4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Improve Destination Accessibility

Increase Transit Accessibility

Improve Pedestrian Network

Provide Traffic Calming Measures

Implement NEV Network

Limit Parking Supply

Expand Transit Network

Increase Transit Frequency

Implement Trip Reduction Program

Market Commute Trip Reduction Option

Employee Vanpool/Shuttle

Provide Riade Sharing Program

Condo/Townhouse High Rise	1,206.00	Dwelling Unit	18.84	1,206,000.00	2028
Regional Shopping Center	3,138.60	1000sqft	72.05	3,138,600.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.4	**Precipitation Freq (Days)**	20
Climate Zone	10			**Operational Year**	2035
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Population based on 1.95 factor
User Defined recreation - private open space
Other asphalt surfaces - roadways

Construction Phase - Construction assumptions

Off-road Equipment - Construction Assumptions

Off-road Equipment - Construction Assumptions - no cranes

Trips and VMT - SCAQMDs analysis of Construction Worker and Vendor Trip Rates

On-road Fugitive Dust - 100% paved roads

Grading -

Vehicle Trips - Based on trip generation from Traffic Study
City park is private open space

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Road Dust - 100% paved roads

Woodstoves - No woodstoves

Construction Off-road Equipment Mitigation - Mitigation Assumption; Tier 4 required by January 2016 SCAQMD Rule 403 and 403.1

Mobile Land Use Mitigation -

Mobile Commute Mitigation - Applicant Assumption

Area Mitigation - Per SCAQMD Rule 1113 and Specific Plan

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Water And Wastewater - Calculated

Sequestration -

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

3.2 Building Construction - 2023

Unmitigated Construction On-Site

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Improve Destination Accessibility

Increase Transit Accessibility

Improve Pedestrian Network

Provide Traffic Calming Measures

Implement NEV Network

Limit Parking Supply

Expand Transit Network

Increase Transit Frequency

Implement Trip Reduction Program

Market Commute Trip Reduction Option

Employee Vanpool/Shuttle

Provide Riade Sharing Program

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Private Park 7 acres
25 acres of road
Includes all land uses from Planning Area 1-8

Construction Phase - Construction Assumptions. Assuming Planning Area 1-8 is built at the same time

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Construction assumptions

Off-road Equipment - Defaults

Trips and VMT - SCAQMDs analysis of Construction Worker and Vendor Trip Rates

On-road Fugitive Dust - 100% paved roads

Grading - Based on previous data

Architectural Coating -

Vehicle Trips - Private City Park/Open Space

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Road Dust - 100% paved road

Woodstoves - No woodmass

Area Coating -

Energy Use -

Water And Wastewater - Calculated Rates

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation - January 1, 2015, required Tier 3 equipment

Mobile Land Use Mitigation - 0.04 low penetration NEV network

Mobile Commute Mitigation - Based by Applicant

Area Mitigation - SCAQMD Rule 1113

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Operational Off-Road Equipment - no default

3.1 Mitigation Measures Construction

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

3.2 Site Preparation - 2015

Unmitigated Construction On-Site

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Improve Destination Accessibility

Increase Transit Accessibility

Improve Pedestrian Network

Provide Traffic Calming Measures

Implement NEV Network

Limit Parking Supply

Expand Transit Network

Increase Transit Frequency

Implement Trip Reduction Program

Market Commute Trip Reduction Option

Employee Vanpool/Shuttle

Provide Riade Sharing Program

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Private Park 7 acres
25 acres of road
Includes all land uses from Planning Area 1-8

Construction Phase - Construction Assumptions. Assuming Planning Area 1-8 is built at the same time

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Construction assumptions

Off-road Equipment - Defaults

Trips and VMT - SCAQMDs analysis of Construction Worker and Vendor Trip Rates

On-road Fugitive Dust - 100% paved roads

Grading - Based on previous data

Architectural Coating -

Vehicle Trips - Private City Park/Open Space

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Road Dust - 100% paved road

Woodstoves - No woodmass

Area Coating -

Energy Use -

Water And Wastewater - Calculated Rates

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation - January 1, 2015, required Tier 3 equipment

Mobile Land Use Mitigation - 0.04 low penetration NEV network

Mobile Commute Mitigation - Based by Applicant

Area Mitigation - SCAQMD Rule 1113

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Operational Off-Road Equipment - no default

3.1 Mitigation Measures Construction

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

3.2 Site Preparation - 2015

Unmitigated Construction On-Site

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Improve Destination Accessibility

Increase Transit Accessibility

Improve Pedestrian Network

Provide Traffic Calming Measures

Implement NEV Network

Limit Parking Supply

Expand Transit Network

Increase Transit Frequency

Implement Trip Reduction Program

Market Commute Trip Reduction Option

Employee Vanpool/Shuttle

Provide Riade Sharing Program

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Private Park 7 acres
25 acres of road
Includes all land uses from Planning Area 1-8

Construction Phase - Construction Assumptions. Assuming Planning Area 1-8 is built at the same time

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Construction assumptions

Off-road Equipment - Defaults

Trips and VMT - SCAQMDs analysis of Construction Worker and Vendor Trip Rates

On-road Fugitive Dust - 100% paved roads

Grading - Based on previous data

Architectural Coating -

Vehicle Trips - Private City Park/Open Space

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Road Dust - 100% paved road

Woodstoves - No woodmass

Area Coating -

Energy Use -

Water And Wastewater - Calculated Rates

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation - January 1, 2015, required Tier 3 equipment

Mobile Land Use Mitigation - 0.04 low penetration NEV network

Mobile Commute Mitigation - Based by Applicant

Area Mitigation - SCAQMD Rule 1113

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Operational Off-Road Equipment - no default

3.1 Mitigation Measures Construction

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

3.2 Site Preparation - 2015

Unmitigated Construction On-Site

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Improve Destination Accessibility

Increase Transit Accessibility

Improve Pedestrian Network

Provide Traffic Calming Measures

Implement NEV Network

Limit Parking Supply

Expand Transit Network

Increase Transit Frequency

Implement Trip Reduction Program

Market Commute Trip Reduction Option

Employee Vanpool/Shuttle

Provide Riade Sharing Program

Re: Section 24 Specific Plan – Supplemental Localized Significance Threshold Analysis

Mr. Hampson:

Per your request, Air Quality Dynamics has prepared a supplemental Localized Significance Threshold (LST) analysis to identify the downwind concentration of fine particulates ($PM_{2.5}$) associated with the buildout of the proposed project. This was done as use of the South Coast Air Quality Management District's (SCAQMD) LST screening procedure showed that the predicted mass daily rate for the combined project (Active Adult Community/Tribal Planning Areas) exceeded the allowable emission budget of 3 pounds per day.

The SCAQMD offers an additional assessment methodology should a calculated emission budget be exceeded whereby air dispersion modeling is performed to demonstrate that pollutant concentrations are below localized significant levels.

As such, dispersion modeling was used in the preparation of this analysis and incorporated all relevant and appropriate procedures presented by the U.S. Environmental Protection Agency, California Environmental Protection Agency and South Coast Air Quality Management District (SCAQMD). The methodologies and assumptions offered under this regulatory guidance were used to ensure the effective quantification of particulate exposures associated with the generation of $PM_{2.5}$ emissions from identified area and energy source activity.

The following summarizes the protocol used to evaluate $PM_{2.5}$ exposures and presents the results of the supplemental LST analysis.

Estimation of $PM_{2.5}$ Concentrations

In order to assess the impact of $PM_{2.5}$ emissions on the adjoining residents, air quality modeling utilizing the Industrial Source Complex-Short Term (ISCST3) model was performed. The model is a steady state Gaussian plume model used by the SCAQMD to develop the LST Methodology.

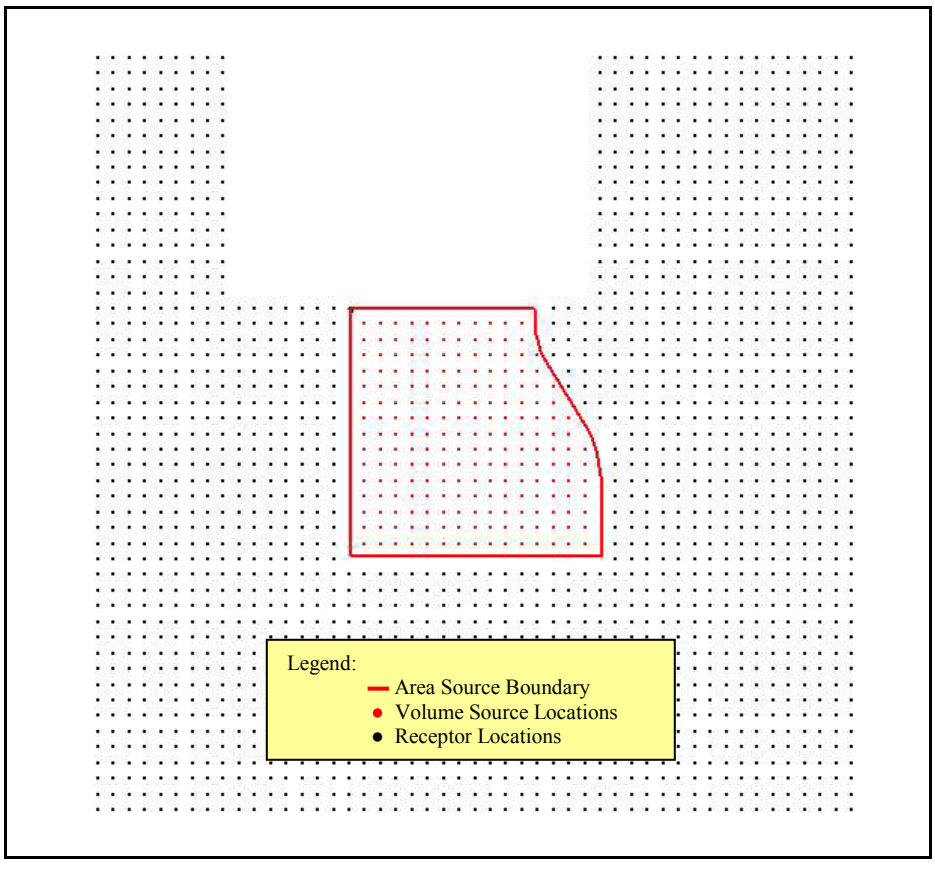
Source treatment for hearth and energy consumption were treated as side-by-side elevated volume sources uniformly spaced at 100 meters with release heights of 4.57 meters and initial vertical dimensions of 2.13 meters to account for the buoyancy associated with the combustion

of natural gas and elevated flue sources from a representative single family home. Fugitive dust emissions associated with landscape activities were treated as a ground-based source with a one meter vertical dimension and source area incorporating project site acreage and configuration. Attachment B presents the emission calculation worksheet for the identified sources.

Air dispersion models require additional input parameters including pollutant emission data and local meteorology. Due to the their sensitivity to individual meteorological parameters such as wind speed and direction, the U.S. EPA recommends that meteorological data used as input into dispersion models be selected on the basis of relative spatial and temporal conditions that exist in the area of concern. In response to this recommendation, meteorological data from the SCAQMD Palm Springs monitoring station (Source Receptor Area 30) was used to represent local weather conditions and prevailing winds.

To accommodate a Cartesian grid format, direction dependent calculations were obtained by identifying the universal transverse mercator (UTM) coordinates for each source location. Off-site receptors were uniformly placed to provide dense coverage throughout the adjoining community. A flagpole receptor height of two meters was also assumed and assigned to each receptor location. A graphical representation of the source-receptor grid network is presented in Figure 1. A complete listing of model input/output files are provided in electronic format in Attachment C

Figure 1
Source-Receptor Grid Network



Pollutant Impact Analysis

Pollutant emissions are considered to have a significant effect on the environment if they result in concentrations that create either a violation of an ambient air quality standard, contribute to an existing air quality violation or expose sensitive receptors to substantive pollutant concentrations. Should ambient air quality already exceed existing standards, the SCAQMD has established significance criteria for selected compounds to account for the continued degradation of local air quality.

For fine particulates, background concentrations representative of the project area exceed the California Ambient Air Quality Standard (CAAQS). As a result, a significant impact is achieved when operational emissions produce a measurable change over existing background levels. Although background concentrations exceed the CAAQS annual averaging time for fine particulates, no measurable change criteria currently exists. As a result, the SCAQMD has established a significance threshold of 2.5 micrograms per cubic meter ($\mu g/m^3$) for the 24-hour averaging time to assess $PM_{2.5}$ impacts.

Results

Results of the modeling exercise predicted a maximum 24-hour average concentration of 0.16061 $\mu g/m^3$ for the maximum exposed receptor. This value is well below the identified significance threshold of 2.5 $\mu g/m^3$.

I can be reached at (818) 703-3294 should you have any questions or require additional information.

Sincerely,

Bill Piazza

CONTENTS

EXECUTIVE SUMMARY

A proposed specific plan for an eventual residential/commercial subdivision within the Agua Caliente Indian Reservation necessitated a biological survey and impact analysis.

Five species covered under the Tribal Habitat Conservation Plan (THCP) of the Agua Caliente Band of Cahuilla Indians were detected onsite and are considered resident: the Coachella Valley milk-vetch, Coachella Valley fringe-toed lizard, flat-tailed horned lizard, western burrowing owl (Mountains and Canyons Conservation Area only) and Palm Springs Ground Squirrel. Three additional covered species (Coachella giant sand-treader cricket, Coachella Valley Jerusalem cricket and Palm Springs pocket mouse) may occur onsite but were not detected.

Most of the land within the project boundaries is considered habitat for the Coachella Valley fringe-toed lizard. Six observations of this species were recorded and the loose, wind-blown sand substrate that covers most of the site is the lizard's preferred habitat. The flat-tailed horned lizard also favors wind-blown sand flats and one specimen of this species was recorded.

The western burrowing owl was detected within the project boundaries on six occasions including one active burrow. A survey for owls is recommended not more than 30-days prior to future ground disturbance on the site. The Palm Springs ground squirrel was detected only twice in the southwestern quarter of the site but should be expected throughout the project area.

The Coachella Valley milk-vetch has previously been recorded from the site. However, three years of drought, including the winter of 2013-2014, prevented seeds of this species from germinating and no living specimens were encountered during the surveys. Nonetheless, over a dozen dried milk-vetch seed pods were discovered in the southeastern quarter of the project site.

Two observations of the loggerhead shrike, not a covered species but considered sensitive by wildlife regulatory agencies, were recorded though no nests were found.

No blue-line stream corridors (streams or dry washes) were found within the project boundaries. Therefore, no streambed alteration permits are required from the federal government.

With regard to mitigating impacts to sensitive species, the project site falls under the jurisdiction of the THCP. The Plan indicates the site lies outside Target Acquisition Areas and the Fluvial Sand Transport Process Area. Therefore, mitigation for impacts to all covered species described in this report consists of the payment of $2,371 per disturbed acre. The fee is paid to the Agua Caliente Band of Cahuilla Indians who, in turn, use the fee to purchase comparable habitat elsewhere in the Coachella Valley.

Following the implementation of the required and recommended mitigation described in this report, development of the project site is not expected to have significant adverse impacts upon sensitive species or other biological resources beyond the project site.

I. INTRODUCTION

On November 28, 2013, the firm of James W. Cornett - Ecological Consultants, Inc., was retained by Meridian Consultants to conduct a biological survey and analysis on an approximately 577-acre site located within the Agua Caliente Band of Cahuilla Indians Reservation and within the sphere of influence of the City of Rancho Mirage, Riverside County, California. The project site encompassed the majority of Section 24, Range 5 East, Township 4 South (San Bernardino Baseline and Meridian). The regional location is shown in Figure 1, the area location in Figure 2 and the specific location with project boundaries in Figure 3. Site photographs are shown in Figures 4-7.

This study was included as part of an environmental assessment mandated by the National Environmental Policy Act (NEPA) and the City of Rancho Mirage, Riverside County, California. The biological survey and impact analysis were designed to ascertain the impacts of development on the biological resources of the project site and immediate vicinity.

Specific purposes of the biological surveys and impact analyses are listed below.

1. Determine the vascular plant and vertebrate animal species that occur on, and immediately adjacent to, the project site.

2. Ascertain the presence of any plant or animal species given special status by the federal government or the Agua Caliente Band of Cahuilla Indians as stated in the Tribe's Habitat Conservation Plan (THCP).

3. Ascertain the existence of other significant biotic elements, corridors or communities.

4. Consider the site's biological resources as they relate to the THCP.

5. If necessary and where feasible, recommend measures to mitigate significant adverse impacts of the project on any sensitive species determined to occur within the project boundaries, unique biotic elements or unique biological communities.

II. SITE AND PROJECT DESCRIPTIONS

Climate

The project area lies within the confines of a geographical region known as the Colorado Desert (Jaeger, 1957). As is typical of this subdivision of the Sonoran Desert, annual rainfall averages less than six inches (National Climatic Center, 2013). Most precipitation falls during the winter and late spring with occasional summer storms accounting for approximately one fifth of the annual total. Winter days are mild, averaging 71 degrees Fahrenheit. Winter nights occasionally drop to near freezing. The month of July brings the hottest temperatures with daytime highs averaging 109 degrees F.

Physical Features

The elevation of the project site ranges from approximately 252 feet above sea level at the northeast corner of the project site rising to 353 feet near the southeast corner. The only topographical relief consists of sand hummocks that rise from one to four feet above their base. The hummocks have been formed by shrubs that interrupt the flow of sand carrying wind coming from the northwest off the Whitewater River Floodplain. The shrubs reduce wind velocity and result in sand deposits or "hummocks" on the leeward or easterly side of the shrubs. The environment of the project site is included as part of the sand field habitat of the valley floor as described in the THCP.

There are no naturally occurring springs or permanent aquatic habitats within the project site boundaries. No blue-line stream corridors (streams or dry washes) are shown on U.S. Geological Survey maps for the project site nor are there botanical indicators of such corridors. Thus, there appear to be no need to obtain streambed alteration permits from the federal government.

Soil characteristics are uniform over the entire site. Soil is composed of wind-blown alluvium created by persistent air movements from the northwest. This process increased in intensity with the drying out of the Coachella Valley at the close of the Pleistocene epoch ending 10,000 years before present. At the current time residential and commercial developments to the west and north have resulted in some sand stabilization on portions of the site.

Surrounding Lands

To the east of the project site is located Bob Hope Drive, a relatively busy four-lane thoroughfare. To the east of Bob Hope Drive is the Agua Caliente Resort Spa and relatively undisturbed habitat similar to the project site (see Figure 3).

Dinah Shore Drive, another relatively busy four-lane thoroughfare, forms the southern boundary of the project site. Immediately south of Dinah Shore Drive is a golf course and residential development.

Another golf course and residential development are located along the western boundary of the project site.

Ramon Road, a busy four-lane thoroughfare, forms the northern site boundary. Relatively undisturbed creosote scrub habitat, similar to the project site, lies immediately north of Ramon Road.

The project site is nearly an ecological island bounded on all four sides by paved roadways (three of them carrying high volumes of traffic) and on two sides by residential developments. These undoubtedly severely limit the movement of small terrestrial animals on and off the project site.

Existing Impacts

The area has been impacted by human developments and activities on all boundaries of the project site. A residential development to the west has lifted and shielded the site from prevailing westerly winds emanating from the San Gorgonio Pass. This has had the effect of reducing wind-carried sand resulting in the partial stabilization of sand deposits across some of the project site.

Native vegetation has been removed from approximately forty acres in the northwestern corner of the site when sand was excavated to provide fill for freeway interchanges in 2010. Native vegetation has also been removed and soils compacted on the northeastern corner of the project site (approximately 40 acres) to create a temporary parking lot. Another approximately 40 acres in the southwestern corner of site has received large mounds of fill dirt in the past decade.

Several elevated bill boards have been installed along the eastern and southern edges of the site. Unpaved access roads parallel the eastern and southern boundaries.

A four-foot high sand fence has been installed along the southern project boundary.

The entire project area has been inundated with the exotic and invasive Sahara mustard, *Brassica tournefortii*. The establishment of this non-native, ephemeral species has likely contributed to the stabilization of blowsand on the project site.

Project Description (Provided by Meridian Consultants)

The Agua Caliente Band of Cahuilla Indians (“Tribe”) intends to prepare an Environmental Impact Statement (EIS) for the proposed Section 24 Specific Plan in compliance with the Agua

Caliente Tribal Environmental Policy Act (Tribal Ordinance No. 28). The Tribe is acting as the lead agency for the preparation of the EIS as the Section 24 Specific Plan area is located within the boundaries of the Agua Caliente Indian Reservation.

The Specific Plan area is located within the Sphere of Influence of the City of Rancho Mirage as identified by the Riverside Local Agency Formation Commission (LAFCO). Following action on the EIS and Section 24 Specific Plan by the Tribe, the Specific Plan area may be annexed to the City of Rancho Mirage.

The Tribe and Pulte Home Corporation/SCC Rancho Mirage Holdings LP ("Pulte/SCC") are proposing the Section 24 Specific Plan to coordinate the planning and future development of the Specific Plan area, which consists of land under separate ownerships, including approximately 120 acres located on Ramon Road that is owned by the Tribe, approximately 97 acres located on Bob Hope Drive that is allotted to members of the Tribe and under contract to be acquired by the Tribe, approximately 40 acres located on the corner of Bob Hope Drive and Dinah Shore Drive that is allotted to members of the Tribe, and 320 acres located north of Dinah Shore Drive that is currently allotted to members of the Tribe and under contract to be acquired by Pulte Homes/SCC and developed as an active adult residential community for residents aged 55 and above.

The Section 24 Specific Plan would allow development of a mix of retail, entertainment, office, hotel and residential uses intended to complement existing and planned surrounding uses in the City of Rancho Mirage. The Section 24 Specific Plan would create eight Planning Areas and a circulation system planned to support the proposed uses. Commercial uses are proposed on Ramon Road and Bob Hope Drive with residential uses proposed for the remainder of the Specific Plan area.

An active adult residential community, containing up to 1,200 units, is proposed on the 312 acres located north of Dinah Shore Drive. The Specific Plan will include development standards and design guidelines for this new residential community. Planning Area 8 will be the first portion of the Specific Plan area to develop, with full development anticipated to occur within 6-8 years.

No timeframes have been identified for development of the remaining Planning Areas, which are being programmatically planned at this time to coordinate streets and other infrastructure, and to ensure the comprehensive land use planning of the Specific Plan area in relation to existing and planned surrounding uses. The Specific Plan will include development and design standards for the Ramon Road, Bob Hope Drive and Dinah Shore Drive frontages to promote compatibility with surrounding uses. The land uses that would be allowed by the proposed Specific Plan in Planning Areas 1-7 are described below.

The proposed Specific Plan will allow approximately 67 acres of multi-family residential development, at a density of up to 18 dwelling units per acre, in Planning Areas 1B, 2B, 5, 6B and 7B. Up to 1,206 multi-family residential units would be allowed by the proposed Specific

Plan in these areas. Retail commercial uses would be allowed in Planning Area 3, located on the corner of Ramon Road and Bob Hope Drive and Planning Area 7A, located on the corner of Bob Hope Drive and Dinah Shore Drive.

The Specific Plan would allow development of up to 777,000 square feet (s.f.) of development on the 51 acres designated for retail commercial uses. Resort flex uses, a mix of hotel, retail commercial and entertainment uses, would be allowed in Planning Areas 1A, 4 and 6A on Ramon Road and Bob Hope Drive. Up to 1,271,600 s.f. of retail commercial, hotel, and entertainment uses would be allowed on the 73 acres designated for resort flex uses. Planning Area 2A, centrally located on Ramon Road, would be designated Mixed Use Core, with up to 1,090,000 s.f. of development allowed on this 25 acres. This land use designation would allow a mix of uses, including community retail commercial uses, office, and attached residential units. In total the Specific Plan would allow a maximum of 2,406 residential dwelling units and 3,138,000 square feet of commercial development.

III. STUDY METHODS

Prior to the initiation of field work, reviews of the literature and institutional records were conducted to determine the biological resources that might exist within the general area and to determine the possible occurrence of special status species. Records, collections, websites and/or staff of the University of California at Riverside Herbarium, the Boyd Deep Canyon Desert Research Center and the Coachella Valley Association of Governments were consulted for specific information as to the occurrence of selected species. A California Department of Fish & Game Natural Diversity Database (updated, March, 2014) check was also reviewed.

Field surveys were initiated in February of 2014. Specific dates of biological surveys were February 10, 11, 12, 14, 15, 16, 18, 19, 20, 21, 23, 24, 25, 26 and 27; and March 1, 2, 22 and 23, 2014. Night surveys were conducted on the evenings of February 19 and 24, 2014.

Survey dates were in late winter and early spring when all plant species and resident vertebrate species can be detected when maximum daytime air temperatures exceed 80° F. (Most days exceeded 80° during field surveys.) Reducing the likelihood that any species would be detected was the existence of unusually dry winters in 2012, 2013 and 2014. Drought dictates against the germination of ephemeral plant species and reproduction and survival in all animal species. In spite of severe long-term drought, it was concluded that this phenomenon did not impact the findings in this report because of evidence of sensitive species that was discovered and historical information regarding the biota of the project site.

Surveys were conducted by walking east/west transects at 10-yard intervals through the project site. The survey pattern used has been approved by the U.S. Fish & Wildlife Service for determining the presence or absence of the burrowing owl and desert tortoise and represents an intensive survey effort that resulted in no officially listed or federally protected species being overlooked (see Results section).

Private properties surround Section 24 prohibiting offsite surveys. Inability to conduct offsite surveys was considered inconsequential because very busy four-lane thoroughfares exist on the north, south and east boundaries of the project site. In addition, a walled residential community forms the western boundary. These barriers dramatically reduce dispersal movements of species on and off the site, particularly small terrestrial vertebrates.

Animal surveys were conducted simultaneously with plant surveys. In addition, twenty-five live-animal traps (which capture animals unharmed) for large and small mammals were set within the project site for twenty-four hour periods on February 19 and 24, 2014.

In an effort to determine if large animal corridors existed on the project site special attention was given to observing and identifying animal tracks. In addition, sand sifting and smoothing was done in several areas so that tracks would be more prominent and identifiable. Road kills on surrounding paved roadways were also monitored on all site visits.

Invertebrate sampling was conducted on the evenings of February 19 and 24, 2014. Three Bioquip Light Traps were used for attracting and live-capturing flying insects and some terrestrial arthropods. Black lights were the attracting mechanism with each trap powered by a 12-volt automobile battery. Traps were placed for maximum visibility.

Although scientific name changes occur as new discoveries are made in plant and animal taxonomy, the scientific names used in this report are taken from the standard and most available references describing the species found in the desert regions of Southern California—Bruce G. Baldwin's *The Jepson Manual* (Second Edition) published in 2012; D. P. Tibor's *Inventory of rare and endangered vascular plants of California* published in 2001; R. A. Stebbins' *A field guide to western reptiles and amphibians* published in 2003; Peterson's *Bird of North America* published in 2008; and E. W. Jameson's and H. J. Peeters' *California mammals* published in 2004. Plant common names used in this report are taken from Baldwin (2012), Jaeger (1969) and Tibor (2001). Animal common names are taken from Stebbins (2003), Peterson (2008) and Jameson and Peeter (2004).

Fieldwork was conducted by James Cornett (M.S., biology) and Walter Millin (B.A., environmental studies). Plant identifications were made by Andrew Sanders and Mr. Cornett. Animal remains were identified by Robert Reynolds and Mr. Cornett. The literature review was conducted by Terry Belknap. The report was written by Mr. Cornett.

IV. PLANT SURVEY RESULTS

A single plant association or *community* was found on site: the Sonoran creosote bush scrub community as described by Sawyer Keeler-Wolf (1995).

Sonoran creosote bush scrub community dominates vegetation of the entire area and is the pervasive plant community throughout the Colorado Desert of southeastern California. The creosote bush (*Larrea tridentata*) is, by far, the dominant perennial followed by Emory's Dalea (*Dalea emoryi*), wingscale (*Atriplex canescens*) and croton (*Croton californicus*).

Approximately 25% of the project site has been disturbed by road shoulder clearing, removal of topsoil for fill, grading for a temporary a parking lot and fill piling. The vegetation of these areas is dominated by weed species that germinate and grow following the damage or removal of native vegetation. Within the project area such species include Sahara mustard (*Brassica tournefortii*), Emory's Dalea (*Dalea emoryi*) and croton (*Croton californicus*). These species are often found throughout the California deserts wherever the natural vegetation has been removed. (The Sahara mustard is also established in undisturbed areas of the project site.)

The Inventory of Rare and Endangered Vascular Plants of California, published by the California Native Plant Society (2001), the *CNDDB Special Plant List* (2013) or the *Endangered, Threatened, and Rare Plants of California* (2013) lists a total of four plant species that could conceivably occur on the project site. They are the glandular ditaxis (*Ditaxis clariana*), ribbed cryptantha (*Cryptantha costata*), flat-seeded spurge (*Chamaesyce platysperma*), and Coachella Valley milk vetch (*Astragalus lentiginosus coachellae*).

1. The glandular ditaxis is a very rare perennial herb that blooms from December through March. It is restricted to sandy environments in the Sonoran Desert and has been found in the Coachella Valley at elevations similar to those found on the project site. Since the glandular ditaxis is a perennial, it is likely that it would be detected during the plant surveys. It was not detected and therefore presumed to not occur onsite. This species is not listed as rare, threatened or endangered by either the state or federal governments nor is it proposed to be listed at this time.

2. The ribbed cryptantha is an uncommon ephemeral known to occur on sandy soils in the Coachella Valley. The project site can be considered suitable habitat for this species. It was not detected but the surveys were done following an early winter period of below-average precipitation when most ephemerals would not be detected. The ribbed cryptantha is not listed as rare, threatened or endangered by either the state or federal governments nor is it proposed to be listed at this time.

3. The flat-seeded spurge is an extremely rare ephemeral herb known to occur on sandy soils in the Sonoran Desert. There has been at least one specimen found in the Coachella Valley. The species was not detected but the surveys were done in a winter of below-average precipitation.

The flat-seeded spurge is not listed as rare, threatened or endangered by either the state or federal governments nor is it proposed to be listed at this time.

4. The Coachella Valley milk vetch is an uncommon, spring-blooming ephemeral herb that is known to occur on sandy soils in the Coachella Valley. No living individuals of this subspecies were detected on or near the project site. However, many seed pods of this species were found and the area where they were located has been mapped and shown in Figure 3. Prior surveys on the project site in 2011 revealed 309 living individuals of this species within the project boundaries (Cornett, 2011). The project site appears to have a large seed bank of this species within the sandy soil and it is considered to be present today within the project boundaries.

No additional plant surveys are recommended. The only officially listed plant species that is considered to be present (as seed) is the Coachella Valley milk vetch. The milk vetch is listed as endangered by the U.S. Fish & Wildlife Service.

A complete list of vascular plant species found within the project boundaries has been placed in Table 1 of the Appendix. Taxonomic nomenclature follows Baldwin (2012). Common names are taken from Jaeger (1969), Baldwin (2012), Munz (1974) or Tibor (2001).

V. ANIMAL SURVEY RESULTS

The fauna of the project site and surrounding vicinity is composed of species typical of sandy, windswept habitats in the Coachella Valley portion of the Colorado Desert as defined by Jaeger (1957). Animal species associated with residential subdivisions were also recorded from the site.

Arthropods

Encountered arthropods on the site included the sand scorpion (*Paruroctonus mesaensis*), Eleodes beetle (*Eleodes armata*), harvester ant (*Pogonomyrmex californicus*) and creosote bush grasshopper (*Bootettix argentatus*).

Three insect species known to occur within the Coachella Valley have been placed on the California Department of Fish and Game's *Special Animals* list. They are the Coachella giant sand treader cricket (*Macrobaenetes valgum*), Coachella Valley Jerusalem cricket (*Stenopelmatus cahuilaensis*) and Coachella Valley grasshopper (*Spaniacris deserticola*). None of these three insect species were found during the surveys and none have any official status with the federal government. The Coachella giant sand treader cricket and Jerusalem cricket are covered species under the THCP.

Amphibians and Reptiles

No amphibian species were found during the surveys and none are expected.

Detected reptiles included the side-blotched lizard (*Uta stansburiana*), western whiptail (*Cnemidophorus tigris*), desert iguana (*Dipsosaurus dorsalis*), western shovel-nosed snake (*Chionactis occipitalis*) and sidewinder (*Crotalus cerastes*).

Six observations of the federally threatened Coachella Valley fringe-toed lizard, *Uma inornata*, were recorded (February 10, 11, 12, 18, 20, 26, 2014). Suitable habitat (surfaces of loose, windblown sand) for the lizard exists across the entire site with the exception of the temporary parking area in the northeast corner (approximately 40 acres). With this single exception, the lizard should be expected throughout the project site.

A concerted effort was made to locate sign of the officially listed desert tortoise (*Goperhus agassizi*). However, no evidence of any kind was found and no direct observations were made. In addition, the California Natural Diversity Database (March, 2014) has no records of the tortoise on or within one mile of the project site. It is therefore concluded that this species does not occur within the project site and immediate vicinity and no additional surveys for this species are recommended.

An intensive effort was also made to locate individuals or sign of the flat-tailed horned lizard, *Phrynosoma mcallii.* A single individual was found (February 16, 2014). Most of the project site is considered suitable habitat for this species and it may be more widespread than the discovery of a single specimen would indicate. The surveys were done in late winter and many individuals might still be in hibernation. In 2011, the U.S. Fish & Wildlife Service considered listing the flat-tailed horned lizard but elected to not do so in May of that year.

Birds

Frequently detected birds within the project area were the common raven (*Corvus corax*), greater roadrunner (*Geococcyx californianus*), mourning dove (*Zenaida macroura*), house finch (*Carpodacus mexicanus*) and Say's phoebe (*Sayornis saya*).

No observations of LeConte's thrasher (*Toxostoma lecontei*) were recorded during the surveys. In the Coachella Valley this species is closely associated with golden cholla, an arborescent cactus that provides a nesting site for the thrasher. The cactus species is absent from the project area and, therefore, it was concluded the thrasher does not occupy the project site at this time. LeConte's thrasher is a covered species under the THCP but is not listed by the USFWS.

Two sensitive avian species were observed within the project boundaries: the burrowing owl (*Athene cunicularia*) and loggerhead shrike (*Lanius ludovicianus*).

Burrowing Owl

The burrowing owl was recorded within project site boundaries on six separate days: February 11, 16, 24, 25, and 26 and March 1, 2014. (see Figure 3 for locations). All observations were of adult birds. One active burrow was found on the project site. The entire project site is considered potential habitat for the burrowing owl.

According to the THCP, the burrowing owl is not a covered species within the Valley Floor Conservation Area. However, it is protected in the United States by the Migratory Bird Treaty Act of 1918. Mitigation of impacts to the owl is required under the Act.

Loggerhead Shrike

The loggerhead shrike was observed on two occasions within the project site boundaries: February 20 and March 2, 2014. The locations are shown in Figure 3. No old or new nests were found but the species is likely resident in the project area because of suitable habitat and prey.

According to the THCP, the loggerhead shrike is not a covered species and has no special federal status. It is considered a Species of Special Concern by the state of California.

Mammals

Recorded mammals included the black-tailed jackrabbit (*Lepus californicus*), Palm Springs ground squirrel (*Spermophilus tereticaudus chlorus*), desert kangaroo rat (*Dipodomys deserti*) and coyote (*Canis latrans*). No individuals of the Palm Springs Pocket Mouse (*Perognathus longimembris bangsi*), a covered species, were found.

The Palm Springs Ground Squirrel is the only mammalian covered species discovered within the project boundaries. It was only detected twice (February 25, 26, 2014) but should be expected throughout the project site as the habitat is suitable. It currently is not a listed species and has a much broader range than was previously thought (Federal Register, 2009). It is, therefore, unlikely that it will be listed in the foreseeable future.

Wildlife Corridors

Smoothing of surfaces to yield tracks was performed on each site visit to determine if important wildlife corridors existed on the site. Much of the project site was sampled using this technique. Tracks of ravens, roadrunners, coyotes and black-tailed jackrabbits were each recorded. However, no discernable and routinely used corridors could be found.

A complete list of vertebrate species observed or detected on the project site can be found in Table 2 of the Appendix.

VI. FINDINGS AND RECOMMENDATIONS

Intensive plant and animal surveys were conducted within the boundaries of the proposed project site. Four sensitive species were detected that are classified as covered species in the Valley Floor Conservation Area of the THCP. The covered species are Coachella Valley milk vetch, Coachella Valley fringe-toed lizard, flat-tailed horned lizard and Palm Springs ground squirrel. Under the THCP adverse impacts to these four species can be mitigated by the project proponent paying the Tribe the required mitigation fee of $2,371 per disturbed acre for all covered species. Collected fees are used to purchase and preserve comparable habitat elsewhere in the Coachella Valley.

Three additional covered species may also occur within the project site but were not detected during the surveys. They are the Coachella giant sand treader cricket, Coachella Valley Jerusalem cricket and Palm Springs pocket mouse. Any adverse impacts to these three species are mitigated by paying the habitat mitigation fee described in the previous paragraph. Impacts to all covered species are mitigated by the payment of the one-time fee of $2,371 per acre.

Burrowing Owl

The burrowing owl was observed six separate times within the project site boundaries. One active burrow was found. According to the THCP the burrowing owl is not a covered species in the Valley Floor Conservation Area (HTCP, page 1-3). However, the Migratory Bird Act prohibits harming the owl therefore mitigation of potential adverse impacts are required. Owl mitigation is provided in the **Staff Report on Burrowing Owl Mitigation** prepared by the California Department of Fish and Game on March 7, 2012, and approved and accepted by the U.S. Fish & Wildlife Service. Mitigation for the owl is summarized below.

1. A preconstruction survey should take place not more than 30 days prior to project grading to determine the location of active burrows on and within 550 yards of an approved project site. If no active burrows are found in the survey area, site disturbance may commence providing a biological monitor is onsite.
2. A biological monitor, with the authority to halt or redirect grading, should be present whenever grading or construction vehicles are present and operating on the project site. The function of the monitor is to protect burrowing owls that arrive on or near the project site after the clearance survey and during the construction period
3. The breeding season of the western burrowing owl is from February 1 through August 31 of each year. No construction disturbances of any kind should occur within 500 meters (550 yards) of an active burrow during this time period. Thus, on a project site, grading should take place from September 1 through January 30 of each year to avoid restriction or cancellation of grading because of the presence of burrowing owls during the breeding season.

4. Resident owls present on or near the project site outside the breeding season can, in some instances, be relocated to other sites by a permitted biologist under the authorization of the U.S. Fish and Wildlife Service.

Loggerhead Shrike

According to the THCP, the loggerhead shrike is not a covered species and has no special federal status. It is considered a Species of Special Concern by the state of California. Mitigating impacts to the shrike is not required under federal statutes or the THCP. Nevertheless, it is recommended that breeding surveys be conducted simultaneously with burrowing owls surveys 30 days prior to any construction activities that are planned between February 15 and June 15, breeding seasons for both species. If a shrike nest is found, a buffer should be established in which construction activities are prohibited until all young have fledged. The width of the buffer should be determined by a qualified biologist.

Indirect Impacts

The project site is surrounded by high-volume roadways and two residential developments. As a result, it is nearly an ecological island with likely little significant biological interaction with natural habitats elsewhere in the Coachella Valley. Therefore, it is concluded that the development of the project site will have no significant indirect impacts to biological resources in the region.

Conclusion

Development of the proposed project site is not anticipated to have significant adverse impacts upon biological resources in the region providing the mitigation described in this report is implemented.

Attention: Mr. Tony Locacciato, AICP

Subject: Soils/Geology Review
Section 24 Specific Plan - Rancho Mirage Area
Riverside County, California

In accordance with your request and authorization, we are pleased to present herewith the results of our geotechnical/geologic review of the subject site located southwest of the intersection of Ramon Road and Bob Hope Drive, north of Dinah Shore Drive and east of Los Alamos Road, in the Rancho Mirage area of unincorporated Riverside County, California. We understand that the subject site/parcels, known collectively as planned "Section 24" will consist of a mix of retail, entertainment, office, resort and residential development. This report summarizes our findings and conclusions, and provides preliminary geotechnical recommendations for site development. Based on the results of this review, the site is considered suitable for the intended use provided our recommendations included herein are properly incorporated during design and construction phases of development. However, design level geotechnical evaluations will be needed to further define the extent of remedial grading and/or allowable settlements based on individual building loads and requirements.

If you have any questions regarding this report, please do not hesitate to contact the undersigned. We appreciate this opportunity to be of service on this project.

Respectfully submitted,
LEIGHTON AND ASSOCIATES, INC.

1.0 INTRODUCTION

1.1 Purpose and Scope

This soils/geology review is for the proposed "Section 24 Specific Plan" project located in the Rancho Mirage area of Riverside County, California (see Figure 1). Our scope of services for this review included the following:

- Review of sequential pairs of aerial photographs and our in-house and relevant published data for this area (see references at the end of this report).
- A site geologic reconnaissance and visual observations of surface conditions.
- Excavation, sampling and logging of 9 exploratory geotechnical hollow stem auger borings throughout the site. Logs of test borings are presented in Appendix A.
- Laboratory testing of representative soil samples obtained from the subsurface exploration program. A brief description of laboratory testing procedures and laboratory test results are presented in Appendix B.
- Geotechnical engineering analyses performed or as directed by a California registered Geotechnical Engineer (GE) including preliminary foundation and seismic design parameters based on the 2013 California Building Code (CBC). A California Certified Engineering Geologist (CEG) performed engineering geology review of site geologic hazards.
- Preparation of this report which presents the results of our review and provides preliminary geotechnical recommendations for the proposed development.

This report is not intended to be used as an environmental site assessment (Phase I or other).

1.2 Site Location and Description

The project site is located on several contiguous undeveloped parcels (Assessor Parcel Numbers (APNs) 673-120-021; -022; -023; -024; and -025), totaling approximately 577.33 acres (gross). The property is located southwest of the intersection of Ramon Road and Bob Hope Drive, north of Dinah Shore Drive, east of Los Alamos Road in an unincorporated portion of Riverside County, California (within the sphere of influence of the City of Rancho Mirage). The approximate limits of the site are shown on the Site Location Map, Figure 1. The property is

located immediately west of the Aqua Caliente Casino Resort Spa; north and east of the Westin Mission Hills resort community and northwest of Desert Ridge Plaza shopping center.

Topographically, the site and surrounding area slopes to the north and north-east. Site elevations range from high point elevation of approximately 356 feet above mean sea level (msl) near the southwestern corner to a low point elevation of approximately 248 feet (msl) near the northeast corner of the property.

The site is currently vacant land characterized with typical sand dune topography. It appears that a borrow source was located along the central western boundary and as well as an area for soil stockpiling in the southwest corner. Remnants of gravel parking lot are located at northeast corner, adjacent to intersection of Bob Hope Drive and Ramon Road.

1.3 Proposed Development

Based on a provided project description and conceptual plan by MSA Consulting, we understand that the proposed mix-use development will consist of retail, entertainment, office space, resort, residential lots, park sites, open spaces, several lakes and associated street improvements. Although structural loads are not known to us at this time, typical column loads for retail, office/hotel, and commercial structures are expected to range up to 200 kips and perimeter bearing wall loads are to range up to 6 kips per lineal foot. We anticipate residential lots to host a one- or two-story single or multi-family residential homes consisting of typical wood-frame structure with slab-on-grade foundations.

We anticipate that site grading will include typical cut and fill grading to create level pads, access streets and maximum 3:1 (horizontal to vertical) slopes. Based on provided preliminary Earthwork Exhibit (ALT 10) prepared by MSA Consulting Inc. (MSA, 2014) the maximum proposed cut and fill thickness is on the order of 45 feet (cut) to 50 feet (fill).

2.0 FIELD EXPLORATION AND LABORATORY TESTING

2.1 Field Exploration

Our field exploration program consisted of 9 hollow-stem auger borings excavated at the approximate locations shown on the Geotechnical Map (Plate 1, Geotechnical Map). During excavation, bulk samples and relatively "undisturbed" Ring samples were collected from the exploration borings for further laboratory testing and evaluation. The relatively undisturbed samples were obtained utilizing a modified California drive sampler (2⅜-inch inside diameter and 3-inch outside diameter) driven 18 inches in general accordance with ASTM Test Method D3550. Standard penetration tests (SPT) were performed using a 2-inch outside diameter (1⅜-inch inside diameter) sampler driven 18 inches in general accordance with ASTM Test Method D1586. The number of blows to drive the samplers are recorded on the boring logs for each 6-inch increment (unless encountering refusal or >50 blows per 6 inches). Sampling was conducted by a staff geologist from our firm. After logging and sampling, the excavations were loosely backfilled with spoils generated during excavation. The logs of exploratory test borings are presented in Appendix A.

2.2 Laboratory Testing

Laboratory tests were performed on representative bulk and undisturbed drive samples to provide a basis for development of remedial earthwork and geotechnical design parameters. Selected samples were tested for the following parameters: insitu moisture and density, maximum dry density (Proctor), R-Value, gradation, collapse, soluble sulfate, pH, resistivity and chloride content. The results of our laboratory testing are presented in Appendix B.

3.0 GEOTECHNICAL AND GEOLOGIC FINDINGS

3.1 Regional Geology

The site is located within the Coachella Valley area in the Colorado Desert Geomorphic Province of California. The San Bernardino Mountains of the Transverse Ranges Geomorphic Province are to the north and the San Jacinto Mountains of the Peninsular Range are to the south. The dominant structural feature in this region is the active San Andreas transform system that consists of several major northwest-trending right lateral strike slip faults that extend through the San Gorgonio pass along the southern foothills of the San Bernardino Mountains, and along the northeast margin of the Coachella Valley. The San Andreas Fault Zone is composed of a series of fault zones of which the South Branch of the San Andreas is located in the vicinity, generally north of the site. Figure 2, Regional Geologic Map, depicts the fault location and shows the region as underlain by unconsolidated Holocene sediments (alluvium and other deposits). The site itself is underlain by wind-blown (aeolian) sand deposits as well as alluvial soil eroded from the nearby mountains and deposited in the site vicinity.

3.2 Site Specific Geology

Based on the results of our field exploration and review of relevant geologic data for this area (see References), the site subsurface materials consist of dune sands over alluvium to the depths explored. Stockpiled undocumented fill soils are locally observed onsite. These units are discussed in the following sections in order of increasing age and further described on the logs of geotechnical borings in Appendix A.

3.2.1 Undocumented Fill (Map Symbol Afu)

As indicated above, a borrow source and associated grading was located along the central, western boundary and soil stockpiling was observed in the southwest corner. Grading to produce a large gravel parking field was also noted in the north east corner of the site. If encountered during site grading, undocumented fills are considered unsuitable for support of additional fill or structures or other planned improvements. The undocumented fill soils appear to be generated from onsite or nearby sources; hence they should be generally suitable for use as compacted fills provided they are cleared of debris, organics, and any deleterious materials.

3.2.2 Dune Sand (Map symbol Qs)

Dune sand materials are expected to mantle the majority of the site. The depth of the dune sand materials cannot be easily verified based on this limited investigation and relatively homogenous onsite alluvium. However, it is estimated that the dune sands generally extend to a depth varying from 5 to 20 feet below ground surface (BGS). These materials generally consist of light brown gray to darker gray and loose to medium dense silty sand to poorly-graded fine sand. Based on the results of our laboratory testing, these materials are expected to possess a very low expansion potential (EI<21) and N-values ranging from 5 to 15 blows/foot.

3.2.3 Quaternary Alluvium (Map Symbol Qal)

Quaternary-aged alluvial deposits were encountered in all of our borings to the maximum depth explored. As encountered, the alluvium typically consists of light brown to brownish gray, medium dense to very dense, poorly-graded fine sand to sand with silt. The alluvium is expected to generally possess very low expansion potential (EI<21).

3.3 Groundwater and Surface Water

Groundwater was not encountered in any of the borings and no standing water was observed on the ground surface during the time of the investigation. According to Department of water Resources, Southern District, Well 04S05E29A001S located west of the site, groundwater depths may be between 160 and 175 feet below ground surface (bgs). Based on this data, it appears that shallow groundwater has not been present recently, or historically. As such, groundwater is not expected to be a constraint to development of the site and considered to be no impact to this site. However, it should be noted that local perched water conditions may exist intermittently and may fluctuate seasonally, depending on rainfall and irrigation conditions. Surface runoff from the adjacent elevated portions of the site should be anticipated.

3.4 Faulting and Fissuring

This site is not located within a currently designated Alquist-Priolo Earthquake Fault Zone or County of Riverside Fault Zone. No active, inactive fault traces or fissuring are known to traverse the planned development portions (Bryant and Hart, 2007) and no evidence of onsite faulting was observed during our investigation. As defined by the California Geologic Survey, an active fault is one that has had surface displacement within the Holocene Epoch (roughly the last 11,000 years).

The closest known active fault zone is the Coachella Segment of the San Andreas Fault Zone located approximately, 5.0 miles (7.6 km) northwest of the site (Blake, 2000d). Twenty eight active faults are known to exist within 100 Km (62.4 miles) of the site. A table of the major active earthquakes (>5.5 Mw) within 20 miles of the site in the last 150 years is presented in the table below. The South Branch Segment of the San Andreas Fault Zone is considered to be the source of the design earthquake. Due to the distance to active fault(s), ground rupture at this site is considered to be no impact.

Fault Segment	Distance from Site	Moment Magnitude
San Andreas	4.7 miles (7.6 Km)	7.1
Burnt Mountain	9.6 miles (15.5 Km)	6.4
Eureka Peak	11.8 miles (19.0 Km)	6.4
Pinto Mountain	20.3 miles (32.7 Km)	7.0

3.5 Ground Shaking

Strong ground shaking can be expected at the site during moderate to severe earthquakes in this general region. This is common to virtually all of Southern California and can be considered a significant impact. Intensity of ground shaking at a given location depends primarily upon earthquake magnitude, site distance from the source, and site response (soil type) characteristics. Based on the 2013 California Building Code (CBC) and using the USGS Ground Motion Parameter Calculator, the seismic coefficients for this site are provided in the following table:

Table 1. 2013 CBC Site-Specific Seismic Coefficients

CBC Categorization/Coefficient		Design Value (g)
Site Longitude (-116.41581)	Site Latitude (33.80725)	
Site Class Definition	**D**	
Mapped Spectral Response Acceleration at 0.2s Period, S_S		2.01
Mapped Spectral Response Acceleration at 1s Period, S_1		0.97
Short Period Site Coefficient at 0.2s Period, F_a		**1.00**
Long Period Site Coefficient at 1s Period, F_v		**1.50**
Adjusted Spectral Response Acceleration at 0.2s Period, S_{MS}		2.01
Adjusted Spectral Response Acceleration at 1s Period, S_{M1}		1.46
Design Spectral Response Acceleration at 0.2s Period, S_{DS}		***1.34***
Design Spectral Response Acceleration at 1s Period, S_{D1}		***0.97***

* g- Gravity acceleration

3.6 Dynamic Settlement (Liquefaction and Dry Settlement)

Liquefaction and dynamic settlement of cohesionless soils can be caused by strong vibratory motion due to earthquakes. Research and historical data indicate that loose granular soils below a near-surface groundwater table are most susceptible to liquefaction. Due to the absence of shallow groundwater, the liquefaction-induced settlement is considered to be no impact for this site.

However, during a strong seismic event, seismically-induced settlement can still occur within loose to moderately dense, dry or saturated granular soils. Settlement caused by ground shaking is often non-uniformly distributed, which can result in differential settlement. Based on the proposed remedial grading recommendations in areas of planned development, the potential total settlement resulting from ground shaking is considered minimal or less than ½ inch in the upper 50 feet of soils. The seismically-induced ground settlement is considered to be less than significant impact when the recommendations contained herein are implemented.

3.7 Flooding

The site is not within a FEMA flood plain. However, the northeast portion of the site is within a Coachella Valley Water District flood hazard area (CVWD, 2014 and Northwest Hydraulics, 2014).

3.8 Seiche and Tsunami

Due to the sites elevated location and lack of nearby open bodies of water, the possibility of the seiches or tsunami is considered to be no impact for this site.

3.9 Expansive/Collapsible Soils

Limited laboratory testing indicated that onsite soils possess a very low expansion potential (EI<21). Based on the remedial grading recommendations in areas of planned development, the potential impact due to collapsible soils, if they exist onsite, is less than significant.

3.10 Slope Stability and Landslides

Cut and fill slopes are currently planned on the order of approximately 20 feet high at inclinations of 3:1 (horizontal to vertical). As such, slope instability is not considered an issue at this site. The site is not considered susceptible to seismically induced landslides and therefore there is no impact for this site.

4.0 SUMMARY OF FINDINGS AND CONCLUSIONS

Based on the results of this review, it is our opinion that the proposed development is feasible from a geotechnical/geologic standpoint. The following is a summary of the main geotechnical findings or factors that may affect development of the site.

- The existing onsite soils appear to be suitable for reuse as fill during proposed grading provided they are relatively free of organic material and debris.
- Undocumented fill soils (existing stockpiled soils), topsoil, and loose dune sand are considered to be potentially compressible. These materials should be recompacted in areas of planned development.
- The near surface soils are potentially compressible in their present state and may settle under the surcharge of fills or foundation loading. As such, these materials should be removed (over-excavated) and re-compacted in all settlement-sensitive areas based on specific building loads and settlement criteria for individual structures.
- Based on our subsurface exploration, it is our opinion that the onsite earth materials can be excavated with heavy-duty conventional grading equipment in good working condition.
- Evidence of active faulting was not identified within or projecting into the planned development area. Strong ground shaking may occur at this site due to local earthquake activity.
- Groundwater was not encountered; however, perched groundwater may develop in areas of soils with contrasting permeabilities possibly resulting in saturated soil conditions.
- Based on preliminary laboratory results and field observations, onsite earth materials are expected to possess a very low expansion potential and negligible sulfate exposure to concrete.
- Cut/Fill slopes are anticipated to be less than 20 feet in height and are expected to be grossly stable. Due to the cohesionless nature of site soils, surficial erosion should be anticipated.
- Unprotected pads and slope faces will be susceptible to erosion. This risk can be reduced by planting the slopes as soon as possible after grading, and by maintaining proper erosion control measures.
- A relative small low lying northeast portion of the site is located within a local CVWD Flood Hazard area. The design civil engineer should review this condition and address the flood design mitigation.

5.0 RECOMMENDATIONS

5.1 General

Based on the results of this review, it is our opinion that the subject site is suitable for the proposed development from a geotechnical viewpoint. Design and grading of the site should be in accordance with our recommendations included in this report and based on additional site-specific development plans and evaluations made during design and construction by the geotechnical consultant.

5.2 Earthwork Considerations

Earthwork should be performed in accordance with the General Earthwork and Grading Specifications in Appendix C as well as the following recommendations. The recommendations contained in Appendix C, are general grading specifications provided for typical grading projects and some of the recommendations may not be strictly applicable to this project. The specific recommendations contained in the text of this report supersede the general recommendations in Appendix C.

The contract between the developer and earthwork contractor should be worded such that it is the responsibility of the contractor to place the fill properly in accordance with the recommendations of this report, and applicable County Grading Ordinances, notwithstanding the testing and observation of the geotechnical consultant during construction.

5.2.1 Site Preparation and Remedial Grading

Prior to grading, the proposed structural improvement areas (i.e. all structural fill areas, pavement areas, buildings, etc.) of the site should be cleared of surface and subsurface obstructions, heavy vegetation and boulders. Roots and debris should be disposed of offsite. Septic Tanks or seepage pits, if encountered, should be abandoned in accordance with the County of Riverside Department of Health Services guidelines.

The near surface soils are potentially compressible in their present state and may settle under the surcharge of fills or foundation loading. As such, these materials should be removed (over-excavated) and re-compacted in all settlement-sensitive areas in accordance with specific building loads and/or settlement criteria for individual structures. In general, it is estimated that with pre-watering to optimum moisture condition to depths of 5 to 7 feet below existing grades (in fill areas) the planned remedial removal depths may range from 3 to 5 feet below bottom of footings for most buildings. In

general, the depth of removal should be anticipated to extend to 3 feet below street subgrade, pad subgrade or footing bottom, or whichever is deeper. However, such criteria should be further verified based on review of future site development plans and foundation loads.

Acceptability of all removal bottoms should be reviewed by the geotechnical consultant and documented in the as-graded geotechnical report. The removal limit should be established by a 1:1 (horizontal: vertical) projection from the edge of fill soils supporting settlement-sensitive structures downward and outward to competent material identified by the geotechnical consultant. Removal will also include benching into competent material as the fills rise. Areas adjacent to existing structures or property limits may require special considerations and monitoring. Steeper temporary slopes in these areas may be considered.

5.2.2 Cut/Fill Transition Lots

In order to mitigate the impact of underlying cut/fill transition conditions, we recommend over-excavation of the cut portion of transition lots. Over-excavation should extend to a minimum depth of 3 feet below the bottom of the proposed footings or one-half of the maximum fill thickness on the lot, whichever is deeper (not to exceed 10 feet). This overexcavation does not include scarification or preprocessing prior to placement of fill.

5.2.3 Structural Fills

The onsite soils are generally suitable for re-use as compacted fill provided they are free of debris and organic matter. Areas to receive structural fill and/or other surface improvements should be scarified to a minimum depth of 8 inches, conditioned to at least optimum moisture content, and recompacted. Fill soils should be placed at a minimum of 90 percent relative compaction (based on ASTM D1557) and near or above optimum moisture content. Placement and compaction of fill should be performed in accordance with local grading ordinances under the observation and testing of the geotechnical consultant. The optimum lift thickness to produce a uniformly compacted fill will depend on the type and size of compaction equipment used. In general, fill should be placed in uniform lifts not exceeding 8 inches in thickness.

Fill slope keyways will be necessary at the toe of all fill slopes and cut slope replacement fills. Keyway schematics, including dimensions and subdrain recommendations, are provided in Appendix C. All keyways should be excavated into dense bedrock or dense alluvium as determined by the geotechnical engineer. The cut portions of all slope and keyway excavations should be geologically mapped and approved by a geologist prior to fill placement.

Fills placed on slopes steeper than 5:1 (horizontal:vertical) should be benched into dense soils (see Appendix C for benching detail). Benching should be of sufficient depth to remove all loose material. A minimum bench height of 2 feet into approved material should be maintained at all times.

5.2.4 Shrinkage and Subsidence

The volume change of excavated onsite materials upon compaction is expected to vary with materials, volume of roots and deleterious materials, density, insitu moisture content, location, and compaction effort. The in-place and compacted densities of soil materials vary and accurate overall determination of shrinkage and bulking cannot be made. Therefore, we recommend site grading include, if possible, a balance area or ability to adjust import quantities to accommodate some variation. Based on our experience with similar materials, we anticipate 12 to 15 percent shrinkage in the upper 5 to 10 feet of dune sand/alluvium.

Subsidence due solely to scarification, moisture conditioning and recompaction of the exposed bottom of overexcavation, is expected to be on the order of 0.10 foot. This should be added to the above shrinkage value for the recompacted fill zone, to calculate overall recompaction subsidence.

5.2.5 Import Soils

Import soils and/or borrow sites, if needed, should be evaluated by the geotechnical consultant prior to import. Import soils should be uncontaminated, granular in nature, free of organic material (loss on ignition less-than 2 percent), have a very low expansion potential (with an Expansion Index less than 21) and have a low corrosion impact to the proposed improvements.

5.2.6 Utility Trenches

Utility trenches should be backfilled with compacted fill in accordance with Sections 306-1.2 and 306-1.3 of the Standard Specifications for Public Works Construction, (“Greenbook”), 2012 Edition (or most recent). Fill material above the pipe zone should be placed in lifts not exceeding 8 inches in uncompacted thickness and should be compacted to at least 90 percent relative compaction (ASTM D 1557) by mechanical means only. Site soils may generally be suitable as trench backfill provided these soils are screened of rocks over 1½ inches in diameter and organic matter. If imported sand is used as backfill, the upper 3 feet in building and pavement areas should be compacted to 95 percent. The upper 6 inches of backfill in all pavement areas should be compacted to at least 95 percent relative compaction.

Where granular backfill is used in utility trenches adjacent moisture sensitive subgrades and foundation soils, we recommend that a cut-off "plug" of impermeable material be placed in these trenches at the perimeter of buildings, and at pavement edges adjacent to irrigated landscaped areas. A "plug" can consist of a 5-foot long section of clayey soils with more than 35-percent passing the No. 200 sieve, or a Controlled Low Strength Material (CLSM) consisting of one sack of Portland-cement plus one sack of bentonite per cubic-yard of sand. CLSM should generally conform to Section 201-6 of the Standard Specifications for Public Works Construction, ("Greenbook"), 2012 Edition. This is intended to reduce the likelihood of water permeating trenches from landscaped areas, then seeping along permeable trench backfill into the building and pavement subgrades, resulting in wetting of moisture sensitive subgrade earth materials under buildings and pavements.

Excavation of utility trenches should be performed in accordance with the project plans, specifications and the California Construction Safety Orders (2012 Edition or more current). The contractor should be responsible for providing a "competent person" as defined in Article 6 of the California Construction Safety Orders. Contractors should be advised that sandy soils (such as fills generated from the onsite alluvium) could make excavations particularly unsafe if all safety precautions are not properly implemented. In addition, excavations at or near the toe of slopes and/or parallel to slopes may be highly unstable due to the increased driving force and load on the trench wall. Spoil piles from the excavation(s) and construction equipment should be kept away from the sides of the trenches. Leighton does not consult in the area of safety engineering.

5.2.7 Drainage

All drainage should be directed away from structures, slopes and pavements by means of approved permanent/temporary drainage devices. Adequate storm drainage of any proposed pad should be provided to avoid wetting of foundation soils. Irrigation adjacent to buildings should be avoided when possible. As an option, sealed-bottom planter boxes and/or drought resistant vegetation should be used within 5-feet of buildings.

5.2.8 Slope Design and Construction

Based on our understanding and planning purposes, all fill and cut slopes will be designed and constructed at 3:1 (horizontal:vertical) with benches at maximum 30 foot intervals. These slopes are considered grossly stable for static and pseudostatic conditions. For planning purposes, cut slopes exceeding 5 feet in height should be constructed as replacement fill slopes due to the highly erosive nature of site soils. Future grading plans should be subject to further review and evaluation.

The outer portion of fill slopes should be either overbuilt by 2 feet (minimum) and trimmed back to the finished slope configuration or compacted in vertical increments of 5 feet (maximum) by a weighted sheepsfoot roller as the fill is placed. The slope face should then be track-walked by dozers of appropriate weight to achieve the final slope configuration and compaction to the slope face.

Slope faces are inherently subject to erosion, particularly if exposed to wind, rainfall and irrigation. Landscaping and slope maintenance should be conducted as soon as possible in order to increase long-term surficial stability. Berms should be provided at the top of fill slopes. Drainage should be directed such that surface runoff on the slope face is minimized

5.3 Foundation Design

5.3.1 Bearing and Lateral Pressures

Based on our analysis, the proposed residential/ and retail/commercial structures may be founded on conventional foundation systems based on the design parameters provided below. The proposed foundations and slabs should be designed in accordance with the structural consultants' design, the minimum geotechnical recommendations presented herein, and the 2013 CBC. In utilizing the minimum geotechnical foundation recommendations, the structural consultant should design the foundation system to acceptable deflection criteria as determined by the architect. Foundation footings may be designed with the following geotechnical design parameters:

- Bearing Capacity: A net allowable bearing capacity of 2,000 pounds per square foot (psf), or a modulus of subgrade reaction of 150 pci may be used for design of footings founded entirely into compacted fill. The footings should extend a minimum of 12 inches below lowest adjacent grade. A minimum base width of 18 inches for continuous footings and a minimum bearing area of 3 square feet (1.75 ft by 1.75 ft) for pad foundations should be used. Additionally, an increase of one-third may be applied when considering short-term live loads (e.g. seismic and wind).

- Passive Pressures: The passive earth pressure may be computed as an equivalent fluid having a density of 300 psf per foot of depth, to a maximum earth pressure of 3,000 pounds per square foot. A coefficient of friction between soil and concrete of 0.35 may be used with dead load forces. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third

The footing width, depth, reinforcement, slab reinforcement, and the slab-on-grade thickness should be designed by the structural consultant based on recommendations and soil characteristics indicated herein and the most recently adopted edition of the CBC.

5.3.2 Settlement

For preliminary design purposes, the project civil engineer, structural engineer, and architect should consider the potential effects of both static settlement and dynamic settlement presented below.

- Static Settlement**:** Most of the static settlement of onsite soils is expected to be immediate or within 30 days following fill placement. A differential static settlement of 0.5 inch over a 40-foot span may be considered. Additional settlement will also occur in the future if sites grades are raised or due to specific or large footing/foundation loads.

- Dynamic Settlement: Based on our analysis, we estimate that total dynamic settlement is expected to be less than 0.5 inch. Differential settlement is expected to be minimal or less than 0.25 inches over a 40-foot horizontal span.

