TABLE OF CONTENTS

SECTION 1 - SUMMARY

PURPOSE

The purpose of this report is to document the hydrologic and hydraulic analyses performed in support of the Oak Valley North – Trailer Lot 1 project located in the city of Calimesa in the County of Riverside, California. The overall Oak Valley North project site (TPM 38589) consists of approximately 110 acres of predominantly vacant land, with one existing single-family residence in the west-central region of the site, and a natural watercourse running through the east-central region of the overall site. It is bounded by Calimesa Boulevard along the southwest, vacant land to the northwest, Beckwith Avenue to the northeast, and existing residential tracts to the southeast.

The Oak Valley North – Trailer Lot 1 project is bounded by Beckwith Ave to the northeast, and vacant land to the northwest, the Oak Valley North – Building 1 and 2 developments to the southwest, and the Oak Valley North – Trailer Lot 2 development to the southeast. The project proposes to build an industrial development on approximately 10 acres. This report will summarize the hydrologic and hydraulic analyses that were conducted in order to determine the necessary drainage improvements required to provide flood protection for the proposed building and safely convey the runoff through the site.

The scope of this report will include the following:

- Determine the peak 100-year and 10-year flow rates for the developed condition using the Riverside County Flood Control and Water Conservation District (RCFC&WCD) Rational Method.
- Determine the required storm drain facilities, alignment, and sizes required to flood protect the project site.
- Determine the necessary detention volume required to release flows such that they avoid causing hydromodification impacts and are consistent with the available capacity of the existing culverts.
- Preparation of a preliminary report summarizing the hydrology and hydraulic results.

DESCRIPTION OF WATERSHED

As previously described, the project is proposing an industrial development on approximately 16 acres of vacant land within the boundaries of the overall Oak Valley North project boundary. The overall Oak Valley North project and all areas within its boundary, including the Oak Valley North – Trailer Lot 1 project, is located within a proposed Specific Plan within the city of Calimesa.

The currently vacant overall Oak Valley North project site generally drains towards the southeast of the site, where existing culverts convey flows under Calimesa Boulevard and Interstate I-10 highway. The project site is currently impacted by offsite flow from the adjacent San Bernardino Mountains, located northeast of the overall Oak Valley North project site. The offsite flows combine with the existing onsite flows and are conveyed south through the site via existing streambed areas before ultimately discharging into the existing southerly Caltrans culverts. A separate drainage study titled "Hydraulic Analyses for Culverts Crossing I-10" was prepared by JLC Engineering & Consulting for an adjacent project to the south and encompasses the existing condition of the culverts toward which Oak Valley North drain. This report also describes how the project is impacted by offsite flows along Calimesa Boulevard as upstream culverts overflow to the ultimate local low point within the project frontage. This overflow and the existing onsite and offsite tributary flows currently backup onto the project site, causing flooding that does not overtop I-10 highway. Relevant excerpts from this report are included in **Appendix D**.

Existing elevations across the Oak Valley North – Trailer Lot 1 project site vary from 2334 to 2307 (NAVD88 datum). The site currently slopes down at approximately 3% grade from the northeast to the

southwest. The existing drainage pattern for the site and the general area is characterized by sheet flow. Existing flows outlet into culverts before ultimately discharging into San Timoteo Creek.

The project is located within the currently proposed Oak Valley North Specific Plan and is also within the Santa Ana River watershed area.

PROPOSED CONDITIONS

In the proposed condition of the Oak Valley North – Trailer Lot 1 project, onsite runoff will be conveyed throughout the site via proposed curbs and gutters. Onsite runoff will then be captured by a network of drainage inlets provided at low points. Proposed private underground storm drain conveys captured flows towards proposed biotreatment devices for water quality treatment. Modular Wetland System (MWS) vaults are being proposed to provide water quality treatment. (Additional information regarding the MWS vaults can be found in the separate PWQMP Report.) An underground chamber detention system with orifice outlets is proposed to release onsite flows for increased runoff and HCOC requirements.

All flows captured onsite are then conveyed towards a proposed storm drain outlet, which will be sized to convey the fully developed, routed flows generated by the Oak Valley North – Trailer Lot 1 project towards the proposed backbone storm drain line, and ultimately toward the existing culvert outlets. As in the existing condition, these culverts will outlet south of I-10 before ultimately discharging into San Timoteo Creek.

Offsite flows north of the project site will be intercepted by backbone improvements within Beckwith Avenue prior to impacting the Oak Valley North – Trailer Lot 1 project site. A separate drainage study for the overall Oak Valley North project encompasses these improvements.

This project site exists within the San Timoteo sub-basin of the Santa Ana River Watershed. The onsite and offsite flows will ultimately outlet into an existing unimproved natural channel within the River and Land Conservancy (RLC) parcel. As part of the RLC, the channel will remain undeveloped and is not within the City of Calimesa or Riverside County Flood Control maintenance responsibility. The RLC parcel flows to the San Timoteo Creek and ultimately to the Santa Ana River. A total of 4,600 acres are tributary to the drainages impacted by the project site. Approximately 110 acres are proposed for development with the Oak Valley North project, consisting of less than 3% of the total tributary area. The project increased runoff would be inconsequential to the overall drainage of the tributaries into a larger water body. The Oak Valley North project proposes to mitigate flows for HCOC requirements and for the capacities of the existing culverts that outlet onsite and offsite flows.

METHODOLOGY

HYDROLOGY

Hydrologic calculations were performed in accordance with the RCFC&WCD Hydrology Manual, dated April 1978. The Rational Method was utilized in determining peak flow rates.

The hydrological parameters, including rainfall values and soil types were derived from the RCFC&WCD Hydrology Manual. The isohyetal maps and soil map have been included in Section 2.

Rational Method calculations were performed using a computer program developed by CivilDesign Corporation and Joseph E. Bonadiman and Associates Inc. The computer program is commonly referred to as CivilD which incorporates the hydrological parameters outlined in the RCFC&WCD Hydrology Manual.

The Rational Method was used to determine the peak flow rates to size and design the drainage facilities need to convey onsite flows through the site to the proposed underground chambers. The flow rates were computed by generating a hydrologic "link-node" model in which the overall area is divided into separate drainage sub-areas, each tributary to a concentration point (node) determined by the proposed layout and grading.

