources (CRHR) are considered significant and are thus referred to as historical resources (CEQA). California PRC 5020.1(j) defines a "historical resource" as including, but not limited to, any object, building, structure, site, area, place, record, or manuscript which is historically or architecturally significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military or cultural annals of California. California PRC 5020.1(h) defines a "historic district" as a definable unified geographic entity that possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development.

Evaluation of archaeological and historic resources is based on the criteria set forth in Section 15064.5 (a) (3) of the CEQA Guidelines. This statute states that a site is eligible for listing in the California Register of Historical Resources if the resource retains enough of its historic character or integrity, and meets one or more of the following criteria:

1) is associated with events that have made a significant contribution to broad patterns of California's history and cultural heritage;
2) is associated with the lives of persons significant in our past;
3) embodies the distinctive characteristic of a type, period, or method of construction, or represents the work of an important creative individual, or possesses high artistic values;
4) has, or may be likely to yield, important information in prehistory or history.

Integrity is the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance. Historical resources eligible for listing in the CRHR must meet at least one of the criteria of significance described above and retain sufficient historic integrity to convey the reasons for their significance. The following seven aspects define historic integrity:

1) Location. The place where the historic property was constructed or the place where the historic event occurred.

2) Design. The combination of elements that create the form, plan, space, structure, and style of a property.
3) Setting. The physical environment of a historic property.
4) Materials. The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
5) Workmanship. The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
6) Feeling. A property's expression of the aesthetic or historic sense of a particular period of time.
7) Association. The direct link between an important historic event or person and a historic property.

To retain historic integrity, a resource should possess several of the above-mentioned aspects. The retention of specific aspects of integrity is essential for a resource to convey its significance. Comparisons with similar properties are considered when evaluating integrity as it may be important in deciding what physical features are essential to reflect the significance of a historic context. If a property is determined to not be eligible or individual listing on the CRHR, then it will not be evaluated for historic integrity.

If the resource is considered not significant (not a historical resource under CEQA), the effects of the Project on that resource will not be considered significant and the resource need not be considered further in the CEQA process.

If the resource is considered significant (a historical resource under CEQA), and it is determined that the Project will cause a substantial adverse change in the significance of a resource, it will be necessary to develop mitigation measures to render impacts to less than significant (CEQA Guidelines, Section 15064.5 [c]). Under CEQA, avoidance is the preferred mitigation for archaeological sites. Other mitigation measures are provided in the Guidelines (Section 15126.4[b][3]). When data recovery excavation is the only prudent and feasible alternative, excavations should be carried out in accordance with methods outlined in a project specific excavation plan or Treatment Plan.

Sources Consulted

2

RECORDS SEARCH

Jessica Akmenkalns, Researcher for the NWIC, provided the results of a records search for cultural resources and studies within a $^1/_4$-mile radius of the Project Area on November 16, 2021 (Appendix B). In addition to official maps and records, the following sources of information were consulted as part of the records search:

- Built Environment Resources Directory (BERD), which includes:
  - National Register of Historic Places (NRHP)
  - California Historical Landmarks
  - Office of Historic Preservation Historic Properties Directory
- Office of Historic Preservation Archaeological Determinations of Eligibility
- California Inventory of Historical Resources
- Special Research Collections at the UCSC and UCSB Libraries (aerial images and historic maps)

BERD

No properties are listed on the Directory within a $^1/_4$-mile radius of the Project Area.

OFFICE OF HISTORIC PRESERVATION ARCHAEOLOGICAL DETERMINATIONS OF ELIGIBILITY

No properties are listed on the Archaeological Determinations of Eligibility Directory within a $^1/_4$-mile radius of the Project Area.

CALIFORNIA INVENTORY OF HISTORICAL RESOURCES

No properties are listed on the Directory within a $^1/_4$-mile radius of the Project Area.

PREVIOUSLY CONDUCTED CULTURAL RESOURCE STUDIES

According to the NWIC, no cultural resource studies have been conducted within the Project Area and five cultural resource studies have been conducted within a $^1/_4$-mile radius of the Project Area

and consisted of field studies for both archaeological resources and historic properties. The previous studies are listed in Table 1 below.

Table 1. Cultural Resource Studies Conducted Within a $^1/_4$-Mile Radius of the Project Area.

Report No.	Citation Title	Authors	Citation Year
S-04183	An Archaeological Reconnaissance of Calabazas Creek (from Lawrence Expressway to Wolfe Road), for the Santa Clara Valley Water District	R. Edwards	1974
S-07390	A Cultural Resources Survey of the Proposed Lawrence Expressway High Occupancy Vehicle Lanes Project, Located in the Cities of Sunnyvale, Santa Clara, and San Jose, Santa Clara County, California	R. L. Anastasio et al.	1985
S-09368	Cultural Resource Evaluation of the Calabazas Creek Flood Control Project in the Cities of Cupertino and Santa Clara, County of Santa Clara	R. Cartier	1987

S-24944	Historic Property Survey Report - Negative Findings, Wolfe Road Widening Project, City of Sunnyvale, Santa Clara County, California	Basin Research Associates, Inc.	2000

PREVIOUSLY RECORDED CULTURAL RESOURCES

The records search identified no cultural resources located within the Project Area nor within a $^1/_4$-mile radius of the Project Area.

HISTORICAL IMAGERY

Albion conducted an online search of historic maps and aerials and found information pertinent to the Project Area from the following:

- 1864 rancho map
- 1876 plat map
- 1889 plat map
- 1939 aerial photograph
- 1956 aerial photograph
- 1965 aerial photograph

ARCHIVES

Online catalogs of the Sunnyvale Public Library, San José Public Library/Dr. Martin Luther King, Jr. Library's California Room, and History San José were examined for this Project. Appointments with the three repositories and on-location research was conducted on January 16, 17, and 18. In addition, SCUSD provided copies of the original architectural plans and property deeds for the two subject properties.

Other resources that were used include, but are not limited to, the following:

- Santa Clara County Archives
- California State Library, Witkin State Law Library
- California State Library, California History Room
- Internet Archives (archive.org)
- Ancestry.com
- HistoricAerials.com
- Online Archive of California
- Society of Architectural Historians online archives
- Digitized San Jose Mercury News
- Digitized San Jose Evening News
- California Department of Education website
- Santa Clara County Office of Education

Background

3

NATURAL ENVIRONMENT

Geomorphologically, Santa Clara Valley is a structural basin within the Coast Ranges Geomorphic Province. It forms a relatively level flood plain at the southern end of San Francisco Bay and is oriented in a roughly northwest-southeast orientation. The valley runs for a length of approximately 100 kilometers (62 miles) from north to south, eventually terminating near the city of Hollister in San Benito County. It is approximately 20 kilometers (15 miles) in width and encompasses approximately 1,312 square miles. The northern part of the valley, which forms the southern end of San Francisco Bay, is a complex network of marshes, wetlands, sloughs, and creeks, and ranges in elevation to just above mean sea level (msl). The southern part of the valley, by contrast, is generally a broad and level-to-sloping plain, with an elevation of over 200 feet. The valley is drained by the Guadalupe River and a number of streams, creeks, and tributaries (e.g., Coyote, Los Gatos, Stevens, and Alimitos). Dominant landforms include the northwest-trending Diablo Range to the east and the Santa Cruz Mountains to the west. The Diablo Range is part of the Franciscan Complex and was formed during the Upper Jurassic-Cretaceous. The Santa Cruz Mountains are also part of the Franciscan Complex but contain later Pliocene sedimentary deposits. Between these ranges, the main habitat types are valley oak savanna, grasslands, and riparian corridors. The two former habitat types often form a single habitat, dominated by an overstory of scattered valley oaks (*Quercus lobata*) and an understory of bunch grasses, spear grass, needle grass, and forbs. Flora dominating riparian corridors includes California bay laurel, willow, sycamore, cottonwood, and a number of smaller hydrophytic plants. The valley is geologically active with three major faults, including San Andreas, Hayward, and Calaveras, running roughly north-to-south.

By the late 18th century, the Santa Clara Valley was made up of a mosaic of different ecological communities, including tidal marshlands, uplands, grassland prairie, oak-grassland savanna, and riparian corridors. The first of these, tidal marshlands, were especially prevalent around the margins of the San Francisco Bay. Freshwater from a multitude of rivers, creeks, and streams met with the saltwater of the Bay, creating a vast, brackish tidal marshland, which was a haven for various fish, waterfowl, marine mammals, and invertebrates. Floral communities consisted of dense perennial grasses in the inter-tidal sand and mud flats just above mean high-water level. The most common species included Tule reeds (*Schoenoplectus acutus*), eelgrass (*Zostera marina*), saltgrass (*Distichlis spicata*), pickleweed (*Salicornia sarcocornia*), and cordgrass (*Spartina* spp.). The high productivity of the sloughs attracted a diversity of marine and estuarine creatures, including leopard sharks (*Triakis semifasciata*), bat rays (*Myliobatus californica*), Pacific herring (*Clupea harengus*), Pacific sardine (*Sardinops sagax*), sturgeon (*Acipenser* spp.), salmon (*Oncorhynchus* spp.), among numerous other taxa. Shorebirds common to this area included gulls (*Larus* spp.), rails (Rallidae), egrets (*Ardea* spp.), herons (*Ardea* spp.), cormorants (*Phalacrocorax* spp.), pelicans (*Pelecanus* spp.), and a host of ducks (Anatidae), geese (*Anser*, *Branta*, *Chen* spp.), and various other waterfowl. This region also attracted

mammals, such as sea otters (*Enhydra lutris*), harbor seals (*Phoca vitulina*), and elk (*Cervus elaphus nannodes*), which waded into the shallows to feed on marsh grasses. Invertebrates common to this habitat included California horn snail (*Cerithidea californica*), bay mussel (*Mytilus edulis*), oyster (*Ostrea lurida*), bent-nosed clam (*Macoma nasuta*), and Pismo clam (*Tivela stultorum*).

Surrounding the marshes was extensive grassland prairie, which during pre-European times, would have consisted of tall, perennial bunch grasses and forbs. Prairie grasses included oatgrass (*Danthonia californica*), red fescue (*Festuca rubra*), Pacific reedgrass (*Calamagrostis nutkaensis*), tufted hairgrass (*Deschampsia cespitosa*), soaproot (*Chlorogalum pomeridianum*), *broadiaea*, and iris (Iridaceae), among other taxa. Interspersed within this community was a dense scrub community consisting primarily of evergreen shrubs, vines, and forbs. In the margin between the marshes and grassland, willows (*Salix* spp.) grew in abundance. The area's native inhabitants periodically burned the grassland prairie to facilitate the growth of new shoots, and hence increase the abundance of browsing animals. Mammals common to this community included Tule elk (*Cervus elaphus nannodes*), badger (*Taxidea taxus*), black-tailed jackrabbit (*Lepus californicus*), pocket gopher (*Thomomys bottae*), and California vole (*Microtus californicus*). A number of raptors were found in this habitat, including northern harrier (*Circus cyaneus*) and Swainson's hawk (*Buteo swainsonii*).

Upland habitats include the Santa Cruz Mountains to the west and Diablo Range to the east. The Santa Cruz Mountains separate the valley from the Pacific Ocean to the west and rise to an elevation of approximately 1,154 meters (3,786 feet) at Loma Prieta Peak. Other prominent peaks in the range include Mount Umunhum at 1,063 meters (3,486 feet) and Bielawski at 985 meters (3,231 feet). These mountains form a rain-shadow effect for regions to the east, diverting the moisture of eastward-moving Pacific storms. Consequently, the floral communities, especially those on west-facing slopes, contain mesic-adapted trees, shrubs, and other plants that are able to tolerate cooler and wetter conditions. Coast redwood (*Sequoia sempervirens*) and Douglas-fir (*Pseudotsuga menziesii*) dominate the overstory, but coast live oak (*Quercus agrifolia*), Pacific madrone (*Arbutus menziesii*), and big leaf maple (*Acer macrophyllum*) also occur. At lower elevations, chaparral communities are dominant, with manzanita, California scrub oak, and chamise the predominant taxa. The mountains are a region of high biological diversity and include a host of animals including black-tailed deer (*Odocoileus hemionus*), raccoon (*Procyon lotor*), mountain lion (*Puma concolor*), coyote (*Canis latrans*), skunk (*Mephitis mephitis*), and Western gray squirrel (*Sciurus griseus*). Occasionally, black bears (*Ursus americanus*) are sighted, though they are typically rare.

The Diablo Range extends from the Carquinez Strait in the north to Orchard Peak in the south, near Cholame. The range is mostly rolling grassland, plateaus, and canyons, punctuated by sudden peaks. Most of these range in elevation around 910 meters (3,000 feet), though the highest peak, Mount San Benito, rises to a height of 1,605 meters (5,267 feet). The dominant floral community is California oak woodland, with coast live oak and blue oak (*Quercus douglasii*) the most prevalent. California buckeye (*Aesculus californica*), black oak (*Quercus kelloggii*), and Coulter pine (*Pinus coulteri*) are also found in the range. Chaparral communities, also prevalent in this range, provide habitat for bobcat (*Lynx rufus*) and gray fox (*Urocyon cinereoargenteus*), as well as numerous rodents. Raptors, such as red-tailed hawk (*Buteo jamaicensis*) and golden eagle (*Aquila chrysaetos*), are found in the range. Pronghorn antelope (*Antilocapra americana*) and grizzly bear (*Ursus arctos*) were once abundant in this range, along with Tule elk, but have now been extirpated from the region.

Much of the Santa Clara Valley, especially the relatively flat, level ground, is composed of oak-grassland savanna. This community, as its name implies, contains groves of widely spaced, tall valley oak (*Quercus lobata*), which is the largest oak tree in California. This species can attain heights of 30 meters or more. Its bark is hard and thick and its leaves exhibit a characteristic lobed shape. Other oak species include blue oak and coast live oak. The earliest Spanish explorers called the Santa Clara Valley *Llano de los Robles*, or "valley of the oaks" on account of the numerous communities of this tree. The understory is composed of bunch grasses, forbs, and shrubs. Oaks provide food, nesting habitat, and/or shelter for a variety of birds, including acorn woodpecker (*Melanerpes formicivorus*), western scrub jay (*Aphelocoma californica*), and yellow-billed magpie (*Pica nuttalli*), among other taxa. Deer, bobcats, coyotes, and rabbits (both cottontail rabbit [*Sylvilagus nuttallii*] and brush rabbit [*Sylvilagus bachmanii*]) are plentiful. Like the grassland prairie, the region's native inhabitants periodically burned this habitat in order to facilitate the growth of new grasses and shrubs.

A number of riparian corridors, sometimes called riparian woodlands, are found throughout the Santa Clara Valley. These are especially productive habitats (Schoenherr 1992:153), and home to a wide variety of plants and animals. Two taxa of plants especially common to riparian woodlands in California are willows and poplars (*Populus* spp.). There are two main willow species in Santa Clara lowland habitats; these are yellow willow (*Salix lasiandra*) and arroyo willow (*Salix lasiolepis*). The Fremont cottonwood (*Populus fremontii*) also commonly occurs in this habitat. Mammals frequently encountered in riparian settings are the same that typically inhabit the oak woodland savanna, such as deer, rabbits, hares, coyotes, and rodents; however, a number of additional creatures that were important resources for aboriginal Californians are found in riparian settings. These include Pacific pond turtles (*Clemmys marmorata*), brackish water crabs (*Rhithropanopeus harrisi*), fresh water clams and mussels (*Anodonta* spp. and *Margaritifera margaritifera*), and, during the spawning season, numerous anadromous fishes, such as steelhead (*Oncorhynchos mykiss*). However, birds are the most conspicuous animals of riparian woodlands (Schoenherr 1992:163), and include a whole host of different species, including flycatchers, vireos, goldfinches, warblers, and sparrows, among numerous others.

PRECOLONIAL CONTEXT

CHRONOLOGY

Precolonial history of the southern San Francisco Bay area is complex due to the dramatic increase in human populations from middle to late Holocene times (Milliken et al. 2007). Cultural chronology is quite variable spatially but is generally framed within a tripartite sequence that is commonly used in central California—Early, Middle, and Late (Hylkema 2002; Milliken et al. 2007). These temporal periods are preceded by early to middle Holocene occupation, often characterized as the Millingstone Period (Hylkema 2002; Milliken et al. 2007).

The Millingstone Period (9000–5500 years BP) is characterized by small groups who travelled widely and practiced broad spectrum foraging of easily acquired plant and animal resources. Artifacts common to this time period are handstones and millingstones. Flaked stone implements, such as projectile points, are much less common than grinding and battering tools (Fitzgerald 2000). Common foods are thought to have included a variety of small seeds, shellfish, and small mammals.

The Early Period ranges from approximately 5500–2500 BP and encompasses an era where people are thought to still have practiced wide-ranging residential mobility but placed a greater emphasis on hunting larger game. Large pinnipeds, such as northern fur seal, are common to coastal archaeological sites during this time. Several styles of large projectile points correspond to this general time frame, which also marks the initial use of mortar and pestle technology.

The Middle Period dates from 2500–1000 BP and appears to represent a time when people were somewhat more residentially stable and practiced more logistical (short-term) mobility (Milliken et al. 2007:106). By this time, people went on extended resource acquisition forays for the purpose of bringing subsistence or trade items back to residential base camps. Large, terrestrial mammals were hunted more often during this time and grinding implements become more common (Milliken et al. 2007:107).

The Late Period begins at 1000 BP and extends to ca. 1550 BP (Hylkema 2002:33), or perhaps more recently. The Late Period is characterized by increased sociopolitical complexity and settlement centralization. Large village sites in the northern Santa Clara Valley are often found in the valley center along perennial streams (Bergthold 1982; Milliken et al. 2007). There is continued prevalence of mortar and pestle technology, thought to signify a greater reliance on acorn than in earlier times. Other labor-intensive foods were also used with greater frequency during this latest time period (Hylkema 2002). For example, sea otter and harbor seal were exploited more heavily. These animals are thought to be more labor-intensive to capture compared to other pinnipeds and large mammals, which were more commonly hunted in earlier time. Bow and arrow technology is also believed to have been adopted by aboriginal hunters during this latest precolonial interval (Milliken et al. 2007:117).

LOCAL PRECOLONIAL CONTEXT

Archaeological studies indicate that the Santa Clara Valley was occupied as early as 10,000 years ago. A research design proposed by King and Hickman (1973) for the region has identified broad periods of occupation between 7000 and 400 BP.

The earliest period, the Millingstone Horizon (7000–4000 BP), was thought to represent the first aboriginal groups in the Valley. King and Hickman proposed that these populations were the result of overpopulation in the coastal areas of southern California. As population pressures increased in these regions, pioneering groups are thought to have moved into previously unoccupied territories. Archaeological evidence for this period is scant; occupation components reveal low artifact counts, few radiocarbon dates, and poor depositional integrity (Hildebrandt and Mikkelsen 1993:34). Tool assemblages from a cluster of sites located near Coyote Creek just north of Morgan Hill (CA-SCL-178, -237, and -167) reveal a preponderance of small, informal flake tools, handstones and milling slabs, and an absence of beads and ornaments (Hildebrandt 1983). Radiocarbon assays from one site (CA-SCL-178) range from 10,000 to 8500 BP, indicating earlier occupation of the Valley than proposed by King and Hickman.

The next period identified by King and Hickman is the Middle Horizon (4000–1500 BP). Aboriginal settlements during this interval are thought be more permanent than during the Millingstone Horizon. They also propose that population densities increased during this time stimulating dependence on a stored food economy with an emphasis on acorn processing. Continued population growth is thought to have resulted in tremendous economic stress and an increase in

warfare. King and Hickman hypothesize that native populations attempted to alleviate this stress in a number of ways including population control and adjustments in settlement strategy.

The last period of occupation, the Protohistoric Period (1500–400 BP), is characterized by a return to a settlement system marked by highly dispersed populations and an increase in temporary habitation sites.

Archaeological evidence indicates that acorn processing did indeed grow in importance sometime between 4000 and 2750 BP. This is seen in an increase in the number of mortars and pestles recovered from sites dating to this time (Hildebrandt and Mikkelsen 1993:34). Evidence does not, however, appear to substantiate King and Hickman's claim for permanent settlements during the Middle Horizon. In fact, artifact collections dating to this time are very similar to the previous interval. Flake tools continue to dominate assemblages, and there is continued absence of bone tools, beads, and ornaments. Further, investigations of components dating between 2700 and 1450 BP actually indicate a decline in artifact density and assemblage diversity at a time when King and Hickman predict a peak in large, permanent settlements. Finally, King and Hickman's depiction of precontact aboriginal groups as highly dispersed mobile populations is not at all supported by ethnographic accounts at the time of contact with the first Europeans.

ETHNOGRAPHIC CONTEXT

By the time the Spanish began extensively exploring Alta California in the 18th century, a substantial Native American population occupied the Santa Clara Valley. This population, originally called Costanoan but now known as the Ohlone, occupied a large area in north-central California, from the San Francisco Peninsula and the East Bay, south to the Santa Clara Valley down to Monterey, and inland south to San Juan Bautista. This area encompassed a mosaic of different habitat types, including grasslands, woodlands, chaparral, redwood forests, coastal shrub, estuaries, and tidal marshes. Miwok tribelets were to the north and northeast of their Ohlone neighbors. Yokuts tribelets were to the east. Immediate neighbors to the south of the Ohlone included the Hokan-speaking Esselen and Salinan.

OHLONE

The Ohlone spoke a Costanoan language, which belongs to the Utian family of the larger Penutian language stock. Speakers of Penutian inhabited north central California and included tribal groups such as the Maidu, Wintu, Miwok, and Yokuts. Anthropologists have traditionally divided the Costanoan language into eight different dialects, which Levy (1978) characterized as "different from one another as Spanish is to French." According to Levy (1978:485), the Ohlone inhabitants of the Santa Clara Valley spoke a Costanoan dialect known as "Tamyen" or "Tamien."

The original name for the Ohlone, Costanoan, is a derivation of the Spanish term "costeños" or "costaños," which means "coast dwellers." In the early part of the 20th century, many anthropologists used the term "Costanoan" in reference to native peoples who once occupied the Bay Area. In 1902, C. Hart Merriam (in Heizer 1967) referred to Bay Area languages as "Olhonean," a term derived from the name of a tribelet located on the coast between San Francisco and Santa Cruz that was spelled variously as "Alchone," "Olchone," "Oljon," or "Olhon" (Heizer 1974; Levy 1978). More recently, modern descendants of Costanoan peoples have identified themselves as "Ohlone"

(Bean 1994), a derivation of Olhone, and that is the term that will be used here, except in reference to the language family.

Researchers have hypothesized from linguistic evidence that the Ohlone were late entrants into the area. Anthropologists argue that the ancestors of the Ohlone originally migrated into the San Francisco and Monterey Bay areas from the San Joaquin-Sacramento River system sometime around AD 500 (linguistic and archaeological evidence summarized by Levy 1978:486; Bean 1994:xxi). This migration represented movement of several Penutian-speaking peoples westward into areas formerly inhabited by Hokan-speakers. Other researchers have posited a much earlier time for the movement of Penutian-speakers into the area. For example, Whistler (1977) suggests that Penutian-speakers (e.g., Miwok and Ohlone) settled in the area around 3000 BC. Whenever the migration actually occurred, and indeed if such a migration took place, the ancestors of the ethnohistoric Ohlone were fully ensconced in the area by the Late Holocene.

Estimates of total Ohlone population during the time of European contact are varied. Kroeber (1925) suggested an estimate of 7,000 people, while Cook (1943) posited a total of about 11,000 at the beginning of the Mission Period, and Heizer (1974) and Levy (1978) estimated about 10,000. Based on Mission records, Milliken (1995:25) estimated a population density of about 2.5 people per square mile. In the San Francisco peninsula area, Milliken (1995:19) claimed that the earliest explorers usually encountered native villages every "three to five miles," and noted that their descriptions suggested village populations numbering from 60 to 90 persons. Elsewhere in Ohlone territory, estimates of village sizes range from 200 to 400 people. Milliken (1995:19) reported that the largest village, near Carquinez Strait, had a population of some 400 people. Other large villages were located on San Francisquito Creek (250 inhabitants), and on the coast at Point Año Nuevo (no estimate given).

According to Milliken (1995:256), Tamien speakers occupied much of what today is the flat Santa Clara Valley, from the Guadalupe River westward to Stevens Creek, near the present-day city of Cupertino. From north to south, this region encompassed the area from present-day Agnews down to modern downtown San Jose. Within a four-mile radius of the Santa Clara Mission site there were three large villages of over 120 inhabitants and two very small hamlets (Milliken 1995:66). Although the native names for these three villages have been lost, the missionaries gave them Spanish designations. The village of San Francisco Solano was located near the mouth of the Guadalupe River, while the village of Santa Ysabel was situated farther east, along the lower Coyote River. The third large village, called San Jose Cupertino, was three miles southwest of the Santa Clara Mission site. One of the small hamlets was located very near the site of the original Santa Clara church, while the second hamlet was approximately one mile upstream on the Guadalupe River.

Ethnographers (Bean 1994; Broadbent 1972; Kroeber 1925; Levy 1978; Milliken 1995) have been able to piece together a generalized picture of traditional Ohlone culture using oral history, archaeological investigations, and 18th century Spanish letters, diaries, and accounts. The Ohlone lived in approximately 50 autonomous villages that Kroeber called tribelets (Levy 1978). The tribelet defined the basic unit of Ohlone political organization. Tribelet chiefs might be either men or women. The office was inherited patrilineally, usually passing from father to son (Levy 1978:487). Each tribelet occupied a permanent primary habitation site, in addition to many smaller resource procurement camps. Each village within the tribelet was occupied for several months each year, with groups of families moving between different locations as food resources became seasonally available. Groups of families coalesced during winter, in part to make use of shared food stores but

also to engage in annual ceremonial activities. Many Spanish diaries also note that warfare was common between Ohlone groups, normally consisting of small-scale battles resulting from arguments over land rights, or in defense of the honor of some individual or family in a tribelet (Broadbent 1972; Margolin 1978; Milliken 1995).

Early Spanish chroniclers, like Father Juan Crespi, describe the Ohlone as "graceful and well-formed" (Heizer 1974:15). Diaries and ethnographic reports indicate that Ohlone men and boys generally went naked, but covered themselves in mud during chill mornings. They wore necklaces of *Olivella* shells and abalone pendants, and many had pierced ears and nasal septums, which they adorned with various ornaments. Unlike most native Californians, some Ohlone men did not pluck out their beards but allowed the hair to grow on their chins (Levy 1978:493; Milliken 1995:18). Men with long hair either braided it or tied it on top of their head with a buckskin thong. Women wore skirts of braided plant fiber in the front and sea otter or deerskin rear aprons. Women commonly sported tattooed chins, which consisted of lines and rows of dots. Both sexes wore robes in cold weather. These consisted of woven animal skins such as rabbit or sea otter fur. During ritual occasions, ceremonial dances, and warfare, men frequently applied various plant dyes to their body and adorned themselves with feathers and other finery.

The Ohlone were hunters and gatherers who supported themselves largely or entirely by the exploitation of natural plants and animals. They followed a seasonal round of resource availability. Life varied with the seasons, requiring dispersed family groups to move over the tribelet territory during seasons of abundance when a heavy labor effort was required; resources were stored for the lean winter and early spring when the tribelet tended to congregate together (Levy 1978).

Although the Ohlone consumed a variety of different foods, most references to ethnographic subsistence practices indicate that they relied on the acorn as a staple food (Beechey 1968; Bickel 1981; Broadbent 1972; King 1974; Milliken 1995:17). The preferred acorns came from Tanbark oak (*Lithocarpus densiflorus*), valley oak (*Quercus lobata*), coast live oak (*Quercus agrifolia*), and California black oak (*Quercus kelloggii*). Readying the acorns for consumption was an involved process. Acorns were usually collected in fall and ground into flour using stone pestles in either portable stone or bedrock mortars. The flour was leached in freshwater streams to remove the tannic acid. Acorn meal was consumed during winter as mush or cakes (Broadbent 1972:61). In addition to acorns, other important plant resources were Buckeye (the nuts of which were leached and made into a mush), and the seeds of dock, gray pine, and tarweed, all of which were roasted in baskets with hot coals before eating. Berries gathered by the Ohlone included gooseberries, blackberries, madrone, and wild grapes. Roots were also gathered; these included wild onion, cattail, and wild carrot. For coastal groups, kelp was a common food, which was sun-dried and roasted (Broadbent 1972).

Shell mounds attest to the importance of shellfish in the Ohlone diet, particularly for coastal populations. Indeed, there are many references to shellfish collection and consumption in the diaries of Spanish explorers, indicating that this resource was of significance to Contact-Period diets. Shellfish resources of primary importance included mussels (*Mytilus* spp.), abalone, (*Haliotis* spp.), and various clam, oyster, and scallop species. Mussels, clams, and other species were collected year-round but primarily during winter, being taken by hand or with prying bars or sticks. Clams were dug from beds within tidal flats, and a variety of fish (salmon, sturgeon, steelhead, and numerous other marine species native to California waters) were captured with spears or nets from riverine or coastal habitats (Broadbent 1972; Levy 1978). In addition, sea lions, seals, and sea otters were taken,

by clubbing them on the beaches (Baumhoff 1963:17). The meat of beached whales was also occasionally consumed after being roasted in earth ovens. Some Ohlone groups also used small "balsas," or rafts made from Tule reeds, not only to exploit marine fishes but also to obtain lakeside waterfowl, such as ducks and geese.

Various land animals were also important to Ohlone subsistence. Large terrestrial game mammals such as deer, pronghorn, and tule elk (Baumhoff 1963:17) were key sources of protein. In order to facilitate the hunting of deer, the Ohlone, like many other Californian groups, periodically practiced controlled burning of chaparral-bearing grasslands and woodlands. These fires cleared lands of dense vegetation cover and increased the productivity of grasses and stimulated re-growth of tender shoots that attracted browsing deer. Rabbits were also taken. These were hunted in large, communal drives and snared in nets, where they were summarily clubbed to death. Ohlone hunted other small game as well, such as squirrel, ground squirrel, woodrat, and even mouse and mole (Levy 1978:491). Insects such as caterpillars and grasshoppers were also collected and eaten.

Little is known about Ohlone mythology and cosmology, although ethnographers agree that their beliefs were similar to their Yokuts and Salinan neighbors to the east and south (Kroeber 1925:470-473; Levy 1978:489-490). The sun was one of several principal deities; prayers were directed to the sun through offerings of smoke, seeds, tobacco, and shell beads (Broadbent 1972; Levy 1978). Other prominent deities included Coyote, who was reputed to have taught the Ohlone the arts of subsistence. Shamans held prominent places in Ohlone culture. They wielded magical powers and maintained contact with the spirit realm. They were also healers who cured disease and could diagnose ailments through ritual singing and dancing. Shamans could also control the weather and assure an abundant crop of acorns or a successful hunt (Levy 1978:489).

According to ethnographers (Baumhoff 1980; Kroeber 1925; Loeb 1933; Milliken 1995), it is likely that Ohlone peoples practiced elements of the Kuksu religious cult. This cult was prominent among a number of indigenous northern and central California groups during the period just before and during European contact (e.g., Pomo, Patwin, Maidu, and Miwok). The Kuksu religion involved ceremonial dances, ritual, and specific regalia, such as elaborate headgear made of tule and decorated with sticks to which feathers were attached. Although the purpose of the cult has been debated and speculated upon for decades, it appears that it might have been practiced for the purpose of ensuring productive hunting, fertility, bountiful harvests, good weather, and good health.

HISTORIC CONTEXT

SPANISH MISSION PERIOD (1769–1834)

The Ohlone first came into contact with Europeans in 1602–03 during the voyage of Sebastian Vizcaino, who briefly described the Ohlone inhabitants of Monterey (known as the Rumsen). This contact was brief and it was not until nearly 170 years later that the Spanish again made contact with the Ohlone. In 1769, Gaspar de Portolá, traveling north by land along the Pacific Ocean from San Diego in order to establish a settlement in Monterey, was the first European to sight San Francisco Bay. As he journeyed through Ohlone territory, Portolá gave brief descriptions of the Indians he encountered. Shortly thereafter, in 1770, Lieutenant Pedro Fages led a small expedition inland from Monterey. One of the expedition's chroniclers, Juan Crespí, made extensive notes on

the aboriginal inhabitants of the area. As they traversed the Santa Clara Valley, Crespí made the following remarks:

> There is a positive maze of very large freshwater lakes with a great deal of swamp and bulrush patches in this hollow, and I know not how many large running streams, and two or three very large heathen villages. Our captain told me that when they explored here last year, there was a village close to the lakes, some of which we saw from afar off, and they had several Tule-rush floats with oars, with which they fished in the lakes. We saw four heathens running far off at a trot, obviously going to give warning to the other village that was said to be farther up along the route we were following. (Crespí [1772] in Brown 1994:9)

In 1777, the first Mission in Santa Clara was established in what would later be known as the Santa Clara Valley, though at the time was called *Llano de Los Robles* (or "Plain of the Oaks") by the Spanish (Garcia 1997:5). The valley formed a broad, grassy plain that was dotted with oaks and well-watered by creeks and streams. Numerous Native villages also occupied the region, an important reason the Spanish decided to establish a Mission in the area. The reason for colonization in California was to protect the Spanish-owned, northern Mexico silver mines and other New World investments from Russians encroaching from the north (Archibald 1978:xi; Webb 1982[1952]:3). Establishing missions, presidios, and pueblos was seen as an inexpensive way of protecting northern Mexico, while simultaneously attempting to spread Spanish culture and Christian faith. Interactions between Franciscan priests, diverse soldiers of the Crown, and local and non-local indigenous peoples took place under this economic and political regime for nearly sixty years, and under Spanish and later Mexican governments.

The Indigenous Population

Movement of indigenous peoples to the Spanish Missions was one response to the many ways the Spanish and Mexican governments, and their supporters, disrupted local communities. After baptism, indigenous peoples found themselves forging a new community with others who spoke different Indian languages, claimed various tribal territories, and affiliated themselves with dissimilar lineage lines, all the while, interacting with a colonial presence that sought to transform them into "productive citizens" of the colony (Senkewicz 2002:23).

The Spanish policy of *reducción* affected local communities. M. Hylkema (1995:28) addresses the intent of the Missionaries for bringing Native Americans into the Mission system:

> Spain's goal to colonize California depended entirely on the ability of the missionary priests to reorganize the Native populations into an agrarian work force. At the time of the Spanish explorations the indigenous people within the Ohlonean cultural sphere were organized into over fifty political units, or tribelets, with variations of language, custom and appearance. ...The large populations and their complexity of cultures were generally of little interest to the Spaniards who were intent upon breaking down traditional Indian ways to facilitate their reorganization (redución). Europeans of the 18th century cultivated a perception of moral superiority over non-Christian people, which of course served to justify the management of other cultures to attain their goals….

Franciscan priests reproduced the common Spanish colonial practice of moving Native peoples into mission centers, strategically disassociating them from their homelands and the mythical landscapes, graves of their ancestors, and the named rocks and landmarks contained therein

(Lightfoot 2005:65; Margolin 1989:33). The historical record tells us this practice created mission populations composed of peoples from variable ethnolinguistic groups and very distant polities. During several population spikes, more than 1,400 Native Americans lived at Mission Santa Clara. Mission Santa Clara's historic documents indicate a steady influx of Ohlone, Northern Valley Yokuts, and Miwok populations from diverse villages within those ethnolinguistic territories.

Thus the Indian village at Mission Santa Clara is best viewed as a growing and changing amalgam of indigenous peoples drawn at first from the San Francisco Bay region and later as far away as the San Joaquin Valley and the foothills of the Sierra Nevada. The population represented dozens of formerly autonomous tribelets of no more than a few hundred people, some closely related culturally and linguistically, others from vastly different traditions. The community or perhaps communities within the village were adjusting to both the Spanish Colonial regime and to day-to-day relationships with people with whom they had little or no contact prior to the advent of the Mission.

MEXICAN PERIOD (1821–1848)

After the Mexican War of Independence ended in 1822, the secularization of Mission lands began. This involved the confiscation of Mission lands and properties by Mexican civil authorities, and the transfer of these to Mexican citizens. Many Mexican Californians strongly supported the transfer of "landed wealth" from the church to the citizens (Senkewicz 2002:24). The Mexican government carved out and granted large ranches to Mexican citizens, who used the land to graze cattle. These ranchos and herds allowed the Californios to engage in trade with ships visiting the coast, exchanging hides and tallow for manufactured goods. Many ranchos were established around Mission Santa Clara, including Rancho Pastoria de Las Borregas, Rancho Quito, Rancho de los Coches, and Rancho Posolmi (Yñigo). Most of the former 80,000 acres of Mission Santa Clara lands were divided among loyal Mexican subjects (Hall 1871:57-81). For example, Rancho Pastoria de Las Borregas was granted to Francisco Estrada in 1842.

The neophyte population generally scattered away from the mission centers after secularization (1834). However, some mission Indians may have chosen to continue living at Mission Santa Clara. For example, in the diary of a Santa Clara Student, John Brown Jr., the author describes an "old Indian [who] now has a cane, his exact age cannot be determined; some say 120, others only 100" (Giacomini and McKevitt 2000). The few neophytes who chose to remain in their ancestral territory did not have legal ownership of their homelands, although some did petition the Mexican government for land grants. Some mission neophytes were successful in their petition. For example, Luis Yñigo, an Ohlone Indian from the region the priests called "San Bernardino," was granted 800 acres, the Posolmi Rancho (CL1501) (Milliken 2009). In addition, Rancho Ulistac was granted to two California Indians, Marcello (CL1360) and Cristobal, in 1845 (Milliken 2009). Some indigenous peoples were given jobs as manual laborers or domestic servants on these Mexican Ranchos, which often were later purchased by American settlers and became American cattle ranches. By 1850, the Native American population in the Santa Clara Valley was estimated at approximately 1,000, divided "between rancherias on the Judson place, the Marvin Murphy ranch [formerly Rancho Pastoria de las Borregas], and the Inigo reservation" (James and McMurray 1933). Others California indigenous peoples lived near one of the pueblos, where work was easier to find as foreign settlers began to pour into the region. Others still migrated to the interior hoping to join kin already there or establish new sociopolitical connections.

After the secularization of the Missions (1834), the many Mexican Californio and recent Mexican immigrant residents who were not granted rancho land often clustered near the former missions, reusing former mission adobe structures and constructing new adobes as well. Squatting in abandoned mission buildings was widely practiced, especially in northern California (Hughes 1975). These squatters may have taken up occupations as farmers, merchants, craftsmen, or campistas (individuals who used their property to grow crops and raise livestock) (Gonzalez 2009).

AMERICAN PERIOD (1841–PRESENT)

The various cities that make up what is present-day Santa Clara County all stemmed from the establishment of Mission Santa Clara de Asis in 1777. The development of these towns can be attributed to the influx of immigrants and settlers in this area during the American Period. When Americans began moving into the Santa Clara area, around 1841, *Californios* here "experienced a decline in economic status, political power, and social influence" (Hughes 1975). This was a harbinger of events to come, as small adobe buildings to house individual families were constructed or adapted from former Mission buildings. Following trends seen elsewhere in North America, an American system of land law, which imposed artificial but ordered grids over a landscape, was later established. Consequently, legal contests led to most *Californios* loosing most of their land to Americans (Senkewicz 2002). For example, in 1842, a portion of the Mission Santa Clara sheep pasturage was granted to Francisco and Inez Estrada who used the land for their Rancho Pastoria de Los Borregas. Less than a decade later, half of this Rancho (4,800 acres) was purchased by Martin Murphy Jr., whose family was among the earliest Anglo settlers in the Santa Clara Valley, and this purchased land would eventually become the City of Sunnyvale. Murphy's contributions to the development of Sunnyvale were significant due to the impacts on the subsequent fruit and canning industries.

In 1846, members of the first large overland immigration reached the Santa Clara Valley. The "Great Migration" of 1846 consisted of entire families, a completely different type of American immigrant than had arrived before. Many of the immigrant families who sought to relocate to California did so based on descriptions in eastern newspapers that encouraged Americans to come and settle the area. The families were informed by Fremont and the *Californios* that they could shelter during the rainy season at a number of mostly unoccupied Missions, including Mission Santa Clara, furthering the appeal to settle in the Santa Clara Valley (City of Sunnyvale 2012; Garcia 2000-2001). Following patterns of squatting witnessed during the Mexican Period, a group of 175 settlers from Sutter's Fort temporarily inhabited some of the abandoned Mission Santa Clara buildings in 1846 (Garcia 2002:96).

Among the immigrant families that had arrived in the Great Migration was the Murphy family, who first settled in Sacramento and later made their way to Santa Clara. In contrast to the immigrant families that occupied the Missions by squatting, the Murphy family was privileged enough to have purchased a portion of former Mission Santa Clara sheep pasturage that through land grants and land disputes had come into the possession of Mariano Castro, San Jose's former Alcalde (City of Sunnyvale 2012). It was this purchase in 1850 that paved the way for the development of the City of Sunnyvale.

Gold Rush Immigration and Land Disputes

On January 24, 1848, nine days prior to the signing of the Treaty of Guadalupe Hidalgo, James Marshall found gold at Coloma. The discovery of gold and the subsequent rush to the gold fields resulted in an exodus of anyone in California who could leave home. The Santa Clara Valley was no exception. Even Father Real joined the many gold seekers (Garcia 1997:37). The Santa Clara/San José area was nearly depopulated. By the end of the year, some returned and found the price of provisions had risen dramatically because crops had not been harvested. In addition to those returning from the gold fields, many newcomers also arrived in the area, further expanding the population.

While immigrants entering the area prior to 1848 had caused problems by squatting on Mission and Rancho lands, these were minor compared to the impacts caused by the onslaught of people entering the area following the discovery of gold. Many newcomers settled on the land to make their fortunes, finding that agriculture was more lucrative than mining. With the influx of people now greater than the outflow, the area looked like a half-military and half-civil settlement with numerous white tents dotting the open areas (Hall 1871:197). As fresh produce became valuable for residents and miners, Santa Clara's Mission pear orchard became of major economic importance (McKevitt 1979:33). Typical of the litigation over land ownership and/or possession in the area, the ensuing fight over possession and ownership of the pear orchard would not be settled until 1855.

While disputes over land ownership were ongoing, the use of land itself was undergoing change. Before 1846, little American style agriculture existed in the Santa Clara area. The agricultural products needed for sustenance were provided by crops raised at the Mission and individual family plots. Following the arrival of the early American immigrants, wheat farming had quickly become the dominant crop. By the early 1850s, farmers had begun planting small orchards and vineyards; some experimenting with these crops on their grain farms. The productivity of the Mission's orchards had impressed the many agricultural entrepreneurs who settled here after the Gold Rush. Their interest in Santa Clara Valley land inspired this area's earliest development and cultivation of fruit products.

The Murphy family had a large impact on the early development of orchards specific to the town of Sunnyvale, in fact Murphy is credited with having planted some of the first orchards in the Santa Clara Valley and his early use of farm machinery was also noted in historical documents (City of Sunnyvale 2012). Furthermore, the land that Murphy attained in 1850 became more than just the City of Sunnyvale. Murphy's Bayview Farm was integral for some of the social and political developments of Sunnyvale, and he gave the Southern Pacific Railroad permission to pass through his land which contributed to the growing development and industries in the broader region (City of Sunnyvale 2012).

Incorporation

The development of the San Francisco and San Jose Railroad passing through Murphy's Bayview Farm in 1864 led to the establishment of Murphy Station, which would become Sunnyvale, as well as the later established Lawrence Station in Santa Clara (City of Sunnyvale 2012). This became important for the fruit agriculture and canning industries that flourished in the following years and the railroad was also a key contribution to the future expansion of Sunnyvale. Upon his death in 1884, Murphy's land was divided and became smaller farms that were self-sufficient for a while, but were eventually impacted by the nationwide depression in the 1890s. The portion of Murphy's land

that was Bayview Farm ended up in the possession of his son Patrick Murphy, who leased 200 acres to Antone Vargas, an immigrant Portuguese farmer. These 200 acres were subsequently purchased by Walter E. Crossman; it was Crossman who first planned the town of Sunnyvale with the potential for future growth in mind. Crossman is also credited with having come up with the name Sunnyvale ("City of Destiny") which was adopted by the community in 1901. Sunnyvale began rapidly developing in the years that followed. However, broader events contributed to the impacts on economic growth in Sunnyvale in the early 1900s.

The San Francisco earthquake in 1906 was one of these events. After the San Francisco earthquake, a nationwide depression that began in 1907 slowed down some of the progress that Sunnyvale had been making. Nevertheless, the city boundaries were able to continue to expand and by 1912 Sunnyvale's population had reached 1,200. In 1912, the economic growth in Sunnyvale continued to be agricultural based, and this remained the case until the 1930s, though this is not to say that significant industrial economic growth had not occurred. Other significant economic impacts during the first few decades of the 1900s in this area included World War I, which resulted in more industrial development, settlers, and military presence in the Santa Clara region as well as in Sunnyvale specifically.

The Expansion of the Fruit Industry

By 1900, the fruit industry business had started expanding. During the last quarter of the 19th century, agriculture had become the primary industry in the Santa Clara Valley. Grain had given way to orchards, vast seed farms, and vineyards. James and Eloise Dawson established the first cannery in Santa Clara County in 1871. "Fruit orcharding and the canning industry grew up virtually side by side, establishing a symbiotic relationship which lasted until the next century when orchards and fruit production were eliminated by residential and industrial land development (City of Sunnyvale 2012). In 1890, Charles Morse leased 1,400 acres on what used to be Murphy ranch for seed-growing, and in 1898 Morse Avenue was established on this property.

Military impacts and the strength of the fruit agriculture industries in Sunnyvale allowed for the city and most of its settlers to thrive during times when many other communities were negatively impacted. While other communities experienced hardships during the 1930s depression, Sunnyvale's canning and fruit industry, which had grown as industries benefitting from one another, were booming. The subsequent construction of what is now Moffett Field paved the way for more military related economic growth and by the time World War II happened, Sunnyvale was in a position to accommodate the influx of business and building that resulted from this. The war shifted the main industry in Sunnyvale from agriculture to industrial development and the population in Sunnyvale continued to grow.

Transportation

Whether for moving people or goods, the development of early adequate transportation systems played a major role in the growth of the Santa Clara Valley. By the mid-1860s, the main road to San Francisco, which ran up The Alameda, had considerable traffic with stagecoaches and horseback riders traveling between San Francisco and San Jose. Prior to 1864, horse-drawn wagons transported fruit produce from the orchards along this roadway on the way to the port of Alviso for shipment to San Francisco and Oakland.

While it had become easier and quicker for people to travel, the high costs and inefficiency of the Alviso shipping network affected industrial growth (Garcia 1997:67). Construction of a railroad had been discussed off and on during the 1850s. On August 18, 1860, the San Francisco and San Jose Railroad (S.F. & S.J. R.R. Co) was incorporated (Harrison 1981:5).

In September 1863, Charles McLaughlin, who owned the land east of the Santa Clara Mission, deeded the right-of-way across his property for the construction of the S.F. & S.J. R.R. Co. The railroad depot for Santa Clara was constructed on the east side of the tracks. On January 17, 1864, regular service between San Jose and San Francisco started, with two trains running each way on Sundays and one round-trip on weekdays. Within a month, the railroad had two trains each way daily. Additional service was offered on the freight train, which had passenger cars attached to the rear. The journey took three and one-half hours with a fare of only $2.50 (Garcia 1994:28) and freight charge of $2.00 (Rood 1865).

In the mid-1880s, the old San Jose and Santa Clara trolley was replaced by a new electric cable system. In March 1888, the first cars were run on the S.J. & S.C. RR's new electrified line. The new electrified line proved to be less than satisfactory as the underground electrical system shorted out time and time again. By 1890, the line was converted to an overhead electrical system. In 1892, when the Alum Rock line was incorporated into the system, a picnic-bound Santa Clara group could board a San Jose and Santa Clara trolley car at Jefferson and Franklin Streets (the turntable was located on Franklin and Lincoln Streets) and ride electric all the way to the Alum Rock Park terminal.

During the first decades of the 20th century the trolley system continued to expand. Through several incorporations and consolidation, it grew and prospered until by 1926, there was a total of 126.71 miles of electric line in Santa Clara County. However, by the mid-1930s, it had become obvious that the trolley system was facing serious issues. As Malcolm R. Gaddis (Gaddis 1992:4) described it in a presentation he made in June 1992 to the American Public Transit Association in Los Angeles:

> The San Jose Railroad was faced with declining ridership, competition from automobiles and the great depression. A number of steps were taken to try to keep the trolley line in operation. Birney cars were purchased, faster schedules were established, and older cars were converted for one-man operation. Some cars were sold and busses were purchased, much of the rail was badly worn and there were continuous arguments about street maintenance.

On April 10, 1938, the last clanging of the trolley bells was heard in the Santa Clara Valley. The rails on the trolley line were removed and covered with asphalt, and the trolley itself replaced by still newer technology, the gas-powered bus.

Immigration

European

The fruit and canning industries that thrived during Sunnyvale's developmental history were the products of a landscape that was dense with orchards. These developments cannot be recognized without shining light on the immigrants that contributed to the growth of these industries in the late 1800s. European immigrants created and maintained this landscape. In the 1890s, Italian and Portuguese immigrants were among the Europeans that settled in Sunnyvale and contributed their agricultural knowledge brought from their homelands in order to take up the work of tenant

farming; they also worked in canneries seasonally. Notable contributions to the landscape and canning industries by immigrants included Antone Vargas, who had purchased a portion of the Bay View land from Crossman, planting two redwood saplings that are now local historical landmarks as well as some apricot trees. During the same decade, Rudolph and Charlotta Muender, a German couple, settled in the area and purchased land. They contributed to the landscape by planting prunes, cherries, and peaches.

More and more Europeans were attracted to the region as agricultural production expanded and manufacturing enterprises grew during the first decade of the 20th century. For example, Italians came to the Santa Clara Valley from all regions of Italy, including Sicily, Calabria, Basilicata, Tuscany, and Piedmont. Beginning in the 1880s, the Eden of the World beckoned Italian immigrants as farmers, ranchers, orchardists, vegetable growers, and winemakers (Marrazzo 2007). Because so many Italians moved to the Santa Clara Valley, the local historian Marrazzo (2007) published an entire volume of photographs and stories that highlight their story.

Many other groups came into the Santa Clara region during development of the Late American Period. Settlers of Anglo (English) origin, both men and women, had a decided effect on the local community. Garcia et al. (2002) document many Anglo-American names that gained local recognition during the latter half of the 19th century. The stories of James Alexander Forbes, Dr. Henry Warburton, Dr. Arthur Wellesley, Mrs. Mary Judson Saxe, James Monroe Kenyon, Dr. Benjamin Franklin Headen, Mary Bennett, and William Fitts (who married into the locally prominent Pinedo family) are amongst those highlighted in the document. The Spanish and Portuguese immigrants in large part settled in other areas of the town where the earlier arrivals from Spain and Portugal were already established.

Chinese

Immigrants in the settled lands that would become Sunnyvale did not all have access to the same resources and due to racist colonial ventures, they did not all attain the same privileges that allowed some immigrants to thrive. Chinese and Japanese immigrants had very different experiences than that of European immigrants. California's Gold Rush period impacted the population, making Chinese immigrants the largest minority at the time in California, and this also resulted in Chinese immigrants dominating the labor force population and contributing massively to the development and growth in areas like Santa Clara County (Chang 1997:2).

Garcia et al. (2002:61) describes Santa Clara's Chinese immigrant population:

> A few Chinese had appeared in the Santa Clara area after the Gold Rush, such as Sing Kee, a cook, laundryman and weather prognosticator employed by Dr. Saxe in 1860. It wasn't until 1863–1864 that the first group of Chinese immigrants arrived, entering Santa Clara Valley as workers on the construction of the San Francisco and San Jose Railroad. While most early Chinese immigrants were employed by the railroad and as land clearers or domestics, many soon found work as farm laborers, working harder for less money than comparable Caucasian help. Despite hostility expressed towards them, the Chinese remained dominant in agricultural field work until the turn of the century…

The Chinese Exclusion Act in 1884 had stated that, "All Chinese laborers that came in after November 17, 1880 were to be deported [and that] all the Chinese that were in the U.S. before this date were [to be] registered and given certificates that had their names, age, occupation, physical

markings on their bodies and more" (Garcia n.d.:20-21, 56). This Act was very popular among the political and business interests. After its passage, Santa Clara's Chinese population came under attack, mostly over the use of Chinese laborers, leading to vigilante acts. Opposition to their presence grew over the following decade until in January 1903, the Commercial League, who was promoting the town as "Progressive Santa Clara...where health and plenty are the portion of her people," took steps to have them completely removed.

Chinese immigrants were viewed and treated as a source of cheap labor and were not given the right to own land. By 1900, Japanese immigrants had become the replacement for the dwindling Chinese populations. In contrast to European immigrants, Japanese immigrants were not arriving with families, but rather were mostly men who likely had left their families back in their homelands. Though they were also denied the resources that were given to European immigrants, they did not allow themselves to be subjugated as a source of labor, resulting in the formation of groups of resistance and solidarity that allowed them to become independent agriculturalists (City of Sunnyvale 2012).

Suburban Housing

The Late American Period was also marked by the subdivision of parcels and the construction of homes. Housing development in Sunnyvale grew substantially as a result of war impacts. World War I caused a large workforce influx to require accommodation, causing more homes to be built as the population grew. This growth continued during World War II with the onslaught of war production and military presence resulting in military housing tracts. Housing production increased overall during the war, and the landscape by the 1950s reflected a plethora of new permanent housing developments that military subdivisions had become the catalyst for. This time period began and shaped the suburban developments that continued in the 20th century. The housing subdivisions that came thereafter were due to Joseph Eichler, a prominent housing developer, who was responsible for the development of the housing tracts Sunnyvale Manor, Sunnymount Gardens, and Sunnyvale Manor Addition No.1. These three single family residential subdivisions built between 1948 and 1950 were part of the Early Eichler Developments, though he continued building small tracts of custom homes until the 1974 (City of Sunnyvale 2012).

HISTORY OF THE PROJECT AREA

The Project Site locations are associated with Rancho Quito and Rancho Pastoria de Los Borregas (Appendix A: Figures A-3 and A-4). Rancho Pastoria de Los Borregas is associated with Sunnyvale and Rancho Quito is associated more closely with the modern surrounding areas in Santa Clara County of Cupertino, Campbell, and Saratoga. Rancho Quito was granted to Jose Noriega and his father-in-law Jose Zenon Fernandez in 1842 by Mexican governor Juan Alvarado. In 1844, Noriego sold his portion of Rancho Quito to Jose Manuel Alviso, who then sold the Rancho to Jose Ramon Arguello in 1859. A Plat Map from 1864 indicates the Project Area is within the boundaries of what used to be the *Quito Rancho* (Appendix A: Figure A-4).

Plat Maps from 1876 and 1889 both depict the Project Area on plots of land under the care of W. Wilcox and A. Patterson; these appear to be in an area marked as belonging to the Milliken Family (Appendix A: Figures A-5 and A-6). A plat map from 1867 indicates the northwest portion of the property upon which the Project Area is located was once owned by W. Wilcox and the southeast portion of the Project Area was owned by J.W. Johnson (Appendix A: Figure A-5). The 1889 plat map

indicates that W. Wilcox continued to own portions of the Project Area, but new property owners at this time included Mrs. R.S. Burns and A.J. Landrum (Appendix A: Figure A-6).

Aerial photography from 1939 and 1956 shows the Project Area on an orchard (Appendix A: Figures A-7 and A-8) The neighboring plots have similar cultivation areas suggesting farming activities were predominant is this part of Sunnyvale. These aerial photos depict one historic-era structure in the Project Area. This structure first appears in aerial photographs in 1939 (Appendix A: Figure A-7) and continues to be present in an aerial photo from 1956 (Appendix A: Figure A-8).

Property deeds provided by the SCUSD indicate that the Jefferson School District purchased the western 47.26 acres of the 71-acre subject parcel from Ignazio and Rosalia Castello in 1955. That acreage was part of a larger farming property that the Castellos subdivided in 1949 for building restricted single-family homes. The remaining 23.8 acres to the east was two parcels when it was sold to the Jefferson School District in 1960. 13.518 acres were owned by Dominic, Lena, Salvatore Jr., and Rosie Cirrincione and the remaining 11.817 acres were owned by Frank L., Pearl, Salvatore, and Pauline Teresi. A 1956 aerial photograph shows the entire 71 acres planted in fruit trees (Appendix A: Figure A-7). A 1959 topographic survey shows the approximately 23 combined acres as orchards of prune, apricot and cherry trees.

The US Census of 1940 indicates all were farming families or "orchardists." Ignazio and Rosalia Castello were Italian immigrants and were living on Reed Lane, in the Santa Clara Township, according to the 1940 census. The 1940 census identifies the four Cirrinciones named on the deed as California natives. Salvatore Cirrinciones Sr. and his wife Katie, who were born in Italy, lived on Wolf Road Homestead, Santa Clara Township, with Dominic, Lena, Salvatore Jr., and Rosie Cirrincione. Salvatore Sr. and Katie Cirrinciones were likely Dominic's and Salvatore Jr.'s parents. The 1940 census shows Frank Teresi as the son of Sicilian-born Salvatore and Sarah Teresi. The 1950 census indicates Frank and Salvatore Teresi were brothers and lived together on a farm on the south side of El Camino Real with their wives, Pearl and Pauline.

Research has not resulted in any additional information about these Italian immigrants and first-generation California-born farming families. The Italian-born senior members of the families were likely part of the significant influx of Italians into the area during the late 19th and early 20th century, attracted by rich agricultural land and associated opportunities. They appear to have been typical farming families that subdivided and sold their property as Santa Clara County's post-war population grew rapidly and suburban communities developed.

A 1965 aerial photograph shows the current school sites, which public records indicate were constructed in 1964 (Appendix A: Figure A-9). As the aerial shows, most of the neighboring parcels by the 1960s were no longer farmlands but had been developed into residential plots.

ARCHITECTURAL CONTEXT

SANTA CLARA UNIFIED SCHOOL DISTRICT HISTORIC CONTEXT

The Santa Clara Unified School District (SCUSD) includes neighborhoods in the cities of Sunnyvale, San José, Cupertino, and Santa Clara; it comprises approximately 56 square miles of 1,290-square-mile Santa Clara County (Santa Clara Unified School District 2022a; United States Census Bureau

2022) (Appendix A: Figure A-10). The district, which educates over 15,300 K-12 students and an additional 6,000 students in preschool through adult school, is made up of 18 elementary school sites, one K-8 school site, four middle-school sites, three high-school sites, three alternative high-school sites, and four leased sites Santa Clara Unified School District (Santa Clara Unified School District 2022a, 2022b). SCUSD is one of 32 elementary, high school and unified school districts in Santa Clara County, not counting the Community College District, charter, or court schools (Santa Clara County Office of Education 2022a). Unified school districts are districts that teach both elementary and secondary levels of education.

19th Century Public Education in Santa Clara County

On April 11, 1850, the California State Legislature passed an act providing for the election of a superintendent of public education, as directed by the Constitution of the State of California. John G. Marvin was elected that year on October 7 to serve as the state's first public school superintendent (San Jose Mercury News 1951:181). Despite this, the first schools in Santa Clara County were private schools generally operated by religious entities or informal schools organized by residents (Laffey and Detlefs 1995:51). In 1852 the Legislature authorized a state school tax of five cents per $100 and a county school tax of no more than two cents per $100 to initiate funding of the state's public education system (Santa Clara County Office of Education 2022b). It also allotted three school commissioners to each township and included the duties of a County Superintendent of Schools as among the responsibilities of the County Assessor (San Jose Mercury News 1951:181). The first Santa Clara County Assessor was J.H. Morgan, elected in 1853; consequently he also become the county's first Superintendent of Schools (Laffey and Detlefs 1995:51).

One year earlier, in the fall of 1852, the Santa Clara County Commissioners designated eight townships as school districts: Gilroy, Burnett, New Almaden, San José, Santa Clara, Fremont, Alviso, and Washington (now part of Alameda County). On March 15, 1853, the Santa Clara Register printed a notification that a school had opened in San José, signed by the San José Commissioners of Common Schools; the parents were expected to pay any costs that exceeded the school funds provided by the State. By May the school, located in a Baptist church, had ten pupils registered but insufficient funds to pay the teacher. The 1853 Legislature amended the State's school law to allow the Common Council to levy taxes on real or personal property to support city schools (San Jose Mercury News 1951:181). By 1866 Santa Clara County Schools were some of the best funded in California (Laffey and Detlefs 1995:51).

The State Legislature revised the County Assessor's duties in 1855 to no longer include that of Superintendent of Schools. Freeman Gates, a San José teacher, became Santa Clara County's first elected Superintendent of Schools (Santa Clara County Office of Education 2022b). In October 1855 Santa Clara County redistricted itself into eight townships and 16 school districts. School districts in the townships of Fremont, Santa Clara and Redwood numbered six; San José, Alviso, Burnett, Almaden and Gilroy had ten. Within a month, district designations were revised again, and four separate school districts were established in the Santa Clara township (Munro-Fraser 1881:137). By the end of 1859 there were 710 students enrolled county wide (Laffey and Detlefs 1995:51).

The 1860s marked significant expansion of Santa Clara County schools, with the erection of over two dozen schoolhouses. These included schools in the Cambrian, Encinal, Jefferson, Laguna, Mt. Pleasant, Pala, Summit, Hester, and Willow Glen districts. What was once the Jefferson School

District is now within the boundaries of the SCUSD (Appendix A: Figure A-11). The first high school in the county was opened in San José in 1860 (San Jose Mercury News 1951:181).

Santa Clara County's rural school districts constructed generally small wood-framed one- or two-room schoolhouses between 1850 and 1880 (Appendix A: Figure A-12). These early schools appear to have been of consistent design with schoolhouses throughout the country (San Jose Mercury News 1951:181). Located along existing roads and intersections, these schoolhouses were exposed to noise and dust, poorly lit, had poor ventilation and heating, and often had no wells, washbasins or toilet facilities (Englehardt Jr. 1942:172). The typical classroom layout was rectangular, with the teacher's desk in front of rows of students' desks, emphasizing his or her authority (Ogata 2008:563) (Appendix A: Figure A-13). The Mayfield School in Fremont township was described as being of common construction and type. An early California State Superintendent of Schools who visited it in 1855 referred to it as a "herring box" (San Jose Mercury News 1951:181). Schools also found accommodations in existing buildings, such as Mr. Dunphy's school on the second floor of a two-story rented building in San José; Red Mac's Saloon occupied the first floor. Some schools shared buildings with other entities like churches or meeting halls (San Jose Mercury News 1951:183).

The rapid increase of population on the West Coast that followed the completion of the Transcontinental Railroad in 1869 resulted in a shortage of school funding and space (Laffey and Detlefs 1995:52). According to the Census Bureau, the population in Santa Clara County grew from 11,912 in 1860 to 26,246 in 1870, a more than 120% increase (Bay Area Census 2022). At least four, and possibly six, new districts were established in the 1870s. These included Eagle, Uvas, Llagas, and Midway (Appendix A: Figure A-14). Fifteen new school districts were formed in the 1880s, among them were Mount Hamilton, Halls Valley, Huyck, Campbell, Burrell, Lakeside, and Austin. Similarly, in the following decade, another thirteen districts were created, two in the new towns of Morgan Hill and Palo Alto (San Jose Mercury News 1951:183). Most districts consisted of only one or two schools.

Despite the rapid establishment of new school districts, they were not always able to keep up with the educational needs of their growing communities. Although state funds covered much of the cost, parents had to purchase their children's books and cover other expenses; some poor families simply could not afford to send their children to school. Lack of adequate funding also resulted in deferred maintenance and inattention to advancement in school design to better serve the student body. In the 1873 Santa Clara School District's annual report, the School Superintendent accused the city of allowing the schools to become dilapidated. He stated that "the Cheap-John system which seems to pervade all the departments of our town governments admonishes us out of the necessity of studying economy, even to the degree of meanness" (San Jose Mercury News 1951:183).

Another challenge the public educators faced was poor attendance. In 1860 the Santa Clara County Superintendent of Schools stated that "the principal cause of non-attendance by the children is the indifference with which many parents in the county districts treat all things connected with school discipline." "Discipline" in this instance was not referring to behavior but to regular attendance, particularly in the rural districts where farming and ranching families were dependent on children helping at critical times such as harvest or planting (Laffey and Detlefs 1995:51-52). In 1874, California made education for children from eight to 14 years of age compulsory and guaranteed state aid for each school based on the number of children in each district. High schools would not receive state funding until 1902. In 1911, the state stopped providing aid for each child in a given district but based the funding on attendance (California Department of Education 1961).

Despite the State's intervention, these challenges continued even as the number of school districts increased. By 1875 Santa Clara County boasted 53 school districts, 83 school buildings and 105 teachers. The average daily attendance was recorded as 4,892, not counting San José school attendance. This number indicated that only half of school-age children regularly attended school. By 1881 there were 62 districts county-wide, and by 1900 there were a total of 97 schools in 84 districts, and 562 teachers educating 14,320 students (Laffey and Detlefs 1995:52). The majority of these schools were in rural communities and small towns, with the basic one- or two-room wood-framed schoolhouse still the most commonly built school type.

Late 19th and Early 20th Century: Continued Growth, New Approaches to Education and School Design

As the county's population increased and towns became more urbanized in the 1880s and 1890s, the basic schoolhouse was gradually replaced by larger, yet still modestly scaled schools that often-expressed contemporary Victorian architectural styles. Nation-wide attitudes toward the importance of lower education were changing. With the close of the 19th century, school building design began to trend toward a more monumental and unified plan with architectural revival-style embellishments and elaborate approaches and entrances to celebrate the public's civic pride and devotion to education (Englehardt Jr. 1942:174) (Appendix A: Figure A-15). These schools typically had a central entrance, symmetrically planned classrooms on either side of a long corridor, and a large auditorium (Appendix A: Figure A-16). The classroom plan was rectangular with blackboards on one or two walls, rows of windows on one side, and the desks in rows to emphasize order, desk work, and the teacher's authority (Ogata 2008:563). The unreinforced masonry San José High School that opened in 1898 was a relatively grand civic building with classical styling, and a symmetrical design composition (San Jose Mercury News 1951:181).

Architects and engineers introduced improved technologies and stronger materials that allowed school buildings to be two to three stories in height. They designed schools with improved ventilation and exposure to natural light and enhanced safety by using fireproof materials (Yates 2013:1). These advancements in architectural design and the need for larger school buildings established a new era of school construction (Englehardt Jr. 1942:173). However local school designers apparently did not plan for potential seismic events, and the 1906 earthquake destroyed the new San José High School (San Jose Mercury News 1951:181) and damaged the newly built Santa Clara High School (Appendix A: Figure A-17). California would not mandate earthquake-resistant building construction for schools until after the 1933 Long Beach earthquake (Seismic Safety Commission n.d.).

As stated earlier, attitudes toward education began to evolve in the late 19th century. The influential progressive education movement would lead to significant changes in school and campus design over the next several decades. The movement was a reaction against the existing formalism and authoritarian teaching practices of traditional education and inspired a broad restructuring of educational methods in the United States. Guided by the theories of educators and philosophers such as John Dewey of the Columbia University Teachers College, the movement emphasized more hands-on, child-centered methods and curricula, individual achievement, and differentiation of children's abilities (Sapphos Environmental 2014:39). The progressive education movement also brought a new emphasis on student health and physical activity as essential for proper childhood and adolescent mental and physical development (Yates 2013:2). The notion that such development

took place in stages led to the creation of the 6-3-3-year division of elementary schools, junior high schools, and high schools during this period (Yates 2013:1-2).

As the progressive education movement gradually took hold in the first two decades of the 20th century, new school design incorporated features to support the health and well-being of the children (Yates 2013:1-2). The 1906-built Santa Clara High School building was designed with traditional classroom layouts, but also included boys and girls "play rooms" and showers, a robust ventilation system, and landscaped grounds and tennis courts (Evening News 1906:2) (Appendix A: Figure A-18).

In 1909 the Santa Clara County Board of Education, which consisted of the elected county superintendent of schools and four members appointed by the board of supervisors, amended an 1880 political code to provide that a majority of appointed members be experienced teachers who held at least a grammar school teaching certificate. The board of education was now authorized to qualify and hire teachers and set the standards for graduation (Laffey and Detlefs 1995:52). Superintendent D.T. Bateman established the Teachers' Institute of the Santa Clara County Office of Education in 1911 to offer professional development to teachers. Teacher round tables included topics such as "How to Make Mathematical Work More Nearly Meet the Needs of Daily Life" and "Teaching Peace by Means of History" (Santa Clara County Office of Education 2022b). The supervision of attendance and child welfare was added to the duties of the county superintendent in 1918 (Santa Clara County Office of Education 2022c). These actions further reflect the gaining influence of the progressive education movement and the county's adoption of its theories.

The creation of new school districts in Santa Clara County continued and by 1912 there were at least 102 districts, not counting high schools, outside of the city of San José's corporate limits. Prior to the turn of the 20th century, there was a high school in San José, one in Santa Clara, one in Gilroy, and one in Palo Alto. By 1951 the communities of Santa Clara, Morgan Hill, Los Gatos, Campbell, Mountain View, Fremont, and East Side had high schools. All, except for Palo Alto and San José, served large rural areas and were classified as union high schools (San Jose Mercury News 1951:183). For example, graduates from Jefferson, Santa Clara, and Alviso elementary school districts matriculated to the Santa Clara Union High School District's high school (Evening News 1959:15).

On April 30, 1926, voters in the Jefferson, Agnew, Braly and Milliken elementary school districts elected to consolidate the districts into the Jefferson Union School District. Each of these school districts was comprised of a single school. Both the Milliken and the Braly schools were two-story Mission Revival buildings; the Jefferson school, a simple board and batten single-gabled building located on Kifer Road (formerly unincorporated) constructed in 1857, was said to be the oldest school building in continuous use in the state at the time (See Appendix A: Figure A-12 and A-19) (San Jose Mercury Herald 1926a:7; 1926b:10). Irvin Pomeroy, trustee of the Milliken school, appealed to the voters, saying that, "the need of better schooling for our children is becoming acute. In the Milliken school children are so crowded for room that classes are held on the stage of the assembly. With these four districts consolidated we will have enough pupils for a separate classroom for each grade and special instruction in such subjects as domestic science and trades" (San Jose Mercury Herald 1926b:10).

The new district quickly applied for and received a $100,000 bond to construct a new Jefferson Grammar School at Lawrence Road and Reed Lane (San Jose Mercury Herald 1926a:7). The new Mission revival style building, designed by architects Wolfe and Higgins, was constructed of

reinforced concrete and contained thirteen rooms that included classrooms, manual training and domestic science departments, offices, a library, and an assembly room capable of seating 600. Joseph Hancock, county superintendent of schools, stated that the Jefferson Union School District was the wealthiest in the county, with an assessed value of $3,000,000 (Evening News 1927:6) (Appendix A: Figure A-20 and A-21).

Santa Clara County Public Education and School Development Post 1930

The 1933 Long Beach earthquake destroyed 70 schools and resulted in significant damage to another 120 schools in Southern California. The California Legislature enacted the Field Act on April 10, 1933, one month after the earthquake, to protect children and staff from death and injury in public schools grades K-14 and protect the public's investment in school buildings during and after earthquakes (Seismic Safety Commission n.d.). The requirements of the act included maintaining one-story massing for new elementary schools and no more than two stories for junior and high schools. These requirements were in line with school design trends already in being adopted in California and beyond (Sapphos Environmental 2014:21).

As Santa Clara County developed from primarily agriculture prior to World War II to industry during the war years, the rural school districts grew and organized union districts for either elementary or high school purposes. Under this system two or more contiguous districts united. District superintendents focused on establishing a centrally located school and provided transportation for students. By 1950 there were eight union school districts in Santa Clara County: Cupertino, Jefferson, Los Gatos, Campbell, Saratoga, Almaden, Alum Rock and Berryessa, and Loma Prieta and Ausaymus (San Jose Mercury News 1951:183). Midway School District was annexed to the Jefferson School District in 1949 (San Jose Mercury Herald 1949b:16). The 1927-built Jefferson school was expanded in 1946 and 1948, with the construction of ten new classrooms and a cafeteria-music building. Enrollment increased an average of 20% each year between 1944 and 1949 (San Jose Mercury Herald 1949a:11). In 1949 the Jefferson Unified School District encompassed the area from Sunnyvale city limits on the west to Coyote River on the east, and from a mid-way point between Stevens Creek and Homestead Roads on the south to Alameda County line on the north. The current SCUSD boundary appears to be wholly within the 1949 Jefferson Unified School District boundary. By 1950 the Santa Clara County school system included 39 elementary school districts, eight high-school districts and two unified school districts, totaling 109 schools with a combined enrollment of 51,797 (San Jose Mercury News 1951:183).

The 1960s and 1970s brought a major change to the area as Santa Clara County grew rapidly and urban development overtook most remaining rural areas (Santa Clara County Office of Education 2022b). Population in Santa Clara County continued to grow as technology-based industries established during the war year expanded. A 1961 San Jose Mercury News article titled, "High Schools Bulge: Educators Grope for More Space As War Babies Swamp Ninth Grade", stated that enrollment for each grade was slightly larger than the next one above. This steady climb was illustrated by comparing 1960 first grade enrollment to 12th grade enrollment: County wide 16,533 first graders were registered that year compared to only 6,990 12th grade students (San Jose Mercury News 1961:26-27). This large increase in attendance occurred primarily in the former rural areas of the county. Young families of newcomers moved into newly built housing tracts of mostly modest ranch and minimal-traditional style homes that replaced the county's orchards and farmlands. That year the Santa Clara High School District was already constructing its third high school, Adrian Wilcox, scheduled to open in September. Concurrently, the district was planning a

second phase to accommodate the expected high school student body increase of around 600 per year (San Jose Mercury News 1961:26-27). In September 1965, Santa Clara, Jefferson, and Alviso Elementary School Districts joined the Santa Clara High School District to form the Santa Clara Unified School District (Appendix A: Figure A-22) (San Jose Mercury News 1965:56). The Patrick Henry Campus, built 1960–1962 to accommodate 1,000 6th, 7th, and 8th grade students (Evening News 1960:9), was originally built as part of the Jefferson School District (Goudie 1960); phase 1 of the Marian A. Peterson High School was designed in 1964 as part of the Santa Clara High School District (Richards 1964).

SANTA CLARA UNIFIED SCHOOL DISTRICT CAMPUS PLAN TYPOLOGY

Of the 33 school campuses that make up today's SCUSD, all but six were initially designed and/or constructed prior to the establishment of the district in 1965, primarily in the 1950s and early 1960s. The six campuses built after the unification of the district are of modern construction, built in 1995 or later. Buchser Middle School, the only extant pre-World War II-built school in the district, was initially constructed in 1937 (Santa Clara Unified School District 2022b). The Buchser campus has been significantly expanded and no longer resembles a pre-war educational institution. In the years after the district's unification SCUSD built out or added to many of these campuses, and further addressed the shortage of classrooms by the introduction of portable or temporary classrooms district wide, particularly in the 1990s.

Functional School Campus Site Plans, 1940s–1970s

Despite the infill and alterations implemented by SCUSD throughout the years, two standard campus designs, the "finger plan" and the "cluster plan", are easily recognizable district wide. A sub-design of the cluster plan is the open-space plan, where the buildings in the cluster-plan campuses had greater interior flexibility – open-space shells so that team teaching could be accommodated in a variety of patterns. School architects applied these two distinctive functional campus plans throughout California and the nation, with the finger plan beginning in the late 1930s and refined into the 1950s, followed by the cluster plan in the 1960s and 1970s. The open-space plan proved to be problematic and short lived; it was quickly modified to recapture the visual and sound separation of the self-contained classroom (California Department of Education 2000).

Architects interpreted these basic campus plan concepts and tailored them to the size of the student body, campus location – rural, suburban, or urban settings – climate, and topography. In the 1940s and 1950s school districts in California used a rule-of-thumb approach to determine school site size. Elementary schools were to have a minimum site of five acres plus an additional acre for each 100 pupils of predicted ultimate enrollment. For middle schools the basic size was 15 acres and high schools 15–20 acres plus the same additional acre per 100 students of predicted enrollment. By the mid-1960s, with land becoming scarce and expensive, school planners began to apply more precise methods to determine school size to support the functions or activities of the proposed educational program (California Department of Education 2000).

Combinations of these two basic campus design forms were applied as the finger plan transitioned into the cluster plan with this more site- and function-specific approach to school design. Both plans share the basic architectural principles that reflected those of midcentury modern design with their use of steel framing, plate glass, and low-rise horizontal massing to reflect the relationship between modern architectural forms and progressive teaching methods (Ogata 2008:562-563).

The Marian A. Peterson Middle School, originally Marian A. Peterson High School initially designed in 1964 for the Santa Clara Union High School District, is a hybrid of the finger plan and cluster plan campus; the Patrick Henry campus, was designed as the Patrick Henry Intermediate School for the Jefferson Union School District in 1960 in the cluster-plan style.

The Finger Plan

Just prior to the U.S. entering World War II European-trained architects working in the U.S. began to design schools and campuses that were radically different from the period-revival monumental school buildings that contained all school functions. One-story schools with expansive windows and immediate access to outdoor space just beyond the classrooms were introduced by master architect Richard Neutra in 1939 (Appendix A: Figure A-23). He designed single-story experimental schools in Los Angeles with large sliding glass doors that led to adjacent gardens or courtyards modeled on contemporary ideas about students' need for access to air and light, and that were well suited to the mild California climate (Ogata 2008:564).

The experimental school design evolved into the finger-plan campus concept with architects Franklin & Kump's design of the Acalanes Union High School in Lafayette, California (1939–1940). Franklin & Kump also designed San José High School in 1952, further refining the finger plan. *Architectural Forum 91* (October 1949) called the plan type the "western finger plan" and that the finger-plan school resembled "a tree plan, based on a trunk corridor with side branches. It rests on radical standardization of classrooms; on absolute insistence that all classrooms share the best (north) orientation to sun and air; daylight for all of them from the open-corridor side as well as the main window side. This plan is not only flexible… but extensible indefinitely outward like a tree, by growing at branch-ends and by sprouting new branches" (Sapphos Environmental 2014:92).

Architectural Forum further described Acalanes as "the first large-scale school which could serve as a complete demonstration of principles which amounted to a schoolhouse revolution – the revolution of the thirties. Since then, the Acalanes type of school, with its wide ranging, one-story classrooms arranged according to the 'finger' plan, has swept the West Coast, is sweeping rapidly across the Midwest on its way to the East Coast" (Sapphos Environmental 2014:92).

Consistent with contemporary design principals, the finger-plan became the most common school building type in the 1940s and 1950s in California (Appendix A: Figure A-24). This campus design also satisfied the construction requirements of the 1933 Field Act. These finger-plan schools were multi-structure residential-scale campuses with individual purpose-built buildings with minimal ornamentation or only modest application of modern architectural elements (California Department of Education 2000). Administration buildings, auditoriums and gymnasiums, separate classroom, shop, and specialty wings, and cafeterias were designed to connect to the outdoors with patio spaces and covered open corridors linking buildings. Natural light and ventilation were provided by bands of windows, including multilight sashes, casements, and clerestories (Sapphos Environmental 2014:21). These school buildings reflected a more intimate and better integrated element of the community compared to the earlier period-revival monumental buildings. This newer campus style was a workplace and recreation center, sited in a manner that was more intimately associated with community living. This type of arrangement was flexible and eliminated much of the institutional atmosphere of the earlier large, compact buildings (Englehardt Jr. 1942:175).

In addition to the site plans' suitability for housing progressive education methods, these schools were considered safer for evacuation. Along with the age-old threats of earthquake and fire, residual anxieties of the war and subsequent Cold War added to the appeal of this style of school campus. Other practical aspects of these single-story schools were low-cost materials, swift constructability, and flexibility. With the baby boom in full swing, these rigid-frame schools could be quickly built and easily expanded as needed, with war-industry-made prefabricated materials and steel, and continuous fenestration (Ogata 2008:568). Instead of an auditorium, these post-war flexible school campuses included a multi-purpose building for school assembly, cafeteria, and meetings (Ogata 2008:569).

All of SCUSD's elementary schools built in the 1950s were designed in the finger plan and share the same midcentury modern design principles and type of structural materials. These schools, significantly more modest in scale compared to Acalanes Union High School and San José High School, include Bowers, Bracher, Briarwood, Central Park, Haman, Mayne, Millikin, Pomeroy, Scott Lane, Washington, and Westwood elementary schools (Appendix A: Figures A-25 through A-28).

Cluster Plan

The Architects Collaborative (TAC), a firm founded by master architect Walter Gropius, designed a prototype school in 1954 that could be quickly and economically constructed and easily expanded (Appendix A: Figure A-29). The design included a cluster of individual one-story buildings grouped around a central administration building. Small square classrooms were arranged in a grid that created outdoor "classrooms" or common areas interspersed between the buildings. Residential in scale, these buildings evoked the feeling of post-war suburban houses with the ubiquitous picture windows looking out onto landscaped spaces.

Contemporaneous with TAC's publishing their prototype cluster-plan campus design, the finger plan began to lose popularity. In addition to the large tracts of land required to accommodate a finger-plan campus, the spread-out buildings meant long cross-campus walk times and restricted communication. Classrooms oriented to maximize access to natural light proved to be costly. The variability of natural light throughout the day resulted in periods of excessive heat and glare followed by the need to augment daylight with electrical lighting. A desire for greater flexibility, domesticity and economy influenced a shift in campus design away from the finger plan to the more compact cluster plan. (Sapphos Environmental 2014:97; Ogata 2008:572).

The cluster plan retained the low massing, generally single-story layout of the finger-plan, and architects still designed classrooms with indoor-outdoor access and views. But rather than extending wings along an axis, the site plan transitioned to grouping individual modular buildings and structures around a central landscaped courtyard. The views from the classrooms were now oriented toward the courtyard and other classrooms, resulting in a more communal setting and informal environment (Sapphos Environmental 2014:99).

Although school designers continued to construct finger-plan campuses, the cluster-plan approach began to be widely adopted in the 1960s. The later finger-plan campuses were usually condensed or used for elementary schools and smaller upper-level schools, particularly in California where there was still ample space (Sapphos Environmental 2014:98). By 1965, according to *California School Buildings, 1960-1965,* "The 'Cluster Plan' has replaced the 'Finger Plan' concept for elementary schools. Arrangement of classrooms around a core area encourages cooperation between teachers

by giving them opportunities to share multi-use areas, resource centers and teacher prep areas all adjacent to their classrooms. Better acoustical control and better lighting is evident, and technology is employing these comfort factors to be coordinated with flexible interiors" (Gibson and Eatough 1966:viii).

The Marian A. Peterson High School (now middle school), while primarily a cluster-plan campus, includes some residual design elements of the finger-plan campus, as can be seen in the original plot plan drawn in 1964 by architect L.F. Richards (Appendix A: Figures A-30 through A-32). Phase 1 of the campus plan had the academic buildings, library, administration building, multi-purpose building, gymnasium and locker rooms clustered around a large central courtyard. The planned siting of three long, parallel future academic buildings on the west side of the campus partially connected by a covered breezeway reflects the spatial arrangement of a finger plan; the northwest-most "future academic" building was added to the campus by 1969.

Patrick Henry Intermediate School, designed in 1960 by architect Clyde D. Goudie, and expanded in 1962 with a design by the architectural firm Goudie & Griffin, is a cluster-plan campus with four L-shaped classroom buildings, the administration building, and the multi-purpose building spatially arranged around a large central courtyard (Appendix A: Figures A-33 and A-34). The classroom buildings are also arranged to create two secondary courtyards between two sets of the buildings. While the campus layout closely follows the cluster plan, the classrooms' fenestration is limited to bands of clerestory windows on the outward facing building façades; no classrooms have views looking onto the courtyards.

Open-Plan Design

A sub-design of the cluster plan is the open-space plan. While retaining the core campus arrangement and building orientation of the cluster plan, beginning in the mid- to late-1960s campus buildings were designed to have greater interior flexibility (California Department of Education 2000: 7). The objective was to have classrooms with adaptable interiors with moveable walls to accommodate changes in group size and/or activities. To accomplish this school architects designed buildings with large interior spaces separated by non-load-bearing walls, long and high roof spans, and steel structural systems. A relative lack of windows further accommodated this flexibility. This was made possible by modern air conditioning systems. Massing increased and exterior corridors moved inside since the buildings by necessity took up a greater area of the campus site. Some open-plan schools were designed in circular plan, with hexagonal or circular classrooms clustered around a common area (Sapphos Environmental 2014:104-105). SCUSD's Cabrillo Middle School, built in 1961, appears to be an example of a circular-design open-plan campus that followed the principle of the cluster plan. Survey of this campus is beyond the scope of this study (Appendix A: Figure A-35).

The open plan was not widely accepted and was short-lived. By the 1980s there was a return to the visual and sound separation provided by the self-contained classroom. However, the structural flexibility associated with the open-space plans continued to be used for common spaces, such as gyms, auditoriums, and cafeterias, most of which used moveable walls and space-function adjacency design to improve flow between the functional spaces (California Department of Education 2000:8).

Campus Typology Eligibility Standards

The following are California Register of Historical Resources eligibility standards, character-defining features, and integrity considerations by which to assess the potential significance of the overall design and layout of a school campus based on post World War II campus typology. These standards were adapted from the 2014 *Los Angeles Unified School District Historic Context Statement, 1870-1969.*

Table 2. Santa Clara Unified School District Campus Eligibility Standards

Property Type:	Institutional/Educational
Property Subtypes:	Elementary, Middle, and High Schools
Period of Significance:	1950–1969
Location:	Santa Clara Unified School District, Santa Clara County, California
Area of Significance:	Criterion A, associated with events that have made a significant contribution to broad patterns of local or regional history, or cultural heritage of California or the United States

This criterion applies primarily to the consideration of a campus as a historic district. Individual buildings may have specific architectural/design significance that would be evaluated under criterion 3, as the embodiment of the distinctive characteristics of a type, period, or method of construction, as an example of the work of a master architect, or for high artistic value.

Eligibility Standards:

- Clearly defines the characteristics of a postwar modern finger-plan or cluster-plan school campus
- Displays a unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces such as courtyards, patios or outdoor play areas
- One-story massing
- Classrooms clearly express their function, with axial, finger-like wings, plentiful fenestration, and connections to the outdoors
- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features, Buildings/Structures:

- Modular design, with a rhythmic, asymmetrical but balanced composition
- A modern design idiom, usually regional mid-century modernist or International style

- Differential window locations, sizes, and configurations in response to the location of the sun to maximize natural interior light or to create cross-lit classrooms
- Generous expanses of windows, including steel- and wood-framed multilight windows, in awning and hopper casements, clerestories and fixed panes
- Flat roof or broken-plane roof used for lighting and acoustics

Character-Defining Features, Campus:

- Unified campus design includes most or all of the following attributes:
    - Lack of formality and monumentality
    - Low massing – usually one-story classrooms and up to two stories for auditoriums/multipurpose rooms
    - Strong geometric ordering of buildings and outdoor spaces
    - Decentralized pavilion-like layout
    - Rational, function-driven site design
    - Buildings extend across the site
    - Buildings are oriented to outdoor spaces
    - Purposeful indoor-outdoor integration
- Building plans and site design clearly express their function; classroom wings are often one-story finger-like wings organized in parallel (finger plan) or around a central axis point (cluster plan)
- Indoor-outdoor spaces. Classrooms connected by patios, courtyards, and outdoor canopied corridors
- One-story massing, particularly for elementary schools; up to two to three stories for middle and high schools
- Building types and plans expressive of postwar ideals in education and school design
    - Finger plan, generally 1950s
    - Cluster plan, late 1950s into 1960s
    - Combination of the two plans that clearly express informality and indoor-outdoor connections
- Automobile traffic and drop-off areas separated from campus, linked to the interior by extended canopied corridors
- Buildings sited inward toward green spaces and courtyards
- Outdoor corridors sheltered beneath simple canopies that form links between the campus buildings
- Classrooms are a series of axial, modular units
- An informal, domestic scale for the buildings and campus, particularly for elementary schools

- Patios, terraces, and plantings adjacent to and alternating with buildings
- Associated with post World War II suburbanization and growth near major employment centers
- Built in residential neighborhoods on large expanses of land, with space devoted to landscape, play yards, and, particularly for high schools, athletic fields, stadiums, and tennis courts

Integrity Considerations:

- Retains most of the essential physical features from the period of significance
- School expansion and new construction over the years, in particular in the postwar period, may have resulted in the addition of in-fill buildings and structures in areas originally designed for outdoor spaces
- School may have been designed to be expanded as enrollment increased
    - Original site design and building types should be readily discernable
    - Additions should follow original build-out plans
    - Additions beyond those in an original build-out plan should be compatible with and visually subordinate to the original campus buildings and structures
- Materials may have been removed or replaced
- Modern lighting and fencing are unlikely to significantly affect integrity
- Overall campus and individual buildings should retain integrity of location, setting, materials, design, workmanship, feeling, association from its period of significance
- Additions of portable or permanent buildings after the period of significance is acceptable provided the original campus design is intact and the additions are on the periphery of the original campus on secondary elevations

Table 3. Santa Clara Unified School Sites.

	Address	City	Constructed – Buildings	Constructed – Portables	Architectural Type
Elementary School Sites					
Agnew Elementary	3534 Zanker Road	San Jose	2018-2021	N/A	New construction
Bowers Elementary	2755 Barkley Avenue	Santa Clara	1956-1958	1992-2010	Finger Plan
Bracher Elementary	2700 Chromite Drive	Santa Clara	1958-1959	1990-1998	Finger Plan

Martinson Campus	1350 Hope Drive	Santa Clara	1995	N/A	New construction

ARCHITECTURAL TYPOLOGY

Modern and Modernist architecture spanned the late 1920s through the 1970s and included several distinctive styles of architecture. Regional expressions of Modernism can be found throughout California and the United States. Key characteristics of Modern buildings is the lack of historical ornament and references, and an emphasis on a new architectural vocabulary. In the San Francisco Bay Area Streamline Modern, International Style, Second Bay Tradition, Mid-Century Modern, International Style, Brutalism, and Contractor Modern populate the cities and suburbs. New materials and building technologies stimulated the rapid post World War II promulgation of these architectural styles, with the mass-production of building products that were distinct from earlier products. These included materials that were often factory finished, such as plate glass, structural glass, spandrel glass, acoustical board, asphalt tile, vinyl asbestos tile, aluminum, concrete, ceramic, terrazzo, vinyl fabric, gypsum board and plaster, rubber topset, plywood, clear wire glass, and plastic laminate.

The historic-period post-war SCUSD campuses, built between 1951 and 1969, share the basic design principles and express simple application of Mid-Century Modern design elements regardless of campus plan. “Mid-Century Modern” is not an academically accepted architectural style term but was generated by the public. It describes a wide range of design elements incorporated into buildings during the 1940s through the 1960s. Mid-Century Modern was influenced by the more formal machine-age aesthetic of the International style. Mid-Century Modern expresses the architectural features of International style in a more relaxed, generally scaled down and regional style and sometimes adopts architectural elements from other Modernist styles. It is characterized by honest expression of structure and function with little applied ornament. The style can be found in postwar institutional buildings, commercial buildings, as well as residences.

Mid-Century Modern style is characterized by balanced, rhythmic composition with an emphasis on simple, geometric forms. Footprints are generally square or long rectangular; buildings are seldom more than two stories in height and are predominately horizontal in massing. This composition is achieved by modular post-and-beam construction that allows for large expansions of open floor plans. The rooflines are low-shed, low-gabled or flat, with wide eaves and cantilevered canopies supported on posts or spider-legs. Windows are generally flush-mounted with metal frames that may act as infill panels or extend to the gable. Ribbons of clerestory windows are also commonly found on Mid-Century Modern buildings.

Character-Defining Features

- Horizontal design composition and massing, generally only one to two stories in height
- Simple geometric volumes and strong right angles
- Flat, shed, or low-pitch gable roofs often with wide cantilevered overhangs
- Projected eaves and exposed rafters
- Projected vertical elements
- Exterior material of stucco, brick, concrete, or corrugated metal
- Stacked Roman brick or stone as accent materials
- Terrazzo paving
- Articulated primary façades
- Angled or deeply recessed vestibules
- Frequent use of sheltered exterior corridors with flat or slightly sloped roofs supported by posts, piers, or pipe columns
- Atrium or courtyard entryways
- Modular design
- Simply treated materials
- Visually expressed structural systems, generally of wood or steel post-and-beam
- Lack of historical design elements or ornamentation
- Generous expanses of fenestration, often in bands of grouped multi-light windows, generally steel or wood framed

- Canted windows
- Spandrel glass

Figures A-36 through A-39 in Appendix A are examples of SCUSD Mid-Century Modern schools. Figures A-40 through A-42 in Appendix A are some examples of National Register of Historic Places listed Mid-Century Modern Architecture in California.

4

METHODS

On January 17, 2022, Albion Archaeologist Brenda Arjona conducted a pedestrian survey for the Project. The Archaeological Survey Area included Marian A. Peterson Middle School site, Patrick Henry Elementary School site (no longer open), and Laurelwood Elementary School site (Appendix A: Figure A-43).

Marian A. Peterson Middle School and Patrick Henry Elementary School are adjacent to one another. The portion of the Project Area containing these two schools can be subdivided into the following significant areas: Two sports field areas, an athletic track, the Farm, and the paved parking lots pertaining to each school site. The Project Area is about 50% paved over and 40% ground surface with poor visibility due to dense grass, vegetation, and trees (Appendix A: Figure A-44).

Laurelwood Elementary, the smaller surveyed project area contains a large grass field area as well as a smaller patch of grass surrounded by classroom buildings. The rest of the property is paved over as features of the school, which is still in operation. This portion of the Project Area is about 40% ground surface with poor visibility due to dense grass and about 60% paved over (Appendix A: Figure A-45).

Albion's pedestrian survey was conducted using 3-meter-wide transects while closely inspecting the ground surface across all project areas. Ground surface visibility at both Project Area locations was poor due to the features of the schools, such as athletic fields and playgrounds. Dense grass and vegetation cover about 40% of the ground surface at both locations, since these areas contain fields in-use for both community sports and extracurricular activities associated with the schools. Paved surfaces covered about 50% of the Project Area, as these areas include parking lots, classrooms and administrative structures associated with the schools, playground adjacent areas, paved paths, and areas for physical activities.

SURVEY RESULTS

CULTURAL RESOURCES

Albion's pedestrian survey efforts yielded one isolated find within the Marian A. Peterson Middle School and Patrick Henry School portion of the Project Area (Appendix A: Figure A-46). This isolate, a historic-era porcelain transfer print fragment, was observed in the southwest quadrant of the northwest Project Area, along the east side of the field track behind the bleachers and adjacent to the grass field in the upper southwest quadrant (Isolated Resource 001) (See Appendix C). Aside

from this, no other precolonial or historic-era cultural resources or features were observed during the surface investigation of the Project Area.

SENSITIVITY ASSESSMENT

PRECOLONIAL ARCHAEOLOGICAL SENSITIVITY

Using a model, the potential for buried archaeological sites can be conceptualized as a set of factors that either encouraged or discouraged human use or occupation of certain landforms (e.g., aspect, extent, setting, slope), combined with those that affected the subsequent preservation (i.e., erosion or burial) of those landforms (Meyer et al. 2010; Rosenthal and Meyer 2004). Using this model, landforms can be ranked as being more or less sensitive based on demonstrated relationships between environmental variables and known precolonial site locations.

For example, the contact between depositional and non-depositional (e.g., eroded or older) landforms can also be a factor because these often mark environmental ecotones, or spatial transitions between different ecosystems, habitats, and/or plant and animal communities (Rosenthal and Meyer 2004; Meyer et. al 2010). In California, precolonial sites are commonly identified at or along ecotones, and are frequently located near the contact between younger and older geomorphic surfaces, such as fans or terraces that are higher than the floodplain (Rosenthal and Meyer 2004; Meyer et. al 2010). For this reason, areas in which both landforms occur in close proximity have a higher potential for containing buried archaeological resources than broad, level depositional landforms that lack elevated surfaces. Additionally, a study of GIS data indicates that archaeological site densities are greatest at distances of 200 meters (~656 feet) or less from a known watercourse (Rosenthal and Meyer 2004; Meyer et. al 2010). Consequently, it is expected that previously unidentified buried sites will be located relatively close to present springs and water courses, as well as former ones.

In summary, using this model, the potential for buried archaeological deposits can be conceived as follows:

- Very Low — pre-latest Pleistocene deposits regardless of the combination of other factors,
- Low — Latest Pleistocene or Holocene deposits with slopes greater than 9 degrees located more than 200 meters (656 feet) from a water source and/or geomorphic contact,
- Moderate — Holocene deposits with slopes less than 9 degrees located less than 200 meters (656 feet) geomorphic contact, located more than 200 meters (656 feet) from a water source,
- High — Holocene deposits with slopes less than 9 degrees located less than 200 meters (656 feet) geomorphic contact, AND less than 200 meters (656 feet) from a water source,
- Very High — Holocene deposits with slopes less than 9 degrees located less than 200 meters (656 feet) from a geomorphic contact, water source, and confluence of two or more watercourses, AND/OR contains previously identified buried site.

The Project Area contains soils hypothesized to be from the Pleistocene to the Holocene (Appendix A: Figure A-47) (Byrd et al. 2017). These soils are located in a flat alluvial fan with slopes less than 9 degrees and less than 200 meters (656 feet) from a water course. Additionally, Far Western

Anthropological Group completed a buried site assessment for Caltrans District 4 of the San Francisco Bay-Delta and immediate vicinity (Byrd et al 2017). This study included the current Project Area and assessed the buried site sensitivity to be moderate-high. We draw from Byrd et al. and have reviewed the current Project Area and confirm it holds a moderate-high sensitivity to contain buried precolonial resources. Based on this model and the Caltrans District 4 buried site assessment, the sensitivity for the Project Area to contain buried archaeological sites is moderate to high.

HISTORIC ARCHAEOLOGICAL SENSITIVITY

It is our professional opinion that there is a low potential for any buried historic-era archaeological resources to be located within the Project Area. The first documented historic-era development of the project consisted of agricultural fields during the 20th century. Further, our visual inspection of the Project Area ground surface did not identify any evidence of in-tact historic-era archaeological deposits. Therefore, it is our assessment that the proposed Project is not likely to impact any subsurface historic-era cultural resources.

Architectural Field Methods, Results, and Evaluation

5

METHODS

On January 17, 2022, architectural historian Meg Scantlebury surveyed Marian A. Peterson Middle School and Patrick Henry Intermediate School campuses; the Laurelwood Elementary School Site was not included in the architectural study (Appendix A: Figure A-48). SCUSD staff provided access to the campuses. Although the Project footprint does not include all of the Peterson campus, Ms. Scantlebury surveyed the entirety of each of the two campuses. Large properties that include buildings and structures designed together by plan or historic period have the potential to be historic districts; all associated, potentially contributing resources of this kind of property need to be included in an intensive architectural resources survey to adequately assess its eligibility as a district. The survey consisted of photographing buildings, structures, circulation systems, and landscaping and taking field notes of her observations. Prior to the survey, Ms. Scantlebury researched the online catalogs of the Sunnyvale Public Library, San José Public Library/Dr. Martin Luther King, Jr. Library's California Room, and History San José. She also made appointments with the three repositories and conducted on-location research on January 16, 17, and 18, 2022. SCUSD provided Ms. Scantlebury with copies of the original architectural plans and property deeds for the two subject properties.

RESULTS

PATRICK HENRY CAMPUS PROPERTY DESCRIPTION

Patrick Henry Intermediate School is located on the southeast portion of the subject parcel APN 313-10-004 (See Appendix A: Figure A-48). Its primary entrance is on Dunford Way to the south; Teal Drive demarcates the eastern boundary of the campus. North of the campus is a large informal grassy field the full width of the campus. To the west of the campus is a large oval running track surrounding a grass-covered soccer pitch/football field, beyond the play field is the Santa Clara Unified School District Farm. North of the Farm is the Bryan Osborne Nature Center, and the Marian A. Peterson Middle School campus. The 71.08-acre property is surrounded by subdivisions of primarily modestly scaled single-family homes and multi-family units built in the 1950s–1970s. A private school, a Sunnyvale city park, and a church are south of the property.

The school was designed and built in two phases. The original campus, designed by Jefferson School District architect Clyde D. Goudie in 1960, included the overall campus design, building siting, exterior open spaces and courtyards, parking, pedestrian, automobile and bus circulation, classroom buildings, and the administration building. Architects Goudie & Griffin designed the two additional

buildings, multipurpose building, and locker building in 1962. The 1960 campus layout plan included the siting of these two future buildings.

Table 4. Patrick Henry School Description.

Address:	1095 Dunford Way, Sunnyvale, California 94087
Assessor's Parcel Number (APN):	313-10-004. Includes Patrick Henry School Campus, Marian A. Peterson Middle School, Santa Clara Unified School District Farm, and Bryan Osborne Nature Center
Total Acreage of Parcel:	71.08 acres
Developed Acreage of the Patrick Henry School:	Approximately 13.8 acres
Owner:	Santa Clara Unified School District
Architects:	Clyde D. Goudie (1960), Goudie & (Dewitt J.) Griffin (1962)
Structural Engineers:	Paquette & Maurer (1960), Ackerman and Aronoff (1960)

Campus Description

The Patrick Henry Intermediate School was designed in the "cluster plan", following the prototype 1954 school design by The Architects Collaborative, in which classrooms are inwardly sited, clustered around courtyards and centrally located administration and multipurpose buildings (see Appendix A: Figures A-48 and A-49). In the center of the campus is the largest of three courtyards. The administration building and multipurpose building face north onto the south side of the central courtyard. One narrow façade of each of the four L-shaped classroom buildings flank the east, north, and west sides of the central courtyard. Exterior covered corridors surround the central courtyard and connect the four classroom buildings, the multipurpose building, and the administration building. These walkways are sheltered by flat roofs cantilevered off the façades of each classroom building, supported by exposed steel rafters and steel columns forming an upside-down L-shape. Classroom buildings A and D are sited in a sort of yin/yang pattern to create a secondary courtyard northwest of the central courtyard; classroom buildings B and C are also sited similarly to create another secondary courtyard, northeast of the central courtyard. The courtyards are simple and informal, paved with concrete slabs and dotted with occasional trees, some planting beds, and benches.

The entrance to the campus is on the south side of the property, on Dunford Way, through a flat-roof-covered walkway between the administration building to the east and the multipurpose building to the west. The roof of this north-south arcade is cantilevered off the west façade of the administration building and is supported on the east by a series of concrete vertical slabs. The walkway opens onto the central courtyard. A horse-shoe shaped asphalt parking lot, student drop-off area, and bus driveway is west of the multipurpose building, facing Dunford Way; a slightly larger rectangular asphalt parking lot is east of the administration building, also facing Dunford Way. A

grassy area with some trees is planted between the southern façade of the multipurpose building and Dunford Way, with a flagpole near the entrance arcade. There is also a small lawn area between the rectangular parking lot and classroom building B.

Between classroom building B and Teal Drive to the east is an informally landscaped area with patches of grass and scattered trees and bushes. An asphalt pathway leads from Teal Drive through the grounds and passes along the south side of classroom building B toward the central courtyard. Other paved pathways wind through the landscaped area north of this pathway identified on Google Earth as Lochinvar Avenue.