5.3.3 Vapor Retarder

It has been a standard of care to install a moisture retarder underneath all slabs where moisture condensation is undesirable. Moisture vapor retarders may retard but not totally eliminate moisture vapor movement from the underlying soils up through the slabs. Moisture vapor transmission may be additionally reduced by use of concrete additives. Leighton does not practice in the field of moisture vapor transmission evaluation/mitigation. Therefore, we recommend that a qualified person/firm be engaged/consulted with to evaluate the general and specific moisture vapor transmission paths and any impact on the proposed construction. This person/firm should provide recommendations for mitigation of potential adverse impact of moisture vapor transmission on various components of the structure as deemed appropriate. The slab subgrade soils should be well wetted prior to placing concrete.

5.4 Retaining Walls

Retaining wall earth pressures are a function of the amount of wall yielding horizontally under load. If the wall can yield enough to mobilize full shear strength of backfill soils, then the wall can be designed for "active" pressure. If the wall cannot yield under the applied load, the shear strength of the soil cannot be mobilized and the earth pressure will be higher. Such walls should be designed for "at rest" conditions. If a structure moves toward the soils, the

resulting resistance developed by the soil is the "passive" resistance. Retaining walls backfilled with non-expansive soils should be designed using the following equivalent fluid pressures:

Table 2. Retaining Wall Design Earth Pressures (Static, Drained)

Loading Conditions	Equivalent Fluid Density (pcf)	
	Level Backfill	2:1 Backfill
Active	35	50
At-Rest	50	80
Passive*	300	150 (2:1, sloping down)

* This assumes level condition in front of the wall will remain for the duration of the project, not to exceed 3,000 psf at depth. If sloping down (2:1) grades exist in front of walls, then they should be designed using passive values reduced to ½ of level backfill passive resistance values.

Unrestrained (yielding) cantilever walls should be designed for the active equivalent-fluid weight value provided above for very low to low expansive soils that are free draining. In the design of walls restrained from movement at the top (non-yielding) such as basement or elevator pit/utility vaults, the at-rest equivalent fluid weight value should be used. Total depth of retained earth for design of cantilever walls should be measured as the vertical distance below the ground surface measured at the wall face for stem design, or measured at the heel of the footing for overturning and sliding calculations. Should a sloping backfill other than a 2:1 (horizontal:vertical) be constructed above the wall (or a backfill is loaded by an adjacent surcharge load), the equivalent fluid weight values provided above should be re-evaluated on an individual case basis by us. Non-standard wall designs should also be reviewed by us prior to construction to check that the proper soil parameters have been incorporated into the wall design.

All retaining walls should be provided with appropriate drainage. The outlet pipe should be sloped to drain to a suitable outlet. Typical wall drainage design is illustrated in Appendix C, *Retaining Wall Backfill and Subdrain Detail*. Wall backfill should be non-expansive (EI $\leq$ 21) sands compacted by mechanical methods to a minimum of 90 percent relative compaction (ASTM D 1557). Clayey site soils should not be used as wall backfill. Walls should not be backfilled until wall concrete attains the 28-day compressive strength and/or as determined by the Structural Engineer that the wall is structurally capable of supporting backfill. Lightweight compaction equipment should be used, unless otherwise approved by the Structural Engineer.

5.5 Geochemical Characteristics

Limited laboratory testing indicated a negligible concentration of soluble sulfates in onsite soils for representative samples. The laboratory test results are presented in Appendix B.

Additional corrosion testing should be performed on representative finish grade soils at the completion of rough grading. Concrete foundations in contact with site soils should be designed in accordance with 2013 CBC. A qualified corrosion engineer should be consulted to review the results of laboratory tests and coordinate additional testing if corrosion sensitive materials are to be used.

5.6 Preliminary Pavement Design Parameters

In order to provide the following recommendations, we have assumed an R-value of 45 based on our laboratory testing and the granular nature of the onsite soils and results of our laboratory testing. For the final pavement design, appropriate traffic indices should be selected by the project civil engineer or traffic engineering consultant and representative samples of actual subgrade materials should be tested for R-value.

Table 3. Preliminary Pavement Design

Street Type	Loading Conditions TI	*AC Pavement Section Thickness*	
		Asphaltic-Concrete (AC) Thickness (inch)	Aggregate Base (AB) Thickness (inch)
Parking Stalls	5	3.0	4
Local Street	5.5 to 6	3.0	6
Heavy Traffic Driveways/trucks	6.5 to 7	4.0	6

The subgrade soils in the upper 6 inches should be properly compacted to at least 95 percent relative compaction (ASTM D1557) and should be moisture-conditioned to near optimum and kept in this condition until the pavement section is constructed. Proof-rolling subgrade to identify localized areas of yielding subgrade (if any) should be performed prior to placement of aggregate base and under the observation of the geotechnical consultant.

Minimum relative compaction requirements for aggregate base should be 95 percent of the maximum laboratory density as determined by ASTM D1557. Base rock should conform to the "Standard Specifications for Public Works

Construction" (green book) current edition or Caltrans Class 2 aggregate base having a minimum R-value of 78. Asphaltic concrete should be placed on compacted aggregate base and compacted to a minimum 95 percent relative compaction

The preliminary pavement sections provided in this section are meant as minimum, if thinner or highly variable pavement sections are constructed, increased maintenance and repair may be needed.

6.0 GEOTECHNICAL CONSTRUCTION SERVICES

Geotechnical review is of paramount importance in engineering practice. Poor performances of many foundation and earthwork projects have been attributed to inadequate construction review. We recommend that Leighton be provided the opportunity to review the grading plan and foundation plan(s) for each type of structure that design level recommendations can be provided based on actual loads and locations.

Reasonably-continuous construction observation and review during site grading and foundation installation allows for evaluation of the actual soil conditions and the ability to provide appropriate revisions where required during construction. Geotechnical conclusions and preliminary recommendations should be reviewed and verified by Leighton during construction, and revised accordingly if geotechnical conditions encountered vary from our findings and interpretations. Geotechnical observation and testing should be provided:

- After completion of site demolition and clearing,
- During ground preparation, fill slope key excavations, overexcavation of surface soils and subdrain placement as described herein,
- During compaction of all fill materials,
- After excavation of all footings, and prior to placement of concrete,
- During utility trench backfilling and compaction, and
- When any unusual conditions are encountered.

Additional geotechnical exploration and analysis may be required based on final development plans, for reasons such as significant changes in proposed structure locations/footprints. We should review grading (civil) and foundation (structural) plans, and comment further on geotechnical aspects of this project.

7.0 LIMITATIONS

This report was necessarily based in part upon data obtained from a limited number of observances, site visits, soil samples, tests, analyses, histories of occurrences, spaced subsurface explorations and limited information on historical events and observations. Such information is necessarily incomplete. The nature of many sites is such that differing characteristics can be experienced within small distances and under various climatic conditions. Changes in subsurface conditions can and do occur over time. This investigation was performed with the understanding that the subject site is proposed for residential and commercial development. The client is referred to Appendix D regarding important information provided by the Associated Soil and Foundation Engineers (ASFE) on geotechnical engineering studies and reports and their applicability.

This report was prepared for Meridian Consultants, LLC., based on its needs, directions, and requirements at the time of our investigation. This report is not authorized for use by, and is not to be relied upon by any party except Meridian consultants, LLC, and its successors and assigns as owner of the property, with whom Leighton and Associates, Inc. has contracted for the work. Use of or reliance on this report by any other party is at that party's risk. Unauthorized use of or reliance on this report constitutes an agreement to defend and indemnify Leighton and Associates, Inc. from and against any liability which may arise as a result of such use or reliance, regardless of any fault, negligence, or strict liability of Leighton and Associates, Inc.

APPENDIX C

EARTHWORK AND GRADING SPECIFICATIONS

APPENDIX C

GENERAL EARTHWORK AND GRADING SPECIFICATIONS

TABLE OF CONTENTS

1.0 General

1.1 Intent

These General Earthwork and Grading Specifications are for the grading and earthwork shown on the approved grading plan(s) and/or indicated in the geotechnical report(s). These Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the specific recommendations in the geotechnical report shall supersede these more general Specifications. Observations of the earthwork by the project Geotechnical Consultant during the course of grading may result in new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

1.2 The Geotechnical Consultant of Record

Prior to commencement of work, the owner shall employ the Geotechnical Consultant of Record (Geotechnical Consultant). The Geotechnical Consultants shall be responsible for reviewing the approved geotechnical report(s) and accepting the adequacy of the preliminary geotechnical findings, conclusions, and recommendations prior to the commencement of the grading.

Prior to commencement of grading, the Geotechnical Consultant shall review the "work plan" prepared by the Earthwork Contractor (Contractor) and schedule sufficient personnel to perform the appropriate level of observation, mapping, and compaction testing.

During the grading and earthwork operations, the Geotechnical Consultant shall observe, map, and document the subsurface exposures to verify the geotechnical design assumptions. If the observed conditions are found to be significantly different than the interpreted assumptions during the design phase, the Geotechnical Consultant shall inform the owner, recommend appropriate changes in design to accommodate the observed conditions, and notify the review agency where required. Subsurface areas to be geotechnically observed, mapped, elevations recorded, and/or tested include natural ground after it has been cleared for receiving fill but before fill is placed, bottoms of all "remedial removal" areas, all key bottoms, and benches made on sloping ground to receive fill.

The Geotechnical Consultant shall observe the moisture-conditioning and processing of the subgrade and fill materials and perform relative compaction testing of fill to determine the attained level of compaction. The Geotechnical Consultant shall provide the test results to the owner and the Contractor on a routine and frequent basis.

1.3 The Earthwork Contractor

The Earthwork Contractor (Contractor) shall be qualified, experienced, and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing the grading in accordance with the plans and specifications.

The Contractor shall prepare and submit to the owner and the Geotechnical Consultant a work plan that indicates the sequence of earthwork grading, the number of "spreads" of work and the estimated quantities of daily earthwork contemplated for the site prior to commencement of grading. The Contractor shall inform the owner and the Geotechnical Consultant of changes in work schedules and updates to the work plan at least 24 hours in advance of such changes so that appropriate observations and tests can be planned and accomplished. The Contractor shall not assume that the Geotechnical Consultant is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish the earthwork in accordance with the applicable grading codes and agency ordinances, these Specifications, and the recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of the Geotechnical Consultant, unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, insufficient buttress key size, adverse weather, etc., are resulting in a quality of work less than required in these specifications, the Geotechnical Consultant shall reject the work and may recommend to the owner that construction be stopped until the conditions are rectified.

2.0 Preparation of Areas to be Filled

2.1 Clearing and Grubbing

Vegetation, such as brush, grass, roots, and other deleterious material shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies, and the Geotechnical Consultant.

The Geotechnical Consultant shall evaluate the extent of these removals depending on specific site conditions. Earth fill material shall not contain more than 1 percent of organic materials (by volume). No fill lift shall contain more than 5 percent of organic matter. Nesting of the organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area.

As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, coolant, etc.) have chemical constituents that are considered to be hazardous waste. As such, the indiscriminate dumping or spillage of these fluids onto the ground may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed.

2.2 Processing

Existing ground that has been declared satisfactory for support of fill by the Geotechnical Consultant shall be scarified to a minimum depth of 6 inches. Existing ground that is not satisfactory shall be overexcavated as specified in the following section. Scarification shall continue until soils are broken down and free of large clay lumps or clods and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction.

2.3 Overexcavation

In addition to removals and overexcavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured or otherwise unsuitable ground shall be overexcavated to competent ground as evaluated by the Geotechnical Consultant during grading.

2.4 Benching

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical units), the ground shall be stepped or benched. The lowest bench or key shall be a minimum of 15 feet wide and at least 2 feet deep, into competent material as evaluated by the Geotechnical Consultant. Other benches shall be excavated a minimum height of 4 feet into competent material or as otherwise recommended by the Geotechnical Consultant. Fill placed on ground sloping flatter than 5:1 shall also be benched or otherwise overexcavated to provide a flat subgrade for the fill.

2.5 Evaluation/Acceptance of Fill Areas

All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by the Geotechnical Consultant as suitable to receive fill. The Contractor shall obtain a written acceptance from the Geotechnical Consultant

prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys, and benches.

3.0 Fill Material

3.1 General

Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by the Geotechnical Consultant prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to the Geotechnical Consultant or mixed with other soils to achieve satisfactory fill material.

3.2 Oversize

Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 8 inches, shall not be buried or placed in fill unless location, materials, and placement methods are specifically accepted by the Geotechnical Consultant. Placement operations shall be such that nesting of oversized material does not occur and such that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 vertical feet of finish grade or within 2 feet of future utilities or underground construction.

3.3 Import

If importing of fill material is required for grading, proposed import material shall meet the requirements of Section 3.1. The potential import source shall be given to the Geotechnical Consultant at least 48 hours (2 working days) before importing begins so that its suitability can be determined and appropriate tests performed.

4.0 Fill Placement and Compaction

4.1 Fill Layers

Approved fill material shall be placed in areas prepared to receive fill (per Section 3.0) in near-horizontal layers not exceeding 8 inches in loose thickness. The Geotechnical Consultant may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

4.2 Fill Moisture Conditioning

Fill soils shall be watered, dried back, blended, and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture content tests shall be performed in accordance with the American Society of Testing and Materials (ASTM Test Method D1557).

4.3 Compaction of Fill

After each layer has been moisture-conditioned, mixed, and evenly spread, it shall be uniformly compacted to not less than 90 percent of maximum dry density (ASTM Test Method D1557). Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction with uniformity.

4.4 Compaction of Fill Slopes

In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by backrolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet in fill elevation, or by other methods producing satisfactory results acceptable to the Geotechnical Consultant. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of maximum density per ASTM Test Method D1557.

4.5 Compaction Testing

Field-tests for moisture content and relative compaction of the fill soils shall be performed by the Geotechnical Consultant. Location and frequency of tests shall be at the Consultant's discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

4.6 Frequency of Compaction Testing

Tests shall be taken at intervals not exceeding 2 feet in vertical rise and/or 1,000 cubic yards of compacted fill soils embankment. In addition, as a guideline, at least one test shall be taken on slope faces for each 5,000 square feet of slope face and/or each 10 feet of vertical height of slope. The Contractor shall assure that fill construction is such that the testing schedule can be accomplished by the Geotechnical Consultant. The Contractor shall stop or slow down the earthwork construction if these minimum standards are not met.

4.7 Compaction Test Locations

The Geotechnical Consultant shall document the approximate elevation and horizontal coordinates of each test location. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so that the Geotechnical Consultant can determine the test locations with sufficient accuracy. At a minimum, two grade stakes within a horizontal distance of 100 feet and vertically less than 5 feet apart from potential test locations shall be provided.

5.0 Subdrain Installation

Subdrain systems shall be installed in accordance with the approved geotechnical report(s), the grading plan. The Geotechnical Consultant may recommend additional subdrains and/or changes in subdrain extent, location, grade, or material depending on conditions encountered during grading. All subdrains shall be surveyed by a land surveyor/civil engineer for line and grade after installation and prior to burial. Sufficient time should be allowed by the Contractor for these surveys.

6.0 Excavation

Excavations, as well as over-excavation for remedial purposes, shall be evaluated by the Geotechnical Consultant during grading. Remedial removal depths shown on geotechnical plans are estimates only. The actual extent of removal shall be determined by the Geotechnical Consultant based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, evaluated, and accepted by the Geotechnical Consultant prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by the Geotechnical Consultant.

7.0 Trench Backfills

7.1 Safety

The Contractor shall follow all OSHA and Cal/OSHA requirements for safety of trench excavations.

7.2 Bedding and Backfill

All bedding and backfill of utility trenches shall be performed in accordance with the applicable provisions of Standard Specifications of Public Works Construction. Bedding material shall have a Sand Equivalent greater than 30 (SE>30). The bedding shall be placed to 1 foot over the top of the conduit and densified by jetting. Backfill shall be placed and densified to a minimum of 90 percent of relative compaction from 1 foot above the top of the conduit to the surface.

The Geotechnical Consultant shall test the trench backfill for relative compaction. At least one test should be made for every 300 feet of trench and 2 feet of fill.

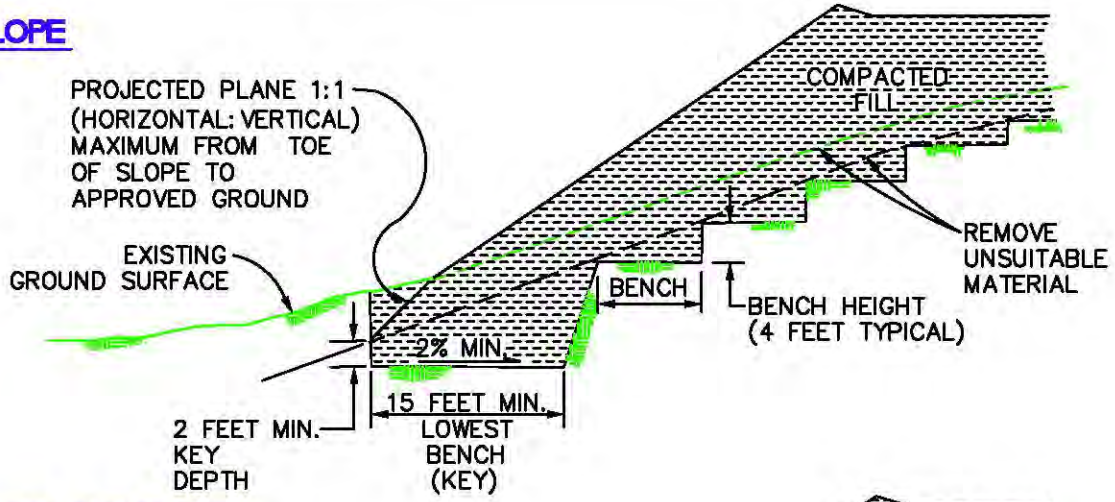
7.3 Lift Thickness

Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to the Geotechnical Consultant that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method.

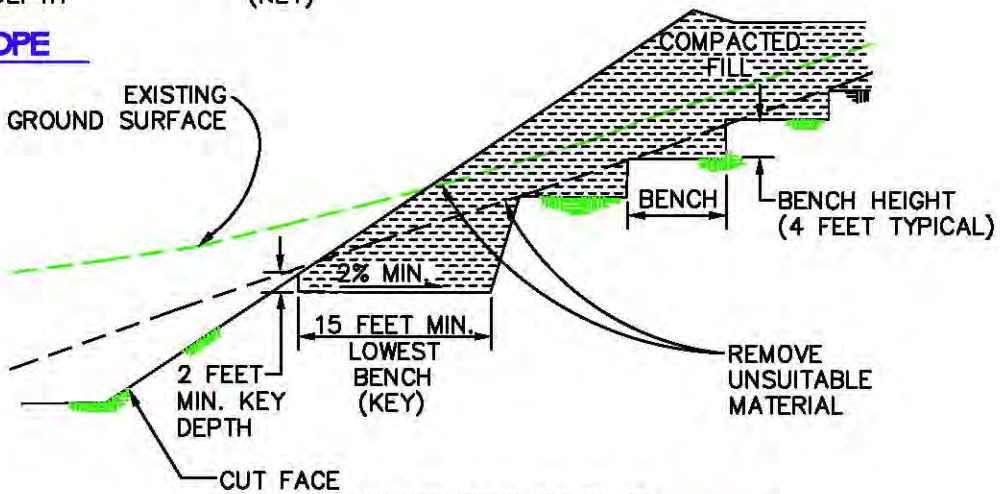
7.4 Observation and Testing

The jetting of the bedding around the conduits shall be observed by the Geotechnical Consultant.

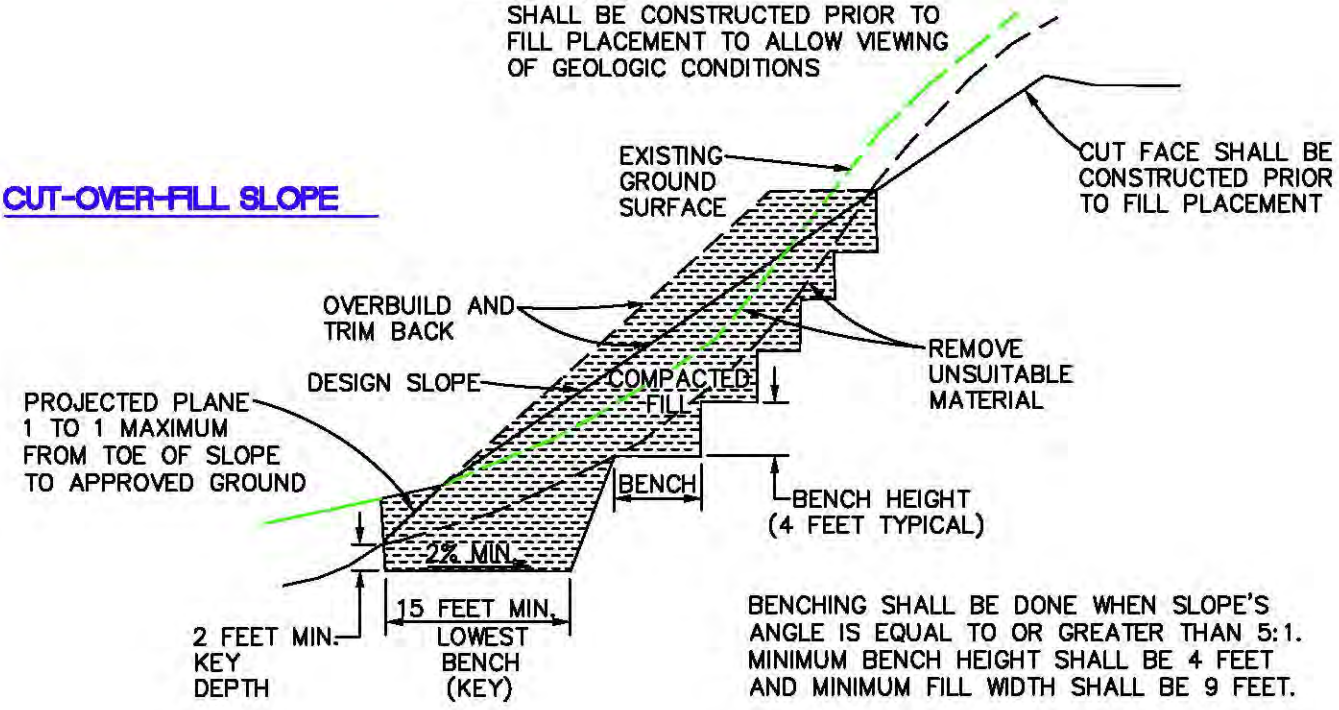
FILL SLOPE



FILL-OVER-CUT SLOPE



CUT-OVER-FILL SLOPE



BENCHING SHALL BE DONE WHEN SLOPE'S ANGLE IS EQUAL TO OR GREATER THAN 5:1. MINIMUM BENCH HEIGHT SHALL BE 4 FEET AND MINIMUM FILL WIDTH SHALL BE 9 FEET.

GENERAL NOTES:

* Waterproofing should be provided where moisture nuisance problem through the wall is undesirable.
* Water proofing of the walls is not under purview of the geotechnical engineer
* All drains should have a gradient of 1 percent minimum
*Outlet portion of the subdrain should have a 4-inch diameter solid pipe discharged into a suitable disposal area designed by the project engineer. The subdrain pipe should be accessible for maintenance (rodding)
*Other subdrain backfill options are subject to the review by the geotechnical engineer and modification of design parameters.

Notes:
1) Sand should have a sand equivalent of 30 or greater and may be densified by water jetting.
2) 1 Cu. ft. per ft. of 1/4- to 1 1/2-inch size gravel wrapped in filter fabric
3) Pipe type should be ASTM D1527 Acrylonitrile Butadiene Styrene (ABS) SDR35 or ASTM D1785 Polyvinyl Chloride plastic (PVC), Schedule 40, Armco A2000 PVC, or approved equivalent. Pipe should be installed with perforations down. Perforations should be 3/8 inch in diameter placed at the ends of a 120-degree arc in two rows at 3-inch on center (staggered)
4) Filter fabric should be Mirafi 140NC or approved equivalent.
5) Weephole should be 3-inch minimum diameter and provided at 10-foot maximum intervals. If exposure is permitted, weepholes should be located 12 inches above finished grade. If exposure is not permitted such as for a wall adjacent to a sidewalk/curb, a pipe under the sidewalk to be discharged through the curb face or equivalent should be provided. For a basement-type wall, a proper subdrain outlet system should be provided.
6) Retaining wall plans should be reviewed and approved by the geotechnical engineer.
7) Walls over six feet in height are subject to a special review by the geotechnical engineer and modifications to the above requirements.

APPENDIX D

ASFE Important Information about Your Geotechnical Engineering Report

Important Information About Your

Geotechnical Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

The following information is provided to help you manage your risks.

Geotechnical Services Are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical engineering study conducted for a civil engineer may not fulfill the needs of a construction contractor or even another civil engineer. Because each geotechnical engineering study is unique, each geotechnical engineering report is unique, prepared *solely* for the client. No one except you should rely on your geotechnical engineering report without first conferring with the geotechnical engineer who prepared it. *And no one — not even you* — should apply the report for any purpose or project except the one originally contemplated.

Read the Full Report

Serious problems have occurred because those relying on a geotechnical engineering report did not read it all. Do not rely on an executive summary. Do not read selected elements only.

A Geotechnical Engineering Report Is Based on A Unique Set of Project-Specific Factors

Geotechnical engineers consider a number of unique, project-specific factors when establishing the scope of a study. Typical factors include: the client's goals, objectives, and risk management preferences; the general nature of the structure involved, its size, and configuration; the location of the structure on the site; and other planned or existing site improvements, such as access roads, parking lots, and underground utilities. Unless the geotechnical engineer who conducted the study specifically indicates otherwise, do not rely on a geotechnical engineering report that was:

- not prepared for you,
- not prepared for your project,
- not prepared for the specific site explored, or
- completed before important project changes were made.

Typical changes that can erode the reliability of an existing geotechnical engineering report include those that affect:

- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light industrial plant to a refrigerated warehouse,
- elevation, configuration, location, orientation, or weight of the proposed structure,
- composition of the design team, or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes—even minor ones—and request an assessment of their impact. *Geotechnical engineers cannot accept responsibility or liability for problems that occur because their reports do not consider developments of which they were not informed.*

Subsurface Conditions Can Change

A geotechnical engineering report is based on conditions that existed at the time the study was performed. *Do not rely on a geotechnical engineering report* whose adequacy may have been affected by: the passage of time; by man-made events, such as construction on or adjacent to the site; or by natural events, such as floods, earthquakes, or groundwater fluctuations. *Always* contact the geotechnical engineer before applying the report to determine if it is still reliable. A minor amount of additional testing or analysis could prevent major problems.

Most Geotechnical Findings Are Professional Opinions

Site exploration identifies subsurface conditions only at those points where subsurface tests are conducted or samples are taken. Geotechnical engineers review field and laboratory data and then apply their professional judgment to render an opinion about subsurface conditions throughout the site. Actual subsurface conditions may differ—sometimes significantly—from those indicated in your report. Retaining the geotechnical engineer who developed your report to provide construction observation is the most effective method of managing the risks associated with unanticipated conditions.

A Report's Recommendations Are *Not* Final

Do not overrely on the construction recommendations included in your report. *Those recommendations are not final,* because geotechnical engineers develop them principally from judgment and opinion. Geotechnical engineers can finalize their recommendations only by observing actual

subsurface conditions revealed during construction. *The geotechnical engineer who developed your report cannot assume responsibility or liability for the report's recommendations if that engineer does not perform construction observation.*

A Geotechnical Engineering Report Is Subject to Misinterpretation

Other design team members' misinterpretation of geotechnical engineering reports has resulted in costly problems. Lower that risk by having your geotechnical engineer confer with appropriate members of the design team after submitting the report. Also retain your geotechnical engineer to review pertinent elements of the design team's plans and specifications. Contractors can also misinterpret a geotechnical engineering report. Reduce that risk by having your geotechnical engineer participate in prebid and preconstruction conferences, and by providing construction observation.

Do Not Redraw the Engineer's Logs

Geotechnical engineers prepare final boring and testing logs based upon their interpretation of field logs and laboratory data. To prevent errors or omissions, the logs included in a geotechnical engineering report should *never* be redrawn for inclusion in architectural or other design drawings. Only photographic or electronic reproduction is acceptable, *but recognize that separating logs from the report can elevate risk.*

Give Contractors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can make contractors liable for unanticipated subsurface conditions by limiting what they provide for bid preparation. To help prevent costly problems, give contractors the complete geotechnical engineering report, *but* preface it with a clearly written letter of transmittal. In that letter, advise contractors that the report was not prepared for purposes of bid development and that the report's accuracy is limited; encourage them to confer with the geotechnical engineer who prepared the report (a modest fee may be required) and/or to conduct additional study to obtain the specific types of information they need or prefer. A prebid conference can also be valuable. *Be sure contractors have sufficient time* to perform additional study. Only then might you be in a position to give contractors the best information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions.

Read Responsibility Provisions Closely

Some clients, design professionals, and contractors do not recognize that geotechnical engineering is far less exact than other engineering disciplines. This lack of understanding has created unrealistic expectations that have led to disappointments, claims, and disputes. To help reduce the risk of such outcomes, geotechnical engineers commonly include a variety of explanatory provisions in their reports. Sometimes labeled "limitations" many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely.* Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The equipment, techniques, and personnel used to perform a *geoenvironmental* study differ significantly from those used to perform a *geotechnical* study. For that reason, a geotechnical engineering report does not usually relate any geoenvironmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated environmental problems have led to numerous project failures.* If you have not yet obtained your own geoenvironmental information, ask your geotechnical consultant for risk management guidance. *Do not rely on an environmental report prepared for someone else.*

Obtain Professional Assistance To Deal with Mold

Diverse strategies can be applied during building design, construction, operation, and maintenance to prevent significant amounts of mold from growing on indoor surfaces. To be effective, all such strategies should be devised for the *express purpose* of mold prevention, integrated into a comprehensive plan, and executed with diligent oversight by a professional mold prevention consultant. Because just a small amount of water or moisture can lead to the development of severe mold infestations, a number of mold prevention strategies focus on keeping building surfaces dry. While groundwater, water infiltration, and similar issues may have been addressed as part of the geotechnical engineering study whose findings are conveyed in this report, the geotechnical engineer in charge of this project is not a mold prevention consultant; ***none of the services performed in connection with the geotechnical engineer's study were designed or conducted for the purpose of mold prevention. Proper implementation of the recommendations conveyed in this report will not of itself be sufficient to prevent mold from growing in or on the structure involved.***

Rely, on Your ASFE-Member Geotechncial Engineer for Additional Assistance

Membership in ASFE/The Best People on Earth exposes geotechnical engineers to a wide array of risk management techniques that can be of genuine benefit for everyone involved with a construction project. Confer with you ASFE-member geotechnical engineer for more information.

Phase I and Limited Phase II Environmental Site Assessment

Leighton and Associates, Inc.
A LEIGHTON GROUP COMPANY

June 23, 2014

Project No. 10143.001

Pulte Homes
27101 Puerta Real, Suite 300
Mission Viejo, California 92691

Attention: Mr. Bob Paradise

Subject: Phase I and Limited Phase II ESA Addendum Letter
Rancho Mirage 1200
Assessor Parcel Numbers 673-120-021 through -025
Rancho Mirage, Unincorporated Area of Riverside County, California

Leighton and Associates, Inc. (Leighton) presents this Addendum to the Phase I and Phase II Environmental Site Assessment (ESA) prepared for the subject site in 2013 (Leighton, 2013). The purpose of this Phase I ESA Addendum is to incorporate the additional property (Assessor Parcel Numbers [APNs] 673-120-021 and 673-120-022) that are now associated with the subject site (see Figure 1 – Site Location Map). The scope of work for this Phase I ESA Addendum Letter included: an updated review of historical aerial photographs and topographic maps (to include the new APNs), review of an online database resources such as Geotracker and Envirostor, a site reconnaissance, and preparation of this addendum letter.

SITE RECONNAISSANCE

On June 20, 2014, Leighton personnel conducted a reconnaissance-level visit of the subject site to observe and document existing site conditions. The two new APNs consist of approximately 72 acres of vacant land. The eastern half of the northeastern parcel (APN 673-120-022) appears to have been paved with asphalt and possibly used as a construction staging/parking or overflow parking lot for the casino (based on aerial photographs). The entrance to this paved area is now blocked and the asphalt is degraded and covered in windblown sand. Small areas of asphalt and construction debris were observed in the middle portion of the northeastern parcel separating the paved area from the vacant land. A stormwater retention basin was observed in the northwestern portion of this parcel. The southeastern parcel was observed to be a

vacant land, with the exception of a pole mounted billboard in the corner of the parcel, and a small stockpile of aggregate base and asphalt debris on the eastern border of the subject parcel (APN 673-120-021). Significant changes were not observed on the original parcels, with the exception of more blown sand on the eastern and southern borders of the subject site.

ONLINE DATABASE RESOURCES

A search of the selected online government databases was conducted by Leighton on June 19, 2014. A review of The Department of Toxic Substances Control's (DTSC) website Envirostor and the State Water Resources Control Board's (SWRCB) online database GeoTracker did not reveal any environmental sites of concern within one mile of the of the subject site.

REVIEW OF HISTORICAL AERIAL PHOTOGRAPHS

Historical aerial photographs were reviewed for information regarding past subject site uses. Aerial photographs dated 1953, 1969, 1978, 1984, 1989, 2002, 2005, 2007, 2009, and 2010 were reviewed.

In the **1953** aerial photograph, the subject site and adjacent properties are vacant, undeveloped land. Paved Ramon Road and Bob Hope Drive are observed to the north and the east of the subject site, respectively. Southern Pacific railroad is observed approximately 650 feet to the northeast of the subject site.

Significant changes were not observed in the **1969, 1978 and 1984** aerial photographs, with the exception of the addition of Interstate 10 (northeast of the railroad) and its on-ramps and off-ramps located to the northeast of the subject site, and what appears to be part of Dinah Shore Drive to the southeast of the subject site.

In the **1989** aerial photograph, the subject site and adjacent properties to the north and east are observed to be vacant, undeveloped land. Paved Dinah Shore Drive and additional residential development are depicted to the south of the subject site, and a golf course was observed to the west of the subject site. Los Alamos Road is a dirt road.

In the **2002** aerial photograph, the subject site and adjacent properties to the north and east are observed to be vacant, undeveloped land. Adjacent properties to the west and south of the subject site were observed to be in development as the present day

residential homes and golf courses. Adjacent to the northeast was observed the original Agua Caliente Casino and Resort. Los Alamos Road is a paved road.

In the **2005** aerial photograph, significant changes were not observed on the subject site and adjacent properties.

In a **2007** aerial photograph viewed on the Riverside County Land Information System (RCLIS) website for APN 673-120-022, it appears that the northeastern section of the subject site appears to have graded and used for staging construction materials, equipment, vehicles, and modular offices (RCLIS, 2014). There is what appears to be a depression in the northeast corner of the staging area. Construction activities for the Agua Caliente Casino and Resort were observed in the adjacent property to northeast of the subject site. Significant changes were not observed on the adjacent properties.

In the **2009** aerial photograph it appears that the construction activities for the Agua Caliente Casino and Resort have ceased and the graded area appears to be vacant. Significant changes were not observed on the majority of the subject site and adjacent properties.

In the **2010** aerial photograph, the subject site and adjacent properties appear in the present day configuration.

REVIEW OF HISTORICAL TOPOGRAPHIC MAPS

Historical topographic maps were reviewed to obtain information regarding past site uses. Topographic map coverage of the site vicinity is provided by “Indio, California” Quadrangle (1904) and “Edom, California” Quadrangle (1941), “Thousand Palms, California” Quadrangle (1947, and 1958), and “Cathedral City, California” Quadrangle (1958, 1972, and 1981). References are provided in Appendix A.

Indio 1904: Structures, tanks, or wells were not depicted on the subject site or adjacent properties.

Edom 1941: Structures, tanks, or wells were not depicted on the subject site or adjacent properties. Southern Pacific railroad is observed approximately 650 feet to the northeast of the subject site.

Thousand Palms 1947: Land use changes were not depicted on the subject site or adjacent properties.

Thousand Palms 1958: Land use changes were not depicted on the subject site or adjacent properties. Ramon Road is observed to the north of the subject site, and Rio Del Sol (present day Bob Hope Drive) is observed to the east of the subject site.

Cathedral City 1958: Land use changes were not depicted on the subject site or adjacent properties, with the exception of some residential development to the southeast of the subject site.

Cathedral City 1972: Land use changes were not depicted on the subject site or adjacent properties.

Cathedral City 1981: Land use changes were not depicted on the subject site or adjacent properties.

CONCLUSIONS AND RECOMMENDATIONS

Historically, the subject site has been vacant, undeveloped land. Portions of the subject site have been graded, used for construction staging, and possibly offsite casino parking.

Based on our review of information on the subject site and the addition of the two APNs, there are no changes to the conclusions and recommendations of the Phase I and Phase II ESA.

We have performed a Phase I and Limited Phase II ESA in conformance with the scope and limitations of ASTM E1527-05 on of the Rancho Mirage 1200 Property, APNs 673-120-021 through -025, Rancho Mirage, an Unincorporated Area of Riverside County, California, the property. Exceptions to, or deletions from, this practice are described in Section 1.5 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property.

In general, observations should be made during future site development for areas of possible contamination such as, but not limited to, the presence of underground facilities, buried debris, waste drums, and tanks, stained soil or odorous soils. Should

such materials be encountered, further investigation and analysis may be necessary at that time.

If you have questions regarding this report, please contact us. We appreciate the opportunity to be of service to Pulte Homes.

Respectfully submitted,

LEIGHTON AND ASSOCIATES, INC.

Project No. 10143.001

Pulte Home Corporation
27101 Puerta Real, Suite 300
Mission Viejo, California 92691

Attention: Mr. Darren Warren

Subject: Phase I and Limited Phase II Environmental Site Assessment, Rancho Mirage 1200, Assessor Parcel Numbers 673-120-023, -024, and -025, Rancho Mirage, Unincorporated Area of Riverside County, California

Leighton and Associates, Inc. (Leighton) is pleased to present this Phase I and Limited Phase II Environmental Site Assessment Report for Rancho Mirage 1200, located in Rancho Mirage, an Unincorporated Area of Riverside County, California (subject site). Leighton declares that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 Code of Federal Regulations (CFR) 312, and the ASTM International (ASTM) Standard E1527-05.

Leighton has the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject site. Leighton has developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

If you have questions regarding this report, please contact us. We appreciate the opportunity to be of service to Pulte Home Corporation.

Respectfully submitted,
LEIGHTON AND ASSOCIATES, INC.

Kristin Stout, REA I
Sr. Project Scientist

Brynn McCulloch, PG
Project Geologist

TABLE OF CONTENTS

List of Accompanying Illustrations and Appendices

1.0 INTRODUCTION

1.1 Authorization

Leighton and Associates, Inc. (Leighton) performed a Phase I and Limited Phase II Environmental Site Assessment (ESA) for the Rancho Mirage 1200 Property, Assessor Parcel Numbers (APNs) 673-120-023, -024, and -025, Rancho Mirage, an Unincorporated Area of Riverside County, California (subject site – Figure 1) in accordance with the authorization of Pulte Home Corporation.

1.2 Purpose

The purpose of the Phase I and Limited Phase II ESA was to identify, to the extent feasible pursuant to the processes prescribed in ASTM International (ASTM) Standard E1527-05, recognized environmental conditions (RECs) in connection with the subject site. Recognized environmental conditions are defined as *"the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimus conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimus are not recognized environmental conditions" (ASTM E1527-05, 2005).*

1.3 Scope of Work

The scope of work was performed in accordance with Leighton's proposal and included the following tasks:

- A reconnaissance-level visit of the subject site for evidence of the release(s) of hazardous materials and petroleum products and to assess the potential for onsite releases of hazardous materials and petroleum products;
- Records review (including review of previous environmental reports, selected governmental databases, and historical review);
- Interviews;

- Limited soil sampling; and
- Preparation of a report presenting our findings.

1.4 Significant Assumptions

Leighton assumes that the information provided by the Client and its agents, regulatory database provider, and regulatory agencies is true and reliable.

1.5 Limitations and Exceptions

Leighton performed the Phase I and Phase II Limited ESA in conformance with the scope and limitations of ASTM Practice E1527-05 of the subject site. Other than the non-scope items shown in Section 1.6 that were not applicable, there were no exceptions to, or deletions from, this practice.

Property-specific activities performed by Leighton and information collected regarding these activities are summarized within this report. The findings of this Phase I and Limited Phase II ESA are presented in Section 8.0. Opinions and conclusions drawn by Leighton, based on the information collected as part of the Phase I and Limited Phase II ESA, are presented in Sections 9.0 and 10.0, respectively. References are included as Appendix A. Site Photographs are presented in Appendix B. Client Supplied documentation is included as Appendix C. Research of Environmental Liens is documented in Appendix D. The Environmental Radius Report is included as Appendix E. Regulatory records requests and responses are included as Appendix F. Historical documentation is provided in Appendix G. Laboratory reports are provided in Appendix H.

This Phase I and Limited Phase II ESA was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession currently practicing in the same locality under similar conditions.

The observations and conclusions presented in this report are professional opinions based on the scope of activities, work schedule, and information obtained through the Phase I and Limited Phase II ESA described herein. Opinions presented herein apply to property conditions existing at the time of our study and cannot necessarily be taken to apply to property conditions or changes that we are not aware of or have not had the opportunity to evaluate. It must be recognized that conclusions drawn from these data are limited to the amount,

type, distribution, and integrity of the information collected at the time of the investigation, the methods utilized to collect and evaluate the data, and that a full and complete determination of environmental risks cannot be made. Although Leighton has taken steps to obtain true copies of available information, we make no representation or warranty with respect to the accuracy or completeness of this information.

This practice does not address whether requirements in addition to all appropriate inquiry have been met in order to qualify for the landowner liability protections including the continuing obligation not to impede the integrity and effectiveness of activity and use limitations, or the duty to take reasonable steps to prevent releases, or the duty to comply with legally required release reporting obligations. Users should also be aware that there are likely to be other legal obligations with regard to hazardous substances or petroleum products discovered on the subject site that are not addressed in this practice and that may pose risks of civil and/or criminal sanctions for non-compliance.

1.6 Special Terms and Conditions

The scope of work for this Phase I and Limited Phase II did not include non-scope considerations, such as, but not limited to, those listed in Section 13 of ASTM E1527-05. This scope of work did not include items such as testing of electrical equipment for the presence of polychlorinated biphenyls (PCBs) or collection of other environmental samples, such as, water, air, building materials, paint or other media; assessment of natural hazards such as naturally occurring asbestos, radon gas, methane gas, or mold; assessment of the potential presence of radionuclides, biological agents, or lead in drinking water; assessment of indoor air quality (such as vapor intrusion assessment); or assessment of nonchemical hazards such as the potential for damage from earthquakes or floods, or the presence of endangered species or wildlife habitats. This Phase I and Limited Phase II also did not include an extensive assessment of the environmental compliance status of the Subject Property or of businesses operating at the Subject Property, or a health-based risk assessment.

1.7 User Reliance

This report is for the exclusive use of Pulte Home Corporation and SCC Rancho Mirage Holdings. Use of this report by any other party shall be at such party's sole risk.

1.8 Important Information about Geoenvironmental Reports

Pulte Home Corporation is referred to Appendix I regarding important information provided by ASFE on geoenvironmental studies and reports.

2.0 SITE DESCRIPTION

2.1 Location and Legal Description

The subject site is located southwest of the intersection of Ramon Road and Bob Hope Drive, north of Dinah Shore Drive, Unincorporated Area of Riverside County, California (Figure 1). The County of Riverside Assessor's Office designates the subject site as APNs 673-120-023, -024, and -025. Addresses were not found to be associated with the subject site. A legal description of the subject site is included in the Environmental LienSearch Report provided by EDR (Appendix D).

2.2 Property and Vicinity General Characteristics

The site vicinity and the surrounding area are generally developed as vacant land, residential and golf properties, and a casino.

2.3 Current Use of the Subject Property

The subject site consists of approximately 488 acres of vacant land (Photos 1 through 8, Appendix B).

2.4 Descriptions of Structures, Roads and Other Improvements on the Property

There are no structures or roads on the subject site.

The following utilities provide or will provide future service to the subject site.

Natural Gas:	The Southern California Gas Company
Source of Potable Water:	Coachella Valley Water District (CVWD)
Electric:	Southern California Edison (SCE)
Sewage Disposal:	CVWD
Solid Waste Disposal:	Not applicable (currently vacant)

2.5 Current Uses of Adjoining Properties

The subject site is currently bordered by Los Alamos Road, a golf course and single family residential homes to the west; Dinah Shore Drive, a golf course and single family residential homes to the south; Ramon Road and vacant land to the north; and Bob Hope Drive, vacant land and Agua Caliente Casino to the east.

3.0 USER PROVIDED INFORMATION

The user of this Phase I and Limited Phase II ESA is identified as Pulte Home Corporation. As a part of the ASTM E1527-05 process, Mr. Bob Paradise, Project Manager at Pulte Home Corporation, completed a questionnaire regarding the property. A copy of this questionnaire is provided in Appendix C.

3.1 Environmental Liens or Activity and Use Limitations

Mr. Paradise indicated that they were not aware of environmental liens or activity and use limitations filed or recorded for the subject site.

Leighton also researched environmental liens through Environmental Data Resources, Inc. (EDR). According to the Environmental LienSearch dated March 4, 2013, environmental liens or activity use limitations were not identified for the subject site. A copy of the lien search is included in Appendix D and references are provided in Appendix A.

3.2 Specialized Knowledge

Mr. Paradise indicated that they do not have specialized knowledge or experience related to the subject site.

3.3 Commonly Known or Reasonably Ascertainable Information

Mr. Paradise is not aware of commonly known or reasonably ascertainable information related to the subject site.

3.4 Valuation Reduction for Environmental Issues

Mr. Paradise stated that the purchase price being paid for the subject site is based on fair market value.

3.5 Owner, Property Manager, and Occupant Information

The subject site is currently owned by Michael Prieto, Cecil Ruiz, and Denise Duran. Refer to Section 6.0 for interview information.

3.6 Reason for Performing Phase I and Limited Phase II ESA

According to the user questionnaire, the reason for requesting this Phase I and Limited Phase II ESA is for due diligence for property acquisition.

3.7 Other

Additional information was not provided by Pulte Home Corporation.

4.0 RECORDS REVIEW

4.1 Physical Setting Source(s)

Leighton reviewed pertinent maps and readily available literature for information on the physiography and hydrogeology of the subject site. A summary of this information is presented in the following subsections.

4.1.1 Topography

The subject site is located in Section 24 of Township 4 South, Range 5 east of the San Bernardino Baseline and Meridian. Topographic map coverage of the site vicinity is provided by the United States Geological Survey (USGS) "Cathedral City, California" Quadrangle (1981). The elevation of the property is approximately 240 to 360 feet above mean sea level and slopes to the southwest and northeast from the central portion of the subject site.

4.1.2 Surface Water

Surface water was not observed on the subject site.

4.1.3 Geology and Soils

According to the Geotechnical Investigation (Leighton, 2013), the subject site is underlain by Dune Sand over Quaternary Alluvium. Dune sand materials are expected to mantle the majority of the subject site. The depth of the dune sand materials cannot be easily verified based on the limited geotechnical investigation and relatively homogenous onsite alluvium. It is estimated that the dune sands generally extend to a depth varying from 5 to 20 feet below ground surface (bgs). These materials generally consist of light brown gray to darker gray and loose to medium dense silty sand to poorly-graded fine sand. Quaternary-aged alluvial deposits were encountered in all of the borings to the maximum depth explored (51 feet bgs). As encountered, the alluvium typically consists of light brown to brownish gray, medium dense to very dense, poorly-graded fine sand to sand with silt.

4.1.4 Hydrogeology

The subject site is located in the Colorado River Basin. Beneficial uses of groundwater included municipal or domestic supply, agricultural supply, industrial service supply, and industrial process supply (Colorado River Water Quality Plan, 2006).

According to Well 04S05E29A001S, dated April 1, 1968 (Water Data Library, 1968), located on the property adjacent to the site, groundwater depth is about 173 feet bgs.

Direction of groundwater flow is not known; however it is generally known to follow topography.

4.1.5 Oil and Gas Fields

Leighton and Associates reviewed the California Department of Conservation, Division of Oil, Gas, and Geothermal Resources, Online Mapping System, updated July 23, 2012. Evidence of oil wells or oil field-related facilities was not indicated on the subject site or adjacent properties.

4.2 Standard Environmental Record Sources

A search of selected government databases was conducted by Leighton using the Environmental EDR Radius Report environmental database report system. Details and descriptions of the database search are provided in the EDR report. The report meets the government records search requirements of ASTM E1527-05 Standard Practice for Environmental Property Assessments: Phase I Environmental Property Assessment Process. The database listings were reviewed within the specified radii established by the ASTM E1527-05. A copy of this report is included in Appendix E.

4.2.1 Subject Property

The subject site was identified in the EDR database report as an INDIAN RESERVATION, part of the Agua Caliente Indian Reservation.

4.2.2 Offsite

Seven facilities were listed on the HAZNET listings:

- Westin Mission Hills Resort, 70705 Ramon Road, Rancho Mirage, located adjacent to the west of the subject site;
- Agua Caliente Band of Cahuilla, 32250 Bob Hope Drive, Rancho Mirage, located adjacent to the northeast of the subject site;
- Westin Mission Hills Resort, 71501 Dinah Shore Drive, Rancho Mirage, adjacent to the west of the subject site; and
- Westin Mission Hills Resort, 71333 Dinah Shore Drive, Rancho Mirage, located adjacent to the west of the subject site.

These facilities were listed for waste disposal and mixing categories and violations or enforcements were not noted; therefore there is a low potential for these facilities to adversely affect the subject site.

The MACCO CONSTRUCTORS, INC., 34200 Rio Del Sol, Thousand Palms, was listed on the SWEEPS and UST listings, and is mapped by EDR 0.02 miles east- southeast of the subject site. Based on the site reconnaissance, this property is located 0.50 miles to the northeast of the subject site. Violations or enforcements were not noted on this facility, therefore there is a low potential for this facility to adversely affect the subject site.

Mission Hills Country Club, 34600 Mission Hills Drive, Rancho Mirage, was listed on the INDIAN and LUST listings, and is located 0.42 miles west- southwest of the subject site. Based on the EDR report, this facility was issued case closure. According to the State Water Resources Control Board (SWRCB) online Geotracker database the facility was issued closure on October 7, 2010. Based on the case closure status, there is a low potential for this facility to adversely affect the subject site.

Flying J Travel Plaza, 72235 Varner Road, Thousand Palms, was listed on the LUST listing, and is located 0.46 miles northeast of the subject site. Based on the EDR report, this facility was issued case closure. According to the SWRCB online Geotracker database the facility was issued closure on October 10, 2003. Based on the case closure status, there is a low potential for this facility to adversely affect the subject site.

Unmapped Listings: Several properties were listed within Environmental EDR Report as “non-geocoded listings”. Non-geocoded or unmapped listings are properties without a complete street address and therefore cannot be located on a map. Leighton reviewed these listings to evaluate if the properties were possibly located near the subject site. Based on information provided in the Environmental EDR Report and area reconnaissance, these unmapped sites are unlikely to have the potential to adversely impact the subject site.

4.2.3 Regulatory Agency Contacts

On February 7, 2013, Leighton requested regulatory records from the following agencies for the APNs 673-120-021, 673-120-022, 673-120-023, 673-120-024, and 673-120-025. It should be noted that the subject site does not have a physical address; therefore, the APNs and a Thomas Guide Map were utilized. It is Leighton’ experience that records often cannot be found without a site address.

- Department of Toxic Substances Control (DTSC) – Cypress and Chatsworth Divisions;
- National Pipeline Mapping System (NPMS);
- Regional Water Quality Control Board, Colorado River Region (RWQCB);
- Riverside County Department of Environmental Health (RCDEH); and
- South Coast Air Quality Management District (SCAQMD)

Records were not found at the agencies contacted. Copies of records requests and responses are provided in Appendix F.

4.2.4 Other Reports

Additional reports were not provided to Leighton for review.

4.3 Historical Use Information on the Property

Leighton reviewed selected historical information on the subject site. These references were reviewed for evidence of activities, which would suggest the presence of hazardous substances at the subject site and to evaluate the

potential for the subject site to be impacted by offsite sources of contamination. The following paragraphs are a chronological summary of the review.

4.3.1 Aerial Photographs

Historical aerial photographs were reviewed for information regarding past subject site uses. Aerial photographs dated 1953, 1969, 1978, 1984, 1989, 2002, 2005, 2009, and 2010 were reviewed. References are provided in Appendix A.

In the **1953** aerial photograph, the subject site and adjacent properties are vacant, undeveloped land. Paved Ramon Road and Bob Hope Drive are observed to the north and the east of the subject site, respectively. Southern Pacific railroad is observed approximately 900 feet to the northeast of the subject site.

Significant changes were not observed in the **1969** and **1978** aerial photographs, with the exception of the addition of Interstate 10 (northeast of the railroad) and its on-ramps and off-ramps to the northeast of the subject site, and what appears to be part of Dinah Shore Drive to the southeast of the subject site.

In the **1984** aerial photograph, the subject site remains vacant, undeveloped land. A golf course and residential development is observed south of the subject site.

In the **1989** aerial photograph, the subject site and adjacent properties to the north and east are observed to be vacant, undeveloped land. Paved Dinah Shore Drive and additional residential development are depicted to the south of the subject site, and a golf course was observed to the west of the subject site. Los Alamos Road is still a dirt road.

In the **2002** aerial photograph, the subject site and adjacent properties to the north and east are observed to be vacant, undeveloped land. Adjacent properties to the west and south of the subject site were observed to be in development as the present day residential homes and golf courses. Adjacent to the northeast was observed the Agua Caliente Casino and Resort. Los Alamos Road is a paved road.

In the **2005, 2009,** and **2010,** aerial photograph, the subject site and adjacent properties appear in the present day configuration.

4.3.2 Historical Topographic Maps

Historical topographic maps were reviewed to obtain information regarding past site uses. Topographic map coverage of the site vicinity is provided by "Indio, California" Quadrangle (1904) and "Edom, California" Quadrangle (1941), "Thousand Palms, California" Quadrangle (1947, and 1958), and "Cathedral City, California" Quadrangle (1958, 1972, and 1981). References are provided in Appendix A.

Indio 1904: Structures, tanks, or wells were not depicted on the subject site or adjacent properties.

Edom 1941: Structures, tanks, or wells were not depicted on the subject site or adjacent properties. Southern Pacific railroad is observed approximately 900 feet to the northeast of the subject site.

Thousand Palms 1947: Land use changes were not depicted on the subject site or adjacent properties.

Thousand Palms 1958: Land use changes were not depicted on the subject site or adjacent properties. Ramon Road is observed to the north of the subject site, and Rio Del Sol (present day Bob Hope Drive) is observed to the east of the subject site.

Cathedral City 1958: Land use changes were not depicted on the subject site or adjacent properties, with the exception of some residential development to the southeast of the subject site.

Cathedral City 1972: Land use changes were not depicted on the subject site or adjacent properties.

Cathedral City 1981: Land use changes were not depicted on the subject site or adjacent properties.

4.3.3 Fire Insurance Maps

Fire insurance maps, or Sanborn® maps, are detailed city plans showing building footprints, construction details, use of structure, street address, etc. The maps were designed to assist fire insurance agents in determining the degree of hazard associated with a particular property. Sanborn Maps were produced from approximately 1867 to the present for commercial, industrial, and residential sections of approximately 12,000 cities and towns in the United States.

According to the report by EDR, there is no Sanborn Fire Insurance Map coverage for the subject site. A copy of this report has been provided in Appendix G.

4.3.4 Historical City Directories

Historical City Directories were reviewed by EDR for information regarding past subject site uses. City directories were reviewed for the following years: 1995, 2000, 2005, and 2010. Adjacent properties of concern were not noted during the city directory review. A copy of this report has been provided in Appendix G.

4.3.5 Other Historical Sources

Additional resources were not researched as a part of this assessment.

4.3.6 Summary of Historical Land Use

Based on historical records, land usage is summarized as follows:

Time Period	Land Usage	Reference
Prior to 1904	Unknown	None Available
Approximately 1904 to present	Vacant, Undeveloped Land	Site Reconnaissance Interviews

5.0 SITE RECONNAISSANCE

5.1 Methodology and Limiting Conditions

On February 26, 2013, a representative of Leighton conducted a reconnaissance–level assessment of the subject site. The property reconnaissance consisted of observing and documenting existing conditions of the subject site and nature of the neighboring development within 0.25-miles of the subject site. Photographs of the subject site are presented in Appendix B and their view directions are noted on Figure 2. Items noted during the property reconnaissance are also depicted on Figure 2.

5.2 General Property Setting

The subject site consists of approximately 488 acres of vacant land (Photos 1 through 8, Appendix B).

The subject site currently consists of a vacant land (Photos 1 through 8, Appendix B).

5.3 Exterior and Interior Observations

5.3.1 Hazardous Substances, Drums, and Other Chemical Containers

Hazardous or regulated substance containers were not observed on the subject site.

5.3.2 Storage Tanks

Evidence of underground storage tanks (USTs) or aboveground storage tanks (ASTs) (such as vent lines, fill or overfill ports) was not observed on the subject site.

5.3.3 Polychlorinated Biphenyls (PCBs)

One pad-mounted transformer was observed in the eastern portion of the subject site along Bob Hope Drive (Photo 9, Appendix B). Visual evidence of leakage or staining was not observed near the transformers. It is not known if the transformer contains PCBs; however the transformer is likely owned, operated, and maintained by SCE.

5.3.4 Waste Disposal

The subject site is unoccupied and there is currently no waste disposal.

5.3.5 Dumping

Soil stockpiles were observed in the western portion of the subject site (Photo 6, Appendix B). The source of the stockpiles may have been generated from nearby grading activities but this could not be confirmed. Refer to Section 7.0 for sampling activities associated with these stockpiles.

Construction debris, such as concrete blocks and metal gate were observed onsite (Photo 7, Appendix B).

5.3.6 Pits, Ponds, Lagoons, Septic Systems, Wastewater, Drains, Cisterns, and Sumps

Evidence of pits, ponds, lagoons, septic systems, wastewater, drains, sumps, and cisterns was not observed on the subject site.

5.3.7 Pesticide Use

Pesticides were not observed on the subject site.

5.3.8 Staining, Discolored Soils, Corrosion

Staining, discolored soils, or corrosion were not observed on the subject site.

5.3.9 Stressed Vegetation

Stressed vegetation was not observed on the subject site.

5.3.10 Unusual Odors

Unusual odors were not detected on the subject site.

5.3.11 Onsite Wells

Wells were not observed or reported onsite.

5.3.12 Other Observations

A PVC riser (Photo 7, Appendix B) was observed in the south portion of the subject site. The purpose of this PVC riser could not be determined.

6.0 INTERVIEWS

Leighton conducted interviews with persons having knowledge of current or past subject site usage. Interviews were conducted either orally or in the form of a written questionnaire. Written responses are included as Appendix C.

6.1 Interview with Owner

On February 8, 2013, Mr. Shaun Murphy, attorney and representative of site owners, completed a Site Contact Interview Form. Mr. Murphy indicated that he is not aware of any environmental concerns associated with the subject site or any adjacent properties.

6.2 Interview with Site/Property Manager

Leighton did not interview the Site or Property Manager as the site is not occupied.

6.3 Interviews with Occupants

Leighton did not interview the occupants as the site is not occupied.

6.4 Interviews with Local Government Officials

Leighton did not interview employees with local government agencies to request information regarding historic and current uses of the subject site with the exception of those noted in Section 4.3.1.

6.5 Interviews with Others

Leighton did not conduct additional interviews for this Phase I and Limited Phase II ESA with the exception of the User interview discussed in Section 3.

7.0 LIMITED PHASE II ESA

Leighton conducted a Limited Phase II ESA on the property based on the findings of site use identified during this Phase I ESA. Soil stockpiles of unknown sources were identified on the western portion of the subject site. The volume of the soil piles is estimated to be 7,800 cubic yards.

On March 12, 2013, a Leighton representative collected 15 representative soil samples from the five homogeneous soil stockpiles. The 15 soil samples were composited in the laboratory into five composite samples. Soil samples G-1-0.5, G-2-0.5, G-3-0.5, G-4-0.5, and G-5-0.5 were composited into sample C-1. Soil samples G-6-0.5 and G-7-0.5 were composited into sample C-2. Soil samples G-8-0.5, G-9-0.5, and G-10-0.5 were composited into sample C-3. Soil samples G-11-0.5, G-12-0.5, and G-13-0.5 were composited into sample C-4. Soil samples G-14-0.5 and G-15-0.5 were composited into sample C-5 (see Figure 2). Freshly exposed soils were excavated from each sample location by removing the surficial 6- to 12-inches of soil and retrieving the sample from depth. Samples were collected in new laboratory supplied 4-ounce glass jars with Teflon-lined lids. The soil samples were labeled with sample identification, date, and time of collection and placed in an ice-chilled cooler and transported under chain-of-custody procedures to Enviro-Chem, Inc. in Pomona, California for analysis.

Each of the composite soil samples were analyzed for total petroleum hydrocarbons (TPH) full carbon chain by EPA Method 8015M, organochlorine pesticides (OCPs) and PCBs by EPA Method 8081A/8082, Title 22 metals by EPA Method 6010B and 7471A, volatile organic compounds (VOCs) by EPA Method 8260B, and semi-volatile organic compounds (SVOCs) by EPA Method 8270C.

Concentrations of TPH, OCPs, PCBs, VOCs, and SVOCs were not reported above the laboratory reporting limits in each of the composite samples analyzed.

Title 22 Metals were detected below their respective EPA Region 9 Regional Screening Levels for residential property (RSL-R) and California Human Health Screening Level for residential property (CHHSL-R) with the exception of arsenic. Arsenic was detected in four of the five composite samples analyzed at concentrations ranging from 0.290 milligrams per kilogram (mg/kg) to 0.627 mg/kg, well below the Department of Toxic Substances Control (DTSC) established background level of 12 mg/kg (DTSC, 2008).

Concentrations of chemicals of potential concern were not identified exceeding the RSLs or CHHSLs for unrestricted land use in the soil stockpiles.

A copy of the laboratory report is provided in Appendix H.

8.0 FINDINGS

Leighton and Associates, Inc. (Leighton) performed a Phase I and Limited Phase II ESA of the Rancho Mirage 1200 Property, Assessor Parcel Numbers (APNs) 673-120-023, -024, and -025, Unincorporated Area of Riverside County, California in accordance with Pulte Home Corporation's authorization.

8.1 Onsite

Historically, the subject site has been vacant, undeveloped land. The subject site consists of approximately 488 acres of vacant land (Photos 1 through 8, Appendix B). Undocumented soil stockpiles were noted onsite in the western portion of the subject site. Sources for the large soil stockpile and soils placed on the southwestern portion of the site are unknown. Soil sampling activities of these soil stockpiles indicated that chemicals of potential concern were not identified.

A PVC riser (Photo 7, Appendix B) was observed in the south portion of the subject site. The purpose of this PVC riser could not be determined.

A search of selected government databases was conducted by Leighton using the EDR Radius Report environmental database report system. Details of the database search along with descriptions of each database researched are provided in the EDR report. The report meets the government records search requirements of ASTM E1527-05 Standard Practice for Environmental Property Assessments: Phase I and Limited Phase II Environmental Property Assessment Process. The database listings were reviewed within the specified radii established by the ASTM E1527-05. The subject site was listed in the database report as being a part of the Agua Caliente Indian Reservation.

8.2 Offsite

Historically, the adjacent properties were vacant, undeveloped land. The subject site is currently bordered by Los Alamos Road, a golf course and single family residential homes to the west; Dinah Shore Drive, a golf course and single family residential homes to the south; Ramon Road and vacant land to the north; and Bob Hope Drive, vacant land and Agua Caliente Casino to the east.

Surrounding properties with environmental concern were not identified on the EDR report.

8.3 Data Gaps

Data gaps were identified by Leighton:

- Historical records prior to 1909 were not available. It is Leighton's opinion that this data gap is not significant to identifying recognized environmental conditions on the subject site.
- A response from the RCDEH has not been received as of the date of this report. Leighton will forward any received response altering the conclusions and recommendations of this report in an addendum letter. It is Leighton's opinion that this data gap is not significant to identifying recognized environmental conditions on the subject site.

9.0 OPINION

9.1 Onsite

It is Leighton's opinion that the soil stockpiles are suitable for reuse on the subject site. Construction debris should be disposed of in accordance with regulatory guidelines.

Leighton recommends caution when grading in the area of the PVC riser. If it is determined that the riser leads to an underground storage area or is indicative of hazardous materials or wastes, additional investigation may be recommended in this area.

