1 Project Description

1.1 Introduction

This Health Risk Assessment (HRA) analyzes the possible health effects associated with toxic air contaminant (TAC) emissions to students and workers at the proposed project site due to proximity to the nearby Interstate 405 (I-405). The Valor Elementary School Project (“Proposed Project” or “Project”) would involve construction and operation of an elementary school approximately 440 feet east of Interstate 405 (I-405).

1.2 Executive Summary

This HRA reviews TAC emissions from nearby roadway sources (I-405) to sensitive receptors on the project site. Sensitive receptors are more susceptible to adverse health effects from traffic pollution due to their age and health status. The South Coast Air Quality Management District (SCAQMD) identifies typical sensitive receptor locations in residences, schools, playgrounds, childcare sites, hospitals, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes (County of Los Angeles 2019). Therefore, this HRA reviews toxic air emissions from nearby roadway sources to the Project's elementary school classrooms and play areas.

The Project entails development of one and two-story, 26.5-foot-tall elementary school building with 28 classrooms for grades transitional kindergarten through fourth. In addition, the Project would construct a multi-purpose room, two play areas, a kindergarten play area, administrative spaces, corridors and storage spaces, and a surface parking lot with an ingress/egress driveway off Plummer Street. This HRA conducts site-specific air dispersion modeling to determine whether health risks to future elementary school students and workers would exceed the SCAQMD's health risk criteria for sensitive receptors

The California Air Resources Board's (CARB) *Air Quality and Land Use Handbook: A Community Health Perspective* recommends that local agencies avoid siting new, sensitive land uses within specific distances of potential sources of TACs, such as freeways and high-traffic roads, distribution centers, railroads, and ports (CARB 2005). In particular, CARB recommends that local agencies avoid siting new, sensitive land uses within 500 feet of a freeway. The primary concern is the effect of diesel particulate matter (DPM), a TAC, on sensitive uses. The project site is located approximately 440 feet east of I-405. Near the project site, the primary source of DPM is truck traffic traveling on the I-405 mainline. In California, approximately 70 percent of total known cancer risk related to air toxics is attributable to DPM (CARB 2022). In addition to DPM, this analysis also examined five other vehicle exhaust pollutants of concern that are emitted from both diesel and gasoline-fueled vehicles: acrolein, acetaldehyde, formaldehyde, benzene, and 1,3-butadiene.

Cancer risk is expressed as the maximum number of new cases of cancer projected to occur in a population of one million people due to exposure to the cancer-causing substance, typically over a specific exposure duration, such as the high-end residency (95th percentile) of 30 years (SCAQMD 2017). Since the students would only be exposed to cancer risks during their tenure at the school, an exposure duration scenario from 3rd trimester to 11 years old¹, and five to 11 years old were

¹ This is a conservative user defined exposure duration since the age intensity factor from 3rd trimester to two years old is ten, compared to a factor of three from age two through 16. The youngest students would be in the transitional kindergarten classrooms.

evaluated. In addition, a 25-year exposure duration scenario was evaluated for elementary school workers, recommended by SCAAQMD in in Assembly Bill 2588 and Rule 1402 Supplemental Guidelines, and Risk Assessment Procedures for Rules 1401, 1401.1, and 212 (2017).

An analysis using the Lakes Environmental American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) View model (version 10.2.1) and CARB's Hotspots Analysis and Reporting Program 2 (HARP 2) risk analysis tool determined that the maximum exposed individual receptor (MEIR) on the project site would be exposed to a high end (95th percentile), 11-year excess cancer risk of approximately 1.97 in one million, which is below SCAQMD's recommended cancer risk criteria of 10 excess cases of cancer in one million individuals (1.0E-05) (SCAQMD 2019). Potential acute and chronic (such as lung inflammation, immune suppression, and immune sensitization) health risks for on-site residential units were also determined to be within SCAQMD health risk criteria. The maximum exposed individual worker (MEIW) would be exposed to a high-end point estimate (95th percentile) and a mean (65th percentile) point estimate for the exposure pathways (Inhalation, soil, breast milk, etc.). In addition, 25-year excess cancer risk of approximately 0.212 in one million, which is below SCAQMD's recommended cancer risk criteria of 10 excess cases of cancer in one million individuals (1.0E-05). In addition, elementary school workers' potential acute and chronic health risks for were determined to be below the health risk thresholds.