A large asphalt parking lot is sited north and west of classroom building D, accessed from Dunford Way between classroom building A and the locker building to the west. West of the parking lot and locker building are Santa Clara Unified School District vehicles and portable metal storage units. An asphalt-paved play area is east of the large parking lot, behind classroom building C, with two half-court basketball courts, three four-square courts, a dodge-ball circle, and two tether-ball circles painted on the surface, along with other surface playground markings.

Chain-link fencing surrounds much of the campus proper.

Buildings

The campus is comprised of seven buildings. Four classroom buildings, buildings A, B, C, and D, are L-shaped of similar size and footprint, each oriented differently (see Appendix A: Figure A-38 and Figures A-49 through A-52). Building A, C, and D have almost identical footprints, with one wing of the L significantly narrower than the other wing; the two wings of building B that make up the L are of similar width. (The plans originally refer to these buildings as units A, C, D, and E; the administration building was referred to as unit B.) While the classroom buildings were designed using the same architectural features, each classroom building was functionally designed to accommodate specific intended uses, such as shop, science, art, sewing, etc. The administration building is a small rectangle. The multipurpose building (referred to as unit F in the plans), is irregularly shaped, with the center of the primary façade that faces the interior large courtyard bowed outwardly and flanked by two small wings. The locker building (referred to in the plans as unit G), is primarily rectangular, with symmetrical bays extending out from both the north and the south façades. It is sited west of the main cluster of campus buildings. All buildings are in poor to fair condition.

The buildings are built on concrete slab foundations atop engineered fill. The sills are redwood and the framing is steel and redwood. The roofing material appears to be rolled asphalt. The roofs of each classroom are a series of very low gables.

The five buildings built in 1960 share the same simple architectural design features and are of similar low horizontal massing. Common exterior wall design features include panels of two basic wall styles repeated in irregular patterns across each building's façade. Large flat plain panels average between 10' and 12' wide between expansion joints, are 12' tall, with a flat parapet topped with a narrow metal cap and are sheathed in cement plaster painted a warm cream color.

The second panel type is a slightly shorter in height 4'-wide design of 4' x 8' plywood topped with a transom window, all articulated within a three-part metal frame. Most transom windows are

hopper-style windows. Interspersed between these plywood panels are occasional panels with inset plate-glass or Aklo-glass, a type of glass developed in 1939 to absorb heat and filter daylight. The plywood panels are painted the same warm cream color. A stepped-down horizontal roof eave with vertical rib-patterned or corrugated blue facia extends slightly out from the wall plane above these panels. This shallow eave is supported by occasional 4" x 4" metal tube columns.

Typical main entrances contain double metal doors hung symmetrically, flanked by metal-framed sidelights; all doors are blue with simple metal frames, and topped with transom lights. These recessed doorways range from 9'6" to 12' in width and are covered with the same cantilevered roofing detail and facia as the tri-part panels. Other doors are single, blue, not recessed, and are plain metal with simple metal trim.

Classroom Building A (1960)

Building A is the western-most classroom building. Like all four classroom buildings, it is L-shaped. The broader leg of the L is oriented east-west and contains two rows of classrooms with a central interior hallway; the portion of the L that extends north of the east-west portion of the classroom building has no interior hallway. The building was designed to contain five classrooms, a metal shop and wood shop, restrooms, a mechanical room and a supply room.

The east façade (east elevation 1) facing the central courtyard is fully recessed behind the continuous covered walkway that surrounds the courtyard. A parapet on the same plane as the building façade extends above the walkway roof. The cantilevered walkway roof is flat, supported by six simple rectangular steel tubes that extend out below the walkway roof horizontally to its edge. Matching steel tubes provide vertical support at the edge of the cantilevered overhang. The walkway extends beyond the northwest and southwest corners of this building's façade. Blue double solid metal doors are recessed in the center of the elevation, flanked by a piece of plywood on one side and a plate-glass panel on the other side. Each side panel is topped with a glass transom. Blue corrugated metal roof facia is visible over the doors, above the walkway roof, and is the width of the recessed doors and side lights. The exterior wall is articulated by four plain unglazed panels on each side of the central entrance, two panels within each bay of the walkway supports. The façade is 72'-wide.

The south façade, behind which are four classrooms, faces the bus driveway. There is no covered walkway. The wall is articulated by a series of cream-colored plywood panels within metal frames with transoms atop each panel. Four of the panels are dark plate glass, specified on the plans as "Aklo" glass. There are two single solid metal doors painted blue and four small air conditioners protrude out of the flat façade. The very shallow eave is covered by a wide facia panel of blue vertically corrugated metal; it is supported by a series of columns a few inches away from the wall. Four trees are planted along this elevation, which is 128'6" wide.

The west façade is the widest at 167'6" (Appendix A: Figure A-53). The southern-most section of the façade has no openings in the wall of the southwestern-most classroom. North of this portion of the wall is a recessed double metal door entrance into the building's interior hallway which is parallel to and closely resembles the east façade entrance onto the central courtyard, with a cantilevered blue roof over the entrance. North of this entrance are the classrooms designed to be shops; this portion of the west elevation is visually divided into five sections. Immediately north of the entrance is a narrow plain cream-colored panel with a flat parapet that is taller than the cantilevered roof over

the entrance. Moving north, there is a series of the typical plywood panels under a lower blue metal roof that extends slightly beyond the plane of the façade. The eave is supported by four irregularly placed metal posts. Under the first extended eave panel are eight plywood metal-framed panels that differ slightly from the typical in that each are topped with two transoms, the lower row of glazing is of the standard narrow width, and the upper row is taller. Two panels are between the first and second steel columns supporting the shallow eave, while four panels are articulated between the second and third columns. The last two panels are between the third column and the last column, which marks the transition away from the typical plywood panel to a taller flat parapeted portion of the elevation. This expanse is narrower than the two eave-sheltered sections on either side of it and contains a single blue metal door with a small vertical light and a double aluminum-framed window in the center. The second eave-sheltered section of the elevation is identical to the first and also contains four air conditioners jutting out of the wall panels. North of the eave-covered section is another taller flat parapeted wall with a double unglazed blue metal door and a single unglazed blue metal door. The rest of the wall is solid, plastered, and painted cream.

The north façade facing the western end of building B is 37'6" wide and contains the entrance to the boys' restroom. The cantilevered roof walkway that protects the entrance is identical to that of the covered walkway along the two eastern façades of the building.

The east elevation that faces the secondary courtyard is 95' in length and is similar in design to the other east façade, with a series of plastered plywood panels within metal frames. The length of the elevation is covered with an identical cantilever-roofed walkway with a flat parapet following the plane of the building façade extended above. The entrance to the girls' restroom is on this elevation as is another single blue solid metal door.

The 93'-wide north elevation that faces the secondary courtyard is similar in design to the southern elevation, with two classrooms rather than four. A double blue solid metal door with side lights and transoms identical to the door on the east façade is located at the 90-degree angle of the L and opens northward into the secondary northwestern courtyard. Plain cream-colored panels with taller parapets are immediately to the east of the entrance, followed by a series of the typical metal-framed cream-colored transomed panels below a slightly extended eave with blue metal facia.

Classroom Building B (1960)

Classroom building B is the eastern-most classroom building (Appendix A: Figure A-54). L-shaped like the other three classroom buildings, one west façade faces the main courtyard, the south façade faces some landscaping and a parking lot, the east façade faces another expanse of landscaping, and its secondary north façade and secondary west façade face the eastern secondary courtyard. The building was designed to house twelve classrooms, a music room, a mechanical room, a boys' restroom and a girls' restroom.

The 72'-wide west façade that faces the central courtyard mirrors that of the east elevation of building A. The only differences are that the plate glass is intact in both side lights flanking the double doors and four squares of louvers venting the mechanical room are inset into the cream-colored cement-plastered panels south of the centrally located entrance.

The 137'-wide south elevation is mostly symmetrical, with thirty panels of metal framed plywood or Aklo glass all with transom windows above, flanked at either end with wider, taller flat cream-colored cement-plastered panels. Of the thirty panels, four are inset with Aklo glass. The line of thirty metal-framed panels is topped with the same slightly extended eave beyond the plane of the panels, and blue facia. The extended eave is supported by seven steel tube columns in a manner identical to the south façade of building A.

The east elevation is 168'-wide and uses the same architectural design details in the following pattern, from south to north: Three wide, flat panels with a taller parapet coated with cream-colored cement-plaster, recessed blue metal double doors flanked by side lights all topped with transoms below a stepped down cantilevered roof with shallow eaves, a wider, taller cement plaster-coated panel, six narrower plywood/transom panels, one Aklo-glass/transom panel, seven plywood/transom panels, one Aklo-glass/transom panel, seven plywood/transom panels, an Aklo-glass/transom panel, five plywood/transom panels, and finally a wider and taller flat cement-plastered cream-colored panel. The roof design is typical for all of the plywood and glass panels.

The north elevation is 72' wide and is identical to the building's west elevation 1.

The secondary west elevation faces the eastern secondary courtyard and is 96' wide. Architectural treatments are typical; from north to south they consist of one wide taller cement-plaster coated panel, followed by four narrower plywood panels inset in metal frames, topped with transoms, a single metal unglazed door in a space consistent in width to the plywood panels, one plywood/transom panel, one Aklo-glazed/transom panel, five plywood/transom panels, a second door identical to the first, one plywood/transom panel, one Aklo-glazed/transom panel, four plywood/transom panels, and a third identical metal door. The series of narrow panels and doors are topped with the same slightly stepped down and slightly extended eave with blue metal facia supported by five steel tube columns.

The secondary north elevation faces the eastern secondary courtyard. From east to west, the design begins with two narrow rows of floor-to-ceiling awning windows, an architectural feature not found in any other campus building. Following the awning windows is a single blue metal door, followed by an Aklo-glazed/transom panel, five plywood/transom panels, another identical single metal door, then one plywood/transom panel. The elevation ends on the west end with two large, flat taller cream-colored cement-plaster coated panels. The same stepped-down eave with blue metal facia extends from the awning windows to the beginning of the tall cement-plaster panels, supported by one steel tube column.

Classroom Building C (1960)

Classroom building C is the northeastern-most classroom building (Appendix A: Figure A-55). L-shaped like the other three classroom buildings, one south façade faces the main courtyard, the west façade faces a wide asphalt-paved uncovered walkway leading from the large northern parking lot to the central courtyard and the east façade of building D. The north elevation faces the student drop-off section of the large parking lot to the north, a dirt, fenced play area that appears to have some empty raised garden beds and, further north, the paved play area described earlier. The secondary south elevation and east elevation face the eastern secondary courtyard and classroom building B. The secondary east elevation also faces a dirt play area with some play structures, raised beds and occasional trees. The building was designed to contain a homemaking room, a sewing

room, boys' and girls' restrooms, storage, a boiler room, five classrooms, a men's room, a women's room, janitor's room and supply room.

The 72'-wide south façade faces the central courtyard and is consistent in design with the other three classroom buildings' main courtyard-facing elevations, with four plain cream-colored plaster coated taller panels on either side of a typical double-door recessed entrance into the central hall of the building's classroom wing.

The east façade facing the secondary courtyard, 96' in width, is also made up of the two typical wall designs, beginning on the south end with a taller cream-colored cement-plastered plain panel followed by one typical plywood/transom panel, a single flush-hung door, four plywood/transom panels, a frosted Aklo glass/transom panel, five plywood/transom panels, a second flush-hung door, one frosted Aklo glass/transom panels, a third typical door, another plywood/transom panel, a taller cement-plastered panel followed by a typical recessed double-door entrance. The transoms are a mix of fixed pane and hopper windows.

The secondary 73'-wide south-facing façade has no fenestration. It consists of a series of the typical taller cream-colored plain cement-plaster covered panels with three typical single metal doors placed irregularly along the wall expanse plus an additional brown-colored door not in the original plans. Approximately half of the width of the elevation has the typical covered walkway which is fenced off with a combination of cyclone fencing and T-111 plywood.

The secondary east-facing façade is only 30' wide and has no fenestration or entrances. It consists of three typical plain cream-colored plaster-coated taller panels with a metal cap.

The north elevation is the widest at 145'. The majority of the architectural wall treatments are typical except for the wall expanse where the entrances to the boys' and girls' restrooms are located. From east to west, the wall panels begin with one wider taller cream-colored plaster-coated plain section followed by seven plywood/transom panels, then a single narrower plain panel, followed by eight plywood/transom panels. Most transoms contain hopper windows. This series is followed by a larger, taller plain panel with a metal cap. To the west are two open doorways into the girls' restroom, a plain door into a storage room, followed by a double-wide opening into what was the boys' restroom which is now infilled with T-111 plywood painted the same cream color. The wall expanse containing these openings is plain, cement-plastered topped with the blue corrugated stepped down roof detail. This is followed by two typical taller plain plastered panels.

The west elevation is 136' wide and is comprised of the typical design features arranged in the following pattern: From north to south the façade begins with two wide taller plain panels with large ventilation louvers and a central plain flush double door into the boiler room, a typical recessed double door, a single plain panel, six plywood/transom panels, a single frosted Aklo/transom panel, seven more plywood/transom panels followed by six taller plain panels with the third panel containing a simple single metal door.

Classroom Building D (1960)

Classroom building D is the northwestern-most classroom building (Appendix A: Figure A-56). L-shaped like the other three classroom buildings, one south façade faces the main courtyard, the narrow west façade faces a small yard with a few trees then the parking lot/driveway that leads to

the large parking lot to the north. The other south and west elevations face the secondary western courtyard. The east elevation faces building C and the wide walkway between the two buildings leading to the central courtyard. The north elevation faces the large parking lot. The building was designed to contain three classrooms, two larger art rooms divided by a mechanical room and a vented drying room, and four science rooms grouped together in twos with shared workrooms, separated by north/south corridor.

The southern-most elevation is consistent with the other classrooms' elevations that open onto the central courtyard – 72' wide, plain wall panels flanking a typical central recessed double door. The covered walkway is directly in front of this elevation.

The 126' east elevation also contains typical architectural wall features. From south to north, it begins with a single plain taller panel followed by a lower blue roof eave panel with a single blue door, then five plywood/transom panels, an Aklo glass/transom panel, two taller plain panels, another Aklo glass/transom panel, five plywood/transom panels, another plain single door, one taller cement-plastered panel, then a typical recessed double entry door with side lights and transoms. The façade ends with four larger plain panels.

The widest elevation is the north façade at 178'; it is comprised of long expanses of typical repeated wall treatments. From east to west, there is a single large plain panel, five plywood/transom panels, a plain door inset in a lower, blue-roofed panel, a wide taller plain panel with louvers and a wide plain blue door into the mechanical room, another single door inset into a lower, blue-roofed panel, followed by a series of 25 plywood/transom and 4 Aklo-glass/transom panels, irregularly placed. The façade ends with a single plain taller panel.

The secondary west elevation is only 30' wide and has no openings. The wall treatment is limited to taller plain panels of the cream-colored cement-plaster coated material.

The secondary 106'-wide south elevation that opens onto the secondary courtyard has no windows and is comprised of fifteen typical plain taller cream-colored panels, three of which contain a single plain blue metal door. Most of this elevation is sheltered by the typical covered walkway.

The west elevation is 96' wide and is also made up of the typical architectural wall treatments. From north to south, it begins with a typical recessed double door/sidelight/transom entrance followed by a taller plain panel, then a plain metal door under the typical lower blue eave which continues above a series of five plywood/transom panels. Two Aklo-glass/transom panels flank a taller wider plain panel, followed by six lower panels consisting of five plywood/transom panels and one panels containing a simple metal door. The façade ends with a single taller plain panel.

Administration Building (1960)

The rectangular administration building is significantly smaller than the four classroom buildings at 64'6" x 56'. It was designed to contain the library, attendance center, nurse's office, clerks' office, reception room, offices for counselors, the vice principal, and the principal, a work room, speech therapy room, and a mechanical systems room. It and its neighboring building to the west, the multipurpose building, are the southern-most buildings on the campus. The broad central covered walkway entrance is immediately to the west of the building; the walkway roof is cantilevered off the subject building's west elevation (Appendix A: Figure A-57).

The south elevation has no entrances. The façade is divided into the two typical architectural design elements. East of the covered entrance are a series of eleven panels set in metal frames. The first two panels are Aklo glass, followed by five panels of cream-colored plywood, two more Aklo glass panels, then finally two additional plywood panels. Each panel includes a transom of Aklo glass. The typical blue corrugated metal facia that covers the shallow roof eave found on the southern elevation of building A spans the cantilevered walkway roof and continues across all articulated panels. The second design element is a flat expanse of cement-plastered cream-colored wall with the higher, flat parapet topped with a metal cap. This expanse is approximately the width of the covered campus entrance to the west of the building.

The east elevation begins, south to north, with a narrow, flat, cream-colored plaster-covered panel with a taller flat parapet followed by two panels of plywood set in metal frames with transoms above them. The shallow blue roof eave and facia slightly extends outward above the transoms. The rest of the façade is made up of six wide panels with flat taller parapets. Each panel is coated with cement plaster painted in the cream color. One panel contains a solid metal door and one panel contains louvers for mechanical ventilation.

The north elevation contains the same architectural details in a slightly different arrangement. Moving from east to west, the façade starts with a wide cream-colored cement plastered panel with a single plain, solid metal door painted blue. It is followed by the typical plywood panels in metal frames with transoms between the plywood and the blue corrugated metal roof facia, followed by the plain, flat cement-plastered panels with taller flat parapets. One single metal door pierces the flat panel. This elevation faces the central courtyard and the covered walkway.

The west elevation abuts the wide covered main campus entrance between the subject building and the multipurpose building to the west. The architectural design elements are consistent with those on the other elevations and the other campus buildings. A single cream-colored cement plaster panel is followed by a metal-framed plate-glass panel then a metal-framed plywood panel, each topped with a transom. These are followed by three broader, flat cement-plaster panels, one with a door piercing it. These panels are then followed by three metal-framed plywood panels with transoms and two Aklo glass panels with transoms, ending with a panel containing a second door.

Multipurpose Building (1962)

The multipurpose building is a mostly symmetrical, essentially pentagonal-shaped building that contains a narrower central symmetrical pentagonal-shaped room that is flanked to the east and west by smaller rooms. The central room was designed accommodate student assembly, with a raised platform on the south elevation for performances or lectures, as well as be used as a cafeteria. Rooms to the west of the assembly room/cafeteria were designed to contain a kitchen and instrument room; rooms to the east were designed to house a vocal music room, a teachers' work room, and men's and women's restrooms.

The building is sited on the south side of the campus with its primary façade facing north onto the central courtyard. Between the building and the courtyard is a typical, free-standing covered walkway. Its placement is awkward, blocking the full view of the building's taller fenestrated façade. South of the building is a lawn (Appendix A: Figure A-58). To the east is the covered main entry to the campus and the administration building, and to the west is a parking lot/student drop off area.

The design borrows from the 1960 design with its use of tall plain panels of cream-colored cement-plastered metal-capped walls and some of the lower blue corrugated roof elements and blue doors. It is consistent with the earlier buildings' horizonal massing and rhythmic use of vertical elements.

The center of the north façade is taller than the two lower wings on either side and extends north toward the courtyard, creating two planes resulting in a shallow point in the middle. The point is sheathed in tall, plain cream-colored cement-plastered wall panels. The point elevations each contain five 11'7"-tall columns of five 3'7"-wide sets of aluminum-framed windows. Each column consists of three 1'8"-tall hopper windows separated by a fixed 3'-tall window and a fixed 3'7" window. The parapet is flat and metal capped. Moving away from the central point, on the other side of the windows, are sets of blue plain metal double doors. The lower wings project out, north of the doors; the angles of the façades of each wing match the angle of the two center planes of the north elevation.

The planes and heights of the east elevation are varied. Beginning south and moving north, the first section shares the roof line with the auditorium. The plane is angled and contains three rhythmically placed slightly recessed approximately 2'-wide ground-to-roof-cap inverted columns (Appendix A: Figure A-59). Within each recess is a tall, tripart window with two 1' 8"-tall hopper windows divided by a 4'5"-tall fixed light. The rest of the 30'-wide section is comprised of flat metal-capped cream-colored wall panels. The wall makes a 90 degree turn west; this short 5'-wide wall contains a single, plain blue metal door. The wall again makes a short 90 degree turn north; this 9'3"-wide wall contains a wide tripart vertical window. The wall again turns 90 degrees west; the 6'6"-wide wall expanse houses another plain door. Again, the wall plane zigzags north and the roof height is lowered. Within this 32'9"-wide portion of the east façade are five columns of tripart windows, similar in pattern and dimension to the plywood/transom panel architectural wall treatment found on the classroom building exteriors. These columns are fully glazed with three panes of tinted glass. The characteristic blue corrugated metal cantilevered roof extends out from the elevation that contains this set of windows. The elevation continues north for 14' and is plain cream-colored siding with one double set of inset hopper windows.

The south elevation has three planes, with the 34'-wide center portion inset and the symmetrical flanking 34'-wide elevations angled southward as they move away from the façade's center (Appendix A: Figure A-60). The center is sheathed in plain cream-colored, tall metal capped walls. The two flanking planes are mirrors of each other and contain a flush-mounted blue double metal door and three evenly spaced columnar windows identical to those found on the southern-most section of the east elevation.

Like the east elevation, the west elevation is made up of several planes and heights but does not exactly mirror the east elevation (Appendix A: Figure A-61). The first plane on the west is 39' wide and contains three evenly spaced columnar windows identical to those found on the south façade. Several feet north of the third window is a plain blue metal door, followed by several feet of the plain, cement-plastered cream-colored tall wall panel. The wall makes a 90 degree turn eastward. The space contains the kitchen and its mechanical systems. Typical architectural details are used, including several plain blue metal doors, cream-colored walls, and the blue corrugated lower roof detail.

Locker Building (1962)

The locker building is a mostly symmetrical, rectangular east-west oriented building with central bays extending off the north and the south elevations (Appendix A: Figure A-62). It was designed to house the girls' and boys' locker rooms and showers; it appears it was not designed to also accommodate any indoor sports or activities. The building is equally divided in two, with the western half mirroring the eastern half. The south bay was designed to house the mechanical systems and the north bay to contain the restrooms. It has been repurposed by the school district as storage and a print shop.

The building is sited on the southwest side of the campus with its primary entrances facing north onto an asphalt surfaced parking lot and large grassy field. An aboveground PG&E power facility surrounded by a chain-link fence is just north of the building. School district maintenance vehicles and storage containers mark the western edge of the campus. Farther west is the Peterson Middle School oval track, to the east is the main campus, and to the south is an informally landscaped area with trees and bushes and Dunford Way.

The design borrows from the 1960 design with its use of tall plain panels of cream-colored cement-plastered metal capped walls and blue doors. Fenestration is limited and, what there is, is not consistent with the other campus buildings' windows.

The eastern half and the western half of the 100'-wide north elevation generally mirror each other, each with a double plain blue metal set of doors, a single blue metal door, and a tri-part vertical window. The central bay contains two sets of two hopper windows, placed high on the façade. The single-door entrances to the boys' and girls' restrooms are on the east and west facing walls of the bay. There is a second plain metal door on one side of the bay. The double doors on the west half of the north elevation are sheltered by a green canvas awning with the words "PRINT SHOP" in white on its face.

The east elevation and the west elevation are each 49' wide. The west elevation was not visible. The east elevation contains a band of four rectangular windows. One is painted cream and one is above a single metal blue door protected by a green canvas awning.

The south elevation is made up of a series of plain cream-colored cement plastered panels. The east and west walls of the mechanical system bay contain ventilation louvers.

MARIAN A. PETERSON MIDDLE SCHOOL PROPERTY DESCRIPTION

Marian A. Peterson Middle School is located on the northwest portion of the subject parcel APN 313-10-004 (See Appendix A: Figure A-48). Its primary access is on Rosalia Avenue and Poplar Way to the north; the northern boundary of the northeast parking lot is Bryant Way. The eastern boundary is Roadrunner Terrace. The western boundary abuts residences. South of the main campus is the football field and track, the Bryan Osborne Nature Center, and the Santa Clara Unified School District Farm; southeast of the campus is the Patrick Henry field and, further south, the Patrick Henry campus. The SCUSD's 71.08 acre-property is surrounded by subdivisions of primarily modestly scaled single-family homes and multi-family units built in the 1950s–1970s (Appendix A: Figure A-63).

Table 5. Marian A. Peterson Middle School Description.

Name:	Marian A. Peterson Middle School, built as Marian A. Peterson High School
Address:	1380 Rosalia Avenue, Sunnyvale, California 94087
Assessor's Parcel Number (APN):	313-10-004. Includes Patrick Henry School Campus, Marian A. Peterson Middle School, Santa Clara Unified School District Farm, and Bryan Osborne Nature Center
Total Acreage of Parcel:	71.08 acres
Developed Acreage of the Peterson School:	Approximately 25 acres
Owner:	Santa Clara Unified School District
Architect:	L.F. Richards (all historic-period phases that are extant)
Structural Engineers:	Carl W. Zeppenfeld (1964), O.B. Christensen (1966), Kirk C. McFarland, Jr. (1969)

The school was designed and built in three phases in the historic period, 1972 or earlier (Appendix A: Figures A-64 through A-66). All historic-era buildings were designed by architect L.F. Richards. The first phase, designed in 1964, included the administration building (demolished), library (demolished), multipurpose building, most of the gymnasium, a locker building (demolished), home economics building "C", science building "D", classroom buildings "A" and "B", and half of shop building "E". The second phase was built in 1966 and included classroom building "F" and building "H" (demolished). The remainder of building "E", classroom building "G", and a small addition to the gymnasium were built in 1969. Extant buildings that were built after the historic period include the current library, administration building, locker room and additional athletic facilities, swimming pool, and the replacement of building "H", as well as the large landscaped area south of the gymnasium and new basketball courts where the original locker room once was. The tennis courts were built between 1968 and 1980. The bleachers for the football field were built in 1969; the identity of the designer is unknown.

Campus Description

Marian A. Peterson High School was originally designed as a hybrid "finger plan" and "cluster plan" campus. The campus is generally arranged in two parts: The western half serves the school's academics and administration while the eastern half contains buildings, structures and spaces associated with the school's athletic programs. Classroom buildings are clustered around the library and administration building, but their arrangement more closely resembles that of the finger plan. While the original library and administration building are no longer extant, their replacements are similarly sited on the campus, in relation to the historic period classroom buildings. The multipurpose building is sited inward toward a landscaped communal area. The gymnasium is sited

on an open, landscaped area that replaced a large locker room building that was recently demolished. The main entrance into the gymnasium does not face inward but faces away from the campus toward the large parking lot to its north.

The school has two parking lots. The smaller lot is sited on the northwest corner of the campus and includes a curved drop-off area and serves as the primary approach to the campus. The larger lot is on the northeast corner of the school, north of the gymnasium, tennis courts and the other athletic facilities. The main entrance to the campus is the modern administration building (Appendix A: Figure A-67). The library, a modern replacement, occupies the back of the administration building. A small, landscaped area north of the administration building marks the entrance to the campus with a sign and flagpole. A modern concrete walkway leading to the administration building is adjacent to a series of trees surrounded by benches that separate the walkway from the parking lot.

The administration/library building is flanked on each side by two east-west oriented long parallel classroom buildings, buildings A, B, F, and G, from the historic period. The space between these parallel buildings is a narrow, paved area shaded by the buildings' deep cantilevered overhangs (Appendix A: Figure A-68). Building H, a modern replacement building, is directly south of the administration/ library building. South of building H is building D, the science building, built in 1964. To the east of building D is a small building, building C, built in 1964 as the home economics building. South of building D is building E. Building E, originally a shop, was built in two phases in the 1960s. The building marks the southwest boundary of the campus, is parallel to, but longer than the other historic-period classroom buildings. Between classroom building G and classroom building E is a landscaped area, with grass, a Y-shaped pathway, and trees. East of classroom E is the Bryan Osborne Nature Center, outside of the project area.

North of classroom building A, separated by a large concrete courtyard with occasional trees and outdoor seating, is the multipurpose building, built in 1964 (Appendix A: Figure A-69). Directly east of the multipurpose building is the gymnasium also built in 1964, with two additions constructed on the building's east end in 1969. Between the east ends of classroom buildings A and B and the newly planted grassy field south of the gym, separated by a fence, is an informal landscaped area on a slight rise, with mature trees, grass and concrete paths (Appendix A: Figure A-70). South of the gym are the new athletic buildings, structures, the swimming pool, basketball courts, and fixed workout equipment. East of the new buildings and pool are the tennis courts which were built prior to 1980. South of the tennis courts is the football field and bleachers, built in the 1960s.

Chain-link fencing and iron fencing surrounds much of the campus proper as well as functional areas within the campus.

Buildings

The campus is comprised of nine historic-period buildings: Seven classroom buildings, the multipurpose building, and the gymnasium. Four of the classroom buildings, buildings A, B, F, and G have identical footprints and are oriented east-west; buildings A and B were built in 1964 during Phase 1 of the campus's construction, and buildings F and G were indicated on the Phase 1 plan sheets as "future academic". Buildings C and D are smaller rectangles, oriented north-south. Classroom E, built in two phases is similar in footprint and orientation to A, B, F, and G, but significantly longer. The multipurpose building and the gymnasium are significantly taller and, while they are similar to the classrooms in their horizontal massing, their overall scale and architectural

features are comparatively grander. All are topped with what appears to be rolled asphalt roofing material. Overall, the historic-era buildings are in good condition. The following discussion only describes the historic-period campus buildings.

Classroom Buildings A, B, F, G

Classroom buildings A, B, F, and G have virtually identical footprints, however each building was purpose-built to accommodate some specific classroom functions, so the floor plans vary. The northwest corner of A and B buildings house men's and women's restrooms with entrances on the west elevation. Building F (identified in the plans as building C) only has a girls' restroom and building G (identified in the plans as building D) only has a boys' restroom. In addition to multiple stall restrooms, in buildings A and B, a single men's room and single women's room is centered between the two larger facilities. Building A contains a large storage room and a mechanical systems room, both accessed from the west end; the west end of building B was designed to house a darkroom, an identical mechanical systems room, and a smaller storage room. Buildings A and B include small teachers' rooms. Building A has eight classrooms; five are a standard square size of 28' x 28', two are larger at 28' x 42', designed to accommodate a driver education class and a mechanical drawing class. The eighth and largest classroom is 28' x 84', designed to house a typing class. Classroom building B contains eleven standard 28' x 28' classrooms. Classroom building F was designed to contain a large arts and crafts room, two standard sized special education rooms and two L-shaped team-teaching rooms. Classroom building G was designed with ten standard-sized classrooms, a larger 28' x 42' drama room, and a smaller 14' x 28' room. There are no interior corridors and all classrooms' entrances are on the north or south elevation.

The exteriors of the west ends of all buildings are identical and clearly express the structural system (Appendix A: Figure A-71). A three-part concrete bent with legs 28' apart that is consistent with the width of the classrooms is visible and frames the exterior flat cement-plastered solid walls. The ends of the bents cantilever 12' beyond the ends of the walls. The roof is a very low side-gable and extends slightly beyond the wall; the facia on the east and west elevations is cream-colored porcelain enameled metal with spaced shallow vertical detailing. The facia on the north and south elevations is covered by rain gutters. The walls are cream colored and the exposed bent is butter yellow (Appendix A: Figure A-72).

The exterior of each north and south elevation is virtually identical, with rhythmic placement of architectural elements (Appendix A: Figure A-73). A series of parallel concrete bents with the two outer legs partially exposed every 14' run the length of the buildings, creating a series of bays, and cantilever 12' beyond the vertical plane of the building. The cantilever beam supports an overhang the length of the building, are fin-like and gradually narrows to 8" wide and extends about 1' beyond the roof of the overhang. The walls between the exposed butter-colored bents are cream-colored cement plaster. Several bands of square windows are just below the roof eaves between the exposed bents. Doors are metal framed and painted blue. Most have a single full-width metal-framed side panels, with the top half glazed and the bottom half enamel coated. The entrances are topped with two transom lights. Single or double rows of metal lockers run the length of the buildings.

The east elevations contain the entrances to the boys', girls', women's and men's rooms, mechanical systems rooms, and building B's darkroom. Louvers vent the mechanical system rooms.

Building C

The 1964 plans identify this building as the Home Economics Building. It is the smallest of all the classroom buildings at 56' square, and doesn't have the long horizontal mass common to classroom buildings A, B, E, F, and G. It was designed to house a sewing studio and a cooking lab, with a small dining room, fitting room, laundry, and storage.

The east elevation is consistent with the west elevation of the classroom buildings A, B, F, and G, but with a single metal door hung in one bay (Appendix A: Figure A-74). The west elevation includes the main entrance and exhibits a variation of the bent design. Rather than the three-leg bent, this façade exposes a four-leg bent, with the center two bents slightly less than 10' apart and containing a metal framed double plate-glass door.

The north and south elevation almost mirror each other and are consistent in design with the other classroom buildings, but with just four of the 14'-wide bays punctuated by five exposed bents. One bay on each of these elevations contains a row of metal lockers and one has a single metal door. Three of the four bays on the south elevation have the band of six windows just below the eave; all four of the bays on the north side have the same window treatment. The low-gable roof and covered cantilevered walkways are identical to those of the other classroom buildings; the facia is similar in style but blue, as are the gutters. A colorful mural is on the north façade of the building.

Building D

Identified on the 1964 plans as the Science Building, this is the only classroom building that does not follow the standardized structural unit sizes of 14' or multiples thereof on all elevations (Appendix A: Figure A-75). This rectangular building is oriented north-south and was designed to accommodate two biology labs, two chemistry labs, a research lab, and an art studio. The building is 72' x 126'. The east and west façades are a series of nine of the standard bays, with the typical exposed bent system, cantilevered walkway overhang, roof style, cream, butter, and blue colors, and wall finish. The facia is blue, unlike that on buildings A, B, F, and G. Most bays contain a row of metal lockers, some include single metal doors in metal frames; all the bays on the east façade contain a band of six window just under the roof eave. Six of the nine bays on the west elevation contain the window treatment, with the three central bays windowless. Two bays have additional roof treatment inconsistent with other buildings in that the eaves of the third and sixth bay project out slightly resulting in a stepped effect. One bay contains three ventilation louver panels.

The north and south elevations are similar to the east elevation of building C in that the exposed bent structural system has four legs rather than the typical three-leg 56'-wide bent. This results in two wide expanses of plain cement-plastered walls with a narrow central plain wall on the north elevation and a single metal framed glass door flanked by two fixed lights of wire glass, all topped with three glass transoms on the south elevation.

Building E

Building E, identified in the original plans as a "shop" was designed and built in two phases in 1964 and 1969. The structural system and exterior design of the 1964 portion of the building is generally similar to the classroom buildings, however the horizontal footprint is longer, and the building is taller. The facia detail and low gable roof match that of the other classrooms. It was designed to

contain a metal shop, a wood shop, offices, drying rooms, tool rooms, and finishing rooms. The east elevation, while taller, matches the west elevation of the classroom buildings with plain cream-colored walls inset within a three-part bent that cantilevers out to create a covered walkway on the north and south elevations.

The north elevation of the 1964 portion of the building is divided into six equal bays of 14' with the same exposed bents and cantilevers as found in the classroom buildings, plus a narrower 7'-wide bay. Moving east to west, the first three bays contain rows of lockers. Taller bands of six windows in each bay begin at approximately the same height as those in the classroom buildings and extend up to the roofline. The fourth bay also contains lockers, a low panel of louvers and a single metal door, but no windows. The fifth bay only contains lockers and a panel of louvers. The sixth bay mirrors the fourth bay; the seventh and eighth bay are identical to the first three. The final half bay of the 1964 building contains lockers and a louvered panel.

The north elevation of the addition is consistent in design, massing, and architectural features with the original 1964 building. It was designed to contain a power mechanics classroom, two drafting rooms, an electronics classroom, a carpentry shop, offices, a lecture room, and an addition to the metal shop. The addition is made up of fourteen bays that match those of the original building, each bay containing either lockers, doors, and/or vents. Four of the bays include upper bands of six windows.

The south elevation of the 1964 construction generally mirrors that of the north elevation, with its structural system clearly expressed by the exposed bents and cantilevers. There are no lockers on this façade. Moving east to west, the first bay is a plain cement-plastered wall with a six-light band of tall windows at the roof line. The second and third bay are hidden behind a taller simple rectangular, flat-roofed structure that extends above the roofline. The fourth bay contains double metal doors with three tall windows above it; the rest of the wall has the typical plastered cream-colored finish. The fifth bay is plain wall, the sixth is a mirror of the fourth bay. The remaining bays are plain and plastered, with no openings.

The south elevation of the 1969 addition also has no lockers. The fourteen bays are mostly plain, with no openings. The two bays on the west end of the elevation each contain large roll-up service doors. Two bays contain double metal man doors, and two contain a narrow band of window just below the roof.

Multipurpose Building

The multipurpose building was designed and built as part of Phase 1 in 1964. It is oriented east-west. The kitchen is on the west side of the building, and on the east is a stage, behind which are music/chorale classrooms and storage. The center section of the building is a large, open, versatile space designed to be used as a cafeteria or for assemblies.

The central portion of the north façade opens onto Rosalia Avenue. The three separate functional components of the building are expressed with the different use of materials, heights and architectural elements. The west portion that houses the kitchen and mechanical systems is an 84'-wide, low building of three flat-topped, stepped-back north-facing planes, the first of which projects slightly north of the façade of the central portion of the building. The space resulting from the step backs is enclosed by a low off-white tilt-up concrete wall, creating an enclosed courtyard that allows

access to the mechanical systems located in the first two stepped building sections. The wall is heavily textured with a flat-topped parapet. The first two planes of the building are concrete tilt-up walls with access doors. They are coated in rough gray concrete embedded with large, coarse tan, brown, and white irregularly sized rocks (Appendix A: Figure A-76). The third plane has low horizontal metal-framed windows presumably to allow natural light into the working kitchen; the unglazed portion is also covered with the decorative rock. The joints of each tilt-up panel and 90-degree angles are indicated by vertical flat cream-colored concrete columns, accentuating the stepped design. The rock-faced wall extends 4' north of the central, main building's façade.

The architectural elements and finishes of the central portion of the building, the "multipurpose" section, are significantly different from either west or east wing (Appendix A: Figures A-77 to A-79). At over 22' tall, with strong vertical architectural features and smooth lighter-colored wall finishes, this wider portion of the building appears significantly taller than the low, horizontal wings due to strong vertical architectural features. The façade is divided into nine mostly butter-colored 14'-wide bays, each divided by either a cream-colored engaged rectangular column or, in the case of two, deep buttress slabs. Flanking all but two eastern-most, and one western most columns/buttresses are a series of narrow vertical flat brushed-aluminum-framed lights. The six-part lights abut the engaged columns and buttress columns and begin inches above the ground with a tall light that matches the door height, followed by four small square lights, topped with a door-height light that stops only a few feet from the roof soffit. There are three bays between the two buttress columns. The center bay is plain butter-colored concrete-plaster with no openings other than the previously described narrow glazing abutting the columns. The other two bays are identical, with central steel-framed double glass doors and with the lower, approximately two-thirds of the wall coated in a cream-colored concrete plaster. Embedded in the cream-colored portion are horizontal aluminum bands that continue the lines of the muntins of the glazed bands of windows. These visually reinforce the horizontality of the roof line. The two buttress columns are horizontally scored in two locations, at the same height as two of the window muntins. A concrete cantilever beam with a vertical notch in the end extends off the top of the columns, supporting the roof. The soffit is slightly stepped back from the end of the cantilever beam. The blue facia covers the edge of the roof that slightly juts out. The facia is a continual pattern of long raised-edge rectangles, further emphasizing the building's horizontality. The strong horizonal lines and vertical members make the building feel larger than it is.

A concrete patio with an octagonal planting bed in the center is in front of the three bays flanked by the buttress columns. Grass, low landscaping, and a few small trees are in front of the east portion of the building. The west portion has a concrete sidewalk, planning beds and a large Ponderosa pine tree.

The eastern portion of the building is the same height as the western wing and also extends about 4' north of the façade of the central portion of the building (Appendix A: Figure A-80). It encloses most of the eastern-most bay of the central section. Like the western wing, it is sheathed in rough gray concrete, embedded with the same rock, and the tilt-ups are indicated by flush flat cream-colored concrete columns. However, the plane is flat, not stepped like the western wing. Also, unlike the western wing, the wall of this wing is topped with a blue metal cap.

The west elevation is 70' wide (Appendix A: Figure A-81). The stepped portions of this elevation are sheathed in the rough concrete and decorative stone; the western-most wall consists of two panels of butter-colored cement-plaster walls divided and flanked by cream-colored smooth flush concrete

columns. Above these walls the 66'-wide west wall of the central, taller portion of the building is visible. It is divided into three bays separated by columns with cantilever beams at the top supporting the roof eaves. The facia is consistent in design with that found on the north façade of the central portion of the building.

The east elevation is wider, at 78' in width (Appendix A: Figure A-82). It is divided into three bays, each covered in the same decorative rock and divided by flat cream-colored flush concrete columns, topped with a narrow blue metal cap. There are metal doors in each bay – two single and one double. As with the western façade, the central portion of the building is visible above the east wing and is identical to that seen above the west wing.

The southern elevation faces onto a large concrete area with some tall Ponderosa pines, brick planters, modular metal picnic tables/benches and benches (Appendix A: Figures A-83 and A-84). A long, free-standing butterfly awning covers a walkway that extends across the central portion of the building and another shelters the west wing. Two lower shelters flank the taller shelter in front of the multipurpose portion of the building.

The roofline of the western wing of the south elevation of the building, as previously stated, is lower than that of the central portion of the building. The front vertical plane of the west wing is consistent with that of the central section. It consists of four bays, three of which are 14' wide, flanked by cream-colored flush concrete columns. The third is the width of three bays. The western-most bay is a plain, butter-colored cement-plastered wall with a single blue metal door, as are the third and fourth bays. The second bay, the 42'-wide bay, is mostly glazed and contains the entrance to the snack bar. The unglazed portion is covered by a colorful mural. A central metal-framed glass double door is flanked by eight long aluminum-framed horizontal windows arranged in two columns of four lights. To the east and west of these windows are single metal framed glass doors.

The façade of the central portion of the building largely mirrors that of the north elevation. The primary difference is the location of the entrances, additional aluminum-framed fenestration that is consistent in geometry with the entrance doors, and the lack of buttressed columns (Appendix A: Figure A-85). The recessed aluminum bands that mirror the muntins in the tall vertical window bands cross five of the bays on the south façade, rather than just three. From west to east, the first bay has no openings other than one band of the vertical lights; the second and sixth bay contain the entrance doors; the center of the third, fourth and fifth bays contain the four-part double door sized windows; and the last three bays are plain except for the vertical bands of glazing on either side of the engaged rectangular columns.

The south façade of the east wing, like the west wing, is at the same spatial plane as the central building except for a 12' panel at the eastern end that protrudes south (Appendix A: Figure A-86). The wing is comprised of five panels of butter-colored plain walls divided into 14' bays divided by cream colored flush concrete columns. One bay has a plain double metal blue door.

Gymnasium

The gymnasium is also part of the original Phase 1 campus design and construction. During the initial design a future addition on the east elevation was indicated on the plans. During the 1969 Phase 3 design the addition, plus a "new auxiliary gym addition" were designed. The building is 110' x 150', plus the eastern "auxiliary" addition of 50' x 55'. The gymnasium was designed as an open floorplan;

the northern entry was designed to contain a lobby, men's and women's restrooms, storage, and a janitor room.

The gym is surrounded on the north and east by an asphalt parking lot and former asphalt-surfaced basketball courts. The north elevation contains the public entrance, planting beds, and a concrete sidewalk. The southern elevation, which opens onto a new concrete-surfaced open space with a low zig-zag concrete seating wall, a free-standing long canopy the width of the building, and a large lawn; it faces the other, newer athletic facilities. The multipurpose building is immediately to the west.

The north façade, the public entrance, is consistent in overall design with the central portion of the multipurpose building, however the bays are wider at 16'8" (Appendix A: Figure A-87). Engaged rectangular concrete columns and cantilevered beams separate the bays. The roof design and detail match that of the multipurpose building. The wall surface between the columns, however, is finished with a more textured material. The long, deep, approximately half-height horizontal sheltered entrance crosses the first six bays starting on the western end of the building. It is enclosed on both ends. The central three sets of double metal framed doors are further sheltered by narrower concrete vertical panels. These panels and the inside of the outer panels are coated with a smooth concrete butter-colored plaster. The north facing planes within the shelter are sheathed in the same rough stone embedded in concrete as can be found on the east and west wings of the multipurpose building, however they have been covered over with a colorful mural. The walls of the building above the shelter are also painted with a school spirit mural that includes the words "ENTERING PIRATE TERRITORY" (Appendix A: Figure A-88). The seventh bay is also painted with the mural; the eighth and ninth bay are plain, textured, and painted the butter color. The outer faces of the shelter walls are unpainted decorative rock.

The east façade is of the main gym consists of six bays separated in the typical manner with the same palate, a very low gable roof, and materials as found in the multipurpose building except that the bays are wider, and the surface is more textured. In the north half of this elevation is a double blue metal door in the central bay. The smaller addition is attached to the southern portion of the larger gym; the roofline of the main building extends slightly above the flat roof of the eastern-most addition. The north, east, and south walls of the addition are divided into three bays each, within the typical engaged concrete rectangular columns. There are no cantilevered beams; the roof is flat, and the facia is at the same plane as the engaged columns with simple blue facia. There is a single blue door on each of these facades (Appendix A: Figure A-89).

The southern elevation of the main gymnasium is also articulated by nine bays between ten engaged rectangular columns with cantilevered beams at the top, under the extended roofline (Appendix A: Figure A-90). The blue facia is peeling. All walls are textured and butter colored, and the columns and cantilever beams are smooth and cream colored. Two bays contain double blue metal doors; both are sheltered by flat horizontal awnings supported by two cables. The door in the southern façade of the smaller addition is also sheltered by the same style of awning.

The west elevation is a mirror of the east elevation without the smaller addition. It has the typical, but wider than those found on the other buildings, six bays articulated by seven engaged concrete rectangular columns with the same finish and roof detail found on the other elevations of the building. The first and sixth bays each have a double blue metal door immediately adjacent to the exterior columns.

EVALUATION

PATRICK HENRY INTERMEDIATE SCHOOL

Criterion 1

Under CRHR criterion 1, the Patrick Henry Intermediate School does not qualify as a historical resource that has made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States. Constructed in 1960 and 1962, it was one of many schools built during the post WWII era of rapid suburbanization and population growth in Santa Clara County, California, and throughout the United States. It is also one of hundreds of schools in Santa Clara County associated with the common trend of establishing and unifying school districts during the 1950s and 1960s. It is a commonplace example of these local and national trends and development patterns.

Criterion 2

Under CRHR criterion 2, the Patrick Henry Intermediate School does not qualify as a historical resource associated with any individual whose activities are demonstrably important within local, California, or national history. For the school to be of significance under this criterion, it would have to be able to illustrate the person's important achievements in the field of education. At the time it was built Lawrence Curtis was the Jefferson School District Superintendent and George Boyko was the principal. While both men likely contributed to the continued growth and progress achieved by the Jefferson School District, what would become the Santa Clara Unified School District in 1965, research has not found that either man has made any specific contributions of demonstrable historic importance that would qualify the school as a historical resource under criterion 2.

The school district purchased the land from the Castello family, the Cirrincione family, and the Teresi family. Research has not resulted in any noteworthy additional information about these Italian immigrants and first-generation California-born farming families. The Italian-born senior members of the families were likely part of the significant influx of Italians into the area during the late 19th and early 20th century, attracted by rich agricultural land and associated opportunities. They appear to have been typical farming families that subdivided and sold their property as Santa Clara County's post-war population grew rapidly and suburban communities developed. Furthermore, other than having once owned the subject land, none appear to have had any association with the current school facilities.

Criterion 3

Under CRHR criterion 3, the Patrick Henry Intermediate School does not qualify as a historical resource that embodies the distinctive characteristics of a type, period, region, or method of construction, or represent the work of a master, or possess high artistic value. Under this criterion, there are three contexts that must be considered: Architectural style of the overall campus and the multipurpose building individually, functional school style as an example of a cluster-plan campus, and the potential for its architects, Clyde D. Goudie and Dewitt J. Griffin, to be considered master

architects. The campus's potential to be a district of a significant concentration of buildings and structures united aesthetically by plan or physical development is also considered.

Architectural Design

The architectural design of the campus classroom buildings is modest Mid-Century Modern style. The designer applied the expected rhythmic composition, low horizontal massing, simple geometric volumes and strong right angles, low-pitched gable roofs with wide cantilevered overhangs, courtyard entryways, simply treated materials, and lack of historical design elements. While the buildings are characteristically Mid-Century Modern, they are not distinctively characteristic of the style and are not significant representatives of the style.

The locker building is primarily utilitarian, with only a few Mid-Century Modern elements applied, like strong right angles and lack of historical design elements; it is therefore not distinctive in its design.

The multipurpose building design is also generally Mid-Century Modern, but introduces some elements not found in the classroom buildings, most specifically its irregular footprint, large expanses of glass on the north elevation, and a series of tall columnar inset windows on the other three elevations that are vaguely classical and somewhat reminiscent of PWA Moderne architectural style with their shallow relief panels. The building uses the same materials and palettes as the other campus buildings, is generally horizontal in its massing, and, other than the slight classical reference, lacks historical design elements or ornamentation. While it is generally overall characteristic of Mid-Century Modern architecture, it, like the rest of the campus buildings is not a distinctive example of the style.

Campus Design

Patrick Henry Intermediate School campus is generally designed in the cluster-plan style; the locker building is not part of the cluster of buildings. The campus is not a distinctive example of this style. While the buildings are oriented inward, facing courtyards, as is typical of this type of campus organization, most of the classroom buildings have a mix of exterior and interior corridors, and classroom fenestration is minimal and too high to bring in enough natural light and air characteristic of the cluster plan. Patrick Henry Intermediate School is not significant under criterion 3 as a distinctive example of the cluster plan campus.

Master Architect

Clyde D. Goudie independently designed the 1960-built campus. He partnered with Dewitt J. Griffin to design the 1962 multipurpose building and locker building. Clyde Goudie was the architect for the Jefferson School District in the 1950s and early 1960s and designed many of the extant elementary schools in what is now the SCUSD. While locally fairly prolific, neither are recognized as being masters in the field of school architecture or architecture in general. Additionally, for a work to be considered significant for being designed by a master, it would need to express a particular phase in the development of the master's career. The Patrick Henry Intermediate School campus is not eligible under criterion 3 because it is not a significant example of the work of a master architect.

District

The Patrick Henry Campus is not a significant historic district. Historic districts usually also meet the significance criteria of criterion 1 for its important association with a trend, and/or criterion 3, having high artistic values. While the campus composition is that of a concentration of buildings, structures, and landscape features that reflect one functional activity, it is an aesthetically commonplace example of a Mid-Century Modern 1960s school, broadly associated with the post WWII commonplace trend of suburban school construction.

Criterion 4

Under CRHR criterion 4, the Patrick Henry Campus is not significant as a source (or likely source) of important information regarding architectural history. This property type is common and does not have any likelihood of yielding important information about historic construction materials or technologies. This evaluation makes no determination regarding the potential for the discovery of significant archaeological resources on the property.

MARIAN A. PETERSON MIDDLE SCHOOL

Criterion 1

Under CRHR criterion 1, the Marian A. Peterson Middle School does not qualify as a historical resource that has made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States. Originally constructed in three phases between 1964 and 1969, it was one of many schools built during the post WWII era of rapid suburbanization and population growth in Santa Clara County, California, and throughout the United States. It is also one of hundreds of schools in Santa Clara County associated with the common trend of establishing and unifying school districts during the 1950s and 1960s. It is a commonplace example of these local and national trends and development patterns.

Criterion 2

Under CRHR criterion 2, the Marian A. Peterson Middle School does not qualify as a historical resource associated with any individual whose activities are demonstrably important within local, California, or national history. For the school to be of significance under this criterion, it would have to be able to illustrate the person's important achievements in the field of education. At the time it was built Wendell Huxtable was the superintendent of the Santa Clara High School District and Louis Martini was the principal. While both men likely contributed to the continued growth and progress achieved by the Santa Clara High School District, what would become the Santa Clara Unified School District in 1965, research has not found that either man has made any specific contributions of demonstrable historic importance that would qualify the school as a historical resource under criterion B. Marian A. Peterson, for whom the school is named, was a former teacher and trustee of the Santa Clara High School District. The naming of the school was honorary; Mrs. Peterson does not appear to have any stronger association with the school.

The school district purchased the land from the Castello family, the Cirrincione family, and the Teresi family. Research has not resulted in any important additional information about these Italian

immigrants and first-generation California-born farming families. The Italian-born senior members of the families were likely part of the significant influx of Italians into the area during the late 19th and early 20th century, attracted by rich agricultural land and associated opportunities. They appear to have been typical farming families that subdivided and sold their property as Santa Clara County's post-war population grew rapidly and suburban communities developed. Furthermore, other than having once owned the subject land, none have any association with the current school facilities.

Criterion 3

Under CRHR criterion 3, the Marian A. Peterson Middle School does not qualify as a historical resource that embodies the distinctive characteristics of a type, period, region, or method of construction, or represent the work of a master, or possess high artistic value. Under this criterion, there are three contexts that must be considered: Architectural style of the overall campus and the multipurpose building and gymnasium individually, functional school style as an example of a hybrid finger- and cluster-plan campus, and the potential for its architect, L. F. Richards to be considered a master architect. The campus's potential to be a district of a significant concentration of buildings and structures united aesthetically by plan or physical development is also considered.

Architectural Design

The architectural design of the campus classroom buildings is modest Mid-Century Modern style. The designer applied the expected rhythmic composition, low horizontal massing, simple geometric volumes and strong right angles, low-pitched gable roofs with wide cantilevered overhangs, courtyard entryways, visually expressed structural systems, simply treated materials, and lack of historical design elements. While the buildings are characteristically Mid-Century Modern, they are not distinctively characteristic of the style and are not pure representatives of the style.

The multipurpose building includes several features that are considered characteristic of Mid-Century Modern architecture, such as simple geometric volumes and strong right angles, a low-pitch gable roof with wide cantilevered overhangs and articulated primary façades. However, the composition, with its distinctively differently designed west and east wings, results in an unbalanced design in both proportion and material. While many significant examples of Mid-Century Modern are symmetrical, it is not essential for the style. The National Register of Historic Places- listed Research House by master architect Richard Neutra is not symmetrical, but a well-balanced composition of vertical and horizontal planes and columns. The multipurpose building also has some elements of New Formalism on the north and south façades of the central portion. New Formalism, which was a rejection to rigid Modernism, includes references to Classical building proportion and scale, columns, and stylized entablatures. The overall design of the building is inconsistent and not a significant example of a Mid-Century Modern or New Formalist building; it does not clearly express either architectural design type.

The gymnasium also includes several features that are characteristic of Mid-Century Modern architecture, such as simple geometric volumes and strong right angles, a low-pitch gable roof with wide cantilevered overhangs and articulated façades. The most architecturally distinctive elevation is the north entrance, with its deep, wide shelter across much of the façade. The placement of the entry shelter, beginning at the west end does not span the entire elevation which results in an unbalanced composition. Overall, the building is only a simple expression of Mid-Century Modern. Its function as a gymnasium prevents the use of fenestration, an important characteristic of Mid-

Century Modern architecture. The building is not a significant example of a Mid-Century Modern architecture; it does not represent an important expression of the style.

Campus Design

Marian A. Peterson Middle School campus is a hybrid of the finger-plan campus and cluster-plan campus. Consequently, it is not a distinctive example of either type of campus design.

Master Architect

L. F. "Fred" Richards designed the first three phases of Peterson Middle School in the 1960s. He received his Bachelor of Architecture in 1934 from the University of Southern California. Prior to WWII he was an in-house architect for Pasetta Construction, which brought him to the Bay Area. During WWII he worked for Kaiser Permanente, returning to Pasetta Construction near the end of the war. When Pasetta retired Richards opened his own business. He served as president of the Santa Clara Valley chapter of the American Institute of Architects (AIASCV) then California Council of the American Institute of Architects (CCAIA). He was elected to Fellowship (FAIA) in 1962. After closing his office, he worked part time for Dennis Burrow, AIA.

Richards designed schools for the Santa Clara, San Jose, San Martin, and Gilroy school districts, as well as the Santa Clara International Swim Center, which he considered his most significant project. While locally fairly prolific, he is not recognized as being a master in the field of school architecture or architecture in general. Additionally, for a work to be considered significant for being designed by a master, it would need to express a particular phase in the development of the master's career. The Marian A. Peterson Middle School campus is not eligible under criterion 3 because it is not a significant example of the work of a master architect.

District

The Marian A. Peterson Middle School Campus is not a significant historic district. Historic districts usually also meet the significance criteria of criterion 1 for its important association with a trend, and/or criterion 3, having high artistic values. While the campus composition is that of a concentration of buildings, structures, and landscape features that reflect one functional activity, it is an aesthetically commonplace example of a Mid-Century Modern 1960s school, broadly associated with the commonplace trend of suburban school construction. Additionally, the campus lacks continuity due to the demolition and replacement of several important buildings and, therefore cannot clearly express the plan and physical development of a 1960s school campus.

Criterion 4

Under CRHR criterion 4, the Marian A. Peterson Middle School Campus is not significant as a source (or likely source) of important information regarding architectural history. This property type is common and does not have any likelihood of yielding important information about historic construction materials or technologies. This evaluation makes no determination regarding the potential for the discovery of significant archaeological resources.

Summary of Findings

6

ARCHAEOLOGICAL RESOURCES

BACKGROUND RESEARCH

A search of records at the NWIC indicated that no cultural resource studies have been conducted within the Project Area, and five cultural resource studies have been conducted within a $^1/_4$-mile radius of the Project Area. Additionally, the record search indicated that no cultural resources have been recorded within the Project Area or within a $^1/_4$-mile radius of the Project Area.

Historic aerial photography and archival research illustrates that the Project Area was a part of Rancho Quito and Rancho Pastoria de Los Borregas. By the late 19th century the Project Area was under the care of W. Wilcox and A. Patterson, in an area marked as belonging to the Milliken Family and later by Mrs. R. S. Burns and A. J. Landrum. By the early to mid-20th century the Project Area consisted of orchards that were owned and operated by Italian immigrant families, including Ignazio and Rosalia Castello. The Castello's sold some of their property to the Jefferson School District in 1955 and more later in 1960. At this time, the property was developed into the Patrick Henry Campus and Marian A. Peterson Middle School.

SURVEY RESULTS

Constraints during the survey included poor surface visibility due to dense grasses and vegetation, pavement, and standing architecture obscuring approximately 90% of the Project Area. The archaeological pedestrian survey yielded positive results, as one historic-era isolated cultural resource was observed on the surface (Iso 1).

PRECOLONIAL RESOURCES ASSESSMENT

Based on buried site sensitivity models, it is our assessment that there is a moderate-high potential for buried precolonial archaeological resources to be located within the Project Area (Byrd 2017; Meyer et al. 2010; Rosenthal and Meyer 2004). The soils within the Project Area are hypothesized to be from the Holocene, and these soils are located in a flat alluvial fan with slopes less than 9 degrees and are less than 200 meters (656 feet) from a water course (Byrd 2017; Meyer et al. 2010; Rosenthal and Meyer 2004). Therefore, there is a moderate-high potential for buried precolonial resources to be found within the Project Area. While the Project Site has been developed in modern times, precolonial sites within such sensitive land formations are often preserved in between or below the modern built environment. Our visual inspection of the Project Area ground surface determined that soils encountered are consistent with what is mapped in the area with no evidence

of culturally produced stratigraphy, and we did not identify any evidence of in-tact precolonial archaeological deposits.

HISTORIC-ERA RESOURCES ASSESSMENT

It is our professional opinion that there is a low potential for any buried historic-era archaeological resources to be located within the Project Area. The first documented historic-era development of the project consisted of agricultural fields during the 20th century. Further, our visual inspection of the Project Area ground surface did not identify any evidence of in-tact historic-era archaeological deposits. Therefore, it is our assessment that the proposed Project is not likely to impact any subsurface historic-era cultural resources.

ARCHITECTURAL RESOURCES

Section 15064.5(a)(2-3) of the CEQA guidelines require that state and local public agencies evaluate the potential for historical resources to be impacted by discretionary activities, using the criteria outlined in California public resources code (PRC) section 5024.1. The Marian A. Peterson Middle School campus and the Patrick Henry Intermediate School campus were evaluated for eligibility for listing on the California Register of Historical Resources (CRHR), using the criteria outlined in California PRC section 5024.1. It has been determined that neither property is associated with events that have made a significant contribution to the broad patterns of history; is associated with the lives of persons important to history; or embodies the distinctive characteristics of a type, period, region or method of construction. Furthermore, neither is likely to yield important information about architectural design or construction. Because neither is eligible for the CRHR, neither is a historical resource for the purposes of CEQA. No further action is required.

RECOMMENDATIONS

Due to the moderate to high potential of the Project Area to contain precolonial archaeological deposits, Albion recommends that, once the Project elements and depths of impact have been designed, an additional archaeological subsurface study be conducted within the areas and to the depth of Project impacts, to further test for the presence or absence of precolonial archaeological resources. This is especially important for Project elements that extend further than 2 feet below ground surface, as the first two feet of soil is likely disturbed by the modern environment. It is Albion's professional opinion that additional archaeological subsurface testing is necessary to determine if the current Project will have an impact on precolonial cultural resources (CEQA Section 15064.5(a)(2-3)).

Additionally, since many important cultural resources, such as tribal cultural resources/traditional cultural properties, do not necessarily leave an archaeological footprint or have physically identifiable manifestations, it is vital to seek out information regarding the possible presence of these important resources and their locations through consultation with local tribal members. Under the authority of Assembly Bill 52, the District is responsible for collecting and incorporating Tribal information into the environmental review process.

One of State's Handsomest High Schools To Be Dedicated At Santa Clara

THE NEW SANTA CLARA HIGH SCHOOL BUILDING —Santa Clara Journal.

The new Santa Clara High School, one of the finest and handsomest educational edifices in the State, will be dedicated at Santa Clara next Friday.

Ever since Professor L. R. Smith assumed the leadership of high school affairs at Santa Clara, the attendance has been increasing with rapid strides, and it was some time ago that the need of a new high school was felt. The present building will not accommodate the enlarged attendance.

When passing the new High School building on Washington street in Santa Clara, one has little idea of the convenience, grandeur and extensiveness of the interior, says the Santa Clara Journal.

The exterior is plain, free from frills and furbelows, but the appearance is one that wears well and does not become tiresome. Upon approaching it you are startled at the size rather than the beauty, but soon become convinced that it is peculiar for its elegance, the materials used in its construction being the very best obtainable.

Upon entering the stone steps we find the entrance done in brilliant green with ceilings of somber red, huge brass chandeliers and woodwork of natural wood. The corridors on both the second and third floors are finished with sand wall and ceilings, and here too is this handsome natural woodwork. Benches of antique design are on the second floor between the doors leading to the auditorium. The principal's (Professor L. R. Smith) room is to your left on entering the floor and here is stationed the Burrell Program Clock, of which so much has been said. The new invention can be set to ring the class bells at any time and does so automatically, thus insuring prompt and accurate calls. On this floor are five class rooms and a study hall library, the teachers' dressing rooms, and auditorium.

THE AUDITORIUM

The auditorium is a dream and appeals to the most fastidious. It has a seating capacity of 600 and contains a lower floor and overhanging balcony. Here too are those beautiful colors, red and green, characteristic of the lobby. It is well lighted, having innumerable stud lights and four immense chandeliers. The stage has the regular theater footlights and overhanging lights and several sets of scenery. There are three dressing rooms equipped with all modern conveniences. Above the stage is gilt frescoing, noticeable for its simplicity.

We then ascend to the third floor. Here are situated the majority of the class rooms, the vice principal's room and the teachers' dressing room. On this floor is the entrance to the balcony of the auditorium. The same finish of walls, ceilings and woodwork prevails here as on the second floor.

BASEMENT OR FIRST FLOOR

The basement or first floor contains the boys' and girls' play rooms, janitor's office and bicycle rooms. The botany rooms, of which Miss Mackay will have charge, has an adjoining room for specimens fitted with cabinets and tables of the most modern make. The lecture room and chemistry and physics rooms are here too. Professor Offield will have charge of these. The experiment rooms are equipped with two tables that will accommodate sixteen pupils. There is also a dark room for photography. In the chemistry room there is an automatic fan for carrying the fumes from the laboratory. The training room has five shower baths to be used by the athletic students.

HEATING APPARATUS

Perhaps the most modern and wonderful part of the building is the heating apparatus. There are three huge furnaces, an electric fan, air pump, etc. The system is known as the Johnson System of Temperature Regulation, and is being installed by L. P. Lee of San Francisco. The thermostatic system works automatically and regulates the temperature not more than one degree either way than the temperature desired. With this system the air is said to be changed six times every hour thus insuring a healthy atmospherical condition of every room.

The grounds of the new school will be set to lawn and flowers and improvements on the tennis courts have already been begun. The courts have been enlarged ten feet, new wire put on and the fence is to be painted. Parquet grounds will also be made.

FORMAL OPENING

The formal opening of the school will be held on Friday afternoon of February 2d, when the public is cordially invited to inspect the building. In the evening there will be a musical and literary entertainment, at which time Benjamin Ide Wheeler of the University of California will deliver an address. As the program has not been completed it is impossible to publish it in detail.

In conclusion, unlimited praise and credit is due to Architect William Binder, the contractors, Morrison Bros., and the entire school board for their untiring, unceasing and strenuous efforts in securing the best and most for the money allotted them.

The new High school building is a great credit to the town and one of which we are justly proud.

Please forward a copy of any resulting reports from this project to the office as soon as possible. Due to the sensitive nature of archaeological site location data, we ask that you do not include resource location maps and resource location descriptions in your report if the report is for public distribution. If you have any questions regarding the results presented herein, please contact the office at the phone number listed above.

The provision of CHRIS Data via this records search response does not in any way constitute public disclosure of records otherwise exempt from disclosure under the California Public Records Act or any other law, including, but not limited to, records related to archeological site information maintained by or on behalf of, or in the possession of, the State of California, Department of Parks and Recreation, State Historic Preservation Officer, Office of Historic Preservation, or the State Historical Resources Commission.

Due to processing delays and other factors, not all of the historical resource reports and resource records that have been submitted to the Office of Historic Preservation are available via this records search. Additional information may be available through the federal, state, and local agencies that produced or paid for historical resource management work in the search area. Additionally, Native American tribes have historical resource information not in the CHRIS Inventory, and you should contact the California Native American Heritage Commission for information on local/regional tribal contacts.

Should you require any additional information for the above referenced project, reference the record search number listed above when making inquiries. Requests made after initial invoicing will result in the preparation of a separate invoice.

Thank you for using the California Historical Resources Information System (CHRIS).

Sincerely,

Jessika Akmenkalns, Ph.D.
Researcher

Patrick Henry Campus is located on the southeast portion of the subject parcel APN 313-10-004. Its primary entrance is on Dunford Way to the south; Teal Drive demarcates the eastern boundary of the campus. North of the campus is a large informal grassy field the full width of the campus. To the west of the campus is a large oval running track surrounding a grass-covered soccer pitch/football field, beyond the play field is the Santa Clara Unified School District Farm. North of the farm is the Bryan Osborne Nature Center, and the Marian A. Peterson Middle School campus. The 71.08 acre-property is surrounded by subdivisions of primarily modestly scaled single-family homes and multi-family units built in the 1950s-1970s. A private school and a church are south of the property.

***Date of Evaluation:** July 2022

(Sketch Map with north arrow required.)

See continuation sheet pages 29-30.

(This space reserved for official comments.)

The school was designed and built in two phases. The original campus, designed by Jefferson School District architect Clyde D. Goudie in 1960, included the overall campus design, building siting, exterior open spaces and courtyards, parking, pedestrian, automobile and bus circulation, classroom buildings, and the administration building. Architects Goudie & Griffin designed the two additional buildings, multipurpose building and gymnasium in 1962. The 1960 campus layout plan included the siting of these two future buildings.

The Patrick Henry Intermediate School was designed in the "cluster plan", following the prototype 1954 school design by The Architects Collaborative, in which classrooms are inwardly sited, clustered around courtyards and centrally located administration and multipurpose buildings. In the center of the campus is the largest of three courtyards. The administration building and multipurpose building face north onto the south side of the central courtyard. One narrow façade of each of the four L-shaped classroom buildings flank the east, north, and west sides of the central courtyard. Exterior covered corridors surround the central courtyard and connect the four classroom buildings, the multipurpose building, and the administration building. These walkways are sheltered by flat roofs cantilevered off the façades of each classroom building, supported by exposed steel rafters and steel columns forming an upside-down L-shape. Classroom buildings A and D are sited in a sort of yin/yang pattern to create a secondary courtyard northwest of the central courtyard; classroom buildings B and C are also sited similarly to create another secondary courtyard, northeast of the central courtyard. The courtyards are simple and informal, paved with concrete slabs and dotted with occasional trees, some planting beds, and benches.

The entrance to the campus is on the south side of the property, on Dunford Way, through a flat-roof-covered walkway between the administration building to the east and the multipurpose building to the west. The roof of this north/south arcade is cantilevered off the west façade of the administration building and is supported on the east by a series of concrete vertical slabs. The walkway opens onto the central courtyard. A horse-shoe shaped asphalt parking lot, student drop-off area, and bus driveway is west of the multipurpose building, facing Dunford Way; a slightly larger rectangular asphalt parking lot is east of the administration building, also facing Dunford Way. A grassy area with some trees is planted between the southern façade of the multipurpose building and Dunford Way, with a flagpole near the entrance arcade. There is also a small lawn area between the rectangular parking lot and classroom building B.

Between classroom building B and Teal Drive to the east is an informally landscaped area with patches of grass and scattered trees and bushes. An asphalt pathway leads from Teal Drive through the grounds and passes along the south side of classroom building B toward the central courtyard. Other paved pathways wind through the landscaped area north of this pathway identified on GoogleEarth as Lochinvar Avenue.

A large asphalt parking lot is sited north and west of classroom building D, accessed from Dunford Way between classroom building A and the gymnasium to the west. West of the parking lot and gymnasium are Santa Clara Unified School District vehicles and portable metal storage units. An asphalt-paved play

area is east of the large parking lot, behind classroom building C, with two half-court basketball courts, three four-square courts, a dodge-ball circle, and two tether-ball circles painted on the surface, along with other surface playground markings.

Chain-link fencing surrounds much of the campus proper.

Buildings

The campus is comprised of seven buildings. Four classroom buildings, buildings A, B, C, and D, are L-shaped of similar size and footprint, each oriented differently. Building A, C, and D have almost identical footprints, with one wing of the L significantly narrower than the other wing; the two wings of building B that make up the L are of similar width. (The plans originally refer to these buildings as units A, C, D, and E; the administration building was referred to as unit B.) While the classroom buildings were designed using the same architectural features, each classroom building was functionally designed to accommodate specific intended uses, such as shop, science, art, sewing, etc. The administration building is a small rectangle. The multipurpose building (referred to as unit F in the plans), is irregularly shaped, with the center of the primary façade that faces the interior large courtyard bowed outwardly and flanked by two small wings. The gymnasium (referred to in the plans as unit G), is primarily rectangular, with symmetrical bays extending out from both the north and the south façades. It is sited west of the main cluster of campus buildings. All buildings are in poor to fair condition.

The buildings are built on concrete slab foundations atop engineered fill. The sills are redwood and the framing is steel and redwood. The roofing material appears to be rolled asphalt. The roofs of each classroom are a series of very low gables.

The five buildings built in 1960 share the same simple architectural design features and are of similar low horizontal massing. Common exterior wall design features include panels of two basic wall styles repeated in irregular patterns across each building's façade. Large flat plain panels average between 10' and 12'-wide between expansion joints, are 12' tall, with a flat parapet topped with a narrow metal cap and are sheathed in cement plaster painted a warm cream color.

The second panel type is a slightly shorter in height 4'-wide design of 4'x8' plywood topped with a transom window, all articulated within a three-part metal frame. Most transom windows are hopper-style windows. Interspersed between these plywood panels are occasional panels with inset plate-glass or Aklo-glass, a type of glass developed in 1939 to absorb heat and filter daylight. The plywood panels are painted the same warm cream color. A stepped-down horizontal roof eave with vertical rib-patterned or corrugated blue facia extends slightly out from the wall plane above these panels. This shallow eave is supported by occasional 4"x4" metal tube columns.

Typical main entrances contain double metal doors hung symmetrically, flanked by metal-framed sidelights; all doors are blue with simple metal frames, and topped with transom lights. These recessed

doorways range from 9'6" to 12' in width and are covered with the same cantilevered roofing detail and facia as the tri-part panels. Other doors are single, blue, not recessed, and are plain metal with simple metal trim.

Classroom Building A (1960)

Building A is the western-most classroom building. Like all four classroom buildings, it is L-shaped. The broader leg of the L is oriented east-west and contains two rows of classrooms with a central interior hallway; the portion of the L that extends north of the east-west portion of the classroom building has no interior hallway. The building was designed to contain five classrooms, a metal shop and wood shop, restrooms, a mechanical room and a supply room.

The east façade (east elevation 1) facing the central courtyard is fully recessed behind the continuous covered walkway that surrounds the courtyard. A parapet on the same plane as the building façade extends above the walkway roof. The cantilevered walkway roof is flat, supported by six simple rectangular steel tubes that extend out below the walkway roof horizontally to its edge. Matching steel tubes provide vertical support at the edge of the cantilevered overhang. The walkway extends beyond the northwest and southwest corners of this building's façade. Blue double solid metal doors are recessed in the center of the elevation, flanked by a piece of plywood on one side and a plate-glass panel on the other side. Each side panel is topped with a glass transom. Blue corrugated metal roof facia is visible over the doors, above the walkway roof, and is the width of the recessed doors and side lights. The exterior wall is articulated by four plain unglazed panels on each side of the central entrance, two panels within each bay of the walkway supports. The façade is 72'-wide.

The south façade, behind which are four classrooms, faces the bus driveway. There is no covered walkway. The wall is articulated by a series of cream-colored plywood panels within metal frames with transoms atop each panel. Four of the panels are dark plate glass, specified on the plans as Aklo glass. There are two single solid metal doors painted blue, and four small air conditioners protrude out of the flat façade. The very shallow eave is covered by a wide facia panel of blue vertically corrugated metal; it is supported by a series of columns a few inches away from the wall. Four trees are planted along this elevation, which is 128' 6"-wide.

The west façade is the widest at 167' 6". The southern-most section of the façade has no openings in the wall of the southwestern-most classroom. North of this portion of the wall is a recessed double metal door entrance into the building's interior hallway which is parallel to and closely resembles the east façade entrance onto the central courtyard, with a cantilevered blue roof over the entrance. North of this entrance are the classrooms designed to be shops; this portion of the west elevation is visually divided into five sections. Immediately north of the entrance is a narrow plain cream-colored panel with a flat parapet that is taller than the cantilevered roof over the entrance. Moving north, there is a series of the typical plywood panels under a lower blue metal roof that extends slightly beyond the plane of the façade. The eave is supported by four irregularly placed metal posts. Under the first extended eave

panel are eight plywood metal-framed panels that differ slightly from the typical in that each are topped with two transoms, the lower row of glazing is of the standard narrow width, and the upper row is taller. Two panels are between the first and second steel columns supporting the shallow eave, while four panels are articulated between the second and third columns. The last two panels are between the third column and the last column, which marks the transition away from the typical plywood panel to a taller flat parapeted portion of the elevation. This expanse is narrower than the two eave-sheltered sections on either side of it and contains a single blue metal door with a small vertical light and a double aluminum-framed window in the center. The second eave-sheltered section of the elevation is identical to the first and also contains four air conditioners jutting out of the wall panels. North of the eave-covered section is another taller flat parapeted wall with a double unglazed blue metal door and a single unglazed blue metal door. The rest of the wall is solid, plastered, and painted cream.

The north façade facing the western end of building B is 37’ 6”-wide and contains the entrance to the boys’ restroom. The cantilevered roof walkway that protects the entrance is identical to that of the covered walkway along the two eastern façades of the building.

The east elevation that faces the secondary courtyard is 95’ in length and is similar in design to the other east façade, with a series of plastered plywood panels within metal frames. The length of the elevation is covered with an identical cantilever-roofed walkway with a flat parapet following the plane of the building façade extended above. The entrance to the girls’ restroom is on this elevation as is another single blue solid metal door.

The 93’-wide north elevation that faces the secondary courtyard is similar in design to the southern elevation, with two classrooms rather than four. A double blue solid metal door with side lights and transoms identical to the door on the east façade is located at the 90-degree angle of the L and opens northward into the secondary northwestern courtyard. Plain cream-colored panels with taller parapets are immediately to the east of the entrance, followed by a series of the typical metal-framed cream-colored transomed panels below a slightly extended eave with blue metal facia.

Classroom Building B (1960)

Classroom building B is the eastern-most classroom building. L-shaped like the other three classroom buildings, one west façade faces the main courtyard, the south façade faces some landscaping and a parking lot, the east façade faces another expanse of landscaping, and its secondary north façade and secondary west façade face the eastern secondary courtyard. The building was designed to house twelve classrooms, a music room, a mechanical room, a boys’ restroom and a girls’ restroom.

The 72’-wide west façade that faces the central courtyard mirrors that of the east elevation of building A. The only differences are that the plate glass is intact in both side lights flanking the double doors and

four squares of louvers venting the mechanical room are inset into the cream-colored cement-plastered panels south of the centrally located entrance.

The 137'-wide south elevation is mostly symmetrical, with thirty panels of metal framed plywood or Aklo glass all with transom windows above, flanked at either end with wider, taller flat cream-colored cement-plastered panels. Of the thirty panels, four are inset with Aklo glass. The line of thirty metal-framed panels is topped with the same slightly extended eave beyond the plane of the panels, and blue facia. The extended eave is supported by seven steel tube columns in a manner identical to the south façade of building A.

The east elevation is 168'-wide and uses the same architectural design details in the following pattern, from south to north: Three wide, flat panels with a taller parapet coated with cream-colored cement-plaster, recessed blue metal double doors flanked by side lights all topped with transoms below a stepped down cantilevered roof with shallow eaves, a wider, taller cement plaster-coated panel, six narrower plywood/transom panels, one Aklo-glass/transom panel, seven plywood/transom panels, one Aklo-glass/transom panel, seven plywood/transom panels, an Aklo-glass/transom panel, five plywood/transom panels, and finally a wider and taller flat cement-plastered cream-colored panel. The roof design is typical for all of the plywood and glass panels.

The north elevation is 72'-wide and is identical to the building's west elevation.

The secondary west elevation faces the eastern secondary courtyard and is 96'-wide. Architectural treatments are typical; from north to south they consist of one wide taller cement-plaster coated panel, followed by four narrower plywood panels inset in metal frames, topped with transoms, a single metal unglazed door in a space consistent in width to the plywood panels, one plywood/transom panel, one Aklo-glazed/transom panel, five plywood/transom panels, a second door identical to the first, one plywood/transom panel, one Aklo-glazed/transom panel, four plywood/transom panels, and a third identical metal door. The series of narrow panels and doors are topped with the same slightly stepped down and slightly extended eave with blue metal facia supported by five steel tube columns.

The secondary north elevation faces the eastern secondary courtyard. From east to west, the design begins with two narrow rows of floor-to-ceiling awning windows, an architectural feature not found in any other campus building. Following the awning windows is a single blue metal door, followed by an Aklo-glazed/transom panel, five plywood/transom panels, another identical single metal door, then one plywood/transom panel. The elevation ends on the west end with two large, flat taller cream-colored cement-plaster coated panels. The same stepped-down eave with blue metal facia extends from the awning windows to the beginning of the tall cement-plaster panels, supported by one steel tube column.

Classroom Building C (1960)

Classroom building C is the northeastern-most classroom building. L-shaped like the other three classroom buildings, one south façade faces the main courtyard, the west façade faces a wide asphalt-paved uncovered walkway leading from the large northern parking lot to the central courtyard and the east façade of building D. The north elevation faces the student drop-off section of the large parking lot to the north, a dirt, fenced play area that appears to have some empty raised garden beds and, further north, the paved play area described earlier. The secondary south elevation and east elevation face the eastern secondary courtyard and classroom building B. The secondary east elevation also faces a dirt play area with some play structures, raised beds and occasional trees. The building was designed to contain a homemaking room, a sewing room, boys' and girls' restrooms, storage, a boiler room, five classrooms, a men's room, a women's room, janitor's room and supply room.

The 72'-wide south façade faces the central courtyard and is consistent in design with the other three classroom buildings' main courtyard-facing elevations, with four plain cream-colored plaster coated taller panels on either side of a typical double-door recessed entrance into the central hall of the building's classroom wing.

The east façade facing the secondary courtyard, 96' in width, is also made up of the two typical wall designs, beginning on the south end with a taller cream-colored cement-plastered plain panel followed by one typical plywood/transom panel, a single flush-hung door, four plywood/transom panels, a frosted Aklo glass/transom panel, five plywood/transom panels, a second flush-hung door, one frosted Aklo glass/transom panels, a third typical door, another plywood/transom panel, a taller cement-plastered panel followed by a typical recessed double-door entrance. The transoms are a mix of fixed pane and hopper windows.

The secondary 73'-wide south-facing façade has no fenestration. It consists of a series of the typical taller cream-colored plain cement-plaster covered panels with three typical single metal doors placed irregularly along the wall expanse plus an additional brown-colored door not in the original plans. Approximately half of the width of the elevation has the typical covered walkway which is fenced off with a combination of cyclone fencing and T-111 plywood.

The secondary east-facing façade is only 30'-wide and has no fenestration or entrances. It consists of three typical plain cream-colored plaster-coated taller panels with a metal cap.

The north elevation is the widest at 145'. The majority of the architectural wall treatments are typical except for the wall expanse where the entrances to the boys' and girls' restrooms are located. From east to west, the wall panels begin with one wider taller cream-colored plaster-coated plain section followed by seven plywood/transom panels, then a single narrower plain panel, followed by eight plywood/transom panels. Most transoms contain hopper windows. This series is followed by a larger, taller plain panel with a metal cap. To the west are two open doorways into the girls' restroom, a plain door into a storage room, followed by a double-wide opening into what was the boys' restroom which is

now infilled with T-111 plywood painted the same cream color. The wall expanse containing these openings is plain, cement-plastered topped with the blue corrugated stepped down roof detail. This is followed by two typical taller plain plastered panels.

The west elevation is 136'-wide and is comprised of the typical design features arranged in the following pattern: From north to south the façade begins with two wide taller plain panels with large ventilation louvers and a central plain flush double door into the boiler room, a typical recessed double door, a single plain panel, six plywood/transom panels, a single frosted Aklo/transom panel, seven more plywood/transom panels followed by six taller plain panels with the third panel containing a simple single metal door.

Classroom Building D (1960)

Classroom building D is the northwestern-most classroom building. L-shaped like the other three classroom buildings, one south façade faces the main courtyard, the narrow west façade faces a small yard with a few trees then the parking lot/driveway that leads to the large parking lot to the north. The other south and west elevations face the secondary western courtyard. The east elevation faces building C and the wide walkway between the two buildings leading to the central courtyard. The north elevation faces the large parking lot. The building was designed to contain three classrooms, two larger art rooms divided by a mechanical room and a vented drying room, and four science rooms grouped together in twos with shared workrooms, separated by north/south corridor.

The southern-most elevation is consistent with the other classrooms' elevations that open onto the central courtyard – 72'-wide, plain wall panels flanking a typical central recessed double door. The covered walkway is directly in front of this elevation.

The 126' east elevation also contains typical architectural wall features. From south to north, it begins with a single plain taller panel followed by a lower blue roof eave panel with a single blue door, then five plywood/transom panels, an Aklo glass/transom panel, two taller plain panels, another Aklo glass/transom panel, five plywood/transom panels, another plain single door, one taller cement-plastered panel, then a typical recessed double entry door with side lights and transoms. The façade ends with four larger plain panels.

The widest elevation is the north façade at 178'; it is comprised of long expanses of typical repeated wall treatments. From east to west, there is a single large plain panel, five plywood/transom panels, a plain door inset in a lower, blue-roofed panel, a wide taller plain panel with louvers and a wide plain blue door into the mechanical room, another single door inset into a lower, blue-roofed panel, followed by a series of 25 plywood/transom and 4 Aklo-glass/transom panels, irregularly placed. The façade ends with a single plain taller panel.

The secondary west elevation is only 30'-wide and has no openings. The wall treatment is limited to taller plain panels of the cream-colored cement-plaster coated material.

The secondary 106'-wide south elevation that opens onto the secondary courtyard has no windows and is comprised of fifteen typical plain taller cream-colored panels, three of which contain a single plain blue metal door. Most of this elevation is sheltered by the typical covered walkway.

The west elevation is 96'-wide and is also made up of the typical architectural wall treatments. From north to south, it begins with a typical recessed double door/sidelight/transom entrance followed by a taller plain panel, then a plain metal door under the typical lower blue eave which continues above a series of five plywood/transom panels. Two Aklo-glass/transom panels flank a taller wider plain panel, followed by six lower panels consisting of five plywood/transom panels and one panels containing a simple metal door. The façade ends with a single taller plain panel.

Administration Building (1960)

The rectangular administration building is significantly smaller than the four classroom buildings at 64' 6" x 56'. It was designed to contain the library, attendance center, nurse's office, clerks' office, reception room, offices for counselors, the vice principal, and the principal, a work room, speech therapy room, and a mechanical systems room. It and its neighboring building to the west, the multipurpose building, are the southern-most buildings on the campus. The broad central covered walkway campus entrance is immediately to the west of the building; the walkway roof is cantilevered off the subject building's west elevation.

The south elevation has no entrances. The façade is divided into the two typical architectural design elements. East of the covered entrance are a series of eleven panels set in metal frames. The first two panels are Aklo glass, followed by five panels of cream-colored plywood, two more Aklo glass panels, then finally two additional plywood panels. Each panel includes a transom of Aklo glass. The typical blue corrugated metal facia that covers the shallow roof eave found on the southern elevation of building A spans the cantilevered walkway roof and continues across all articulated panels. The second design element is a flat expanse of cement-plastered cream-colored wall with the higher, flat parapet topped with a metal cap. This expanse is approximately the width of the covered campus entrance to the west of the building.

The east elevation begins, south to north, with a narrow, flat, cream-colored plaster-covered panel with a taller flat parapet followed by two panels of plywood set in metal frames with transoms above them. The shallow blue roof eave and facia slightly extends outward above the transoms. The rest of the façade is made up of six wide panels with flat taller parapets. Each panel is coated with cement plaster painted in the cream color. One panel contains a solid metal door and one panel contains louvers for mechanical ventilation.

The north elevation contains the same architectural details in a slightly different arrangement. Moving from east to west, the façade starts with a wide cream-colored cement plastered panel with a single plain, solid metal door painted blue. It is followed by the typical plywood panels in metal frames with transoms between the plywood and the blue corrugated metal roof facia, followed by the plain, flat cement-plastered panels with taller flat parapets. One single metal door pierces the flat panel. This elevation faces the central courtyard and the covered walkway.

The west elevation abuts the wide covered main campus entrance between the subject building and the multipurpose building to the west. The architectural design elements are consistent with those on the other elevations and the other campus buildings. A single cream-colored cement plaster panel is followed by a metal-framed plate-glass panel then a metal-framed plywood panel, each topped with a transom. These are followed by three broader, flat cement-plaster panels, one with a door piercing it. These panels are then followed by three metal-framed plywood panels with transoms and two Aklo glass panels with transoms, ending with a panel containing a second door.

Multipurpose Building (1962)

The multipurpose building is a mostly symmetrical, essentially pentagonal-shaped building that contains a narrower central symmetrical pentagonal-shaped room that is flanked to the east and west by smaller rooms. The central room was designed accommodate student assembly, with a raised platform on the south elevation for performances or lectures, as well as be used as a cafeteria. Rooms to the west of the assembly room/cafeteria were designed to contain a kitchen and instrument room; rooms to the east were designed to house a vocal music room, a teachers' work room, and men's and women's restrooms.

The building is sited on the south side of the campus with its primary façade facing north onto the central courtyard. Between the building and the courtyard is a typical, free-standing covered walkway. Its placement is awkward, blocking the full view of the building's taller fenestrated façade. South of the building is a lawn. To the east is the covered main entry to the campus and the administration building, and to the west is a parking lot/student drop off area.

The design borrows from the 1960 design with its use of tall plain panels of cream-colored cement-plastered metal-capped walls and some of the lower blue corrugated roof elements and blue doors. It is consistent with the earlier buildings' horizonal massing and rhythmic use of vertical elements.

The center of the north façade is taller than the two lower wings on either side and extends north toward the courtyard, creating two planes resulting in a shallow point in the middle. The point is sheathed in tall, plain cream-colored cement-plastered wall panels. The point elevations each contain five 11'7"-tall columns of five 3'7"-wide sets of aluminum-framed windows. Each column consists of three 1'8"-tall hopper windows separated by a fixed 3' tall window and a fixed 3'7" window. The parapet is flat and metal capped. Moving away from the central point, on the other side of the windows,

are sets of blue plain metal double doors. The lower wings project out, north of the doors; the angles of the façades of each wing match the angle of the two center planes of the north elevation.

The planes and heights of the east elevation are varied. Beginning south and moving north, the first section shares the roof line with the auditorium. The plane is angled and contains three rhythmically placed slightly recessed approximately 2'-wide ground-to-roof-cap inverted columns. Within each recess is a tall, tripart window with two 1' 8"-tall hopper windows divided by a 4'5"-tall, fixed light. The rest of the 30'-wide section is comprised of flat metal-capped cream-colored wall panels. The wall makes a 90 degree turn west; this short 5'-wide wall contains a single, plain blue metal door. The wall again makes a short 90 degree turn north; this 9'3"-wide wall contains a wide tripart vertical window. The wall again turns 90 degrees west; the 6'6"-wide wall expanse houses another plain door. Again, the wall plane zigzags north and the roof height is lowered. Within this 32'9"-wide portion of the east façade are five columns of tripart windows, similar in pattern and dimension to the plywood/transom panel architectural wall treatment found on the classroom building exteriors. These columns are fully glazed with three panes of tinted glass. The characteristic blue corrugated metal cantilevered roof extends out from the elevation that contains this set of windows. The elevation continues north for 14' and is plain cream-colored siding with one double set of inset hopper windows.

The south elevation has three planes, with the 34'-wide center portion inset and the symmetrical flanking 34'-wide elevations angled southward as they move away from the façade's center. The center is sheathed in plain cream-colored, tall metal capped walls. The two flanking planes are mirrors of each other and contain a flush-mounted blue double metal door and three evenly spaced columnar windows identical to those found on the southern-most section of the east elevation.

Like the east elevation, the west elevation is made up of several planes and heights but does not exactly mirror the east elevation. The first plane on the west is 39'-wide and contains three evenly spaced columnar windows identical to those found on the south façade. Several feet north of the third window is a plain blue metal door, followed by several feet of the plain, cement-plastered cream-colored tall wall panel. The wall makes a 90 degree turn eastward. The space contains the kitchen and its mechanical systems. Typical architectural details are used, including several plain blue metal doors, cream-colored walls, and the blue corrugated lower roof detail.

Locker Building (1962)

The locker building building is a mostly symmetrical, rectangular east-west oriented building with central bays extending off the north and the south elevations. It was designed to house the girls' and boys' locker rooms and showers; it appears it was not designed to also accommodate any indoor sports or activities. The building is equally divided in two, with the western half mirroring the eastern half. The south bay was designed to house the mechanical systems and the north bay to contain the restrooms. It has been repurposed by the school district as storage and a print shop.

The building is sited on the southwest side of the campus with its primary entrances facing north onto an asphalt surfaced parking lot and large grassy field. An aboveground PG&E power facility surrounded by a chain-link fence is just north of the building. School district maintenance vehicles and storage containers mark the western edge of the campus. Farther west is the Peterson Middle School oval track, to the east is the main campus, and to the south is an informally landscaped area with trees and bushes and Dunford Way.

The design borrows from the 1960 design with its use of tall plain panels of cream-colored cement-plastered metal capped walls and blue doors. Fenestration is limited and, what there is, is not consistent with the other campus buildings' windows.

The eastern half and the western half of the 100'-wide north elevation generally mirror each other, each with a double plain blue metal set of doors, a single blue metal door, and a tri-part vertical window. The central bay contains two sets of two hopper windows, placed high on the façade. The single-door entrances to the boys' and girls' restrooms are on the east and west facing walls of the bay. There is a second plain metal door on one side of the bay. The double doors on the west half of the north elevation are sheltered by a green canvas awning with the words "PRINT SHOP" in white on its face.

The east elevation and the west elevation are each 49'-wide. The west elevation was not visible. The east elevation contains a band of four rectangular windows. One is painted cream and one is above a single metal blue door protected by a green canvas awning.

The south elevation is made up of a series of plain cream-colored cement plastered panels. The east and west walls of the mechanical system bay contain ventilation louvers.

Historic Contexts:

Santa Clara Unified School District Historic Context

The Santa Clara Unified School District (SCUSD) includes neighborhoods in the cities of Sunnyvale, San José, Cupertino, and Santa Clara; it comprises approximately 56 square miles of 1,290-square-mile Santa Clara County (SCUSD 2022a; U.S. Census Bureau 2022). The district, which educates over 15,300 K-12 students and an additional 6,000 students in preschool through adult school, is made up of 18 elementary school sites, one K-8 school site, four middle-school sites, three high-school sites, three alternative high-school sites, and four leased sites (SCUSD 2022a, 2022b). SCUSD is one of 32 elementary, high school and unified school districts in Santa Clara County, not counting the Community College District, charter, or court schools (Santa Clara County Office of Education 2022a). Unified school districts are districts that teach both elementary and secondary levels of education.

19th-Century Public Education in Santa Clara County

On April 11, 1850, the California State Legislature passed an act providing for the election of a superintendent of public education, as directed by the Constitution of the State of California. John G. Marvin was elected that year on October 7 to serve as the state's first public school superintendent (San José Mercury News 1951: 181). Despite this, the first schools in Santa Clara County were private schools generally operated by religious entities or informal schools organized by residents (Laffey 1995: 51). In 1852 the Legislature authorized a state school tax of five cents per $100 and a county school tax of no more than two cents per $100 to initiate funding of the state's public education system (Santa Clara County Office of Education 2022b). It also allotted three school commissioners to each township and included the duties of a County Superintendent of Schools as among the responsibilities of the County Assessor (San José Mercury News 1951: 181). The first Santa Clara County Assessor was J.H. Morgan, elected in 1853; consequently he also become the county's first Superintendent of Schools (Laffey 1995: 51).

One year earlier, in the fall of 1852, the Santa Clara County Commissioners designated eight townships as school districts: Gilroy, Burnett, New Almaden, San José, Santa Clara, Fremont, Alviso, and Washington (now part of Alameda County). On March 15, 1853, the Santa Clara Register printed a notification that a school had opened in San José, signed by the San José Commissioners of Common Schools; the parents were expected to pay any costs that exceeded the school funds provided by the State. By May the school, located in a Baptist church, had ten pupils registered but insufficient funds to pay the teacher. The 1853 Legislature amended the State's school law to allow the Common Council to levy taxes on real or personal property to support city schools (San José Mercury News 1951: 181). By 1866 Santa Clara County Schools were some of the best funded in California (Laffey 1995: 51).

The State Legislature revised the County Assessor's duties in 1855 to no longer include that of Superintendent of Schools. Freeman Gates, a San José teacher, became Santa Clara County's first elected Superintendent of Schools (Santa Clara County Office of Education 2022b). In October 1855 Santa Clara County redistricted itself into eight townships and 16 school districts. School districts in the townships of Fremont, Santa Clara and Redwood numbered six; San José, Alviso, Burnett, Almaden and Gilroy had ten. Within a month, district designations were revised again, and four separate school districts were established in the Santa Clara township (Munro-Fraser 1881: 137). By the end of 1859 there were 710 students enrolled county wide (Laffey 1995: 51).

The 1860s marked significant expansion of Santa Clara County schools, with the erection of over two dozen schoolhouses. These included schools in the Cambrian, Encinal, Jefferson, Laguna, Mt. Pleasant, Pala, Summit, Hester, and Willow Glen districts. What was once the Jefferson School District is now within the boundaries of the SCUSD. The first high school in the county was opened in San José in 1860 (San José Mercury News 1951: 181).

Santa Clara County's rural school districts constructed generally small wood-framed one- or two-room schoolhouses between 1850 and 1880. These early schools appear to have been of consistent design with schoolhouses throughout the country (San José Mercury News 1951: 181). Located along existing roads and intersections, these schoolhouses were exposed to noise and dust, poorly lit, had poor ventilation and heating, and often had no wells, washbasins or toilet facilities (Englehardt 1942: 172). The typical classroom layout was rectangular, with the teacher's desk in front of rows of students' desks, emphasizing his or her authority (Ogata 2008: 563). The Mayfield School in Fremont township was described as being of common construction and type. An early California State Superintendent of Schools who visited it in 1855 referred to it as a "herring box" (San José Mercury News 1951: 181). Schools also found accommodations in existing buildings, such as Mr. Dunphy's school on the second floor of a two-story rented building in San José; Red Mac's Saloon occupied the first floor. Some schools shared buildings with other entities like churches or meeting halls (San José Mercury News 1951:183).

The rapid increase of population on the West Coast that followed the completion of the Transcontinental Railroad in 1869 resulted in a shortage of school funding and space (Laffey 1995: 52). According to the Census Bureau, the population in Santa Clara County grew from 11,912 in 1860 to 26,246 in 1870, a more than 120% increase (Bay Area Census 2022). At least four, and possibly six, new districts were established in the 1870s. These included Eagle, Uvas, Llagas, and Midway. Fifteen new school districts were formed in the 1880s, among them were Mount Hamilton, Halls Valley, Huyck, Campbell, Burrell, Lakeside, and Austin. Similarly, in the following decade, another thirteen districts were created, two in the new towns of Morgan Hill and Palo Alto (San José Mercury News 1951: 183). Most districts consisted of only one or two schools.

Despite the rapid establishment of new school districts, they were not always able to keep up with the educational needs of their growing communities. Although state funds covered much of the cost, parents had to purchase their children's books and cover other expenses; some poor families simply could not afford to send their children to school. Lack of adequate funding also resulted in deferred maintenance and inattention to advancement in school design to better serve the student body. In the 1873 Santa Clara School District's annual report, the School Superintendent accused the city of allowing the schools to become dilapidated. He stated that "the Cheap-John system which seems to pervade all the departments of our town governments admonishes us out of the necessity of studying economy, even to the degree of meanness (San José Mercury News 1951: 183)."

Another challenge the public educators faced was poor attendance. In 1860 the Santa Clara County Superintendent of Schools stated that "the principle cause of non-attendance by the children is the indifference with which many parents in the county districts treat all things connected with school discipline." "Discipline" in this instance was not referring to behavior but to regular attendance, particularly in the rural districts where farming and ranching families were dependent on children helping at critical times such as harvest or planting (Laffey 1995: 51-52). In 1874, California made education for children from eight to 14 years of age compulsory and guaranteed state aid for each

school based on the number of children in each district. High schools would not receive state funding until 1902. In 1911, the state stopped providing aid for each child in a given district but based the funding on attendance (California Department of Education 1961).

Despite the State's intervention, these challenges continued even as the number of school districts increased. By 1875 Santa Clara County boasted 53 school districts, 83 school buildings and 105 teachers. The average daily attendance was recorded as 4,892, not counting San José school attendance. This number indicated that only half of school-age children regularly attended school. By 1881 there were 62 districts county-wide, and by 1900 there were a total of 97 schools in 84 districts, and 562 teachers educating 14,320 students (Laffey 1995: 52). The majority of these schools were in rural communities and small towns, with the basic one- or two-room wood-framed schoolhouse still the most commonly built school type.

Late 19th and Early 20th Century: Continued Growth, New Approaches to Education and School Design

As the county's population increased and towns became more urbanized in the 1880s and 1890s, the basic schoolhouse was gradually replaced by larger, yet still modestly scaled schools that often expressed contemporary Victorian architectural styles. Nation-wide attitudes toward the importance of lower education were changing. With the close of the 19th century, school building design began to trend toward a more monumental and unified plan with architectural revival-style embellishments and elaborate approaches and entrances to celebrate the public's civic pride and devotion to education (American Educational Research Association 1942: 174). These schools typically had a central entrance, symmetrically planned classrooms on either side of a long corridor, and a large auditorium. The classroom plan was rectangular with blackboards on one or two walls, rows of windows on one side, and the desks in rows to emphasize order, desk work, and the teacher's authority (Ogata 2008: 563). The unreinforced masonry San José High School that opened in 1898 was a relatively grand civic building with classical styling, and a symmetrical design composition (San José Mercury News 1951: 181).

Architects and engineers introduced improved technologies and stronger materials that allowed school buildings to be two to three stories in height. They designed schools with improved ventilation and exposure to natural light and enhanced safety by using fireproof materials (Yates 2013: 1). These advancements in architectural design and the need for larger school buildings established a new era of school construction (American Educational Research Association 1942: 173). However local school designers apparently did not plan for potential seismic events, and the 1906 earthquake destroyed the new San José High School (San José Mercury News 1951: 181) and damaged the newly built Santa Clara High School. California would not mandate earthquake-resistant building construction for schools until after the 1933 Long Beach earthquake (Seismic Safety Commission n.d.).

As stated earlier, attitudes toward education began to evolve in the late 19th century. The influential progressive education movement would lead to significant changes in school and campus design over

the next several decades. The movement was a reaction against the existing formalism and authoritarian teaching practices of traditional education and inspired a broad restructuring of educational methods in the United States. Guided by the theories of educators and philosophers such as John Dewey of the Columbia University Teachers College, the movement emphasized more hands-on, child-centered methods and curricula, individual achievement, and differentiation of children's abilities (Sapphos Environmental 2014: 39). The progressive education movement also brought a new emphasis on student health and physical activity as essential for proper childhood and adolescent mental and physical development (Yates 2013: 2). The notion that such development took place in stages led to the creation of the 6-3-3-year division of elementary schools, junior high schools, and high schools during this period (Yates 2013: 1-2).

As the progressive education movement gradually took hold in the first two decades of the 20th century, new school design incorporated features to support the health and well-being of the children (Yates 2013: 1-2). The 1906-built Santa Clara High School building was designed with traditional classroom layouts, but also included boys and girls "play rooms" and showers, a robust ventilation system, and landscaped grounds and tennis courts (Evening News 1906: 2).

In 1909 the Santa Clara County Board of Education, which consisted of the elected county superintendent of schools and four members appointed by the board of supervisors, amended an 1880 political code to provide that a majority of appointed members be experienced teachers who held at least a grammar school teaching certificate. The board of education was now authorized to qualify and hire teachers and set the standards for graduation (Laffey 1995: 52). Superintendent D.T. Bateman established the Teachers' Institute of the Santa Clara County Office of Education in 1911 to offer professional development to teachers. Teacher round tables included topics such as "How to Make Mathematical Work More Nearly Meet the Needs of Daily Life" and "Teaching Peace by Means of History" (Santa Clara County Office of Education 2022b). The supervision of attendance and child welfare was added to the duties of the county superintendent in 1918 (Santa Clara County Office of Education 2022c). These actions further reflect the gaining influence of the progressive education movement and the county's adoption of its theories.

