Status: Completed - Case Closed
Status Date: 08/30/2012
Case Worker: JS
RB Case Number: Not reported
Local Agency: SAN DIEGO COUNTY LOP
File Location: Local Agency
Local Case Number: H02893-001
Potential Media Affect: Aquifer used for drinking water supply
Potential Contaminants of Concern: Gasoline
Site History: The Site is an active service station consisting of three fuel underground storage tanks (USTs), four fuel dispenser islands with associated product piping, and a station building. On December 12, 2002, four 10,000-gallon USTs, five dispenser islands, and associated product piping were removed. Wayne Perry collected fourteen soil samples from beneath the dispenser islands and USTs during upgrade activities. Petroleum hydrocarbon contamination was detected in soil and unauthorized release case H02893-001 was opened by the Department of Environmental Health (DEH) in March 2003. No benzene concentrations and low concentrations of toluene, ethylbenzene and xylene were detected in soil at the Site. The main constituents of concern in soil at the Site are methyl tertiary butyl ether (MTBE) and tertiary butyl ether (TBA). Distribution of soil contamination is mostly localized around the UST cavity. There is no remaining residual total petroleum hydrocarbon-impacted soil that is above 100 mg/kg. Nine groundwater monitoring wells have been installed at the Site. Groundwater was monitored and sampled between December 2003 and January 2012. No liquid-phase hydrocarbons have been present in groundwater since sampling began in December 2003. The dissolved-phase groundwater plume is adequately assessed. Groundwater impacts include dissolved total petroleum hydrocarbons as gasoline (TPHg), MTBE and TBA. The dissolved phase groundwater plume is centered on well MW-3 and is mostly contained onsite. The dissolved plume is stable and the overall mass of impacts is decreasing. The environmental consultant analyzed the trends for MTBE and TBA. The analysis indicates that MTBE and TBA in groundwater will drop below their water quality objectives by 2049 and 2040, respectively. The DEH vapor risk model was utilized to evaluate the potential human health risk associated with soil vapor intrusion to Site building occupants and to the offsite Soup Plantation building workers (on the adjacent property to the east). Based on the model results, vapor from soil and groundwater contamination does not pose a vapor inhalation risk to the occupants of both buildings. A Corrective Action Plan (CAP) was submitted on October 21, 2011. The CAP concludes that the most appropriate remedial option is no further action with regulatory case closure. The Public Participation process for the CAP was completed. The public comment period ended on March 23, 2012. DEH received no comments. According to the environmental consultants registered professional, the Site presents no significant risk to human health and the environment. DEH concurs with this conclusion.

Click Here:

Environmental Interest/Information System:

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RB Case Number: 2091200
LOC Case Number: H02426-003
File Location: Regional Board
Potential Media Affect: Aquifer used for drinking water supply, Soil
EDR Link ID: L10003156547

Potential Contaminants of Concern: * Chlorinated Hydrocarbons, Dichloroethane (DCA), Dichloroethene (DCE), Other Solvent or Non-Petroleum Hydrocarbon, Tetrachloroethylene (PCE), Trichloroethylene (TCE), Vinyl chloride, Arsenic, Benzene, MTBE / TBA / Other Fuel Oxygenates, Naphthalene, Other Petroleum, Waste Oil / Motor / Hydraulic / Lubricating, * Acids/Corrosives

Site History: The Omar Rendering site is situated on 40 acres enclosed by a chain-link and wood fence. The facility accepted hazardous wastes from 1959 to 1978 and utilized evaporation ponds for disposal. Prior to 1980, the contents of six former Class I waste ponds were removed and disposed at a permitted off site location. In 1981, the impacted soil from beneath the Class I waste ponds was placed in a lined and capped waste cell in the northwest corner of the site, in accordance with RWQCB Order No. 80-06 (Closure Requirements for the Omar Rendering Company Dumpsite in the Otay River Valley). Subsequently, the waste cell has been maintained and monitored per RWQCB Order No. 87-141, [Waste Discharge Requirements (WDRs) for the Omar Rendering Company Closed Class I Disposal Site including Technical Change Order No. 1 Monitoring and Reporting Program], which was replaced by RWQCB Order No. 97-Annual/Semi-Annual Report April 2010 Former Omar Rendering Site 2 40 (Waste Discharge Requirements for Closure and Post-Closure Maintenance for the Class I Waste Management Containment Cell, Omar Rendering Facility, Darling International, which includes Monitoring and Reporting Program 97-40). Program No. 97-40 requires semi-annual groundwater monitoring and periodic monitoring and maintenance of the cap and surface water control features. The waste cell has the following physical properties: h Approximate waste cell area: 5 acres. h Stratigraphy, approximate depth below grade (City of Chula Vista Engineering Department, Samuel F. Savino PE, As-built grading plan, sheet 4 of 7, Sections A-A and B-B, dated 10-27-82). 0-6 ft: clean soil cover 6-9 ft: compacted clay cap 9-53 ft: compacted soil waste There is currently no documented human health exposure. 53-56 ft: compacted clay liner (base is at approx. elev. of

MAP FINDINGS

OMAR FORMER RENDERING PLANT (Continued)

S100833528

155 feet mean sea level [MSL]) h The bottom of the waste cell is greater than 25 feet above the groundwater table (the water table is encountered at an elevation of 120 to 130 feet MSL in the vicinity of the waste cell). h Clay material used for liners was analyzed and determined to have a permeability of less than 1E-06 centimeters per second (cm/sec), and compacted to 90 percent relative compaction (Geocon, Testing and Observation Services During Grading Operations, dated January 1982). h The material placed in the waste cell was primarily impacted soil excavated from beneath the former Class I ponds and rendering waste ponds (pond contents were removed off site); consequently, the material is assumed to have a low organic content, and have low potential for generating methane gas. h The waste cell contents were compacted to at least 90 percent relative compaction (Geocon, January 1982). San Diego Water Board issued cleanup and abatement Order R9-2003-0080 and addendum no. 1 to that Order for cleanup and abatement of areas of the site impacted by pollutants from the former waste disposal pits located on site. The monitoring and maintenance of the Omar Landfill are covered by WDRs Order 97-40 (and addenda thereto) and a detection monitoring program issued under authority of Water Code section 13263, and the landfill is not part of the cleanup being conducted under the CAO. On March 20, 2019, the State Water Resources Control Board issued an Order For the Determination of the Presence of Per- and Polyfluoroalkyl Substances (PFAS), Order WQ 2019-0006-DWQ, to several landfill sites throughout the State of California. Thus, PFAS sampling was conducted at the Former Omar Rendering landfill during that same year. Only one groundwater well exceeded the California Division of Drinking Water notification level for polyfluorooctane sulfonic acid (PFOS) (6.5 nanograms per liter [ng/L]) with a concentration of 18 ng/L. Considering that groundwater underneath the site location is excepted from municipal use (see footnote 11 of Table 2-5 of page 68 of Chapter 2 of the Basin Plan), human health risk of contamination throughdrinking water is not applicable. With regards to groundwater reaching the Otay River to the south and the impact on aquatic freshwater habitat, the measured PFOS concentration is also below the May 2020 aquatic habitat ecotoxicity environmental screening level for PFOS (0.075 micrograms per liter or 75 ng/L).

Threat To Public Health & Env: trichloroethane (TCA), aldrin, and polychlorinated biphenyls (PCBs).
The public may be exposed to contaminated dust and/or volatile organic compounds if soil is disturbed. Ground water contamination could occur if the pond residuals are released from the disposal cell. Chronic exposures could occur if contaminated soils are left exposed after construction. There is no documented exposure at this time.

Site Activity Status: The potential responsible party conducted a site assessment in Summer, 1988 to determine the location and concentrations of contaminants onsite and the potential to migrate off the property. DHS will evaluate the findings of the assessment to determine a priority for scheduling the site in future Bond Expenditure Plans.

CA BOND EXP. PLAN:

Responsible Party: BACKLOG SITE CLEANUP PLANNING REPORT
 Project Revenue Source Company: Not reported
 Project Revenue Source Addr: Not reported
 Project Revenue Source City,St,Zip: Not reported
 Project Revenue Source Desc: This site is projected to be remediated by the responsible parties will reimbursement to DHS for its oversight activities. If the RPs are unable to fund site cleanup, another source of funds will need to be identified.

Site Description: The site was formerly a junkyard. Many of the wastes onsite are thought to be associated with nearby naval facilities.

Hazardous Waste Desc: Soil contamination includes low levels of copper, zinc, cadmium and lead. Hazardous wastes previously stored and spilled include petroleum distillates, solvents, electrical insulating oils, trichloroethane (TCA), chloroform, and perchloroethylene (PCE). The site is located on fill material.

Threat To Public Health & Env: There is some potential threat to the Otay River. Farmland is adjacent to the site. PCE and TCA were found in standing surface water and ground water. Ground water is within 12 feet of the surface. The site has been partially abated through removal of the most highly contaminated soil. This site will be further evaluated in the future to determine if additional cleanup action is necessary.