The Unit Hydrograph Method was used to determine the peak flow rates and volumes associated with the 2-year-24-hour and 100-year storm events for the site. Calculations were performed for both the existing condition and developed condition to be used in the analysis of the proposed detention systems. See Section 4 for additional information and results regarding the hydrologic analyses performed for this project.

HYDRAULICS

Water quality calculations were performed using spreadsheets that were created by RCFC&WCD. Final calculations and additional details can be found in the Preliminary-WQMP.

Basin routing calculations to determine the proposed detention design will be provided in the Final Drainage Study.

Hydraulic calculations to determine the required pipe sizes of proposed storm drain facilities will be provided in the Final Drainage Study.

SECTION 2 - HYDROLOGY ANALYSIS

HYDROLOGY PARAMETERS

The RCFC&WCD Hydrology Manual was used to determine several of the hydrological parameters. The following rainfall depths were utilized in the hydrology analyses, which were obtained from the isohyetal maps provided in the RCFC&WCD Hydrology Manual:

Table 1 – Precipitation Values

	Duration
Storm Event	1-Hour (inches)
10-Year	0.91
100-Year	1.35

The value for slope of intensity was determined to be 0.550. The standard intensity-duration curve data (Plate D-4.1) have been included in Appendix A.

Based on the Plate C-1.18 (El Casco) in the RCFC&WCD Hydrology Manual, the project site is classified as soil type B. The soils map is included in Appendix A.

The cover type was determined based on the existing land cover and proposed land use of the site. Hydrological computations for the existing condition were done using 'Annual Grasses (Poor)'. The 'Urban, Commercial Landscaping' cover type was used to represent the developed condition. The table below summarizes the runoff index values and the recommended values for percentage of impervious cover for each category:

Table 2 – Cover Type

Cover Type	Soil Group A	Soil Group B	Soil Group C	Soil Group D	Percentage of Impervious Cover
Annual Grasses (Poor)	67	78	86	89	0%
Commercial Landscaping	32	56	67	75	80-100%

ON-SITE RATIONAL METHOD HYDROLOGY

The rational method was used to determine peak flow rates in order to adequately size the proposed subsurface storm drains and associated inlets used to convey on-site flows to the proposed underground detention chambers. Calculations were performed for approximately 10 acres of total area that is tributary to the proposed storm drain facilities within the Oak Valley North – Trailer Lot 1 project boundary. A

small portion of the site, consisting mainly of the driveways and adjacent slopes areas will drain towards Beckwith Ave, and be captured in the proposed catch basins.

The Oak Valley North – Trailer Lot 1 project drains to the proposed backbone storm drain line, and ultimately towards "Culvert B1" (an existing DBL 48" CMP per JLC Report included in Appendix D), which is located south of the project site along Calimesa Boulevard.

Subareas within the rational method calculations for the Oak Valley North – Trailer Lot 1 project have been broken up based on the area tributary to the local low spots. The T100-series consists entirely of the onsite project area. In final engineering, areas will be further broken up to determine the 100-year flow rates entering any proposed inlets located onsite. The majority of flows are directed towards the proposed inlets via curbs and gutters. Most subareas consist of a combination of the proposed building, parking stalls, drive aisles, concrete walkways, and landscaped areas. All onsite areas within the calculations were considered as commercial subarea types.

The following table summarizes the rational method results at key points:

Table 3 – Rational Method Results

Point of Interest	10-Year Peak Flow Rate (cfs)	100-Year Peak Flow Rate (cfs)
Node T106 – Flows from the western and central portions of Trailer Lot 1	16.4	24.5
Node T106 – Flows from the eastern portion of Trailer Lot 1	5.7	8.4
Node T109 – Cumulative onsite runoff	20.5	30.5

The rational method output files and hydrology map have been included in Appendix A.

OFF-SITE RATIONAL METHOD HYDROLOGY

As described in Section 1, the overall Oak Valley North project site is impacted by offsite flows generated by the San Bernardino Mountains located northeast of the project site at Beckwith Avenue. These flows will enter the backbone storm drain facilities and will not impact the Oak Valley North – Trailer Lot 1 project. Details regarding these offsite flows and the backbone storm drain facilities can be found in the separate drainage study for the overall Oak Valley North project.

SECTION 3 - HYDRAULIC ANALYSIS

ON-SITE STORM DRAIN FACILITIES

The project will utilize curbs and gutters to convey onsite flows to the proposed storm drain systems. Storm drain system conveys flows to the underground chambers in the southeast side of the project site. After entering the chambers, flows will outlet to the proposed backbone storm drain line, and ultimately towards "Culvert B1" (an existing DBL 48" CMP per JLC Report included in Appendix D) located south of the project site along Calimesa Boulevard.

Onsite Storm Drain

Hydraulic calculations will be performed for all proposed, onsite storm drain facilities, 12 inches in diameter or greater, in the Final Drainage Study.

Underground Chambers

To meet HCOC requirements and the capacity of existing culverts downstream of the project site, an underground detention system is proposed to hold approximately 204,120 cubic feet of runoff. This would require the system to consist of 1890′ cumulative length x 9′ deep x 12′ wide rectangular chambers, for the 100-yr 24-hr storm event. Solid chambers are proposed, as infiltration is not feasible. An outlet structure is proposed to consist of an orifice with the invert at the bottom of the chambers to release flows consistent with the capacity of the existing culvert pipes. Details of the chambers have been included in Appendix B.

Outlet structure orifice sizing will be provided in the Final Drainage Study.

Inlet Capacities

Grate inlets are proposed at the low points within gutters in order to capture onsite flows. For larger flows, a series of 3′x3′ or 2′x3′ grates may be proposed in ribbon gutters to prevent excessive ponding from occurring. Hydraulic calculations will be provided in the Final Drainage Study.

OFF-SITE STORM DRAIN FACILITIES

As described in Section 1, the overall Oak Valley North project site is impacted by offsite flows generated by the San Bernardino Mountains located northeast of the project site at Beckwith Avenue. These flows will enter the backbone storm drain facilities and will not impact the Oak Valley North – Trailer Lot 1 project. Details regarding these offsite flows and the backbone storm drain facilities can be found in the separate drainage study for the overall Oak Valley North project.