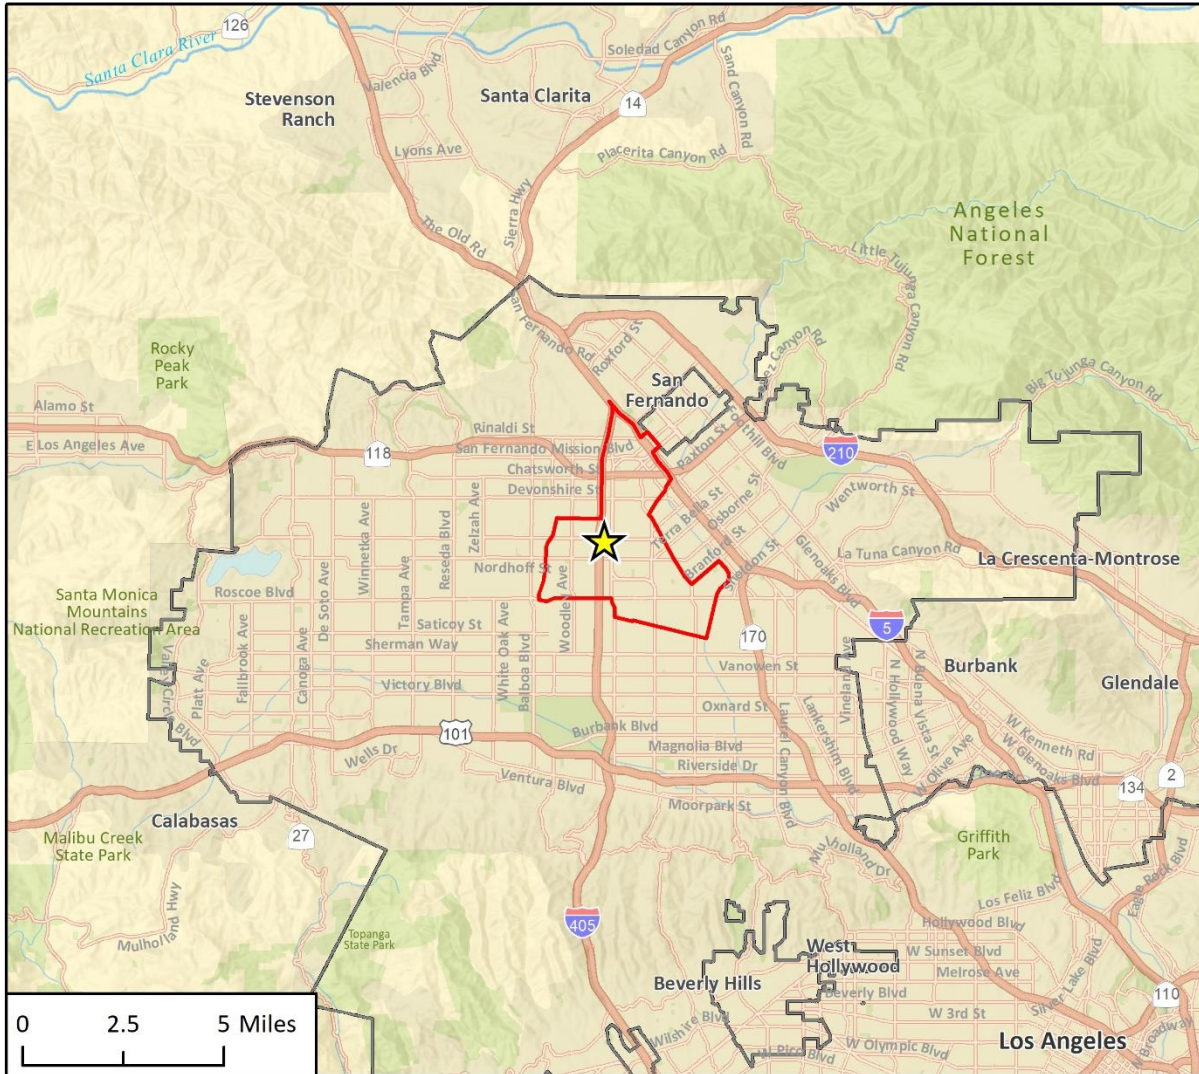

1.3 Project Site and Description

The Project entails development of one and two-story, 26.5-foot-tall elementary school building with 28 classrooms for grades transitional kindergarten through fourth.² In addition, the Project would construct a multi-purpose room, two play areas, a kindergarten play area, administrative spaces, corridors and storage spaces, and a surface parking lot with an ingress/egress driveway off Plummer Street. The elementary school building would have a total building area of 34,755 square feet and would accommodate a maximum enrollment of 552 students. The Proposed Project is approximately 440 feet east of the I-405 and surrounded by residential uses in all directions. Primary vehicular access to the project site would be provided by an entrance located along Plummer Street.

Figure 1 shows the Project's regional location. Figure 2 shows the project site location.

² The building height to the roof level is 24 feet; however, the maximum building height is 26.5 feet due to the 2.5-foot-tall parapet above roof level.

2 Background

2.1 Local Climate and Meteorology

The project site is in the South Coast Air Basin (SCAB), which is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east, and includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties, in addition to the San Geronio Pass area in Riverside County. The regional climate in the SCAB is considered semi-arid and is characterized by warm summers, mild winters, infrequent seasonal rainfall, moderate daytime onshore breezes, and moderate humidity. The air quality within the SCAB is primarily influenced by meteorology and a wide range of emissions sources, such as dense population centers, substantial vehicular traffic, and industry.