Site Activity Status: In February, 1981, a cleanup and abatement order was issued by the RWQCB, San Diego Region. DHS was working in coordination with the U.S. Navy, a potentially responsible party, when the salvage yard was destroyed by fire in August, 1985. Some subsequent surface removal occurred. There has been inadequate characterization to determine the current levels of contamination. Additional site characterization is necessary to confirm the adequacy of cleanup. The responsible parties are continuing remediation work under the oversight of the San Diego RWQCB.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

| Version Date: | 2012 |

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

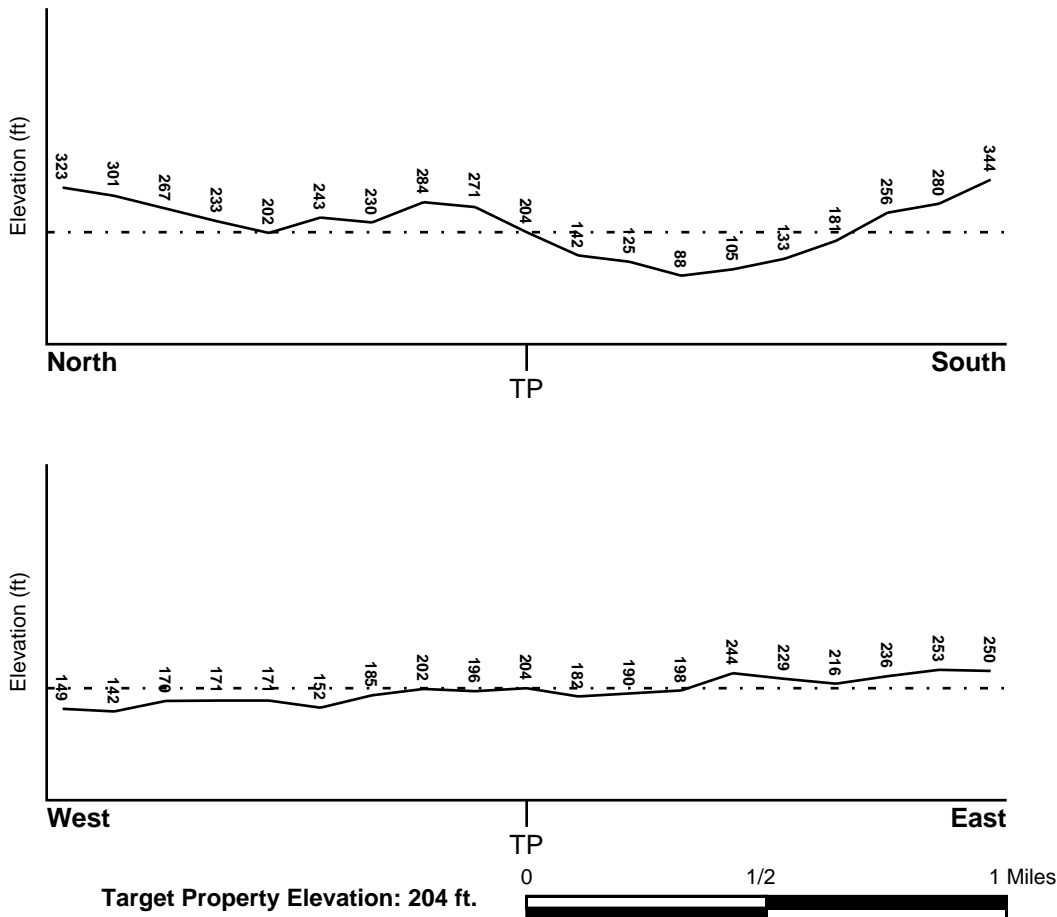

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

| | |
|---|-------------------------|
| <u>Flood Plain Panel at Target Property</u> | <u>FEMA Source Type</u> |

NATIONAL WETLAND INVENTORY

| | |
|------------------------------------|--|
| <u>NWI Quad at Target Property</u> | <u>NWI Electronic Data Coverage</u> |
| IMPERIAL BEACH | YES - refer to the Overview Map and Detail Map |

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

| | |
|-----------------------------|---|
| Search Radius: | 1.25 miles |
| Location Relative to TP: | 1/2 - 1 Mile East |
| Site Name: | APPROPRIATE TECHNOLOGIES II |
| Site EPA ID Number: | CAT080010101 |
| Groundwater Flow Direction: | W TOWARD SAN DIEGO BAY. |
| Inferred Depth to Water: | 110 to 180 feet. |
| Hydraulic Connection: | Information is not available regarding the hydraulic connection between aquifer(s) underlying the site. |
| Sole Source Aquifer: | No information about a sole source aquifer is available |
| Data Quality: | Information is inferred in the CERCLIS investigation report(s) |

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: OLIVENHAIN

Soil Surface Texture: cobbly loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

| Soil Layer Information | | | | | | | |
|------------------------|-----------|-----------|--------------------|---|---|--|----------------------|
| Layer | Boundary | | Soil Texture Class | Classification | | Saturated hydraulic conductivity micro m/sec | Soil Reaction (pH) |
| | Upper | Lower | | AASHTO Group | Unified Soil | | |
| 1 | 0 inches | 9 inches | cobbly loam | Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils. | FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay | Max: 14 Min: 4 | Max: 5.5 Min: 5.1 |
| 2 | 9 inches | 27 inches | very cobbly clay | Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils. | FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay | Max: 14 Min: 4 | Max: 5.5 Min: 5.1 |
| 3 | 27 inches | 44 inches | cobbly loam | Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils. | FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay | Max: 14 Min: 4 | Max: 5.5 Min: 5.1 |

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 2

Soil Component Name: SALINAS

Soil Surface Texture: clay loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

| Soil Layer Information | | | | | | | |
|------------------------|-----------|-----------|--------------------|--|--|---|----------------------|
| Layer | Boundary | | Soil Texture Class | Classification | | Saturated hydraulic conductivity micro m/sec | Soil Reaction (pH) |
| | Upper | Lower | | AASHTO Group | Unified Soil | | |
| 1 | 0 inches | 22 inches | clay loam | Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils. | FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay Soils. | Max: 4 Min: 1.4 | Max: 8.4 Min: 7.9 |
| 2 | 22 inches | 46 inches | clay loam | Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils. | FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay Soils. | Max: 4 Min: 1.4 | Max: 8.4 Min: 7.9 |
| 3 | 46 inches | 64 inches | loam | Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils. | FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay Soils. | Max: 4 Min: 1.4 | Max: 8.4 Min: 7.9 |

Soil Map ID: 3

Soil Component Name: OLIVENHAIN

Soil Surface Texture: cobbly loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

Source: FEMA

Telephone: 877-336-2627

Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

Source: Department of Fish and Wildlife

Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program

State Water Resources Control Board

Telephone: 916-341-5577

The GAMA Program is California's comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Health Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database

Source: Department of Water Resources

Telephone: 916-651-9648

California Drinking Water Quality Database

Source: Department of Public Health

Telephone: 916-324-2319

The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations

Source: Dept of Conservation, Geologic Energy Management Division

Telephone: 916-323-1779

Oil and Gas well locations in the state.

California Earthquake Fault Lines

Source: California Division of Mines and Geology

The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon

Source: Department of Public Health

Telephone: 916-210-8558

Radon Database for California

PHYSICAL SETTING SOURCE RECORDS SEARCHED

Area Radon Information

Source: USGS

Telephone: 703-356-4020

The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones

Source: EPA

Telephone: 703-356-4020

Sections 307 & 309 of IRRA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

Certified Sanborn® Map Report

06/23/21

Site Name:

517 Shinohara Lane
517 Shinohara Lane
Chula Vista, CA 91911
EDR Inquiry # 6549730.3

Client Name:

SCS Engineers
8799 Balboa Avenue
San Diego, CA 92123
Contact: Allison Oneal

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by SCS Engineers were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # 2CC8-4E1E-8D57
PO # 517 Shinohara Lane
Project 517 Shinohara Lane

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: 2CC8-4E1E-8D57

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- Library of Congress
- University Publications of America
- EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

SCS Engineers (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

Re: Annual Report: April 2020 to March 2021, Monitoring and Reporting Program No. R9-2017-0114 and Cleanup and Abatement Order R9-2003-0080, Waste Management Containment Cell, Former Omar Rendering Site, 1886 Auto Park Place, Chula Vista, CA, 91911. RWQCB Reference Number L10003156547: lquetin

Ms. Quetin:

Otay Mesa Ventures II, L.L.C. (OMV) is pleased to deliver the enclosed 2021 Annual Report for the Former Omar Rendering Site in Chula Vista, California. This report was prepared in accordance with the requirements of Regional Water Quality Control Board (RWQCB) Monitoring and Reporting Program R9-2017-0114 and Cleanup and Abatement Order (CAO) R9-2003-0080, and CAO Addenda No. 1 and 2. Groundwater monitoring wells were sampled in August 2020 and January 2021 with the samples analyzed at Eurofins/Calscience Environmental Laboratories, Inc. in Garden Grove, California.

Issues of note include the following:

- Maintenance issues corrected during the current monitoring period included replacing locks, clearing vegetation around the wells, and clearing the access route and area surrounding MW-17.
- Analytical results remained relatively consistent with previous monitoring events across the site. The main constituent of concern, trichloroethene (TCE), has continued to remain above screening levels in background well MW-13. Program well results remained well below concentrations observed at background well MW-13. TCE will continue to be carefully monitored across the site.
- The metal and general chemistry results from wells MW-02, MW-03, MW-08 and MW-13 continue to show that the system monitoring wells (both upgradient and downgradient) exceed the Basin Plan Water Quality Objectives for the Otay Hydrologic Subunit. However, these exceedances appear to be the result of naturally occurring water variability rather than contributions from the waste management unit.

LandBank Properties, L.L.C.

Ms. Quetin
April 29, 2021
Page 2

- South of the site, temporary well location TPMW-01 was not sampled during the August 2020 event due to beehives in the area. During the January 2021 event, the location was sampled, and TCE was detected at a concentration of 6.3 µg/L. Concentrations of TCE will continue to be carefully monitored at TPMW-01 in future events.
- A homeless encampment was reported around MW-17 during both semiannual inspections. APTIM maintenance crews attempted to clear some of the area in July 2020; however, the encampment had grown considerably between inspections. The well was unable to be sampled during the January 2021 event due to the inhabitants of the area and safety concerns of the samplers.

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

Sincerely,

OTAY MESA VENTURES II, L.L.C.

1.0 Introduction

This annual report describes the results of the April 2020 through March 2021 annual and semiannual monitoring performed at the Former Omar Rendering Site in Chula Vista, California (Figure 1) as required by the California Regional Water Quality Control Board, San Diego Region (RWQCB). The monitoring oversight and reporting was performed by Aptim Environmental & Infrastructure, LLC (APTIM), on behalf of Otay Mesa Ventures II, L.L.C. (OMV). Monitoring and reporting activities were designed to comply with Monitoring and Reporting Program No. R9-2017-0114 (RWQCB 2017a) as well as the companion Cleanup and Abatement Order (CAO) R9-2003-0080 (RWQCB 2003) and addenda (RWQCB 2007 and 2017b).