9.2 Offsite

No offsite recognized environmental conditions were identified that would negatively impact the subject site.

10.0 CONCLUSIONS

We have performed a Phase I and Limited Phase II ESA in conformance with the scope and limitations of ASTM E1527-05 on of the Rancho Mirage 1200 Property, APNs 673-120-023, -024, and -025, Rancho Mirage, an Unincorporated Area of Riverside County, California, the property. Exceptions to, or deletions from, this practice are described in Section 1.5 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property.

In general, observations should be made during future property development for areas of possible contamination such as, but not limited to, the presence of underground facilities, buried debris, waste drums, and tanks, stained soil or odorous soils. Should such materials be encountered, further investigation and analysis may be necessary at that time.

11.0 DEVIATIONS

Leighton did not deviate from or alter the scope of work, as defined in Section 1.3 of this report. Significant data gaps were not identified that affect the ability of Leighton to identify recognized environmental conditions at the subject site.

12.0 ADDITIONAL SERVICES

Leighton did not perform work outside the scope of work as defined in Section 1.3 and 1.6 of this report.

13.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

13.1 Corporate

Leighton is a California corporation, providing geotechnical and environmental consulting services throughout California. We are solely a consulting firm without interests in real property other than our office locations in Southern California. We provide professional environmental consulting services including application of science and engineering to environmental compliance, hazardous materials/waste assessment and cleanup, and management of hazardous, solid and industrial waste. Phase I and Limited Phase II Environmental Property Assessments are a part of this practice area and have been conducted by us.

13.2 Individual

The qualifications of the Project Scientist and the other Leighton environmental professionals involved in this Phase I and Limited Phase II ESA meet the Leighton corporate requirements for performing Phase I and Limited Phase II ESAs as specified by ASTM E1527-05. In addition, Ms. Kristin Stout is a Registered Environmental Assessor I.

13.3 Environmental Professional Statement

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional, as defined by §312.10 of 40 CFR Part 312.

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject site. I have developed and performed all the appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Kristin Stout, REA I
Senior Project Scientist

Phase I ESA Users Questionnaire

Project Name: Rancho Mirage 1200

Project Address and/or APN:

South of Ramon Rd, West of Bob Hope Dr, North of Dinah Shore Dr, East of Los Alomos in Rancho Mirage

Client (or user of the Phase I Environmental Site Assessment)	**Contact Name/Title:**
Pulte Homes	Bob Paradise

Client Phone: 951.258.6001

Site Owner: Michael Prieto, Ceclie Ruiz, Denise Duran

Reason Phase I is required: Property acquisition

Type of property:

Raw Land

Type of property transaction (e.g., Sale, purchase, exchange):

Purchase

Complete and Correct Address of the property and APN(s):

673120024, 673120023, 673120025, 673120022

Any scope of services beyond the ASTM Practice E 1527:

No

All Parties that will rely on the Phase I report:

Pulte Homes, SCC Rancho Mirage Holdings

Name and Contact Information for Site Contact:

Bob Paradise - 951.258.6001

Any special terms or conditions:

Any other pertinent knowledge or experience with the property (e.g., prior reports, documents, correspondence concerning the environmental conditions of the property):

(1). Environmental cleanup liens that are filed or recorded against the site (40 CFR 312.25).

Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state or local law? ☐ Yes | ☑ No

If Yes, Describe:

(2). Activity and land use limitations (AULs) that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26).

Are you aware of any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law? ☐ Yes | ☑ No

If Yes, Describe:

(3). Specialized knowledge or experience of the person seeking to qualify for the Landowners Liability Protections (LLP) (40 CFR 312.28).

As the user of this ESA do you have any specialized knowledge or experience related to the property or the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business? ☐ Yes | ☑ No

If Yes, Describe:

(4). Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 DRF 312.29).

Does the purchase price being paid for this property reasonably reflect the fair market value of the property?

☑ Yes | ☐ No

If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property? ☐ Yes | ☑ No

If Yes, Describe:

(5). Commonly known or reasonable ascertainable information about the property (40 CFR 312.30).

Are you aware of commonly known or *reasonably ascertainable* information about the property that would help the *environmental professional* to identify conditions indicative of releases or threatened releases? For example, as user,

(a.) Do you know the past uses of the property? ☐ Yes | ☑ No

(b.) Do you know of specific chemicals that are present or once were present at the property? ☐ Yes | ☑ No

(c.) Do you know of spills or other chemical releases that have taken place at the property? ☐ Yes | ☑ No

(d.) Do you know of any environmental cleanups that have taken place at the property? ☐ Yes | ☑ No

If Yes, Describe:

(6). The degree of obviousness of the presence of likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

As the *user of this ESA,* based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of contamination at the *property?* ☐ Yes | ☑ No

If Yes, Describe:

EDR Environmental LienSearch™ Report

The EDR Environmental LienSearch Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Database Descriptions

NPL: NPL National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices. NPL - National Priority List Proposed NPL - Proposed National Priority List Sites.

NPL Delisted: DELISTED NPL The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate. DELISTED NPL - National Priority List Deletions

CERCLIS: CERCLIS CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL. CERCLIS - Comprehensive Environmental Response, Compensation, and Liability Information System

NFRAP: CERCLIS-NFRAP Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site. CERCLIS-NFRAP - CERCLIS No Further Remedial Action Planned

RCRA COR ACT: CORRACTS CORRACTS identifies hazardous waste handlers with RCRA corrective action activity. CORRACTS - Corrective Action Report

RCRA TSD: RCRA-TSDF RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste. RCRA-TSDF - RCRA - Treatment, Storage and Disposal

RCRA GEN: RCRA-LQG RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. RCRA-LQG - RCRA - Large Quantity Generators RCRA-SQG - RCRA - Small Quantity Generators. RCRA-CESQG - RCRA - Conditionally Exempt Small Quantity Generators.

Federal IC / EC: US ENG CONTROLS A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health. US ENG CONTROLS - Engineering Controls Sites List US INST CONTROL - Sites with Institutional Controls.

ERNS: ERNS Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances. ERNS - Emergency Response Notification System

Database Descriptions

State/Tribal NPL: RESPONSE Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk. RESPONSE - State Response Sites

State/Tribal CERCLIS: ENVIROSTOR The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites. ENVIROSTOR - EnviroStor Database

State/Tribal SWL: SWF/LF (SWIS) Active, Closed and Inactive Landfills. SWF/LF records typically contain an inve ntory of solid waste disposal facilities or landfills. These may be active or i nactive facilities or open dumps that failed to meet RCRA Section 4004 criteria for solid waste landfills or disposal sites. SWF/LF (SWIS) - Solid Waste Information System

State/Tribal LTANKS: LUST SONOMA CO. LUST - Leaking Underground Storage Tank Sites. LUST REG 9 - Leaking Underground Storage Tank Report. LUST REG 3 - Leaking Underground Storage Tank Database. SAN MATEO CO. LUST - Fuel Leak List. LUST REG 6L - Leaking Underground Storage Tank Case Listing. RIVERSIDE CO. LUST - Listing of Underground Tank Cleanup Sites. INDIAN LUST R10 - Leaking Underground Storage Tanks on Indian Land. INDIAN LUST R8 - Leaking Underground Storage Tanks on Indian Land. INDIAN LUST R4 - Leaking Underground Storage Tanks on Indian Land. INDIAN LUST R7 - Leaking Underground Storage Tanks on Indian Land. INDIAN LUST R9 - Leaking Underground Storage Tanks on Indian Land. INDIAN LUST R1 - Leaking Underground Storage Tanks on Indian Land.

State/Tribal Tanks: UST Active UST facilities gathered from the local regulatory agencies UST - Active UST Facilities AST - Aboveground Petroleum Storage Tank Facilities. INDIAN UST R8 - Underground Storage Tanks on Indian Land. INDIAN UST R6 - Underground Storage Tanks on Indian Land. INDIAN UST R5 - Underground Storage Tanks on Indian Land. INDIAN UST R4 - Underground Storage Tanks on Indian Land. INDIAN UST R9 - Underground Storage Tanks on Indian Land. INDIAN UST R7 - Underground Storage Tanks on Indian Land. INDIAN UST R10 - Underground Storage Tanks on Indian Land. INDIAN UST R1 - Underground Storage Tanks on Indian Land.

State/Tribal VCP: VCP Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs. VCP - Voluntary Cleanup Program Properties

Database Descriptions

US Brownfields: US BROWNFIELDS Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs. US BROWNFIELDS - A Listing of Brownfields Sites

Other SWF: SAN DIEGO CO. LF VENTURA CO. LF - Inventory of Illegal Abandoned and Inactive Sites. CA LA LF - City of Los Angeles Landfills. LOS ANGELES CO. LF - List of Solid Waste Facilities. San Diego County Solid Waste Facilities. LOS ANGELES CO. LF - Solid Waste Facilities WMUDS/SWAT - Waste Management Unit Database.

Other Haz Sites: US CDL A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments. US CDL - Clandestine Drug Labs SCH - School Property Evaluation Program. SAN DIEGO CO. HMMD - Hazardous Materials Management Division Database.

Other Tanks: CA FID UST The Facility Inventory Database (FID) contains a historical listing of active and inactive underground storage tank locations from the State Water Resource Control Board. Refer to local/county source for current data. CA FID UST - Facility Inventory Database ALAMEDA CO. UST - Underground Tanks. KERN CO. UST - Underground Storage Tank Sites & Tank Listing. MARIN CO. UST - Underground Storage Tank Sites. NAPA CO. UST - Closed and Operating Underground Storage Tank Sites. ORANGE CO. UST - List of Underground Storage Tank Facilities. RIVERSIDE CO. UST - Underground Storage Tank Tank List. SAN FRANCISCO CO. UST - Underground Storage Tank Information. SOLANO CO. UST - Underground Storage Tanks. SUTTER CO. UST - Underground Storage Tanks. VENTURA CO. UST - Underground Tank Closed Sites List. YOLO CO. UST - Underground Storage Tank Comprehensive Facility Report. EL SEGUNDO UST - City of El Segundo Underground Storage Tank. LONG BEACH UST - City of Long Beach Underground Storage Tank. TORRANCE UST - City of Torrance Underground Storage Tank. UST SAN JOAQUIN - San Joaquin Co. UST. UST MENDOCINO - Mendocino County UST Database. SWEEPS UST - SWEEPS UST Listing.

Local Land Records: DEED Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners. DEED - Deed Restriction Listing

Spills: HMIRS Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT. HMIRS - Hazardous Materials Information Reporting System CHMIRS - California Hazardous Material Incident Report System. Orange Co. Industrial Site - List of Industrial Site Cleanups.

Other: RCRA NonGen / NLR RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste. RCRA NonGen / NLR - RCRA - Non Generators TRIS - Toxic Chemical Release Inventory System. TSCA - Toxic Substances Control Act. FTTS - FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act). Dear Mrs. Stout:

We have received your Public Records Act Request for records from the Department of Toxic Substances Control. After a thorough review of our files we have found that, **no such records** exist at this office pertaining to the sites/facility referenced.

Southwest of Ramon Rd & Bob Hope Drive, 5 various APN #'S all in Rancho Mirage

If you have any questions, would like further information regarding your request, please contact our Regional Records Coordinator at (714) 484-5336.

We would like to inform you about Envirostor, a database that provides information and documents on over 5,000 DTSC cleanup sites. Envirostor can be accessed at: http://www.envirostor.dtsc.ca.gov/public. Also, a computer is available in the Central Files of each DTSC Regional Office for use by community members to view Envirostor.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

COMMENTS
DF = Dilution Factor
MDL = Method Detection Limit
PQL = Practical Quantitation Limit
J = Trace Concentration between MDL and PQL
Actual Detection Limit = PQL X DF
ND = Below the Actual Detection Limit or non-detected
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
@ = Must meet both the STLC Limit at 560 and EPA-TCLP Limit at 5
* = STLC analysis for the metal is recommended (if marked)
** = Additional Analysis required, please call to discuss (if marked)
*** = The concentration exceeds the TTLC Limit, and the sample is defined as hazardous waste as per CCR-TITLE 22 (if marked)
-- = Not analyzed/not requested

APPENDIX I

Important Information About Your Geoenvironmental Report

Geoenvironmental studies are commissioned to gain information about environmental conditions on and beneath the surface of a site. The more comprehensive the study, the more reliable the assessment is likely to be. But remember: Any such assessment is to a greater or lesser extent based on professional opinions about conditions that cannot be seen or tested. Accordingly, no matter how many data are developed, risks created by unanticipated conditions will always remain. *Have realistic expectations.* Work with your geoenvironmental consultant to manage known and unknown risks. Part of that process should already have been accomplished, through the risk allocation provisions you and your geoenvironmental professional discussed and included in your contract's general terms and conditions. This document is intended to explain some of the concepts that may be included in your agreement, and to pass along information and suggestions to help you manage your risk.

Beware of Change; Keep Your Geoenvironmental Professional Advised

The design of a geoenvironmental study considers a variety of factors that are subject to change. Changes can undermine the applicability of a report's findings, conclusions, and recommendations. *Advise your geoenvironmental professional about any changes you become aware of.* Geoenvironmental professionals cannot accept responsibility or liability for problems that occur because a report fails to consider conditions that did not exist when the study was designed. Ask your geoenvironmental professional about the types of changes you should be particularly alert to. Some of the most common include:

- modification of the proposed development or ownership group,
- sale or other property transfer,
- replacement of or additions to the financing entity,
- amendment of existing regulations or introduction of new ones, or
- changes in the use or condition of adjacent property.

Should you become aware of any change, *do not rely on a geoenvironmental report.* Advise your geoenvironmental professional immediately; follow the professional's advice.

Recognize the Impact of Time

A geoenvironmental professional's findings, recommendations, and conclusions cannot remain valid indefinitely. The more time that passes, the more likely it is that important latent changes will occur. *Do not rely on a geoenvironmental report if too much time has elapsed since it was completed.* Ask your environmental professional to define "too much time." In the case of Phase I Environmental Site Assessments (ESAs), for example, more than 180 days after submission is generally considered "too much."

Prepare To Deal with Unanticipated Conditions

The findings, recommendations, and conclusions of a Phase I ESA report typically are based on a review of historical information, interviews, a site "walkover," and other forms of noninvasive research. When site subsurface conditions are not sampled in any way, the risk of unanticipated conditions is higher than it would otherwise be.

While borings, installation of monitoring wells, and similar invasive test methods can help reduce the risk of unanticipated conditions, *do not overvalue the effectiveness of testing.* Testing provides information about actual conditions only at the precise locations where samples are taken, and only when they are taken. Your geoenvironmental professional has applied that specific information to develop a general opinion about environmental conditions. *Actual conditions in areas not sampled may differ (sometimes sharply) from those predicted in a report.* For example, a site may contain an unregistered underground storage tank that shows no surface trace of its existence. *Even conditions in areas that were tested can change,* sometimes suddenly, due to any number of events, not the least of which include occurrences at

adjacent sites. Recognize, too, that *even some conditions in tested areas may go undiscovered,* because the tests or analytical methods used were designed to detect only those conditions assumed to exist.

Manage your risks by retaining your geoenvironmental professional to work with you as the project proceeds. Establish a contingency fund or other means to enable your geoenvironmental professional to respond rapidly, in order to limit the impact of unforeseen conditions. And to help prevent any misunderstanding, identify those empowered to authorize changes and the administrative procedures that should be followed.

Do Not Permit Any Other Party To Rely on the Report

Geoenvironmental professionals design their studies and prepare their reports to meet the specific needs of the clients who retain them, in light of the risk management methods that the client and geoenvironmental professional agree to, and the statutory, regulatory, or other requirements that apply. The study designed for a developer may differ sharply from one designed for a lender, insurer, public agency...or even another developer. *Unless the report specifically states otherwise, it was developed for you and only you.* Do not unilaterally permit any other party to rely on it. The report and the study underlying it may not be adequate for another party's needs, and you could be held liable for shortcomings your geoenvironmental professional was powerless to prevent or anticipate. Inform your geoenvironmental professional when you know or expect that someone else—a third-party—will want to use or rely on the report. *Do not permit third-party use or reliance until you first confer with the geoenvironmental professional who prepared the report.* Additional testing, analysis, or study may be required and, in any event, appropriate terms and conditions should be agreed to so both you and your geoenvironmental professional are protected from third-party risks. *Any party who relies on a geoenvironmental report without the express written permission of the professional who prepared it and the client for whom it was prepared may be solely liable for any problems that arise.*

Avoid Misinterpretation of the Report

Design professionals and other parties may want to rely on the report in developing plans and specifications. They need to be advised, in writing, that their needs may not have been considered when the study's scope was developed, and, even if their needs were considered, they might misinterpret geoenvironmental findings, conclusions, and recommendations. *Commission your geoenvironmental professional to explain pertinent elements of the report to others who are permitted to rely on it, and to review any plans, specifications or other instruments of professional service that incorporate any of the report's findings, conclusions, or recommendations.* Your geoenvironmental professional has the best understanding of the issues involved, including the fundamental assumptions that underpinned the study's scope.

Give Contractors Access to the Report

Reduce the risk of delays, claims, and disputes by giving contractors access to the full report, *providing that it is accompanied by a letter of transmittal that can protect you* by making it unquestionably clear that: 1) the study was not conducted and the report was not prepared for purposes of bid development, and 2) the findings, conclusions, and recommendations included in the report are based on a variety of opinions, inferences, and assumptions and are subject to interpretation. Use the letter to also advise contractors to consult with your geoenvironmental professional to obtain clarifications, interpretations, and guidance (a fee may be required for this service), and that—in any event—they should conduct additional studies to obtain the specific type and extent of information each prefers for preparing a bid or cost estimate. Providing access to the full report, with the appropriate caveats, helps prevent formation of adversarial attitudes and claims of concealed or differing conditions. If a contractor elects to ignore the warnings and advice in the letter of transmittal, it would do so at its own risk. Your geoenvironmental professional should be able to help you prepare an effective letter.

Do Not Separate Documentation from the Report

Geoenvironmental reports often include supplemental documentation, such as maps and copies of regulatory files, permits, registrations, citations, and correspondence with regulatory agencies. If subsurface explorations were performed, the report may contain final boring logs and copies of laboratory data. If remediation activities occurred on site, the report may include: copies of daily field reports; waste manifests; and information about the disturbance of subsurface materials, the type and thickness of any fill placed on site, and fill placement practices, among other types of documentation. *Do not separate supplemental documentation from the report. Do not, and do not permit any other party to redraw or modify any of the supplemental documentation for incorporation into other professionals' instruments of service.*

Understand the Role of Standards

Unless they are incorporated into statutes or regulations, standard practices and standard guides developed by the American Society for Testing and Materials (ASTM) and other recognized standards-developing organizations (SDOs) are little more than aspirational methods agreed to by a consensus of a committee. The committees that develop standards may not comprise those best-qualified to establish methods and, no matter what, no standard method can possibly consider the infinite client- and project-specific variables that fly in the face of the theoretical "standard conditions" to which standard practices and standard guides apply. In fact, these variables can be so pronounced that geoenvironmental professionals who comply with every directive of an ASTM or other standard procedure could run afoul of local custom and practice, thus violating the standard of care.

Accordingly, when geoenvironmental professionals indicate in their reports that they have performed a service "in general compliance" with one standard or another, it means they have applied professional judgement in creating and implementing a scope of service designed for the specific client and project involved, and which follows some of the general precepts laid out in the referenced standard. To the extent that a report indicates "general compliance" with a standard, you may wish to speak with your geoenvironmental professional to learn more about what was and was not done. *Do not assume a given standard was followed to the letter.* Research indicates that that seldom is the case.

Realize That Recommendations May Not Be Final

The technical recommendations included in a geoenvironmental report are based on assumptions about actual conditions, and so are preliminary or tentative. Final recommendations can be prepared only by observing actual conditions as they are exposed. For that reason, you should retain the geoenvironmental professional of record to observe construction and/or remediation activities on site, to permit rapid response to unanticipated conditions. *The geoenvironmental professional who prepared the report cannot assume responsibility or liability for the report's recommendations if that professional is not retained to observe relevant site operations.*

Understand That Geotechnical Issues Have Not Been Addressed

Unless geotechnical engineering was specifically included in the scope of professional service, a report is not likely to relate any findings, conclusions, or recommendations about the suitability of subsurface materials for construction purposes, especially when site remediation has been accomplished through the removal, replacement, encapsulation, or chemical treatment of on-site soils. The equipment, techniques, and testing used by geotechnical engineers differ markedly from those used by geoenvironmental professionals; their education, training, and experience are also significantly different. If you plan to build on the subject site, but have not yet had a geotechnical engineering study conducted, your geoenvironmental professional should be able to provide guidance about the next steps you should take. The same firm may provide the services you need.

Read Responsibility Provisions Closely

Geoenvironmental studies cannot be exact; they are based on professional judgement and opinion. Nonetheless, some clients, contractors, and others assume geoenvironmental reports are or certainly should be unerringly precise. Such assumptions have created unrealistic expectations that have led to wholly unwarranted claims and disputes. To help prevent such problems, geoenvironmental professionals have developed a number of report provisions and contract terms that explain who is responsible for what, and how risks are to be allocated. Some people mistake these for "exculpatory clauses," that is, provisions whose purpose is to transfer one party's rightful responsibilities and liabilities to someone else. Read the responsibility provisions included in a report and in the contract you and your geoenvironmental professional agreed to. *Responsibility provisions are not "boilerplate."* They are important.

Rely on Your Geoenvironmental Professional for Additional Assistance

Membership in ASFE exposes geoenvironmental professionals to a wide array of risk management techniques that can be of genuine benefit for everyone involved with a geoenvironmental project. Confer with your ASFE-member geoenvironmental professional for more information.

Notes:

(1) Alpha Factor: Coefficient of absorption relating to the effects of the ground surface. An alpha factor of 0 indicates that the site is an acoustically "hard" site, such as aspalt. An alpha factor of 0.5 indicates that the site is an acoustically "soft" site such, as heavily vegetated ground cover.

"-" = contour is located within the roadway lanes or within 75 feet of the roadway centerline.

Noise levels and distances to contours do not assume any natural or constructed barriers that may attenuate noise.

Notes:

(1) Alpha Factor: Coefficient of absorption relating to the effects of the ground surface. An alpha factor of 0 indicates that the site is an acoustically "hard" site, such as aspalt. An alpha factor of 0.5 indicates that the site is an acoustically "soft" site such, as heavily vegetated ground cover.

"-" = contour is located within the roadway lanes or within 75 feet of the roadway centerline.

Noise levels and distances to contours do not assume any natural or constructed barriers that may attenuate noise.

Notes:

(1) Alpha Factor: Coefficient of absorption relating to the effects of the ground surface. An alpha factor of 0 indicates that the site is an acoustically "hard" site, such as aspalt. An alpha factor of 0.5 indicates that the site is an acoustically "soft" site such, as heavily vegetated ground cover.

"-" = contour is located within the roadway lanes or within 75 feet of the roadway centerline.

Noise levels and distances to contours do not assume any natural or constructed barriers that may attenuate noise.

Notes:

(1) Alpha Factor: Coefficient of absorption relating to the effects of the ground surface. An alpha factor of 0 indicates that the site is an acoustically "hard" site, such as aspalt. An alpha factor of 0.5 indicates that the site is an acoustically "soft" site such, as heavily vegetated ground cover.

"-" = contour is located within the roadway lanes or within 75 feet of the roadway centerline.

Noise levels and distances to contours do not assume any natural or constructed barriers that may attenuate noise.

SUBJECT: Section 24 Specific Plan Traffic Impact Study – Supplemental Analysis

Dear Mr. Locacciato;

Endo Engineering prepared and submitted a draft traffic impact study addressing the Section 24 Specific Plan on April 2, 2014. Minor modifications to the Planning Area boundaries within the Specific Plan were subsequently made to reflect topographic issues that would affect future development plans for the 577 gross acres within the project site. This supplemental information became available in September 2014, after the traffic impact study was completed on April 2, 2014 and revised on July 24, 2014. The modified Conceptual Land Use Plan (attached) would not result in a significant change in any of the findings or recommendations within the *Draft Section 24 Specific Plan Traffic Impact Analysis* (Revised July 24, 2014).

Modified Conceptual Land Use Plan

Although the resort flex area increased by eight acres and the retail area increased by one acre, the maximum development potential of the non-residential uses within the Specific Plan remained unchanged at 3,138,600 square feet. Despite a decrease of nine acres in the area within the Specific Plan designated for multi-family residential development and an increase of one acre in the active adult community within Planning Area 8, the maximum permitted number and type of residential dwelling units uses remained unchanged (i.e., 1,206 multi-family residential dwelling units and 1,200 active adult single-family dwelling units). The area required for rights-of-way decreased by one acre.

Since the maximum allowed development remain unchanged, the number of trips that the project would generate would remain unchanged. The RIVTAM socioeconomic parameters for the project site used to forecast future horizon year 2035 travel demands upon full development of the proposed Section 24 Specific Plan would not change with the modified Conceptual Land Use Plan. The distribution of the various land uses within the Specific Plan would remain essentially consistent with that previously evaluated. For example, the relocation of an acre of multifamily residential development from one side of Casino Road to the opposite side would not change the volume of traffic generated by that acre of development from using Casino Road. The site access and internal circulation plan did not change.

Cordially,
ENDO ENGINEERING

SUBJECT: Section 24 Specific Plan Traffic Impact Study

Dear Mr. Locacciato;

Endo Engineering is pleased to submit this analysis of the full range of potentially significant transportation consequences associated with implementation of the proposed Section 24 Specific Plan being prepared by the Agua Caliente Band of Cahuilla Indians. The Section 24 Specific Plan would coordinate the planning and future development of 577 acres under separate ownerships within the boundaries of the Agua Caliente Indian Reservation. The project site is undeveloped and located south of Interstate 10 and Ramon Road, north of Dinah Shore Drive, west of Bob Hope Drive, and east of Los Alamos Road. The site is west of the Agua Caliente Casino Resort Spa, within unincorporated Riverside County and the City of Rancho Mirage Sphere of Influence. The Section 24 Specific Plan area is surrounded on all four sides by the City of Rancho Mirage. Following action on the EIS and the Section 24 Specific Plan by the Agua Caliente Band of Cahuilla Indians, the Specific Plan area may be annexed to the City of Rancho Mirage.

The Riverside County General Plan would change the historical growth pattern of random sprawl by moving toward a pattern of concentrated growth and increased job creation in strategic areas, which provide various transportation options for access to the region. In view of its prominent and centralized location within the Coachella Valley, the proposed Section 24 Specific Plan would provide a unique opportunity to implement that vision. The proposed project would create a vital mixed-use development, within the context of a destination resort community, that is supportive of transit and other alternative transportation modes. The development would be pedestrian-friendly and located within an area where the use of golf carts and NEVs is commonplace and multi-use paths exist and are being expanded to accommodate cycling, pedestrians, and golf carts.

The development proposed would take maximum advantage of the opportunities afforded by the seasonal influx of tourists and part-year residents but also provide a mix of future uses that would support the local community and be economically viable year-round. To promote walking and cycling as healthy alternatives to commuting long distances by automobile, the Section 24 Specific Plan would provide a variety of housing options and create employment and entertainment opportunities in close proximity. Cohesive design elements would protect unique viewsheds and introduce streetscapes with coordinated landscaping to reinforce and enhance community aesthetics. The project would create a safe environment within which the use of alternative transportation modes for short trips would increase over time and continue to be a viable option as the population ages.

28811 Woodcock Drive, Laguna Niguel, CA 92677-1330
Phone: (949) 362-0020 E-Mail:endoengr@cox.net

A maximum of 2,406 residential dwelling units and 3,138,600 square feet of non-residential development (retail commercial, entertainment, office, and hotel) would be allowed by the Section 24 Specific Plan. The initial phase would be completed in the year 2022 and include up to 1,200 single-family residential dwelling units within a gated community designed for active senior adults that would complement surrounding land uses in the City of Rancho Mirage. Although no time frame has been established for development following the initial phase, the remaining area is being programmatically planned in conjunction with the Section 24 Specific Plan to ensure land use compatibility and coordinate streets and other necessary infrastructure.

The traffic study details: (1) existing circulation conditions; (2) impacts associated with the initial phase of development; (3) impacts associated with project buildout; (4) future impacts in the horizon year 2035; and (5) mitigation measures that would meet the relevant circulation system performance standards. We trust that the information provided herein will be of value to you and the Agua Caliente Band of Cahuilla Indians in their review of the impacts and conditions of approval associated with the project. Should questions or comments develop regarding the findings and recommendations within this report, please do not hesitate to contact me.

Cordially,
ENDO ENGINEERING

1.0 INTRODUCTION AND SUMMARY

1.1 Purpose and Objectives

This traffic impact study was developed for use in the preparation of an Environmental Impact Statement (EIS) for the proposed Section 24 Specific Plan in Riverside County, California. The project site is located entirely within the Agua Caliente Indian Reservation and within the Sphere of Influence of the City of Rancho Mirage as defined by the Riverside County Local Agency Formation Commission (LAFCo). In compliance with their Environmental Policy Act (Tribal Ordinance No. 28) the Agua Caliente Band of Cahuilla Indians ("Tribe") is acting as the lead agency for the preparation of the EIS. Following action on the EIS and Section 24 Specific Plan by the Tribe, the Specific Plan area may be annexed to the City of Rancho Mirage. To facilitate compliance with the California Environmental Quality Act (CEQA) by the City of Rancho Mirage, the EIS will be prepared in compliance with the CEQA Guidelines.

This traffic impact study was conducted to provide an objective and factually supported full-disclosure analysis of the potentially significant transportation consequences associated with implementation of the proposed project as well as anticipated future discretionary actions and approvals. In the process, potential cumulative transportation impacts associated with other existing, approved, and proposed development in the study area were also evaluated. To achieve the objective, information was obtained from field observations in the study area, discussions with representatives of affected agencies and the project design team. Adopted plans and policies were analyzed. Available studies, reports, data, literature, and relevant local and regional transportation models were also reviewed.

The analyses summarized herein were designed to achieve the following objectives.

- Describe the thresholds used to determine if a significant impact would occur.
- Collect and analyze the data necessary to identify, disclose, and focus on those impacts determined to be potentially significant.
- Identify improvements that would avoid significant effects, where feasible.
- Reduce adverse effects through the project design process or the incorporation of appropriate mitigation.
- Foster inter-agency coordination during the project review process.
- Clearly document the study methodology, assumptions, findings, and recommendations to support informed decision making.

1.2 Site Location and Study Area

The 577-acre undeveloped project site is centrally located within the Coachella Valley, in unincorporated Riverside County. Figure 2-1 depicts the project site in its regional context. The site occupies all of Section 24 except the 63 acres located on the east side of Bob Hope Drive. The project site is surrounded on all four sides by land located within the City of Rancho Mirage and is within the City of Rancho Mirage Sphere of Influence. The project site is located south of Interstate 10 (I-10), near the recently constructed Bob Hope Drive interchange. The site extends south of Ramon Road to Dinah Shore Drive and west of Bob Hope Drive to Los Alamos Road (see Figure 2-2). The site is located south of Section 13, west of Section 19, and east of Section 23 (the Mission Hills golf resort community).

The study area extends east of Da Vall Drive to Monterey Avenue and south of I-10 to Gerald Ford Drive. Seventeen existing key intersections within the study area were identified and approved by the Tribe and the City of Rancho Mirage for peak hour delay and level of service analysis (as shown in Figure 3-1) to determine the traffic impacts of the proposed Specific Plan project. The City of Cathedral City is adjacent to the study area to the west and north. The City of Palm Desert is adjacent to the study area to the east.

1.3 Existing General Plan and Zoning Designations

The *Riverside County Comprehensive General Plan (Revised 2008)* and the *Western Coachella Valley Area Plan (October 2003)* assign three land use designations to the area within the project site: CR (120 gross acres), CT (217 gross acres), MDR (240 gross acres). These designations would allow up to 1,200 single family dwelling units and approximately 3.85 million square feet of non-residential building space associated with local and regional serving retail and service uses,

tourist commercial, hotel, professional offices, recreational and amusement uses.[1] Development at the maximum intensity and density allowed by the *Riverside County General Plan* could generate up to 88,560 unadjusted weekday trips, as shown in Table 2-1.[2]

The proposed Section 24 Specific Plan would establish development standards for consistent land uses (i.e., 1,200 single-family dwellings for active senior adults (aged 55 and above) and a maximum non-residential building area that represents 81.4 percent of the maximum allowed under the land use designations in the *Riverside County General Plan*. A maximum of 1,206 multiple-family residential dwellings not anticipated by the *Riverside County General Plan* are proposed in close proximity to the proposed local and visitor-serving retail and service uses that would be employment generators within the site. Even though the project would include approximately twice as many residential dwellings as the *Riverside County General Plan*, they would generate a similar number of residential trips because 1,200 dwellings would be for active adults (age-restricted for residents aged 55 and above). Development at the maximum intensity and density allowed by the proposed Section 24 Specific Plan could generate up to 73,890 unadjusted weekday trips, which is approximately 16.5 percent below the number of trips that would be generated by the amount and type of development allowed by the current *Riverside County General Plan* land use designations.

The *City of Rancho Mirage General Plan* applies a C-C designation to approximately 75 net acres within the site with the potential to generate approximately 33,100 weekday trips. The *City of Rancho Mirage General Plan* designates approximately 39 net acres of the site R-H (9 dwelling units per acre, maximum) which would allow up to 351 multi-family dwelling units. The remaining 414 net acres are designated R-M (4 dwelling units per acre, maximum) which would allow up to 1,656 single-family detached dwelling units. The proposed project includes 84 percent of the residential acreage shown in the *City of Rancho Mirage General Plan.* However, the multiple-family residential density proposed would be twice that allowed by the *City of Rancho Mirage General Plan.* The proposed project would include twenty percent more residential dwellings (2,406 versus 2,007 units). However, the residential trip generation of the proposed project would be 64 percent of that associated with the 2,007 dwelling units allowed by the *City of Rancho Mirage General Plan* (i.e., 5,590 fewer weekday trips, as shown in Table 2-1). The lower trip generation would be attributed to the 1,200 proposed single-family dwelling units for active senior adults (with residency limited to adults aged 55 and above), which would generate substantially fewer trips on weekdays than conventional single-family dwellings. Development at the maximum intensity and density allowed per the *City of Rancho Mirage General Plan* would generate a total of 48,780 unadjusted weekday trips.

1.4 Proposed Section 24 Specific Plan

The Section 24 Specific Plan would establish a unified vision for the project site to guide the future development of a cohesive and complementary mix of land uses consistent with both local and regional planning goals. The Section 24 Specific Plan provides comprehensive development standards and design guidelines for use in the future development of a mixed-use regional destination resort community with residential uses located near employment opportunities, tourist-related and local-serving commercial and entertainment uses. Offices and hotels would be permitted uses within the proposed Section 24 Specific Plan.

Figure 2-3 depicts the proposed land uses, site access connections, and internal circulation system planned to support the development. A maximum of 2,406 residential dwelling units and 3,138,600 square feet of non-residential development (retail commercial, entertainment, office, hotel) would be allowed by the Section 24 Specific Plan. The mixed-use development proposed would incorporate "complete streets" designed to be supportive of transit and alternative transportation modes. The proposed development reflects the policies and goals set forth in the *Riverside County General Plan* and the *Western Coachella Valley Area Plan* which encourage more concentrated growth at key locations with existing regional and local transportation infrastructure.

The 1,200 single-family residential dwelling units proposed within a gated community designed for active senior adults (residency would be limited to adults aged 55 and above) would complement surrounding existing and planned land uses in the City of Rancho Mirage. The higher density multiple-family attached dwelling units would reflect the emerging pattern

---

[1] The Riverside County Traffic Analysis Model (RIVTAM) is the approved regional transportation model used to forecast future horizon year 2035 traffic projections for the project site. In RIVTAM, the gross acreage designated in the *Riverside County General Plan* for commercial land uses is converted to net acreage (by assuming that 25 percent of the gross area would be reserved for roads, rights-of-way, easements, etc.) and the Floor Area Ratio (FAR) represents the non-residential building floor area divided by the net area of each parcel.

[2] These "unadjusted" trips represent the sum of the individual trip-generation estimates associated with each land use within the mixed-use development, without adjustments to remove the double counting of internally-captured trips (i.e., trips with both an origin and a destination within the site that would occur without requiring vehicular travel on external streets).

of more concentrated growth and increased job creation to more cost-effectively accommodate the future transit demands created.

The project site encompasses 577 acres of which approximately 528 net acres would ultimately be developed. The remaining 49+ acres within the site would be roadway rights-of-way. Table 2-2 summarizes the proposed land uses within the site by Planning Area. The proposed land use designations include: Retail, Resort Flex, Mixed Use Core, Residential (Multiple-Family), and Residential (Single-Family) for active seniors (age 55 and over). The initial phase of development would include the development of up to 1,200 single-family homes for active adults (aged 55 and above) within Planning Area 8. The Section 24 Specific Plan would include up to 1,206 multiple-family residential dwellings after the initial phase. Although no time frame has been established for the future development of Planning Areas 1 through 7, these areas are being planned in conjunction with the Section 24 Specific Plan to coordinate streets and other necessary infrastructure and promote land use compatibility.

The RIVTAM model run conducted for the traffic analysis was based on socioeconomic data derived from the proposed residential units and square feet of non-residential uses. The analysis conducted for the study evaluated 3,138,600 square feet of non-residential uses and 2,406 residential units. After this model run was conducted, minor adjustments were made to the configuration of the Planning Areas. The configuration currently proposed for the Draft Section 24 Specific Plan site will allow the development of 529 net acres of the 577-acre site, with 313 net acres in Planning Area 8, 216 net acres in Planning Areas 1 through 7, and 48 acres for roadway rights-of-way. The differences between the size of the Planning Areas originally assumed for the traffic analysis (312 net acres for Planning Area 8, 216 net acres for Planning Areas 1 through 7, and 49 acres of roadway rights-of-way) versus the Draft Specific Plan as currently proposed (313 net acres for PA 8, 216 net acres for PA 1 through 7, and 48 acres for roadway rights-of-way) would not alter the trip generation. The differences between the Specific Plan addressed in the traffic analysis and the currently proposed Specific Plan would not affect the socioeconomic parameters used in the RIVTAM run. Therefore, the analysis presented in this study is consistent with the total non-residential development area and residential units proposed in the Specific Plan.

Proposed Site Access

Figure 2-3 illustrates the proposed site access and internal circulation layout including the internal street designations referred to throughout this report. The initial phase would ultimately be accessed via full-turn access connections proposed opposite three existing T-type intersections (Intersections 8, 9 and 12), as shown in Figure 2-3. However, the extension of Casino Road, from Bob Hope Drive to Planning Area 8, would not be constructed by Pulte Homes as part of the improvements associated with the development of the active adult community in the initial phase.

The timing of the construction of Casino Road on-site, between Planning Area 8 and Bob Hope Drive, is currently unknown. The extension of Casino Road to Planning Area 8 may not occur until adjacent land within Planning Areas 2, 3, 4, and/or 5 is developed. Although the connection of Casino Road on-site between Planning Area 8 and Bob Hope Drive is planned, there may be an interval when the initial phase is completed without the access afforded by Casino Road. As a result, the evaluation of the traffic impacts associated with the completion of the initial phase of development assumed that Casino Road would not be constructed between Planning Area 8 and Bob Hope Drive by the year 2022.

The site access plan proposed to support the ultimate development within the project site would include two existing signalized intersections (Intersections 9, and 12). In addition, five future signalized full-turn site access intersections are proposed (Intersections 13, 18, 19, 20, and 21) as well as two future unsignalized full-turn access intersections (Intersections 22 and 23). All seven of the proposed right-in/right-out access connections would be associated with phases of site development after the initial phase is completed.

The two future signalized full-turn site access intersections proposed on Ramon Road, between Los Alamos Road and Bob Hope Drive, (Intersections 18 and 19) would be located opposite the future access intersections associated with the adopted City of Rancho Mirage Section 13 Specific Plan to the north. The two future signalized full-turn site access intersections proposed on Bob Hope Drive, between Casino Road and Dinah Shore Drive, (Intersections 20 and 21) would be located opposite future access intersections associated with the adopted City of Rancho Mirage Section 19 Specific Plan to the east.

Project Phasing

Planning Area 8 would be developed as the initial phase of the proposed project. Buildout of Planning Area 8 is expected to require six to eight years to complete and occur by the year 2022. No time frame has been established to date for development within Planning Areas 1 through 7. For the purposes of this traffic impact analysis, buildout of the entire project

was assumed to occur by the year 2035, which is the horizon year used in the approved regional transportation model (RIVTAM).

1.5 Principal Findings

Performance Criteria

The *Riverside County Comprehensive General Plan* states that for development within the Sphere of Influence of an incorporated jurisdiction, city standards should generally apply where annexation to the city will logically occur in the short to intermediate range future. The *City of Rancho Mirage General Plan* identifies the adopted performance criteria to be used to evaluate the adequacy of the circulation system to serve the desired future land uses as follows: "While LOS C has long been considered the desirable and optimal level of traffic volume on any given roadway, it represents a standard that is progressively more difficult and less cost-effective to achieve in urban areas. For peak operating periods, LOS D or a maximum volume-to-capacity ratio of 0.90 is now considered the generally acceptable service level."

The City of Cathedral City standard is LOS D. The City of Palm Desert has adopted LOS C as the target for design purposes but considers LOS D provisionally acceptable for intersections that are fully improved and cannot be mitigated to achieve LOS C.

Existing Conditions

All of the seventeen key intersections are currently providing acceptable levels of service in the peak season during the weekday morning and evening peak hours. Peak hour traffic volumes do not currently warrant traffic control signals at the unsignalized key intersection of Los Alamos Road with Via Bella or the intersection of the Westin Resort Villas access with Dinah Shore Drive. The project site has adequate access for the land uses proposed.

Existing Plus Initial Phase Conditions

The initial phase of the proposed development would generate approximately 4,480 weekday trips of which 234 would occur during the morning peak hour and 289 would occur during the evening peak hour on weekdays. Although site traffic generated by the initial phase of development would degrade the peak hour LOS at two of the site access intersections (Intersection 8 and 12) from LOS A to LOS B, this impact would not be significant. All of the key intersections and site access intersections would provide acceptable levels of service upon completion of the initial phase, provided the intersection of Los Alamos Road with Via Bella [Intersection 8] and the intersection of the Westin Mission Hills Access with Dinah Shore Drive [Intersection 12] are improved to provide site access, as shown in Figure 6-2. No new traffic signals would be warranted or required by the initial phase of development. Although multiple access points are desirable to minimize circuitous travel, provide alternate access during maintenance activities and enhance emergency access, the two initial access connections would provide sufficient capacity for the initial phase of development. The extension of Casino Road, from Bob Hope Drive to Planning Area 8, would facilitate internal trip interactions between the active adult community and the non-residential land uses developed in subsequent phases of the Section 24 Specific Plan.

Existing Plus Project Buildout Conditions

Development of the project site at the maximum intensity/density that would be permitted by the proposed Specific Plan would add 59,450 weekday trips to the surrounding street system. Of that total, approximately 2,965 trips would be inbound to the site and 2,874 trips would be outbound from the site during the evening peak hour on a typical weekday.

Traffic generated by the project would cause the peak hour traffic signal warrants to be met at five intersections where site access is proposed including: two future intersections proposed on Ramon Road, two future intersections proposed on Bob Hope Drive, and one existing unsignalized intersection on Dinah Shore Drive, where a site access connection is proposed. All of these intersections would be signalized in conjunction with the proposed project. All of the key intersections are projected to provide acceptable levels of service in the peak hours on weekdays with existing plus project buildout traffic volumes, provided the proposed site access improvements and traffic control signals (shown in Figure 6-3) are constructed when necessary to accommodate the traffic generated by the proposed development. No improvements would be required for existing plus project buildout traffic volumes, other than the improvements proposed to facilitate site access.

Future Year 2022 Through Traffic Conditions (With No Site Traffic)

Future year 2022 through (non-site) traffic conditions were evaluated by adding to existing traffic volumes: (1) the cumulative traffic associated with two near-term developments, and (2) the portion of the projected future growth between the year 2013 and the year 2035 expected to occur by the year 2022. As shown in Tables 5-6 and 5-7, the key intersections are projected to operate at acceptable peak hour levels or service in the year 2022 without the traffic generated by the initial phase of the proposed project. All of the key intersections except two would operate at LOS C or better during the peak hours with the projected year 2022 through traffic volumes. Two of the signalized key intersections (Da Vall Drive at Ramon Road and Bob Hope Drive at Gerald Ford Drive) are projected to operate at LOS D during the morning peak hours and LOS C during the evening peak hours with the year 2022 through traffic volumes. These levels of service are considered acceptable.

Future Year 2022 Plus Initial Phase Conditions

The addition of the site traffic generated by the active adult homes in the initial phase of development to area roadways in the year 2022 would change the peak hour level of service on the minor-street approach at one unsignalized key intersection. During weekday evening peak hours, the site traffic generated by the initial phase is expected to increase the average control delay experienced by eastbound motorists on Via Bella approaching the intersection of Los Alamos Road by 0.6 seconds per vehicle. This increase would cause the peak hour level of service on the approach with the most delay at this intersection to drop from LOS A to LOS B. Since the intersection would have very little control delay and operate at LOS B or better, this impact would be less than significant. The addition of site traffic is not projected to change the peak hour LOS at any of the signalized key intersections in the year 2022.

Horizon Year 2035 Plus Project Buildout Traffic Conditions

As shown in Tables 5-8 and 5-9 the ultimate street system shown in both the *City of Rancho Mirage General Plan* and the *Riverside County General Plan* would accommodate the traffic associated with buildout of the proposed project in the horizon year 2035 at acceptable levels of service (LOS D or better). With the future horizon year 2035 traffic projections, deficiencies were identified at two of the off-site key intersections evaluated: (1) Bob Hope Drive at Gerald Ford Drive, and (2) Da Vall Drive at Ramon Road. Each of these key intersections would require localized mitigation to maintain acceptable levels of service in the form of an additional left-turn lane on one approach, as shown in Figure 6-4. These required improvements would be consistent with the General Plan classifications of Gerald Ford Drive and Da Vall Drive, where the mitigation would be required.

Bob Hope Drive at Gerald Ford Drive [Intersection 17] would require a second eastbound left-turn lane to accommodate projected year 2035 traffic volumes with or without site traffic. The City of Rancho Mirage has included improvements to this intersection in the 2014-2015 Capital Improvement Program (CIP). The planned improvements include the provision of dual left-turn lanes and a dedicated right-turn lane on all four approaches to this intersection. Construction is scheduled to start in May 2015 and end in October, 2015.

Da Vall Drive at Ramon Road [Intersection 3] would require a second southbound left-turn lane to accommodate projected year 2035 traffic volumes with or without traffic from the proposed Section 24 Specific Plan project. Existing development encroaches on the right-of-way required to widen Da Vall Drive to the four-lane divided roadway classification shown in both City and County General Plans. The additional southbound left-turn lane required on Da Vall Drive at Ramon Road would be consistent with the improvements typically required on a four-lane divided roadway.

The 2010 *Transportation Project Prioritization Study* (TPPS) identifies eligible transportation improvement projects on the Regional Arterial system and ranks them based upon various evaluation criteria. CVAG distributes regional transportation improvement funds (including revenue from Measure A and the TUMF program) to supplement local revenues and/or developer contributions required for approved regional road construction projects. CVAG's policy is to pay 75 percent of eligible project costs, with the public agencies responsible for approving the project contributing the remaining 25 percent. The widening of Da Vall Drive to its ultimate cross-section, between Ramon Road and Vista Chino, is an eligible and buildable project (designated B-419) in the TPPS. With a score of 9.3 points, it is ranked 88th of the 247 buildable projects therein. The required mitigation for the intersection of Da Vall Drive at Ramon Road should be part of this roadway improvement project.

The remaining key intersections are projected to operate at acceptable levels of service with the improvements proposed for the site access intersections, as shown in Figure 6-4. Five of the proposed site access intersections would require signalization to provide acceptable levels of service. Four of the five site access intersections that would require signalization are future intersections proposed in conjunction with the Section 24 Specific Plan with traffic signal control. The fifth site access point that would require signalization is proposed on Dinah Shore Drive, approximately 1,220 feet west of Bob Hope Drive (opposite the existing Westin Resort Villas access).

1.6 Recommendations

Section 6 provides a detailed discussion of: (1) standard mitigation for individual development projects, (2) recommendations associated with the initial phase of development, and (3) recommendations associated with full development of the Section 24 Specific Plan. The existing approach lane geometrics at the key intersections are shown in Figure 6-1. Figure 6-2 illustrates the minimum lane geometrics required at the key intersections for the initial phase of the proposed development. Figure 6-3 illustrates the minimum approach lane geometrics required and traffic control assumed for existing plus project buildout conditions. Figure 6-4 illustrates the minimum approach lane geometrics required and traffic control assumed for conditions in the horizon year 2035. The approach lanes therein represent: (1) existing lanes; (2) lanes required to eliminate off-site intersection deficiencies; and (3) future lanes recommended to ensure adequate site access and internal circulation.

Initial Phase Improvements

The developer of the initial phase shall provide, at a minimum, the lane geometrics shown in Figure 6-2 at the site access points in conjunction with the development of the initial phase.

1. The developer of the initial phase shall provide, at a minimum, the lane geometrics shown in Figure 6-2 at the site access points in conjunction with the development of the initial phase.

    - A "STOP" sign shall be installed facing westbound vehicles at the site access proposed on Los Alamos Road, opposite Via Bella [Intersection 8] and a northbound and southbound left-turn bay shall be provided in the median on Los Alamos Road at the intersection of Via Bella.

    - The existing traffic control signal and approach lane geometrics shall be modified at the intersection of the Westin Mission Hills Golf Resort Access with Dinah Shore Drive [Intersection 12] to provide access to the initial phase of development. Two southbound exit lanes shall be provided, including a dedicated right-turn lane and a shared through/left lane. Two northbound entry lanes shall be provided to permit residents to enter while a visitor is awaiting authorization for entry.

2. Adequate stacking distance (100 feet) shall be provided on the approach to each of the three proposed gated entries to store vehicles entering the initial phase. The pavement in advance of the gate shall be wide enough to allow non-accepted vehicles to turn around in advance of the gate. Any gated entry that allows visitor access should provide two entry lanes to allow residents to bypass the vehicles of visitors awaiting entry authorization.

3. The controlled primary entryways to the initial phase of development may be required to include provisions to facilitate access by emergency vehicles. If required, all power-operated controlled access devices shall have a radio-controlled override system capable of opening the gate or barrier when activated by a special transmitter located in emergency vehicles and be equipped to facilitate opening in the event of a power failure.

4. An adequate supply of off-street parking in appropriate locations is an essential component of a balanced neighborhood and should be provided within the initial phase to meet the needs of residents and visitors. Regular use of on-street parking should be expected and accommodated because visitor parking will be heavy at times.

Project Buildout Improvements

The minimum required site access improvements shown in Figure 6-4, including the intersection approach lane geometrics, "STOP " signs, and new traffic control signals, should be provided when necessary to accommodate the traffic generated by the development of the Section 24 Specific Plan.

Traffic signals will be warranted and shall be installed along Ramon Road and Bob Hope Drive at the following five site access intersections to maintain acceptable levels of service in conjunction with adjacent development:

- The Westin Resort Villas @ Dinah Shore Drive [Intersection 13],
- Street “C” @ Ramon Road [Intersection 18],
- Street “D” @ Ramon Road [Intersection 19],
- Bob Hope Drive @ Street “D” [Intersection 20], and
- Bob Hope Drive @ Street “E” [Intersection 21].

2.0 PROPOSED DEVELOPMENT

With its unique natural beauty and resources as well as its history as a retirement destination with seasonal tourism, the Coachella Valley has become a world-class resort destination. As many as 100,000 seasonal residents spend the winter months in the Coachella Valley. Another 3.5 million conventioneers and tourists visit the Coachella Valley each year. The year-round agricultural industry in the Coachella Valley has been augmented by a leisure, hospitality, and retail economy that has developed to accommodate tourists and the influx of seasonal residents.

The *Riverside County General Plan* would change the historical growth pattern of random sprawl by moving toward a pattern of concentrated growth and increased job creation in strategic areas, which provide various transportation options for access to the region. In view of its prominent and centralized location within the Coachella Valley, the proposed Section 24 Specific Plan provides a unique opportunity to implement that vision.

The proposed project would create a vital mixed-use development, within the context of a destination resort community, that is supportive of transit and other alternative transportation modes. The development would be pedestrian-friendly and located within an area where the use of golf carts and NEVs is commonplace and multi-use paths exist and are being expanded to accommodate cycling, pedestrians, and golf carts. The proposed project would be within walking distance of two sites adjacent to the Union Pacific Railroad corridor that are being considered for development as a future regional multi-modal transit center. The development would take maximum advantage of the opportunities afforded by the seasonal influx of tourists and part-year residents but also provide a mix of future uses that would support the local community and be economically viable year-round. The Section 24 Specific Plan would provide a variety of housing options and create employment and entertainment opportunities in close proximity, to promote walking and cycling as healthy alternatives to commuting long distances by automobile. Cohesive design elements would protect unique viewsheds and introduce streetscapes with coordinated landscaping to reinforce and enhance community aesthetics. The project would create a safe environment within which the use of alternative transportation modes for short trips would grow over time and continue to be a viable option as the population ages.

2.1 Project Location

Figure 2-1 illustrates the project site in its regional context within the Coachella Valley region of eastern Riverside County, California. The project site is centrally located within the Coachella Valley, which is approximately 45 miles long and 15 miles wide. The Coachella Valley is separated from the Greater Los Angeles Area to the northwest by the San Gorgonio Pass, through which Interstate 10 (I-10) and the Union Pacific Railroad are the major transportation corridors.

The site is located south of the Union Pacific Railroad corridor and I-10, at the newly constructed Bob Hope Drive interchange. The undeveloped project site is comprised of 577 gross acres entirely within the Agua Caliente Indian Reservation. It is within the Rancho Mirage Sphere of Influence in unincorporated Riverside County. The site occupies approximately 90 percent of Section 24, including all the area west of Bob Hope Drive. The adjacent area within Section 24, located south of Ramon Road and east of Bob Hope Drive, is not a part of the project site and is developed as the Agua Caliente Casino Resort Spa.

Figure 2-2 depicts the project site in its local context. The site is situated between the desert resort cities of Palm Springs (to the west) and Palm Desert (to the east). Cathedral City is located both west and north of the site. The City of Rancho Mirage surrounds the project site on all sides and the Specific Plan area is an island of unincorporated land.

The site is bounded by and has frontage on four existing arterial streets. It extends south of Ramon Road to Dinah Shore Drive and east of Los Alamos Road to Bob Hope Drive. It is bordered to the south and west by the Westin Mission Hills Golf Resort and Mission Hills community. The Desert Ridge Shopping Center is located on the southeast corner of the intersection of Bob Hope Drive and Dinah Shore Drive. The Agua Caliente Casino Resort Spa is located south of Ramon Road and east of Bob Hope Drive, within the portion of Section 24 that is not a part of the project site.

2.2 Land Ownership Within the Section 24 Specific Plan Area

The proposed Specific Plan would establish the 8 planning areas shown in Figure 2-3 for the purposes of planning and regulating land use. A total of 120 gross acres along the south side of Ramon Road (primarily within Planning Areas 1 through 3) are owned by the Tribe. The 97 gross acres located immediately west of and adjacent to Bob Hope Drive (within Planning Areas 4, 5, and 6) are allotted to members of the Tribe and under contract to be acquired by the Tribe. acre parcel located on the northwest corner of the intersection of Bob Hope Drive and Dinah Shore Drive (Planning Area 7) is allotted to members of the Tribe. The remaining 320 gross acres within the site are located on the northeast corner of the intersection of Los Alamos Road and Dinah Shore Drive (within Planning Area 8) and allotted to members of the Tribe. This area is under contract to be acquired by Pulte Home Corporation/SCC Rancho Mirage Holdings LP and developed as an active adult residential community for residents aged 55 and above.

2.3 Existing Agua Caliente Land Use Ordinance Designations

The northernmost 120 acres within the site, located south of Ramon Road (primarily within Planning Areas 1 through 3) are designated "Tribal Enterprise" in the Agua Caliente Land Use Ordinance (amended in January 2011). Future land uses within areas designated Tribal Enterprise are subject to Tribal Council determination. The remainder of the site is designated "Land Use Contract," a designation applied to land allotted to individual members of the tribe. Future land uses in areas designated Land Use Contract are defined by the applicable city/county zoning code.

2.4 Existing County and City General Plan Land Use Designations

Riverside County General Plan and Western Coachella Valley Area Plan

The *Riverside County General Plan* and the *Western Coachella Valley Area Plan* (October 2003) include three land use designations within the project site: CR, CT, MDR. The "Commercial Retail" (CR) designation applies to the 120 gross acres located along the south side of Ramon Road (within Planning Areas 1, 2 and 3). This designation has a building intensity range of 0.20 to 0.35 FAR and includes local and regional serving retail and service uses.[1]

A "Commercial Tourist" (CT) designation applies to 217 gross acres including: 57 acres along the west side of Bob Hope Drive in Planning Areas 4 and 6; 40 acres on the northwest corner of the intersection of Bob Hope Drive with Dinah Shore Drive in Planning Area 7; and 120 acres within Planning Area 8. The CT designation has a building intensity range of 0.20 to 0.35 FAR and reflects tourist-related commercial land uses including: hotels, golf courses, and recreational activities.

The Riverside County Transportation Analysis Model (RIVTAM) assumes a maximum Floor Area Ratio (FAR) of 0.35 for non-residential land uses designated CR and CT. At the maximum permitted building intensity allowed under the land use designations in the *Western Coachella Valley Area Plan*, the site could be developed with approximately 3.85 million square feet of non-residential building space. This building area would accommodate local and regional serving retail and service uses as well as tourist commercial (hotel, visitor-serving commercial, recreation/amusement) uses. The trip-generation potential of commercial retail and tourist commercial development on-site at the maximum intensity allowed by the CR and CT designations would be 78,330 weekday trips. RIVTAM reflects land uses in specific plans, general plans, and zoning; however, the future growth assumed for the horizon year 2035 in RIVTAM was constrained by the *SCAG 2004 Growth Forecast* distribution. Consequently, all of the potential future trip generation associated with buildout of the City and County General Plans is not included in the RIVTAM model.

A "Medium Density Residential" (MDR) designation applies to 240 gross acres within the site including 200 acres within Planning Area 8 and 40 acres within Planning Areas 4 and 5. This designation allows a residential density of 2 to 5 dwelling units per acre. A total of 240 gross acres within the site could be developed with up 1,200 single-family detached/attached dwelling units, under the MDR land use designation of the site shown in the *Western Coachella Valley Area Plan*. These dwelling units have a potential trip generation of 10,230 weekday trips. The total trip generation of the site if developed at the maximum intensity/density allowed by the *Riverside County General Plan* would be 88,560 unadjusted weekday trips.

The City of Rancho Mirage General Plan

The *Rancho Mirage General Plan* includes three land use designations within the project site: C-C, R-H, and R-M. The "Community Commercial" (C-C) designation (with a maximum Floor Area Ratio of 0.35) applies to 75 net acres located south of and adjacent to Ramon Road within Planning Areas 2 and 3. This designation allows regional and community commercial shopping centers and hotels. With a maximum building gross floor area of 1,143,450 square feet, the area designated Community Commercial, could generate up to 33,100 weekday trips.

---

[1] The Floor Area Ratio (FAR) is the amount of non-residential building square footage in relation to the size of the lot (i.e., the net area of the parcel in square feet). RIVTAM is consistent with the RCIP socioeconomic assumptions and methodology, which convert all gross acreage with non-residential land use designations in the *Riverside County General Plan* to net acreage (by assuming that 75 percent of the gross area would be developable and 25 percent would be reserved for roads, right-of-way, easements, etc.) prior to determining the associated building area and employment.

A "High Density Residential" (R-H) designation applies to 39 net acres within Planning Area 1. This designation would allow a density of 4 to 9 dwelling units per acre with a maximum of 351 single-family attached or multi-family dwelling units. Based upon the trip-generation rates published by the Institute of Transportation Engineers (ITE) in *Trip Generation* (2008), this area could generate up to 1,920 weekday trips. A "Medium Density Residential" (R-M) designation applies to the remaining 414 net acres within the site. This designation would allow up to four dwelling units per acre or a maximum of 1,656 single-family detached dwelling units. Based upon the trip-generation rates published by the ITE, this area could generate up to 13,760 weekday trips.

The two residential land use designations for the site in the *Rancho Mirage General Plan* would permit up to 2,007 dwelling units to be developed with the potential to generate up to 15,680 weekday trips. With up to 33,100 non-residential trips and 15,680 residential trips, development within the site at the maximum density and intensity allowed by the *City of Rancho Mirage General Plan* could generate up to 48,780 unadjusted weekday trips.

Consistency With General Plan Land Use Designations

Table 2-1 summarizes the maximum residential and non-residential development within the project site for three conditions: (1) proposed by the Section 24 Specific Plan, (2) allowed by the *Riverside County General Plan*, and (3) allowed by the *City of Rancho Mirage General Plan.* The proposed Section 24 Specific Plan would allow more dwelling units than the existing City and County General Plans. However, the initial phase of 1,200 age-restricted dwellings proposed for active adults (age 55 and above) would generate substantially fewer trips than conventional single-family detached dwellings. As a result, the total number of residential weekday trips generated by the 2,406 dwelling units proposed would be slightly less than the trips generated by the 1,200 conventional (not age-restricted) single-family dwellings allowed under the *Riverside County General Plan* and 35 percent less than the number trips generated by the maximum allowed number of residential dwelling units allowed by the *City of Rancho Mirage General Plan*. The residential component of the proposed project would generate 5,590 fewer residential trips on weekdays than the maximum number of residential dwellings allowed by the *City of Rancho Mirage General Plan.*

Consistent with the CR and CT land use designations shown for the site in the *Riverside County General Plan*, the proposed Section 24 Specific Plan would guide the development of tourist-oriented commercial, local serving retail and service uses, professional offices, entertainment, and hotel uses. The maximum proposed non-residential building floor area would be 18.6 percent less than the maximum allowed by the *Western Coachella Valley Area Plan*. Since the number of trips generated would be a function of the total size of the non-residential building gross floor space developed, the proposed project would be expected to generate approximately 18.6 percent fewer non-residential trips on weekdays than the maximum allowed by the *Riverside County General Plan* designations. However, the area proposed as non-residential land uses with the project would be nearly twice the area designated C-C in the *City of Rancho Mirage General Plan*. As a result, the proposed project would generate nearly twice the number of non-residential trips on weekdays anticipated by the *City of Rancho Mirage General Plan.*[2]

The Section 24 Specific Plan would allow development with the potential to generate substantially more weekday trips than the *City of Rancho Mirage General Plan* designations and substantially fewer trips than the *Riverside County General Plan* designations. The proposed density of the multi-family residential dwellings within the site would be twice the highest density allowed by the *City of Rancho Mirage General Plan*. The *City of Rancho Mirage General Plan* suggests that higher residential densities may be appropriate in special circumstances or where conditions would support the densities, such as planned communities, affordable housing, and senior housing in close proximity to commercial, medical, and other supportive land uses. Residential communities developed through the Specific Plan process allow creative and flexible planning where smaller units and higher densities could provide a wider range of residential product types with integrated access and private internal roadways as well as facilities supportive of a variety of alternative transportation modes. By their very nature, Specific Plans for large and complex mixed-use developments can create opportunities to provide development amenities beyond those that would be feasible in smaller, more conventional developments.

[2] Unadjusted trips have not been reduced to reflect the internal trip interactions that occur within a mixed-use development or pass-by trips attracted to the site from the traffic that would be passing the site on adjacent streets without the proposed Section 24 Specific Plan.