2.2 Toxic Air Contaminants

A TAC is an air pollutant that may cause or contribute to an increase in mortality or serious illness or which may pose a present or potential hazard to human health. TACs may result in long-term health effects such as cancer, birth defects, neurological damage, asthma, or genetic damage, or short-term acute effects such as eye watering, respiratory irritation, runny nose, throat pain, and headaches. TACs are considered either carcinogenic or non-carcinogenic based on the nature of the health effects associated with exposure. For carcinogenic TACs, potential health impacts are evaluated in terms of overall relative risk expressed as excess cancer cases per one million exposed individuals. Non-carcinogenic TACs differ in that there is generally assumed to be a safe level of exposure below which no negative health impact is believed to occur. These levels are determined on a pollutant-by-pollutant basis.

Diesel Particulate Matter

Fine particulates are generally associated with combustion processes and form in the atmosphere as a secondary pollutant through chemical reactions. PM₁₀ (particulate matter measuring no more than 10 microns in diameter) is a by-product of fuel combustion and wind erosion of soil and unpaved roads, and it is directly emitted into the atmosphere through these processes. Chemical reactions in the atmosphere also create PM₁₀. Fine particulate matter poses a serious health threat to all groups, but particularly to the elderly, children, and those with respiratory problems. More than half of the fine particulate matter inhaled into the lungs remains there, which can cause permanent lung damage. These materials can damage health by interfering with the body's mechanisms for clearing the respiratory tract or by acting as carriers of an adsorbed toxic substance.

Diesel engine fuel combustion forms an important fraction of the particulate matter emission inventory, as particulates in diesel emissions are very small and readily respirable. The particles have hundreds of chemicals adsorbed onto their surfaces, including many known or suspected mutagens and carcinogens. The Office of Environmental Health Hazard Assessment (OEHHA) reviewed and evaluated the potential for diesel exhaust to affect human health, and the associated scientific uncertainties (CARB 1998). Based on the available scientific evidence, it was determined that a level of DPM exposure, below which no carcinogenic effects are anticipated, has not been identified. The Scientific Review Panel that approved the OEHHA report determined that, based on studies to date, 3×10^{-4} micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) is a reasonable estimate of the unit risk for DPM. This

means that a person exposed to a DPM concentration of $1 \mu\text{g}/\text{m}^3$ continuously over the course of a lifetime has a 3 in 10,000 chance (or 300 in one million chance) of contracting cancer due to this exposure. According to South Coast Air Quality Management District (SCAQMD) in 2018, the SCAB portion of Los Angeles County bears the greatest average cancer risk of 497 per one million. The Burbank Area air monitoring station, approximately 3.65 miles northwest of the project site, measured a total health risk of 526 per one million (SCAQMD 2021). Therefore, CARB has determined these particulate emissions to be a TAC.

DPM has a significant impact on California's population. It is estimated that about 70% of total known cancer risk related to air toxics in California is attributable to DPM. Based on 2012 estimates of statewide exposure, DPM is estimated to increase statewide cancer risk by 520 cancers per million residents exposed over a lifetime (CARB 2022).

CARB staff have conducted risk characterization scenarios to determine the potential excess cancer risks involved when individuals are near various sources of diesel engine emissions, ranging from school buses to high volume freeways. The purpose of the risk characterization was to estimate, through air dispersion modeling, the cancer risk associated with typical diesel-fueled engine or vehicle activities based on modeled PM concentration at the point of maximum impact. The study included various sources of DPM emissions, including idling school buses, truck stops, low- and high-volume freeways, and other sources. High-volume freeways (20,000 trucks per day) were estimated to cause 800 to 1,700 per million potential excess cases of cancers, while low-volume freeways (2,000 trucks per day) were estimated to cause about 100 to 200 per million potential excess cases of cancers (CARB 2000).

Other Mobile Source Contaminants

Besides DPM, several other pollutants that are a public health concern are emitted by vehicle exhausts. The United States Environmental Protection Agency (USEPA) has identified six pollutants of highest priority: diesel particulate matter, acrolein, acetaldehyde, formaldehyde, benzene, and 1,3-butadiene. The latter five pollutants are part of the total organic gases emitted by diesel fueled vehicles. A brief description of each of these chemicals follows:

- **Acrolein** is the simplest unsaturated aldehyde. It is a widely produced substance with a piercing, disagreeable, acrid smell similar to that of burning fat. Acrolein is an unstable toxic substance that can burn the nose and throat and is a severe pulmonary irritant. It is a flammable and poisonous substance prepared industrially by the oxidation of propene. Small amounts of acrolein are formed and enter the air when trees, tobacco, other plants, gasoline, and oil are burned.
- **Acetaldehyde**, sometimes known as ethanol, is an organic chemical compound used as an intermediate in the production of acetic acid, certain esters, and a number of other chemicals. It is a flammable liquid with a fruity smell. Acetaldehyde is a toxic when applied externally for prolonged periods, an irritant, and a probable carcinogen.
- **Formaldehyde** is an organic chemical compound containing a terminal carbonyl group. It is produced in the atmosphere by the action of sunlight and oxygen on atmospheric methane and other hydrocarbons, becoming a part of smog. Additionally, formaldehyde is an intermediate in the oxidation (or combustion) of methane as well as other carbon compounds including automobile exhaust. Formaldehyde is a flammable substance that can be toxic, allergenic, and carcinogenic. It is naturally made in small amounts in human bodies and is found in small amounts in household sources, such as fiberglass, carpets, permanent press fabrics, paper products, and some household cleaners.