Table 1 provides an index of the site monitoring submittal requirements in RWQCB Program No. R9-2017-0114 and CAO R9-2003-0080 and references the section of this report where each requirement is discussed. Table 2 provides a list of constituents required by orders R9-2017-0114 and CAO R9-2003-0080.

1.1 Monitoring Program

Program No. R9-2017-0114 specifically requires semiannual monitoring of four wells under the Monitoring and Reporting Program: MW-02, MW-03, MW-08, and MW-13 (known hereafter as the “program” wells). These wells monitor for a potential release from the waste containment cell located in the northwest corner of the Former Omar Rendering Site (Figures 2 through 5).

CAO R9-2003-0080 Addendum No.1 was approved by the RWQCB in April 2007 (RWQCB 2007). The CAO addendum requires semiannual sampling and analysis of wells: MW-16, MW-17, MW-18, MW-20, and MW-21R. Wells MW-22, MW-23, and MW-24, installed in 2010 and 2011, are additionally sampled as part of the CAO monitoring suite. The remaining site wells: MW-01R, MW-04, BGW-02, SVGW-10/SVGW-10R, MW-09, MW-10, MW-19, MW-07, and MW-11 are not required to be sampled for water quality, but are monitored for groundwater elevations (Figures 2 and 3).

Reporting requirements were updated in Program R9-2017-0114 and Addendum No.2 of the CAO by the RWQCB in August 2017. Requirements were revised from semiannual reporting to annual reporting only (RWQCB 2017a and 2017b).

Former monitoring wells MW-14, MW-15A, MW-15B, and MW-25 were abandoned in 2013 and are no longer part of the monitoring system. Well abandonment documentation was reported for wells MW-14, MW-15A, and MW-15B in the April 2013 Annual Report (Shaw Environmental & Infrastructure, LLC. [Shaw]-CB&I Federal Services LLC [CB&I] 2013a).

Documentation for the MW-25 well abandonment was reported in a Monitoring Well Destruction Report to the County of San Diego (Shaw-CB&I 2013b) and in the October 2013 Semiannual Report (Shaw-CB&I 2013c).

The current SVGW-10R location was previously monitored for groundwater elevation as SVGW-10. The original well became obstructed and was reconstructed in August 2016. Following reconstruction, this well was sampled for data confirmation in August 2016 and February 2017. High pH levels were recorded, and the well was redeveloped in August 2017 and resampled in August 2017 and February 2018. In accordance with RWQCB comments, if this location should be used for future sample collection, the well will be replaced (RWQCB 2018; Landbank 2018).

1.2 Report Organization

In accordance with regulatory guidelines, an annual monitoring report is submitted in April of each year. Semiannual reporting is no longer required per guidance in R9-2017-0114 and Addendum No.2 of the CAO (RWQCB 2017a and 2017b, respectively). Report requirements are noted in Table 1, and constituents for the monitoring program are shown in Table 2. Groundwater elevation data and field parameters are presented in Table 3. Tables 4 through 7 summarize analytical results from the most recent sampling event.

A graphical representation of the historic data from site wells is presented in time-series plots in Appendix A. Historic groundwater elevation and precipitation data are presented in hydrographs in Appendix B. Groundwater sample collection logs from the most recent annual monitoring period are provided in Appendix C. Analytical data reports for sampled wells are presented in Appendix D, and analytical data from wastewater samples are included in Appendix E. Data quality was assessed in Appendix F, and site inspection documents are provided in Appendix G.

2.0 Background Information

Prior to 1980, the contents of six former Class I waste ponds (Figures 2 and 3) were removed and disposed at a permitted off-site location. In 1981, the impacted soil from beneath the Class I waste ponds was placed in a lined and capped waste cell in the northwest corner of the site, in accordance with RWQCB Order No. 80-06 (RWQCB 1980). Subsequently, the waste cell was maintained per RWQCB Order No. 87-141 (RWQCB 1987), which was replaced by RWQCB Order No. 97-40 (Waste Discharge Requirements for Closure and Post-closure Maintenance of the Waste Cell, RWQCB 1997). The monitoring and reporting program associated with Order 97-40 was superseded by R9-2017-0114 (RWQCB 2017a). Program R9-2017-0114 requires semiannual groundwater monitoring and periodic monitoring and maintenance of the cap and surface water control features with annual reporting.

The waste cell was designed to have the following physical properties:

- Approximate waste cell area: 5 acres.
- Stratigraphy, approximate depth below grade (City of Chula Vista 1982).
 - 0 - 6 feet: clean soil cover.
 - 6 - 9 feet: compacted clay cap.
 - 9 - 53 feet: compacted soil waste.
 - 53 - 56 feet: compacted clay liner (base is at an approximate elevation of 155 feet above mean sea level [msl]).
- The bottom of the waste cell is greater than 25 feet above the groundwater table (the water table is encountered at an elevation of approximately 120 to 132 feet above msl in the vicinity of the waste cell).
- Clay material used for liners was analyzed and determined to have a permeability of less than 1E-06 centimeters per second, and compacted to 90 percent relative compaction (Geocon, Inc. 1982).
- The material placed in the waste cell was primarily impacted soil excavated from beneath the former Class I ponds and rendering waste ponds (pond contents were removed off-site); consequently, the material is assumed to have a low organic content and have low potential for generating methane gas.

The waste cell contents were compacted to at least 90 percent relative compaction (Geocon, Inc. 1982). A waste cell site map indicating the limits of waste is included as Figure 4.

In 2016, the top of the waste cell at 1886 Auto Park Place was paved for use as a parking lot for vehicle storage. The surface of the waste cell is maintained by the property owner. The existing aerial photograph shown on Figure 5 indicates the location of the waste cell and surrounding zones.

2.1 Geology

The site geology generally consists of fill soil overlying two *in situ* geologic units. The Sweetwater Formation is found above an approximate elevation of 150 feet above msl, and consists of thick, massive beds of hard clay and dense, silty and clayey sand. Some clay beds have a high percentage of bentonite clay. The Mission Valley Formation is found below an approximate elevation of 150 feet above msl and is primarily massive beds of dense, silty, fine sand. The fill soil is primarily reworked Sweetwater Formation. Cross-sections indicating site geology are included as Figure 6.

2.2 Hydrogeology

Groundwater at the site primarily occurs in an unconfined aquifer consisting of silty, fine sands within the Mission Valley Formation and alluvium. The Omar site is located within the Otay Valley Hydrologic Subunit (10.20) of the Otay Hydrologic Unit (RWQCB 1994). The Otay Valley Hydrologic Subunit is designated as having existing beneficial uses for municipal, agricultural, and industrial use (RWQCB 1994).

Groundwater beneath the site flows within the Mission Valley Formation and alluvium to the south-southwest, toward the axis of the Otay River Valley. Groundwater directly beneath the river valley is expected to flow westward within the river valley alluvium.

As described in the Comprehensive Site Investigation Report (Shaw 2010a), groundwater velocities in the area are highly variable. Velocities range from less than one foot per year to over 100 feet per year across the Omar site and surrounding properties. Historically, velocities south of the waste cell have been low at approximately 21 feet per year, and velocities south of the former waste pits have been less than 50 feet per year. South of Main Street, velocities increase locally to over 100 feet per year (Shaw 2012). Current groundwater elevations and velocities across the site are reported in Section 4.1.

2.3 Conceptual Site Model

The conceptual site model was updated in 2012 and reported in the Supplemental Report of Comprehensive Site Investigation (Shaw 2012). The model concludes the following:

- Residual impacted soil is encapsulated within the waste cell and beneath the former ponds. The potentially impacted soil remaining in place covers an approximate 5-acre

subarea. Due to the depth of burial, direct human contact with impacted soil has not been a concern.

- The groundwater beneath the Omar site has been impacted with volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), and inorganic constituents. The VOCs impacting groundwater are primarily the chlorinated solvents Trichloroethene (TCE) and tetrachloroethene (PCE).
- Residual concentrations in soil and groundwater at the site are unlikely to pose a significant risk to future occupants of a commercial/industrial building or to nearby residents.
- Modeling results show the southern extent of contamination is defined by MW-17 and temporary well point TPMW-01, the western extent is defined by MW-18, and the eastern extent is defined by OVIP-02. Based on the results from MW-22 and former well MW-25, the northern extent is near the northern boundary of the site.
- The vertical extent of contamination is well-defined at the southern (downgradient) portion of the property based on data obtained in cluster wells MW-09, MW-20, and MW-10.
- Microbial degradation of chlorinated organic compounds is occurring in the groundwater system below the former waste pits where reducing conditions exist. The data from deep well MW-21R is strongly indicative of microbial degradation of chlorinated compounds in the deeper parts of the groundwater system.
- As TCE migrates to the south into aerobic groundwater conditions, any microbial degradation is occurring at a slower rate so that the degradation is not reflected in any of the indicator parameters or daughter products. However, as the TCE migrates back into the anaerobic conditions in the riverbed, degradation is occurring.
- Modeling results show the potential impact the TCE plume may have on water quality in the Otay River alluvium to be 4 micrograms per liter ($\mu\text{g/L}$).

Contamination north of the former ponds (MW-13) is likely due to a previous migration from the former ponds. The model indicates that a groundwater mound was created during operation of the ponds which may have pushed contaminants northward against the regional gradient. Radial flow from the mound temporarily reversed the gradient on the north side of the ponds pushing VOC contaminated water to the northwest (upgradient from the background well, MW-13). When the ponds were cleaned and liners removed, the mound mostly dissipated, and groundwater resumed its normal flow to the south. However, remnant concentrations may have been left in the northern portion of the property. Groundwater flow has been regularly monitored to flow south over the past 20 years.

2.4 Regulatory Comments

Comments from the RWQCB were received on July 30, 2020 following review of the Annual 2020 Monitoring Report (OMV 2020a). The Board requested a new TCE concentration map (RWQCB 2020). Comments were addressed, and TCE concentration maps are included herein as Figures 7 and 8.

2.5 Compliance Record

The following section includes compliance activities conducted at the site during this annual monitoring period.