Table 2-1
Section 24 Specific Plan
Compared to County/City General Plan Land Uses

Land Use Type/Parameter	Section 24 Specific Plan	Riverside County G.P.	Rancho Mirage G.P.
NON-RESIDENTIAL LAND USES			
- Area (Gross)	177 Acres	337 Acres	80 Acres
- Net Area With Designation	149 Net Acres	252.75 Net Acres	75 Net Acres
- Floor Area Ratio[a] (Max.)	0.48	0.35	0.35
- Building Gross Floor Area (Max.)	3,138,600 S.F.	3,853,427 S.F.	1,143,450 S.F.
- Employment[b] (Max.)	6,277 Jobs	7,707 Jobs	2,287 Jobs
- Weekday Trips Generated[c] (Max.)	63,800 Trips	78,330 Trips	33,100 Trips
RESIDENTIAL LAND USES			
Med. Density Residential Area			
- Site Area With Designation	312 Net Acres	240 Gross Acres	414 Net Acres
- Density Allowed[d] (Max.)	4 DU/Net Acre	5 DU/Gross Acre	4 DU/Net Acre
- Maximum Dwelling Units Allowed	1,200 SF Sr. Adult Units	1,200 SF Units	1,656 SF Units
- Weekday Trips Generated[c]	4,480 Trips	10,230 Trips	13,760 Trips
High Density Residential Area			
- Site Area With Designation	67 Net Acres	–	39 Net Acres
- Density Allowed[d] (Max.)	18 DU/Net Acre	–	9 DU/Net Acre
- Dwelling Units Allowed (Max.)	1,206 MFA Units	–	351 MFA Units
- Weekday Trips Generated	5,610 Trips	–	1,920 Trips
Subtotal Residential Area			
- Dwelling Units (Max.)	2,406 DU	1,200 DU	2,007 DU
- Weekday Trips Generated[c]	10,090 Trips	10,230 Trips	15,680 Trips
- Population[e] (Max.)	4,331	3,564	5,603
UNADJUSTED WEEKDAY TRIPS[f]	73,890 Trips	88,560 Trips	48,780 Trips

a. The Floor Area Ratio (FAR) is the amount of non-residential building gross floor area (in square feet) divided by the net area of the parcel (in square feet). The RCIP and RIVTAM assume that the net acreage is 75% of the gross acreage with commercial land use designations in the *Riverside County General Plan*. FAR values for the Commercial Retail designation ranged from a low of 0.20 to a probable value of 0.23 and a maximum value of 0.35. For areas designated Commercial Tourist, RIVTAM FAR values ranged from a low of 0.20 to a probable value of 0.25 and a maximum value of 0.35. A maximum FAR of 0.35 applies to those areas designated Community Commercial in the *City of Rancho Mirage General Plan* per Section 17.10.020 of the *Rancho Mirage Municipal Code*. The FAR shown for the proposed Section 24 Specific Plan is the average value for all of the non-residential development combined. Minor recent changes to the proposed Section 24 Specific Plan have altered the acreages and land use densities without altering the total proposed residential and non-residential uses, or projected trip generation. The maximum FAR and residential densities will be defined in the Section 24 Specific Plan.

b. For the RCIP and RIVTAM, employment estimates were based upon an employment density factor of 500 S.F. of building gross floor area per employee for areas designated Commercial Retail (CR) and Commercial Tourist (CT) in the *Riverside County General Plan*.

c. The ITE regression equations in *Trip Generation* (8th Edition, 2008) associated with Land Use Codes 820, 210, 230, and 251 were used to estimate the weekday trip generation potential associated with commercial shopping centers, conventional single-family detached dwellings, multiple-family attached dwelling units, and single-family detached dwellings for active senior adults (age 55 and above), respectively. All weekday trip generation estimates shown reflect "unadjusted" trips (i.e., internal and external trips without reductions associated with internal trip capture or pass-by trips).

d. The 1,200 active adult single-family detached age-restricted residential dwellings proposed in Planning Area 8 would have a density of 3.75 dwelling units per gross acre (3.85 units per net acre). The RCIP and RIVTAM use the density allowed and the gross acreage to estimate the number of dwelling units allowed.

e. The population density was assumed to be 2.97 persons/household per the Land Use Element of the *Riverside County General Plan*. The City population assumed 2.97 persons/household for Medium Density Residential and 1.95 persons/household for High Density Residential dwellings. The Section 24 Specific Plan population assumed the age-restricted single-family units would reduce the overall population density to 1.8 persons/household.

f. The *City of Rancho Mirage General Plan* Traffic Model projected weekday productions and attractions for the site using a different methodology. A trip-generation rate of 350 weekday trips per acre of C-C and a residential trip-generation rate of 4.6 weekday trips per dwelling unit were assumed for the R-H and R-M designations, with an average residential density of 3.2 DU/Acre assumed for R-M areas and 8.0 DU/Acre assumed for R-H areas, rather than the maximum density allowed.

2.5 Project Description

The Section 24 Specific Plan would establish a unified vision for the project site to guide the future development of a cohesive and complementary mix of land uses consistent with both local and regional planning goals. The Section 24 Specific Plan provides a comprehensive set of development standards and design guidelines for use in the future development of a mixed-use regional destination resort community with residential uses located near employment opportunities, tourist-oriented commercial and local-serving retail and service uses, professional office space, hotel, and entertainment uses.

Figure 2-3 shows the location of the various planning areas within the site as well as the proposed land uses and the site access and internal circulation system planned to support the development. A maximum of 2,406 residential dwelling units and 3,138,600 square feet of non-residential development (retail commercial, entertainment, office, hotel) would be allowed by the Section 24 Specific Plan that would complement surrounding existing and planned land uses in the City of Rancho Mirage. A total of 528 net acres on-site would ultimately be developed, as shown in Table 2-2. Approximately 49 acres of the site would be rights-of-way associated with streets and highways.

Non-residential land uses would be constructed along Ramon Road and Bob Hope Drive. Single-family detached residential uses would be constructed north of Dinah Shore Drive and east of Los Alamos Road in a gated community for active adults. Multiple-family attached residential development is proposed in five areas located between the lower density single-family residential uses in Planning Area 8 and the higher intensity non-residential land uses along Ramon Road and Bob Hope Drive.

The proposed development within each Planning Area is summarized in Table 2-2. The initial phase of the development would include up to 1,200 single-family residential dwelling units for active seniors (aged 55 and above) within a gated community in Planning Area 8. Although no timeframe has been established to date for Planning Areas 1 through 7, this area is being programmatically planned in conjunction with the Section 24 Specific Plan to coordinate streets and other necessary infrastructure and promote land use compatibility.

A total of 67 net acres of multiple-family attached residential development is proposed within five Planning Areas at a density of up to 18 dwelling units per acre. Within this area up to 1,206 multi-family attached dwelling units would be allowed. Although multi-family residential units would be an allowed use above the retail commercial development under the Mixed Use Core designation of Planning Area 2A, a maximum of 1,206 multi-family residential units would be allowed within the Section 24 Specific Plan area.

The development of up to 1,271,600 square feet of non-residential building floor area would be permitted on the 73 net acres designated as Resort Flex in Planning Areas 1A, 4, and 6A. This development would include a mix of hotel, retail commercial, and entertainment uses. A total of 51 acres are designated for retail commercial uses in Planning Areas 3 and 7A. The development of up to 777,000 square feet of retail building area would be allowed in this area. The 25 net acres designated Mixed Use Core in Planning Area 2A would accommodate up to 1,090,000 square feet of community retail commercial uses, office uses, and possibly attached residential units above the commercial uses.

Proposed Site Access and Internal Circulation

Figure 2-3 shows the site access and internal circulation system planned to support the proposed land uses within the Section 24 Specific Plan area. The letter designations assigned to the internal streets (Street “A” through Street “E”) for ease of reference within this report are shown in Figure 2-3. The number assigned to each existing key intersection for reference in this report is shown on page 3-1 and shown in Figure 3-1. The future full-turn site access intersections and their intersection numbers are shown in Figure 2-3 including each intersection number and the letter designation assigned to each proposed internal street.

Initial Phase Access

The initial phase of development would include the development of up to 1,200 single-family homes for active adults (aged 55 and above) within Planning Area 8. The initial phase would be accessed via full-turn access connections proposed opposite two existing T-type intersections: Los Alamos Road at Via Bella [Intersection 8], and the Westin Mission Hills Access at Dinah Shore Drive [Intersection 12]. Ultimately, a third access to Planning Area 8 would be provided by the extension of Casino Road, from Bob Hope Drive to Planning Area 8. This extension of Casino Road would not be constructed by Pulte Homes as part of the improvements associated with the development of the active adult community in the initial phase.

Table 2-2
Section 24 Specific Plan Land Use Summary[a]

Planning Area	Land Use[b] Designation	Area (Net Acres)	Intensity/Density[c]	Maximum[d] Development
Planning Area 1A	Resort Flex	25	0.40 FAR	435.6 T.S.F.
Planning Area 1B	Residential (MF)	10	18 D.U./Acre	180 D.U.
Planning Area 2A	Mixed Use Core	25	1.00 FAR	1,090.0 T.S.F.
Planning Area 2B	Residential (MF)	10	18 D.U./Acre	180 D.U.
Planning Area 3	Retail	26	0.35 FAR	396.0 T.S.F.
Planning Area 4	Resort Flex	29	0.40 FAR	505.0 T.S.F.
Planning Area 5	Residential (MF)	27	18 D.U./Acre	486 D.U.
Planning Area 6A	Resort Flex	19	0.40 FAR	331.0 T.S.F.
Planning Area 6B	Residential (MF)	10	18 D.U./Acre	180 D.U.
Planning Area7A	Retail	25	0.35 FAR	381.0 T.S.F.
Planning Area 7B	Residential (MF)	10	18 D.U./Acre	180 D.U.
Planning Area 8 (Initial Phase)	Active Adult (Age 55+) Residential (SF)	312	4 D.U./Acre	1,200 D.U.
Total		528		3,138,600 S.F. 1,200 SF Units 1,206 MF Units

a. Source: Meridian Consulting LLC. "Notice of Intent to Prepare an Environmental Impact Statement for the Proposed Section 24 Specific Plan, Riverside County." January 14, 2014. In addition to the net acreage, 49 acres would be associated with roadway rights-of-way for a total gross acreage of 577.0 acres. Minor recent changes to the Section 24 Specific Plan have altered the acreages and land use densities for the individual Planning Areas, without altering the total proposed residential and non-residential uses. The maximum development for each Planning Area will be defined in the Section 24 Specific Plan.
b. MF=Multiple-Family. SF=Single-Family.
c. FAR=Floor Area Ratio. D.U.=Dwelling Units.
d. T.S.F.=Thousand Square Feet of Building Floor Area

The timing of the construction of Casino Road on-site, between Planning Area 8 and Bob Hope Drive, is currently unknown. The extension of Casino Road to Planning Area 8 may not occur until adjacent land within Planning Areas 2, 3, 4, and/or 5 is developed. As a result, the evaluation of the traffic impacts associated with the completion of the initial phase of development assumed that Casino Road would not be constructed between Planning Area 8 and Bob Hope Drive by the year 2022.

Access Plan to Support Development Upon Project Completion

The site access plan proposed to support the ultimate development within the project site would include two existing signalized intersections (Intersections 9 and 12). Five future signalized full-turn site access intersections (Intersections 13, 18, 19, 20, and 21) are proposed. Three unsignalized full-turn site access intersections (Intersections 8, 22 and 23) along Los Alamos Road would serve site traffic. Seven future right-in/right-out site access connections are proposed in conjunction with the proposed project; three on Ramon Road, three on Bob Hope Drive, and one on Dinah Shore Drive. All of these right-in/right-out site access points would all be associated with phases of site development after the initial phase is completed.

The two future signalized full-turn site access intersections proposed on Ramon Road, between Los Alamos Road and Bob Hope Drive, (Intersections 18 and 19) would be located opposite the future access intersections associated with the adopted City of Rancho Mirage Section 13 Specific Plan to the north. The two future signalized full-turn site access intersections proposed on Bob Hope Drive, between Casino Road and Dinah Shore Drive, (Intersections 20 and 21) would be located opposite future access intersections associated with the adopted City of Rancho Mirage Section 19 Specific Plan to the east.

Right-In/Right-Out Access Connections

The proposed right-in/right-out access connections were designated by letter in clockwise order, beginning at the northwest corner of the site, as shown in Figure 4-6. Access A through Access C are proposed from west to east along Ramon Road to serve Planning Areas 1A, 2A, and 3, respectively. Access D through Access F are proposed from north to south along Bob Hope Drive to serve Planning Areas 4, 6A, and 7A, respectively. Access G is proposed on Dinah Shore Drive, west of Bob Hope Drive, to serve Planning Area 7A.

Access to Ramon Road

The proposed site access plan for Ramon Road would include the use of the existing signalized intersection of Los Alamos Road with Ramon Road [Intersection 5] to accommodate site traffic destined to and from Planning Areas 1A, 1B and 8. A future signalized full-turn site access would be constructed on the south side of Ramon Road, one-quarter mile east of Los Alamos Road, at Street "C" [Intersection 18] to serve both the Resort uses in Planning Area 1 and the most intense Mixed Use Core uses proposed in Planning Area 2. A future signalized full-turn site access would also be constructed on the south side of Ramon Road, one-quarter mile west of Bob Hope Drive, at Street "D" [Intersection 19] to serve both the more intense Mixed Use Core uses in Planning Area 2 and the Retail uses in Planning Area 3. Street "D" would be improved within the project site as a four-lane divided Minor Arterial Roadway with a raised landscape median (16 feet in width) within a 110-foot right-of-way. Sidewalks (5-feet in width) and bicycle lanes (5-feet in width) would be incorporated on both sides of this roadway.

Access to Bob Hope Drive

The proposed access along Bob Hope Drive would include the construction of a fourth intersection leg at the existing signalized three-leg intersection of Bob Hope Drive and Casino (Intersection 9). This intersection currently has signal mast arms and signal heads on all four approaches. The westerly extension of Casino Road would provide a direct and convenient route to and from the Agua Caliente Casino Resort Spa for all transportation modes. It would also substantially reduce the volume of site traffic turning right onto and left across Ramon Road, west of Bob Hope Drive.

Two future signalized full-turn intersections are proposed at one-quarter-mile intervals along Bob Hope Drive, between the existing signalized intersections at Dinah Shore Drive and at Casino. The future intersection of Bob Hope Drive with Street "D" (Intersection 20) would connect the proposed internal boulevard through the project site from Ramon Road to Bob Hope Drive. Intersection 20 would be located opposite the street proposed to serve the Section 19 Specific Plan area (east of Bob Hope Drive). The future intersection proposed at Street "E" (Intersection 21) would be located between Planning Areas 6 and 7, opposite the future access proposed to serve the Section 19 Specific Plan area to the east.

Access to Dinah Shore Drive

The existing signalized intersection of Los Alamos Road with Dinah Shore Drive (Intersection 11) is located on the southwest corner of the initial phase of the Section 24 Specific Plan. The primary gated entry for the initial phase of development would be located approximately 1,770 feet east of Los Alamos Road, opposite the existing signalized access on Dinah Shore Drive

associated with the Westin Mission Hills Golf Resort (Intersection 12). This access would require the construction of a north leg at the existing intersection and the modification of the existing traffic control signals.

The future access for Planning Area 7B would be located approximately 1,220 feet west of Bob Hope Drive, opposite the existing unsignalized access on Dinah Shore Drive associated with the Westin Mission Hills Resort Villas (Intersection 13). The ultimate site traffic volumes at this intersection are expected to meet traffic signal warrants. Traffic signal control would be constructed at this intersection in conjunction with the proposed site access improvements. This signalized intersection would be approximately 2,300 feet east of the signalized Westin Mission Hills Golf Resort access (Intersection 12).

Access to Los Alamos Road

The proposed project would take access to Los Alamos Road at three proposed unsignalized full-turn site access intersections. The initial phase of the proposed project would take access to Los Alamos Road opposite Via Bella at the existing unsignalized intersection [Intersection 8]. This intersection is located approximately 1,430 feet south of Ramon Road and 3,860 feet north of Dinah Shore Drive. It would be two-way stop controlled in the future.

Subsequent phases of development would take access to Los Alamos Road for the multiple-family residential land uses proposed within Planning Area 1B via Street "A" [Intersection 22]. This future site access connection on Los Alamos Road is not expected to accommodate sufficient future traffic volumes to warrant traffic control signals. The proposed Resort uses within Planning Area 1 would take access to Los Alamos Road via Street "B" [Intersection 23]. This intersection is also expected to be two-way stop controlled.

Street "D" (Proposed Internal Boulevard)

Street "D" would provide two travel lanes in each direction, separated by a raised landscape median 16 feet in width. This internal multi-modal corridor would extend from its signalized intersection with Ramon Road to its signalized intersection with Bob Hope Drive. It would be aligned with Planning Areas 3 and 4 to the east and Planning Areas 2, 5 and 6 to the west. The alignment would facilitate the phased construction of various Planning Areas within the Specific Plan without interrupting access to the initial phase or previous phases of the development.

Street "D" would be accessible to automobiles, service vehicles, emergency vehicles, neighborhood electric vehicles (NEVs), golf carts, and neighborhood circulator vehicles. This boulevard would provide landscaped buffers between the 5-foot sidewalks proposed on both sides of the roadbed right-of-way/property line. A 5-foot wide on-street Class II bicycle lane would be provided on each side of Street "D", separated from the travel lanes by a 2-foot buffer. The bicycle lanes would be visually separated from the sidewalks by an 8-foot landscape buffer.

Proposed Neighborhood Circulator Service

Neighborhood circulator vehicles (NCVs) are envisioned as a viable means of providing free public transportation services for the community over a relatively small area via shuttles circulating on a fixed route with an established schedule. A typical mini-bus that could be used for a neighborhood circulator service would accommodate 19 passengers and provide two wheelchair positions, a wheelchair lift, and a rack for bicycles. The neighborhood circulator vehicles would improve local access for individuals with limited mobility.

Project Phasing

The initial phase of development would include the 1,200 dwelling units proposed within Planning Area 8 as a gated community for active adult aged 55 and above. The development within Planning Area 8 is expected to require six to eight years to complete. Full development and occupancy of the initial phase of the proposed development was assumed to occur by the year 2022.

No time frame has been established to date for development within Planning Areas 1 through 7. For the purposes of this traffic impact analysis, full development and occupancy of the entire project was assumed to occur by the horizon year of 2035 used in the RIVTAM model. This is a conservative assumption made for the purpose of assessing the potential traffic impact of the proposed project. The Agua Caliente Tribe currently has no plans or timing defined for development of Planning Areas 1 through 7, and it is anticipated that development of the uses that would be allowed by the Specific Plan would extend beyond 2035.

3.0 AREA CONDITIONS

3.1 Study Area and Key Intersections

The area of potential influence and key intersections to be evaluated were identified through coordination with Ms. Margaret Parks, the Director of Planning and Natural Resources for the Agua Caliente Band of Cahuilla Indians, Mr. Bud Kopp, the City of Rancho Mirage Planning Manager, and Mr. Bill Enos, the Rancho Mirage City Engineer. The study area extends east of Da Vall Drive to Monterey Avenue and south of I-10 to Gerald Ford Drive, as shown in Figure 3-1. The seventeen existing key intersections include:

[1] Bob Hope Drive @ the I-10 Westbound Ramps,
[2] Bob Hope Drive @ the I-10 Eastbound Ramps,
[3] Da Vall Drive @ Ramon Road,
[4] Rattler Road @ Ramon Road,
[5] Los Alamos Road @ Ramon Road,
[6] Bob Hope Drive @ Ramon Road,
[7] I-10 Eastbound Ramp @ Ramon Road,
[8] Los Alamos Road @ Via Bella,
[9] Bob Hope Drive @ Casino,
[10] Da Vall Drive @ Dinah Shore Drive,
[11] Los Alamos Road @ Dinah Shore Drive,
[12] Westin Mission Hills Access @ Dinah Shore Drive,
[13] Westin Resort Villas Access @ Dinah Shore Drive,
[14] Bob Hope Drive @ Dinah Shore Drive,
[15] Key Largo Avenue @ Dinah Shore Drive,
[16] Monterey Avenue @ Dinah Shore Drive, and
[17] Bob Hope Drive @ Gerald Ford Drive.

Five of the existing key intersections are located on Ramon Road (including one at the I-10 eastbound onramp). Seven of the existing key intersections are located on Dinah Shore Drive. Six of the existing key intersections are located on Bob Hope Drive (including two at the new I-10 interchange). Two of the existing key intersections are located on Da Vall Drive and two are located on Los Alamos Road. One existing key intersection is located on Gerald Ford Drive.

The key intersections are referenced throughout this report with the north-south street name first, followed by the east-west street name. The existing key intersections were numbered from north to south and from west to east. This provided graphic continuity to facilitate visual comparisons between neighboring intersections.

All of the proposed future full-turn site access intersections were evaluated to ensure that they will provide acceptable levels of service in the horizon year 2035 with the project completed. The internal streets were labeled from Street "A" to Street "E", as shown in Figure 2-3. The proposed future full-turn site access intersections were numbered for reference as key intersections 18 through 23 (see Figure 2-3) and include:

[18] Street "C"@ Ramon Road,
[19] Street "D"@ Ramon Road,
[20] Bob Hope Drive @ Street "D",
[21] Bob Hope Drive @ Street "E",
[22] Los Alamos Road @ Street "A" (the multiple-family access), and
[23] Los Alamos Road @ Street "B" (the resort access).

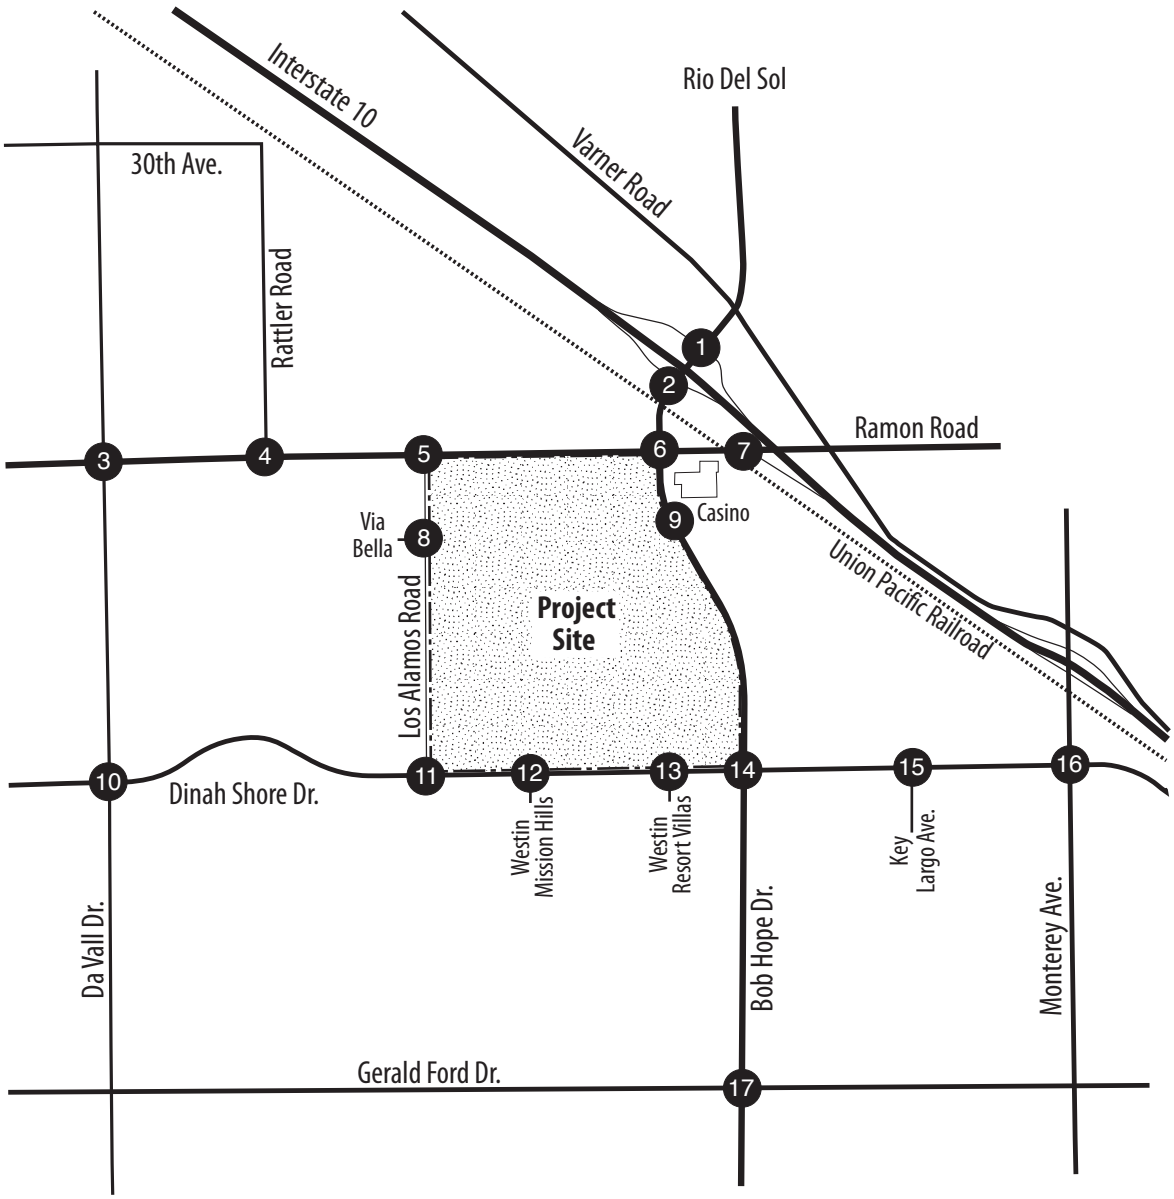
Future internal streets are proposed opposite four existing tee intersections [Intersection 8, 9, 12 and 13]. Rather than assigning these internal streets letter designations, these intersections were referenced by the existing street names.

An operational analysis was not conducted for the proposed right-in/right-out site access points. These access connections will have few conflicting movements and most motorists passing through them will experience relatively little or no control delay. Even though the peak hour delay at these access points was not evaluated, the future site traffic volumes were identified (see Figure 4-3). For reference, the proposed right-in/right-out site access points were designated beginning at the northwest corner of the site and continuing in a clockwise direction to the southeast corner of the site as Access A through Access G.

3.2 Study Area Land Use

The City of Rancho Mirage is largely comprised of low-density residential land uses and golf resort communities accessed via a grid network of arterials streets. The arterial streets provide connections to the neighboring cities of Cathedral City and Palm Springs to the west and Palm Desert and Indian Wells to the east as well as the unincorporated areas of Riverside County. Popular destinations within the study area include: the Agua Caliente Casino Resort Spa, the Westin Mission Hills Golf Resort and Spa, the Rancho Mirage High School, the Braille Institute of America, the Mission Hills Country Club, the Monterey Shore Shopping Center, the Monterey MarketPlace, the Desert Gateway regional commercial center, the Children's Discovery Museum, and Sunnylands (the Annenberg Estate).

Figure 3-1
Study Area and Key Intersections



Legend

1 Existing Key Intersection

Project Site

Endo Engineering

Scale: 1" = 3,200'

Development within the City of Rancho Mirage includes: major resort hotels, vacation rentals, resort-based golf courses, upscale retail centers, and professional services related largely to meeting the needs generated by permanent residents and seasonal tourism. Rancho Mirage has numerous golf resorts and country clubs including: Tamarisk, the Springs, Sunrise, Omni Rancho Las Palmas Resort and Spa, the Mission Hills Country Club, Rancho Las Palmas, Rancho Mirage, Morningside, Mission Hills North, and Tuscania. Commercial office and high-end retail centers like The River shopping complex are located south of the study area, along Highway 111. The Eisenhower Medical Center and the Betty Ford Center are also located south of the study area.

There are no industrial land uses within the City of Rancho Mirage. However, light industrial development is located east of Monterey Avenue and south of Interstate 10, in the neighboring City of Palm Desert. Dinah Shore Drive provides access to this area. A light industrial area is also located north of Interstate 10 and east of Bob Hope Drive/Rio Del Sol Road in the Thousand Palms community.

The 2010 United States Census reported that 7,089 housing units (50 percent) of the 14,243 housing units in Rancho Mirage were owner occupied. Renters occupied 1,740 housing units (12 percent). The remaining 38 percent of the housing units (5,414 units) were vacant homeowner units (second homes) or vacant rental units. The homeowner vacancy rate was 5 percent and the rental vacancy rate was 17.2 percent. In 2010, 19 percent of the population (17,154) lived in rental housing units and 81 percent of the population lived in owner-occupied housing units. The owner-occupied housing units had an average of 1.95 residents per household and the rentals had an average of 1.90 residents per rental unit. Nearly 35 percent of the households were occupied by only one resident. More than 22 percent were occupied by one resident aged 65 or older. The median age in Rancho Mirage in 2010 was 62.3 years and 44 percent of the population was 65 years of age or older. The average family size was 2.46. Only 11.7 percent of the 8,829 households had children under the age of 18 living in them.

The area east of the site surrounding the intersection of Monterey Avenue and Dinah Shore Drive is developed with numerous big box retail stores (Costco, Wal-Mart, Sam's Club, Home Depot, home improvement stores, Joann's Craft Store) that will attract consumers from the project site in the future. The Monterey MarketPlace, the Monterey Shores Shopping Center, the Desert Gateway Shopping Center, and the SBB College are all located south of I-10 at the Monterey Avenue Interchange. A Lowe's Home Improvement Center is located east of Monterey Avenue and north of Gerald Ford Drive. The Pavilions Shopping Center is located on the southwest corner at the intersection of Bob Hope Drive and Gerald Ford Drive. A Fire Station and the Children's Discovery Museum are located south of Gerald Ford Drive, west of this commercial center. Desert Ridge Plaza, a neighborhood shopping center with a Walgreens Drug Store as an anchor, is located on the southeast corner of the intersection of Bob Hope Drive and Dinah Shore Drive.

Bob Hope Drive provides access to the south for trips associated with development within the City of Rancho Mirage such as Sunnylands (the Walter and Leonore Annenberg Estate), the Eisenhower Memorial Hospital and Medical Center, The River commercial/entertainment complex, and the Shops on El Paseo. Da Vall Drive, Bob Hope Drive, and Monterey Avenue provide access to Highway 111, which connects several cities and popular destinations within the Coachella Valley. Highway 111 also provides access to the Palm Desert Civic Center and the College of the Desert via Fred Waring Drive.

The Agua Caliente Casino Resort Spa occupies a 36-acre parcel within Section 24 that is located on the southeast corner of the intersection of Bob Hope Drive and Ramon Road. This adjacent development is not a part of the project site but will be connected to the proposed Section 24 Specific Plan area via the future extension of Casino, west of Bob Hope Drive, between the retail development proposed for Planning Area 3 and the future resort uses in Planning Area 4. The signalized intersection of Bob Hope Drive with Casino will provide a direct and convenient connection between the Agua Caliente Casino Resort Spa and the future residential and non-residential development proposed within the project site designed to encourage trips between the project site and the Agua Caliente Casino Resort Spa while minimizing vehicular travel on Ramon Road and Dinah Shore Drive.

The Agua Caliente Casino Resort Spa includes: a 340-room hotel; 70,000 square feet of gaming floor space with 1,800 slots machines; a 2,000 seat theater for live concert performances; 13,000 square feet of flexible meeting space; six dining venues; a resort pool, spa, and fitness center; and 2,500 parking spaces in a three-story parking structure. This development takes access to and from Ramon Road via a right-in/right-out driveway located east of Bob Hope Drive. It also takes access to Bob Hope Drive, via a signalized full-turn access located at Casino and an unsignalized right-in/right-out driveway located south of Casino.

Existing Land Uses

The 577-acre project site is currently undeveloped. Section 13 is located north of the project site and also undeveloped. The portion of Section 13 located south of Interstate 10 and north of Ramon Road, on both sides of Bob Hope Drive, was annexed by the City of Rancho Mirage in 2012. The General Plan land use designation for this area is regional interstate commercial, a designation that allows mixed-use development with commercial retail, office, resort hotel and restaurant uses. The City's General Plan requires the preparation and approval of a Specific Plan prior to development of this area. Prior to approval, the Section 13 Specific Plan will be subject to environmental review and development review by the City of Rancho Mirage.

The Westin Mission Hills Golf Resort and Spa is located south of the project site at 71333 Dinah Shore Drive, in Rancho Mirage. The main access (key intersection 12) is signalized and located on the south side of Dinah Shore Drive, east of Los Alamos Road. This development includes a hotel with 512 guest rooms, 65,000 square feet of indoor meeting space, 26,000 square feet of outdoor meeting space, a 17,326 square foot ballroom, spa facilities, a fitness center, three swimming pools, a 60-foot water slide, restaurants (signature, café, bar, lounge, grill), two championship golf courses, and seven lighted tennis courts. The Gary Player Signature Golf Course is located west of the project site, within Section 23. The Pete Dye Championship Golf Course is located south of Dinah Shore Drive and west of Bob Hope Drive.

The Westin Mission Hills Resort Villas are also located south of the project site and west of Bob Hope Drive, at 71777 Dinah Shore Drive, Rancho Mirage. This development includes 316 guest rooms, the Restaurant Bella Vista, the Season's Grill, and poolside grills. Access is via an unsignalized gated entry on the south side of Dinah Shore Drive, opposite Planning Area 7B (key intersection 13).

The area located east of the project site is within the Section 19 Specific Plan area and currently undeveloped. Although the Section 19 Specific Plan was approved by the City of Rancho Mirage in 2010, no development has occurred in Section 19. The Section 19 Specific Plan includes planned access connections to Bob Hope Drive, Dinah Shore Drive, and Key Largo Avenue. It also includes access to a future overcrossing of Interstate 10 via the northerly extension of Key Largo Avenue. The intersection of Key Largo Avenue and Dinah Shore Drive is evaluated as key intersection 15.

The Rancho Mirage High School was recently constructed north of Ramon Road and west of Rattler Road. It is located on 60 acres west of Rattler Road and north of Ramon Road. The Rancho Mirage High School opened in August 2013 with a Fall 2013 enrollment of 900 students (freshmen and sophomores only). It is projected to have an enrollment of 1,600 students by the year 2016. The 332,000 square foot school is expected to have an ultimate capacity of 2,300 students in grades 9 through 12. It has a 600-seat theater as well as stadium seating for 3,895. It provides 390 staff parking places and 420 parking spaces for students. A 20-acre site for a future elementary school is located west of Rattler Road, immediately north of the Rancho Mirage High School.

The Palm Valley School is located on the west side of Da Vall Drive, north of Dinah Shore Drive. This school accommodates students in grades K-12 and has an enrollment of approximately 400 students. The campus has substantial space for future expansion. The Cathedral City High School is located north of Dinah Shore Drive and west of Plumley Road. The enrollment of 2,800 dropped by approximately 25 percent, following the opening of the new Rancho Mirage High School.

Anticipated Future Development

General Plans identify land uses based upon a 20-year or longer planning horizon. Zoning identifies specific immediate uses of the land to implement the long-term intent of the General Plan. City General Plans have authority over territory located within the city limits. Land within a city's Sphere of Influence (SOI) can be given land use designations by both the city and the County of Riverside. The city's designation applies if the land is annexed into the city. Otherwise, the county's designation prevails. Spheres of influence established by the Riverside Local Agency Formation Commission are intended to reflect the probable physical boundaries and service area of cities. The project site is located with the Sphere of Influence of the City of Rancho Mirage.

Near-Term Cumulative Projects Evaluated

The City of Rancho Mirage identified two near-term developments for evaluation with the initial phase of the Section 24 Specific Plan in the year 2022. The traffic associated with each of these two developments was assigned to the surrounding streets and added to the future year 2022 non-site (through) traffic volumes (shown in Table 4-4, Figures 4-9 and 4-11) and evaluated in Table 5-7.

One near-term cumulative development was Tentative Tract Map 36553 and Preliminary Development Plan 13005 for 122 single-family detached homes on 36.68 acres located on the northwest corner of the intersection of Rattler Road and Ramon Road. These dwellings would take access from Rattler Road.

The second near-term cumulative development was Tentative Parcel Map 31761 and Preliminary Development Plan 07012 (FDP08002) for 9.69 acres located on the southeast corner of Ramon Road and Da Vall Drive. Approximately 6.79 acres would be developed as a single-story physical rehabilitation hospital with 70 beds and 64,768 square feet. It was assumed that this development would have access connections on both Ramon Road and Da Vall Drive.

Long-Term Cumulative Development

The Riverside County Traffic Analysis Model (RIVTAM) was used to forecast non-site traffic volumes for the future horizon year 2035. Riverside County, the Riverside County Transportation Commission (RCTC), and the members of the Coachella Valley Association of Governments (CVAG) have approved RIVTAM as the regional traffic model for Riverside County, including the Coachella Valley. Future traffic projections from RIVTAM represent the best available projections for the study area and the horizon year 2035.

The traffic analysis zones in RIVTAM reflect SCAG modeling by Census Tract. Base year and future land use forecasts provided by individual jurisdictions and Riverside County are used in developing the socio-economic input data required by RIVTAM. The 2035 SCAG population and employment growth projections were allocated by area, based on the existing and proposed future land use forecasts identified by each city. Riverside County planners provided estimates for Tribal lands and unincorporated areas. RIVTAM reflects the transportation network shown in the approved general plans of the jurisdictions within the Coachella Valley.

North City Specific Plan (Cathedral City)

The North City Specific Plan was approved by Cathedral City in 2009. The North City Specific Plan addressed the future development of 4,664 acres located north of Interstate 10, between the future northerly extension of Da Vall Drive and Palm Drive. Approximately 235 acres are designated BP (Business Park). Another 518 acres are designated MU-U (Mixed Use-Urban). A total of 402 acres are designated MU-N (Mixed Use-Neighborhood). A light industrial designation applies to 267 acres. An OS-R (Open Space-Residential) applies to 832 acres. In all, 2,900 acres would remain in OS (Open Space-Conservation).

The North City Specific Plan mixed-use development was projected to require 50 years to complete. No construction activity has been initiated to date on this development. The development is transected by Varner Road and the future alignment of Valley Center Boulevard, both of which are shown aligned parallel to Interstate 10. Access to Interstate 10 would be via four interchanges located at: Gene Autry Trail/Palm Drive, Landau Boulevard, Date Palm Drive, and Da Vall Drive. The Interstate 10 interchanges at Landau Boulevard and at Da Vall Drive do not currently exist.

North City Extended Specific Plan (Cathedral City)

The North City Extended Specific Plan was approved in the year 2013 by Cathedral City and included annexation of the 591.38-acre site. This site is located north of I-10 north and south of Varner Road on both sides of Bob Hope Drive. The land uses approved include approximately 65 acres zoned Mixed-Use Urban (MU-U), 116 acres zoned Mixed-Use Neighborhood (MU-N), 74 acres zoned Industrial (I-1), and 240 acres of Open Space (OS). The remaining 96 acres were roadway right-of-way. No construction activity has been initiated to date on this development.

Section 19 Specific Plan (Rancho Mirage)

Section 19 extends north of Dinah Shore Drive, between Bob Hope Drive and Key Largo Avenue. The goal of the planning process for the Section 19 Specific Plan initially involved attracting large retailers within a planned commercial district context. However, the Monterey Avenue corridor in Palm Desert was determined to have absorbed nearly all of the big box retail uses that would have been feasible for the Section 19 Specific Plan area.

On February 18, 2010, the 270-acre Section 19 Specific Plan was approved by the City of Rancho Mirage. The Specific Plan area is located north of Dinah Shore Drive and south of the Union Pacific Railroad, between Bob Hope Drive and Key Largo Avenue. The development plan includes residential uses and non-residential (commercial/retail, office, resort, and mixed-

use) development including an 11-acre public facility. The mixed-use development would include a town center, community retail shops and boutiques, high-end thematic restaurants, medium-density and high-density residential neighborhoods, resort and business hotels, retail space for the sale of furniture and furnishings, designer outlets, and resort recreational uses. To date, no construction activity has been initiated on this development.

3.3 Site Accessibility

Based upon its proximity to the newly constructed Interstate 10 interchange at Bob Hope Drive, the project site benefits from a high level of regional accessibility. With Ramon Road, Bob Hope Drive, Dinah Shore Drive, and Los Alamos Road forming the site boundaries, a high level of access is also afforded by the surrounding street system.

3.4 Existing Transportation System

Airport Facilities

Palm Springs International Airport is the largest of the three airports serving the Coachella Valley. This airport is located approximately 3.6 miles west of the project site, within the City of Palm Springs. This commercial airport is located north of Ramon Road and south of Vista Chino, between Gene Autry Trail and Farrell Drive. With connections throughout California and the continental United States, Palm Springs International Airport is the major facility for regional air passenger transportation in the Coachella Valley. It also handles air freight. Heliport access is limited to medical evacuation flights between the Desert Regional Medical Center heliport and the Palm Springs International Airport.

Railroad Facilities

The Union Pacific Railroad line traverses the area south of Interstate 10 and north of the project site. A grade separated railroad crossing exists where Bob Hope Drive crosses over the railroad line, north of the project site. The recently completed I-10 interchange project at Bob Hope Drive included the construction of a new six-lane bridge over the Union Pacific Railroad.

Within Riverside County, freight rail is an important backbone of the goods movement industry. The Union Pacific Railroad provides freight rail service to Riverside County, with up to fifty freight trains per day passing through the area to/from major cities throughout the continental United States.

AMTRAK operates 15 long distance trains on a national network of routes that range in length from 764 to 2,438 miles. Amtrak operates 70 intercity trains and 100 commuter trains per day in California. AMTRAK provides regional passenger rail and bus service in the Coachella Valley. The only AMTRAK station in Riverside County is located within the City of Palm Springs. AMTRAK provides bus connections on a daily basis to and from the San Bernardino AMTRAK station for other Riverside County areas.

The North Palm Springs Amtrak train station is a stop three times per week on AMTRAK's Sunset Limited passenger service between Los Angeles and New Orleans. Connecting service to Chicago is available from a stop in San Antonio, Texas. The North Palm Springs train station is located 0.6 miles south of Interstate 10, at the intersection of North Indian Canyon Drive and Palm Springs Station Road. AMTRAK does not currently provide commuter rail services.

Existing Roadway and Highway Facilities

The existing transportation system in the study area is shown in Figure 3-2. The traffic control at intersections and the number of mid-block through lanes are shown as well as whether each roadway is divided or undivided. Divided facilities typically include a median, which separates traffic lanes in opposite directions and provides space for left-turn bays at intersections. Undivided facilities typically require motorists making left turns to queue in a through lane, thereby reducing the capacity of the roadway. By prohibiting on-street parking, some undivided roadways can be flared to provide left-turn lanes at intersections. Figure 6-1 shows the existing intersection approach lanes and traffic control type at the key intersections.

Regional travel tends to occur along the major axis of the Coachella Valley. Interstate 10 (I-10) facilitates the movement of vehicles in the Coachella Valley between the northwest and the southeast. I-10 extends from Pacific Coast Highway, in western Los Angeles County, through San Bernardino County and Riverside County. After passing through Blythe, I-10

Figure 3-2

- Stop Sign
- All Way Stop Control
- Signalized Intersection

Endo Engineering

Scale: 1" = 3,200'

extends to the east across Arizona and the transcontinental United States. The posted speed limit on Interstate 10 in the project vicinity is 70 miles per hour.

Regional access for the project site is currently available from Interstate 10, via the recently completed interchange at Bob Hope Drive. Motorists can access I-10 in both directions via the Bob Hope Drive interchange, which includes a new eight-lane overcrossing at I-10 and new ramps configured as a spread diamond interchange. Motorists from Palm Springs, Cathedral City, Rancho Mirage, and Thousand Palms who are destined to the east via Interstate 10 can also access the freeway from Ramon Road via the eastbound on-ramp located east of Bob Hope Drive and the Union Pacific Railroad corridor. Ramon Road crosses over I-10 on a two-lane bridge structure and was recently signalized at the intersection of the I-10 eastbound on-ramp.

Interstate 10 (I-10) is located one-quarter mile north of the project site and provides regional access. I-10 is a freeway under the jurisdiction of Caltrans with a 70 mph posted speed limit that facilitates the movement of vehicles in the Coachella Valley between the northwest and the southeast. Interstate 10 is currently an eight-lane freeway west of and a six-lane freeway east of the Monterey Avenue interchange. Interstate 10 is accessed from Ramon Road via an eastbound on-ramp [intersection 7]. Diamond interchanges are located at Monterey Avenue, Bob Hope Drive, and Date Palm Drive. The Date Palm Drive interchange is located 3.5 miles northwest of the Bob Hope Drive interchange. The Monterey Avenue interchange is approximately 1.5 miles east of the Bob Hope Drive interchange. The signalized intersections of Bob Hope Drive with the Interstate 10 eastbound and westbound ramps were evaluated as key intersections 1 and 2.

Bob Hope Drive is classified as a six-lane divided Urban Arterial Highway in the *County of Riverside General Plan* and a six-lane divided Major Arterial in the *Rancho Mirage General Plan.* Bob Hope Drive is a designated truck route and scenic corridor. This roadway was recently improved in conjunction with the interchange improvements at Interstate 10. Where Bob Hope Drive abuts the project site, it currently provides three northbound through lanes and two southbound through lanes and has a posted speed limit of 55 mph. The posted speed limit is 50 mph south of Dinah Shore Drive.

The Bob Hope Drive overpass at Interstate 10 provides three northbound and three southbound through lanes. At the ramp terminals, the roadbed provides dual left-turn lanes and two through lanes in one direction with three through lanes in the opposite direction. Bob Hope Drive is a six-lane divided arterial south of Interstate 10. The roadbed flares at Ramon Road to provide an exclusive southbound right-turn lane, dual southbound left-turn lanes and three through lanes.

Ramon Road is a four-lane divided arterial immediately east of Bob Hope Drive. West of Bob Hope Drive, Ramon Road is a five-lane divided arterial for approximately 950 feet, with two westbound and three eastbound through lanes. West of the five-lane section, Ramon Road provides three through lanes in each direction with a raised center median divider. Ramon Road is classified as a Major Arterial in the *Rancho Mirage General Plan* with a 120-foot right-of-way. The posted speed limit on Ramon Road within the City of Rancho Mirage is 55 miles per hour.

Dinah Shore Drive is a four-lane divided Minor Arterial with an existing 110-foot right-of-way. It has a 16-foot wide raised landscape median and provides two travel lanes in each direction. The posted speed limit on Dinah Shore Drive is 45 MPH, west of Da Vall Drive, and 50 MPH between Da Vall Drive and Monterey Avenue. Dinah Shore Drive is fully improved adjacent to the Mission Hills Golf Resort and provides a 17-foot wide landscaped parkway with a meandering 12-foot multi-use trail.

Los Alamos Road is currently a two-lane undivided roadway between Ramon Road and Dinah Shore Drive. It is fully improved on the west side. The posted speed limit is 50 mph. A meandering 12-foot wide multi-use trail exists on the west side of Los Alamos Road, which accommodates golf carts, pedestrians, and cyclists. Both the City and County circulation plans classify Los Alamos Road as a future four-lane divided roadway. However, the right-of-way required by the City classification would be 110 feet, whereas the County would require a 118-foot right-of-way.

Da Vall Drive, north of Ramon Road, is a four-lane undivided roadway that narrows to a two-lane undivided roadway before terminating south of the Union Pacific Railroad and Interstate 10. Da Vall Drive may ultimately provide access for site traffic to a future interchange at Interstate 10. The posted speed limit on Da Vall Drive is 45 miles per hour. Da Vall Drive is shown with a four-lane divided cross-section in the Circulation Elements of both of the adjacent cities of Rancho Mirage and Cathedral City. Da Vall Drive, south of Dinah Shore Drive, is improved as a four-lane divided roadway with a posted speed limit of 45 miles per hour. North of Dinah Shore Drive, the right-of-way and improvements along Da Vall Drive are inconsistent. Where the land along the west side of Da Vall Drive is undeveloped and within the Agua Caliente Indian Reservation, the ultimate right-of-way has not been dedicated and General Plan roadway improvements have not been made. The east side of Da Vall Drive was fully improved in conjunction with the development of the adjacent Mission Hills

community. The west side of the roadway is fully improved for approximately one-quarter mile south of Ramon Road, adjacent to the Desert Shadows RV Resort and Forest Lawn Memorial Park and Mortuary. However, for approximately 3,500 feet south of Sunshine Way, Da Vall Drive is currently a two-lane undivided roadway except where the pavement width flares to 38 feet to accommodate a southbound left-turn bay for access to the Mission Hills community. The west side of Da Vall is fully improved for 130 feet immediately north of Dinah Shore Drive.

Rattler Road was recently constructed between 30th Avenue and Ramon Road to provide access to the Rancho Mirage High School. The posted speed limit on Rattler Road is 40 mph unless children are present, when it is 25 mph. Rattler Road is a two-lane divided roadway adjacent to the school, and a two-lane undivided roadway north of the school. Rattler Road is flared north of Ramon Road to provide three southbound lanes and two northbound lanes.

Gerald Ford Drive is a four-lane divided Minor Arterial with a 110-foot right-of-way. Within the study area the posted speed limit is 50 MPH. No trucks are allowed to use Gerald Ford Drive.

Existing Traffic Volumes

Seasonal fluctuations in traffic demand reflect trip purposes and the activity in the area served by the roadways. The Coachella Valley is relatively isolated from neighboring urbanized regions and is home to hundreds of resort facilities and retirement communities. In the Coachella Valley, a large tourist and retired population, supported by large service sector employment, generates travel patterns that are, in many ways, atypical of Southern California.

Approximately 3.5 million people visit the Coachella Valley each year. The tourist season extends from October to May, with the increase in the tourist population beginning to peak in January and decreasing substantially after April. Traffic volumes throughout the Coachella Valley are subject to significant seasonal fluctuations, as the population swells in the winter and spring with tourists and "snow birds," then decreases as they leave to avoid the hot summer months.

Caltrans Traffic Count Data

The most recent Caltrans daily traffic count data for Interstate 10 reflects peak month volumes in the year 2012.[1] Caltrans data indicates that the annual average daily traffic (AADT) volume on I-10 is 91,000 vehicles per day (between Bob Hope Drive and Date Palm Drive) and 93,000 vehicles per day (between Bob Hope Drive and Monterey Avenue). East of Monterey Avenue the AADT is 94,000 vehicles per day.

During the peak month, the average daily traffic (ADT) volume on Interstate 10 is 9.9 percent higher than the AADT between Bob Hope Drive and Date Palm Drive. The volume during the peak month is 9.7 percent higher than the AADT on Interstate 10 between Bob Hope Drive and Monterey Avenue. East of the Monterey Avenue interchange, the ADT on Interstate 10 during the peak month is 11.8 percent higher than the AADT.

The peak hour traffic volume on Interstate 10 of 8,100 vehicles per hour is 8.9 percent of the AADT between Bob Hope Drive and Date Palm Drive. The peak hour volume of 8,300 vehicles per hour on I-10, east of the Bob Hope Drive interchange, also represents 8.9 percent of the AADT. East of the Monterey Avenue interchange, the peak hour volume is 8,500 vehicles per hour (9 percent of the AADT).

Approximately 14,590 vehicles per day (VPD) are currently using I-10 for travel to and from the west and 17,610 VPD are currently using I-10 for travel to and from the east via the new I-10 interchange at Bob Hope Drive and the eastbound I-10 on-ramp from Ramon Road. This indicates that origins and destinations located along I-10 west of the study area account for approximately 45 percent of the 32,200 vehicles per day entering and exiting I-10 in the vicinity of the project site. Origins and destinations along I-10 located east of the study area account for 55 percent of the trips accessing I-10 at Bob Hope Drive and Ramon Road.

Approximately 80 percent of the traffic destined to the east on Interstate 10 from the study area uses the on-ramp on Ramon Road, rather than the on-ramp at the Bob Hope Drive interchange to enter the freeway. The eastbound I-10 on-ramp on Ramon Road improves traffic operations at the intersection of Bob Hope Drive and Ramon Road by allowing a combined total of more than one thousand vehicles during the morning and evening peak commuter travel hours to pass through the intersection in the eastbound through lanes and the dedicated northbound right-turn lane, resulting in less delay than using the Bob Hope eastbound I-10 on-ramp.

---

[1] State of California Department of Transportation. *2012 Traffic Volumes on the California State Highway System*; Sacramento, California.

Interstate 10 serves a substantial volume of heavy trucks transporting freight. The heavy vehicles using Interstate 10 currently comprise approximately 23.6 percent of the daily traffic volume, east of Indian Canyon Drive.[2] The Riverside County Department of Public Health specifies a truck mix of 8 percent for Major Highways and Arterial Highways for modeling noise impacts. An 8 percent truck mix was assumed for the peak hour operational analysis of intersections in the study area with every development scenario except those in the horizon year 2035, for which a 5 percent truck mix was assumed.

New Traffic Count Data

Manual intersection turning movement counts were made by Counts Unlimited, Inc. at seventeen existing key intersections to document the existing travel patterns within the study area. The intersection counts were collected continuously for two hours in the morning (from 7:00 a.m. to 9:00 a.m.) and for two hours in the evening (from 4:00 p.m. to 6:00 p.m.) on Wednesday, November 6, 2013. This data was needed to evaluate the existing traffic operations during the peak travel hours on the adjacent streets. The intersection count data, prior to being increased to reflect peak season conditions, is provided in Appendix 1.

While the traffic counts were being made at the key intersections, 24-hour directional traffic counts were collected at five locations including: Bob Hope Drive (north and south of Ramon Road); Ramon Road (west of Bob Hope Drive and west of the I-10 eastbound on-ramp); and Dinah Shore Drive (west of Bob Hope Drive). The 24-hour machine traffic count locations and data are provided in Appendix 1. The 24-hour traffic counts were used to identify the relationship between the daily two-way traffic volumes on area roadways and the peak hour traffic volumes on those roadways. The 24-hour traffic count data was also used to identify an appropriate seasonal adjustment factor for use in expanding the peak hour count data to reflect peak season conditions in the study area.

Relationship Between Daily and Peak Hour Volumes

The highest hourly two-way volumes at the five 24-hour count locations that occurred between 7:00 AM and 9:00 AM (6,227 vehicles per hour) and between 4:00 PM and 6:00 PM (7,100 vehicles per hour) were added together and then divided by the sum of the 24-hour volumes (89,596 vehicles per day) to identify the percentage of the daily volume than was present during the morning and evening peak hours on the streets in the study area. The morning and evening peak hour traffic volume on all of the roadway segments, combined, represented approximately 15 percent of the daily volume on the roadways. This relationship was used to estimate the peak season daily traffic volumes within the study area for each roadway segment adjacent to the key intersections from the peak hour traffic volumes, after they were expanded to reflect peak season conditions.

Peak Season Traffic Expansion Factor

Since traffic volumes in the study area peak in the winter, traffic count data collected in November must be increased to reflect peak season conditions in the winter months. The twenty-four hour weekday traffic count data collected on November 6, 2013 was compared to peak season traffic count data for the same roadways published by CVAG in the *2013 Traffic Census Report* to identify an appropriate seasonal adjustment factor for use in expanding the new traffic count data collected at the key intersections to reflect peak season traffic volumes within the study area. A five percent seasonal expansion factor was identified and applied to the peak hour traffic count data to reflect the existing turning movement volumes at the key intersections during the peak season.

Peak season traffic count data available from the City of Rancho Mirage are shown in Table 3-1. A comparison of the count data collected in March of 2013 to the new 24-hour traffic counts collected in November 2013 validated the five percent seasonal expansion factor. Available 24-hour traffic count data collected for roadways within the northern portion of the study area during September of 2012 were also provided in Table 3-1. These traffic counts from September 2012 occurred shortly after the Bob Hope Drive I-10 interchange was completed, when the dynamic redistribution of traffic associated with the opening of the new interchange may or may not have completely stabilized .

a. Traffic count data shown for September, 2012 and November, 2013 was collected by Counts Unlimited, Inc. and was not expanded to reflect peak season conditions. The 24-hour directional traffic count data shown for March, 2013 was collected by Newport Traffic Studies and reflects peak season conditions. This data was available on the City of Rancho Mirage website. NB=Northbound. SB=Southbound. EB=Eastbound. WB= Westbound.

b. The winter 2013 24-hour two-way traffic count data shown in brackets was taken from the CVAG *2013 Traffic Census Report*.

Peak Season Traffic Volumes

Figure 3-3 shows the current peak season daily traffic volumes on the roadway links adjacent to the key intersections. These daily traffic volumes were determined from the peak hour traffic counts made at the key intersections, after they were expanded to reflect peak season conditions. Figure 3-4 shows the current peak season turning movement volumes during the morning and evening peak hours at the key intersections. These volumes represent the new tuning movement counts, expanded by five percent.

Peak Hour Factor

Traffic flow rates can vary substantially over the course of an hour, particularly in the vicinity of schools, where the traffic volumes within the fifteen minutes immediately before and after the school day may exceed the capacity of a roadway even though the hourly volumes would be less than the capacity. For this reason, HCM analyses typically evaluate the peak fifteen -minute traffic flow rate during the peak hour.

Using the peak 15-minute flow rate produces a more conservative analysis that accommodates nearly all of the variations in flow that occur during the peak hour. Since the inputs to the HCM procedures are typically expressed in terms of hourly traffic volumes, a peak hour factor (PHF) is used to increase the traffic volume during the peak hour to reflect the peak 15-minute flow rate. The peak hour factor is the ratio of the total hourly volume to four times the peak 15-minute volume within that hour. Values for PHFs are determined from the peak hour traffic counts made at each key intersection based on the traffic volumes during each 15-minute interval.

A very low PHF (0.25) indicates that all peak hour vehicles arrive in the peak fifteen minutes. A PHF of 1.0 indicates that vehicles are evenly distributed over the peak hour. Site-specific morning and evening PHFs were determined from the observed 15-minute counts at each key intersection during the peak hours. These PHFs are provided in the intersection count data in Appendix 1 and documented for each operational analysis of the key intersections in Section 5. The 2008 Riverside County Transportation Department *Traffic Impact Analysis Preparation Guide* recommends that that actual peak hour factors be determined from traffic counts at the intersections being evaluated and utilized in the existing and near-term operational analyses and PHF of 1.0 be applied to buildout traffic conditions. The future horizon year 2035 conditions with and without site traffic were evaluated using a PHF of 1.0.

Existing Pedestrian Volumes Crossing Ramon Road at Rattler Road

The intersection of Rattler Road and Ramon Road is signalized and provides a crosswalk on the west leg of Ramon Road for students walking to and from the Rancho Mirage High School. Based on the November 6, 2013 traffic count data, the morning peak hour occurs at this intersection between 8:00 AM and 9:00 AM. During that hour, a total of 598 vehicles were counted on Rattler Road, north of Ramon Road (263 northbound and 335 southbound). The afternoon peak hour occurred at this intersection between 2:45 PM and 3:45 PM. During that hour a total of 475 vehicles were counted on Rattler Road, north of Ramon Road (225 northbound and 250 southbound).

Pedestrian counts were made at this intersection from 7:00 AM through 9:00 AM and from 2:00 PM through 4:00 PM on November 6, 2013. Crosswalks at this intersection for students of the Rancho Mirage High School are located on the west leg of Ramon Road and on Rattler Road. The pedestrian counts for the crosswalk on Ramon Road included: three pedestrians crossing between 7:15 and 7:30 AM, nine pedestrians crossing between 8:00 and 8:15 AM, and one pedestrian crossing between 8:45 AM and 9:00 AM. No pedestrians were observed between 7:00 AM and 9:00 AM crossing Rattler Road at this intersection. The afternoon count for the Rattler Road crosswalk included one pedestrian crossing between 3:00 PM and 3:15 PM and another crossing between 3:15 PM and 3:30 PM. Sixteen pedestrians crossed Ramon Road at the crosswalk during the afternoon count period. All sixteen crossings occurred between 3:00 PM and 3:15 PM.

Truck Access and Goods Movement

Throughout California, approximately 76 percent of all inbound and outbound freight is shipped by truck. The agricultural and industrial sectors of Riverside County's economy generate a significant amount of truck traffic and depend upon the safe and efficient movement of goods. The primary means of transporting goods and consumer products in Riverside County is large trucks. Truck volumes in the region are projected to increase by forty percent between the year 2003 and the year 2020. Goods movement in the study area is expected to grow rapidly in response to the projected growth in population as well as international trade. Caltrans data for the year 2012 indicates that trucks currently represent 23.6 percent of the traffic volume on Interstate 10 within the study area.

3.5 Relevant Circulation Plans

The site has frontage on four existing *Riverside County Comprehensive General Plan* roadways: Ramon Road, Bob Hope Drive, Dinah Shore Drive, and Los Alamos Road. No other *Riverside County Comprehensive General Plan* roadways are located within or adjacent to the project site.

Riverside County General Plan

The Circulation Element of the *County of Riverside General Plan* identifies the need to shape future growth patterns by moving away from random growth toward concentrated growth and increased job creation. This will require a regional and local linkage system between communities to encourage increased ridership of public transit systems and the increased use of alternative modes of transportation including bicycles and walking.

Riverside County collaborates with cities to implement and integrate right-of-way requirements and improvement standards for General Plan roadways that cross jurisdictional boundaries. For development within the Sphere of Influence of an incorporated jurisdiction, city standards should generally apply where annexation to the City will logically occur in the short to intermediate range future. Where roadways designed to differing city and County standards meet, the transitional areas should be designed on an individual basis to facilitate satisfactory operational and safety performance.

The Circulation Element of the *Riverside County General Plan* (Revised October 7, 2003) classifies the roadways in the study area as Urban Arterial, Arterial Highway, Major Highway, Secondary Highway or Collector Street, as shown in Figure 3-5. Figure 3-6 illustrates the typical Riverside County street cross-sections by roadway classification. Table 3-2 summarizes the Riverside County intersection spacing standards by roadway classification.

Table 3-2
Riverside County Access Standards by Corridor Classification[a]

Street Classification	Minimum Right-of-Way Width Required[b]	Number of Lanes Required[c]	Intersection Spacing Standards
Urban Arterial	152 Feet	6 or 8 Lanes	1/4 Mile Intersection Spacing
Arterial Highway	128 Feet	4 or 6 Lanes	1/4 Mile Intersection Spacing Minimal Driveway Access
Major Highway	118 Feet	4 Lanes	660-Foot Intervals
Secondary Highway	100 Feet	4 Lanes	330-Foot Intervals
Collector Street	74 Feet	2 Lanes	Parcel Access Discouraged[d]

a. Source: "County of Riverside General Plan"; Table C-1.
b. Additional right-of-way may be required at intersections.
c. Arterial highways and urban arterial highways typically have raised medians that allow dual left-turn bays and exclusive right-turn lanes at intersections with secondary or higher classification highways. Major highways typically have painted medians that allow dual left-turn bays and exclusive right-turn lanes at intersections with secondary or higher classification highways. Although no median or turn lanes are typically required on secondary highways, a single left-turn bay and exclusive right-turn lane can be accommodated at intersections with secondary or higher classification highways.
d. Parcel access may be permitted only if no local streets are present.

Urban arterials typically provide six or eight through lanes. They may provide dual left-turn lanes and a dedicated right-turn lane at intersections with secondary and higher classification roadways. A roadway with an Urban Arterial classification typically requires a 152-foot right-of-way. Riverside County has designated four Urban Arterials within the study area. They include: (1) Bob Hope Drive, between Varner Road and Dinah Shore Drive, (2) Ramon Road, west of Interstate 10 to Da Vall Drive, (3)Dinah Shore Drive, between Los Alamos Road and Monterey Avenue, and (4) Monterey Avenue, between Varner Road and Gerald Ford Drive.

Collector	NA	20’	2	17’	40’	74’

Notes: Improvements may be reconfigured to accommodate exclusive transit lanes or alternative lane requirements. Additional right-of-way may be required at intersections. Expressways, urban arterials and arterials have raised medians. Majors and industrial collectors have painted medians.

Source: *Riverside County General Plan*; December 2008.

Arterial Highways typically provide four or six through lanes and have a raised median. They may provide dual left-turn lanes and a dedicated right-turn lane at intersections with secondary and higher classification roadways. Arterial Highways typically require a 128-foot right-of-way. Six roadways in the study area are designated Arterial Highway in the Riverside County Circulation Element. They include: (1) Varner Road, northwest of Ramon Road, (2) Ramon Road, east of Varner Road, (3) Dinah Shore Drive, between Plumley Road and Los Alamos Road, (4) Gerald Ford Drive, (5) Bob Hope Drive, south of Dinah Shore Drive, and (6) Monterey Avenue, south of Gerald Ford Drive.

Major Highways require a 118-foot right-of-way and provide four through lanes with a painted median. They may provide dual left-turn lanes and a dedicated right-turn lane at intersections with secondary and higher classification roadways. Riverside County has designated three Major Highways in the study area including: (1) Da Vall Drive, south of Interstate 10, (2) Los Alamos Road, between Ramon Road and Gerald Ford Drive, and (3)Monterey Avenue, between Ramon Road and Varner Road.

Secondary Highways require a 100-foot right-of-way and provide four through lanes with no median. Two of the roadways within the study area are classified as Secondary Highways by the County of Riverside. They include: Rio Del Sol Road, north of Varner Road, and Varner Road, southeast of Ramon Road.

Riverside County has classified Rio del Sol Road, north of Vista Chino, as a Collector Street. Collector Streets provide one travel lane in each direction within a 40-foot roadbed and require a 74-foot right-of-way. Collector Streets generally are not required to provide exclusive turn lanes at intersections.

Designated Truck Routes

Interstate 10 is a primary corridor for the movement of goods within and through the Coachella Valley and the San Gorgonio Pass. I-10 and Highway 111 are part of the state highway truck route system. Both of these facilities are in the Surface Transportation Assistance Act (STAA) Network, which allows larger trucks with no maximum overall length.