- **Benzene**, or benzol, is an organic chemical compound and a known carcinogen. It is a colorless and highly flammable liquid with a sweet smell and a relatively high melting point. Benzene is an important industrial solvent and precursor in the production of drugs, plastics, synthetic rubber, and dyes. Benzene is a natural constituent of crude oil and may be synthesized from other compounds present in petroleum. It is found in gasoline and cigarette smoke. Natural sources of benzene include emissions from volcanoes and forest fires.
- **1,3-Butadiene** is an important industrial chemical used in the production of synthetic rubber (about 75 percent of manufactured 1,3-butadiene), which is then used primarily in the production of automobile tires. It is a colorless gas with a mild gasoline-like odor. Gasoline contains small amounts that are exhausted into the air after the combustion process. It is a carcinogen, highly irritative, and flammable.

2.3 Air Quality Regulation

Federal and state governments have established ambient air quality standards for the protection of public health. The USEPA is the federal agency designated to administer air quality regulation, while the CARB is the state equivalent in the California Environmental Protection Agency (CalEPA). County-level Air Quality Management Districts (AQMDs) provide local management of air quality. The CARB has established air quality standards and is responsible for the control of mobile emission sources, while the local AQMDs are responsible for enforcing standards and regulating stationary sources. The SCAQMD is the designated air quality control agency in the SCAB.

Toxic Air Contaminants

In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health (Assembly Bill [AB] 1807: Health and Safety Code Sections 39650–39674). The Legislature established a two-step process to address the potential health effects from TACs. The first step is the risk assessment (or identification) phase. The second step is the risk management (or control) phase of the process.

The California Air Toxics Program establishes the process for the identification and control of TACs and includes provisions to make the public aware of significant toxic exposures and for reducing risk. Additionally, the Air Toxics “Hot Spots” Information and Assessment Act (AB 2588, 1987, Connelly Bill) was enacted in 1987 and requires stationary sources to report the types and quantities of certain substances routinely released into the air. The goals of the Air Toxics “Hot Spots” Act are to collect emission data, identify facilities having localized impacts, ascertain health risks, notify nearby residents of significant risks, and reduce those significant risks to acceptable levels. The Children’s Environmental Health Protection Act, California Senate Bill 25 (Chapter 731, Escutia, Statutes of 1999), focuses on children’s exposure to air pollutants. The act requires CARB to review its air quality standards from a children’s health perspective, evaluate the statewide air quality monitoring network, and develop any additional air toxic control measures needed to protect children’s health.

The SCAQMD regulates TAC emission’ in the SCAB. SCAQMD’s Rule 1401, *New Source Review of Toxic Air Contaminants*, establishes limits for maximum individual cancer risk, cancer burden, and non-cancer acute and chronic hazard indices from new permit units, relocations, or modifications to existing permit units emitting various TACs. Benzene, including benzene from gasoline, is included on SCAQMD’s list of TACs subject to cancer risk and non-cancer hazard index limits.

Passage of Proposition 65 (encoded in California Health and Safety Code Section 25249.6) in 1986 prohibits a person in the course of doing business from knowingly and intentionally exposing any

individual to a chemical that has been listed as known to the state to cause cancer or reproductive toxicity without first giving clear and reasonable warning. For a chemical that is listed as a carcinogen, the “no significant risk” level under Proposition 65 is defined as the level that is calculated to result in not more than one excess case of cancer in 100,000 individuals (1.0E-05). The SCAQMD recommends the use of this risk level (also reportable as 10 in one million) as the significance threshold for toxic air contaminants (SCAQMD 2019).

The Air Toxic “Hot Spots” Information and Assessment Act of 1987 (AB 2588) seeks to identify and evaluate risk from air toxics sources but does not directly regulate air toxics emissions. Under AB2588, TAC emissions from individual facilities are quantified and prioritized. “High priority” facilities are required to perform a health risk assessment and, if specific thresholds are violated, are required to communicate the results to the public in the form of notices and public meetings. Although TACs and PM_{2.5} tend to be localized and are found in relatively low concentrations in ambient air, exposure to low concentrations over extended periods can result in increased risk of cancer and/or adverse health effects in local communities.

The City of Los Angeles Planning Commission (PC) provides Zoning Information Number 2427 (Z.I. No. 2427) to advise applicants that there are risks associated with sensitive uses within 1,000 feet of freeways. The PC uses the Freeway Adjacent Advisory Notice to address concerns about planning projects involving sensitive uses (e.g., schools) within 1,000 feet of a freeway. This notice advises applicants to use methods that analyze and reduce risks related to TAC emissions from freeways. Specifically, Z.I. No. 2427 suggests that project applicants conduct a site-specific HRA, improve indoor air quality with minimum efficiency reporting value (MERV)-Rated or high-efficiency particulate air (HEPA) filtration equipment, and further reduce exposure to TACs through various project design strategies. Furthermore, Article 5 and Article 9 in Chapter IX of the Los Angeles Municipal Code requires MERV 13 filters on all buildings within 1,000 feet of a freeway.