- RWQCB comments on the 2020 Annual Report were addressed in a Response to Comment document uploaded to Geotracker on October 2, 2020 (OMV 2020b).
- Figures showing the TCE concentrations have been added to this report in response to the RWQCB comment. Figure 7 presents data collected in August 2020, and Figure 8 reflects the data collected in January 2021.

2.6 Planned Activities

Sampling and site inspections will continue semiannually and be reported annually in accordance with Program R9-2017-0114 (RWQCB 2017a). Additional waste cell best management practices will continue to be inspected, maintained, and reported in accordance with the site Industrial Stormwater Pollution Prevention Plan and addendum (CB&I 2016; APTIM 2018).

3.0 Methods

The following section describes groundwater monitoring and sample collection methods.

3.1 Monitoring System

Groundwater chemistry was most recently monitored at the site in four program wells (MW-02, MW-03, MW-08, and MW-13) and seven CAO wells (MW-16, MW-18, MW-20, MW-21R, MW-22, MW-23, and MW-24). One additional downgradient temporary well location, TPMW-01, was also sampled during the January 2021 event; however, the temporary location was inaccessible due to beehives during the August 2020 event. Well locations are shown on Figures 2 and 3. CAO well MW-17 was not sampled during the January 2021 event due to safety concerns with a homeless encampment at the well; however, the well was sampled during the August 2020 event.

The program wells are used to monitor the containment cell area. Well MW-13 is the original upgradient program monitoring well, and wells MW-02, MW-03, and MW-08 are the program monitoring wells located downgradient of the waste cell.

The CAO wells are used to monitor residual groundwater impacts from former waste pond operations. Nine additional CAO wells are monitored for groundwater elevation only (BGW-02, MW-01R, MW-04, MW-09, MW-10, MW-19, MW-07, MW-11, and SVGW-10R). Personnel could not access the MW-11 location during the January 2021 event because new locks were installed by the property owner.

3.2 Sampling Method

A low-flow purge and sampling method was used during this monitoring event. The low-flow method involved the removal of water directly from the screened interval at low enough flow rates to maintain minimal drawdown and avoid disturbing any stagnant water above the screen. Sampling is conducted in accordance with San Diego County, Department of Environmental Health (SDCDEH) Site Assessment and Mitigation (SAM) guidelines (SDCDEH 2004 and updates including the updated SAM Section 5 Site Investigation Techniques [2011]).

Prior to sampling, each groundwater monitoring well was measured to determine depth to static water. Dedicated discharge lines were used at each well, and pumping equipment was properly cleaned before use to prevent cross-contamination of samples. A low-flow/bladder pump was installed in each well at the mid-point of the screened interval. As groundwater pumped through the flow-through cell, field parameters such as pH, specific conductivity, temperature, dissolved oxygen, and oxidation-reduction potential were measured to verify stabilization and recorded on sample collection logs (Appendix C).

Groundwater in each well was sampled directly from the dedicated discharge line immediately after purging. Samples were placed into new, pre-preserved containers provided by the analytical laboratory. Sample bottles were labeled, sealed in plastic bags, stored on ice, and transported in a cooler to the laboratory via courier using chain-of-custody procedures. Laboratory analyses were performed by Eurofins Calscience, Inc. in Garden Grove, California. This laboratory is certified under the State Water Resources Control Board Environmental Laboratory Accreditation Program. Appendix D contains the analytical reports for wells sampled during this monitoring event.

Groundwater was sampled from one additional temporary well point (TPMW-01) located off-site to the south during the January 2021 event. The temporary point was installed using a drive-point piezometer. Because the soil in this downgradient location was filled with river rock (between 2-to-3 inches and 8-to-10 inches in diameter), rock was removed by hand prior to installing the point. Once the area was cleared, the point was driven approximately 3 feet below ground surface. After reaching total depth, the point was pulled back, and the sleeve was released to open the screen. The point was then purged and sampled using the low-flow sampling method. Following sample collection, the temporary point was abandoned in accordance with SDCDEH guidelines. The temporary well location was located south of off-site well MW-16 (Figures 2 and 3). The temporary point was unable to be accessed during the fall 2020 sampling event due to beehives located across the area.

3.3 Analytical Parameters

According to Monitoring and Reporting Program R9-2017-0114 and Order 97-40, all groundwater samples from program wells are to be analyzed for VOCs, SVOCs, metals, and general chemistry semiannually. All CAO sampling wells following the guidelines of the CAO R9-2003-0080 are to be analyzed for VOCs and general chemistry semiannually, metals annually for the first three years following installation then every two years thereafter, and SVOCs every 5 years.

During the August 2020 and January 2021 sampling events, program wells were analyzed for VOCs, SVOCs, metals, and general chemistry. In August 2020 and January 2021, CAO wells were analyzed for VOCs and general chemistry. At these locations, metals are analyzed, at a minimum, every two years and SVOCs every 5 years. During this monitoring period, metals were analyzed at all sampled wells for informational purposes. These locations shall next be analyzed for metals in spring 2023 in accordance with the CAO. SVOCs are also scheduled to be analyzed at CAO wells in spring 2023; SVOCs were previously analyzed at the CAO wells in February 2018. Table 2 shows a list of constituents for Program R9-2017-0114 and CAO R9-2003-0080.

3.4 Waste Disposal

Waste disposal during the current monitoring period included the removal of purged groundwater from each of the fall 2020 and spring 2021 semiannual sampling events. The groundwater waste was temporarily contained on-site in a 55-gallon drum pending analysis and off-site disposal. The drum from the August 2020 sampling event was transported as non-hazardous waste by Patriot Environmental Services, Inc. to Patriot Wastewater/Patriot Environmental Services in Anaheim, California on November 3, 2020. The drum from the January 2021 event was transported as non-hazardous waste by Patriot Environmental Services, Inc. to U.S. Ecology in Beatty, Nevada on February 25, 2021. Waste manifests and the drum sample analytical data are included in Appendix E.

4.0 Groundwater Monitoring

The following section is a review of groundwater data collected during the current annual reporting period.

4.1 Groundwater Elevations

Groundwater levels were measured on August 11 and 12, 2020 for the fall event and on January 19 and 20, 2021 for the spring event (Table 3). Groundwater elevation contour maps are illustrated in Figures 2 and 3. Groundwater elevations across the site vary considerably. Elevations of groundwater north of the waste cell are approximately 183 feet above msl at MW-11 and 197 feet above msl at MW-22. The elevation of groundwater across the site ranges from approximately 138 feet above msl at the northern terraces to approximately 95-99 feet above msl south of Main Street. Overall, groundwater flows in a south to southwest direction across the site toward the Otay River. Groundwater directly beneath the river valley axis is assumed to flow westward within the Quaternary alluvium.

Hydraulic gradients at the site are highly variable north and south of the former waste ponds. The gradient from background well, MW-13, to the southern boundary at MW-20 is approximately 0.01 feet per foot (ft/ft) to the south. Hydraulic gradients from the former waste pond area (BGW-02) to MW-20 south of the site, as well as beyond to southern well MW-16 are approximately 0.02 ft/ft to the south.

Figures 2 and 3 show the area of the former ponds as relatively flat across Terraces 1, 2, and 3 with a gradient ranging from 0.001 to 0.01 ft/ft. The shallow gradient in this area may reflect the remnants of the mound created by those former ponds.

The area north of the ponds is relatively steep with a topographic elevation difference of approximately 65 feet between wells MW-22 and MW-13 with a hydraulic gradient of approximately 0.24 ft/ft to the south. The steep gradient between the upslope wells (MW-11 and MW-22) and the program wells is considered a function of the relatively high rate of infiltration/recharge from the housing at the top of the slope and the steep slope itself. The recharge beneath the irrigated area around the housing has created a mound within the less permeable Sweetwater Formation. As the water table reaches the terraces, it is within or closer to the more permeable Mission Valley Formation, and the contours flatten out in response to the faster drainage in that formation.

Using a constant porosity of 0.20 and an average hydraulic conductivity of 0.35 feet per day (ft/day) as calculated in the Supplemental Report of Comprehensive Site Investigation

(Shaw 2012), the average velocity of groundwater across the site is approximately 0.02 ft/day (6.39 feet per year).

4.2 Laboratory Analyses

Samples collected during this monitoring period were analyzed by Eurofins Calscience, Inc. in Garden Grove, California. Completed chain-of-custody forms and laboratory data reports for each sample are included in Appendix D, and data results are summarized in Tables 4 through 7. Applicable maximum contaminant levels (MCLs; RWQCB 2018) and Environmental Screening Levels (ESLs; RWQCB 2019d) are included for comparison on Tables 4, 5, and 6. Chain-of-custody forms and laboratory data reports for drum wastewater samples are included in Appendix E.

Program wells are sampled semiannually for VOCs (Table 4), metals and general chemistry (Table 5), and SVOCs (Table 6). The program wells monitor for a potential release from the waste containment cell and include three wells south of the waste cell (MW-02, MW-03, and MW-08), and one background well (MW-13). Each of the other sampled wells are analyzed for VOCs and general chemistry semiannually (Tables 4 and 5, respectively). At these locations, metals are analyzed, at a minimum, every two years and SVOCs every 5 years. During this monitoring period, metals were analyzed at all sampled wells and are reported in Table 5.

A discussion of laboratory analyses and data quality assessment for the August 2020 and January 2021 sampling events are further discussed in Appendix F. Analytical data associated with the site will be uploaded to the State Water Resources Control Board's Geotracker website.

4.3 Groundwater Analytical Results

A summary and discussion of the results from the current monitoring period at the Former Omar Rendering site are provided herein.

4.3.1 Volatile Organic Compounds

TCE, PCE, cis-1,2-dichloroethene (cis-1,2-DCE), 1,1-dichloroethane (1,1-DCA), and 1,1-dichloroethene (1,1-DCE) are the main VOC constituents of concern detected in the site wells. Additional VOCs historically reported in site wells (particularly in wells located near the former ponds) include chloroform, 1,2-dichloroethane (1,2-DCA), 1,1,2-trichloroethane (1,1,2-TCE), and tert-Butanol (TBA). Concentrations of VOCs detected in site wells are summarized below by well and shown in Table 4. Screening levels are included in the table for reference. Concentrations of TCE are also presented on contour maps included as Figures 7 and 8. Due to high target analyte (TCE) concentrations in wells MW-21R, MW-23, and MW-24, dilutions were required for analysis; reporting limits for not-detected analytes were elevated due to the dilutions.