Designated Scenic Corridors

Many corridors in the Coachella Valley traverse scenic resources and encourage the growth of tourism. To enhance the aesthetic experiences of residents and visitors as well as protect and maintain the unique visual features along highways located within these corridors, various scenic roadways have been officially recognized and designated. The *Western Coachella Valley Area Plan* (October 2003) identifies Bob Hope Drive, between Interstate 10 and Gerald Ford Drive, as a County Eligible Scenic Highway. Policies therein seek to protect and maintain resources in corridors along scenic highways by imposing conditions on developments within scenic highway corridors requiring the dedication of scenic easements consistent with the Scenic Highways Plan when necessary to preserve unique or special visual features. The *Riverside County General Plan* also requires trail alignments that either provide access to or link scenic corridors, schools, parks, and other natural areas.

Interstate 10 is an Eligible County Scenic Highway between State Route 62 (west of the study area) and the Colorado River. To preserve the visual resources of the I-10 scenic corridor, the State Scenic Highways Land Use Standards should be applied to all projects within the I-10 scenic highway corridor. These standards include a 50-foot setback from the edge of the right-of-way for all new development where feasible. Interstate 10 is an important visual corridor that should receive special landscape treatments because so many motorists and tourists form their image of the adjacent cities from their travels along I-10. Two types of high-speed corridor treatments are possible along this route: (1) buffered edges to screen unsightly views from the freeway, and (2) landscaped edges designed to promote select views into the adjacent cities.

City of Rancho Mirage General Plan

The project site is located within the Sphere of Influence of the City of Rancho Mirage. The City of Rancho Mirage has adopted LOS D as the maximum acceptable service level for peak operating periods in the Circulation Element of the *City of Rancho Mirage 2005 General Plan*. Figure 3-7 shows the roadway classifications in the Circulation Plan and Figure 3-8 shows the typical street sections associated with each roadway classification in the *City of Rancho Mirage General Plan*.

Bob Hope Drive is classified as a Major Arterial (six-lane divided) in the *City of Rancho Mirage 2005 General Plan* to accommodate future traffic projections and be consistent with the Riverside County Integrated Project (RCIP) network designations. Bob Hope Drive was extended north of Ramon Road to Varner Road in conjunction with the recent construction of a new spread diamond Interstate 10 interchange. This new interchange replaced three of the four ramps

previously located at the Ramon Road diamond interchange. Only the eastbound I-10 on-ramp from Ramon Road was retained. Five critical intersections are identified along Bob Hope Drive at the intersections of the following roadways: the Westbound I-10 Ramps, the Eastbound I-10 Ramps, Ramon Road, Dinah Shore Drive, and Gerald Ford Drive.

Ramon Road is classified as a 6-lane divided Major Arterial between Da Vall Drive and the I-10 overcrossing. A 120-foot right-of-way is typically required of facilities with a Major Arterial designation. Three critical intersections are identified along Ramon Road at the intersections of Da Vall Drive, Los Alamos Road, and Bob Hope Drive.

Dinah Shore Drive is classified as a 6-lane divided Major Arterial, between Los Alamos Road and Monterey Avenue. A 120-foot right-of-way is typically required of roadways with a Major Arterial designation. Between Plumley Road and Los Alamos Road, Dinah Shore Drive is classified as a 4-lane divided Minor Arterial, which typically requires a 110-foot right-of-way. Prior to the 2005 update of the *City of Rancho Mirage General Plan*, Dinah Shore Drive, between Los Alamos Road and Bob Hope Drive, was designated and constructed as a 4-lane divided Minor Arterial with a 110-foot right-of-way. Four critical intersections are identified along Dinah Shore Drive at the intersections of Da Vall Drive, Los Alamos Road, Bob Hope Drive, and Monterey Avenue.

Los Alamos Road is classified as a 4-lane divided Minor Arterial, which typically requires a 110-foot right-of-way. Critical intersections are identified on Los Alamos Road at Ramon Road and at Dinah Shore Drive.

Da Vall Drive, south of Interstate 10, is designated as a 4-lane divided Minor Arterial, which typically requires a 110-foot right-of-way. Critical intersections along Da Vall Drive are designated within the study area at Ramon Road and Dinah Shore Drive.

Monterey Avenue is a six-lane divided roadway, north of Dinah Shore Drive, that provides north-south access between Interstate 10 and Highway 111. It is designated as a 6-lane divided Major Arterial within the study area in the *Rancho Mirage General Plan*.

Rattler Road is designated as a four-lane divided Major Collector between Ramon Road and 30th Street. Major Collectors typically require a 100-foot right-of-way.

North of Ramon Road, a future four-lane divided Minor Arterial is shown in the Circulation Element extending across Section 13 to the Union Pacific Railroad corridor where it turns northwest and continues to Da Vall Drive. This future Minor Arterial is shown intersecting Ramon Road opposite Street "C", the future full-turn Section 24 access connection proposed between Planning Areas 1 and 2 (Intersection 18 in Figure 2-3).

A Future Minor Arterial with a four-lane divided cross-section is shown in the Circulation Element extending east of Bob Hope Drive across the Section 19 Specific Plan area to Key Largo Avenue. This Minor Arterial intersects Bob Hope Drive north of the point where the alignment of Bob Hope Drive turns west of the eastern boundary of Section 24. This location appears to be opposite the Section 24 Specific Plan future full-turn site access proposed on Bob Hope Drive at Street "D" [Intersection 20].

Truck Routes

The City of Rancho Mirage has designated the following truck routes within the study area: Ramon Road (between Da Vall Drive and the Union Pacific Railroad corridor); Dinah Shore Drive (between Plumley Road and Monterey Avenue); Bob Hope Drive (between Varner Road and Gerald Ford Drive); and Monterey Avenue (south of Dinah Shore Drive). In addition, two roadways are time-restricted truck routes where truck travel is prohibited between the hours of 9:00 PM and 6:00 AM. These roadways include: Gerald Ford Drive (between Plumley Road and Bob Hope Drive) and Bob Hope Drive (south of Gerald Ford Drive).

Scenic Routes

The Community Design Element of the *City of Rancho Mirage General Plan* identifies several policies to strengthen the image of Rancho Mirage by beautifying its arterial streets. From design guidance for entry monuments to the identification of specific landscape themes, these policies encourage quality retail development, recommend enhanced intersection treatments, provide visually distinct gateway landscaping along designated entries to the City, and preserve special view corridors. The major focus of these arterial beautification strategies will be along Bob Hope Drive, between Ramon Road and Dinah Shore Drive.

The Community Design Element of the *City of Rancho Mirage General Plan* identifies special scenic view corridors that must be preserved and enhanced. Along Ramon Road, the viewsheds to both the east and west have been identified for preservation and enhancement. Along Dinah Shore Drive, the viewshed to the west has been identified for preservation and enhancement. Unique views of mountains and other natural open spaces along these corridors would be preserved through compliance with building height restrictions, the use of low-profile median landscaping, and the provision of wide landscaped parkways.

Streetscape Plans for Scenic Roadways

Streetscape improvement plans that reflect the policies and programs identified in the Community Design Element of the *City of Rancho Mirage General Plan* would be required for all major arterials abutting the project site, prior to the initiation of future landscape or roadway improvements. Design plans exist for the City's Major Arterials at three distinct levels designated: boulevard, gateway, and special arterial streetscape plans. The implementation of these streetscape improvements is both a public and private responsibility.

As the City's primary entry, Bob Hope Drive would require a formal landscape plan incorporating community-wide design themes. The intersection of Bob Hope Drive with Ramon Road is designated as a "Primary Gateway". Given this designation, the design of this intersection should incorporate monument signage and include special paving, widened setbacks, and coordinated accent landscaped treatment at all four corners. A "Gateway Landscaping" designation applies to both sides of Bob Hope Drive, between Ramon Road and Dinah Shore Drive. The gateway landscape plan envisions a formal skyway design with decorative palms interspersed with smaller specimens to create a dynamic entry into the City.

The Community Design Map in the *City of Rancho Mirage General Plan* includes a "Special Arterial Landscaping" designation for both Ramon Road and Dinah Shore Drive within the city limits. This designation allows more design flexibility in that each roadway would take on a unique landscape theme reflecting the design character of the adjacent uses. Both formal and informal landscape treatments may be featured, depending on the character of the adjacent development. However, a more coordinated landscape treatment of these arterials and the intensification of planting at major intersections to create an "oasis" effect would be required as well as the preservation of view corridors through streetscape improvements and specialized design standards such as widened parkways and enhanced landscaping to reduce visual impacts.

Two intersections adjacent to the project site are designated as "Enhanced Intersections" in the Community Design Element of the *City of Rancho Mirage General Plan:* (1) Los Alamos Road at Ramon Road, and (2) Bob Hope Drive at Dinah Shore Drive. Enhanced intersections include coordinated planning for all four corners through widened setbacks, special crosswalk paving, accent lighting, trees, and other landscaping. Program 3C in the Community Design Element includes undergrounding utilities whenever possible and adopting lighting standards that create the minimum visual impact without compromising safety.

Goals, Policies and Programs

The City's street system shall be designed and constructed to maximize mobility, minimize congestion, and assure that all intersections and street segments shall operate at LOS "D" or better during the peak hours of traffic, as generated by buildout of the Land Use Plan. The number of access points and intersections along arterials shall be limited in order to preserve mid-block and intersection capacities and to maintain public safety. City Program 4.B facilitates the consolidation of access driveways along all arterials in a manner that minimizes conflicting turning movements and maximizes the use of existing and planned signalized intersections. City Policy 9 states that circulation and access for undeveloped parcels shall be coordinated with surrounding properties.

Per City Policy 10, streets within private planned residential areas shall be installed and maintained as private streets, and shall be developed in accordance with development standards set forth in the Zoning Ordinance and other applicable standards and guidelines. Emergency police, fire and paramedic vehicle access shall be provided with all new development to the satisfaction of the City. The City shall preserve and protect existing and future school sites, to the greatest extent practical, from excessive noise and traffic conditions and ensure compatible surrounding land uses.

Critical Intersections

At the discretion of the City Engineer, the City of Rancho Mirage shall require improvements at "critical intersections" beyond those necessary to meet the adopted level of service performance standard. The "critical intersections" identified within the *City of Rancho Mirage General Plan* represent locations where ideal roadway configurations would provide three through lanes, dual left-turn lanes, and a single dedicated right-turn lane on each approach. As a result, these intersections are expected to require additional right-of-way to accommodate full-width roadway improvements. Those "critical intersections" involving major arterials designated as scenic corridors in the *Rancho Mirage General Plan* may be required to dedicate right-of-way beyond that associated with the typical cross-section associated with the facility classification and prepare streetscape plans incorporating landscaping consistent with the standards in the Community Design Element of the *City of Rancho Mirage General Plan*.

Congestion Management Program (CMP)

The Congestion Management Program (CMP) is intended to link land use, transportation, and air quality with reasonable growth management methods, strategies and programs that effectively utilize new transportation funds to alleviate traffic congestion and related impacts. The Riverside County Transportation Commission (RCTC) is the designated Congestion Management Agency (CMA) that prepares the Riverside County Congestion Management Program updates in consultation with local agencies, the County of Riverside, transit agencies and sub-regional agencies like the Coachella Valley Association of Governments (CVAG).

The CMA provides a uniform database of traffic impacts for use in countywide transportation computer models. To analyze traffic impacts associated with development proposals or land use plans, the RCTC has recognized use of the Riverside County Traffic Analysis Model (RIVTAM) and other models. The methodology for measuring levels of service (LOS) must be that contained in the *Highway Capacity Manual*. Traffic standards must be set no lower than LOS E for any segment or intersection on the CMP system unless the current LOS is lower (i.e., LOS F).

The RCTC has designated a system of highways and roadways to include (at a minimum) all State Highway facilities within Riverside County and a system of principal arterials as the Congestion Management System (CMS). All State Highways within Riverside County have been designated as part of the CMP System of Highways and Roadways. The following facilities are designated as part of the Riverside CMP System of Highways and Roadways in the Coachella Valley:

- Interstate 10 (San Bernardino County line to State line);
- State Route 111 (Interstate 10 to Imperial County line);
- Ramon Road (Interstate 10 to State Route 111); and
- Monterey Avenue (Interstate 10 to State Route 111).

The 2011 level of service screening analysis in the CMP found that Interstate 10 is operating at LOS C with a peak hour traffic volume (in both directions) of 7,521 vehicles per hour at Date Palm Drive and 8,758 vehicles per hour between Ramon Road and Monterey Avenue. Ramon Road, west of Bob Hope Drive, was evaluated and determined to be operating at LOS C with 2,435 vehicles in the peak hour (both directions). Ramon Road, east of Bob Hope Drive, was identified as operating at LOS F with a peak hour two-way volume of 2,781 vehicles per hour. This unacceptable level of service was attributed to the construction activities associated with the Interstate 10 interchange at Bob Hope Drive.[3]

Per the adopted Level of Service standard of "E", when a Congestion Management System (CMS) segment falls to LOS F, a deficiency plan must be prepared by the local agency where the deficiency is located, following coordination with other agencies identified as contributors to the deficiency. The deficiency plan must contain mitigation measures (including TDM strategies and transit alternatives) and a schedule for mitigating the deficiency. RCTC will prepare deficiency plans when deficiencies are identified by local jurisdictions on the State Highway System.

When the I-10 interchange construction at Bob Hope Drive was completed and travel patterns returned to normal in 2012, the traffic volume on Ramon Road, east of Bob Hope Drive, decreased by 56 percent to 1,218 vehicles per hour and the peak hour LOS improved to acceptable levels. Consequently, a deficiency plan will not be required for Ramon Road, west of Bob Hope Drive.

---

3 VRPA Technologies, Inc.. *2011 Riverside County Congestion Management Program;* December 14, 2012.

Transportation Uniform Mitigation Fee (TUMF) Program

The Coachella Valley Association of Governments (CVAG) has developed a Transportation Uniform Mitigation Fee (TUMF) program that compliments the objectives of the Congestion Management Program (CMP). The member agencies of CVAG collect a uniform development impact fee to help fund construction of the regional system of roads, streets, and highways (excluding state or federal highways) needed to accommodate growth in the region.

The TUMF program is a component of the Measure "A" sales tax approved by Riverside County voters in 1988 and effective through the year 2039. Measure A and the TUMF program help fund the construction of the regional system of roads, streets, and highways to accommodate growth in the region. Transportation-related improvement projects partially funded by the TUMF program include: arterial street construction, street widening, intersection enhancements, and freeway interchange improvements. Regional transportation funds are meant to supplement, not replace local revenues and/or developer contributions required for approved regional road construction projects. CVAG members that participate in the TUMF and the Multiple Species program pay 25 percent of the cost of eligible regional transportation projects while CVAG pays 75 percent.

CVAG follows the protocol outlined in the *Coachella Valley Regional Arterial Program Policy and Procedures Manual* (Updated January 27, 2014), which details the process to be followed by Lead Agencies seeking Measure "A" and TUMF revenues for eligible transportation-related improvement projects. The revenues distributed by CVAG include the Measure "A" sales tax, TUMF collected by CVAG member agencies, and state and federal funding. Lead agencies submitting projects for review and funding through the CVAG Regional Arterial Program must document the project limits, the need for the improvement, and the cost of project design and construction (including right-of-way acquisition, preliminary engineering, alignment and traffic studies, administration, and project management). The CVAG *Regional Arterial Cost Estimate* (RACE) is updated periodically for use in estimating improvement costs.

CVAG uses the ranking identified in the latest version of the *Transportation Project Prioritization Study* (TPPS) to allocate the available funding to eligible projects within the Coachella Valley that would meet demonstrated transportation needs. The four primary criteria applied to determine funding priorities include: surface road conditions, system continuity considerations, the level of service, and the accident rate. Additional criteria that may increase the priority of an improvement project include: (1) an improvement cost of less than $1 million; (2) an improvement involving a roadway segment crossing the Whitewater River or a major tributary; (3) project readiness (i.e., right-of-way available, environmental document approved, agency funds reserved, plans and specifications complete); and (4) an improvement that represents a backbone level project (i.e., it is integral to the continued and future development of an area). A lower ranked project in the TPPS receiving "outside funds" may be moved up the priority list, provided it would be of sufficient benefit to the region.

Regional Transportation Improvement Plans

SCAG is responsible for preparing the 2012 Regional Transportation Plan to address requirements set forth in SB 375. The Regional Transportation Plan (RTP) is a multi-modal long-range planning document prepared by SCAG. It involves coordination with federal, state and other regional, sub-regional, and local agencies in southern California. The RTP is prepared every three years and reflects the current future horizon based on a 20-year projection of future needs. It includes programs and policies for congestion management, transit, bicycles, pedestrians, roadways, freight, and finances. It is used as a long-range plan for federally funded transportation projects.

The Capital Improvement Program (CIP) is a 7-year program including all regional and local capital improvement projects that maintain or improve the LOS for traffic and transit and conform to transportation-related emission air quality mitigation measures. Currently, regional projects are programmed in the Riverside County Transportation Improvement Plan (TIP), while locally funded projects (off the State Highway System) are identified in local agency CIPs. To comply with CMP Statutes, CIP requirements shall be the same as and accomplished through the RCTC TIP development process. Projects in the CIP may be incorporated into the Regional Transportation Improvement Program (RTIP) for the programming of Flexible Congestion Relief (FCR) and Urban and Commuter Rail funds.

The *2010 Update CVAG Transportation Project Prioritization Study*[4] includes the Da Vall Drive interchange at I-10 as a buildable project with relatively low priority (ranked 79th). It would require roadway improvements between Vista Chino and Varner Road, including a bridge over the Union Pacific Railroad and a bridge at the Long Canyon Channel, in addition to the interchange improvements. These improvements would exceed $91,000,000 and not be initiated until 1.5 billion dollars

[4] KOA Corporation. *2010 Update CVAG Transportation Project Prioritization Study;* November 2010.

in other roadway improvements were completed by CVAG. The widening of Da Vall Drive, north of Ramon Road, to its ultimate cross-section is also a buildable project (designated B-419) in the 2010 TPPS. It is ranked 88th of 247 buildable projects and has a score of 9.3 points. The cost associated with the widening of Da Vall Drive, between Ramon Road and Vista Chino, was estimated to be $24,025,032 in the 2010 TPPS.

Existing TSM Programs

There are no Transportation System Management plans in effect in the study area at present. No transit stations or park-and-ride facilities currently exist in the vicinity.

3.6 Alternative Transportation Modes

Public Transportation

The Sunline Transit Agency provides fixed-schedule bus service (SunBus) between local communities and on-demand transportation (SunDial) for individuals with disabilities. The SunLine Transit Agency provides public transportation for 3.5 million passengers annually. A fleet of low-emission buses operate on seven days per week (excluding Thanksgiving and Christmas) along the fourteen fixed-schedule SunBus transit routes to provide public transportation service to nine cities and five communities within the Coachella Valley.

SunBus Line 32 provides service between the Palm Springs Air Museum (on Gene Autry Trail) and the Palm Desert Civic Center. Popular destinations served by Line 32 include: the Agua Caliente Casino Resort Spa, the College of the Desert, the Eisenhower Medical Center and the Westfield Palm Desert shopping center. Line 32 is located on Ramon Road, between Date Palm Drive and Monterey Avenue. This portion of SunBus Line 32 is adjacent to the northern site boundary. Buses on Line 32 operate between 5:02 AM and 10:46 PM on weekdays with 50-minute headways. On Saturdays and Sundays, the buses on Line 32 operate between 6:54 AM and 10:48 PM with one-hour headways.

Transit stops for westbound buses are currently located along the north side of Ramon Road: (1) west of Rattler Road, near Rancho Mirage High School, and (2) approximately 180 feet west of Bob Hope Drive, near the northeast corner of the project site. Transit stops for eastbound buses are also located along the south side of Ramon Road: (1) approximately 880 feet east of Da Vall Drive, at the Braille Institute, and (2) approximately 160 feet east of Bob Hope Drive, at the Agua Caliente Casino Resort Spa.

Line 32 operates along Monterey Avenue (between Ramon Road and Dinah Shore Drive), along Dinah Shore Drive (between Monterey Avenue and Bob Hope Drive), and along Bob Hope Drive (south of Dinah Shore Drive). At the intersection of Bob Hope Drive and Dinah Shore Drive, SunBus Line 32 is located closest to the southeast corner of the project site. Two existing transit stops for Line 32 are located near this intersection. For eastbound buses (i.e., those traveling from Palm Springs to the City of Palm Desert) a transit stop is located on the west side of Bob Hope Drive, approximately 120 feet south of Dinah Shore Drive. For westbound buses (i.e., those destined for the City of Palm Springs from the City of Palm Desert) a transit stop is located on the south side of Dinah Shore Drive, approximately 300 feet east of Bob Hope Drive.

SunLine Transit Agency buses are wheelchair accessible and have bicycle racks that can accommodate either two or three bicycles and are convenient for cyclists to use. Bike racks are proposed by SunLine Transit at select bus stop locations within the City of Rancho Mirage. One of these locations is within the study area, just west of the intersection of Monterey Avenue and Dinah Shore Drive (at Stop #939). Buses traveling from Palm Springs and Palm Desert on Line 32 would stop near these bicycle racks, which would be located on the far side of the intersection of Shoppers Lane and Dinah Shore Drive. No bicycle commuter showers or clothing lockers are currently located within the City of Rancho Mirage. The City currently has no requirements for bicycle amenities.[5]

No transit stations or park-and-ride facilities currently exist in the City of Rancho Mirage. The *Section 19 Specific Plan* included a potential site adjacent to the Union Pacific Railroad corridor for the future development of a multi-modal transit center. The future plans for the *Section 13 Specific Plan* area also included a possible site for a future multi-modal transit center adjacent to the Union Pacific Railroad corridor.

---

5 Ryan Snyder Associates, LLC and Urban Crossroads. *Final CVAG Non-Motorized Transportation Plan Update*; September, 2010.

The SunLine Transit Agency contracts with a private provider for SunDial, a door-to-door dial-a-ride service. SunDial is a demand response service designed to serve seniors and those with disabilities on an appointment basis between 8:30 a.m. and 9:00 p.m. on weekdays, and between 8:30 a.m. and 4:00 p.m. on weekends. In addition to SunDial, a subscription-based transit service is available through agencies serving people with disabilities who need regular repetitive trips.

Golf Carts and NEVs

Residents of Rancho Mirage use golf carts for more than transportation on individual golf courses. Golf carts are used for access between residences and the golf courses in adjacent neighborhoods. They are also used for local trips made between residences and commercial and medical facilities, the City Hall, and golf cart paths in adjoining cities. Golf carts are legally restricted to designated pathways and roadways within Rancho Mirage with speed limits that do not exceed 35 mph and can be operated at no more than 20 mph. Figure 3-9 shows the existing and future City of Rancho Mirage golf cart circulation system.

The California Vehicle Code (CVC) defines golf carts as vehicles designed to operate at a maximum speed of 15 mph and states that golf carts can be driven only on roadways with posted speed limits of up to 25 mph except in cases where travel on roadways with higher speed limits is permitted by ordinance or resolution of a local authority. The CVC defines Neighborhood electric vehicles (NEVs) as vehicles that can reach speeds of 20 to 25 mph within one mile. NEVs may be operated on any roadway with a posted speed limit of 35 mph or less and may cross at intersections that have a higher speed limit than 35 mph.

Like bikeways, golf cart paths have three classifications (Class I, Class II, and Class III). Class I paths are completely separated from the roadway used by motor vehicles. Class I facilities are for shared one-way or two-way use by golf carts, bicyclists, and pedestrians and are incorporated in Class I bikeways. Class II golf cart facilities provide a striped lane on a street or highway for one-way golf cart and bicycle travel. Class III facilities are established by placing "Golf Cart Route" signs along roadways with speed limits of 25 mph or less to provide linkages to Class I or Class II facilities.

Non-Motorized Transportation

Bicycling, walking and equestrian transportation modes represent non-motorized alternatives to the automobile. Bikeways and pathways are used by a wide variety of people including children on their way to and from school, commuters riding to and from work, and people exercising, racing or touring. While recreational riders seek routes leading to parks, through areas of interest, or racing circuits, commuters want the shortest, fastest, and safest route between two points.

Bikeways

Caltrans standards are used to design bikeways by most jurisdictions throughout California. The City of Rancho Mirage adheres to Caltrans bikeway standards. Bike lanes on existing roadways should conform to Caltrans standards or be upgraded to meet Caltrans standards. These standards apply to three different classifications of bicycle facilities: Class I, Class II, and Class III bikeways.

A Class I Bikeway is a bike path that provides for bicycle travel on a right-of-way completely separated from any street or highway. The paths may be located along alignments parallel to streets or unrelated alignments as long as there is no encroachment from motor vehicle or pedestrian traffic except at grade intersections. A Class II Bikeway is a bike lane that provides a striped lane for one-way bike travel within the paved area of a street or highway. These bike lanes are within an exclusive right-of-way designated for use by bicyclists. However, cross traffic is permitted for driveway access. A Class III Bikeway is a bike route in which both bicycle and motor vehicle traffic share the same roadway surface area. The route is marked with signs or stenciled lettering on the pavement identifying the roadway as part of a bikeway system.

Existing Bikeways

Within the City of Rancho Mirage, Class I bikeways are typically a combined meandering sidewalk and bike path within the landscaped parkway along arterial streets. Most of the arterial streets within the City have a roadbed of sufficient width to allow for a four-foot wide Class II bike lane along the curb. The Conservation and Open Space Element states that Class III bike routes are not recommended for Rancho Mirage except: (1) where Class I and II facilities are not feasible and an essential regional bike route connection is desired, or (2) where Class I and Class II facilities are not warranted due to lesser roadway classifications.

Figure 3-9

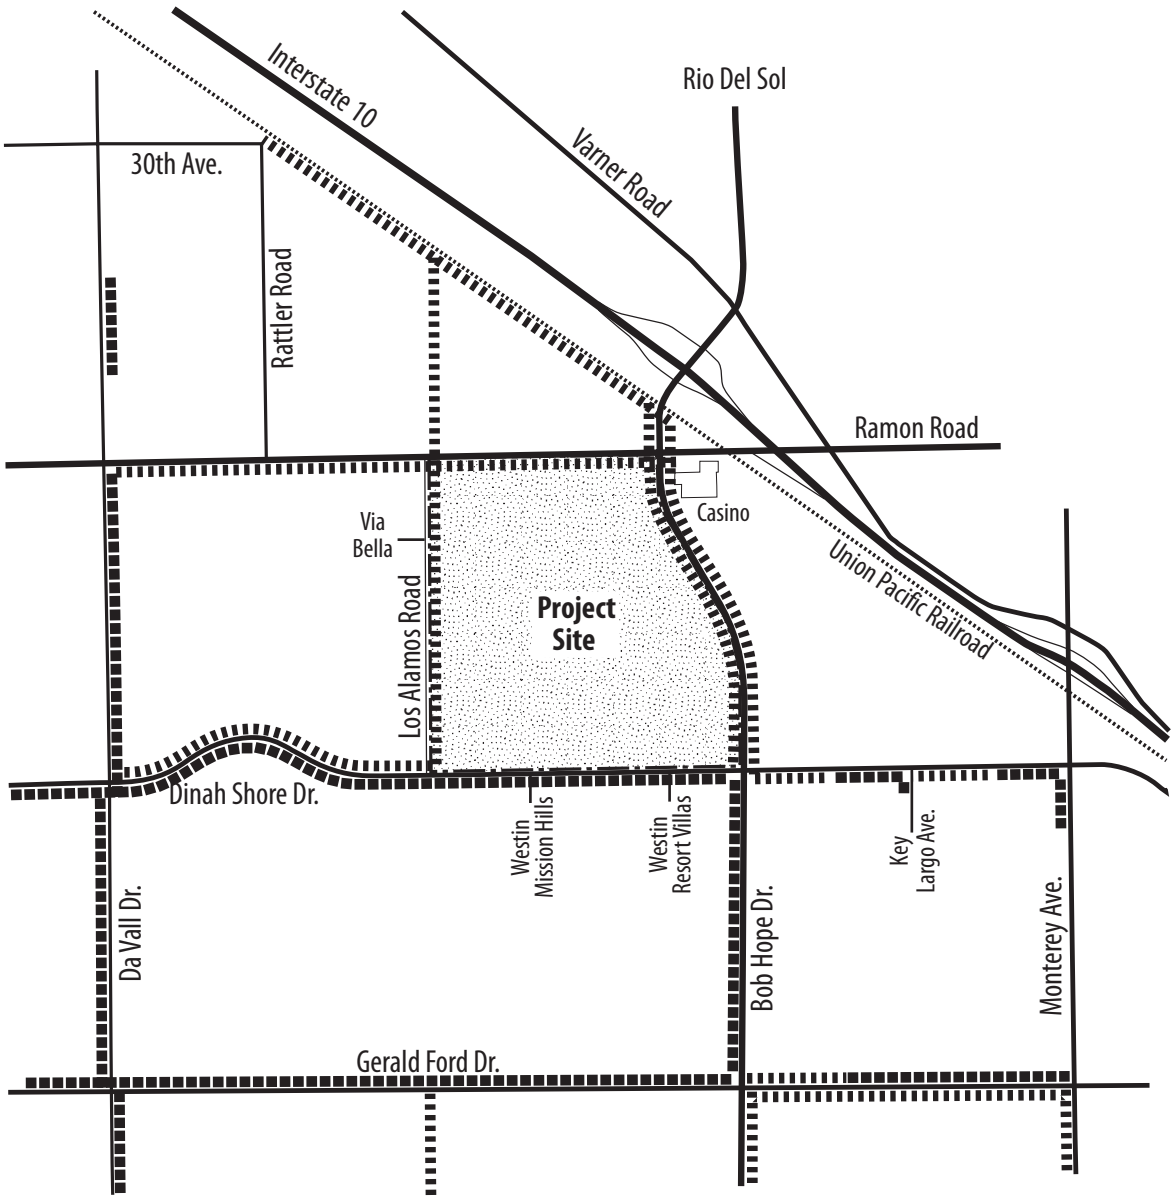
Bicycle/Golf Cart/Pedestrian Paths



Endo Engineering

Source: *City of Rancho Mirage General Plan* (Revised November 2005)

Scale: 1" = 3,200'

The combined length of the existing bikeways within the City of Rancho Mirage totals approximately 16.6 miles. The existing bikeways have been funded by the City with General Funds or Development Impact Fees (DIF). The following Class II bikeways exist within the study area.

- A Class II bikeway extends 4.7 miles along the east side of Bob Hope Drive, from Ramon Road south to Sunrise Drive.
- A Class II bikeway extends 2.0 miles along Gerald Ford Drive from Los Alamos Road to Monterey Avenue.
- A Class II bikeway extends 1.7 miles along Ramon Road from the western city limit to Bob Hope Drive.
- A Class II bikeway extends 0.4 miles along Los Alamos Road, south of Gerald Ford Drive to Sunny Lane.
- A Class II bikeway is located on the west side of Bob Hope Drive, south of Cherry Hills Drive to Sunrise Drive.
- A Class II bikeway is located on Monterey Avenue, between Dinah Shore Drive and Gerald Ford Drive.

The City of Rancho Mirage has bicycle parking at the following locations: the Monterey MarketPlace, the southwest corner of Monterey Avenue and Dinah Shore Drive, the City Hall, The River Shopping Center, the Library, the Eisenhower Medical Center, the Pavilions Shopping Center (southwest corner of the Bob Hope Drive/Gerald Ford Drive intersection), the southwest corner of the Monterey Avenue intersection with Country Club Drive, Whitewater Park.

A sidewalk/golf cart/bicycle path exists on Da Vall Drive, from Dinah Shore Drive north beyond Ramon Road. It terminates south of 30th Avenue. A sidewalk/golf cart/bicycle path also exists on Ramon Road, between Da Vall Drive and Los Alamos Road. A sidewalk/golf cart/bicycle path exists on the south side of Dinah Shore Drive from Plumley Road to Bob Hope Drive.

Future Bikeways

The City of Rancho Mirage has proposed ten bikeway projects for inclusion in the *CVAG Non-Motorized Transportation Plan* that would supplement the existing bikeways by a total of 11.3 new miles of bikeways. The following bikeway projects are proposed within the study area.

- A Class I bikeway project 0.7 miles in length is proposed along the Union Pacific Railroad corridor from the northern city limit to the eastern city limit. This facility is estimated to cost $700,000.
- A future one-mile long Class II bikeway project is proposed along Da Vall Drive, from Ramon Road to Dinah Shore Drive, with an estimated cost of $50,000.
- A future 3.1-mile long Class II bikeway project is proposed along Dinah Shore Drive, from Da Vall Drive to Monterey Avenue, with an estimated cost of $155,000.
- A future 1.5-mile long Class II bikeway project is proposed along Gerald Ford Drive, from Plumley Road to Los Alamos Road, with an estimated cost of $75,000.

A bicycle parking program project is proposed with an estimated cost of $25,000. New bicycle parking will be added by the property owners at the intersection of Dinah Shore Drive and Bob Hope Drive and at the Agua Caliente Casino Resort Spa (on the southeast corner of the intersection of Bob Hope Drive and Ramon Road). The Section 24 Specific Plan will be developed on the opposite side of the street from these bicycle parking areas. Bikeways proposed in conjunction with Section 24 Specific Plan (along Ramon Road, Bob Hope Drive, and Dinah Shore Drive) will make these bicycle parking areas accessible to future residents of Section 24.

The bikeway and trail system *identified in the Western Coachella Valley Area Plan* (October 2003) includes future Class I bike paths at three locations within the study area. These locations include: the north side of Interstate 10, along Ramon Road, and along Bob Hope Drive. A Class I bikeway is a bike path that provides for bicycle travel on a right-of-way completely separated from any street or highway. The paths may be located along alignments parallel to streets or unrelated alignments, as long as there is no encroachment from motor vehicle or pedestrian traffic, except at grade intersections.

Multi-Purpose Trails

The County of Riverside has pedestrian and multi-purpose trails that accommodate hikers and others as an integral part of the circulation system. These trails connect communities and activity centers and also provide recreational and leisure opportunities.

The City of Rancho Mirage encourages pedestrian and non-motorized transportation by making provisions for sidewalks, bike lanes, and multi-use trails within roadway designs and rights-of-way. Alternative transportation corridors enhance and provide a range of mobility options for residents and visitors. The City encourages developments to consider pedestrian safety and accommodate safe routes which are clearly marked and striped. They should be designed as one-way routes to flow in the same direction as the adjacent automobile traffic. Combination sidewalk/bikeway/golf cart paths require a minimum eight-foot width. Figure 3-9 shows the existing and future pedestrian path circulation system. As shown therein, future sidewalk/bikeway/golf cart paths are planned on the perimeter of the project site (along Ramon Road, Bob Hope Drive, and Los Alamos Road) in the *Rancho Mirage General Plan* that would link with the integrated system being developed throughout the study area.

The *Public Rights-of-Way Accessibility Guidelines* require that when new pedestrian facilities are planned in the United States, they must be accessible and usable by persons with disabilities (including physical, visual, hearing or cognitive impairments).[6] This includes provisions for curb ramps and sidewalks where appropriate. These guidelines consider pedestrian facilities to include: sidewalks, shared-use paths, shared streets, and off-road paths.

In accommodating pedestrians with disabilities, auditory, tactile, and kinesthetic information may be required to aid pedestrian movements at intersections and mid-block crossing locations. Treatments may include accessible pedestrian signals, audible signals, and other wayfinding cues. Ramps rather than stairs, curbs, or raised channelizing islands can enhance the mobility of people with disabilities including pedestrians with visual impairments.

3.7 Mobility for Persons With Special Needs

Older drivers may have age-related diminished capabilities with the potential to impact the safety and efficiency of the street system. To better meet the needs and capabilities of older street users, their special needs should be considered in street design, traffic control, and lighting design. Appropriate enhancements and design measures can improve their performance.

Pedestrians include a person walking, a person in a wheelchair, on skates, or on a skateboard. Long crossing distances and high vehicle speeds generally discourage pedestrians. A mix of land uses and pedestrian-scale lighting provide a sense of comfort. Pedestrian facilities include sidewalks and curb cuts; crosswalks; traffic control features (pedestrian signals); and ramps for older walkers, bicycles, and persons with mobility impairments. They may also include bus stops; passenger loading areas; amenities (benches and shelters); and stairs, escalators or elevators linked to these facilities. Audible pedestrian signals and tactile ramp and crosswalk materials to aid the visually impaired may be required for persons with disabilities.

Pedestrians tend to walk in a path that has the shortest distance between two points. They resist changes in grade or elevation when crossing roadways and tend to avoid using special underpass or overpass facilities. Pedestrians will typically not walk more than one mile to work or walk more than 0.5 mile to catch a bus. Pedestrian volumes peak at noon, rather than at the morning and evening peak commuter times. Older pedestrians may be affected by limitations in sensory, perceptual, cognitive, or motor skills. In areas where there are many older people, an average walking speed of 2.8 feet per second should be considered for use in design.

---

6 *Public Rights-of-Way Accessibility Guidelines (draft)*. Washington, DC: U.S. Access Board, 2005. Accessible via www.access-board.gov/prowac/draft.htm.

4.0 PROJECTED TRAFFIC

A period of 20 years is widely used as a basis for design. Estimating traffic beyond this period is usually not justified because of probable changes in the regional economy, population, and land development along the roadways, which cannot be predicted with any degree of assurance.[1] Although no time frame has been established for development within the Section 24 Specific Plan area after the initial phase, project completion was assumed for the purposes of this analysis to occur in the horizon year 2035, the future year for which travel demand within the study area can be projected by the approved regional traffic model (RIVTAM).

4.1 Analysis Periods and Horizon Years Evaluated

To identify the potentially significant traffic impacts of a project and the corresponding design and mitigation requirements, the trip-generation rates for different days and time periods must be examined to determine when the trip generation associated with the development will peak. The peaking characteristics of the adjacent street system must also be examined to correctly identify and select the appropriate time period for analysis. The time period that should be analyzed is that in which the combination of site traffic and adjacent street traffic is at its maximum.

In most cases, the trip generation rates reflecting the morning and evening peak hours of the adjacent street system are used for the impact evaluation. These rates reflect the highest volume hour between 7:00 A.M. and 9:00 A.M. and between 4:00 P.M. and 6:00 P.M. However, some land uses generate trips that peak at different times than the adjacent streets. Examples include theaters, churches, schools, and industrial uses with shifts that end at 3:00 P.M. Hotels, construction sites, and golf course maintenance facilities often have shifts that end at 3:00 PM.

Several schools are located within the study area including two high schools. School traffic tends to exhibit a relatively sharp peak over the twenty-minute period immediately before classes begin for the day and after the school day ends. The school day begins at 8:00 A.M. on 136 days per year at the Rancho Mirage High School. On 37 Wednesdays per year, collaboration time begins at 7:45 A.M. and Period 1 begins at 9:05 A.M. These start times result in school traffic peaking during the same hours that commuter travel peaks (i.e., between 7:00 A.M. and 9:00 A.M. on weekdays). The school day ends at 2:55 P.M., before the evening commuter traffic flows on Ramon Road reach their peak.

Time Period Selected For Analysis

Site traffic volumes vary with the type and intensity of the proposed development. For example, office uses generate relatively little weekend traffic but high entering volumes in the morning and high exiting volumes during the afternoon or evening on weekdays. Residential land uses generate trips with little day-to-day variation but the opposite directional distribution, with high outbound traffic volumes during the morning and high inbound traffic volumes during the evening on weekdays. Traffic peaks occur at large regional shopping centers during the evening on weekdays but during the midday on weekends.

The development proposed would include up to 2,406 residential dwelling units and 3,138,600 feet of non-residential development. The exact scale, size, and composition of the tourist-oriented commercial, local-serving retail, office, entertainment, and hotel uses within the mixed-use non-residential areas of the Section 24 Specific Plan have not been determined but will be developed in a manner designed to promote complementary and synergistic relationships between the various uses. Each of the proposed land use types will generate trips with a unique profile that peak at slightly different times of the day, on different days of the week, and with different percentages of inbound versus outbound trips during the peak hours. Each trip involves a vehicle movement in one direction, either entering or leaving an individual land use, that must be accommodated by the surrounding street system as well as the access intersections and the internal streets.

The number of trips generated by the proposed residential and non-residential uses will vary by season and peak during the winter months, when tourists and visitors are attracted to the area by its mild climate, natural beauty, and numerous recreational opportunities. The tourist season in the Coachella Valley extends from October through May, with the peak occurring in January. The seasonal influx of part-year residents ("snow birds" from Canada and areas within the northern United States with cold climates) that begins in October reverses by April. Both the tourist population and the number of part-year seasonal residents decrease substantially after April.

---

[1] AASHTO. *A Policy on Geometric Design of Highways and Streets*. 1994. pp 61.

When all of the trips generated by the various proposed land uses are combined, the composite trip-making pattern is expected to exhibit characteristics similar to the background traffic in the study area in terms of its seasonal, daily, peak hour, and directional distribution. Therefore, the conditions selected for analysis included the peak morning and evening commuter travel hours on the adjacent streets on typical weekdays during the peak season. Although commercial and residential development will also generate traffic peaks during the midday on weekends, the absence of commuter traffic on the adjacent streets at that time makes it less critical from a traffic impact perspective.

When combined, the traffic generators proposed within the Section 24 Specific Plan area are expected to generate the highest volume of traffic on the roadways abutting the site on weekday mornings (between 7:00 A.M. and 9:00 A.M.) and evenings (between 4:00 P.M. and 6:00 P.M.). Since many retail land uses are not open for business in the morning between 7:00 A.M. and 9:00 A.M., the traffic volumes generated by the site on weekdays are expected to be higher during the evening peak hour than the morning peak hour. The residential land uses for senior adults in the initial phase would generate fewer trips during the morning peak hour than conventional single-family detached residential uses for larger families, which generate more trips to school and work on weekday mornings.

Horizon Years and Development Scenarios Evaluated

The initial phase of the proposed project would include the construction of up to 1,200 single-family residential dwelling units within a gated community for active adults aged 55 and above. This phase of the development would occur over a period of six to eight years and be completed in the year 2022. Although a timeframe has not been established for implementation of the development proposed within Planning Areas 1 through 7, buildout of the entire project was assumed to occur by the horizon year 2035. Consequently, the key intersections were evaluated with and without the proposed project at three different points in time. These include: (1) the existing year 2013, (2) the near-term year 2022, when the initial phase is completed, and (3) the long-term horizon year 2035, when the site development is completed.

The peak season during the year 2013 was evaluated as the existing baseline condition, based on new traffic counts made at each of the key intersections on November 6, 2013 that were expanded by five percent to reflect peak season conditions. The near-term future year 2022 conditions were evaluated to identify potential impacts and mitigation when the initial phase of development is completed. The long-term future horizon year 2035 conditions were evaluated based on future travel demand forecasts produced by the regional transportation model developed for Riverside County in association with SCAG to determine if the future circulation system planned for the study area can accommodate site traffic as well as the cumulative travel demands generated by all future development anticipated by city and county general plans and the SCAG regional growth forecasts.

For each development scenario, peak season morning and evening peak hour conditions were evaluated to establish whether or not mitigation would be required to achieve the applicable intersection performance standards. The development scenarios assessed included the following:

- Existing Conditions;
- Existing Plus Initial Phase Conditions;
- Existing Plus Project Buildout Conditions;
- Future Year 2022 Through Traffic Conditions;
- Future Year 2022 Plus Initial Phase;
- Horizon Year 2035 Through Traffic Conditions; and
- Horizon Year 2035 Plus Project Buildout Conditions.

Existing conditions with and without site traffic volumes generated by the initial phase were evaluated to assess conditions prior to the addition of traffic generated by cumulative developments. The existing+project buildout scenario assumed no traffic growth other than the site traffic volumes. All of the future scenarios evaluated included growth in background traffic projected by RIVTAM. The near-term year 2022 scenarios also included cumulative traffic generated by two projects within the study area.

Future year 2022 (near-term) traffic conditions at the key intersections were evaluated with and without the site traffic associated with the initial phase of the proposed project. The intermediate year 2022 “through” traffic volumes were developed from the existing and horizon year 2035 “through” traffic projections by interpolation, assuming a geometric growth rate. Cumulative traffic generated by two cumulative projects within the study area identified by the City of Rancho Mirage was also added to the near-term through traffic projections.

Future horizon year 2035 traffic conditions were evaluated with and without the site traffic associated with buildout of the proposed project. RIVTAM traffic projections reflecting buildout of the proposed project were needed to determine whether the regional roadway network shown in the Circulation Plan of the *Riverside County General Plan* and the Rancho Mirage 2005 General Plan would provide acceptable levels of service with project buildout traffic volumes in the horizon year 2035.

4.2 Site Traffic Projections

Riverside County General Plan Trips

The Land Use Element of the *Riverside County General Plan* designations for the 577 gross acres within the project site are shown in Table 2-1. A total of 240 gross acres within the project site are designated Medium Density Residential (which allows 2 to 5 dwelling units per acre) in the Land Use Element of the *Riverside County General Plan.* Up to 1,200 single-family detached dwelling units would be allowed by this designation. Based upon the ITE *Trip Generation* rates for conventional single-family detached housing (Land Use Code 210) these 1,200 dwellings have the potential to generate approximately 10,230 weekday trips.

The *Riverside County General Plan* also designates 120 acres of the site as Commercial Retail (CR) and 257 gross acres as Commercial Tourist (CT). RIVTAM reduces the gross acreage by 25 percent to estimate the net acreage. With 252.75 net acres and a maximum FAR of 0.35, the maximum gross floor area (GFA) allowed for commercial land uses would be 3,853,427 square feet. RIVTAM uses the project-related population, number of households, and employment (jobs) as factors in estimating the project-related weekday trip generation. Assuming an employment density of 500 square feet per employee, the number of jobs associated with the maximum allowed non-residential development per the *Riverside County General Plan* designations would be 7,707 jobs.

The maximum proposed non-residential building floor area would be 18.6 percent less than the maximum allowed by the *Western Coachella Valley Area Plan*. Since the number of trips generated would be a function of the total size of the non-residential building floor space developed, the proposed project would be expected to generate approximately 18.6 percent fewer non-residential weekday trips than the maximum allowed by the *Riverside County General Plan*. Assuming the weekday trip-generation rate for shopping centers from the regression equation in *Trip Generation* (ITE, 2008), the commercial uses allowed within the site by the *Riverside County General Plan* could generate up to 78,330 weekday trips. The combined residential and commercial trip generation would total 88,560 weekday trips (prior to internal trip capture and pass-by trip reductions).

City of Rancho Mirage General Plan Trips

Assuming the *Rancho Mirage General Plan* average household size of 2.97 for R-M and 1.95 for R-H, the 2,007 dwelling units permitted by the 414 net acres designated R-M and the 39 acres designated R-H within the project site could add up to 5,603 new residents to the City of Rancho Mirage. Based on the trip-generation rates in ITE *Trip Generation*, 2007 dwelling units would have the potential to generate approximately 15,680 weekday trips.

The 75 net acres designated C-C would permit up to 1,143,450 square feet of GFA, assuming the maximum FAR of 0.35. With an employment density of 500 square feet per employee, a total employment of 2,287 would result from the development of the site. Based on the trip-generation rates in ITE *Trip Generation*, a community commercial shopping center with 1,143.45 TSF would have the potential to generate approximately 33,100 weekday trips.

The weekday trip generation associated with the maximum permitted residential density and the non-residential community commercial portion of the site would be 48,780 weekday trips. This total represents “unadjusted” trips, prior to reductions for internal trip making between the residential and commercial components and without pass-by trip reductions.

Site-Generated Trips With Proposed Project

The Institute of Transportation Engineers (ITE) publication *Trip Generation* (8th Edition; December 2008) is the principal source of trip-generation rates for site traffic analysis. The procedures and guiding principles outlined in *Trip Generation Handbook - An ITE Recommended Practice* (March, 2001) were employed to identify appropriate trip-generation rates, based upon the weighted averages and, where appropriate, the regression equations developed by the ITE.

While site-specific conditions like the availability of transit and walk-in traffic can result in different vehicular trip-generation rates, the practice of making adjustments to the rates for small differences in auto occupancy or transit usage is questionable, given the precision of the measurement of the ITE trip-generation rates and their day-to-day variation. Therefore, no transit usage or auto occupancy adjustments were made to the ITE trip-generation rates.

While this results in a "worst case" analysis, as required by CEQA, it is not meant to imply that alternative modes of transportation would not play an important role in future trip-making within the project site. The *2004 CVAG Origin Destination Survey* found that less than one percent of the trips in the region were completed using public transportation but residents in multi-family housing were twice as likely to use public transportation than residents of single-family housing. Approximately 4 percent of all trips made by the households surveyed were made by walking and one percent were made by bicycle. Residents of non-retired households were four times more likely to walk to their destination than residents of retired households.

Unadjusted Trip Generation

The trip-generation forecast shown in Table 4-1 was developed with the trip-generation rates developed by the Institute of Transportation Engineers (ITE) from data collected at isolated single-use stand-alone developments in suburban settings with little or no transit service and free parking. The ITE considers shopping centers a single land use, even though they may include banks, restaurants, office buildings, health clubs, movie theaters and other recreational facilities. The trip-generation data gathered at the driveways of shopping centers only includes external trips (i.e., those trips with either an origin or a destination located outside of the shopping center). Since the ITE data for shopping centers does not include any internal trips, the trip-generation forecast for a shopping center should not be "adjusted" (i.e., reduced) to reflect trip interactions between the various uses within the shopping center that do not require travel on external streets.

Table 4-1
Unadjusted Weekday Site Trip-Generation Forecast[a]
(Section 24 Specific Plan)

Land Use Category	Land Use Quantity[b]	Morning Peak Hour In	Out	Total	Evening Peak Hour In	Out	Total	Daily 2-Way
INITIAL PHASE								
Residential (Adult Single-Family)	1,200 DU	82	152	234	176	113	289	4,480
ALL SUBSEQUENT PHASES								
Non-Residential (Retail/Mixed Use Core)[c]	3,139 TSF	718	459	1,177	3,137	3,266	6,403	63,800
Residential (Multi-Family Attached)	1,206 DU	64	314	378	310	153	463	5,610
SPECIFIC PLAN BUILDOUT		864	925	1,789	3,623	3,532	7,155	73,890

a. Based upon trip-generation data published by the ITE in *Trip Generation* (8th Edition, December, 2008). The ITE Land Use Codes (LUC) assumed include: LUC 251 for Senior Adult Housing-Detached Residential Dwellings (age 55+); LUC 820 for commercial center uses; and LUC 230 for Multiple-Family Attached Residential uses. ITE trip-generation rates reflect neighborhood commercial centers, community commercial centers, regional and super regional centers with up to 2.3 million square feet of gross leasable area (GLA) in suburban areas within the United States. Some contained non-merchandising facilities such as: office buildings, movie theaters, restaurants, post offices, banks, health clubs, and recreational facilities (e.g., ice skating rinks or indoor miniature golf courses). A shopping center's composition is related to its market area in terms of size, location, and types of stores.

b. DU=Dwelling Units. TSF=Thousand Square Feet of Building Floor Area.

c. The 3,138,600 square feet of non-residential development would include a complementary mix of land uses which could include: retail commercial, entertainment, office, hotel uses within the Planning Areas designated Resort Flex, Mixed Use Core and Retail shown in Figure 2-3.

The morning peak hour trip-generation estimate was based on the rates identified for the highest volume hour between 7:00 A.M. and 9:00 A.M. The evening peak hour forecast was based upon the rates identified for the highest volume hour between 4:00 P.M. to 6:00 P.M. These rates reflect the peak hours of the adjacent street traffic within the study area.

As shown in Table 4-1, the initial phase of development would generate approximately 4,480 weekday trips when completed. Of that total, 234 trips (82 inbound and 152 outbound) are expected to occur during the morning peak hour and 289 trips (176 inbound and 113 outbound) are expected to occur during the evening peak hour. The number of unadjusted trips shown for subsequent phases and project buildout in Table 4-1 must be adjusted (reduced) to reflect trips made on-site, between the residential land uses and the non-residential land uses, that will be "captured" internally and not made on external streets. A reduction in the non-residential trip generation forecast would also be appropriate to account for pass-by trips.

Adjusted Trip Generation

The development of mixed-use projects reduces the trip generation associated with the development below that which is projected directly from the ITE trip-generation rates. When several different land use types are included in a single mixed-use development, the traffic added to the adjacent streets may be less than the sum of the individual trip generation associated with each individual land use code. The reduction is attributable to trips being made by vehicles on internal roadways that remain internal to the proposed development (e.g., between the residential and retail or entertainment uses). The internal trip interactions that occur without using streets external to the project site are counted twice when the trip generation of the individual uses is summed to establish the "unadjusted" trip generation.

Since the precise mix and size of the various non-residential land uses within the project have not been established, the trip generation was estimated by using the ITE trip-generation rates developed from data collected at more than 300 shopping centers ranging in size from neighborhood and community commercial centers to regional and super regional centers. These rates reflect data collected at commercial developments that include a range of non-merchandising facilities. The land uses in shopping centers include banks, small offices, restaurants, and retail stores. The shopping center data was deemed appropriate because it inherently eliminates internal trips made between various uses within the non-residential portion of the Specific Plan. However, adjustments to address the internal trip interactions between the non-residential component of the Specific Plan and the residential component are appropriate and can be made even though the shopping center trip-generation rates were used to develop Table 4-1.

The number of internal trips between the residential land uses and the non-residential within the multi-use site is a function of both the size of the receiving land use (the number of trips attracted to the non-residential development proposed) and the size of the originating land use (the number of trips produced and sent by the proposed residential land uses). The number of internal trips that will be captured within the site will be constrained by the smaller of these two values. An iterative balancing procedure must be utilized to constrain internal trip making estimates to realistic values, based upon the size (scale) and mix (diversity) of the various land uses within the site as well as their proximity, ease of access, and the availability of competing land uses in the surrounding area.

The internal capture rate between the proposed residential and non-residential uses on-site would be limited by the total number of residential trips. Since the residential trips would represent only 13.7 percent of the total site trip generation, a conservative internal capture rate of 15 percent of the residential trips was assumed for this analysis. While the potential exists for the internal capture rate to ultimately be higher than 15 percent, a higher rate could not be justified without more detailed information regarding the size, location, and diversity of the non-residential land uses.

Since the initial phase of development would include only residential development, no internal trip interactions would occur and the trip generation shown in Table 4-1 was assumed for the initial phase of the development. Table 4-2 shows the adjusted trip-generation forecast associated with buildout of the proposed project. The procedure used to remove the internal trips between the residential and non-residential components of the development (trips that that were counted twice in Table 4-1) is summarized in Table 4-2.

The proposed project would generate a combined total of 71,260 adjusted weekday trips (including pass-by trips on abutting roadways). Approximately 2,630 weekday trips are expected to occur between the various land uses proposed within the site using internal pathways. Approximately 68,630 weekday trips are expected to be external trips (i.e., trips with either an origin or a destination that is located off-site) that require travel on roadways that may abut the site but are not located entirely within the proposed development. During the morning peak hour on weekdays, the proposed project would generate a total of 1,677 adjusted trip-ends of which 1,565 would be external trips and 112 would be internal trips. The external trips would include 751 inbound and 812 outbound trips. During the evening peak hour, a total of 6,957 adjusted trip-ends would be generated. Approximately 6,759 would be external trips and the remaining 198 would be internal trips. The external trips would include 3,524 inbound and 3,433 outbound trips.

Table 4-2
Adjusted Weekday Site Trip-Generation Forecast
(Section 24 Specific Plan)

Internal Trip Interactions (Interval and Direction)	Unadjusted Trips[a]	Internal Trips[b]	External Trips	Adjusted Trips
RESIDENTIAL TRIPS (Single-Family Initial Phase)				
- Daily (Two-Way)	4,480	1,170	3,310	3,895

- AM Inbound	864	112	752	808
- AM Outbound	925	112	813	869
- PM Inbound	3,623	198	3,425	3,524
- PM Outbound	3,532	198	3,334	3,433

a. Unadjusted trips per Table 4-1, which have not been adjusted to remove trips captured internally that were counted twice.
b. Each value shown was counted twice. Values shown must be reduced by 50 percent, then added to the external trips to identify the adjusted trips with the internal trips included once.

Pass-By Trip Adjustment

Pass-by trips will be attracted from the traffic passing the site on adjacent streets that provide direct access to the proposed non-residential development. Although the intercepted pass-by trips would be turning in and out of the site access points, they would not be new trips on the roadway network. Consequently, they were deducted from the background traffic when the site traffic was assigned to the adjacent roadways. The pass-by trips were included in the traffic volumes entering and exiting the development at the site access points. Pass-by trips must be included in the projected traffic volumes at the site access points to ensure that the design of the access points can accommodate the total number of vehicles expected to enter and exit the site during the peak hours.

The proportion of pass-by trips has been found to decrease with the size of the shopping center. While very large shopping centers (those with more than a million square feet of GLA) have been found to attract as little as 19 percent of their trips from passing traffic, small shopping centers (those with less than 100 T.S.F.) have been found to attract between 51 and 72 percent of their trips from traffic passing on the adjacent roadways.[2] The average pass-by rate for shopping centers is 34 percent.[3]

---

2 Stover, Vergil G., Frank J. Koepke. *Transportation and Land Development* (Second Edition), ITE, 2002.

3 Institute of Transportation Engineers. *Trip Generation Handbook - An ITE Recommended Practice;* March 2001. [pp 48-57].

If the non-residential uses proposed are designed to support the surrounding community, approximately 25 percent of the commercial trips could come from pass-by traffic on the adjacent roadways with site access connections. Since the commercial uses anticipated on-site have not been established, a conservative pass-by rate of 15 percent was assumed.

The 68,630 external weekday trip generation shown in Table 4-2 includes an estimated 9,180 daily pass-by trips that would be using the adjacent roadways with or without development within Section 24. Therefore, upon project buildout, the site development would add 59,450 new primary external weekday trips to the through traffic volumes on the surrounding street system. During the morning peak hour on weekdays, the 120 pass-by trips on the adjacent streets, would reduce the number of new primary external trips added to the through traffic volumes on the surrounding street system by the proposed project to 688 inbound and 749 outbound trips. The 920 pass-by trips attracted to the site from the traffic during the evening peak hour on the adjacent streets would reduce the number of new primary external trips added to the surrounding street system by the project to 2,965 inbound and 2,874 outbound trips.

Modal Split

In all neighborhoods some trips are made without using motor vehicles. School-aged children may walk to school or walk to the home of a friend in the neighborhood. Some people walk their dogs while others walk for the health benefits or just to get outside and stretch their legs. Residents may ride bicycles for recreation or to get to and from school or work.

In dense residential neighborhoods and mixed-use commercial neighborhoods, a significant number of trips are made by pedestrians, bicyclists, and motorists who combine stops for several purposes into a single trip. Consequently, mixed-use developments can reduce the number of vehicle trips made external to as well as internal to the neighborhood.

Optimizing land use and transportation planning requires development plans that address the need for homes to be provided in close proximity to schools, retail shops, business centers, and employment opportunities. The provision of complementary land uses within close proximity facilitates the use of travel modes other than private automobiles. People are more likely to walk, cycle, or use public transportation where the available transportation infrastructure makes alternative modes of travel attractive, convenient, and safe. The use of alternative travel modes reduces the demand for roadway capacity.

The trip-generation data published by the ITE is based upon counts of motor vehicle trips associated with single-use developments where virtually all access is by private automobile and all parking is accommodated within the site. The growth of transit services in suburban areas, rising energy costs, and heightened public awareness of climate change and the need to reduce greenhouse gas emissions may affect future trip-generation rates. At the present time, adjustments for modal split are required only when a traffic study is being performed for developments in urban areas like Central Business Districts, where the use of non-automobile modes is significant.

The Coachella Valley Association of Governments (CVAG) *2004 Origin Destination Survey* found that 92 percent of all trips by Coachella Valley residents were made in private passenger cars (automobiles, sport utility vehicles, and pick-up trucks). Less than one percent of the trips in the region were completed using public transportation. Four percent of the trips in the region were completed by walking. One percent of the trips were completed by riding a bicycle. The remaining trips were completed by school buses and other modes. The majority of casino visitors and shopping area visitors travel to the region by car. More than fifty percent of all trips completed by residents of the Coachella Valley region had a vehicle occupancy of one person.

Alternative transportation modes account for less than five percent of all trips generated in the vicinity of the project, and the variations from day-to-day in the future site traffic volumes would exceed five percent. Therefore, a modal split adjustment to reduce the site-generated traffic volumes was not included to ensure that the project-related impacts are not understated.

Site Trip Distribution and Traffic Assignment

The trips generated by the proposed land development are distributed to geographic origins and destinations and then assigned to specific segments of the transportation network. The directional orientation of site traffic is determined by the geographical location of the site and the land uses that will serve as trip origins and destinations. The origin of trips inbound to the site can be affected by the size and type of development attracting the trip, the existing land uses in the surrounding area, the locations of competing developments, and the surrounding population, employment, and roadway conditions.

The CVAG *2004 Origin Destination Survey* identified the following top destinations for Coachella Valley residents:

- La Quinta Wal-Mart / Lowe's / La Quinta High School (42,200 Daily Trips)
- Town Center Mall / Palm Desert College of the Desert (36,600 Daily Trips)
- Palm Desert Costco / Home Depot (19,200 Daily Trips)
- Eisenhower Medical Center (14,100 Daily Trips)
- Palm Springs International Airport (11,900 Daily Trips)

The City of Rancho Mirage attracts 46,600 weekday trips or 6.1 percent of the weekday trips generated by households located throughout the Coachella Valley region. That represents 6.1 percent of all trips generated by the households located within the Coachella Valley. The CVAG *2004 Origin Destination Survey* found that on a typical weekday, the origins of those household trips destined for Rancho Mirage included the following:

- Palm Desert (35%)
- Rancho Mirage (33.7%)
- Palm Springs (10.5%)
- Cathedral City (8.9%)
- Indio(4.3%)
- Indian Wells (3.2%)
- La Quinta (2.4%)
- Desert Hot Springs (2.3%)
- Coachella (0.7%)

The City of Rancho Mirage attracts 7.7 percent of the home-based work trips generated by households in the Coachella Valley. The City of Rancho Mirage attracts 31 percent more home-based work commute trips than the households within Rancho Mirage generate.

Households in the City of Rancho Mirage generate 5.8 percent of the shopping trips in the Coachella Valley region. The City of Rancho Mirage attracts six percent of the household shopping trips generated within the Coachella Valley. The City of Palm Desert attracts 35.4 percent of the household shopping trips. La Quinta and Cathedral City attract 12.3 percent and 12.8 percent, respectively, of the shopping trips made by households within the Coachella Valley.

The City of Rancho Mirage attracts more than twice as many recreational trips than its households generate. Indian Wells attracts 2.5 times the number of recreational trips generated by its households. Approximately 12.2 percent of all of the Coachella Valley household recreational trips are made to destinations within the City of Rancho Mirage.

The City of Rancho Mirage attracts 5.5 times the number of medical trips generated by its households. Rancho Mirage is the top medical destination in the Coachella Valley, capturing 31.9 percent of the home-based medical trips generated within the Coachella Valley.