SECTION 4 - DETENTION SYSTEM ANALYSIS

ON-SITE UNIT HYDROGRAPH METHOD HYDROLOGY

The unit hydrograph method was used to determine the peak flow rates and volumes in order to adequately size the proposed underground chamber detention systems to address HCOC and increased runoff mitigation. Unit hydrographs were performed for both the existing condition and developed condition. The existing condition is used to establish a baseline for comparative purposes.

A routing analysis will be provided in the Final Drainage Study to demonstrate that the underground chamber system contains substantial volume needed to route flows down to existing condition peak flow rates to avoid hydromodification impacts, and to limit flows such that they are consistent with the capacity of the existing culverts.

At this preliminary stage, the underground detention chambers are sized to detain the entire volume of the largest post-development storm event (24-hour, 100-year). In final engineering, storm drain lift stations and/or orifice plates will be designed to outlet onsite flows per the existing capacity of the culverts.

The unit hydrograph models the entire Oak Valley North – Trailer Lot 1 project site as one drainage area in both the existing and developed conditions. In the existing condition analysis, the 'Annual Grasses (Poor)' cover type was utilized on a 100% pervious area. In the proposed condition analyses, the 'Urban, Commercial Landscaping' cover type was utilized.

The following table summarizes the results of the unit hydrograph analysis:

Table 4 – Unit Hydrograph Results

	Existing Condition		Proposed Condition	
Storm Event	Volume (Ac-ft)	Peak Flow (cfs)	Volume (Ac-ft)	Peak Flow (cfs)
2-Year, 24-Hour	0.20	0.33	1.7	2.7
100-Year, 1-Hour	0.9	31.3	1.0	38.8
100-Year, 3-Hour	1.0	15.3	1.5	18.3
100-Year, 6-Hour	1.2	14.3	2.1	17.8
100-Year, 24-Hour	2.3	6.7	4.6	8.2

The unit hydrograph output files and hydrology map have been included in Appendix C.

OFF-SITE UNIT HYDROGRAPH METHOD HYDROLOGY

The 100-year flow rates for the existing culverts in Calimesa Boulevard were analyzed using the unit hydrograph method. As mentioned before, this hydrology analysis is presented in a separate drainage study prepared by JLC titled "Hydraulic Analyses for Culverts Crossing I-10." This study encompasses the entire existing condition of the areas tributary to this section of existing culverts.

Relevant excerpts and maps for this separate report have been included in Appendix D.

UNIT HYDROGRAPH ANALYSIS

The following table presents the result of unit hydrograph analysis for the 24-hour 2-year and 1-, 3-, 6-, and 24-hour 100-year storm events to preliminarily size the underground chamber systems to provide the necessary storage volume needed to restrict the outflow to existing condition flow rates.

Table 5 – Unit Hydrograph Analysis

	Existing Condition		Proposed Condition		Unit Hydrograph Analysis Results
Storm Event	Volume (AC-ft)	Peak Flow (cfs)	Volume (AC-ft)	Peak Flow (cfs)	Detention Volume (cf)
2-Year, 24-Hour	0.20	0.33	1.7	2.7	-
100-Year, 1-Hour	0.9	31.3	1.0	31.3	-
100-Year, 3-Hour	1.0	15.3	1.5	18.3	-
100-Year, 6-Hour	1.2	14.3	2.1	17.8	-
100-Year, 24-Hour	2.3	6.7	4.6	8.2	204,120

A routing analysis will be provided in the Final Drainage Study to demonstrate that the underground chamber system contains substantial volume needed to route flows down to existing condition peak flow rates to avoid hydromodification impacts, and to limit flows such that they are consistent with the capacity of the existing culverts.

At this preliminary stage, the underground detention chambers are sized to detain the entire volume of the largest post-development storm event (24-hour, 100-year). In final engineering, storm drain lift stations and/or orifice plates will be designed to outlet onsite flows per the existing capacity of the culverts.

SECTION 5 - CONCLUSION

Based on the analyses and results of this report, the following conclusions were derived from the hydrology and hydraulic results:

- The proposed drainage improvements will adequately convey flows to the existing culverts and provide flood protection for the 100-year storm event.
- The proposed underground detention chambers will adequately release flows such that they avoid hydromodification impacts and are consistent with the available capacity of the existing culverts.
- The proposed project will not impact flooding condition to upstream or downstream properties.

Travel time through pipe =    0.55 min.
Time of concentration (TC) =     5.55 min.

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
Process from Point/Station      108.000 to Point/Station      106.000
**** CONFLUENCE OF MINOR STREAMS ****
______________________________________________________________________________
Along Main Stream number: 1 in normal stream number 2
Stream flow area =      1.800(Ac.)
Runoff from this stream =      8.437(CFS)
Time of concentration =    5.55 min.
Rainfall intensity =     4.999(In/Hr)
Summary of stream data:

Stream   Flow rate      TC            Rainfall Intensity
 No.       (CFS)       (min)                 (In/Hr)

1       24.495     10.33                 3.552
2        8.437      5.55                 4.999
Largest stream flow has longer time of concentration
Qp =     24.495 + sum of
          Qb         Ia/Ib
           8.437 *    0.711 =      5.995
Qp =     30.490

Total of 2 streams to confluence:
Flow rates before confluence point:
      24.495       8.437
Area of streams before confluence:
        6.800        1.800
Results of confluence:
Total flow rate =     30.490(CFS)
Time of concentration =    10.334 min.
Effective stream area after confluence =      8.600(Ac.)

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
Process from Point/Station      106.000 to Point/Station      109.000
**** PIPEFLOW TRAVEL TIME (Program estimated size) ****
______________________________________________________________________________
Upstream point/station elevation =  2303.900(Ft.)
Downstream point/station elevation =  2285.300(Ft.)
Pipe length  =   145.00(Ft.)   Manning's N = 0.013
No. of pipes = 1  Required pipe flow  =    30.490(CFS)
Nearest computed pipe diameter  =     18.00(In.)
Calculated individual pipe flow  =    30.490(CFS)
Normal flow depth in pipe =   12.29(In.)
Flow top width inside pipe =   16.75(In.)
Critical depth could not be calculated.
Pipe flow velocity =     23.71(Ft/s)
Travel time through pipe =    0.10 min.
Time of concentration (TC) =    10.44 min.
End of computations, total study area =            8.60 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.