Results of VOC analyses are summarized and discussed below.

- Background well, MW-13, has shown stable concentrations of TCE during the 2020-2021 monitoring period. Concentrations remain above the TCE screening levels (MCL of 5 µg/L and ESL of 1.2 µg/L). Concentrations of other constituents of concern at MW-13 remain relatively stable though concentrations surpass screening levels for 1,1-DCA, chloroform, cis-1,2-DCE, and PCE.
- VOCs remained relatively consistent at program well MW-02 with concentrations exceeding ESLs for chloroform (1.3 µg/L during the August 2020 and January 2021 events), PCE (0.71 µg/L [January 2021]), and TCE (1.6 µg/L [January 2021]). MCLs were not exceeded at MW-02 during this monitoring period.
- Program well MW-03 yielded a detectable concentrations of TCE and chloroform below respective screening levels during the 2020-2021 monitoring period. TCE was reported at 0.52 µg/L [August 2020] and an estimated 0.35 [January 2021]), and chloroform was reported at 0.55 and 0.50 µg/L in August and January, respectively.
- Program well MW-08 yielded an estimated detection of 1,1-DCA below the ESL during the August 2020 event (0.093 µg/L). TCE was also detected during both 2020-2021 events, above the ESL in August 2020 (1.6 µg/L) and below the ESL in January 2021 (1.0 µg/L). MCLs were not exceeded at MW-08 during this monitoring period.
- Downgradient off-site well, MW-16, shows decreasing concentrations of VOCs yielding results below ESLs with the exception of 1,1-DCE, PCE, and TCE. 1,1-DCE was detected at an estimated concentration of 4.4 µg/L in August 2020. TCE was detected at 44 µg/L [August 2020] and 28 µg/L [January 2021]). PCE was detected at 1.4 µg/L [August 2020] and 0.91 µg/L [January 2021]. MCLs were not exceeded at MW-16 except for TCE.
- Southern well MW-17 had no VOC constituent of concern detections above the reporting limits during the current monitoring period with the exception of 3.5 µg/L during the August 2020 event. The well was inaccessible for sampling during the January 2021 event.
- Concentrations at western well, MW-18, remained stable during the current monitoring period. The ESLs for TCE (1.2 µg/L) and PCE (0.64 µg/L) were exceeded during both events. TCE was detected at concentrations of 3.7 µg/L and 4.3 µg/L in August 2020 and January 2021, respectively. PCE was detected at 1.1 µg/L [August 2020] and 1.0 µg/L [January 2021]). Estimated concentrations of chloroform and 1,1-DCA were detected at MW-18 below screening levels during the August 2020 event. MCLs were not exceeded at MW-18 during this monitoring period.
- Downgradient well MW-20 exceeded the screening levels for TCE with concentrations of 13 µg/L and 16 µg/L in August 2020 and January 2021, respectively. PCE was detected at 0.51 µg/L in August 2020 and above the ESL at 0.75 µg/L during the January 2021 event. Estimated detections of 1,1,2-TCE, 1,1-DCA, and chloroform were reported below respective screening levels.

- Reconstructed well MW-21R, along the south side of the former ponds on Terrace 1, showed increased concentrations of constituents of concern during the current monitoring period. Screening levels were surpassed for multiple constituents. Due to high concentrations of TCE (8,000 µg/L [August 2020] and 9,300 µg/L [January 2021]), dilutions were required for analysis. Therefore, reporting limits for VOCs were increased and reported accordingly.
- Concentrations at the northernmost upgradient well, MW-22, were generally consistent with historic detections. Screening levels were exceeded for TCE, vinyl chloride, cis-1,2-DCE, and 1,1-DCA. TCE concentrations were reported at 17 µg/L and 16 µg/L during the August 2020 and January 2021 events, respectively.
- Well MW-23, located on the east side of the site, showed increased concentrations of TCE during the current monitoring period. TCE was detected above screening levels at concentrations of 9,100 µg/L in August 2020 and 7,800 µg/L in January 2021. Due to these high concentrations of TCE, dilutions were required for the VOC analyses, and reporting limits were elevated. Screening levels were also exceeded at reported concentrations for 1,1-DCA, 1,1-DCE, chloroform, and cis-1,2-DCE.
- Well MW-24 at the northeast corner of the site produced generally consistent results during the current monitoring period. Due to high concentrations of TCE (4,500 µg/L [August 2020] and 4,200 µg/L [January 2021]), dilutions were required for analysis. Therefore, reporting limits for VOCs were increased and reported accordingly. Reported concentrations for 1,1-DCA, 1,1-DCE, 1,2-DCA, benzene, chloroform, dichloromethane, and TBA also exceeded screening levels.
- Temporary well TPMW-01, located downgradient of the site, was sampled in January 2021; however, the well area was inaccessible during the August 2020 event. Results from January 2021 reported concentrations of TCE above the screening levels at 6.3 µg/L and of cis-1,2-DCE at an estimated 0.66 µg/L during the January 2021 event. Additional VOCs were not detected above respective screening levels.

In summary, VOC constituents of concern remained relatively consistent at program wells when compared to previous monitoring periods. Concentrations of TCE in program wells remain below those concentrations observed at the background well. Although concentrations of TCE at the downgradient program wells have not exceeded MCLs, some results did exceed ESLs. Similarly, screening levels of TCE were exceeded at the background program well and many of the CAO wells. Therefore, concentrations of TCE will continue to be carefully monitored in future events. Table 7 summarizes quality control results for samples collected during this event, and the data quality assessment is included as Appendix F.

4.3.2 Metals and General Chemistry

Samples from program wells exceeded MCLs and/or ESLs in some metals and general chemistry constituents; however, the current concentrations are relatively consistent with previous results.

CAO wells are scheduled for metals analysis every two years at a minimum. Metals were most recently analyzed for informational purposes during the current monitoring period and are scheduled for future analysis during the spring of 2023. Table 5 summarizes current metals and general chemistry results, and Appendix A presents historic results graphed in time-series plots.

4.3.3 Semivolatile Organic Compounds

Program well samples were analyzed for SVOCs and were not detected during the fall 2020 and spring 2021 monitoring period (Table 6).

CAO wells are scheduled for SVOC analysis every five years and were not analyzed for SVOCs during the current monitoring period. SVOCs were last analyzed at CAO wells in February 2018 and are scheduled for next analysis in spring 2023.

5.0 Discussion

The following section is a review of analytical data collected to date.

5.1 Historic Groundwater Elevations

Historic groundwater elevation data and precipitation data (National Weather Service, 2020-2021 and Western Regional Climate Center, 2020-2021) are provided in hydrographs (Appendix B). As indicated in the graphs, groundwater monitoring wells have had relatively constant water levels since their construction, with the following observations:

- The relatively high total precipitation in 1993 apparently led to a corresponding increase in groundwater elevation in several wells.
- Wells MW-02, MW-03, and MW-08 experienced increases in water levels since 2003, which coincides with, and may be due to, the installation of irrigation around the waste cell following development of the property.

Historic groundwater level data indicate that annual precipitation cycles have caused an annual water level variation of approximately four feet across the site. Multi-year climate cycles have not caused notable changes in the groundwater elevations beneath the terraces; however, they have historically caused variations of up to 10 feet beneath the lowland. The wells in the lowland display greater variation in water level because the aquifer is locally overlain by the relatively thinner and higher permeability sediments of the Quaternary alluvium, and the lowland area is closer to the Otay River valley.

An overall review of wells screened across the water table suggests the unconfined surface dips generally to the south, toward the river. However, some wells may represent discontinuities in the aquifer. As reported in the Supplemental Report of Comprehensive Site Investigation (Shaw 2012), a consistent upward hydraulic gradient has been observed beneath the terraces in the vicinity of cluster wells MW-02, MW-03, and MW-08. Beneath the lowland, a consistent downward hydraulic gradient has been observed in the MW-09 and MW-10 well pair, and a strong downward gradient of -0.45 ft/ft exists in the vicinity of BGW-02 and MW-21R. These gradients may be due to the deeper wells (MW-09 and MW-21R) being screened within a faster-draining, coarse-grained formation (Mission Valley) as shown in the cross-sections on Figure 6. The gradient at BGW-02 may be the result of a slower-draining, semi-perched layer that is in horizontal contact with the uppermost aquifer.

These gradients might also be explained by the site history. The waste ponds used in the 1960s and 70s likely acted as a source of recharge to the aquifer and created a groundwater mound in the center of the site. Once the ponds were removed in 1980, the recharge would have ceased,

and the groundwater would have begun to return to the original gradient with an overall southerly flow. This mounding and subsequent removal of the recharge source would provide the following explanation, “During the time that the ponds were active, the groundwater mound could have reversed the gradient directly north of the ponds, pushing contaminants northwards against the overall southerly flow. This would explain how the increased concentrations have been observed on the north end of the site, currently upgradient of the source.”

The anomalous vertical gradients noted above are probably because the local groundwater conditions have not yet completely reached equilibrium.

5.2 Historic Groundwater Analytical Results – Program Wells

This section discusses the trends observed in the groundwater analytical data at program wells, MW-02, MW-03, MW-08, and MW-13. Program wells MW-02, MW-03, and MW-08 are in proximity and downgradient of the waste cell. MW-13 is the upgradient well, located near the former ponds. Time-series plots for selected chemicals at these wells are presented over the period from 1988 to the present in Appendix A. In the time-series plots, the non-detect results are shown as zero concentration. Appendix B presents hydrographs.

Upgradient program well, MW-13, has shown a gradual increase in TCE concentrations since the monitoring began (Appendix A) reaching 92 µg/L in February 2019 and decreasing again in following events. The VOCs detected in MW-13 are believed to be residual groundwater impacts from the former waste pond operations which ceased in the 1970s. Residual groundwater impacts due to former pond operations are detectable in several CAO wells.