2.4 Sensitive Receptors

SCAQMD Risk Assessment Procedures define receptors as any location outside the boundaries of a facility at which a person could experience repeated, continuous exposure. The procedures further note that sensitive receptors include any residence (e.g., private homes, condominiums, apartments, and living quarters), schools (including preschools and daycare centers), health facilities (e.g., hospitals, retirement and nursing homes, long-term care hospitals, hospices), as well as prisons, dormitories, or similar live-in housing where children, chronically ill individuals, or other sensitive persons could be exposed to TACs (OEHHA 2015). The project would add permanent sensitive receptors approximately 440 feet east of I-405 that will expose them to TAC emissions. The project would include a one and two-story, 26.5-foot-tall elementary school building with 28 classrooms for grades transitional kindergarten through fourth. The elementary school would accommodate a maximum enrollment of 552 students.

3 Impact Analysis

3.1 Methodology

3.1.1 Air Dispersion Modeling

Site-specific air dispersion modeling was conducted using AERMOD. Mobile source TAC emissions associated with vehicle traffic on I-405 were estimated based on the methodology and spreadsheet developed by the UC Davis-Caltrans Air Quality Project, Estimating Mobile Source Air Toxics Emissions [MSAT]: A Step-By-Step Project Analysis Methodology (2006). This spreadsheet was designed to estimate the total amount of the six pollutants of concern discussed in Section 2.2, *Toxic Air Contaminants*, based on total organic gases emission factors and diesel particulate emission factors from EMFAC2021. The analysis was based on year 2024 composite emission factors. The UC Davis-Caltrans spreadsheet contains speciation factors from the CARB, and the USEPA’s Motor Vehicle Emission Simulator (MOVES; USEPA 2016) was used to supplement missing values for acrolein. These emission and speciation factors were then multiplied by traffic volumes for the mainline to obtain total emissions from I-405 within one-half mile of the project site. The project site is not near any associated freeway on- and off-ramps within 500 feet. Emission factors for this study were based on grams per mile. Spreadsheet outputs from the UC Davis-Caltrans MSAT model and composite emission rates are contained in Appendix A.

For mainline I-405 emissions, emission factors were based on the posted speed limit of 65 miles per hour (mph). Traffic volumes for the I-405 mainline were obtained from California Department of Transportation (Caltrans) *2020 Traffic Volumes on California State Highways*, the most recently available traffic count information. According to the Caltrans traffic data (2020a), the Annual Average Daily Traffic (AADT) volume along I-405 north of Nordhoff Street is 195,000 vehicles, while AADT south of Nordhoff Street is 193,000 vehicles. Based on Caltrans *2020 Annual Average Daily Truck Traffic on the California State Highway System* (2020b), truck traffic comprises approximately 6.4 percent of vehicle traffic on I-405 between Sherman Way and Saticoy Street, which is the closest freeway segment with available Caltrans truck traffic data to the project site. In addition, the truck traffic percentage is conservative since it’s the largest published truck traffic percentage on I-405. Table 1 summarizes mainline segment AADT and truck traffic percentages used in modeling.

Table 1 Freeway and Ramp Traffic and Truck Percentages

Roadway/Ramp Segment	Average Annual Daily Traffic (AADT)	Truck Traffic Percentage (%)
Interstate 405 Mainline		
North of Nordhoff Street	195,000	6.40
South of Nordhoff Street	193,000	6.40