Area averaged pervious area fraction(Ap) = 0.100
Area averaged RI index number =  56.0

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 4010

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

22-0085 - OAK VALLEY NORTH TRAILER LOT 1
ONSITE UNIT HYDROGRAPH ANALYSIS
EXISITNG CONDITION, 100-YEAR 1-HOUR
FN: T1ONSITEPRE1100.OUT- AV

Drainage Area = 10.10(Ac.) = 0.016 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 10.10(Ac.) = 0.016 Sq. Mi.
Length along longest watercourse = 1020.00(Ft.)
Length along longest watercourse measured to centroid = 580.00(Ft.)
Length along longest watercourse = 0.193 Mi.
Length along longest watercourse measured to centroid = 0.110 Mi.
Difference in elevation = 27.00(Ft.)
Slope along watercourse = 139.7647 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.065 Hr.
Lag time = 3.91 Min.
25% of lag time = 0.98 Min.
40% of lag time = 1.56 Min.
Unit time = 5.00 Min.
Duration of storm = 1 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
10.10	0.54	5.45

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
10.10	1.28	12.93

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 0.540(In)

Area Averaged 100-Year Rainfall = 1.280(In)

Point rain (area averaged) = 1.280(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 1.280(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
10.100	78.00	0.000

Total Area Entered = 10.10(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
78.0	78.0	0.268	0.000	0.268	1.000	0.268
					Sum (F) =	0.268

Area averaged mean soil loss (F) (In/Hr) = 0.268
Minimum soil loss rate ((In/Hr)) = 0.134
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Slope of intensity-duration curve for a 1 hour storm =0.5500

Study date 06/12/23 File: T1ONSITEPROP242.out

++

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 4010

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

22-0085 - OAK VALLEY NORTH TRAILER LOT 1
ONSITE UNIT HYDROGRAPH ANALYSIS
PROPOSED CONDITION, 2-YEAR 24-HOUR
FN: T1ONSITEPROP242.OUT- ABE

Drainage Area = 10.10(Ac.) = 0.016 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 10.10(Ac.) = 0.016 Sq. Mi.
Length along longest watercourse = 860.00(Ft.)
Length along longest watercourse measured to centroid = 210.00(Ft.)
Length along longest watercourse = 0.163 Mi.
Length along longest watercourse measured to centroid = 0.040 Mi.
Difference in elevation = 17.40(Ft.)
Slope along watercourse = 106.8279 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.022 Hr.
Lag time = 1.31 Min.
25% of lag time = 0.33 Min.
40% of lag time = 0.52 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
10.10	2.40	24.24

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
10.10	6.50	65.65

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 2.400(In)
Area Averaged 100-Year Rainfall = 6.500(In)

Point rain (area averaged) = 2.400(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 2.400(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
10.100	56.00	0.900

Total Area Entered = 10.10(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)

56.0 36.0 0.706 0.900 0.134 1.000 0.134
Sum (F) = 0.134

Area averaged mean soil loss (F) (In/Hr) = 0.134
Minimum soil loss rate ((In/Hr)) = 0.067
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.180

U n i t H y d r o g r a p h
FOOTHILL S-Curve

Unit Hydrograph Data

Unit time period (hrs)		Time % of lag	Distribution Graph %	Unit Hydrograph (CFS)
1	0.083	381.606	65.823	6.700
2	0.167	763.212	34.177	3.479
			Sum = 100.000 Sum=	10.179

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

Unit	Time (Hr.)	Pattern Percent	Storm Rain (In/Hr)	Loss rate(In./Hr) Max	Low	Effective (In/Hr)
1	0.08	0.07	0.019	(0.238)	0.003	0.016

Study date 06/08/23 File: T1ONSITEPROP1100.out

++

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 4010

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

22-0085 - OAK VALLEY NORTH TRAILER LOT 1
ONSITE UNIT HYDROGRAPH ANALYSIS
PROPOSED CONDITION, 100-YEAR 1-HOUR
FN: T1ONSITEPROP1100.OUT- ABE

Drainage Area = 10.10(Ac.) = 0.016 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 10.10(Ac.) = 0.016 Sq. Mi.
Length along longest watercourse = 860.00(Ft.)
Length along longest watercourse measured to centroid = 210.00(Ft.)
Length along longest watercourse = 0.163 Mi.
Length along longest watercourse measured to centroid = 0.040 Mi.
Difference in elevation = 17.40(Ft.)
Slope along watercourse = 106.8279 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.022 Hr.
Lag time = 1.31 Min.
25% of lag time = 0.33 Min.
40% of lag time = 0.52 Min.
Unit time = 5.00 Min.
Duration of storm = 1 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
10.10	0.54	5.45

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
10.10	1.28	12.93

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 0.540(In)
Area Averaged 100-Year Rainfall = 1.280(In)

Point rain (area averaged) = 1.280(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 1.280(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
10.100	56.00	0.900

Total Area Entered = 10.10(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)

I. INTRODUCTION

The purpose of this study is to analyze the existing culvert capacities crossing Interstate 10 and discharging into Tentative Tract Map 37862. The existing culverts are located along Interstate 10 between Cherry Valley Boulevard and just north of Singleton Road in the unincorporated area of Calimesa in the County of Riverside. The scope of this report will include the following:

- Determine the 100-year flow rates for the 3-hour, 6-hour and 24-hour storm durations for the existing condition watersheds tributary to the existing culverts using the Riverside County Flood Control and Water Conservation District (RCFC & WCD) Unit Hydrograph Method.
- Determine the maximum capacity for each culvert crossing Interstate 10 based upon the maximum ponded depth at the upstream culvert entrance.
- Determine the available storage upstream of the two culverts located at the low point of the freeway, and develop a storage volume vs. outflow table to be utilized in a basin routing analyses.
- Perform a routing in series analyses that incorporates the flows through the culverts to determine the actual flow rate discharging through the culverts into Tentative Tract Map 37862.