Since 1988, VOCs such as TCE have shown a general decrease in concentration in the program wells downgradient of the waste cell (Appendix A). Table 4 and Appendix A shows limited concentrations of VOCs continue to be identified. Concentrations of metals and general chemistry constituents have remained generally consistent over time; however, some of these constituents have been identified above water quality objectives (Table 5). These exceedances appear to be the result of naturally occurring water variability rather than contributions from the waste cell.

Downgradient wells MW-02 and MW-03 had historic concentrations of TCE at 290 and 270 µg/L, respectively, in 1988, which had decreased to 22 and 19 µg/L, respectively, the following year. VOC concentrations have been consistently low during the subsequent years, showing a slight concentration increase of TCE in March 2003 (40 µg/L at MW-02 and 21 µg/L at MW-03). From 2004 to the present, TCE has been detected at low concentrations below the MCL in downgradient wells MW-02 and MW-03. Chloroform has also historically been present at low levels in MW-02 and MW-03. Chloroform detections have declined since peaking in the early 1990s and have ranged from non-detect to 3.7 µg/L over the past decade. Inorganic and

metals concentrations have been relatively consistent over time, with concentrations of some constituents above water quality objectives.

Downgradient well MW-08 has historically had few VOC detections since monitoring began in 1988. Benzene was detected at concentrations of 3.0 µg/L and 1.0 µg/L on March 19, 1996 and June 20, 1996, respectively. Carbon disulfide was detected at a concentration of 1.4 µg/L on March 28, 2000, and acetone was detected at an estimated 5 µg/L on August 5, 2014. During the February 2016 event, TCE was detected above the MCL at a concentration of 11 µg/L. Concentrations have since decreased. Inorganic and metals concentrations have remained relatively consistent throughout the monitoring period. VOC concentrations will be closely monitored at MW-08 in future events.

Constituents of concern in program wells south of the waste cell (MW-02, MW-03, and MW-08) are generally consistent with background levels in program well MW-13. They are considered to represent residual impacts from the former pond operations, not an impact of the existing waste cell.

5.3 Historic Groundwater Analytical Results – CAO Wells

In addition to sampling requirements under Program No. R9-2017-0114, Addendum No. 1 to the CAO requires sampling of wells MW-16 and MW-17 (both down gradient of the property line), MW-18 (cross-gradient from the property line), and MW-20 and MW-21R (downgradient and within the property line). Monitoring wells MW-22 (off-site to the north), MW-23 (on-site to the east), and MW-24 (on-site to the northeast) were also incorporated into the monitoring network after their installation in 2010 and 2011.

On April 20, 2007, the CAO monitoring network was reduced in accordance with an addendum issued by the RWQCB. The addendum to the CAO allowed a reduction in the number of CAO monitoring wells requiring sampling. The remaining wells at the site are no longer required to be sampled; these are monitored for groundwater elevation only.

VOCs are analyzed semiannually at CAO wells. The primary VOC in terms of maximum concentration and frequency of occurrence is TCE. Historically, 1,1-DCE; 1,1-DCA, PCE, and chloroform have also been detected. Methylene chloride (dichloromethane) and vinyl chloride have historically been detected in MW-22 and MW-24. Appendix A contains time-series plots of VOC concentrations in site monitoring wells.

Four monitoring wells are currently located directly downgradient of the former Class I ponds: MW-01R, MW-04, BGW-02, and MW-21R. Because these wells are in the plume interior and are not useful sentry locations, MW-01R, MW-04, and BGW-02 were removed from the required sampling array in April 2007. Historic sample results indicate these three wells have

historically had detections of VOCs, including variable concentrations of TCE. Past sample events also reported SVOC concentrations in these wells, with the long-term trend toward fewer detectable SVOCs and lower concentrations of SVOCs (Appendix A).

MW-21R is currently monitored as the interior well, downgradient of the former pond locations. The location was originally installed in 2003 as MW-21 prior to an obstruction and ultimate well reconstruction in June 2010 as MW-21R. When sampling resumed at the reconstructed well in 2010, TCE was detected at 2,400 µg/L. Since that time, concentrations of TCE have fluctuated at MW-21R with recent concentrations reaching 9,300 µg/L in January 2021. Since the 2010 reconstruction of MW-21R, methylene chloride (dichloromethane) has also fluctuated in concentrations ranging from 420 µg/L (August 2012) to non-detect, with a recent concentration reported at an estimated 30 µg/L (January 2021). SVOCs were analyzed at well MW-21R in June 2010, February 2011, August 2013, and February 2018. SVOCs were not detected at MW-21R with the exception of naphthalene at 66 µg/L (2010), 2-nitrophenol at 55 µg/L (2018), and 4-nitrophenol at 850 µg/L (2010), 1,400 µg/L (2011), 1,900 µg/L (fall 2013), and 610 µg/L (spring 2018).

During the site investigation in 2010, a new background monitoring well, MW-22, was installed in the adjacent property north of the site (Shaw 2010a). This well is located upgradient of the former waste pond locations. The primary VOCs historically detected at this northern location include TCE, 1,1-DCA, cis-1,2-DCE, and vinyl chloride. Low concentrations of 1,1-DCE, trans-1,2-dichloroethene, and chloroform have also been detected with lowered reporting limits. The VOCs detected in this well are probably due to the temporary reversal of the groundwater gradient during operation of the ponds in the 1970s. Groundwater flow is currently to the south, back under the former pond locations. Analytical results from MW-22 are included as time-series plots (Appendix A).

The northeastern portion of the site is monitored by on-site wells MW-23 and MW-24. Well MW-23 monitors the area east of the former ponds, near the eastern perimeter of the site. VOCs identified in this eastern well location include TCE, 1,1-DCA, 1,1-DCE, cis-1,2-DCE, chloroform, and historically 1,1,2-TCE, methylene chloride (dichloromethane) and TBA. Estimated concentrations of benzene and vinyl chloride have also historically been detected with lowered reporting limits. SVOCs were analyzed at MW-23 after installation (June 2010), fall 2013 (with only one detection at 49 µg/L of 4-nitrophenol), and spring 2018 (no detections above reporting limits).

Monitoring well MW-24 was installed in April 2011 (Shaw 2012) and monitors the area immediately northeast of the former pond locations. The primary VOCs detected at MW-24 include TCE, 1,1-DCA, 1,1-DCE, methylene chloride (dichloromethane), chloroform, and TBA. Historic concentrations of 1,2-DCA, benzene, and xylenes have also been detected with lowered reporting limits. MW-24 has exceeded screening levels for TCE over the course of monitoring,

with concentrations fluctuating from 2,700 µg/L to 5,600 µg/L. SVOCs were analyzed during the initial sampling of MW-24, during the fall 2013 event and again in spring 2018. Concentrations of SVOCs were reported for 2-nitrophenol at 130 µg/L (2011), 91 µg/L (2013), and 64 µg/L (2018). Concentrations of 4-nitrophenol were also detected at 1,300 µg/L (2011), 690 µg/L (2013), and 370 µg/L (2018). In 2013, one detection of 2,4-dinitrophenol (140 µg/L) was also reported (the current ESL is 39 µg/L). There are currently no MCLs to use for comparison with these SVOC constituents.

The area west of the site was originally monitored by off-site wells MW-18 and MW-19 (installed in 2003). Following the 2007 update to monitoring requirements, MW-19 was removed from the sampling array and is gauged for groundwater elevation only. Currently, MW-18 is the off-site sample point to the west. TCE, PCE, and low levels of 1,1-DCA and chloroform are the main VOCs detected at this well, with SVOCs remaining undetected. TCE was initially detected at MW-18 at a concentration of 5.2 µg/L in 2005. PCE was first detected at MW-18 in August 2012 at 1.3 µg/L. Concentrations of TCE and PCE have remained relatively stable.

Wells located on-site near the southern perimeter of the site (MW-09, MW-10, MW-20, MW-15A, and MW-15B) have historically had low or no detection of VOCs with slight TCE fluctuations. Monitoring well MW-10 had TCE concentrations ranging from 3 µg/L to 88 µg/L, while other detected VOCs remained relatively stable over the years. Wells MW-09, MW-10, MW-15A, and MW-15B were removed from the required sampling array in April 2007. MW-15A and MW-15B were abandoned in March 2013. Monitoring well MW-20 (installed in 2003) currently acts as the monitoring point along the southern perimeter of the site. MW-20 has had concentrations of TCE ranging from 71 µg/L (June 2003) down to 8.4 µg/L (February 2009). Detections of TCE have continued to fluctuate over the past decade with recent detections at 13 µg/L (August 2020) and 16 µg/L (January 2021). Chloroform, PCE, 1,1-DCA, acetone, 1,4-dichlorobenzene, and 1,1,2-TCE have historically been detected at low levels.

Monitoring wells MW-16 and MW-17 were installed in 2003 to monitor groundwater off-site to the south. Between April and August of 2005, the ground surface and monitoring well MW-16 at the property to the south of the site were extended by a grading contractor. Topography and well casing were raised approximately 30 additional feet from the original ground surface. The top-of-casing elevation at MW-16 was resurveyed in June 2010 and is currently located at approximately 129 feet above msl.

Impacts off-site to the south are defined by monitoring wells MW-16 and MW-17. The only VOC detected at southwest monitoring well MW-17 has been TCE (1.3 µg/L in fall 2012, 3.9 µg/L in spring 2014, and 3.5 µg/L in August 2020). Detections at MW-16 have historically included TCE, PCE, chloroform, cis-1,2-DCE, 1,1,2-TCE, 1,2-DCA, 1,1-DCA, and 1,1-DCE with historic estimated concentrations of acetone and benzene. Concentrations of TCE in

monitoring well MW-16 have historically ranged from 3 µg/L to 92 µg/L (2013) with concentrations showing a general decline since 2013. VOCs are being carefully monitored and evaluated at this downgradient location.