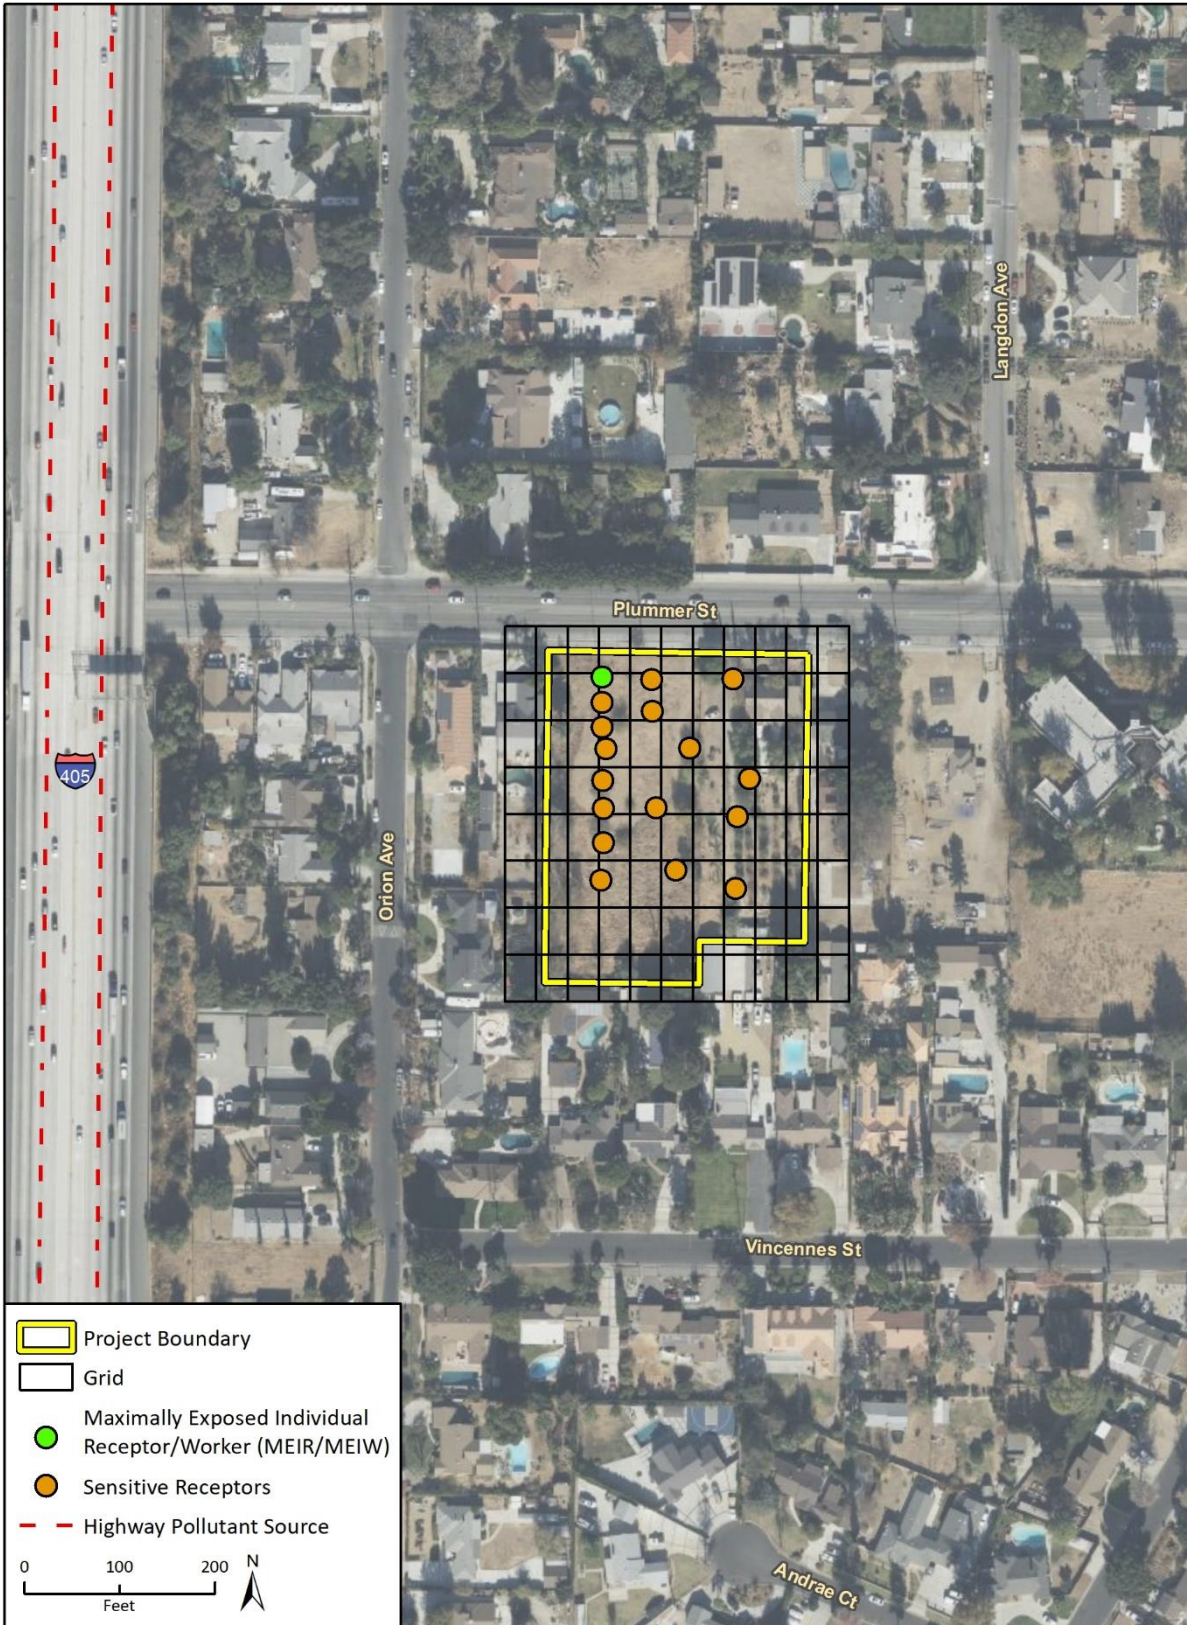

Sources: Caltrans 2020a, 2020b.

The AERMOD modeling includes 24 representative sensitive receptor locations in a grid throughout the project site. As discussed in Section 1, *Project Description*, the proposed is a one and two-story, 26.5-foot-tall elementary school with 28 classrooms for grades transitional kindergarten through fourth. Discrete receptors were placed on the grid on the ground floor (zero feet) and the second

floor, approximately 12 feet (3.66 meters) high. A 10-by-10-point receptor grid with 10 meters by 15-meter spacing was used for modeling. Figure 3 depicts the sources, receptor grid, and sensitive receptors.³

³ Seven sensitive receptors are on the second floor and superimposed on several of the sensitive receptors shown in Figure 3.