II. PROJECT SITE AND DRAINAGE OVERVIEW

A commercial development is proposed on the south easterly side of Interstate 10 between Cherry Valley Boulevard and Singleton Road, including a portion north of Singleton Road. Based upon the area of the project, a total of 8 culverts currently cross Interstate 10 and discharge into the property. Additionally, due to the larger culvert crossing in the south portion of the project site, an existing stream traverses the project site from east to west. In order to accurately model the existing stream and pipes required to connect to the existing culverts, a hydraulic analysis was required.

Figure 2 shows the location of each culvert in relation to the proposed project, Tentative Tract Map 37862. Culvert A is located at the southerly project boundary, and discharges directly into the stream traversing the site. Flows in excess of the capacity of Culvert A are conveyed to Culvert B3. Culverts D1, D2, and C collect flows and discharge to the northerly portion of the project site. Flows in excess of the capacity for Culverts D1, D2, and C will overflow to Culvert E. Flows in excess of the capacity of Culvert E and Culvert B3 will be conveyed to the low point at Culverts B1 and B2.

III. HYDROLOGY ANALYSIS

The RCFC & WCD Hydrology Manual (Reference 1) was used to develop the hydrological parameters for the unit hydrograph method. The calculations were performed using the computer program developed by Civil Cadd/Civil Design.

The rainfall values were obtained from the Riverside County Hydrology Manual, and are summarized below:

Duration	2-Year Rainfall	100-Year Rainfall
1-Hour	0.58	1.30
3-Hour	0.90	2.13
6-Hour	1.50	3.10
24-Hour	2.75	7.00

The rainfall maps have been included as Exhibit E. The hydrologic soils were obtained from the USDA's Natural Resources Conservation Service Websoil Survey (see Exhibit D).

Five unit hydrograph watersheds were analyzed, and are shown on Exhibit A. The watersheds have been designated as Areas A, B, C, D and E. The watershed areas represent the naming convention for the downstream culverts in which the watersheds are tributary to (see Figure 2).

The unit hydrograph calculations were based upon the existing land use as determined by aerial imagery, and have been delineated on Exhibit C. The existing land uses and their corresponding impervious area and runoff index numbers are summarized below:

Land Use	Impervious Fraction	Soil "A" Runoff Index	Soil "B" Runoff Index	Soil "C" Runoff Index	Soil "D" Runoff Index
Open Space – Fair Cover	0	46	66	77	83
Open Space – Poor Cover	0	62	76	84	88
Rural Residential	0.05	46	66	77	83
1 Acre Residential	0.20	32	56	69	75
Residential Low	0.45	32	56	69	75
Residential Low Medium	0.55	32	56	69	75
Residential High	0.80	32	56	69	75
Commercial	0.90	32	56	69	75

The unit hydrograph calculations were performed for the 100-year, 3-hour, 6-hour and 24-hour duration. These unit hydrographs were used to perform basin routing in series in order to determine which duration would result in the largest flow rates through the systems. The unit hydrograph calculations have been included in Appendix A. The unit hydrograph hydrology map has been included as Exhibit A.

IV. CULVERT CAPACITIES

In order to perform the routing in series, the capacities for the culverts not located at the low point were necessary. The capacities for Culverts A, B3, C, D1, D2 and E were determined using Water Surface Profile Gradient Program iterations until the upstream water surface elevation was equal to the maximum upstream ponded depth (which was determined by the topographic mapping).

Culvert A is a double 10'W x 7'H reinforced concrete box with an existing tributary flow rate of 2,695.4 ft^3/s. A HEC-RAS analyses was performed for the channel downstream of Culvert A, and including the Culvert A crossing, as well as a portion of the channel upstream of Culvert A. A lateral weir was modeled at the culvert where flows would leave the system. Based upon the HEC-RAS results included in Appendix E, the Culvert can convey 2,633.4 ft^3/s and 62.0 ft^3/s will leave the system and be conveyed to Culvert B3.

Culvert B3 is a double 42" CMP culvert. A flow rate for Culvert B3 was not determined since it is included in the Area B watershed, therefore a capacity was determined based upon the maximum allowable ponded depth before flows would overtop to the low point for Culverts B1 and B2. The maximum allowable ponded depth is 2284.00, and the maximum flow through the culverts with an upstream elevation of 2284.00 is 236 ft^3/s per the WSPG analysis (see Appendix B.2) and the upstream water surface elevation analyses. The WSPG analyses utilized a pressure momentum calculation at the upstream end of the analyses that did not accurately represent the upstream water surface elevation, therefore a hand calculation was done and resulted in a lower water surface elevation than the WSPG analyses calculated, shown in the table below:

CULVERT B3 UPSTREAM WSE CALCULATION

WSPG US INV	Dc	Vel. Head	1.5 Vh	Dc + 1.5 Vh	Actual US WSE
2278.67	3.27	1.37	2.055	5.325	2284.00

The flows that overtop Culvert A are tributary to Culvert B3. Since only 62.0 ft^3/s is tributary to Culvert B3 and the capacity is 236 ft^3/s, the entire tributary flow will enter Culvert B3. Therefore, no flows will bypass from Culvert B3 to Culverts B1 and B2.

Culvert D1 and D2 are 30" CMP and 36" RCP, respectively, and were analyzed the same as Culvert B3 since individual flow rates to each culvert was not determined (both Culverts D1 and D2 are within the Area D watershed). Therefore, the maximum ponded depth that was contained at the upstream end of the culverts was utilized as the maximum ponded depth for the WSPG analyses. Culvert D1 can pond to elevation 2293.00 and Culvert D2 can pond to elevation 2291.00. The resulting maximum flow rates based upon these upstream elevations is 43 ft^3/s for Culvert D1 and 104 ft^3/s for

Culvert D2. The WSPG calculations have been included in Appendix B.4 and B.5, respectively. Flows that cannot be conveyed through Culverts D1 and D2 will flow along the freeway to Culvert E.

Culvert C is an 6'W x 8'H RCB with a tributary flow rate of 1,325.0 ft^3/s from Area C. A weir was analyzed at the breakout point for Culvert C, which is adjacent to Calimesa Boulevard (see Figure 3). The weir elevation is 2303.00, and based upon the WSPG Analyses, upstream water surface elevation analyses, and Weir Analyses, the maximum flow through the culvert is 914 ft^3/s with a ponded elevation of 2306.14, while the weir will convey 411 ft^3/s with a water surface elevation of 2306.14 as well. The WSPG calculations are included in Appendix B.3 and the weir analysis is included in Appendix C.2. The upstream water surface elevation based upon the WSPG calculations included a pressure/momentum calculation that raised the WSE higher than it actually is. Therefore, a hand calculation was included on the Weir Equation Analyses that more accurately represents the upstream water surface elevation, however, it is only lower by approximately 1 foot. Flows that overtop Culvert C will will overflow to Culverts D1 and D2, and then due to the limited capacity of these culverts, the flows will ultimately be conveyed along the freeway to Culvert E.