The creation of new school districts in Santa Clara County continued and by 1912 there were at least 102 districts, not counting high schools, outside of the city of San José's corporate limits. Prior to the turn of the twentieth century, there was a high school in San José, one in Santa Clara, one in Gilroy, and one in Palo Alto. By 1951 the communities of Santa Clara, Morgan Hill, Los Gatos, Campbell, Mountain View, Fremont, and East Side had high schools. All, except for Palo Alto and San José, served large rural areas and were classified as union high schools (San José Mercury News 1951: 183). For example, graduates from Jefferson, Santa Clara, and Alviso elementary school districts matriculated to the Santa Clara Union High School District's high school (Evening News 1959: 15).

On April 30, 1926, voters in the Jefferson, Agnew, Braly and Milliken elementary school districts elected to consolidate the districts into the Jefferson Union School District. Each of these school districts was

comprised of a single school. Both the Milliken and the Braly schools were two-story Mission Revival buildings; the Jefferson school, a simple board and batten single-gabled building located on Kifer Road (formerly unincorporated) constructed in 1857, was said to be the oldest school building in continuous use in the state at the time (San José Mercury Herald 1926a: 10; 1926b: 7). Irvin Pomeroy, trustee of the Milliken school, appealed to the voters, saying that, "the need of better schooling for our children is becoming acute. In the Milliken school children are so crowded for room that classes are held on the stage of the assembly. With these four districts consolidated we will have enough pupils for a separate classroom for each grade and special instruction in such subjects as domestic science and trades." (San José Mercury Herold 1926a: 10)

The new district quickly applied for and received a $100,000 bond to construct a new Jefferson Grammar School at Lawrence Road and Reed Lane (San José Mercury Herold 1926b: 7). The new Mission revival style building, designed by architects Wolfe and Higgins, was constructed of reinforced concrete and contained thirteen rooms that included classrooms, manual training and domestic science departments, offices, a library, and an assembly room capable of seating 600. Joseph Hancock, county superintendent of schools, stated that the Jefferson Union School District was the wealthiest in the county, with an assessed value of $3,000,000 (Evening News 1927: 6).

Santa Clara County Public Education and School Development Post 1930

The 1933 Long Beach earthquake destroyed 70 schools and resulted in significant damage to another 120 schools in Southern California. The California Legislature enacted the Field Act on April 10, 1933, one month after the earthquake, to protect children and staff from death and injury in public schools grades K-14 and protect the public's investment in school buildings during and after earthquakes (Seismic Safety Commission n.d.). The requirements of the act included maintaining one-story massing for new elementary schools and no more than two stories for junior and high schools. These requirements were in line with school design trends already in being adopted in California and beyond (Sapphos Environmental 2014: 21).

As Santa Clara County developed from primarily agriculture prior to World War II to industry during the war years, the rural school districts grew and organized union districts for either elementary or high school purposes. Under this system two or more contiguous districts united. District superintendents focused on establishing a centrally located school and provided transportation for students. By 1950 there were eight union school districts in Santa Clara County: Cupertino, Jefferson, Los Gatos, Campbell, Saratoga, Almaden, Alum Rock and Berryessa, and Loma Prieta and Ausaymus (San José Mercury News 1951: 183). Midway School District was annexed to the Jefferson School District in 1949 (San José Mercury Herold 1949a: 16). The 1927-built Jefferson school was expanded in 1946 and 1948, with the construction of ten new classrooms and a cafeteria-music building. Enrollment increased an average of 20% each year between 1944 and 1949 (San José Mercury Herold 1949b: 11). In 1949 the Jefferson

Unified School District encompassed the area from Sunnyvale city limits on the west to Coyote River on the east, and from a mid-way point between Stevens Creek and Homestead Roads on the south to Alameda County line on the north. The current SCUSD boundary appears to be wholly within the 1949 Jefferson Unified School District boundary. By 1950 the Santa Clara County school system included 39 elementary school districts, eight high-school districts and two unified school districts, totaling 109 schools with a combined enrollment of 51,797 (San José Mercury News 1951: 183).

The 1960s and 1970s brought a major change to the area as Santa Clara County grew rapidly and urban development overtook most remaining rural areas (Santa Clara County Office of Education 2022b). Population in Santa Clara County continued to grow as technology-based industries established during the war year expanded. A 1961 San José Mercury News article titled, "High Schools Bulge: Educators Grope for More Space As War Babies Swamp Ninth Grade", stated that enrollment for each grade was slightly larger than the next one above. This steady climb was illustrated by comparing 1960 first grade enrollment to 12th grade enrollment: County wide 16,533 first graders were registered that year compared to only 6,990 12th grade students (San José Mercury News 1961: 26-27). This large increase in attendance occurred primarily in the former rural areas of the county. Young families of newcomers moved into newly built housing tracts of mostly modest ranch and minimal-traditional style homes that replaced the county's orchards and farmlands. That year the Santa Clara High School District was already constructing its third high school, Adrian Wilcox, scheduled to open in September. Concurrently the district was planning a second phase to accommodate the expected high school student body increase of around 600 per year (San José Mercury News 1961: 26-27). In September 1965, Santa Clara, Jefferson, and Alviso Elementary School Districts joined the Santa Clara High School District to form the Santa Clara Unified School District (San José Mercury News 1965: 56). The Patrick Henry Campus, built 1960-1962 to accommodate 1,000 6th, 7th, and 8th grade students (Evening News 1960: 9), was originally built as part of the Jefferson School District (SCUSD 1960); phase 1 of the Marian A. Peterson High School was designed in 1964 as part of the Santa Clara High School District (SCUSD 1964).

Santa Clara Unified School District Campus Plan Typology

Of the 33 school campuses that make up today's SCUSD, all but six were initially designed and/or constructed prior to the establishment of the district in 1965, primarily in the 1950s and early 1960s. The six campuses built after the unification of the district are of modern construction, built in 1995 or later. Buchser Middle School, the only extant pre-World War II-built school in the district, was initially constructed in 1937 (SCUSD 2022b). The Buchser campus has been significantly expanded and no longer resembles a pre-war educational institution. In the years after the district's unification SCUSD built out or added to many of these campuses, and further addressed the shortage of classrooms by the introduction of portable or temporary classrooms district wide, particularly in the 1990s.

Functional School Campus Site Plans, 1940s – 1970s

Despite the infill and alterations implemented by SCUSD throughout the years, two standard campus designs, the "finger plan" and the "cluster plan", are easily recognizable district wide. A sub-design of the cluster plan is the open-space plan, where the buildings in the cluster-plan campuses had greater interior flexibility – open-space shells so that team teaching could be accommodated in a variety of patterns. School architects applied these two distinctive functional campus plans throughout California and the nation, with the finger plan beginning in the late 1930s and refined into the 1950s, followed by the cluster plan in the 1960s and 1970s. The open-space plan proved to be problematic and short lived; it was quickly modified to recapture the visual and sound separation of the self-contained classroom (California Department of Education 2000).

Architects interpreted these basic campus plan concepts and tailored them to the size of the student body, campus location - rural, suburban, or urban settings - climate, and topography. In the 1940s and 1950s school districts in California used a rule-of-thumb approach to determine school site size. Elementary schools were to have a minimum site of five acres plus an additional acre for each 100 pupils of predicted ultimate enrollment. For middle schools the basic size was 15 acres and high schools 15-20 acres plus the same additional acre per 100 students of predicted enrollment. By the mid-1960s, with land becoming scarce and expensive, school planners began to apply more precise methods to determine school size to support the functions or activities of the proposed educational program (California Department of Education 2000).

Combinations of these two basic campus design forms were applied as the finger plan transitioned into the cluster plan with this more site- and function-specific approach to school design. Both plans typically share the basic architectural principles that reflected those of midcentury modern design with their use of steel framing, plate glass, and low-rise horizontal massing to reflect the relationship between modern architectural forms and progressive teaching methods (Ogata 2008: 562-563).

The Marian A. Peterson Middle School, originally Marian A. Peterson High School, initially designed in 1964 for the Santa Clara Union High School District, is a hybrid of the finger plan and cluster plan campus; the Patrick Henry campus, was designed as the Patrick Henry Intermediate School for the Jefferson Union School District in 1960 in the cluster-plan style.

The Finger Plan

Just prior to the U.S. entering World War II European-trained architects working in the U.S. began to design schools and campuses that were radically different from the period-revival monumental school buildings that contained all school functions. One-story schools with expansive windows and immediate access to outdoor space just beyond the classrooms were introduced by master architect Richard Neutra in 1939. He designed single-story experimental schools in Los Angeles with large sliding glass doors that

led to adjacent gardens or courtyards modeled on contemporary ideas about students' need for access to air and light, and that were well suited to the mild California climate (Ogata 2008: 564).

The experimental school design evolved into the finger-plan campus concept with architects Franklin & Kump's design of the Acalanes Union High School in Lafayette, California (1939-1940). Franklin & Kump also designed San José High School in 1952, further refining the finger plan. *Architectural Forum 91* (October 1949) called the plan type the "western finger plan" and that the finger-plan school resembled "a tree plan, based on a trunk corridor with side branches. It rests on radical standardization of classrooms; on absolute insistence that all classrooms share the best (north) orientation to sun and air; daylight for all of them from the open-corridor side as well as the main window side. This plan is not only flexible… but extensible indefinitely outward like a tree, by growing at branch-ends and by sprouting new branches." (Sapphos Environmental 2014: 92)

Architectural Forum further described Acalanes as "the first large-scale school which could serve as a complete demonstration of principles which amounted to a schoolhouse revolution – the revolution of the thirties. Since then, the Acalanes type of school, with its wide ranging, one-story classrooms arranged according to the 'finger' plan, has swept the West Coast, is sweeping rapidly across the Midwest on its way to the East Coast." (Sapphos Environmental 2014: 92)

Consistent with contemporary design principals, the finger-plan became the most common school building type in the 1940s and 1950s in California. This campus design also satisfied the construction requirements of the 1933 Field Act. These finger-plan schools were multi-structure residential-scale campuses with individual purpose-built buildings with minimal ornamentation or only modest application of modern architectural elements (California Department of Education 2000). Administration buildings, auditoriums and gymnasiums, separate classroom, shop, and specialty wings, and cafeterias were designed to connect to the outdoors with patio spaces and covered open corridors linking buildings. Natural light and ventilation were provided by bands of windows, including multilight sashes, casements, and clerestories (Sapphos 2014: 21). These school buildings reflected a more intimate and better integrated element of the community compared to the earlier period-revival monumental buildings. This newer campus style was a workplace and recreation center, sited in a manner that was more intimately associated with community living. This type of arrangement was flexible and eliminated much of the institutional atmosphere of the earlier large, compact buildings (American Educational Research Association 1942: 175).

In addition to the site plans' suitability for housing progressive education methods, these schools were considered safer for evacuation. Along with the age-old threats of earthquake and fire, residual anxieties of the war and subsequent Cold War added to the appeal of this style of school campus. Other practical aspects of these single-story schools were low-cost materials, swift constructability, and flexibility. With the baby boom in full swing, these rigid-frame schools could be quickly built and easily expanded as needed, with war-industry-made prefabricated materials and steel, and continuous fenestration (Ogata

2008: 568). Instead of an auditorium, these post-war flexible school campuses included a multi-purpose building for school assembly, cafeteria, and meetings (Ogata 2008: 569).

All of SCUSD's elementary schools built in the 1950s were designed in the finger plan and share the same midcentury modern design principles and type of structural materials. These schools, significantly more modest in scale compared to Acalanes Union High School and San José High School, include Bowers, Bracher, Briarwood, Central Park, Haman, Mayne, Millikin, Pomeroy, Scott Lane, Washington, and Westwood elementary schools.

Cluster Plan

The Architects Collaborative (TAC), a firm founded by master architect Walter Gropius, designed a prototype school in 1954 that could be quickly and economically constructed and easily expanded. The design included a cluster of individual one-story buildings grouped around a central administration building. Small square classrooms were arranged in a grid that created outdoor "classrooms" or common areas interspersed between the buildings. Residential in scale, these building evoked the feeling of post-war suburban houses with the ubiquitous picture windows looking out onto landscaped spaces.

Contemporaneous with TAC's publishing their prototype cluster-plan campus design, the finger plan began to lose popularity. In addition to the large tracts of land required to accommodate a finger-plan campus, the spread-out buildings meant long cross-campus walk times and restricted communication. Classrooms oriented to maximize access to natural light proved to be costly. The variability of natural light throughout the day resulted in periods of excessive heat and glare followed by the need to augment daylight with electrical lighting. A desire for greater flexibility, domesticity and economy influenced a shift in campus design away from the finger plan to the more compact cluster plan. (Sapphos Environmental 2014: 97, Ogata 2008: 572).

The cluster plan retained the low massing, generally single-story layout of the finger-plan, and architects still designed classrooms with indoor-outdoor access and views. But rather than extending wings along an axis, the site plan transitioned to grouping individual modular buildings and structures around a central landscaped courtyard. The views from the classrooms were now oriented toward the courtyard and other classrooms, resulting in a more communal setting and informal environment (Sapphos Environmental 2014: 99).

Although school designers continued to construct finger-plan campuses, the cluster-plan approach began to be widely adopted in the 1960s. The later finger-plan campuses were usually condensed or used for elementary schools and smaller upper-level schools, particularly in California where there was still ample space (Sapphos 2014: 98). By 1965, according to *California School Buildings, 1960-1965,* "The 'Cluster Plan' has replaced the 'Finger Plan' concept for elementary schools. Arrangement of classrooms

around a core area encourages cooperation between teachers by giving them opportunities to share multi-use areas, resource centers and teacher prep areas all adjacent to their classrooms. Better acoustical control and better lighting is evident, and technology is employing these comfort factors to be coordinated with flexible interiors" (Gibson 1966: viii).

The Marian A. Peterson High School (now middle school), while primarily a cluster-plan campus, includes some residual design elements of the finger-plan campus, as can be seen in the original plot plan drawn in 1964 by architect L.F. Richards. Phase 1 of the campus plan had the academic buildings, library, administration building, multi-purpose building, gymnasium and locker rooms clustered around a large central courtyard. The planned siting of three long, parallel future academic buildings on the west side of the campus partially connected by a covered breezeway reflects the spatial arrangement of a finger plan; the northwest-most "future academic" building was added to the campus by 1969.

Patrick Henry Intermediate School, designed in 1960 by architect Clyde D. Goudie, and expanded in 1962 with a design by the architectural firm Goudie & Griffin, is a cluster-plan campus with four L-shaped classroom buildings, the administration building, and the multi-purpose building spatially arranged around a large central courtyard. The classroom buildings are also arranged to create two secondary courtyards between two sets of the buildings. While the campus layout closely follows the cluster plan, the classrooms' fenestration is limited to bands of clerestory windows on the outward facing building façades; no classrooms have views looking onto the courtyards.

Open-Plan Design

A sub-design of the cluster plan is the open-space plan. While retaining the core campus arrangement and building orientation of the cluster plan, beginning in the mid- to late-1960s campus buildings were designed to have greater interior flexibility (California Department of Education 2000: 7). The objective was to have classrooms with adaptable interiors with moveable walls to accommodate changes in group size and/or activities. To accomplish this school architects designed buildings with large interior spaces separated by non-load-bearing walls, long and high roof spans, and steel structural systems. A relative lack of windows further accommodated this flexibility. This was made possible by modern air conditioning systems. Massing increased and exterior corridors moved inside since the buildings by necessity took up a greater area of the campus site. Some open-plan schools were designed in circular plan, with hexagonal or circular classrooms clustered around a common area (Sapphos Environmental 2014: 104-105). SCUSD's Cabrillo Middle School, built in 1961, appears to be an example of a circular-design open-plan campus that followed the principle of the cluster plan. Survey of this campus is beyond the scope of this study.

The open plan was not widely accepted and was short-lived. By the 1980s there was a return to the visual and sound separation provided by the self-contained classroom. However, the structural flexibility associated with the open-space plans continued to be used for common spaces, such as gyms,

auditoriums, and cafeterias, most of which used moveable walls and space-function adjacency design to improve flow between the functional spaces (California Department of Education 2000: 8).

Architectural Typology

Modern and Modernist architecture spanned the late 1920s through the 1970s and included several distinctive styles of architecture. Regional expressions of Modernism can be found throughout California and the United States. Key characteristics of Modern buildings is the lack of historical ornament and references, and an emphasis on a new architectural vocabulary. In the San Francisco Bay Area Streamline Modern, International Style, Second Bay Tradition, Mid-Century Modern, International Style, Brutalism, and Contractor Modern populate the cities and suburbs. New materials and building technologies stimulated the rapid post World War II promulgation of these architectural styles, with the mass-production of building products that were distinct from earlier products. These included materials that were often factory finished, such as plate glass, structural glass, spandrel glass, acoustical board, asphalt tile, vinyl asbestos tile, aluminum, concrete, ceramic, terrazzo, vinyl fabric, gypsum board and plaster, rubber topset, plywood, clear wire glass, and plastic laminate.

The historic-period post-war SCUSD campuses, built between 1951-1969, share the basic design principles and express simple application of Mid-Century Modern design elements regardless of campus plan. “Mid-Century Modern” is not an academically accepted architectural style term but was generated by the public. It describes a wide range of design elements incorporated into buildings during the 1940s through the 1960s. Mid-Century Modern was influenced by the more formal machine-age aesthetic of the International style. Mid-Century Modern expresses the architectural features of International style in a more relaxed, generally scaled down and regional style and sometimes adopts architectural elements from other Modernist styles. It is characterized by honest expression of structure and function with little applied ornament. The style can be found in postwar institutional buildings, commercial buildings, as well as residences.

Mid-Century Modern style is characterized by balanced, rhythmic composition with an emphasis on simple, geometric forms. Footprints are generally square or long rectangular; buildings are seldom more than two stories in height and are predominately horizontal in massing. This composition is achieved by modular post-and-beam construction that allows for large expansions of open floor plans. The rooflines are low-shed, low-gabled or flat, with wide eaves and cantilevered canopies supported on posts or spider-legs. Windows are generally flush-mounted with metal frames that may act as infill panels or extend to the gable. Ribbons of clerestory windows are also commonly found on Mid-Century Modern buildings.

Evaluation:

Patrick Henry Intermediate School

1. Under CRHR criterion 1, the Patrick Henry Intermediate School does not qualify as a historical resource that has made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States. Constructed in 1960 and 1962, it was one of many schools built during the post WWII era of rapid suburbanization and population growth in Santa Clara County, California, and throughout the United States. It is also one of hundreds of schools in Santa Clara County associated with the common trend of establishing and unifying school districts during the 1950s and 1960s. It is a commonplace example of these local and national trends and development patterns.

2. Under CRHR criterion 2, the Patrick Henry Intermediate School does not qualify as a historical resource associated with any individual whose activities are demonstrably important within local, California, or national history. For the school to be of significance under this criterion, it would have to be able to illustrate the person's important achievements in the field of education. At the time it was built Lawrence Curtis was the Jefferson School District Superintendent and George Boyko was the principal. While both men likely contributed to the continued growth and progress achieved by the Jefferson School District, what would become the Santa Clara Unified School District in 1965, research has not found that either man has made any specific contributions of demonstrable historic importance that would qualify the school as a historical resource under criterion 2.

   The school district purchased the land from the Castello family, the Cirrincione family, and the Teresi family. Research has not resulted in any noteworthy additional information about these Italian immigrants and first-generation California-born farming families. The Italian-born senior members of the families were likely part of the significant influx of Italians into the area during the late 19th and early 20th century, attracted by rich agricultural land and associated opportunities. They appear to have been typical farming families that subdivided and sold their property as Santa Clara County's post-war population grew rapidly and suburban communities developed. Furthermore, other than having once owned the subject land, none appear to have any association with the current school facilities.

3. Under CRHR criterion 3, the Patrick Henry Intermediate School does not qualify as a historical resource that embodies the distinctive characteristics of a type, period, region, or method of construction, or represent the work of a master, or possess high artistic value. Under this criterion, there are three contexts that must be considered: Architectural style of the overall campus and the multipurpose building individually, functional school style as an example of a cluster-plan campus, and the potential for its architects, Clyde D. Goudie and Dewitt J. Griffin to

be considered master architects. The campus's potential to be a district of a significant concentration of buildings and structures united aesthetically by plan or physical development is also considered.

Architectural Design:
The architectural design of the campus classroom buildings is modest Mid-Century Modern style. The designer applied the expected rhythmic composition, low horizontal massing, simple geometric volumes and strong right angles, low-pitched gable roofs with wide cantilevered overhangs, courtyard entryways, simply treated materials, and lack of historical design elements. While the buildings are characteristically Mid-Century Modern, they are not distinctively characteristic of the style and are not significant representatives of the style.

The gymnasium is primarily utilitarian, with only a few Mid-Century Modern elements applied, like strong right angles and lack of historical design elements; it is therefore not distinctive in its design.

The multipurpose building design is also generally Mid-Century Modern, but introduces some elements not found in the classroom buildings, most specifically its irregular footprint, large expanses of glass on the north elevation, and a series of tall columnar inset windows on the other three elevations that are vaguely classical and somewhat reminiscent of PWA Moderne architectural style with their shallow relief panels. The building uses the same materials and palettes as the other campus buildings, is generally horizontal in its massing, and, other than the slight classical reference, lacks historical design elements or ornamentation. While it is generally overall characteristic of Mid-Century Modern architecture, it, like the rest of the campus buildings is not a distinctive example of the style.

Campus Design:
Patrick Henry Intermediate School campus is generally designed in the cluster-plan style; the gymnasium is not part of the cluster of buildings. The campus is not a distinctive example of this style. While the buildings are oriented inward, facing courtyards, as is typical of this type of campus organization, most of the classroom buildings have a mix of exterior and interior corridors, and classroom fenestration is minimal and too high to bring in enough natural light and air characteristic of the cluster plan. Patrick Henry Intermediate School is not significant under criterion 3 as a distinctive example of the cluster plan campus.

Master Architect:
Clyde D. Goudie independently designed the 1960-built campus. He partnered with Dewitt J. Griffin to design the 1962 multipurpose building and gymnasium. Clyde Goudie was the architect for the Jefferson School District in the 1950s and early 1960s and designed many of the

extant elementary schools in what is now the SCUSD. While locally fairly prolific, neither are recognized as being masters in the field of school architecture or architecture in general. Additionally, for a work to be considered significant for being designed by a master, it would need to express a particular phase in the development of the master's career. The Patrick Henry Intermediate School campus is not eligible under criterion 3 because it is not a significant example of the work of a master architect.

District:
The Patrick Henry Campus is not a significant historic district. Historic districts usually also meet the significance criteria of criterion 1 for its important association with a trend, and/or criterion 3, having high artistic values. While the campus composition is that of a concentration of buildings, structures, and landscape features that reflect one functional activity, it is an aesthetically commonplace example of a Mid-Century Modern 1960s school, broadly associated with the post WWII commonplace trend of suburban school construction.

4. Under CRHR criterion 4, the Patrick Henry Campus is not significant as a source (or likely source) of important information regarding architectural history. This property type is common and does not have any likelihood of yielding important information about historic construction materials or technologies. This evaluation makes no determination regarding the potential for the discovery of significant archaeological resources on the property.

Marian A. Peterson Middle School is located on the northwest portion of the subject parcel APN 313-10-004. Its primary entrance is on Rosalia Avenue and Poplar Way to the to the north; the northern boundary of the northeast parking lot is Bryant Way. The eastern boundary is Roadrunner Terrace. The western boundary abuts residences. South of the main campus is the football field and track, the Bryan Osborne Nature Center, and the Santa Clara Unified School District Farm; southeast of the campus is a large grassy field and, further south, the Patrick Henry campus. The SCUSD's 71.08 acre-property is surrounded by subdivisions of primarily modestly scaled single-family homes and multi-family units built in the 1950s -1970s.

(This space reserved for official comments.)

The school was designed and built in three phases in the historic period, 1972 or earlier. All historic-era buildings were designed by architect L.F. Richards. The first phase, designed in 1964, included the administration building (demolished), library (demolished), multipurpose building, most of the gymnasium, a locker building (demolished), home economics building "C", science building "D", classroom buildings "A" and "B", and half of shop building "E". The second phase was built in 1966 and included classroom building "F" and building "H" (demolished). The remainder of building "E", classroom building "G", and a small addition to the gymnasium were built in 1969. Extant buildings that were built after the historic period include the current library, administration building, locker room and additional athletic facilities, swimming pool, and the replacement of building "H", as well as the large landscaped area south of the gymnasium and new basketball courts where the original locker room once was. The tennis courts were built between 1968 and 1980. The bleachers for the football field were built in 1969; the identity of the designer is unknown.

Campus Description

Marian A. Peterson High School was originally designed as a hybrid "finger plan" and "cluster plan" campus. The campus is generally arranged in two parts: The western half serves the school's academics and administration while the eastern half contains buildings, structures and spaces associated with the school's athletic programs. Classroom buildings are clustered around the library and administration building, but their arrangement more closely resembles that of the finger plan. While the original library and administration building are no longer extant, their replacements are similarly sited on the campus, in relation to the historic period classroom buildings. The multipurpose building is sited inward toward a landscaped communal area. The gymnasium is now sited on an open, landscaped area but was originally opposite the large locker room building that was recently demolished. The main entrance into the gymnasium does not face inward but faces away from the campus toward the large parking lot to its north.

The school has two parking lots. The smaller lot is sited on the northwest corner of the campus and includes a curved drop-off area and serves as the primary approach to the campus. The larger lot is on the northeast corner of the school, north of the gymnasium, tennis courts and the other athletic facilities. The main entrance to the campus is the modern administration building. The library, a modern replacement, occupies the back of the administration building. A small, landscaped area north of the administration building marks the entrance to the campus with a sign and flagpole. A modern concrete walkway leading to the administration building is adjacent to a series of trees surrounded by benches that separate the walkway from the parking lot.

The administration/library building is flanked on each side by two east-west oriented long parallel classroom buildings, buildings A, B, F, and G, from the historic period. The space between these parallel buildings is a narrow paved area shaded by the buildings' deep cantilevered overhangs. Building H, a

modern replacement building, is directly south of the administration/library building. South of building H is building D, the science building, built in 1964. To the east of building D is a small building, building C, built in 1964 as the home economics building. South of building D is building E. Building E, originally a shop, was built in two phases in the 1960s. The building marks the southwest boundary of the campus, is parallel to, but longer than the other historic-period classroom buildings. Between classroom building G and classroom building E is a landscaped area, with grass, a Y-shaped pathway, and trees. East of classroom E is the Bryan Osborne Nature Center, outside of the project area.

North of classroom building A, separated by a large concrete courtyard with occasional trees and outdoor seating, is the multipurpose building, built in 1964. Directly east of the multipurpose building is the gymnasium also built in 1964, with two additions constructed on the building's east end in 1969. Between the east ends of classroom buildings A and B and the newly planted grassy field south of the gym, separated by a fence, is an informal landscaped area on a slight rise, with mature trees, grass and concrete paths. South of the gym are the new athletic buildings, structures, the swimming pool, basketball courts, and fixed workout equipment. East of the new buildings and pool are the tennis courts which were built prior to 1980. South of the tennis courts is the football field and bleachers, built in the 1960s.

Chain-link fencing and iron fencing surrounds much of the campus proper as well as functional areas within the campus.

Buildings

The campus is comprised of nine historic-period buildings: Seven classroom buildings, the multipurpose building, and the gymnasium. Four of the classroom buildings, buildings A, B, F, and G have identical footprints and are oriented east-west; buildings A and B were built in 1964 during Phase 1 of the campus's construction, and buildings F and G were indicated on the Phase 1 plan sheets as "future academic". Buildings C and D are smaller rectangles, oriented north-south. Classroom E, built in two phases is similar in footprint and orientation to A, B, F, and G, but is significantly longer. The multipurpose building and the gymnasium are significantly taller and, while they are similar to the classrooms in their horizontal massing, their overall scale and architectural features are comparatively grander. All are topped with what appears to be rolled asphalt roofing material. Overall, the historic-era buildings are in good condition. The following discussion only describes the historic-period campus buildings.

Classroom Buildings A, B, F, G

Classroom buildings A, B, F, and G have virtually identical footprints, however each building was purpose-built to accommodate some specific classroom functions, so the floor plans vary. The

northwest corner of A and B buildings house men's and women's restrooms with entrances on the west elevation. Building F (identified in the plans as building C) only has a girls' restroom and building G (identified in the plans as building D) only has a boys' restroom. In addition to multiple stall restrooms, in buildings A and B, a single men's room and a single women's room is centered between the two larger facilities. Building A contains a large storage room and a mechanical systems room, both accessed from the west end; the west end of building B was designed to house a darkroom, an identical mechanical systems room, and a smaller storage room. Buildings A and B include small teachers' rooms. Building A has eight classrooms; five are a standard square size of 28'x28', two are larger at 28'x42', designed to accommodate a driver education class and a mechanical drawing class. The eighth and largest classroom is 28'x84', designed to house a typing class. Classroom building B contains eleven standard 28'x28' classrooms. Classroom building F was designed to contain a large arts and crafts room, two standard sized special education rooms and two L-shaped team-teaching rooms. Classroom building G was designed with ten standard-sized classrooms, a larger 28'x42' drama room, and a smaller 14'x28' room. There are no interior corridors and all classrooms' entrances are on the north or south elevation.

The exteriors of the west ends of all buildings are identical and clearly express the structural system. A three-part concrete bent with legs 28' apart that is consistent with the width of the classrooms is visible and frames the exterior flat cement-plastered solid walls. The ends of the bents cantilever 12' beyond the ends of the walls. The roof is a very low side-gable and extends slightly beyond the wall; the facia on the east and west elevations is cream-colored porcelain enameled metal with spaced shallow vertical detailing. The facia on the north and south elevations is covered by rain gutters. The walls are cream colored, and the exposed bent is butter yellow.

The exterior of each north and south elevation is virtually identical, with rhythmic placement of architectural elements. A series of parallel concrete bents with the two outer legs partially exposed every 14' run the length of the buildings, creating a series of bays, and cantilever 12' beyond the vertical plane of the building. The cantilever beams support an overhang the length of the building, are fin-like and gradually narrow to 8"-wide and extend about 1' beyond the roof of the overhang. The walls between the exposed butter-colored bents are cream-colored cement plaster. Several bands of square windows are just below the roof eaves between the exposed bents. Doors are metal framed and painted blue. Most have a single full-width metal-framed side panels, with the top half glazed and the bottom half enamel coated. The entrances are topped with two transom lights. Single or double rows of metal lockers run the length of the buildings.

The east elevations contain the entrances to the boys', girls', women's and men's rooms, mechanical systems rooms, and building B's darkroom. Louvers vent the mechanical system rooms.

Building C

The 1964 plans identify this building as the Home Economics Building. It is the smallest of all the classroom buildings at 56' square, and doesn't have the long horizontal mass common to classroom buildings A, B, E, F, and G. It was designed to house a sewing studio and a cooking lab, with a small dining room, fitting room, laundry, and storage.

The east elevation is consistent with the west elevation of the classroom buildings A, B, F, and G, but with a single metal door hung in one bay. The west elevation includes the main entrance and exhibits a variation of the bent design. Rather than the three-leg bent, this façade exposes a four-leg bent, with the center two bents slightly less than 10' apart and containing a metal framed double plate-glass door.

The north and south elevation almost mirror each other and are consistent in design with the other classroom buildings, but with just four of the 14'-wide bays punctuated by five exposed bents. One bay on each of these elevations contains a row of metal lockers and one has a single metal door. Three of the four bays on the south elevation have the band of six windows just below the eave; all four of the bays on the north side have the same window treatment. The low-gable roof and covered cantilevered walkways are identical to those of the other classroom buildings; the facia is similar in style but blue, as are the gutters. A colorful mural is on the north façade of the building.

Building D

Identified on the 1964 plans as the Science Building, this is the only classroom building that does not follow the standardized structural unit sizes of 14' or multiples thereof on all elevations. This rectangular building is oriented north-south and was designed to accommodate two biology labs, two chemistry labs, a research lab, and an art studio. The building is 72'x126. The east and west façades are a series of nine of the standard bays, with the typical exposed bent system, cantilevered walkway overhang, roof style, cream, butter, and blue colors, and wall finish. The facia is blue, unlike that on buildings A, B, F, and G. Most bays contain a row of metal lockers, some include single metal doors in metal frames; all the bays on the east façade contain a band of six window just under the roof eave. Six of the nine bays on the west elevation contain the window treatment, with the three central bays windowless. Two bays have additional roof treatment inconsistent with other buildings in that the eaves of the third and sixth bay project out slightly resulting in a stepped effect. One bay contains three ventilation louver panels.

The north and south elevations are similar to the east elevation of building C in that the exposed bent structural system has four legs rather than the typical three-leg 56'-wide bent. This results in two wide expanses of plain cement-plastered walls with a narrow central plain wall on the north elevation and a single metal framed glass door flanked by two fixed lights of wire glass, all topped with three glass transoms on the south elevation.

Building E

Building E, identified in the original plans as a "shop" was designed and built in two phases in 1964 and 1969. The structural system and exterior design of the 1964 portion of the building is generally similar to the classroom buildings, however the horizontal footprint is longer, and the building is taller. The facia detail and low gable roof match that of the other classrooms. It was designed to contain a metal shop, a wood shop, offices, drying rooms, tool rooms, and finishing rooms. The east elevation, while taller, matches the west elevation of the classroom buildings with plain cream-colored walls inset within a three-part bent that cantilevers out to create a covered walkway on the north and south elevations.

The north elevation of the 1964 portion of the building is divided into six equal bays of 14' with the same exposed bents and cantilevers as found in the classroom buildings, plus a narrower 7'-wide bay. Moving east to west, the first three bays contain rows of lockers. Taller bands of six windows in each bay begin at approximately the same height as those in the classroom buildings and extend up to the roofline. The fourth bay also contains lockers, a low panel of louvers and a single metal door, but no windows. The fifth bay only contains lockers and a panel of louvers. The sixth bay mirrors the fourth bay; the seventh and eighth bay are identical to the first three. The final half bay of the 1964 building contains lockers and a louvered panel.

The north elevation of the addition is consistent in design, massing, and architectural features with the original 1964 building. It was designed to contain a power mechanics classroom, two drafting rooms, an electronics classroom, a carpentry shop, offices, a lecture room, and an addition to the metal shop. The addition is made up of fourteen bays that match those of the original building, each bay containing either lockers, doors, and/or vents. Four of the bays include upper bands of six windows.

The south elevation of the 1964 construction generally mirrors that of the north elevation, with its structural system clearly expressed by the exposed bents and cantilevers. There are no lockers on this façade. Moving east to west, the first bay is a plain cement-plastered wall with a six-light band of tall windows at the roof line. The second and third bay are hidden behind a taller simple rectangular, flat-roofed structure that extends above the roofline. The fourth bay contains double metal doors with three tall windows above it; the rest of the wall has the typical plastered cream-colored finish. The fifth bay is plain wall, the sixth is a mirror of the fourth bay. The remaining bays are plain and plastered, with no openings.

The south elevation of the 1969 addition also has no lockers. The fourteen bays are mostly plain, with no openings. The two bays on the west end of the elevation each contain large roll-up service doors. Two bays contain double metal man doors, and two contain a narrow band of windows just below the roof.

Multipurpose Building

The multipurpose building was designed and built as part of Phase 1 in 1964. It is oriented east-west. The kitchen is on the west side of the building, and on the east is a stage, behind which are music/chorale classrooms and storage. The center section of the building is a large, open, versatile space designed to be used as a cafeteria or for assemblies.

The central portion of the north façade opens onto Rosalia Avenue. The three separate functional components of the building are expressed with the different use of materials, heights and architectural elements. The west portion that houses the kitchen and mechanical systems is an 84'-wide, low building of three flat-topped, stepped-back north-facing planes, the first of which projects slightly north of the façade of the central portion of the building. The space resulting from the step backs is enclosed by a low off-white tilt-up concrete wall, creating an enclosed courtyard that allows access to the mechanical systems located in the first two stepped building sections. The wall is heavily textured with a flat-topped parapet. The first two planes of the building are concrete tilt-up walls with access doors. They are coated in rough gray concrete embedded with large, coarse tan, brown, and white irregularly sized rocks. The third plane has low horizontal metal-framed windows presumably to allow natural light into the working kitchen; the unglazed portion is also covered with the decorative rock. The joints of each tilt-up panel and 90-degree angles are indicated by vertical flat cream-colored concrete columns, accentuating the stepped design. The rock-faced wall extends 4' north of the central, main building's façade.

The architectural elements and finishes of the central portion of the building, the "multipurpose" section, are significantly different from either west or east wing. At over 22'-tall, with strong vertical architectural features and smooth lighter-colored wall finishes, this wider portion of the building appears significantly taller than the low, horizontal wings due to strong vertical architectural features. The façade is divided into nine mostly butter-colored 14'-wide bays, each divided by either a cream-colored engaged rectangular column or, in the case of two, deep buttress slabs. Flanking all but two eastern-most, and one western most columns/buttresses are a series of narrow vertical flat brushed-aluminum-framed lights. The six-part lights abut the engaged columns and buttress columns and begin inches above the ground with a tall light that matches the door height, followed by four small square lights, topped with a door-height light that stops only a few feet from the roof soffit. There are three bays between the two buttress columns. The center bay is plain butter-colored concrete-plaster with no openings other than the previously described narrow glazing abutting the columns. The other two bays are identical, with central steel-framed double glass doors and with the lower, approximately two-thirds of the wall coated in a cream-colored concrete plaster. Embedded in the cream-colored portion are horizontal aluminum bands that continue the lines of the muntins of the glazed bands of windows. These visually reinforce the horizontality of the roof line. The two buttress columns are horizontally scored in two locations, at the same height as two of the window muntins. A concrete cantilever beam with a vertical notch in the end extends off the top of the columns, supporting the roof. The soffit is

slightly stepped back from the end of the cantilever beam. The blue facia covers the edge of the roof that slightly juts out. The facia is a continual pattern of long raised-edge rectangles, further emphasizing the building's horizontality. The strong horizonal lines and vertical members make the building feel larger than it is.

A concrete patio with an octagonal planting bed in the center is in front of the three bays flanked by the buttress columns. Grass, low landscaping, and a few small trees are in front of the east portion of the building. The west portion has a concrete sidewalk, planning beds and a large Ponderosa pine tree.

The eastern portion of the building is the same height as the western wing and also extends about 4' north of the façade of the central portion of the building. It encloses most of the eastern-most bay of the central section. Like the western wing, it is sheathed in rough gray concrete, embedded with the same rock, and the tilt-ups are indicated by flush flat cream-colored concrete columns. However, the plane is flat, not stepped like the western wing. Also, unlike the western wing, the wall of this wing is topped with a blue metal cap.

The west elevation is 70'-wide. The stepped portions of this elevation are sheathed in the rough concrete and decorative stone; the western-most wall consists of two panels of butter-colored cement-plaster walls divided and flanked by cream-colored smooth flush concrete columns. Above these walls the 66'-wide west wall of the central, taller portion of the building is visible. It is divided into three bays separated by columns with cantilever beams at the top supporting the roof eaves. The facia is consistent in design with that found on the north façade of the central portion of the building.

The east elevation is wider, at 78' in width. It is divided into three bays, each covered in the same decorative rock and divided by flat cream-colored flush concrete columns, topped with a narrow blue metal cap. There are metal doors in each bay – two single and one double. As with the western façade, the central portion of the building is visible above the east wing and is identical to that seen above the west wing.

The southern elevation faces onto a large concrete area with some tall Ponderosa pines, brick planters, modular metal picnic tables/benches and benches. A long, free-standing butterfly awning covers a walkway that extends across the central portion of the building; another shelters the west wing. Two lower shelters flank the taller shelter in front of the multipurpose portion of the building.

The roofline of the western wing of the south elevation of the building, as previously stated, is lower than that of the central portion of the building. The front vertical plane of the west wing is consistent with that of the central section. It consists of four bays, three of which are 14'-wide, flanked by cream-colored flush concrete columns. The third is the width of three bays. The western-most bay is a plain, butter-colored cement-plastered wall with a single blue metal door, as are the third and fourth bays. The second bay, the 42'-wide bay, is mostly glazed and contains the entrance to the snack bar. The unglazed portion is covered by a colorful mural. A central metal-framed glass double door is flanked by

eight long aluminum-framed horizontal windows arranged in two columns of four lights. To the east and west of these windows are single metal framed glass doors.

The façade of the central portion of the building largely mirrors that of the north elevation. The primary difference is the location of the entrances, additional aluminum-framed fenestration that is consistent in geometry with the entrance doors, and the lack of buttressed columns. The recessed aluminum bands that mirror the muntins in the tall vertical window bands cross five of the bays on the south façade, rather than just three. From west to east, the first bay has no openings other than one band of the vertical lights; the second and sixth bay contain the entrance doors; the center of the third, fourth and fifth bays contain the four-part double door sized windows; and the last three bays are plain except for the vertical bands of glazing on either side of the engaged rectangular columns.

The south façade of the east wing, like the west wing, is at the same spatial plane as the central building except for a 12' panel at the eastern end that protrudes south. The wing is comprised of five panels of butter-colored plain walls divided into 14' bays divided by cream colored flush concrete columns. One bay has a plain double metal blue door.

Gymnasium

The gymnasium is also part of the original Phase 1 campus design and construction. During the initial design a future addition on the east elevation was indicated on the plans. During the 1969 Phase 3 design the addition, plus a "new auxiliary gym addition" were designed. The building is 110' x 150', plus the eastern "auxiliary" addition of 50'x 55'. The gymnasium was designed as an open floorplan; the northern entry was designed to contain a lobby, men's and women's restrooms, storage, and a janitor room.

The gym is surrounded on the north and east by an asphalt parking lot and former asphalt-surfaced basketball courts. The north elevation contains the public entrance, planting beds, and a concrete sidewalk. The southern elevation opens onto a new concrete-surfaced open space with a low zig-zag concrete seating wall, a free-standing long canopy the width of the building, and a large lawn; it faces the other, newer athletic facilities. The multipurpose building is immediately to the west.

The north façade, the public entrance, is consistent in overall design with the central portion of the multipurpose building, however the bays are wider at 16'8". Engaged rectangular concrete columns and cantilevered beams separate the bays. The roof design and detail match that of the multipurpose building. The wall surface between the columns, however, is finished with a more textured material. The long, deep, approximately half-height horizontal sheltered entrance crosses the first six bays starting on the western end of the building. It is enclosed on both ends. The central three sets of double metal framed doors are further sheltered by narrower concrete vertical panels. These panels and the inside of the outer panels are coated with a smooth concrete butter-colored plaster. The north facing planes

within the shelter are sheathed in the same rough stone embedded in concrete as can be found on the east and west wings of the multipurpose building, however they have been covered over with a colorful mural. The walls of the building above the shelter are also painted with a school spirit mural that includes the words "ENTERING PIRATE TERRITORY". The seventh bay is also painted with the mural; the eighth and ninth bay are plain, textured, and painted the butter color. The outer faces of the shelter walls are unpainted decorative rock.

The east façade is of the main gym consists of six bays separated in the typical manner with the same palate, a very low gable roof, and materials as found in the multipurpose building except that the bays are wider, and the surface is more textured. In the north half of this elevation is a double blue metal door in the central bay. The smaller addition is attached to the southern portion of the larger gym; the roofline of the main building extends slightly above the flat roof of the eastern-most addition. The north, east, and south walls of the addition are divided into three bays each, within the typical engaged concrete rectangular columns. There are no cantilevered beams; the roof is flat, and the facia is at the same plane as the engaged columns with simple blue facia. There is a single blue door on each of these facades.

The southern elevation of the main gymnasium is also articulated by nine bays between ten engaged rectangular columns with cantilevered beams at the top, under the extended roofline. The blue facia is peeling. All walls are textured and butter colored, and the columns and cantilever beams are smooth and cream colored. Two bays contain double blue metal doors; both are sheltered by flat horizontal awnings supported by two cables. The door in the southern façade of the smaller addition is also sheltered by the same style of awning.

The west elevation is a mirror of the east elevation without the smaller addition. It has the typical, but wider than those found on the other buildings, six bays articulated by seven engaged concrete rectangular columns with the same finish and roof detail found on the other elevations of the building. The first and sixth bays each has a double blue metal door immediately adjacent to the exterior columns.

Historic Contexts:

Santa Clara Unified School District Historic Context

The Santa Clara Unified School District (SCUSD) includes neighborhoods in the cities of Sunnyvale, San José, Cupertino, and Santa Clara; it comprises approximately 56 square miles of 1,290-square-mile Santa Clara County (SCUSD 2022a; U.S. Census Bureau 2022). The district, which educates over 15,300 K-12 students, is made up of 18 elementary school sites, one K-8 school site, four middle-school sites, three high-school sites, three alternative high-school sites, and four leased sites (SCUSD 2022a, 2022b). SCUSD is one of 32 elementary, high school and unified school districts in Santa Clara County, not counting the

Community College District, charter, or court schools (Santa Clara County Office of Education 2022a). Unified school districts are districts that teach both elementary and secondary levels of education.

19th-Century Public Education in Santa Clara County

On April 11, 1850, the California State Legislature passed an act providing for the election of a superintendent of public education, as directed by the Constitution of the State of California. John G. Marvin was elected that year on October 7 to serve as the state's first public school superintendent (San José Mercury News 1951: 181). Despite this, the first schools in Santa Clara County were private schools generally operated by religious entities or informal schools organized by residents (Laffey 1995: 51). In 1852 the Legislature authorized a state school tax of five cents per $100 and a county school tax of no more than two cents per $100 to initiate funding of the state's public education system (Santa Clara County Office of Education 2022b). It also allotted three school commissioners to each township and included the duties of a County Superintendent of Schools as among the responsibilities of the County Assessor (San José Mercury News 1951: 181). The first Santa Clara County Assessor was J.H. Morgan, elected in 1853; consequently he also become the county's first Superintendent of Schools (Laffey 1995: 51).

One year earlier, in the fall of 1852, the Santa Clara County Commissioners designated eight townships as school districts: Gilroy, Burnett, New Almaden, San José, Santa Clara, Fremont, Alviso, and Washington (now part of Alameda County). On March 15, 1853, the Santa Clara Register printed a notification that a school had opened in San José, signed by the San José Commissioners of Common Schools; the parents were expected to pay any costs that exceeded the school funds provided by the State. By May the school, located in a Baptist church, had ten pupils registered but insufficient funds to pay the teacher. The 1853 Legislature amended the State's school law to allow the Common Council to levy taxes on real or personal property to support city schools (San José Mercury News 1951: 181). By 1866 Santa Clara County Schools were some of the best funded in California (Laffey 1995: 51).

The State Legislature revised the County Assessor's duties in 1855 to no longer include that of Superintendent of Schools. Freeman Gates, a San José teacher, became Santa Clara County's first elected Superintendent of Schools (Santa Clara County Office of Education 2022b). In October 1855 Santa Clara County redistricted itself into eight townships and 16 school districts. School districts in the townships of Fremont, Santa Clara and Redwood numbered six; San José, Alviso, Burnett, Almaden and Gilroy had ten. Within a month district designations were revised again, and four separate school districts were established in the Santa Clara township (Munro-Fraser 1881: 137). By the end of 1859 there were 710 students enrolled county wide (Laffey 1995: 51).

The 1860s marked significant expansion of Santa Clara County schools, with the erection of over two dozen schoolhouses. These included schools in the Cambrian, Encinal, Jefferson, Laguna, Mt. Pleasant, Pala, Summit, Hester, and Willow Glen districts. What was once the Jefferson School District is now

within the boundaries of the SCUSD. The first high school in the county was opened in San José in 1860 (San José Mercury News 1951: 181).

Santa Clara County's rural school districts constructed generally small wood-framed one- or two-room schoolhouses between 1850 and 1880. These early schools appear to have been of consistent design with schoolhouses throughout the country (San José Mercury News 1951: 181). Located along existing roads and intersections, these schoolhouses were exposed to noise and dust, poorly lit, had poor ventilation and heating, and often had no wells, washbasins or toilet facilities (Englehardt 1942: 172). The typical classroom layout was rectangular, with the teacher's desk in front of rows of students' desks, emphasizing his or her authority (Ogata 2008: 563). The Mayfield School in Fremont township was described as being of common construction and type. An early California State Superintendent of Schools who visited it in 1855 referred to it as a "herring box" (San José Mercury News 1951: 181). Schools also found accommodations in existing buildings, such as Mr. Dunphy's school on the second floor of a two-story rented building in San José; Red Mac's Saloon occupied the first floor. Some schools shared buildings with other entities like churches or meeting halls (San José Mercury News 1951:183).

The rapid increase of population on the West Coast that followed the completion of the Transcontinental Railroad in 1869 resulted in a shortage of school funding and space (Laffey 1995: 52). According to the Census Bureau, the population in Santa Clara County grew from 11,912 in 1860 to 26,246 in 1870, a more than 120% increase (Bay Area Census 2022). At least four, and possibly six, new districts were established in the 1870s. These included Eagle, Uvas, Llagas, and Midway. Fifteen new school districts were formed in the 1880s, among them were Mount Hamilton, Halls Valley, Huyck, Campbell, Burrell, Lakeside, and Austin. Similarly, in the following decade, another thirteen districts were created, two in the new towns of Morgan Hill and Palo Alto (San José Mercury News 1951: 183). Most districts consisted of only one or two schools.

Despite the rapid establishment of new school districts, they were not always able to keep up with the educational needs of their growing communities. Although state funds covered much of the cost, parents had to purchase their children's books and cover other expenses; some poor families simply could not afford to send their children to school. Lack of adequate funding also resulted in deferred maintenance and inattention to advancement in school design to better serve the student body. In the 1873 Santa Clara School District's annual report, the School Superintendent accused the city of allowing the schools to become dilapidated. He stated that "the Cheap-John system which seems to pervade all the departments of our town governments admonishes us out of the necessity of studying economy, even to the degree of meanness (San José Mercury News 1951: 183)."

Another challenge the public educators faced was poor attendance. In 1860 the Santa Clara County Superintendent of Schools stated that "the principle cause of non-attendance by the children is the indifference with which many parents in the county districts treat all things connected with school discipline." "Discipline" in this instance was not referring to behavior but to regular attendance, particularly in the rural districts where farming and ranching families were dependent on children

helping at critical times such as harvest or planting (Laffey 1995: 51-52). In 1874, California made education for children from eight to 14 years of age compulsory and guaranteed state aid for each school based on the number of children in each district. High schools would not receive state funding until 1902. In 1911, the state stopped providing aid for each child in a given district but based the funding on attendance (California Department of Education 1961).

Despite the State's intervention, these challenges continued even as the number of school districts increased. By 1875 Santa Clara County boasted 53 school districts, 83 school buildings and 105 teachers. The average daily attendance was recorded as 4,892, not counting San José school attendance. This number indicated that only half of school-age children regularly attended school. By 1881 there were 62 districts county-wide, and by 1900 there were a total of 97 schools in 84 districts, and 562 teachers educating 14,320 students (Laffey 1995: 52). The majority of these schools were in rural communities and small towns, with the basic one- or two-room wood-framed schoolhouse still the most commonly built school type.

Late 19th and Early 20th Century: Continued Growth, New Approaches to Education and School Design

As the county's population increased and towns became more urbanized in the 1880s and 1890s, the basic schoolhouse was gradually replaced by larger, yet still modestly scaled schools that often expressed contemporary Victorian architectural styles. Nation-wide attitudes toward the importance of lower education were changing. With the close of the 19th century, school building design began to trend toward a more monumental and unified plan with architectural revival-style embellishments and elaborate approaches and entrances to celebrate the public's civic pride and devotion to education (American Educational Research Association 1942: 174). These schools typically had a central entrance, symmetrically planned classrooms on either side of a long corridor, and a large auditorium. The classroom plan was rectangular with blackboards on one or two walls, rows of windows on one side, and the desks in rows to emphasize order, desk work, and the teacher's authority (Ogata 2008: 563). The unreinforced masonry San José High School that opened in 1898 was a relatively grand civic building with classical styling, and a symmetrical design composition (San José Mercury News 1951: 181).

Architects and engineers introduced improved technologies and stronger materials that allowed school buildings to be two to three stories in height. They designed schools with improved ventilation and exposure to natural light and enhanced safety by using fireproof materials (Yates 2013: 1). These advancements in architectural design and the need for larger school buildings established a new era of school construction (American Educational Research Association 1942: 173). However local school designers apparently did not plan for potential seismic events, and the 1906 earthquake destroyed the new San José High School (San José Mercury News 1951: 181) and damaged the newly built Santa Clara High School. California would not mandate earthquake-resistant building construction for schools until after the 1933 Long Beach earthquake (Seismic Safety Commission n.d.).

As stated earlier, attitudes toward education began to evolve in the late 19th century. The influential progressive education movement would lead to significant changes in school and campus design over the next several decades. The movement was a reaction against the existing formalism and authoritarian teaching practices of traditional education and inspired a broad restructuring of educational methods in the United States. Guided by the theories of educators and philosophers such as John Dewey of the Columbia University Teachers College, the movement emphasized more hands-on, child-centered methods and curricula, individual achievement, and differentiation of children's abilities (Sapphos Environmental 2014: 39). The progressive education movement also brought a new emphasis on student health and physical activity as essential for proper childhood and adolescent mental and physical development (Yates 2013: 2). The notion that such development took place in stages led to the creation of the 6-3-3-year division of elementary schools, junior high schools, and high schools during this period (Yates 2013: 1-2).

As the progressive education movement gradually took hold in the first two decades of the 20th century, new school design incorporated features to support the health and well-being of the children (Yates 2013: 1-2). The 1906-built Santa Clara High School building was designed with traditional classroom layouts, but also included boys and girls "play rooms" and showers, a robust ventilation system, and landscaped grounds and tennis courts (Evening News 1906: 2).

In 1909 the Santa Clara County Board of Education, which consisted of the elected county superintendent of schools and four members appointed by the board of supervisors, amended an 1880 political code to provide that a majority of appointed members be experienced teachers who held at least a grammar school teaching certificate. The board of education was now authorized to qualify and hire teachers and set the standards for graduation (Laffey 1995: 52). Superintendent D.T. Bateman established the Teachers' Institute of the Santa Clara County Office of Education in 1911 to offer professional development to teachers. Teacher round tables included topics such as "How to Make Mathematical Work More Nearly Meet the Needs of Daily Life" and "Teaching Peace by Means of History" (Santa Clara County Office of Education 2022b). The supervision of attendance and child welfare was added to the duties of the county superintendent in 1918 (Santa Clara County Office of Education 2022c). These actions further reflect the gaining influence of the progressive education movement and the county's adoption of its theories.

The creation of new school districts in Santa Clara County continued and by 1912 there were at least 102 districts, not counting high schools, outside of the city of San José's corporate limits. Prior to the turn of the twentieth century, there was a high school in San José, one in Santa Clara, one in Gilroy, and one in Palo Alto. By 1951 the communities of Santa Clara, Morgan Hill, Los Gatos, Campbell, Mountain View, Fremont, and East Side had high schools. All, except for Palo Alto and San José, served large rural areas and were classified as union high schools (San José Mercury News 1951: 183). For example, graduates from Jefferson, Santa Clara, and Alviso elementary school districts matriculated to the Santa Clara Union High School District's high school (Evening News 1959: 15).

On April 30, 1926, voters in the Jefferson, Agnew, Braly and Milliken elementary school districts elected to consolidate the districts into the Jefferson Union School District. Each of these school districts was comprised of a single school. Both the Milliken and the Braly schools were two-story Mission Revival buildings; the Jefferson school, a simple board and batten single-gabled building located on Kifer Road (formerly unincorporated) constructed in 1857, was said to be the oldest school building in continuous use in the state at the time (San José Mercury Herald 1926a: 10; 1926b: 7). Irvin Pomeroy, trustee of the Milliken school, appealed to the voters, saying that, "the need of better schooling for our children is becoming acute. In the Milliken school children are so crowded for room that classes are held on the stage of the assembly. With these four districts consolidated we will have enough pupils for a separate classroom for each grade and special instruction in such subjects as domestic science and trades." (San José Mercury Herold 1926a: 10)

The new district quickly applied for and received a $100,000 bond to construct a new Jefferson Grammar School at Lawrence Road and Reed Lane (San José Mercury Herold 1926b: 7). The new Mission revival style building, designed by architects Wolfe and Higgins, was constructed of reinforced concrete and contained thirteen rooms that included classrooms, manual training and domestic science departments, offices, a library, and an assembly room capable of seating 600. Joseph Hancock, county superintendent of schools, stated that the Jefferson Union School District was the wealthiest in the county, with an assessed value of $3,000,000 (Evening News 1927: 6).

Santa Clara County Public Education and School Development Post 1930

The 1933 Long Beach earthquake destroyed 70 schools and resulted in significant damage to another 120 schools in Southern California. The California Legislature enacted the Field Act on April 10, 1933, one month after the earthquake, to protect children and staff from death and injury in public schools grades K-14 and protect the public's investment in school buildings during and after earthquakes (Seismic Safety Commission n.d.). The requirements of the act included maintaining one-story massing for new elementary schools and no more than two stories for junior and high schools. These requirements were in line with school design trends already in being adopted in California and beyond (Sapphos Environmental 2014: 21).

As Santa Clara County developed from primarily agriculture prior to World War II to industry during the war years, the rural school districts grew and organized union districts for either elementary or high school purposes. Under this system two or more contiguous districts united. District superintendents focused on establishing a centrally located school and provided transportation for students. By 1950 there were eight union school districts in Santa Clara County: Cupertino, Jefferson, Los Gatos, Campbell, Saratoga, Almaden, Alum Rock and Berryessa, and Loma Prieta and Ausaymus (San José Mercury News 1951: 183). Midway School District was annexed to the Jefferson School District in 1949 (San José Mercury Herold 1949a: 16). The 1927-built Jefferson school was expanded in 1946 and 1948, with the

construction of ten new classrooms and a cafeteria-music building. Enrollment increased an average of 20% each year between 1944 and 1949 (San José Mercury Herold 1949b: 11). In 1949 the Jefferson Unified School District encompassed the area from Sunnyvale city limits on the west to Coyote River on the east, and from a mid-way point between Stevens Creek and Homestead Roads on the south to Alameda County line on the north. The current SCUSD boundary appears to be wholly within the 1949 Jefferson Unified School District boundary. By 1950 the Santa Clara County school system included 39 elementary school districts, eight high-school districts and two unified school districts, totaling 109 schools with a combined enrollment of 51,797 (San José Mercury News 1951: 183).

The 1960s and 1970s brought a major change to the area as Santa Clara County grew rapidly and urban development overtook most remaining rural areas (Santa Clara County Office of Education 2022b). Population in Santa Clara County continued to grow as technology-based industries established during the war year expanded. A 1961 San José Mercury News article titled, "High Schools Bulge: Educators Grope for More Space As War Babies Swamp Ninth Grade", stated that enrollment for each grade was slightly larger than the next one above. This steady climb was illustrated by comparing 1960 first grade enrollment to 12th grade enrollment: County wide 16,533 first graders were registered that year compared to only 6,990 12th grade students (San José Mercury News 1961: 26-27). This large increase in attendance occurred primarily in the former rural areas of the county. Young families of newcomers moved into newly built housing tracts of mostly modest ranch and minimal-traditional style homes that replaced the county's orchards and farmlands. That year the Santa Clara High School District was already constructing its third high school, Adrian Wilcox, scheduled to open in September. Concurrently the district was planning a second phase to accommodate the expected high school student body increase of around 600 per year (San José Mercury News 1961: 26-27). In September 1965, Santa Clara, Jefferson, and Alviso Elementary School Districts joined the Santa Clara High School District to form the Santa Clara Unified School District (San José Mercury News 1965: 56). The Patrick Henry Campus, built 1960-1962 to accommodate 1,000 6th, 7th, and 8th grade students (Evening News 1960: 9), was originally built as part of the Jefferson School District (SCUSD 1960); phase 1 of the Marian A. Peterson High School was designed in 1964 as part of the Santa Clara High School District (SCUSD 1964).

Santa Clara Unified School District Campus Plan Typology

Of the 33 school campuses that make up today's SCUSD, all but six were initially designed and/or constructed prior to the establishment of the district in 1965, primarily in the 1950s and early 1960s. The six campuses built after the unification of the district are of modern construction, built in 1995 or later. Buchser Middle School, the only extant pre-World War II-built school in the district, was initially constructed in 1937 (SCUSD 2022b). The Buchser campus has been significantly expanded and no longer resembles a pre-war educational institution. In the years after the district's unification SCUSD built out or added to many of these campuses, and further addressed the shortage of classrooms by the introduction of portable or temporary classrooms district wide, particularly in the 1990s.

Functional School Campus Site Plans, 1940s – 1970s

Despite the infill and alterations implemented by SCUSD throughout the years, two standard campus designs, the "finger plan" and the "cluster plan", are easily recognizable district wide. A sub-design of the cluster plan is the open-space plan, where the buildings in the cluster-plan campuses had greater interior flexibility – open-space shells so that team teaching could be accommodated in a variety of patterns. School architects applied these two distinctive functional campus plans throughout California and the nation, with the finger plan beginning in the late 1930s and refined into the 1950s, followed by the cluster plan in the 1960s and 1970s. The open-space plan proved to be problematic and short lived; it was quickly modified to recapture the visual and sound separation of the self-contained classroom (California Department of Education 2000).

Architects interpreted these basic campus plan concepts and tailored them to the size of the student body, campus location - rural, suburban, or urban settings - climate, and topography. In the 1940s and 1950s school districts in California used a rule-of-thumb approach to determine school site size. Elementary schools were to have a minimum site of five acres plus an additional acre for each 100 pupils of predicted ultimate enrollment. For middle schools the basic size was 15 acres and high schools 15-20 acres plus the same additional acre per 100 students of predicted enrollment. By the mid-1960s, with land becoming scarce and expensive, school planners began to apply more precise methods to determine school size to support the functions or activities of the proposed educational program (California Department of Education 2000).

Combinations of these two basic campus design forms were applied as the finger plan transitioned into the cluster plan with this more site- and function-specific approach to school design. Both plans typically share the basic architectural principles that reflected those of midcentury modern design with their use of steel framing, plate glass, and low-rise horizontal massing to reflect the relationship between modern architectural forms and progressive teaching methods (Ogata 2008: 562-563).

The Marian A. Peterson Middle School, originally Marian A. Peterson High School, initially designed in 1964 for the Santa Clara Union High School District, is a hybrid of the finger plan and cluster plan campus; the Patrick Henry campus, was designed as the Patrick Henry Intermediate School for the Jefferson Union School District in 1960 in the cluster-plan style.

The Finger Plan

Just prior to the U.S. entering World War II European-trained architects working in the U.S. began to design schools and campuses that were radically different from the period-revival monumental school buildings that contained all school functions. One-story schools with expansive windows and immediate access to outdoor space just beyond the classrooms were introduced by master architect Richard Neutra in 1939. He designed single-story experimental schools in Los Angeles with large sliding glass doors that

led to adjacent gardens or courtyards modeled on contemporary ideas about students' need for access to air and light, and that were well suited to the mild California climate (Ogata 2008: 564).

The experimental school design evolved into the finger-plan campus concept with architects Franklin & Kump's design of the Acalanes Union High School in Lafayette, California (1939-1940). Franklin & Kump also designed San José High School in 1952, further refining the finger plan. *Architectural Forum 91* (October 1949) called the plan type the "western finger plan" and that the finger-plan school resembled "a tree plan, based on a trunk corridor with side branches. It rests on radical standardization of classrooms; on absolute insistence that all classrooms share the best (north) orientation to sun and air; daylight for all of them from the open-corridor side as well as the main window side. This plan is not only flexible… but extensible indefinitely outward like a tree, by growing at branch-ends and by sprouting new branches." (Sapphos Environmental 2014: 92)

Architectural Forum further described Acalanes as "the first large-scale school which could serve as a complete demonstration of principles which amounted to a schoolhouse revolution – the revolution of the thirties. Since then, the Acalanes type of school, with its wide ranging, one-story classrooms arranged according to the 'finger' plan, has swept the West Coast, is sweeping rapidly across the Midwest on its way to the East Coast." (Sapphos Environmental 2014: 92)

Consistent with contemporary design principals, the finger-plan became the most common school building type in the 1940s and 1950s in California. This campus design also satisfied the construction requirements of the 1933 Field Act. These finger-plan schools were multi-structure residential-scale campuses with individual purpose-built buildings with minimal ornamentation or only modest application of modern architectural elements (California Department of Education 2000). Administration buildings, auditoriums and gymnasiums, separate classroom, shop, and specialty wings, and cafeterias were designed to connect to the outdoors with patio spaces and covered open corridors linking buildings. Natural light and ventilation were provided by bands of windows, including multilight sashes, casements, and clerestories (Sapphos 2014: 21). These school buildings reflected a more intimate and better integrated element of the community compared to the earlier period-revival monumental buildings. This newer campus style was a workplace and recreation center, sited in a manner that was more intimately associated with community living. This type of arrangement was flexible and eliminated much of the institutional atmosphere of the earlier large, compact buildings (American Educational Research Association 1942: 175).

In addition to the site plans' suitability for housing progressive education methods, these schools were considered safer for evacuation. Along with the age-old threats of earthquake and fire, residual anxieties of the war and subsequent Cold War added to the appeal of this style of school campus. Other practical aspects of these single-story schools were low-cost materials, swift constructability, and flexibility. With the baby boom in full swing, these rigid-frame schools could be quickly built and easily expanded as needed, with war-industry-made prefabricated materials and steel, and continuous fenestration (Ogata

2008: 568). Instead of an auditorium, these post-war flexible school campuses included a multi-purpose building for school assembly, cafeteria, and meetings (Ogata 2008: 569).

All of SCUSD's elementary schools built in the 1950s were designed in the finger plan and share the same midcentury modern design principles and type of structural materials. These schools, significantly more modest in scale compared to Acalanes Union High School and San José High School, include Bowers, Bracher, Briarwood, Central Park, Haman, Mayne, Millikin, Pomeroy, Scott Lane, Washington, and Westwood elementary schools.

Cluster Plan

The Architects Collaborative (TAC), a firm founded by master architect Walter Gropius, designed a prototype school in 1954 that could be quickly and economically constructed and easily expanded. The design included a cluster of individual one-story buildings grouped around a central administration building. Small square classrooms were arranged in a grid that created outdoor "classrooms" or common areas interspersed between the buildings. Residential in scale, these building evoked the feeling of post-war suburban houses with the ubiquitous picture windows looking out onto landscaped spaces.

Contemporaneous with TAC's publishing their prototype cluster-plan campus design, the finger plan began to lose popularity. In addition to the large tracts of land required to accommodate a finger-plan campus, the spread-out buildings meant long cross-campus walk times and restricted communication. Classrooms oriented to maximize access to natural light proved to be costly. The variability of natural light throughout the day resulted in periods of excessive heat and glare followed by the need to augment daylight with electrical lighting. A desire for greater flexibility, domesticity and economy influenced a shift in campus design away from the finger plan to the more compact cluster plan. (Sapphos Environmental 2014: 97, Ogata 2008: 572).

The cluster plan retained the low massing, generally single-story layout of the finger-plan, and architects still designed classrooms with indoor-outdoor access and views. But rather than extending wings along an axis, the site plan transitioned to grouping individual modular buildings and structures around a central landscaped courtyard. The views from the classrooms were now oriented toward the courtyard and other classrooms, resulting in a more communal setting and informal environment (Sapphos Environmental 2014: 99).

Although school designers continued to construct finger-plan campuses, the cluster-plan approach began to be widely adopted in the 1960s. The later finger-plan campuses were usually condensed or used for elementary schools and smaller upper-level schools, particularly in California where there was still ample space (Sapphos 2014: 98). By 1965, according to *California School Buildings, 1960-1965,* "The 'Cluster Plan' has replaced the 'Finger Plan' concept for elementary schools. Arrangement of classrooms

around a core area encourages cooperation between teachers by giving them opportunities to share multi-use areas, resource centers and teacher prep areas all adjacent to their classrooms. Better acoustical control and better lighting is evident, and technology is employing these comfort factors to be coordinated with flexible interiors" (Gibson 1966: viii).

The Marian A. Peterson High School (now middle school), while primarily a cluster-plan campus, includes some residual design elements of the finger-plan campus, as can be seen in the original plot plan drawn in 1964 by architect L.F. Richards. Phase 1 of the campus plan had the academic buildings, library, administration building, multi-purpose building, gymnasium and locker rooms clustered around a large central courtyard. The planned siting of three long, parallel future academic buildings on the west side of the campus partially connected by a covered breezeway reflects the spatial arrangement of a finger plan; the northwest-most "future academic" building was added to the campus by 1969.

Patrick Henry Intermediate School, designed in 1960 by architect Clyde D. Goudie, and expanded in 1962 with a design by the architectural firm Goudie & Griffin, is a cluster-plan campus with four L-shaped classroom buildings, the administration building, and the multi-purpose building spatially arranged around a large central courtyard. The classroom buildings are also arranged to create two secondary courtyards between two sets of the buildings. While the campus layout closely follows the cluster plan, the classrooms' fenestration is limited to bands of clerestory windows on the outward facing building façades; no classrooms have views looking onto the courtyards.

Open-Plan Design

A sub-design of the cluster plan is the open-space plan. While retaining the core campus arrangement and building orientation of the cluster plan, beginning in the mid- to late-1960s campus buildings were designed to have greater interior flexibility (California Department of Education 2000: 7). The objective was to have classrooms with adaptable interiors with moveable walls to accommodate changes in group size and/or activities. To accomplish this school architects designed buildings with large interior spaces separated by non-load-bearing walls, long and high roof spans, and steel structural systems. A relative lack of windows further accommodated this flexibility. This was made possible by modern air conditioning systems. Massing increased and exterior corridors moved inside since the buildings by necessity took up a greater area of the campus site. Some open-plan schools were designed in circular plan, with hexagonal or circular classrooms clustered around a common area (Sapphos Environmental 2014: 104-105). SCUSD's Cabrillo Middle School, built in 1961, appears to be an example of a circular-design open-plan campus that followed the principle of the cluster plan. Survey of this campus is beyond the scope of this study.

The open plan was not widely accepted and was short-lived. By the 1980s there was a return to the visual and sound separation provided by the self-contained classroom. However, the structural flexibility associated with the open-space plans continued to be used for common spaces, such as gyms,

auditoriums, and cafeterias, most of which used moveable walls and space-function adjacency design to improve flow between the functional spaces (California Department of Education 2000: 8).

Architectural Typology

Modern and Modernist architecture spanned the late 1920s through the 1970s and included several distinctive styles of architecture. Regional expressions of Modernism can be found throughout California and the United States. Key characteristics of Modern buildings is the lack of historical ornament and references, and an emphasis on a new architectural vocabulary. In the San Francisco Bay Area Streamline Modern, International Style, Second Bay Tradition, Mid-Century Modern, International Style, Brutalism, and Contractor Modern populate the cities and suburbs. New materials and building technologies stimulated the rapid post World War II promulgation of these architectural styles, with the mass-production of building products that were distinct from earlier products. These included materials that were often factory finished, such as plate glass, structural glass, spandrel glass, acoustical board, asphalt tile, vinyl asbestos tile, aluminum, concrete, ceramic, terrazzo, vinyl fabric, gypsum board and plaster, rubber topset, plywood, clear wire glass, and plastic laminate.

The historic-period post-war SCUSD campuses, built between 1951-1969, share the basic design principles and express simple application of Mid-Century Modern design elements regardless of campus plan. “Mid-Century Modern” is not an academically accepted architectural style term but was generated by the public. It describes a wide range of design elements incorporated into buildings during the 1940s through the 1960s. Mid-Century Modern was influenced by the more formal machine-age aesthetic of the International style. Mid-Century Modern expresses the architectural features of International style in a more relaxed, generally scaled down and regional style and sometimes adopts architectural elements from other Modernist styles. It is characterized by honest expression of structure and function with little applied ornament. The style can be found in postwar institutional buildings, commercial buildings, as well as residences.

Mid-Century Modern style is characterized by balanced, rhythmic composition with an emphasis on simple, geometric forms. Footprints are generally square or long rectangular; buildings are seldom more than two stories in height and are predominately horizontal in massing. This composition is achieved by modular post-and-beam construction that allows for large expansions of open floor plans. The rooflines are low-shed, low-gabled or flat, with wide eaves and cantilevered canopies supported on posts or spider-legs. Windows are generally flush-mounted with metal frames that may act as infill panels or extend to the gable. Ribbons of clerestory windows are also commonly found on Mid-Century Modern buildings.

Evaluation:

1. Under CRHR criterion 1, the Marian A. Peterson Middle School does not qualify as a historical resource that has made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States. Originally constructed in three phases between 1964 and 1969, it was one of many schools built during the post WWII era of rapid suburbanization and population growth in Santa Clara County, California, and throughout the United States. It is also one of hundreds of schools in Santa Clara County associated with the common trend of establishing and unifying school districts during the 1950s and 1960s. It is a commonplace example of these local and national trends and development patterns.

2. Under CRHR criterion 2, the Marian A. Peterson Middle School does not qualify as a historical resource associated with any individual whose activities are demonstrably important within local, California, or national history. For the school to be of significance under this criterion, it would have to be able to illustrate the person's important achievements in the field of education. At the time it was built Wendell Huxtable was the superintendent of the Santa Clara High School District and Louis Martini was the principal. While both men likely contributed to the continued growth and progress achieved by the Santa Clara High School District, what would become the Santa Clara Unified School District in 1965, research has not found that either man has made any specific contributions of demonstrable historic importance that would qualify the school as a historical resource under criterion B. Marian A. Peterson, for whom the school is named, was a former teacher and trustee of the Santa Clara High School District. The naming of the school was honorary; Mrs. Peterson does not appear to have any stronger association with the school.

   The school district purchased the land from the Castello family, the Cirrincione family, and the Teresi family. Research has not resulted in any important additional information about these Italian immigrants and first-generation California-born farming families. The Italian-born senior members of the families were likely part of the significant influx of Italians into the area during the late 19th and early 20th century, attracted by rich agricultural land and associated opportunities. They appear to have been typical farming families that subdivided and sold their property as Santa Clara County's post-war population grew rapidly and suburban communities developed. Furthermore, other than having once owned the subject land, none appear to have any association with the current school facilities.

3. Under CRHR criterion 3, the Marian A. Peterson Middle School does not qualify as a historical resource that embodies the distinctive characteristics of a type, period, region, or method of construction, or represent the work of a master, or possess high artistic value. Under this criterion, there are three contexts that must be considered: Architectural style of the overall

campus and the multipurpose building and gymnasium individually, functional school style as an example of a hybrid finger- and cluster-plan campus, and the potential for its architect, L.F. Richards to be considered a master architect. The campus's potential to be a district of a significant concentration of buildings and structures united aesthetically by plan or physical development is also considered.

Architectural Design:

Classrooms:
The architectural design of the campus classroom buildings is modest Mid-Century Modern style. The designer applied the expected rhythmic composition, low horizontal massing, simple geometric volumes and strong right angles, low-pitched gable roofs with wide cantilevered overhangs, courtyard entryways, visually expressed structural systems, simply treated materials, and lack of historical design elements. While the buildings are characteristically Mid-Century Modern, they are not distinctively characteristic of the style and are not pure representatives of the style.

Multipurpose Building:
The multipurpose building includes several features that are considered characteristic of Mid-Century Modern architecture, such as simple geometric volumes and strong right angles, a low-pitch gable roof with wide cantilevered overhangs and articulated primary façades. However, the composition, with its distinctively differently designed west and east wings, results in an unbalanced design in both proportion and material. While many significant examples of Mid-Century Modern are symmetrical, it is not essential for the style. The National Register of Historic Places- listed Research House by master architect Richard Neutra is not symmetrical, but a well-balanced composition of vertical and horizontal planes and columns. The multipurpose building also has some elements of New Formalism on the north and south façades of the central portion. New Formalism, which was a rejection of rigid Modernism, includes references to Classical building proportion and scale, columns, and stylized entablatures. The overall design of the building is inconsistent and not a significant example of a Mid-Century Modern or New Formalist building; it does not clearly express either architectural design type.

Gymnasium:
The gymnasium also includes several features that are characteristic of Mid-Century Modern architecture, such as simple geometric volumes and strong right angles, a low-pitch gable roof with wide cantilevered overhangs and articulated façades. The most architecturally distinctive elevation is the north entrance, with its deep, wide shelter across much of the façade. The placement of the entry shelter, beginning at the west end does not span the entire elevation

which results in an unbalanced composition. Overall, the building is only a simple expression of Mid-Century Modern. Its function as a gymnasium prevents the use of fenestration, an important characteristic of Mid-Century Modern architecture. The building is not a significant example of a Mid-Century Modern architecture; it does not represent an important expression of the style.

Campus Design:
Marian A. Peterson Middle School campus is a hybrid of the finger-plan campus and cluster-plan campus. Consequently, it is not a distinctive example of either type of campus design.

Master Architect:
L.F. "Fred" Richards designed the first three phases of Peterson Middle School in the 1960s. He received his Bachelor of Architecture in 1934 from the University of Southern California. Prior to WWII he was an in-house architect for Pasetta Construction, which brought him to the Bay Area. During WWII he worked for Kaiser Permanente, returning to Pasetta Construction near the end of the war. When Pasetta retired Richards opened his own business. He served as president of the Santa Clara Valley chapter of the American Institute of Architects (AIASCV) then California Council of the American Institute of Architects (CCAIA). He was elected to Fellowship (FAIA) in 1962. After closing his office, he worked part time for Dennis Burrow, AIA.

Richards designed schools for the Santa Clara, San Jose, San Martin, and Gilroy school districts, as well as the Santa Clara International Swim Center, which he considered his most significant project. While locally fairly prolific, he is not recognized as being a master in the field of school architecture or architecture in general. Additionally, for a work to be considered significant for being designed by a master, it would need to express a particular phase in the development of the master's career. The Marian A. Peterson Middle School campus is not eligible under criterion 3 because it is not a significant example of the work of a master architect.

District:
The Marian A. Peterson Middle School Campus is not a significant historic district. Historic districts usually also meet the significance criteria of criterion 1 for its important association with a trend, and/or criterion 3, having high artistic values. While the campus composition is that of a concentration of buildings, structures, and landscape features that reflect one functional activity, it is an aesthetically commonplace example of a Mid-Century Modern 1960s school, broadly associated with the commonplace trend of suburban school construction. Additionally, the campus lacks continuity due to the demolition and replacement of several important buildings and, therefore, cannot clearly express the plan and physical development of a 1960s school campus.

4. Under CRHR criterion 4, the Marian A. Peterson Middle School Campus is not significant as a source (or likely source) of important information regarding architectural history. This property type is common and does not have any likelihood of yielding important information about historic construction materials or technologies. This evaluation makes no determination regarding the potential for the discovery of significant archaeological resources.

95112

RE: Consultation for the Santa Clara Unified School District Proposed Master Plan Environmental Impact Report

Dear Ms. Mills,

The Santa Clara Unified School District (SCUSD), as lead agency under the California Environmental Quality Act (CEQA), is preparing an environmental impact report (EIR) for the proposed Peterson Laurelwood Master Plan and the existing Laurelwood Elementary School Campus Plan (Proposed Master Plan). Dogtrot Historical Consulting has contracted with Impact Sciences, on behalf of SCUSD, to assist in the identification of historical built resources that have the potential to be affected by activities considered in the plan. California Public Resources Code (PRC) 5020.1(j) defines a "historical resource" as including, but not limited to, any object, building, structure, site, area, place, record, or manuscript which is historically or architecturally significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military or cultural annals of California. Section 15064.5(a)(2-3) of the CEQA Guidelines require that state and local public agencies evaluate the potential for historical resources to be impacted by discretionary activities, using the criteria outlined in PRC section 5024.1.

The Proposed Master Plan includes the Patrick Henry School campus, Marian A. Peterson Middle School campus, and future use of the existing Laurelwood Elementary School. The plan's purpose is to create a long-term planning document that provides a visionary site plan to guide future expansion with enhanced student and community access to the sites. Currently funding is identified for only the new Laurelwood Elementary School and the Peterson track and field facility. As such, the historic property survey and evaluation is limited to determining the potential historical significance of the Patrick Henry and Peterson school buildings and campuses. Should these properties be determined to be historical

1070 Perkins Way
Sacramento, CA 95818
916-995-3868
meg@dogtrot-historical.com

resources eligible for the California Register of Historical Resources, and the activities proposed have the potential to adversely affect these resources, public and agency consultation will help to determine the most appropriate way to avoid or mitigate those impacts.

Patrick Henry Intermediate School campus, 1095 Dunford Way, Sunnyvale, was constructed in 1960 and 1962. Marian A. Peterson Middle School campus, 1380 Rosalia Avenue, Sunnyvale, was initially constructed between 1964 and 1969. Several buildings from Peterson's initial construction have been replaced. Research on the history of these two properties and the SCUSD is currently underway. If you or your organization have information on these two properties or would like to consult on the CRHR eligibility determination, please contact me, Meg Scantlebury, at meg@dogtrot-historical.com. I can also be reached at 916-995-3868.

I look forward to receiving your response.

Sincerely,

Meg Scantlebury
Architectural Historian

RE: Consultation for the Santa Clara Unified School District Proposed Master Plan Environmental Impact Report

Dear Mr. Curtin,

The Santa Clara Unified School District (SCUSD), as lead agency under the California Environmental Quality Act (CEQA), is preparing an environmental impact report (EIR) for the proposed Peterson Laurelwood Master Plan and the existing Laurelwood Elementary School Campus Plan (Proposed Master Plan). Dogtrot Historical Consulting has contracted with Impact Sciences, on behalf of SCUSD, to assist in the identification of historical built resources that have the potential to be affected by activities considered in the plan. California Public Resources Code (PRC) 5020.1(j) defines a "historical resource" as including, but not limited to, any object, building, structure, site, area, place, record, or manuscript which is historically or architecturally significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military or cultural annals of California. Section 15064.5(a)(2-3) of the CEQA Guidelines require that state and local public agencies evaluate the potential for historical resources to be impacted by discretionary activities, using the criteria outlined in PRC section 5024.1.

The Proposed Master Plan includes the Patrick Henry School campus, Marian A. Peterson Middle School campus, and future use of the existing Laurelwood Elementary School. The plan's purpose is to create a long-term planning document that provides a visionary site plan to guide future expansion with enhanced student and community access to the sites. Currently funding is identified for only the new Laurelwood Elementary School and the Peterson track and field facility. As such, the historic property

survey and evaluation is limited to determining the potential historical significance of the Patrick Henry and Peterson school buildings and campuses. Should these properties be determined to be historical resources eligible for the California Register of Historical Resources, and the activities proposed have the potential to adversely affect these resources, public and agency consultation will help to determine the most appropriate way to avoid or mitigate those impacts.

Patrick Henry Intermediate School campus, 1095 Dunford Way, Sunnyvale, was constructed in 1960 and 1962. Marian A. Peterson Middle School campus, 1380 Rosalia Avenue, Sunnyvale, was initially constructed between 1964 and 1969. Several buildings from Peterson's initial construction have been replaced. Research on the history of these two properties and the SCUSD is currently underway. If you or your organization have information on these two properties or would like to consult on the CRHR eligibility determination, please contact me, Meg Scantlebury, at meg@dogtrot-historical.com. I can also be reached at 916-995-3868.

I look forward to receiving your response.

Sincerely,

Meg Scantlebury
Architectural Historian

RE: Response to AB 52 Tribal Consultation for the Santa Clara Unified School Proposed Master Plan EIR, Santa Clara, California

HorSe Tuuxi Mr. Sarmento and Ms. Ruiz,

Thank you for contacting our tribal administration with regards to the proposed Peterson Laurelwood Master Plan and the existing Laurelwood Elementary School Campus Project (Proposed Master Plan) located in the Cities of Sunnyvale and Santa Clara, Santa Clara County, California.

We have reviewed our site sensitivity maps and as far as we can tell there are no specifically known or recorded ancestral heritage sites within the subject parcel(s) that are situated in proximity to Calabazas Creek, which in all likelihood in the past periodically flooded and created important inland marsh resources. Furthermore, given the fact of previous construction within these two parcels, does not mean there are no extant subsurface occupational and/or mortuary-related ancestral remains within these two areas. We do know, however, that there are major and significant ancestral cemetery sites that have been recorded within the nearby region, such as the ***Kalawwasa Rummeytak*** **(Calabazas [Squash] Creek Site, CA-SCL-134)** located adjacent to, and to the north of Calabazas Creek, approximately 2 miles to the northeast of the larger subject parcel; and **CA-SCL-612**, located approximately 2 miles due east of the smaller subject parcel at the intersection of Homestead Road and Scott Blvd, east of Saratoga Creek. Also, we know that Dr. Bert Gerow in the early 1970s recovered burials on Kiefer Road, at an unrecorded site located approximately 1.6 miles north of the larger property. Given these factors, can you please share with us the results of your archival literature search conducted at the Northwest Information Center, Sonoma State University, in order for us to update our site sensitivity maps?

As you may already know that this project area falls within the aboriginal territory of ***Thámien*** Ohlone-speaking tribal groups of the greater Santa Clara Valley whose villages were missionized into Missions Santa Clara and San Jose, and therefore, have historic and biological ties to the Muwekma Tribe's history and genealogical heritage. The enrolled Muwekma members are **directly descended** from this region (specifically to the ***Thámien*** Ohlone-speaking ***Alson*** [**Santa Agueda**] **Ohlone Tribe**), and our genealogy was independently verified by the Bureau of Indian Affairs' Office of Federal Acknowledgement in 2002 as part of our petitioning efforts to regain the Tribe's previous federally acknowledge status. Furthermore, as the only documented previously Federally Recognized Ohlone tribe of the S.F. Bay Area, we, along with our over 600+ BIA documented tribal members claim this region as part of our ancestral and historic homeland.

Based upon our review of what you have sent to our Tribe, as mentioned above, there is a possibility of potential impacts to unreported and previously disturbed and undisturbed subsurface ancestral heritage features within the project parcels. As in the case of many areas within the greater Santa Clara County region, when 19th and 20th century construction projects occurred, almost never were our ancestral remains reported upon by the newspapers or formally recorded by municipalities, agencies and their representatives, and at times, by archaeologists, therefore, our knowledge-base has been obfuscated by these very same agencies, archaeologists and entities of dominant society.

Muwekma Tribe's Formal Determination of Previous Unambiguous Federal Recognition

The enrolled Muwekma members are **directly descended** from the aboriginal tribal groups whom were missionized into Missions Santa Clara, Dolores (SF), and San Jose, and our tribal member's genealogy and descendancy was independently verified by the Bureau of Indian Affairs' Office of Federal Acknowledgement in 2002 as part of our petitioning efforts to regain our Tribe's previous federally acknowledged status. Furthermore, as the only documented previously Federally Recognized Ohlone/Costanoan tribe, we, along with our over 600+ BIA documented tribal members, we claim the greater Santa Clara Valley region as part of our ancestral and historic homeland. Although, through various marginalizing mechanisms enacted by the dominant society, our ancestors found safe havens on our rancherias established in the East Bay, where it was one of the few areas, our people were able to live unmolested especially after the newly arrived intolerant American colonists.

In 1989 our Tribe sent a letter to the Branch of Acknowledgement and Research in order to have our Acknowledged status restored. After eight years in the petitioning process, and after submitting several hundred pages of historic and legal documentation, on May 24, 1996 the Bureau of Indian Affairs' Branch of Acknowledgment and Research (BAR) made a positive determination that:

> Based upon the documentation provided, and the BIA's background study on Federal acknowledgment in California between 1887 and 1933, **we have concluded on a preliminary basis that the Pleasanton or Verona Band of Alameda County was previous acknowledged between 1914 and 1927**. The band was among the groups, identified as bands, under the jurisdiction of the Indian agency at Sacramento, California. The agency dealt with the Verona Band as a group and identified it as a distinct social and political entity.

On December 8, 1999, the Muwekma Tribal Council and its legal consultants filed a lawsuit against the Interior Department/BIA – naming Secretary Bruce Babbitt and previous AS-IA Kevin Gover over the fact the Muwekma as a previously Federally recognized tribe it should not have to wait 24 or more years to complete our reaffirmation process.

In 2000 – D.C. District Court Justice Ricardo Urbina wrote in his **Introduction of his Memorandum Opinion Granting the Plaintiff's Motion to Amend the Court's Order** (July 28, 2000) and **Memorandum Order Denying the Defendants' to Alter or Amend the Court's Orders** (June 11, 2002) that:

> The Muwekma Tribe is a tribe of Ohlone Indians indigenous to the present-day San Francisco Bay area. In the early part of the Twentieth Century, the Department of the Interior ("DOI") recognized the Muwekma tribe as an Indian tribe under the jurisdiction of the United States." (Civil Case No. 99-3261 RMU D.D.C.)

Based upon the above, supported by the attached ethnohistoric and **legal** background information about our tribe's historic status that we are submitting, we make the following cultural resources management recommendations in dealing with any potential adverse effects on any and all ancestral heritage sites, features, and/or artifacts located within our aboriginal territory, and in this specific case:

1. Due to the proposed future construction as stated in the proposed Peterson Laurelwood Master Plan and the existing Laurelwood Elementary School Campus Project within these identified parcels, and given their proximity to the Calabazas Creek and flood plain, as well as to previously recorded sites in the area, we are recommending that all subsurface excavations be monitored by a Muwekma Ohlone tribal monitor in conjunction with the contracted environmental/CRM (Albion) firm's field personnel and/or other consulting archaeologists.
2. Should any significant subsurface pre-contact ancestral Muwekma Ohlone features and/or burials be encountered, then all work shall be halted within 50 feet of the find until the feature be fully evaluated and determined to be significant under extant laws and statutes.
3. Should any ancestral human remains be discovered during the course of construction, then the Muwekma Ohlone Tribe should be contracted and involved along with the contracted environmental/CRM (Albion) firm's archaeologists in the exposure, removal, documentation, analysis, final report writing, and reburial of our ancestral remains.

In conclusion, the Muwekma Ohlone Tribal leadership expects a comprehensive monitoring program be implemented that will offset any adverse impacts to any of the Tribe's ancestral heritage cemeteries and village sites.

Furthermore, should evidence of our ancestral heritage indeed be identified during the testing and/or monitoring phases within those identified project locations, then our Tribal leadership desires to also submit an updated tribal ethnohistory to the final archaeological report that addresses the Muwekma Ohlone history and heritage, and our ties to the greater *Thámien* Ohlone-speaking tribal regions (now referred to as San Francisco Bay Costanoan Language region; Milliken et al 2009), as well as to the neighboring tribal groups that were brought under the sphere of influence of Missions, Santa Clara, San Jose, San Francisco, Pueblo de San Jose; and addressing the ensuing adverse impacts that occurred to our ancestral people through the colonial eras of Spanish and American conquests and destruction, as well as, about the Tribe's continued existence today.

I am attaching a copy of one of the Tribe's ethnohistorical reports on the recovery of our ancestors from ***3rd Mission Santa Clara de Thámien*** (CA-SCL-30/H) along with other legal and historic documentation.

Should you have any questions, please feel free to contact me at marellano@muwekma.org, or Chairwoman Charlene Nijmeh at cnijmeh@muwekma.org (408-464-2892), or Alan Leventhal at aleventh@muwekma.org (408-761-4526).

On behalf of the Muwekma Ohlone Tribe of the San Francisco Bay Area,

Charlene Nijmeh, Chairwoman, Muwekma Ohlone Tribe,

Acknowledgements

The Muwekma Tribal Council wants to thank Prometheus who funded the Burial and Archaeological Data Recovery Program for the recovery of the Muwekma Ohlone Tribe's ancestral remains from the **3rd Mission Santa Clara Indian Neophyte Rancheria** area adjacent to the ***Clareño Muwékma Ya Túnnešte Nómmo*** **[Where the Clareño Indians are Buried] Site CA-SCL-30/H** on this construction project.

We want to thank the archaeological field personnel from PaleoWest for working closely with Muwekma tribal members assigned to monitor this project and for supporting the publication of our ethnohistory as a companion volume to the final archaeological report.

We want to offer acknowledgement and thanks to the Elders of the Muwekma Ohlone Tribe, members of the Tribe's Language Committee **Monica V. Arellano, Sheila Guzman Schmidt** and **Gloria E. Arellano Gomez** who originally named this site in the Tribe's language, and also enrolled tribal members for their support on this as well as other projects addressing their ancestral heritage sites.

We also want to acknowledge the tribal co-authors Vice Chairwoman and MLD **Monica V. Arellano,** Tribal Councilwoman **Sheila Guzman Schmidt,** Tribal Councilwoman **Gloria E. Arellano Gomez,** Chairwoman **Charlene Nijmeh,** and Tribal Ethnohistorian **Alan Leventhal** who contributed to the ethnohistory chapter.

It is our hope that this report provides historical, cultural, and educational information about our Tribe's history and heritage and dispels many of the myths about our people. It is in the spirit of the preservation and dissemination of the Tribe's long history, struggle, and heritage that this report has been written. Aho!

Reburial Honoring Ceremony

A **Reburial Honoring Ceremony** will be conducted on-site of our ancestral infant remains within this heritage cemetery site. Plans for a Reburial Honoring Ceremony will be held by the Muwekma Ohlone tribal leadership by the time this volume has been published.

Dedication of this Report

Dedication of this Report

This report is dedicated to and in honor of the passing of
1) Muwekma Tribal Elder Albert Galvan, and;
2) The unknown Infant who was buried at *Clareño Muwékma Ya Túnnešte Nómmo* Site (CA-SCL-30/H);
3) The approximately 8,000 Ancestral Ohlone, Yokuts, Plains Miwok and other tribal relations who are buried at the two Indian Neophyte cemeteries associated with the 3rd and 4th Santa Clara de Thámien Missions, and throughout California.

In almost all of the previous published Muwekma Tribal archaeological reports, we honor one of the Elders or tribal members who have passed away. A decision was made to honor Tribal Elder and former Tribal Councilman **Albert Benjamin Galvan** who had passed away on November 20, 2020 at the age of 60 (**Figure TOC-1)**.

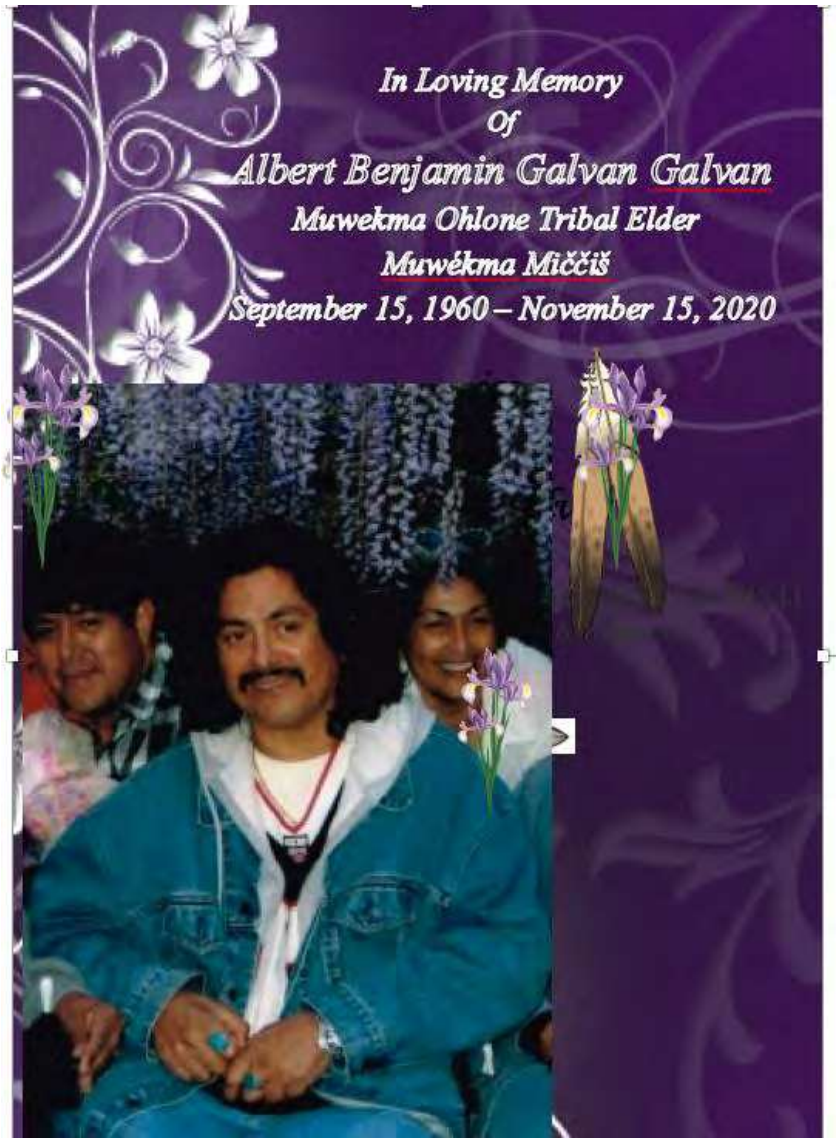

Figure TOC 1: Albert Benjamin Galvan

On November 15, 2020**,** Albert Benjamin Galvan**,** Muwekma Ohlone Tribal Elder - *Muwékma Miččiš*, and former Tribal Councilman passed away peacefully in Hayward, California surrounded by his family. Albert was 60 years old.

Born September, 15 1960 in Oakland, California to Muwekma Ohlone parents Jenny Mora and Ben Michael Galvan. He is survived by his sons Chad, Adam and Alex, grandchildren Gabriel, Phoenix, Silas and Raiden, by his many loving family members and friends, Muwekma Tribal relations, and will be greatly missed. Albert grew up in the San Leandro area within his families' ancestral homeland of the Jalquin/Yrgin Ohlone Tribe.

From 1968-1976, Albert worked with his father Ben and Uncle Phil on the maintenance and care of the **Ohlone Indian Cemetery**. He attended Pacific and Lincoln High Schools from 1974 -1977. Albert also worked on the recovery of pre-contact and historic artifacts during the restoration of Mission San Jose. During the 1980s Albert worked at Star Catering, at the Oakland Airport Flexigraphics, in Union City, and the San Leandro Glass Company.

During the 1990s he worked on several ancestral heritage sites through the Muwekma Ohlone Tribe's Cultural Resource Management business, and participated in several celebratory Tribal events such as the 1992 Cinco de Mayo Parade in San Francisco with the Muwekma Ohlone float which won first prize, 4th of July American's Festival, Guadalupe Park in San Jose, and others.

His mother Jenny Mora was a middle daughter of Muwekma Elder Mary Muñoz and Jose Mora. His aunts and uncles include Joseph Mora, Lupe Mora Massiatt, Margaret Mora, Alice Mora, Frances Mora Smith, Virginia Mora Massiet, Louis E. Medina, Edward Medina and Jesse Ramos. Albert's father was Muwekma Elder Michael F. Galvan (Ben) who in the early 1950s lived in the Oakland area and later in their ancestral homeland of San Leandro. Albert's four siblings are Theresa A. Laudani, Katherine J. Galvan, Ramona Robins, and Michael F. Galvan Jr.

During the early 1960s, Albert's parents and the other Muwekma Ohlone families gathered and worked under the principal efforts of his grandmother Dolores Marine Alvarez Piscopo Galvan and his aunt, Dottie Galvan Lameira, in order to protect the Ohlone Indian Cemetery in Fremont from destruction. His mother's mom, Mary Muñoz Mora, and her extended family attended various meetings and barbecues that were held near Mission San Jose. They all worked cleaning up and weeding the Ohlone Indian cemetery. Albert's mother was also listed as a Member of the "Ohlone Chapter, American Indian Historical Society."

By 1984, the Muwekma Ohlone Tribal leadership formed a formal Tribal government in order to articulate with Federal, State and local agencies about legal and cultural issues confronting the disenfranchised Muwekma Ohlone Tribal community. A few years later, Albert Galvan joined the Muwekma Tribal Council. As the Tribal Council developed policies and political strategies to deal with legal issues, Albert's family had been introduced to the effort by the Tribe to obtain Federal Recognition from the U.S. Government. Albert's cousins JoAnn Brose and Richard Massiatt are presently serving as Tribal Council members, while his aunt Lupe Mora Massiatt was a member of the Muwekma Ohlone Elders Council.

By the time the Tribe sent in its letter to petition the Federal Government for Acknowledgement in 1989, Albert's family got involved with both archaeological issues and the Tribe's efforts to regain its former Federal Recognition. Albert and his family participated as a Tribal members at Tribal Council meetings; Tribal sponsored events and educational workshops. During the Tribe's response to the Bureau of Indian Affair's (BIA) negative proposed finding, Albert's grandmother along with several of his aunts provided critical oral histories that helped reverse some of the negative findings and disprove some of the negative assumptions that the BIA had previously determined about the continuous existence of the Muwekma Ohlone Tribe

Albert Benjamin Galvan, following in the footsteps of his mother Jenny Mora Galvan, of his grandmother Mary Muñoz Mora Archuleta, continued to serve as a cultural bridge between two worlds – the post-transitional world of the neglected Federally Recognized Verona Band of Alameda County – to the incipient Ohlone Indian Tribe, Inc. to which his father Benjamin Michael Galvan became the president/chairman from 1965 to 1971 – and the revitalized and organized Muwekma Ohlone Tribe to which he was indeed a Tribal Elder of distinction. Soft spoken, loving and caring father, he fully knew and understood his Ohlone Indian identity from both sides of his family.

During the 1990s Albert gave various educational and cultural-related presentations at Coyote Hills East Bay Region Park, at the Blackhawk Museum in Danville, San Jose State University, at several public schools, and other educational institutions. Even though Albert struggled with his MS condition, this did not stop him from working on several of his Tribe's ancestral heritage sites, such as *Kaphan Húunikma* (The Three Wolves Site) CA-SCL-732 and CA-SCL-548 in San Jose. He also served as a Most Likely Descendant for the Tribe, and co-authored several articles on the Tribe's history including: The Muwekma Ohlone Indians of the San Francisco Bay, and The Cultural Revitalization and Federal Acknowledgment of Three Costanoan Tribes: A View from the Families of Harrington's Linguistic and Cultural Consultants.

Figure TOC 2: Albert, his Mother Jenny Galvan (right) and Aunt Dottie Lameira (left) at CA-SCL-732 *Kaphan Húunikma* (The Three Wolves Site)

Albert and his family lived to see a potentially bright future for all of the Muwekma Ohlone families. He also saw history being made when the title of the Ohlone Indian Cemetery in Fremont passed from the Catholic Church to the American Indian Historical Society, and then to his father's family whom made up the Board of Directors of Ohlone Indian Tribe, Inc.

Albert lived to see the Muwekma obtain a formal determination by the BIA of previous unambiguous Federal Recognition, a successful lawsuit against the Department of the Interior, and a positive determination that 100% of the enrolled membership are directly descended from members of the previously recognized **Verona Band of Alameda County**, which was also determined to be a historic tribe. Albert also lived to see U.S. District Judge, Ricardo Urbina formal opinion that:

> The Muwekma Tribe is a tribe of Ohlone Indians indigenous to the present-day San Francisco Bay area. In the early part of the Twentieth Century, the Department of the Interior ("DOI") recognized the Muwekma tribe as an Indian tribe under the jurisdiction of the United States.