Figure 3 Sources and Receptors

Imagery provided by Microsoft Bing and its licensors © 2022.

Fig. 3 Sources and Receptors

AERMOD was used to calculate the concentrations of TACs at the project site. AERMOD is a steady-state, multiple-source, Gaussian dispersion model. The AERMOD model requires hourly meteorological data consisting of wind vector, wind speed, temperature, stability class, and mixing height. Specific meteorology and terrain data from SCAQMD's Van Nuys Airport air monitoring station (of the closest station to the project site) and the United States Geological Survey (USGS) Digital Elevation Model (DEM) data for the Van Nuys and San Fernando Quadrangle were input to the model. The project site base elevation is approximately 264 meters above mean sea level (amsl). I-405 varies in elevation between approximately 256 and 274 meters amsl along the length of the approximately one-mile segment modeled. The dispersion model considers these differences in topography. The I-405 mainline within a half-mile of the project site was modeled as line volume sources in AERMOD. The presence of buildings and other structures disturbs downwind air flow. However, building downwash is only calculated for point sources and is not appropriate to include in AERMOD for this HRA. The plume height was based on an average for light- and heavy-duty vehicles (SBCAPCD 2020).⁴

3.1.2 Health Risk Modeling

The CARB Hot Spots Analysis and Reporting Program 2 (HARP) Version 2.1.5 was used to calculate the potential risk values associated with the worst-case one-hour and average annual toxic emission concentrations at Project receptors. Risk was assessed for elementary students from 3rd trimester to 11 years old, and 5 years old to 11 years old. The elementary school workers were analyzed using SCAQMD-recommended exposure duration of 25 year. Elementary student risk was assessed by including all mandatory minimum pathways in the risk analysis and calculated the Risk Management Policy (RMP) using the Derived Method for cancer risks and the OEHHA Derived Method using the 95th percentile breathing rates for non-cancer risks. Worker exposure was assessed by including worker minimum pathways and was calculated using the OEHHA Derived Method. A 73 percent fraction of time-at-home was applied for age groups older than 16 years, consistent with SCAQMD procedures (SCAQMD 2017).

As discussed in Section 2.3, *Air Quality Regulation*, the City of Los Angeles requires all new sensitive use structures constructed within 1,000 feet of a freeway to install MERV 13 air filters in the building ventilation systems. Furthermore, Subchapter 7, Section 150(m) of the 2019 California Energy Code requires the use of MERV 13 filters in all new buildings. Therefore, this analysis includes an adjustment for MERV 13 filters, which remove approximately 90 percent of DPM from the intake air (Singer *et al.* 2016). The risk adjustment was based on the USEPA-recommended daily activity pattern of 19.6 hours per day spent inside and 4.4 hours per day outside, and a 180-day per year exposure frequency (USEPA 2011; Bay Area Air Quality Management District 2016). See Appendix B for the MERV 13-adjusted results.

3.2 Significance Thresholds

The SCAQMD recommends the use 10 in one million cancer risk as the significance threshold for TACs (SCAQMD 2019).

⁴ If multiple pollutants are being modeled and the emission factors vary significantly for different vehicle types, then determine the Top of Plume Height based on the traffic volume weighted approach.

The SCAQMD also recommends that the non-carcinogenic hazards of toxic air contaminants should not exceed a hazard index (the summation of the hazard quotients for all chemicals to which an individual would be exposed) of 1.0 for either chronic or acute effects (SCAQMD 2019).

3.3 Results

3.3.1 Air Dispersion Modeling and Risk Analysis Results

Health risks for a total of 24 sensitive receptor points distributed throughout the project site were modeled. Each of these receptors represents a proposed location of the elementary school classrooms and play areas. A receptor grid was used to evaluate whether sensitive receptor locations reflected the pattern of exposure. Acute and chronic risk were determined for maximum hour and maximum annual exposure. Risk levels for the maximally exposed individual receptor (MEIR) and maximally exposed individual worker (MEIW) are shown in Table 2. Refer to Appendix A for more detailed accounting of total health risks for all receptors of concern.

As shown in Table 2, the MEIR would be exposed to a high-end (95th percentile), 11-year excess cancer risk of approximately 1.97 in one million, which does not exceed the threshold of ten excess cases of cancer in one million individuals (1.0E-05) (SCAQMD 2019). In addition, potential chronic and acute (such as lung inflammation, immune suppression, and immune sensitization) health risks were approximately 0.0029 and 0.011, respectively, which also do not exceed the threshold of 1.0. In addition, the MEIW would be exposed to excess cancer risk of approximately 0.212 in one million,⁵ which does not exceed the threshold of ten excess cases of cancer in one million individuals (1.0E-05) (SCAQMD 2019). The potential chronic and acute health risks for the worker were approximately 0.0029 and 0.011, respectively, which are also less than the threshold of 1.0. Therefore, sensitive student and worker receptors at the proposed elementary school would not experience cancer, chronic, and acute health risk exceeding the health risk thresholds. Therefore, no further action is recommended for the HRA.