Site Traffic Assignment

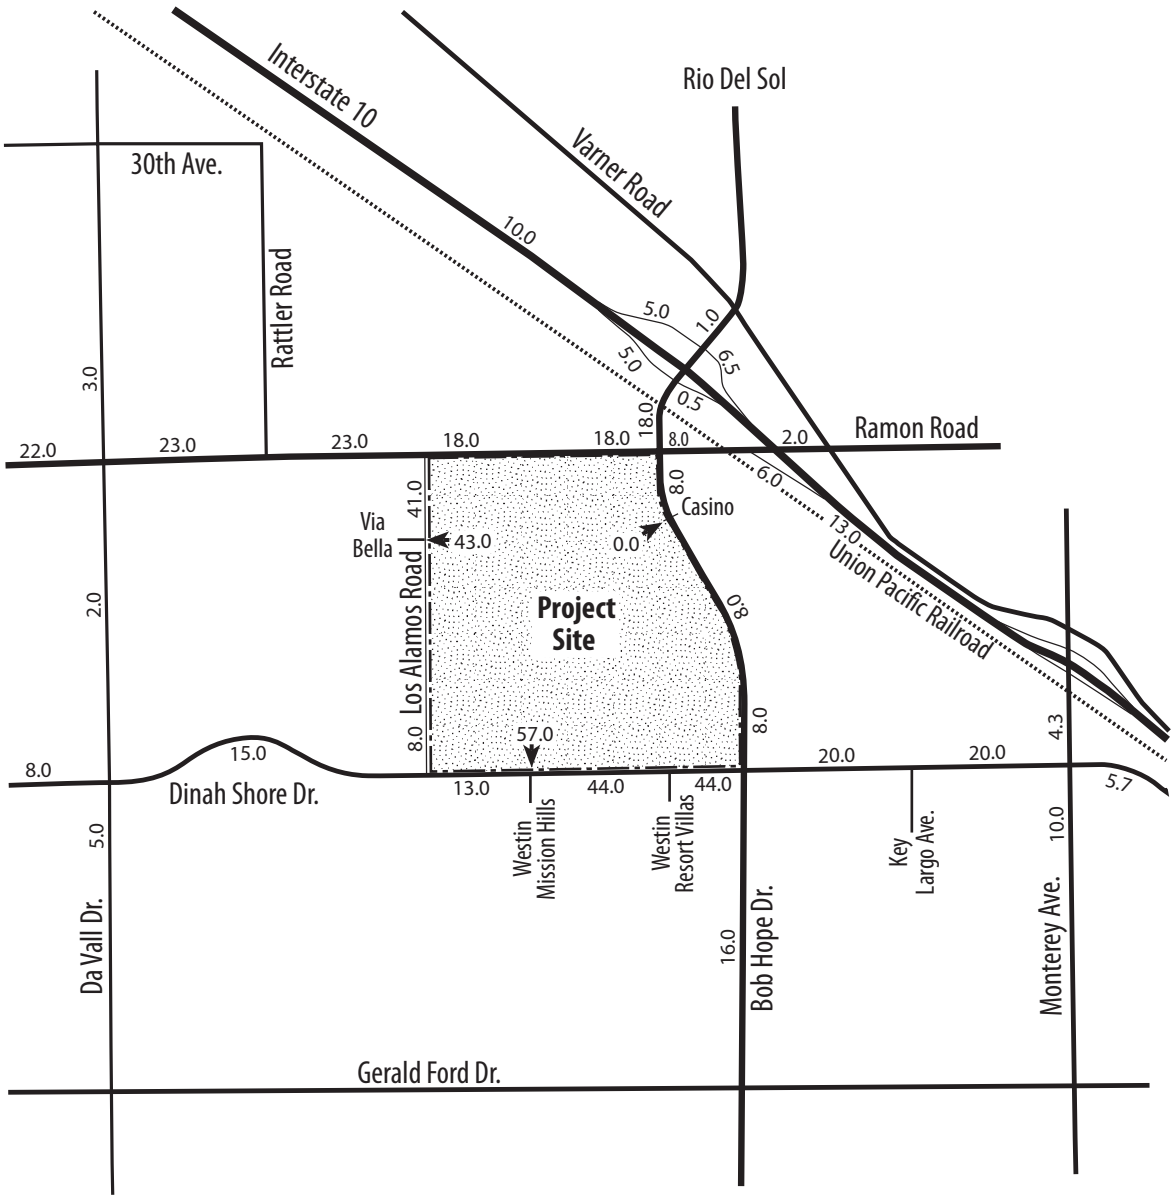
Site traffic was assigned to the surrounding street system based upon the location of the existing and future land uses that would attract site traffic and generate trips destined to the site. The proposed site access locations, any anticipated left-turn restrictions at the proposed site driveways and access to regional transportation facilities were also considered in the site traffic assignment.

The proposed initial phase of development would occur within Planning Area 8 and generate approximately 4,480 weekday trips. Planning Area 8 would be developed as a gated community with two access connections to the surrounding roadways located opposite existing intersections. The distribution of the site-generated traffic associated with the initial phase of development is shown in Figure 4-1.

The primary access for the initial phase is proposed to Dinah Shore Drive, opposite the existing signalized access to the Westin Mission Hills Golf Resort [Intersection 12]. This site access is projected to serve approximately 57 percent of the traffic generated by the initial phase (2,550 ADT). Access to Los Alamos Road would be opposite the existing unsignalized intersection at Via Bella [Intersection 8]. Approximately 43 percent of the traffic generated by the initial phase (1,930 ADT) would enter and leave Planning Area 8 via this access connection. This intersection would remain unsignalized upon completion of the initial phase of development.

The active adult community proposed in Planning Area 8 will ultimately have access to Bob Hope Drive via the westerly extension of Casino Road between Planning Areas 2 and 3 (to the north) and Planning Areas 4 and 5 (to the south). This

Figure 4-1
Site Traffic Distribution
(Initial Phase)



Legend

Endo Engineering

Scale: 1" = 3,200'

access would ultimately accommodate approximately 35 percent of the traffic generated by the initial phase (1,570 ADT) and provide the most direct connection to Interstate 10 for regional trips.

The composite directional distribution of all project-related or "site" traffic with full development of the proposed Section 24 Specific Plan is shown in Figure 4-2. The percentages shown in Figure 4-2 reflect the combination of all new inbound and outbound external project-related trips to be added to the surrounding street system. The percentages shown were determined from the combined total of 59,450 primary external weekday trips generated by the proposed project.

Figure 4-3 illustrates the distribution of the external site traffic to each of the proposed site access connections proposed along the site boundaries. It can be seen from Figure 4-3 that the land use and internal circulation plan focused the site traffic to the site access connections along Bob Hope Drive (49.1 percent of site traffic) and Ramon Road (32.7 percent of site traffic) by locating the higher intensity land uses along these two abutting arterials. The proposed land use plan and site access plan minimized the amount of site traffic that would use Los Alamos Road (6.5 percent) and Dinah Shore Drive (11.7 percent) by locating the lower intensity uses along these roadways.

Weekday Site Traffic Volumes

Table 4-3 provides the daily site-generated traffic volumes on the roadways adjacent to the key intersections on a typical weekday in the peak season. Existing peak season weekday traffic volumes are also shown in Table 4-3 that represent existing non-site ('through") traffic volumes. Site-generated traffic volumes are shown in Table 4-3 for both the initial phase of the proposed development as well as full development.

The site traffic volumes at each of the key intersections projected to occur during the morning and evening peak hours on a typical weekday in the peak season are shown in Figure 4-4. The intersection turning movement volumes shown in Figure 4-4 would be generated by the initial phase of the proposed development. The weekday peak hour turning movement volumes shown in Figure 4-4 were added to the existing non-site traffic volumes and also to the future year 2022 through traffic volumes to evaluate the impact of the initial phase of development on traffic operations at the key intersections.

Figure 4-5 shows the weekday peak hour site traffic volumes at the key intersections and the proposed full-turn site access intersections with full development of the project. These site traffic volumes were added to the existing traffic volumes and also added to the horizon year 2035 through traffic projections to assess the impact of the project on the surrounding street system. Figure 4-6 provides the site traffic volumes with full development of the Section 24 Specific Plan at the right-in/right-out driveways proposed along Ramon Road, Bob Hope Drive, and Dinah Shore Drive.

4.3 Existing Plus Site Traffic Projections

Appendix G of the CEQA Guidelines states that a project would normally have a significant effect on the environment if it could cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in the number of vehicle trips, the volume-to-capacity ratio of the streets, or congestion at intersections). With existing traffic volumes and site-generated traffic volumes, the significance of the effect of site traffic on the environment can be assessed. Evaluating the change in traffic operations at the key intersections before and after site-generated traffic is added to the existing baseline traffic can reveal the significance of project-related effects on the environment without introducing uncertainties related to cumulative developments or projected increases in background traffic volumes.

Existing Plus Initial Phase Traffic Projections

Figure 4-7 shows the existing plus initial phase peak hour traffic volumes at the key intersections. These volumes include existing traffic volumes (from Figure 3-4) as well as the site traffic volumes generated by the initial phase of the proposed project (from Figure 4-4). Table 4-3 identifies the existing plus initial phase weekday traffic volumes on area roadways.

Existing Plus Project Buildout Traffic Projections

Figure 4-8 depicts the existing plus site buildout peak hour traffic volumes at the key intersections. These volumes include existing traffic volumes (from Figure 3-4) as well as the site traffic volumes generated by buildout of the proposed project (from Figure 4-5). Table 4-3 provides the existing plus project buildout weekday traffic volumes on area roadways.

4.4 Future Through Traffic Projections

Future Traffic Volume Forecast Methodology

Through (non-site) traffic volumes are made up of trips having neither an origin nor a destination within the project site. Non-site traffic includes existing traffic and future traffic generated by developments other than the proposed project. The traffic count program quantified the existing through traffic volumes. Regional and local traffic forecasting models are a good source of future traffic projections.

The assumptions used in any model must be reviewed to determine if the future projections include any future traffic associated with development within the project site that was anticipated by local and regional general plans and regional growth forecasts. If site traffic is included, it must be removed to develop future non-site traffic projections.

RIVTAM provides a source for future travel demand estimates that can be used in preparing Federal and California environmental clearance documents. The most recent socioeconomic input data was used in RIVTAM. It covers the entire six-county SCAG Region. The model was calibrated and validated using year 2007 travel statistics. The use of RIVTAM to identify the future growth in traffic demand was determined to be the most comprehensive approach and the most appropriate method of projecting future traffic volumes associated with development within the surrounding area and Riverside County for the horizon year 2035. Background traffic volumes for the year 2022 were developed by interpolating between existing traffic volumes and year 2035 non-site traffic volumes, assuming that the growth in the travel demand is geometric.

The Riverside County Transportation Commission recognizes use of the Riverside County Traffic Analysis Model to analyze traffic impacts associated with development proposals or land use plans. Riverside County and the members of CVAG have approved RIVTAM as the regional traffic model for Riverside County, including the Coachella Valley. Future traffic projections from RIVTAM represent the best available traffic projections for the study area and the horizon year 2035.

Base year 2008 and future horizon year 2035 land use forecasts were provided by individual jurisdictions and Riverside County for use in developing the socioeconomic input data required by RIVTAM. The 2035 SCAG population and employment growth projections were allocated by area, based on the existing and proposed future land use forecasts identified by each jurisdiction. Riverside County planners provided estimates for Tribal lands and unincorporated areas.

To ensure consistency with the forecasts being used for projects throughout the Coachella Valley and Riverside County, the RIVTAM was used to forecast the horizon year 2035 travel demand within for the study area.[4] The socioeconomic data (SED) used by this travel demand forecasting model were modified for the project site to reflect project buildout conditions with development at the maximum density/intensity allowed by the proposed Section 24 Specific Plan. The RIVTAM Traffic Analysis Zones and socioeconomic assumptions for the proposed project are provided in Appendix 2.

RIVTAM has a detailed zonal system, a portion of which includes the study area, as shown in Appendix 2. It uses updated household trip generation and attraction models, an expanded modal choice model, a parking-cost model and improved factors for representing peaking characteristics. Trip type variables for home-based work trips include: household size, household income, and the number of workers. Home-based non-work trip and non-home-based trip variables include: the number of adults, workers, children, income, and vehicle availability.

The boundaries for the Section 24 Specific Plan conform to RIVTAM Traffic Analysis Zone (TAZ) 4637. Prior to the SED changes made in RIVTAM to evaluate the proposed project, the SED for TAZ 4637 included: 97 households, a population of 257 residents, and a total employment of 246 (jobs). After modifications were made to reflect project completion at the maximum intensity/density allowed by the Section 24 Specific Plan, the SED for TAZ 4637 included: 2406 households, a population of 4,331 residents, and a total employment of 6,277 (jobs).

Year 2035 RIVTAM Projections

The RIVTAM horizon year 2035 daily traffic projections include both site traffic and the growth in background traffic on the roadway network. However, determining the significance of site traffic impacts requires an evaluation of the future peak hour turning movement volumes at the key intersections within the study area. To determine the future peak hour turning movement volumes, the site was modeled using data from recent peak hour traffic counts made at the key intersections and ITE trip-generation rates to estimate the future weekday and peak hour site traffic volumes as well their inbound and outbound directional distribution.

Using a detailed manual traffic assignment consistent with the distribution developed from the RIVTAM projections, peak hour and daily site traffic volumes were distributed to the surrounding street system. By subtracting the daily site traffic from the RIVTAM projections, the weekday "through" traffic volumes for the horizon year 2035 were determined for the roadway network within the study area.

Year 2035 non-site peak hour turning movement projections were developed by assuming that the increase in peak hour volumes between the year 2013 and the year 2035 would reflect the increase in the daily volumes. Each existing turning

---

[4] RIVTAM was developed by Iteris, Inc. and AFSHA Consulting, Inc., for the Riverside County Transportation Department, CVAG, the Riverside County Transportation Commission (RCTC), and the Western Riverside Council of Governments. AFSHA Consulting, Inc. developed new RIVTAM projections for the horizon year 2035 with revised socioeconomic data for TAZ 4637 reflecting buildout of the project site at the maximum development intensity that would be allowed by the proposed Section 24 Specific Plan. The previous socioeconomic data and the trips associated with that data were replaced.

movement volume was multiplied by the ratio of the future year 2035 daily traffic projection divided by the current weekday traffic volume on both intersection legs associated with that turning movement. The increase in non-site peak hour turning volumes was normalized to the growth in daily traffic volumes to ensure that the future peak hour volumes would accurately reflect the overall increase in daily traffic volumes. In any instances where the current volume exceeded the future volume projection (or a future projection was not available from RIVTAM) the current volume was increased by ten percent and assumed to reflect the future year 2035 non-site traffic volume.

The daily project-related traffic volumes were subtracted from the year 2035+project daily RIVTAM projections to identify horizon year 2035 through traffic volumes. For any roadway segments not included in RIVTAM (such as Rattler Road and Key Largo Avenue) a ten percent growth in the existing traffic volumes was assumed. The through traffic volumes for the year 2022 shown in Figure 4-9 were determined by interpolation between the existing traffic volumes and the horizon year 2035 through traffic projections, assuming the traffic growth is geometric. The horizon year 2035 non-site peak hour traffic volumes are shown in Figure 4-10.

Cumulative Traffic Projections

Although the increase in travel demand associated with development throughout Southern California, Riverside County, and the cities within Coachella Valley was addressed with the RIVTAM year 2035 traffic projections, the peak hour turning volumes associated with two cumulative projects within the study area that will be completed in the near-term may not be adequately addressed at the key intersections by the RIVTAM projections. The Pelagic Residential project, Tentative Tract Map 36553, includes 122 single-family detached dwelling units and is located on the west side of Rattler Road, north of Ramon Road. The Rancho Mirage Rehabilitation Hospital (Tentative Parcel Map 31761) is located on the southeast corner of the intersection Da Vall Drive and Ramon Road, and includes an access on both Ramon Road and Da Vall Drive.

Development details related to the two cumulative projects were obtained from the City of Rancho Mirage "Development Activity Summary" dated February 5, 2014. The trips that would be generated by these two approved projects were estimated, as shown in Table 4-4. They were assigned to the surrounding street system and added to the future year 2022 non-site traffic volumes developed from the RIVTAM projections.

Table 4-4
Cumulative Weekday Trip-Generation Forecast[a]

Land Use Category	Land Use Quantity[b]	Morning Peak Hour In	Out	Total	Evening Peak Hour In	Out	Total	Daily 2-Way
PELAGIC RESIDENTIAL TTM36553/PDP13005	122 DU	24	71	95	79	46	126	1,250
RANCHO MIRAGE REHAB. HOSPITAL TPM31761/PDP07012[c]	64.768 TSF	43	30	73	31	43	74	1,070
TOTAL		67	101	168	110	89	200	2,320

a. Based upon trip-generation data published by the ITE in *Trip Generation* (8th Edition, December, 2008). The ITE Land Use Codes (LUC) assumed include: LUC 210 for Single Family-Detached Residential Dwellings; LUC 610 for Hospital uses.
b. DU=Dwelling Units. TSF=Thousand Square Feet of Building Floor Area.

As shown in Table 4-4, the two cumulative projects would generate a combined total of approximately 2,320 weekday trips when completed. Of that total, 168 trips (67 inbound and 101 outbound) are expected to occur during the morning peak hour and 200 trips (110 inbound and 89 outbound) are expected to occur during the evening peak hour. The traffic volumes generated by these two cumulative projects were distributed to the adjacent streets based on the distribution of peak hour counts made at the intersection of Rattler Road and Ramon Road. Fifty-seven percent of the traffic from both cumulative projects was assigned to the west and forty-three percent of the traffic was assigned to the east. The cumulative traffic was added to the year 2022 non-site traffic volumes developed from RIVTAM to determine the year 2022 through traffic volumes.

Endo Engineering

Any location where the year 2035 non-site traffic projection did not specifically include the traffic from the two cumulative projects was identified by comparing the 2035 non-site traffic volumes to the year 2022 plus cumulative traffic volumes. At two locations [Intersections 3 and 4] the year 2035 through traffic volumes were increased to reflect the higher year 2022+cumulative traffic volumes.

Year 2022 Through Traffic Projections

The existing peak hour turning movements were proportionately increased to reflect year 2022 peak hour through turning movement volumes, based upon the difference between the existing daily volumes and the year 2022 through daily traffic projections. Figure 4-9 presents the peak hour through traffic volumes at the key intersections, prior to the addition of site traffic generated by the initial phase of the proposed project.

Horizon Year 2035 Through Traffic Projections

The existing peak hour turning movements were proportionately increased to reflect year 2035 through peak hour turning movement volumes, based upon the difference between the existing daily volumes and the year 2035 daily through traffic projections. Figure 4-10 illustrates the peak hour through traffic volumes at the key intersections in the year 2035, prior to the addition of site traffic.

4.5 Future Total Traffic Projections

Once the through traffic volumes were projected for each of the future analysis years, the traffic volumes generated by the proposed project were added to the roadways and intersections in the study area to obtain the total future traffic volumes. This process reflected the location of each proposed land use within the site as well as the proposed internal circulation and site access plans.

Year 2022 Total Traffic Projections

Figure 4-11 depicts the year 2022 total peak hour traffic volumes at the key intersections. These volumes include through traffic volumes for the year 2022 (from Figure 4-9) as well as the site traffic volumes generated by the initial phase of the proposed project (from Figure 4-4). Since the initial phase of project development does not include shopping opportunities on-site, the site access turning volumes for the senior housing development may exceed the year 2035 volumes. Table 4-5 identifies the year 2022 weekday through traffic volumes, and total traffic volumes with the proposed project on the roadways within the study area.

Horizon Year 2035 Total Traffic Projections

Figure 4-12 depicts the horizon year 2035 total peak hour traffic volumes at the key intersections and the site access intersections. These volumes include year 2035 through traffic volumes as well as site traffic volumes upon buildout of the proposed project (from Figure 4-5). Table 4-5 identifies the horizon year 2035 weekday through traffic volumes, and total traffic volumes with the proposed project on the roadways within the study area.

Horizon Year 2035 Total Traffic Projections By Alternative

Table 4-6 provides the total traffic projections by development alternative for various roadway segments within the study area in the horizon year 2035. In addition, ambient traffic projections for the year 2035 are shown that assume no on-site development. The traffic projections shown in Table 4-6 reflect weekday conditions during the peak season with three development alternatives other than the proposed development. These alternatives include development per: (1) the *City of Rancho Mirage General Plan* land use designations; (2) the *Riverside County General Plan* land use designations; and (3) the proposed Section 24 Specific Plan land uses with 1,200 conventional (without age restrictions) single-family detached dwelling units within Planning Area 8.

5.0 TRAFFIC ANALYSIS

The evaluation of the change in roadway operating conditions resulting from traffic generated by the Section 24 Specific Plan is presented below. The analysis addresses existing, near-term future and long-term future conditions with and without the initial phase and full development of the uses that would be permitted by the proposed Section 24 Specific Plan. These analyses were conducted to identify the transportation-related implications of the project and any improvements necessary to ensure acceptable traffic operating conditions in the future. Peak hour capacity and level of service analyses were performed for each of the unsignalized and signalized key intersections as well as the primary full-turn site access intersections. The future peak hour traffic operations at the site access connections proposed along the perimeter of the project site that would be restricted to right-in/right-out movements were not evaluated from a control delay and level of service perspective. Evaluation of these intersections was deemed unnecessary because these intersections would have few conflicting movements and operate with relatively little control delay in the future.

The Riverside County Transportation Analysis Model (RIVTAM) horizon year 2035 traffic projections were utilized to ensure that regional development throughout Southern California would be taken into account. RIVTAM was modified to incorporate socioeconomic (SED) data reflecting full development of the land uses that would be permitted by the proposed Section 24 Specific Plan. RIVTAM assigned trips from the project site taking into account both capacity constraint and travel time considerations. This approach was used to ensure that the recommendations in Section 6 would meet the mobility needs of the proposed development as well as those of other existing and future developments generating trips that will pass through the study area in the horizon year 2035.

Other factors considered in the traffic impact evaluation included: traffic safety, traffic control needs, transit needs, pedestrian and bicycle movements, emergency vehicle and service/delivery vehicle access, and the adequacy of both on-site and off-site reservoirs for vehicle queuing. Section 5.6 (Other Considerations) includes a discussion of several special issue topics considered relevant to the potential impacts of the proposed project on transportation within the study area. These topics include:

- Future improvements of Dinah Shore Drive and Los Alamos Road adjacent to the site;
- Future improvements at the intersection of Bob Hope Drive and Ramon Road;
- Future conditions at the intersection of Bob Hope Drive and Varner Road; and
- Future conditions on Interstate 10.

5.1 Thresholds of Significance

The National Environmental Policy Act (NEPA) like the California Environmental Quality Act (CEQA) sets forth a policy of environmental protection and a protocol by which all agencies make environmental protection part of their decision-making process in their respective jurisdictions. NEPA applies only to projects receiving federal funding or approval by federal agencies, whereas CEQA applies only to projects receiving any form of state or local approval, permit, or oversight. CEQA makes environmental protection mandatory by requiring state and local agencies to follow a protocol of analysis and public disclosure of environmental impacts of proposed projects as well as adopt all feasible measures to mitigate those impacts

Under CEQA, every agency in the state of California is encouraged to develop and publish independent thresholds of significance supported by substantial evidence, against which to compare the environmental impacts of projects. A lead agency would normally consider the impacts of a project significant if, and only if, they would exceed the established thresholds. In the absence of significance thresholds developed by lead agencies, impact assessments apply the significance criteria detailed in the CEQA Guidelines: Appendix G "Environmental Checklist Form".[1]

Appendix G of CEQA Guidelines identify projects that would normally have a significant effect on transportation as those that would:

- Cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume-to-capacity ratio on roads, or congestion at intersections.
- Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways.

---

[1] California Resources Agency. *CEQA Guidelines*: Appendix G "Environmental Checklist Form". December 1, 2005.

- Substantially increase hazards due to a design feature (such as sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
- Result in inadequate emergency access.
- Result in inadequate parking capacity.
- Conflict with adopted policies, plans or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks).

Lead agencies may defer to other local or regional agencies with published guidelines for the resources they regulate. Under CEQA, if the lead agency determines that the project may have significant environmental impacts, the lead agency must prepare an environmental impact report (EIR).

The Riverside County *Traffic Impact Analysis Preparation Guide* (April, 2008) states that the following types of traffic impacts are considered to be "significant" under CEQA:

- When existing traffic conditions exceed the General Plan target LOS.
- When project traffic, when added to existing traffic, will deteriorate the LOS to below the target LOS, and impacts cannot be mitigated through project conditions of approval.
- When cumulative traffic exceeds the target LOS and impacts cannot be mitigated through the TUMF network (or other funding mechanism), project conditions of approval, or other implementation mechanisms.

5.2 Local and Regional Performance Standards

Various agencies with jurisdiction over portions of the transportation system have adopted performance standards for use in determining the future infrastructure needed to accommodate projected travel demands. The agencies with jurisdiction over the transportation facilities within the study area include: (1) the California Department of Transportation (Caltrans), (2) the Riverside County Transportation Commission (as the designated Congestion Management Agency for Riverside County), (3) the Riverside County Land Management Agency, (4) the City of Rancho Mirage, (6) the City of Cathedral City, and (7) the City of Palm Desert. Each of these agencies has adopted roadway performance standards.

Caltrans LOS Standard

Caltrans is responsible for monitoring freeway performance and developing plans and strategies to address any deficiencies on State Highways and other State-operated facilities. Caltrans is responsible for traffic operations on Interstate 10 and at the signalized intersections of the Interstate 10 freeway ramps on Bob Hope Drive and on Ramon Road. Caltrans also evaluates development projects of local and regional significance to determine if they will impact the State transportation system and work with lead agencies to develop potential mitigation measures.

Caltrans District 8 has jurisdiction over Interstate 10 and the traffic signal timing for ramps that provide access to Interstate 10. For freeway segments, Caltrans requires an operational analysis based on the methods outlined in the *Highway Capacity Manual* (HCM 2000). For basic freeway segments, the measure of effectiveness is density in terms of passenger cars per mile per lane. The truck mix is needed to expand the traffic volume on the freeway segment to passenger car equivalents (PCEs) and the performance standard throughout California is set at the transition between LOS C and LOS D.

However, the Interstate 10 Route Concept Fact Sheet (Caltrans, March 2000) which is currently being updated identified future right-of-way requirements and a design concept to accommodate buildout of the local general plans with a target of maintaining LOS "E" during the peak periods in the urbanized and urbanizing areas and LOS "C" in the rural areas. The rationale for maintaining these levels of service was "to achieve a reasonable balance between desired levels of mobility and forecasted traffic with consideration of development abutting rights of way and constrained financial transportation resources".

CMP LOS Standard

The Riverside County Transportation Commission (RCTC) has jurisdiction over all intersections and segments along the CMP System of Highways and Roadways within Riverside County. The CMP System includes all State highways (Interstate

10 and Highway 111) and the following Principal Arterials: Ramon Road (west of I-10), and Monterey Avenue (between I-10 and Highway 111). RCTC requires LOS analyses to be conducted using HCM-based methods.

The minimum level of service standard for intersections and roadway segments within the CMP System of Highways and Roadways is LOS E unless the intersection or segment had a lower level of service or LOS F in 1991 when the baseline CMP data was collected. Such facilities are exempt from CMP deficiency plan requirements. However, if the level of service is improved to LOS E or better after 1991, the LOS must then be maintained. Intersections or street segments that have dropped to LOS F since 1991 would be subject to the development of a deficiency plan prepared by the local agency where the deficiency is located, following coordination with other agencies identified as contributors to the deficiency. The deficiency plan must contain mitigation measures (including TDM strategies and transit alternatives) and a schedule for mitigating the deficiency. The Riverside County Transportation Commission prepares deficiency plans for the State Highway System when deficiencies are identified by local jurisdictions.

County of Riverside Target LOS

"The existing *Riverside County Comprehensive General Plan* establishes Level of Service C as a target for all county maintained roadways and conventional State highways, except that LOS D could be allowed in urban areas at intersections of any combination of Major Streets, Arterials, Expressways, or conventional State highways within one mile of a freeway interchange, and also at freeway ramp intersections. Current policy requires development projects to mitigate impacts on roadways based on the LOS C standard. Current General Plan policy also permits allowing development projects to mitigate to LOS D, subject to Board of Supervisors approval, in those instances where mitigation to LOS C is deemed to be impractical."[2] The *Western Coachella Valley Area Plan* states that LOS D may be allowed in Community Development areas at intersections of any combination of secondary highways, major highways, arterials, urban arterials, expressways, conventional state highways or freeway ramp intersections. LOS E may be allowed in designated community centers, to the extent that it would support transit-oriented development and walkable communities.

Riverside County policy also permits applying city standards to development within the Sphere of Influence of an incorporated jurisdiction where annexation to the city will logically occur in the short to intermediate range future. Riverside County considered the impact of the *Riverside County Comprehensive General Plan* to be significant if it would decrease the LOS on a freeway segment below LOS E. The key intersections located within unincorporated Riverside County are also within the City of Rancho Mirage Sphere of Influence. The methodology provided in the *Highway Capacity Manual* (HCM 2000) is required by Riverside County for the intersection analysis.

City of Rancho Mirage LOS Policy

The Circulation Element includes as a policy, the provision and maintenance of Level of Service D operation for the Rancho Mirage circulation network, based upon peak hour intersection operation. The City of Rancho Mirage requires individual development projects to analyze the LOS at individual intersections to ensure that development projects do not create bottlenecks at the intersections of the roadway system whose roadway widths and rights-of-way were previously examined in the year 2005 in conjunction with the *Rancho Mirage General Plan* update process. Rancho Mirage experiences significant seasonal fluctuations in traffic demand with the peak traffic flows occurring in the winter months.

Cathedral City LOS Standard

For planning and design purposes, Cathedral City has also established Level of Service "D" as minimum peak hour system performance standard for traffic volumes on the roadway system. Cathedral City experiences seasonal variations in traffic volumes associated with tourism and part-year residents. The Cathedral City General Plan addresses peak season traffic conditions.

City of Palm Desert Target LOS

The Circulation Element of the *City of Palm Desert General Plan* states that peak hour intersection operation at LOS "C" or better is generally acceptable. However, as traffic volumes in the City increase, LOS "C" represents a standard that is progressively more difficult and costly to achieve in urban areas. For peak operating periods, LOS "D" and/or a maximum

---

2 RCIP *Riverside County Comprehensive General Plan Environmental Impact Report*. pp 4.16-11.

volume to capacity ratio of 0.90 is provisionally considered the generally acceptable service level. The City of Palm Desert LOS "C" goal should only be exceeded where maximum feasible intersection improvements have been implemented.

5.3 Capacity and Level of Service Analysis

Roadway Capacity

A given lane or roadway may provide a wide range of service levels, depending upon traffic volumes and speeds. Roadway capacity has been defined as the maximum number of vehicles that can pass over a given roadway during a given time period under prevailing roadway and traffic conditions. The capacity of a roadway that is used for design purposes (which is generally set at either the upper limit of LOS C or LOS D) is the level at which the facility is handling the maximum traffic volume that it can accommodate while maintaining an acceptable level of driver satisfaction.

The maximum capacity of a roadway is generally defined at the upper limit of LOS E and reflects the maximum traffic volume that a roadway can theoretically handle. The maximum capacity is determined from roadway factors (such as lane widths, lateral clearance, shoulders, surface conditions, alignment and grades) as well as traffic factors (such as vehicle composition i.e. truck and bus mixture, distribution by lane, peaking characteristics, traffic control devices, intersections, etc.).

Street geometric design features that may be less than ideal and adversely affect operating conditions include: narrow lanes and/or shoulders, street grades, constrained design speeds (sharp horizontal and vertical curves), excessive or poorly spaced intersections, private driveways for adjacent development, and a lack of turn lanes. The *Highway Capacity Manual* can be used to identify these features and determine the traffic volumes that can be served by streets with less than ideal design features.

Level of Service Criteria

Levels of service (LOS) are commonly used to describe how well a transportation facility operates from the traveler's perspective. Levels of service use a familiar scale ranging from LOS A (best) to LOS F (worst). Levels of service can be used to describe the performance of a highway segment or intersection with LOS A used to characterize essentially free flow operation and LOS F used to reflect substantial congestion, long delays and stop-and-go operation. LOS has been widely adopted as a standard or criterion on which decisions are based regarding the approval of land development, upgrading traffic control systems, and allocating costs for mitigating traffic impacts.

A change in average control delay from 35 to 55 seconds per vehicle (i.e., LOS C to LOS D) indicates that the roadway performance has transitioned from one range to another and that change would be perceived by drivers. No change in LOS indicates that the average delay may have increased, but the change would not be perceived by drivers.

Levels of service are defined by one or more measures of effectiveness such as: speed and travel time, traffic volume, geometric features, traffic interruptions, delays, the ability to move freely, driver comfort and convenience, and vehicle operating costs. For peak hour traffic operations at intersections, the six levels of service are based on relative levels of driver acceptability of delay. Since drivers are willing to accept more delay at signalized than unsignalized intersections, separate ranges of delay have been identified for LOS based on the intersection control type, as shown in Table 5-1.

The preferred method of gauging congestion is to evaluate intersection operations during the peak hours, since the approach lane configuration at intersections represents the limiting factor in the capacity of the transportation system. A peak hour intersection analysis requires more data but can more clearly define the circulation system performance characteristics. Once these characteristics are known, the intersection approach lanes and traffic control required to accommodate the travel demands and meet the applicable intersection performance standards can be determined.

Methodology Overview

The *Highway Capacity Manual* (HCM) provides the best available techniques for determining capacity, delay, and levels of service for transportation facilities.[3] A brief discussion of the *Highway Capacity Manual* operational methodologies for signalized and unsignalized intersections is provided in Appendix 3. The relationship between peak hour intersection control delay and levels of service is shown in Table 5-1.

---

[3] *Highway Capacity Manual;* Fourth Edition; TRB Report 209; Transportation Research Board, National Research Council; Washington, D.C.; 2000.

Table 5-1
Intersection Level of Service Criteria

Level of Service (LOS)	Average Control Delay (Seconds/Vehicle)		Traffic Flow Characteristics
	Signalized	Unsignalized	
A	≤ 10	≤ 10	Good progression, few stops, and short cycle lengths. Most vehicles arrive during the green phase and many do not stop. Little or no delay at unsignalized intersections.
B	> 10 and ≤ 20	> 10 and ≤ 15	Good progression, short cycle lengths or both. More vehicles stop than with LOS A, causing higher levels of average delay. Short traffic delays at unsignalized intersections.
C	> 20 and ≤ 35	> 15 and ≤ 25	Satisfactory operation with fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear. Cycle failure occurs when a given green phase does not serve queued vehicles and overflow occurs. A significant number of vehicles stop but many pass through without stopping. Average traffic delays at unsignalized intersections.
D	> 35 and ≤ 55	> 25 and ≤ 35	Tolerable delay, where congestion becomes more noticeable and many vehicles stop. Individual cycle failures are noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high V/C ratios. Long traffic delays at unsignalized intersections.
E	> 55 and ≤ 80	> 35 and ≤ 50	Unstable flow with poor progression, frequent cycle failures, long cycle lengths and high V/C ratios. Individual cycle failures and long queues are frequent occurrences. This is considered the limit of acceptable delay by many agencies. Very long traffic delays at unsignalized intersections.
F	> 80	> 50	Considered unacceptable to most drivers. Arrival flow rates exceed the discharge capacity of intersection with many individual cycle failures. Poor progression and long cycle lengths as well as high V/C ratios and high delay. Unacceptable traffic delays at unsignalized intersections.

Source: *Highway Capacity Manual,* Special Report 209, Transportation Research Board, Fourth Edition, 2000; pp. 10-16.

The Highway Capacity Software (HCS+) package is a direct computerized implementation of the HCM 2000 procedures. It is prepared under FHWA sponsorship and maintained by the McTrans Center at the University of Florida Transportation Research Center. The most recent version of HCS+ (Version 5.3) was employed to assess the key intersections in the project vicinity. The computerized HCS+ worksheets are included in Appendix 3.

An eight percent truck mix was assumed for the peak hour operational analysis of existing and year 2022 conditions. A five percent truck mix was assumed for the future year 2035 operational analyses. The peak hour factors determined from the peak hour traffic counts at the existing key intersections were assumed for the existing and year 2022 operational analyses.

The horizon year 2035 analysis assumed a peak hour factor of 1.0. The existing approach lane geometrics at the key intersections are shown in Figure 6-1. Figure 6-2 illustrates the minimum lane geometrics required for the initial phase of the proposed development. Figure 6-3 illustrates the minimum required approach lane geometrics and traffic control assumed for existing plus project buildout conditions. Figure 6-4 illustrates the minimum required approach lane geometrics and traffic control assumed for conditions in the horizon year 2035. The approach lanes therein represent: (1) existing lanes; (2) lanes required to eliminate off-site intersection deficiencies; and (3) future lanes recommended to ensure adequate site access. Ultimately, the circulation system within the study area may have additional lanes beyond those shown in Figure 6-4.

Performance Standard Addressed

No scientific method exists for deciding the maximum degree of congestion that might be accepted as a basis for design. The level of congestion considered acceptable for a street or intersection will vary from one agency to another and from one community to another. The expectations of people using a street will also vary by facility type, day of the week, and time of the day. The degree of congestion that the public is willing to accept as reasonable remains a local decision.

For conditions to be tolerable, the traffic demand must not exceed the capacity of a street or highway to prevent complete stoppages or stop-and-go driving conditions. This design principle is reflected in the Congestion Management Program performance standard of LOS E. The attitude of motorists toward adverse operating conditions is influenced by their awareness of the construction and right-of-way costs necessary to provide better service. This design principle is reflected in the willingness of the City of Palm Desert to accept LOS D provisionally, in densely developed areas where facilities have been fully improved and high land values would make achieving LOS C extremely costly.

Adopting a higher level of service performance standard may be reasonable in rural areas where travel demands are relatively stable throughout the year and traffic densities and traffic congestion are relatively low. The cost of correcting deficiencies is lower in rural areas where the adjacent land is less densely developed and land values are low compared to urban and suburban areas.

The seasonal variation in travel demand within the study area is much greater than it is within Riverside County as a whole. Adopting LOS D as the minimum performance standard during the peak hours in the peak season in areas where the seasonal population is nearly equal to the number of permanent residents would result in LOS C conditions when seasonal visitors are not present. That means during more than half of the year, LOS C or better conditions would be expected during the peak hours. While all jurisdictions should strive to provide the highest level of service that is feasible, in heavily developed areas, conditions may necessitate the use of LOS D for arterials. AASHTO suggests that “For some urban and suburban highways, conditions may necessitate the use of level of service D.”[4]

All of the key intersections that have corners located within unincorporated Riverside County are also within the Sphere of Influence of Rancho Mirage. The *Riverside County Comprehensive General Plan* states that for development within the Sphere of Influence of an incorporated jurisdiction, city standards should generally apply where annexation to the city will logically occur in the short to intermediate range future. Level of Service "D" was utilized as the target intersection service level during peak hours in the peak season. This performance standard is utilized by the City of Rancho Mirage and City of Cathedral City.

Two of the key intersections are under the jurisdiction of both the City of Rancho Mirage and the City of Palm Desert. Although Palm Desert has identified LOS C as a target, for peak operating periods, LOS “D” and/or a maximum volume to capacity ratio of 0.90 is provisionally acceptable where maximum feasible intersection improvements have been implemented. Maximum feasible intersection improvements have been implemented at the intersection of Monterey Avenue and Dinah Shore Drive [Intersection16]. Therefore, LOS D was assumed as the target LOS for this intersection. The intersection of Key Largo Avenue and Dinah Shore Drive [Intersection15] is not fully improved, but not expected to exceed LOS C in the future.

Operational Analysis

Existing Conditions (Year 2013 - Peak Season)

The evaluation of peak hour traffic operations at the seventeen key intersections in terms of control delay and levels of service (LOS) is summarized in Tables 5-2 and 5-3. All of the key intersections currently provide LOS C or better operation during the peak season with the existing traffic volumes, intersection approach lane configurations, and traffic control.

As shown in Table 5-2, the unsignalized intersection of Los Alamos Road with Via Bella [Intersection 8] is providing a very high level of service (LOS A) during the peak hours for all movements. The unsignalized northbound approach at the intersection of the Westin Resort Villas access with Dinah Shore Drive [Intersection 13] currently operates at LOS B during the morning peak hour and LOS C during the evening peak hour. The northbound volumes at this intersection are substantially below the minimum peak hour traffic signal warrant and are not expected to warrant signalization in the future.

a. Delay = Intersection Control Delay (seconds per vehicle). Assumes intersection geometrics shown in Figure 6-1 and Figure 6-2 and an eight percent truck mix. Based upon the *Highway Capacity Manual* signalized operation methodology implemented by the Highway Capacity Software (HCS+ Version 5.3). LOS is the intersection level of service. LOS was determined from the delay (≤10 sec./veh.=LOS A; >10 and ≤20 sec./veh.=LOS B; >20 and ≤35 sec./veh.=LOS C; >35 and ≤55 sec./veh.=LOS D; >55 and ≤80 sec./veh.=LOS E; >80 sec./veh. = LOS F) per 2000 HCM page 10-16. See Appendix 3 for the signalized intersection HCS worksheets.

Existing Plus Project (Initial Phase) Conditions

All of the key intersections evaluated will continue to operate at acceptable levels of service during the peak hours upon completion of the initial phase of the proposed development. The traffic generated by the active adult community will change the peak hour level of service at two of the intersections evaluated. Both of these intersections would provide direct access to the active adult community proposed within Planning Area 8.

The addition of the traffic associated with the initial phase of the proposed project to existing traffic volumes would result in an increase in the average control delay during the peak hours of up to one second per vehicle traveling eastbound on Via Bella at Los Alamos Road [Intersection 8]. As shown in Table 5-2, the project-related increase in average control delay experienced by these motorists during the peak hours is expected to change the level of service on this approach from LOS A to LOS B. This increase in delay would most likely not be perceived by motorists, since the eastbound approach would continue to operate at LOS B, which is considered an acceptable level of service associated with relatively low levels of delay. Most of the vehicles passing through this intersection would be traveling northbound or southbound on Los Alamos Road, which is projected to operate with an average of 7.5 seconds per vehicle of control delay. This level of control delay is indicative of LOS A operation. Many motorists on Los Alamos Road will pass through the intersection at Via Bella during the peak hours with no control delay.

As shown in Table 5-3, the increase in the average control delay of 5.1 seconds per vehicle associated with the proposed site access connection opposite the existing signalized intersection of the Westin Mission Hills Access and Dinah Shore Drive [Intersection 12] would cause the morning peak hour level of service to drop from LOS A to LOS B. No change in the level of service at this intersection during the evening peak hour is projected to occur when the active adult community is developed.

Existing Plus Project Buildout Conditions

As shown in Table 5-4, the addition of the site traffic associated with buildout of the proposed project to existing traffic volumes would result in a potential operational deficiency at one intersection [Intersection 13]. That deficiency would be avoided through the installation of traffic control signals in conjunction with the implementation of the proposed Section 24 Specific Plan. A traffic control signal would be installed in conjunction with the site access connection proposed opposite the existing Westin Resort Villas access on Dinah Shore Drive [Intersection 13] and activated when warranted by site traffic volumes. With traffic signal control, this intersection would operate at LOS A during the morning peak hour and maintain LOS C operation during the evening peak hour.

The addition of site traffic associated with buildout of the proposed project to existing traffic volumes would result in a drop in the morning peak hour LOS at two intersections where site access connections are proposed. The eastbound approach at the unsignalized intersection of Los Alamos Road and Via Bella would experience a drop from LOS A to LOS B when site traffic is added.

As shown in Table 5-5, the addition of site traffic to existing traffic volumes at the signalized intersection of Bob Hope Drive and Casino [Intersection 9] would cause an increase in the average intersection delay of 17.6 seconds per vehicle during the morning peak hour. An increase in average control delay of this magnitude would be noticeable to motorists and decrease the level of service provided by this intersection from LOS A to LOS C.

The addition of site buildout traffic to the existing traffic volumes at the signalized key intersections would cause a drop in the evening peak hour levels of service at eight of the key intersections. The level of service is projected to drop from LOS A to LOS B at three of the key intersections including: Los Alamos Road at Ramon Road, the Eastbound I-10 Ramps at Ramon Road, and Los Alamos Road at Dinah Shore Drive. The level of service is projected to drop from LOS B to LOS C at the intersection of Bob Hope Drive with the Westbound Interstate 10 Ramps.

The level of service is projected to drop from LOS C to LOS D at three intersections including: Da Vall Drive at Ramon Road, Monterey Avenue at Dinah Shore Drive, and Bob Hope Drive at Gerald Ford Drive. The level of service is projected to drop from LOS A to LOS D at the intersection of Bob Hope Drive with Casino. Provided intersection 13 is signalized when warranted in conjunction with the implementation of the Section 24 Specific Plan, all of the key intersections would provide acceptable levels of service with existing plus project buildout traffic volumes and the site access improvements proposed at intersections 8, 9 and 13.

Table 5-4
Existing Weekday Peak Hour Delay and Levels of Service[a]
At the Unsignalized Key Intersections With and Without Project Buildout

a. Appendix 3 includes the HCS worksheets. The values shown assume an eight percent truck mix and the intersection geometrics and traffic control shown in Figure 6-1 and Figure 6-3. NA=Not Applicable. The change in delay and LOS associated with site traffic is not directly comparable if an intersection is unsignalized without the proposed project but signalized with the project.

b. Delay=average control delay (seconds/vehicle) for the left-turn move from the major street onto the minor street. LOS was determined from the delay (0-10 sec./veh. = LOS A; 10-15 sec./veh. = LOS B; 15-25 sec./veh. = LOS C; 25-35 sec./veh. = LOS D; 35-50 sec./veh. = LOS E; 50+ sec./veh. = LOS F) per HCM 2000 page 17-2 and 17-32.

c. EB= Eastbound. NB=Northbound. Delay=average approach control delay (seconds/vehicle) for the minor-street approach that exhibits the most delay at this intersection. LOS was determined per the HCM 2000 (page 17-2 and 17-32).

a. Delay = Intersection Control Delay (seconds per vehicle). Assumes intersection geometrics shown in Figure 6-1 and Figure 6-3 and a five percent truck mix. Based upon the *Highway Capacity Manual* signalized operation methodology implemented by the Highway Capacity Software (HCS+ Version 5.3). LOS is the intersection level of service. LOS was determined from the delay (≤10 sec./veh.=LOS A; >10 and ≤20 sec./veh.=LOS B; >20 and ≤35 sec./veh.=LOS C; >35 and ≤55 sec./veh.=LOS D; >55 and ≤80 sec./veh.=LOS E; >80 sec./veh. = LOS F) per 2000 HCM page 10-16. See Appendix 3 for the signalized intersection HCS worksheets. NA=Not Applicable. The change in delay and LOS associated with site traffic is not directly comparable when an intersection is unsignalized without the proposed project but signalized and improved with the project.

Future Year 2022 Conditions (No Site Traffic)

Table 5-6 summarizes the future traffic operations at the two unsignalized key intersections in the year 2022, prior to the addition of the trips that would be generated by the initial phase of the proposed project. Table 5-7 provides the overall intersection delay and corresponding levels of service during the peak hours for the fifteen signalized key intersections without project traffic. All of the key intersections are projected to operate at acceptable levels or service (LOS D or better) in the year 2022 with cumulative traffic and the projected growth in background traffic, prior to the addition of site traffic.

Motorists traveling on the minor-street approaches at the two unsignalized key intersections are projected to experience LOS C or better operation with short to average traffic delays while waiting to turn onto the major streets during the peak hours in the peak season. Motorists turning left from Los Alamos Road onto Via Bella will experience an average delay of 7.5 to 7.7 seconds per vehicle (LOS A) during the peak hours. On average, motorists turning left from Dinah Shore Drive into the unsignalized Westin Resort Villas access [Intersection 13] are projected to experience a delay of 9.6 seconds per vehicle during the morning peak hour (LOS A) and 10.4 seconds per vehicle during the evening peak hour (LOS B). Based upon applicable local performance standards, these levels of service are considered acceptable.

Thirteen of the fifteen signalized key intersections are projected to operate at LOS C or better during the peak hours in the year 2022, prior to the addition of site traffic. Two of the signalized key intersections are projected to operate at LOS D during the morning peak hour and LOS C during the evening peak hour in the year 2022 without site traffic. These two intersections are: Da Vall Drive at Ramon Road [Intersection 3] and Bob Hope Drive at Gerald Ford Drive [Intersection 17]. Peak hour operation at LOS D or better is considered acceptable and consistent with the performance standards utilized by the City of Rancho Mirage and City of Cathedral City (the municipalities with jurisdiction over these intersections).

Future Year 2022 Plus Project (Initial Phase) Conditions

As shown in Table 5-6, the addition of the site traffic associated with the initial phase of the proposed project to future year 2022 plus cumulative traffic volumes would cause the peak hour level of service on the minor-street approach at one existing unsignalized key intersection to drop from LOS A to LOS B. The construction of the proposed site access on Los Alamos Road, opposite Via Bella, is projected to increase the average control delay experienced by eastbound motorists on Via Bella by up to 1.1 seconds per vehicle during the peak hours. These motorists are controlled by a stop sign on Via Bella that will remain after the project is built. The increase in delay when site traffic is added would cause the level of service for motorists on the minor-street approach (eastbound Via Bella) during the evening peak hour to drop from LOS A to LOS B. The level of delay associated with LOS B is characterized by drivers as short (see Table 5-1). This intersection would continue to provide acceptable levels of service following the addition of site traffic in the year 2022.

The projected increases in the overall average control delay at the fifteen signalized key intersections that would result when the trips generated by the initial phase of the proposed development are added are shown in Table 5-7. The overall average intersection control delay at these intersections would increase by up to 4.6 seconds per vehicle during the morning peak hour at the main access to the initial development phase in Planning Area 8. This increase would be sufficient to change the level of service at this signalized intersection [Intersection 12], from LOS A to LOS B. None of the other project-related increases in overall intersection control delay would be sufficient to change the intersection LOS at the signalized key intersections evaluated.

Future Horizon Year 2035 Conditions

A horizon year 2035 analysis was performed to determine if the applicable long-term regional and local Circulation Plans for the study area would be adequate to accommodate project traffic at acceptable levels of service or if additional mitigation would necessary. The RIVTAM traffic model projections based on model assumptions including buildout of the project site formed the basis for determining turning movement volumes for the required intersection analysis. Future horizon year 2035 conditions with no site traffic need not be evaluated to determine if the ultimate circulation system within the study area would be adequate. However, as an indicator of the relative impact of the proposed project at the key intersections, horizon year 2035 conditions with no site traffic have been evaluated and are summarized in Tables 5-8 and 5-9.

Table 5-6
Year 2022 Weekday Peak Hour Delay and Levels of Service[a]

LOS ALAMOS ROAD @ RETAIL ACCESS [INTERSECTION 23]	This intersection would not exist.							
- Morning Peak Hour	NA	NA	NA	7.8/A	WB	10.0/B	NA	NA
- Evening Peak Hour	NA	NA	NA	8.3/A	WB	12.6/B	NA	NA

a. Appendix 3 includes the HCS worksheets. The values shown assume a five percent truck mix, a peak hour factor of 1.00 and the intersection geometrics and traffic control shown in Figure 6-4. NA=Not Applicable. The change in delay and LOS associated with site traffic is not directly comparable if an intersection is unsignalized without the proposed project but signalized with the project.

b. Delay=average control delay (seconds/vehicle) for the left-turn move from the major street onto the minor street. LOS was determined from the delay (0-10 sec./veh. = LOS A; 10-15 sec./veh. = LOS B; 15-25 sec./veh. = LOS C; 25-35 sec./veh. = LOS D; 35-50 sec./veh. = LOS E; 50+ sec./veh. = LOS F) per HCM 2000 page 17-2 and 17-32. Intersection 22 has an average control delay that rounds up to 10.0 seconds per vehicle (LOS A) whereas intersection 22 has slightly more than 10.0 but less than 10.1 seconds per vehicle of delay, which corresponds to LOS B.

c. EB= Eastbound. WB=Westbound. Delay=average approach control delay (seconds/vehicle) for the minor-street approach that exhibits the most delay at this intersection. LOS was determined per the HCM 2000 (page 17-2 and 17-32).

a. Delay = Intersection Control Delay (seconds per vehicle). The values shown assume the intersection approach lanes shown in Figures 6-1 and 6-4 and a five percent truck mix. Based upon the *Highway Capacity Manual* signalized operation methodology implemented by the Highway Capacity Software (HCS+ Version 5.3). LOS is the intersection level of service. LOS was determined from the delay (≤10 sec./veh.=LOS A; >10 and ≤20 sec./veh.=LOS B; >20 and ≤35 sec./veh.=LOS C; >35 and ≤55 sec./veh.=LOS D; >55 and ≤80 sec./veh.=LOS E; >80 sec./veh. = LOS F) per 2000 HCM page 10-16. See Appendix 3 for the signalized intersection HCS worksheets. The mitigation necessary for intersection 3 to maintain LOS D or better operation was assumed both with and without site traffic to show the change in delay and LOS associated with site traffic.

a. Delay = Intersection Control Delay (seconds per vehicle). Assumes intersection geometrics shown in Figure 6-1 and Figure 6-4 and a five percent truck mix. Based upon the *Highway Capacity Manual* signalized operation methodology implemented by the Highway Capacity Software (HCS+ Version 5.3). LOS is the intersection level of service. LOS was determined from the delay (≤10 sec./veh.=LOS A; >10 and ≤20 sec./veh.=LOS B; >20 and ≤35 sec./veh.=LOS C; >35 and ≤55 sec./veh.=LOS D; >55 and ≤80 sec./veh.=LOS E; >80 sec./veh. = LOS F) per 2000 HCM page 10-16. See Appendix 3 for the signalized intersection HCS worksheets.

b. The mitigation identified for intersection 17 to maintain LOS D or better operation was assumed both with and without site traffic to show the change in the delay and LOS associated with site traffic.

The overall intersection delay and levels of service shown in Tables 5-8 and 5-9 assume the approach lane geometrics at the key intersections shown in Figure 6-4. The average intersection delay shown in Table 5-9 reflects a lower projected truck mix (five percent) and a higher peak hour factor (1.00), consistent with the input parameters specified by the Riverside County Transportation Department in *Traffic Impact Analysis Preparation Guide* (April 2008). The higher peak hour factor reflects future conditions with heavier traffic volumes distributed more evenly during the peak hours.

Future Horizon Year 2035 Plus Project Buildout Conditions

As shown in Table 5-8, with site traffic, the unsignalized intersection of Los Alamos Road and Via Bella [Intersection 8] is projected to provide acceptable levels of service during the morning and evening peak hours. Motorists making left turns from Los Alamos Road will experience LOS A and those traveling eastbound on Via Bella will experience an average delay during the peak hours which is consistent with LOS B or better operation. The two site access intersections proposed on Los Alamos Road, between Ramon Road and Via Bella, are projected to operate at LOS B or better during the peak hours with two-way stop control and the intersection approach lanes shown in Figure 6-4.

As shown in Table 5-9, the traffic associated with the full development of the proposed project is expected to change the peak hour level of service by one LOS at nine of the signalized key intersections evaluated. Five of these intersections [Intersections 1, 5, 6, 15, and 16] are projected to operate at LOS D or better without mitigation. Two of these intersections [Intersections 3 and 17] would require mitigation to meet the minimum performance standard. The remaining two intersections [Intersections 9 and 13] would be improved to accommodate site access at acceptable levels of service in conjunction with the development of the proposed Section 24 Specific Plan.

As shown in Table 5-9, two of the existing key intersections [Intersection 9 and Intersection 13] would function as signalized full-turn site access intersections in the year 2035. The signalized intersection of Bob Hope Drive with Casino [Intersection 9] would operate at LOS B during the morning peak hour and LOS C during the evening peak hour with site traffic in the horizon year 2035 and the intersection approach lanes shown in Figure 6-4.

A traffic control signal would be installed in conjunction with the site access connection proposed opposite the existing Westin Resort Villas access on Dinah Shore Drive [Intersection 13]. This traffic control signal would be activated prior to buildout of the project site, when warranted by site-generated traffic. As shown in Table 5-9, with site traffic, traffic signal control, and the intersection approach lanes shown in Figure 6-4, this intersection would operate at LOS A during the morning peak hour and LOS B during the evening peak hour in the horizon year 2035.

It can be concluded from the analysis summarized in Tables 5-8 and 5-9 that the General Plan street system would accommodate the traffic associated with buildout of the proposed project in the horizon year 2035 at acceptable levels of service. Two of the off-site signalized key intersections evaluated [Intersection 3 and Intersection 17] would require localized mitigation in the form of an additional left-turn lane on one approach by the year 2035 to maintain acceptable levels of service. These required off-site improvements would be consistent with the General Plan classifications of the two roadways where mitigation would be required.

Da Vall Drive at Ramon Road

The eastern side of Da Vall Drive has been improved, between Ramon Road and a point just north of Via Del Paradiso, to provide approximately 35 feet of pavement with curbs, gutters, and a multi-use trail. The two existing southbound lanes on Da Vall Drive at this intersection include a dedicated left-turn lane and a shared through/right-turn lane. However, one additional southbound left-turn lane will be required on Da Vall Drive, at the intersection of Ramon Road, to accommodate the projected horizon year 2035 traffic volumes at acceptable levels of service.

The right-of-way reserved along Da Vall Drive, based upon its historical classification in the city and county General Plans appears to have been 100 feet. Da Vall Drive, north of Ramon Road, is currently designated as a four-lane divided Major Highway by Cathedral City, which would typically provide a 16-foot median with two 12-foot travel lanes and an 8-foot shoulder in each direction within a 112-foot right-of-way. Da Vall Drive is currently classified as a four-lane divided Minor Arterial by the City of Rancho Mirage. Minor Arterials typically provide an 86-foot roadbed and a 16-foot median within a 110-foot right-of-way. The difference between the two cross-sections would be approximately one less foot of right-of-way and three additional feet of pavement between the curb and the median on the east side of the centerline.

The alignment of any street is often governed by the existing or likely future development along it. Once a street alignment is constructed, changing its primary geometry is difficult and costly. Noticeable changes in alignment to accommodate right-of-

way conditions on opposite sides of an intersection are undesirable because the view of the road ahead is limited, and operational problems may result, especially at night. Design improvements to existing intersections are often constrained in urban areas. Since the centerline of Da Vall Drive also reflects the city limit of the adjacent cities of Rancho Mirage and Cathedral City, the ultimate improvements to Da Vall Drive, north of Ramon Road, will require coordination between these two cities to maintain the location of the centerline.

Although the centerline of Da Vall Drive has been established, the roadway improvements have been inconsistent to date because the right-of-way required and applicable standard cross-section have changed over time. The existing land uses located along both sides of Da Vall Drive limit the amount of right-of-way available. However, the existing development on the west side of Da Vall Drive (i.e., the administrative facilities at the Desert Memorial Park Cemetery) appears to represent the critical constraint with respect to the provision of dual southbound left-turn lanes on Da Vall Drive at Ramon Road in the future.

The lack of sufficient right-of-way on the west side of Da Vall Drive to accommodate three southbound lanes (dual left-turn lanes and a shared through/right lane) at the intersection of Ramon Road is an issue that will have to be addressed by Cathedral City to maintain traffic operations at this intersection in the year 2035 at levels of service consistent with the Cathedral City performance standard (LOS D). The existing southbound left-turn volume at this intersection (218 VPH during the morning peak hour) exceeds the 200 VPH criteria used by most designers considering the provision of dual left-turn lanes.

Bob Hope Drive at Gerald Ford Drive

A deficiency was identified for the horizon year 2035 conditions at the intersection of Bob Hope Drive and Gerald Ford Drive. The existing eastbound left-turn bay at this intersection is 150 feet in length and can accommodate up to seven passenger vehicles. During the peak hour in the peak season, approximately 163 vehicles per hour (VPH) currently make eastbound left turns at this intersection. From a traffic capacity and safety perspective, it is important for turn bays on arterial streets to be long enough to store all arriving vehicles during peak traffic conditions. The eastbound left-turn volume on Gerald Ford Drive at the intersection of Bob Hope Drive [Intersection 17] will require additional queue storage length in the future.

Most designers consider providing dual left-turn lanes whenever the left-turn volume approaches or exceeds 200 VPH. As shown in Figure 4-9 and Figure 4-10, the eastbound left-turn volume on Gerald Ford Drive at Bob Hope Drive is projected to increase to 194 VPH during the evening peak hour in the year 2022 and 208 VPH by the year 2035 without site traffic. The projected year 2035 plus project eastbound left-turn volume of 260 VPH would require additional queue storage length to prevent spillback into the adjacent through lane.

This deficiency was assumed to be mitigated in the year 2035 by improvements planned and funded by the City of Rancho Mirage that are scheduled to be completed during the year 2015. Although the planned improvements will provide dual left-turn lanes and a dedicated right-turn lane on all four approaches at this intersection, Table 5-9 and Figure 6-4 reflect the minimum intersection improvements required to achieve the performance standard.

Future Site Access Intersections

Following the site access improvements proposed in conjunction with the Section 24 Specific Plan, all of the future proposed full-turn site access intersections would provide acceptable levels of service upon completion of the proposed development. Future conditions at the three unsignalized site access intersections along Los Alamos Road [Intersections 8, 22, and 23] are shown in Table 5-8. As shown therein, these three unsignalized site access intersections would provide LOS B or better operation for motorists on the minor-street approaches. This LOS assumes a single-lane minor-street approach and that Los Alamos Road is improved as a two-lane roadway with a raised median and a left-turn bay at each intersection, as shown in Figure 6-4.

Future conditions at the three signalized site access intersections proposed opposite existing T-intersections on Bob Hope Drive and Dinah Shore Drive [Intersections 9, 12, and 13] are shown in Table 5-9 and assume the approach lanes shown in Figure 6-4. The project-related impact at the intersection of Bob Hope Drive with Casino [Intersection 9] appears to be slightly greater with the existing plus project buildout scenario than with the horizon 2035+project buildout scenario. Although the traffic volumes at this intersection would be higher with the horizon 2035+project buildout scenario, the existing plus project buildout scenario was evaluated with the higher existing truck mix and existing peak hour factor. The recommended intersection lane requirements would be the same for both scenarios.

Signalized full-turn site access connections are proposed at 0.25-mile spacing intervals along Ramon Road and Bob Hope Drive. Full-turn site access connections along Dinah Shore Drive are proposed opposite the existing signalized intersection providing access for the Westin Mission Hills Golf Resort and Spa (1,780 feet east of Los Alamos Road) as well as opposite the unsignalized access for the Westin Resort Villas (1,220 feet west of Bob Hope Drive). With site traffic, the peak hour traffic signal warrants would be met and new traffic control signals would be installed at the following full-turn site access intersections:

- Westin Resort Villas @ Dinah Shore Drive [Intersection 13],
- Street "C" @ Ramon Road [Intersection 18],
- Street "D" @ Ramon Road [Intersection 19],
- Bob Hope Drive @ Street "D" [Intersection 20], and
- Bob Hope Drive @ Street "E" [Intersection 21].

Table 5-10 shows the projected overall intersection average delay and levels of service during the peak hours at the proposed future full-turn signalized site access intersections along Ramon Road and Bob Hope Drive [Intersections 18, 19, 20, and 21]. As shown therein, all four of the intersections proposed along Ramon Road and Bob Hope Drive are projected to operate at acceptable levels of service during the peak hours in the horizon year 2035 with the traffic volumes generated upon buildout of the proposed project. During the peak hours the levels of service at these site access intersections are projected to be LOS C or better.

Table 5-10
Horizon Year 2035 Weekday Peak Hour Delay and LOS
At the Signalized Site Access Intersections

Signalized Intersection	Avg. Delay[a] (Sec./Veh.)	Critical V/C Ratio	LOS[b]
STREET "C" @ RAMON ROAD [INTERSECTION 18]			
- Morning Peak Hour [PHF=1.00]	5.0	0.44	LOS A
- Evening Peak Hour [PHF=1.00]	17.1	0.81	LOS B
STREET "D" @ RAMON ROAD [INTERSECTION 19]			
- Morning Peak Hour [PHF=1.00]	5.6	0.47	LOS A
- Evening Peak Hour [PHF=1.00]	28.2	0.93	LOS C
BOB HOPE DRIVE @ STREET "D" [INTERSECTION 20]			
- Morning Peak Hour [PHF=1.00]	6.8	0.51	LOS A
- Evening Peak Hour [PHF=1.00]	16.7	0.78	LOS B
BOB HOPE DRIVE @ STREET "E" [INTERSECTION 21]			
- Morning Peak Hour [PHF=1.00]	64	0.53	LOS A
- Evening Peak Hour [PHF=1.00]	11.2	0.69	LOS B

a. Average Delay = Average Control Delay (seconds per vehicle). Assumes existing intersection geometrics as shown in Figure 6-4 and a five percent truck mix. Based upon the *Highway Capacity Manual* signalized operational methodology implemented by Version 5.3 of the Highway Capacity Software (HCS+). See Appendix 3 for the signalized intersection HCS worksheets. PHF is the peak hour factor specified in the Riverside County Transportation Department *Traffic Impact Analysis Preparation Guide* (2008).

b. LOS is the intersection level of service. The LOS was determined from the delay (≤10 sec./veh.=LOS A; >10 and ≤20 sec./veh.=LOS B; >20 and ≤35 sec./veh.=LOS C; >35 and ≤55 sec./veh.=LOS D; >55 and ≤80 sec./veh.=LOS E; >80 sec./veh. = LOS F) per page 10-16 of the HCM.

5.4 Traffic Signal Warrant Analysis

When properly used, traffic control signals are valuable devices for the control of vehicular and pedestrian traffic. They assign the right-of-way to the various traffic movements and thereby profoundly influence traffic flow. The justification for the installation of a traffic signal at an intersection is based on the warrants adopted by Caltrans in the January 13, 2012 *Manual of Uniform Traffic Control Devices* (CA MUTCD) and the Federal Highway Administration. There are nine basic types of

traffic signal warrants including those for: eight-hour vehicular volume, four-hour vehicle volume, peak hour, pedestrian volume, school crossing, coordinated signal system, crash experience, roadway network, and intersection near a grade crossing.

The installation of a traffic signal should not be considered unless one or more of the factors described in the warrants is met. However, the satisfaction of a warrant is not necessarily sufficient justification in and of itself for the installation of signals.

Delay, congestion, approach conditions, driver confusion, future land use or other evidence of the need for right-of-way assignment beyond that which could be provided by stop signs must be demonstrated. Improper or unwarranted signal installations may cause: (1) excessive delay; (2) disobedience of the signal indications; (3) circuitous travel on alternate routes; and (4) increased crash frequency. Consequently, a traffic control signal should not be installed unless an engineering study indicates that installing the traffic control signal would improve the overall safety and/or operation of the intersection. A traffic control signal should not be installed if it would seriously disrupt progressive traffic flow.