Culvert E is a 30" RCP with a tributary flow rate of 62.0 ft^3/s from Area E. A weir was analyzed with an invert elevation of 2285.00. Based upon the WSPG for Culvert E, the maximum flow rate through the culvert is 42 ft^3/s with a water surface elevation of 2285.67, while the weir can pass 20 ft^3/s with a water surface elevation of 2285.67. The WSPG calculations are included in Appendix B.6 and the weir analysis is included in Appendix C.3. Flows that cannot be conveyed through Culvert E will be conveyed to Culverts B1 and B2.

Culverts B1 and B2 are located within a low point that pass under the low point of the freeway. The culverts were used as the outflow for the final stage of the routing in series analyses. A volume vs. outflow table had to be compiled in order to accurately route the tributary flows and volume to Culverts B1 and B2. Culvert B1 is an existing double 48" CMP with an invert elevation of 2268.93 (the inverts of the two CMP culverts comprising of Culvert B1 differ slightly, so the higher of the two was utilized), and Culvert B2 is an existing 48" CMP with an invert of 2268.38. For depths above the soffit of the pipe (elevation 2273.00 and above), orifice equations were utilized to determine the flow through the culverts. However, for depths less than the soffit of the pipe, a different methodology had to be utilized. Critical depth analyses were performed for varying flow rates in the pipe to determine the water surface elevation that corresponds to that flow rate. The critical depth analysis was based upon the following equation:

$$\text{Depth} = Y_C + 1.5\,(V_C^2 / 2g)$$

Where:

Y_C = Depth of flow at critical depth
V_C = Velocity at critical depth

The spreadsheets included in Appendix D.1 iterate using the goal seek function to solve for the Depth value. Once the equivalent depths for the corresponding flow rates were determined, the flow rates corresponding to water surface elevations 2269, 2270, 2271 and 2272 were interpolated and utilized as the outflow for the culverts at these elevations. A weir was also analyzed for flows that could potentially overtop the freeway. The freeway low point is at elevation 2279.00, and includes a 3 foot barrier between the two travel ways. This barrier was added to the low point to include a weir flow line elevation of 2282.00 and a length of 877 feet, which represents the length along the low point of the freeway. A composite outflow was developed (shown on Table 4 of the Culvert B1 and B2 outflow calculations included in Appendix D.2) that represents the total flow rate from the low point through the culverts and overtopping the freeway. The storage upstream of Culverts B1 and B2 was developed using the existing contours, and is shown on Figure 3.

The hydraulic analyses for the culverts was used in the basin routing in series analyses discussed below.

V. ROUTING IN SERIES

Using the unit hydrographs prepared for the watershed, and the culvert analyses, a routing in series was performed using the CivilD program. This would give the most accurate representation of what will be conveyed through culverts B1 and B2, as well as overtop the freeway. The analyses were performed for the 3-hour, 6-hour and 24-hour storm durations for the 100-year storm event. The process of routing the unit hydrographs in series is described blow.

Since the flows that overtop Culvert A of 62 ft^3/s are tributary to Culvert B3, which has a capacity of 236 ft^3/s, the entirety of these bypass flows can be conveyed through Culvert B3. Therefore, Culvert A, Culvert B3 and Area A unit hydrograph were not included in the routing in series analyses since flows would not be tributary to Culverts B1 and B2.

The analyses started with Area C, in which the unit hydrograph was added from a file. A flowby basin was then used to model the 914 ft^3/s leaving through Culvert C. The excess flow will bypass to Culverts D1 and D2, and was stored as stream 1. The Area D hydrograph was then added to Stream 1 at Culverts D1 and D2. A flowby was then modeled for the 147 ft^3/s leaving through Culverts D1 and D2, and the overflow was stored in Stream 1, and is tributary to Culvert E. Area E was input and added to Stream 1, and then a flowby was modeled for 42 ft^3/s leaving through Culvert E. The remaining flows are tributary to Culverts B1 and B2, and was stored as Stream 1. This stream was then combined with the Area B unit hydrograph for a total tributary flow

rate tributary to Culverts B1 and B2. This hydrograph is then routed through a retarding basing using the volume vs. outflow table developed for Culverts B1 and B2. The results of the routing in series for the outflow and upstream ponded depth for Culverts B1 and B2 are summarized below:

Storm Duration	Flow Rate through Culverts B1 and B2	Upstream Ponded Depth for Culverts B1 and B2
100-Year, 3-Hour	557.30 ft^3/s	2278.55
100-Year, 6-Hour	556.53 ft^3/s	2278.53
100-Year, 24-Hour	342.41 ft^3/s	2273.71

Based upon the results, the 100-year, 3-hour storm event will result in the highest flow rate through the culverts of 565.96 ft^3/s, and the highest ponded depth of 2278.55. Based upon this depth, the flows will not pond within the freeway which is at elevation 2279.00 and will not overtop the freeway.

The routing in series calculations have been included in Appendix D.

VI. CONCLUSIONS AND RECOMMENDATIONS

Hydrology and hydraulic analyses were performed for the culverts crossing Interstate 10 upstream of Tentative Tract Map 37862 to determine the maximum flow rates conveyed by the culverts, and if flows would overtop the freeway. Based upon the analyses, the following can be concluded:

1. Based upon the culvert capacities and the routing in series analyses, the maximum flow rate within the stream traversing the project site will be 4,355.7 ft^3/s, which is the sum of the flows conveyed through Culverts A, B3, C, D1, D2, and E, plus the routed flow through Culverts B1 and B2.
2. The maximum water surface elevation at the low point is 2278.55. The freeway roadway is at 2279.00 and the 3 foot median barrier is at 2282.00, therefore flows will not pond over the roadway or overtop the freeway barrier.