Albert represented the seventh generation of a line of Ohlone Indians whose lives were disrupted by the expanding Hispanic Empire and the American Conquest of California. All of Albert's maternal and paternal Ohlone ancestors came into the Mission San Jose. Albert's lineage is descended from his great-great-great-great grandmother Efrena Quennatole who was born in 1797 and was of the Carquin Ohlone/Napian Coast Miwok Tribe of the North S. F. Bay and his great-great-great-great grandfather, Liberato Culpecse who was born in 1787, and baptized at Mission Dolores, and who was of the Jalquin/Saclan Tribes of the East Bay. Albert was further descended from Liberato's parents Faustino Poylemja who was born around 1764 from the Saclan Tribe (Walnut Creek/Concord/Lafayette area) and Obdulia Jobocme who was born around 1766 from the Jalquin Tribe from the greater San Lorenzo/San Leandro/Hayward region.

Efrena and Liberato's daughter was Maria Efrena Yakilamne. She was born in 1832 and was baptized at Mission San Jose, and buried at the Ohlone Cemetery. Maria Efrena had married Panfilo Yakilamne (Ilamne Tribe), and their daughter was Avelina Cornates. Avelina was born in 1863 and was baptized in 1864 at Mission San Jose, and she died in 1904 and buried at the Ohlone Indian Cemetery. Avelina had married Rafael Marine, and one of their daughters was Dolores Marine who was born in 1890, and another daughter, Victoria Marine who was born on May 9, 1897 on the Pleasanton Rancheria, and both were baptized at Mission San Jose. Victoria died and was buried at the Ohlone Cemetery in 1922 at the young age of 25. Victoria had married John Muñoz and they had two surviving children, Albert's grandmother, Mary who was born in 1910 and his great-aunt, Flora who was born in 1917.

Albert's Ohlone Tribal ancestors and families have been waiting since 1906 for their **rights** to be recognized and honored by the United States Government. Albert had been waiting his entire 60-year life span for full Federal rights to be accorded to his Tribe. In his own quiet way, Albert had made major contributions towards the reaffirmation of the Muwekma Ohlone Tribe, and he leaves that legacy for the future generations of the Tribe.

Albert passed away within his Tribe's ethnohistoric Jalquin Ohlone ancestral territory. Go with peace and join your Muwekma relations and ancestors and know that you made this world a better place for your Tribe.

'Úṯaspu Méene Albert - Mak 'Aččo, Mak Suyya, Mak Miččiš. Hemmen Heyešmin Meene Hišmet. Good Bye Albert - **Our Friend, Our Relation, Our Elder. May the Great Creator Bless You.**

Sunuuniy makiš 'em-suyya tušwiikne, makiš kaayi mak-hinnan makkam rokét 'ayye 'em-suyyakma.
Makkam kam mak sai-tak.

We are sorry your family member has passed, our hearts are very sad for you and your family.
You all are in our prayers. *A*ho!

Volume III:
An Ethnohistory of Santa Clara Valley and Adjacent Regions; Historic Ties of the Muwekma Ohlone Tribe of the San Francisco Bay Area and Tribal Stewardship Over the Human Remains Recovered on the Prometheus Project located at 575 Benton Street and affiliated with the 3rd Mission Santa Clara de Thámien Indian Neophyte Cemetery and Indian Rancheria: *Clareño Muwékma Ya Túnnešte Nómmo* [Where the Clareño Indians are Buried] Site CA-SCL-30/H.

by
Monica V. Arellano, Alan Leventhal, Charlene Nijmeh, Shelia Guzman Schmidt, and Gloria Arellano Gomez

Introduction

As presented elsewhere in this report the Muwekma Ohlone Tribe of the San Francisco Bay Area had oversight and monitored the burial recovery/mitigation program conducted on this portion of the land surrounding the **3rd Mission Santa Clara de Thámien,** its adjacent **Indian Neophyte Cemetery,** and **Indian Rancheria Site CA-SCL-30/H** which is located at 575 Benton Street, City of Santa Clara, Santa Clara County, California. The Muwekma Ohlone Tribe has over the past 41 years continuously exercised its stewardship over the Tribe's ancestral heritage sites and human remains discovered within our aboriginal territory. The Tribe's leadership and members were involved in the recovery program and contributed this chapter to the final report on this ancestral cemetery site which the Tribe, in 2011, had renamed the cemetery portion of site CA-SCL-30/H ***Clareño Muwékma Ya Túnnešte Nómmo*** **[Where the Clareño Indians are Buried]** in the Tribe's aboriginal Chochenyo/Thámien (San Francisco Bay) Ohlone language (Milliken et al. 2019; Leventhal et al. 2011).

The Muwekma Ohlone Tribal leadership has over the past 41 years continuously exercised its stewardship over and renaming the Tribe's ancestral heritage village and cemetery sites, as well as some of the ancestral human remains discovered within our aboriginal ethnohistoric territory. This practice follows Muwekma Tribal tradition by which the Tribal leadership has over these past decades renamed some of our ancestral village and cemetery sites as part of a process to reclaim the Tribe's ancestral homeland with our Heritage Sites. This renaming tradition has formally occurred at many other South, East and West Bay pre-contact ancestral Muwekma Ohlone cemetery sites.

The Renaming of the 3rd Mission Santa Clara de Thámien (CA-SCL-30/H) Locality by the Muwekma Ohlone Tribe in Our Native Chochenyo/Thámien (San Francisco Bay) Ohlone Language

Previously, back in 2011, as the designated **Most Likely Descendant Tribal Group**, a decision was made by the Muwekma Ohlone Tribal leadership and the Tribe's Language Committee (Monica V. Arellano, Sheila Guzman-Schmidt and Gloria E. Arellano-Gomez) to honor their deceased ancestors by renaming the site with a place name in the Tribe's aboriginal Ohlone Chochenyo/Thámien language.

This renaming tradition has formally occurred at a multitude of Bay Area pre-contact ancestral Muwekma Ohlone cemetery sites as part of a reclamation process of the Tribe's Ancestral Heritage sites which include:

1) CA-SCL-732 located to the south/southeast of CA-SCL-128 along Coyote Creek. CA-SCL-732 was renamed ***Kaphan Umux*** **(Three Wolves) Site** [and recently corrected to ***Kaphan Húunikma***] in 1995 (Cambra et al. 1996; Hammett 1996);
2) CA-SCL-38 located in Milpitas located to the north of the site consisting of a very large mortuary earth mound that was renamed the ***Yukisma*** **("at the Oaks") Site** in 1996 (Bellifemine 1997);
3) CA-SCL-867 which is located in the Willow Glen area of San Jose approximately 3.75 miles to the south/southeast of **CA-SCL-30/H,** was renamed the ***Ríipin Waréeptak*** **Site** which means **"(in the) Willows Area**" in 2006 (Leventhal, et. al 2007);
4) CA-SCL-869 located approximately 6 miles to the south of **CA-SCL-128** was renamed ***Katwáš Ketneyma Waréeptak*** **(The Four Matriarchs) Site** in 2009 (Leventhal et al. 2009);
5) In 2010 the **CA-SCL-287/CA-SMA-263** site complex was renamed ***Yuki Kutsuimi Šaatoš Inūxw*** **[Sand Hill Road] Sites** located approximately 23 miles to the northwest on Stanford University lands (Leventhal et. al 2010);
6) At **CA-SCL-894** (redesignated as **CA-SCL-948** by the Northwest Information Center on August 17, 2016) entailed the recovery of a single male burial from the California Fox Theatre located approximately 1000 feet east of **CA-SCL-128** on South Market Street in downtown San Jose was renamed ***Tupiun Táareštak*** meaning **Place of the Fox Man Site** (Leventhal et. al 2012a);
7) The Muwekma Language Committee renamed a site excavated by San Jose State University in 1964 as part of a finalized archaeological report on site **CA-SCL-895/Blauer Ranch**. The language committee decided to rename this site after the original Mexican land grant **Yerba Buena y Socayre** which translates into the Muwekma language as ***Kiriṭ-smin 'ayye Sokőte Tápporikmatka*** **[Place of Yerba Buena and Laurel Trees Site]** (McDaniel et al. 2012);
8) CA-SCR-12 on the Santa Cruz coast was excavated by San Jose State University in 1986 and was renamed by the Tribe to ***Satos Rini Rumaytak*** meaning **At the Hill Above the River Site** (Starek 2014);
9) The Tribe's language committee renamed site **CA-SCL-125** which includes the **Santa Teresa Spring** at the Bernal-Gulnac-Joice Ranch County Park to ***'Arma 'Ayttakiš Rúmmey-tak*** meaning **(Place of the Spirit Woman Spring Site)** (Mabie 2015);
10) The Tribe had renamed **CA-SCL-128 (the Holiday Inn Site)** located in downtown San Jose in the ***Chochenyo/Thámien*** language to ***Thámien Rúmmeytak*** meaning **Place of the *Thámien* [(Guadalupe) River Site (CA-SCL-128/Hyatt Place Hotel)]** and is currently in the process of finalizing an extension of that ancestral cemetery (Leventhal et al 2015, Report in progress 2021);
11) Beginning in 2014, the monitoring of the construction on the expansion of the **Ronald McDonald House** on Stanford University campus, uncovered, three discrete **Early Bay Period** ancestral Muwekma burials, along with several isolated human remains, as well as non-burial features at site **CA-SCL-609**. The Tribe decided to honor the important service offered by the Ronald McDonald House to families by renaming the site ***Horše 'Iššéete Ruwwatka*** meaning **Place of the Good Health House Site** (Leventhal et al. 2016);
12) In September 2016, while working on a new Rapid Bus Transit platform along with water lines to a fire hydrant located on the eastside of San Jose, **Santa Clara Valley Transportation Authority** construction crews encountered an ancestral Muwekma burial at a site designated as **CA-SCL-950**. During the course of skeletal analysis, the Tribe's language committee named the site ***Cashrishmini 'Awweš 'Írek 'Innutka*** meaning **Yellow Salt (Alum) Rock Road Site** in the Tribe's language (Leventhal et al. 2017a);

13) **CA-SCL-851 (MST Site)** our Tribe was involved in the recovery project that involved ten ancestral Muwekma Ohlone burials which was conducted on behalf of Public Storage on Tully Road in San Jose in 2000. Public Storage failed to allow the Tribe to continue to monitor the rest of the construction project, as well as, did not provide funding for any analysis, final report, or reburial of those remains. The Muwekma leadership decided to rename this site ***'Utthin Širkeewis Tcitca 'Irekmatka*** meaning **Two Black Obsidian Rocks Site** (Leventhal et al. 2020);
14) In December 2017 several areas in a housing development located south of the Eastridge Mall in east San Jose yielded evidence of over 20 ancestral Muwekma Ohlone ancestral burials. As a result, during the course of the recovery of the ancestral remains, the Muwekma language committee named this site: ***Yakmuy 'Ooyákma-tka*** meaning **Place of the East Ridge Site (CA-SCL-215)** (Analysis and report in progress);
15) In the East Bay near the Tribe's historic Sunol and Alisal Rancherias our Tribe had renamed an ancestral cemetery site ***'Ayttakiš 'Éeṯe Hiramwiš Trépam-tak*** **[Place of Woman Sleeping Under the Pipe Site], CA-ALA-677/H** (Leventhal et al. 2017b);
16) Our Tribal Language Committee had named a major **Late Period** ancestral Muwekma Ohlone cemetery on an on-going project located at the **Sunol Water Temple** (**CA-ALA-565)** to ***Sii Túupentak*** meaning **Place of the Water Round House Site** (Byrd et al 2020)**;**
17) CA-ALA-704 located between the Town of Sunol and the Sunol Water Temple (site CA-ALA-565/H), was concurrently named ***Rummey Ta Kuccuwiš Tiprectak*** meaning **Place of the Stream of the Lagoon Site** by the Muwekma Ohlone Tribal leadership and Language Committee in our ***Chochenyo/Thámien*** language [see brief discussion about the background of the origins of the place name ***Thámien***, and the use of the Muwekma Ohlone ***Chochenyo/Thámien*** language in translating names for these sites as part of the Tribe's language revitalization and ancestral heritage site reclamation below]. The ***Rummey Ta Kuccuwiš Tiprectak*** locality is an ancestral Muwekma Ohlone heritage site that was occupied from 2437 to 177 calibrated years before present based on 60 radiocarbon dates. It is also the location of the mid-nineteenth-century Mexican Period Suñol Adobe (Byrd et al. 2020);
18) The Muwekma Tribal leadership recently working with East Bay Regional Park District (EBRPD) on the Garms Staging Area Project, Pleasanton Ridge, in the City of Pleasanton located north of the Tribe's historic Alisal Rancheria, has named site **CA-ALA-706**, ***Garms Ṯarin Warep-tak*** meaning the **Garms Grassland Site** (project and report in progress Shoup et al. Archaeological/ Historical Consultants);
19) Since 1982, the Muwekma Tribal leadership and Language Committee has worked with the East Bay Regional Park District administration and staff in naming parks, trails and places. In January of 2015, the Muwekma Language Committee proposed translating **Coyote Hills** into the Chochenyo language and presented the staff with ***Máyyan Šáatošikma.*** Later that year, EBRPD staff reached out to the Tribe and requested a translation for potential translated signage for 12 trails in various parks. In 2018, EBRPD staff requested a translation for a sign at Coyote Hill EBRPD. The Muwekma Language Committee recommended ***'Akkoyṯ Mak Muwékma Hiswi Warep Máyyan Šáatošikma*** meaning **Welcome to Muwekma's Ancestral Homeland Coyote Hills.** However, the EBRPD staff suggested otherwise, and limited the signage to read ***'Akkoyṯ Máyyan Šáatošikma*** meaning W**elcome to Coyote Hills;**
20) During the late 1950s through the 1960s, Stanford University and San Jose State University ran a series of summer excavations at **CA-ALA-329**, the Ryan Mound located at Coyote Hills, East Bay Region Park District. Over 550 burials were recovered along with several having the distinctive N Series "Banjo/Big Head" Kuksu pendants. As a result of the presence of so many of

the abalone pendants, the Muwekma Language Committee renamed this ancestral heritage mortuary mound ***Mánni Muwékma Kúksú Hóowok Yatiš Túnnešte-tka*** which translates as **Place Where the People of the Kúksú (Bighead) Pendants are Buried Site** (Leventhal 1993).
21) Working with Stanford University's administration on the Senior Class housing project, due to the Early Bay temporal period of the AMS dated burials, the Muwekma Tribal leadership renamed **CA-SCL-623,** ***Mánni Miččiyma Muwékma Yatiš Túnnešte-tka*** which means **Place Where the Ancient People are Buried Site** (Morley and Cambra 2000; Leventhal et al. in progress).
22) More recently, the Tribal leadership recovered an adult male ancestor at a site located in southwest San Jose along the upper reaches of the Guadalupe River. The individual was discovered laying on a bed of blue mussel shells, and a result, the Tribe's Language committee, named the site ***Táareš Tunnešte 'Ullaaštak Chitcomini Šaro-tka*** meaning **Place of the Man Buried on a Bed of Blue Mussel Shells Site CA-SCL-967** (Leventhal et al. 2020)**;**

As mentioned above, because of the discovery in 2011 of at least thirteen individuals whom were buried on top of each other and who had died very close in time to each other (1781-1818), the Muwekma Tribal Language Committee decided upon the name ***Clareño Muwékma Ya Túnnešte Nómmo*** **[Where the Clareño Indians are Buried] Site**. Therefore, CA-SCL-30/H will at times be referred interchangeably as ***Clareño Muwékma Ya Túnnešte Nómmo*** **Site** in following chapter**.**

In this ethnographic section, we provide an ethnohistoric overview of the **Santa Clara Valley** and surrounding geographic regions. This section also explores the complex historic interrelationships between the aboriginal Ohlone tribal groups from the greater San Francisco Bay region at the time of contact and the ensuing impacts resulting from the advent of the expanding late 18th century Hispanic Empire; the establishment of the Catholic Church and the effects of Missionization; the mid-19th century American conquest of California; the Gold Rush and theft of California Indian lands; the effects of the emergent State of California; and the Federal Recognition of California Indian Tribes, and specifically the **Verona Band of Alameda County** [the Bureau of Indian Affairs' (BIA) formal designation of the Muwekma Tribe from 1906-1927; see details below]. These topics are introduced and explored though discussions involving contact-period regional and ethnohistorical tribal ties to the present-day Muwekma Ohlone Tribe and by presenting aspects of the survival strategies and continual cultural and political identity of this historic tribe.

Ethnographic, Ethnohistoric and Ethnogeographic Setting

The ***Clareño Muwékma Ya Túnnešte Nómmo*** **[Where the Clareño Indians are Buried] Site** represents a post-contact ancestral Muwekma Ohlone heritage cemetery associated with the Third or Murguiá Mission Santa Clara (1781-1818). Formally designated with the State's trinomial system as CA-SCL-30/H, the site is located within the contact-period ethnogeographic territory of the **Our Mother Santa Clara Tribal Group/District** which was part of the larger defined **Thámien Ohlone-speaking** linguistic territory of the greater Santa Clara Valley. The ***Clareño Muwékma Ya Túnnešte Nómmo*** **Site** is also located within the larger catchment of the adjacent contact-period **Thámien** Ohlone-speaking village districts that includes **Our Patron San Francisco, San Juan Bautista** and **San Carlos/Matalan** Tribal Groups/Districts which were so named by the Mission Santa Clara priests (see C. King 1994, Milliken 1991, 1995, 2004; Hylkema1995, 2007 [CA-SCL-690 Tamien Station].

Milliken in his major study on the reconstructed ethnogeography of the San Francisco Bay region writes that "Fathers Murguiá and Peña of Mission Santa Clara noted in the title page of their Libro de Bautismos (Book of Baptisms), and again in a letter dated 1777, that the mission was built in an area known as **Tamien**" (Milliken 1995:256). Elsewhere, Milliken states that "Our Patron San Francisco, probably placed on the Guadalupe River near Our Mother Santa Clara and Santa Ysabel, east of present-day downtown Santa Clara" was part of the core villages that comprised the Tamien tribal district (Milliken in Hylkema 2007:52). He also suggested that "the villages of San Jose Cupertino, Our Mother Santa Clara, and Our Patron San Francisco formed a single tribelet that controlled most of the Guadalupe River system, and therefore, the core of the Santa Clara Valley" (ibid:54).

Although Winter, Milliken (and others) have spelled Tamien without the letter "h," historian Arthur Spearman, however, in his 1963 publication titled The Five Franciscan Churches of Mission Santa Clara, provided the following historic excerpt from a letter from Father Peña to Father Serra:

> Letter to Padre Presidente Junipero Serra
> From Padre Tomas de la Peña
> **Mission Santa Clara de Thámien**
>
> December 31, 1777
>
> The site of the Mission, which in the language of the natives is called ***Thámien***, is a plain stretching more than three leagues in every direction, pleasant to behold, with much land for irrigation of crops, and extensive areas for raising cattle. There is abundance of Ash, Alders. White Poplar, and Red, Willow, Laurel, black and live Oaks. At the distance of four leagues to the west is much redwood, so-called, from which we have already obtained some boards. A large population of Gentiles surrounds the site, such that we judge there are more than forty rancherias within a radius of five leagues, of a people that we may call Tares, since this is the name they give to the men (Spearman 1963:15). [Cited from Hylkema 2007: iii].

Furthermore, Milliken (1991) noted the following observation by the Spanish priests whom had established the **First Mission Santa Clara** in 1777 located 1 mile to the north of the **Prometheus Project** and the **3rd Mission Santa Clara**, its neophyte cemetery and rancheria (**Map 1**):

> "Mission Santa Clara in Thámien Lands
>
> … The Santa Clara Mission settlement lay at the northeastern edge of the **Thámien** tribal district, very near to lands of three other tribes. Three large villages of over 120 inhabitants each lay within four-mile radius of the Santa Clara Mission site. The native names of those villages are not known. The missionaries at Mission Santa Clara gave each of them a Spanish designation; San Francisco Solano village of the Alson tribe a mile or two downstream at the mouth of the Guadalupe River, Santa Ysabel village of a different, unnamed tribe east of San Francisco Solano on the lower Coyote River, and San Joseph Cupertino village of the Thámien tribe in the oak grove about three miles to the southwest of the mission site.

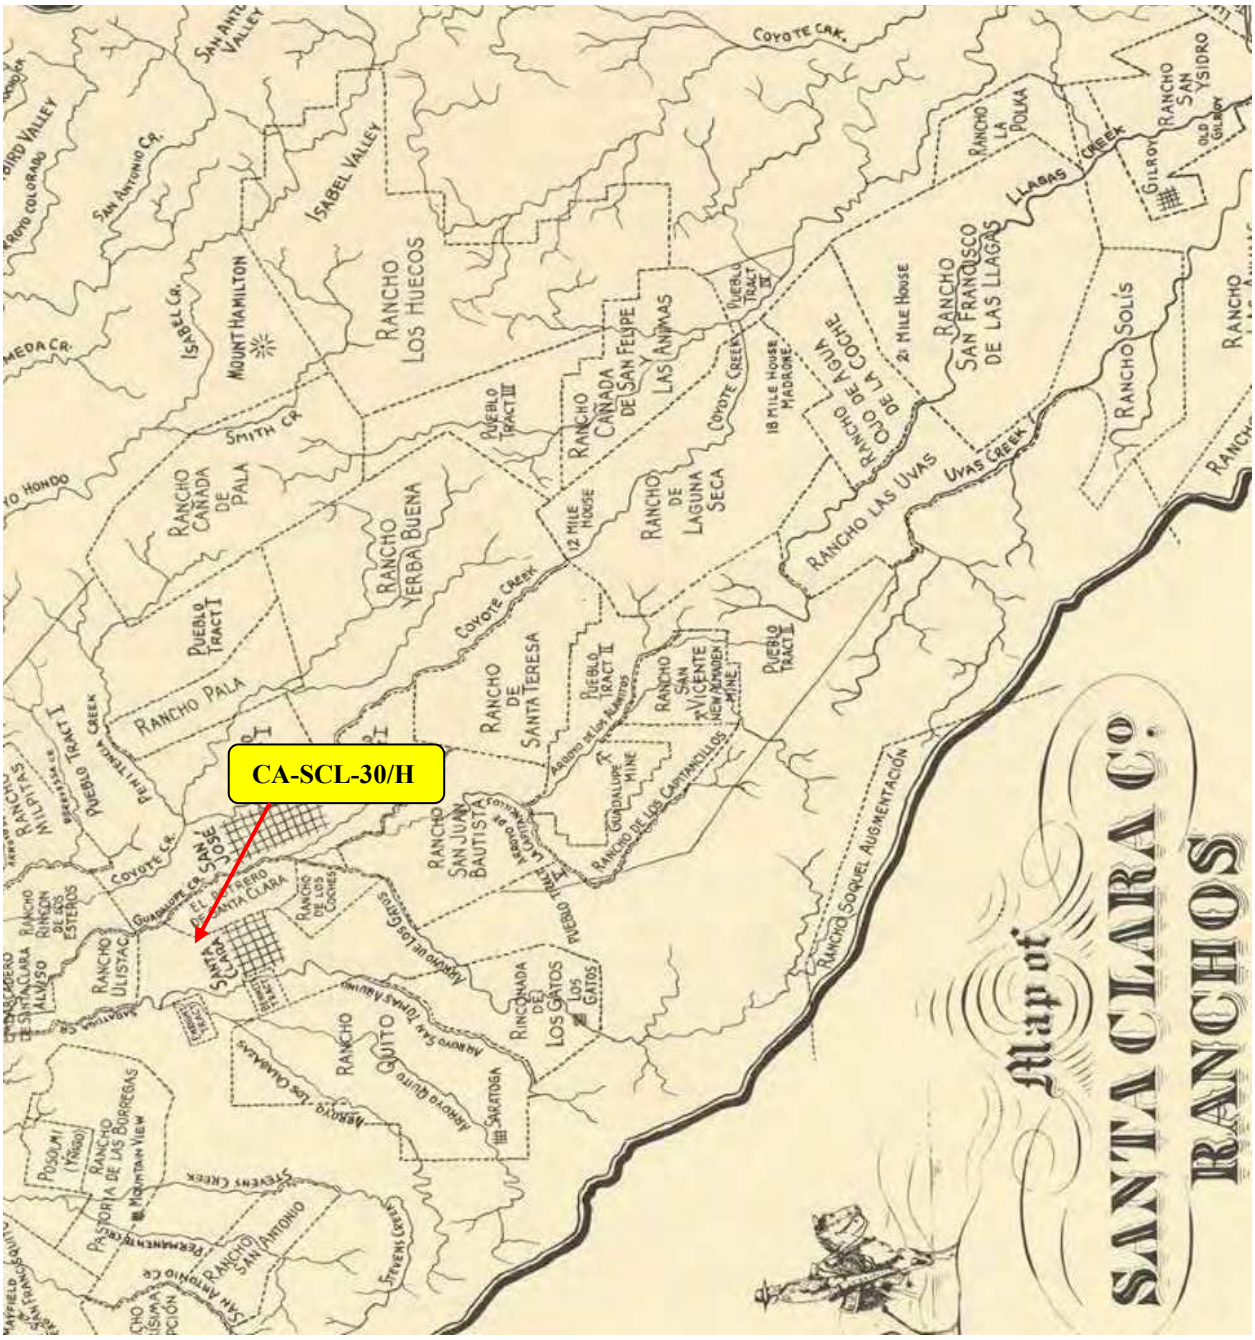
> Still nearer to the site were two tiny hamlets, **Our Mother Santa Clara** within a few hundred yards of the first mission site, and **Our Patron San Francisco** perhaps another mile upstream on the Guadalupe River" (Milliken 1991:116-117).

It is interesting to note that, on June 9, 1907, the San Jose Mercury News published an article titled **Marking the County's Historic Sites** noted the following about the founding of Mission Santa Clara:

> The mission Santa Clara, California, or **Mission Santa Clara de Thamien**, as it came to be known, most probably from a prior Indian name, "Thamien," was founded on January 12, 1777, by the Franciscan father, Tomas de le Pena, acting under the direction of the pioneer of Christianity in these parts, the illustrious Father Junipero Serra.

Milliken (2007) stated that "**Our Mother Santa Clara**, which was probably west of the Guadalupe River within a few yards of one of the Mission Santa Clara sites" was part of the core villages that comprised the Tamien tribal district (Milliken in Hylkema 2007:52). He also suggested that "the villages of **San Jose Cupertino**, **Our Mother Santa Clara**, and **Our Patron San Francisco** formed a single tribelet that controlled most of the Guadalupe River system, and therefore, the core of the Santa Clara Valley" (ibid). Some of these intermarried tribal groups, village communities, and districts also included the: **San Francisco Solano**, **San Juan Bautista**, and **San Carlos** or **Matalan Tribal Group/Districts**, and the bilingual **Alson** Thámien/Chochenyo Ohlone-speaking tribal group from the Alviso/Milpitas area.

The **San Juan Bautista** Tribal District located to the south of Mission Santa Clara, (not to be confused with the **Mission San Juan Bautista** established about 20 years later in 1797 which is located further south within **Mutsun** Costanoan-speaking territory in San Benito County), was identified by the Mission Santa Clara priests as being located to the south of the mission that included a portion of the Coyote Creek Corridor. To the west were the Puichon Ohlone (San Bernardino), and directly across on the eastern side of the bayshore, were the northern Santa Clara Valley **Thámien/Chochenyo Alson,** and the East Bay Chochenyo Ohlone-speaking ***Tuibun*** Ohlone tribal groups from the Santa Agueda District.



Map 1: Rancho Map of Santa Clara County (Arbuckle with Rambo 1968)

Previous Ethnohistoric Studies

Meaningful Contact Period ethnohistoric studies focusing on the demographic and geopolitical distribution of the different Ohlone/Costanoan tribal groups that came under the influence of Mission Santa Clara in 1777 were conducted by Chester King in the 1970s (1974, 1977, 1978a, 1978b, and 1994) and continued by Milliken (1983, 1991, 1995, 2004 and 2007 [in Hylkema 2004, 2007]); Cambra et al. 1996; Leventhal et al. 2011, 2020), Panich 2020, and others.

These studies helped lay the foundation for reconstructing the geopolitical and linguistic boundaries of those tribal groups and districts that were brought into each Bay Area mission, as well as providing information about the transformation and the cultural and political adaptation and responses of those surviving Ohlone/Costanoan tribal groups who adjusted to the disruption caused by the expanding Hispanic colonial empire, the impacts of missionization and ensuing spread of diseases and malnutrition.

The Santa Clara Valley and adjacent areas supported fairly large populations of Native peoples for upwards to over a period spanning the past 10,000 years [e.g., CA-SCR-177 (Cartier ed. 1993) and CA-SCL-178 (Hildebrandt 1983)]. During the Early to Late Periods (past 4000 years) this is evidenced by the prevalence of large pre-contact cemeteries within the San Francisco Bay region [see reports on Emeryville (CA-ALA-309); Ellis Landing (CA-CCO-295); Santa Rita Village (CA-ALA-413) [Wiberg 1984]; Patterson Mound (CA-ALA-328) [Davis and Treganza 1959]; Ryan Mound (CA-ALA-329) [Leventhal 1993]; CA-SCL-732, Three Wolves Site (Cambra et. al 1996); CA-SCL-38 (Bellifemine 1997); CA-SCL-690 Tamien Station (Hylkema 2007); CA-SCL-674 Rubino Site (Grady et al. 1999); University Village (CA-SMA-77) [Gerow 1968], CA-SCL-6W Lick Mill Boulevard (Cartier and others]; CA-SCL-128 (Winter 1978a and 1978b; Leventhal et al. 2015); CA-ALA-565/H and CA-ALA-704 (Byrd et al. 2020a, 2020b); and others].

Furthermore, based upon the analysis of grave-associated wealth and mortuary patterns derived from central California cemetery sites and specifically at **CA-SCL-128 *Thámien Rúmmeytak***, **CA-SCL-690 Tamien Station**, **CA-SCL-38 *Yukisma* Mound, CA-ALA-329 *Mánni Muwékma Kúksú Hóowok Yatiš Túnnešte-tka*,** and more recently at **CA-ALA-565 *Sii Túupentak***, **CA-CCO-138 Hotchkiss Mound (Delta Region)** (Atchley 1994), **Castlewood Country Club, Pleasanton**, **CA-ALA-309 Emeryville Mound, Tomales Bay (Marin County), Sacramento Valley,** and sites from the **Napa Region** (Gifford 1947**),** it can be postulated that the greater San Jose area appears to have been located within the southwestern most region of a Late Period religious complex, ceremonial, economic interaction sphere that employed the use of **Kuksu "Big Head"** (or "N series") abalone shell effigy pendants. These Kuksu effigy pendants first appeared sometime around the Middle Late Transition Period (MLT) 1000 A.D./Phase IA - Late Period (ca. 1100 A.D.), and presumably represents inclusion in the greater geographically-area-wide ceremonial interaction sphere that included the **Kuksu** religion that was practiced by a multitude of North–Central California Indian tribal groups (Kroeber 1925, Loeb 1932, 1933, Winter 1978a; Leventhal 1993; Hedges 2019).

These Kuksu practicing tribal groups ranged from the Hokan-speaking Salinans to the south (southern Monterey County); to the San Francisco Bay Penutian-speaking Ohlone and interior Bay Miwok and North Valley Yokuts tribal groups (Contra Costa and San Joaquin Counties), to the Penutian-speaking Coast Miwok and Patwin (Marin, Napa, Yolo, and Colusa Counties); to the Penutian-speaking Plains Miwoks and Konkow-Nisenan (Maidu-speaking groups) in the Sacramento and Central Valley foothills of the Sierra Nevada; to the Hokan-speaking Pomoan tribal groups (Sonoma, Lake and Mendocino Counties), Yukian-speaking Yukian tribal groups (northern Mendocino), and the Athabascan-speaking Cahto tribe located to the north of Fort Bragg. (see Loeb 1932, 1933; Du Bois 1939; Gifford 1947:20; Bennyhoff 1977:50; Winter 1978a; Bean and Vane 1978; Leventhal 1993:230-236; Hylkema 2007).

The preliminary data derived from comparatively similar mortuary patterning and associated grave assemblages identified from Late Period cemetery sites factored in conjunction with the similarities of tribal personal name-endings derived from the mission records such as "***-tole***" and variations of "***-mayen***" for females (of high status or chief) and "***-cse***" (or a variant thereof e.g., "***csi***") for males (also of high status or chief/capitan) that are found amongst the different linguistic groups within the same macro-geographical area as the **Big Head/Kuksu** pendants, supports the contention that the South and East Bay regions had very strong cultural ties, via trade, intermarriage, ceremonial interaction and shared religious belief systems as well as other cultural influences with the Central Valley interior, including the Sacramento and San Joaquin Delta (Stockton) regions (Lillard, Heizer and Fenenga 1939; Heizer and Fenenga 1939; Gifford 1947; Bennyhoff 1977; (CA-ALA-329) Leventhal 1993; Milliken 1995; Jones and Klar 2007; also see CA-SCL-128, Holiday Inn Site, Winter 1978a; (CA-SCL-38) Bellifemine 1997; (CA-SCL-128) Leventhal et al. 2015; (CA-ALA-565/H) Byrd et al., 2020; Hedges 2019). Gifford while discussing chieftanship notes that:

> Among the Southern Maidu, such a woman chief bore the title of *mayen* (cf. Miwok *mayengo*, Costanoan *mayin*). The Southern Maidu female chiefs who bore this title were either wives or daughters of chiefs. Such a chiefess functioned when the chief died without a male heir. She gave ceremonies like a male chief (Gifford 1927:250).

The evidence of a far-flung ceremonial and economic interaction sphere further suggests that the Thámien Ohlone-speaking tribal groups, including the **Our Mother Santa Clara** tribal/village/district catchment region and their further neighbors (i.e., **San Antonio** tribal district), were significantly involved within this larger religious and ceremonial interaction network that was partially influenced through mechanisms of trade, economic, military and marriage alliances with those tribal groups located to the east and north (Delta region) of the South Bay region – a region that at the time of Spanish contact had already cross-cut several major linguistic boundaries (including San Francisco Bay Ohlone, North Valley Yokut, Patwin, Coast Miwok, Bay Miwok and Plains Miwok) as well.

Limited detailed ethnohistoric (Contact Period) information about the aboriginal lifeways of the different San Francisco Bay Ohlonean-speaking tribal groups who resided within this mega-sphere of socio-cultural interaction, tends to be restricted to the various accounts written by early Spanish explorers, missionaries, secular and military authorities, and visiting European travelers. Other historical records written after the cataclysmic impact caused by missionization, colonialism and the ensuing American conquest continuing through the 20th century includes research conducted by more formally trained ethnographers, ethnohistorians, linguists as well as by other chroniclers to the greater Bay Area.

Early Spanish Expeditions to the San Francisco Bay Region

According to ethnohistoric research conducted by Milliken and others, an expedition led by **Gaspar de Portola** and Father **Juan Crespi** had traveled north along the California coast north of Monterey and on October 23, 1769 had encountered the **Quiroste** Ohlone village of **Mitenne** near *Punta de Año Nuevo* (New Year's Point). The **Quiroste** were located on the Pacific coast between Bean Hollow Creek and *Año Nuevo* and approximately 25 miles to the southwest of the **Puichon** tribal group from the Palo Alto and San Francisquito Creek region of the West Bay. Milliken citing Crespi [1769] noted that:

> The friendly Quirostes showered the Spaniards with foods and gifts. They brought two or three bags of the (wild) tobacco they use, and our people took all they wanted of it. One (old) heathen man came up smoking upon a very large (and well carven) Indian pipe made of hard stone. The Indians almost all carry tall red-colored staffs, some with many feathers; they presented four of these to Sergeant Don Francisco Ortega (Milliken 2007:87)

Sometime around mid-November [1769] the Portola expedition traveling south along the east side of the San Francisco peninsula eventually entered the territories of the Ssalsons, Lamchins and Puichons. The Lamchin Ohlone-speaking tribal group was the immediate northern neighbor of the Puichon and their territory spanned from Belmont to Redwood City. The Ssalson tribal group was located north of the Lamchin. Milliken indicated that the expedition "camped in the Palo Alto area" (2007:88).

In 1770 Captain Commander **Pedro Fages**, was perhaps, the first Spanish exploration to travel through the northern part of the **San Juan Bautista** and **San Carlos/*Matalan*** tribal districts (Thámien Ohlone-speaking territory) within the greater Santa Clara Valley. The **San Juan Bautista** and **San Carlos** (aka **Matalan**) Thámien Ohlone-speaking groups occupied the areas of south San Jose south to Morgan Hill. Milliken commented on and noted in his 1991 doctoral study on the San Francisco Bay tribal groups such as the "**Matalans** and **Thámiens"** (whom were also intermarried with the neighboring **San Antonio** rancherias) at the time of contact (1770-1810) in the following historical account derived from Captain Fages' diary:

> The **Matalans** and **Thamiens** of Santa Clara Valley watched a small Spanish party pass north through their lands in November of 1770. The party, under Pedro Fages, continued north along the east shore of San Francisco Bay (until) (sic) it reached a plain opposite the Golden Gate (presently North Oakland). ... Fages wrote of only one encounter:
>
> > 'Up close to the lake we saw many friendly good-humored heathens, to whom we made a present of some strings of beads, and they responded with feathers and geese stuffed with grass, which they avail themselves of to take countless numbers of these birds [Fages 1770 in Bolton 1911].'
>
> The goose hunters were Tuibuns or Alsons at a lake on the Fremont Plain just south of Alameda Creek (Milliken 1991:78).

The Chochenyo Ohlone-speaking **Tuibuns** or the Thámien Ohlone-speaking **Alson**s of the northeastern Santa Clara Valley whom Fages observed at the "lake on the Fremont Plain just south of Alameda Creek" were from the **Santa Agueda/Estero District** and were missionized into the Santa Clara Mission "during the 1780s and 1790s" (Milliken 1995:258).

Captain Commander Fages apparently at a later date again passed through the Thámien-Ohlone-speaking region in 1772 and explored the interior of the East Bay (see Crespi in Bolton 1926:336; Hylkema 1995). However, it was not until 1774 that the first intensive exploration of the Santa Clara Valley region occurred, which was led by Captain Fernando Rivera y Moncada who was accompanied by Fray (Father) Francisco Palóu. Writing of this expedition, Milliken made note of one of Rivera y Moncada's accounts:

> The next Spanish expedition into the Bay Area, in the late fall of 1774, came for the purpose of scouting locations for a possible mission and military base on the San Francisco Peninsula. ... Near the town of Coyote, probably Matalan territory, a group of local people were startled, but not terrorized.
>
> > 'We passed a patch of willows and cottonwoods, and now found running water in the creek. Here all at once there were heathens standing with their weapons in hand [though] they made no show of them. In people such as these, who have no knowledge of others and live like wild beasts at bay, it is a second nature to snatch them up (Rivera y Moncada [1774] quoted in Milliken 1991:80-81).'

Milliken commenting on the Fernando Rivera *y* Moncada expedition going through the **Puicho***n* Ohlone territory of the West Bay noted that:

> The new Spanish party intended to document the nature of San Francisco Bay and scout a location for a Spanish presidio and mission near its mouth. Passing through the Santa Clara Valley, the party arrived among the **Puichons** on San Francisquito Creek on November 28, 1774, where it was warmly received. Here, Father Palou commented about similarities between the local language and that of the natives at Mission Carmel (Milliken 2007:89)

Presumably near the same location as noted above by Rivera y Moncada, on November 26, 1774, Father Palóu independently recorded that the expedition had descended the north slope of what was probably Tulare Hill (south San Jose) and approached a stretch of trees where they found pools of water. Palóu wrote:

> We descended the hill and approached the trees, which we found to mark a river which had water only in pools. At about half-past twelve we halted near it, close to some live oaks with which the plain of the river (was) covered. Near the camping place we found vestiges of a village which showed evidences of having been recently moved (Bolton 1926:261).

Bolton while translating Palóu 's dairy also attempted to plot the location of where the party halted: "This camp was made soon after crossing the hills north of Coyote" (ibid). Conceivably, this location possibly represents the first written record near the location of the ***Kaphan Húunikma*** (Three Wolves Site: CA-SCL-732) locality because that site is located approximately one mile north of Tulare Hill (see Cambra et al 1996). The Three Wolves Site as mentioned above is located approximately 12 miles to the southeast of the first Mission Santa Clara (near where the San Jose International Airport is located) and the Prometheus Project.

Three years later, Mission Santa Clara was established on January 12, 1777. Collectively, with the establishment of Mission Dolores in 1776, Mission Santa Clara in 1777, and later Mission San Jose in 1797, located east of the Fremont Plain, the various Ohlonean tribal groups within the San Francisco Bay region began to experience the cataclysmic disintegration from this newly imposed colonial system of indenture and peonage. Milliken in one of his studies offered the following explanation of the circumstances under which the Ohlone tribal people agreed to enter into these missions:

> Through the ritual of baptism some young people from the Yelamu tribe began to exchange their independence for a subservient role of "neophytes" at Mission San Francisco in the spring of 1777. During the summer and fall local **Alson** and **Thamien** teenagers joined the Mission Santa Clara community. Francisco Palóu wrote that the first converts came to the missions out of interest in cloth, trinkets, and Spanish foods.
>
> > 'They can be conquered first only by their interest in being fed and clothed, and afterwards they gradually acquire knowledge of what is spiritually good and evil. If the missionaries had nothing to give them, they could not be won over [Palóu 1786].

Most scholars have agreed with Palóu's assessment that a material impulse brought the first Indian converts to be baptized at the mission. Sherburne Cook [1943:73] wrote that "ceremony, music, processions" and "inducements of clothing, shelter, and food" attracted large numbers of converts over the first twenty years. Malcolm Margolin [1989:28] pointed out "the dazzle of Spanish goods" (Milliken 1991:109-110).

Panich in his 2020 study titled Narratives of Persistence: Indigenous Negotiations of Colonialism in Alta and Baja California contributes to this discussion that:

> The Spanish clearly abhorred Indigenous beliefs, but they typically approached their initial face-to-face interactions with native people very differently. These were facilitated by gift exchanges that served as potent social lubricants among people of widely divergent worldviews. Like Native Californians throughout the region, Ohlone people often presented the Spanish with gifts of food and gladly received foreign objects in return – particularly glass beads and cloth that the Spanish purposefully brought along for just these kinds of occasions. There is little doubt the Spanish viewed these exchanges through an ethnocentric lens (Panich 2020:58).

While some of these limited interpretive perspectives provides an explanation from the contemporary "dominant society" perspective, which suggests at its foundation that "lesser complex indigenous cultures" were unilaterally influenced by the "more complex European colonizing cultures," perhaps as an alternative perspective we need to consider and explore possible other explanations, especially when viewing these dynamics through the social rules and mechanisms of late 18th century California Indian world view rather than through the colonial lens. Such alternative explanations should consider those pre-existing and established Native protocols and socio-cultural-political rules of social conduct, interaction and integration accorded to strangers, visitors, and distinguished guests as practiced by central California tribal groups.

For example, in cases when elites and high status families from neighboring tribal groups made arrangements to visit, and/or those who were invited to ceremonies, funerals, and/or economic exchange functions (e.g., Mourning Anniversaries, ceremonial dances, weddings, trade feasts, and etc.), there were specific rules that these groups would follow as social protocols. These same social principals and rules that were enacted between tribal groups and elite families would have no doubt been in effect at the time when the Spanish expeditions made their presence known.

After the period of contact had been established between the Indian tribal communities and the newly settled Spanish colonizers, no doubt, those established elites and their families desired to have their children associated (to some degree) with these newly established powerful and (relatively) wealthy Spanish entities and power brokers.

Some of these aboriginal social rules and protocols probably included:

> 1. Marriage arrangements of eligible teenagers for purposes of establishing and/or strengthening inter-tribal and/or intra-tribal alliances especially between and amongst powerful elite families;
> 2. The attempt by these powerful elites and/or families of specialists to establish formal ties with these newly emergent Spanish power brokers through "apprenticeships" – by having their children enter into the missions through the ritual of baptism-- and by doing so, creating and thus perpetuating, an extant belief system that this "apprenticed relationship" would continue to maintain their own power brokerage with the extant and transformed communities and provide them additional prestige within this new order.

By acting in conformance with these older socio-political-economic rules for establishing and maintaining military alliances, trade networks, and marriage alignments with neighboring tribal groups, villages and the with newly established Spanish colonial settlements, these elites were probably under the belief that by exercising this formal process, partially through the ceremony of baptizing themselves and/or their children, it was done as a continuation of their aboriginal power brokerage (see Bean 1978). For example there was a reciprocal ceremonial practice of purifying with water (ritual washing) persons of the opposite moiety (deer vs. bear or land vs. water) amongst central California tribal groups especially during and after the handling of the dead and their personal property. Therefore, the use of water in baptism had some pre-existing analogous practice and meaning in aboriginal purification ceremonies (Gifford 1955).

Initially, the "official policy" of the Spanish Empire was to develop the missions into self-supporting agricultural centers whereby Indians would be "civilized" and become peon laborers for the civilian pueblos and presidios. Ultimately it was expected that the Indians would themselves become citizens of the crown and help further colonize the region for Spain (see Rawls 1986, Hurtado 1988 and Monroy 1990). Nonetheless, the colonial experience resulted in the decimation of the California Indian tribes who were exposed to European diseases, unsanitary living conditions, and malnutrition while residing at and around the missions (Cook 1976a,b; Milliken 1995). Although the Native population was severely depleted after the first 40 years, by the time of the secularization of the missions during the mid-1830s, the surviving missionized Ohlone/Costanoan Indians continued to live and work in several Post-Contact Indian communities within the Santa Clara Valley as well as on the various rancherias and *Californio* ranchos surrounding each of the other greater Bay Area missions.

Distribution of Ohlone Tribal Groups of Santa Clara Valley and Adjacent East Bay

At the time of European contact in 1769, the Spanish explorers called the Indians living along the Monterey coast "Costeños," or people of the coast. After the missions were established, the Indians and the Spanish priests referred to the Mission Santa Clara Indian people as "Clareños" (Harrington 1921-1934). During the mid-19th century, scholars anglicized the term Costeños into "Costanoan"[1] to encompass all those tribal groups whose aboriginal territories spanned from greater Monterey Bay, Missions Soledad, Santa Cruz, Santa Clara, San Francisco, East Bay and the Carquinez Straits, and who spoke cline of distinctive, but related languages (Heizer 1974; Levy 1978; Milliken et al 2007; Milliken et al. 2009).

Very little information about the aboriginal Thámien-Ohlone speaking tribal groups who once occupied the lower Guadalupe River, Coyote Creek and Alameda Creek drainages was recorded by Contact Period Spanish missionaries who first established Mission Santa Clara de Thámien. Apparently some of these missionaries did not record the names of the many Thámien tribal rancherias and villages, as was practiced at the other neighboring Costanoan linguistic area missions (e.g., Missions San Jose, Dolores, San Juan Bautista and others). Instead, the mission Fathers had simply assigned names of Saints to the various villages and as directional "districts" surrounding Mission Santa Clara, rather than documenting the specific tribal villages from where the newly recruited and baptized Indians came from (see C. King 1994).

Milliken (1983, 1991, 1995, and 2007) and C. King (1978, 1994) have to date, conducted the most comprehensive geopolitical reconstructive ethnohistoric studies using the available Santa Clara Mission records (also see Winter 1978a and 1978b). Their studies clearly demonstrate that both the Thámien-Ohlone speaking tribal groups of Santa Clara Valley and the neighboring East Bay Chochenyo-Ohlone speaking tribal groups (e.g., Santa Agueda, Alson and Tuibun) of the Fremont Plain were brought under the sphere of influence of Mission Santa Clara and many of these Indians were baptized, married and had died at this mission. Chester King in his 1994 study entitled "Central Ohlone Ethnohistory" noted:

> The area between San Jose and San Juan Bautista [mission] and extending from Santa Cruz to the San Joaquin Valley has proven to be difficult map by village or tribe. At Santa Clara Mission only the closest villages were given separate names. The more distant were grouped by region (C. King 1994:203).

[1] More recently, various authors have suggested that the present-day descendants prefer to be called "Ohlone"; however, there are three surviving historic BIA-documented tribal groups with ancestral ties to 1) Missions San Jose, Dolores, Santa Clara, 2) Missions San Juan Bautista and Santa Cruz, and 3) Missions San Carlos (Carmel) and Soledad, who have formally organized (in accordance with the 1934 Indian Reorganization Act). These three historic tribal communities whose ancestors spoke their respective Costanoan/Ohlone languages as late as the 1930s, have since revitalized and organized themselves as tribal governments and communities. All three are presently listed with the BIA's, Office of Federal Acknowledgment (OFA) as: Muwekma Ohlone Tribe of the San Francisco Bay Region, Amah-Mutsun Ohlone Tribal Band, and Ohlone/Costanoan-Esselen Nation respectively. The tribal name Muwekma is actually the aboriginal term referring to "la Gente" meaning "the People" in the Thámien and Chochenyo languages spoken in the South and East Bay (Kroeber 1910; Harrington 1921-1934; Milliken et al. 2007).

> The closest villages to the mission were given the names "our mother Santa Clara" (north San Jose), "**our father San Francisco**" (downtown San Jose), **San Juan Bautista** (San Jose south of Hillsdale), **San Jose Cupertino** (Cupertino), **Santa Ysabel** (east San Jose), and **San Francisco Solano** (Milpitas-Alviso).
>
> The next four groups recognized in the Santa Clara Mission registers are very large and include people from villages located in particular directions from the mission. The four groups were **Santa Agueda** (villages north of Milpitas), **San Bernardino** (villages west of Cupertino), **San Carlos** (villages south of San Jose), and **San Antonio** (villages east of San Jose), northeast of San Antonio were the **Luechas** and southeast of San Antonio were **Tayssen**. (King 1977, Milliken 1991) [Cited by King 1994:203].

Milliken, in his 1995 published monumental doctoral study A Time of Little Choice: The Disintegration of Tribal Culture in the San Francisco Bay Area 1769-1810, provides a more detailed location for the southern neighboring **Matalan** or San Carlos group:

> The **Matalan** tribe held the Santa Clara Valley corridor from the present town of Coyote south to the present town of Morgan Hill (1995:248).

In the 2007 **Tamien Station (CA-SCL-690)** site report, Milliken also provides reconstructed information regarding the geographical distribution and inter-relationships between the Thámien Ohlone-speaking tribal groups within the region surrounding Mission Santa Clara by noting that:

> … Four of the seven towns near Mission Santa Clara supplied enough converts to suggest that they originally contained more than 100 inhabitants.
>
> **San Bernardino**, probably located on lower Stevens Creek, at what is now Mountain View (44 adult married converts 1778-1800).
>
> **San Francisco Solano**, probably situated on the lower Guadalupe River at or near present Alviso (44 adult married converts 1778-1800).
>
> **Santa Ysabel**, probably established on the lower Coyote River or Penitencia Creek, now in north San Jose (40 adult married converts 1794-1802).
>
> **San Jose Cupertino**, probably found on Calabazas Creek or upper Stevens Creek, now part of Cupertino (50 adult married converts between 1780 -1797).
>
> The other three smaller villages were:
>
> **Our Mother Santa Clara**, which was probably west of the Guadalupe River within a few yards of one of the Mission Santa Clara sites … .
>
> **Our Patron San Francisco**, probably placed on the Guadalupe River near Our Mother Santa Clara and Santa Ysabel, east of present-day downtown Santa Clara

> **San Juan Bautista**, probably located on the Guadalupe River in the Willow Glen area south of present-day downtown San Jose … . (Milliken 2004:58-59; 2007:51-52).

In the same study, Milliken also noted that:

> The **Santa Ag**ueda district was the source of 90 percent of the Native people who went to Mission San Jose. Thus the Santa Agueda district actually must have been located on the Fremont Plain (2004:61; 2007:54) [see **Map 2** and **Map 3** below].

In an earlier study, Milliken (1983) determined that:

> The East Bay people at Santa Clara Mission were listed under the district name "Santa Agueda". ... The earliest were the "Estero," "Alameda," "Palos Colorados," and "Este." Many "Alameda" and "Estero" adults at Mission San Jose had children that had been baptized at Santa Clara under the "Santa Agueda" designation. ... Most of the Santa Clara converts who later married at Mission San Jose were also "Santa Agueda"..., although some were from "San Bernadino"... .
>
> ... The Mission San Jose priests provided more detailed genealogical information for each person than did those at Mission San Francisco. ... The cross references indicate that people from the "Estero" and the "Alameda" districts came from the Yrgin and Tuibun tribelets (Milliken 1983:99).

In his 1991 dissertation, Milliken, presented information about the "Santa Clara Valley Conversions, 1780-1784" stating that:

> At the start of 1780 the core group of adult Christians at Mission Santa Clara were from the Alson village of San Francisco Solano, rather than the nearer tiny Thamien villages of Our Mother Santa Clara and Our Patron San Francisco. (1991:139)
>
> Within the Santa Clara Valley and adjacent regions, during the first twenty years since the establishment of Mission Santa Clara, Milliken suggested that "(c)onversion of adult married couples in April (1795) had been concentrated among people from the southern East Bay, **Alson**, **Tuibun**, and perhaps **Jalquin/Yrgin**" tribal groups (1991:224).

Milliken's research also demonstrated that after the Mission San Jose was established in 1797, that "(i)n January of 1801 twenty-one couples became Christians, ... (t)hey were **Alsons** and **Tuibuns** from the local villages of the Fremont Plain" (1991.:265). These East Bay Chochenyo (and possibly) Thámien-Ohlone speaking tribal couples were relations to the families from those same tribal groups who were baptized years earlier at Mission Santa Clara.

Furthermore, it is interesting to note that Milliken also pointed out that "(i)n January and February (1802) twenty-one **Jalquin/Yrgin** families moved to Mission San Francisco" and, "they were intermarried with **Seunens** and **Tatcans**" (1991:266); [see **Map 3** and **Map 4,** and **Figure 1 Ohlone Indians at Mission Dolores** drawn by **Louis Choris** below].

It is important to note here that many of the lineages enrolled in the Muwekma Ohlone Tribe trace their direct ancestry to the Thámien/Chochenyo Ohlone-speaking **Alson**, and to the Chochenyo Ohlone-speaking **Seunen** and **Jalquin** tribal groups whom were missionized in to Missions Santa Clara, Dolores and San Jose.

Milliken noted that the **Alson** was "a tribe that held the low marshlands at the very southern end of the San Francisco Bay, probably both north and south of the mouth of the Coyote River [Creek] now the cities of Newark, Milpitas and Alviso" (1995:235). He also mentions that the **Seunen** tribal group was:

> A tribe that held a fairly small territory at the northwest side of the Livermore Valley in the hills east of San Francisco Bay. … Most of the Seunens went to Mission San Jose between 1801 and 1804, although four of them went to Mission San Francisco in 1801 and 1802 as part of a large Jalquin group" (1995:254).

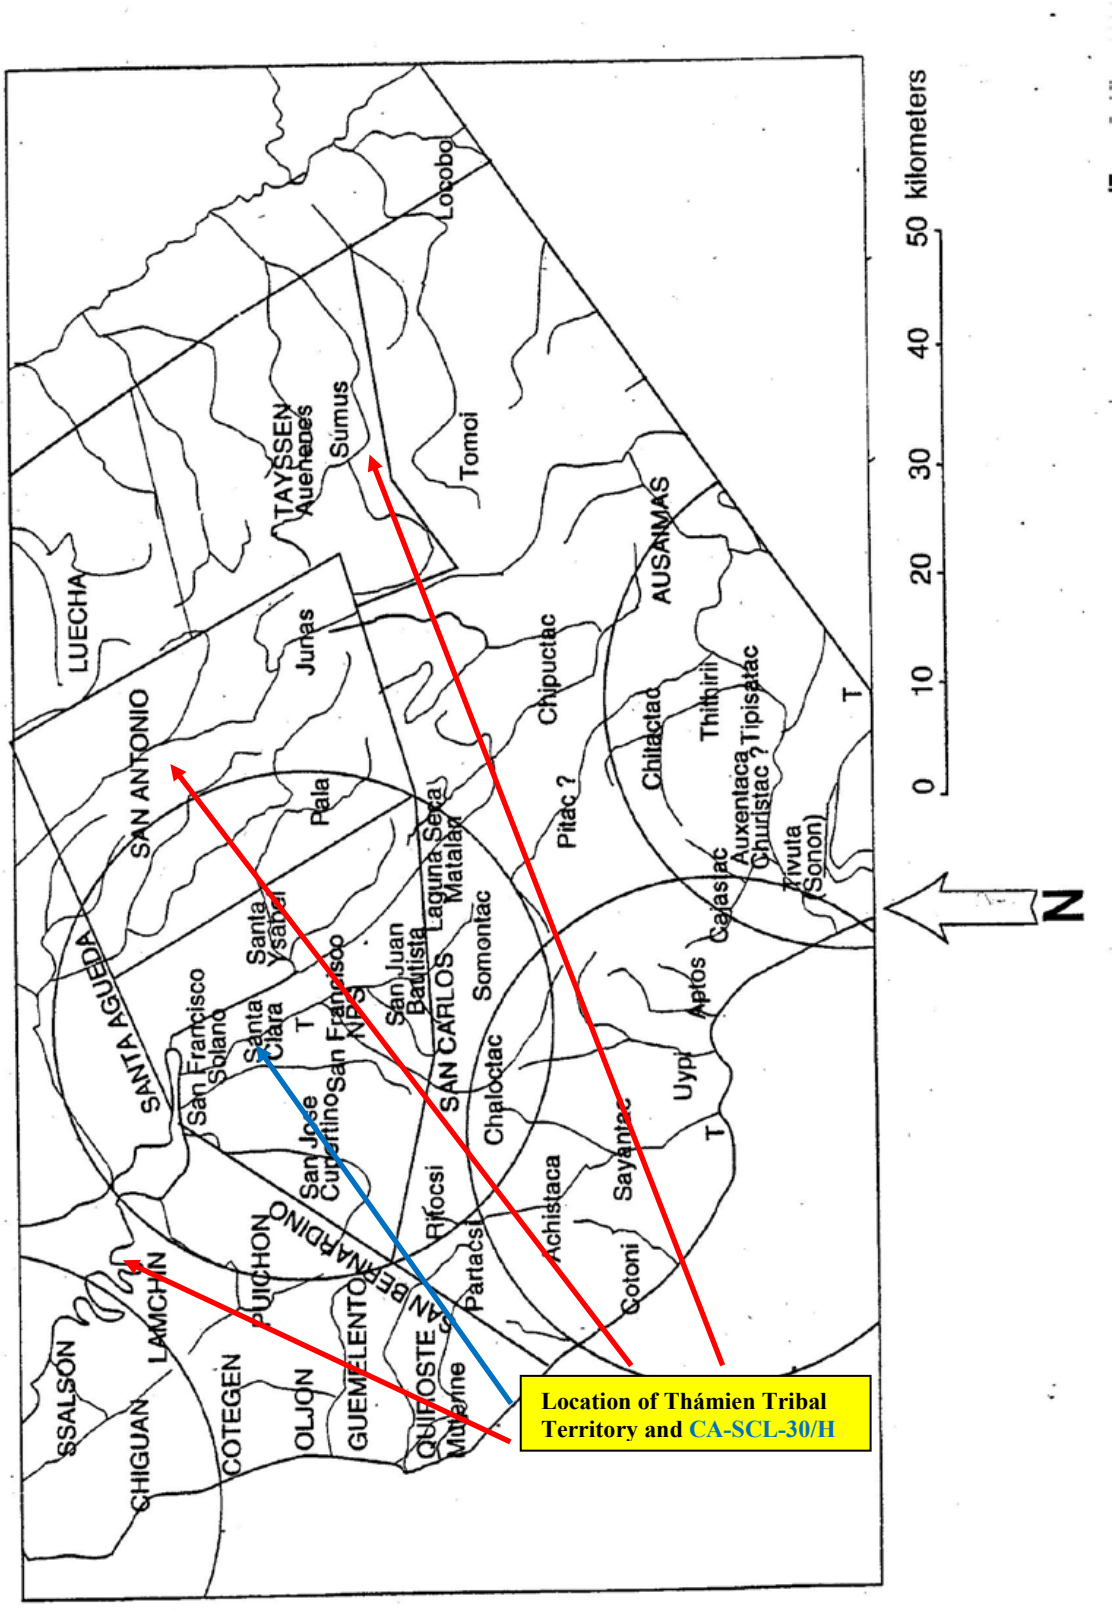
Milliken stated that the **Jalquins** and **Yrgins** were most probably a single tribal group. He suggested that the Yrgins represented the southernmost community from this tribal group who were missionized into Mission San Jose, while the northern Jalquins came under the influence of Mission Dolores in San Francisco.

The complex process that brought together East Bay and Santa Clara Valley Ohlone tribal groups into the mission system, though cataclysmic, these newly emergent mission-based communities had nonetheless maintained vestiges of their languages and culture that survived into the early 20th century. The impact of the Hispano-European colonization and missionization resulted in the first major rupture in the lives of California Indians and especially those along the coastal-interior mission strip.

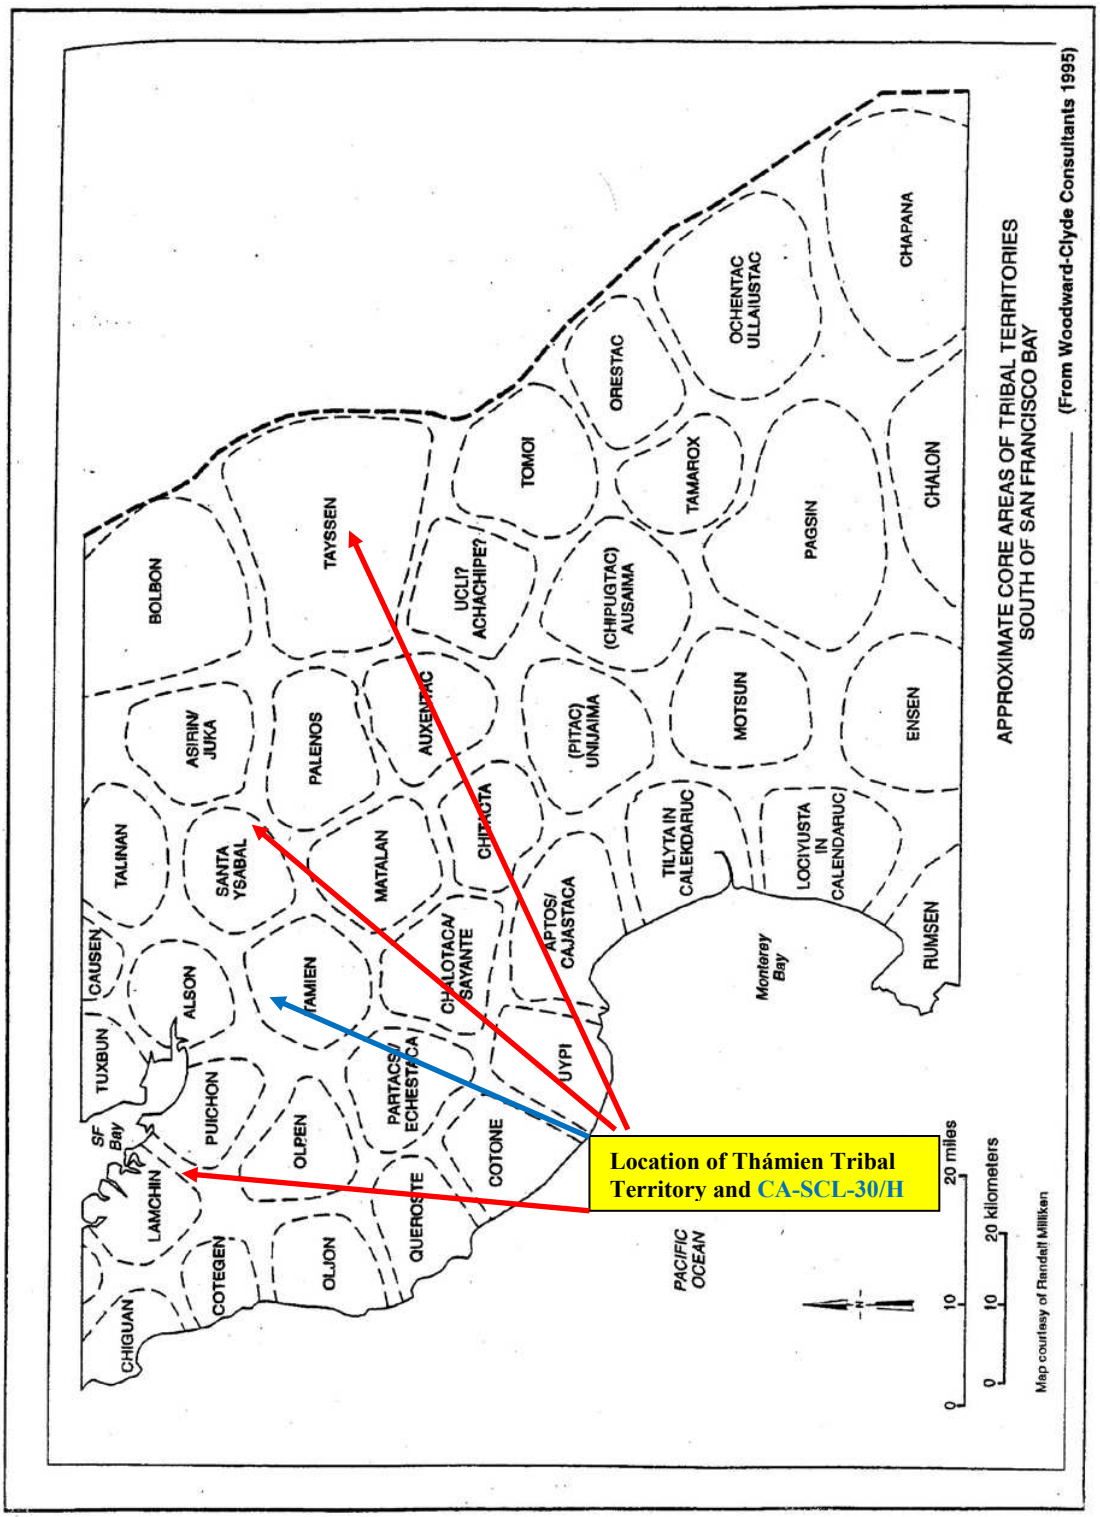
Thus two of the East Bay Chochenyo Ohlone-speaking linguistic consultants, Maria de los Angeles Colos who was born in 1839/40 and Jose Guzman who was born about 1853, had provided Smithsonian's Bureau of American Ethnology linguist John Peabody Harrington with the observation that "the **Clareños** [Indians of Mission Santa Clara] were very much intermarried with the **Chocheños** [Indians of Mission San Jose], the dialects were similar," and also at this time Harrington recorded the Chochenyo linguistic term – "***mu^{w}e'kma*, la gente**" [meaning the people] (Harrington 1929 field notes [1921-1934]).

Milliken (1991), based upon the mission records, conducted ethnogeographic reconstructions of tribal, village and district locations surrounding Mission Santa Clara for inclusion in his doctoral dissertation and had noted that:

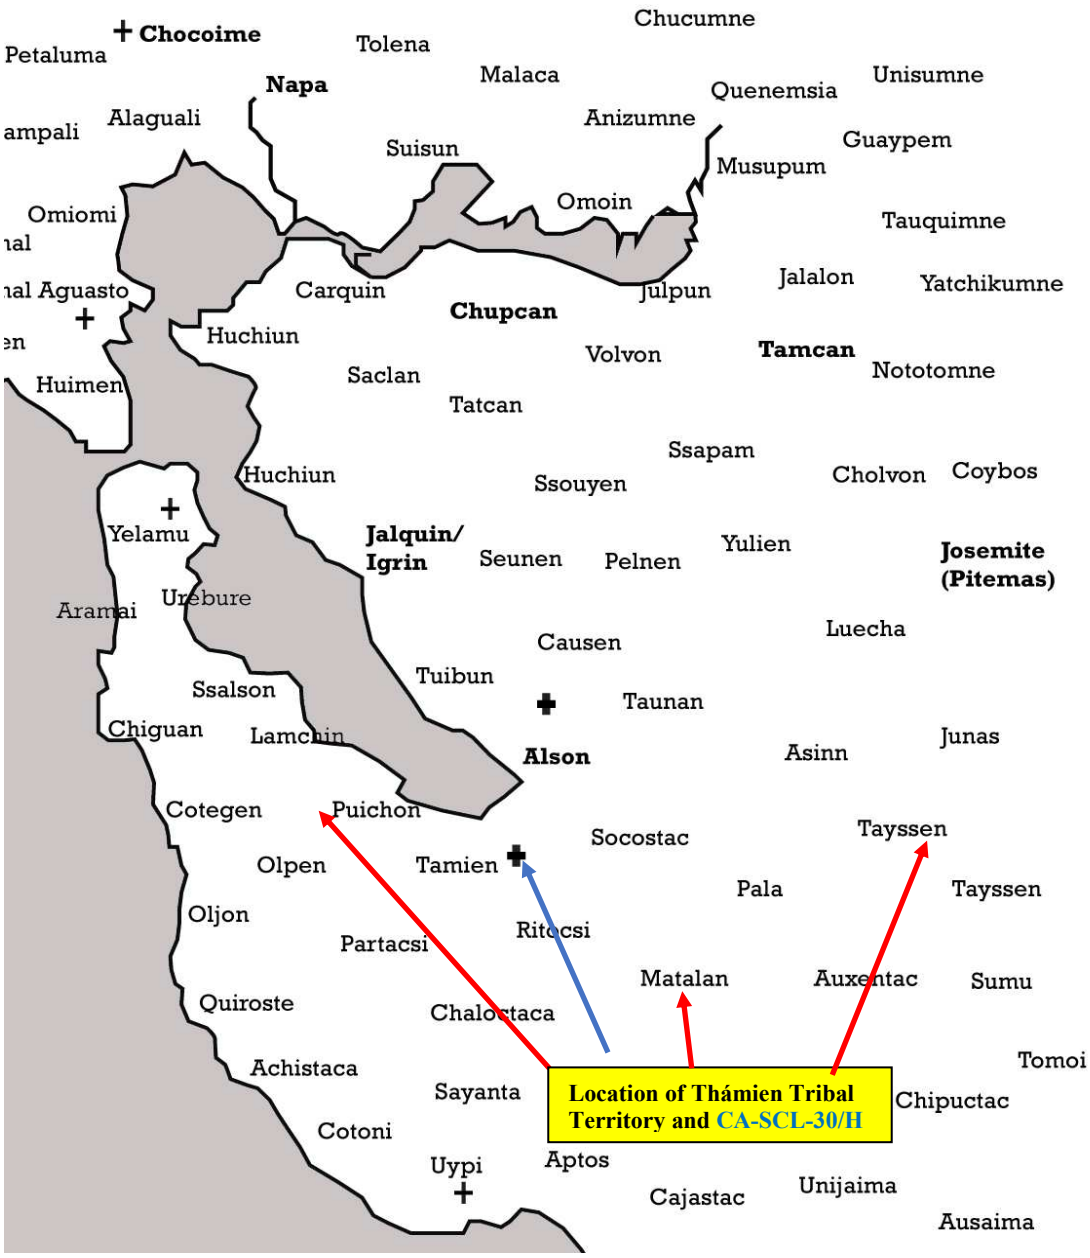
> The Santa Clara Mission settlement lay at the northeastern edge of the **Thamien** tribal district, very near to the lands of three other tribes. ...



Map 2: Distribution of Thámien Ohlone Tribal Groups/Districts and Location of CA-SCL-30/H (blue) in the Santa Clara Valley [From C. King 1994]



Map 3: Distribution of Ohlone Tribal Groups Surrounding the Thámien Region
[From Milliken 1994]



Map 4: Distribution of San Francisco Bay Tribal Groups
[From Milliken 1991]

Figure 1: Indians at Mission Dolores in 1816 [Drawn by Louis Choris 1816]

The missionaries at Mission Santa Clara gave each of them a Spanish designation; San Francisco Solano village of the **Alson** tribe a mile or two downstream at the mouth of the Guadalupe River, Santa Ysabel village of a different, unnamed tribe east of San Francisco Solano on the lower Coyote River, and San Joseph Cupertino village of the **Thamien** tribe in the oak grove about three miles to the southwest of the mission site (1991:117).

Chester King's Almaden Valley Ethnohistoric Study

In 1978 Chester King contributed an important ethnohistoric study focusing on one of the first major Thámien Ohlonean tribal groups to be brought into Mission Santa Clara. This study entitled *Almaden Valley Ethnohistory* was published in **The Archaeological Mitigation of 04-SCL-132, Alamitos Creek** by Archaeological Resource Management (1978). The following subsection presents excerpted information from King's study that principally focuses on the San Carlos Thámien Ohlone-speaking tribal group from the greater Almaden Valley and adjacent areas that were brought into Mission Santa Clara beginning in 1781:

Introduction

The Spanish colonization of the central Santa Clara Valley centered at Mission Santa Clara, where the Ohlone Indians living in the area were concentrated. The missionization program first directed its efforts to recruiting converts to the Church from the native settlements closest to the mission. As the population of these villages was depleted, the missionaries recruited converts from greater distances. The historical evidence indicated that conversions increased following Spanish military expeditions during which native people were killed. Fear of reprisals seems to have been one of the main motives for giving children to the missions or for personally joining the system.

After 1796, the mission population ceased to grow although many Ohlone were recruited every year. Diseases introduced by the Spanish resulted in the deaths of numerous Indians. It seems as though the concentration of people beyond a certain number resulted in increases in deaths as a result of disease. Violence against the native people by missionaries, settlers, and soldiers was also a cause of death. The data in the mission registers indicates that following 1782, many parents of young baptized children died without being baptized themselves.

Mission Recruitment from the San Carlos [Matalan] Tribe

… The people of the San Carlos tribe lived in the Almaden and Coyote Valleys with their tribal center at *Rancho La Laguna Seca.* The *Ranchos* were huge tracts of land, located in the undeveloped areas surrounding the Pueblo de San Jose, used for grazing. *La Laguna Seca* was centered in the Coyote Valley and encompassed the foothills on either side of the valley. *Rancho de Los Capitancillos* contained the Santa Cruz Mountain foothills on the east [west] side of the Almaden Valley, and was probably the "Mountains" referred to in the mission data of the 1780s … .

…. When the missionaries began baptizing people from a settlement, they usually first recruited children who were surrendered by their parents. Later, the Fathers increasingly induced adults to come to the missions. Many adults were often baptized in large numbers following times of major military activity.

… [P]lacenames mentioned in the Santa Clara Mission registers for villages within the San Carlos group illustrate a model of recruitment from the area. As recruitment of neophytes for Mission Santa Clara diminished the size of the settlements closest to the mission, the missionaries began taking people from villages farther from the mission.

… The mission registers … show that in the San Carlos tribe, people who lived in the mountains or *sierra* (*Los Capitancillos*--Almaden) were, in 1781, the first group to be baptized by the missionaries. Following the mountain people, Indians from *Rancho La Laguna* Seca--Coyote (also called *Matalanes)* were then baptized, beginning in 1789. The last date for a baptism of a person from the mountains (Almaden) was September 1790. After 1790, most of the baptisms were from *Rancho La Laguna Seca* (Coyote). This dominance continued until July 1802, then a single baptism in September 1803 was the last recorded from *Rancho La Laguna Seca.* The main villages in the Coyote Valley and remaining settlements of the Almaden Valley were essentially abandoned in 1802. After 1802, most of the people baptized by the missionaries were from a *"Rancheria de Guarto."* In the register, a man named Guarto was baptized #4871. Some of the latest (1807) associations between the mission and the Indians were with a *rancheria* of *Tomoy* which also contributed many baptisms to Mission Santa Cruz.

The information presented [in the Santa Clara baptism registry] shows that prior to 1794 some of the children baptized by the missionaries remained in their native villages with their unbaptized parents. The Fathers usually baptized the children in a settlement first, then tried to convert the parents at a later time.

The [data] also indicates that occasionally old people stayed in their native villages until they died. The relatively high frequency of burials or cremations of children by non-Christian parents demonstrates resistance by many adults to convert.

[The baptismal data also] indicates that a number of non-Christian San Carlos Indians were living in the Pueblo de San Jose at the time that they were baptized, during the later half of the 1790s. The move into the Pueblo was probably prompted by the Spanish military expeditions against the Ohlone in 1794.

Relations Between the Spanish and Indians from 1782 to 1802

Militarism and Baptism:

In January of 1783, Pedro Fages, Governor of Alta California, led a military expedition against *rancherias* in the vicinity of Mission Santa Clara. Father Palou of the mission reported:

> He came back again to chastise some heathen in the neighborhood of Santa Clara who had killed some mares belonging to the settlers of the Pueblo de San Jose. The heathen took up arms, and our soldiers killed two of them without having one of ours even wounded, and being frightened by this they voluntarily gave up some of their children for baptism (Bolton, 1926: 224).

The increase in baptisms in the San Carlos tribe in 1783 … may have been an effect of this expedition. On May 15, 1783, Fages sent a letter saying, among other things, that "the Indians of the *Sierra de San Jose* (Almaden hills) and those around Monterey are very peaceful as a result of the threat made to them, and many have been baptized at Santa Clara Mission" (California Archives 23: 99).

Except for those from close villages, most of the baptisms made between 1783 and 1789 were of children less than eleven years old. The recruitment situation during this time was described by Father Peña on December 31, 1786:

> There are innumerable heathen in the *Rancherias* that surround the mission and only a few of them know [Christianity] from those who have become baptized. We are denied the assistance of the guard in order to go out to allure them, flatter them, and charm them, without which we are unable to assure the fruit that we are after, as we have experimented, visiting from time to time the *rancherias,* to request them humbly [to submit] to the superiority... . (AGN. Mexico: Missions, Alta California, Series 2A, Vol. 2, Santa Clara Archives).

Brutality on the part of the missionaries was both a symptom and a cause for resistance by the Ohlone. When Father Peña of Mission Santa Clara was tried in 1786 for beating four Indians to death, he cited the behavior of Spanish soldiers against the Indians in his own defense. It was probably the Fages expedition of 1783 to which Peña referred:

> ... it has already been two years since the same Captain Dn Nicholas Soler has told and published to the whole province that the Governor (Pedro Fages) had killed with lashes and had commanded the two Sargeants at the Monterey Presidio and the San Francisco Presidio to kill more than twenty heathen Indians. On occasions soldiers use their weapons against the heathen without having encountered resistance. At times the heathen have been left abused by the cruel punishment of being hung in the trees by a foot, by scarifying their buttocks with swords, the soldiers hang them and then beat them with staffs alternating until they have all had a turn (AGN Prov. Internas, Vol. 1, No. 6: 46).

Military Policy in the Pueblo:

A series of dispatches written by Pedro Fages from Monterey and Ygnacio Vallejo, *Commandante* of the Pueblo de San Jose, indicate the 1785 to 1788 policy of the military. This policy was to keep all unbaptized Indians out of the settlement of San Jose, to not trade with the unbaptized Indians, to not allow the Indians to ride horseback, and to maintain an alert guard at the Pueblo because of potential attacks by the surrounding Indians, and to punish any neophyte who came to the Pueblo without passes (California Archives 44: 5-8).

On January 5, 1788, Fathers Peña and Noboa observed:

> ... [the heathen live with some] frequency in the Pueblo de San Jose, where many of both sexes have become semi-domestic servants and laborers of our neighbors. They are allowed to live with their old freedoms and heathen customs; along with these they have learned other unbecoming vices that they acquaint themselves with the Pueblo, and since they get food for their work they reject submission to the yoke of Evangalicism. (AGN Mexico: Missions Alta Calif, Series 2A, Vol. 2, Santa Clara Archives).

The situation of non-Christian Indians living in the Pueblo de San Jose described by Fathers Peña and Noboa was counter to instructions issued by Governor Fages on September 4, 1785. Fages' orders stated that "the Indians should be watched, not let into houses, not allowed to sleep in houses, and not permitted to ride horses, nor herd animals" (California Archives 44: 5). Also, "if anyone goes out in order to trade with the Indians or non-Christians for otter hides that are worth some means ought to be punished, 103 *estoperotes are* required" *(Ibid.:* 22).

These orders seem to indicate that during the last half of the 1780s, interactions between the Spanish settlers, the military, and the unbaptized Ohlones increased. … On April 30, 1788, Arguello reported to Fages concerning an altercation between heathen Indians in the vicinity of Santa Clara Mission and Spanish involvement. He said that Sargeant Amador was dispatched to Mission Santa Clara because of a report that the heathen of the *rancheria* near the mission had fought with the "Mountain Indians," and several mission Indians were involved in the skirmish. Sargeant Amador found two or three Christian Indians, who had gone to see the skirmish, being punished by the missionaries upon his arrival.

After this, Sargeant Amador went around to all the surrounding *rancherias* and scolded the leaders. He was informed that a heathen called "the Corporal of the laborers of the Pueblo" went about calling a meeting to make war against other heathen on account of a woman. He was captured, given several lashes and after being held prisoner for three days was set free (California Archives 4: 261).

A letter by Governor Fages to Macario Castro on January 2, 1790, outlined the degree to which the military should be involved in native disputes:

> When some non-Christians are being persecuted by others who have taken their women, you should persuade them that they ought to return them (the women). Try to make the persecutors see the wrong in what they have done, and tell them that if I know [about it], it will make me angry. Then I will come with many soldiers to punish them. The same approach is to be used if natives of the distant *Rancherias* steal women of their neighbors. The officials should be sent to petition the chiefs with the same council. If, on the other hand, the women have already been captured for some time and are with children, leave them as they are since it is desired that the non-Christians be free" (California Archives 44: 27-29).

Monterey Presidio:

The first year in which non-Christian Indians recruited from the San Jose area worked for the Monterey Presidio was 1790. Indians who lived in the Almaden Valley were probably among those providing services at Monterey, though it seems that the San Carlos tribe was not extensively involved in the labor program. After 1795, it appears that the San Antonio tribe [from the hills to the east of San Jose] provided the Presidio with most of the day laborers and harvesters of hemp.

Men were given a blanket or other payment and provisions of grain in return for working for the Presidio. In correspondence concerning Indian day laborers, *Capitancillos are* mentioned. It is possible that the name *Los Capitancillos,* associated with the Land Grant in the Almaden Valley, *was* derived from "sub-chiefs" discussed in Fages' May 31, 1790 letter to Macario Castro:

> ... neither hatchets nor other types of tools or arms are to be given to the Indians or their *Capitancillos* who struck the Indian woman. They should be admonished that if they repeat their act, they will be punished (California Archives 44: 37).

On July 22**,** 1790, Fages again wrote to Castro, this time concerning Indian laborers:

> Of the twenty-four Indians who arrived, not all are useful. The old ones have little value for the work. Can you see to getting fifty or twenty more and send them.
> The saddened Indian is in grievous condition due to being surprised in his dance. He has been strange, this action was not commanded, but contrary to it.

> In the company of Romero, you go to them. So as to not confuse them, it is best to see the *Capitancillos* and persuade them with suavety and style that four, six, or eight workers should come from each *Rancheria*. In this way they will come … (California Archives 44: 39).

On August 3, 1790, Governor Fages wrote:

> The method of gathering Indians is for the *Capitanejos* to be found and shown the need that the King has of them *(Ibid.: 41).*

On August 22, 1798, Fages wrote:

> Pablo and the other "capitan" came and pledged their aid, with Romero they will gather the Indians in the *Rancherias* that they are able to ... *(Ibid :* 42).

Abandonment of the Almaden Valley:

The mission registers seem to indicate that most of the members of the San Carlos tribe left the Almaden Valley and were baptized sometime around 1795. Abandonment of the valley and joining the Church was probably a result of military expeditions in 1794, which were in reprisal to the Ohlone's slaughtering of Spanish stock animals. In late 1794 to early 1795, following the military action, an increase in the baptisms of adults occurred. Later baptisms listed for the San Carlos tribe are of people who were probably coming from the Coyote Valley and other areas more distant from the mission than the Almaden Valley. The pattern of baptisms from more distant areas seems to indicate that most of the Ohlone had been removed from the Almaden Valley by 1795 (cited from King 1978:39-46 in A.R.M. 1978)

Distribution of Costanoan/Ohlone Languages

Ohlone/Costanoan-related languages were spoken over a considerable geographic area, stretching from the San Francisco Peninsula, Angel Island and the Carquinez Strait to the north (e.g., the bilingual Karkin/Carquin) to a less well defined southern boundary near or inland around Soledad and just south of Monterey Bay on the coast bordering Esselen and Esselen-Costanoan (e.g., the bilingual Sargentaruc) speaking tribal groups.

The interpretive linguistic literature, which includes Kroeber (1910, 1925), Beeler (1961), Levy (1976; 1978), and Milliken (1991) diverges concerning the extent to which the variation between what language was spoken from place to place should be differentiated as either **dialects** of one idiom or as completely separate languages. Levy (1976; 1978) identified eight distinct Ohlone idioms: ***Ramaytush*** (San Francisco Peninsula), ***Awaswas*** (Santa Cruz area), ***Rumsen*** (Monterey Bay and Carmel Valley), ***Mutsun*** (San Juan Bautista), ***Chalon*** (Soledad), ***Thámien*** (Santa Clara Valley), ***Chochenyo*** (East Bay), and ***Karkin*** (southern and northern shores of Carquinez Strait and possibly up to lower the Napa Valley).

Perhaps the most-weighty first-hand study in this regard was initiated by Father Felipe Arroyo de la Cuesta, who was perhaps the first literary person to describe the regional variation and interrelatedness of Costanoan/Ohlone languages. In his May 1, 1814 reply to the Interrogatory of 1812 regarding the languages spoken around Mission San Juan Bautista, Father de la Cuesta stated the following about the Costanoan/Ohlone languages:

> Though they appear to speak distinct languages this is only accidentally true; that is, some of the words are different only because of the manner of pronunciation, in some cases rough, in others agreeable, sweet, and strong. Hence it is that the Indians living in a circumference of thirty or forty leagues* understand one another (Arroyo de la Cuesta [1814] in Geiger and Meighan 1976: 20-21).
> [***Note**: a league equals about 2⅔ miles or 4.3 kilometers]

Aided by the linguistic records written by Father Arroyo de la Cuesta, Milliken (1991) concluded that people who lived in neighboring villages and regions likely would have spoken mutually comprehensible dialects, but that those who lived at the farthest extremes of the Costanoan/ Ohlone area probably would not have been able to understand one another. If, in fact, language variation occurred as smooth clines in this way, then the southern Santa Clara Valley was one of the regions of transition from one dialect to another. The Mission San Juan Bautista Mutsun-speaking dialect, bordered on the south of the centrally located Santa Clara Valley dialect Thámien-Ohlone speaking language area, likely making the Coyote Creek corridor a place where dialectic differences merged or overlapped [see Forbes 1969:184, for the **Muwekma (northern)** and **Mutsun-Rumsen (southern)** divisions of Ohlonean languages; Levy 1976; 1978].

Ortiz (1994a) in her study entitled **Chocheño and Rumsen Narratives: A Comparison** points to this difference by employing Costanoan personal names generated by Milliken from the mission records centering around the terms **Kaknú** (prairie falcon) from the Santa Clara Valley area to the North Bay and **Ka-kun** (Chicken Hawk) which was used in Costanoan speaking tribal territories to the south of Santa Clara Valley (Mutsun/Rumsen –speaking areas within the greater Monterey Bay region):

> Kaknú's use disappears in the personal names of those individuals baptized at Mission San Carlos Borromeo, Mission Santa Cruz, and San Juan Bautista. The similar "cancun," however, occurs in the names of four persons baptized at Mission Santa Clara. Two such names belong to individuals from the Fremont area, one from the San Antonio Valley, and only one outside that area. (Ortiz 1994a:107).

The existence of the **Mutsun** and **Thámien** linguistic boundary was also noted by 19th century historian Frederic Hall in his 1871 publication The History of San Jose and Surroundings:

> … The tribe of Indians which roamed over this great valley, from San Francisco to near San Juan Bautista Mission, (known a century ago as the valley of San Bernardino,) were the Olhones (sic) or (Costanes.)
>
> Their language slightly resembled that spoken by the Mutsuns, at the Mission of San Juan Bautista, although it was by no means the same. (1871:40)

Although Levy strongly implied that language areas were coterminous with areas of ethnic identity, e.g., that those people who spoke the Chochenyo dialect self-identified as the Chochenyo people, there is no evidence to support such a view. To the contrary, regional cultural identities in native California clearly overlapped language boundaries. Moreover, based upon pre-contact inter-marriages, especially among elites, natives (especially women due to village exogamy and patrilocal residential patterns) were more than likely multi-lingual speakers (see Blackburn 1976;

Milliken 1983:70; 1991), which again in the case of the Coyote Creek corridor seems particularly likely amongst the Thámien-speaking San Carlos/Matalan tribal group due to their strategic location bordering north of the Mutsun-speaking tribal groups. [**Note:** for an updated re-classification of the circum-San Francisco Bay Ohlone languages as a single language identified as **San Francisco Bay Costanoan** as determined by linguist Catherine Callaghan, see Milliken et al. 2009].

Evidence of Social Stratification and Hereditary Leadership in the S.F. Bay Area

Clearly, the basic political unit for native Californians, including those of the Thámien Ohlone-speaking tribal groups, was the sedentary residential village (representing one of many within the larger geo-political tribal territory). Pre-contact and contact-period central California tribal geopolitical boundaries, social structures, subsistence-settlement patterns and ceremonial and economic institutions were very complex and social interactions and ritual obligations between lineages went beyond the residential village community (Goldschmidt 1951; Blackburn 1976; Bean 1978; Bean and Vane 1978; T. King 1970, 1974; Wiberg 1984; Luby 1991; Leventhal 1993; Bellifemine 1997; Panich 2020, and others).

Because of the seasonality of subsistence-related activities covering a wide range of the micro-ecosystems (e.g. fresh water creeks and streams, inland lagoons and marshes, bay shore wetlands, coastal, and estuarine resources, hardwood and mixed chaparral forests, grasslands, etc.) that were all possibly located within a single tribal territory, Native families and small multi-family groups may have moved about during the course of a year from one harvesting locality to another all within a half day's trek from sedentary villages or resource-base camps.

These temporary resource-based sites and camps, possibly composed of several temporary house-shelters, contrasted with the larger, permanent (or semi-permanent) strategically situated principal ceremonial village. Thus each tribal group actually occupied a territory dotted with seasonal resource-related occupational and specialized task sites, lesser villages, as well as, semi-sedentary and sedentary villages. The Coyote Creek corridor, with its mostly year-round water supply and mixture of seasonally variable riparian, fresh water marshes, foothill, upland and valley habitats, fits this description well. **Father Paloú**, in 1774, described his encounter with this riparian habitat:

> [We] came to a large bed of a river [Coyote Creek], well grown with cottonwoods, alders, and willows, but without water. We followed this bed along its bank, which was very high and steep, and we made out across the river on a hill to the north of a village of heathen.
>
> We followed the bed of the river and came to a thick wood of several kinds of trees and blackberry bramble which it was necessary to cross, and in it we found some little houses of the heathen, who at the noise we made, left their things and concealed themselves in the thick woods. We crossed, near a village, a good brook of running water, which we soon saw no more, and we judged that it sank into the sand (Bolton 1926: 260).

Encompassing the territorial areas of each tribal group and its macro-resource harvest (catchment) zone were larger regions composed of several villages and their outliers (ceremonial shrines, cemeteries and specialized task sites). The Spanish explorers called these territorial units *rancherias*. Anthropologists have described these larger regions variably. Kroeber (1939, 1962) used the term "tribelet" to denominate rather small multi-village regions that he asserted composed the largest political units in native California.

C. King's (1977) description of pre-contact conditions in the southern Santa Clara Valley offers an early assessment of the political geography of what he calls the "**Matalan** tribelet," who inhabited the Coyote Creek corridor, Almaden Valley and environs just south of the Santa Teresa Hills area to just south of Morgan Hill. Perhaps unsurprisingly, King conflated language boundaries with the political borders of Kroeberian defined tribelets. There is also some confusion between the extent to which villages and multi-village regions composed units of kinship, such as clans, moieties, lineages, or residence groups, which are not equivalent.

Milliken (1991) recognized that villages were residential units composed of several non-related kin groups in the Ohlone/Costanoan areas generally, and the Santa Clara Valley specifically (Milliken 2004; 2007). He also described the larger multi-village regions as political groups that defended large territories. Bean (1976) has shown that intermarriage between village elites constructed regional elites, also described by King (1977) specifically for the **Thámien**-Ohlone speaking **Matalan** tribal territory. Through trade fairs and feasts, marriages and funerals, and other important ceremonial events were part of widespread ritual complexes such as the **Kuksú** religion, such elites were able to intermarry across considerable distances, effectively integrating even larger zones of complex interaction.

As far as these elites and the social hierarchy are concerned, many early explorers made clear that institutions of authoritarian leadership existed among native Californians in the San Francisco Bay area. While Father Arroyo de la Cuesta erroneously wrote "they neither had nor recognized any captain or superior," (Arroyo de la Cuesta [1814] 1976:115), he nonetheless described charismatic individuals who were instrumental in organizing both warfare and peacemaking with neighboring groups.

Milliken (2004) quoting Father Narciso Duran from Mission San Jose:

> They recognize neither distinction nor superiority at all. Only in war do they obey the most valiant or the luckiest, and in acts of superstition they obey the sorcerers and witch-doctors. Outside of these they do not recognize any subordination, either civil or political (Duran quoted in McCarthy 1958: 274).

C. King, by contrast, quoting Father Amoros' description of the natives near Mission San Carlos (Monterey) noted:

> The prominent Indians are the captains or kings. There is one for each tribe. They command obedience and respect during their lifetime. This office is hereditary, or, in default of an heir by direct descent, it goes to the closest relative. This chief alone among the pagans could retain or desert a number of unmarried women; but if he had children by one of them, she was held in higher esteem and he lived permanently with her (King 1977 quoting Heizer 1974: 41).

Bean (1976) concurs that chiefs (often referred to as ***capitanes*** (captains) by the Spaniards) utilized their kin-ties with neighboring elites to facilitate trade relations that acted as insurance against periods of relative resource deprivations, as well as possessing the power to collect and redistribute food surpluses in their own territories.

The power of chiefs and the elite families that controlled chiefly positions were symbolized by the possession of treasure goods which passed down through families over considerable lengths of time. King's ethnohistory of the Matalan (the **San Carlos** Thámien Ohlone-speaking tribal group) describes leadership and social stratification that accords with Bean's framework.

Milliken's view (1983, 1991), while tending more toward a strictly charismatic rather than stratified view of chiefs, also makes clear the importance of leadership among the pre-contact Ohlone/Costanoan peoples. He (Milliken 1983: 55-56) cites Father Vicente de Santa Maria who wrote:

> We noticed an unusual thing about the young men: none of them ventured to speak and only their elders replied to us. They were so obedient that, notwithstanding we pressed them to do so, they dared not stir unless one of the old men told them to; ... [Santa Maria in Galvin 1971 [1775]: 31].

Leventhal (1993:155-157) in his archaeo-mortuary study entitled A Reinterpretation of Some Bay Area Shellmound Sites: A View from the Mortuary Complex at CA-ALA-329, the Ryan Mound also considered the first-hand ethnohistoric observations made by Father Santa Maria in 1775 concerning Native political authority and military capability recorded among the **Carquin (**Karkin) Ohlone tribal group residing on both sides of the Carquinez Straits, in the southern vicinity of the Town of Martinez. Father Santa Maria noted:

> On the 15th of August the longboat set out on a reconnaissance of the northern arm [of the bay] with provisions for eight days. On returning from this expedition, which went to have a look at the rivers, José Cañizares said that in the entranceway by which the arm connects with them [Carquinez Strait] there showed themselves fifty-seven Indians of fine stature who as soon as they saw the longboat began making signs for it to come to the shore, offering with friendly gestures assurances of good will and safety.
>
> There was in authority over all these Indians one whose kingly presence marked his eminence above the rest. Our men made a landing, and when they had done so the Indian chief addressed a long speech to them ... .
>
> ... After the feast, and while they were having a pleasant time with the Indians, our men saw a large number of heathen approaching, all armed with bows and arrows.
>
> ... This fear obliged the sailing master to make known by signs to the Indian chieftain the misgivings they had in the presence of so many armed tribesmen. The ***themi**** (chief) (sic), understanding what was meant, at once directed the Indians to loosen their bows and put up all their arrows, and they were prompt to obey. The number of Indians who had gathered together was itself alarming enough.

> There were more than four hundred of them, and all, or most of them, were of good height and well-built [Santa Maria in Galvin 1971:51-53].

[*Note: The term ***themi*** might be in the root of the place-name **Thámien** in reference to *Capitans* or Chiefs as in the case of the 1842 land grant to Justo Larios' **Rancho Cañada de los Capitancillos** meaning "**Valley of the Little Captains**" located near New Almaden in south San Jose and site **CA-SCL-967**].

Captain Commander Fages (governor of Alta California, Monterey) in 1775 also contributed first-hand descriptive accounts about aspects of aboriginal contact-period political authority, social structure, and redistributive economy among the Costanoan-Esselen groups in the Monterey Bay region:

> Besides their **chiefs of villages**, they have in every district another one who **commands four or five villages together**, **the village chiefs being his subordinates**.
>
> Each of them collects every day in his village the tributes which the Indians pay him in seeds, fruits, game, and fish. ...
>
> The subordinate captain is under obligation to give his commander notice of every item of news or occurrence, and to send him all offenders under proper restraint, that he may reprimand them and hold them responsible for their crimes. ... Everything that is collected as the daily contribution of the villages is turned over to the commanding captain of the district, who goes forth every week or two to visit his territory. The villages receive him ceremoniously, make gifts to him of the best and most valuable things they have, and they assign certain ones to be his followers and accompany him to the place where he resides (Priestley1937:73-74).

Material Culture and Subsistence

The Spanish explorers encountered in central coastal California modes of living which were alien to their sensibilities. While the soils were clearly fertile, the native peoples did not cultivate (with the exception of Native tobacco). The numbers and diversity of wildlife astounded such early writers as Pedro Fages and Fray Juan Crespi, yet through their eyes such faunal abundance connoted untrammeled wilderness; everywhere they traveled they encountered villages and substantial populations of Native peoples. It is only recently that anthropologists have been able to pierce the incomprehension that the Spaniards and other European evinced about native Californian peoples before the latter's ways of life were destroyed by the activities of the former.

The material culture -- in other words the technologies for producing goods and products [technomic, sociotechnic and ideotechnic products (after Binford 1962, 1971)] -- that native Californians created are clearly derived from their adaptation to the landscapes they inhabited and the resources they utilized. Native Californians were sedentary-to-semi-sedentary gathering, hunting and fishing peoples living in an extraordinarily rich biotic habitat who, by their subsistence activities, tended to increase rather than deplete the resources upon which they depended.

Lewis (1973), Bean and Lawton (1976) and Blackburn (1976) were among the first to demonstrate that natives' use of controlled burns augmented the growth of wild grains eaten both by humans and herds of herbivores who congregated around areas humans altered in this way. These practices have been referred to as "quasi-agriculture" and "incipient game management." Fire management also helped to create concentrations of oak trees in specific areas from which harvests of acorns played an important seasonal role in native diets (Lewis 1973; Bean and Lawton 1976; Weigel 1993; Anderson 2006; Lightfoot and Parrish 2009).

Tools manufactured by natives were thus utilized to process the foods obtained from native resource management. Hunters, mostly male (women did engage in rabbit and possibly antelope drives and fishing; (see E. Wallace 1978), flaked ultra-sharp chert and obsidian arrow points, dart points, knives, chopping tools, scrapers, etc., found at the sites of their hunting camps, hunting blinds, and village sites. Such tools could also be used by women to process and cook meat, fish, and shellfish. Both sexes likely contributed to the weaving of string, cordage, rope, fishing nets and the construction of basketry traps for fish and small animals. But women clearly excelled in fiber manufactures: California is renowned as the locus of the finest and most diverse basketry in the world, and the macro-Ohlone/Costanoan region was no exception in this regard. Women utilized porous baskets to leach acorn meal in order to remove toxic tannic acid, and water-tight baskets to cook a variety of meals from different plants, animals and fish. Baskets were used in fishing, for hauling abalone and other mussels from the waterside, and for winnowing wild grain. Very large woven baskets on stilts acted as granaries and very small baskets were used to store jewelry and other commodities (Elsasser 1978; Shanks and Shanks 2006).

Both genders may have worked *Haliotis* (abalone), *Olivella* shells, and colorful feathers were integrated into elaborate necklaces, ear, nose and hair ornaments, and beads woven into dance skirts, headdresses and other ceremonial regalia (Bates 1982). While men and children commonly virtually wore no clothing during the warmer summer months, women used plant fibers and deer skin to fashion skirts and aprons. Ritual regalia and the finery of the social elite were also manufactured from the pelts of rabbits, deer, elk, antelope, bear and wild cat or, in coastal and bay areas, from sea otter and sea lion fur.

Residential shelters were basically round grass or tule and bulrush thatched structures built on willow pole frames, while the larger, excavated semi-subterranean ceremonial buildings utilized for assembly or dance houses and sweat lodges, probably used boughs of hardwood or redwood trees (especially on the West Bay) as center posts for structural support. The sweat lodges and dance houses (***túupentak*** in the Chochenyo dialect, but more commonly referred to in the literature by the Mexican term “temescal”) may also have been earth covered as elsewhere in California.

Ritual Practices and Ceremonial Sites

Of all aspects of pre-contact native Californian culture, religion and ritual evoked the most hostility from Spanish colonial invaders whose observations accordingly are difficult to assess for accuracy. It is clear that performances which in Western discourse are referred to as dancing were central aspects of religious ritual and reenactment of Creation Time, not only in the sense of worship, but also as activities which could themselves positively affect the balance of forces in the world and universe (Bean and Vane 1978).

From the reports and diaries of Fages, Font, Paloú, Crespi, Arroyo de la Cuesta, and others it is also apparent that each region's rituals may have varied in details of procedure, regalia, and song. However, given the view that these rituals were perhaps practiced within a larger framework or ceremonial interaction sphere among neighboring tribal groups, Milliken's caution (2004) that one ought not to draw excessively direct conclusions about the nature of ritual in the Santa Clara Valley from what is known about dance ceremonies conducted by East Bay Ohlones or the peoples of the Monterey region that may be useful, but not necessarily conclusive.

Notwithstanding that proviso, Santa Clara Valley Ohlone tribal groups likely danced world renewal ceremonies and paid a great deal of attention to funerary and mourning rituals as can be ascertained by Late Period mortuary sites (e.g., **CA-SCL-128**, [***Thámien Rúmmeytak***] Holiday Inn Site (Leventhal et al. 2015); **CA-SCL-38, *Yukisma* Mound** (Bellifemine 1997), **CA-SCL-690 Tamien Station** (Hylkema 2007); **CA-ALA-329 *Mánni Muwékma Kúksú Hóowok Yatiš Túnnešte-tka*** (Leventhal 1993); and more recently ***Síi Túupentak*/CA-ALA-565/H** in Sunol (see Byrd et al. 2020).

Dance enabled participants to open and travel through doors between the conscious world and an ongoing supernatural world where the beings who had initiated the creation of the world and of human beings continued to enact mythic dramas. Dancers' regalia were imbued with the power of these rituals, and certain natural locations, such as springs, rock formations, trees, etc. marked nodal points and served as shrines where ritual performance became particularly effective (see Bean 1975; Bean and Vane 1978, Bates 1982, Davis 1992).