Peak hour signal warrants (see Appendix 4) are used as a preliminary indication of the need for traffic signals in the future. These signal warrants should be considered in conjunction with the unsignalized intersection peak hour analysis to provide a more complete understanding of the need for signalization. The actual design and installation of signals should be based upon detailed studies that include extensive traffic counts.

Rural volume warrants (70 percent of the urban warrants) apply when the 85th percentile speed of traffic on the major street exceeds 40 mph in either an urban or a rural area, or when the intersection lies within the built-up area of an isolated community with a population under 10,000. All other areas are considered to be urban.

Rural peak hour signal volume warrants were checked for each of the unsignalized site access intersections. The signal warrant spreadsheet is included in Appendix 4. Traffic signal warrants would be met and traffic control signals are recommended to maintain acceptable peak hour levels of service at the following intersections:

- The Westin Resort Villas @ Dinah Shore Drive [Intersection 13],
- Street “C” @ Ramon Road [Intersection 18],
- Street “D” @ Ramon Road [Intersection 19],
- Bob Hope Drive @ Street “D” [Intersection 20], and
- Bob Hope Drive @ Street “E” [Intersection 21].

All five of the intersections found to warrant traffic signals with year 2035 plus project buildout traffic volumes would function as primary site access intersections. Signalization is proposed at all five of these intersections in conjunction with the implementation of the proposed Section 24 Specific Plan.

Progression Speed and Signal Spacing

Traffic volumes change over time as development and activity patterns change. Signalized intersection spacing is an essential element of a safe and efficient arterial roadway. Interconnected traffic signals that are synchronized to facilitate the progression of platoons of through traffic can increase capacity.

As arterial and cross street traffic volumes increase, longer cycle lengths are used to minimize lost time, especially when there are more than two signal phases. Cycle lengths of 80 to 120 seconds are common on major arterials is suburban areas. Closely-spaced or irregularly-spaced traffic signals on arterial roadways can result in frequent stops, and unnecessary delay. Long and uniform traffic signal spacing allows timing plans that can efficiently accommodate traffic volumes in both peak and off-peak periods as conditions change over time. The access standards applied throughout Riverside County specify 0.25-mile intersection spacing for Urban Arterials with six or eight through lanes. The Section 24 Specific Plan would be consistent with this access standard.

When a signalized intersection deviates from an established uniform interval, progression can be maintained by increasing the percentage of the cycle length devoted to the major arterial and decreasing the green time allocated to the intersecting street. The green time on Ramon Road shall be maximized by providing multiple lanes on the minor-street approaches at the site access intersections. This will facilitate the development of a traffic signal timing plan in the future that maximizes the minimum through bandwidths along Ramon Road.

5.5 Site Access and Internal Circulation Analysis

The site access points in the Section 24 Specific plan were located and designed in accordance with accepted planning principles and current traffic engineering practices. The site access and internal circulation plan would control access to more efficiently serve the mobility needs of through traffic on the adjacent arterial roadways as well as site access needs. The right-turn only access points would distribute the site traffic more evenly along key mobility corridors, thereby reducing the disruption of through traffic associated with turning movements generated by site development at the proposed new signalized site access intersections along these corridors. The internal circulation plan is designed to provide cross-parcel connections to encourage site traffic to utilize the internal roadways for internal trip making.

The site access plan would maintain adequate spacing from adjacent street and driveway intersections for the primary signalized access points along the perimeter of the project. The Riverside County access standards by corridor classification shown in Table 3-2 specify the use of one-quarter mile (1320-foot) intersection spacing along Urban Arterials and Arterial Highways. The signalized site access intersections proposed to serve the project would be located at one-quarter-mile spacing intervals along Ramon Road and Bob Hope Drive, consistent with the Riverside County standards and opposite the access connections planned to serve the Section 19 Specific Plan (to the east) and the Section 13 Specific Plan (to the north).

Adequate inbound and outbound capacity shall be provided to accommodate the site traffic volumes. The proposed traffic control type at the site access intersections appears to be appropriate. The proposed site access plan incorporates joint access (the sharing of a driveway access point by two or more planning areas), which is a desirable and effective means of minimizing the adverse impacts of site access connections on adjacent streets.

Right-Turn Deceleration Lanes

While not required to achieve acceptable levels of service at the site access intersections, right-turn lanes may be used to improve both safety and traffic operations at intersections by providing space for the deceleration and storage of right-turning vehicles. A number of factors enter into the decision regarding whether right-turn lanes should be used including: speeds, traffic volumes, truck mix, capacity, roadway type, service provided, and the arrangement and frequency of intersections.

Careful consideration should be given to the provision of right-turn deceleration lanes at the site access intersections along Bob Hope Drive, Ramon Road, and Dinah Shore Drive to minimize the disruption of platoons caused by vehicles entering and exiting the proposed access connections and maintain traffic progression on the abutting high-speed arterials. Allowing vehicles to change speeds in a right-turn lane rather than in a through-traffic lane minimizes the degree of interference with through traffic but also reduces speed differentials, thereby improving traffic safety. A right-turn lane can preclude the undesirable effects resulting from the deceleration of turning vehicles and minimize collisions between vehicles turning right and trailing vehicles, particularly on high-volume, high-speed major roads. In general, high-volume and high-speed (greater than 45 mph) roadways with access points projected to accommodate 40 or more right-turning vehicles during the peak hour (or more than 1,000 right-turning vehicles per day) would benefit from exclusive right-turn deceleration lanes. Figure 4-5 and Figure 4-6 provide the right-turn entering volumes at each site access connection proposed.

A right-turn deceleration lane may result in a reduction in intersection sight distance. Vehicles in the right-turn lane may block the sight line of drivers waiting to turn right out of a site access to through traffic approaching from the left. This can be a significant issue where right-turn-on-red movements are permitted from the site access connection onto the major street.

Another design consideration is that larger curb radii produce higher vehicle entry speeds that can negatively impact the safety of pedestrians and bicyclists. To reduce the potential severity of vehicle-pedestrian collisions, the design must minimize the curb radii while still accommodating the turning path of the design vehicle to reduce the speeds of turning vehicles and pedestrian crossing distances.

Site Distance Requirements

Providing adequate intersection sight distance at proposed site access connections ensures that drivers leaving the project site can see far enough along the roadway they are turning onto to perceive any approaching vehicles and judge their rate of closure, then enter the abutting roadway safely when a suitable gap in traffic occurs. Adequate stopping sight distance

allows drivers approaching the site access point on the major street to see a vehicle turning onto the roadway ahead of them and safely take evasive action, if necessary, by slowing down or changing lanes. Both of these sight distances are a function of the speed of vehicles on the major abutting arterial.

Elderly drivers and other drivers who are unfamiliar with an area (tourists, visitors, etc.) may require more time to recognize and react to a potential conflict ahead at an unsignalized site access point. Decision sight distance reflects the extra time required for unfamiliar drivers to recognize and safely respond to an unexpected, difficult, or unfamiliar situation. This is an important consideration when locating and designing access to land uses that may be frequented by drivers with these characteristics.

Long driveway spacing and limiting the types of movements that can be made at individual driveways can simplify the driving task and allow drivers on high-speed arterial streets to focus on one approaching intersection at a time. Where heavy trucks are likely to use an unsignalized access connection, the provision of intersection sight distance in excess of the minimum may be appropriate. Heavy vehicles require more time to complete their turns and accelerate than passenger vehicles. As a result, they require larger gaps in the approaching traffic in which to complete their turning movement out of a site and onto a high-speed arterial.

Clear sight triangles must be provided and maintained free of potential obstructions (such as buildings, perimeter walls, parked vehicles, signs, entry treatments, vegetation over 20 inches high, etc.) at the site access intersections as well as at on-site circulation intersections. On-street parking frequently obstructs sight distances and should be prohibited within the sight triangles at intersections and driveways. Inappropriate landscaping or inadequate landscape maintenance within the sight triangle can also obstruct sight distance at intersections and site driveways.

The provision of intersection sight distance in excess of the minimum would enhance traffic safety at the unsignalized right-in/right-out site access connections proposed along the high-speed arterials that border the site (particularly Bob Hope Drive). With a speed limit of 55 mph and a design speed of 60 mph, the minimum intersection sight distance would be 575 feet on Bob Hope Drive. Drivers of passenger vehicles waiting to make a right-turn from site Access "E" onto Bob Hope Drive (see Figure 4-6) will need to be able to see at least 575 feet to their left in order to judge the speed of approaching traffic and turn safely onto Bob Hope Drive when an adequate gap in the approaching traffic appears. The minimum intersection sight distance of 575 feet will influence where the site access is located along Bob Hope Drive because the roadway alignment includes a horizontal curve that reduces the stopping sight distance available for motorists approaching on Bob Hope Drive as well as the intersection sight distance for motorists exiting the site onto Bob Hope Drive inside the horizontal curve at Access "E".

The eastbound Street "E" approach to Bob Hope Drive (Intersection 21 in Figure 2-3) also appears to be located inside the horizontal curve on Bob Hope Drive. Adequate intersection sight distance will need to be provided and maintained at Intersection 21 for vehicles exiting the site on Street "E" to safely execute right-turn-on-red movements onto Bob Hope Drive.

Site Access Spacing on Los Alamos Road

The Section 24 Specific Plan includes two access intersections along Los Alamos Road within a distance of approximately 1,430 feet between Ramon Road [Intersection 5] and Via Bella [Intersection 8]. If the two access locations are evenly spaced, Intersection 22 and Intersection 23 would be approximately 475 feet apart. Driveway spacing is tied to the posted speed limit along arterials as well as the separation between the proposed access connections and adjacent roadway intersections.

Criteria used for the spacing of unsignalized access points include: (1) the distance from an intersection to the nearest driveway (corner clearance); and (2) the distance between driveways. Adequate corner clearance avoids conflicts between driveway traffic and vehicles stacking or turning at adjacent roadway intersections. The 95th-percentile back-of-queue length for the northbound left-turn movement on Los Alamos Road at Ramon Road is projected to be 12 car lengths (300 feet) during the evening peak hour in the year 2035 with site traffic. Therefore, if Street "B" intersects Los Alamos at least 300 feet south of Ramon Road, it will be outside the functional area of the adjacent intersection and provide adequate corner clearance.

The minimum standard for access spacing is frequently the same as for stopping sight distance. For example, a 35 mph roadway would require a minimum of 250 feet between site access points. This access spacing allows drivers on roadway where site access in being proposed to be prepared for entering and exiting vehicles at each site access point.

The current posted speed limit on Los Alamos Road is 50 mph. With a posted speed of 50 mph, the stopping sight distance would be 425 feet and the intersection sight distance would 590 feet. Therefore, the minimum separation between the site access points would be the stopping sight distance of 425 feet. A desirable intersection spacing would be equal to the intersection sight distance of 590 feet for a passenger car making a left turn onto Los Alamos Road from a stop. When Los Alamos Road is fully improved, it will likely have a lower posted speed limit. With a lower posted speed of 45 mph, the stopping sight distance would be 360 feet and the intersection sight distance would be 530 feet. The site access spacing along Los Alamos Road, between Via Bella and Ramon Road, should reflect the minimum stopping sight distance, based on the speed of the vehicles on Los Alamos Road. Clear sight triangles should be provided and maintained at each of the proposed site access intersections along Los Alamos Road.

5.6 Other Considerations

Future Improvement of Los Alamos Road

The year 2035 traffic volumes for Los Alamos Road, adjacent to Section 24, are projected to remain less than 10,000 ADT, and could be accommodated by a two-lane divided roadway. Without Los Alamos Road extended south of Dinah Shore Drive, the potential for growth in the non-site through traffic volumes on Los Alamos Road from the area south of Dinah Shore Drive would be limited.

The City of Rancho Mirage Sphere of Influence area, between Interstate 10 and Ramon Road, included approximately 623 acres designated R-M in the City General Plan which allows up to 4 dwelling units per acre. The Rancho Mirage General Plan Traffic Model assumed 15 weekday trips per acre for this designation based upon an average density of 3.2 dwelling per acre. This would result in 9,350 weekday trips being generated east of Da Vall Drive and west of Bob Hope Drive, between Ramon Road and Interstate 10. For north/south access, these trips could use Da Vall Drive, Rattler Road, and future roadways intersecting Ramon Road opposite Mission Hills and Section 24. The portion of these trips likely to use Los Alamos Road, to travel south of Ramon Road would be relatively small and could be accommodated by the two-lane divided cross-section proposed.

The City of Rancho Mirage annexed the portion of Section 13 located south of Interstate 10 and north of Ramon Road, on both sides of Bob Hope Drive, in 2012. The General Plan land use designation for this area is regional interstate commercial, a designation that allows mixed-use development with commercial retail, office, resort hotel and restaurant uses. The City's General Plan requires the preparation and approval of a Specific Plan prior to development of this area. Prior to approval, the Section 13 Specific Plan will be subject to environmental and development review by the City of Rancho Mirage.

The three unsignalized project access intersections (Intersection 8, 22, and 23) were evaluated with year 2035 traffic volumes (see Figure 4-12) and the lane geometrics shown in Figure 6-4. All three intersections are projected to provide LOS B or better levels of service for all movements with approach lanes consistent with a two-lane divided roadway cross-section. These lanes can be provided with the median configured as a two-way left-turn lane or as a raised or painted median with a left-turn lane at intersections.

The existing lane configuration at the intersection of Los Alamos Road and Ramon Road would be adequate to accommodate year 2035 plus project traffic volumes. If the land north of Ramon Road is developed and takes access to Ramon Road opposite Los Alamos Road, the intersection of Los Alamos Road and Ramon Road may ultimately need to be restriped to provide three northbound approach lanes (a dedicated left-turn lane, a northbound through lane, and a dedicated right-turn lane).

To provide the maximum flexibility for future development, Los Alamos Road, south of Ramon Road, should provide sufficient pavement width to accommodate at least three northbound approach lanes (with no on-street parking permitted) and one 20-foot wide southbound departure lane (a single 12-foot wide travel lane with an 8-foot wide shoulder for use in emergencies and to provide an adequate turning radius for large delivery vehicles). A future bicycle/golf cart/pedestrian path is shown along the east side of Los Alamos Road, between Dinah Shore Drive and Ramon Road, in the *City of Rancho Mirage General Plan*. This bicycle/golf cart/pedestrian path is shown continuing north of Ramon Road, opposite the intersection of Los Alamos Road.

Future Improvement of Dinah Shore Drive

The peak hour analysis of the intersections along Dinah Shore Drive indicates that with the existing approach lane geometrics, they will operate at LOS C or better in the year 2035 with project traffic. Daily traffic volumes projected by RIVTAM between Date Palm Drive and Bob Hope Drive are less than 30,000 vehicles per day. As a guideline for planning purposes, Riverside County has identified 32,300 vehicles per day as the maximum two-way daily traffic volume at the upper limit of LOS D for a typical 4-lane divided Arterial Highway. Therefore, Dinah Shore Drive has a projected horizon year 2035 plus project traffic demand that would be consistent with a four-lane divided cross-section.

Any potential benefit to be gained from widening Dinah Shore Drive to six lanes adjacent to the project site (in terms of providing additional capacity for regional through traffic) would be lost if the four-lane fully improved portion of Dinah Shore Drive west of the project site were not widened to six lanes as well. Dinah Shore Drive, from Cathedral City to Bob Hope Drive, is not expected to serve any major trip generators (other than the existing Cathedral City High School). The Cathedral City High School constrains future widening along Dinah Shore Drive. Future enrollment projections for Cathedral City High School are expected to decrease substantially now than the Rancho Mirage High School has opened. This should decrease future traffic volumes on Dinah Shore Drive, east and west of Da Vall Drive.

Although the *City of Rancho Mirage General Plan* traffic model projected much higher future traffic volumes for Dinah Shore Drive than RIVTAM , the roadbed is constrained to a four-lane cross-section (much of which is fully improved) west of Los Alamos Road. The adjacent Mission Hills resort community has completed full-width improvements along Dinah Shore Drive, including an existing underpass bridge structure to allow grade-separated access to the golf courses and homes north and south of Dinah Shore Drive. The Westin Mission Hills Golf Resort and Villas has fully improved the south side of Dinah Shore Drive, between Bob Hope Drive and Los Alamos Road. A raised median has been constructed as well as curbs and gutters on the north side of Dinah Shore Drive, adjacent to the project site.

The initial phase of the proposed Section 24 Specific Plan would occupy approximately 320 acres adjacent to the north side of Dinah Shore Drive and generate substantially less traffic than the 320 acres designated R-M in the City of *City of Rancho Mirage General Plan.* The ultimate site access plan for the Section 24 Specific Plan focuses site traffic away from Dinah Shore Drive and Los Alamos Road onto Bob Hope Drive. This should reduce future traffic demands on Dinah Shore Drive, between Bob Hope Drive and Los Alamos Road.

The RIVTAM projections conform to the SCAG 2004 Growth Forecast. While not anticipated by the year 2035, the potential exists for traffic volumes at the intersection of Bob Hope Drive and Dinah Shore Drive to exceed the RIVTAM projections after the horizon year 2035. The *Section 19 Specific Plan Traffic Study* concluded that the intersection of Bob Hope Drive and Dinah Shore Drive could require dual left-turn lanes and exclusive right-turn lanes on all four approaches, as well as a third westbound through lane. The City of Rancho Mirage General Plan identifies this intersection as a critical intersection where additional right-of-way may be required to provide dual left-turn lanes and right-turn lanes in all directions. If a third westbound through lane is ultimately required at this intersection, it would only need to extend west of Bob Hope Drive for a distance of approximately 400 feet in order to provide additional capacity at the intersection of Bob Hope Drive and Dinah Shore Drive. This westbound through lane could transition into an auxiliary right-turn deceleration lane serving the proposed right-in/right-out driveway for Planning Area 7A.

Bob Hope Drive at Ramon Road Future Improvements

When the Bob Hope Drive I-10 interchange was built, the west leg at the intersection of Bob Hope Drive and Ramon Road was constructed with only two westbound through lanes for a distance of approximately 950 feet. The east leg of the intersection includes four lanes at the intersection but narrows to the east because the bridge over the Union Pacific Railroad and Interstate 10 has a 2-lane divided cross-section. Since there are only two westbound approach lanes on Ramon Road at the intersection of Bob Hope Drive the two existing westbound departure lanes at this intersection have a minimal impact on the intersection LOS. The existing dedicated southbound right-turn lane provides sufficient capacity to accommodate the existing and future year 2035 traffic volumes without a third westbound departure lane on Ramon Road, west of Bob Hope Drive.

In view of the high existing and projected future southbound right-turn volume on Bob Hope Drive at the intersection of Ramon Road, constructing a channelized free-flow right-turn lane with a dedicated downstream acceleration lane that transitions into a third westbound through lane on Ramon Road would appear to be a logical future improvement at this intersection. However, a free-flow right-turn lane would result in only a minor improvement in the overall operation of this intersection (i.e., a reduction in the weighted average intersection control delay of approximately two seconds per vehicle

during the evening peak hour). Since this intersection is projected to operate at acceptable levels of service without mitigation, this improvement is not needed or recommended at this time.

The 95th-percentile back-of-queue length for the eastbound left-turn movement on Ramon Road at Bob Hope Drive is projected be nine vehicles per lane during the evening peak hour. Assuming 25 feet per vehicle, the queue storage length required for the year 2035 with project buildout traffic would be 225 feet per lane. Each existing eastbound left-turn lane on Ramon Road at Bob Hope Drive is 300 feet long (plus taper). Therefore, the existing eastbound dual left-turn lanes appear to provide adequate queue storage to accommodate the horizon year 2035 plus site traffic volumes.

The 95th-percentile back-of-queue length for the northbound left-turn movement on Bob Hope Drive at Ramon Road is projected be seventeen vehicles per lane during the evening peak hour. Assuming 25 feet per vehicle, the queue storage length required for the year 2035 with project buildout traffic would be 425 feet per lane. Each existing northbound left-turn lane is approximately 250 feet long (plus taper). Although, the northbound left-turn lanes appear to provide adequate queue storage currently they may ultimately require additional storage length to accommodate the queue during the peak hours. The 50th-percentile back-of-queue length in the year 2035 is projected to be 225 feet per lane.

Bob Hope Drive at Varner Road

The intersection of Bob Hope Drive with Varner Road is projected to operate at acceptable levels of service during the peak hours in the peak season with the existing intersection geometrics and the horizon year 2035 plus Section 24 Specific Plan traffic projections from RIVTAM. However, this intersection may ultimately experience greater traffic flows than projected by RIVTAM as a result of the 2014 annexation of the 591-acre North City Extended Specific Plan (NCESP) site to Cathedral City and the approval of the Specific Plan to guide the future development of that site.

The approval of the NCESP replaced the LI (Light Industrial) land use designation of this site in the *Riverside County General Plan* and the *Western Coachella Valley Area Plan* with a Specific Plan designation. With the approved NCESP a mixed-use development with retail/commercial uses, restaurants, offices and service uses, light industrial uses, hotels, and residential land uses would be developed north of I-10.

Because of its proximity to the I-10 interchange at Bob Hope Drive, the intersection of Bob Hope Drive and Varner Road will function as the primary access intersection for the NCESP. If the ultimate traffic volumes generated by the future land uses within the NCESP site approach the projections in the traffic impact study prepared by Endo Engineering (which reflect the maximum allowed development intensity) improvements will be required at the intersection of Bob Hope Drive and Varner Road to maintain acceptable levels of service with or without traffic generated by the future development of the Section 24 Specific Plan.

Two percent of the daily Section 24 Specific Plan trip generation (1,160 daily trips) was assigned to Bob Hope Drive, south of Varner Road. The NCESP traffic impact study included 6,850 daily trips representing the future growth in background traffic on Bob Hope Drive, south of Varner Road. The 1,160 daily trips associated with buildout of the Section 24 Specific Plan would represent 17 percent of the daily increase in background traffic volumes evaluated in the *North City Extended Specific Plan Traffic Impact Study*. Some of the future residents of the Section 24 Specific Plan may use Bob Hope Drive and Varner Road to access the future employment opportunities and retail developments within the NCESP.

The NCESP traffic impact study was completed in the year 2013, prior to the development of a land use plan for the Section 24 project. Although that study did not explicitly address the Section 24 Specific Plan, the NCESP traffic study identified mitigation to accommodate a future growth in non-site traffic volumes on Bob Hope Drive (south of Varner Road) nearly six times the future traffic volume projected to result from the Section 24 Specific Plan.

Future development within the NCESP will be phased. As specific development plans are processed for individual planning areas within the NCESP, a focused traffic impact study may be required by Cathedral City to address site-specific issues and concerns including any future deficiencies in the operation of the intersection of Bob Hope Drive and Varner Road. A focused traffic impact study should evaluate any operational deficiencies and identify necessary improvements, prior to the construction of future phases of the NCESP development.

Future Conditions On Interstate 10

The existing ramps at the interchanges in the study area appear to provide adequate capacity to accommodate future traffic volumes in the horizon year 2035 with project buildout. The proposed project would increase the future traffic volumes on

Interstate 10 as shown in Figure 4-5, Figure 4-12, Table 4-3, and Table 4-5. Upon project buildout, approximately 8,720 vehicles per day are projected to be added to I-10 west of Bob Hope Drive and 11,060 vehicles per day are projected to use I-10 east of Ramon Road. The year 2035 plus project weekday traffic projections for Interstate 10 from RIVTAM included 207,176 ADT (west of Bob Hope Drive) and 218,693 ADT (east of Ramon Road). A single-lane freeway ramp can accommodate approximately 16,000 ADT at the upper limit of LOS C and 18,000 ADT at the upper limit of LOS D.[5] The future daily ramp volumes (see Table 4-5) are projected to range from 3,260 to 16,400 vehicles per day.

The *2000 Route Concept Fact Sheet Interstate Route 10* (March 29, 2000) developed by the Caltrans District 8 Division of Planning is currently being updated, but provides relevant data for historical purposes. I-10 is a major east/west urban corridor and commuter route between Los Angeles and Riverside County. It connects the urban centers in Los Angeles County (to the west) to the rural areas in eastern Riverside County. It provides for the safe and efficient interstate and inter-regional movement of people and goods. In doing so, it also connects commerce, industry, agriculture, mineral wealth, and recreation spatially and economically to ports, airports, rail yards, and other states.

I-10 is included in the State Freeway and Expressway System and the State Interregional Road System. It is classified as a "High Emphasis" and "Gateway" route. Within District 8, I-10 is included in the National Highway System, the Department of Defense Priority Network and the Strategic Highway Corridor Network. The March 2000 route concept was to maintain LOS "E" during the peak periods in the urbanized and urbanizing areas and LOS "C" in the rural areas. The rationale for maintaining these levels of service was "to achieve a reasonable balance between desired levels of mobility and forecasted traffic with consideration of development abutting rights of way and constrained financial transportation resources". Implementation of intelligent transportation system, TDM, and TSM strategies are central to achieving the desired LOS.

Improvements previously identified as necessary to achieve the desirable LOS through the year 2015 included eight mixed-flow freeway lanes from State Route 62 (on the west) to Jefferson Street (on the east). That would require two additional mixed-flow lanes between Monterey Avenue and Jefferson Street. The long-term right-of-way needs for I-10, considering buildout of the development portrayed in the surrounding local general plans as of the year 2000, included a ten-lane freeway (8 mixed-flow lanes plus 2 HOV lanes) through the urbanized and urbanizing areas from the Los Angeles County line to State Route 86. Four mixed-flow lanes were identified for the rural areas between SR-86 and the Arizona State Line.

Caltrans is responsible for the planning, design, construction, operation and maintenance of the State highway system. State Transportation Improvement funds are used for highway system improvements and apportioned with 25 percent from Caltrans and 75 percent from regional transportation planning agencies. The ultimate transportation corridor and long-term right-of-way needs associated with Interstate 10 in the Coachella Valley will be identified in the updated Interstate 10 Route Concept Report so that adequate right of way can be preserved for the ultimate route concept.

RIVTAM distributes regional "through" traffic among the major east-west arterials located between I-10 and Highway 111. It also assigns regional through traffic to Interstate 10, which is the major continuous high-speed transportation artery extending from the metropolitan areas in western Riverside County, Los Angeles County and Orange County through the Coachella Valley. The continued development of the arterial grid system in conjunction with the improvement of Interstate 10 freeway access points is expected to eventually reduce the overwhelming reliance on Highway 111 for inter-city travel in the Coachella Valley and increase the relative importance of Interstate 10. The future development between Interstate 10 and Highway 111 affords a unique opportunity to alter the balance of population and employment in the region. Future growth planned for the Coachella Valley must provide a better balance between jobs and the labor force to help the region remain a self-contained community. Consistent with this goal, the proposed project would create thousands of employment opportunities in close proximity to I-10 and residential development at a density sufficient to support public transit.

The proposed Section 24 Specific Plan would improve the balance between local jobs and the local labor force within the Coachella Valley. The employment opportunities would be located near a major transit center being planned between the project site and Interstate 10. The land use types and intensities proposed are generally consistent with the *Riverside County General Plan* and the *Western Coachella Valley Area Plan* (Commercial Retail, Commercial Tourist, Medium Density Residential). The total number of weekday trips generated by the proposed project would be 16.4 percent less than the weekday trips associated with development of the site at the maximum development intensity permitted by the *Riverside County General Plan* land use designations.

---

5 Riverside County Integrated Project. *Riverside County General Plan*. Circulation Element Figure C-3. Revised: March 2001.

The Interstate 10 freeway and the arterial street network within the study area have been designed to accommodate traffic demands upon buildout of the *Riverside County General Plan* and the surrounding local general plans. Although the Interstate 10 freeway is currently operating at LOS C during the peak hour, the traffic volume is projected to double by the year 2035. The updated route concept plan for Interstate 10 currently being developed by Caltrans, will identify an ultimate design for I-10 that accommodates development within the study area, including project site. The proposed Section 24 Specific Plan should not have a significant adverse impact on Interstate 10 in the year 2022 or in the year 2035.

6.0 FINDINGS AND RECOMMENDATIONS

The objective of this traffic analysis was to determine and disclose all significant impacts of the proposed project and identify the mitigation measures necessary to reduce the impacts to acceptable levels. The Section 24 Specific Plan EIS will contain a series of measures that reflect design features incorporated in the Specific Plan and measures that will be imposed on subsequent projects within the Specific Plan area via conditions of project approvals.

The recommendations below are intended to provide safe and efficient traffic movements to/from within and past the proposed Specific Plan development while minimizing potential impacts to through traffic on the adjacent arterials. Acceptable levels of service are required after the completion of each phase of development as well as upon completion of the entire Specific Plan. Mitigation strategies have been identified that would respond best to the site-specific transportation needs of the project and the adjacent area.

Mitigation has been identified to address the impacts associated with the initial phase of development to facilitate the identification of equitable assessments to fund improvements. Recommended network improvements recognize that individual developments and increasing traffic volumes are part of the long-term growth projected for the study area. Consequently, some improvements are necessary to address both site specific and area-wide mobility needs.

6.1 Thresholds of Significance

The minimum LOS performance standards vary by agency with jurisdiction over the transportation facility and remain a local decision. Caltrans has developed future right-of-way requirements for Interstate 10 in the study area to maintain LOS E during peak periods. The Congestion Management Plan also identifies LOS E as the minimum level of service standard for intersections and roadway segments within the CMP System of Highways and Roadways, including Ramon Road and Monterey Avenue.

The City of Rancho Mirage and the City of Cathedral City have identified Level of Service D as the minimum performance standard for the circulation network, based upon peak hour intersection operation. Both cities experience seasonal variations in traffic demand, which must be addressed in maintaining LOS D. For peak operating periods, LOS D and/or a maximum volume-to-capacity ratio of 0.90 is provisionally considered the generally acceptable service level by the City of Palm Desert, provided the target LOS "C" goal is only exceeded where maximum feasible intersection improvements have been implemented.

6.2 Traffic Impact Findings

Existing Baseline Conditions

All of the key intersections are currently providing acceptable levels of service in the peak hours of the peak season with the existing traffic controls and approach lane geometrics shown in Figure 6-1. Peak hour traffic volumes do not currently warrant traffic control signals at the unsignalized key intersection of Los Alamos Road with Via Bella or the intersection of the Westin Resort Villas access with Dinah Shore Drive. The project site has adequate access for the land uses proposed.

Conditions With Initial Phase

As shown in Table 4-1, the initial phase of the proposed development would generate approximately 4,480 weekday trips of which 234 would occur during the morning peak hour and 289 would occur during the evening peak hour on weekdays. Although site traffic generated by the initial phase of development would degrade the peak hour LOS at one intersection from LOS A to LOS B, this impact would not be significant. All of the key intersections and site access intersections would provide acceptable levels of service upon completion of the initial phase, provided the three site access intersections are improved as shown in Figure 6-2. No new traffic signals would be warranted or required by the initial phase of development.

The analysis of the initial phase assumed that access would be provided to the active adult community in the year 2022 via connections to two perimeter streets: (1) Los Alamos Road, opposite Via Bella, and (2) Dinah Shore Drive, opposite the Westin Mission Hills Access. Multiple access points to residential subdivisions are desirable to minimize circuitous travel, provide alternate access during roadway maintenance activities, and enhance emergency access.

A third access to the active adult community is planned via the westerly extension of Casino Road, from Bob Hope Drive to Planning Area 8. Access to the active adult community via Casino Road is not required from a capacity perspective but would increase internal trip interactions between the residential land uses within Planning Area 8 and future developments within Planning Areas 1 through 7. The extension of Casino Road will not be constructed by Pulte Homes as part of the improvements associated with the development of the active adult community in the initial phase of development. The extension of Casino Road from Bob Hope Drive to Planning Area 8 may not occur until adjacent land within Planning Areas 2, 3, 4, and/or 5 is developed.

Existing Plus Project Buildout Conditions

Full development of the project site at the maximum intensity/density permitted would add 59,450 weekday trips to the surrounding street system. Of that total, approximately 2,965 trips would be inbound to the site and 2,874 trips would be outbound from the site during the evening peak hour on a typical weekday. Site traffic would cause the rural peak hour traffic signal warrants to be met at five intersections where site access is proposed including: two future intersections proposed on Ramon Road, two future intersections proposed on Bob Hope Drive, and one existing unsignalized intersection on Dinah Shore Drive, where a site access connection is proposed. All of these intersections would be signalized in conjunction with the proposed project. All of the key intersections are projected to provide acceptable levels of service in the peak hours on weekdays with existing plus project buildout traffic volumes, provided the proposed site access improvements and traffic control signals (shown in Figure 6-3) are constructed when necessary to accommodate the traffic generated by the proposed development. No improvements would be required for existing plus project buildout traffic volumes, other than those improvements proposed to facilitate site access.

Horizon Year 2035 Plus Project Buildout

Mitigation that would eliminate deficiencies in the peak hour traffic operations was identified for two off-site key intersections with horizon year 2035 plus project buildout traffic volumes, as shown in Figure 6-4. Improvements that would eliminate one of the deficiencies identified are funded and scheduled for completion by the City of Rancho Mirage in the year 2015. The other deficiency was identified at the intersection of Da Vall Drive and Ramon Road, where three corners are under the jurisdiction of the City of Cathedral City and one corner is under the jurisdiction of the City of Rancho Mirage. The improvement necessary to eliminate this deficiency would require the City of Cathedral City to obtain additional right-of-way on a corner where an existing development encroaches on the ultimate right-of-way of Da Vall Drive.

Da Vall Drive is classified as a four-lane divided roadway in the *Riverside County General Plan* as well as the General Plans of both the City of Rancho Mirage and the City of Cathedral City. With a second southbound left-turn lane on Da Vall Drive at Ramon Road the 95th-percentile back-of-queue length in each of the left-turn lanes is projected to extend twelve car lengths (300 feet) north of Ramon Road in the year 2035. This would require the acquisition of right-of-way in a developed area that appears to be functioning as an administrative area within the Desert Memorial Park Cemetery.

The additional southbound left-turn lane required on Da Vall Drive at Ramon Road would be consistent with the improvements typically required for a four-lane divided Minor Arterial roadway designated as a critical intersection in the *City of Rancho Mirage General Plan*. Therefore, the ultimate circulation system in the *City of Rancho Mirage General Plan* would be adequate to serve project-related traffic upon buildout of the site.

CVAG distributes funds to help fund the construction of the regional system of roads, streets, and highways to accommodate growth in the region for transportation improvement projects within the Coachella Valley. These funds are associated with Measure A (sales tax), the TUMF program, and other state and federal sources. Transportation-related improvement projects partially funded by the TUMF program include: arterial street construction, street widening, intersection enhancements, and freeway interchange improvements. Regional transportation funds are meant to supplement, not replace local revenues and/or developer contributions required for approved regional road construction projects. CVAG members that participate in the TUMF and the Multiple Species program pay 25 percent of the cost of eligible regional transportation projects while CVAG pays 75 percent.

The widening of Da Vall Drive, between Ramon Road and Vista Chino, to its ultimate cross-section is included as an eligible buildable project (designated B-419) in the 2010 *Transportation Project Prioritization Study* (TPPS) and the CVAG Regional Arterial Program. It is ranked 88th of 247 buildable projects with a score of 9.3 points. The cost associated with the widening of Da Vall Drive, between Ramon Road and Vista Chino, was estimated to be $24,025,032 in the 2010 TPPS. This cost

Endo Engineering

reflects improvements to Da Vall Drive within project limits that extend substantially beyond the first 300 feet north of Ramon Road.

An improvement that represents a backbone level project (i.e., is integral to the continued and future development of an area) may be eligible for bonus points which can increase its priority ranking in the TPPS. Since Ramon Road is a TUMF facility, if the priority of the I-10 Da Vall Drive Interchange project increases in the future, the widening of Da Vall Drive, between Vista Chino and Ramon Road, may become a backbone level project. By participating in the TUMF program or contributing on a fair-share basis to roadway improvements of area-wide benefit, individual project proponents will mitigate the cumulative impact of their traffic on the future deficiency projected to occur at the intersection of Da Vall Drive and Ramon Road.

6.3 Site Access and Internal Circulation Findings

Street "C" at Ramon Road [Intersection 18]

The northbound left-turn queue on Street "C" at Ramon Road is projected to include 15 vehicles and extend 375 feet with a single left-turn lane. These vehicles on Street "C" will block access to Planning Area 1A and Planning Area 2A. The minimum distance to the first access connection to these Planning Areas should be determined by the length of the back-to-back left-turn lanes needed on Street "C", south of Ramon Road. Providing northbound dual left-turn lanes on Street "C" at Ramon Road can reduce the northbound left-turn queue length to less than 175 feet. While not required to improve the level of service, consideration should be given to providing dual northbound left-turn lanes on Street "C" at Ramon Road to reduce the separation required between Ramon Road and the first internal street access for the adjacent planning areas.

Street "D" at Ramon Road [Intersection 19]

The proposed improvements for Street "D" are shown in Figure 12 of the *Section 24 Specific Plan*, where Street "D" is referred to as "A" Street Boulevard. It is recommended that dual left-turn lanes be provided on the westbound and northbound approaches at the intersection of Street "D" and Ramon Road. While not required to achieve acceptable levels of service, dual left-turn lanes would substantially benefit the project by improving access to Planning Areas 2 and 3.

This intersection will serve the second highest volume of site traffic. During the peak hour, both the northbound and the westbound left-turn volumes at this intersection are projected to exceed 300 vehicles per hour upon project buildout. Although not required at this intersection to achieve LOS D (as shown in Table 5-10 and Figure 6-4) dual left-turn lanes are typically provided where left-turn volumes exceed 300 vehicles per hour. The proposed four-lane cross-section of Street "D" would provide the two southbound departure lanes required with dual westbound left-turn lanes.

In addition to improving the overall intersection LOS, dual left-turn lanes would reduce the length of the left-turn queue of vehicles that forms each signal cycle by approximately 50 percent. This is important on Ramon Road, where the median will have to accommodate back-to-back left-turn lanes with sufficient space to store the left-turning vehicles that will accumulate each signal cycle.

The northbound left-turn queue on Street "D" at Ramon Road is projected to include 23 vehicles and extend 575 feet with a single left-turn lane. These vehicles on Street "D" will block access to Planning Area 2A and Planning Area 3. The minimum distance to the first access connection to these Planning Areas should be determined by the length of the back-to-back left-turn lanes needed on Street "D", south of Ramon Road. Providing northbound dual left-turn lanes on Street "D" at Ramon Road can reduce the northbound left-turn queue length to less than 300 feet.

All signalized intersections should provide at least two approach lanes on each approach. If a single northbound left-turn lane is provided on Street "D", a dedicated northbound right-turn lane should be provided as the second approach lane. Even if dual northbound right-turn lanes are provided, a dedicated northbound right-turn lane would be required to allow a right-turn on red movement to accommodate the right-turn volume (191 vehicles per hour) on Street "D" at Ramon Road.

Casino West of Bob Hope Drive [Intersection 9]

The eastbound approach on Casino at the intersection of Bob Hope Drive should provide a through lane and a dedicated right-turn lane to accommodate the projected right-turn volume during the peak hour (in excess of 300 vehicles per hour) at LOS D. A single shared through/right lane would result in the approach operating at LOS F upon project completion. Dual

eastbound left-turn lanes would be required on Casino at Bob Hope Drive to achieve acceptable levels of service during the peak hours. The dual eastbound left-turn lanes required on Casino are projected to have vehicles waiting to turn left onto Bob Hope Drive extending 300 to 400 feet in each left-turn lane. This queue length will increase the minimum setback necessary between Bob Hope Drive and the first access connection on Casino for Planning Area 3 and Planning Area 4.

In view of the projected volumes on Casino, between Bob Hope Drive and Street "D", this roadway should be constructed as a four-lane divided facility. A nontraversable landscape median would enhance traffic safety and control access to the adjacent planning areas. The first planning area access on Casino should be located approximately 660 feet west of Bob Hope Drive to accommodate back-to-back left-turn lanes between Bob Hope Drive and the left-turn access for Planning Area 4. This setback would also apply to the first access connection to Planning Area 3 that would permit southbound left-turns across Casino. The number of lanes required on Casino, west of Street "D", cannot be determined without additional information regarding access to/from Planning Area 2B and Planning Area 5.

Street "D" at Bob Hope Drive [Intersection 20]

Site traffic will warrant signalization in conjunction with adjacent development at the intersection of Street "D" and Bob Hope Drive. As shown in Figure 6-4, a single eastbound left-turn lane and right-turn lane would provide acceptable levels of service. A northbound left-turn lane would be required on Bob Hope Drive with 350 feet of queue storage length. The eastbound approach would require 375 feet of left-turn storage with a single left-turn lane.

With a single left-turn lane, the eastbound left-turn queue on Street "D" at Bob Hope Drive is projected to include 14 vehicles and extend 350 feet. This 350-foot long queue of vehicles on Street "D" could block access to Planning Area 4 and Planning Area 6A. The minimum distance to the first access connection to these Planning Areas should be determined by the length of the back-to-back left-turn lanes needed on Street "D", west of Bob Hope Drive. Providing eastbound dual left-turn lanes on Street "D" at Bob Hope Drive can reduce the eastbound left-turn queue length to less than 175 feet. While not required to improve the level of service, consideration should be given to providing dual eastbound left-turn lanes on Street "D" at Bob Hope Drive to reduce the separation required between Bob Hope Drive and the first internal street access for the adjacent planning areas.

Street "E" at Bob Hope Drive [Intersection 21]

Site traffic will warrant signalization in conjunction with adjacent development at the intersection of Street "E" and Bob Hope Drive. As shown in Figure 6-4, a single eastbound left-turn lane and right-turn lane would provide acceptable levels of service. A northbound left-turn lane would be required on Bob Hope Drive with 225 feet of queue storage length. The eastbound approach would require 250 feet of left-turn storage with a single left-turn lane.

Street "D" at Casino

Assuming both Street "D" and Casino are four lane roadways where they intersect, this internal intersection is not projected to meet signal warrants upon project buildout. Street "D" (designated Street "A" Boulevard in the Specific Plan) and Casino will function as the two principal internal vehicular circulation facilities within Specific Plan 24. Street "D" lies adjacent to four of the commercial parcels and three of the multi-family parcels. This internal multi-modal corridor would extend from its signalized intersection with Ramon Road to its signalized intersection with Bob Hope Drive. Street "D" would connect the commercial and multi-family residential parcels located in the eastern portion of Section 24 west of Bob Hope Drive with the commercial and multi-family residential parcels located in the northern portion of Section 24 south of Ramon Road.

Street "D" would provide a two travel lanes in each direction, separated by a raised landscape median 16 feet in width within a 110-foot right-of-way. Street "D" would be accessible to automobiles, service vehicles, emergency vehicles, neighborhood electric vehicles (NEVs), golf carts, and neighborhood circulator vehicles. A 5-foot wide sidewalk and a Class II striped on-street 5-foot wide bicycle lane would be provided on both sides of Street "D". A two-foot buffer would be provided between the on-street bike lane and the adjacent outer travel lane on Street "D".

Ultimately, Casino will be extended west of Bob Hope Drive to connect the active adult residential community in Planning Area 8 with the Agua Caliente Casino Resort Spa located east of Bob Hope Drive. Casino will be extended between and provide access to the future Retail development proposed within Planning Area 3 and the future Resort development proposed in Planning Area 4. With three non-residential Planning Areas to the northwest and three more to the south, the existing intersection of Bob Hope Drive and Casino will become the most centralized site access intersection for non-residential trips.

The ultimate traffic volumes through the intersection of Street "D" and Casino will be largely the result of external residential site access trips and internal trips between the commercial parcels and between the commercial and residential parcels. The magnitude of these traffic volumes will depend upon the strength of the interaction between the various land uses and the locations of the internal access points along Street "D".

Preliminary estimates of the potential traffic volumes for the intersection of Street "D" at Casino indicate that it is unlikely for this intersection to meet traffic signal warrants upon project buildout, since Street "D" would be a four-lane roadway and Casino will require at least two approach lanes at the intersection of Street "D". At the present level of site planning, it appears that the intersection of Street "D" and Casino should be unsignalized (TWSC, AWSC, or roundabout). The appropriate traffic control type should be reviewed at a future time, when more detailed development plans are available.

6.4 Standard Mitigation for Individual Development Projects

1. The property owners shall dedicate appropriate right-of-way to accommodate the ultimate improvement of the abutting General Plan roadways and fully improve those roadways in conjunction with adjacent development.

2. To ensure compliance with applicable roadway and access design standards when individual development projects are processed, their final layout and site access design may be subject to review and approval and a focused traffic impact study may be required to evaluate site-specific access and circulation issues as well as the timing of required improvements. Entry drives, the internal circulation design, and other features may require additional street widths. A traffic signing and striping plan may be required for review and approval in conjunction with detailed construction plans for the project site.

3. To ensure that motorists can enter and exit the site with minimum hazard and disruption of "through" traffic, clear unobstructed sight distances shall be provided at all site access points as well as at all internal intersections. When individual development projects are processed, sight distances shall be reviewed at the project access points (based upon AASHTO sight distance standards) when final grading, landscape and street improvement plans are prepared.

4. Clear sight triangles shall be provided and maintained at each of the proposed site access intersections.

5. Individual project proponents shall comply with applicable requirements in the Section 24 Specific Plan and construct the future combination sidewalk/bikeway/golf cart paths (with a minimum eight-foot width) along Ramon Road, Bob Hope Drive, Dinah Shore Drive, and Los Alamos Road, as shown in the *City of Rancho Mirage General Plan*.

6. Individual project proponents shall provide sufficient off-street parking shall be provided on-site as detailed in the Section 24 Specific Plan (Table 8) to meet the requirements of the applicable jurisdiction and the Uniform Federal Accessibility Standards.

7. Individual project proponents shall coordinate with the SunLine Transit Agency regarding the need for public transit facilities on and adjacent to the project site. At bus stops, the *Americans with Disabilities Act Accessibility Guidelines* require a minimum paved area depth of 8 feet.

8. Individual project proponents shall pay development impact fees and/or participate in a traffic mitigation fee program developed to ensure that a fair-share contribution is made to future roadway infrastructure improvements of benefit to all developments within the Section 24 Specific Plan.

9. Individual project proponents may be required to contribute a traffic mitigation fee to ensure that a fair-share contribution is made to future roadway infrastructure improvements of area-wide benefit prior to the issuance of building permits, equivalent to the Traffic Uniform Mitigation Fee.

10. A series of utility poles are located close to the curb along the north side of Dinah Shore Drive. Undergrounding these transmission lines is desirable from a traffic safety and aesthetic perspective. The proponents of individual developments adjacent to Dinah Shore Drive shall coordinate with the utility company to proactively address potential strategies to reduce risks posed by the utility poles. The proponents of individual developments within the Section 24 Specific Plan may be required to contribute Development Impact Fees, as outlined in the City of

Rancho Mirage Municipal Code Section 3.29.130, which provides a mechanism for funding the undergrounding of utility facilities including electrical transmission lines.

6.5 Roadway Improvements Needed

The streets within the initial phase of development shall be constructed and maintained as private streets, as shown in the Section 24 Specific Plan. The Institute of Transportation Engineers recommends that private streets be developed in accordance with the same guidelines established for public neighborhood streets. The City of Rancho Mirage typically requires private streets to provide a 37-foot minimum right-of-way. Figure 15 within the Section 24 Specific Plan illustrates the improvements proposed for local interior roadways with a 37-foot right-of way within the active adult community. These improvements include one travel lane in each direction, an on-street parking lane, and a five-foot wide sidewalk adjacent to the curb along one side of the roadway.

Initial Phase Improvements

1. The developer of the initial phase shall provide, at a minimum, the lane geometrics shown in Figure 6-2 at the site access points in conjunction with the development of the initial phase.

    - A "STOP" sign shall be installed facing westbound vehicles at the site access proposed on Los Alamos Road, opposite Via Bella [Intersection 8] and a northbound and southbound left-turn bay shall be provided in the median on Los Alamos Road at the intersection of Via Bella.

    - The existing traffic control signal and approach lane geometrics shall be modified at the intersection of the Westin Mission Hills Golf Resort Access with Dinah Shore Drive [Intersection 12] to provide access to the initial phase of development. Two southbound exit lanes shall be provided, including a dedicated right-turn lane and a shared through/left lane. Two northbound entry lanes shall be provided to permit residents to enter while a visitor is awaiting authorization for entry.

2. Adequate stacking distance (100 feet) shall be provided on the approach to each of the three proposed gated entries to store vehicles entering the initial phase. The pavement in advance of the gate shall be wide enough to allow non-accepted vehicles to turn around in advance of the gate. Any gated entry that allows visitor access should provide two entry lanes to allow residents to bypass the vehicles of visitors awaiting entry authorization.

3. The controlled primary entryways to the initial phase of development may be required to include provisions to facilitate access by emergency vehicles. If required, all power-operated controlled access devices shall have a radio-controlled override system capable of opening the gate or barrier when activated by a special transmitter located in emergency vehicles and be equipped to facilitate opening in the event of a power failure.

4. An adequate supply of off-street parking in appropriate locations is an essential component of a balanced neighborhood and should be provided within the initial phase to meet the needs of residents and visitors. Regular use of on-street parking should be expected and accommodated because visitor parking will be heavy at times.

Project Buildout Improvements

1. The minimum required site access improvements shown in Figure 6-4, including the intersection approach lane geometrics, "STOP " signs, and new traffic control signals, should be provided when necessary to accommodate the traffic generated by the development of the Section 24 Specific Plan.

2. Traffic signals will be warranted and shall be installed when warranted along Ramon Road and Bob Hope Drive at the following five site access intersections to maintain acceptable levels of service in conjunction with adjacent development:

    - The Westin Resort Villas @ Dinah Shore Drive [Intersection 13],
    - Street "C" @ Ramon Road [Intersection 18],
    - Street "D" @ Ramon Road [Intersection 19],
    - Bob Hope Drive @ Street "D" [Intersection 20], and
    - Bob Hope Drive @ Street "E" [Intersection 21].

3. Each of the proposed full-turn site access intersections that will be signalized shall provide a minimum of two approach lanes on the minor-street approaches to minimize the disruption of through traffic on the major street.

4. The locations of the proposed right-in/right-out site access points shall provide adequate stopping sight distance, and intersection sight distance as well as corner clearance (to avoid conflicts between driveway traffic and vehicles stacking or turning at adjacent roadway intersections). Corner clearance will be particularly important where the queue lengths in the through lanes on Ramon Road and Bob Hope Drive may extend more than 600 feet (i.e., Access "C" and Access "F" as shown in Figure 4-3).

5. Clear unobstructed sight distances shall be provided at the site access points on Ramon Road and Bob Hope Drive as well as at all internal intersections to ensure that motorists can enter, exit, and traverse the site safely with minimal disruption to through traffic on the abutting arterial roadways. The intersection of Bob Hope Drive with Street "E" [Intersection 21] and the right-turn only access intersection proposed on Bob Hope Drive, immediately north of Intersection 21, are located on the inside of a horizontal curve that may limit both stopping sight distance and intersection sight distance.

6. While not required to achieve acceptable levels of service, careful consideration should be given to the provision of a right-turn deceleration lane at those site access intersections along Bob Hope Drive, Ramon Road, and Dinah Shore Drive where 40 or more vehicles are projected to turn right into the site during the peak hour.

7. The minimum standard for access spacing is frequently the same as for stopping sight distance. The site access spacing along Los Alamos Road, between Via Bella and Ramon Road, should reflect the minimum stopping sight distance, based on the future speed limit on Los Alamos Road, which is expected to be lower than the current design speed.

Appendix 2
RIVTAM Modifications

RIVTAM Circulation Network Prior To Modifications

The extension of Bob Hope Drive, north of Ramon Road to Varner Road, and the construction of a new diamond interchange at Interstate 10 were completed in 2012. The RIVTAM network reflected this improvement. Bob Hope Drive, from Dinah Shore Drive northward, was upgraded from its Minor Arterial (four-lane divided) classification to a Major Arterial (six-lane divided) classification. The RIVTAM network incorporated this change.

Dinah Shore Drive, between Bob Hope Drive and Los Alamos Road, was upgraded from its Minor Arterial (four-lane divided) classification to a Major Arterial (six-lane divided) classification in the *Rancho Mirage 2005 General Plan*. This reclassification was included in RIVTAM.

Although Key Largo Avenue was extended north of Dinah Shore Drive and over Interstate 10 to Ramon Road as a four-lane divided Minor Arterial in the *Rancho Mirage 2005 General Plan,* it was not in the RIVTAM street network. Although a new east/west four-lane divided Minor Arterial was added to the *Rancho Mirage 2005 General Plan* north of Dinah Shore Drive, between Bob Hope Drive and Key Largo Avenue ("B Street" in the Section 19 Specific Plan) this new roadway was not included in RIVTAM.

Modifications Incorporated in RIVTAM

Los Alamos Road was deleted from RIVTAM between Dinah Shore Drive and Gerald Ford Drive but retained adjacent to the western boundary of Section 24. The existing Westin Mission Hills Golf Resort and the Mission Hills Country Club development would preclude the construction of Los Alamos Road, south of Dinah Shore Drive.

Dinah Shore Drive was downgraded from a six-lane divided to a four-lane divided facility, between Bob Hope Drive and Los Alamos Road. This change was made to quantify the future traffic projections for parallel facilities to identify appropriate mitigation for any significant impacts that might result from downgrading Dinah Shore Drive.

The Agua Caliente Casino was moved from west of Bob Hope Drive to east of Bob Hope Drive. The Rancho Mirage High School was added north of Ramon Road, between Los Alamos Road and Da Vall Drive, with a year 2035 enrollment of 2000 assumed. The data for the project site were replaced with SED reflecting the ultimate maximum development intensity/density that would be allowed by the proposed Section 24 Specific Plan. The nodal connectors within the project site were modified to more accurately reflect the proposed internal circulation and site access plan.

Through coordination with AFSHA Consulting, Inc., the socioeconomic data in RIVTAM for TAZ 4637 were replaced with data reflecting buildout of the proposed land uses within the Section 24 Specific Plan. The new SED assumed for TAZ 4637 included 2,406 households, a population of 4,331, and a total employment of 6,277 for buildout with the proposed project. The SED for the 1,200 senior adult dwelling units were adjusted to reflect the age-restricted housing for active adults proposed by increasing the assumed age of the homeowner and assuming that nearly one-half of the occupants would be retired. The SED for the 3,138,600 square feet of non-residential building area associated with the proposed project was converted to employment by assuming the employment density factor used in RIVTAM for areas designated C-R and C-T (500 square feet of building area per employee). This factor was also assumed for the Riverside County Integrated Project (RCIP) modeling.

HCM INTERSECTION ANALYSIS METHODOLOGY AND WORKSHEETS

Appendix 3
Highway Capacity Manual 2000 Methodology

Unsignalized Intersections

Some of the key intersections in the study area are unsignalized and controlled by stop signs on one or more of the approaches. Unsignalized intersections are typically categorized as either two-way stop-controlled (TWSC) or all-way stop-controlled (AWSC) intersections. At TWSC intersections, the approaches controlled by the stop sign are referred to as the minor street approaches. Minor street approaches can be either public streets or private driveways. The intersection approaches that are not controlled by stop signs are called the major street approaches.

To evaluate the ability of these intersections to serve traffic demands during peak hours, the capacity is determined for each minor approach movement and the left-turn movements from the major street onto the minor street, and then compared to the demand for each movement. The methodology utilized to determine the maximum capacity of the minor approach movements and the left turn onto the minor street (in passenger car equivalents per hour or PCPH) accounts for approach grade and speed, heavy vehicle mix, lane configuration, and type of traffic control. It allows the maximum potential capacity to be determined from the conflicting volumes and the critical gap associated with each type of vehicle maneuver. Once the capacity of each of the critical movements is calculated, the anticipated delay and the level of service for each of the intersection movements and each minor approach can be evaluated.

Typically, the movement with the longest average control delay or worst level or service defines the overall intersection evaluation; however, this may be tempered by engineering judgment, when conditions warrant it. Although the level of service is primarily related to the average control delay, which is given in terms of seconds of delay per vehicle by minor movement and intersection approach, other performance measures for TWSC and AWSC intersections include: delay to major street through vehicles, queue length, and volume-to-capacity ratio.

For example, left turns from the minor leg may experience delay consistent with LOS F operation, while the major street through movements experience little or no delay and LOS A. Since the major-street through movements typically accommodate the majority of the traffic demand at the intersection, the overall intersection LOS would most likely be LOS A or LOS B. If the delay for the traffic on the minor leg is reduced by installing a traffic signal, the overall intersection delay will increase, as large numbers of vehicles on the major through moves are delayed by the new signal. The increase in total delay may lower the overall intersection LOS. For this reason, excessive delays on the minor legs of two-way stop intersections are only mitigated with a traffic signal when the minor street can no longer effectively provide access, as evidenced by traffic signal warrants being met. This eliminates situations where a large number of motorists are delayed for the benefit of only a few cars.

Capacity Considerations

A two-way left-turn lane (TWLTL) or a raised or striped median allows a minor stream vehicle to cross one major traffic stream at a time. It results in two-stage gap acceptance, provided that sufficient storage space is available in the median or TWLTL to store vehicles. It reduces the critical gap (the minimum gap that would be acceptable to a driver on the minor approach) in the stream of traffic on the major street and increases the capacity of the minor approach.

The grade of the approach directly affects the capacity of each minor movement. Compared to a level approach, downgrades increase capacity and upgrades decrease the approach capacity.

A flared approach on the minor street increases the capacity of the minor street approach. It allows more vehicles to be served simultaneously. Increasing the length of the flared pavement improves access to the additional lane. Even with a flared approach, vehicles seeking to use the flared lane may be delayed by queued vehicles blocking access to the additional lane. Therefore, flaring does not increase the capacity of the approach to the extent that an additional lane would.

The presence of traffic signals upstream from the intersection on the major street will produce platoons and affect the capacity of the minor street approaches if the signal is located within 0.25 mile of the intersection. Four flow regimes can result: no platoons, platoons from the left only, platoons from the right only and platoons from both directions.

Signalized Intersections

The *Highway Capacity Manual* (HCM 2000) signalized intersection capacity and level of service methodology addresses the capacity and level of service of intersection approach land groups as well as the level of service of the intersection as a whole. The analysis is undertaken in terms of the ratio of demand flow rate to capacity (V/C ratio) for individual movements during a peak 15-minute interval and the composite V/C ratio for the sum of critical movements or lane groups within the intersection. The level of service is determined based upon average control delay per vehicle.

HCS Worksheets

The HCS Worksheets are lengthy and available under separate cover by request.

Appendix 4

TRAFFIC SIGNAL WARRANTS

Peak Hour Signal Warrants

Signal Warrants Spreadsheet

Appendix 4
MUTCD Traffic Control Signal Warrants

The Federal Highway Administration (FHWA) publishes the *Manual on Uniform Traffic Control Devices* (MUTCD), which contains all national design, application, and placement standards for traffic control devices. The purpose of these devices, which include signs, signals, and pavement markings, is to promote highway safety, efficiency, and uniformity so that traffic can move efficiently on the Nation's streets and highways. All traffic control devices nationwide must conform to the MUTCD. Although the FHWA adopts the standards, the individual State and local highway agencies, not the FHWA, select, install, operate, and maintain traffic control devices on all roadways (including the Interstate and the U.S. numbered systems) nationwide.

A traffic signal assigns intersection right-of-way and promotes the orderly movement of pedestrians and vehicles. However, improper signal controls sometimes lead to intentional violations, unnecessary delays and traffic diversion to less desirable routes.

The selection and use of traffic control signals should be based on an engineering study of roadway, traffic, and other conditions. A careful analysis of traffic operations, pedestrian and bicyclist needs, and other factors at a large number of signalized and unsignalized intersections, coupled with engineering judgment, has provided a series of signal warrants detailed in the FHWA's MUTCD (2009 Edition)[1] that define the minimum conditions under which installing traffic control signals might be justified. As of January 13, 2012, Caltrans has adopted the *California Manual on Uniform Traffic Control Devices* (California MUTCD 2012) to include FHWA's 2009 MUTCD to prescribe uniform standards for traffic control devices in California.

In order to justify the installation of a traffic control signal, a traffic control signal needs study is required that demonstrates delay, congestion, approach conditions, driver confusion, future land use, physical characteristics of the location, the factors contained in the traffic signal warrants, and/or other evidence of the need for right-of-way assignment beyond that which could be provided by a STOP sign. The FHWA's MUTCD (2009 Edition)[2] and the California MUTCD 2012 provide guidance and signal warrant sheets for use in developing traffic control signal needs studies.

The following are warrants for installation of a traffic control signal.

Warrant 1 - Eight Hour Vehicular Volume (including minimum vehicle volume and interruption of continuous traffic warrants)

Warrant 2 - Four-Hour Vehicular Volume

Warrant 3 - Peak Hour

Warrant 4 - Pedestrian Volume

Warrant 5 - School Crossing

Warrant 6 - Coordinated Signal System

Warrant 7 - Crash Experience

Warrant 8 - Roadway Network

Warrant 9 - Intersection Near A Grade Crossing

Disadvantages of Signalization

Improperly designed or installed traffic signals, those that are poorly maintained, and unjustified traffic signals can result in one or more of the following disadvantages:

- Excessive delay;
- Excessive disobedience of the signal indications;
- Increased use of less adequate routes (as road users attempt to avoid traffic signals); and
- Significant increases in the frequency of collisions (especially rear-end collisions).

1 U.S. Department of Transportation, Federal Highway Administration, *Manual on Uniform Traffic Control Devices for Streets and Highways,* (2009 Edition).
2 Ibid.

Advantages of Signalization

Traffic signals that are properly designed, located, operated, and maintained have one or more of the following advantages:

- They provide for the orderly movement of vehicular and pedestrian traffic.
- They increase the traffic handling capacity of the intersection (if the signal operational parameters are reviewed and updated on a regular basis and when land use changes have occurred).
- They reduce the frequency and severity of certain types of crashes (especially right- angle collisions).
- They are coordinated to provide for continuous or nearly continuous movement of traffic at a definite speed along a given route under favorable conditions.
- They interrupt heavy traffic at intervals to permit other traffic (vehicular or pedestrian) to cross.

Alternatives to Signalization

Since vehicular delay and the frequency of some types of collisions can be greater under traffic signal control than under STOP sign control, consideration should be given to providing alternatives to traffic signals even if one or more of the signal warrants has been satisfied.

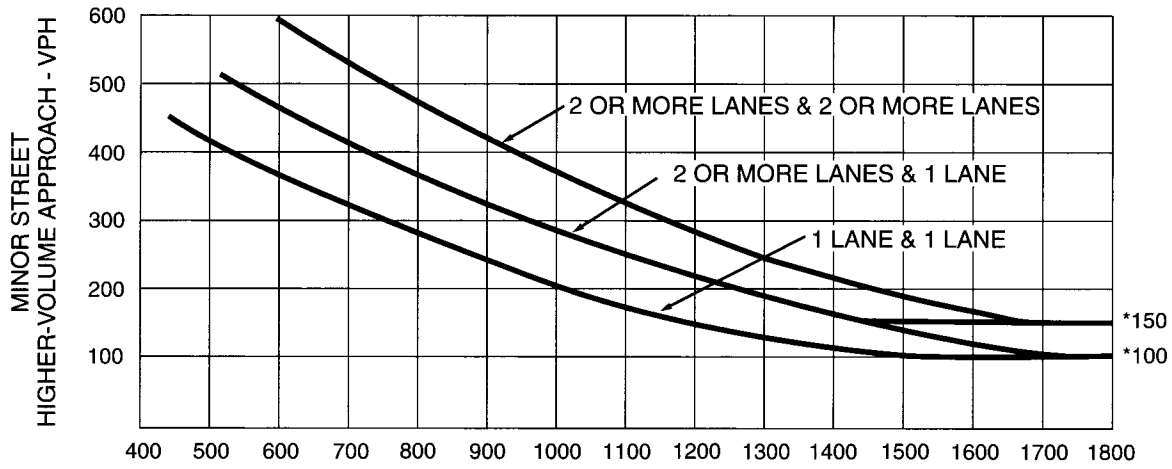
Alternatives for consideration may include:

- Improving the sight distance at the intersection by moving the stop line(s) and making other changes;
- Adding one or more lanes on a minor street approach to reduce the number of vehicles per lane on the approach;
- Channelizing vehicular movements;
- Installing roadway lighting if a disproportionate number of collisions occur at night;
- Restricting one or more turning movements, perhaps on a time-of-day basis, if alternative routes are available;
- Installing multiway STOP sign control if the warrant is satisfied;
- Installing a roundabout intersection;
- Installing warning signs on the major street regarding the approaching intersection;
- Installing flashing beacons on warning signs in advance of the intersection or at the intersection; and
- Installing measures designed to reduce speeds on the approaches.