I. INTRODUCTION

Oak Valley Town Center (OVTC), Parcel Map No. 37862, is a proposed development in the City of Calimesa, lying southwesterly of the Interstate 10 Freeway (I-10) off the Singleton Road exit. The project is roughly 230 acres and will develop business park and commercial land use areas, as well as the infrastructure Singleton and Roberts Road. Oak Valley Town Center is a part of the Summerwind Ranch at Oak Valley Specific Plan that proposes the development of residential, business park, commercial and open space land use areas across roughly 2,600 acres of land.

The purpose of this study is to determine the existing and proposed hydrologic conditions to properly size the necessary drainage improvements to support the construction of Oak Valley Town Center. The scope of this report will include:

- Determine peak 100-year flow rates for the construction of the project's ultimate developed condition using the Rational Method outlined in the Riverside County Flood Control and Water Conservation District
- Based on the ultimate developed condition, determine the necessary drainage improvements that will properly convey the calculated 100-year flow rates
- Summarize analyses and proposed infrastructure storm drain improvements

II. PROJECT SITE

Oak Valley Town Center is part of the Summerwind Ranch at Oak Valley Specific plan that lies within the San Timoteo sub-basin of the Santa Ana River Watershed. The project site lies within an open grassland valley that is bounded by the I-10 freeway to the east and rolling hills and ridgelines to the west and south. Most of the project is undeveloped. There are a handful of existing properties that are fairly spread apart from each other along the I-10, as well as a couple of properties within the central portion of the valley.

Large off-site tributary areas on the east side of the I-10 contribute significant drainage to the project site through multiple pipe and box culverts. Drainage from these tributary areas begin in the San Bernardino Mountain ranges and flow in a southwesterly manner, ultimately, flowing through the proposed project site until it reaches the San Timoteo Creek. The proposed storm drain system will maintain the existing drainage course and outlet on-site, as well, as intercepted off-site drainage, into the natural streambed areas leading to the San Timoteo Creek; ultimately joining the Santa Ana River. See Figures 1 and 2 for the project Vicinity Map and Site Plan, respectively.

III. HYDROLOGY

The rational design parameters and methodologies outlined in the Riverside County Flood Control and Water Conservation District's (RCFCWCD) *Hydrology Manual*[1] were used to determine the 100-year design flow rates for the project. Calculations for the rational methodology were performed using the CivilDesign computer software.

Two hydrology analyses will be performed for this project site:

- On-site hydrology
    - The rational method was used to calculate the 100-year flow rates for the on-site tributary areas. We assume the ultimate developed condition to determine the peak flow rates tributary to the proposed OVTC storm drain infrastructure. This includes the OVTC project site, as well as future Summerwind developments located north of OVTC.
- Off-site hydrology
    - The unit hydrograph method will be used to calculate the 100-year flow rates for the off-site tributary areas. Off-site refers to the large tributary areas east of the I-10, where their respective flow rates are collected via pipe and box culverts that cross the I-10 and outlet onto the OVTC project site.

On-site Hydrology

The 100-year flow rates for Areas A and B, as shown on Exhibit B, will be analyzed using the rational method.

As directed by the *Hydrology Manual*[1], Antecedent Moisture Condition II (AMC II) was used for all rational method analyses.

Soil classification for the project site is based on the Hydrologic Soils Group Map for El Casco (Plate C-1.18) of the *Hydrology Manual*[1], as shown on Appendix A-4 of this report. Hydrologic soils group (HSG) "B" and "D" are what primarily occupies the project site. There are small patches of areas within the rolling hills and ridgelines where HSG "A" and "C" are present. Soil "B" is described as soils with a moderate rate of water transmission and soil "D" is described as soils with high runoff potential.

The rainfall values and slope of intensity duration curve were obtained from the isohyetal maps in the *Hydrology Manual*[1], as shown on Appendices A-1 to A-3. Below is a summary of the design parameters used for calculation.

2-Year-1-Hour Precipitation per Plate D-4.3 (Appendix A-1)	0.54”
100-Year-1-Hour Precipitation per Plate D-4.4 (Appendix A-2)	1.33”
Slope of Intensity Duration Curve per Plate D-4.6 (Appendix A-3)	0.55

For rational method purposes, the project site was analyzed as an undeveloped area – poor cover for the undeveloped condition. Since the hydrology study is split up into two parts (On-site and Off-site) for the undeveloped condition, the flow rates calculated in each report were simply added together to compute a total Q for each drainage area. Refer to Exhibit A for the total Q and on-site drainage area delineation.

The areas tributary to storm drain Line A are designated as Drainage Area A and Areas C, D and E, as shown on Exhibit B. Areas C, D and E are off-site tributary areas, while Drainage Area A is on-site. As mentioned before, off-site tributary areas are analyzed by the unit hydrograph method, per a separate study. The off-site areas were included in the rational method calculations as a user defined entry to account for the drainage coming from existing culverts crossing the I-10. The portion of Drainage Area A, where the OVTC project site is located, consists of industrial parcels, a commercial parcel and the infrastructure Singleton and Roberts Road streets for the ultimate developed condition. See Figure 2 for the Project Site plan. For hydrology purposes, the industrial parcels were analyzed as commercial land use. Since the ultimate developed condition is assumed to determine the peak 100-year flow rates tributary to the OVTC infrastructure storm drain system, Drainage Area A includes future Summerwind developments. Per Tentative Tract Map No. 33536, planning areas E-1, E-2 and D-1, which are delineated as Garden Courts, Townhomes and Community Recreation land use, respectively, are tributary to the OVTC storm drain infrastructure and are included in the rational method analysis calculations. For hydrology purposes, the Garden Courts and Townhomes were analyzed as commercial land use and the Community Recreation as condominium land use. See Exhibit B for the on-site hydrology map.

The areas tributary to storm drain line B are designated as Drainage Area B and Areas A and B, as shown on Exhibit B. Areas A and B are off-site tributary areas, while Drainage Area B is on-site. As mentioned before, off-site tributary areas are analyzed by the unit hydrograph method, per a separate study. Like Line A, the off-site drainage was used as a user defined entry to account for the drainage coming from the existing culverts crossing the I-10. Drainage Area B only consists of a commercial parcel for the developed condition. See Exhibit B for the Drainage Area B on-site hydrology map.