Humans could also hallow sacred places through the burial of their ancestors in locations that even the Spanish identified as cemeteries (Leventhal 1993; Font in Bolton 1933 below). This is of note specifically in the case of the analysis conducted at the ***Clareño Muwékma Ya Túnnešte Nómmo* Site (CA-SCL-30/H** – 3rd Mission Santa Clara**)** which contained at least several thousand burials that bridged traditional Ohlonean world view and the transformed/emergent Hispano-Catholic Clareño world view of cemeteries as "sacred places" (Leventhal et al. 2011; Panich 2015, 2018, 2020). This is also of especial note for the purposes of this study since the ***Thámien Rúmmeytak* Site (CA-SCL-128)** contains at least upwards to 100 ancestral burials, and therefore does indeed represent the presence of a large ancient cemetery.

Pedro Font traveling through different parts of the Santa Clara Valley made several observations about the nature of Contact Period Ohlone cemeteries. Near modern-day Gilroy, Font noted:

> On passing near the village I mentioned on the road we saw on the edge of it something like a cemetery. It was made of several small poles, although it was not like the cemeteries which we saw on the Channel [between Santa Barbara and the Channel Islands]. On the poles were hung some things like snails and some tule skirts which the women wear. Some arrows were stuck in the ground, and there were some feathers which perhaps were treasures of the persons buried there (in Bolton 1933: 322).

Even closer to the 3rd Mission Santa Clara Indian Neophyte cemetery ***Muwékma Ya Túnnešte Nómmo*** **Site (CA-SCL-30/H)**, and approximately 3 miles northwest of the ***Thámien Rúmmeytak*** **Site,** Father Font described the following scene within the nearby Coyote Creek corridor located approximately 7 miles southeast of the mission. From his description, it can be understood that the use of feathers and other regalia hung from poles and related structures may not have been exclusive to cemeteries but were established as a kind of shrine:

> At this place we found still standing the poles of the little bower erected in the journey which in September of last year was made by the ship captain Don Bruno de Hezeta and Father Paloú … . We found that the Indians had made a fence of little poles around them, and in the middle had set up a thick post about three spans long, decorated with many feathers tied in something like a net, as if dressed, and with an arrow stuck through them.
>
> On one pole many arrows were tied and from another were hung three or four balls of grass like tamales, filled with pinole made of their seeds and of acorns, or of others of their foods which we did not recognize. In the middle of a long stake there was hung a tuft of several goose feathers, but we were unable to understand what mystery this decoration concealed (Font 1930 [1776]:321-322).

These above ethnohistoric observations potentially provide some of the parameters of ceremonial activity and ritual performance that were carried on at the **CA-SCL-128** site locality (within the ancestral Thámien-Ohlone speaking tribal territory) approximately between 2000 to ~300 years ago when these ancestral Ohlone people died and were buried at what was to be named ***Thámien Rúmmeytak*** by the present-day Muwekma Ohlone Tribe of the San Francisco Bay Area.

The Transformation of Costanoan/Ohlone Societies Resulting from the Impact of the Spanish Empire's Expansion into Alta California (1769-1836)

Based upon the research of many Californian anthropological scholars (e.g., Kroeber 1932, 1939, Goldschmidt 1951; Gifford 1955; T, King 1970, 1974; Fredrickson 1973; Bennyhoff 1977; Chartkoff and Chartkoff 1984; Moratto 1984; Bean and King, eds. 1974; Bean and Blackburn, eds. 1976; and others), prior to the time of contact with the expanding Spanish empire, central California Indian societies had already developed complex social, political, economic and ceremonial institutions that interconnected neighboring tribal groups and regions. This is evidenced by the wide distribution of artifact assemblages, traits and burial patterns found in central California mortuary mounds (sometimes referred to as Shellmounds in the San Francisco Bay Area) especially during **Phases I** and **II** of the **Late Period** (**Dating Scheme B1**: Bennyhoff and Hughes 1987) or during the beginning of the **Middle-Late Transition Augustine Pattern** post-**AD 1020** (Groza 2011; Byrd et al. 2017 the **Dating Scheme D2 Late Phase 1 (L1) AD 1265 –AD 1520** and **Late Phase 2 (L2) AD 1520 – AD 1770** (Groza et al. 2011; Byrd et al. 2019), and also demonstrated by the even wider distribution of the **Kuksú religion** which as stated above geographically ranged from the Salinan tribal groups to the south in Monterey County to the Cahto and Yuki to the north in Mendocino County; (see Mason 1918; Loeb 1932, 1933; Bennyhoff 1977; Bean and Vane 1978; Winter 1978a; Leventhal 1993; Bellifemine 1997; Hedges 2019; Byrd et al. 2020a).

These inter-regional linkages were principally integrated through mechanisms of trade, kinship (especially through marriage alliances of elites), the performance of shared rituals and ceremonial obligations (e.g., Kuksu ceremonies, trade feasts, funerals and mourning anniversaries [see Blackburn 1976]).

Among village elites, for example, the political world clearly did not stop at the boundaries of their own territory. Elites from villages throughout the territory of Ohlone/Costanoan-speaking peoples (and neighboring linguistic groups) married their children into other elite families from important neighboring villages, villages in which Ohlone/Costanoan-related languages may or may not have been spoken by neighboring tribal groups (see Milliken 1993; Milliken et al. 2009).

Intermarriage gave rise to extended kinship networks of multi-lingual elite families and communities, whose wealth and status represented the accumulation of economic surpluses from territories much larger than the village community itself (Bean 1978; Milliken 1990, 1991; Brown 1994). Through elite intermarriage, larger regions were integrated which overlapped and crossed linguistic boundaries (Bean and Lawton 1976; Bean 1992; Byrd et al. 2020a).

Elite intermarriage patterns also facilitated and underscored other regional integrating forces such as trade and ritual obligation (see Blackburn 1976). People from different villages, often distantly related, struck up personal trading relationships, called "special friendships," which often lasted whole lifetimes (Bean 1976). Through networks of "special friends" different foods, tools, and treasure goods were traded from village to village over long distances.

Networks of ritual and ceremonial obligation called together large numbers of diverse peoples for particular occasions, such as the funerals of significant inter-village elite personages (Blackburn 1976). On such occasions, trade fairs also occurred where elites likely arranged the future marriages of their children. Taken all together, the trading of subsistence and treasure goods, the exchanges of marriage partners, and the cycles of ritual and ceremony tied together constellations of kin-based village communities into integrated political, economic and cultural fields led by a small, inter-village elite strata (see Fages 1775 [1937]; Bean 1992). These elite-ruled realms might be described as quasi-chiefdoms or ranked chiefdoms (Service 1962, 1975; Fried 1967; for an archaeological perspective on evidence of social ranking within the San Francisco Bay see T. King 1970, 1974; Wiberg 1984; Luby 1991; Leventhal 1993; Bellifemine 1997; and others).
The paradox of a bountiful environment, large populations, and lack of recognizable cultivation confounded the Spaniards, the first Europeans determined to control what is now the state of California. Elsewhere in Latin America, particularly in the Andes and Meso-America (see Salomon 1981, Rappaport 1990, Smith 1990, many others), indigenous structures of governance and processes for manufacturing commodities were more familiar to European eyes. Therefore, at least for a time following the initial conquest of indigenous civilizations, the Spaniards harnessed indigenous political and economic organization for their own purposes. Because the Spaniards could not cognitively apprehend a civilization whose productive base, economic surplus, and sources of wealth were fundamentally alien, their domination of Californian natives hinged upon completely re-molding their cultures and societies into forms that were comprehensible to European sensibilities.

The Franciscan missions, the method the Spanish Empire used to lay claim to California, may be seen as the process of implanting European political and economic systems. This process required that Native American religions and cultural practices be restricted and eventually forbidden, and later, the destruction of the economic and environmental foundations of native life (Cook 1976b; Castillo 1978).

The missionized Native peoples of the Bay Area and elsewhere in coastal California became a labor force for an emergent agricultural and pastoral economy which obliged natives to leave aside most indigenous ritual and ceremonial practices, as well as the manufacture of many aspects of aboriginal material culture. As agricultural laborers, missionized Indians were largely separated from the seasonal rhythms of their own food production practices, while the growth of mission farms and rangeland for cattle initiated an environmental transformation of the Bay Area and the entire coast that destroyed much of the resource base of the indigenous economy.

Demographic collapse of the Ohlone/Costanoan populations held captive at Mission Dolores at the tip of the San Francisco peninsula, Missions Santa Clara and San Jose in the South and East Bay respectively; Mission San Juan Bautista farther to the south (San Benito County), and the Esselens at Mission San Carlos surrounding the Monterey peninsula occurred because of the horrendous effects of European-introduced diseases, exacerbated by the unhealthy diet and over-crowded living conditions at the missions. Birth rates plummeted from a psychological phenomenon now recognized as post-traumatic stress (Cook 1976a; Rawls 1986; Hurtado 1988; Jackson 1992).

As the populations of Ohlone/Costanoans both inside and surrounding the missions contracted diseases, survivors tended to congregate around the missions, seeking solutions to their seemingly unsolvable problems from the missionaries and colonists who were causing those same problems. Under the circumstance of socio-cultural "holocaust" which took approximately forty years (1769-1810) to unfold, many Bay Area Ohlones may have identified with their oppressors, who seemed to have overthrown and taken control of all of the old systems of spiritual and earthly power, although others may have fled and sought protection with the interior tribes to the east (see Milliken 1991, 1995, and 2008 for a different interpretation that partly exonerates the missions).

In response to the diminution of their labor-force, the Franciscan fathers and civil authorities directed Spanish soldiers to bring in new converts from outlying tribal areas. The neighboring Coast Miwok, Bay and Plains Miwok, Yokut, Patwin, and Esselen speaking peoples from villages located east, north and south of the Bay Area missions became the new cohort of neophytes as laborers, and they intermarried with the surviving "*viejos Cristianos*" Ohlone-speaking peoples (Harrington 1921-1939; Milliken 1978, 1982, 1983, 1990, 1991, 1995, 2007, 2008; Milliken et al. 2009; Panich 2020, and others).

Such intermarriage patterns were, as emphasized above, already established between neighboring North Valley Yokuts, Coast Miwok, Bay Miwok and Plains Miwok, Patwin and Ohlone/Costanoan-speaking elites during the late pre-contact and contact periods. Milliken (1991) discussing common female name suffixes amongst the **Huchiun-Aguastos** Ohlone/Costanoan-speaking tribal group of the southeast shore of the San Pablo Bay region noted:

> The Huchiun-Aguastos spoke a Costanoan dialect most similar to their Huchiun neighbors, and also very similar to the Carquins, if female personal names suffix clusters are good reflections of language. "Maen/main" [mayen] was the most common female name suffix at thirty-one percent, higher than any other Bay Area group.
>
> … Huchiun-Aguastos, Huchiun, and Carquin personal names contains numerous root and suffix syllable clusters common to Coast Miwok, and Bay Miwok names, such as "eyum," "joboc," "ottaca," "saquen," and "tole", suggesting extensive culture sharing in the San Pablo Bay area across language boundaries. (1991:427)

At the missions, intermarriage apparently continued to subtly reinforce sociopolitical hierarchies and older surviving elite families. Even under the triple assault of religious conversion, ecological and economic transformation, and demographic collapse, indigenous political leadership and resistance did not disappear.

In Panich's 2020 study, he contributes to this discussion by stating that:

> In the northern region of Alta California, people of diverse tribal backgrounds bonded together based on the shared experience of living and working at particular mission establishments. Through this pattern of coalescence, mission-based Native populations typically acquired generalized identities associated with the missions themselves (e.g., Clareño, Gabrielino, etc.) but it likely that these externally applied ethnonyms masked considerable internal divisions.
>
> Time was an important variable affecting the nature of mission communities. Indigenous people who were baptized in the early years had, for better or worse, adapted certain aspects of their precontact polities and lifeways to the constraints of the mission system. These people—whom colonists dubbed *Christianos Viejos*, or "Old Christians" – may not have truly embraced Christianity more were they particularly loyal to the colonial order but they nonetheless saw some advantages to aligning themselves with Euro-Americans, who by now were clearly here to stay (Panich 2020:99).

The missions struggled against frequent desertions by neophytes, and armed rebellions occurred at Missions Dolores, San Jose and Santa Clara (Milliken 1983, 1991). Led by **Pomponio** and **Charquin** at Mission San Francisco (early 1820s), by the famous **Estanislao** at Mission San Jose (1828-1829), and by **Cipriano** and **Yozcolo** at Mission Santa Clara (late 1830s), indigenous guerrilla armies combined the forces of both runaway neophytes and natives from villages the Spanish had not yet dominated (Holterman 1970; Brown 1975; Rawls 1986; Milliken 2008; Panich 2020). Yet the Spaniards mostly succeeded in destroying the ecological basis for the indigenous economy, and in transforming the Bay Area peoples and their close neighbors into an exploited, impoverished soon-to-be landless working class.

In Frances L. Fox's 1978 publication titled **Land Grant to Landmark**, he noted that:

> In reality no picture of this period could be complete without mentioning the Indians, as they were the working arms which made it possible to carry out agriculture and other projects needed to provide necessities of daily living. Without them the romantic leisurely days of early California would not have existed, as it was not uncommon for the *ranchero* to have from fifty to a hundred servants in the household. .
>
> Dr. john Marsh, American pioneer of 1836m stated, "Throughout all California the Indians were the principal laborers; without them the business of the country could hardly be carried on. … (Fox 1978:7-8).

It was as indebted peons that the ancestors of the Muwekma, the Ohlone people of the San Francisco Bay Area and elsewhere in Hispanic California confronted the next two stages of European domination, with the secularization of the missions and the ensuing conquest of California by the United States.

West Bay Ohlone Tribal Groups and the Last of the Puichon Descended Indians - The Evencio Family of San Mateo County

Randall Milliken, Lawrence Shoup and Bev Ortiz (2009) had conducted a comprehensive ethnohistoric study for the Golden Gate National Park on the Indians of the San Francisco Bay Area, wrote the following historic account on the Evencio family. Descended from the **Lamchin/Puichon Ohlone**-speaking tribal groups of the West Bay around San Francisquito Creek area, and the Saclan Bay Miwok speaking tribal group of the East Bay, Pedro Evencio (**Figure 2**) and his children were the last of the ***Doloreño*** Indians who had aboriginal descent from the West Bay. Milliken wrote:

> A four year old boy named Yaculo, who was to found the only San Mateo county Indian extended family documented into the twentieth century, was baptized at Mission Dolores on October 31, 1790. He was brought to the mission by his father Gesmon ("The Sun" [also spelled Exmon]) and his mother Ssipiem, San Francisco Bay Costanoan speakers from either the **Lamchin** or **Puichon** local tribe, and he was christened Evencio. Four years later, Evencio's future parents-in-law were baptized. They were Sacalinchi and his wife Uimusmaen, who led the first group of adult **Saclan Bay Miwoks** [from the East Bay] through the baptismal ceremony at the mission in December of 1794; after fleeing in 1795 they returned with a son who was christened Juan Diego in 1798. Their mission-born daughter Geronima, Evencio's future wife, was baptized in June of 1800. Geronima and Evencio were married in about 1826 and had at least eight children between that year and 1844. Their oldest son, **Pedro Evencio**, was the man whose testimony in federal court in 1869 about the eviction of the Indians from Rancho San Mateo ….
>
> … Pedro Evencio's paternal grandparents, Rosendo Exmon and Osana Ssapiem, were baptized at Mission Dolores in 1793 (SFR-B 1231, 1248), three years later than their son Evencio Yaculo. Evencio Yaculo grew up in the Mission Dolores community and married Salaverba, a Huchiun San Francisco Bay Costanoan, in 1804 (SFR-M 953, SFR-B 2747).

Evencio and Salaverba had five children before she died in 1820 …. Evencio Yaculo then married Geronima sometime during the mid-1820s, although no record of the wedding has been found. The seven children of Evencio and Geronima who appear in the Mission Dolores baptismal record were baptized between 1828 and 1844. Since none of them was named Pedro, we presume that he was born in 1826 and that Evencio Yaculo and Geronima were also married that year.

Evencio Yaculo and Geronima raised their children during the Rancho Era at the mission outstation of Rancho San Mateo. Pedro Evencio stated in 1869 court testimony that his father had been the leader of the San Mateo Indian community when Pedro was young. …

Pedro Evencio married Pastora at Mission Dolores in December of 1846. She was a Churuptoy **Patwin** from the present Woodland, Yolo county area by way of Mission San Francisco Solano (SFS-B 1166). The marriage entry lists Pedro as 20 years old and the bride as 18 (SFR-M 2162). Pedro Evencio and Pastora had four children who were baptized at Mission Dolores between 1852 and 1862. Those children were typical mixed-ancestry Doloreños, having as they did a Puichon San Francisco Bay Costanoan/Saclan Bay Miwok father and a Churuptoy Patwin mother.

Figure 2: Pedro Evencio (Photo taken by Mary S. Barnes from Stanford in 1894)

Unfortunately, with the passing of the Evencio family, there are no other known living descendants from either the *Puichon* Ohlone or other West Bay Ohlonean tribal groups that survived into the late 20th century with the possible exception of individuals within the Cordero family (see below).

There are however enrolled members of the Muwekma Ohlone Tribe, who are descendants of *Doloreños*, Ohlone Indians who were brought into Mission Dolores, during the early part of the 19th century from the East Bay. Mission records attest that there was intermarriage between elites from the ***Yelamu*** Ohlone of San Francisco and the ***Jalquin*** East Bay Ohlones during the early Contact Period (Milliken 1991:111; 1995:62).

In 2009, Milliken et al. noted the **recently discovered descendency of the Cordero family** noting:

> Until recently, it was believed that the last known descendent of a native Peninsula group died in the 1920s. We have now learned that Jonathon Cordero, sociology professor at California Lutheran University, traces his family's roots back to Francisca Xavier, a San Francisco Bay Costanoan from the Aramai village of Timigtac, on the Pacific Coast just south of San Francisco. From a wider perspective, hundreds of people are alive today who descend from local groups that spoke the same San Francisco Bay Costanoan language, but lived elsewhere around San Francisco Bay. Additionally, thousands of people trace their ancestry back to tribal speakers of Mutsun and Rumsen, two Monterey Bay Area languages of the same language family as San Francisco Bay Costanoan. The single-language family to which their ancestors all belonged has been labeled Costanoan since 1891, Olhonean (by a few) since the 1930s, Ohlone (by some) since 1978, and Ohlone/Costanoans (mainly by government agencies) since the early 1990s. (Milliken et al. 2009:2).

Milliken et al. also noted about the recent genealogical revelation conducted on the Cordero family that:

> Only one descendent family of San Francisco Peninsula Ohlone/Costanoans can now be identified. The family descends from Francisca Xaviera of the Aramai local tribe (of modern Pacifica) and her husband Jose Ramos (from Tulanzingo, Mexico), who married at Mission Dolores in 1783. Their children and grandchildren considered themselves to gente de razón, and were so considered within the hierarchal world of early Hispanic California. Their modern descendents, who carry the surnames Cordero, Robles, and Soto, among others, **have not participated as Indians in the modern cultural or political arenas** (Milliken et al. 2009:239).

Panich in his 2020 publication set the stage for the post-secularization of the Bay Area missions stating that:

> From secularization [1834-36] to the dawn of the twentieth century, Bay Area Ohlone people faced a new set of challengers spurred by the advance of American settler colonialism. Though the promises of secularization were almost immediately broken by Mexican-period elites, Native people were able to fall back on the skills learned in the missions to maintain economic continuity in California's agrarian economy. In the late 1840s, the dual revolution of American annexation and the Gold Rush quickly transformed the region, and Ohlone families and their

> relations sought refuge in the hills of the southeastern Bay Area as the demographic and political changes radiated outward from the north. There, they found common cause at Alisal and other interrelated rancherias. Indigenous religion thrived at the same time that agricultural work remained an important sources of livelihood despite the rapid urbanization of San Francisco, Oakland, and San Jose. The lives of individual Ohlone are difficult to see against the backdrop of the region's demographic and economic growth during this time, but Native people maintained significant social identities based on precontact and mission ancestry even as they intermarried with each other to perpetuate their contemporary community (2020:141).

1834-1846 Secularization of the Missions and its Aftermath

In the last decades of Mission San Jose's existence, between 1800 and the 1830s under Franciscan administration, the population of Ohlone peoples from the East, South and West Bay had endured such steep demographic declines that, as mentioned above, the mission's fathers were obliged to seek further afield for native people for conversion and to provide the labor to maintain the mission's farmlands, ranches and extensive herds.

As discussed above, many Indians from the Coast Miwok, Bay and Plains Miwok, to the north and east of the missions, and from the North Valley Yokut and Patwin tribal groups as well, were converted at Missions Dolores, San Jose and Santa Clara (Cook 1957, 1960; McCarthy 1958; Bennyhoff 1977; Milliken 1982, 1991, 1995, 2008; Milliken, Leventhal and Cambra 1987). Also as noted previously, marriage exchanges between these tribal peoples followed extremely old and established kinship traditions in central California; intermarriage and strong relations of kinship continued within the setting of the mission, albeit under circumstances Indian peoples found alien, harsh and objectionable.

Notwithstanding the enormously destructive changes missionization wreaked upon indigenous culture and society, the missions themselves were vulnerable to the winds of political change. Situated at the very northern edge of the Spanish empire, central California's history was really a part of a larger Latin American history until the late 1840s.

The Spanish crown had decided to secularize the missions as early as 1813, but the struggle for Mexican independence intervened. Between 1834 and 1836, the Mexican Republic enacted legislation that terminated the missions and proposed to divide mission properties among the missionized indigenous peoples. Yet this division of land and resources did not fully occur in the San Francisco Bay region. Instead, the local families of Spanish-Mexican descent, known as ***Californios***, proceeded to make formal claims upon most of the property owned by missions Santa Clara and San Jose. Large cattle ranchos were created and the *Californios* established themselves as neo-feudal lords (Phillips 1981; Milliken 2008; Milliken, Leventhal and Cambra 1987).

Milliken, conducting research with the Muwekma Tribe for the Interpretive Recommendations and Background Report for the East Bay Regional Park District, noted:

> Under Spanish law, Mission lands were to be held in trust for the Indians until the government felt that they had become enough like Europeans to be considered "people of reason". The Mexican government came under strong pressure during the 1820's to ignore the Indian land rights and open up mission lands to settlement by the families of ex-soldiers and by new settlers from Mexico. The government of Mexico finally gave in to these pressures with a series of secularization acts between 1834 and 1836. On paper these acts protected the Indian land rights. Administrators were to divide mission properties among the Indians, with the left over lands to be allocated to Mexican immigrants through petition.
>
> A veritable landrush began among local Mexican families from San Jose when Jose Jesus Vallejo became administrator of Mission San Jose in 1836. Within a two-year period, an instant feudal aristocracy was formed, complete with a population of Indian serfs. Families such as the Vallejos, Pachecos, Alvisos, Castros, and Bernals gained control of the mission lands and herds. These new land owners continued to live in San Jose, while former Mission San Jose Indians did all the labor on various ranchos (Milliken, Leventhal and Cambra 1987:11).

Thus the ancestors of the Muwekma Ohlone experienced a second abrupt and catastrophic shift in their lives when the Mexican government secularized the Franciscan Missions. Although, as stated above, Mexican law decreed that half of all the mission held lands were to be issued to the newly patriated neophytes, no such lands were formally granted with the exception of three or four individual land grants to several Clareño Ohlone Indian families (see below). Most Indians left the missions to become manual laborers, domestics and vaqueros on neighboring Californio-owned ranchos.

Mexican Land Grants Issued to Secularized Clareño Indians

Rancho Ulistac

Around the area of **Mission Santa Clara**, however, several (**Clareño**) Ohlone families were fortunate to be granted land grants by the Mexican government. In 1845, Governor Pio Pico granted the **Ulistac** land grant near Alviso in Santa Clara to **Marcello** (SCL-B #1360; baptized June 15, 1789 at age 4), whose father Alexandro Seunes (SCL-B # 4577; baptized July 21, 1804 at age 44 and died August 5, 1812) and whose mother Pacanagua (not baptized) were from the **San Bernardino** (district) Tamien Ohlone-speaking tribal group located to the west of Mission Santa Clara.

The Ulistac land grant was also issued to two other Mission Santa Clara Indian men named **Pio Guatus** (SCL-B # 4805; baptized June 21, 1805 at age 12 and died November 21, 1846) and **Cristobal** (SCL-B # 6157; baptized November 7, 1813 at age 3 days) and whose father was Audito Lataig (SCL-B # 4737; baptized June 20, 1805 at age 20) and whose mother Audita Petsilate (SCL-B # 4838; baptized June 21, 1805 at age 20, and died February 1, 1825) were from the **Tayssen** Ohlone-speaking tribal group**.**

As mentioned above, the **San Bernardino** tribal group/district was located in the Stevens Creek, Saratoga and Pescadero Creek water shed region to the west/southwest of Mission Santa Clara (Milliken 1995). **Pio Guatus** and **Cristobal** were traced through the Mission Santa Clara Baptismal records to the **Tayssenes** (and **Sumu**) Thámien Ohlone-speaking tribal group whose territory included the upland valleys to the southeast of San Jose towards the Orestimba Creek drainage and who were located to the east of the **Paleños**/**San Antonio** tribal group (Milliken 1995:229).

Rancho **Ulistac** measured half a league (2270 acres) and included the bay shore of the present-day cities of Santa Clara and Alviso (Brown 1994).

Rancho Posolmi

Earlier, on February 15, 1844, another Clareño Ohlone Indian named, **Lope Yñigo**, was issued title to 1695.9 acres (2.64 square miles) around present-day Moffett Field near Mountain View by Governor Micheltorena (Brown 1994). This land grant was called **Rancho Posolmi y Pozitas de las Animas (Little Wells of Souls).** Apparently, Yñigo was recognized as a chief or ***capitane*** of the "San Bernardino" Ohlone-speaking people who originally occupied this region. He was baptized at Mission Santa Clara in 1789 (SCL-B # 1501; baptized December 26, 1789 at age 8 years old). Yñigo's father Celedonio Samis (SCL-B # 3106; baptized April 5, 1795 at age 4 and died November 8, 1820) and mother Temnen (died before being baptized) were also from the **San Bernardino** tribal district located to the west/northwest of Mission Santa Clara (Huntington Library On-Line Mission Database).

Posolmi land grant was also referred to as **Yñigo's grant**, **Yñigo Reservation** (Thompson and West 1876 Historical Atlas Map of Santa Clara County) and **Pozitas de las Animas**, or **Little Wells of the Souls**.

Although reduced to approximately 400 acres, Yñigo's claim came under review in the U.S. Land Commission of 1852 (Walkinshaw vs. the U.S. Government, Posolmi, 125, Land Case 410) and he retained this small portion of his land until his death on March 2, 1864. Yñigo was buried somewhere on his land which is now occupied by Moffett Field and Lockheed Corporation. After Yñigo's death, it appears that his descendants may have afterwards moved to the Alviso Rancho [(see U.S. Land Commission Index to land Grants 1852, U.S. General Land Office, Posolmi, 125, Land case 410); Bancroft 1886; Harrington 1921-1934; Arbuckle 1968; see: Thompson and West 1876 Map identifies Yñigo Reservation (Moffett Field); Yñigo Rancho by Pat Joyce; Obituary of Yñigo in the **San Jose Patriot**)].

Rancho de los Coches

Also in 1844, Governor Manuel Micheltorena formally granted **Rancho de los Coches** (**the Pigs**), totaling 2219.4 acres, to a Mission Santa Clara (Clareño Ohlone) Indian named **Roberto Balermino**. Since 1836 Roberto had occupied this land west/southwest of the confluence point where the Guadalupe River and Los Gatos Creek meet in downtown San Jose. He built his adobe dwelling in the "Willows" area of what is now part of Willow Glen.

It is interesting to note that Rancho San Juan Bautista borders on the southeastern side of Rancho de los Coches and the ***Clareño Muwékma Ya Túnnešte Nómmo*** **Site (CA-SCL-30/H – Mission Santa Clara)** is located approximately three miles to the northwest of Roberto's adobe/homestead.

Fox (1978) in his publication, wrote about Roberto and his Land Grant stating:

> Undoubtedly Roberto was an Indian of stature as judged by his position of authority with the mission, the subsequent granting of the *Rancho de los Coches*, and the issuing of a "Certificate of Emancipation" giving him full citizenship rights. Such recognition was seldom given to Indians during this period (1978:15).
>
> …An interesting sidelight of the Roberto's Adobe history is that a part of the *Rancho de los Coches* it was a landmark case in the land grant settlements confirming the rights of Indians to hold grants and dispose of them. It was believed unusual for an Indian to receive a land grant , although in the same year 1844, Governor Manuel Micheltorema granted Rancho Posolmi (1695.90 acres) to Yñigo, chief of the tribe inhabiting land now occupied by Moffett Field (1978:21).

Roberto was baptized **Roberto Antonio** on September 26, 1785 at the age of 3 years old (SCL-B # 0791). He was identified as being from the **San Juan Bautista (district)** Tamien Ohlone-speaking tribal group. Roberto's father was Juan Jose, who was baptized on December 4, 1802 at the age of 40 years (SCL-B. #4384). Juan Jose was also identified as being from the San Juan Bautista (district) Ohlone tribal group. Juan Jose's Indian name was **Guascai** and he died on February 7, 1825 (MSC death register #5808). Roberto's mother's name was identified as **Sulum** but there was no additional baptism information.

Rancho de los Coches was adjacent to the aboriginal territory of Roberto's tribal homeland that included the district that the Spanish Priest called **San Juan Bautista** (again not to be confused with Mission San Juan Bautista located south near Hollister). At the age of nineteen (around 1801) Roberto had married his first wife Maria Estefana (this date is based upon the birth of one of their children). Roberto's marriage to Maria Estefana connected him to the **Alson** Ohlone Tribal group of the **San Francisco Solano** district located to the north of Mission Santa Clara (Milpitas/Alviso), and also connected him to the **Santa Ysabel** district to the east hills above San Jose (Brown 1994; C. King 1994).

Maria Estefana was baptized on August 8, 1785 (5 days old) and she was identified as coming from the **Santa Ysabel** (district) Costanoan/Ohlone-speaking tribal group (SCL-B. #0773). Maria Estefana's mother was **Micaelina Antonia** who was baptized at Mission Santa Clara on June 18, 1780 at the age of 18 years. She was identified as belonging to the **San Francisco Solano** (district) Costanoan/Ohlone tribal group (SCL-B #0181). Maria Estefana's father was named **Francisco Gil** by the Spanish priests and was baptized on April 21, 1782 at the age of 20 years (SCL-B #0347). His Indian name was Gilan. Francisco Gil was identified as coming from the **Santa Ysabel** (district) Costanoan/Ohlone tribal group. Maria Estefana died on April 29, 1811,

Approximately 4 years after the death of Maria Estefana, Roberto married a Clareño Ohlone Indian woman named **Manuela**. Manuela was baptized at Mission Santa Clara on November 30, 1804 at the age of 7 years (MSC Bapt. # 4656). Her Indian name was **Chebuunot** and she was identified as coming from the **Rancheria San Antonio** – Sojue(?) district/tribal group located in the mountains to the east of the mission. Forty-four years later, Manuela died on February 17, 1849 (MSC death register # 8207).

Roberto and Manuela sold the rancho to Antonio Sunol on January 1, 1847m for the equivalent of $500.00, and recorded in that deed of sale it states "I am in debt to him [Sunol] for $500, and have no means to acquit myself of this debt. Signed Jose Roberto Valermino … (Fox 1978:23). Roberto died later that year on October 26, 1847 (MSC death register #8053).

Years later, on February 17, 1851, Juan Balermino, Roberto's son renounce any claims to the Rancho, which was sold by his father to Antonio Sunol. Fox noted that "by the end of 1851 the entire family was deceased. They may have succumbed as a result of. The deadly choler epidemic that swept through the valley during that time" (1978:23).
[**Note:** between the summer of 2009 to its grand opening on March 7, 2015, the Muwekma Tribal leadership and Language Committee, brought the history and heritage of Roberto Antonio Balermino and his family back to visibility by naming a public park located at 1527 Almaden Expressway in his honor as a major Clareño Muwekma Ohlone Indian historic figure.]

Rancho La Purisima Concepcion

On the West Bay, a land grant was issued to another Clareño Ohlone Indian man named **Jose Gorgonio** and his family. **Jose Gorgonio** and his son, **Jose Ramon**, were granted **Rancho La Purisima Concepcion** by Governor Juan B. Alvarado on June 30, 1840. This rancho comprised 4,440 acres or 1 square league around the present day Palo Alto/Los Altos Hills area (Brown 1994). **Jose Gorgonio** was probably baptized as **Gorgonio** (SCL-B #1721; baptized July 15, 1790 at age 1½ years). His father's Indian name was **Lulquecse** and his mother's name was **Seguem.** Lulquecse was identified as **Chrisostomo Lulquesi** (SCL-B #2672; baptized November 27, 1794 at age 42 and had died November 5, 1801). He was listed as being from the **San Bernardino** district located to the west of Mission Santa Clara. Gorgonio was also identified as being from the San Bernardino tribal district.

Other Indian Settlements

During the post-secularization period (after 1836), there were at least six Indian rancheria settlements established areas surrounding **Pueblo de San Jose**. One major rancheria was located on the **Santa Teresa Rancho** (Bernal's property) south of the Pueblo San Jose near the Santa Teresa Hills. Another was located in the valley east of San Jose called **Pala Rancho**, while a third was established along the Guadalupe River above Agnew on the **Rinca de los Esteros Rancho** (City of Santa Clara)**.**

In the present-day City of Cupertino was the **Quito Rancho**. In **Pueblo de San Jose**, there was a settlement of "free Indians" on the east side of Market Street, and the sixth community was located further west along the banks of the Guadalupe River near Santa Clara Street (King 1978; Winter 1978a).

Establishment of the East Bay Rancherias

After secularization of the missions, many of the Mission Santa Clara (Clareño) Ohlones, including the **Luecha**, **Santos** and other families, found refuge with their familial cousins residing in the East Bay on rancho lands owned by Californios, especially near the present-day towns of **Pleasanton**, **San Leandro/San Lorenzo**, **Livermore**, **Sunol**, **Niles** and **Alviso** (Harrington 1921-1934).

During the years 1841-1842 some of the surviving Bay Area Mission Indians left the missions and found work on many of these neighboring ranchos as domestics, field laborers, farm hands and vaqueros (cowboys). During this period of time there appears to have been a free and independent Indian community working (and possibly owning) land between the San Leandro and San Lorenzo Creeks located within the aboriginal ***Jalquin/Yrgin*** **Ohlone**-speaking tribal territory near the present-day City of Hayward (see Nicholas Gray Survey Map of 1855; also see Harrington 1921-1934 interviews with Susanna Nichols, Jose Guzman and Maria de los Angeles Colos).

Recent research was conducted into the land claims made by two direct ancestral Muwekma Indian brothers Ancieto and Silvestre who lived on the **San Lorenzo/San Leandro Rancheria**. Detailed information was found in the following publication titled **A Geographic History of the San Lorenzo Creek Watershed: Landscape Patterns Underlying Human Activities. Prepared for the Alameda County Clean Water Program. A Technical Report of the Regional Watershed Program**, published in SFEI Contribution 85. San Francisco Estuary Institute, Oakland, California by, R. Grossinger and E. Brewster, in 2003. The following has been excerpted from that report:

> **Mission San Jose - Rangeland**
>
> In 1796 the alluvial plain surrounding San Lorenzo Creek, from which the Yrgin [Jalquin Ohlone] had harvested grains and hunted wildlife for generations, became part of the Mission San Jose Rancho. Established 15 miles south of San Lorenzo Creek, Mission San Jose constitutes the first major European land use of the area, and a potentially significant early impact to the watershed. The Mission is also the initial center of European development of the southern East Bay.
>
> After the secularization of the California missions in 1834, the lands around San Lorenzo Creek were granted by the Mexican government to several men including Joaquin Estudillo (San Leandro), Guillermo Castro (San Lorenzo Alto), Francisco Soto (San Lorenzo Baja), and Jose Amador (San Ramon) before the establishment of ranchos. During this period, grazing density may have reached even higher levels than during the Mission era. Some accounts put Castro's herd at 10,000–15,000 head in an area of less than 30,000 acres (a density of 1 cow/2-3 acres). As the herds expanded into the Yrgin's lands during this period, the Yrgin themselves probably served as vaqueros, herding the cattle on lands that had been previously their own. The high human mortality rate at the mission necessitated continual recruitment of converts, often using force to cause relocation to the mission. After 1810, many of the converts brought to the mission each year were from the larger populations of the Central Valley, who became the new labor force for Mission system.

The relationship between native peoples and the land has typically been denigrated since European contact (e.g. "In this land of plenty they had scarcely wits enough to keep alive" (Stuart 1951). Yet local tribes not only helped shape the open grassland ecosystem that facilitated the Spanish cattle-based economy, but also largely built the Mission landscape, as the primary source of labor for Mission activities. A rare recognition is found in a cemetery marker near Mission San Jose: "Here sleep Four Thousand of the Ohlone Tribe who helped the Padres build this Mission San Jose de Guadalupe. Sacred be their memory." (Stuart 1951: 39)

The Diramaderos, or "overflowing of the springs", was an array of mineral springs associated with the Hayward Fault. The springs produced a sizable flow (est. 3000 gallons of water per minute, ~6.7 cfs) that had a large zone of spatial influence. Early maps show stream channels extending from the springs across nearly the entire alluvial plain.

The spreading of these waters toward San Lorenzo Creek created an area between the spring channels and the creek that had an unusually high water table and supported extensive willow marshes, or "sausals." The sausals supplied native peoples with building materials and were likely managed, with techniques such as coppicing, to provide straight branches for arrows, baskets, and houses. The groves also provided shade on an open plain, shelter from the winds off the Bay, and probably contained smaller springs. In fact, the one native village in the area that was not associated with the Bay or the base of the hills was located in these groves, and later became downtown San Lorenzo. The water supplied by the Diramaderos may also have been partly responsible for San Lorenzo Creek's perennial flow along its lower reaches. The flowing of the springs at Diramaderos is said to have ended with the 1868 Hayward fault earthquake.

Some writers speculate that as many as 150 people lived in the native village at Diramaderos during the early 19th century, in a community that received unusual legal recognition from the Mexican government. As a condition of the grant to Estudillo, the Indians at the Diramaderos were granted the land "on the meadows" north of San Lorenzo Creek. These wet meadows and "overflow lands" were to be used by the Yrgin as a hunting and fishing preserve (Sandoval 1988: 43).

This stipulation was a rare instance of explicit transfer of lands to an Indian group in the Bay Area. It appears to have contributed to the general confusion regarding the boundary between Estudillo and Soto, making their claims more difficult to pursue in the American courts. Eventually both the Yrgin and the Mexican Rancheros lost ownership of the land to immigrant Americans. A map produced as part of these court

Towns

At the time of European contact, San Lorenzo Creek watershed was part of the lands of the Yrgin people. The Yrgin appear to have been closely related to their neighbors to the north, the **Jalquin,** who lived in the vicinity of San Leandro Creek and the Redwoods, and the **Seunen**, of the present San Ramon-Dublin area to the east. The Yrgins entered Mission San Jose primarily between 1799 and 1805, due to a variety of pressures, including aggressive missionary work, disease, and decreasing food supply.

In their initial contacts, the native people were generally peaceful in response to the newcomers. In an indicative description by Father Font, he reports that "[o]ne Indian who carried his provisions on the end of a pole invited us to eat some of them" (Bolton 1933: 357). In the vicinity of San Lorenzo Creek, Father Font describes the local language as "distinct from all those we had formerly heard," reflecting the cultural diversity of the Bay Area, which supported several dozen distinct tribes at the time of European contact (Milliken 1985).

Studies of the Alameda Creek area, several miles to the south, and other parts of the Bay Area, suggest that indigenous residences shifted seasonally to utilize the resources available at different times of year. Because of the year-round availability of shellfish and other aquatic foods, however, tribes usually maintained some permanent presence in a village on the shores of the Bay. In the San Lorenzo area, the shellmounds located at the northern edge of the vast South Bay marshlands may have been such a village. During winter, migratory waterfowl were hunted in the marshes. During spring and summer, groups spread out to the collect bulbs, greens, and grass seeds from the alluvial plain. They developed base camps and brought materials back to the bayside village for winter storage. In summer and fall, the hills were utilized for hunting deer and the intensive gathering of acorns from groves of oak trees. Seasonal villages were associated with these activities.

Artifacts and historical information suggest that seasonal villages in the San Lorenzo Creek area were probably located at the Diramaderos springs, in downtown Hayward, in the vicinity of the San Lorenzo Cemetery, and at the Holy Sepulcher Cemetery. These summer and fall habitations are located at springs or creeks at the base of the hills that would provide water sources later into the year, or, in the case of downtown San Lorenzo, along the creek in the willow groves downstream of the large spring at Diramaderos. Miller suggests that the Hayward Civic Plaza was a key village site because San Lorenzo Creek provided the only perennial source of freshwater (1975: 10).

Most of the early Spanish and American town centers in the vicinity - including San Lorenzo, Hayward, Alvarado (numerous shellmounds), and Mission San Jose (the Indian village of Oroysom) — were established on native village sites, which had already been identified as the best spots for human settlement. In fact, some of these sites, such as San Lorenzo and Alvarado, had been physically constructed by indigenous communities. Shellmounds several stories high provided an elevated position above the valley floor, removed from floods, and often planted with buckeye trees for shade.

Despite persistent Indian presence in the vicinity, squatters such as Mulford and Roberts were able to establish an American settlement in the shellmounds and willow groves near the Bay during the 1850s. "Squattersville" became the town of San Lorenzo, well-positioned for access to the waterfowl and salt resources of the marshes, and a natural crossroads (leading to its other historical name: "Four Corners").

Roads

When Europeans first explored the Bay Area, they generally didn't have to blaze trails through thick chaparral or tall grass. Rather, they followed the road - "el camino." The first Spanish expeditions commonly record "well-beaten paths," even in places where few native peoples were encountered (e.g. Bolton 1927: 285). Coming up the East Bay in 1776, Font comments that "the road is apart from the estuary, at first about a league and then farther and farther away" (Bolton 1933: 359) and "the road followed the foothills" (Bolton 1933: 361). Anza's diary from the same expedition summarizes the route near San Lorenzo Creek, also notes the grassland-covered hills, conspicuously lacking forest: "the road runs close to a small range completely bare of trees, for none are seen except some which grow in the canyons" (Bolton 1930: 135).

The roads encountered by the Spanish had been etched into the landscape through centuries of indigenous use, connecting villages or towns to local resources and more distant destinations. The Indian road described above linked the Santa Clara Valley with the Oakland area. With the assumption of control by the Spanish government, it became El Camino Real, the only continuous road along the East Bay plain in historical times. Present-day Mission Boulevard (East 14th St./International Blvd. in Oakland) largely follows the original Indian and subsequent Spanish road, but some adjustments were made. …

Despite these variations, many important modern roads generally follow ancient routes. Redwood Road carried felled trees from the neighboring San Leandro Creek watershed down through the less rugged Castro Valley. Marina Boulevard crossed the alluvial plain to Mulford Landing, the shellmounds, and a large salt pond. Similarly, Hesperian Boulevard split off from El Camino south of San Leandro to reach the important shellmounds, salt ponds, and landings on Alameda Creek at Alvarado.

As mentioned above in the study, eventually both the Indians and the Californios lost their ownership of their respective lands as a result of the U.S. land claims commission.

The Muwekma Enrolled Armija Family Descendancy from Silvestre Avendano

Genealogical studies conducted by the Muwekma tribal leadership as well as genealogists, have demonstrated direct lineal descent from Silvestre and his brother, Ancieto through Silvestre's son Jose Elias Armija (aka Elias Aleas Armijo). The following Mission San Jose record information has been identified for Elias Armija's (Jose Aleas) ancestry. Jose Elias Armija's mother **Perpetua SSAUECHEQUI** was from the **Tamcan** Tribal group from around the Byron area.

1809 Mar 16, #1636 **Perpetua SSAUECHEQUI**, Tamcan Tribe
Born: 1807 (2 years old at baptism)
Father: Deceased (gentil difunto)
Mother: Oyojola o Guayaatne
Godparents: Maria Higuera

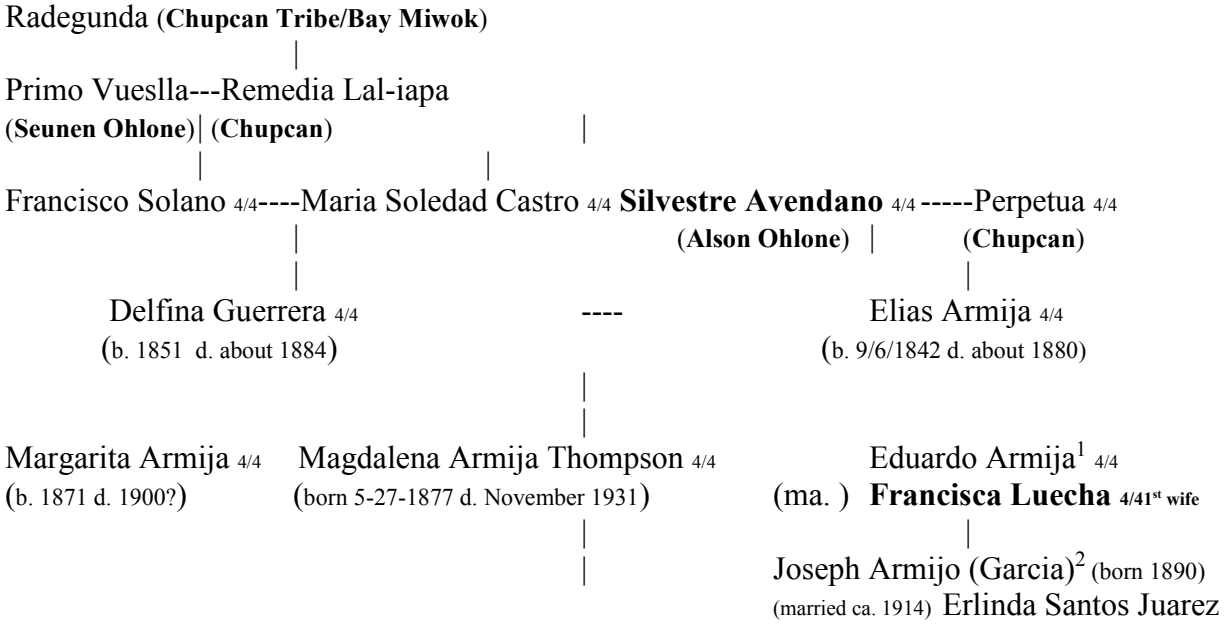
Jose Elias' father was Silvestre (Avendano) who was born February 26, 1800. It was from the baptismal information of one of his siblings **Ancieto** and Fermin that we know that they were from "del estero" which is located on the Fremont Plain within the **Alson** Ohlone Tribal territory:

1800 Feb 26, #292 **Silvestre**, Mission (del estero)
Born: Feb 26, 1800
Father: Crisanto (neofitos)
Mother: Crisanta
Godparents: Teodora Peralta

By 1842, Perpetua Ssauechequi had married Silvestre Avendano in October 1842 and they had a son named Jose Elias who was baptized at Mission San Jose:

1842 Nov 6, #8167, **Jose Elias**
Born: Oct 1842 (1 month old)
Father: Silvestre Avendano (MSJ # 292)
Mother: Perpetua (MSJ # 1636)

The Mission records for Jose Elias document that **Silvestre Avendano** was his father who was also baptized at Mission San Jose (MSJ Bapt. #292).
The Armija Family Ancestry is traced through several generations of Indians. The following is a basic genealogical tree:



|
Alphoso and Daniel Juarez
(b. 1914 and b. 1917)

(children) | (children)| (married) **Chona Bautista** **4/4 2nd wife**
| | |
Belle Stokes (Nichols) Rosa Bernal Cecelia Armija Marine
[bapt. Isabelle S. Olivares] Henry Marshall (born 1900 – d. 1949)
(born 2-19-1890) Roberto Mach (Marshall)
Joseph Aleas Flora Emma Thompson Martel
(born 5-11-1893) Emily Thompson
Ernest Thompson
Eduardo Thompson **(enrolled Muwekma tribal member)**
Lorenzo Thompson, Sr. **(enrolled Muwekma tribal member)**

Another Muwekma lineage having affiliation with the **San Lorenzo Rancheria** included the founding Elders **Liberato Culpecse** and his wife **Efrena Quennato**le who lived on that rancho. Based upon Mission San Jose record studies, the Muwekma Ohlone Tribe has documented that **Efrena Quennatole** [who was the great-grandmother of Dario, Dolores, Isabelle, Ramona, Mercedes, Victoria, Lucas and Trina Marine, grandmother of **Avelina Cornates Marine** and **Francisca Nonessi Guzman**, and the mother of **Maria Efrena** and **Liberato Nonessi, Jr.**] was recalled by Verona Band/Muwekma Ohlone consultants **Jose Guzman** and **Maria de los Angeles Colos** during one of their interviews with Harrington (see below). Mission records suggest that Efrena Quennatole and her third husband **Ybon Uacu-uga**, were living at "**de Rancho de San Lorenzo**" at the time of the birth and baptism of their son Ybon in 1838 (Mission San Jose baptism dated March 31, 1838). Years later, Ybon (Jr.) went through life by the name of Miguel Santos Pastor and he had married Celsa Santos[2]. The following is Ybon's Mission San Jose 1838 baptismal record:

1838 Mar 31,	**Ybon**, "de Rancho de San Lorenzo"
Born:	Mar 16, 1838 (15 days old)
Father:	Ybon
Mother:	Efrena

Based upon his research, Milliken also discovered that during this period of time:

> One group of Indians established an independent community somewhere along the road north from Mission San Jose toward Alameda Creek during the 1840's. The head of the community was Buenaventura, one of the few survivors of the original villages from the local "Estero" area, or bayshore.

[2] On the **1880 Census, Miguel Santos** (age 40); Maria (Celsa), wife, age 35; Hosa S. (Jose Santiago), son, age 15; Maria (Antonia), daughter, age 7; Vincent (Jose Antonio), son, age 5; and Pappoose, son, age 5/12, (born January 1880), were residing in Brooklyn Township, north of the San Leandro Creek near the old San Lorenzo Rancheria, possibly near the old town of Fitchburg (now Oakland).

> Buenaventura had been baptized as a two-year old at Mission San Jose in 1798 (JOB 161). Father Miguel Muro granted a license to Buenaventura, six other adult males and their families on 2 November 1844. His wife Desideria was of a family that had moved to the mission from the Jalalon area, now eastern Contra Costa county. Buenaventura died in 1847. Desideria sold the group's license to an American in 1849. The U.S. Land Commission of the 1850's did not recognize the license as a valid land title, however [Land Case 290 n.d.:11] (Milliken, Leventhal and Cambra 1987).

The "**Estero**" area along the bayshore included the **Chochenyo/Thámien Ohlone**-speaking (bilingual) **Alson** tribal group located along the lower Guadalupe River and the Chochenyo Ohlone-speaking **Tuibun** tribal group of the Fremont Plain. As discussed above both of these groups were first missionized at Mission Santa Clara (Milliken 1983, 1991, 2007, 2008).

1846 - 1870s American Invasion and Post-Conquest Period

Many of the missionized Indians, who had previously labored in the mission's fields and cared for the livestock, were hired on as vaqueros by the new Californio estate-owners, who continued the tradition of controlling indigenous peoples on and near the old mission lands. Yet, many of the formerly missionized Indians who worked on these ranchos opted in some cases to move to the most remote areas of the back-country within their old homelands. At least a thousand former mission Indians lived in the vicinity of Mission San Jose in the early 1840s, and it is likely that more Indians came to the area from the Mission Santa Clara region (History of Washington Township 1904). During this historic period, the part of the East Bay extending north of Mission San Jose up to San Leandro became a region of refuge (especially after the American invasion and conquest of California), to which the missionized Indian peoples of the East and South Bay migrated and in which communities of mission survivors coalesced.

During this period, invasion of the tribal territories throughout California accelerated dramatically and created the third major rupture to the lives of California Indians. Losses of land due to the Bear Flag Revolt of 1846-47 (American Conquest under **John C. Fremont** [**Figure 3**]), Gold Rush of 1848-49, and indifferent enforcement of the Treaty of Guadalupe Hidalgo of 1848 cut off any traditional means of subsistence, and forced the ancestors of the Muwekma Ohlones residing on the East Bay rancherias and surrounding ranchos into even greater dependence on the non-Indian economy.

Figure 3: John C. Fremont
[Note: Sent by his Father-in-Law Senator Thomas Hart Benton to Seize California in 1846]

The transition of power during the Gold Rush years and California Statehood witnessed great changes in policies towards Native Americans in California. One of the major figures to emerge during this period was **Peter Hardeman Burnett** (November 15, 1807 – May 17, 1895) (**Figure 4**) was an American politician who briefly served as the territorial civilian governor of California in December 1849. Burnett was the first elected state Governor of California, who served from December 20, 1849 to January 9, 1851. He was also the first California governor to resign from office.

Figure 4: Governor Peter Burnett

On September 9, 1850, California became the 31st state in the Union and with tensions rising between the newly established American settlers as they claimed more and more Indian lands and committed depredations against tribal groups. Four months later, on January 7, 1851, in Governor Peter Burnett's first address to the California State legislature, he opined that "**a war of extermination will continue to be waged between the races until the Indian race becomes extinct** … ." (California State Senate Journal, 1851; Hurtado 1988:135).

Peter Burnett's legacy is largely mixed. While regarded as one of the "fathers" of modern California, Burnett's openly racist attitudes towards Black people, Chinese, and Native Americans has left a tarnished legacy for himself and California's treatment toward minority groups. Furthermore, while Burnett was serving in the Oregon Territorial Legislature (1848) his attitude toward minorities especially African Americans helped facilitate the exclusion of Black people from that state until 1926. Also, his open hostility to foreign laborers influenced a number of federal and state California legislators to push legislation, such as the Chinese Exclusion Act of 1882.

As mentioned above Burnett was also an advocate of exterminating California Indian tribes, a policy that continued with successive state administrations over the ensuing decades. The State at one point offered a bounty ranging from 25 cents to 5 dollars for Indian scalps.

After California statehood, in 1850, President Millard Fillmore and the United States Congress appointed three commissioners to enter into treaties (the only legal instrument that the federal government had to take land from tribes) with the Indians of California for the purpose of ceding and to have them quit-claim all lands identified within the eighteen treaties which were negotiated between 1851-1852 **(Figure 5).** In return for quit claiming their aboriginal title to California, the tribes of California were to receive, as a set-aside, reservation lands totaling approximately 8.5 million acres along with food, supplies and services (Heizer 1972; Hoopes 1975)..

Although reaching Washington D.C., these eighteen treaties were never ratified by the United States Senate (Heizer 1972; Hoopes 1975). Under the terms of these treaties, the ancestors of the Muwekma Ohlone Tribe were to be the intended "beneficiaries" of two of the treaties: **E. Treaty** of **Dent's** and **Vantine's Crossing,** May 28, 1851 and **M. Treaty of Camp Fremont,** March 19, 1851. Had these treaties been ratified the Muwekma Ohlone tribal communities would have, in all likelihood, been rounded up and forced to move to the central valley.

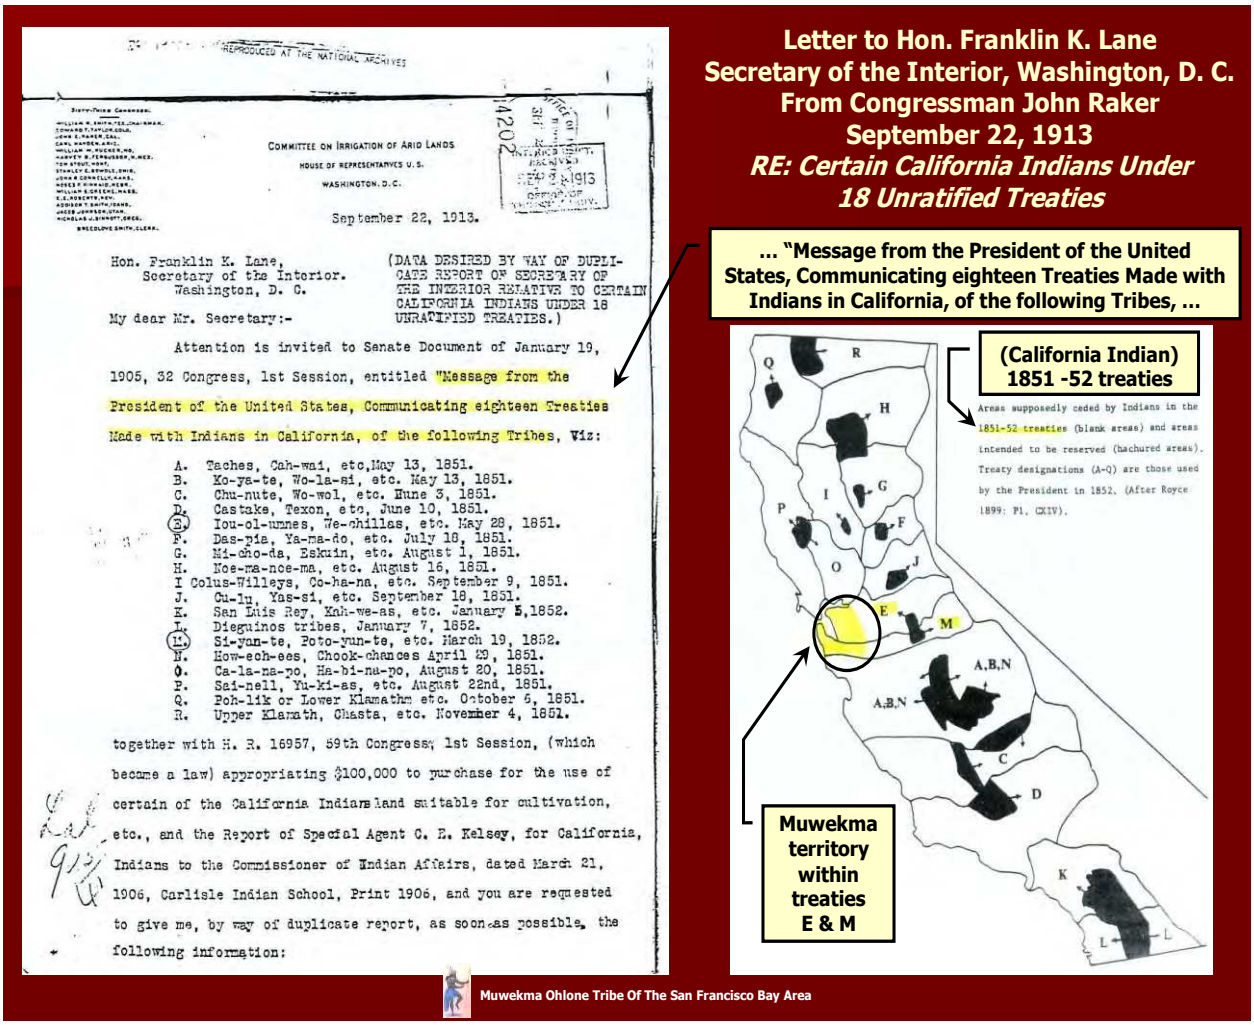


Figure 5: Eighteen Unratified Treaties of California

In a Daily Alta California article about The Indian Commissioners published on January 24, 1851 the author noted that:

> We happen to know something about the commission, something of its members, something of its intentions. Of the commissioners, we can tell the Legislature and Gov. McDougall, what they already probably know that is has ample powers to treat, and form treaties, with the Indians, that they have a *carte blanc* [sic] for that purpose, that they are prepared with proper goods for presents, and can draw upon U.S. officers here for such funds as are necessary. In reference to the members of that commission we may say that we have full confidence in their ability and integrity to consummate their mission in a manner honorable to their government, advantageous to our citizens, and for the best future for the Indians.
>
> As to their intentions and movements. Their intentions are peaceable treaties and extinguishment of Indian titles, if it can be peacefully effected. For this relinquishment of course they are empowered to secure the native occupants for the soil a remunerative consideration in the way of installments or some other equally

> satisfactory and protective, which shall amply pay the Indians for the rights which they yield, and secure to them the means of subsistence (published in Exterminate Them! by Trafzer and Hyer 1999.)

Trafzer and Hyer also noted that:

> … [T]he federal government dispatched three commissioners – Redick McKee, George Barbour, and O. M. Wozencraft – to negotiate agreements with the indigenous inhabitants of California. They negotiated 18 treaties with California's tribes, which the United States Senate rejected. At one time, California's tribes controlled all of the land, water, minerals, and other resources of the region, but under the treaties of the 1850s, they would have lost most of their estate. However, they would have retained for themselves approximately one-seventh of the state as Indian reservations. Even this was too much for whites in California, and the California delegation worked feverishly to scuttle the treaties, so that the native people had little formal relationship with the federal government, so that the state could assert its powers over the Indians. As a result, California allowed whites to steal Indian land, enslave Indian children, rape native women, and murder indiscriminately Indian men, women, and children (1999: 135-136).

As stated above, the newly elected senators from California, argued that the Indians should get nothing, and as a result the 18 unratified treaties were submerged under a seal of secrecy. No one was to know that the United States Government recognized the aboriginal title of all of California, belonged to the Indians facing genocide.

During this transformative American Conquest period between the late 1840s and 1860s, the small steps that the Indian rancherias of the San Francisco Bay, the ancestors of the contemporary Muwekma Ohlone, had taken to revitalize their communities and culture suffered a series of severe blows. The military invasion of California by the United States in 1846 and the subsequent Gold Rush (1849), followed by statehood in 1850, ushered in a new period of genocide against indigenous Californians.

A war of involuntary servitude and extermination was launched against indigenous peoples by the first legislators of the state (Hoopes 1975; Rawls 1986). Laws barred Indians from voting, from giving testimony in court, or from bringing lawsuits (Rawls 1986; Hurtado 1988). At the same time, American laws in most cases refused to recognize the validity of the land titles for the Californios' ranchos (1853 land cases). Coupled with a crippling drought afflicting central California during the 1860s, most of the Californios could not afford to maintain their land bases and were driven off their South and East Bay estates (Wood 1883). New American owners most likely expelled the Indian vaqueros and their families from the land (Milliken 2008; Milliken, Leventhal and Cambra 1987).

Between the decades spanning 1840 and the early 1860s, for reasons that are still not completely clear, many if not most of the remaining Indian people from Mission San Jose, perhaps many from Mission Santa Clara and elsewhere, gathered at several refuges which included the **Alisal (the Alders) Rancheria**, located just southwest of the city of Pleasanton on **Rancho El Valle de San Jose** which was granted to Antonio Maria Pico, Antonio Suñol and Augustin and Juan Bernal on April 10, 1839.

One historic account about the establishment of some of the East Bay rancherias has recently come to light via the oral recollections of Mary Ann Harlan Smith which was recorded by her daughter Emma Smith. Mary Ann Harlan was the daughter of George Harlan who was a wagon master on the ill-fated Donner Party expedition and who led his group successfully into California in 1846/47. Mary Ann Harlan had married Henry C. Smith in 1847 and was living at Mission San Jose at the time of the removal of the Indians to Alisal located between Sunol and Pleasanton. Emma Smith recorded the following account from her mother:

> My husband was appointed the first Alcalde or justice of the peace by Gov. Riley, Military Governor of California. He could speak Spanish very fluently and the Spaniards came to him with their difficulties. My husband and his brother remained in partnership for a couple of years, then his brother sold his interest to E. L. Beard and moved to Martinez. Beard and my husband continued in business for a short time. My husband purchased tract of land two and a half miles from the Mission, and also 800 acres on the Arroyo De Alameda, where he afterwards laid out and named the town of Alvarado. My second daughter, Emma was born in Mission San Jose. … .
>
> I grew very tired of living there, so we built a house on the rancho, near the Mission and moved there. We engaged in farming and stock raising. In the summer of 1850, my father who was living in Mission San Jose died from typhoid fever at the age of forty-eight.
>
> … . **The Mission Indians had a rancheria on our rancho and we often watched them performing their religious ceremonies.** They had a large room dug in the ground and covered with brush and earth, with one door to enter. This place was called a sweet house. The Indians decorated themselves with feathers and all sorts of ridiculous costumes. A fire was built in the center of the room and the Indians danced around it. When one made a trip in those days from Oakland to San Jose, one would see millions of cattle and quite a lot of wheat which was raised by the Indians.
>
> **Cholera broke out among the Indians, and a number of them died.** Their crying and howling and moaning were almost unbearable. My brother Joel, was obliged to take his family and go away where they could not hear the dreadful noise. When I found out that he was going, I had our men take me and my family along. I was very much afraid of the disease. My husband was away at the time. **When he returned and found us gone, he immediately had all the Indians moved to the Alisal, located where Pleasanton now is.** (Emma Smith, 1923). [Emphasis added]

The Alisal Rancheria appears to have been established in the vicinity of a large pre-contact ancestral Muwekma Ohlone village, now underneath or near the Castlewood Country Club (Gifford 1947). The Bernals, who, unlike many of their Californio neighbors, were able to hold onto their rancho lands, continued to maintain their economy with the help of Indian labor. The Bernals also had a long history of sponsoring Indian children as godparents and apparently had children with some of the ancestors of the Muwekma Ohlone.

Furthermore, Muwekma Elder **Maria de los Angeles Colos** (Angela), one of J. P. Harrington's principal Chochenyo speaking and cultural consultants, stated that she was born on the Bernal rancho located at the Santa Teresa Hills (near ancestral heritage site CA-SCL-125) in south San Jose located approximately nine miles southeast from the Third Mission Santa Clara (Harrington 1921-1934; Ortiz 1994a).

From the Santa Clara and San Jose Mission records research conducted by the Muwekma Ohlone Tribe, it was discovered that Maria de los Angeles' parents were Zenon and Joaquina Pico whom were married at Mission Santa Clara in 1838. Angela Colos informed J. P. Harrington that her father was a **Koriak** whom some have thought to be originally from northern Siberia (Ortiz 1995:101). However, C. Hart Merriam in his collection of place names suggested that the "'Koreakka' was a variant of the name for the Karquins (Korekines) … Tribe of South of Suisun Bay, probably same as Karquines" (unpublished Merriam notes, U.C. Berkeley). The Karquins were northern Ohlone.

Other examples of interrelationships with the Bernal and Sunol families are found in the mission records, censuses and historic documents. In the Alisal Rancheria community there was a Clareño Ohlone man named Raymundo Bernal, who was also identified in San Jose Mission records as Raymond Sunol. Mission Santa Clara baptismal records identifies a child by the name of **Jose Raymundo (Bernal)** who was baptized on April 10, 1842 (MSC Baptism # 10219). He was identified as the son of Domingo Bernal and Maria Tacia Sunol who were both listed as "neofitos" (baptized Indians). His godparents were **Antonio Bernal** and Eusebia Valencia.

Raymundo Bernal (Sunol) was married to a Angela Cornelia (**Angela Colos**) and they had a child named **Joaquino Guadalupe Sunol** who was baptized at Mission San Jose on May 15, 1872.

1872 May 15, #1046, Page 211, **Joaquino Guadalupe Sunol** (Indiei) [Indians]
Born: Jul 7, 1872 (probably 1871)
Father: Raimundi Sunol (Bernal)
Mother: Angela Cornelia (Colos?)

A year later, on May 30, 1873, Maria de los Angeles and Raymundo Bernal (Sunol) joined with other Indian couples of the Muwekma community to renew their marriage vows at Mission San Jose. Interestingly, this was done during the height of the 1870 Ghost Dance religious movement (Milliken 2008:90-91).

1873 May 30, #212, Page 62, Jose cum Refugia - This entry holds three marriages.
Die 30, May 1873, coram Maria Selio et Raimundo consentium renovavares J.o Jose cum Rafaela; 2. **Reimendums Bernal (Sunol) et Maria de los Angeles** 3. Maria con Selso.

In 1875, Raymundo Sunol (Bernal) and Maria had their third son, Eduardo Sunol who was baptized at Mission San Jose on December 19, 1875:

1875 Dec 19, #1378, Page 262, **Eduardo Sunol**
Born: Oct 13, 1875
Father: Raymundo Sunol
Mother: Maria (de los Angeles)
Godparents: Philippo & Maria Catharina Gonzales*
[***Note**: Philippo and Maria Catherina Gonzales were Indians from the Alisal community]

the 1880 Census for **Murray Township**, Alameda County (District 26), **Angela Colos** was identified as **Sincion, Anchaline**, (Asuncion, Angeline) Indian, age 30. She was listed as a **widow** and living with her daughters, **Francisca** (**Luecha**), Indian, age 14 (born ca. 1866), Juana, Indian,

age 11 (born ca. 1869), Louisa (Aloisia?), Indian, age 6, Rita (Aloisia?), Indian, age 2. Angela Colos and her family were living eight houses away from **Antonio Bernal, Jr**.

Also on the 1880 Census for **Murray Township**, Alameda County (District 26), a **Ramon Sinol** (Sunol), estimated age 22 (born ca. 1858) was listed as a farm hand in the household of John Kottenger. He was also living not too far from Angela Colos and her daughters. Ramon was in all likelihood Angela and Raymundo's son Joseph who was born in 1862. Raymundo Sunol (Bernal) and his half-sister, **Francesca Luecha** appeared as godparents for another Indian couple in 1882.

Raymundo Bernal was remembered by Muwekma Ohlone Elder **Dario Marine** in 1965, when he was interviewed by members of his sister's family during the time when the Tribe was involved in saving the Ohlone Indian Cemetery located in Fremont from destruction. Dario was born in 1888 and in that 1965 interview he identified the Ohlones who were members of the Muwekma/Verona Band/Mission San Jose Indian community. Dario remembered Raymundo and Guadalupe Bernal stating:

> **Raymundo Vernal [Bernal/Sunol]** was Great grandfather people, so were Lupe Vernal and Jose Vinoco [Binoco] an uncle (Avelina Family History, Dario Marine Interview 1965).

In 1894, Antonio Bernal (most likely Jr.?) and Muwekma ancestor, **Magdalena Armija Marshall Thompson** (b. 1878 – d. 1931) had a daughter named Rosa Bernal who was baptized at Mission San Jose on January 26, 1895:

1895	Jan 26,	**Rosa Bernal** (Indian)
	Born:	Nov 20, 1894
	Father:	Antonio Bernal
	Mother:	Magdalena Armina (Armija)
	Godparents:	Manetta Cosmo* & Petra Igo (Phoebe Inigo Alaniz)

[***Note**: Rosa's Godfather was either Daniel Cosmos or Manuel Santos]

Perhaps, as a consequence of these factors and familial interrelationships between the Bernals, Sunols and the ancestors of the Muwekma Ohlone, the Bernal family was willing to allot a portion of their rancho lands to the Muwekma Indian community which became the Alisal Rancheria.

In other areas throughout the East Bay, small groups of formerly missionized Indians also settled at lesser known rancherias in nearby Livermore (**Arroyo del Mocho**), Niles (**El Molino**), San Lorenzo (**The Springs**) and Sunol (Harrington 1921-1934). All of these rancherias maintained close ties with their Plains Miwok, Bay Miwok, and Coast Miwok and North Valley Yokut neighbors and Ohlone blood-relations as well (Kroeber 1904; Gifford 1926, 1927; Kelly 1932).

The Alisal Rancheria was unquestionably one of the most prominent and important communities of Ohlone Indians from at least the 1860s onward into the early twentieth century, and constituted the first known post-American conquest, Indian revitalization center within the Bay Area.

The people of Alisal and surrounding rancherias revived many dance ceremonies during the early 1870s, which strongly implies that other traditional arts and kinds of cultural knowledge, about ceremonial regalia, songs, sacred language, and crafts also experienced a cultural resurgence. But more than revival took place at Alisal and the other rancherias.

The available evidence depicts a constant ebb and flow of people, of surviving Indians from all over the Bay Area (including **Clareño Ohlones** from the Mission Santa Clara area) and central California moving into and out of Alisal, Niles, San Lorenzo and Livermore rancherias (Gifford 1926, 1927; Gayton 1936; Kelly 1978; Harrington 1921-1934). Thus, many surviving fragments of traditional knowledge and ritual were brought together in this one place, from the many Ohlone peoples, each with their own varying customs and ways of thinking, as well as from the intermarried and neighboring Miwoks, Yokuts, and other more distant tribal peoples brought under the sphere of influence of the missions. Inevitably, a blending of older forms took place, a fusion of traditions and religious beliefs that together generated a new cultural vitality (Gifford 1926, 1927; DuBois 1939).

1870 Religious Revitalization Movement: The Ghost Dance at the Pleasanton Rancheria

During the 1870s, a religious messianic-oriented revitalization movement referred to as "**the Ghost Dance**" spread throughout central California. This first Ghost Dance originated in Nevada beginning around 1869, involved a Paiute prophet named Wodziwob who taught that by dancing certain dream inspired dances, Indian people could end the domination of their land and destruction of their lives by the whites, and usher in a new golden age for all Indian peoples (Du Bois 1939).

At Alisal, the ancestors of the contemporary Muwekma Ohlone combined elements and doctrine from the imported Ghost Dance with the ancient **Kuksú** Religion, regalia and compliment of dances, the World Renewal Ceremonies as well as other rites practiced throughout central and northern California (Gifford 1926; Loeb 1932, 1933; DuBois 1939; Bean and Vane 1978). So potent was the syncretic combination derived by the people of Alisal (and the surrounding rancherias) that non-Christian Native American missionaries were sent out from there to preach the new religious doctrine to other indigenous peoples to the east, south, and north of the Pleasanton (Alisal) Rancheria (Gifford 1926, 1927, 1955; Kelly 1932, 1991; Gayton 1936; Field et al. 1992).

Berkeley Anthropologist Edward W. Gifford visited the Livermore and Pleasanton region in 1914 and the Alisal Rancheria in particular. Still later, as a result of field work conducted in the interior amongst neighboring central California tribes, Gifford reported in his Miwok Cults (1926) and Southern Maidu Religious Ceremonies (1927) that his principal cultural consultants recollected that the songs, dances and regalia were brought to them by three non-Christian missionaries from the Pleasanton region. These three teachers were **Sigelizu**, who taught the following dances to the Central Miwok: *Tula*, *Oletcu, Kuksuyu*, *Lole*, *Sunwedi*, *Sukina*, *Kilaki*, *Mamasu*, and *Heweyi*. Another man named **Yoktco**, from Pleasanton, introduced similar dances to Southern Maidu, while a third, named **Tciplitcu** taught these dances to Miwoks and North Valley Yokut people at Knight's Ferry.

Interestingly, all three teachers had non-Hispanic or non-Anglo names, thus perhaps representing through a revitalized religious doctrine a rejection of the colonial (alien) order. Knight's Ferry is on the Stanislaus River, in ***Lacquisamne*** North Valley Yokut tribal territory (see information relating to the Estanislao rebellion), showing continuous ties to the area throughout the 1870s.

The *Lacquisamne* tribal region is also where Muwekma Elder Jose Guzman's maternal grandmother, Nimfadora, originally came from in the early 19th century (Milliken, Leventhal and Cambra 1987; Milliken 1991; see MSJ baptismal record # 4276, September 26, 1820).

Ethnographic information from the Coast Miwok region on the Marin Peninsula recorded by Berkeley anthropologist Isabel Kelly 1931-1932 (1932, 1978, and 1991) who independently provided other accounts about how important the Pleasanton/San Jose Mission [**Verona Band**] region was to the Coast Miwok and demonstrates the ebb and flow of contact between Marin and Pleasanton areas during this period of time. Tom Smith and Maria Copa were two of Kelly's principal Coast Miwok linguistic and cultural consultants. Kelly inquired from them "Did they dance Kuksui at San Jose?" Maria Copa's response was:

> I should say so. My grandmother said that the people here had to buy Kuksui Dance from the San Jose people. All of those songs are in the San Jose language (Kelly 1991:354).

There were also specific references to Mrs. Martha Guzman (herself a Coast Miwok and Costanoan descendant) from Marin regarding the *kawai-yoyolomko* (horse eaters) [Costanoans]:

> This is what the people around Redwood City were called. Mrs. Guzman's father belonged to those people. I saw Mrs. Guzman last night. Her father came from Santa Clara, although once before she said Redwood City (Kelly 1991:355).

Jose Guzman (born around 1853) was one of the last knowledgeable singers from the Muwekma community until his death in 1934 (Harrington recorded 27 songs at Niles in 1930). He recollected songs that he and his father were introduced to while visiting other Indian communities to the south at Missions San Juan Bautista and San Antonio (and possibly San Carlos/Carmel) during the time the 1870 Ghost Dance was in its full height.

Although not mentioned by name, Berkeley anthropologist Cora DuBois attempted to interview Jose Guzman in 1934 as part of her 1870 Ghost Dance Study stating:

> In the central portion of California which lies to the north and south of the Sacramento delta there occurred during the 1870's an interchange of dances and ceremonies.
> Gifford described a portion of these movements when he presented data concerning the Pleasanton revival. One man from Pleasanton, called Yoktco, took the Kuksui and other dances to the Nisenan of Ione; while Sigelizu, also of Pleasanton, imported a series of dances to the Central Miwok of Knights Ferry. Gifford is inclined to attribute the Pleasanton "revival" and the spread of dances from there to the 1870 Ghost Dance. …

> Unfortunately, the last survivor of the Pleasanton period is unable to throw light on the tentative suggestions of Gifford and Gayton. Repeated attempts to elicit information were useless because his physical disabilities and senility. (1939:114)

U. C. Berkeley ethnographer Edward Gifford during the early twentieth century interviewed various Maidu and Miwok elders who remembered aspects of the 1870 Ghost Dance religious revitalization when they were young. These interior Miwok elders recollected that "there appeared... teachers of dances who came from the west" (Gifford 1926:400). As mentioned above, based upon Gifford's interviews with both Miwok and Maidu elders they identified the names of three of these missionaries: **Yoktco**, who preached among the Southern Maidu; **Sigelizu**, himself a Plains Miwok, who came to the Central Sierra Miwok; and **Tciplitcu**, a Costanoan/Ohlone man who taught the dances to the Plains Miwok were known to have come from the Pleasanton area (ibid).

Gifford wrote the following background information about Yoktco and his ties to the northern Ohlone/Bay Miwok region in his 1927 Southern Maidu Religious Ceremonies:

> Yoktco, the introducer of the third and latest stratum of dances was said by informants. To have dwelt in the vicinity of Mt. Diablo (regarded by the Indians as the home of spirits), Contra Costa county. Actually he lived at the Indian settlement near Pleasanton, Alameda county, but that fat of dwelling near the great mountain, which is visible over a large area in central California, seemed to impress the informants more and may have been also impressed upon them by Yoktco.
>
> …At dancing time Yoktco spoke a strange language, Yokuts or Costanoan perhaps, both of which he would have become acquainted with at Pleasanton, where he resided the Indians formerly gathered at Mission San Jose, Alameda county.
>
> When Yoktco cam eto Ione, in Northern Miwok territory, to give instruction he brought dancers from Pleasanton to show the Ione people the steps. He also taught his dances at Folsom in Southern Maidu territory,. There he taught *hiweyi*, *kilaki*, *kuksui*, (with two performers called *kuksu*i and *musil*), *mamas*, and *ta* (Gifford 1927:229-230).

Also as mentioned above, all of these men's names are in their respective indigenous language, whereas after missionization, Costanoan/Ohlones, Miwoks, Yokuts, and their descendants were given either Hispanic or Anglo Christian names when baptized. A more generalized revival of indigenous names may have also taken place at Alisal as well as on the other rancherias in order to "reject" the older imposed colonial system. Although the Ghost Dance did not achieve its full objectives, its fluorescence at Alisal and at the other rancherias demonstrates the depth and conviction of indigenous identity and culture in the East Bay during the late nineteenth and early twentieth centuries.

Furthermore, cultural ties to the interior tribes continued to be maintained during the 1940s and later years, especially by Dario Marine and his son Lawrence Domingo Marine who had married Pansy Potts (daughter of Marie Potts) who was from one of the Maidu tribal groups. Dances that

were exported from Pleasanton continued to be danced by members of the Miwok, Nisenan and Maidu tribal communities into the present day (see Gifford 1926, 1927; Du Bois 1939). The children of Lawrence Domingo Marine (Lawrence Mason Marine and Marvin Lee Marine) were taught tribal dances and continued the tradition of dancing with these interior tribal communities to present day and some of these dances have been recently reintroduced back to the Costanoan/Ohlone area (News from Native California, Vol. 7 No. 3, 1993). More recently Marvin Lee Marine (Maidu/Muwekma) has reintroduced traditional dances back to the Costanoan/Ohlone region, with the Amah-Mutsun Tribal Band having learned some of the dances from him. His older brother, Lawrence Mason Marin, recently passed away on December 22, 2020.

A number of published and unpublished documents also record the lifeways and linguistic complexity of the Alisal Indian community or as it also came to be known after the construction by Western Pacific of the Verona Railroad Station nearby, the "**Verona Band of Alameda County.**" In 1880, French linguist Alphonse Pinart recorded a detailed North Valley Yokuts vocabulary from the mother of Phoebe Inigo Alaniz, **Maria Trinidad Gonzales** at Alisal (Kroeber 1908; Merriam 1955). Other languages were also spoken, particularly the Plains Miwok **Ki'k** (meaning "water") language, as well as the Chochenyo and Thámien Ohlone dialects as well as other Costanoan idioms (Curtin 1884, Kroeber 1910; Gifford 1914; Mason 1916; Harrington 1921-1934; Milliken, Leventhal and Cambra 1987). It was Phoebe Inigo Alaniz and her mother Trinidad Gonzales who raised two of Mercedes Marine's sons, Albert Arellano and Thomas Garcia, after Mercedes died in 1914. Albert Marine, who was born on the Alisal Rancheria was the grandfather of Muwekma Vice Chairwoman Monica V. Arellano who is also the lead author on this ethnohistory.

LATE 19TH CENTURY: EAST BAY RANCHERIAS

Muwekma Community Identified as the "Nusbaumer Indians" by the News Media

During the 1880s to the early 1900s the Muwekma Ohlone tribe and members of their community occasionally appeared in the various Bay Area newspapers. Other than referring to them just as Indians, they were at times referred to as the **Nusbaumer Indians** because the **Alisal Rancheria** was located on the land purchased by **Carl Duerr** and **Louis Nusbaumer** that was part of the old Bernal-Sunol-Pico ***Rancho El Valle de San José*** **(Map 5).** Furthermore, various articles written by members of the dominant society, in one newspaper, the *San Francisco Call* on December 29, 1889 published caricatures of some of the notable people of the Pleasanton area including one of the "Nusbaumer Indians," as well as another article in the *Daily Alta California* casting negative impressions on the surviving members of the ancestral Muwekma Alisal/Sunol/Niles communities.

> **Daily Alta California, Volume 80, Number 167, 16 June 1889**
> **A DECAYING TRIBE.**
> **Chief Avencio and His Four Score Subjects at Sunol.**
> **Once There Were Hundreds**.
>
> **The Story of Their Life as Told by Those Who Have Lived Among Them in the [Sunol] Glen— A Doomed Race**.

The story is the old one of whisky, disease and indolence, which have always marked the contact of high pressure Caucasian civilization with the rude habits of the savage whom he found in possession of this continent through all its width of forest, mountain and prairie between the two oceans. But in this story the chapter of violence has never been written which has been so prominent in the other tales of Indian affairs, and for that much one should be thankful; the story of the Indians of Alameda county is not blotted with the record of midnight raid and vengeful reprisal; rows of scalps do not dry in the smoke of the lodges, and murdered settlers not lie bleeding on the edges of their clearings.

It is a story of the survival of the fittest, which is the strongest, of the steady, merciless extinction of the lower race before the higher. What remnants have they left? A shell mound on the bay shore, two more on the encinal shore of the basin, a few forgotten burial places in the marshes or the canyons in the hills, just one topographical name and some eighty people slowly dying in **Sunol Glen** and at **Niles**. Once they covered the land. The mission priests of the rule of St. Francis found them numerous enough a century ago to found for their instruction the Mission of San Jose, where pious fathers taught native catechumens that Christian civilization of progress which has killed them. In the childhood of men yet young there were still hundreds of them, and now but four score may be found. Who knows aught about them?

Neglected by the church, **forgotten by the Government**, they linger in the canyon of the Alameda where passers on the railroad sometimes catch a glimpse of the brown shimmer of their skins as they wade the creek in search of fish; the curious may have caught a phrase or so of their guttural speech, but it is probable that there is not a white man in the county who knows by what name they call themselves. Long years ago the **Nusbaumers** settled in the narrows of the Livermore valley, first at Pleasanton, later on a portion of the **Rancho el Valle de San Jose** at **Sunol**. The Indians then were thick all about them, and it is from conversation with the two brothers, **George Nusbaumer**, the County Surveyor, and **Emil Nusbaumer**, of the District Attorney's office, that this fragmentary account of the remnants of the Indians has been drawn.

Wherever, in the pastoral days of the land, there was a Spanish rancho, there was always in the neighborhood an Indian rancherie, whose people were practically peons of the Spaniards.

But they led an easy life, their services were only seldom required, and meanwhile they were not ill-treated, and received a fair provision of food in case of need; but the land was such a savage paradise, so filled with all sorts of game, that the food supply rarely gave them concern. When the Nusbaumers lived at Pleasanton there was a large rancherie on the Bernal portion of the rancho, and the Indians were all about.

When they moved to the old homestead in the glen the chief, **Avencio**, [although this is the name of Jose Guzman and his father Habencio Guzman, this might be mistaken as the name of **Captain Jose Antonio**] who still lives, came to ask permission to

build a rancherie on the property, which was granted, and the Nusbaumer boys had, therefore, good facilities for watching the Indian life.

In this rancherie were nine large houses, a temescal, and a number of smaller houses. These structures were uniformly four sided, with a pitched roof. The walls were formed by driving stakes of the proper length and then weaving between them osiers and reeds tied with rawhide. Over this was plastered adobe. The roofs were made of tules and were quite water-tight. The floors were always the natural soil stamped hard and even. It was characteristic of the tribe that though they carefully eschewed any neatness about their persons, their houses were kept very clean, and before each was a little area where no rubbish was allowed to lie. A sweat-house, known in the native tongue as a "temescal," [*Tupentak*] was a prominent feature of every rancherie. It was always built near some pool in the creek, and was generally partly underground. A pit was dug about four feet deep, and some fifteen feet across, and over this was built a penthouse with a small vent in the top. The only entrance was through a little passage some ten feet long, which would allow a man to enter by crawling, and at its inner end was a door, which could be closed so as almost completely to exclude the air Into this they were wont to crawl whenever ill, build a fire on the floor and fill it with cobbles, and when they were sufficiently heated, deluge them with water, while the patient sat in the hot cloud of steam until he could bear it no longer, when he crept out of the temescal and plunged at once into a cool stream.

The people were well formed and rugged, and rarely had an illness before they were contaminated by the vices of civilization. Men full six feet in height were not uncommon. Quarrels with white men were unknown, and among themselves were rare, except when they were drunk. Though it is contrary to law, whisky is constantly sold them, and they are no good until the whisky is all gone. They retain no traditions of their former history and religion, or if there are any such they are too taciturn to communicate them even to those who know them best. They are in the main kind to their women, rarely abusing them, though, according to savage custom, making them do all the hard work. Marriage is simply cohabitation, and divorce was equally simple. Their families seem never to have been large, and are now smaller than ever. Most of those still remaining are of the pure blood, and the few half-breeds are, as usual, endowed with all the characteristic vices and none of the virtues of their parent stocks.

For food they used the native vegetables, game and fish, and the refuse of the ranches, being quite content to feed upon a cow that was found dead in the pasture, and which no white man would touch. They are expert fishermen, and are fond of the big dace [minnow family] and suckers in the Alameda. These fish they sometimes caught with spears and sometimes by building elaborate fish traps composed of dams and weirs. More commonly they made use of a recumbent weed which grows everywhere along the creek, and is known only as the "fishweed" [Yerba de Pescado].

The leaves and stems of this they were in the habit of bruising to a pulp and then throwing into a pool. Soon all the fish for a considerable distance around within reach of its stupefying influence floated to the surface, belly up, and were brought to shore. The poison was only temporary in its effect, and never had any bad effect upon the food value of the fish. They would seem never to have had any hooks, but were experts in the use of slip nooses of horse hair, with which they were very deft in catching fish of even considerable size. Their customary drink was a decoction of the parched acorns of the live oak, which **Emil Nusbaumer** describes as not unpleasant to the taste.

They seemed to know almost by instinct when the sturgeon were running in the San Joaquin, and all the men organized a great party to cross the mountains and spear the fish. Sometimes they smoked the sturgeon and brought a supply home, but more commonly they feasted and speared and speared and feasted, until they were gorged. Similarly, they were in the habit of forming parties to go down to the salt marshes and net ducks. Smoked duck and jerked beef were the only provisions that they ever stored, and not much of either. They were never known to beg for food; and in general begging was not characteristic of them. One of their greatest delicacies was the flesh of the chickenhawk.

Twice a year they had great dances, and the custom is still kept up. This is about the only occasion in which the chief seems to have any power over the tribe, and even then it is but ceremonial. One dance comes in the spring, about the time when the berry crop is at its best, the others along later when the watermelons are most abundant. Sometimes the dance is held in the temescal, but more often in the woods, where an area some fifty feet in diameter is cleared and surrounded with handles.
In the center is a fire, and about it dance men and women painted with bars of red and white across their cheeks and clad in costumes of reeds and feathers. About the fire they dance and whoop and yell, while an orchestra of eight or ten men sing in agreeable cadences monotonous tones to the accompaniment of split sticks, which they shake in regular measure. Sleeping by day and dancing by night they often consume a week at a time, and can give no explanation except that the custom is traditional.

On the death of an Indian the women sit around and howl for a day or so, the length of the howling time being dependent upon the degree of consideration in which the dead was held. After a sufficient howl the body is encased in a plain box and put in the ground without further ceremony. A favorite burial ground up to within the last dozen years was on the first little hill this side of Pleasanton, on the lands of Neal. Those who best knew them rarely learned any words of their native language, which is still used by them universally in communication among themselves. Two salutations are all that are known — wellawella* huga for "good morning," and for "good night" wellawella hi. Such and so much is what is known of that swiftly vanishing tribe known in default of a better name as the **Nusbaumer Indians (**Daily Alta California, Vol 80, No. 167, 16 June 1889).
*[Note: **welwel** means “good” and **hi** means “sun” in the Plains Miwok “kik” language spoken at the Alisal Rancheria (Barrett 1908:366.]

Brief Background on the Nusbaumer Family (1856-1878)

Louis Nusbaumer and his wife Elizabeth (Roth) Nusbaumer lived in San Francisco until the fall of 1856, when they moved on an eighty-acre farm on Dry Creek, Washington Township, Alameda County, which was purchased by Carl (Charles) Duerr for Nusbaumer and himself. In October, 1857 Duerr and Nusbaumer (**Figure 6**) had rented the estate of John W. Kottinger, which was situated in Murray Township, embracing the larger part of the present town of Pleasanton. Their business consisted of merchandising and sheep-raising. At the expiration of their lease in 1862, they bought a joint interest in the old Bernal-Sunol-Pico ***Rancho El Valle de San José*** consisting of some three thousand acres, where they made their permanent home.

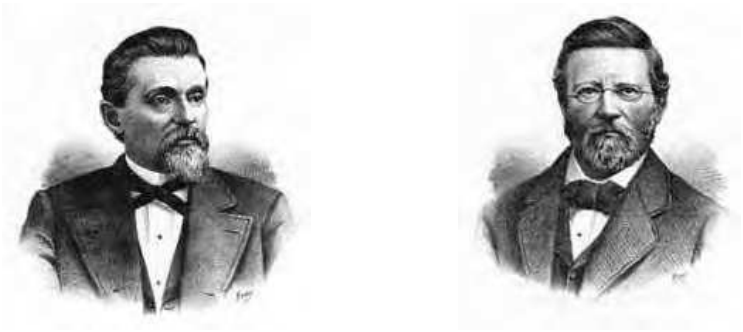

Figure 6: Portraits of Carl Duerr and Louis Nusbaumer

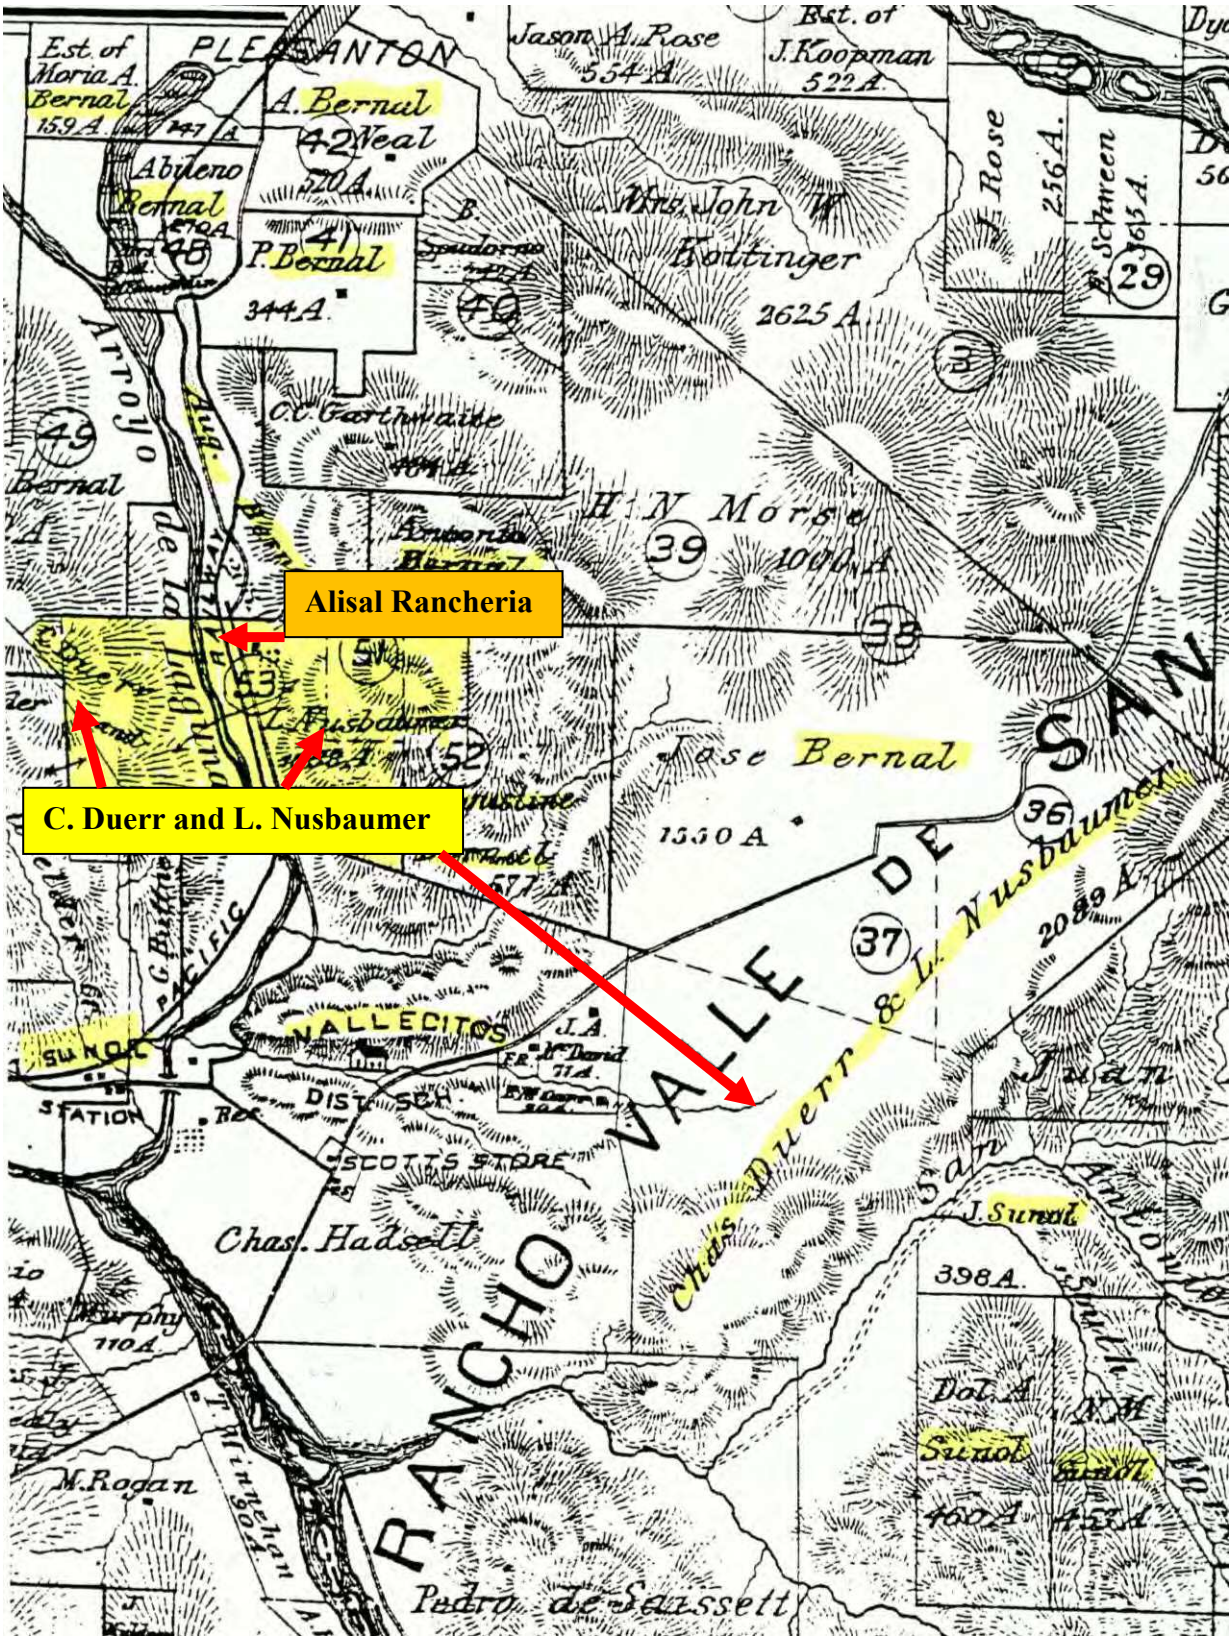
Years later on the 10th day of July, 1878, Louis Nusbaumer's youngest son Emil became the Deputy District Attorney of Alameda County. He was born in San Francisco, February 13, 1856. He first attended school six miles from home, in Dublin, afterwards in Pleasanton, when a school was first established there about 1865, and later in Vallecitos (Sunol) from 1868 to 1872 **(Map 6)**.

In 1873 Louis became a clerk in Sunol, in a general store [Scott's store by Sunol Corner which was opened in the 1850s], which had also the post-office and express office. Years later Emil became a Judge of the Superior Court, where he remained until his election as Justice of the Peace for Oakland Township in 1882. From January 1, 1883, to December 31, 1888, he served as Justice, and in 1889 was appointed Deputy by George W. Reed, District Attorney.



Map 5: 1878 Map of the Duerr and Nusbaumer Properties and Alisal Rancheria
(1878 Thompson and West)

Sometime during the late 1870s, U.S. Senator **George** and **Phoebe Apperson Hearst** purchased a large parcel of land from either Duerr and Nusbaumer or the Bernals that included the Alisal Rancheria, and they allowed the Indians to maintain their community for a time being and some worked for the Hearsts and Appersons. A slow decline in the Verona Band community during the late 19th century, however, is apparent in light of later events. Pressures of assimilation, an increasingly large number of white Americans settling in surrounding towns and farmlands and taking over the old *Californio* ranchos, the precarious economics of seasonal ranch work, and some out-migration, as well as death due to infectious diseases all contributed to the waning of the indigenous revival at Alisal (Olsen, Leventhal and Cambra 1985; Milliken 1994 in Davis et al. 1994).

According to several historic documents, the last Kuksú dances were held at Alisal in 1897 (Womens' Research Committee of Washington Township 1904; Marine Family History 1965; Galvan 1968). Writing in 1904, the authors of the History of Washington Township wrote about such ceremonial events:

> The dance in September was a very serious, ceremonial dance, lasting several days. Their dresses, worn for the dance, were very elaborate and well made, of feathers. Upon one day, the Coyote dance, a rude sort of play, was given, one of the favorite characters being Cooksuy [Kuksu]—a clown.
>
> There must have been some meaning of a memorable character to this dance, because when asked why they danced, they always replied: "**Because our fathers are dead**" (1904:52).

Earlier that year, on January 6, 1897, the last recognized ***Capitan*** of the Alisal Rancheria, **José Antonio**, died. Noted in Book of Funerals at Mission San Jose 1859-1908 (p. 147):

> **Josephus Antonius, Indian** DOD: 6 Jan 1897, Age: about 70 [60]. Buried: Indian Cemetery, Mission San Jose, D.A. Rapora, Astt. Mission San Jose

In 1904, the **Northern Association for California Indians**, a philanthropic group of concerned citizens who advocated on behalf of the dying and landless Indians submitted a "**Memorial of the Northern California Indian Association, Praying that Lands be Allotted to the Landless Indians of the Northern Part of the State of California**" to President Theodore Roosevelt. The Memorial was signed by Mrs. T. C. Edwards, President, and **Charles E. Kelsey**, Secretary for the Association. Attached to the **Memorial** was a "Schedule" identifying the landless Indian bands/communities and their estimated population which were scattered throughout northern California (meaning north of Los Angeles County).

In Alameda County, the Schedule identified the Indians living at **Pleasanton** (Verona Band) as having a population of 70, at **Niles (Figure 7) [**there was a community with a population of 8, and in Contra Costa County in the towns of Danville and Byron having a population of 5 and 20 people, respectively]**.**

All four communities were identified as "Costanoan." (Sen. Doc. No. 131, 58th Cong., 2d Sess., 1904, 1-16 (reprinted in Robert Heizer's Federal Concern about Conditions of California Indians 1853 to 1913: Eight Documents 1979).