Due to the presence of jurisdictional wetlands south of the site, the option of locating a permanent monitoring well downgradient of MW-16 to define the southern limits of the plume is not technically feasible currently. To define the downgradient limits of impacted groundwater, temporary well points have historically been installed, sampled, and abandoned south of the site. The first temporary well location (TPMW-01) was sampled south (downgradient) of MW-16 in March 2010, and results were reported in the Comprehensive Site Investigation Report (Shaw 2010a). Four additional locations were chosen as temporary well points during additional investigations in 2011 and 2012. TPMW-02 was located southwest of MW-16, and temporary points TPMW-03, TPMW-04, and TPMW-05 were located southeast of MW-16. Estimated concentrations of TCE, 1,1-DCA, 1,1-DCE, cis-1,2-DCE, PCE, and acetone were historically detected at the temporary, TPMW-01, location. Temporary well points TPMW-02 through TPMW-05 had no detections of VOCs, except for one detection of 3.4 µg/L TCE at the TPMW-03 location in April 2011 (Shaw 2012).

During the current monitoring period, one temporary well was constructed, sampled, and abandoned at the TPMW-01 location (Figure 3). Concentrations of TCE have historically fluctuated at TPMW-01 from non-detect to a detection of 8.2 µg/L (August 2016) with a recent detection reported at 6.3 µg/L during the January 2021 event. Concentrations of TCE will continue to be carefully monitored at the temporary location. In accordance with the site feasibility study, if an MCL is exceeded at this location for three consecutive monitoring events, additional step-out locations will be sampled during the following semiannual event (Shaw-CB&I 2014).

Historic data from the adjacent property east of the site (Otay Valley Industrial Park [OVIP] on Design Court) were reported by Woodward Clyde Consultants in 1990 to have reportable TCE and PCE concentrations (Woodward Clyde Consultants 1990). According to public records, the chlorinated hydrocarbon case at the Design Court site was closed in 1992 (Geotracker 2021). In a follow-up investigation for the Omar site in August 2010, well OVIP-MW04 was sampled to assess groundwater to the east. OVIP-MW04 had no detections of VOCs except 3.5 µg/L of PCE (Shaw 2010b). The detection in OVIP-MW04 is not expected to be from the Omar site because wells OVIP-MW02, OVIP-MW03, and OVIP-MW05 are between the plume and OVIP-MW04, and those wells have historically had no PCE detections. The historic data from OVIP locations reported general chemistry concentrations similar to those found at the Omar site. According to public records, the OVIP wells were installed by Woodward Clyde Consultants in June and July of 1990; however, the current owner and status of the wells is unknown.

To further investigate groundwater east of the Omar site, an additional well location (MW-25) was installed in November 2011 (Shaw 2012). Well MW-25 was located at the adjacent landfill property to the northeast of the Omar site. SVOCs were not detected at MW-25 when it was initially sampled in January 2012. VOCs including chloroform and TCE were detected at low concentrations in MW-25 in 2012. Additional samples were collected from the MW-25 location during the February 2013 event to identify potential migration from the site, and VOCs were not detected above the reporting limits. Review of groundwater analytical data from MW-25 indicated contaminants of concern had not migrated from the site to the northeast. Well MW-25 was abandoned in September 2013 (Shaw-CB&I 2013b).

5.4 Site Maintenance Inspection

A complete site maintenance inspection was conducted at the site in July 2020 and January 2021 in accordance with Program R9-2017-0114. Additional waste cell best management practices were also inspected in accordance with the site Stormwater Pollution Prevention Plan. Appendix G presents the semiannual field inspection logs; the inspection information is summarized below:

- Maintenance issues corrected during the current monitoring period included replacing locks and clearing vegetation around wells. Additional maintenance was needed along the road to and around MW-17 due to homeless encampments in the area.
- The fence line around the waste cell and gate remains intact and locked, with “No Trespassing” signs posted. The upper gate to the parking area is open during business hours, and the parking lot is actively used and maintained by the owners.
- Terraces 1 and 3 remain fenced and locked. A business actively operates on Terrace 2. Monitoring wells on the surrounding properties are properly maintained.
- Locks were replaced at multiple wells following the July 2020 inspection.
- New locks were installed by others at gates to MW-11 and MW-17 prior to the January 2021 inspection; access has been impeded at both locations.
- The temporary well point (TPMW-01) was unable to be accessed during the fall 2020 sampling event due to beehives located across the area.
- A homeless encampment was reported around MW-17 during both semiannual inspections. APTIM maintenance crews attempted to clear some of the area in July 2020; however, the encampment had grown considerably between inspections. The well was unable to be sampled during the January 2021 event due to the inhabitants of the area and safety concerns of the samplers.

6.0 Conclusion and Recommendations

In conclusion, concentrations at the site have remained relatively stable in the program wells. Although TCE concentrations have historically shown fluctuations in waste cell program wells, increases are not considered to indicate an impact from the waste cell because the concentrations tend to remain below concentrations at the background well. Concentrations of TCE will continue to be closely monitored in future events.

Concentrations of TCE at temporary point TPMW-01 exceeded screening levels during the January 2021 event. Concentrations of TCE will continue to be carefully monitored at this location during future events. If the MCL is exceeded for three consecutive monitoring events, additional step-out locations will be sampled per the site feasibility study (Shaw-CB&I 2014).

It is recommended that the homeless encampment surrounding MW-17 be addressed during the future monitoring period to regain access to the monitoring well.

Table 1
Omar Former Rendering Plant
Reporting Requirements of the Monitoring and Reporting Program

| Reporting Requirement as stated in Orders R9-2017-0114 & R9-2003-0080 (Addendum 2) | | |
|---|--|---|
| Monitoring and Reporting Program R9-2017-0114 | | Location in this report |
| D.1 | Transmittal Letter: A letter summarizing the major findings during the monitoring period shall be submitted with the report. | A transmittal is included as a cover letter with the submittal of the report. |
| D.1.a | A discussion of any requirement violations found since the last such report was submitted, as well as actions taken or planned for correcting the violations. If the Discharger has previously submitted a detailed time schedule for correcting said requirement violations, a reference to the correspondence transmitting such schedule shall be satisfactory. If no violations have occurred since the last submittal, this shall be stated in the transmittal letter. | Included in the transmittal letter. |
| D.1.b | A statement certifying that, under penalty of perjury, to the best of the signer's knowledge, the report is true, complete, and correct. This statement shall be signed by an individual that meets the requirements contained in Reporting Requirement D.8 of the Order. | Included in the transmittal letter. |
| D.2 | Annual Summary Report: The Discharger shall submit an annual summary report to the San Diego Water Board covering the previous 12 months. The annual reporting period ends on March 31. | Report is submitted annually prior to April 30. |
| D.2.a | Site Maintenance – A summary of semi-annual inspections and a discussion of any significant findings as described in B. Site Maintenance of this MRP. | Site maintenance is discussed in Section 5.4 and in Appendix G. |
| D.2.b | Groundwater Gradient and Direction – For each monitored groundwater body, a description and graphical presentation (e.g., arrow on a map) of the gradient and direction of groundwater flow under and around the containment cell. | Groundwater gradient and direction are discussed in Section 4.1 and presented graphically on Figures 2 and 3. |
| D.2.c | Well Information – For each monitoring well, a description of the method and time of water level measurement, and a description of the purge method used before sampling to remove stagnant water, and after sampling to remove the water that was in the well bore while the sample was being collected. | Sampling methods are discussed in Section 3.2. Water level measurements are reported in Table 3. |
| D.2.d | Sampling Information – For each monitoring well and background monitoring well addressed by the report, a description of the type of pump - or other device - used and its vertical placement for sampling, and a detailed description of the information contained in A.7 of this MRP. | Sampling information is provided in Section 3.2 and on collection logs in Appendix C. Results are reported on Tables 4-7 and in Appendix D. |
| D.2.e | Map – A topographic map at an appropriate scale showing the locations of observation stations, monitoring wells, and background monitoring wells, as well as the direction of groundwater flow at the site. | Topographic information is presented on Figure 5. |
| D.2.f | Graphical Presentation of Analytical Data - For each monitoring well, the laboratory analytical data for all samples collected within at least the previous five calendar years in graphical format. Each graph shall plot the concentration of the constituent over time for a given monitoring well, at a scale appropriate to show trends or variations in water quality. | Analytical data is presented graphically on time-series plots in Appendix A. |
| D.2.g | Compliance Record Discussion - A comprehensive discussion of the compliance record, and the result of any corrective actions taken or planned that may be needed to bring the Discharger into full compliance with the waste discharge requirements. | A record of compliance is discussed in Section 2.5. |
| D.2.h | Summary of Changes - A written summary of the monitoring results and monitoring system(s), indicating any changes made or observed since the previous annual report. | Compliance-related issues are discussed in Sections 2.5 and 2.6; monitoring results/systems are discussed in Sections 4 and 5. |

Table 1
Omar Former Rendering Plant
Reporting Requirements of the Monitoring and Reporting Program

| Reporting Requirement as stated in Orders R9-2017-0114 & R9-2003-0080 (Addendum 2) | | |
|---|---|---|
| Cleanup and Abatement Order R9-2003-0080 (Addendum 2) | | Location in this report |
| F.3.a | Site Maintenance - A summary of semi-annual inspections and a discussion of any significant findings as described in Site Maintenance, Directive E of this Addendum. | Site maintenance is discussed in Section 5.4 and in Appendix G. |
| F.3.b | Flowrate/Direction - For each monitored groundwater body, a description and graphical presentation (e.g., arrow on a map) of the velocity and direction of groundwater flow under/around the site, based on water level elevations observed during the collection of the water quality data submitted in compliance with the Order. | Groundwater flowrate and direction are discussed in Section 4.1 and presented graphically on Figures 2 and 3. |
| F.3.c | Well Information - For each monitoring point, a description of the method and time of water level measurement; a description of the purging method used before sampling to remove stagnant water in the well, and a description of purging method used to collect groundwater samples from the well. | Sampling methods are discussed in Section 3.2. Water level measurements are reported in Table 3. |
| F.3.d | Sampling Information - For each monitoring point, a description of the type of pump or other device used, its vertical placement during sampling, and a detailed description of the information contained in Records of Monitoring Information, Directive D.2 of the Order. | Sampling information is provided in Section 3.2 and on collection logs in Appendix C. Results are reported on Tables 4-7 and in Appendix D. |
| F.2.e | Graphical Presentation of Analytical Data - For each monitoring point, the laboratory analytical data for all samples collected within at least the previous five calendar years presented in graphical format . Each graph shall plot the concentration of the constituent over time for a given monitoring point, at a scale appropriate to show trends or variations in water quality. | Analytical data is presented graphically on time-series plots in Appendix A. |
| F.2.f | Compliance Record Discussion - A comprehensive discussion of the compliance record, and the result of any corrective actions taken or planned that may be needed to bring the Discharger into full compliance with the waste discharge requirements. | A record of compliance is discussed in Section 2.5, and planned activities are included in Section 2.6. |
| F.2.g | Summary of Changes - A written summary of the monitoring results and monitoring system(s), indicating any changes made or observed since the previous annual report. | Compliance changes are discussed in Sections 2.5 and 2.6; monitoring results/systems are discussed in Sections 4 and 5. |
| F.2.h | Map - A topographic map at appropriate scale, showing the locations of all monitoring points and all background monitoring points, as well as the direction of ground water flow at the landfill site. | Topographic information is presented on Figure 5. |

Notes:

°C = degrees Celcius

ID = identification

ft = feet

mg/L = milligrams per liter

µS/cm = micro siemens per centimeter

MSL = mean sea level

mV = milli volts

NA = Data not available

NS = Not sampled; location gauged for water levels only

NTU = Nephelometric Turbidity Units

TPMW = temporary point monitoring well

ToC = top of casing

** = approximate surface elevation used*

Original Top of Casing reference elevation at MW-24 was 207.11.