Calculations for the undeveloped and developed rational method analyses can be found in Appendix B and C, respectively, of this report.

Off-site Hydrology

The 100-year flow rates for Areas A, B, C, D and E, as shown on Exhibit B, were analyzed using the unit hydrograph method. These areas are tributary to existing pipe and box culverts that cross the I-10 and outlet onto the OVTC project site. As mentioned before, the off-site hydrology analysis is presented in a separate study, *Hydraulic Analyses for Culverts Crossing I-10 TTM 37862*[2].

IV. STORM DRAIN HYDRAULICS

Storm Drain

Three mainline storm drain systems (Lines A, B and C) are proposed to support the construction of OVTC.

Line A is a proposed reinforced box culvert (RCB) that runs through the infrastructure Singleton Road. It is the main storm drain system that is responsible for most of the on-site drainage but also takes on significant off-site drainage, as shown as Drainage Area A and Areas C, D and E per Exhibit B. The existing 72" CMP culvert that currently runs under the existing Roberts Road intercepts off-site drainage coming from the 6'x8' RCB crossing the I-10. The project will remove and replace the existing 72" CMP with an 8'x8' (WxH) RCB, where Line A begins. The upstream 72" CMP survey flowline elevation of 2249.61 was maintained to begin the Line A design. As you move downstream in Line A, two sub-mainline storm drain systems, Lines A1 and A2, confluence with Line A at the major intersection of Singleton and Roberts Road. As mentioned before, most of the on-site drainage are collected and conveyed in these storm drain systems (A, A1 and A2). Storm drain lateral stub outs are provided for the commercial and business park parcels. The locations of these lateral stub outs are based on the low points of the rough grading, where it is assumed the private storm drain systems within the parcels will join the infrastructure storm drain system. CP-09 is the only storm drain lateral that collects off-site drainage. It connects to the existing 48" RCP that crosses the I-10 near the eastbound Singleton off-ramp, where it intercepts off-site drainage from Area D. Line A

discharges in the southwest corner of the project site, where it joins the existing watercourse that leads to the San Timoteo Creek.

Line B is a proposed double 6'x4' (WxH) box culvert that crosses the proposed Roberts Road. It collects off-site drainage from Areas B and E that are tributary to four existing culverts that cross the I-10, as well as on-site drainage from a portion of a commercial parcel. Drainage from the four culverts confluence at the current OVTC project boundary where the existing Roberts Road and Cooper Drive intersect. For the rough grade condition, a trapezoidal channel conveys the off-site drainage from this confluence point to the starting point of Line B. The developer of the commercial parcel will be responsible to construct storm drain that collects off-site drainage from the confluence point to the double box culvert once the site plan is finalized. The double box culvert alignment roughly starts from the northerly Roberts Road right-of-way (ROW) line and ends roughly at the southerly ROW line where the collected drainage outlets into the existing watercourse that runs along the southside of the OVTC project site.

Line C is a proposed arch culvert. Like Line B, this culvert crosses Roberts Road and outlets into the existing watercourse that runs along the southside of the OVTC project site. It serves as a by-pass line for the off-site drainage tributary to the existing double 7'x10' box culvert (Culvert A) crossing the I-10 onto the project site.

The Water Surface Profile Gradient Program (WSPG) software was used to analyze the proposed storm drain lines and laterals. The hydraulics is based on the storm drain profile design and the 100-year flow rate calculations per the studies performed for this project site. The WSPG calculations can be found in Appendix E of this report.

Velocity calculations for Drainage Areas A and B for the undeveloped condition and the point of discharge for Lines A and B were calculated using the CivilDesign computer software.The increase in velocity at the point of discharge for Lines A and B will be mitigated by properly sized riprap aprons that contain 2-ton riprap. A manning's number of 0.04 was used for the riprap apron for the developed condition and 0.025 for the undeveloped condition. Calculations for the exit velocities can be found in Appendix F.

The proposed storm drain alignments, pipe sizing and calculated flow rates can be found on the drainage facilities map, as shown on Exhibit C.

Catch Basins

Twelve catch basins are proposed to support the construction of OVTC. Of the twelve proposed catch basins, four are sump and eight are on-grade. The AutoCAD Civil3D Hydraflow Express extension was used to properly size catch basins and determine their efficiency. The curb opening design parameters used in calculation are consistent with the Riverside County Transportation Department catch basin standard details. The flow rates captured by the catch basin are used for the WSPG calculations for their respective storm drain laterals.

A summary table for the proposed catch basins is provided on the next page and the catch basin calculations can be found in Appendix D of this report.

CB #	HYDRO MAP NODE	CATCH BASIN TYPE	SIZE (FEET)	Q_{100} (CFS)	UPSTREAM Q_{BYPASS}	$Q_{TRIBUTARY}$ (CFS)	$Q_{CAPTURED}$ (CFS)	Q_{BYPASS} (CFS)	Q_{BYPASS} TO CB #

V. WATER QUALITY

The developers of the proposed industrial and commercial parcels for OVTC will be responsible for treating their runoff before joining the infrastructure storm drain systems delineated in this drainage study. Catch basin inserts will be installed in all catch basin locations for treating street runoff. Refer to the OVTC Water Quality Management Plan report for more details.

VI. SUMMARY

The developed and undeveloped hydrology conditions were analyzed in this study. All proposed storm drain systems (Line A, B & C) intercept off-site drainage crossing the I-

10 freeway onto the project site. Lines A and B also convey on-site drainage from the proposed developments. On-site drainage from the proposed developments and streets will be treated by approved BMPs prior to discharging into the storm drain systems. The increased velocities at the point of discharge for both Lines A and B will be mitigated by properly sized riprap aprons.

Below are summary tables comparing the flow rates and exit velocities at the point of discharge for Lines A and B.

Flow Rate

Storm Drain Line	A	B
Undeveloped Flow Rate (CFS)	1,593	768
Developed Flow Rate (CFS)	1,775	829
Difference (CFS)	+182	+61

Velocity

Storm Drain Line	A	B
Undeveloped Exist Velocity (Feet per Second)	16.2	14.2
Developed Exist Velocity (Feet per Second)	8.5	6.6
Difference (Feet per Second)	-7.7	-7.6