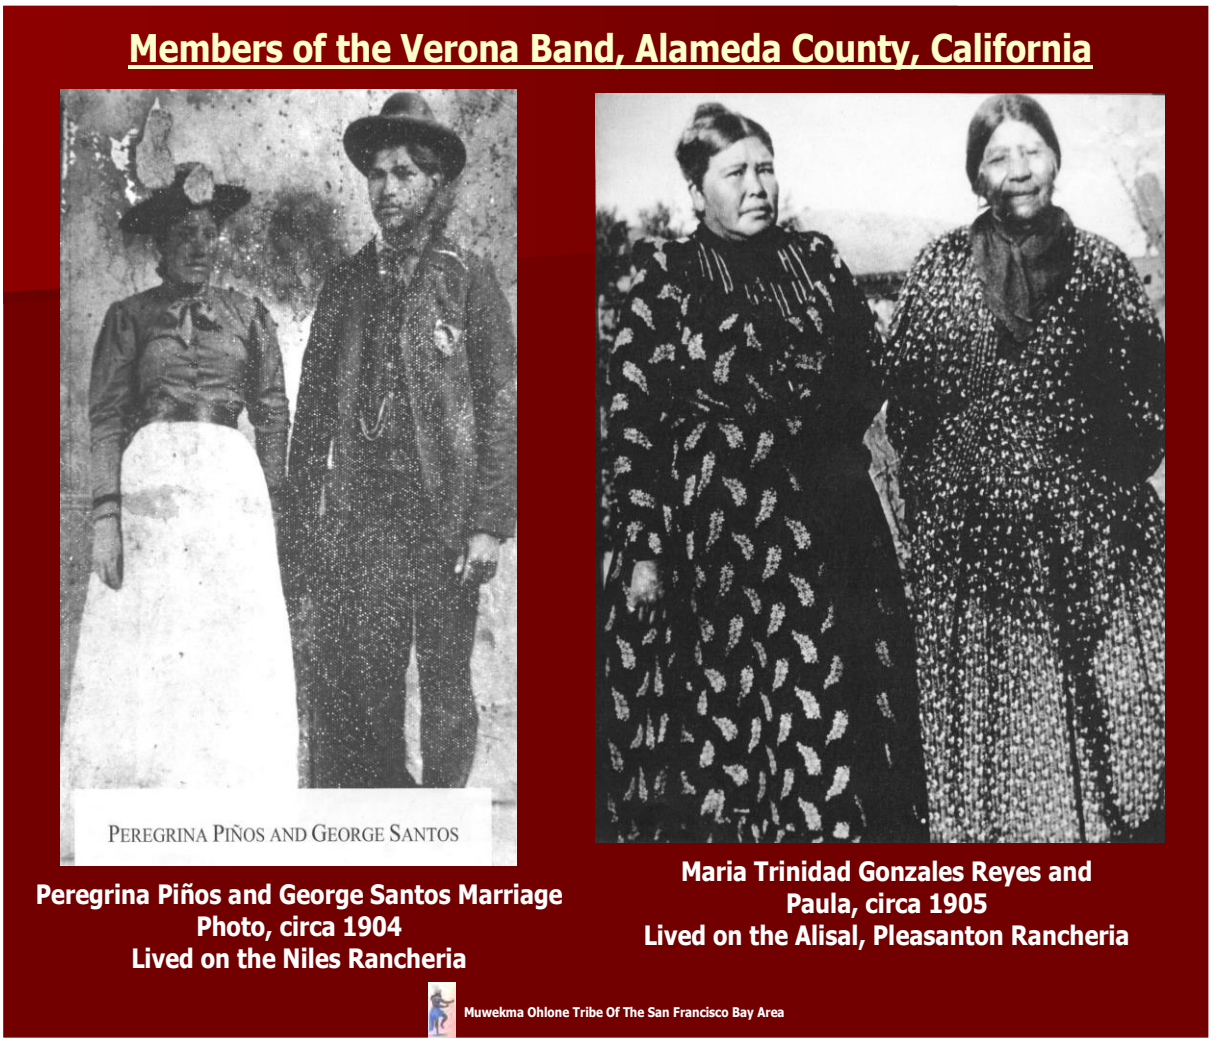


Figure 7: Muwekma Indians at the Niles and Pleasanton Rancherias

In the History of Washington Township published in 1904, the authors provided the following commentary about the Mission San Jose/Verona Band/Muwekma Indians residing at the nearby rancherias:

> The only remaining Indian villages today in this part of the state are in this township. They are in the native tongue, El Molino, the mill near Niles, and Alisal near Pleasanton, with perhaps half a hundred persons in each village. In the former, the last full-blooded Indian chief died some three years ago. In Alisal, the wife of the chief still lives, and six others of full blood. ... Alisal is on Mrs. Phoebe Hearst's property, and that lady has always a kindly hand ready to help them when necessary. ...
>
> All of the information appearing in these papers concerning the old Indian history and customs has been gleaned from these seven full-blooded Indians, one being the widow [Jacoba] of the last chief, whose name was **Jose Antonio**. .... (History of Washington Township, 1904:53).

From the interviews conducted between 1925-1930 with Muwekma Elders Jose Guzman and Maria de los Angeles Colos, Bureau of American Ethnology linguist John Peabody Harrington, was able to learn that ***Capitan*** **Jose Antonio's** Indian name was **Hu'ská** (Harrington Field Notes 1921-1934). Jose Antonio was a great-great-grand relation to some of the current generation of the Muwekma Elders and ex-council members such as Lawrence Mason Marine, Jr. and his younger brother (Dance Leader) Marvin Lee Marine are directly descended from him and Jose Guzman. Jose Guzman had married Jose Antonio's daughter Augusta Losoyo.

After his death in 1897, Jose Antonio's wife Jacoba, who was a *mayen* (meaning the wife of a captain or a female chief), directed that the ceremonial round house/sweat-lodge (or ***tuupentak*** in Chochenyo) be torn down, in keeping with tradition (Galvan 1968). A new ***tuupentak*** was not constructed, as it would have been in previous times, because the community did not formally select a new captain. Apparently, the political power was inherited by Jacoba through marriage as well as her descendency from her parents *Capitan* Taurino and Joaquina.

According to Muwekma oral tradition, it was Raphael Marine, husband of Avelina Cornates Marine who was tasked to take down the old ceremonial ***Tuupentak*** **(**roundhouse). Interestingly, just two years prior to his death, in 1895 *Capitan* Jose Antonio and his wife Jacoba served as godparent to Raphael and Avelina Marine's fourth daughter, **Mercedes Marine** (co-authors Monica V. Arellano and Gloria Gomez's great-grandmother) who after the death of her mother Avelina in 1904, was raised on the Alisal rancheria by Jacoba. (1910 Federal Indian Population Census, "**Indian Town**," Pleasanton Township, Alameda County).

Also raised by Jacoba was **Catherine Guzman Peralta** one of Jose Guzman's granddaughters (**Figure 8**). who was identified on the **1900 Federal Indian Census** (Washington Township); **Kelsey's 1905-1906 Special Indian Census;** (Heizer 1971); and the **1910 Federal Indian Population Census** (Pleasanton Township) as an Indian resident of the Alisal Rancheria in Alameda County.

Just before the turn of the 20th century (1897) there were still at least eleven casitas (houses) and the ***Tuupentak*** (temescal/round house) still standing on or near the Alisal Rancheria. During this critical period of time, the Guzman, Armija, Santos, Pinos, Marine, Nichols, Inigo (Alaniz), and other interrelated Muwekma **(Verona Band**) families remained in the Sunol/Pleasanton/ Livermore area or on the original Alisal Rancheria until fire destroyed the remaining houses due to work along the Western Pacific Railroad tracks sometime around 1916.

The house of **Catherine Peralta** (granddaughter of Jose Guzman) and **Dario Marine** (eldest son of Avelina Cornates Marine) which was originally owned by Jacoba and Jose Antonio had burned down as a result of that fire. Prior to the fire, Catherine and Dario had raised their first four children, Beatrice (born 1909), Josephine (b. 1911), Evelyn (b. 1914) and Filbert Marine (b. 1915) on the rancheria.

By the time their fifth child, Lawrence Domingo Marine was born in 1919, they had moved to 544 Alvarado-Centerville Road in Centerville now part of the City of Fremont (see 1900 and 1910 Indian Censuses and 1920 Census, Washington Township; Harrington field notes; Olsen, Leventhal and Cambra 1985; 1928-1933 California Enrollment Applications # 10298 and 10675; 1910, 1920 and 1930 Federal Censuses).

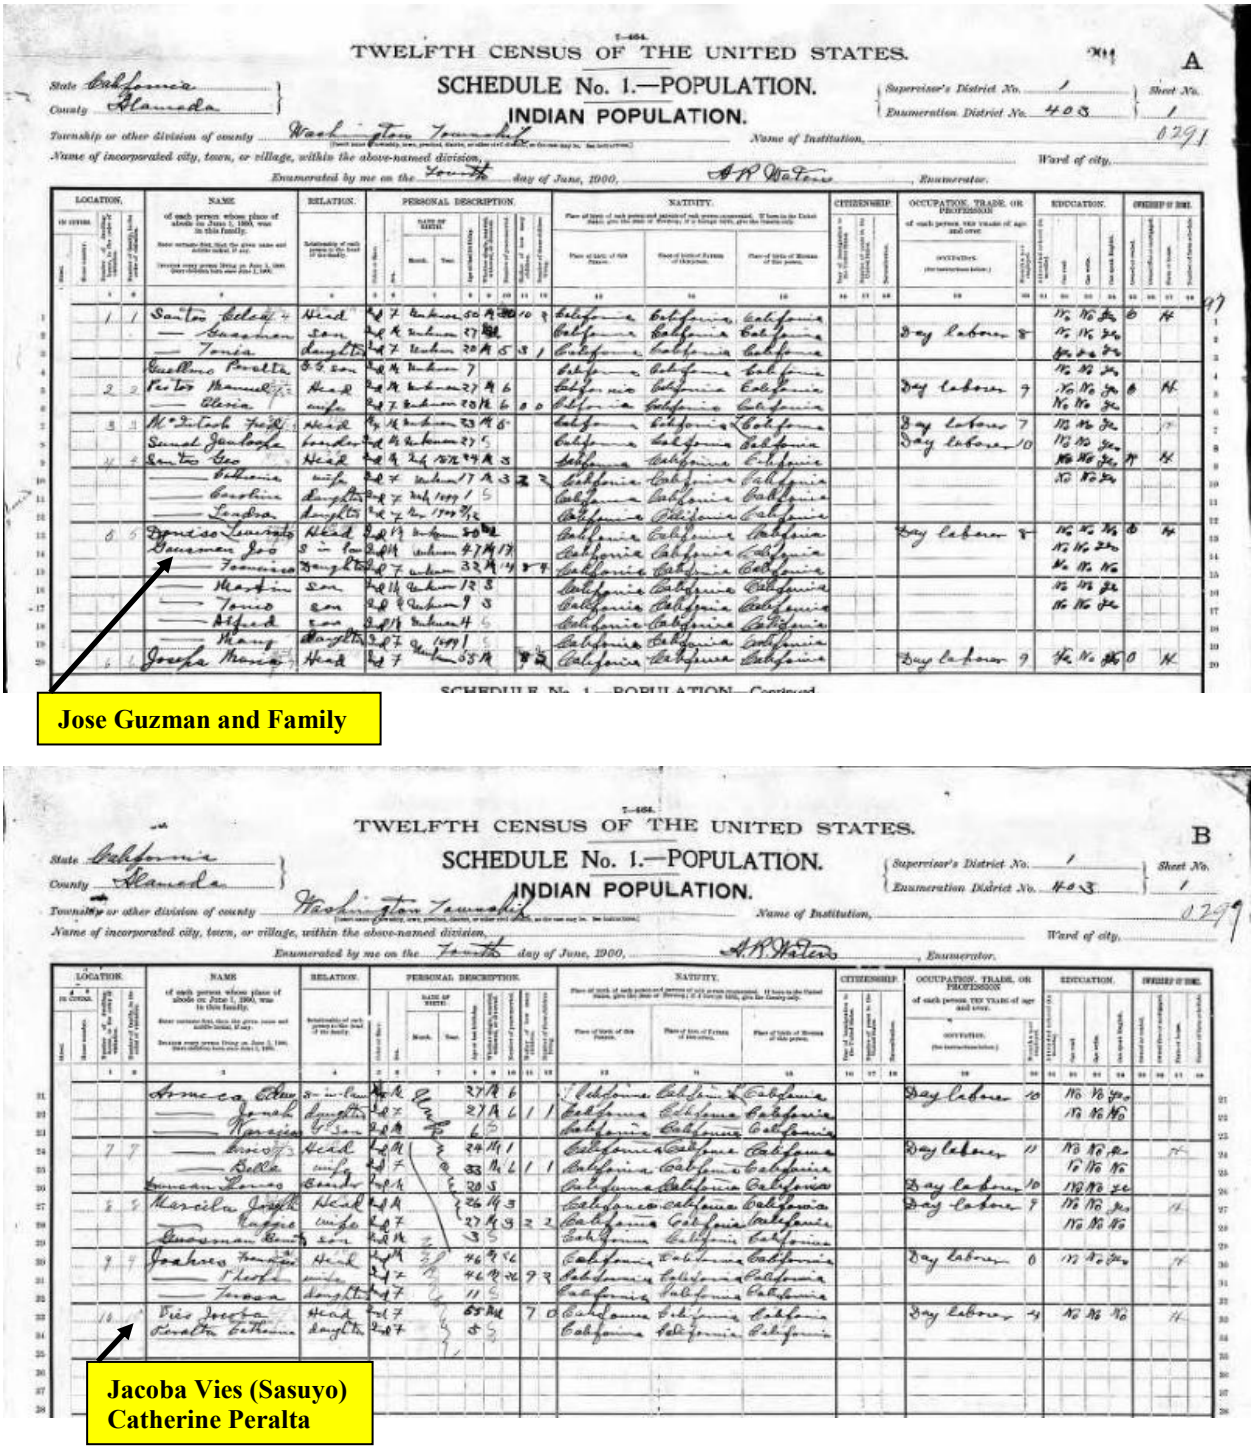

Figure 8: 1900 Indian Population Census, Niles, Washington Township, Alameda County

After the Alisal Rancheria was abandoned, the various surviving Muwekma families continued to work locally in the East Bay, residing on ranches, vineyards, hopyards and renting homes in Niles (e.g., Shinn property), Newark, Centerville, Fremont, Milpitas, Pleasanton, Sunol, Livermore, Alameda and elsewhere. The Muwekmas continued to live peaceably near the Alisal Rancheria as long as they could and had continued to visit and use the locality as best they could.

Avelina Cornates Marine's children [Dario, Dolores, Elizabeth (Belle), Ramona, Mercedes, Victoria, Lucas and Trina Marine] along with the Nichols, Guzman, Binoco, Pinos, Santos, Inigo, Juarez, Armija and other Muwekma families, had to readapt and relocate to other nearby residences in order to work and maintain their families. Some of the men worked for Southern Pacific Railroad, Spring Valley Water Company, Leslie Salt, and on the local orchards, ranches, and farms.

During the 20th century Muwekma families continued to marry and baptize their children at Mission San Jose, St. Augustine's Church in Pleasanton, Corpus Christi in Niles, and St. Edwards in Newark. Photographic and other records showing life around the Alisal Rancheria and neighboring areas from the early 1900s, WW I, the depression, and WW II survive.

Kelsey Special Indian Census 1905-1906, Congressional Homeless California Indian Act of 1906, and the Federal Recognition of the Muwekma/Verona Band of Alameda County.

In 1905, as a result of the discovery of the **18 unratified California Indian Treaties** (which were negotiated between 1851-1852) from the **U. S. Senate Secret Archives**. Mr. **Charles E. Kelsey**, a lawyer who resided on S. 12th Street in San Jose, was serving at that time as the Secretary for the philanthropic **Northern Association for California Indians** (**Figure 9**). In 1905 he was appointed **Special Indian Agent to California** by the Commissioner of Indian Affairs (**Indian Service Bureau/Bureau of Indian Affairs)** in Washington, D.C. Agent Kelsey was charged by the BIA to conduct a Special Indian Census and identify all of the landless and homeless California tribes and bands residing from north of Los Angeles to the Oregon border who were to come under the jurisdiction of the BIA and the ensuing Congressional Homeless Indian Acts. For a detailed overview of the rediscovery of the 18 treaties and the efforts of Charles E. Kelsey, see The Secret Treaties with California's Indians by Larisa K. Miller published by Prologue Magazine, Fall/Winter 2013.
(https://followingdeercreek.files.wordpress.com/2017/03/secret-treaties-with-california-indians.pdf.)

Figure 9: Special Indian Agent Charles E. Kelsey

Based upon the partial results of Kelsey's Special Indian Census which was initiated by the discovery of the 18 unratified California Indian treaties in 1905 from the Senate archives, Congress passed multiple Appropriation Acts beginning in 1906 on through 1937, for the purpose of purchasing "home sites" for the many surviving, but landless, California Indian tribes and bands.

One of the bands officially identified by Special Indian Agent Kelsey was the **Verona Band of Alameda County** residing between Pleasanton, Sunol and Niles (as well as living in other adjacent towns, areas and ranches surrounding Mission San Jose). The direct ancestors of the present-day Muwekma Tribe who comprised the Verona Band became **Federally Acknowledged** by the U.S. Government through the **Appropriation Acts of Congress** beginning in 1906.

While Kelsey was working out details of his Special Indian Agent assignment in Washington D.C., after he completed his Special Indian Census (1905-1906), Acting Indian Commissioner Charles F. Larrabee forwarded the following letter to President Theodore Roosevelt:

> May 23, 1908 Letter from Acting Commissioner C. F. Larrabee to President Theodore Roosevelt
>
> "Doctor [Stanford's President David Starr] Jordan commends, and justly, the services of Special Agent C. E. Kelsey, who during the past few years has been engaged in an attempt to secure them fixity of tenure in their homes, security of legal rights and additional lands on which the homeless Indians can be placed from an appropriation granted by Congress under the act of June 21, 1906 (34 Stat. L 325, 335).
>
> Among the resolutions passed by the conference was one pledging the members of the conference … to assist in the upholding and continuance of this work until every landless Indian in California shall be secured land upon which he can maintain a home; …
> …
> When California was ceded to the United States by the treaty of Guadalupe Hidalgo, the Indian occupants of that state had certain rights to the lands which they occupied and under the law then existing could not be legally ejected therefrom.
> …
> Also treaties which had been concluded with the various bands or tribes were overlooked or ignored and failed of ratification, the Indians claimants never being paid for their land.
>
> It is believed that Congress realizes this fully and if the money which has already been appropriated is insufficient **to give every landless Indian a place he may call his own**, that later it will grant additional appropriation for their benefit.
>
> It is the intention of the Office to persist in the work that is now going on until every Indian has been cared for, and while it is impossible now to undo all that is past and restore the original owners of the soil to their possessions, the Congress will be asked from time to time, if necessary, to do what seem reasonable and enable the homeless Indians to have a fair start in life even at this late day (Letter dated May 23, 1908; pages 1-4, National Archives).

Between the years 1906 and 1927, the Verona Band fell under the direct jurisdiction of the Indian Service Bureau in Washington, D.C., and by 1914, the Tribe's jurisdiction was transferred to the **Reno Agency,** and later again, transferred over to the **Sacramento Agency** (sometime around 1923). During this time, Federal Government Indian Service Bureau agents attempted to purchase land for many of the Federally Recognized, landless, California Indian tribes and bands.

To this effort, both the Indian Service Bureau agents and the Indian bands were faced with two major obstacles:

1. Many Californian landowners did not want Indians living next to or near them, so they would not sell suitable parcels of land.

2. Others who were willing to sell parcels to the government wanted greatly inflated prices, usually at prices much higher than what was either allocated to purchase lands, or above the actual value of the land.

After the Congressional Appropriation Acts of 1906, 1908, and ensuing years (until 1937) many Indians in California obtained trust lands as members of tribes which had not abandoned their respective tribal areas, and these homesites became known as Indian "**rancherias**." [see the Indian Homestead Act of March 3, 1875 (18 Stat. L. 420), 25 U. S. C. 334, 336, Feb. 8, 1887, Ch. 119, Sec. 4, and other statutes, (34 Stat. 325, June 24, 1906 and 35 Stat. 70, April 30, 1908), and using an added set aside of $10,000 under the Joint Resolution of March 4, 1915 (CR 6122, March 4, 1915)].

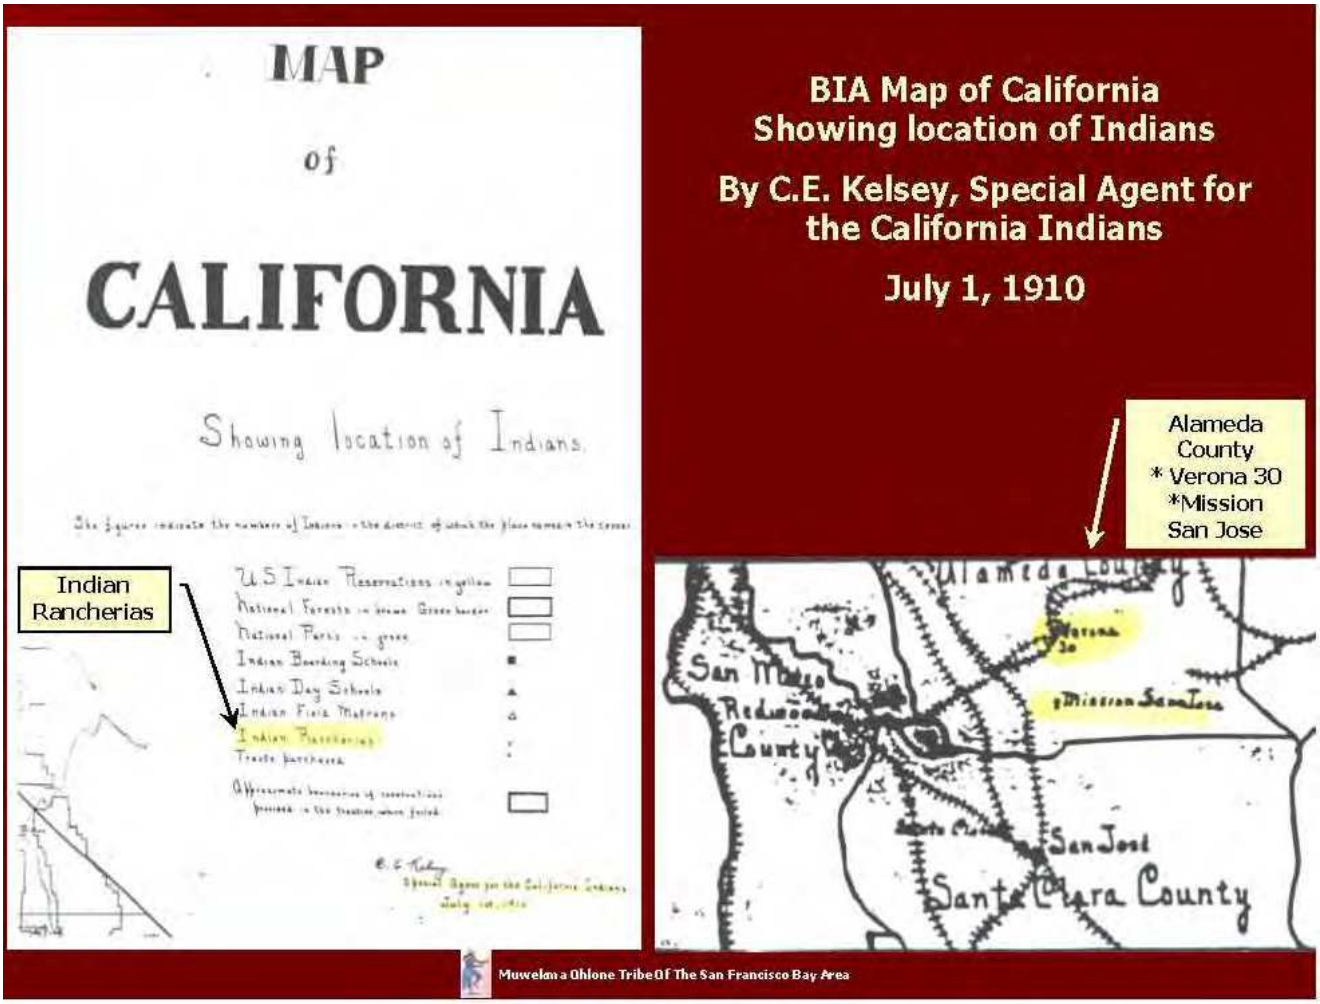
The evidence of previous **Federal Recognition** of virtually all the present-day unacknowledged tribal groups in California and especially in this case, the **Verona Band of Alameda County**, is found in the Federal records at the National Archives (Record Group 75. California Consolidated Files, Cal. Special, file # 12026113-032, filed with 114202-13-032; Map, accompanying Letter of October 4, 1913, Special Indian Agent for California C. E. Kelsey to Commissioner in response to request for information from 2nd Dist. Congressman John Raker, 9/22/1913. See file # 114202) (**Map 6 – Special Indian Agent Kelsey's 1910 Map of Indian Rancherias – Verona Band**).

On October 4, 1913, Special Indian Agent Charles Kelsey wrote a response letter to Cato Sells Commissioner of Indian Affairs informing him of the following information relative to the 18 unratified treaties:

> 1. None of the treaties mentioned in the Senate document were ever ratified. … It is clear the treaties were never ratified and so never became technically operative. The Government took everything ceded in the treaties and more, i.e., for example the reservations, and paid nothing.
> …
> 4. Absolutely no steps or measures have been taken or had to extinguish the rights of the tribes to the lands described in the treaties unratified, in any way, shape, or form.
> 12. … The Indian Office did not even have record of the 18 treaties until we dug them out of the secret archives of the Senate.

… About two thousand Indians have still no land. … It may be necessary to buy land for about 1100 of them. All of these 2,000 Indian still landless are descendants of Indians represented in the 16 [northern California] treaties.

By the end of 1913, being exhausted and personally in debt to the amount over $18,000, Special Indian Agent C. E. Kelsey tendered his formal resignation. It was not until a year later that a new agent, **Charles H. Asbury** from the Reno Agency, was selected to replace Kelsey.



Map 6: Indian Agent Kelsey's 1910 Map of Indian Rancherias – Verona Band

Writing to the Commissioner of Indian Affairs on Dec. 7, 1914, from the Reno, Nevada Indian Agency, **Charles H. Asbury,** already named Special Indian Agent for California, reported progress in his investigation of the character, location and need of landless California Indians.

It is noteworthy that he called on his predecessor C. E. Kelsey for help in locating **30 individuals at Verona**, and then proceeded to suggest that they receive assistance in a land purchase in his report to the Commissioner. However, a thorough investigation of the Indians of California not provided with land would have required a great deal of time and expense.

Being understaffed and located in Reno, Special Agent Asbury was not able to accomplish anything on behalf of the landless California Indian bands and he was reassigned to the Indian Agency in the Southwest sometime in 1915. **John Terrell** was then selected as a replacement as Special Indian Agent for most of northern and central California by May 1915 and he continued to conduct on-site inspections and make censuses of many the bands that were under his jurisdiction.

However, during Terrell's tenure between 1915 and 1919, his efforts were oriented towards "needy" tribes and bands that were located in northern California counties (e.g., Mendocino and north) as well as the Sacramento Valley and the Sierra. Those tribes that were located within the northern "**mission area**" including the Muwekma (Verona Band of Alameda County), Amah Mutsun (San Juan Bautista Band), Esselen Nation (Monterey Band of Monterey County), the Salinan Indian tribal communities (Pleyto, Milpitas and Jolon) centering around Missions San Miguel and San Antonio, as well as the **Coast Miwok** tribal community located at the towns of Bodega Bay, Marshall, and Fishman were all but ignored and neglected.

A Call to War: Muwekma Men Enlist in all Three Branches of the U.S. Armed Forces Before and During World War I [1914 – 1920]

Even before California Indians legally became citizens in **1924,** prior to and during America's entrance into World War I on **April 6, 1917**, at least six Muwekma men joined 17,000 other Native Americans and served in the United States Armed Forces in the Army, Navy, and Marine Corps. These Muwekma men enlisted through the **San Francisco Presidio** and **Mare Island** and four of them are buried at the **Golden Gate National Cemetery.**

Antonio (Toney) Guzman, U.S. Army, Private, **166th Field Artillery Brigade, Battery F, 347th Field Artillery, 91st Division**. Toney Guzman was born on March 27, 1890 either in Centerville or on the Niles Rancheria. He was the son of Muwekma Indians Francisca Nonessa and Jose Guzman. Toney enlisted in the U.S. Army and he fought in the **Meuse-Argonne** (September 26 to October 8, 1918), **Ypres-Lys**, and **Lorraine** campaigns in France. Toney served in the Army from April 29, 1918 and was honorably discharged at the **San Francisco Presidio** on April 26, 1919 (**Figure 10**).

The **91st Division** was known as the "**Wild West Division.**" The Division's shoulder patch was a green fir tree referring to its origin at Camp Lewis in the Pacific Northwest. The Division was deployed to France in August, 1918 and fought with great distinction. In the **Ypres-Lys** campaign, the Division served in the **Flanders Army Group**, under the command of the **King of Belgium**. The Division was headquartered adjacent to Flanders Field. Five members of the Division earned the **Congressional Medal of Honor**. The **347th Field Artillery Regiment** was assigned 4.7" inch guns, and the 91st Division received the following **Victory Medal Clasps**: **Ypres-Lys**, **St. Mihiel**, **Meuse-Argonne,** and **Defensive Sector**.

Twelve days before the end of World War I, the division, as part of the VII Corps of the French Sixth Army, helped drive the Germans east across the Escaut River. The division was awarded separate campaign streamers for its active role in the **Lorraine, Meuse-Argonne** and **Ypres-Lys** campaigns

In October 1931, Toney Guzman and his brothers enrolled with the **Bureau of Indian Affairs** under their mother's **BIA Application #10293**. On his WW II Registration Card dated April 27, 1942, Toney was identified as "**Indian."** Toney passed away on **October 8, 1948** and was buried on October 12, 1948 at the **Golden Gate National Cemetery** (Section J, Grave 254).

Figure 10: Toney Guzman (1934)

Alfred (Fred) Guzman, U.S. Army, Private, **Company "C," 110th Infantry**, **28th Division** under Brigadier General T. W. Darrah. Alfred Guzman was born on the Pleasanton Rancheria on June 27, 1896 to Francisca and Jose Guzman. Prior to the declaration of War, Fred Guzman had served in the **National Guard** at **Fort Mason in San Francisco** in **1917**. Afterwards he enlisted in the U.S. Army, and served in the **28th Division**, **55th Brigade Infantry, 110th Infantry, Company "C"** and fought in the major battles at **Ourcq-Vesle** (July 28, 1918), **Second Battle of the Marne** (July 15-August 5, 1918), **Meuse-Argonne Offensive** (September 26 to October 8, 1918), and **Havrincourt** (October 8 – November 11, 1918) in France.

The 28th Division fought in the following **campaigns:** Champagne-Marne**,** Aisne-Marne**,** Oise-Aisne**,** Meuse-Argonne**,** Champagne **(1918), and** Lorraine **(1918). The cost in lives of these six campaigns was 4,183 casualties including 760 dead. The six fleurs-de-lis on the regimental insignia commemorates their World War I service. T**he **28th Infantry Division** was a unit of the United States Army formed in 1917 at the outbreak of World War I. It was nicknamed the "Keystone Division", as it was formed from units of the Pennsylvania Army National Guard; Pennsylvania is known as the "**Keystone State.**" It was also nicknamed the "Bloody Bucket" division by German forces in WWII, after its red insignia. Fred Guzman served from **July 28, 1917** and was honorably discharged at **San Francisco Presidio** on May 31, 1919. On his WW II Registration Card dated April 25, 1942, Fred was identified as **Indian**. Fred Guzman died on **November 3, 1961**, was buried at **Golden Gate National Cemetery** (Section Y, Grave 1059).

Joseph Aleas, U.S. Army, Sergeant, **Company D, 21st MG BN, 7th Division**. Joseph Aleas was born on the Alisal (Pleasanton) Rancheria on May 11, 1893 and was the son of Margaret Armija. He enlisted in the US Army on **June 30, 1916**. According to Armija-Thompson family recollections, he was a good horseman and wanted to fight against Pancho Villa, who had led approximately 1,500 Mexican raiders in a cross-border attack against Columbus, New Mexico, in response to the U.S. government's official recognition of the Carranza regime. Villa's troops attacked a detachment of the 13th U.S. Cavalry, seized 100 horses and mules, burned the town, killed 10 soldiers and eight of its residents, and made off with ammunition and weapons.

President Woodrow Wilson responded by sending 6,000 troops under General John J. Pershing to Mexico to pursue Pancho Villa and his troops. This military mobilization was called the Punitive or Pancho Villa Expedition.

Later, Joseph Aleas served in France with the **21st Machine Gun Battalion, 7th Infantry Division** (its Hourglass insignia dates back to 1918). Organized originally to serve in the American Expeditionary Forces (AEF) during World War I, the U.S. Army's 7th Infantry Division was created at Camp Wheeler, Georgia on December 6, 1917 and the 7th fought in **Alsace-Lorraine**, France during the war. The division also served as an occupation force during the post-war period.

On October 10-11, 1918 the 7th was shelled for the first time and later it encountered gas attacks in the **Saint-Mihiel** woods. Defensive occupation of this sector continued from October 10th to November 9th during which the infantry regiments of the 7th Division probed up toward **Prény** near the Moselle River, captured Hills 323 and 310, and drove the Germans out of the **Bois-du Trou-de-la-Haie** salient. After 33 days in the line of fire, the 7th Division had suffered 1,988 casualties, of which three were prisoners of war. Thirty Distinguished Service Crosses were awarded members of the 7th Division.

Joseph Aleas was honorably discharged at **Camp Funston**, Riley, Kansas on July 9, 1920 and was awarded the **World War I Victory Medal** and the **Bronze Victory Button**. Joseph Aleas enrolled with the **Bureau of Indian Affairs** in October 1931 (**BIA Application # 10299**). On May 24, 1955 Joseph enrolled during the second enrollment period with the **Bureau of Indian Affairs**. Joseph Francis Aleas passed away **July 13, 1964** and was buried at the **Golden Gate National Cemetery** Plot Z, grave 2597 (**Figure 11**).

Henry Abraham Lincoln Nichols, U.S. Navy, Fireman 1st Class**, Battleships *USS Arizona* and *USS Oklahoma*.** Henry Nichols was born in Niles on February 12, 1895 to Charles Nichols and Muwekma Ohlone Susanna Flores Nichols. Henry enlisted on May 23, 1917 and first served on the **USS *Albatross.*** By December 31, 1917 he was transferred to the Battleship **USS *Arizona***, and later on March 26, 1918 he was transferred again to the Battleship **USS *Oklahoma.*** During World War I Henry Nichols served in the North Atlantic and was on escort duty in December 1918 when the *Oklahoma* was serving as escort during President Woodrow Wilson's arrival in France at the end of the war (November 11, 1918). The *Oklahoma* returned to Brest, France on June 15, 1919 to escort home President Wilson who was transported on the *USS George Washington* from his second visit to France.

Henry Nichols was honorably discharged at Mare Island on August 14, 1919 and was issued the **World War I Victory Medal**. On Henry Nichols Draft Registration Card dated April 27, 1942 he is identified as **Indian**. Henry Nichols died on January 5, 1956 and buried at the **Golden Gate National Cemetery** (Section L-5, Grave 7455).

Figure 11: Grave Stones of Joseph Aleas, Fred Guzman, Toney Guzman, Henry Nichols

Franklin P. Guzman (Service # 87843) Sergeant, **U.S. Second Marine Corps Division, Fourth Marine Infantry Brigade, Sixth Machine Gun Battalion, 81st "D" Company.** Franklin was born on the Alisal Rancheria on January 15, 1898 and was the son of Pleasanton Indians Teresa Davis and Ben Guzman (who later died in 1907). He was also the nephew of Toney and Fred Guzman. Franklin was listed on the **1910 Federal Indian Population Census** for "**Indian Town**", Pleasanton Township. He enlisted on October 20, 1916 while working near Sacramento, reported for duty on October 25, 1916 and was assigned to **Company "B" Marine Barracks, Navy Yard, Mare Island**. On May 28, 1917 Franklin was promoted to the rank of Corporal. By March 31, 1918, he earned an **Expert Rifleman Badge** and a **Marksman Badge** and by April he was assigned to the **111th Company, 8th Regiment**.

In May, Franklin was transferred to the **150th Company 1st Machine Gun Replacement Battalion** at Quantico, Virginia and he was promoted to Sergeant on May 22, 1918.

The 1st Machine Gun Replacement Battalion sailed on May 26, 1918 on the *USS Henderson* and disembarked in France on June 8, 1918. The 1st Machine Gun Battalion was later renamed the 6th Machine Gun Battalion in France. From September 12 to 16, 1918 the brigade was engaged in the **St. Mihiel offensive** in the vicinity of **Remenauville**, **Thiaucourt**, **Xammes**, and **Jaulny**. On September 16, 1918, he was wounded in the left thigh and from September through December he was placed in various Field and Base Hospitals in France, and finally transferred back to the States on December 16, 1918. Franklin remained in recovery at the US Navy Hospital at Norfolk, Virginia until he was honorably discharged from service as a Sergeant on June 27, 1919.

Franklin's Battalion participated in the **Chateau-Thierry** sector (capture of Hill 142, Bouresches, Belleau Wood) from June to July, 1918; **Aisne-Marne** (Soissons) offensive from July 18 to July 19, 1918; **Marbache** sector, near Pont-a-Mousson on the Moselle River from August 9 to August 16, 1918; **St. Mihiel** from September 12 to September 16, 1918; and later the **Meuse-Argonne** offensive (October 1 to 10, 1918, and November 1 to 10, 1918). Franklin passed away on May 30, 1979 and was buried in the **Riverside National Cemetery** (Section 8, Grave 2826) (**Figure 12**).

Figure 12: Veteran Headstone for Franklin Guzman

John Michael Nichols was a Muwekma Ohlone Indian from the San Francisco Bay Area. He was born on September 29, 1893 in Niles, California and was baptized at Mission San Jose. John was the older brother of Henry Nichols who had served in the Navy on the battleships *Arizona* and *Oklahoma* during WWI (May 1917 – August 1919).

John enlisted in the US Army on **October 27, 1914** and was stationed at **Fort McDowell on Angel Island**. He fought in France serving with the **59th Coast Artillery Corps (CAC)**. In 1913, the defenses of individual harbors were renamed coast defenses, as in "the **Coast Defenses of San Francisco**." Coast artillery districts were retained, but the term now had a different meaning. Three continental coast artillery districts were created within the geographic departments. The Pacific Coast Artillery District (ranging from San Diego to Puget Sound) was established in the Western Department. Beginning in December 1917 and continuing into 1918, Regular Army and National Guard companies were combined, creating the **54th** through the **71st Artillery Regiments**, **CAC**.

The 59th was engaged in the **St. Mihiel** offensive and the **Meuse-Argonne** offensive and earned a Service Clasp (WWI Victory Medal for: **St. Mihiel Offensive, France (**2 September-16 September 1918), and **Meuse-Argonne Offensive, France** (26 September-11 November 1918)). John was discharged at **Fort Winfield Scott** at the **SF Presidio** on June 4, 1920. John apparently came back to the states with the 67th C.A.C. which appears on his gravestone. John M. Nichols was listed as an **Indian** on the 1930 Federal Census along with his son Alfred in Santa Cruz County, California. On John Nichols's WWII Draft Registration Card dated April 27, 1942 he was identified as residing at the Veteran's Home in Napa (Yountville), California and he had resided there from 1941 to 1953. John Nichols died in April 1968 while living in Stockton, California (**Figures 13** and **14**).

The regiments in France were largely demobilized as soon as possible after returning to the states, typically by March 1919. However, 12 regiments that had served in France were retained in active service at the end of the war for training purposes. This number was shortly reduced to 10: 42nd, 43rd, 52nd, and 53rd Artillery, CAC (Ry) formed the 30th Brigade, posted at Camp Eustis, VA. The 31st Brigade, consisting of the 55th, 57th, and **59th Artillery**, **CAC (TD),** was initially posted at **Fort Winfield Scott, CA,** before moving to Camp Lewis, WA, in the later months of 1919 (California State Military History site:
http://www.militarymuseum.org/Muwekma.html.).

Muwekma Tribe Honors the Native American Code Talkers Who Served During WWI

Excerpted from two websites on the implementation and use of Native American code talkers on the front lines during World War I. Even though the Muwekma men who enlisted did not serve as code talkers, nonetheless, the tribal leadership thought it important to honor those Native men by including information of their service to the U.S. Those website authors provide the following information on line:

> In France during World War I, the 142nd Infantry Regiment, 36th Division, had a company of Indians who spoke 26 languages and dialects. Two Indian officers were selected to supervise a communications system staffed by 18 Choctaw. The team transmitted messages relating to troop movements and their own tactical plans in their native tongue. Soldiers from other tribes, including the Cheyenne, Comanche, Cherokee, Osage, and Yankton Sioux also were enlisted to communicate as code talkers. Previous to their arrival in France, the Germans had broken every American code used, resulting in the deaths of many Soldiers. However, the Germans never broke the Indians' "code," and these Soldiers became affectionately known as "code talkers" (**Figure 15**).
> (https://www.army.mil/americanindians/code_talkers.html)
>
> When the United States entered World War I in April 1917, it had not yet granted citizenship to all Native Americans, and government-run boarding schools were still largely attempting to stamp out their languages and cultures. Nonetheless, several thousand Native Americans enlisted in the armed forces to fight the Central Powers. Nearly 1,000 of them representing some 26 tribes joined the 36th Division alone, which consisted of men from Texas and Oklahoma.
> (https://www.history.com/news/world-war-is-native-american-code-talkers)

Figure 15: Native American Code Talkers During WWI

After serving overseas during World War I, the over 17,000 Native American servicemen were offered a path to citizenship if they wanted to apply. On November 6, 1919, the United States Congress granted citizenship to the honorably discharged Indian veterans of World War I who were not yet citizens.

> BE IT ENACTED . . . that every American Indian who served in the Military or Naval Establishments of the United States during the war against the Imperial German Government, and who has received or who shall hereafter receive an honorable discharge, if not now a citizen and if he so desires, shall, on proof of such discharge and after proper identification before a court of competent jurisdiction, and without other examination except as prescribed by said court, be granted full citizenship with all the privileges pertaining thereto, without in any manner impairing or otherwise affecting the property rights, individuals or tribal, of any such Indian or his interest in tribal or other Indian property.

The 1919 American Indian Citizenship Act did not grant automatic citizenship to American Indian veterans who received an honorable discharge. The Act merely authorized those American Indian veterans who wanted to become American citizens to apply for and be granted citizenship. Few Indians actually followed through on the process, but it was another step towards citizenship.

It was during President Calvin Coolidge's Administration that the United States Congress finally granted citizenship to Native American servicemen and their respective tribes on June 2, 1924, (**Figure 16**). However, the Native American tribes of Arizona and New Mexico would have to wait another 24 years before full citizenship and voting rights were granted in 1948 after their service in the Armed Forces during World War II.

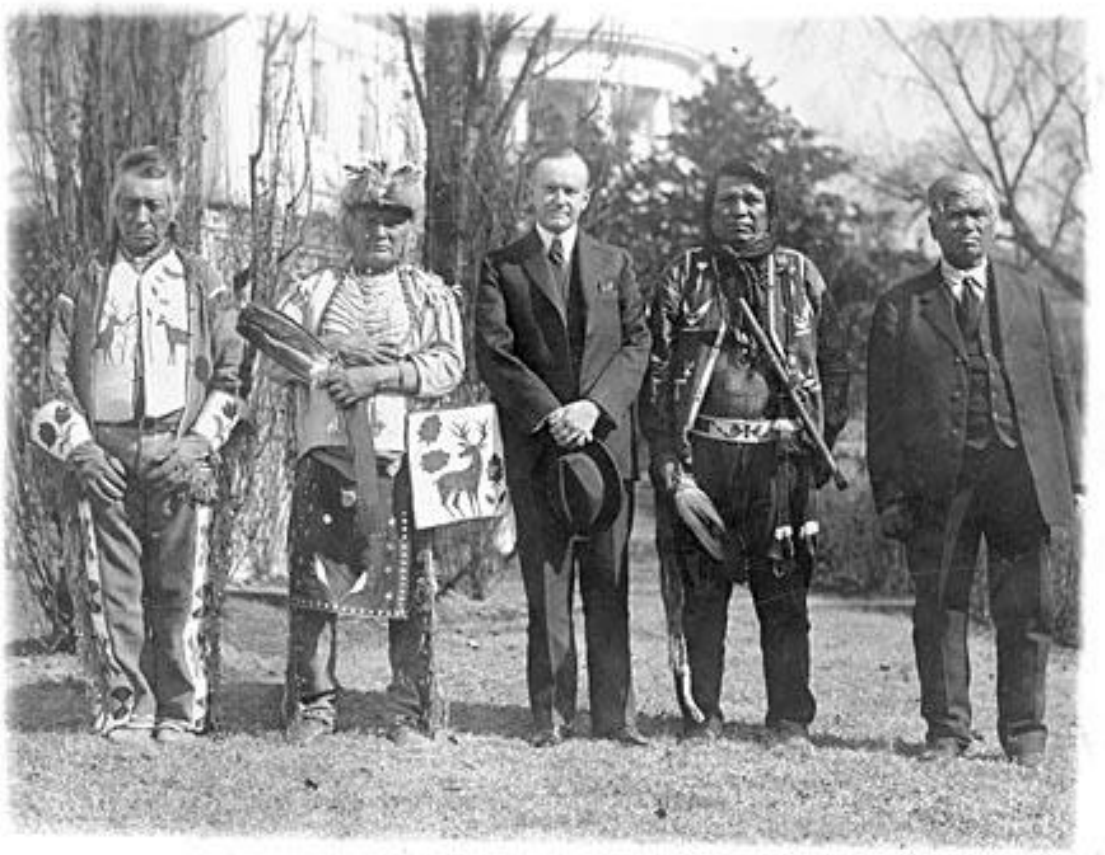

Figure 16: President Calvin Coolidge with Four Osage Indian Leaders

Thomas Grillot in his recently published book titled First Americans: U.S. Patriotism in Indian Country after World War I wrote that:

> The years between 1918 and the end of the 1940s were crucial ones in recent Indian history. Beginning in the 1920s, reservation groups were allowed to claim reparation for broken treaties from the American government in the U.S. Court of Claims. A few years later, they were encouraged to write constitutions for their tribal governments. The New Deal saw the first major attempt to reverse the most undesirable effects of the assimilation policy the federal government had followed since the last decades of the nineteenth century. World War II occasioned the massive reenlistment of yet another generation of Indian soldiers. Finally, at the end of the 1940s, the major assault on the existence of reservations as separate territories known as "termination" began.

The Muwekma/Verona Band under the Jurisdiction of the Indian Service Bureau: Reno and Sacramento Agencies 1923 – 1927, and the Removal of 135 Landless Tribal Bands

After Terrell left the Indian Service, the jurisdiction fell to **James Jenkins**, Superintendent of the Reno Agency. Writing his Annual Report to the Commissioner of Indian Affairs in 1923, Superintendent Jenkins commented:

> The jurisdiction of Reno Agency comprises the following named reservations and colonies, villages, camps, etc., in addition to all scattered bands of Indians in Nevada and California not under the jurisdiction of any other superintendency; also Indians whose allotments, homesteads, etc., are carried at the land offices located at Stockton, Sacramento, Visalia, San Francisco, Los Angeles, and Independence and Marysville, California, and Carson City and Elko, Nevada. …
>
> … Other Indians in California under this jurisdiction but not occupying government lands are found in the localities named below:
>
> | **County** | **Communities** | **Estimated** |
> |---|---|---|
> | **Alameda** | **Verona** | **30** |
>
> (Jenkins:1923 Annual Report: 3-5)

Sometime around 1923, the jurisdiction of the landless Indians of northern central California had shifted to the Sacramento Agency under the aegis **Colonel Lafayette A. Dorrington**, who was a prison warden in the Philippines during the American occupation. Dorrington, who was probably a political appointee to the Sacramento Superintendency and was probably rewarded for his military service as a prison warden in the Philippines during the post-Spanish American War period of occupation.

It is interesting to note that Dorrington's on-line Military Burial record provides the following information: He was identified as a **1st Lieutenant Company H, 2nd Nebraska Infantry – 4/29/98 to 10/24/98; 2nd Lt., Company L, 2nd U.S. Infantry; 10/27/98 to 6/22/99** which served in **Cuba.** His last rank was **1st Lieutenant, Company A, 34th U.S. Volunteer Infantry.** His last

appointment was 7/5/99 and he was discharged on 6/30/1901. Dorrington died on October 8, 1934 and was buried at Arlington National Cemetery on January 13, 1937. His grave is located in Section 3, Grave No. 3947 (document from Ancestry.com).

In January 1927, Sacramento Superintendent **Col[onel]. Lafayette A. Dorrington** (1918-1930) received a detailed office directive from **Assistant Commissioner E. B. Merritt** for him to list by county all of the tribes and bands under his jurisdiction that had yet to obtain a land base for their "home sites." This directive was issued so that Congress could plan its allocation budget for fiscal year 1929. Dorrington, who was not an advocate for California Indians, was chronically derelict in his duties and he decided not to respond to this directive. He also decided not to respond to many of the other requests issued by the Washington, D. C. Office. By May 1927, under threat of investigation, Dorrington yet again received another strongly worded directive from the Assistant Commissioner E. B. Merritt (**Figure 17**).

To this second directive, Dorrington reluctantly responded on June 23, 1927 by generating a report, which in effect, illegally, unilaterally, and administratively "**terminated**" the existence and needs of approximately 135 tribes and bands throughout northern California from their **Federally Acknowledged** status. He did this by completely dismissing the needs of these identified homeless and landless tribal groups. The very first casualty on Dorrington's "**hit list"** was the **Verona Band of Alameda County**. Without any benefit of any on-site visitation or needs assessment, which he was charged to conduct by the Assistant Commissioner, Dorrington opined:

> There is one band in Alameda County commonly known as the Verona Band, … located near the town of Verona; these Indians were formerly those that resided in close proximity of the Mission San Jose. It **does not appear** at the present time that there is need for the purchase of land for the establishment of their homes. (Dorrington Report dated June 23, 1927)

The fact that Dorrington makes mention that the Verona Band resided "near the town of Verona" makes it clear that he never visited the Muwekma Tribal community. There is no town of Verona in Alameda County. Thus, with the stroke of a pen and without benefit of any due process or direct communication with the tribe, the Muwekma/Verona Band along with the other 134 tribes and bands of California, apparently **lost their formal status as Federally Recognized Tribes**. Although not formally "terminated" by any policy decision or act of Congress these tribes were essentially knocked off the "radar screen" of the Bureau of Indian Affairs and as landless tribes were considered **ineligible** to organize as tribes under the 1934 Indian Reorganization Act.

During the 20th Century, no other state within the United States had experienced the massive **illegal "termination"** of so many Federally Recognized tribal groups whose rights were extinguished by gross negligence and crass neglect.

This massive dismissal and removal of recognized landless tribes was deliberate and due as a result of the callous actions and dereliction of duty by an incompetent **Bureau of Indian Affairs** agent.

Three years later, Dorrington, still being prodded by BIA officials in Washington, D.C. about the needs of the landless and homeless Indians in California under his jurisdiction, offered insight to his actions and his personal beliefs in a letter he wrote to **Commissioner Rhoads**. In that letter dated April 23, 1930, Dorrington wrote:

…Kindly be respectfully advised that the matter of land purchase for homeless Indians has really been given constant and diligent attention throughout the current fiscal year to date and an earnest effort has been made to fully meet the needs of the Indians to the fullest extent without unnecessary or unjustified expenditure of funds, believing that to be the spirit of the law and your wishes in the premises. …

It has been my opinion, and therefore my belief, for several years that the best interests of the Indians will be served through an arrangement whereby those concerned may be settled on the already acquired land **instead of procuring additional which cannot be turned to beneficial use and occupancy by the Indians** in mind because of their inability financially to establish themselves thereon.

…In its final analysis, Mr. Commissioner, kindly understand and know that **additional land for homeless Indians of California is not required and therefore further demands on the appropriation for the fiscal year 1930 are not warranted or justified** (Dorrington Letter to Commissioner Rhoads April 20, 1930). [Emphasis added]

Figure 17: Sacramento Superintendent Lafayette A. Dorrington October 21, 1926

By July 1931, **Dorrington** had either quit the Indian Service or was transferred or was fired and he was replaced by **Oscar H. Lipps** as Superintendent of the Sacramento Agency. **Lipps,** responding to an inquiry written by Assistant Commissioner J. Henry Scattergood offered specific concerns about the **conditions of the homeless California Indians** for whom land was purchased:

> Receipt is acknowledged of your letter, dated June 30, 1931, relating to the matter of purchasing land for homeless Indians of California. …I am addressing this letter to you personally and calling the subject matter thereof to your special attention for the reason that there **appears to be a grave lack of understanding in the Office regarding this whole matter of providing homes for homeless California Indians**.
>
> I think it is all the more important that this matter be brought to your personal attention at this time in view of your recent visit to California with the Senate Committee and your familiarity with the sentiment and feeling in this State with respect to the past administration of the affairs of the California Indians.
>
> The conditions on some of these rancherias are simply deplorable. No one can view many of them and observe the conditions under which the Indians are trying to exist without the feeling that someone is guilty of **gross neglect** or **inefficiency** and that a **cruel injustice** has been meted out to a helpless people under the name of beneficent kindness… And yet there are those who say that I will never do to let the local authorities have charge of the affairs of the Indians lest the Indians be neglected and abuse.
>
> …**I have not yet seen a single instance where the federal government has done anything like so much for the improvement of the homes and living conditions of the Indians under this jurisdiction** as has been done by Sonoma County for the Indians residing on the Stewart's Point Rancheria.
>
> Now it seems to me that the thing for us to do is to look at the facts in the face and admit that in the past the Government has been woefully negligent and inefficient, and then start out with the determination, as far as possible, to rectify our past mistakes.
>
> It is difficult to locate the blame, but somewhere along the line there appears to have been **gross negligence** or **crass indifference**. If Congress has been honestly and fully advised of conditions and has refused or failed to give relief asked for, then the Indian Bureau is not responsible for the neglect of the Indians. On the other hand, if Congress believed and intended by appropriating funds for the purchase of lands for homeless Indians and improvements thereon that good and suitable lands would be purchased and houses constructed and improvements made, **then we have neglected to do our duty** (Lipps letter to Assistant Commissioner Scattergood 1931 [Emphasis added].

Although left completely landless, and in some instances completely homeless, between 1929 and 1932 **all of the surviving Verona Band/Muwekma lineages enrolled with the BIA under the 1928 California Indian Jurisdictional Act** which were approved by the Secretary of Interior in the pending claims settlement. Concurrently, during the last decades of the 19th century and first three of the 20th century (between 1884 and 1934), renowned anthropologists and linguists such as Jeremiah Curtin, Alfred Kroeber, E. W. Gifford, John Alden Mason, C. Hart Merriam, and John

Peabody Harrington interviewed the last fluent speakers of the "Costanoan" and other Indian languages spoken at the East Bay rancherias. It was during this time period that **Verona Band Elders** still employed the linguistic term **"Muwekma"** which means **"la Gente or the People"** in Chochenyo and Thámien Ohlone language spoken in the East and South San Francisco Bay region.

Muwekma Enrollment with the Bureau of Indian Affairs (1928-1932): The Passage of the California Indian Jurisdictional Act of 1928

As a result of the passage of the Indian Citizenship Act of 1924, also known as the Snyder Act, California Indians and Allied Indian Associations started to advocate looking into claims against the federal government for lands illegally taken under the 18 unratified treaties of California. Under the 1924 Act indigenous people did not have to apply for citizenship, nor did they have to give up their tribal citizenship to become a U.S. citizen. Most tribes had communal property and in order to have a right to the land, Indians must belong to the tribe.

In 1928, the United States Congress passed the **California Indian Jurisdictional Act**, which created a census of all eligible Indians who could prove that their ancestors resided in California at the time when the 18 unratified treaties were negotiated between 1851-1852. Between the years 1928 and 1932 a little over 17,000 California Indians filled out applications and almost all were approved by the Indian Service Bureau.

During this time period almost all of the Muwekma Indian head of households enrolled as "**Ohlones**" and/or as "**Mission San Jose Tribe**" under this act and their applications were approved by the Secretary of Interior, the BIA and Federal (**Figures 18** to **37: Muwekma Ohlone BIA 1928-1932 Applications**).

Enrolling were members of the Marine-Peralta, Marine-Alvarez-Piscopo-Galvan, Marine-Sanchez, Marine-Arellano-Garcia, Marine-Muños, Marine-Armija, Armija-Thompson, Armija-Aleas, Armija-Nichols, Guzman, Binoco, Bautista-Armija, Inigo-Gonzalez-Alaniz, Santos-Pinos-Colos-Saunders-Pena-Corral, and Pinos-Juarez families. All of these Muwekma families were living in the Pleasanton, Sunol, Niles, Newark, Livermore as well as other areas within the East Bay and Santa Clara County.

DEPARTMENT OF THE INTERIOR
OFFICE OF INDIAN AFFAIRS

Application Number 10298

Application for enrollment
with the Indians of the State of California under
the Act of May 18, 1928 (45 Stat. L. 602)

The Secretary of the Interior,

Washington, D. C.

Sir:

I hereby make application for the enrollment of myself (and minor children living on May 18, 1928) as Indians of the State of California in accordance with the provisions of the Act of Congress of May 18, 1928 (45 Stat. L. 602). The evidence of identity is herewith subjoined.

1. State the full names, ages, sex, and dates of birth of yourself and your minor children living on May 18, 1928.

English Names	Relationship in Family	Ages in 1928	Sex	Dates of Birth Month Day Year	Degree of Indian Blood
Marine, Lucas	Head	38	M	10-18-1900	1/2
" , Ernest	Son	2	M	1-26-1926	3/4

Note:* See application of Katie Marine, wife, Centerville, Alameda County, California. App. No. 10675

2. Residence on May 18, 1928 Centerville, Alameda County, California.

3. Post Office Box 6, Centerville (Town or City, Box Number or Rural Route Number.) Alameda (County) California (State)

Note:* Does not live on Trust Lands.

4. Place of birth of yourself and each of your minor children Near Sunol, Alameda County, California. My child was born in Alameda County, California.

Name Marine, Lucas Application Number 10298 Action taken Approved, FAB

Figure 18: Lucas Marine BIA Application # 10298

5. Where have you and your children resided since birth? In Alameda and Mendocino Counties, California.

6. Are you married? Yes.

7. If a married woman, give your name before you were married. ---

8. Name and exact date of birth (Month, Day, and Year) of your wife (or husband). Katie Marine, nee Peralta-- Age about 35 years.

9. Is he (or she) of Indian blood? If so, state the name of the Tribe or Band, and degree of Indian blood.

Yes 4/4 Ohlones, (Tribal name unknown) Alameda County, California.

10. What is your degree of Indian blood and to what Tribe or Band of Indians of the State of California do you belong?

1/2 (Degree of Indian Blood) — Ohlones (?) Tribal name Unknown, Alameda County, California. (Name of Tribe or Band)

11. To what Treaty or Treaties were you or your ancestors a party, and where did you (or they) reside on June 1, 1852? Where and when were said Treaties negotiated?

I do not know.

12. Give the names of your California Indian ancestors living on June 1, 1852, through whom you claim, who were parties to any Treaty or Treaties with the United States. If you claim through more than one ancestor living on that date, set forth each claim separately. State your descent from said ancestor or ancestors setting forth your relationship to them.

Names	Tribe or Band	Relationship by Blood
Evalina Marine	Ohlones, Tribal name unknown, Alameda County, California.	Mother.

Muwekma Children Attend Indian Boarding Schools

During the Great Depression years (1930s through the beginning of World War II), the Muwekmas continued to adjust to the economic hardships facing the families. Although at times moving around as farm hands, fruit pickers and laborers, the family heads still maintained important social kinship networks, religious, economic and political ties with each other.

Just prior to the outbreak of World War II, the youngest son of Dario Marine (BIA Application # 10677) and Catherine Peralta Marine (BIA Application # 10675), **Lawrence Domingo Marine** was sent to the Bureau of Indian Affair's Indian boarding school at **Sherman Institute**, Riverside County in southern California from 1931-1940 and there he met his future wife, Pansy Lizzette Potts (daughter of Marie Potts Mason, Maidu Tribe). Lawrence and Pansy's first three children Lawrence Mason Marine, Marvin Lee Marine and Suzie Marine were born and raised in Quincy, California (Maidu territory) and later they lived in Sacramento. Both Lawrence and Marvin Lee became traditional California Indian dancers with the help of their grandmother Marie Potts and Nisenan/Miwuk tribal elder, Bill Franklin (see Bibby article in News for Native California Vol. 7, No. 3, Summer 1993:21-36).

The children of Jack Guzman and Flora (Marine) Munoz, John Guzman, Jr. and his sister Rena Guzman were sent to the BIA boarding school at **Chemawa**, in Salem, Oregon from 1944 -1947. At this time, leadership was still in the hands of Muwekma adults and elders: Phoebe Alaniz (Petra Inigo) [died 1947], Margarita Pinos Juarez, Francisca Nonessi Guzman (died 1942), Dolores Marine Galvan, Dario Marine, Lucas Marine, and Trina Marine.

John Peabody Harrington's Ethnographic and Linguistic Field Work: Interviews with the Muwekma Tribal Community

During the late 1920s and early 1930s, anthropological linguist John Peabody Harrington from the Bureau of American Ethnology conducted interviews with members of the Muwekma tribal community (e.g., Susanna Nichols, Jose Guzman, Francisca Nonessi, Maria de los Angeles Colos, Catherine Peralta and others) who were still residing in the Niles, Centerville, Newark, Pleasanton and Livermore areas.

Harrington's principal linguistic and cultural consultants are direct biological ancestors of the Muwekma Ohlone families many of whom are presently living in the Oakland/ Livermore/Hayward/Castro Valley/Fremont/Newark/Niles/San Jose/Tracy areas. Also during this period of time sound recordings made by Harrington of twenty-seven songs sung by Jose Guzman in 1930 and later in 1934 photos were taken by C. Hart Merriam of Jose Guzman and his family members which attest to the Tribe's presence within their historic homeland (See **Figure 38 - John P. Harrington, Muwekma Elders Jose Guzman** and **Maria de los Angeles "Angela" Colos).**

J. P. Harrington's field notes (dated October 12, 1929, and October 1934) provides information about the culture, history and languages spoken by the **Verona Band/**Mission San Jose Indians. Jose Guzman and Angela Colos shared the following information with him:

- The San Jose Indians were of many tribes gathered at the mission. They are called Chocheños.

- I asked inf. how to say Abajeños, but inf. never heard the term. But inf. knows how to say arribenos.... when I asked if these were the Indians of Oakland, Inf. said no, that they were from [Martinez].

- Inf. does know one tribe, Halkin. It is the name of a tribe up San Rafael way. Liberato here was a Halkin, or was said to be one. [inf.] told him he was a Halkin, and Liberato got mad, denied it.... He [Jose Guzman] made a map, showing the location of "Hacienda Station" for Mrs. Hearst's place.

- From Sunol, … he drew a line, indicating the former location of "Barona" [Verona] Station north of the San Jose Mission. Then, he noted under Roundhouse/Dancehouse:

- Was a big temescal just up the road from here. Until recently could see the place. Door inside and a big hole & also a smaller hole in the roof. Tu'pentak, temescal. Used to have fiestas here**.**

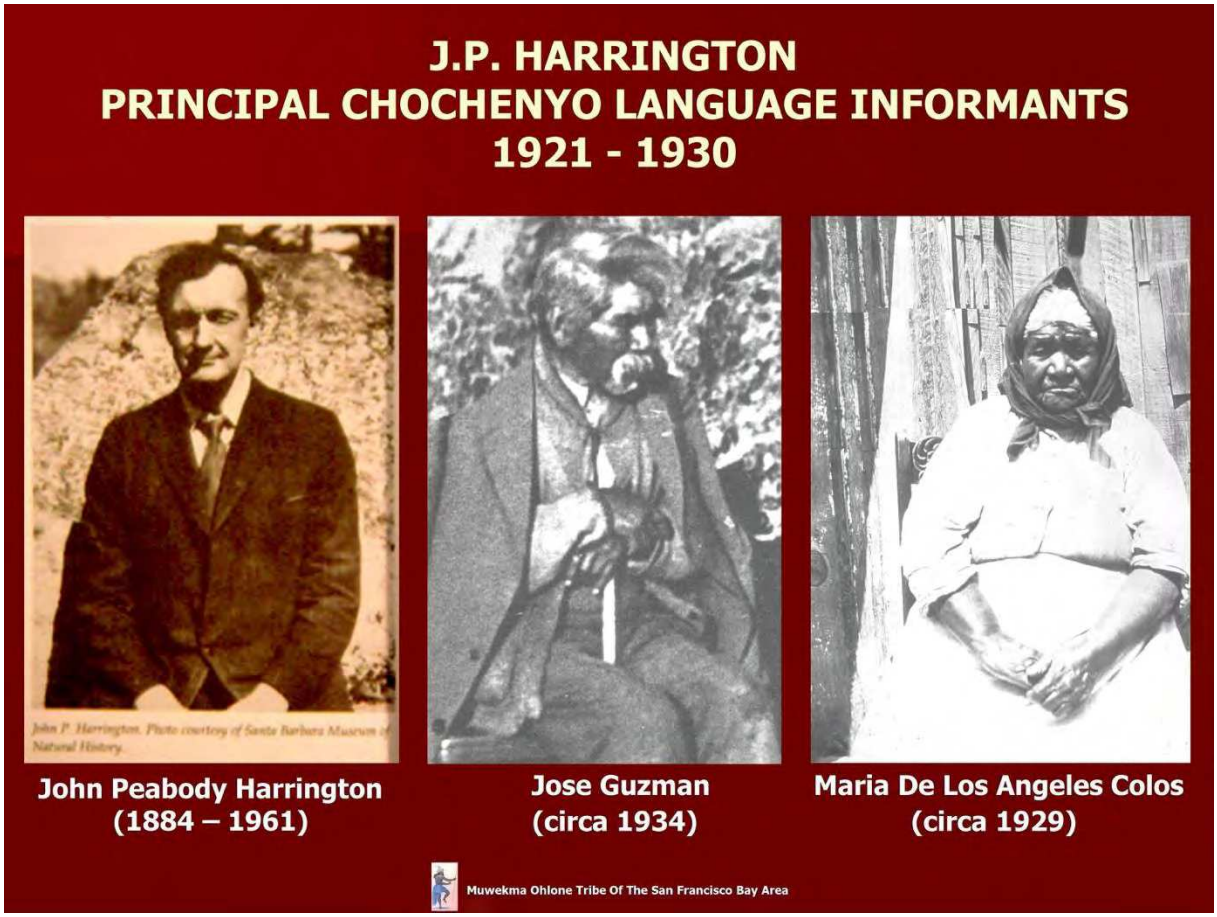

Figure 38: J. P. Harrington, Muwekma Elders Jose Guzman and Angela Colos

The Outbreak of World War II: Muwekma Men Again Answer the Call to War

During **World War II**, almost all of the Muwekma men served in the United States Armed Forces both in the Pacific and European theaters and stateside. Five brothers enlist in the Armed Forces.

- Hank A. Alvarez, Pfc. U.S. **Army, 101st Airborne Division landed Utah Beach Normandy.** Hank was born on February 27, 1922 in San Jose. He spent his childhood in Santa Cruz, Alvarado and Brentwood. While living in Brentwood, on March 18, 1932, his mother Dolores Marine enrolled herself and her children with the **Bureau of Indian Affairs** (see **Figure 26** BIA Application # 10681 above).

Hank enlisted at the San Francisco Presidio and served from December 28, 1942 to December 15, 1945 in the 101st Airborne Division. He returned home from Europe with the 82nd Medical Battalion, 12th Armored Division. While serving in the **101st Airborne Division** he landed at Utah Beach in Normandy, he was later reassigned to the **106th Infantry Division, 423rd Infantry Regiment, Company B** and continued to fight in France, Belgium, Luxembourg and Germany. He regiment saw action at Saint Laurent sur Mer and Saint Nazaire, France, and near Malmedy, Belgium. Later, Hank was reassigned to the **326th Engineer Battalion** during the **Battle of the Bulge** at **Bastogne** and at the **Ramagen Bridge** crossing the Rhine River in Germany. After landing in Europe Hank's units fought in the following campaigns with the 101st Airborne Division: **Ardennes, Rhineland (GO 40 WD 45)**, and **Northern France (GO 33 WD 45).** Hank was issued the following medals and badges: **Sharpshooter M1**, **WWII Victory Medal**, and **European African Middle East Campaign Medal**. The 101st Airborne Division and the 106th Infantry Division earned **Presidential Unit Citations**. Hank was honorably discharged at Camp Beale, California on December 15, 1945.

Hank enrolled himself and his family with the **BIA** on April 26, 1950 during the second enrollment period. During the early 1960s Hank served in a leadership position along with his brothers and sister to save the Tribe's **Ohlone Indian Cemetery** from destruction. Hank has served on the Muwekma Tribal Council since 1992 and is presently the oldest surviving member of the Verona Band of Alameda County and oldest veteran in the Tribe.

- John (Johnnie) Abraham Alvarez was the older brother of Hank Alvarez. John Alvarez was born on May 24, 1914 in San Jose and spent most of his life living in Santa Cruz. He was enrolled with his siblings with the **BIA** in March 1932. John enlisted in **U.S. Army** on October 22, 1941 just prior to America's Declaration of War against Japan, Germany and Italy and he served as a Pfc. in the **U.S. Army Air Corps** in the **Pacific Theater**. A letter was sent to Dolores Marine Alvarez Piscopo Galvan that her son John while serving overseas was **missing in action**, however, although the details are now clouded he was either liberated or saved and he continued to serve. John was honorably discharged on November 20, 1945 and received the **American Defense Service Medal, American Campaign Medal, WWII Victory Medal,** and **Honorable Service Lapel Button WWII**. John Alvarez died on March 6, 2002.

- Francis Salvador "Sal" Samuel Dominic Piscopo, Sergeant Technical [E-7] U.S. Army, European Theater. Salvador was born in San Jose on October 1, 1923 and was a younger brother of Hank and John Alvarez. He went by the name of Samuel Dominic by the time he enlisted in the US Army. Sal was enrolled on March 18, 1932 with the **Bureau of Indian Affairs** with his siblings under his mother Dolores Marine's **BIA Application # 10681**. Sal spent his younger years living in San Jose and Brentwood.

Sal enlisted in the **U.S. Army** on January 25, 1943. He attained the rank of **Sergeant Technical (E-7)** and served in the **14th Mechanized Cavalry Group, 18th Cavalry Squadron.** On 28 August 1944, the 14th Cavalry Group sailed for Europe, where it landed on **Omaha Beach** on 30 September and pressed east. On 18 October 1944, the unit was split into the **18th Squadron**, attached to the **2nd Infantry Division**, and the 32nd Squadron, attached to the 83rd Infantry Division. The unit regained its autonomy on 12 December 1944 and began guarding the Losheim Gap in Belgium. On 16 December, the 14th Cavalry Group received the full brunt of the German winter counteroffensive in the **Battle of the Bulge**. After two days of savage fighting, the unit reassembled at Vielsam, Belgium and was attached to the **7th Armored Division**.

On 23 December, the unit secured the southern flank of the perimeter, which allowed friendly troops to withdraw to safety. On 25 December, the unit was reequipped, attached to the **XVIII Airborne Corps** and moved back into the Bulge to push back the German Army. After the bloody and brutal fight in the Ardennes, the regiment was assigned to the **3rd US Army**.

2nd Infantry Division **7th Armored Division** **XVIII Airborne Corps** **3rd Army**

In December 1944, **the 18th Cavalry Squadron** was **"chopped"** to the **106th Infantry Division** still in sector. The tasks for these squadrons were the traditional cavalry missions of screening to the front and reconnaissance. On 12 December, the 32nd Squadron was returned to Group control and passed lines to the rear for refitting. The 18th Squadron also retuned to Group control but continued its screening mission in the Ardennes region of Belgium.

At 0630 on 16 December 1944, Von Rundstedt launched the final German bid for victory - the now famous 'Ardennes Offensive' or better known as the 'Battle of the Bulge'. After a terrific artillery and rocket barrage designed to destroy communications and disrupt our organization, the German attack was launched. The full weight of this drive was felt early that morning when more than half of the **18th Cavalry Squadron became surrounded, and were captured** or killed by 10:00 hours.

Patton's Third Army Division had begun the Lorraine Campaign by August 1944 and reached the Moselle River near Metz, France. By December 1944, Salvador's tank division turned north to relieve the surrounded and besieged **101st Airborne Division** at **Bastogne** in the Ardennes during the **Battle of the Bulge**. By February 1945 the Third Army moved into the Saar Basin in Germany and later crossed the Rhine River at Oppenheim on March 22, 1945.

On Salvador Piscopo's uniform at the time when his photograph was taken he had four **service bars** representing **two years of overseas service** and also one **three-year reenlistment service stripe**. Sal was wounded when his tank was hit by German anti-tank fire. He carried shrapnel in his chest all of his life. He also was captured by the Germans and was issued a medal with five **Bronze Service Stars, European-African-Middle Eastern Campaign, Good Conduct Medal** and **World War II Victory Medal** and participated in the **Rhineland** (15 Sep 44 to 21 Mar 45), Ardennes-Alsace (16 Dec 44 to 25 Jan 45), and **Central Europe** (22 Mar to 11 May 45) **Campaigns**. He was hospitalized after being liberated and after he was discharged. His brother Hank Alvarez said that Sal's nickname was "**Fade Away**" meaning that "no one can find him, one day he's around and then he would be gone for weeks and then show up again". Sal was discharged at Camp Beale in 1945. Salvador died on September 21, 1968 and is buried in the Disabled Veterans section of **Oak Hill Cemetery** in San Jose, California.

- Philip Galvan Pvt. US Army, Fort Benning, Georgia. Philip was born in September 1926 in Alvarado, Alameda County and was the younger brother of Sal Piscopo. He was enrolled along with his siblings with the **Bureau of Indian Affairs** on his mother Dolores Marine's BIA Application # 10681. Philip enlisted in the **U.S. Army** on April 13, 1944 and was sent to the Monterey Presidio and afterwards he was stationed at Fort Benning, Georgia. Fort Benning was the home of the 2nd Armored Division called "Hell on Wheels". At Ft. Benning the core units of the 2nd Armored Division were the 41st Armored Infantry Regiment, the 66th Armored Regiment,

the 67th Armored Regiment, the 17th Armored Engineer Battalion, the 82nd Armored Reconnaissance Battalion, and the 142nd Armored Signal Company. The 2nd Armored had three artillery battalions (the 14th, 78th, and 92nd). The Division also had support units, including the 2nd Ordnance Maintenance Battalion, a Supply Battalion, the 48th Armored Medical Battalion, and a Military Police Platoon. Some of the units were attached to the 41st Infantry Division in Europe Philip was honorably discharge at Camp Beale in 1946. During the 1960s Philip and his siblings were responsible for protecting the Tribe's Ohlone Indian Cemetery from destruction. Later, Philip joined the editorial board of the American Indian Historical Society's Indian Historian publication journal. Philip also served as the Secretary for the Ohlone Indian Tribe from 1965 to 1971. Philip Galvan was the caretaker of the Tribe's Ohlone Indian Cemetery, located near Mission San Jose. On June 13, 1982, Phil and his brother Ben Galvan laid the cornerstone for the widely acclaimed reconstruction of the 1809 Mission San Jose adobe Church. Philip passed away on March 25, 2013 at the age of 87 years.

- "Ben" Michael Benjamin Galvan, Merchant Marines, **U.S. Navy – (USS *Enterprise)*, U.S. Army and Army Air Corps**. Ben was born on June 23, 1927 in Alvarado and was the last "formal" member of the Federally Recognized Verona Band of Alameda County. In March 1932, he was enrolled with the Bureau of Indian Affairs under his mother Dolores Marine Alvarez Piscopo Galvan's BIA Application # 10681. After serving in the Merchant Marines because he was under aged, he served in the Navy on board the *USS Enterprise*.

The *USS Enterprise* participated in nearly every major engagement of the war against Japan, including the Battle of Midway, the Battle of the Eastern Solomons, the Battle of the Santa Cruz Islands, various other air-sea actions during the Battle of Guadalcanal, the Battle of the Philippine Sea, and the Battle of Leyte Gulf, as well as participating in the "Doolittle Raid" on Tokyo. USS *Enterprise* has the distinction of earning **20 battle stars** and a **Presidential Unit Citation**, the most for any U.S. warship in World War II. Ben Galvan was awarded six Battle Stars and a Purple Heart.

After being injured during combat on the *USS Enterprise*, Ben requested to be transferred to the U.S. Army/Army Air Corps. At the end of his service, he reenlisted in the service on January 15, 1946 at Camp Beale, Marysville, California. On December 4, 1951 Ben enrolled himself and his family during the second BIA enrollment period.

During the early 1960s he was involved is saving the Ohlone Indian Cemetery from destruction and in 1965 Ban became the first chairman of the Ohlone Tribe. Ben served as the chairman of the Ohlone Tribe for thirteen years from 1965 to 1978. Ben Galvan passed away on April 13, 1987.

- Thomas Joseph Garcia, Pfc. U.S. Army, **Co. F. 358th Engineers GS Regiment**. Joseph Garcia was born on December 12, 1912 on the Alisal Rancheria near Pleasanton. Both his mother Mercedes Marine and his father Joseph Armijo Garcia were Muwekma Ohlone Indians. After the death of his mother in 1914, Joseph was adopted by his godmother Phoebe Inigo Alaniz who was also a member of the Verona Band Indian Community. He enrolled with the **Bureau of Indian Affairs** with his step-mother **Phoebe Alaniz** on October 7, 1930 (Application # 10301) and spent most of his life in Livermore.

Thomas Garcia enlisted on July 30, 1942 at the **San Francisco Presidio** and he served until November 27, 1945. On January 10, 1943 the **358th Engineers Regiment** was activated at Camp Claiborne, Louisiana and they departed the U.S. for Europe on July 1, 1943. The Regiment landed in France on August 24, 1944 and crossed into Belgium November 27, 1944 and participated in the **Normandy**, **Northern France**, **Rhineland**, and **Central Europe Campaigns**. He was honorably discharge on November 27, 1945. On April 22, 1953, he enrolled during the second **BIA** enrollment period. Thomas Garcia passed away on February 9, 1956 and was buried **Golden Gate National Cemetery** (Section Q, Grave 59).

- Ben L. (Angel) Guzman, Pfc. U.S. Army. Bennie Guzman was born on October 2, 1922 in Niles. His father was Fred Guzman who had served in the 28th Infantry Division during WW I. Bennie enlisted on November 5, 1942 at **San Francisco Presidio**. He first went to Camp Niles, California and then onto Camp White, Oregon, and fought in the **Asiatic Pacific Theater of Operations**. His enlistment record identifies him as an "**American Indian, Citizen"**. Ben attained the rank of Private and was discharged on January 9, 1946 at Camp Beale, California. He was issued the **World War II Victory Medal**, **WW II Lapel Button**, **Asiatic-Pacific Campaign Medal**, **Bronze Star**, and **Combat Infantry Badge**. Ben Guzman died on March 11, 1995 and he is buried in the **San Joaquin National Cemetery** in Gustin, Ca. (Plot C-3 0 517).

- Frank Harry Guzman, Pfc. U.S. Army. Frank was the younger brother of Bennie Guzman and he was born on April 2, 1926 in Pleasanton. Muwekma Ohlone Indians Dario Marine and Cecelia Armija were his godparents. Frank and his brother Bennie were photographed with their uncle Toney Guzman by anthropologist C. Hart Merriam in September 1934.

Frank's enlistment record identifies him as an "**American Indian, citizen"** and that he enlisted at the **San Francisco Presidio**. Frank served from July 21, 1944 to June 1946 as a Light Machine Gunner in the unattached **345th Infantry Regiment, 87th Infantry Division** that was during the war assigned to the **3rd Corps**, **8th Corps**, **12th Corps of General Patton's 3rd Army** (25 Nov 1944), **15th Corps of the 7th Army**, **8th Corps of the 1st Army** and the **8th Corps of the 9th Army** during the European Theater of Operations (October 1944 - May 1945). Frank was also briefly assigned to the **82nd Airborne Division** and received his Parachute Badge.

On December 15, 1944, the **345th Infantry** Regiment was in the vicinity of Rimling, France and by December 17rt the regiment took the town of Medelsheim, Germany. By December 26th the Germans had broken through the American defenses along the German-Belgian border between Malmedy, Belgium and Echternach, Luxembourg and create a fifty-five mile salient through the Ardennes Forest. The 345th was sent to the Cathedral city of Rheims to prevent a German breakthrough there and by December 28th the regiment was reassigned to General Patton's Third Army. On 29 December 29th the 345th Infantry Regiment was again on the road bound for an assembly area in the Luchie Woods 19 kilometers southwest of Moircy, Belgium.

The **Battle of the Bulge** which lasted from December 16, 1944 to January 28, 1945 was the largest land battle of World War II in which the United States participated. More than a million men fought in this battle including some 600,000 Germans, 500,000 Americans, and 55,000 British. At the conclusion of the battle the casualties were as follows: 81,000 U.S. with 19,000 killed, 1,400 British with 200 killed, and 100,000 Germans killed, wounded or captured.

Frank was engaged in the **Rhineland** and **Central Europe** campaigns. He received the Army **Presidential Unit Citation Ribbon**, **Combat Infantry Badge**, **European Africa and Middle Eastern Campaign Meda**l (**Three Bronze Stars for Campaigns**), **Good Conduct Medal**, **American Campaign Medal**, **World War II Victory Medal**, **Army of Occupation Medal (Berlin), Parachute Badge, Marksman Badge** for Machine Gun and Rifle. Frank Guzman was honorably discharged at Camp Beale, California on June 27, 1946. Frank Guzman was a member of the V.F.W. Post No. 1537 of Tracy, California; he died on March 17, 1982.

aul Marine, Pfc. U.S. Army, 58th Armored Field Artillery he son of Muwekma Ohlone Indians Lucas Marine and Catherine y 26, 1926 in Centerville. He was enrolled with his father with the nuary 11, 1930 (**BIA Application # 10299**) and his mother had llment (**Application # 10675**). His father Lucas Marine had Cornates Marine) and Ernest's mother (Catherine Peralta Marine) cation.

Ernest Marine enlisted on April 13, 1944 at the Monterey Presidio. On June 6th 1944 (D-Day), the 58th was ordered to land on Omaha Beach in support of the 116th Combat Team, and the 2nd and 5th Ranger Battalions. Ernest served in Europe in the unattached **58th Armored Field Artillery Battalion** self-propelled 105 Howitzers, temporarily attached to the **29th Infantry Division, V Corps** and **XIX Corps**, and he fought in the **Rhineland** (September 15, 1944 – March 21, 1945), **Ardennes-Alsace** (**Battle of the Bulge, Bastogne, Belgium**, December 16, 1944 – January 25, 1945) and **Central Europe Campaigns** (March 22, 1945 – May 11, 1945). Ernest enrolled with his father Lucas Marine during the second **BIA** enrollment period on December 23, 1950. Ernest Marine was honorably discharged at Camp Beale on June 15, 1946. After the war he spent most of his life living with his aunt Trina Thompson Ruano in Newark and he passed away on October 20, 1977 in Sacramento.

- Filbert S. Marine, Technician Fifth Grade (**T/5** or **TEC 5, U.S. Army, Pacific Theater.** Filbert was the last child born on the Alisal Rancheria on December 31, 1915. Both of his parents Dario Marine and Catherine Peralta were **Muwekma Ohlone Indians**. His godparents were also Muwekma Ohlone Indians Franklin Guzman who served in the Marine Corps during WWI and Francisca Guzman. Filbert and his siblings were enrolled with the Bureau of Indian Affairs on their father's BIA **Application # 10677** on March 11, 1932.

Filbert enlisted in the Army on February 18, 1942 at the Presidio of Monterey. His enlistment record identifies him as "**American Indian**, citizen." He fought in the Pacific Theater and was assigned to the **226th Field Artillery Battalion, Battery B**. His unit was assigned to **XXIV Corps** during the Battle of Leyte in the Philippines. The Marines that took part in the Leyte landings were elements of the VAC Artillery, which had been attached to the XXIV Corps earlier in 1944, while still at Hawaii. The **V Amphibious Corps** (VAC) was a formation of the United States Marine Corps and was composed of the 3rd, 4th and 5th Marine Divisions during World War II. They were the amphibious landing force for the United States Fifth Fleet and were notably involved in the battles for **Tarawa** and **Saipan** in 1944 and the **Battle of Iwo Jima in 1945.**

The Marine complement consisted of the 5th 155mm Howitzer Battalion; the 11th 155mm Gun Battalion, and Headquarters Battery. Army field artillery battalions in the XXIV Corps were the 198th Field Artillery Battalion (155mm Howitzer), the **226th Field Artillery Battalion (155mm Gun),** and the 287th Field Artillery Battalion (Observation).

The Marine artillery elements assigned to the XXIV Corps, as well as the **226th Field Artillery Battalion** had been formed from former seacoast artillery units; though familiar with heavy artillery, the men had received only rudimentary field artillery training. Prior to the departure of these units from Hawaii, the Marine artillery had undergone intensive field artillery training. Embarkation of personnel from Hawaii was accomplished between 6 and 14 September 1944.

The island of Leyte, lying in the Visayas Group of the Central Philippines, is 115 miles in length and varies in width from 15 to 40 miles. The main mountain range runs the entire length of the island from north to south, leaving a wide coastal plain along the east coast. The Sixth Army troops for Operation KING II, code name for the invasion of Leyte, were composed of the X and **XXIV Corps** and the 6th Ranger Battalion. The X Corps included the 1st Cavalry Division and the 24th Infantry Division; the XXIV Corps consisted of the 7th and 96th Infantry Divisions. After the Leyte (20 Oct 1944) Philippine Campaign ended, the **226th Field Artillery Battalion** continued on and participated in the **Okinawa Campaign** (14 June 1945). Filbert's unit may have gone from Camp Forrest, Tennessee to Fort Oglethorpe Georgia to Fort Sill, Oklahoma to Camp Stoneman, California to Maui to Oahu to Molokai to Eniwetok to Manus to Leyte to Samar and ended up on (Ryukyus) Okinawa in 1945.

Filbert was issued the **Asiatic-Pacific Campaign Medal**, **Good Conduct Medal**, **Philippines Liberation Medal**, **World War II Victory Medal, and Philippine Liberation Medal** and was honorable discharged on November 24, 1945 with the rank of Tec. 5. He died in Sacramento on March 31, 1953 and was buried in the military section (Veteran's Plot) of the City of Sacramento Cemetery.

--Lawrence Domingo Marine, Platoon Sergeant, U.S. Marine Corps (Serial # 299599)**.** Lawrence was the younger brother of Filbert Marine and he was born on May 4, 1919 in Centerville. He was one of the last Muwekma Ohlone Indians to be baptized at Mission San Jose. He was enrolled with the Bureau of Indian Affairs on his father's BIA **Application # 10677** on March 11, 1932. He was also sent to **Indian Boarding School** at **Sherman Institute**, Riverside, California in 1931 and graduated from there in 1939. He also met his future wife Pansy Potts from the Maidu Tribe while attending Sherman Institute.

After leaving Sherman Institute, Domingo returned to the Bay Area and enlisted in the U.S. Marine Corps in January 1940 in San Francisco. By December 1, 1940, he was assigned to **Headquarters and Service Battery, 1st Battalion, 10th Marine, 2nd Marine Brigade FMF**, in San Diego before shipping out to the Pacific. By April 1, 1942, Lawrence was promoted to Corporal while stationed

at Tutuila, American Samoa. Later by January 1, 1943, Lawrence was promoted to Sergeant while stationed at Guadalcanal while assigned to **Headquarters and Service Battery, 1st Battalion, 10th Marine, 8th Marine Reinforced**. He was later transferred to **Battery "A", 75mm Gun, 10th Marines, 2nd Marine Division, FMF, In the Field** by April 1943. By July 1, 1944, he was assigned to the **Light Anti-Aircraft Group, Eighth Anti-Aircraft Battalion, Corps Artillery, Fifth Amphibious Corps** and later by October 1, 1944, Lawrence was a **Platoon Sergeant**, (identified in the Muster rolls as **Assistant Platoon Commander, 2nd Platoon, 40 mm Battery**) with the **Light Anti-Aircraft Group, Eighth Anti-Aircraft Battalion, Fleet Marine Force, Pacific.** From April 1 – April 30, 1945, Lawrence's unit location and "secret agenda" was on Okinawa, Ryukyus Islands. By January 1 -January 30, 1946, Lawrence's unit returned to the U.S. and was station on Treasure Island. Lawrence was now with the **Guard Company Marine Barracks, Treasure Island Activities, San Francisco**. He was still classified as a Platoon Sergeant, Sergeant of Guard.

Lawrence D. Marine was engaged in the following major battles, engagements, and ports from January 2, 1942 – November 8, 1945: **Hawaiian Islands Area**, **American Samoan Islands**, **Wellington, New Zealand, Guadalcanal, B.S.I** (**British Solomon Islands, New Georgia**), **Eniwetok, Marshall Islands, Ulithi, Caroline Islands, Okinawa,** and **Ryukyus** (southern Japanese Islands). The **Battle of Eniwetok** was a battle of the Pacific campaign of World War II, fought February 17, 1944 - February 23, 1944 on Eniwetok Atoll in the Marshall Islands.

The invasion of Eniwetok followed the American success in the battle of Kwajalein to the southeast. Capture of Eniwetok would provide an airfield and harbor to support attacks on the Mariana Islands to the northwest. **Battle of Okinawa** was the largest amphibious invasion of the Pacific campaign and the last major campaign of the Pacific War. More ships were used, more troops put ashore, more supplies transported, more bombs dropped, more naval guns fired against shore targets than any other operation in the Pacific. The fleet had lost 763 aircraft. Casualties totaled more than 38,000 Americans wounded and 12,000 [including nearly 5,000 Navy dead and almost 8,000 Marine and Army dead killed or missing], more than 107,000 Japanese and Okinawan conscripts killed, and perhaps 100,000 Okinawan civilians who perished in the battle.

Lawrence Domingo Marine was honorably discharged at **Treasure Island** on November 20, 1946 after having an extended two-year reenlistment. He received the **Presidential Unit Citation**, **Good Conduct Medal**, and **Good Conduct Medal Bar No. (1), Honorable Discharge Button, Honorable Service Button.** Lawrence Marine enrolled during the second **BIA** enrollment period on October 12, 1950. He passed away on May 21, 1988 and was buried in Woodland, California.

- Henry Vernon Marshall, Sergeant, U.S. Marine Corps was born in Newark on June 27, 1925. He was the son of Muwekma Ohlone Indian Henry Marshall, Sr. who was the son of Magdalena Armija Marshall Thompson. Henry Marshall, Jr. was a member of the Verona band of Alameda County. His grandmother, Magdalena enrolled her children with the Bureau of Indian Affairs on October 7, 1930 (BIA Application # 10296). Henry Marshall, Jr. enlisted on May 19, 1942 (Service # 394908) in the United States Marine Corps and was assigned to the **1st Marine Division** (Guadalcanal). He fought in the Pacific Theater of Operations and was issued the **Navy Presidential Unit Citation** with one

Bronze Star, **American Campaign Medal**, **Asiatic Pacific Campaign Medal, Rifle Sharpshooter Badge,** and a three-tiered **Weapons**(?) qualifying badge. He was honorably discharged on May 19, 1946. His father later enrolled the family during the third **BIA** enrollment period on May 7, 1969 as part of the California Indian Claims Judgment. Henry passed away on September 24, 1986.

- Arthur M. Pena, Sergeant, U.S. Army, Company A, 155th Engineers Combat Battalion, Pacific Theater. Arthur was born in Crockett, California on September 24, 1924. His mother was Erolinda Santos (Juarez/Saunders) Pena Corral who was a member of the **Muwekma Ohlone Verona Band Indian Community**. Arthur was enrolled along with his mother and siblings with the **Bureau of Indian Affairs** on his great-aunt Maggie Pinos Juarez's **BIA Application # 10676** on March 18, 1932. Prior to WWII, Arthur was working for Southern Pacific Railroad.

Arthur Pena registered with the draft board on December 21, 1942 and enlisted in the army on April 13, 1943 at the **San Francisco Presidio** and served in the unattached **155th Engineering Combat Battalion** in the Pacific Theater. He served in the **Southern Philippines** and **Western Pacific Campaigns** (**Leyte** October 17, 1944 – July 1, 1945 and **Western Pacific** June 15, 1944 – September 2, 1945) and his battalion was sent to **Guadalcanal** (August 12 – August 24, 1944). From Guadalcanal, the battalion went on to **Palau, Ulithi, New Caledonia** (February 20, 1945)**, Southern Philippines** (May 16, 1945), and **Japan** (September 8, 1944 – September 25, 1945).

Arthur Pena was honorably discharged at Camp Beale, Marysville, California on February 2, 1946 and he was issued the **Philippines Liberation Ribbon**, **Asiatic Pacific Campaign Medal**, **American Campaign Medal**, **Good Conduct Medal** and **World War II Victory Medal**. He reenlisted on August 7, 1946 and served in Germany in Company C 793rd Military Police Battalion and he also went through the European Command Intelligence School. He was honorably discharged on March 25, 1955 and then reenlisted again on March 26, 1955. After serving another two years, Arthur was discharged at Fort Leonard Wood, Missouri on December 9, 1957. Arthur was also issued the **UN Service Meda**l, **National Defense Service Medal**, and **Army of Occupation Germany Medal**. On December 27, 1957, he enrolled his family with the Bureau of Indian Affairs during the second enrollment period.

- Robert P. Corral, U.S. Army, Pfc. Infantry, Head Quarters Regiment, Ft. Benning, GA. Robert was born in Crockett, California on June 1, 1926 and was the younger brother of Arthur Pena. His mother was Erolinda Santos (Juarez/Saunders) Pena Corral who was a member of the Muwekma Ohlone Verona Band Indian Community. Robert was enrolled along with his mother and siblings with the **Bureau of Indian Affairs** on his great-aunt Maggie Pinos Juarez's **BIA Application # 10676** on March 18, 1932.

Robert enlisted at the **San Francisco Presidio** on December 18, 1944 and was honorably discharged on November 13, 1946. At Fort Benning, Georgia Robert completed six parachute jumps and was awarded a **Parachutist Badge, World War II Victory Medal, Good Conduct Medal, and American Campaign Medal.** On May 16, 1955 Robert enrolled himself and his family during the second BIA enrollment period. During the third BIA enrollment period on April 30, 1969, Robert enrolled his family as "**Ohlone Indians**" with the BIA as part of the California Indian Claims Judgment (Application # 21123). During the 1990s Robert P. Corral served as a **Muwekma Ohlone Tribal Elder** and he passed away on June 28, 1996 in Stockton.

- Enos Marine Sanchez, Pfc. U.S. Army, 89th Division, 1st Battalion, Co. M, 354th Infantry Regiment, (39 390 899). Enos Sanchez was born on February 1, 1910 near the Alisal Rancheria in Sunol and his birth certificate identified him as "**California Indian.**" Enos and his younger siblings were enrolled with the **Bureau of Indian Affairs** on March 18, 1932 (**BIA Application # 10680**). He along with his mother was Ramona Marine Sanchez were members of the Federally Recognized **Verona Band of Alameda County**.

Enos enlisted on June 29, 1942 in Sacramento and was shipped out to Camp Carson, Colorado Springs and later that year served in Greenland and Iceland. The 89th Division was called the "**Rolling W**" standing for MW (Middle West). After landing at LeHarve, France, the 89th received orders to move into Mersch, Luxembourg (March 8, 1945). The 89th was assigned to the **XII Corps** of **General Patton's Third Army**. Crossing into Germany the 89th met the German 2nd Panzer Division and seven Volksgrenadier Divisions and by March 26, 1945, the 89th crossed the Rhine River. Enos' Military Occupational Specialty (MOS) was a Heavy Machine Gunner (605). On April 4, 1945, the 4th Armored and the 89th Infantry Divisions were involved in the liberation of the **Ohrdruf Death Camp,** which was part of the Buchenwald concentration camp network. It was the first Nazi concentration camp liberated by the U.S. Army.

Enos' unit fought in the **Rhineland** and **Central Europe** (GO WO WD 45) **Campaigns** and he was awarded the **Combat Infantry Badge (31), Good Conduct Medal, American Campaign Medal, European, African, Middle Eastern Campaign Medal, World War II Victory Medal** (TWX WD 23 Oct 45), and **Marksman M1 Rifle** Sep 42 (55). Enos was honorable discharged on November 15, 1945 and separated from Camp Beale, California. In 1965 Enos was identified along with his family and fellow Tribal members by the American Indian Historical Society on a list of "**Ohlone Contacts and Ohlone Members**". He died on July 19, 1995 at the age of 85 and was buried at the **Calvary Cemetery** in San Jose California.

- Robert R. Sanchez, U.S. Army, Technician Fourth Grade, 7th Co. 508th Prcht. Infantry, 82nd Airborne Division. Robert Sanchez was the younger brother of Enos Sanchez and he was born in Sunol near the Alisal Rancheria on March 26, 1917. Robert and his siblings were enrolled with the **Bureau of Indian Affairs** on March 18, 1932 (**BIA Application # 10680**).

Robert enlisted in October 1942, and he volunteered to join the 82nd Airborne Division, 508th Parachute Infantry Regiment. On June 5-6, 1944, the paratroopers of the 82nd's three parachute infantry regiments and reinforced glider infantry regiment boarded hundreds of transport planes and gliders and, began the largest airborne assault in history. They were among the first soldiers to fight in Normandy, France.

The Division air-assaulted behind **Utah Beach, Normandy, France**, between Saint Mere Eglise and Carentan on June 6, 1944, being reinforced by the **325th Glider Regiment** the next day. The 82nd Airborne Division was reinforced by both the attached 507th PIR and the **508th PIR**.

The **508th Parachute Infantry Regiment** (a.k.a. the Red Devils) **whose battle cry was "**Diablo!**"** was originally an organic part of the **2nd (Battalion) Airborne Infantry Brigade** that was attached to the **82nd Airborne Division** through most of its time in combat. Campaigns include **Normandy** (D-Day June 6, 1944), **Rhineland**, **Ardennes-Alsace** (France), and **Central Europe** (Nijmegen-Arnhem Holland, and Belgium).

By July 1945, the 82nd Airborne was moved to Berlin to occupy the American Sector. The 508th which had fought alongside the 82nd since Normandy was sent to occupy Frankfort, Germany. For his service in the 508th PIR, **Robert Sanchez** was issued the **Distinguished (Presidential) Unit Citation**, **Combat Infantry Badge, Parachute Badge, European Africa and Middle Eastern Campaign Medal, World War II Victory Medal, Army of Occupation Medal (Berlin), Belgian Citation (Lanyard) and French Citation (Lanyard).**

The **82nd Airborne Division** and the 508th Parachute Infantry Regiment **were issued the** Distinguished (Presidential) Unit Citations **for actions during the** Normandy **Campaign.** "The 508th Parachute Infantry is cited for outstanding performance of duty in action against the enemy

between 6 and 9 of June 1944, during the invasion of France. … The courage and devotion to duty shown by members of the 508th Parachute Infantry are worthy of emulation and reflect the highest traditions of the Army of the United States. The **Netherlands Citation** was issued by the Dutch Government to the 82nd Airborne and its attached divisions (508th PIR) on October 8, 1945 for airborne operations and combat actions in the central part of the Netherlands (**Nijmegen**) during the period from September 17, 1944 to October 4, 1944. The 82nd Airborne Division became the first non-Dutch military unit to be awarded the ***Militarie Willems Orde***, Degree of Knight Fourth Class to wear the Orange Lanyard of the Royal Netherlands Army.

The **Belgian Citation** (Lanyard) was issued by the Belgian Government to the 82nd Airborne Division with the 508th Parachute Infantry attached "has distinguished itself particularly in the Battle of the Ardennes" from December 17, 1944 – December 31, 1944. The **French Citation** (Lanyard) was issued to the 508th Parachute Infantry by the Government of France. "The President of the Provisional Government of the French Republic Cites to the Order of the Army: 508th Parachute Infantry Regiment: A magnificent unit, reputed for the heroism and spirit of sacrifice of its combatants and which made proof of the greatest military qualities during the battle of Normandy" (June 6, 1944 – June 20, 1944). This citation includes the award of the ***Croix de Guerre with Palm.***

O. B. Hill from the 508th P.I.R. Association, 82nd Airborne Division wrote: "2,056 men of the 508th Parachute Infantry Regiment (attached to the 82nd Airborne) jumped into Normandy on D-Day, and on July 15, 1,918 returned. The rest had been killed, captured or wounded".

Robert was honorably discharged on February 2, 1948 and spent most his life in the greater Bay Area. Robert Sanchez was one of the early prime movers and active Elders in the Muwekma Ohlone Tribe. He passed away on April 26, 1999.

- Daniel G. Santos (Juarez), Technical Sergeant, **U.S. Army**, **41st Division** – 1941-1945. Daniel Santos (Saunders/Juarez) was born in Sunol near the Alisal Rancheria on January 21, 1917. Both his parents Joseph Saunders and Erolinda Santos were members of the **Verona Band of Alameda County**. Daniel was enrolled with the **Bureau of Indian Affairs** along with his mother and siblings under his great-aunts' **BIA Application (# 10676)** on March 18, 1932.

Daniel Juarez (Santos) received a draft notice dated **March 14, 1941**, from Local Board No. 36 located in Manteca, California. It was addressed to Mr. Dan George Juarez, Route, Box 29A, Tracy, California. The letter stated:

> We received a call for 70 men to be inducted from this area on March 27th 1941. … it is probable that you will be included in the group, and we are therefore taking this

opportunity of notifying you, before (?) official order is issued, so that you may make your plans accordingly.

Daniel enlisted on March 27, 1941 at Sacramento before the war was declared. The **Jungleer** or **Sunset Division** was Federalized on September 16, 1940. By December 7, 1941, the 41st Division was ready. It continued the series of "firsts" by being the first United States Division to deploy to the South Pacific. It became the first American Division sent overseas after Pearl Harbor, the first American Division trained in Jungle Warfare. It spent 45 months overseas (longer than any other Division), and earned the title of "**Jungleers**". The 41st Division left for Australia in March of 1942. Elements of the division landed January 23, 1943 in **Dobodura, New Guinea.** On the **Island of Biak** (May 27, 1944) the American Forces fought the first tank battle of the war against the Japanese destroying seven without loss. The division also fought in the Philippines (January 9, 1945) and fought on **Palawan** and **Sulu Archipelago** (March 10, 1945) and arrived in **Japan** on October 6, 1945. The 41st participated in 3 campaigns (**New Guinea, Luzon, and Southern Philippines**) and suffered 4,260 casualties.

Former Secretary of Defense Caspar W. Weinberger also served in the 41st Division as an officer. The 41st Division earned three **Distinguished (Presidential) Unit Citations**. Daniel Santos was honorably discharged in 1945. Daniel enrolled with the Bureau of Indian Affairs during the second BIA enrollment period on May 23, 1955. He also worked at Leslie Salt Company in Newark and spent his life working on and racing cars. Daniel passed away on April 28, 1980.

- Lawrence Thompson, Sr., Tec Fifth Grade, U.S. Army, 640th Tank Destroyer Battalion. Lorenzo Thompson, Sr. was born in Newark September 9, 1918. His mother Magdalena Armija Thompson was a member of the **Verona Band of Alameda County**. Lawrence and his siblings enrolled with their mother with the Bureau of Indian Affairs on October 7, 1930.

The **640th Tank Destroyer Battalion** was formed at Camp San Luis Obispo on December 19, 1941 as an element of the **40th Infantry Division**, and served in the Pacific Theater of Operation. The 640th was activated on March 3, 1941 from National Guard Divisions from California and Utah and was sent overseas on August 23, 1942.

The 640th Campaigns included: **Bismarck Archipelago, Southern Philippines,** and Luzon and were issued 3 **Distinguished Unit Citations**; Awards: MH-1; DSC-12; DSM-1; SS-245; LM-21; SM-30; BSM-1,036; AM-57.