Following construction and grading activities at Terrace 2, the well casing at MW-24 was cut down by 3.310 feet, and the surface was recompleted with a flush-grade well head security vault in June 2019.

Notes:

J - estimated value

MCL - Maximum Contaminant Level

NV - no value

RWQCB ESL - Regional Water Quality Control Board Environmental

Screening Levels, January 2019

U - not detected at or above the stated reporting limit

µg/L - micrograms per liter

Shaded cells indicated concentrations above MCLs and ESLs

Notes:

J - estimated value

MCL - Maximum Contaminant Level

NV - no value

RWQCB ESL - Regional Water Quality Control Board Environmental
Screening Levels, January 2019

U - not detected at or above the stated reporting limit

µg/L - micrograms per liter

WATER LEVELS MEASURED BY: DLS, NAH

WATER SAMPLES COLLECTED BY: DLS, NAH

GROUND WATER SAMPLE COLLECTION LOG

Project No.: 102405

Project Name: OMAR Former Rendering Site

Well ID: MW-02 Sample ID: MW-02

Site Location: Chula Vista, California

Date Collected: 8-11-2020 Time: 1254

Sample Collected by: DLS

Chain-of-Custody Control No.: _____

QC/Duplicate Sample Type: NONE ID: -

EQUIPMENT

Purging Method/Equipment: Low Flow

pH/Conductivity Meter No: 596128

Sampling Equipment/ID No.: GED T300

Water Level Meter ID: 35516

Flow Rate During Purging: 50 ml/min.

Flow Rate During Sampling: 50 ml/min. (VOA)

Note: Flow rate for VOAs should be no greater than 100 ml/minute.

Daily field instrument calibration verification performed? YES

PURGING INFORMATION

Measuring Point: Top of Casing

Drawdown depth limit (DDL) = DTW_i + 0.3 (ft): 37.48

Casing ID (in.): 4

Approximate depth of pump inlet (ft): 42

Depth to Water - Initial (DTW_i) (ft) 37.18

Depth to Well Bottom (ft) 46.9

PID Reading: 0.0

Screen Interval (ft): 36-46

CO₂: >200 mg/L
Ferrous Iron: 0 mg/L

If the water level is above the top of the screen, the pump should be set at the approximate mid-point of the screen. If the water level is below the top of the screen, set the pump between the water level and the bottom of the screen. ** Note: If there is less than 1.5ft of water, the well should be bailed dry and sampled on recharge.

GROUND WATER SAMPLE COLLECTION LOG

Project Name: Former OMAR Rendering Site
 Project No.: 102405

Site Location: 1886 Auto Park Pl. Chula Vista, CA

Sample ID: TPMW-01

Well ID: TPMW-01

Duplicate Sample ID: —

EQUIPMENT / NOTES

Date / Time Collected: 1/20/2021 @ 1140

Purging Method/Equipment: Micropurge

Sample Collected by: DLS

Sampling Equipment/ID No.: Non-dedicated Bladder Pump #: 1.5' QED

pH Meter #: 596128

Flow Rate During Purging: 50 mL

Water Level Meter #: —

Flow Rate During Sampling: 50 mL

Note: Flowrate for VOC sampling should be no greater than 100 ml/min

Daily field instrument calibration verification performed?

Drawdown depth limit (DDL) = DTWI + 0.3': —

PURGING INFORMATION

Approximate depth of pump inlet (feet): 2.5'

Measuring Point: Top of Casing

PID Reading: 0.0

Casing size: TEMPORARY WELL

Ferrous Iron: 0 mg/L

Screened Interval: DUG TO 3'

CO₂: 2200 mg/L

Depth to Water - Initial (DTWI) (ft): —

Weather Conditions: OVERCAST

Depth to Well Bottom (ft): 3'

Temperature: 70

| Time of Reading | Purge Rate (ml/min) | Dynamic Depth to Water | Conductivity (µS/cm) | Temperature (°C / F) | pH | Turbidity (NTU) | ORP | DO (mg/L) |

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

GC/MS VOA

| Qualifier | Qualifier Description |
|-----------|--|
| * | LCS or LCSD is outside acceptance limits. |
| B | Compound was found in the blank and sample. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| F2 | MS/MSD RPD exceeds control limits |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

GC/MS Semi VOA

| Qualifier | Qualifier Description |
|-----------|--|
| F1 | MS and/or MSD recovery exceeds control limits. |

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|---|
| 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| F1 | MS and/or MSD recovery exceeds control limits. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| B | Compound was found in the blank and sample. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |

Narrative

Job Narrative 570-35586-1

Comments

No additional comments.

Receipt

The samples were received on 8/11/2020 6:25 PM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.0° C and 3.5° C.

GC/MS VOA

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-87321.

Method 8260B: The method blank for analytical batch 570-87532 contained Chloroform above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for the following sample associated with analytical batch 570-87532 were outside control limits: MW-03 (570-35586-5[MS]) and MW-03 (570-35586-5[MSD]). The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with analytical batch 570-88196.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA

Method 8270C: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-87594 and analytical batch 570-87892 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

HPLC/IC

Method 300.0: Due to the high concentration of Sulfate, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 570-86937 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method 300.0: The following samples were diluted due to the nature of the sample matrix: MW-03 (570-35586-5[MS]) and MW-03 (570-35586-5[MSD]). Because of this dilution, the matrix spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

Method 300.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for Orthophosphate as P analytical batch 570-87205 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-89513 and analytical batch 570-89598 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6010B: Due to the high concentration of Calcium and Magnesium, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-89513 and analytical batch 570-89598 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Case Narrative

Client: Aptim Environmental & Infrastructure Inc
Project/Site: Omar Former Rendering Plant - Program Wells

Job ID: 570-35586-1

Job ID: 570-35586-1 (Continued)

Laboratory: Eurofins Calscience LLC (Continued)

Method 6010B: Due to the high concentration of Sodium, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-89513 and analytical batch 570-89763 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Lab Admin

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

List Number: 1

Creator: Ramos, Maribel

List Source: Eurofins Calscience

| Question | Answer | Comment |
|--|--------|---------|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Job ID: 570-35704-1

Qualifiers

GC/MS VOA

| Qualifier | Qualifier Description |
|-----------|--|
| * | LCS or LCSD is outside acceptance limits. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| me | LCS Recovery is within Marginal Exceedance (ME) control limit range (± 4 SD from the mean). |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| F2 | MS/MSD RPD exceeds control limits |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Comments

No additional comments.

Receipt

The samples were received on 8/12/2020 7:00 PM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.3° C.

GC/MS VOA

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-88333.

Method 8260B: Unless there is a specific client QAPP requirement, the reported analyte list for batch quality control samples (LCS, LCSD, MS, and MSD) is in accordance with EPA Method 8260B. Refer to the QC Sample Results section of this report. (LCS 570-88333/3)

Method 8260B: The lot test of the laboratory trip blank water associated with 200529A indicated a detection above the method detection limit (MDL) for the following analyte(s): Methylene Chloride.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-88612.

Method 8260B: The method blank for analytical batch 570-88612 contained Chloroform above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

HPLC/IC

Method 300.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for Orthophosphate as P analytical batch 570-87490 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-89918 and analytical batch 570-90161 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6010B: Due to the high concentration of Calcium, Magnesium and Sodium the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-89918 and analytical batch 570-90161 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Lab Admin

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

| Question | Answer | Comment |
|---|--------|---------|
| Radioactivity wasn't checked or is \leq background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <math><6\text{mm}</math> (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

GC/MS VOA

| Qualifier | Qualifier Description |
|-----------|--|
| * | LCS or LCSD is outside acceptance limits. |
| B | Compound was found in the blank and sample. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

HPLC/IC

| Qualifier | Qualifier Description |
|-----------|---|
| 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |

Metals

| Qualifier | Qualifier Description |
|-----------|---|
| 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| B | Compound was found in the blank and sample. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|----------------|---|
| α | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Comments

No additional comments.

Receipt

The samples were received on 8/11/2020 6:25 PM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.0° C.

GC/MS VOA

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-87321.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-87320.

Method 8260B: The method blank for analytical batch 570-87532 contained Chloroform above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for the following sample associated with analytical batch 570-87532 were outside control limits: (570-35586-A-5 MS) and (570-35586-A-5 MSD). The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with analytical batch 570-88196.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

HPLC/IC

Method 300.0: Due to the high concentration of Sulfate, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 570-86937 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method 300.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for Orthophosphate as P analytical batch 570-87205 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-89513 and analytical batch 570-89598 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6010B: Due to the high concentration of Calcium and Magnesium, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-89513 and analytical batch 570-89598 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method 6010B: Due to the high concentration of Sodium, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-89513 and analytical batch 570-89763 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.