⁵ Based on a high-end point estimate for soil and breast milk exposure pathways and a mean point estimate for the remaining pathways for an SCAQMD-recommended 25-year exposure period.

Table 2 Potential Health Risks at the MEIR

	Maximum Exposed Individual Resident (MEIR) ¹	Maximum Exposed Individual Worker (MEIW) ²
Cancer Risk		
Incremental Excess Cancer Risk	1.97 in one million (ground floor) ³	0.212 in one million (ground floor) ⁴
<i>Threshold</i>	<i>10 in one million</i>	<i>10 in one million</i>
Threshold Exceeded?	No	No
Chronic Risk		
Chronic Hazard Index	0.0029 (ground floor)	0.0029 (ground floor)
<i>Threshold</i>	1.0	1.0
Threshold Exceeded?	No	No
Acute Risk		
Acute Hazard Index	0.011 (ground floor)	0.011 (ground floor)
<i>Threshold</i>	1.0	1.0
Threshold Exceeded?	No	No

¹ Highest cancer risk for student exposure from 3rd trimester to 11 years old and 5 to 11 years old. Cancer risk includes adjustment for use of MERV 13 filters, pursuant to Los Angeles Municipal Code and 2019 California Energy Code requirements. The MEIR is a student classroom located in the northwestern portion of the building on the ground floor. For cancer, chronic, and acute risk, the MEIR is Receptor ID 112 ground floor.

² Based on 25-year worker exposure. Cancer risk includes adjustment for use of MERV 13 filters, pursuant to Los Angeles Municipal Code and 2019 California Energy Code requirements. The MEIW is a worker located in the northwestern portion of the building on the ground floor. For cancer, chronic, and acute risk, the MEIW is Receptor ID 112 ground floor).

³ Cancer risk without MERV 13 is 3.62 in one million.

⁴ Cancer risk without MERV 13 is 0.39 in one million

See Appendix A for model outputs and summary form and Appendix B for the MERV 13-adjusted cancer risk.

PAGE 1

*** MODELOPTs: NonDEFAULT CONC FLAT FLGPOL URBAN ADJ_U*

*** MODEL SETUP OPTIONS SUMMARY

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 84 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 9818605.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

ADJ_U* - Use ADJ_U* option for SBL in AERMET

CCVR_Sub - Meteorological data includes CCVR substitutions

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: FREEWAY

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 84 Source(s); 3 Source Group(s); and 124
Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)

and: 84 VOLUME source(s)

and: 0 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with a total of 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor

Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE

Keyword)

Model Outputs External File(s) of High Values for Plotting (PLOTFILE

Keyword)

Model Outputs Separate Summary File of High Ranked Values (SUMMFILE

Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and

Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 235.00 ; Decay
Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ;
Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: 15526-15544 Plummer Street.err

**File for Summary of Results: 15526-15544 Plummer Street.sum

HARP2 - HRACalc (dated 21081) 7/7/2022 3:25:26 PM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully

RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: Cancer
Calculation Method: Derived

EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: -0.25
Total Exposure Duration: 11

Exposure Duration Bin Distribution

3rd Trimester Bin: 0.25
0<2 Years Bin: 2
2<9 Years Bin: 0
2<16 Years Bin: 9
16<30 Years Bin: 0
16 to 70 Years Bin: 0

PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: True
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

INHALATION

Daily breathing rate: LongTerm24HR

****Worker Adjustment Factors****
Worker adjustment factors enabled: NO

****Fraction at time at home****
3rd Trimester to 16 years: OFF
16 years to 70 years: ON

SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Warm

HOMEGROWN CROP PATHWAY SETTINGS

Household type: HouseholdsthatGarden
Fraction leafy: 0.137
Fraction exposed: 0.137
Fraction protected: 0.137
Fraction root: 0.137

TIER 2 SETTINGS

Tier2 adjustments were used in this assessment. Please see the input file for details.

Appendix B: MERV 13-Adjusted Health Risk Results

RINCON CONSULTANTS, INC.
Environmental Scientists | Planners | Engineers
rinconconsultants.com

Valor Elementary School: Adjusted Potential Carcinogenic Health Risks Within the Project Site

Calculation from Birth to Fourth Grade

	Factor
EF = Exposure frequency in days per year	180
EFa = Exp. Freq adjusted outside; only 4.4 hours/day outside	33
EFai = Exp. Freq adjusted inside; 19.6 hours/day inside	147
FE = Filter Efficiency	90%
DPM = Percent of risk associated with DPM	62%

Equation =
$$\text{Adjusted Risk} = ((\text{Unadjusted Risk})/EF * Efa) + ((1 - (FE * DPM)) * ((\text{Unadjusted Risk})/EF * EFai))$$

Cancer Health Risk - 11 Year (Residency at 95th Percentile)

	Unadjusted Risk	Exceed Criterion? (10 ⁻⁵)	Adjusted Risk	Exceed Criterion? (10 ⁻⁵)