Lawrence Thompson enlisted at the age of 23 on September 10, 1941 at the **San Francisco Presidio**. At that time, he was living at 2370 Pine St. in San Francisco**.** His MOS was Cannons S45 and he fought in the following campaigns: **Aleutian Islands [Attu and Kiska Island** with the **7th Infantry Division], Luzon** and **Southern Philippines** and **Eastern Mandates [Marshall**

Islands, Kwajalein, Eniwetok]. Initially deployed to Hawaii in September 1942, the **640th Tank Destroyer Battalion** participated in combat landings at **Guadalcanal** (February 5, 1944), **Cape Glouster, New Britain** (May 3, 1944), **Lingayen Gulf, Luzon, Commonwealth of the Philippines** (January 9, 1945), and **Los Negros Islands** (March 29, 1945). The **640th Tank Destroyer Campaign Honors** include: **Bismarck Archipelago** [**islands of New Guinea**] (December 15, 1943 – November 27, 1944)**,** and **Luzon and Southern Philippines [GO 33 WD 45]** (December 15, 1944 – July 4, 1945). "**Seek, Strike, and Destroy"** was the motto of the Tank Destroyers.

Lawrence Thompson was honorably discharged on October 2, 1945 at Camp Beale, Marysville, California and was issued the **American Defense Service Medal**, **Asiatic Pacific Campaign Medal** and **Philippine Liberation Ribbon with Bronze Star**.

After the war Lawrence Thompson, Sr. and his son Lawrence Thompson, Jr. enrolled with the Bureau of Indian Affairs during the third BIA enrollment period on June 24, 1969. Later during the early 1990s Lawrence, Sr. served on the Muwekma Tribal Council. He passed away in November 1999.

- George James (Guzman) Hernandez was born in Niles on November 13, 1923 to Candeliana (Carolyn/Carrie) Guzman Hernandez (born March 12, 1905) who was the daughter of Muwekma Elder **Francisca Guzman Nonessa** (BIA #10293) and Manuel Hernandez. Manuel Hernandez was working for Elbert Apperson during the early 1900s while living on Glenn Avenue in Sunol (1920 Federal Census). George enlisted on September 12, 1945 at Camp Beale, Marysville, California and had the rank of Private in the United States Army, he was discharged from the service on July 2, 1946. On his June 30, 1942 Draft Registration card he identified Paul Guzman (Hernandez) as his uncle and that he worked on the W. Walton Ranch in Centerville (now the City of Fremont) which was the same employer of his uncle Toney Guzman. He was the nephew of Toney and Fred Guzman, and first cousin to Frank Harry and Bennie Guzman.

George died in the Town of Middleton, Lake County on June 26, 1995 and was buried in the **Golden Gate National Cemetery**, Section K, Site 631.

See **Figures 39** and **40** for some of the Muwekma men who served in WWII.

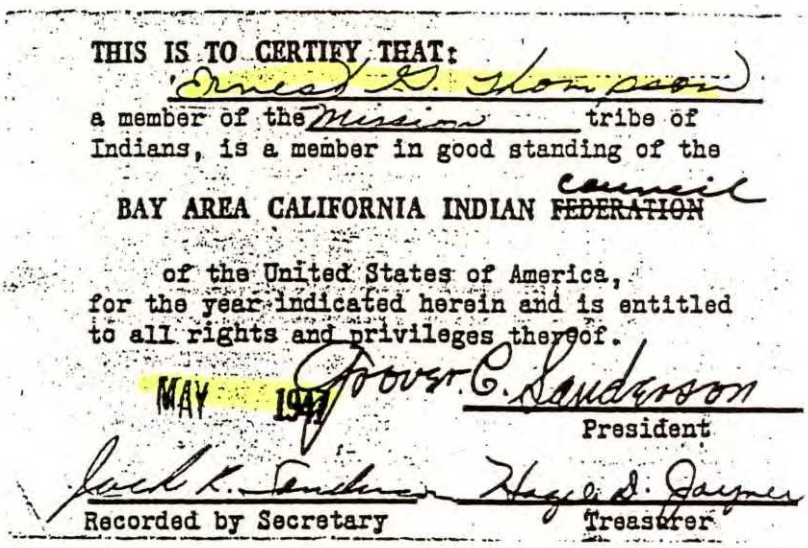
Figure 39: Some of the Muwekma Men Who Served During World War II

Figure 40: Some of the Muwekma Men Who Served During World War II

From Post-World War II to the 1960s

At the end of the war, the returning Muwekma men had to readjust to the peacetime economy and search for employment throughout the central California region. Work was difficult to find at times, but families helped each other and maintained tribal relations through religious and social mechanisms (e.g., compadrazo/godparenting and witnessing) that have long been established within the Muwekma families.

After World War II, in May 1947, **Ernest Thompson, Jr.** the son of Magdalena Armija Thompson, along with other tribal elders became members of the **Bay Area California Indian Council** which represented the contractual interests for over one thousand California Indians residing in the Bay Area as a result of the 1928, 1944, and 1946 Indian Claims Acts and ensuing legal decisions by the Justice Department (**Figure 41**).



THIS IS TO CERTIFY THAT:
Ernest D. Thompson
a member of the Mission tribe of
Indians, is a member in good standing of the
BAY AREA CALIFORNIA INDIAN ~~FEDERATION~~ Council
of the United States of America,
for the year indicated herein and is entitled
to all rights and privileges thereof.

Figure 41: Ernest Thompson Membership in Bay Area California Indian Council

After 1950, those surviving Muwekma and other California Indians were issued checks for the sum of **$150.00** per person as compensation for the value (with interest going back to 1852) for the value of the 8.5 million acres of land and promised services that they never received. Deducted from the final lump sum was the cost of every military operation, Indian services, and bullets spent to kill Indian people, so that the settlement would not be a burden to the American taxpayer.

Although still landless, community and tribal related activities fell under the leadership of Muwekma Elder, **Margarita (Maggie) Pinos Juarez**, and **Dolores Marine Galvan** ,and her brothers **Dario Marine** and **Lucas Marine,** and her younger sister, **Trina Marine Thompson Ruano** (Ernest Thompson, Sr., had married Trina after the death of his first wife, Magdalena Armija Thompson)**.** These tribal activities and interactions were further spurred by communications with the BIA Sacramento Agency, which notified the Muwekma lineages of the expanded enrollment opportunities under the California Indian Jurisdictional Act for children born after May 28, 1928. Families contacted and helped each other to go to Sacramento to enroll their children, nieces and nephews. After the California Indian Roll was approved on November 23,

1951, the Sacramento Area Office published a list of enrollees that identified **forty** Muwekma as "**Tribe Mission San Jose**" (BIA list 1951).

Also, during this period of time (from 1930s and 1950s), some of the families moved about seeking new employment opportunities and residential stability. The residence of Lucas Marine and Catherine Peralta (before her passing in 1934), as well as Francisca Guzman and her son Alfred Guzman and his family resided on the **Shinn Ranch** in Niles and became an important gathering place for the families and relations (see Harrington notes 1921-1934 regarding events between Liberato and Pedro Confessor prior to the turn of the century). Other important households were the residences of Dolores Marine Galvan in Brentwood and San Jose, Dario Marine in Centerville and later Woodland, and Margarita Pinos Juarez and Trina Marine Thompson Ruano in Newark where the families would gather for various occasions.

Continuous Connections to the Tribe's Sacred Sites: The Protection of the Ohlone Indian Cemetery, Located in Fremont, Mission San Jose, California

The **Ohlone Indian Cemetery** located on Washington Boulevard, one mile west of Mission San Jose in Fremont, was used for burial by members of the Guzman, Santos, Pinos, Marine, Armija (Thompson) and Nichols families until 1926, while the original Ohlone burial ground was located under the northern wing of the mission church. Martin Guzman (died October 4, 1925), Victorian Marine Munoz (died November 27, 1922), and her son Jose Salvador Munoz (died 1921) were some of the last Muwekma Ohlone Indians to be buried there. On Jose Salvador Munoz's death certificate it identifies his place of burial as "**Ohlone Cem**"[etery].

During the 1960's Muwekma families under the leadership of **Dolores Marine Galvan**, participated in securing the legal title to the Historic Ohlone Cemetery located on Washington Boulevard in the City of Fremont. In 1971, a board of directors for the Ohlone Indian Tribe, Inc. was established by Dolores Marine Galvan and her children Philip Galvan, Benjamin Michael Galvan and Dolores Galvan Lameira in order to secure title to the tribe's ancestral cemetery.

During this period of time when the **American Indian Historical Society** obtained legal title of the Ohlone Cemetery on behalf of the Muwekma Ohlone community, invitations went out to various families, including the children of Magdalena Armija, Ernest Thompson and the other Marine-related families, to help clean up the run-down cemetery (**Figure 42 – Ohlone Cemetery**). As mentioned above, the Guzman, Marine, Armija-Thompson and Nichols families had loved ones (e.g., Avelina Cornates Marine (died 1904), Elizabeth (Belle) Marine Nichols (d. 1911), Ramona Marine Sanchez (d. 1921), Victoria Marine Munoz (d. 1922), Dario's son Gilbert Marine, Rosa Nichols and Mary Nichols, Salvador Munoz (d. 1922), Charles Thompson (d. ~ 1917), Martin Guzman (d. 1925), and others were buried there during the first three decades of this century (Marine Family History 1965; Leventhal, Escobar, Alvarez, Lameira, Sanchez, Sanchez, Sanchez and Thompson 1995).

Figure 42: Lillian Massiatt, Ramona and Michael Galvan at Ohlone Cemetery (1966)

Benjamin Michael Galvan who was born on June 23, 1927, and was the last formal member of the historic Verona Band of Alameda County to be born into the Federally Recognized tribe. Ben was born the same day that BIA Superintendent Lafayette A. Dorrington decided in his report that the landless Verona Band tribe did not need any land. Ben served as the **first chairman** of the Ohlone Indian Tribe between 1965 and 1978.

Since World War II, Dolores Marine's (**1928 BIA Application 10681**) children had married and raised families and Henry "Hank" Alvarez and his sister, Dolores "Dotty" Galvan Lameira are Muwekma Tribal Elders, and had served as elected council members. Dotty Lameira's son Arnold Sanchez had served as an elected tribal councilman. The family of Benjamin and Jenny Galvan are also enrolled in the Tribe and their son, Albert Galvan, had also served as a tribal council member. The same is the case for the children and grandchildren of Victoria Marine (**1928 BIA Application # 10678**). Magdalena Armija had married Ernest Thompson, Sr. and their sons Edward Thompson and Lawrence Thompson, Sr. were elders, and Lawrence was a former elected tribal councilman of the tribe (**1928 BIA Application # 10296**).

The children of Ernest Thompson, Jr. are also enrolled tribal members. As discussed earlier, Francisca Nonessi (**1928 BIA Application 10293**) was married to Jose Guzman, their son Jack Guzman (Sr.) had married Flora Freda Munoz (Victoria Marine's daughter), and their son John Guzman, Jr. (now deceased) and daughter, Rena Guzman Cerda and their respective children are Muwekma tribal members. Lawrence Mason Marine, the grandson of Dario Marine (**1928 BIA Application 10677**) and Catherine Peralta (**1928 BIA Application 10675**) also served as a tribal councilman.

The children and grandchildren (**1928 BIA Application 10680**) of Ramona Marine and Porfirio Sanchez instituted the contemporary leadership of the Muwekma Ohlone Tribe, and were joined by the children of Trina Marine Elston Thompson Ruano (**1928 BIA Application 10682**) and Albert Marine Arellano (**1928 BIA Application 10679**) in their efforts to spearhead the tribe's regaining its previously recognized status and revitalization.

In the late 1890s, George Santos (grandson of Hipolito Santos and Refugia Simon who were one of the founding families of the Niles rancheria) had married Peregrina Pinos (who was the daughter of Benedicta Guerrera and Manuel Pinos). Their eldest daughter, Erolinda Pinos Corral, enrolled with the BIA with her children along with her Aunt, Maggie Pinos Juarez, in 1932 (**1928 BIA Application 10676**). The children and grandchildren Alfonso Juarez, who was the eldest son of Erolinda Santos Juarez Pena Corral are enrolled members of the Muwekma Ohlone Tribe. Presently Carol Juarez Sullivan is a Muwekma tribal councilwoman.

Anthropologists and the Court of Claims of 1946 and the Hearings of 1954-1955

Published elsewhere, that the adverse impact that Berkeley Anthropologist A. L. Kroeber's pronouncement in his 1925 monumental tome Handbook of the Indians of California (Bureau of American Ethnology Bulletin 78) had by stating that the "Costanoan group is extinct so far as all practical purposes are concerned," contributed to the perpetration and perpetuation of the myths, misinformation, marginalization, disenfranchisement, and detriment to the surviving Ohlone/Costanoan communities, as well as, to other tribal groups (Buckley 1989; Leventhal et al. 1992; Field et al. 1992; Leventhal et al. 1994; Field with the Muwekma Tribe 2003; Field et al. 2013; and others).

Kroeber and his colleagues had interviewed the Elders of the Muwekma Verona Band community in the early 1900s, yet by 1925 he issued his extinction sentence as the quintessential authority on California Indians. Independently, as presented elsewhere in this chapter, the Muwekma were: **1)** under the direct jurisdiction of the Bureau of Indian Affairs between 1906 [1914] and 1927; **2)** Muwekma tribal elders and their respective families enrolled with the Bureau of Indian Affairs (1929-1932) under the 1928 California Indian Jurisdictional Act; **3)** Muwekma children were sent to Indian boarding schools at Riverside and Chemawa (1930s -1940s); **4)** enrolled as members of the Bay Area California Indian Council (1947), **5)** and those Muwekma heads of households enrolled with the BIA during the second BIA enrollment period (1950-1957) and again during the third BIA enrollment (1968-1971). Therefore, how could the Muwekma tribal community be pronounced "extinct" by members of the dominant society, especially if they continued to present themselves as an actively living tribal community, but landless Indian tribe?

As stated above, the adverse effect of Kroeber's extinction sentence was especially felt when the Muwekma was involved in the repatriation of their ancestral human remains from Stanford University in 1989. Various anthropologists and educational institutions blatantly attacked Muwekma echoing Kroeber's sentence of extinction.

For example, Government Anthropologist Ruth Underhill essentially parroted Kroeber in her 1953 book **Red Man's America**:

> Esselen . . .: Possibly a remnant of a larger group; first California group to become extinct.
> Costanoan . . . : Now extinct for all practical purposes (1953:288, 291).

Lantis, Steiner, and Karinen, cultural geographers teaching at two California universities (Chico State and Long Beach State) wrote in their 1963 textbook **California: Land of Contrast** the following excerpted account for the Costanoans and the Esselens of the central coast:

> The Hokans were represented by three groups (Esselens, Salinan, and Chumash). The Esselen lived south of the Costanoans in limited numbers. . . . These were the first California Indians to become extinct (1963:266).

In her very widely read 1992 Cultural Anthropology text on Native American Societies titled Native North Americans: A Comprehensive Account, Anthropologist Alice Kehoe declared:

> The central coast south of San Francisco and the adjacent Santa Clara Valley across the Coast Range were occupied by the Costanoans, once speaking a language closely related to Miwok, now effectively extinct as a nation (1992:402).

Another such group, called ACPAC (American Committee for Preservation of Archaeological Collections) was supported by Constance Cameron (Museum of Anthropology, California State University) and Clement W. Meighan (Emeritus Professor of Anthropology, UCLA) and a number of others. This group published a politically charged informational newsletter that has made the Ohlones something of a *bete noire*. In 1993, E. J. Neiburger's article "Profiting From Reburial" declaimed:

> Public money for reburials is the latest growth industry for numerous activists: $135,000 of taxpayers' money was used to pay off land-owners, lawyers, archaeologists and activists … . Religious and historic traditions, accurate identifications and the desires of the next-of-kin have little influence on many activists who demand reburial of all remains under a variety of self-styled "traditional" religions. Thus, Stanford University has released 550 Ohlone skeletons to individuals who had identified with this tribe (**the last recognized member of which died in the early 1800s**) (Originally published in Nature 1990, 344:297; republished in ACPAC Newsletter, March 1993:3).

In 1989, Frank Norick, then Principal Museum Anthropologist at the Phoebe Apperson Hearst Museum at UC Berkeley, was quoted in a newspaper interview as follows:

> . . . there are few Indians left in the Bay Area who have some vague Native American heritage, but until [a recent book on the subject] came out, they didn't know who the East Bay Indians were. We don't know who the East Bay Indians were, and the few Indians that happened to survive were swallowed up and exterminated by civilization by the latter part of the last century. That's not to say that there aren't people around here who are of Indian heritage, but I'd be willing to bet they couldn't give you even the semblance of a [lineage] account that was aboriginal (Norick interview in Express Newspaper 9/21/89:15-16).

These are some of the examples that the Muwekma Ohlone Tribe had brought forward in several previous publications. Nonetheless, while these anti-Ohlone perspectives had cast negative views about California Indian in general, and the Ohlone in particular, one anthropologist Dr. Omar C. Stewart, did publish an important narrative about the changing role of anthropologists as legal witnesses and advocates on behalf of California Indian tribes during the Claims Hearings of 1955.

Anthropologists Alfred L. Kroeber and Omar C. Stewart,
and the California Indian Claims Hearings 1954-1955

The following was excerpted from a 1961 paper written and submitted by Dr. Omar C. Stewart to The Kroeber Anthropological Society Papers (Number 25) that was included in a special edition titled Alfred L. Kroeber: A Memorial. The paper itself was titled Kroeber and the Indian Claims Commission Cases. Stewart at the invitation of Kroeber and others provided testimony at these hearings, and because of his previous interactions in Indian-related court cases, he helped guide the UC Berkeley team of anthropologists to prepare to present testimony and evidence before the Court of Claims.

> **Kroeber and the Indian Claims Commission Cases**
>
> The role of A. L. Kroeber in Docket 31-37, Indians of California vs. The United States of America, before the Indian Claims Commission, may well serve as the symbol of a change in anthropology in America. Kroeber and other anthropologists serving as expert witnesses on opposite sides in litigation before the U. S. Indian Claims Commission have marshalled in a new dimension of applied anthropology. A short history of Indian claims cases, particularly for California Indians, and a review of the contribution of anthropology to hearings under Public Law 726 - 79th Congress, 2nd Session (H.R. 4497) known as The Indian Claims Commission Act of August 13, 1946, 60 Stat. 1049, will reveal the extent of the changes which have come about.
>
> At the outset we should be reminded that claims cases against the U. S. Government by Indian tribes are not new. In 1863 the law establishing the U. S. Court of Claims as amended bracketed Indian tribes with foreign countries and required all to obtain from Congress special permission to sue the U. S. Government. Nevertheless, a large number of claims were adjudicated during the last century. The procedure was for the tribe and/or its attorney to obtain a special act of Congress, called **Jurisdictional Act**, to allow a tribe to sue the government in the Court of Claims. Not only were years required to obtain congressional approval for such special laws, but additional years were needed to get a decision from the Court of Claims because of its chronic backlog of cases. Even more discouraging than the delays, from the point of view of the Indians and their attorneys, was the frequent very explicit and limiting phraseology of the bills of authorization, which in turn were followed to the letter by both the Court of Claims and the Supreme Court. Notwithstanding the slowness of legislation and of court action from January 28, 1884 to May 7, 1945, one hundred fifty-two separate cases were authorized by Congress and reached the Court of Claims. It will be of interest to review the decisions rendered before the passage of the Indian Claims Commission Act of 1946: …

… In other words, during the seventy-one years preceding the Indian Claims Commission Act of 1946, the Court of Claims declared that $37,753,954.13 should be paid the Indians to satisfy legal claims against the government, whereas payment of about **two billion dollars** had been requested. A review of many records reveals the curious fact that, in spite of the interest and knowledge that local anthropologists might always be expected to have concerning the American Indians, and in spite of the extent of the litigation, in all this time anthropologists, so far as I could discover, had nothing to do with either the obtaining of the permission to get into court or with the hearings in the Court of Claims, with two exceptions. The exceptions were the remarkable work of **Dr. C. Hart Merriam**, biologist turned ethnologist, on behalf of the Indians of California leading to a decision dated December 4, 1944, requesting Congress to pay them **$5,024,842.34**, and the testimony of **Dr. John P. Harrington** in the Alcea Case (103 C.Cls. 494) in 1945.

The claims cases of the Indians of California **rest ultimately upon original Indian title**, which was recognized by the eighteenth and nineteenth century laws of Spain and of Mexico and **by the United States in the Treaty of Guadalupe Hidalgo**, proclaimed July 4, 1848. They are supported by Acts of Congress of September 30, 1850, and February 27, 1851, appropriating **$50,000.00** to pay the expenses of a treaty commission **to negotiate with the Indians of California to extinguish their Indian title to the lands of California, and by the 18 treaties signed by the Indians but not ratified by Congress**. Traveling to get the treaties signed was a major exploring expedition as reported in "The Journal of the Expedition of Colonel Redick M'Kee [McKee]. .. through Northwestern California . ..1851," by George Gibbs, and printed by Henry R. Schoolcraft in his History . . . of the Indian Tribes of the United States, Part III, 1853. (The Journal was reprinted in the Hearings for the Indians Claims Commission Act, 79th Cong., 2nd Session, June-July, 1946.) While M'Kee was negotiating treaties in northern California, O. M. Wozencroft and G. W. Barbour were getting treaties signed in central and southern California. Funds were exhausted before all tribes were visited. After the last treaty was signed January 7, 1852, with the Diegueno Indians [of southern California], the 18 treaties were delivered to the Senate by President Millard Fillmore, June 1, 1852, **with recommendation for ratification by officials of the Bureau of Indian Affairs**.

By coincidence, the first California State Legislature was in session when the 18 treaties were sent to the U. S. Senate and **the California Legislature memorialized the U. S. Senate not to ratify the treaties because the area to be assigned the Indians was evaluated at $100,000,000**. It was then, on June 7, 1852, that **the California senators succeeded in having the treaties classified as secret and hidden away in Senate files**, where they remained until 1905 when **the injunction of secrecy was removed**. In many other ways the Gold Rush miners' disregard for the rights of the aborigines characterized California for at least three decades.

The **Century of Dishonor** by Helen Hunt Jackson, published in 1881, pricked the conscience of America to the extent that many people of good will decided to do something about the Indian problem. The Indian Rights Association was founded

in Philadelphia in 1882 with a California branch to follow soon. In **Ramona**, 1884, Mrs. Jackson so dramatized the poverty and misery of the Mission Indians of southern California that the Bureau of Indian Affairs bought many small farms to be permanent rancheros for landless Indians in California. Many of the reforms in Bureau administration were achieved by the publicity given Indian problems by the Board of Indian Commissioners from 1881 to 1933. The Board was composed of important citizens appointed by the President of the United States and authorized to visit reservations, investigate conditions and recommend administrative and legislative reforms.

In 1883, Mr. A. K. Smiley, an appointee of President Hayes to the U. S. Board of Indian Commissioners, sought to gain public support for needed changes in Indian affairs by a conference of interested and influential citizens convened at his summer lodge at Lake Mohonk, New York. The Lake Mohonk Conference on Indian Affairs became an annual meeting of officials, missionaries, Indians, and laymen who came together to seek ways to improve the conditions of the Indians. For nearly forty years the Lake Mohonk Conferences brought together annually two to three hundred citizens dedicated to helping the Indians. **Few anthropologists ever attended these conferences**. Many of the same people were listed as members of the Indian Rights Association, the Lake Mohonk Conference, the National Indian Association and many local organizations formed to help the Indians. From the Society of American Indians (1910) to the National Congress of American Indians (19hh) several organizations of "Indians to help Indians" sought assistance from all friends of the Indians to get laws passed which would allow the various tribes to have their claims adjudicated. Again, few anthropologists were members of such organizations.

Perhaps the most important man to help the California Indians get heard in court was Frederick G. Collett. In August, 1946, when he appeared before the congressional committee on Indian Affairs during Hearings on the Indian Claims Commission Act, … .

… Collett helped, without doubt, to secure the passage of the California Indians Jurisdictional Act of May 18, 1928, which **authorized the California State Attorney General to sue for payment for the reservations the Indians had never received**. Collett attempted later to have it amended to allow the Indians to be represented by private legal counsel because he thought private counsel might obtain a better award than the Attorney General of the State of California working without additional recompense. It was during the Hearings before congressional committees concerned with the California Indians Jurisdictional Act from 1920 to 1928 that C. Hart Merriam testified.

No anthropologists were asked to testify before the Committee on Indian Affairs preceding the enactment of H.R. 4497, the Indians Claims Commission Act, August 13, 1946. Only two names of professional anthropologists, those of **A. V. Kidder** and **Gene Weltfish**, appeared in support of the bill, and they were given-only as

members of the Indian Committee of the American Civil Liberties Union. One might properly inquire why anthropologists should be so conspicuous' by their absence when legislation of such great importance to American Indians was being considered. Since the Society for Applied Anthropology had been formed in 1941, one might ask particularly: "Where were the applied anthropologists?"

… At any rate anthropologists, while considering themselves the experts on aboriginal cultures of America, have seemed to avoid involvement in modern Indian Affairs. However, America's first home-grown anthropologists did not feel this way. **Lewis H. Morgan**, for example, was always involved with the practical affairs of the Seneca [Iroquois]. **John W. Powell** made special studies of the Great Basin tribes for the Bureau of Indian Affairs in 1872 and often testified before congressional committees. **George Bird Grinnell** wrote and spoke regarding the contemporary conditions of the Plains Tribes from the time of his first visit in 1870 until his death in 1938. **Warren K. Moorehead**, archaeologist, from 1888, museum curator and teacher at Phillips Academy from 1901 to 1938, was associated with the Bureau of Indian Affairs, but only as investigator. Moorehead was appointed a member of the Board of Indian Commissioners by President Theodore Roosevelt in 1909, a position he kept until the Board system was dissolved in 1933. This, however, is a very small proportion of American anthropologists over this long period, and all four could be classified as "dedicated amateurs."

Professional American anthropology began largely as a museum science of the strange and exotic. Not until just before World War II when **Commissioner John Collier** employed a number of anthropologists was the pattern altered. A few remained in the Indian service during Collier's whole term of office and beyond, but a larger number found practical, applied anthropology not congenial to their training and interest. … However, in March and June 1945, and in June and July 1946, congressmen failed to call anthropologists to testify regarding the proposed Indian Claims Commission Act.

It is against such a background that starting in 1950, dozens of anthropologists were approached and asked to testify as expert witnesses in cases involving millions of dollars. Kroeber received a letter from the attorneys for Indians of California, Docket No. 37, written on June 23, 1952. The attorneys for Indians of California, Docket No. 31, approached him on January 8, 1953, and were told he had "signed up two months ago . . . to work exclusively" for the attorneys for Docket No. 37. Docket No. 31 and Docket No. 37 were finally consolidated by order of the Indian Claims Commission.

Neither Kroeber nor his associates, **Robert F. Heizer**, **Edward W. Gifford**, **Samuel A. Barrett**, **S. F. Cook** and **Donald Cutter**, had previously testified before the Indian Claims Commission. Since I had testified twice, Kroeber invited me to Berkeley to tell him about my own experiences preparing exhibits and testifying, and also my reactions to court room procedures. Later I was invited to be present

when the Indians presented their case in Berkeley, in June, 1954, and also to serve as Kroeber's understudy during cross-examination of the witnesses for the Government in San Francisco, September, 1955.

In spite of the historic reluctance of anthropologists to be involved in modern Indian problems which still prompted a few established members of the profession to refuse employment by either side, Kroeber, past [age] 75, entered energetically and wholeheartedly into restudying the ethnohistory of California in order to present accurately and completely the information pertinent to the case. Realizing the research required to prepare for the searching and detailed questioning by Department of Justice attorneys, Kroeber and Heizer, with the help of a number of graduate students, combed the massive literature on California ethnology to assemble, reproduce if necessary, and tabulate, data on all ethnological points at issue.

Kroeber prepared a new map of the aboriginal linguistic groups of California, changing boundaries which had been drawn for the Handbook of California Indians in 1925 where new evidence had become available. (It is interesting that the 1925 map needed so few modifications).[3]

In accordance with the Indian Claims Commission Act and with decisions of earlier claims cases that had been reviewed by the U. S. Supreme Court, **aboriginal Indian title could be established by evidence that an identifiable group used and occupied a definable area, at the exclusion of others, since time immemorial**. Kroeber quickly recognized the types of data to he presented and then worked to assemble and review the publications which contained the relevant material. Kroeber's Handbook of California Indians was, of course, the primary basis for the case of the Indians of California, but an additional 186 exhibits were required to present ethnographic, historical, botanical and archaeological data not covered by the Handbook.

The attorneys for the Department of Justice are at a real disadvantage when handling cases based on aboriginal use and occupancy. It is simply a matter of fact that most ethnographic reports tend to support the claims of the Indians. However, in order to protect the American taxpayer and comply with the Indian Claims Commission Act itself, the Department of Justice must make the best defense possible. In addition to purely legal consideration, the attorneys for the government

[3] **Note:** it is also interesting that as a result of the passage of HR 2144 in 1992 that created the Advisory council on California Indian Policy (ACCIP), Leventhal contacted the BIA office in Sacramento for a map showing the Agency and sub-Agency jurisdictions in California so that the tribal communities could hold requisite elections for seven representatives from Recognized and Unrecognized, and two from Terminated tribes. Leventhal and others served as volunteers on the Federal Recognition Task Force to create such a map for seven geo-socio-cultural-political regions for those elections to proceed.

found that Kroeber's former students, **Julian H. Steward, William-Duncan Strong, Harold E. Driver, Erminie Brooke Wheeler Voegelin, Walter R. Goldschmidt, Abraham M. Halpern**, and **Ralph L. Beals** could testify that the Indians of California gained most of their subsistence from a relatively small proportion of their territory. …

… It might be best to let Associate Commissioner Louis J. O'Marr himself explain why the Indian Claims Commission accepted Kroeber's interpretation of complete aboriginal land use in California and rejected the Government's ecological theory of partial use, by citing from the Opinion of the Commission rendered July 31, 1959 (8 Ind. C1. Com. 1, pp. 31-36), viz.:

Land Use and Occupancy

"One of the most difficult, if not the most difficult, questions we have to decide is what California lands the petitioners actually occupied and used for their subsistence, that is, the lands they exploited for their day to day existence.

We can proceed with our inquiry with the basic fact, which nobody questions, that Indians occupied and used California lands from time immemorial and as the aboriginal inhabitants thereof. The native population is unknown, but estimates range from a high of 700,000 to 260,000 by Dr. Merriam and 133,000 by Dr. A. L. Kroeber. (Pet. Ex. RH-125, pp. 68-71). These Indians were not an homogenous group, but were made up of many groups or tribelets which compose many linguistic divisions or nationalities in California. It has been estimated by Dr. Kroeber that there were 500 or more Indian groups in California about the time we acquired California from Mexico in 1848. (Record pp. 29-30, 129, 153 and 498).

These tribelets occupied and used fairly well defined areas dependent in sizes upon the economic resources of the particular area and the population requirements of those living in it. …

... Furthermore, it is plain that because of the uneven and rather sparse distribution of the available natural resources in the state, large areas of land were needed to provide subsistence. The Indians' permanent and main habitats were, in general, in locations which provided the greatest abundance of natural resources, but they were required, and generally did, extend their searches over large areas beyond their places of permanent settlement. The record is replete with proof of temporary camps occupied by the Indians in their seasonal gathering, fishing and hunting operations which covered large areas in the mountains, plains and deserts. …

… The testimony and ethnographic literature, of which there are volumes in evidence, show that the Indian groups ranged throughout their respective territories in their gathering, hunting, and fishing exertions. While these Indians were never considered nomads, their exploitation of the available resources in a given territory required frequent and extended traveling within the territories claimed. We believe it unrealistic and contrary to the Indian mode of life to

> restrict Indian territorial rights to the lands which would simply provide adequate subsistence and disallow their land claims to the areas which were of secondary importance or supplemental to the main sources of supplies. We suspect territorial expanse was as much the desire of these primitive peoples as it is characteristic of the white man for there is much ethnographic evidence that the Indian groups in California moved about their respective domains gathering wild foods as they ripened or captured available wild game, and during a normal season would visit and use the whole territory to which they asserted ownership as their exclusive places of abode.
>
> We know of no decision by the courts or the administrative officers of the Government which limited Indian land claims to those lands which provided them with the common necessities of life. The requirements of the Indians were so varied that they could only be obtained from a large area for salt, edible seeds and insects, flint and other important supplies were in most cases not available in the confined areas of valleys but obtainable from desert areas. …
>
> … Since 1946 there have been at least fifty anthropologists involved in the Indian Claims Cases as expert witnesses for the Government or for the Indians. Attorneys did not seek anthropological testimony for either side in the initial cases. Following an order for a rehearing by the Court of Claims in an appeal of a Northern Paiute case, and also a rehearing of a Chippewa case, anthropologists have participated in nearly every case since where aboriginal title was an issue. That anthropologists have also proved useful to the government is apparent. Otherwise it would not have obtained their services. That anthropologists have benefitted from this serious application of their knowledge to practical problems, far more than from the monetary remuneration they received, is also true (Stewart 1961).

Omer Call Stewart (August 17, 1908 – December 31, 1991) was an American cultural anthropologist and author who worked at the University of Colorado. He was a student of Alfred L. Kroeber. He defended Native American land claims. In 1940, he received his doctorate in Anthropology from the University of California, Berkeley. Years later, in 1978, Stewart contributed a chapter titled **Litigation and its Effects** in the Handbook of North American Indians, Vol 8. California,, edited Robert F. Heizer (1978), Washington, D.C.: Smithsonian Institution, Omer C. Stewart. Pages 705-712.

Here it should be pointed out that anthropologists and historians have worked diligently on behalf of Native American tribes as they seek federal recognition or reaffirmation of their previous federally acknowledged status under the 1978 Federal Acknowledgement Project (25 CFR Part 83 *Procedures for Federal Acknowledgment of Indian Tribes*). Both anthropologists and historians had also worked on behalf of petitioning tribes up until the Department of Interior put a stop to BIA scholars by stating:

> The staff's research during the active consideration period is for the purpose of verifying and/or elaborating on an already complete petition. The staff's caseload no longer permits them to do the research necessary to fill in gaps in the petition on

behalf of the petitioner to the extent they have sometimes done in the past (Bureau of Indian Affairs, Office of Federal Acknowledgement Determinations - https://www.bia.gov/as-ia/ofa) .

Muwekma Families Enroll with the Bureau of Indian Affairs during the Second Enrollment Period (1950-1957)

Under the Act of 1948, almost all of the Muwekma Ohlone "heads of household" enrolled with their families once again with during the **second BIA Enrollment** between 1950 and 1957. These Muwekma include:

Dolores Marine Galvan, October 6, 1950**; Domingo Lawrence Marine**, October 12, 1950; **Dario Marine**, November 1, 1950; **Flora Munoz Carranza**, December 12, 1950; **Lucas Marine**, December 23, 1950; **Henry Alvarez**, April 7 & 26, 1951; **Trina Marine Thompson Ruano**, May 21, 1951; **Maggie Pinos Juarez**, July 19, 1951 (**Figure 43)**; **Benjamin Galvan**, December 4, 1951; **Belle Stokes Olivares Nichols,** February 25, 1952; **Ernest Thompson**, April 16, 1952; T**homas Garcia***,* April 22, 1953; **Flora Emma Martel Thompson***,* February 4, 1954; **Erolinda Santos Juarez Pena Corral**, May 16, 1955 (**Figure 43)**; **Robert Corral**, May 16, 1955; **Edward Thompson,** May 21, 1955; **Daniel Santos**, May 23, 1955; **Joseph Francis Aleas**, May 24, 1955; **Albert Arellano**, June 18, 1955; **Dolores "Dottie" Galvan Lameira**, October 3, 1955; and, **Arthur Pena Corral**, December 27, 1957.

Figure 43: Muwekma Elders Maggie Pinos Juarez and Erolinda Santos Juarez Corral

Third Bureau of Indian Affairs Enrollment Period (1969-1971)

Following the Act of 1964, between 1969 and 1971, the following Muwekma "heads of households" and their families once again enroll during the third BIA Enrollment period with most of the applicants identifying themselves as "**Ohlone**" on Question # 6: "**Name the California Tribe, Band or Group of Indians with which your ancestors were affiliated on June 1, 1852**":

Mary Munoz Mora Ramos Archuleta, January 10, 1969, "**Ohlone, Mission**."
Mary Marine Galvan, January 27, 1969, "**Ohlone**."

Ernest George Thompson,. February 20, 1969, "**Ohlone Tribe, Mission San Jose**."
Patricia Ferne Thompson Brooks, March 27, 1969, "Mission Indians."
Madeline Cynthia Thompson Perez, March 27, 1969, "Mission Indians."
Karl Thompson, March 27, 1969, "Mission Indians."
Robert P. Corral,. April 30, 1969, "**Ohlone Indian**."
Henry Marshall, May 7, 1969, "**Ohlones**."
Glenn Thompson, June 11, 1969, "Mission Indian."
Lorenzo Thompson, June 24, 1969,. "Costanoan."
Lawrence Thompson, Jr., June 24, 1969, "Costanoan."
Rosemary Juarez Ferreira, July 15, 1969, "**Ohlone Indians**."
Peter D. Juarez, July 23, 1969, "**Ohlone Indians**."
Dolores Sanchez Martinez, August 11, 1969, "**Ohlone**."
Margaret Martinez, August 21, 1969, "**Ohlone Mission Indian**."
Joan Guzman, August 26, 1969, "**Ohlone Indian.**"
Belle Nichols, September 4, 1969, "Mission."
John Paul Guzman, September 12, 1969, "**Ohlone Mission Indian**."
Beatrice Marine, January 5, 1971, "Costanoan."

Neither the Amah Mutsun tribal community of the greater Mission San Juan Bautista/Gilroy area or the Esselen Nation tribal community of the greater Mission San Carlos (Carmel)/Monterey Bay region ever used the ethnonym tribal identifier "Ohlone" for any of their BIA enrollments (1928 – 1971). It was not until after Malcolm Margolin's interpretive book **The Ohlone Way** was published in 1978 that non-Indians were informing them that they were Ohlone Indians. Therefore, the broader use of 'Ohlone' was later applied by various scholars and archaeological firms to all Costanoan communities after 1978. Only the Muwekma Ohlone Tribe of the San Francisco Bay Area has a history of identifying themselves as Ohlone prior to and after 1978 (Escobar, Field and Leventhal 1999).

The efforts of California Indians to sue the federal government under the Jurisdictional Act of 1928 resulted in the creation of the Federal Indian Claims Commission in 1946. This federal body allowed Indian groups to press for compensation to tribes over the theft of their lands in the 19th century. After 20 years of tortuous maneuvering all separate California Indian claims were consolidated into a single case.

A compromise settlement of **$29,100,000** was offered for **64,425,000 acres of land**. After deduction of (BIA) attorney's fees **($12,609,000**) plus interest the payment amounted to **47 cents per acre**!

Payments of **$668.51** per eligible person was issued by 1972 (**Figure 44**). What is of great significance here is the fact that the entire claims activities were conducted outside of normal court proceedings protected by the constitution. Thus Indians are the only class of citizens in the United States who are denied constitutional protection of their lands.

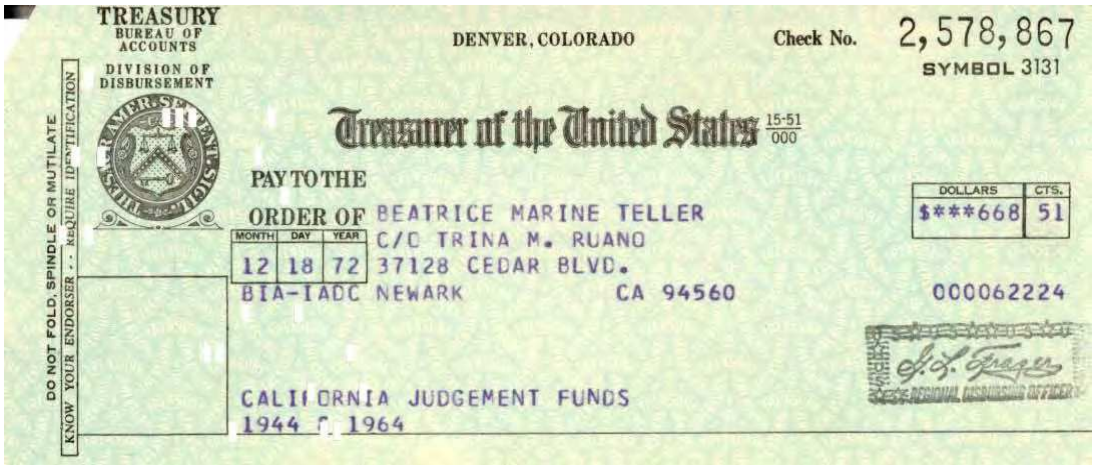

Figure 44: Distribution Check for Muwekma Elder Beatrice Marine for $668.51 (1972)

Muwekma Service in the United States Armed Forces During the 1950s, Viet Nam War, Desert Storm and Iraq

During the 1950s, 1960s and 1970s Muwekma men served in Korea, Viet-Nam and elsewhere.

Candelario T. Martinez served in the **United States Marine Corps** during the Korean War.

Ruben Cota Arellano, Sr. Corporal, U.S. Army, Medical Corps, **SP4 E4 HQ Battery 1st TGT ACQ Battalion, 25th Artillery, APO 2,** July 5, 1960 – July 4, 1966**, Korea.** Ruben passed away on March 4, 2006.

Lawrence Mason Marine served in the United States Marine Corps from 1959-1965 and was **a Staff Sergeant** serving in Viet-Nam**, 3rd Marine Division, 3rd Tank Battalion,** and **3rd Force Reconnaissance, Charlie Company (Viet-Nam) from 1960-1961.** Lawrence also served on the Muwekma Tribal Council. Lawrence passed away on December 22, 2020.

Marvin Lee Marine (younger brother of Lawrence Mason Marine) also served in the Vietnam War in the U.S. Army's **173rd Airborne Division**. His older brother Muwekma Elder Lawrence Mason Marine and his family are enrolled members of the Muwekma Tribe.

- Karl Thompson, SP5, U.S. Army, **43rd Engineer Bn. 931st Eng. Gp. Armed Forces Expeditionary Medal (Korea),** May 8, 1968 – May 7, 1971.

Tom M. Alvarez, Sr., U.S. Army, Medical Corps, 1965 – 1967, Vietnam, recipient of **Soldier's Medal**.

Frank Y. Ruano, Sr., E4, U.S. Army, **56th Artillery**, 1965 – July 25, 1971, **Vietnam.** Frank currently serves on the Muwekma Tribal Council.

Robert C. Martinez, Sr., Sergeant, **Air Cavalry, 14th Cavalry Regiment U.S. Army, European, 7th Army Command**, May 22, 1968 – May 14, 1970.

Ricardo "Rick" Martinez, SP 5 (T) Sergeant, Company D, 69th Engineer Battalion, USARPAC Vietnam; National Defense Service Medal, Vietnam Service Medal, Vietnam Campaign Medal and **Good Conduct Medal;** January 26, 1967 – January 12, 1969, Reenlisted in the Army and Honorably discharged January 24, 1973. Rick passed away on February 8, 2020.

Wayne Gibson, Vietnam, US Army 1969-1971, 4th Infantry Division. In August 1966, led by the 2nd Brigade, the 4th Infantry Division's ("Ivy Division"—a play on the Roman numeral IV) headquarters closed in on the central highlands of Vietnam. On September 25, 1966, the division began a combat assignment against the North Vietnamese that would not end until December 7, 1970. By the time the Ivy Division completed their assignment in Vietnam and returned to Fort Carson, Colorado, at the end of 1970, some 2,497 Ivy soldiers had been killed and 15,229 had been wounded. Eleven Ivy Division soldiers earned the Medal of Honor during that period.

John A. Massiatt, Airman, **U.S. Air Force** January 1, 1968 - October 1, 1969.

Thomas Joseph Marshall (**U.S. Army Vietnam Era**) [deceased]

Richard A. Juarez, SP 4 – **E-4, U.S. Army, 589th Transportation Co., Co. B 4H BN 2D BCT BDE, 1st Army**, Fort Eustis, Virginia., served from January 25, 1971 – October 30, 1973.

JayP Massiet, E5/Staff Sergeant, Military Police, **U.S. Air Force Van Nuys Air National Guard**, June 1975 – January 1988

Michael F. Galvan, Jr., **Sergeant, U.S. Air Force, 95th Recon Squadron,** 1977 – 1997 (**Desert Storm Campaign**)

Tracie Massiet Lents, **U.S. Air Force,** 1979 – 1983

Paul Guzman (Service Records n/a)

John J. Cambra, Jr., Pfc. **U.S. Army Company C 4th Battalion 30th Infantry and Company B 2nd Battalion 159th Infantry**, 1991 – 1994

David J. Splan, Lance Corporal, **U.S. Marine Corps**, 1993 – 2001.

Cory Gumersindo Massiet, Airman 1st Class, **U.S. Air Force,** 1994 – 1997. Separated Edwards Air Force Base, Ca. Awards: Air Force Training Ribbon, National Defense Service Medal, Humanitarian Service Medal.

Jesse Calles, US Army, November 2004-December 2009, Specialist Grade 4, Field Artillery Automated Tactical Data Systems Specialist. Jesse is the grandson of Muwekma Elder Faye Thompson Frei who served the U.S. Army in Baghdad, Iraq (**Operation Iraqi Freedom**) since December 2005 in the **Headquarters and Headquarters Battery Fires Brigade 4th Infantry Division (Mechanized), Awarded the Army Commendation Medal (2006).**

Angela Galvan, the granddaughter of Muwekma Elder Jenny Galvan had recently served in Iraq in the **U.S. Marine Corps, Corporal/E-4, 1st Marine Logistics Group, 7th Engineer Support Battalion, Support Company Motor Transportation Platoon, May 27, 2003 –** She had served in Iraq (twice deployed). **Campaigns and Citations: OIF 2 Fallujah Campaign** in Feb 2004 - Sept 2004 and **OIF 3-6** Sept 2005 - Mar 2006, **Combat Action Ribbon** for operations on Michigan ASR (Alternative Supply Route) and an impact **Navy Marine Corps Achievement Medal for operations in Haditha (December 2005);** also involved during **OIF February 3-6, 2004.**

JayP Massiet, Jr. U.S. Army, Second Tour in Iraq; issued a Purple Heart.

Aaron Lenci, US Navy, Ensign, stationed at Pensacola Naval Air Station (Currently Serving).

David Marroquin, Jr., **California Air National Guard, A1C** (Currently Serving)

Muwekma Tribal Stewardship over their Ancestral Heritage and Cultural Sites

Since 1980 to the present, the Muwekma families have worked independently to establish the "Most Likely Descendant" (MLD) status of members of the Muwekma Tribe in their area with the Native American Heritage Commission of the State of California. Also in 1984 the Muwekma Ohlone Tribal leadership developed their own Cultural Resource Management arm of the tribe, previously identified as Ohlone Families Consulting Services (OFCS), which had been recognized since 1988 by the Department of the Interior as a Native American business under the Buy Indian Act. Over the past several years, all cultural, archaeological and educational-related project are fully under the jurisdiction of the Muwekma Tribal Council.

Since the establishment of the Tribe's Culture Resource Management arm, many of the Muwekmas, as well as, Amah-Mutsun and Esselen Nation tribal members, Pomo, Sioux, Yokuts, Miwok, Wiyot and other tribal people have gone through archaeological training and obtained employment as field crew on various archaeological projects. Over these past decades the Muwekma Tribe has sought alternatives for indigenous people who are concerned about their ancestral past. Under these circumstances, the documented aboriginal Ohlone tribal people of the San Francisco Bay Area have taken greater responsibility for their ancestral heritage as primary stakeholders by becoming fully engaged in the environmental and ensuing scientific processes that affect their ancestral sites, as in the case of the burial recovery project previously conducted at the ***Clareño Muwékma Ya Túnnešte Nómmo*** **[Where the Clareño Indians are Buried] Site (CA-SCL-30/H)** at the 3rd Mission Santa Clara in 2010 (Leventhal et al 2011), and on the present Prometheus project on Benton Street.

Muwekma Ohlone Tribe and its Reaffirmation as a Federally Recognized Tribe

In 1989 the Muwekma Ohlone Tribe began the arduous process of petitioning the U.S. Government regarding its status clarification as a Federally Recognized tribe under 25 C.F.R. Part 83. Over the years, interfacing with the BIA's Office of Federal Acknowledgment has been a very difficult and acrimonious process. However, in face of the "extinction" sentence issued by Alfred L. Kroeber in his 1925 California Handbook, and adversity by the BIA, the Muwekma Ohlone Tribe has nonetheless made great strides forward. In 1996, the Tribe shattered the myth perpetuated by the dominant society, that the Ohlone were never Federally Recognized.

On **May 24, 1996**, the United States Department of the Interior, Deborah Maddox, Director of the Office of Tribal Services for the Bureau of Indian Affairs, formally concluded in a letter sent to the Muwekma Ohlone Tribe that:

> Based on the documentation provided, and the BIA's background study on Federal acknowledgment in California between 1887 and 1933, we have concluded ... that the Pleasanton or Verona Band of Alameda County was previously acknowledged

> between 1914 and 1927. The band was among the groups, identified as bands, under the jurisdiction of the Indian agency at Sacramento, California.
>
> The agency dealt with the Verona Band as a group and identified it as a distinct social and political entity (letter in response to the Muwekma Petition, Branch of Acknowledgment and Research, Bureau of Indian Affairs, Washington, D.C.).

In 1998 working with the Congressional created Advisory Council on California Indian Policy (ACCIP) which was legislated in 1992 (HR 2144) the Muwekma Tribe sought formal alternatives to the arduous Federal Recognition process under 25. CFR Part 83. After obtaining a formal positive determination of previous unambiguous federal recognition (under 25 CFR Part 83.8), the Muwekma leadership in concert with the leadership of another northern California Indian tribe, Tsungwe Council requested support from the BIA in Sacramento. Responding to the tribe's request, Acting Area Director, Michael Smith, wrote:

> The Bureau of Indian Affairs, Sacramento Area Office, is ready to assist the Tsungwe Council and the Muwekma Ohlone Tribe in seeking administrative Federal recognition on the basis your tribes were never terminated (Letter Michael R, Smith dated January 23, 1998) [**Figure 45]**.

On April 13, 2000 as a result of the submittal of reports to Congress the findings from the Advisory Council on California Indian Policy Act (HR 2144), California Congressman George Miller (D- Pleasant Hill) and his staff drafted a Recognition Bill titled California Indian Act of 2000 the purpose of which was:

> To restore Federal recognition to certain California Indian tribes, address the special land need of the California Indians, establish equitable treatment of California Indians in the programs and services of the Bureau of Indians Affairs, develop adequate California tribal justice systems, and for other purposes. Be it enacted by the Senate and House of Representatives of the United State of American in Congress Assembled …

Included in that proposed legislation was the legislative reaffirmation/restoration of six previously federally recognized tribes whose legal status was never terminated by any Act of Congress. These six tribes include: 1) Dunlap Band of Mono Indians; 2) Lower Lake Koi; 3) Tsungwe Council; 4) Muwekma Ohlone Tribe; 5) Tolowa Nation; and 6) Southern Sierra Miwok (from Yosemite) [**Figures 46 – 48**].

JAN-28-98 WED 12:01

United States Department of the Interior

BUREAU OF INDIAN AFFAIRS
Sacramento Area Office
2800 Cottage Way
Sacramento, California 95825

IN REPLY REFER TO:

Ms. Dena Magdaleno
Post Office Box 56
Burnt Ranch, CA 95527

JAN 2 3 1998

Dear Ms. Magdeleno:

This is to acknowledge receipt of your letter dated December 16, 1997 and received in this office on December 22, 1997. Please accept our apologies for the delay in responding.

At your request, I am writing a letter of support for the Tsnungwe Council and the Muwekma Ohlone Tribe in their bid for Federal recognition. First let me state that the Bureau of Indian Affairs, Sacramento Area Office, is painfully conscious of the fact that California Indian tribes and their individual members have suffered numerous atrocities and inequities from the dominant culture through the hands of the United States Government and the State of California. To this day, those tribes who are fortunate to have Federal recognition status continue to suffer inequities in their share of Federal funds compared to funds received by similar tribes in other states. To that end, this office fully supports efforts by Indian groups such as the Tsnungwe Council and the Muwekma Ohlone Tribe in their bids for Federal recognition status.

Along with your request regarding the Tsnungwe Council, you provided a letter signed by the Acting Director, Office of Tribal Services, which acknowledged that you had established evidence that your ancestors were considered as parties to the 1864 Treaty. We concur with the Central Office of this finding and will support your bid for Federal recognition. I believe the Assistant Secretary - Indian Affairs has the administrative authority to reaffirm Federal status to your tribe.

Although the Central Office has noted that the 1851 Treaty did not provide conclusive evidence that the treaty did not establish clear evidence of Federal recognition of your ancestors, I am fully supportive of your efforts to establish "unambiguous" Federal recognition of your ancestoral group as a tribal entity.

The Bureau of Indian Affairs, Sacramento Area Office, is ready to assist the Tsnungwe Council and the Muwekma Ohlone Tribe in seeking administrative Federal recognition on the basis your tribes were never terminated.

Sincerely,

Acting Area Director

Figure 45: Letter of Support from BIA Acting Area Director Michael R. Smith

4/13/00 California Indian Bill Draft

H.L.C.
[DRAFT]

April 13, 2000
106th CONGRESS
2nd Session
H. R. ___

IN THE HOUSE OF REPRESENTATIVES

Mr. George Miller of California introduced the following bill; which was referred to the Committee on _____

A BILL

To restore Federal recognition to certain California Indian tribes, address the special land needs of the California Indians, establish equitable treatment of California Indians in the programs and services of the Bureau of Indian Affairs, develop adequate California tribal justice systems, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE; TABLE OF CONTENTS.

(a) Short Title.--This Act may be cited as the "California Indian Act of 2000".
(b) Table of Contents.--The table of contents for this Act is as follows:

Figure 46: Title Page of Congressman Miller's Recognition Bill (2000)

SEC. 2. FINDINGS AND PURPOSE.

(a) Findings.--Congress finds that--

(1) the Advisory Council on California Indian Policy, pursuant to the Advisory Council on California Indian Policy Act of 1992 (Public Law 10209416; 25 U.S.C. 651 note), submitted its proposals and recommendations regarding remedial measures to address the special status of California's terminated and unacknowledged Indian tribes and the needs of California Indians relating to economic self-sufficiency, health, and education;
(2) in the Advisory Council on California Indian Policy Extension Act of 1998 (Public Law 10509294), the Congress directed the Council to work with the Congress, the Secretaries of the Interior and Health and Human Services, and the California Indian tribes to implement the Council's proposals and recommendations contained in its report to Congress, including presenting draft legislation to Congress for implementation of the recommendations requiring legislative changes.
(3) California Indian tribes cannot effectively exercise sovereignty or self-determination without a land base large enough to develop economically and provide for the basic needs of tribal members, including adequate housing, employment, and social welfare services;
(4) as a result of their uniquely tragic history, California Indian tribes do not have a land base that is adequate to meet their immediate and essential needs for housing, economic development, and cultural and natural resource protection and preservation;
(5) although a large number of California Indian tribes negotiated 18 treaties with the United States in the early 1850's that would have set aside approximately 8,500,000 acres as their tribal homelands, the United States Senate failed to ratify these treaties;
(6) the Senate's failure to ratify the California Indian treaties, in conjunction with Congress' passage of the 1851 Land Claims Act which required those claiming interests in California lands to file their claim within 2 years or forever forfeit such claim, denied California Indians any legally cognizable claim to their ancestral lands;
(7) most California Indians were rendered homeless by these Federal actions, a situation that remained unremedied for many years until the United States

Figure 47: Page 3 of Congressman Miller's Recognition Bill (2000)

and early 1860's by military and volunteer patrols that resulted either in their death, removal to the Hoopa Valley Reservation or hiding in the hills. However, a few years later the Tsnungwe returned to their aboriginal lands where they have remained ever since.

(4) The Muwekma are the aboriginal inhabitants of the southern, eastern, and western regions of the San Francisco Bay Area, including all of what is now San Francisco, San Mateo, Alameda, and Contra Costa Counties, much of what is now Santa Clara County, and parts of Santa Cruz, San Joaquin, Napa, and Solano Counties. The Muwekma Indians are from the following aboriginal tribes: Passasimi/Yatikumne, Tamcan, Josemite, Lacquisemne, Julpun, Napian/Karkin, Jalquin/Yrgin, Alson/Tamien, Suenen, Chupcan, Choquoime, and Nototomne. Spanish missionaries forced the ancestors of the Muwekma Tribe into the Missions Dolores, San Jose, and Santa Clara in the late 18th and early 19th centuries. In the 1830's the Mexican Government secularized the missions and distributed their lands. Many Muwekma left the missions and resettled in other parts of the Bay Area, including on20a number of rancherias in Alameda County, including the Alisal Rancheria near Pleasanton, the Del Mocho Rancheria in Livermore, the El Molino Rancheria in Niles, as well as on rancherias in Sunol and San Leandro/San Lorenzo until the early part of the 20th century. The Muwekma people continue to reside in their aboriginal territory in the San Francisco Bay Area.

(5) The Tolowa are the aboriginal inhabitants of the present day county of Del Norte, located in the northwestern corner of California. In this area, their villages were scattered along the coastline, at the Lakes Earl and Tolowa, and along the larger tributaries of the Smith and Winchuck Rivers. The Tolowa signed a treaty with the United States on August 17, 1857, and were removed to the Klamath Reservation that same year. They were subsequently moved to the Smith River Reserve until it was discontinued on May 3, 1862, and thereafter moved several more times, including to the Siletz Indian Reservation in Oregon and to the Round Valley, Hoopa, and Klamath Reservations in California. Documents of the Bureau of Indian Affairs from 1915 through 1916 show that 100 acres of land was to be purchased for the Lake Earl (Tolowa) Indians and the Lipps-Michaels Survey of Landless Nonreservation Indians of California, 1919091920, confirms such a purchase of 100 acres of undivided land near Crescent City, Del Norte County, for these Indians.

(6) The Southern Sierra Miwuk Nation is composed of several bands or groups of Indians of the Yosemite/Mariposa area. These bands or groups are mentioned in countless official letters and journals of the United States Commissioners who were charged by Congress to negotiate treaties with the California Indian tribes during the period 1851091852. The first treaty camp was Camp Fremont, just northwest of Mariposa, California. The second treaty camp was Camp Barbour, south of Mariposa in the Millerton Lake area. Some of the Southern Sierra Miwuk bands or groups that signed the treaties or were mentioned in the

Figure 48: Page 15 of Congressman Miller's Recognition Bill (2000)

Another letter of support came from Lieutenant Governor Cruz Bustamante who wrote to the BIA on August 29, 2002:

> The Muwekma Ohlone Tribe meets all of the criteria for reaffirmation set by the court as well as the Bureau of Indian Affairs' acknowledgement criteria. The tribe is a previously recognized tribe. It has demonstrated that it has had a trust relationship with the United States from 1906 to the present and Congress has never terminated their relationship. (Letter dated August 29, 2002) [**Figure 49**]

Even though support from recognition had been formally expressed by Congresswoman Zoe Lofgren, State and County politicians, the Advisory Council on California Indian Policy (1998), and in proposed federal legislation sponsored by Congressman George Miller in 2000, the Bureau of Indian Affairs stated in their Final Determination that they would not look at or consider any evidence after 1985.

CRUZ M. BUSTAMANTE
Lieutenant Governor
State of California

August 29, 2002

The Honorable Neal McCaleb
Assistant Secretary-Indian Affairs
United States Department of the Interior
1849 C Street, N.W.
Washington, D.C. 20240

Dear Secretary McCaleb:

I write to urge you to support Petition #111 by the Muwekma Ohlone Tribe for reaffirmation of Federal Acknowledgement.

The Muwekma Ohlone Tribe meets all of the criteria for reaffirmation set by the court as well as the Bureau of Indian Affairs' acknowledgement criteria. The tribe is a previously recognized tribe. It has demonstrated that it has had a trust relationship with the United States from 1906 to the present and Congress has never terminated their relationship.

The tribe's members descend from an historical Indian tribe and they are not members of any other Federally-recognized tribe.

After compiling data and completing extensive research, the Muwekmas have presented a compelling case for the tribe's Federal Acknowledgement. I respectfully urge you and the Bureau of Indian Affairs to carefully review their Petition.

Sincerely,

Cruz M. Bustamante

CRUZ M. BUSTAMANTE
Lieutenant Governor

cc: The Honorable Aurene Martin, Deputy Assistant Secretary-Indian Affairs

Figure 49: Letter of Support from California Lt. Governor Cruz Bustamante

In 2000 – U.S. District Court Justice Ricardo Urbina wrote in his Introduction of his Memorandum Opinion Granting the Plaintiff's Motion to Amend the Court's Order (July 28, 2000) and later in his Memorandum Order Denying the Defendants' to Alter or Amend the Court's Orders (June 11, 2002) that:

> The Muwekma Tribe is a tribe of Ohlone Indians indigenous to the present-day San Francisco Bay area. In the early part of the Twentieth Century, the Department of the Interior ("DOI") recognized the Muwekma tribe as an Indian tribe under the jurisdiction of the United States. (Civil Case No. 99-3261 RMU D.D.C.)

On October 30, 2000, the BIA's Office of Federal Acknowledgment and Tribal Services Division responded to Justice Urbina's Court Order regarding the Muwekma Ohlone Tribal enrollment and their descendency from the Verona Band of Alameda County:

> … . When combined with the members who have both types of ancestors), 100% of the membership is represented. Thus, analysis shows that the petition's membership can trace (and, based on a sampling, can document) its various lineages back to individuals *or to one or more siblings of individuals* appearing on the 1900, "Kelsey", and 1910 census enumerations described above (**Figure 50**).

On June 30, 2005, Congressman Richard Pombo, then ranking Republican Chair of the House Resources Committee wrote to Secretary of Interior Gail Norton supporting a settlement of the Muwekma lawsuit against Interior:

> Dear Secretary Norton:
> As part of my Committee's oversight of the procedures for federal recognition of Indian Tribes, I have heard testimony in a hearing earlier this year of the protracted litigation concerning the recognition of the Muwekma Ohlone Tribe. The Tribe informs me that the Department of the Interior has determined that Muwekma is a previously recognized tribe, federally recognized until **1927,** also that no formal action by the Department and no Act of Congress removed it from recognition and that **99%** of the members of the current tribe are direct descendants of the members of the recognized tribe.
>
> The Muwekma Tribe raises the issue that, in a very similar situation, the Department reaffirmed the federally-recognized status of the Lower Lake Koi Tribe and the Ione Band of Miwok in California by a letter signed by the then Assistant Secretary of the Interior restoring them to recognized **status** without making them go through forma1 recognition procedures.
>
> I understand that in December of **2003** the Tribe explored with the Department a possible settlement, including a rehearing that might lead to reaffirmation of the Tribe, or, according to the Tribe, at the suggestion of a Department attorney, the organization of the half-blood members of the Tribe as a new Tribe under the Indian Reorganization Act. Therefore, I would suggest, if possible, that the Department meet with the Tribe to pursue settlement opportunities. (Letter Rep. Richard Pombo dated June 30, 2005).

After the Office of Federal Acknowledgement "declined" to extend, and therefore reaffirm the Tribe's Federally Acknowledged status on September 6, 2002, the Muwekma Tribe had to pursue its second lawsuit against the Department of the Interior.

Muwekma Tribe's Litigation Against the Department of Interior, Bureau of Indian Affairs

On September 21, 2006, U.S. District Court Justice, Reginald B. Walton in **Muwekma Ohlone Tribe v. Dirk Kempthorne, Secretary of the Interior, et al.**, Civil Action No. 03-1231 (RBW) issued a favorable Court Opinion on the side of the Muwekma Tribe stating:

> The following facts are not in dispute. Muwekma is a group of American Indians indigenous to the San Francisco Bay area, the members of which are direct

descendants of the historical Mission San Jose Tribe, also known as the Pleasanton or Verona Band of Alameda County ("the Verona Band"). … From 1914 to 1927, the Verona Band was recognized by the federal government as an Indian tribe. … Neither Congress nor any executive agency ever formally withdrew federal recognition of the Verona Band. … Nevertheless, after 1927, the federal government no longer acknowledged the Verona Band, or any past or present-day incarnation of the plaintiff, as a federally recognized tribal entity entitled to a government-to-government relationship with the United States … (alleging that "sometime after 1927 the Department began to simply ignore the Tribe for many purposes and substantially reduced the benefits and services provided to the Tribe") … (pages 2-3) **[Figure 51].**

UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

MUWEKMA TRIBE, Plaintiff, v. BRUCE BABBITT,, Secretary of the United States Department of the Interior, and KEVIN GOVER, Assistant Secretary for Indian Affairs, United States Department of the Interior, Defendants.	Civil Action No.: 99-3261 (RMU) Document Nos.: 27, 28

MEMORANDUM OPINION

Granting the Plaintiff's Motion to Amend the Court's Order

I. INTRODUCTION

The Muwekma Tribe is a tribe of Ohlone Indians indigenous to the present-day San Francisco Bay area. In the early part of the Twentieth Century, the Department of the Interior ("DOI") recognized the Muwekma Tribe as an Indian tribe under the jurisdiction of the United States. In more recent times, however, and despite its steadfast efforts, the Muwekma Tribe has been unable to obtain federal recognition, a status vital for the Tribe and its members. Without federal recognition, the Tribe cannot receive the benefits of health care, housing, economic development, and self-governance that the United States provides to federally recognized tribes. *See* Pl.'s Mot. for Summ. J. at 2; 25 C.F.R. § 83.2.

Figure 50: Memorandum of Opinion U.S. District Court (2000)

Specifically, Muwekma contends, inter alia, that the Department violated the Equal Protection Clause and the APA by requiring it to undergo the Part 83 acknowledgment procedures while allowing similarly situated tribal petitioners to bypass these procedures altogether. Compl. ¶¶ 37-39; Points and Authorities in Support of Plaintiff's Motion for Summary Judgment ("Pl.'s Mem.") at 22-30. Currently before the Court are the parties' cross-motions for summary judgment.[4] For the reasons set forth below, the Court denies both parties' motions without prejudice and directs the Department to supplement the administrative record.

I. Background

The following facts are not in dispute. Muwekma is a group of American Indians indigenous to the San Francisco Bay area, the members of which are direct descendants of the historical Mission San Jose Tribe, also known as the Pleasanton or Verona Band of Alameda County ("the Verona Band"). Pl.'s Mem. at 4; Defs.' Mem. at 5; Answer at 6. From 1914 to 1927, the Verona Band was recognized by the federal government as an Indian tribe. Pl.'s Mem. at 4-5; Defs.' Mem. at 5; Answer at 12-13. Neither Congress nor any executive agency ever formally withdrew federal recognition of the Verona Band. Pl.'s Mem. at 5; Answer at 14.

Figure 51: U.S. District Court Opinion (2006)

2003 Litigation

U.S District Judge, Reginald B. Walton further wrote:

> Muwekma brought this action on June 6, 2003, seeking reversal of the Final Determination, placement on the Department's list of federally recognized tribes, and other injunctive relief. ... On July 13, 2005, Muwekma moved for summary judgment, alleging, inter alia, that the Department violated the APA and the Equal Protection Clause when it required Muwekma to petition for acknowledgment of its tribal status pursuant to the "lengthy and thorough" regulatory procedures of Part 83, …, despite administratively reaffirming the status of similarly situated tribes without requiring those tribes to undertake the Part 83 process and without sufficient explanation for the disparate treatment. ... Specifically, Muwekma contends that "[t]he Department returned Lower Lake and Ione to the list of recognized tribes

outside of the [Part 83] procedures [while] requir[ing] Muwekma to complete the Part 83 process and then, applying a greater evidentiary burden, denied Muwekma recognition despite [its] significantly stronger case for recognition." … (pages 10-11) …

If the Department were compelled to require tribes seeking federal recognition to complete petitions under Part 83—that is, if it had no discretion to exempt certain tribes from the Part 83 procedures—then its argument that "federal acknowledgment regulations specifically take into account demonstrations of previous acknowledgment," … Here, however, the Secretary of the Interior is **expressly** empowered to "waive or make exceptions to [the Department's regulations] in all cases where permitted by law," if the Secretary makes a finding that "**such waiver or exception is in the best interest of the Indians**." 25 C.F.R. § 1.2; ... Thus, if the Department is "permitted by law" to waive or except the Part 83 tribal acknowledgment procedures when it is "in the best interest of the Indians," 25 C.F.R. § 1.2, and if it appears that it has waived the acknowledgment procedures in other, ostensibly similar instances, then it is incumbent upon the Department to explain to Muwekma "why it has exercised its discretion in a given manner" in this instance, State Farm, 463 U.S. at 48-49. ... **This it has not done**. (pages 18-20) …

In addition, the Department's representation to Muwekma that it lacked the authority to confer federal recognition on the tribe outside of the Part 83 acknowledgment process, see Answer at 23 (admitting that "[n]otwithstanding the Department actions to the contrary with respect to the Ione Band and Lower Lake, [Department] staff repeatedly advised [Muwekma] that the Assistant Secretary [of Indian Affairs] lacked authority to administratively reaffirm tribal status"), appears from the Department's own admission to be **patently false**, ... (footnote 12, page 21) …

Upon remand, the Department must provide a detailed explanation of the reasons for its refusal to waive the Part 83 procedures when evaluating Muwekma's request for federal tribal recognition, particularly in light of its willingness to "clarif[y] the status of [Ione] . . . [and] reaffirm [] the status of [Lower Lake] without requiring [them] to submit . . . petition[s] under . . . Part 83." … At issue for the purpose of this remand is not whether the Department correctly evaluated Muwekma's completed petition under the Part 83 criteria, but whether it had a sufficient basis to require Muwekma to proceed under the heightened evidentiary burden of the Part 83 procedures in the first place, given Muwekma's alleged similarity to Ione and Lower Lake. In addition, the Department **shall** express its position regarding whether it is permitted, under 25 C.F.R. § 1.2 or otherwise, to waive or make exceptions to the Part 83 acknowledgment procedures, and whether this waiver or exception imposes a lesser evidentiary burden on petitioning tribes than the completion of a Part 83 petition. (pages 31-32) …

IV. Conclusion

When an agency provides a statement of reasons insufficient to permit a court to discern its rationale, or states no reasons at all, the usual remedy is a remand to the agency for additional investigation and explanation.' ... Here, the Court is unable to

> discern the Department‘s rationale for requiring Muwekma to proceed through the Part 83 tribal acknowledgment procedures while allowing other tribes that appear to be similarly situated to bypass the procedures altogether, an issue which is dispositive of Muwekma‘s Equal Protection Act and APA claims. Accordingly, it will remand this matter to the Department for the limited purpose of supplementing the administrative record in a manner consistent with this Opinion. During this time, the case shall be administratively closed. The Court shall retain jurisdiction over this matter and shall require the Department to complete its evaluation and submit a supplement to the administrative record by November 27, 2006. In light of the Department‘s past delays, and given the narrow purpose for which this matter is being remanded, the Court will look extremely skeptically on motions for extensions of time. …. (page 32)

On September 30, 2008 the US District Court in Washington, D.C. handed the Muwekma Tribe another **victory**. Judge Reginald B. Walton opined:

> These arguments, and the explanation from the Department giving rise to them, seemingly cannot be reconciled with the Court‘s September 21, 2006, memorandum opinion. In that opinion, the Court noted that the defendants opposed the plaintiff‘s initial motion for summary judgment on three grounds, two of which concerned whether the plaintiff was similarly situated to Ione and Lower Lake for purposes of the plaintiff‘s constitutional and APA arguments. Specifically, ―the defendants argue[d] that the Department ha[d] not treated like cases differently because by their very nature, federal acknowledgment decisions require highly fact-specific determinations,‖ and ―claim[ed] that [the plaintiff] was not treated differently than similarly situated petitioners because groups demonstrating or alleging characteristics similar to [the plaintiff] are regularly required to proceed through the federal acknowledgment process.

The Court rejected both of these arguments. It dismissed the defendants‘ ―hand-waving reference to highly fact-specific determinations,‘‖ in which, in the Court‘s estimation, ―[did] not free the defendants of their obligation to justify the decision to treat the plaintiff differently from Ione and Lower Lake based on the administrative record for the plaintiff‘s petition. Further, the Court found the argument ―that groups such as [the plaintiff] have been regularly and repeatedly required to submit Part 83 petitions‖ **insufficient** ―to refute [the plaintiff‘s] claim that the Department has treated it differently from similarly situated tribal petitioners without sufficient justification.

The Court further noted in a footnote that the defendants ―”obliquely provided a ―basis for distinguishing [the plaintiff] and Lower Lake in their reply to [the plaintiff‘s] opposition to their cross-motion for summary judgment,” but also found this argument wanting. Specifically, the Court explained that:

> First, and most obviously, [the defendants‘ argument] pertain[ed] only to a difference between [the plaintiff] and one of the tribes with whom it [was] claiming to be similarly situated. **The defendants [did] not assert any ―highly fact-specific determination**[]‖ that would explain why [the plaintiff] is not similarly situated to Ione in such a way as to require a reasoned explanation of the Department‘s disparate

> actions. Second, the Department [did] not contend, here or in the administrative record, that it required [the plaintiff] and not Lower Lake to undergo the Part 83 procedure because the latter, unlike the former, had received land in trust and had participated in an election.
>
> **Having rejected all of the defendants' arguments on the issue of similarity of circumstances**, the Court proceeded to find that **—the Department . . . ha[d] never provided a clear and coherent explanation for its disparate treatment** of [the plaintiff] when compared with Ione and Lower Lake,‖ nor had it ever —articulated the standards that guided its decision to require [the plaintiff] to submit a petition and documentation under Part 83 while allowing other tribes to bypass the formal tribal recognition procedure altogether.‖ Because there was —virtually nothing‖ in the administrative record that would —allow the Court to determine whether [the Department's] judgment . . . reflect[ed] reasoned decisionmaking,‖ the Court concluded that it was —necessary to remand [the] case to allow the Department to supplement the administrative record in this regard.

In other words, the Court determined in its prior memorandum opinion that the defendants' arguments to the effect that the plaintiff was not similarly situated to Ione and Lower Lake were without merit, and remanded the case to the Department so that the Department could explain why it treated the plaintiff differently than other, similarly situated tribes. The necessary implication of both conclusions is that the Court found the plaintiff to be similarly situated to Ione and Lower Lake.

> … Here, the Department's explanation and the defendants' arguments in defense of that explanation and in support of summary judgment in their favor would appear to run afoul of the law of the case established in this Court's prior memorandum opinion. The Court concluded, implicitly if not explicitly, that the plaintiff is similarly situated to Ione and Lower Lake, and remanded the case to the Department for the sole purpose of ascertaining a reason as to why the plaintiff was treated differently. Yet, the defendants do not even acknowledge that their arguments are inconsistent with the law-of-the-case, let alone provide a —compelling reason to depart‖ from it.
>
> The defendants' insouciance regarding the law-of-the-case is particularly troubling because they appear to rely at least in part on administrative records for Ione and Lower Lake that were not considered when the Department initially considered the plaintiff's petition for recognition. This tactic harkens back to the defendants' reply memorandum in support of their initial cross-motion for summary judgment, where they argued —that because the full body of administrative records regarding Ione and Lower Lake [was] not before the Court, [the plaintiff] [could not] establish a violation of the Equal Protection Clause or the APA simply by alleging that it ha[d] been treated differently than those tribes.

The Court rejected that argument, explaining that —[w]hat matter[ed] . . . [was] whether the Department sufficiently justified in the administrative record for [the plaintiff's] tribal petition its decision to treat [the plaintiff] differently from Ione and Lower Lake.
The Court remanded this case to the Department so it could explain why it treated similarly situated tribes differently, **not so that it could construct post-hoc arguments** as to whether the tribes were similarly situated in the first place. **It certainly did not remand the case so that the**

Department could re-open the record, **weigh facts that it had never previously considered, and arrive at a conclusion** vis-à-vis the similarity of the plaintiff's situation to those of Ione and Lower Lake that it had never reached before. **The Court would therefore be well within its discretion to reject the defendants' arguments outright, grant the plaintiff summary judgment with respect to its equal protection claim, and bring this case to a close. [**Emphasis added]

As a result of newly appointed clerks in the Federal Courts, Justice Walton permitted a 180 degree reversal of his demand to Interior, and permitted a post-hoc argument from Interior, which did not exist in the administrative record on how the Office of Federal Recognition considered Muwekma's repeated requests to be treated equally as a similarly situated tribe as was accorded the Ione Miwok and Lower Lake Koi, who were reaffirmed without having to submit a documented petition.

Concluding Remarks

The Muwekma Ohlone Tribe of the San Francisco Bay Area has moved both its legal history and efforts seeking reaffirmation as Federally Recognized tribe almost to full circle, thus completing its over century-long-plus journey since the Tribe first became Federally Acknowledged through the Congressional Homeless Indian Acts beginning in 1906.

The portion of the ***Clareño Muwékma Ya Túnneste Nómmo*** **[Where the Clareño Indians are Buried] Site (CA-SCL-30/H**) located at 575 Benton Street, as well as the many other ancestral heritage/archaeological projects that the Tribe has worked on have also served as important —bridges to the Tribe's long historic and pre-contact ancestral past. This archaeological work has been exceedingly important and meaningful to the Tribal membership by providing a forum -- in the form of the present study and its ethnohistorical ties to the Tribe's to Mission Santa Clara and to its larger territory -- thus allowing our Tribe to have a voice in telling part of its story after being completely disenfranchised for so many decades by public agencies, policy makers, academic institutions and archaeologists**.**

This present ethnohistory study has provided a greater in-depth ethnographic, ethnohistoric and legal background information about our ancestral Muwekma Tribe – the aboriginal and historic tribal people of the greater circum-San Francisco Bay region -- in both a historic and contemporary context. This has been presented in greater detail that most, if not all. CRM studies within the our ancestral homeland. Furthermore, this chapter was structured using contemporary anthropological and historical frameworks with two major research goals in mind:

1. . To present herein, ethnohistoric and historic information that addresses the biological and cultural continuation of our aboriginal Muwekma Ohlone Tribal people from the San Francisco Bay region and thus identifying and discussing those —"vital" cultural linkages between the living people and their ancestors and ancestral heritage sites, and specifically in this case, to those ancestral Clareño Muwekma Ohlone who buried at the Third Mission Santa Clara Indian Neophyte Cemetery, and surrounding areas;
2. To bring forward an interpretive understanding about the life of out ancestral Muwekma Ohlone people who were buried at the ***Clareño Muwékma Ya Túnneste Nómmo*** **Site (CA-SCL-30/H)** and within the Prometheus project area; and bring closure to this project with

the Reburial-Honoring ceremony of these ancestors by placing them back into the earth (***warep***), within the original cemetery location from which they were laid to rest by their people between 1781 and 1818.

The continuation of the Muwekma Tribe's cultural traditions and language has been an ongoing concern over these past decades.

Although there are almost no protections against the destruction of Native American Ancestral Heritage cemetery and village sites, and as far as we know, no ancestral Muwekma Ohlone site is eligible for Historical Landmark status under the Landmark statutes in Santa Clara County, nonetheless our Muwekma Tribe desires to honor the good efforts and diligent work displayed by the Prometheus project construction and management firm, and field archaeological staff from PaleoWest in facilitating the recovery of our ancestral remains who were buried at:

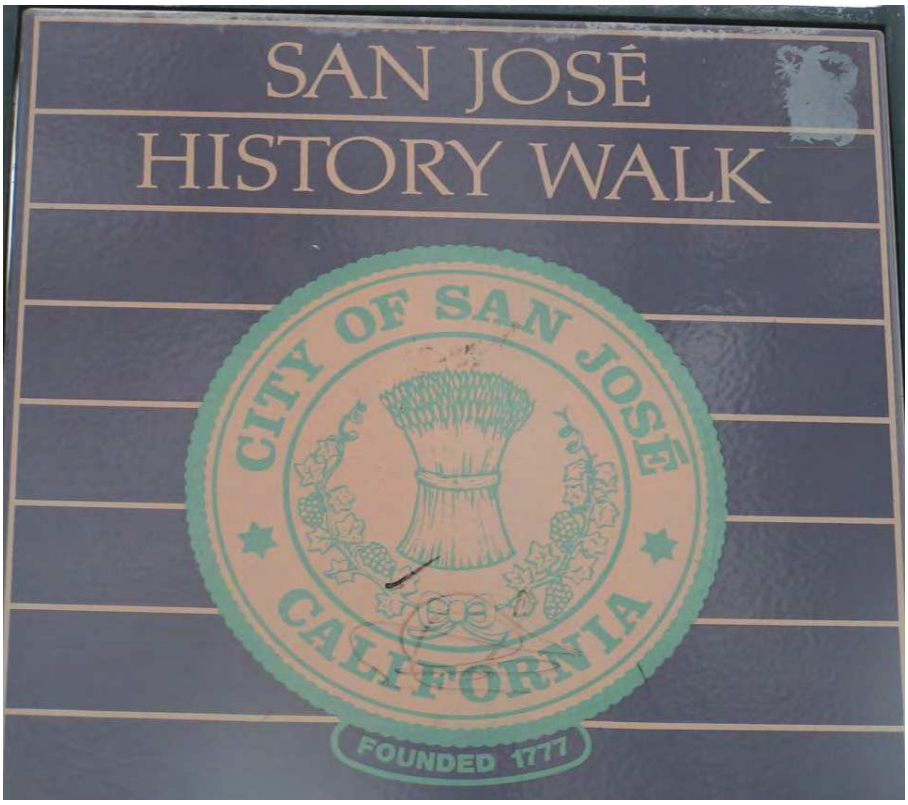

Figure 52: History Walk Historical Marker Downtown San Jose, California

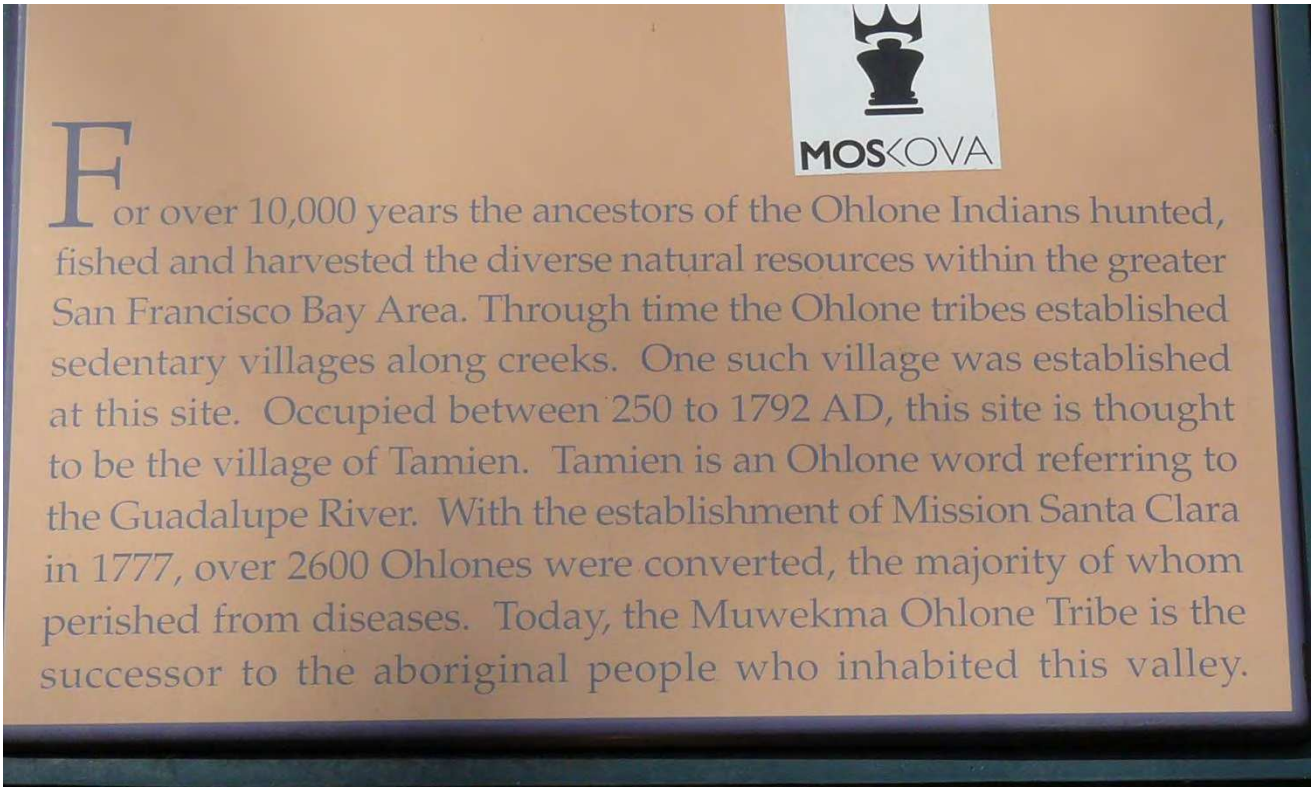

Figure 53: The Site of Tamien an Ohlone Indian Village (*Thámien Rúmmeytak* Site)

Transcription of the Historical Marker Village of Tamien Text

> For over 10,000 years the ancestors of the Ohlone Indians hunted, fished and harvested the diverse natural resources within the greater San Francisco Bay Area. Through time the Ohlone tribes established sedentary villages along creeks. One such village was established at this site. Occupied between 250 and 1792 AD, this village is thought to be the village of Tamien [***Thámien***]. Tamien is an Ohlone word referring to the Guadalupe River. With the establishment of the Santa Clara Mission in 1777, over 2600 Ohlones were converted, the majority of whom perished to diseases. Today the Muwekma Ohlone Tribe is the successor to the aboriginal people who inhabited this valley.

Public Art over the Park Avenue Bridge: Eagle, Coyote and Hummingbird

On May 13, 1994 the City of San Jose unveiled the public art displaying Eagle, Coyote and Hummingbird and a version of the Ohlone Creation Narrative honoring the Muwekma Ohlone Tribe and later immigrants to San Jose, California with a plaque and sculptures (**Figures 54– 58).**

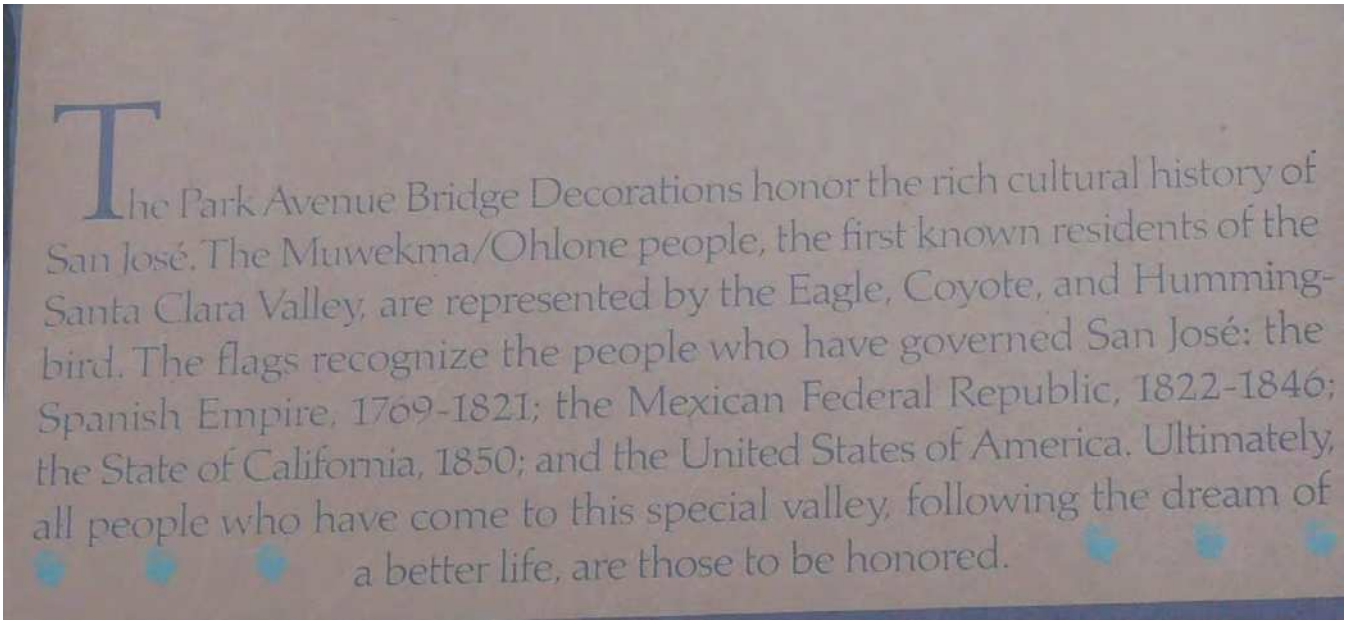

Figure 54: Honoring Plaque over the Park Avenue Bridge Downtown San Jose

Transcription of the Informational Plaque on the Park Avenue Bridge

The Park Avenue Bridge Decorations honor the rich cultural history of San Jose. The Muwekma Ohlone people the first know residents of the Santa Clara Valley, are represented by the Eagle, Coyote and Hummingbird. The flags recognize the people who have governed San Jose: the Spanish Empire, 1769-1821; the Mexican Federal Republic, 1822-1846; the State of California, 1850; and the United States of America. Ultimately all people who have come to this special valley following the dream of a better life, are those to be honored.

The Muwekma Ohlone Tribute (Presented by the Guadalupe River Park Conservancy)

"The Muwekma Ohlone people, Native Americans who once lived along the Guadalupe River, are honored with animal sculptures important to their tradition, on the Park Avenue Bridge. These include the Coyote, the Hummingbird, and the Eagle. The four flags that fly from atop the bridge represent the past and present governments of the area: Spain, Mexico, California and the United States. The Coyotes were created by artist Peter Schiffrin; the Eagle and Hummingbirds by Tom Andrews. The Coyote, Hummingbird and Eagle represent the Muwekma Ohlone creation story. Coyote was the father of the human race who was responsible for creating people and teaching them how to live properly. Hummingbird was wise and clever. Eagle was a leader" (http://www.grpg.org/public-art_).

Eagle

Hummingbird

Coyote

Long ago, it was said that Eagle, Coyote, and Hummingbird watched from the mountain tops the water recede after the great flood. Eagle, The Chief, sent Coyote to see if there was land below. Coyote returned and announced that "the land is dry".

Afterwards, Coyote made all the Indian people of California. He made the Muwekma, (The People) of the Santa Clara Valley. Together the Muwekma, Eagle, Coyote, Hummingbird and all the other animals shared this great and beautiful valley.

With the establishment of the El Pueblo De San José De Guadalupe, the Coyote and the traditional Muwekma / Ohlone way of life became part of our valley's rich historic past.

CALIFORNIA LEGISLATURE

Assembly

CERTIFICATE OF RECOGNITION

PRESENTED TO

MUWEKMA OHLONE TRIBE OF THE SAN FRANCISCO BAY AREA

IN RECOGNITION OF THE

Inaugural California Indian Heritage Flag Raising

For creating a space for the City of Milpitas and its residents to honor the tribes and nations whose land we reside on. Your tireless efforts to demanding a more just and equitable world for all indigenous people is truly and inspiration to us all. On behalf of the 27th Assembly District, thank you for your commitment to celebrating the first people of this continent and congratulations on the success of your Inaugural California Indian Heritage Flag Raising.

Dated this 1st day of November, 2018

HONORABLE ASH KALRA
Chair, Committee on Aging and Long Term Care
27th Assembly District- San Jose

Figure 72: Opening Ceremony with Representatives of the Muwekma Ohlone Tribe and Keynote Address Dolores Huerta American Anthropological Association Meeting (November 14, 2018)

In 2019, the downtown San Jose community, school district and students attending the Burnett Middle School voted to rename that school after the **Muwekma Ohlone Tribe**. Elizabeth Barcelos writing for the online San Jose Spotlight wrote on September 24, 2019:

> The school's outgoing namesake is California's first governor, Peter Burnett, whose racist policies included the Chinese Exclusion Act of 1882 and attempts to keep black Americans out of California. He also believed that Native Americans should be eliminated from the newly-created state, making the change to Ohlone an especially strong statement.
>
> The Ohlone people were the original inhabitants of what is now San Jose. Ohlone College in Fremont is also named after them. According to the ballot, "By choosing this name, we will be teaching students about the Ohlone people while honoring their historical importance in the Santa Clara Valley."

CITY OF SAN JOSE

Proclamation

WHEREAS: The Muwekma Ohlone have called our Valley home for thousands of years before expeditions brought people of European descent to the Bay Area, and comprise all of the known surviving Native American lineages aboriginal to the Bay; and

WHEREAS: Specifically, they constituted the Tamyen community in the Santa Clara Valley who have led land-preservation and natural resource management practices in environmentally sensitive areas like the "Mayan Rummey" (Coyote) watershed; and

WHEREAS: Contrary to actions by the federal government in the 1920's to erase the historical memory of the tribe, several hundred tribal descendants remain in the region and devoutly carry on the traditions of their ancestors; and

WHEREAS: The Muwekma Ohlone, Amah-Mutsun, and Esselen tribes of our region have suffered severe injustice and dispossession, and we honor and support their descendents' efforts to revive their culture, language, and history;

NOW, THEREFORE, I, Sam Liccardo, Mayor of the City of San José, together with my colleagues on the City Council, on this 12th day of October 2020, do hereby recognize and proclaim

INDIGENOUS PEOPLES' DAY

To celebrate Native American history in our valley.

The Honorable Sam Liccardo

Executive Summary

Arcadis U.S., Inc. (Arcadis) was retained by Santa Clara Unified School District (SCUSD) to conduct a Phase I Environmental Site Assessment (ESA) for a portion of the Santa Clara County Assessor Parcel Number (APN) 31310004, excluding the Peterson Middle School structures (subject property). The subject property includes a portion of the Peterson Middle School (specifically, a current parking lot), the Patrick Henry School Campus (including recreational fields), and the SCUSD Farm located at 1380 Rosalia Avenue, 1095 Dunford Way, and 1055 Dunford Way, respectively, in Sunnyvale, California (**Figures 1 and 2**). The Phase I ESA was performed in general accordance with the ASTM International (ASTM) Standard E1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-21).

Subject Property Layout Description

The subject property comprises an approximately 54-acre area that is improved with the following permanent buildings within the Patrick Henry School Campus that are summarized on **Table 1**. Structures in the remaining portions of the subject property include small sheds, Conex boxes, and temporary portable classrooms and trailer buildings that will be removed prior to construction.

Current Building Name (Historical Building Name)	Building Size (square feet)	Purpose
Building E/Building 800 (Building A)	13,328	Former Classroom Building and Conference Room
Building 600 (Building B)	4,223	Former Classroom Building and Storage Area
Building B/Building 500 (Building C)	16,685	Appleseed Montessori and SCUSD Classrooms
Building C (Building D)	12,054	Silicon Valley Academy
Building D (Building E)	12,758	New Concept Chinese School and SCUSD Administrative Offices
Building 300 (Building F)	9,395	Auditorium and Storage Area
Building G	5,170	SCUSD Print Shop/Music Instrument Storage

The buildings listed above are wooden-frame buildings with a plaster exterior that are present in the eastern portion of the subject property. Other than current administrative operations in Building D and the SCUSD Print Shop in Building G, the remaining portions of the Patrick Henry School Campus buildings consist of vacant classrooms, an auditorium used for storage, and utility rooms. A pad-mounted transformer was observed on a concrete pad north of Building G with several large cables emanating from subgrade areas beneath the transformer pad. A pole-mounted transformer is also located south of the Patrick Henry School Campus along the southern boundary of the subject property

on Dunford Way. No labeling was visible regarding the polychlorinated biphenyl (PCB) content of oil within the unit and no staining or evidence of corrosion was noted on or around the units. The western portion of the Patrick Henry Campus consists of a gravel-paved storage area for Conex boxes, vehicle storage, and miscellaneous machinery and equipment storage. The Conex boxes are used for furniture storage and miscellaneous storage for the SCUSD maintenance staff. Arcadis observed five polyethylene tanks in the northeastern portion of the storage yard that were used off-site at a nearby high school for pool cleaning products. According to Mr. Maes, a Maintenance Lead for SCUSD, the tanks were emptied prior to storage at the subject property. Arcadis noted that the tanks appeared to be partially filled with accumulated stormwater. De minimis amounts of staining were observed on the gravel in the storage yard that was attributed to minor leaks and spills from automobile parking. The stains were observed underneath and around cars that were stored in the yard. The remaining portions of the Patrick Henry School Campus consisted of play areas, asphalt-paved parking lots north and south-adjacent to the school buildings, and landscaped and grassy areas east of the school.

The northeastern portion of the subject property along Teal Drive consists of a former soccer field, and small storage sheds that were most recently rented by a recreational soccer league. According to information reported in the EDR Radius Map Report and the Santa Clara Valley Water District (SCVWD), there are two former agricultural wells that have been abandoned at the subject property in the soccer field area and along the eastern boundary with Teal Drive.

The far northern portion of the subject property consists of an asphalt-paved parking lot for the Peterson Middle School, a temporary construction office building, recreational courts, and storage area for the SCUSD. According to Ms. Healy, the office is not currently in use and will be removed. De minimis amounts of hydrocarbon staining was observed on the asphalt-paved parking lot that was attributed to minor leaks and spills from automobiles.

The central portion of the subject property consists of a large grassy football field, track, and bleacher area with a corrugated metal storage building for concession and sports equipment. No areas of concern or staining were observed in this portion of the subject property.

The southwestern portion of the subject property encompasses the SCUSD Farm. The farm consists of mulch and compost storage areas in the eastern portion of the farm, small storage buildings, sheds, and orchard land in the northern portion of the farm, row crops and a storage barn in the central and southern portions of the farm, and a covered patio area and storage building in the western portion of the farm.

Operations

The subject property is owned by the SCUSD. The buildings within the Patrick Henry School Campus were used as classroom space and office space for the SCUSD, New Concept Chinese School, Silicon Valley Academy, and Appleseed Montessori School. The western portion of the Patrick Henry Campus operates as a print shop, storage area for musical instruments, storage yard for SCUSD vehicles, and Conex box storage for miscellaneous equipment. The central and western portions of the subject property are used as recreational fields, solar panels and associated machinery, and portable classroom storage. The southern portion of the subject property is operated as the SCUSD Farm with

areas for orchards and row crops. The northern portion of the subject property is used as an asphalt-paved parking lot for the Peterson Middle School.

Subject Property History

The subject property appeared in topographic maps as developed with four structures in the central portion of the subject property from as early as 1897 through at least 1902. By 1939, these structures had been demolished and the subject property had been redeveloped as part of a larger tract of orchard land. No significant changes were evident until 1960, when the eastern portion of the subject property was cleared and appeared to be under construction. Buildings A through E were constructed in 1960 and Buildings F and G were constructed in 1962. By 1963, the Patrick Henry Campus buildings, an asphalt-paved parking lot in the southeastern portion of the campus, garden and orchard areas in the central and northern portions of the school campus, and recreational court areas north of the building were visible in aerial photography. The area surrounding Building G in the western portion of the campus appeared to be under construction with areas of concrete or building materials. The area north of the school campus was cleared and the western portion of the subject property remained developed with orchards.

By 1968, a small structure was constructed north of Building G in the footprint of the current transformer pad in the western portion of the school campus and the orchard areas in the remaining portions of the subject property had been cleared. The central portion of the subject property was redeveloped with the current football field and track and the western portion was developed with two baseball fields. The far northern portion of the subject property was cleared and appeared to be used for automobile parking. By 1974, bleachers had been constructed along the western portion of the football field and track and several small, cleared areas were visible in the field north of the school campus. The far northern portion of the subject property was further developed with the current asphalt-paved parking lot for the adjoining Peterson Middle School. No significant changes were evident until 1982, when the current corrugated metal shed building was visible north of the bleachers in the central portion of the subject property and a large, cleared area was visible in the footprint of the former baseball field in the southern portion of the subject property. No changes were visible until 1991, when multiple small buildings were visible south of Building G and north of the football field and a rectangular building or Conex box was visible in the far northern portion of the subject property. No changes were evident until 1998, when a new, practice field for the San Jose Saber Cats (arena football) was constructed north of Building G. By 2000, the large rectangular structure north of the building was visible as an enclosed recreational court and by 2002, a new structure had been constructed west of Building G. No changes were evident until 2005, when the area northwest of Building G was used for parking and additional Conex boxes and storage equipment were visible in this area beginning in 2007. By 2008, the southwestern portion of the subject property had been developed with the Full Circle Farm run by the Sustainable Community Gardens and associated buildings and the area northwest of the farm had been cleared and appeared to be used for Conex box or portable classroom storage. By 2013, the current solar panels were constructed in the western portion of the subject property. No changes were evident until 2016, when the practice field for the San Jose Saber Cats and two structures west and northwest of Building G were removed. These areas were further developed as storage areas with portable classroom buildings in the northwestern portion of the subject property and Conex boxes and vehicle storage in the northwestern portion of the Patrick Henry Campus through the present.

Prior owners of the subject property include the Pacific Manufacturing Company, who sold the land to A.H. Buehren on March 3, 1899 as well as Ignasio Rosalia Castello; Dokenic, Lena, Salvtaore, and Rosie Cirrincione; and Frank L., Pearl, Salvatore, and Pauline Teresi,who sold portions of the subject property to the Jefferson Union High School District of Santa Clara County, a former operating name for the SCUSD, between 1955 and 1962. The Patrick Henry School Campus was historically referred to as Patrick Henry Junior High School as of August 1960. The campus was operated as a middle school in the 1960s and 1970s. I 1979, the Patrick Henry School was closed and the school campus was used for administrative office space. Portions of the campus were also rented out to other private schools including the Palmer College of Chiropractic West, who used Building G for cadaver storage for their anatomy and physiology labs. Other tenants at the school have included AppleSeed Academy, Christian Church Scholars, River of Life, Silicon Valley School, New Concept Chinese School, Mount Bell Academy, and Dynasty Academy. With the exception of the SCUSD administrative office space in Building D and a District print shop and music instrument storage area in Building G, the school is currently vacant. The remaining portions of the subject property have been historically developed with orchards, recreational fields (soccer, baseball), and the SCUSD Farm.

Surrounding Area

At the time of Arcadis's site reconnaissance, surrounding area properties consisted primarily of residential properties located along Dunford Way (south of the subject property), Teal Drive (east of the subject property), Norman Drive (west of the subject property), Bryant Way (north of the subject property), and Roadrunner Terrace (northeast of the subject property). Raynor Park Christian Church and the Raynor/Stratford School were located south-adjacent to the subject property across Dunford Way.

Findings and Opinion

Arcadis has performed a Phase I ESA of the subject property in conformance with the scope and limitations of ASTM E1527-21 for Phase I ESAs. This assessment has revealed the following recognized environmental conditions (RECs), controlled recognized environmental conditions (CRECs), historical recognized environmental conditions (HRECs), and noteworthy conditions as defined in Section 1 of this Phase I ESA Report.

Recognized Environmental Conditions

The following RECs were identified in connection with the subject property:

Agricultural Land and Orchard Use: The subject property was developed as part of a larger agricultural tract of land from at least 1939 through 1960, when the Patrick Henry School Campus was constructed. The southern portion of the subject property was more recently redeveloped as the SCUSD Farm from 2008 through the present.

Based on the use of the subject property as a historical orchard, the application of agricultural chemicals is a potential REC for the subject property in accordance with the August 2008 Department of Toxic Substances Control (DTSC) Interim Guidance.

Lead-based Paint: Lead-based paint was commonly used for a variety of purposes, until 1978 when federal regulations banned consumer uses of lead-containing paint, though exceptions applied for certain commercial and other paints. Federal regulations require certain disclosures regarding lead-based paint for housing constructed prior to 1978. The buildings at the subject property were constructed in 1960 and 1962, which pre-dates the ban on consumer uses of lead-containing paint. Painted surfaces were observed throughout the Patrick Henry campus and several buildings had chipped, peeling, and deteriorating paint areas along the sides of the structures. No information was available regarding lead sampling conducted at the school site. It is Arcadis' understanding that the onsite buildings will be properly abated prior to demolition.

Based on the construction dates of the building and the condition of the paint at the school, the potential historical use of lead-based paint on site structures and peeling off the structure and contacting surficial soil is a potential REC in soil for the subject property in accordance with the June 2006 DTSC Interim Guidance.

Polychlorinated Biphenyls (PCBs): PCBs are a group of organic chemicals that were used historically in a variety of industrial and chemical applications, including cooling oil in transformers prior to 1979. PCBs were manufactured in the United States from 1929 until 1979, when PCB manufacturing was banned due to the toxicity of PCBs.

One pad-mounted electrical transformer was observed north of Building G within a larger concrete pad. No labels were present to indicate the PCB content of the transformer and no information was available regarding historical transformers in use at the property. In addition, a pole-mounted transformer is located along the southern boundary of the subject property on Dunford Way. Given the age of the buildings, it is possible that the transformers contain PCBs. The potential presence of PCBs in soil adjacent to the transformers at the subject property is a potential REC in accordance with the June 2006 DTSC Interim Guidance.

Termiticide Application: OCPs were historically used as insecticides for termite controls around wooden structures. The buildings at the Patrick Henry School Campus were constructed in 1960 and 1962 and are wood-framed buildings with plaster exteriors. Based on the construction dates, the potential presence of termiticides in soil adjacent to the structures at the subject property is a potential REC in accordance with the June 2006 DTSC Interim Guidance.

Controlled Recognized Environmental Conditions

No CRECs were identified in connection with the subject property.

Historical Recognized Environmental Conditions

No HRECs were identified in connection with the subject property.

Noteworthy Conditions

The following noteworthy conditions were identified in connection with the subject property:

Asbestos Containing Building Materials (ACBMs): The buildings at the Patrick Henry campus were constructed in 1960 and 1962. Based on the construction dates and prior surveys that have been conducted at the school, ACBMs are likely present at the subject property and represent a noteworthy condition.

Naturally Occurring Asbestos: According to a 2007 Geologic Map of the Cupertino and San Jose West quadrangles, Santa Clara, and Santa Cruz Counties, California, the subject property is located approximately 7 miles northeast of the nearest serpentine rock deposits. Given that the outcrops of the serpentine rock deposits are within the 10-mile radius established by the Interim Guidance for Naturally Occurring Asbestos (NOA) at School Sites (DTSC 2004), the potential presence of NOA is a noteworthy condition for the subject property. It is important to note that NOA is not identified as a REC in the Phase I ESA as naturally-occurring rock deposits do not constituent a REC under CERCLA and therefore are not a REC under ASTM.

Historical Vehicle Storage Operations: The area west of the Building G has been used for automobile and equipment storage since at least 2007. During site reconnaissance, Arcadis observed multiple vehicles stored in this area including damaged vehicles. Small amounts of staining were observed on the gravel within this area that was attributed to minor leaks and spills. As such, the vehicle storage in this area is a noteworthy condition for the subject property.

Historical Well: According to the EDR Radius Map Report database and the California Department of Water Resources Website, a former well was located in the current soccer field in the northern portion of the subject property. The well was historically used as a water supply well and was last sampled in May and September 1949. It is unclear if the well was properly abandoned as no evidence of the current well was visible during site reconnaissance. Arcadis submitted a records request to the California Department of Water Resources and the Santa Clara Valley Water District and no records were available. Given the absence of information regarding the well or proper closure of the well, it is a noteworthy condition for the subject property.

Significant Data Gaps

No significant data gaps were identified during this Phase I ESA.

1 Introduction

Arcadis U.S., Inc. (Arcadis) was retained by Santa Clara Unified School District (SCUSD) to conduct a Phase I Environmental Site Assessment (ESA) for portion of the Santa Clara County Assessor's Parcel Number (APN) 31310004, excluding the Peterson Middle School structures (subject property, **Figures 1 and 2**). The subject property includes a portion of the Peterson Middle School (specifically, a current parking lot), the Patrick Henry School Campus (including recreational fields), and the SCUSD Farm located at 1380 Rosalia Avenue, 1095 Dunford Way, and 1055 Dunford Way, respectively, in Sunnyvale, California.

1.1 Purpose

Arcadis understands that the purpose for conducting this Phase I ESA is to assess and document the current status of environmental impact conditions at the subject property.

1.2 Scope of Work

The Phase I ESA was performed in general accordance with the ASTM International (ASTM) Standard E1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-21), including the limitations outlined in the standard. The goal of the Phase I ESA was to identify recognized environmental conditions (RECs), controlled recognized environmental conditions (CRECs), and historical recognized environmental conditions (HRECs) associated with the subject property.

Findings from this Phase I ESA are classified and defined as follows:

- A REC is defined in ASTM E1527-21 as "the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment."
- A CREC is defined in ASTM E1527-21 as "recognized environmental condition affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of required controls (for example, activity and use limitations or other property use limitations)."
- A HREC is defined in ASTM E1527-21 as "a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations)."
- A de minimis condition is defined in ASTM E1527-21 as "condition related to a release that generally does not present a threat to human health or the environment and that generally would

not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. A condition determined to be a de minimis condition is not a recognized environmental condition nor a controlled recognized environmental condition."

- Noteworthy Conditions are considered environmental issues that do not clearly fall within the ASTM definition of a REC, CREC, HREC, or de minimis condition, fall outside the scope of the ASTM practice (e.g., asbestos), or are considered a business environmental risk.

As required by ASTM E1527-21, the scope of work for this Phase I ESA included the following elements, except as otherwise indicated as a data gap in Section 8.8 or as a deviation in Section 8.9 of this report:

- **Review of User-provided Information:** Arcadis requested and reviewed documents and information provided by the User.
    - The User of this Phase I ESA is Santa Clara USD.
- **Review of Physical Setting Resources:** Arcadis contracted Environmental Data Resources, Inc. (EDR) to provide a report (EDR Report) summarizing physical setting information for the subject property and surrounding area. Arcadis also reviewed other physical setting resources.
- **Review of Government Records:** The EDR Report also summarizes federal, state, tribal, and local environmental record source database listings for the subject property and for the adjoining and surrounding properties within specified search radii, as required by ASTM E1527-21. Arcadis also reviewed regulatory agency files and records, as deemed necessary and documented in Section 9.2 of this Report.
- **Review of Historical Records:** Arcadis reviewed historical records to understand the past uses of the subject property, adjoining properties, and surrounding area.
- **Site reconnaissance**: Arcadis completed a site reconnaissance to visually observe exterior areas and accessible interior common areas and representative occupant spaces. Arcadis did not look under floors, above ceilings, or behind walls. Adjacent properties and the surrounding area were viewed from the subject property and/or from publicly accessible properties or rights-of-way.
    - Ms. Divya Mehta of Arcadis performed the site reconnaissance on April 16th and April 25th, 2022.
    - During the site reconnaissance, the temperature was approximately 60° Fahrenheit, and conditions were observed to be sunny.
- **Interviews with Owners, Operators, and Occupants:** Arcadis interviewed Ms. Michal Healy, Director of Facility Development and Planning (associated with the subject property for 8 years), Ms. Angeline Ruiz, Facility Development and Planning Technician (associated with the subject property for 4 years), and Mr. Dan Maes, Maintenance Lead (associated with the subject property for 7 years) during the site reconnaissance. Ms. Ruiz and Ms. Healy are the key site managers, as defined in ASTM E1527-21.
- **Interviews with Local Government Officials:** Arcadis interviewed government officials via submission of a request for information regarding the subject property.
- **Evaluation and Report:** This Phase I ESA Report summarizes and documents the Phase I ESA.

The scope of work for the Phase I ESA also included the following:

- A cursory visual observation for apparent wetland areas in accessible exterior areas of the subject property and review of readily available wetlands information to identify wetlands that have been previously delineated and/or reported to be present on the subject property.
- A cursory visual observation to identify typical suspect asbestos-containing materials (ACMs) and lead-based paint and a review of associated documentation.
- A review of radon test data for the subject property area as included in the EDR Report.
- A cursory visual observation to identify apparent mold in interior areas, and a review of associated documentation.
- A high-level assessment to identify current or historical use, storage, or disposal of per- and polyfluoroalkyl substances (PFAS) at the subject property, and a review of the EDR Report to identify known releases of PFAS at adjoining or surrounding properties (within the search distances specified in ASTM E1527-21) that are likely to impact the subject property. Arcadis notes that the search radii specified in ASTM E1527-21 and the inherent limitations of PFAS-related database information may not be suited to fully evaluate the potential for PFAS impacts from off-property sources.

The scope of work for this Phase I ESA did not include the collection or analysis of soil, water, air, other environmental media, transformer/electrical fluids, ACMs, lead-based paint, other building materials, mold, or other samples.

2 Subject Property Setting and Description

2.1 Subject Property Location

The subject property is located at 1095 Dunford Way, Sunnyvale, Santa Clara County, California **(Figure 1)**. The subject property comprises a portion of one 71-acre parcel identified by the Santa Clara County Assessor's Office as Assessor Parcel Number (APN) 31310004. The subject property is located along the northwestern corner of Dunford Way and Teal Drive. Land use in the surrounding area consists of residential, agricultural, school, and commercial properties.

2.2 Subject Property Layout Description

The subject property comprised an approximately 54-acre area that was improved with the following permanent buildings within the Patrick Henry School Campus that are summarized on **Table 1**. Structures in the remaining portions of the subject property include small sheds, Conex boxes, and temporary portable classrooms and trailer buildings that will be removed prior to construction.

Table 1. On-property Buildings

Current Building Name (Historical Building Name)	Building Size (square feet)	Purpose
Building E/Building 800 (Building A)	13,328	Former Classroom Building and Conference Room
Building 600 (Building B)	4,223	Former Classroom Building and Storage Area
Building B/Building 500 (Building C)	16,685	Appleseed Montessori and SCUSD Classrooms
Building C (Building D)	12,054	Silicon Valley Academy
Building D (Building E)	12,758	New Concept Chinese School and SCUSD Administrative Offices
Building 300 (Building F)	9,395	Auditorium and Storage Area
Building G	5,170	SCUSD Print Shop/Music Instrument Storage

The buildings listed above are wooden-frame buildings with a plaster exterior that are present in the eastern portion of the subject property. Other than current administrative operations in Building D and the SCUSD Print Shop in Building G, the remaining portions of the Patrick Henry School Campus buildings consist of vacant classrooms, an auditorium used for storage, and utility rooms. A pad-mounted transformer was observed on a concrete pad north of Building G with several large cables emanating from subgrade areas beneath the transformer pad. A pole-mounted transformer is also located south of the Patrick Henry School Campus along the southern boundary of the subject property

on Dunford Way. No labeling was visible regarding the polychlorinated biphenyl (PCB) content of soil within the unit and no staining or evidence of corrosion was noted on or around the units. The western portion of the Patrick Henry Campus consists of a gravel-paved storage area for Conex boxes, vehicle storage, and miscellaneous machinery and equipment storage. The Conex boxes are used for furniture storage and miscellaneous storage for the SCUSD maintenance staff. Arcadis observed five polyethylene tanks in the northeastern portion of the storage yard that were used off-site at a nearby high school for pool cleaning products. According to Mr. Maes, ae Maintenance Lead for SCUSD, the tanks were emptied prior to storage at the subject property. Arcadis noted that the tanks appeared to be partially filled with accumulated stormwater. De minimis amounts of staining were observed on the gravel in the storage yard that was attributed to minor leaks and spills from automobile parking. The stains were observed underneath and around cars that were stored in the yard. The remaining portions of the Patrick Henry School Campus consisted of play areas, asphalt-paved parking lots north and south-adjacent to the school buildings, and landscaped and grassy areas east of the school.

The northeastern portion of the subject property along Teal Drive consists of a former soccer field, and small storage sheds that were most recently rented by a recreational soccer league. According to information reported in the EDR Radius Map Report and the SCVWD, there are two former agricultural wells that have been abandoned at the subject property in the soccer field area and along the eastern boundary with Teal Drive.

The far northern portion of the subject property consists of an asphalt-paved parking lot for the Peterson Middle School, a temporary construction office building, recreational courts, and storage area for the SCUSD. According to Ms. Healy, the office is not currently in use and will be removed. De minimis amounts of hydrocarbon staining was observed on the asphalt-paved parking lot that was attributed to minor leaks and spills from automobiles.

The central portion of the subject property consists of a large grassy football field, track, and bleacher area with a corrugated metal storage building for concession and sports equipment. No areas of concern or staining was observed in this portion of the subject property.

The southwestern portion of the subject property encompasses the SCUSD Farm. The farm consists of mulch and compost storage areas in the eastern portion of the farm, small storage buildings, sheds, and orchard land in the northern portion of the farm, row crops and a storage barn in the central and southern portions of the farm, and a covered patio area and storage building in the western portion of the farm.

Photographs of the subject property and surrounding areas were taken to document current conditions and are included in **Appendix A**.

2.2.1 Heating and Cooling

One large natural gas-fired boiler unit is located in a utility room in the northwestern portion of Building C that was used to provide heat and hot water to most of the buildings on the Patrick Henry School Campus. One smaller natural gas-fired boiler was located in the southern portion of Building E/Building 800. Multiple electric-powered mini split units and packaged electric and natural gas-fired units are used to heat and cool the remaining buildings and are housed on the roof of the buildings. Multiple

small electric-powered mini air conditioning units were observed for classrooms in Buildings B and C that are mounted along the side of the buildings.

2.3 Operations

The subject property is owned by the SCUSD. The buildings within the Patrick Henry School Campus were used as classroom space and office space for the SCUSD, New Concept Chinese School, Silicon Valley Academy, and AppleSeed Montessori School. The western portion of the Patrick Henry Campus operates as a print shop, storage area for musical instruments, storage yard for SCUSD vehicles, and Conex box storage for miscellaneous equipment. The central and western portions of the subject property are used as recreational fields, solar panels and associated machinery, and portable classroom storage. The southern portion of the subject property is operated as the SCUSD Farm with areas for orchards and row crops. The northern portion of the subject property is used as an asphalt-paved parking lot for the Peterson Middle School.

2.4 Physical Setting

2.4.1 Topography

According to information obtained from the U.S. Geological Survey (USGS) 7.5 Minute Series Topographic Map of the Cupertino and San Jose West, California quadrangles dated 2018, the subject property is at an approximate elevation of 124 feet above mean sea level and is generally flat with a slight slope to the northeast. The topography of the surrounding area is also flat with a general topographic gradient to the northeast.

2.4.2 Geology

No previous environmental investigation reports were available for the subject property; therefore, property-specific geology information was not available. Geologic information in the EDR Report **(Appendix B)** specifies that the sediments beneath the subject property have been identified as part of the Quaternary Series of the Quaternary System of the Cenozoic Era. According to the United States Department of Agriculture (USDA) Soil Conservation Service, the subject property is underlain by the Botella soil component, which has a surface soil texture of clay loam and exhibits moderate infiltration rates.

According to a well completion report provided by the California Department of Water Resources (DWR) for a nearby public supply well, soils in the subject property area consist of gravel, sand, and clay from approximately 0 to 23 feet below ground surface (bgs). Deeper soils are a mix of gravel and coarse sands, hard clay, and sandy clays.

According to a 2007 Geologic Map of the Cupertino and San Jose West quadrangles, Santa Clara, and Santa Cruz Counties, California presented in the United States Geological Survey MapView Database, the subject property is underlain by alluvial sand, fine-grained, silt, and gravel. Where differentiated, these surficial sediments represent alluvial fan deposits at the base of slopes and the outer edge of fan areas. According to the database, the subject property is located approximately 7 miles northeast of the

nearest serpentine rock deposits. Given that the outcrops of the serpentine rock deposits are within the 10-mile radius established by the Interim Guidance for Naturally Occurring Asbestos (NOA) at School Sites (DTSC 2004), the potential presence of NOA is a Noteworthy Condition for the subject property.

2.4.3 Hydrology

2.4.3.1 Surface Water

No surface water bodies are located on the subject property. The closest surface water feature is man-made pond located north-adjacent to the subject property within the Bryan Osborne Nature Center. Other water bodies in the surrounding area included Calabazas Creek, located approximately 1,700 feet southeast of the subject property, and the San Francisco Bay located approximately 5 miles north of the subject property.

2.4.3.2 Wetlands

According to information obtained from the U.S. Fish and Wildlife Service (FWS) National Wetland Inventory (NWI) included in the EDR Report, no NWI-delineated wetland areas are located on the subject property. The closest delineated wetlands were identified approximately 0.75 miles southeast of the subject property along Calabazas Creek. During the Site reconnaissance, Arcadis did not observe apparent wetlands at the subject property. According to Ms. Healy and Ms. Ruiz, no wetlands have been delineated at the subject property.

2.4.4 Hydrogeology

According to the EDR Report and the DWR Website, a former well was located in the current soccer field in the northern portion of the subject property. The well was historically used as a water supply well and was last sampled in May and September 1949. No evidence of the well was visible during site reconnaissance. Arcadis submitted a records request to the DWR and no records were available. According to the SCVWD mapping database, a second well is mapped along the eastern boundary of the subject property. According to records provided by the SCVWD, the well was historically located 25 feet east of Teal Drive and is located at the east-adjoining residential neighborhood. No information was available from the SCVWD regarding the well reported in the EDR Report and the DWR Website. Based on the absence of this information, the well is a noteworthy condition for the subject property.

Arcadis reviewed documents associated with the former Panasonic, Intersil, and Siemens facilities that are located approximately 3,000 feet south (hydraulically upgradient) of the subject property. Several groundwater monitoring wells have been installed associated with these offsite facilities to evaluate the extent of chlorinated solvents in groundwater. According to a 1990 Phase II Investigation conducted by Beak Consultants Limited (Beak) and the most recent 5-Year Report conducted in September 2020 for the Intersil Inc. and Siemens Facility, regional groundwater underlying the area south of the subject property consists of the shallow water-bearing zones and the deep aquifer. The shallow water bearing unit has been divided into three main zones: A-zone, B-zone, and C-zone groundwater. According to the most recent 5-Year Report, the A-zone was found to extend from the top of the groundwater table at approximately 40 feet bgs to 115 to 125 bgs, B-zone groundwater was found from 130 to 150 feet bgs, and C-zone groundwater was found from 180 to 210 feet bgs. The deep aquifer was separated

from the C-zone groundwater by a thick aquitard and extends from approximately 300 to 500 feet bgs. Groundwater flow for the shallow water-bearing zones flows to the north and northeast. The four closest groundwater monitoring wells to the south of the subject property are PG-1B, S-3B, S-4C, LH-1C (**Figure 3**). These wells were most recently sampled in 2019 and trichloroethylene (TCE) and other chlorinated solvents were either not detected or were not detected above the 2019 groundwater vapor intrusion Regional Water Quality Control Board Environmental Screening Levels (RWQCB ESLs) for either the residential or commercial/industrial scenario. This investigation is discussed further in Section 6.3.

3 Subject Property History

3.1 Historical Subject Property Summary

The subject property appeared in topographic maps as developed with four structures in the western portion of the parcel from as early as 1897 through at least 1902. By 1939, these structures had been demolished and the subject property had been redeveloped as part of a larger tract of orchard land. No significant changes were evident until 1960, when the eastern portion of the parcel was cleared and appeared to be under construction. Buildings A through E were constructed in 1960 and Buildings F and G were constructed in 1962. By 1963, the Patrick Henry Campus buildings, an asphalt-paved parking lot in the southeastern portion of the campus, garden and orchard areas in the central and northern portions of the school campus, and recreational court areas north of the building were visible in aerial photography. The area surrounding Building G in the western portion of the campus appeared to be under construction with areas of concrete or building materials. The area north of the school campus was cleared and the western portion of the subject property remained developed with orchards.

By 1968, a small structure was constructed north of Building G in the footprint of the current transformer pad in the western portion of the school campus and the orchard areas in the remaining portions of the subject property had been cleared. The central portion of the subject property was redeveloped with the current football field and track and the western portion was developed with the current baseball field. By 1974, bleachers had been constructed along the western portion of the football field and track and several small, cleared areas were visible in the field north of the school campus. No significant changes were evident until 1982, when the current corrugated metal shed building was visible north of the bleachers. No changes were visible until 1991, when multiple small buildings were visible south of Building G and north of the football field. No changes were evident until 1998, when a new, practice field for the San Jose Saber Cats (arena football)was constructed north of Building G. By 2000, the large rectangular structure north of the building was visible as an enclosed recreational court and by 2002, a new structure had been constructed west of Building G. No changes were evident until 2005, when the area northwest of Building G was used for parking and additional Conex boxes and storage equipment was visible in this area beginning in 2007. By 2008, the southwestern portion of the subject property had been developed with the Full Circle Farm run by the Sustainable Community Gardens and associated buildings and the northwestern portion of the subject property had been cleared and appeared to be used for Conex box or portable classroom storage. By 2013, the current solar panels were constructed in the western portion of the subject property. No changes were evident until 2016, when the practice field for the San Jose Saber Cats and two structures west and northwest of Building G were removed. These areas were further developed as storage areas with portable classroom buildings in the northwestern portion of the subject property and Conex boxes and vehicle storage in the northwestern portion of the Patrick Henry Campus through the present.

Prior owners of the subject property include the Pacific Manufacturing Company, who sold the land to A.H. Buehren on March 3, 1899 as well as Ignasio Rosalia Castello; Dokenic, Lena, Salvtaore, and Rosie Cirrincione; and Frank L., Pearl, Salvatore, and Pauline Teresi, who sold portions of the subject property to the Jefferson Union High School District of Santa Clara County, a former operating name for the SCUSD, between 1955 and 1962. The Patrick Henry School Campus was historically referred to as

Patrick Henry Junior High School as of August 1960. The campus was operated as a middle school in the 1960s and 1970s. In 1979, the Patrick Henry School was closed and the school campus was used for administrative office space. Portions of the campus were also rented out to other private schools including the Palmer College of Chiropractic West, who used Building G for cadaver storage for their anatomy and physiology labs. Other tenants at the school have included Appleseed Academy, Christian Church Scholars, River of Life, Silicon Valley School, New Concept Chinese School, Mount Bell Academy, and Dynasty Academy. With the exception of the SCUSD administrative office space in Building D and a District print shop and music instrument storage area in Building G, the school is currently vacant prior to redevelopment. The remaining portions of the subject property have been historically developed with orchards, recreational fields (soccer, baseball), and the SCUSD Farm.

3.2 Historical Information Sources

A list of the sources reviewed **(Appendix C)** is presented in the table below; information from these sources is summarized in Section 3.1. Additional details regarding the records (such as the names of the publishers, titles of the publications, and years of publication for city directories, business directories, and historical maps; the names of the entities that produced aerial photographs, and dates or years that the photographs were taken) are included in the appended documents.

Table 2. Historical Information Sources

Type of Record	Dates of Information	Source
Aerial photographs and satellite imagery	1939, 1948, 1950, 1956, 1963, 1968, 1974, 1982, 1991, 1993, 1998, 2006, 2009, 2012, 2016	The EDR Aerial Photo Decade Package
Aerial photographs and satellite imagery	1948, 1985, 1991, 1993, 2000, 2000 through 2020	Google Earth Pro
Aerial photographs and satellite imagery	1948, 1953, 1956, 1960, 1968, 1980, 1982, 1987, 1991, 1993, 1998, 1999, 2002, 2005, 2009, 2010, 2012, 2014, 2016, 2018	Nationwide Environmental Title Research, LLC (NETR) Online
Fire insurance maps	No maps available	Certified Sanborn® Map Report

Other	May 15, 2022	User Questionnaire

3.3 Prior Environmental Assessments, Investigations, and Events

Arcadis reviewed the following environmental report for the subject property (Appendix D).

***Six-Month Surveillance Asbestos Hazard Emergency Response Act (AHERA) Report*, prepared by Hazmat Doc (Hazmat), dated June 12, 2020.**

Hazmat conducted an asbestos survey at the Patrick Henry School Campus in June 2020. This survey was an update to prior surveys conducted between May 2015 and November 2019 in accordance with federal AHERA requirements. Prior surveys identified numerous suspect ACBMs at the school including vinyl floor and associated mastic, floor tiles and associated mastic, caulking, ceiling tiles and associated mastic, plaster wall surfacing, fire door core insulation, and carpet mastic. The survey identified the following conditions:

- Numerous suspect ACBMs have been identified at the building through surveys conducted between 2015 and 2020; however, it does not appear that these materials have been sampled.
- Multiple tile, adhesive, and mastic samples were observed in fair condition; however, no abatement was done. Hazmat recommended that these materials be a managed in place; however, Arcadis noted that recommendations later in the report stated that damaged materials should be replaced.

Additional details regarding the specific locations and conditions of ACBMs identified at the Patrick Henry Campus are summarized in the survey report. The subject property address is listed in the DTSC Haznet database and Hazardous Waste Tracking System (HWTS) databases in 2001 for the removal of asbestos containing waste (California Waste Code 151). No further information was available from SCUSD regarding the materials removed during this abatement work. The historical use of ACBMs in buildings within the Patrick Henry School Campus are a noteworthy condition under ASTM 1527-21 for the subject property. It is Arcadis' understanding that the onsite buildings will be properly surveyed and abated for hazardous materials, including ACBMs, prior to demolition.

***Soil Report*, prepared by Soil Control Lab, dated April 16, 2022.**

SCUSD provided a copy of soil analysis that was conducted for the SCUSD Farm. Soil samples were collected and analyzed for multiple metals and soil health parameters (e.g., ammonia, nitrate, available

nitrogen) to support agricultural purposes and not for environmental purposes. Arcadis noted that the metals reported in the report were not detected above the applicable 2019 RWQCB ESLs or the 2022 DTSC screening levels. No screening levels were available for soil health parameter constituents.

4 Subject Property Regulatory Database Information

The EDR Report summarizes the federal, state, tribal, and local environmental record source regulatory database listings for the subject property and for the adjoining and surrounding properties within specified search radii, as required by ASTM E1527-21. The subject property address was listed on the databases indicated in the table below. Details of the database listings are discussed in the sections of this Report indicated below; database listings pertaining only to environmental compliance are not further discussed.

Table 3. Environmental Database Listings

Database Name	Database Description	Entity Name Listed	Report Section
California Haznet	The CA Haznet Database provides information for facilities that generate and transport hazardous waste from hazardous waste manifests submitted to the DTSC.	Palmer College Chiro/West, Santa Clara USD	Section 5.3
California Hazardous Waste Tracking System (CA HWTS)	The CA HWTS system database provides information for facilities listed on hazardous waste manifests submitted to the Department of Toxic Substances Control (DTSC).	Palmer College Chiro/West, Santa Clara USD	Section 5.3

Search results for the adjoining and surrounding properties are discussed in Section 6. The subject property address at 1380 Rosalia Avenue is listed on databases that are discussed in Section 6.2 as it pertains to listings at the adjoining Peterson Middle School buildings.

5 Operational Environmental Matters

5.1 Material Handling and Storage

5.1.1 Aboveground Storage Tanks (ASTs)

Arcadis observed seven polyethylene empty tanks stored in the maintenance storage yard in the western portion of the Patrick Henry campus. According to Mr. Maes, these tanks previously held chlorine and other water treatment chemicals for a nearby school in the SCUSD. The tanks appeared to be in good condition and were partially filled. The current content of the tanks was unknown as Mr. Maes reported that the tanks were empty and may be filled currently with rainwater.

No other ASTs were observed at the subject property, and no evidence of historical ASTs was identified through the review of the sources listed in Section 8 or through physical evidence observed during the Site reconnaissance.

5.1.2 Underground Storage Tanks (USTs)

No USTs were observed at the subject property, and no evidence of current or historical USTs was identified through the review of the sources listed in Section 8 or through physical evidence observed during the Site reconnaissance.

5.1.3 Other Material Handling and Storage

Based on Arcadis' on-property observations, the following materials are currently handled and stored at the subject property:

- **Paint:** Paint used for maintenance activities is stored in 5-gallon cans and 10-gallon buckets within utility and maintenance rooms at the Patrick Henry campus.
- **Cleaning Materials:** Arcadis observed several small containers (less than 5 gallons) of cleaning materials stored on carts and in storage areas of the Patrick Henry campus buildings.

Arcadis did not observe containers of hazardous substances or petroleum products, other than those described above and used in connection with identified uses at the subject property.

Arcadis did not observe opened or damaged containers with unidentified contents suspected of being hazardous substances or petroleum products at the subject property.

Based on the use of the subject property as cultivated farmland and orchard land, agricultural chemicals such as pesticides, herbicides, and fertilizers likely have been used at the subject property. Information regarding use, storage, or application rates of such chemicals was not available. Provided that the chemicals have been applied in accordance with manufacturer recommendations, residuals remaining in subject property soils and/or groundwater are expected to be similar to other area properties. No information was available to determine whether residual concentrations exceed government use or exposure criteria. Based on the duration of agricultural operations and the potential

use of lead or arsenic-based pesticides, the application of agricultural chemicals is a REC for the subject property.

5.2 Air Emissions

Arcadis did not observe air emissions that are likely to adversely affect other environmental media or to present a REC at the subject property. There are two natural gas-fired furnace units and two natural gas-fired boiler units present at the Patrick Henry School Campus buildings that are not currently in use. Other potential sources of air emissions include natural gas and electric-powered heating and cooling units housed on the roof of the subject property buildings. Arcadis did not observe other sources of air emissions at the subject property.

5.3 Waste

5.3.1 Hazardous Waste

No hazardous wastes were observed to be generated or disposed at the subject property.

According to listings in the Haznet and HWTS databases, the subject property is listed in the databases in 2001 for the disposal of ACBMs. The Palmer College Chiro/West facility is also listed in the Haznet and HWTS databases for the generation of laboratory waste chemicals (California Waste Code 551), and metal sludge (California Waste Code 171) in 1993. No violations were noted.

Other than the listings discussed above, no other evidence of historical on-property hazardous waste generation or disposal was identified through the review of the sources listed in Section 8 or through physical evidence observed during the Site reconnaissance.

Ms. Healy and Ms. Ruiz stated that the Patrick Henry Campus has not been subject to enforcement pursuant to RCRA or the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA or Superfund), as it pertains to cleanups of on-property hazardous waste releases or disposal.

5.3.2 Other Regulated Waste

Based on interviews with Mr. Maes and Arcadis' on-property observations, the following other regulated waste streams are currently generated or were formerly generated at the subject property: academic laboratory waste and universal waste (halogen lamps and batteries).

According to Mr. Maes, these wastes are not stored at the Patrick Henry campus and are taken off-site for storage at the larger SCUSD storage yard. Arcadis did observe new halogen bulbs stored in Building E/Building 800 in a cardboard box.

Mr. Maes was not aware of spills or releases of other regulated waste at the subject property. No other regulated wastes were observed at the subject property, and no evidence of other historical regulated wastes was identified through the review of the sources listed in Section 8.

5.3.3 Non-Hazardous Waste

Based on Arcadis' on-property observations, recycling and general refuse are the only non-hazardous solid waste and recycling stream that are or were formerly generated at the subject property. These materials are stored in dumpsters in the asphalt-paved parking lot north of the Patrick Henry Campus buildings or in a gated area south of Building G.

In general, housekeeping in the non-hazardous waste accumulation areas was observed to be good. No staining or evidence of spills or releases was noted.

Ms. Healy and Ms. Ruiz were not aware of spills or releases of non-hazardous waste at the subject property. No other non-hazardous wastes were observed at the subject property, and no evidence of other historical non-hazardous wastes was identified through the review of the sources listed in Section 8 or through physical evidence observed during the Site reconnaissance.

5.3.4 On-property Solid Waste Disposal

During the Site reconnaissance, Arcadis looked for areas that were apparently filled or graded by non-natural causes (or filled with material of unknown origin) that suggest the presence of trash construction debris, demolition debris, or other solid waste disposal, or mounds or depressions suggesting trash or other solid waste disposal. No such areas were observed.

5.4 Water, Wastewater, and Storm Water

5.4.1 Water Use and Supply

The subject property is connected to the City of Sunnyvale water supply. No other sources of water are used at the subject property.

As discussed in Section 2.4.4, there was a historical municipal well that was present in the northern portion of the subject property. According to information provided in the EDR Radius Map Report from the California Department of Water Resources, the well was last sampled in May and September 1949. No further information was available regarding the well. A request was submitted to the California Department of Water Resources for additional information regarding the well and no further information was available regarding the well.

5.4.2 Wastewater

5.4.2.1 Drains and Sumps

Floor drains were observed in multiple student and employee restrooms throughout the Patrick Henry campus. De minimis amounts of staining were observed near floor drains in restrooms and maintenance areas that were attributed to poor housekeeping. One groundwater sump structure was observed in the Building D boiler room that was used to pump accumulated stormwater to the sanitary sewer system. No other floor drains or sumps were observed at the subject property.

5.4.2.2 Septic Systems and Cesspools

No evidence of current or former septic systems or cesspools at the subject property was identified through the review of the sources listed in Section 8 or through physical evidence observed during the Site reconnaissance.

5.4.2.3 Discharges to Publicly Owned Treatment Works

No process wastewater is or was generated at the Patrick Henry campus. Wastewater streams at the campus included mop water from cleaning and boiler blowdown when the machinery was in use. The floor drains at the buildings are routed directly to the sanitary sewer system.

5.4.2.4 Pits, Ponds, and Lagoons

No pits, ponds, or lagoons are located at the subject property.

5.4.3 Storm Water

Stormwater runoff sheet flows to grated inlets located in the paved parking areas outside the building. No visual indications of oil or other pollutants were noted near the drains. The drains are routed to the municipal stormwater system. As noted in Section 5.4.2.1, stormwater that accumulates in the Building D boiler room is pumped via a sump pump to the sanitary sewer system.

5.5 Hazardous Building Materials and Conditions

5.5.1 Asbestos-Containing Materials (ACMs)

ACMs have historically been used in a variety of building materials and other products. Between 1973 and 1978, under the asbestos National Emission Standard for Hazardous Air Pollutants (NESHAP), the USEPA banned spray-applied surfacing ACM. In 1989, the USEPA issued a final rule under Section 6 of the Toxic Substances Control Act (TSCA) banning most asbestos-containing products; however, in 1991, the rule was vacated and remanded by the Fifth Circuit Court of Appeals. Only the bans on corrugated paper, rollboard, commercial paper, specialty paper, flooring felt, and any new uses of asbestos remain banned under the 1989 rule. In addition, the Occupational Safety and Health Act defines presumed ACM (PACM) as thermal system insulation (TSI) and surfacing material found in buildings constructed no later than 1980.

The buildings at the Patrick Henry campus were constructed in 1960 and 1962. Based on the construction dates and prior surveys that have been conducted at the Patrick Henry campus between 2015 and 2020 (discussed in Section 3.3), ACMs are present at the subject property and represent a noteworthy condition.

5.5.2 Lead-based Paint

Lead-based paint was commonly used for a variety of purposes, until 1978 when federal regulations banned consumer uses of lead-containing paint, though exceptions applied for certain commercial and

other paints. Federal regulations require certain disclosures regarding lead-based paint for housing constructed prior to 1978.

The buildings at the subject property were constructed in 1960 and 1962, which pre-dates the ban on consumer uses of lead-containing paint. Painted surfaces were observed throughout the Patrick Henry campus and several buildings had chipped, peeling, and deteriorating paint areas along the sides of the structures. No information was available regarding lead sampling conducted at the school site. Based on the construction dates of the building and the condition of the paint at the school, the potential historical use of lead-based paint on structures is a REC for soil for the subject property.

5.5.3 Mold

Mold growth is not expected in buildings and can be an indication of an underlying water intrusion or humidity issue. While some mold is often present inside buildings, mold typically is only a potential problem when it creates elevated airborne mold spore concentrations or other by-products such as chemical effluents, which can cause indoor air quality issues. Exposures to mold can cause minor respiratory issues, allergic reactions, and in some rare cases, more serious illnesses. Mold growth inside buildings can be mitigated by removal of affected building materials, controlling the amount of moisture inside the building, and eliminating sources of unwanted water intrusion such as roof leaks, pipe leaks, and infiltration around windows and doors.

Arcadis did not observe apparent water damage or staining that would suggest the likely presence of unwanted mold growth. Arcadis did observe water damage to carpets and minor staining on the ceiling tile attributed to leaks but did not observe mold at these locations. Ms. Healy and Ms. Ruiz were not aware of water damage or mold at the subject property.

5.6 Other Hazardous Substances and Emerging Contaminants

5.6.1 Polychlorinated Biphenyls (PCBs)

PCBs are a group of organic chemicals that were used historically in a variety of industrial and chemical applications, including transformers, ballasts, other electrical equipment, and hydraulic oils, among many other products. PCBs were manufactured in the United States from 1929 until 1979, when PCB manufacturing was banned due to the toxicity of PCBs.

The buildings at the Patrick Henry campus were constructed in 1960 and 1962. Based on the construction dates, PCBs may be present in building equipment and materials in these buildings. The small sheds and Conex boxes present in the northwestern portion of the campus were not constructed prior to 1979 and it is unlikely that PCBs are present in the structures.

Arcadis observed the property for types of equipment that have been historically associated with the use of PCBs. According to interviews with Mr. Maes, the buildings at the Patrick Henry campus are equipped with fluorescent lighting and associated light ballasts. According to Mr. Maes, the lamps have been removed and replaced, as needed, but the ballasts are likely original to the buildings. One pad-mounted transformer was present north of Building G and one pole-mounted transformer was present

along the southern boundary of the subject property. Both units appeared to be in good condition with no indications of leaks or spills. No labels were observed to indicate the PCB-content of the transformers. Given the age of the buildings, it is possible that the transformers contain PCBs.

5.6.2 Per- and Polyfluoroalkyl Substances (PFAS)

Per- and polyfluoroalkyl substances (PFAS) are a large group of emerging contaminants of which Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) currently are the two most widely regulated compounds. PFAS can be used in a variety of commercial, industrial, and fire-fighting applications and in medical and consumer products. Other potential sources of PFAS include landfills, biosolids, and pulp and paper mill residuals. PFAS have been manufactured and used in various industries around the world since the 1940s. PFOA and PFOS are no longer manufactured in the United States but are still produced internationally and can be imported into the United States.

Regulatory scrutiny associated with PFAS is increasing, and although USEPA has not yet established regulatory cleanup standards for PFAS, several states have begun promulgating such standards.

Based on Arcadis' review of the sources identified in Section 8.0, neither current nor historical subject property operations appear to include the use of PFAS. Known or potential sources of PFAS associated with adjacent or surrounding properties, if identified, are discussed in Section 6.0.

5.7 Indicators of Environmental Impact

5.7.1 Odors

No odors that would indicate a REC were noted during the Site reconnaissance.

5.7.2 Stains and Corrosion

Arcadis observed multiple areas of de minimis amounts of staining on concrete floors within utility rooms at the Patrick Henry Campus that was attributed to poor housekeeping. De minimis staining was also observed on ceiling tiles and portions of concrete that were attributed to minor leaks from the ceiling. De minimis amounts of staining was also observed near floor drains within the restrooms that was attributed to poor housekeeping. De minimis staining was also observed on the asphalt-paved parking lot that was attributed to minor leaks and spills from automobiles. The flooring materials in these areas were in fair condition with no indications of leaks or spills. As a result, this staining is a de minimis condition.

Arcadis also observed small areas of staining on the gravel within the maintenance yard that was attributed to minor leaks or spills from vehicle storage.

5.7.3 Stressed Vegetation

During the Site reconnaissance, Arcadis' representative looked for areas of stressed vegetation (from other than insufficient water). No areas of stressed vegetation were observed during this assessment.

5.7.4 Environmental Liens and Activity and Use Limitations

Ms. Healy and Ms. Ruiz were not aware of environmental liens or activity and use limitations (AULs) associated with the subject property. No AULs or Liens were recorded in the EDR Environmental Lien and AUL report prepared for the subject property.

5.8 Radon

Radon is a radioactive gas and a product of the natural decay of uranium. Radon can migrate from soil gas into buildings, accumulate in confined spaces, and become a health hazard.

According to the USEPA, the subject property is located in Radon Zone 2, which comprises counties with predicted average indoor radon screening levels from 2 to 4 picocuries per Liter (pCi/L) of air. Federal Area Radon Information from USGS summarizes radon test results at 2 locations in ZIP code 94087, which average 2.45 pCi/L in first floor living areas. The California Radon database summarizes radon test results for 64 locations in Zip Code 94087 in Santa Clara with 8 locations that had radon levels greater than 4 pCi/L.

No property-specific radon test data were available.

6 Adjoining Properties and Surrounding Area

6.1 Current Uses of Adjoining Properties and Surrounding Area

Adjoining properties are those which have a contiguous or partially contiguous border with the subject property, or those which would have a contiguous or partially contiguous border with the subject property but for a street, road, or other public thoroughfare separating the property from the subject property. The following properties adjoin the subject property **(Figure 3)**:

- **North:** Residences are located north of the eastern portion of the subject property, beyond which is Castelton Way. Peterson Middle School is located north of the western portion of the subject property, beyond which are Rosalia Avenue and Bryant Way.
- **East:** Teal Drive, beyond which are residences.
- **South:** Dunford Way is located south of the eastern portion of the subject property, beyond which are residences. The remaining portions of the SCUSD farm are located south of the western portion of the subject property, beyond which are Dunford Way, Raynor Park, and Raynor/Stratford School, and Raynor Park Christian Church.
- **West:** Residences, beyond which are Norman Drive and Marion Way.

Land use in the surrounding area consists of residential, commercial, agricultural, and school properties.

No physical evidence of impact to the subject property from the adjoining properties (such as outdoor storage of drums, tanks, pooled liquids, or poor chemical or waste handling) was observed during a visual survey of the adjoining properties conducted at the time of the Site reconnaissance. However, several of the facilities adjoining and surrounding the subject property were identified in the databases listed in the EDR Report, as discussed in Section 6.3.

6.2 Historical Uses of Adjoining Properties and Surrounding Area

The subject property area appeared as developed with multiple small structures and roads nearby from as early as 1889. Calabazas and Campbell Creek were depicted east and southeast of the subject property by 1897 with the Southern Pacific Railroad tracks depicted far north. No changes were evident until 1939, when the subject property area had been developed with orchards, agricultural row crop areas, and associated residential and commercial buildings. No significant changes were evident until 1956, when the area west-adjacent to the subject property had been redeveloped with a large residential neighborhood and the Raynor School south of the subject property was under construction. The area north-adjacent to the subject property was also developed with row crop land and associated smaller buildings. By 1963, the Raynor School south of the subject property had been constructed and multiple residences had been constructed south and east-adjacent to the subject property. By 1968, the remaining areas of orchard land west and north had been redeveloped with the current Peterson Middle School and residential neighborhoods. The surrounding area continued to be further developed with

courts and building within the Peterson Middle School campus and residential homes north and east of the subject property. By 2008, the adjoining and surrounding properties appeared to be in a configuration generally consistent with the current property uses.

6.3 Environmental Record Sources and Regulatory Agency File and Records Reviews

The EDR Report summarizes the federal, state, tribal, and local environmental regulatory database listings for the subject property and for the adjoining and surrounding properties within specified search radii, as required by ASTM E1527-21. Adjoining and surrounding properties identified within the search radii were evaluated to determine if they are likely to have adversely impacted the subject property. The criteria used to evaluate the potential for adverse impact to the subject property include:

- Distance from the subject property
- Expected depth and direction of groundwater flow
- Expected direction of surface water and stormwater runoff flow
- Presence or absence of documented releases of hazardous substances and/or petroleum products at the identified facilities, the nature of such releases, and where applicable, status of associated investigations, remediation, and regulatory closure

6.3.1 Adjoining Properties

Adjoining properties identified in the databases and a determination of the necessity of further regulatory agency research are listed in the following table:

Table 4. Adjoining Property Regulatory Database Listings

Property Name and Address **Direction (and gradient) from Subject Property**	**Database Listing(s)** **Determination of Necessity of Further Regulatory Agency Research**
SCUSD, SCUSD Peterson Middle School 1380 Rosalia Avenue, Sunnyvale, California North (crossgradient)	**RCRA NonGen/NLR** This address is for the Peterson Middle School located immediately north-adjacent to the subject property. SCUSD and SCUSD – Peterson Middle School are listed in the Resource Conservation and Recovery Act Non Generator/ No Longer Generating (RCRA NonGen/NLR) database in 2018 and 2019 as universal waste generators. No further information was available regarding hazardous waste codes and no violations or evaluations were noted. Given that these listings pertain to compliance matters and no violations were noted, no further review is warranted.

Property Name and Address Direction (and gradient) from Subject Property	Database Listing(s) Determination of Necessity of Further Regulatory Agency Research
Gerald Cummings 1054 Castleton Way, Sunnyvale, California North (crossgradient)	**RCRA NonGen/NLR** This property is located immediately north-adjacent to the subject property. Gerald Cummings is listed in the RCRA NonGen/NLR database in 2021. No further information was available regarding historical hazardous waste generation and no violations were noted. Arcadis noted that the mapped address is for a residence that is listed with a NAICS code of 56299, All Other Waste Management Services, and it is unclear what operations were conducted. Given that this listing pertains to compliance matters and no violations were noted, no further review is warranted.
Katie Bessette 1486 Teal Drive, Sunnyvale, California South (upgradient)	**RCRA NonGen/NLR** This property is located immediately east-adjacent to the subject property. Katie Bessette is listed in the RCRA NonGen/NLR database in 2021. No further information was available regarding historical hazardous waste generation and no violations were noted. Arcadis noted that the mapped address is for a residence that is listed with a NAICS code of 56299, All Other Waste Management Services, and it is unclear what operations were conducted. Given that this listing pertains to compliance matters and no violations were noted, no further review is warranted.

6.3.2 Surrounding Properties

Numerous surrounding properties were identified on the databases in the EDR Report. Based on the criteria listed in Section 6.3, the following surrounding properties listed in the EDR database report were evaluated to determine if they are likely to represent a concern of environmental impairment to the subject property:

Panasonic, Intersil, and Siemens at 10900 North Tantau Avenue, Cupertino, California

Panasonic, Intersil, and Siemens operated at a facility that is located approximately 3,000 feet south and hydraulically upgradient to the subject property. The facility is listed in several databases that are summarized below. Database listings that pertain to compliance and are not independently indicative of an environmental concern (e.g., stormwater permitting) are not discussed further.

Intersil Inc. is listed in the RCRA Small Quantity Generator (RCRA-SQG) database in September 1996. The facility was historically listed as a RCRA Large Quantity Generator (RCRA-LQG) in 1980 and 1992 and historically operated as a semiconductor. No further information was available regarding hazardous waste codes and no violations were noted. Panasonic is listed in the Haznet database for generation of laboratory waste chemicals (California Waste Code 551), halogenated solvents (California Waste Code 211), asbestos containing waste (California Waste Code 151), other inorganic solid waste (California Waste Code 181), other empty containers 30 gallons or more (California Waste Code 512) liquids with hexavalent chromium greater than or equal to 500 miligram per liter (mg/L; California Waste Code 723), other organic solids (California Waste Code 352), unspecified solvent mixture and (California Waste Code 214) from 1988 to 1994. Intersil is listed in the HWTS database for hazardous waste generation between 1982 and 1994. No violations were noted.

Intersil Inc./Siemens Components are listed in the National Priority List (NPL), Superfund Enterprise Management System (SEMS), US Engineering Controls, Envirostor, Cleanup Program Sites – Spills, Leaks, Investigations, and Cleanups (CPS-SLIC), Historical Cal-Sites, Record of Decision (ROD), Potentially Responsible Party (PRP), Enforcement (ENF), and the California Environmental Reporting System (CERS) databases for an investigation that began at the facility in 1983. Soil and groundwater sampling was conducted that identified chlorinated solvents in soil and groundwater primarily in the northern and central portions of the facility. Groundwater extraction systems were implemented in 1987 that have been addressing chlorinated solvent concentrations in groundwater. Prior investigations have been conducted that indicated that groundwater flow in the area is to the north-northeast (from the facility towards the subject property). Groundwater sampling has been conducted through the present to evaluate off-site impacts to groundwater. There are four groundwater monitoring wells (PG-1B, S-3B, S-4C, LH-1C) that have been advanced approximately 1,000 feet south and southeast of the subject property. According to the most recent 2019 Groundwater Monitoring Report and 2020 Five-Year Report (Appendix E), trichloroethylene (TCE) was detected at 0.25 microgram per liter (µg/L) at well PG-1B and 0.5 µg/L at well S-4C in October 2019. These concentrations do not exceed the current 2019 RWQCB Environmental Screening Level (ESL) for groundwater vapor intrusion (1.2 µg/L for residential scenarios, 7.5 µg/L for commercial/industrial facilities). TCE was not detected at well S-3B and LH-1C was not sampled. No other volatile organic compounds (VOCs) were detected in the most recent groundwater sampling event in these aforementioned wells. According to the 2019 Groundwater Monitoring Event and 2020 Five-Year Report, the northernmost shallow groundwater monitoring well in the A-zone (A1; well MW-OS-3A1) is located approximately 2,500 feet south of the subject property. The well was installed in 2014 and had a concentration of 21 µg/L that exceeds both the residential and commercial/industrial groundwater vapor intrusion ESLs for TCE. No further wells have been delineated through the present downgradient of the well and according to the 2020 Five-Year Report, the groundwater plume in Zone A only extends 800 feet north (approximately 2,200 feet south of the subject property) and the groundwater plume in the B-zone extends 1,400 feet north (approximately 1,600 feet south of the subject property) of the source areas. Groundwater monitoring wells upgradient of the well have generally indicated decreasing trends and concentrations in A-zone wells. In addition, TCE has not been detected in sampling events between 2015 and 2021 at the Raynor well located south-adjacent to the subject property. Given the decreasing trends in groundwater at the facilities and off-site areas, the distance from the subject property, the depth to groundwater, the extent of the plume as reported in the most recent 2020 Five Year Report; the off-site groundwater VOC plume emanating from the facility is not a REC for the subject property.

EMCON Associates and American Microsystems Inc. at 3800 Homestead Road

American Microsystems Inc. (AMI) is located approximately 2,900 feet south of the subject property. The facility is listed in the Response, Envirostor, Leaking Underground Storage Tank (LUST), CPS-SLIC, Deed, Cortese, ENF, Historical Cortese, and CERS databases for an investigation that began in 1987. The facility is located east-adjacent to the former Siemens and Intersil properties and prior investigations have identified elevated concentrations of chlorinated solvents in soil and groundwater at the facility. According to the most recent 2021 Groundwater Monitoring Report for the facility, groundwater monitoring wells have been advanced northeast of the facility and east of groundwater monitoring wells for the Siemens/Intersil Facility. TCE is the primary constituent of concern in groundwater and was measured at low concentrations at groundwater monitoring wells located downgradient of the former AMI facility. The closest groundwater monitoring wells are E-28A and A-

27A, which are approximately 1,300 and 1,800 feet southeast of the subject property, respectively. TCE was not detected at the two wells during 2017 and they were not re-sampled during the most recent sampling events. TCE concentrations at wells located upgradient to the two wells were also found to have low concentrations of TCE that ranged from 0.9 to 2.5 µg/L. The highest concentration at the wells was found to exceed the residential groundwater vapor intrusion ESL, but not the commercial scenario ESL. Given the low concentrations of TCE in groundwater and the distance from the subject property, the investigation is not a REC for the subject property.

7 Vapor Encroachment Screening

A Vapor Encroachment Screening (VES) was completed for the site consistent with ASTM E2600-15, *Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions.* The E2600-15 standard provides guidance on identifying and evaluating vapor migration at contaminated properties and defines a Vapor Encroachment Condition (VEC) as "the presence or likely presence of COC vapors in the vadose zone of the subject property caused by the release of vapors from contaminated soil and/or groundwater either on or near the subject property as identified by the Tier 1 or Tier 2 procedures in E2600-15." Four conclusions are possible as a result of the VES: (1) A vapor encroachment concern (VEC) exists; (2) a VEC likely exists; (3) a VEC cannot be ruled out; or (4) a VEC can be ruled out because a VEC does not or is not likely to exist.

A Tier 1 VES consists of a review of the information provided in this report combined with the application of professional judgment. In particular, the Tier 1 VES considers (1) a search distance test to determine if any known or suspect contaminated properties are in the area of concern (AOC); and (2) a chemicals of concern (COC) test to determine if COC are likely to be present in the AOC from those known or suspected contaminated properties.

7.1 Contaminated Property Review

Section 6 of this report describes the regulatory review completed for the subject property. All search distances are within those recommended for the VES. Based on the following criteria, none of the properties in the EDR Report appear to present a VEC at the subject property for the following reasons:

- Distance from the subject property;
- Expected depth and direction of groundwater flow;
- Presence or absence of documented releases of hazardous substances and/or petroleum products at the identified facilities, the nature of such releases, and where applicable, status of associated investigations, remediation, and regulatory closure.

7.2 Site Use

The subject property is owned by the Santa Clara USD and the eastern portion was previously leased by several private and charter schools for administrative office and classroom space within the Patrick Henry School Campus. The southern portion of the subject property is developed as part of the SCUSD Farm. The northern portion of the subject property is used as an asphalt-paved parking lot for the

Peterson Middle School. The central and western portions of the subject property are developed with recreational fields.

7.3 Chemicals of Concern

No investigations have been conducted at the subject property to evaluate constituents of concern in soil or groundwater. The primary constituents of concern at investigations south of the subject property are chlorinated VOCs including TCE and PCE.

7.4 Soil and Groundwater Data

As noted in the prior section, no soil and groundwater data are available for the subject property. The closest groundwater monitoring wells are located approximately 1,000 feet south of the subject property that were last sampled in 2019. Groundwater concentrations at two of the wells ranged from 0.25 to 0.5 µg/L. The Raynor municipal water well south-adjacent to the subject property across Dunford Way has been sampled for VOCs from 2013 to 2021 and TCE and other VOC constituents have not been detected.

7.5 Vapor Conduits

Potential vapor conduits include floor drains and sumps that are discussed further in Section 5.4.2.1.

7.6 Clean up Status

No known remediation activities have been performed at the subject property. The investigations at the Intersil Inc./Siemens Components and AMI Industries facilities are still open under RWQCB oversight.

7.7 VES Conclusions

A VEC is not likely to exist based on currently available information.

8 Conclusions

8.1 Findings and Opinion

Arcadis has performed a Phase I ESA of the subject property in conformance with the scope and limitations of ASTM Practice E1527-21 for Phase I ESAs. This assessment has revealed the following RECs, CRECs, HRECs, de minimis conditions, and noteworthy conditions as defined in Section 1.2 of this Phase I ESA Report. Other findings, which do not constitute a REC, CREC, HREC, or de minimis condition in the opinion of the Environmental Professional, may be discussed previously in this report.

8.1.1 Recognized Environmental Conditions

The following RECs were identified in connection with the subject property:

Agricultural Land and Orchard Use: The subject property was developed as part of a larger agricultural tract of land from at least 1939 through 1960, when the Patrick Henry School Campus was constructed. The southern portion of the subject property was more recently redeveloped as a farm from 2008 through the present.

Based on the use of the subject property as historical orchard, the application of agricultural chemicals is a potential REC for the subject property in accordance with the August 2008 DTSC Interim Guidance.

Lead-based Paint: Lead-based paint was commonly used for a variety of purposes, until 1978 when federal regulations banned consumer uses of lead-containing paint, though exceptions applied tor certain commercial and other paints. Federal regulations require certain disclosures regarding lead-based paint for housing constructed prior to 1978. The buildings at the subject property were constructed in 1960 and 1962, which pre-dates the ban on consumer uses of lead-containing paint. Painted surfaces were observed throughout the Patrick Henry campus and several buildings had chipped, peeling, and deteriorating paint areas along the sides of the structures. No information was available regarding lead sampling conducted at the school site. It is Arcadis' understanding that the onsite buildings will be properly abated prior to demolition.

Based on the construction dates of the building and the condition of the paint at the school, the potential historical use of lead-based paint on site structures and peeling off the structure and contacting surficial soil is a potential REC in soil for the subject property in accordance with the June 2006 DTSC Interim Guidance.

Polychlorinated Biphenyls: PCBs are a group of organic chemicals that were used historically in a variety of industrial and chemical applications, including cooling oil in transformers prior to 1979. PCBs were manufactured in the United States from 1929 until 1979, when PCB manufacturing was banned due to the toxicity of PCBs.

One pad-mounted electrical transformer was observed north of Building G within a larger concrete pad. No labels were present to indicate the PCB content of the transformer and no information was available regarding historical transformers in use at the property. In addition, a pole-mounted transformer is located along the southern boundary of the subject property on Dunford Way. Given the age of the buildings, it is possible that the transformers contain PCBs. The potential presence of PCBs in soil

adjacent to the transformers at the subject property is a potential REC in accordance with the June 2006 DTSC Interim Guidance.

Termiticide Application: OCPs were historically used as insecticides for termite controls around wooden structures. The buildings at the Patrick Henry School Campus were constructed in 1960 and 1962 and are wood-framed buildings with plaster exteriors. Based on the construction dates, the potential presence of termiticides in soil adjacent to the structures at the subject property is a potential REC in accordance with the June 2006 DTSC Interim Guidance.

8.1.2 Controlled Recognized Environmental Conditions

No CRECs were identified in connection with the subject property.

8.1.3 Historical Recognized Environmental Conditions

No HRECs were identified in connection with the subject property.

8.1.4 De Minimis Conditions

The following de minimis condition was identified in connection with the subject property:

Staining: Arcadis observed multiple areas of de minimis amounts of staining on concrete floors within utility rooms at the Patrick Henry Campus that was attributed to poor housekeeping. De minimis staining was also observed on ceiling tiles and portions of concrete that were attributed to minor leaks from the ceiling. The flooring materials in these areas were in fair condition with no indications of leaks or spills.De minimis staining was also observed on the asphalt-paved parking lot that was attributed to minor leaks and spills from automobiles. As a result, this staining is a de minimis condition.

8.1.5 Noteworthy Conditions

The following noteworthy conditions were identified in connection with the subject property:

ACBMs: The buildings at the Patrick Henry campus were constructed in 1960 and 1962. Based on the construction dates and prior surveys that have been conducted at the school, ACBMs are likely present at the subject property and represent a noteworthy condition.

Naturally Occurring Asbestos: According to a 2007 Geologic Map of the Cupertino and San Jose West quadrangles, Santa Clara, and Santa Cruz Counties, California, the subject property is located approximately 7 miles northeast of the nearest serpentine rock deposits. Given that the outcrops of the serpentine rock deposits are within the 10-mile radius established by the Interim Guidance for Naturally Occurring Asbestos (NOA) at School Sites, the potential presence of NOA is a noteworthy condition for the subject property.

Historical Vehicle Storage Operations: The area west of the Building G has been used for automobile and equipment storage since at least 2007. During site reconnaissance, Arcadis observed multiple vehicles stored in this area including damaged vehicles. Small amounts of staining were

observed on the gravel within this area that was attributed to minor leaks and spills. As such, the vehicle storage in this area is a noteworthy condition for the subject property.

Historical Well: According to the EDR Radius Map Report database and the California DWR Website, a former well was located in the current soccer field in the northern portion of the subject property. The well was historically used as a water supply well and was last sampled in May and September 1949. It is unclear if the well was properly abandoned as no evidence of the current well was visible during site reconnaissance. Arcadis submitted a records request to the California DWR and the SCVWD and no records were available. Given the absence of information regarding the well or proper abandonment of the well, it is a noteworthy condition for the subject property.

8.1.6 Significant Data Gaps

No significant data gaps were identified during this Phase I ESA.

8.2 Environmental Professional Certification

We declare that, to the best of our professional knowledge and belief, we meet the definition of environmental professional as defined in Title 40 of the Code of Federal Regulations (CFR) § 312.10, and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR § 312.*

The designated Environmental Professionals for this project are Ms. Divya Mehta, Mr. Stephen Daly, and Mr. Lucas Goldstein

Resumes for Ms. Mehta, Mr. Daly, and Mr. Goldstein are attached in **Appendix F**.

*A professional geologist's or registered environmental assessor's certification of conditions comprises a declaration of his or her professional judgment. It does not constitute a warranty or guarantee, expressed or implied, nor does it relieve any other party of its responsibility to abide by contract documents, applicable codes, standards, regulations, and ordinances.

9 Sources, References, Assumptions, and Limitations

9.1 User-provided Information

Ms. Healy of SCUSD provided information regarding the subject property via a User Questionnaire **(Appendix G)**, to satisfy the User's responsibilities described in ASTM E1527-21 Sections 6.2 to 6.7. Information provided by Ms. Healy is summarized in relevant sections throughout this Phase I ESA Report.

9.2 Records Review

9.2.1 Regulatory Agency File and Records Reviews

Regulatory agency files and records requested and/or reviewed for the subject property are summarized in the following table:

Table 5. Regulatory Agency File and Records Requests

Agency	Method of Request	Date of Request	Response
USEPA	Online request; Online database review (Envirofacts, ECHO)	April 22, 2022	No records available
Regional Water Quality Control Board	Email request; Online database review (Geotracker)	April 22, 2022	No records available for the subject property. See Section 6.3 for records reviewed for surrounding area properties.
Department of Toxic Substances Control	Email request; Online database review (Envirostor)	April 22, 2022	No response received
National Pipeline Mapping System (NPMS)	Online database review (NPMS Viewer)	April 22, 2022	No records available
California Department of Water Resources	Email request; Online database review	May 5, 2022	Records available (see Section 2)
Santa Clara County Department of Environmental Health	Online request	April 22, 2022	No records available

Agency	Method of Request	Date of Request	Response
Santa Clara County Department of Agriculture	Online and telephone request	May 5, 2022	No records available for the subject property.
Santa Clara Valley Water District (SCVWD)	Online request; Online database review	May 5, 2022	Records available (see Section 2); however, a copy of the supply well abandonment reports have not yet been received (data gap).
Bay Area Air Quality Management District	Online Request	May 5, 2022	No records available
City of Sunnyvale	Online Request	April 22, 2022	No records available
Pacific Gas & Electric	Telephone Request	May 5, 2022	No response provided

9.2.2 Physical Setting Sources

The physical setting sources are described in Section 2.4 of this Report.

9.2.3 Standard and Other Historical Sources

The standard and other historical sources are listed in Section 3.2 of this Report.

9.3 Interviews with Past and Present Owners and Occupants

Arcadis interviewed the following owner(s) and occupant(s) of the subject property:

- Ms. Healy, Director of Facility Development and Planning (present owner/occupant representative)
- Ms. Ruiz, Facility Development and Planning Technician (present owner/occupant representative)

Contact information for past owners and occupants of the subject property was not provided to Arcadis. The subject property is not abandoned; therefore, owners and occupants of neighboring or nearby properties were not interviewed.

9.4 Interviews with State and/or Local Government Officials

State and/or local government officials contacted during this Phase I ESA are summarized in Section 8.2.1.

Other documents reviewed are referenced throughout this Phase I ESA.

9.6 Significant Assumptions

Arcadis has assumed that the information sources used for this Phase I ESA provided accurate information.

Evaluations presented in this Phase I ESA Report are based exclusively on the sources listed herein; no invasive field activities were conducted, and no laboratory analyses were performed.

The boundaries of the subject property were described in documents provided by Santa Clara USD and by interviews with Property representatives. Arcadis has assumed that this information was accurate.

9.7 Limitations and Exceptions

The services performed and any opinions expressed by Arcadis in this Phase I ESA Report are based upon the limits of the Phase I ESA described herein. Arcadis has relied upon the accuracy of documents, information, data, and other materials provided or made available by the User and others. Arcadis has not independently verified such information and assumes no liability for the accuracy or completeness of such information. Conclusions provided with regard to subsurface soil and groundwater impacts are limited to those that can be formed based on a non-intrusive investigation. The absence of environmental hazards in the subsurface cannot be guaranteed based on conditions observed on the surface. The scope of this project did not include sampling of environmental media. Arcadis makes no guarantee that subject property conditions do not exist, or will not exist in the future, that were undetected or that could lead to liability in connection with the subject property. Similarly, past and present activities at the subject property indicating the potential for the existence of environmental concerns may not have been discovered by Arcadis. Such activities may include those that would indicate the potential for regulated hazardous substances at the subject property. Likewise, subject property conditions or subject property activities that were outside the scope of the services described above, or changes to subject property conditions or regulatory requirements may lead to liabilities in connection with the subject property that are not identified in this Phase I ESA Report. Arcadis has reviewed the information obtained in connection with the performance of the services described above, in keeping with existing applicable environmental consulting standards and enforcement practices but

cannot predict what actions any given agency may take or what standards and practices may apply in the future.

Unless otherwise described in the body of this Phase I ESA Report, if any one or more of the standard sources under ASTM was not reviewed, this was due to information from the source not being readily available or a determination by the Environmental Professional that the standard source was not likely to be useful. Similarly, unless otherwise noted in this Phase I ESA Report, an incompleteness in connection with the review was determined not to affect the Environmental Professional's ability to form conclusions regarding the subject property.

Arcadis evaluates the potential for the presence or likely presence of vapor in the subsurface of the subject property using the Environmental Professional's professional judgment and evaluation of the available information and may use portions of ASTM E2600-15 as a guide. This evaluation is not a full Vapor Encroachment Screen (VES) pursuant to ASTM E2600-15. The vapor evaluation is not exhaustive and cannot wholly eliminate uncertainty regarding the presence or potential presence of vapors in the subsurface of the subject property.

Where access to portions of the subject property or to structures on the subject property was unavailable or limited, Arcadis renders no opinion and accepts no responsibility for assessment of the condition of these portions of the subject property, including specifically, but not limited to, the presence of hazardous substances or petroleum products at these locations. In addition, Arcadis renders no opinion concerning the presence or absence of hazardous substances or petroleum products where direct observation of any part of the subject property, or structure on the subject property, is limited by physical obstructions. Unless otherwise noted herein, Arcadis did not access the roof(s) of on-property building(s).

The conclusions and observations are based upon limited data and professional opinions, and the Site reconnaissance was performed on a particular date. Subject property conditions and activities may change after that date. Therefore, the risk of undiscovered environmental impairment of the subject property cannot be ruled out. Arcadis does not make any representations or warranties regarding the condition or value of the subject property, regardless of the results of the assessment presented in this Phase I ESA Report.

Arcadis' scope of work includes a cursory visual observation for apparent wetland areas and a cursory visual observation to identify typical suspect ACMs and lead-based paint. The Arcadis representative who performed the Site reconnaissance and made such observations is not necessarily a US Army Corps of Engineers (USACOE)-certified wetland professional or a state-accredited asbestos or lead-based paint inspector.

Arcadis makes no guarantees, certifications, warranties, or representations of any kind whatsoever, whether expressed or implied, regarding this Phase I ESA, the condition of the subject property, or the liabilities associated with the subject property.

9.8 Data Gaps

ASTM E1527-21 defines a data gap as "a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." The following data gaps were identified during this Phase I ESA:

Past Uses of the Subject Property: Arcadis was unable to identify the past uses of the subject property back to first developed use or 1940, whichever is earlier, pursuant to ASTM E1527-21 Section 8.3.8; thus, the failure to achieve the historical research objective is a data failure. Based on information obtained from other sources (as listed in Section 3.2 of this report), the subject property appeared as developed with four structures from as early as 1889 and was later visible in aerial photography by 1939 as orchard land. This data gap is unlikely to affect Arcadis' ability to identify RECs at the subject property; therefore, this data gap is considered to be non-significant.

Limiting Conditions: During the subject property reconnaissance, Arcadis was unable to visually observe the interior of recreational storage sheds located in the northern portion of the subject property as no keys were available. According to interviews with Ms. Healy, Ms. Ruiz, and Mr. Maes, these structures are fully enclosed and were historically used for recreational equipment storage. This data gap is unlikely to affect Arcadis' ability to identify RECs at the subject property; therefore, this data gap is considered to be non-significant.

9.9 Deviations

No deviations from ASTM E1527-21 occurred in this Phase I ESA.

9.10 Reliance

This Phase I ESA Report has been prepared for the sole use of SCUSD and the contents thereof may not be used or relied upon by any other person without the express written consent and authorization of Arcadis. Use of this Phase I ESA Report by any other party shall be at such party's sole risk and liability.

9.11 Viability

The components of this Phase I ESA were completed on the dates indicated in the following table. The Phase I ESA is viable for 180 days following the earliest of the components specified below:

Table 6. Viability of Phase I ESA

Component	Earliest Date Completed	Last Day of Viability
Interviews with owners, operators, and occupants	April 13, 2022	October 10, 2022

Component	Earliest Date Completed	Last Day of Viability
Searches for recorded environmental cleanup liens (a user responsibility)	April 25, 2022	October 22, 2022
Reviews of federal, tribal, state, and local government records	April 22, 2022	October 19, 2022
Visual inspections of the subject property and of adjoining properties	April 13, 2022	October 10, 2022
Declaration by the environmental professional responsible for the assessment or update	June 20, 2022	November 16, 2022
Overall Viability Date		**October 20, 2022**

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 01/25/2022 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

Lists of Federal sites subject to CERCLA removals and CERCLA orders

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 01/25/2022 has revealed that there is 1 SEMS site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Lists of Federal RCRA generators

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 02/28/2022 has revealed that there are 6 RCRA-SQG sites within approximately 0.25 miles of the target property.

Lists of state- and tribal (Superfund) equivalent sites

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, has revealed that there is 1 RESPONSE site within

approximately 1 mile of the target property.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/24/2022 has revealed that there are 4 ENVIROSTOR sites within approximately 1 mile of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 3 CPS-SLIC sites within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 02/28/2022 has revealed that

there are 47 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

CUPA Listings: A listing of sites included in the county's Certified Unified Program Agency database. California's Secretary for Environmental Protection established the unified hazardous materials and hazardous waste regulatory program as required by chapter 6.11 of the California Health and Safety Code. The Unified Program consolidates the administration, permits, inspections, and enforcement activities.

A review of the CUPA Listings list, as provided by EDR, has revealed that there are 11 CUPA Listings sites within approximately 0.25 miles of the target property.

Summary Details:

Conditions at proposal June 24, 1988): Intersil, Inc., and Siemens Components have manufactured semiconductors for several years on two locations near one another covering 15 acres in Cupertino, Santa Clara County, California. The facilities are surrounded by residential, industrial, and business areas. Investigations conducted in 1982 as part of the California Regional Water Quality Control Board s underground tank leak detection program found organic solvents, including trichloroethylene, 1,1,1-trichloroethane, tetrachloroethylene, trichlorofluoroethane, and 1,1-dichloroethylene, in soils on the site and in ground water on and off the site. Contamination is believed to have resulted from locali ed spills and from leaking underground storage tanks, piping, and other equipment involving the two companies. More than 300,000 people obtain drinking water from public wells within 3 miles of the site. Siemens and Intersil began remedial investigations at the site in 1982 and 1983, respectively, under State supervision. The underground storage tanks were removed, and in 1983 a system was installed to extract gases from soil; the system was expanded in 1985. In June 1986, the California Regional Water Quality Control Board issued Waste Discharge Requirements under the California Water Code requiring both companies to determine the extent of contamination in ground water and soils. In July 1986, a system was installedto pump contaminated ground water in the uppermost aquifer to the surface and treat it. Since April 1988, a pump and treat system for the two uppermost aquifers has been in full-scale operation. Intersil stopped operations in 1988, and all remaining underground

PANASONIC (Continued) **1000218337**

equipment was removed. Status August 30, 1990): In February 1990, the two companies released draft reports of remedial investigations/feasibility studies for the site and off-site downgradient areas. Interim off-site remedial activities are scheduled to begin in June 1990. Also in June 1990, the State plans to issue tentative site cleanup requirements and hear public comments on the proposed remedial action plan.

Background Info:	A manufacturer of microwave electronic equipment has been in operation at the site since 1963. Manufacturing processes include the use of acids and solvents. Contamination at the site appears to be primarily associated with a neutralization sump and a chemical storage shed. The facility is located within the Hillview-Porter region. Detected soil contaminants include trichloroethene (TCE), dichloroethene (DCE), trichloroethane (TCA), and chlorobenzenes. Groundwater contaminants include TCE at 910 parts per billion (ppb), 1,1-DCE at 92 ppb, chloroform at 100 ppb, and Freon at 63 ppb. There are seven private wells and a creek downgradient of the site. There are two backup municipal supply wells within 1.5 miles of the site. Inhabitants of the residential area downgradient from the site are potential receptors for groundwater and surface water contamination.

Environmental Interest/Information System:
California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.
US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.
RCRAInfo is a national information system that supports the Resource

PANASONIC (Continued) **1000218337**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

the regional board and/or EPA.

Treat To Water: Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.

Complexity: Category B - Any facility having a physical, chemical, or biological waste treatment system (except for septic systems with subsurface disposal), or any Class II or III disposal site, or facilities without treatment systems that are complex, such as marinas with petroleum products, solid wastes, and sewage pump out facilities.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

CERS Description: Hazardous Waste Generator

Violations:

Site ID: 124830
Site Name: ivy truman automotive
Violation Date: 05-24-2016
Citation: 22 CCR 16 66266.130 - California Code of Regulations, Title 22, Chapter 16, Section(s) 66266.130
Violation Description: Failure to properly handle, manage, label, and recycle used oil and fuel filters.
Violation Notes: Returned to compliance on 06/06/2016. Hazardous waste oil area-secondary containment contained waste oil and debris. CFC 5004.2 Not maintained clean and dry.
Violation Division: Sunnyvale Department of Public Safety
Violation Program: HW
Violation Source: CERS,

Site ID: 124830
Site Name: ivy truman automotive
Violation Date: 07-26-2021
Citation: 22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description: Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes: Returned to compliance on 10/14/2021. Black, red and yellow oil caddies do not have a hazardous waste label posted.
Violation Division: Sunnyvale Department of Public Safety
Violation Program: HW
Violation Source: CERS,

Site ID: 124830
Site Name: ivy truman automotive
Violation Date: 06-10-2019
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description: Failure to annually review and electronically certify that the business plan is complete and accurate on or before the annual due date.
Violation Notes: Returned to compliance on 06/12/2019. The business failed to electronically submit and certify that the business plan is complete, accurate, and in compliance with EPCRA on or before the annual due date. Electronically submit and certify that the business plan is complete, accurate, and in compliance with EPCRA within 30 days. On an ongoing basis, electronically submit and certify the business plan annually on or before the annual due date.
Violation Division: Sunnyvale Department of Public Safety
Violation Program: HMRRP
Violation Source: CERS,

Site ID: 124830
Site Name: ivy truman automotive
Violation Date: 07-07-2020
Citation: 40 CFR 1 265.173 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.173
Violation Description: Failure to meet the following container management requirements: (a) A

IVY TRUMAN AUTOMOTIVE (Continued) **S121741495**

container holding hazardous waste must always be closed during storage, except when it is necessary to add or remove waste. (b) A container holding hazardous waste must not be opened, handled, or stored in a manner which may rupture the container or cause it to leak.

Violation Notes: Returned to compliance on 08/22/2020. Used oil filters (paper, metal, and mixed container) are open when not in use.
Violation Division: Sunnyvale Department of Public Safety
Violation Program: HW
Violation Source: CERS,

Site ID: 124830
Site Name: ivy truman automotive
Violation Date: 07-07-2020
Citation: 22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description: Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes: Returned to compliance on 08/22/2020. Labels on waste oil are faded and no longer legible. One portable oil draining container does not have hazardous waste label, the other portable container has faded writing and is no longer legible.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Violations:
Site ID: 64084
Site Name: Saigon Cleaners
Violation Date: 08-26-2020
Citation: 22 CCR 12 66262.34(e) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(e)
Violation Description: Failure to meet the following conditions of satellite accumulation regulations: Accumulate up to 55 gallons of hazardous waste or one quart of acute hazardous waste at or near the initial point of accumulation which was under the control of the operator. Total time hazardous waste can be accumulated onsite in any generator accumulation area is one year, i.e., the combined accmulation time at a satellite accumulation point and at a 90/180/270 accumulation area (depending on size of generator and distance transported), whichever comes first. The generator complies with section 66265.171, 66265.172, and 66265.173(a). The container must be clearly marked with the initial date that hazardous waste is first placed in the container and labelled with the words Hazardous Waste including specified information Container must be labelled with the date the satellite accumulation limit is reached and moved within three days after reaching the 55 gallon (or one quart) limit to a 90 day accumulation area 55 gallons (or one quart of acute hazardous waste) of waste per process may be accumulated
Violation Notes: Returned to compliance on 09/24/2020. Hazardous waste has been stored on site since 1/28/2019 (>1 year). Ensure that all hazardous wastes being accumulated pursuant to satellite accumulation meet all applicable requirements and submit documentation of compliance to the CUPA.

Environmental Interest/Information System:
AIR EMISSIONS CLASSIFICATION UNKNOWN
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
HAZARDOUS AIR POLLUTANT MAJOR

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Case Type:	Cleanup Program Site
Case Worker:	GOR
Local Agency:	SANTA CLARA COUNTY LOP
RB Case Number:	Not reported
File Location:	All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected:	Soil
Potential Contaminants of Concern:	DDD / DDE / DDT, Other Insecticides / Pesticide / Fumigants / Herbicides, Arsenic, Lead
Site History:	"Gateway Village is an approximately 12.5-acre residential apartment/retail project currently under development at 3610 and 3700 El Camino Real, which is located at the southwestern corner of El Camino Real and the Lawrence Expressway, in Santa Clara, California (the Site). The development by Essex Santa Clara Square, LLC (Essex) is proceeding in two phases, beginning with residential development, consisting of approximately 420 units, to be constructed in the southern half of the Site. Commercial development on the northern half of the Site will follow completion of the residential portion. Organochlorine Pesticides (OCPs) and metals arsenic and lead have been reported above applicable screening levels. Portions of contaminated soil have been brined beneath the parking garage, and other portions will be covered with an 18" soil cap. A deed restriction is required to manage contamination and engineering controls long term.

Case Type:	Cleanup Program Site
Case Worker:	TLF
Local Agency:	SANTA CLARA COUNTY LOP
RB Case Number:	Not reported
File Location:	All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected:	Other Groundwater (uses other than drinking water), Soil, Soil Vapor
Potential Contaminants of Concern:	Tetrachloroethylene (PCE), Trichloroethylene (TCE), Vinyl chloride
Site History:	A former dry cleaner operated in Suite 7 from XX to XX. Subsurface investigations have reported PCE in soil vapor beneath the former dry cleaner suite at a max concentration of 23,000 micrograms per cubic meter. Additional assessment is required to define the extent of contamination and develop a remedial strategy.

RB Case Number:	05-039
Local Agency:	SANTA CLARA COUNTY LOP
File Location:	All Files are on GeoTracker or in the Local Agency Database
Local Case Number:	07S1W05F01f
Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	MTBE / TBA / Other Fuel Oxygenates, Gasoline
Site History:	In August 1992, an initial subsurface investigation was performed at the site and 4 groundwater monitoring wells were installed. Between March and May 1994, 2 additional groundwater monitoring wells and a groundwater recovery well were installed. In October, 1994, 2 vapor extraction wells and an air sparge well were installed and utilized for a vapor extraction and air sparge pilot test. In December, the USTs and associated product lines were replaced at the site. Approximately 54 cubic yards of soil were removed at this time. Free product (FP) has been found in wells MW1, MW2, MW4 and RW1 and skimming operations were conducted between 1994-1999. It is estimated that 30 gallons of FP were removed. Vapor extraction along with groundwater extraction systems ran onsite from February 1996 through December 1999. Groundwater extraction continued through April 2002. Between 1995 and 2006, additional monitoring wells and vapor extraction wells were installed on and offsite and additional investigations were conducted. FP was measured in well RW2 in August 2003 (after remediation system shut off) and am absorbent sock was installed in the well. The sock was removed in November 2003. Groundwater elevation rose across the site approximately 25 feet since investigations commenced in 1993. An investigation of shallower groundwater was conducted in 2007. It was reported that groundwater was first encountered at depths between 33.5 and 50 feet bgs and the average depth to water in wells at the site was 20 feet bgs; it appears the confining conditions exist in the subsurface. Groundwater extraction activities re-commenced in December 2008.

File Location:	All Files are on GeoTracker or in the Local Agency Database
Local Case Number:	07S1W06F04f
Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	MTBE / TBA / Other Fuel Oxygenates, Gasoline
Site History:	Previous fuel leak case at this site that was closed on 4/24/91. The case was closed with residual soil contamination of 1 parts per million (ppm) Total Petroleum Hydrocarbons (TPH) as Gasoline (TPHg), 1 ppm TPH as Diesel (TPHd), and 30 ppm Total Oil and Grease (TOG). 1993 In September, 11 soil borings (UB through UL) were advanced to depths of 5-50 ft bgs onsite. 3 soil vapor extraction wells (UV1 through UV3) were also installed to 60-85 ft bgs. 51 soil samples were collected and reported to contain maximum concentrations of 13,000 ppm TPHg, 150 ppm Benzene, 1,200 ppm Toluene, 250 ppm Ethylbenzene, and 1,500 ppm Xylenes. The 3 soil samples collected in borings UG and UL were also analyzed for TPHd, TOG, Volatile Organic Compounds (VOCs), and Semi-Volatile Organic Compounds (SVOCs), which were not reported to be present above the laboratory reporting limits. The highest concentrations were reported for soil samples collected from borings UB and UV2 advanced in the area of the former USTs. 1994 In January, a soil vapor extraction (SVE) test was conducted on wells UV1 and UV2. Based on the results of the test, it was recommended to utilize SVE to remediate the site. In March, 2 soil borings (UM and UN) were advanced to depths of 46.5 ft bgs on- and offsite. 12 soil samples were collected and reported to have maximum concentrations of 0.067 ppm Benzene, 0.024 ppm Toluene, 0.01 ppm Ethylbenzene, and 0.047 ppm Xylenes. TPHg was not reported to be present in the samples above the laboratory reporting limits. No work was conducted between 1994 and 1997. In June 1996 following a meeting with the Santa Clara Valley Water District (oversight agency at that time), it was again recommended that SVE be implemented at the site. 1997 In October, a waste oil UST and a clarifier were removed from

UNOCAL (Continued) **U001594936**

the site. 2 soil samples were collected from the waste oil UST excavation at 8 ft bgs and were reported to contain a maximum concentration of 2.1 ppm TPHd. VOCs, HVOCs and TOG were not reported to be present above the laboratory reporting limtis. 1998 In June, the dispensers and some piping were replaced. 6 soil samples were collected from 3.5-4 ft bgs and were not reported to have concentrations of the Constituents of Concern (COCs), except for one detection of Benzene (0.006 ppm) and Methyl tert Butyl Ether (MtBE) (0.15 ppm) in sample P1. 1999 In February, 3 borings (GP1 through GP3) were advanced onsite in the area of the dispensers to depths of 15-49 ft bgs. Groundwater was encountered at 41 ft bgs in boring GP1 during drilling. 9 soil samples were collected and reported to contain maximum concentrations of 740 ppm TPHg, 5.2 ppm Benzene, 12 ppm Toluene, 7.1 ppm Ethylbenzene, 45 ppm Xylenes, and 5.82 ppm MtBE in the sample collected from 40.5-41 ft bgs in GP1. A grab groundwater sample was collected from GP1 and was reported to contain 310,000 parts per billion (ppb) TPHg, 24,000 ppb Benzene, 45,000 ppb Toluene, 7,000 ppb Ethylbenzene, 37,000 ppb Xylenes, and 57,000 ppb MtBE. In April, 3 monitoring wells (MW1 through MW3) were installed onsite to 60.5 ft bgs. 9 soil samples were collected and reported to have low to non-detectable concentrations of the COCs. Following completion of the wells, groundwater was reported to be present between 43-44 ft bgs. Periodic groundwater monitoring began at the site. The highest concentrations of COCs in groundwater were reported for well MW1, which is located just north of the existing USTs. In August, during groundwater monitoring, free product (FP) was reported to be present in well MW1 and was measured to be approximately 1.21 feet thick. Weekly bailing of FP started in September and continued through April 2004. In October, FP was measured in well MW3 (located west of the dispenser islands) in addition to in well MW1. In September, a slug test was conducted and a 5-day dual phase extraction test was conducted. 2000 In March, 5 monitoring wells (MW4 through MW8) were installed on and offsite. The report of this investigation was not found in the file. In a later report, it is noted that 15 soil samples were collected and that there was only one detection of 0.006 ppm Toluene in the sample collected at 30 ft bgs in MW7 located along the southern boundary of the property. The wells were added to the groundwater monitoring program. In May, a Corrective Action Plan (CAP) proposing soil vapor extraction and groundwater extraction to remediate the site. In June, 3 groundwater extraction wells (EW1 through EW3) were installed onsite to 60 ft bgs around the existing USTs. 9 soil samples were collected and reported to have maximum concentrations of 25 ppm TPHg, 0.47 ppm Benzene, 1.6 ppm Toluene, 0.4 ppm Ethylbenzene, 2.6 ppm Xylenes, and 2.7 ppm MtBE. In July, FP was measured to be present in new well EW3. Between 2000 and 2004, only groundwater monitoring and FP bailing occurred at the site. 2004 In April, SVE system was started onsite. The groundwater extraction (GWE) system was not started due to electrical problems. The SVE system was shut down in July due to noise complaints. In November, a dual phase extraction (DPE) event was conducted for 55 hours on well MW1. The event removed approximately 6,500 gallons of groundwater and 7.1 gallons of TPH. 2005 In February, 4 soil borings (SB1 through SB4) were advanced onsite to 55 ft bgs. A report of this investigation was not found in the file. A later report notes that 6 soil samples were collected between 40-55 ft bgs and were reported to contain low to non-detectable concentrations of the COCs. In April, the SVE system was restarted and operated for less than 2 weeks when

UNOCAL (Continued) **U001594936**

it was shut down again due to noise complaints. The system was restarted in May and set to run only during the day. It operated for approximately 13 days before it was found off again. The system was restarted at the end of June. In September, 2 monitoring wells (MW9 and MW10) were installed offsite and extraction well EW4 was installed onsite. 6 soil samples were collected and reported to contain maximum concentrations of 120 ppm TPHg, 1.3 ppm Benzene, 2.3 ppm Toluene, 1.5 ppm Ethylbenzene, 7.8 ppm Xylenes, and 1.9 ppm MtBE in samples collected in well EW4. The wells were added to the groundwater monitoring program. Between 2005 and 2007, SVE continued and routine groundwater monitoring continued at the site. 2007 In December, 6 ozone sparge wells (OS1 through OS6) were installed onsite to depths of 60-67 ft bgs. 16 soil samples were collected and reported to contain maximum concentrations of 3,000 ppm TPHg, 14 ppm Benzene, 260 ppm Toluene, 49 ppm Ethylbenzene, 500 ppm Xylenes, 1.9 ppm MtBE, and 0.44 ppm Tert Butyl Alcohol (TBA) in the sample collected at 45 ft bgs in OS6. 2009 In May, 3 monitoring wells (MW11 through MW13) were installed onsite to 60 ft bgs. 9 soil samples were collected and reported to have maximum concentrations 15 ppm TPHd, 320 ppm TPHg, 0.59 ppm Benzene, 15 ppm Toluene, 9.3 ppm Ethylbenzene, 48 ppm Xylenes, 0.13 ppm MtBE, and 0.13 ppm TBA. The new wells were added to the groundwater monitoring program. In June, bi-weekly groundwater extraction events from well MW1 using a bailer were reported to have been conducted and continued through January 2010 to remove FP. Records of this work were not found and the total volume of groundwater and FP removed were not documented. It is estimated that overall, from 1999 through 2010, 112 gallons of FP was removed from the site. In September, two air sparge feasibility tests were conducted at the site. The results of the test indicated that sparging could be effectively implemented at the site. Oxygen injection commenced around this time. Oxygen was injected instead of ozone due to high influent vapor phase petroleum hydrocarbon concentrations. 2010 In August, damaged wells OS4 through OS6 were destroyed and replaced with wells OS4R through OS6R. 2011 In April, the SVE and air sparge systems were shut down. It is estimated that the system removed 43,260 pounds TPHg, 372 pounds Benzene, and 34 pounds of MtBE. In July, another CAP was submitted that recommended Monitored Natural Attenuation (MNA). Groundwater monitoring continued through 2013. 2013 In November, the final round of groundwater monitoring was conducted and reported maximum concentrations of 8,200 ppb TPHg, 930 ppb Benzene, 2.9 ppb Toluene, 480 ppb Ethylbenzene, 25 ppb Xylenes, 760 ppb MtBE, and 1,000 ppb TBA. Considerations and/or Variances: There is one active irrigation well located approximately 640 feet from the plume boundary. The consultant concluded that Based on the limited lateral extent (less than 100 feet) of the dissolved-phase petroleum hydrocarbon plume as defined by the groundwater monitoring well network, the distance of the irrigation well from the Site, and the depth of the screen interval of the irrigation well compared to depth-to-groundwater, it is unlikely that the irrigation well would be impacted by the dissolved-phase petroleum hydrocarbon plume associated with the Site. Multiple attempts were made to obtain access to sample the irrigation well and were not successful.

SHELL - 905 EL CAMINO (Continued) **S106091049**

Site History:

Previous investigations at the site have been conducted by EMCON Associates, Inc. (EMCON), Pacific Environmental Group, Inc. (PEG), Toxichem Management Systems, Inc. (Toxichem), Shaw Environmental & Infrastructure (Shaw), Cambria Environmental Technology, Inc. (Cambria), and Conestoga-Rovers & Associates (CRA). A summary of these investigations is provided below. 1984 Soil Investigation: On September 7, 1984, EMCON installed one 3-inch-diameter well (EW-1) on the northeast side of the underground storage tank (UST) complex in service at that time. Six soil samples were collected, and no total petroleum hydrocarbons as gasoline (TPHg) were detected in the soil samples. 1991 Soil Investigation: Seven exploratory borings (S-A through S-G) were drilled and sampled by PEG on April 3, 1991. The borings were drilled in anticipation of the replacement of the USTs. The borings were located in the vicinity of the UST complex in service at that time and in the location of the proposed new UST complex. Details of this investigation were presented in PEGs May 6, 1991 site assessment report. 1999 Soil Investigation: Cambria drilled and sampled four exploratory borings (SB-1 through SB-4) in January 1999. Details of the investigation are presented in Cambrias March 22, 1999 Phase II Subsurface Investigation Report. 1999 UST Replacement: During May 1999, the USTs and associated product piping were replaced. Details of the investigation are presented in Cambrias August 26, 1999 Underground storage Tank and Product Piping Removal Closure Report. 1999 Well Destruction: Cambria destroyed well EW-1 located immediately northeast of the UST complex. Details of the well destruction are presented in Cambrias August 26, 1999 Well Abandonment Report. 2001 Site Assessment: Toxichem drilled two cone penetration test (CPT) borings (CPT-1 and CPT-2) and one hand-auger boring (HA-1) in the down-gradient groundwater direction from the USTs and product islands. Methyl tertiary-butyl ether (MTBE) concentrations of up to 16 milligrams per kilogram (mg/kg) were encountered in boring CPT-1 at 29 feet below grade (fbg). Details of the investigation are presented in Toxichems October 24, 2001 Site Assessment Report and Additional Site Investigation Work Plan. 2002 Additional Site Assessments: On April 29 and 30, 2002, Toxichem installed three groundwater monitoring wells (MW-1, MW-2, and MW-3). MTBE was detected in the soil samples from all three monitoring wells at depths of 20 to 45 fbg. Maximum concentrations of 130,000 micrograms per liter (g/L) MTBE and 29,000 g/L tertiary butyl alcohol (TBA) were detected in the initial groundwater sample collected from MW-1. Between May 13 and 20, 2002, Toxichem drilled seven CPT borings (CPT-3 through CPT-9) in various depths and locations across the site. Borings CPT-3 to CPT-6 were drilled off site to depths ranging from 55 to 90 fbg. Borings CPT-7 to CPT-9 were drilled on site to depths ranging from 80 to 90 fbg. MTBE was detected in the soil sample from CPT-9 at 31 fbg. Maximum concentrations of 15,000 g/L MTBE and 400 g/L TBA were detected in the grab groundwater sample collected from CPT-3. A half-mile radius well survey was obtained from the Santa Clara Valley Water District (SCVWD). Three water-production wells and three extraction wells were identified within the survey radius. The closest water-producing well is located approximately 500 feet west-southwest of the site (upgradient). Details of this well survey and site assessment are documented in Toxichems July 15, 2002 Additional Site Assessment Report. 2002 Additional Site Assessment: On October 24 through 25, 2002, Toxichem drilled seven CPT borings (CPT-10 through CPT-16) in various depths and locations across the site. Borings CPT 10 through CPT-12 were

SHELL - 905 EL CAMINO (Continued) **S106091049**

advanced on site to approximately 75 fbg. Borings CPT 13 through CPT-16 were drilled off site to approximately 35 to 40 fbg. MTBE concentrations of 1.9 mg/kg and 3.8 mg/kg were detected in the soil samples from CPT-11 and CPT-12, respectively. MTBE concentrations were detected in all grab groundwater samples, with a maximum concentration of 21,000 g/L at boring CPT 15. Details of this site assessment are documented in Toxichems December 12, 2002 Additional Site Assessment Report and Work Plan. 2003 Additional Site Assessment: Between February 3 and 5, 2003, Toxichem drilled and installed five monitoring wells (MW-4, MW-5, MW-6, MW-7A, and MW-7B). Wells MW-4 through MW-6 and MW-7A were installed to approximately 40 fbg. Well MW-7B was installed to approximately 60 fbg and is screened in the deeper water-bearing zone. MTBE concentrations were detected in soil samples from all wells with a maximum concentration of 13 mg/kg at MW 5. Only well MW-7B had a sufficient amount of groundwater for sampling, which yielded an MTBE concentration of 23 g/L. Details of this site assessment are documented in Toxichems June 2, 2003 Additional Site Assessment and First Quarter 2003 Groundwater Monitoring Report. 2003 Feasibility Study: In July and August 2003, Shaw conducted a feasibility study at the subject site that included the consecutive performance of a groundwater extraction (GWE) test, a soil vapor extraction (SVE) test, and a simultaneous GWE and SVE test referred to as a dual-phase extraction (DPE) test on both shallow (perched) and deeper water bearing zones. Approximately 9.4 pounds of TPHg and 0.45 pounds of MTBE were removed from the vadose zone beneath the site. GWE activities removed approximately 0.006 pounds of MTBE from the groundwater in both the shallow (perched) and deeper water-bearing zones underneath the site. Based on the results of the tests, Shaw concluded that DPE would be a viable interim remedial method for the shallow water-bearing zone, while GWE would be a feasible remedial strategy in the deeper water-bearing zone. Details of the feasibility study are documented in Shaws April 14, 2004 Remedial Feasibility Testing Report. 2003 Soil and Groundwater Investigation: Shaw installed two additional wells (MW-8 and MW-9) to monitor groundwater in the shallow and deeper water-bearing zones. Details of the installation are presented in Shaws October 17, 2003 Well Installation Report. 2004 Interim Semi-monthly SVE: Starting on July 8, 2004, Shaw began implementing a periodic mobile SVE program on selected wells in the shallow water-bearing zone. On September 27, 2004, Shaw discontinued the periodic SVE events due to low hydrocarbon mass recovery. 2004 Corrective Action Plan (CAP): Shaw submitted a CAP to the SCVWD on August 24, 2004. The SCVWD approved implementation of the CAP; however, Shaw had not implemented the recommended GWE system prior to transfer of the site to Cambria in November 2006. Site concentrations are significantly reduced since the time the CAP was prepared. 2004 Off-Site Groundwater Investigation: On October 28 and 29, 2004, Shaw advanced five CPT borings (CPT-17 through CPT-21) in various locations off site which were drilled to approximately 60 fbg. Details of the installation are reported in Shaws March 8, 2005 Off-Site Exploratory Borings. 2005 Soil and Groundwater Investigation: Shaw installed three additional off-site wells (MW-10, MW-11, and MW-12) to monitor groundwater in the deeper water-bearing zone. The wells were installed down gradient of the site to continue assessment of the plume. Details of the installation are presented in Shaws September 1, 2005 Off-site Well Installation and Second Quarter 2005 Groundwater Monitoring and Sampling Report. 2006 Well Destruction: Shaw destroyed wells MW-2 and

SHELL - 905 EL CAMINO (Continued) **S106091049**

MW-5 located northeast of the UST complex. Details of the well destructions are presented in Shaws November 6, 2006 Well Destruction Report. 2008 Well Installation: CRA installed one on-site well (MW-13) to monitor groundwater in the deeper water-bearing zone. The well was installed down gradient of the UST complex to continue assessment in the potential source area. Details of the installation are presented in CRAs June 20, 2008 Subsurface Investigation Report. 2011 Site Conceptual Model (SCM): On July 29, 2011, CRA prepared and submitted an SCM for this site and requested case closure. Groundwater Monitoring Program: There are currently nine monitoring wells on site (MW 1, MW-3, MW-4, MW-6, MW-7A, MW-7B, MW-8, MW-9, and MW-13) and three off site monitoring wells (MW-10 through MW-12) located northeast of the site in Aloha Mobile Home Park. Groundwater sampling was suspended per Santa Clara County Department of Environmental Healths June 23, 2009 letter granting no further action pending a case closure review. As CRA recommended, we conducted a one-time groundwater monitoring event during the first quarter 2014. Wells MW-3, MW-7B, MW-9, MW-10, MW-11, MW-12, and MW 13 were redeveloped. Wells MW-1, MW-4, MW-6, MW-7A, and MW-8 were not redeveloped due to insufficient water. Wells MW-1, MW-3, MW-7B, MW-9, MW-10, MW-11, MW-12, and MW-13 were gauged and sampled on January 23, 2014. Wells MW-4, MW-6, MW-7A, and MW-8 could not be sampled due to insufficient water. Only 55 g/L TPHg were detected in well MW-3. No other constituents of concern were detected in any groundwater samples from any of the well. 2014 Soil and Groundwater Investigation: CRA advanced one direct push boring and five cone penetration test borings to evaluate subsurface conditions on site near well MW-6 and down gradient of the site. Groundwater was not present in any boring location from 35 to 40 fbg, at depths consistent with the shallow-screened wells. CRA collected soil samples from borings CPT-22 through CPT-27 at depths correlating with historical impacts in shallow-screened wells. No COCs were detected. Details of the installation are presented in CRAs August 5, 2014 Subsurface Investigation Report and Closure Request.

File Location: Regional Board
Potential Media Affected: Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern: 1,1,1-Trichloroethane (TCA), Trichloroethylene (TCE)
Site History: The Siemens property is a two property Superfund site property along

SIEMENS-19000 HOMESTEAD RD (Continued) **S104573904**

with the adjacent upgradient former Intersil /DTKM. Similar to the Teledyne-Spectraphysics North Bayshore Area, there is also the "Intersil/Siemens" off-property area to the north of the Siemens property. Siemens collects groundwater from the off-property area and pumps it through the on-property groundwater extraction and treatment (GWET) system. Underground storage tank removal, soil excavation and soil vapor extraction have substantially decreased groundwater-CVOC levels at the former Siemens property. Siemens curtailed their vapor extraction system in 2004 after removing approximately 19,000 pounds of volatile organic compounds from the vadose zone alone.. Since that time they voluntarily performed a pilot study testing the feasibility of enhanced reductive dechlorination on the north side of the property and proceeded without Water Board oversight to expand ERD pilot study that was interrupted several years ago by lowered groundwater levels. Results of the pilot study have not been submitted to the Regional Water Board. Since that time they voluntarily performed an enhanced reductive dechlorination (ERD) pilot study on the north side of the property and proceeded without Water Board oversight to expand ERD pilot study that was interrrupted several years ago by lowered groundwater levels. Results of the ERD pilot study have not been submitted to the Water Board. Groundwater extraction and treatment along north and south margins of the site has hydraulically contained groundwater contaminants for over 20 years. The water-bearing zones of concern were recently re-designated A2, A3, and A4 Zones within the A aquifer. During the 1990s, above-average rainfall raised groundwater levels by 50 feet to create a resaturated zone, currently designated as the A2 And A3 Zones. Based on results of soil cleanup confirmation sampling in the south portion of the property,Siemens encountered groundwater-TCE up to 3,000 parts per billion (ppb) in the A2 Zone. After reporting these results to the Regional Water Board, we required the Responsible Party for former Intersil (GE) to re-characterize their side of the A2 Zone where they detected groundwater-TCE levels up to 9,000 ppb. Siemen has been conducting followup on-property ERD pilot studies that showed promising results indicating TCE levels lowered by at least a factor of 10. On-property vapor intrusion (VI) concerns arose within the last five years, when on-property Kaiser employees were mis-informed by Kaiser management that they were not working on a Superfund site property, Indoor air sampling was then conducted in the building and based on indoor air CVOC levels similar to ambient air levels, the vapor intrusion evaluation concluded that vapor intrusion is not occurring. However, the employees no longer trusted anything management after misinforming them about the contaminated nature of the property. When Kaiser engaged the Regional Water Board, we issued a fact sheet summarizing Indoor air sampling results in the context of toxicological principles, the Kaiser employees were reportedly satisfied. Off-property vapor intrusion evaluation has been completed across the on- and off-property areas and indicated that no vapor intrusion is occurring above levels of concern. Subsequent and very thorough re-evaluation of on- and off-property residential VI verified ND levels of TCE in the off-property residential IA and below-ESL levels in the on-property commercial buildings.

Potential Media Affected: Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern: 1,1,1-Trichloroethane (TCA), * * 1,2-DICHLOROBENZENE, * * 1,4-DICHLOROBENZENE, Other Solvent or Non-Petroleum Hydrocarbon, Freon, Tetrachloroethylene (PCE), Trichloroethylene (TCE), Xylene

3800 HOMESTEAD RD, AMI (Continued) **S102423592**

Site History: This site is adjacent to and cross gradient from the Siemens property of the Intersil-Siemens Superfund site. AMI conducted groundwater extraction until achieving asymptotic removal rates. Then AMI implemented an on-property in-situ chemical oxidation to further reduce chlorinated volatile organic compound (CVOC) levels in groundwater. Subsequent monitoring appears to indicate that on- and off-property groundwater-CVOC levels have continued to decrease and the site is currently under an informal monitored natural attenuation program. Although the groundwater-CVOC levels are below our May 2008 environmental screening levels (ESLs) for potential indoor air (IA) vapor intrusion (VI), the ESLs presume what may be an excessively high attenuation factor of 1,000; and our draft revised ESLs are still out for public comment. Although there has been no IA VI evaluation at the site to definitely indicate that IA VI is not occurring, we are currently in the process of directing the Responsible Parties for the adjacent Intersil-Siemens Superfund site to IA test the former AMi Building 700/800 that is west of and adjacent to the buildings over the former AMI source area. IA testing at Building 700/800 cleared it of VI issues.