General Notes

1. The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal.
2. A traffic control signal should not be installed unless an engineering study indicates that installing a traffic control signal will improve the overall safety and/or operation of the intersection.
3. A signal should not be installed if it will seriously disrupt progressive traffic flow.
4. Bicycles may be counted as either vehicles or pedestrians for signal warrant analysis.
5. Pedestrian volume counts should be taken on each crosswalk during the same periods as the vehicular counts and during the hours of highest pedestrian volume.
6. Quantify pedestrian delay time for at least two 30 minute peak pedestrian delay periods of an average weekday or like periods of a Saturday or Sunday.
7. The posted or statutory speed limit or the 85th-percentile speed on the uncontrolled approaches to the location should be noted.
8. The distance to the nearest traffic control signals should be noted.
9. Where feasible, note the queue length on stop-controlled approaches.
10. For signal warrant analysis, a location with a wide median (even if the median is greater than 30 feet) should be considered as one intersection.
11. For detailed guidance regarding the application of signal warrants refer to the California MUTCD 2012.

Figure 4C-3. Warrant 3, Peak Hour



*Note: 150 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 100 vph applies as the lower threshold volume for a minor-street approach with one lane.

Appendix 5 - Traffic Glossary

Access point -- An intersection, driveway, or opening on the right-hand side of a roadway. An entry on the opposite side of a roadway or a median opening also can be considered as an access point if it is expected to influence traffic flow significantly in the direction of interest.

All-way stop controlled -- An intersection with stop signs at all approaches. The driver's decision to proceed is based on the rules of the road (e.g., the driver on the right has the right-of-way) and also on the traffic conditions of the other approaches.

Annual Average Daily Traffic (AADT) -- The total volume passing a point or segment of a highway facility in both directions for one year divided by the number of days in the year.

Average Daily Traffic (ADT) -- The total volume passing a point or segment of a highway facility in both directions on an average day during a specified interval (which can be the peak month or weekdays etc.).

Average Day -- A day representing traffic volumes normally and repeatedly found at a location, typically a weekday when volumes are influenced by employment or a weekend day when volumes are influenced by entertainment or recreation.

Approach -- All lanes of traffic moving towards an intersection of a midblock location from one direction including any adjacent parking lanes.

Arterial -- Signalized streets that serve primarily through traffic and provide access to abutting properties as a secondary function, having signal spacing of 2 miles or less and turn movements at intersections that usually do not exceed 20 percent of total traffic.

Average approach delay -- Average stopped-time delay at a signalized intersection plus average time lost because of deceleration to and acceleration from a stop, generally estimated as 1.3 times the average stopped time delay.

Average control delay -- the total time vehicles are stopped in an intersection approach during a specified time interval divided by the volume departing from the approach during the same time period. It does not include queue follow-up time (i.e. the time required for the vehicle to travel from the last-in-queue position to the first-in-queue position).

Average stopped-time delay -- The total time vehicles are stopped in an intersection approach or lane group during a specified time interval divided by the volume departing from the approach or lane group during the same time period, in seconds per vehicle.

Average total delay -- The total additional travel time experienced by drivers, passengers, or pedestrians as a result of control measures and interaction with other users of the facility divided by the volume departing from the corresponding cross section of the facility.

AWSC intersection -- an all-way stop-controlled intersection, which can be a three-way stop if the intersection has only three legs or a four-way stop if the intersection has four legs.

Bike lane -- A portion of a roadway that has been designated by striping, signing, and pavement markings for the preferential or exclusive use of bicycles.

Bike path -- A bikeway physically separated from motorized traffic by an open space or barrier, either within the highway right-of-way or within an independent right-of-way.

Bikeway -- Any road, path, or way that in some manner is specifically designated as being open to bicycle travel, regardless of whether such facilities are designated for the exclusive use of bicyclists or are to be shared with other vehicles.

Capacity -- The maximum rate of flow at which persons or vehicles can be reasonable expected to traverse a point or uniform segment of a lane or roadway during a specified time period under prevailing roadway, traffic, and control conditions, usually expressed as vehicles per hour or persons per hour.

Clearance lost time -- The minimum possible time interval between the departure of one bus from a bus berth and the entrance of another.

Clearance time -- The time, in seconds, between signal phases during which an intersection is not used by any traffic.

Conflicting approach -- The approach at approximately 90 degrees to the subject approach at an all-way stop-controlled (AWSC) intersection.

Conflicting traffic volume -- The volume of traffic that conflicts with a specific movement at an unsignalized intersection.

Control delay -- The component of delay that results when a control signal causes a lane group to reduce speed or to stop; it is measured by comparison with the uncontrolled condition.

CMP -- Congestion Management Program, designed to ensure that a balanced transportation system is developed that relates population growth, traffic growth, and land use decisions to transportation system level of service performance standards to help reduce traffic congestion and improve air quality.

Constrained operation -- An operating condition in a weaving area in which, because of geometric constraints, weaving vehicles are unable to occupy as large a portion of available lanes as required to achieve balanced operation.

Critical gap -- The minimum time interval between vehicles in a major traffic stream that permits side-street vehicles in a stop-controlled approach to enter the intersection under prevailing traffic and roadway conditions, in seconds.

Critical lane group -- The lane groups that have the highest flow ratio for a given signal phase.

Critical volume-to-capacity ratio -- The proportion of available intersection capacity used by vehicles in critical lane groups.

Crosswalk -- That part of a roadway at an intersection included within the connections of the lateral lines of the sidewalks on opposite sides of the highway measured from the curbs (or in the absence of curbs, from the edges of the traversable roadway) and in the absence of a sidewalk on one side of the roadway, the part of a roadway included within the extension of the lateral lines of the sidewalk at right angles to the centerline. Any portion of a roadway at an intersection or elsewhere distinctly indicated as a pedestrian crossing by lines on the surface, which may be supplemented by a contrasting pavement texture, style or color.

Cycle -- Any complete sequence of signal indications.

Cycle length -- The total time required for one complete sequence of signal indications.

Deceleration lane -- A paved auxiliary lane, including tapered areas, allowing vehicles leaving the through-traffic lane of the roadway to decelerate.

Delay -- Additional travel time experienced by a driver, passenger, or pedestrian beyond what would reasonably be desired for a given trip.

Demand volume -- The traffic volume expected to desire service past a point or segment of the highway system at some future time, or the traffic currently arriving or desiring service past such a point, usually expressed as vehicles per hour.

Effective green time -- The time allocated for a given traffic movement (green plus yellow) at a signalized intersection less the start-up and clearance lost times for the movement.

Exclusive turn lane -- A designated left- or right-turn lane or lanes used only by vehicles making those turns.

Expressway -- An arterial which increases vehicular capacity by reducing at-grade access and increased signal spacing.

Flared approach -- A shared right-turn lane that allows right-turning vehicles to complete their movement while other vehicles are occupying the lane.

Free flow speed -- (1) The theoretical speed of traffic when density is zero, that is, when no vehicles are present; (2) the average speed of vehicles over an arterial segment not close to signalized intersections under conditions of low volume.

Gap acceptance -- The process by which a minor-street vehicle accepts an available gap to maneuver.

Green time -- The actual length of the green indication for a given movement at a signalized intersection.

HCM -- Highway Capacity Manual

HCS -- Highway Capacity Software implementing the Highway Capacity Manual procedures.

Ideal conditions-- Characteristics for a given type of facility that are assumed to be the best possible from the point of view of capacity, that is, characteristics that if further improved would not result increased capacity.

Intersection -- The area embraced within the prolongation or connection of the lateral curb lines, or if none the lateral boundary lines of the roadways of two highways that join one another at, or approximately at right angles, or the area within which vehicles traveling on different highways that join at any other angle might come into conflict. The junction of an alley or driveway with a roadway or highway does not constitute an intersection.

Intersection delay -- The total additional travel time experienced by drivers, passengers, or pedestrians as a result of control measures and interaction with other users of the facility, divided by the volume departing from the corresponding cross section of the facility.

Interval -- The part of a signal cycle during which signal indications do not change.

Level of service (LOS) -- A qualitative measure describing operational conditions within a traffic stream, generally described in terms of such factors as speed and travel time, freedom to maneuver, traffic interruptions, comfort and convenience, and safety.

Lost time -- The time during which the intersection is not effectively used by any movement. Clearance lost time plus start-up lost time.

Major street -- The street not controlled by stop signs at a two-way stop-controlled intersection. The street normally carrying the higher volume of vehicular traffic.

Maximum service flow rate -- The highest 15-minute rate of flow that can be accommodated on a highway facility under ideal conditions while maintaining the operating characteristics for a stated level of service, expressed as passenger cars per hour per lane.

Minor Street -- The street controlled by stop signs at a two-way stop-controlled intersection; also referred to as a side street. The street normally carrying the lower volume of vehicular traffic.

Passenger car equivalent -- The number of passenger cars that are displaced by a single heavy vehicle of a particular type under prevailing roadway, traffic, and control conditions.

Peak hour -- The hour during which the greatest number of vehicles are traveling on a given facility.

Peak hour factor -- The hourly volume during the maximum volume hour of the day divided by the peak 15-minute rate of flow within the peak hour; a measure of traffic demand fluctuation within the peak hour.

Pedestrian Clearance Time -- The time provided for a pedestrian crossing in a crosswalk, after leaving the curb or shoulder, to travel to the far side of the traveled way or to a median.

Performance measure -- A quantitative or qualitative characteristic describing the quality of service provided by a transportation facility or service.

Permitted plus protected -- Compound left-turn protection that displays the permitted phase before the protected phase.

Permitted turns -- Left or right turns at a signalized intersection that are made against an opposing or conflicting vehicular or pedestrian flow.

Phase -- The part of a signal cycle allocated to any combination of traffic movements receiving the right-of-way simultaneously during one or more intervals.

Planning analysis -- A use of capacity analysis procedures to estimate the number of lanes required by a facility in order to provide for a specified level of service based on approximate and general planning data in the early stages of project development.

Platoon -- A group of vehicles or pedestrians traveling together as a group, either voluntarily or involuntarily because of signal control, geometrics, or other factors.

Platoon -- A group of vehicles or pedestrians traveling together as a group, either voluntarily or involuntarily, because of traffic signal controls, geometrics, or other factors.

Protected turns -- Left or right turns at a signalized intersection made with no opposing or conflicting vehicular or pedestrian flow.

Queue -- A line of vehicles or persons waiting to be served by the system in which the rate of low from the front of the queue determines the average speed within the queue. Slowly moving vehicles or people joining the rear of the queue are usually considered a part of the queue. The internal queue dynamics may involve a series of starts and stops. A faster-moving line of vehicles is often referred to as a moving queue or a platoon.

Red Clearance Interval -- An optional interval that follows a yellow change interval and precedes the next conflicting green interval.

Right-of-Way Assignment -- The permitting of vehicles and/or pedestrians to proceed in a lawful manner in preference to other vehicles or pedestrians by the display of signal indications.

Roadway Network -- A geographical arrangement of intersecting roadways.

RTIP -- Regional Transportation Improvement Program is a list of transportation projects, their costs and projected funding sources, and their anticipated date of completion.

RTP -- Regional Transportation Plan is a plan adopted for the region's transit, highways, bicycle programs, commuter and inter-city rail lines.

Shared lane capacity -- The capacity of a lane at an unsignalized intersection that is shared by two or three movements, in passenger cars per hour.

Signal Coordination -- The establishment of timed relationships between adjacent traffic control signals.

Signal Phase -- the right-of-way, yellow change, and red clearance intervals in a cycle that are assigned to an independent traffic movement or combination of movements.

Signal System -- two or more traffic control signals operating in signal coordination.

Signal Timing -- the amount of time allocated for the display of a signal indication.

Signal Warrant -- a threshold condition that, if found to be satisfied as part of an engineering study, shall result in analysis of other traffic conditions or factors to determine whether a traffic control signal or other improvement is justified.

TDM -- Transportation Demand Management is a program designed to decrease the demand for peak hour commute and truck travel and increase the use of alternative transportation modes.

TIS -- Traffic Impact Study A Congestion Management Program (TIS) analysis is required for all large projects.

Total delay -- The sum of all components of delay for any lane group, including control delay, traffic delay, geometric delay, and incident delay.

Trip-end -- one end of a trip at either the origin or the destination; i.e. each trip has two trip-ends.

Traffic -- pedestrians, bicyclists, ridden or herded animals, vehicles, streetcars, and other conveyances either singularly or together while using any highway for purposes of travel.

Traffic Control Signal -- any highway traffic signal by which traffic is alternately directed to stop and permitted to proceed.

Travel speed -- The average speed, in miles per hour, of a traffic stream computed as the length of a highway segment divided by the average travel time of the vehicles traversing the segment.

Travel time -- The average time spent by vehicles traversing a highway segment, including control delay, in seconds per vehicle or minutes per vehicle.

TSM -- Transportation Systems Management is a program to facilitate low cost traffic flow improvements like coordinating traffic signals, metering freeway ramps and incident management.

Two-way left-turn lane (TWLTL) -- The center lane on a three-lane or multi-lane highway that is used continuously for vehicles turning left in either direction of flow at mid-block locations.

Two-way stop-controlled -- The type of traffic control at an intersection where drivers on the minor street or a driver turning left from the major street wait for a gap in the major-street traffic to complete a maneuver.

Unconstrained Operation -- An operating condition in a weaving area where geometric constraints do not limit the ability of weaving vehicles to achieve balanced operation.

Unsignalized intersection -- Any intersection not controlled by traffic signals.

V/C ratio -- The ratio of demand flow rate to capacity for a traffic facility.

Volume -- The number of persons or vehicles passing a point on a lane, roadway, sidewalk etc. during some time interval, often taken to be one hour, expressed in vehicles.

VMT -- Vehicle miles traveled.

Yellow Change Interval -- the first interval following the green interval during which the yellow signal indication is displayed.

Appendix 6

CITY OF RANCHO MIRAGE REVIEW COMMENTS AND RESPONSES

October 6, 2014
City of Rancho Mirage Comments
Comments on the Section 24 Traffic Impact Study

Comment 1 – Sole Reliance on RivTAM Traffic Model

The Endo study projects much lower traffic numbers than the approved 2005 General Plan in the vicinity of the project as shown in the table below.

Location	2035 Section 24 T.S.	RM GP Buildout	% of RM GP Buildout
Bob Hope Drive n/o Ramon Rd.	40,520	67,700	60%
Bob Hope Drive s/o Ramon Rd.	37,660	55,300	68%
Ramon Road w/o Bob Hope Dr.	50,070	74,800	67%
Dinah Shore Drive w/o Bob Hope Dr.	27,080	49,400	55%

The Endo study has relied entirely on the RivTAM traffic model and considers it an adequate evaluation of the projects long term cumulative traffic impacts. The RivTAM model is not intended to represent General Plan buildout, but rather buildout at a target horizon year (i.e. 2035), and it is not known if the model that was used included the known cumulative development Specific Plans in the vicinity. The City will require that infrastructure facilities accommodate full buildout of the City and the study should use the City provided data for analysis of General Plan infrastructure needs.

Response to Comment 1:

As explained in more detail below, the RivTAM model used in the Section 24 Specific Plan Traffic Study is a more sophisticated, comprehensive and current model than the 2005 City of Rancho Mirage General Plan Traffic Model (RMTM) and reflects the full amount of population and housing projected in the City's General Plan. For this reason, the traffic volumes projected by the RivTAM model are more reliable than the volumes in the City's 2005 model for these roadways.

Based on the RivTAM forecasts, the City's General Plan Circulation System can accommodate the proposed Section 24 Specific Plan project and the other residential and population growth allowed by the City's General Plan as well as the employment growth forecast for the year 2035 in the SCAG *2004 Growth Forecast*. In other words, the RivTAM 2035 forecasts include the growth allowed by the City's General Plan.

Section 24 is located within unincorporated Riverside County and the Sphere of Influence of the City of Rancho Mirage. Two subregional travel demand models were considered for use in forecasting long-term traffic projections for the *Section 24 Specific Plan Traffic Impact Study*. The Riverside County Traffic Analysis Model (RivTAM), completed in May 2009, was developed with the cooperative efforts of the Riverside County Transportation Department (RCTD), Western Riverside Council· of Governments (WRCOG), Coachella Valley Association of Governments (CVAG), Riverside County Transportation Commission (RCTC), Southern California Association of Governments (SCAG), and California Department of Transportation (Caltrans). The RivTAM incorporates a detailed description of Riverside County, while maintaining consistency with the SCAG Regional Model.

The RivTAM provides long-term traffic projections for the horizon year 2035 and is intended for use for transportation planning purposes throughout Riverside County by all levels of governmental jurisdiction and by private entities and as a tool to determine potential impacts of large development proposals, General Plan land use changes, and forecasting for transportation projects.

The RMTM, developed in 2005, was based on the Coachella Valley Area Transportation Study (CVATS) model, which was the best available regional model at that time. The CVATS model is no longer supported by CVAG or SCAG. The CVATS model did not include recently completed and planned improvements to the circulation system in the vicinity of the Section 24 Project Site, including six of the existing I-10 interchanges in the Coachella Valley. It did not reflect the existing configuration at the Bob Hope Drive and Ramon Road interchanges or the planned Da Vall Road Interchange to the east of Section 24.

The RMTM was used to develop buildout projections for the 2005 update of the Rancho Mirage General Plan. It was used to model the 15,796 acres within the City of Rancho Mirage as well as 4,084 acres within the Northern Sphere of Influence (SOI) and 1,465 acres within the Southern SOI. While it included development within the Section 19 Specific Plan area, it did not reflect all of the land uses subsequently approved for the Section 19 Specific Plan in 2009.

In 2009, CVATS was superceded by RivTAM, which is a more sophisticated capacity-restrained gravity flow model, with land uses reflecting Tribal lands and all local general plans and the roadway network in the Circulation Element of the Riverside County General Plan. RivTAM includes regional cumulative development anticipated in the horizon year 2035 per the SCAG 2004 Growth Forecast for six southern California counties.

The RMTM future traffic projections overstate the development potential and future traffic volumes that the circulation network within the City of Rancho Mirage will be required to accommodate from buildout of the uses currently allowed by the City's General Plan. As shown in the table below, the 2005 City traffic model evaluated 18 percent more housing, 2 percent more population and 61 percent more employment

than projected from buildout of the 2005 *Rancho Mirage General Plan*. By comparison, RivTAM includes 100 percent of the housing and population growth anticipated upon buildout of the 2005 *Rancho Mirage General Plan* as well as approximately 70 percent of the employment anticipated by the 2005 *Rancho Mirage General Plan.*

Future Growth Projections

Projection	Rancho Mirage[a] General Plan Buildout	SCAG/RIVTAM[a] Evaluated	City Traffic Model[b] Evaluated
Housing	16,612	16,917	19,522
Population	32,393	32,541	33,130
Employment	25,029	17,249	40,323

a. Source: The Planning Center, *Section 19 Specific Plan EIR,* May 2009 (page 5.10-13).
b. Source: Urban Crossroads; *City of Rancho Mirage General Plan Traffic Study*, March 2005 (page 3-3.

It should be noted that the RMTM included 4,084 acres north of Interstate 10 (I-10) that were 99% vacant and projected to generate 133,134 daily trips, primarily as a result of future employment, most of which was the result of 12,000 future jobs associated with non-residential land uses assumed in this area.

Much of this area will never be developed and very little, if any, of the area north of I-10 is expected to be annexed to the City of Rancho Mirage, based on the current Riverside County LAFCo Spheres of Influence for the Cities of Rancho Mirage and Cathedral City north of the I-10. Approximately 1,200 acres of this area is Tribal (Allottee) land. More than 1,500 acres of this area was subsequently been included in the Multiple Species Habitat Conservation Area and other conservation areas that will never be developed. Approximately 591 acres in this area have been annexed to Cathedral City in conjunction with the approval of the North City Extended Specific Plan. The land uses for this area are not the same as assumed in the 2005 Rancho Mirage General Plan designations for the Northern SOI and will result is substantially less employment, and daily trips, than were assumed in the 2005 RMTM. This assumed future growth is reflected in the higher employment projections used in the RMTM and the higher projected traffic volumes on roads in this portion of the City's planning area.

RivTAM includes 100 percent of the households and population identified to result from buildout of the 2005 Rancho Mirage General Plan. RivTAM also reflects approximately 70 percent of the employment projected for buildout of the 2005 Rancho Mirage General Plan. Since RivTAM is a 20-year horizon model, not a General plan buildout model, it constrained the employment with Rancho Mirage by the year 2035 to reflect the SCAG 2004 Growth Forecast. The SCAG 2012 Growth Forecast currently being used to update RivTAM anticipates 7 to 8 percent less growth than the SCAG 2004

Growth Forecast and, for this reason, the estimate of employment growth is conservative, and more up to date and realistic than the amount of employment assumed in the 2005 RMTM, which assumed a large amount of employment growth on the City's SOI area north of the I-10 that will not occur, as discussed above.

The Riverside County Traffic Analysis Model (RivTAM) was determined to be the most appropriate model based on the following considerations:

- RivTAM is the approved subregional transportation model that includes socioeconomic data from six counties in Southern California.
- RivTAM provides horizon year 2035 traffic projections based on 52 socio-economic input parameters per TAZ, consistent with the 2008 SCAG Travel Demand Model and the SCAG 2004 Growth Forecast.
- RivTAM was approved by Riverside County, RCTC, CVAG, as well as all of the cities in the Coachella Valley and the Agua Caliente Band of Cahuilla Indians for use as the subregional model for the Coachella Valley.
- RivTAM was released in November 2010, updated in August 2013, and is updated periodically as new information is available. The August 2013 version was used to prepare the Section 24 Traffic Impact Study.
- RivTAM superseded the CVATS travel demand model, which is no longer supported by CVAG or SCAG.

The Rancho Mirage Traffic Model (RMTM) was not utilized based on the following considerations, which indicate that this model is not as up to date or accurate as the RivTAM model.

- The RMTM was based on the now outdated CVATS 2030 traffic model, which was never adopted by and is no longer supported by CVAG or SCAG. The CVATS projections were modified in March 2005 to address 2,910 more households, 737 more residents and 15,294 more employment than buildout per the 2005 Rancho Mirage General Plan.
- The RMTM assumptions for the area north of Interstate 10 (within the Northern Sphere of Influence) generated 133,134 daily trips and substantially overstated the future traffic demands that would need to be served by the Rancho Mirage circulation system.
- The RMTM is an older model that does not reflect changes to the circulation system that have occurred since 2005, such as the completion of the improvements to six key I-10 interchanges in this portion of the Coachella Valley, including the final configuration of the major recent improvements to the Bob Hope Drive/Ramon Road interchange. For this

reason, the 2005 City model projected substantially more trips on arterial streets parallel to I-10 such as Ramon Road.

The Section 24 traffic study used RivTAM to develop long-term traffic projections because it incorporates a much larger area, uniformly addresses all cities and unincorporated Riverside County, incorporates more recent data, and is regularly updated. RivTAM is especially useful for development in areas involving multiple jurisdictions.

The socioeconomic data in the City's 2005 General Plan, in the General Plan Traffic Model and in RivTAM for the City of Rancho Mirage was reviewed. This review revealed that the RivTAM 2035 growth forecasts include 100% of the population and housing growth projected for full buildout of the City's General Plan. The RivTAM growth forecast includes approximately 70% of the employment growth projected in the City's 2005 traffic model and do not assume development of the 1,500 acres within conservation areas established north of I-10 that will never be developed. This difference partially explains the difference in the future forecasted traffic volumes on Bob Hope Drive, Ramon Road, and Dinah Shore Drive. The other major factor discussed above is that the City's 2005 model does not reflect the future planned circulation system as accurately as the RivTAM model. These are the primary reasons why the RivTAM model provides more reliable future forecasts that more accurately reflect the likely buildout of the City's General Plan.

Section 7.2 of the *Riverside County TIA Preparation Guide* states: *"Development proposals that also include a General Plan Amendment, Specific Plan, Zone Change or other approval that increases traffic beyond what was approved in the [County] General Plan will also be required to perform a Build-out Analysis to assess long-term impacts. This analysis will determine if the Circulation Element of the General Plan is adequate to accommodate projected traffic at the target LOS, or if additional mitigation is necessary."* Table 2-1 of the traffic study shows that the Section 24 Specific Plan would not increase traffic beyond the amount generated by the land uses allowed by the Riverside County General Plan. Therefore, a General Plan buildout analysis is not required to assess long-term impacts. The *Section 24 Specific Plan Traffic Impact Study* exceeded the traffic modeling requirements outlined in Section 8.2 of the *Riverside County TIA Preparation Guide*.

Section 15130 (b) of the CEQA Guidelines identify two approaches to produce an adequate discussion of cumulative impacts. The first method involved considering a list of related projects while the second involves the use of projections in a regional planning document, such as a regional transportation plan. As discussed above, RivTAM is the approved sub-regional transportation model that addresses regionwide cumulative development projected for the year 2035 and is consistent with the second method identified in the CEQA Guidelines. The use of RivTAM as the source for the long-term traffic projections in the Section 24 was discussed with City of Rancho Mirage

staff at a meeting in January 2014 to discuss the methodology and scope of the Section 24 Traffic Study. City staff agreed at this meeting that RivTAM was the most appropriate model to use for this study.

Comment 2 – Insufficient Study Area

The study area limits used by the Endo traffic study extended 1 mile from the project site. For a project of this size and scope, Mr. Waters recommends that the study limits be expanded up to a 5 mile radius that includes all intersections where the project contributes 50 or more peak hour trips as required by Riverside County. This is typical Riverside County process and has been adhered to by numerous large Specific Plans in the Coachella Valley and elsewhere in the County.

Endo argues that the Riverside County Traffic Study Impact Analysis Preparation Guide requires a buildout analysis for projects that would increase traffic beyond levels associated with the County General Plan, however, this project is decreasing the land use intensity from the County Plan and therefore should not be held to the higher standard. Endo argues that because significant impacts have not been identified in the intersections studied (within 1 mile), there is no need to analyze more distant intersections. Mr. Waters points out that the project is using existing excess capacity at intersections close to the project, while other intersections further from the site currently operating at, or near, capacity may decrease level of service significantly by the added traffic. Mr. Waters indicates that large specific plans do in fact require extensive analysis for a large study area up to 5 miles from the study site. We anticipate that this may be an issue especially for adjoining municipalities.

Response to Comment 2:

In determining the scope of study, the *Riverside County TIA Preparation Guide* was reviewed and the scope of the study was discussed with City staff at the January 9, 2014 traffic scoping study meeting. The project site is located in unincorporated Riverside County. The Riverside County Circulation Element roadway classifications were designed specifically to accommodate the land uses in the Riverside County Land Use Element. The proposed land uses are consistent, but less intense than the uses shown in the Riverside County General Plan. Therefore, the project would be using the roadway capacity that was incorporated in the Riverside County Circulation Element to accommodate the land uses for this site designated in the Land Use Element.

In addition, the City of Rancho Mirage submitted a letter to dated February 12, 2004 in response to the Notice of Intent to prepare the Section 24 Specific Plan EIS issued by the Tribe that included comments on Transportation and Traffic. Specifically, these comments recommended that “all intersections and road segments within a mile of the project site should be studied including the impact on the newly constructed Bob Hope freeway bridge and Ramon Road.”

Specific plans that generate more trips than the Riverside County General Plan land uses may need improvements beyond the General Plan Circulation Element road classifications and require a larger study area. Similarly, specific plans in undeveloped areas with interim roadway improvements may require a larger study area to evaluate the timing of future roadway widening. In addition, specific plans with rapid development schedules may result in near-term impacts over a larger area and require an extended study area. However, the Section 24 Specific Plan has none of these characteristics. The proposed Section 24 Specific Plan would generate fewer trips than the development that would be allowed by the Riverside County General Plan land use designations for Section 24. Most of the streets serving the development are fully widened. The area is centrally located with development in all directions and regional access is provided by I-10. The project will be phased over a long development period with only six percent of the total trip generation occurring by the year 2022, which is the year identified for full development of the active adult residential community in Phase I of the project.

At the traffic study scoping meeting held at the Rancho Mirage City offices on January 9, 2014, City staff requested that the study area be expanded to extend one mile from the perimeter of the project site and the number of intersections studied be expanded from 12 to 17 intersections. The traffic study addressed 17 existing and 23 future key intersections, covering the entire study area requested by City staff. Although project traffic would travel on roadways beyond the study area, the potential incremental contribution of traffic from the Section 24 project to cumulative impacts on streets outside the study area will be mitigated through payment of TUMF fees, which fund improvements to roads throughout the Coachella Valley, consistent with the Riverside County General Plan Circulation Element.

In addition, it should be noted that the study area requested by Rancho Mirage City staff for the Section 24 Traffic Study covers more than three times the area evaluated by the City in the *Traffic Impact Study for the Section 19 Specific Plan*, even though the two projects would generate similar amounts of traffic. The Section 19 Specific Plan would generate 75,054 unadjusted weekday trips while the Section 24 Specific Plan would generate 73,890 unadjusted weekday trips. The *Traffic Impact Study for the Section 19 Specific Plan* evaluated 9 existing and 19 future key intersections, none of which were west of Bob Hope Drive, which is the western boundary of the Section 19 Specific Plan area. The scope of the Section 24 traffic study is consistent with the *Riverside County TIA Preparation Guide,* addresses the study area requested by the City in January 2014, and is larger and more comprehensive than the study area the City used in the Section 19 Specific Plan Study for project that generates a similar amount of traffic.

Comment 3 – Lack of Information regarding Cumulative Projects

Endo has relied on the RivTAM model to project City of Palm Desert and Cathedral City traffic for near term cumulative development. It appears that these cities were not contacted. RivTAM input data shall be updated to include known cumulative development, including Specific Plans, in Cathedral City and Palm Desert.

Response to Comment 3:

At the January 2014 traffic study scoping meeting, the City of Rancho Mirage staff identified two near-term cumulative developments that were addressed in the traffic study. The year 2022 near-term traffic scenario in the *Section 24 Specific Plan Traffic Impact Study* included these two cumulative projects, as well as background traffic growth determined by interpolating between existing and year 2035 traffic volumes. The traffic impacts from the *Section 24 Specific Plan* development would be very limited in the year 2022, since the initial phase only represents six percent of the total project trip generation. This initial phase of development reflects the full development of the proposed 320-acre active adult community. For the year 2035 long-term traffic scenario, the *Section 24 Specific Plan Traffic Impact Study* used RivTAM to address all cumulative traffic impacts from growth projected throughout six Southern California counties. All cumulative development through the year 2035 in Rancho Mirage, unincorporated Riverside County, Tribal lands, as well as the neighboring cities was included in RivTAM. As discussed above, the use of the RivTAM model to assess long-term cumulative impacts is consistent with the CEQA Guidelines requirements for analysis of cumulative impacts, and includes the most current and realistic assumptions for cumulative traffic growth. The amount of development assumed for the year 2035 was identified by each jurisdiction, but constrained by the 2004 SCAG Growth Forecast. When RivTAM is updated in the near future, the horizon year growth forecast is expected to decrease by approximately seven percent to reflect the slower growth during the recent recession. As a result, the current version of RivTAM provides a conservative estimate of projected growth and likely cumulative traffic impacts from this growth.

October 6, 2014
Urban Crossroads
(City of Rancho Mirage Traffic Review Consultant)
Comments on the Section 24 Traffic Impact Study

Urban Crossroads Comment 1

No mention is made regarding consistency of the proposed project with the County of Riverside or City of Rancho Mirage General Plan and Zoning. A General Plan amendment (GPA) is required, long range analysis addressing General Plan conditions should be included in the report.

Response to Comment 1

A traffic study scoping meeting was held with the City in January 2014 to discuss the scope and methodology of the traffic study. Based on the discussion at this meeting, it was determined that the Riverside County Transportation Analysis Model (RivTAM) model for 2035 was the most appropriate analysis tool, as RivTAM is the most complete, accurate, and up to date growth model available to assess long-term cumulative traffic impacts. The City participated in the development of RivTAM, which was developed for use for transportation planning purposes through Riverside County by all levels of governmental jurisdiction and to assist in determining potential impacts of large development proposals and General Plan land use changes.

The traffic study identifies the land uses allowed by both the County and City General Plans in relation to the uses that would be permitted by the proposed Section 24 Specific Plan. The intensity of the land uses that would be permitted by the Section 24 Specific Plan and the amount of traffic that would be generated is compared to the uses that would be allowed by the City's General Plan and the County General Plan in Table 2-1. While the Section 24 Specific Plan would generate more traffic than the mix of residential and commercial uses allowed by the City's General Plan, the amount of traffic generated by the Section 24 Specific Plan project would be 16.5 percent less than the amount generated by the Riverside County General Plan land use designations for Section 24, and the RivTAM projections reflect the intensity of development allowed by the County General Plan. To evaluate the impact of the proposed project on the circulation system in the study area, RivTAM was modified to include socio-economic (SED) data representing full development of the uses that would be permitted by the proposed Section 24 Specific Plan.

As described in further detail below, the SED in RivTAM for the 2035 analysis year in RivTAM was reviewed and compared to the buildout projections in the Rancho Mirage General Plan. Through this review it was determined that the RivTAM 2035 growth projections include over 100% of the population and housing growth in the City's General Plan buildout growth projections and 70% of the projected employment. Through further review of the employment projections in the City's General Plan and 2005 General Plan Traffic Model it was determined that the General Plan Traffic Model included a large amount of projected employment north of the I-10 in areas that will not be annexed to the City or developed as assumed in the City's model. Since the RivTAM projections are consistent with updated SCAG growth forecasts, the RivTAM employment projections for the City are considered to be more up to date and reliable than the projection in the 2005 General Plan. This indicates that the RivTAM model considers appropriate long range analysis for the City of Rancho Mirage and the rest of Riverside County.

Urban Crossroads Review of Response to Comment 1

The comment response suggests repeatedly that the RivTAM data used to evaluate project impacts is similar to or exceeds the City of Rancho Mirage General Plan allowable land use. Table 1 below has been prepared based on the data included in the traffic impact study report (Table 4-5) and data extracted from the City of Rancho Mirage General Plan Traffic Study (Urban Crossroads, Inc., 2005). General Plan Traffic Study excerpts

are included as Attachment B to this letter for ease of reference. Table 1 compares the daily traffic volumes at a limited number of locations in the immediate vicinity of the project site, including 2 locations on Bob Hope Drive and one location each on Dinah Shore Drive and Ramon Road.

Table 1
Volume Comparison

Location	2035 Sect 24	RM GP Buildout	Difference	% Difference
Bob Hope Drive n/o Ramon Road	40,520	67,700	27,180	67%
Bob Hope Drive s/o Ramon Road	37,660	55,300	17,640	47%
Ramon Road w/o Bob Hope Drive	50,Q70	74,800	24,730	49%
Dinah Shore Drive w/o Bob Hope Drive	27,080	49,400	22,320	82%

As shown on Table 1, the Section 24 traffic study 2035 With Project Buildout daily volumes range from 27,080 to 50,070 vehicles per day (VPO), while the General Plan buildout daily traffic volumes range from 49,400 to 74,800 VPD. Further investigation of these large daily volume differences is required to explain how the RivTAM data can be considered representative of buildout traffic conditions in the study area.

Response

The information and assumptions in both the 2005 Rancho Mirage Traffic Model (RMTM) and the current RivTAM model were reviewed to identify the differences that resulted in the differenced in traffic volumes noted in this comment. To clarify the differences in the socioeconomic assumptions between the two models, Table A includes the future growth projections associated with each model. The future population growth, housing forecast, and employment forecast shown in Table A include: (1) buildout of the 2005 Rancho Mirage General Plan, (2) the SCAG Growth Forecast used to develop RivTAM, and (3) the socioeconomic input data used in the 2005 Rancho Mirage General Plan traffic model.

Table A
Future Growth Projections

Projection	Rancho Mirage[a] General Plan Buildout	SCAG/RivTAM[a] Evaluated	City Traffic Model[b] Evaluated
Housing	16,612	16,917	19,522
Population	32,393	32,541	33,130
Employment	25,029	17,249	40,323

a. Source: The Planning Center, *Section 19 Specific Plan EIR,* May 2009 (page 5.10-13).
b. Source: Urban Crossroads; *City of Rancho Mirage General Plan Traffic Study*, March 2005 (page 3-3.

As shown in Table A, the 2005 City traffic model evaluated 18 percent more housing, 2 percent more population and 61 percent more employment than anticipated upon buildout of the 2005 *Rancho Mirage General Plan*. By comparison, RivTAM included all of the housing and population growth projected for full development of the uses allowed by 2005 *Rancho Mirage General Plan* as well as approximately 70 percent of the projected employment.

The higher employment number in the RMTM results primarily appears to result from the City's model evaluating 4,084 acres north of Interstate 10 that were 99% vacant and projected to generate 133,134 daily trips, primarily as a result of future employment. This area was in the City's Sphere of Influence in 2005. Much of this area will never be developed and very little, if any, of the area north of I-10 is now expected to be

annexed to the City of Rancho Mirage. Approximately 1,200 acres of this area is Aqua Caliente Tribal (Allottee) land. More than 1,500 acres of this area was subsequently included in the Multiple Species Habitat Conservation Area and other conservation areas that will never be developed. Approximately 591 acres in this area has been annexed to Cathedral City in conjunction with the approval of the North City Extended Specific Plan. The future employment modeled for this area by the RMTM substantially increased the future traffic generation loading on the circulation network in this area and partially explains the discrepancies in the future projections between RivTAM and the RMTM.

The differences in the traffic volumes shown in Table 1 do not necessarily result only from the difference in the employment levels for the City of Rancho Mirage in RMTM and RivTAM. The RMTM is an older model that does not reflect changes to the circulation system that have occurred since 2005, such as the completion of the improvements to six key I-10 interchanges in this portion of the Coachella Valley, including the final configuration of the major recent improvements to the Bob Hope Drive/Ramon Road interchange. For this reason, the 2005 City model retained more trips on arterial streets parallel to Interstate 10 such as Ramon Road. The RMTM did not consider the same planned future circulation improvements that are included in the more up to date RivTAM model. For example, the RMTM did not include the Da Vall Drive interchange, which is now included in the Riverside County General Plan and the Cathedral City General Plan. Three of the four future traffic projections shown in Table 1 are for roadways in the immediate vicinity of the recent Interstate 10 interchange modifications at Bob Hope Drive/Ramon Road, and would have higher projected traffic in the RMTM as a result.

The employment growth assumed in the RMTM for the area north of I-10 exceeded the future increase in employment assumed for the entire City. This difference partially explains the difference in the future forecasted traffic volumes on Bob Hope Drive, Ramon Road, and Dinah Shore Drive. The other major factor discussed above is that the City's 2005 model does not reflect the future planned circulation system as accurately as the RivTAM model. These are the primary reasons why the RivTAM model provides more reliable future forecasts that more accurately reflect the likely buildout of the City's General Plan than the RMTM.

Table 2-1 of the Section 24 Specific Plan Traffic Impact Study shows the type and intensity of land uses that would be allowed by the proposed Section 24 Specific Plan in relation to both the adopted Riverside County General Plan and the 2005 Rancho Mirage General Plan. The land uses allowed for the site by the current County of Riverside General Plan would be more intense than would be allowed by the proposed Section 24 Specific Plan. The land use designations for the site shown in the 2005 City of Rancho Mirage General Plan would be less intense than the proposed Section 24 Specific Plan land uses. The RivTAM SED for the project site were modified to reflect buildout of the proposed Section 24 Specific Plan land uses.

The Riverside County TIA Preparation Guide (Section 7.2) states: "Development proposals that also include a General Plan Amendment, Specific Plan, Zone Change or other approval that increases traffic beyond what was approved in the General Plan will also be required to perform a Build-out Analysis to assess long-term impacts". The Section 24 Specific Plan is located within unincorporated Riverside County and would not increase traffic beyond what was approved in the Riverside County General Plan. Consequently, a General Plan buildout analysis is not required to assess long-term impacts of the proposed project under the standard in the Riverside County TIA Preparation Guide.

The Riverside County Travel Demand Model Socio-Economic Data (SED) inputs were developed based on the Riverside County Projections 2006 (RCP-06) approved by CVAG on January 29, 2007. Population and housing growth was allocated to each partial census tract based on the overall county growth trend, the land use, specific plan, general plan, zoning, and most recently adopted SCAG growth forecast distribution. The RivTAM model future SED input for year 2035 development throughout the City Rancho Mirage was developed for Riverside County through coordination with City representatives, based on the 2005 Rancho Mirage General

Plan. That data was reviewed and approved by the City of Rancho Mirage, as was RivTAM. As discussed above, RivTAM includes 100% of the population and housing growth identified in the City's General Plan and a more updated and realistic projection of the amount of employment that would be generated by the City's General Plan.

For these reasons, RivTAM provides the most reliable forecasts of traffic from projected future growth in the area, including the growth permitted by the City's 2005 General Plan.

Urban Crossroads Comment 2

The project vicinity map presents numerous planned developments, including the North City Specific Plan, the North City Extended Specific Plan, the Section 13 Specific Plan, and the Section 19 Specific Plan. Further discussion of the near term development potential for these planned developments shall be included in the traffic study report.

Response to Comment 2

Additional discussion of the status of these projects has been be added to the traffic study. Near-term development is not anticipated in any of these areas. Please note that City of Rancho Mirage General Plan land use designation for Section 13 requires that a specific plan be approved prior to development of this area. No application for approval of a specific plan has been submitted to the City of Rancho Mirage. The City of Rancho Mirage has also not received any applications for development projects in Section 19 and the City of Cathedral City has also not received any applications for development projects in the North City or North City Extended Specific Plan Areas located north of the I-10.

The near-term and long-term cumulative developments are discussed on pages 3-3 to 3-5. The traffic study included all known near-term cumulative projects within the study area. As discussed above, the other major specific plan projects in the vicinity of Section 24 are not anticipated to result in near-term growth. These other specific plan projects will result in long-term growth. The RivTAM 2035 projections were used to evaluate future cumulative impacts from projections of long-term development and growth throughout the Coachella Valley and Southern California.

Urban Crossroads Review of Response to Comment 2

The response notes that the RivTAM 2035 projections were used to evaluate future cumulative impacts from projections of long-term development and growth throughout the Coachella Valley and Southern California. It is necessary to demonstrate that the RivTAM represents buildout of the known cumulative development Specific Plans in the vicinity of the proposed project to ensure that roadways are properly sized to serve ultimate travel demand in the study area.

Response

As stated in the traffic study, RivTAM is the approved subregional travel demand model developed by Riverside County for use by local jurisdictions to evaluate cumulative traffic impacts. RivTAM provides the best projections available of cumulative traffic volumes for the year 2035, which was evaluated as the project buildout year.

RivTAM is a 20-year planning horizon model developed to forecast year 2035 traffic volumes. The traffic study evaluating the Section 24 Specific Plan evaluated a proposed development within Riverside County that would be consistent with the *Riverside County General Plan* and, for this reason, does not require a General Plan buildout analysis. No further analysis of long-term cumulative traffic impacts is required under CEQA for a project that is consistent with the general plan as the cumulative impact was adequately addressed in the previously certified EIR for the Riverside County General Plan. Per the CEQA Guidelines, a project's contribution to a significant cumulative impact is rendered less than cumulatively considerable, and thus not

significant, if the project funds its fair share of the mitigation designed to alleviate the cumulative impact. The future developments within the Section 24 Specific Plan will pay their fair share of the cost of mitigation through the contribution of fees equivalent to those required by participation in the TUMF program, which funds the improvements to the regional arterial roadway system required to accommodate planned land uses, including the development of the uses allowed by the *Riverside County General Plan* and other jurisdictions as reflected in RivTAM.

Urban Crossroads Comment 3

The project description section of the report presents trip generation totals and comparisons for and to the Riverside County General Plan and the City of Rancho Mirage General Plan that are insufficiently detailed to verify the basis for the data presented. The basis of these trip generation figures needs to be presented in the report. For instance, the report appears to allocate the "High Density Residential" use for Rancho Mirage to multi-family development. The maximum allowable density for this use is 9 dwelling units per acre, which corresponds to single-family detached residential development.

Response to Comment 3

Footnotes a-f to Table 2-1on page 2-4 of the Project Description section present detailed information on the assumptions used to develop the trip generation estimates in this table. Only assumptions documented in the City of Rancho Mirage General Plan EIR, and the Riverside County Integrated Plan (General Plan) assumptions used in the RivTAM were used to develop Table 2-1. The City of Rancho Mirage General Plan High Density Residential land use designation allows 5 to 9 dwelling units per acre. Although this designation was generally assumed to result in approximately 50 percent single-family residential and 50 percent multiple-family residential for in Rancho Mirage General Plan Update traffic model, the area with this designation within the Traffic Analysis Zone (TAZ) that includes the project site, was assumed to be all multiple family residential.

Urban Crossroads Review of Response to Comment 3

Based on the response, it appears that the traffic study is only entitling multiple family residential dwelling units within the project site. Please confirm that this is the intent.

Response

As shown in Table 2-1 of the traffic study, the project includes both non-residential and residential land uses. The 2005 City of Rancho Mirage General Plan designates the 39 acres of Section 24 located adjacent to the intersection of Los Alamos Road and Ramon Road as High Density Residential, a land use designation that would allow the 351 multiple-family residential units identified in Table 2-1. The traffic study includes a detailed description of the land uses proposed in the Section 24 Specific Plan. The Initial Phase would include only single-family dwelling units in the 320 acres proposed for development as an Active Adult (age restricted) Community.

Urban Crossroads Comment 4

The "Consistency with General Plan Land Use Designations" section of the report concludes by stating that the project would generate substantially more non-residential trips than would be allowed under the City of Rancho Mirage General Plan, suggesting that a General Plan buildout analysis shall be (and is not) included in the report. This is also supported by Table 2-1, which indicates that the proposed project would generate 73,890 daily trips, compared to 48,780 daily trips for the City of Rancho Mirage General Plan.

Response to Comment 4

The traffic study included a project buildout analysis prepared in accordance with the methodology in the Riverside County TIA Preparation Guide, which states that project buildout analysis should be conducted using an approved model. This Guide states that if a proposed project is large enough to have the potential to create impacts significantly greater than the Riverside County General Plan land uses, additional modeling may be

required. As described above, the Section 24 Specific Plan project will generate less traffic than the uses allowed by the County General Plan land use designations. Nonetheless, due to the size of the proposed Section 24 Specific Plan Project, additional modeling was completed using RivTAM to analyze the impacts of the project. The proposed land uses were added to the RivTAM model and the results from this additional modeling were used in the analysis.

Examination of the 2035 socio-economic data (SED) in RivTAM showed that the level of growth for Rancho Mirage in these projections equates to 100% of the City's General Plan buildout projections for both population and housing and 70% of the employment projection. The RivTAM employment forecast, which is based on more recent SCAG growth forecasts, is more up to date and reliable than the employment projection in the City's 2005 General Plan. In this regard the RivTAM 2035 growth projections are generally representative of buildout of the City's General Plan.

Urban Crossroads Review of Response to Comment 4

For purposes of modeling General Plan buildout conditions, it is typically necessary to update the RivTAM data to reflect General Plan buildout throughout the jurisdiction under consideration. A recent example is the General Plan traffic study performed for the City of Coachella. The proximity of the proposed project to the City of Rancho Mirage boundary with adjacent jurisdictions indicates the need to ensure that buildout of vacant land in the adjacent areas is also considered.

The tables that are attached to the response to comments document do not include any information related to employment. The majority of the development potential in the City of Rancho Mirage is non-residential. Therefore, employment data is critical to assessing the adequacy of the traffic impact study.

Response

As discussed above, further review of the RivTAM SED indicates that the model includes approximately 70% of the employment projection in the City's 2005 General Plan. The RivTAM employment forecast reflects the SCAG 2004 Growth Forecast for the horizon year 2035 and is more up to date and reliable than the employment projection in the City's 2005 General Plan. Each local jurisdiction, including the City of Rancho Mirage, provided employment, housing, and population data based on their General Plans for incorporation in RivTAM. Only the employment data reflecting buildout of the Section 24 Specific Plan site was modified in RivTAM, as documented in the traffic study appendix. Table 2-1 of the traffic study includes the employment associated with the proposed project as well as the land uses designated in the City and County General Plan for the project site.

The 2005 Rancho Mirage General Plan includes approximately 3,200 jobs for the 75 acres designated C-C within the project site plus the 36 acres designated Rest-H occupied by the Agua Caliente Casino Resort Spa. The maximum employment for the project site under the City General Plan would include 2,287 jobs (based on an assumed FAR of 0.35). The proposed project would have an employment of 6,277 jobs upon project buildout.

The RMTM assumed employment of 40,323 in the City's Planning Area, which exceeds by 61 percent the 25,029 employment projection in the 2005 Rancho Mirage General Plan. The employment assumed in the RMTM included buildout of the Northern and Southern Sphere of Influence areas as defined in the City's General Plan. The development of 4,084 acres north of Interstate 10 was assumed to generate a future employment in excess of 12,000. Much of the area north of I-10 (approximately 1,500 acres) has been included in conservation areas that will never be developed. Cathedral City also annexed 591 acres of this area. It is unlikely that any of the remaining area north of I-10 will be annexed to the City of Rancho Mirage. The potential for the remaining developable area north of I-10 to generate 133,134 trips, as forecast by the RMTM, is very remote.

As stated above, the RivTAM employment forecast, which is based on recent SCAG growth forecasts, is more up to date and reliable than the employment projection in the City's 2005 General Plan. In this regard the RivTAM 2035 growth projections are generally representative of buildout of the City's General Plan.

Urban Crossroads Comment 5

Study area limits for traffic studies prepared in the County of Riverside generally adhere to the requirements of Riverside County and include all intersections within a five (5) mile radius of the project where the project contributes 50 or more peak hour trips. Why was this not performed?

Response to Comment 5

The Riverside County Transportation Department TIA Preparation Guide requires a buildout analysis for all General Plan Amendments and Specific Plans that would increase the amount of traffic generated beyond the amount that would be generated by the land uses allowed by the Riverside County General Plan assumed in RivTAM. If the Section 24 Specific Plan would generate more traffic than the uses allowed by the Riverside County General Plan then the study area would need to be large enough to determine if the General Plan circulation network could support the travel demands generated by the proposed land uses. However, as discussed above, the land uses included in the Section 24 Specific Plan represent a decrease in the land use intensity when compared to the Riverside County General Plan and would result in approximately 16.5 percent fewer weekday trips than the land uses allowed by the Riverside County General Plan. Therefore, the Section 24 Specific Plan should not result in traffic impacts that would require circulation network improvements beyond those already considered in RivTAM based on the County General Plan land use designations for the site.

The City of Rancho Mirage generally examines intersections within one mile of a site and, in this case, the City reviewed the scope of this traffic study and all intersections identified by the City were analyzed.

The scope of the traffic impact analysis in the traffic study was determined based on a review of initial RivTAM model runs, which were reviewed to determine the amount of traffic the project contributed in relation to the capacity of the regional roads and intersections analyzed in the model. Most of the roadways serving the Project Site are high-volume regional arterial streets. Except for the proposed site access intersections, most of the intersections near the Project Site are fully improved to General Plan standards.

In addition, the study area for the traffic study was developed in response to comments from the City of Rancho Mirage provided in a letter to dated February 12, 2004 submitted in response to the Notice of Intent to prepare the Section 24 Specific Plan EIS issued by the Tribe that included comments on Transportation and Traffic. Specifically, these comments recommended that "all intersections and road segments within a mile of the project site should be studied including the impact on the newly constructed Bob Hope freeway bridge and Ramon Road."

City staff requested that the study area be expanded to extend one mile from the perimeter of the project site and the number of intersections studied be expanded from 12 to 17 intersections. The traffic study addressed 17 existing and 23 future key intersections, covering the entire study area requested by City staff. Although project traffic would travel on roadways beyond the study area, the potential incremental contribution of traffic from the Section 24 project to cumulative impacts on streets outside the study area will be mitigated through payment of TUMF fees, which fund improvements to roads throughout the Coachella Valley.

The developers of future projects within the Section 24 Specific Plan will improve the site access intersections and make contributions equivalent to the CVAG TUMF prior to the issuance of building permits. These funds will be used to fund regional transportation improvements, including future improvements to the regional road network to accommodate the traffic volumes identified in the RivTAM traffic model. The traffic study identified that the Section 24 Project would not result in significant impacts to the major arterial intersections analyzed. As

these are the intersections that would be most impacted by the Project, examination of more distant intersections is not necessary as the proposed project has a very long development horizon and may not be completed for fifty years. Any analysis of distant intersections that far in the future would, at best, be speculative. Future traffic volumes at these intersections will depend on the density and intensity actually achieved within the site as well as on all undeveloped land in the surrounding areas. Many variables could change the trip generation of the land uses in the area over time such as the price of gasoline, and the availability of public transportation, and the future Jobs/Housing balance would not result in significant impacts at these intersections.

Urban Crossroads Review of Response to Comment 5

The project site is currently vacant. California Environmental Quality Act (CEQA) guidelines require the evaluation of project impacts compared to the existing (vacant) condition. Large Specific Plans do in fact require extensive analysis for a large study area extending up to (and in some cases beyond) five miles from the project site. A relatively recent example is the Travertine Point Specific Plan project located in the eastern Coachella Valley.

Response

As required by the CEQA, the traffic study includes a detailed evaluation of existing and existing plus project conditions, as well as near-term conditions (including specific cumulative developments) and project buildout conditions. The project buildout analysis included the use of the adopted subregional transportation model to forecast the growth in background traffic associated with cumulative development throughout the Coachella Valley for the horizon year 2035.

Proposed specific plan projects that would increase the intensity of future development within a site and generate more trips than anticipated by the Riverside County General Plan land use designations may require transportation improvements beyond the General Plan Circulation Element classifications and justify a larger study area. Similarly, specific plans in undeveloped areas with interim roadway improvements may require a larger study area to evaluate the timing of future roadway widening. Specific plans with rapid development schedules may result in near-term impacts over a larger area and require an extended study area. The proposed Section 24 Specific Plan has none of these characteristics. The proposed land uses would generate less traffic than anticipated in the Riverside County General Plan. Most of the streets serving the development have already been widened by others and have the available capacity to accommodate the proposed Initial Phase of development without improvements other than proposed for site access. The area is centrally located in the Coachella Valley and regional access is provided by I-10. The project would be constructed over a long development period with only six percent of the total trip generation occurring by the year 2022.

The study area was based on the guidance provided in the Riverside County TIA Preparation Guide and coordination with the City of Rancho Mirage, prior to the initiation of the traffic study. The project site is in unincorporated Riverside County and the Riverside County General Plan Circulation Element roadway classifications were established to be consistent with the land uses in the Land Use Element of the Riverside County General Plan. The proposed land uses are consistent, and less intense than the uses shown in the Riverside County General Plan. The future travel demands associated with the land uses in the Riverside County General Plan have been evaluated in the Riverside County Comprehensive General Plan EIR. In addition, as discussed above, the RivTAM reflects the growth permitted by the City's General Plan as well as the General Plans of other jurisdictions in the County, including the City of Rancho Mirage. For these reasons, the future transportation system required to accommodate those travel demands is shown in the Circulation Element of the Riverside County General Plan and not reflected in RivTAM. The RivTAM forecasts are also used as the basis for the Coachella Valley Regional Arterial Program administered by the Coachella Valley

Association of Governments, which allocates funding for improvements to regional arterial roadways from the TUMF program and Measure A, the sales tax initiative approved by Riverside County voters to fund transportation system improvements through the year 2039.

Urban Crossroads Comment 6

The area conditions section indicates that only the City of Rancho Mirage was contacted regarding potential near term cumulative development. The Cities of Palm Desert and Cathedral City are located in close proximity to the project site and should have also been contacted. Why not?

Response to Comment 6

The City of Rancho Mirage was contacted regarding the potential for near-term cumulative development within the study area, and cumulative development from the Cities of Palm Desert and Cathedral City was addressed by the projected increase in through traffic volumes on the roadways studied in the RivTAM growth projections. Both the near-term and horizon year scenarios included cumulative traffic from the Cities of Palm Desert and Cathedral City based on RivTAM projections.

Urban Crossroads Review of Response to Comment 6

The response to this comment suggests that nearby cumulative development was adequately addressed in the traffic impact study report. This statement cannot be verified in the absence of a list of known cumulative projects from the adjacent jurisdictions.

Response

The City of Rancho Mirage identified two near-term cumulative development projects that were addressed in the traffic study. The year 2022 near-term traffic scenario in the Section 24 Specific Plan Traffic Impact Study included these two cumulative projects, as well as background traffic growth determined by interpolating between existing and year 2035 traffic volumes developed using RivTAM. The traffic impacts from the Section 24 Specific Plan development would be very limited in the year 2022, since the Initial Phase would generate only six percent of the total project-related trip generation. For the horizon year 2035 traffic scenario, the Section 24 Specific Plan Traffic Impact Study used RivTAM to address all cumulative traffic demands associated with development throughout six Southern California counties. RivTAM was developed for use by local jurisdictions and planning agencies in evaluating cumulative development expected to occur by the year 2035 in Rancho Mirage, unincorporated Riverside County, Tribal lands, as well as the neighboring cities.

Urban Crossroads Comment 7

The traffic study (pg. 3-4) identifies the Riverside Traffic Analysis Model (RivTAM) as the basis for establishing project buildout (full occupancy) horizon year conditions. This is appropriate for valuating project buildout impacts, but does not address overall General Plan buildout conditions and transportation infrastructure needs in the study area. The report shall address General Plan buildout conditions and transportation infrastructure needs in the study area.

Response to Comment 7

The Section 24 Specific Plan Traffic Study uses the Riverside County Transportation Analysis Model (RivTAM) model to evaluate the horizon year 2035. The City participated in the development of RivTAM, which was developed for use for transportation planning purposes through Riverside County by all levels of governmental jurisdiction and by private entities and to assist in determining the potential impacts of large development proposals and General Plan land use changes. As described in the 2011 Riverside County Congestion Management Plan, the RivTAM model is based on the SCAG 2008 model (which was updated to include new growth forecasts for the Year 2035) with refinements to reflect local conditions within Riverside County. The RivTAM model is more current than the RMTM and the Coachella Valley Area Traffic Study (CVATS) model, more current than the SCAG Regional Transportation Model, and incorporates the best available growth

forecasts, taking into account both existing and planned land uses and demographic projections. For these reasons, RivTAM is the most complete and accurate growth model available to assess the long-term cumulative traffic impacts of uses allowed by the City's General Plan.

Urban Crossroads Review of Response to Comment 7

As discussed in the response to Comment 4 and the review of this response, it is acknowledged that modifications to the RivTAM input data are necessary to accurately represent General Plan buildout conditions. Based on the traffic volume comparison previously presented in this review letter, it does not appear that General Plan buildout conditions are adequately represented.

Response

As discussed above and summarized below, RivTAM does reflect the growth allowed by the City's General Plan. Since the project is consistent with the Riverside County General Plan, no General Plan buildout analysis is required. RivTAM is not a General Plan buildout model, but rather a 20-year planning horizon model. As discussed above, the RivTAM 2035 projections reflect all of the population and housing anticipated by the City's General Plan and includes future employment based upon the SCAG 2004 Growth Forecast. Since the RivTAM projections are consistent with updated SCAG growth forecasts, the RivTAM employment projections for the City are considered to be more up to date and reliable than the projection in the 2005 General Plan, which as discussed above, assume more employment will be generated in the City's Sphere of Influence than is now anticipated.

The Riverside County General Plan includes a Land Use Element and Circulation Element. The proposed project is consistent with both the Land Use Element and the Circulation Element. The Riverside County General Plan roadway network and City of Rancho Mirage General Plan roadway network would be adequate to provide acceptable levels of service upon buildout of the proposed Section 24 Specific Plan Project as well as the residential and population growth anticipated by the City's General Plan and 70 percent of the City General Plan employment growth. The traffic model was not modified to be a Rancho Mirage General Plan buildout model and the horizon year 2035 traffic projections developed are not intended for use in updating the Rancho Mirage General Plan.

Urban Crossroads Comment 8

The report (pg. 3-4) discusses various Specific Plan developments in this section of the report. The report shall discuss whether these developments are adequately represented in the RivTAM forecasting tool. If they are not adequately represented, additional analysis should be completed that includes these known cumulative developments to adequately address overall long term transportation infrastructure requirements in the study area.

Response to Comment 8

The Section 19 Specific Plan in Rancho Mirage and the North City and North City Extended Specific Plans in Cathedral City are large specific plan areas that will be developed over decades in response to market conditions. As mentioned above, no specific plan has been proposed yet for Section 13. The latest version of RivTAM was obtained from Riverside County at the start of the traffic study in August 2013. RivTAM was developed to be the source of future travel demand estimates for use in Federal and California environmental documents. RivTAM is periodically modified to be consistent with the most recent SCAG Growth Forecast. The demographic assumptions in the traffic analysis zones containing Section 13 and Section 19 Specific Plans were reviewed with the City and determined to be sufficient for the purposes of analyzing potential cumulative impacts in this study as RivTAM is based on adopted local and regional growth projections through the year 2035 and based on review of the SED in RivTAM, this model reflects the growth allowed by both the City and County General Plans.

Urban Crossroads Review of Response to Comment 8

A quantitative comparison of the RivTAM data and the buildout potential of the various Specific Plans is necessary to assess the validity of this response.

Response

Riverside County requires projects that propose an increase in the currently approved density and intensity land use to evaluate the long-term impacts of the project to demonstrate that the planned roadway system can support the proposed project and those land uses already allowed in the area. Since the proposed project would not increase the currently intensity of land uses allowed by the Riverside County General Plan, this long-term buildout analysis is not required.

RivTAM was developed by Riverside County with input from all local jurisdictions and to provide horizon year 2035 travel demand estimates for use in environmental documents. RivTAM represents the best available source for cumulative traffic projections from future development throughout six Southern California counties as it reflects regional growth forecasts from SCAG. The latest available RivTAM update (August 2013) was obtained from Riverside County immediately prior to the initiation of the traffic study. RivTAM includes that portion of the other Specific Plans projected to be developed by the year 2035, based on local projections and the SCAG 2004 Growth Forecast.

Urban Crossroads Comment 9

Chapter 4 of the report begins with a discussion of the use of a 20 year time frame for analysis purposes. Although appropriate for evaluating off-site project impacts, it is important to recognize the buildout infrastructure requirements of the transportation system and ensure that adequate right of way is allocated and that the development project constructs appropriate on-site improvements in accordance with the subdivision map act.

Response to Comment 9

As discussed above, the best long range forecasting tool available for analysis of traffic impacts is the RivTAM 2035 model, which is the basis of the 20-year timeframe mentioned in this comment. The project land uses were added to the model to verify that the City's General Plan Circulation Element street sections were adequate to accommodate the traffic from the Section 24 project. The analysis determined the City's General Plan circulation system can accommodate the traffic from the Section 24 project and the project will dedicate the ROW to develop the adjacent streets consistent with the City's Circulation Element.

As discussed above, Table 2-1 in the traffic study shows the Section 24 Specific Plan would generate less traffic than buildout of the site under the Riverside County General Plan. The roadways as planned in the County Circulation Element and City of Rancho Mirage General Plan Circulation Element would, therefore, provide acceptable levels of service with the addition of traffic from the Section 24 Specific Plan.

Urban Crossroads Review of Response to Comment 9

Please refer to previous review of Responses 1, 2, 4 and 7.

Response

Future traffic conditions at the theoretical build out of Riverside County (including a cumulative analysis of buildout of the cities within the County) were analyzed previously when the proposed General Plan build out circulation system and Circulation Element were adopted in conjunction with the Riverside County General Plan. The comprehensive planned roadway system for Riverside County described in the Circulation Element was evaluated to ensure adequate roadway rights-of-way within the unincorporated territory as needed to enhance the arterial network to respond to anticipated growth and mobility needs. The LOS thresholds and analyses in the EIR addressed segment-level operations to identify deficiencies on the roadway system at build

out and provide for future expansion and improvements based upon travel demand. The certified EIR for the Riverside County General Plan analyzed the overall adequacy of the proposed roadway and highway system in the Circulation Element. Since the proposed project would generate less traffic than the land use designations for the site in the *Riverside County General Plan* and, as discussed in detail above, RivTAM also reflects the growth allowed by the City's General Plan, the transportation system would be adequate and sufficient right-of-way to accommodate future transportation improvements shall be dedicated, as appropriate.

In Riverside County, any individual development project may be required to provide a traffic analysis to assess peak hour impacts at affected intersections to identify needed mitigation measures to achieve or maintain the target level of service. This ensures that individual development projects do not create bottlenecks at the intersections of the roadway system whose roadway widths and rights-of-way were previously examined as part of the General Plan and its environmental analysis. The Section 24 Specific Plan Traffic Impact Study assessed the peak hour impacts at intersections identified for study by the Tribe and the City of Rancho Mirage based upon their familiarity with conditions within the study area.

Urban Crossroads Comment 10

The report discusses the unique peaking characteristics associated with various land uses within the study area. The report also notes the likelihood that the proposed senior adult residential uses would generate traffic during unique time frames (other than the typical AM and PM peak hour peaks of commuter traffic). The study shall therefore include analysis of additional time frames at intersections located in close proximity to uses that generate unusual peak conditions (e.g., schools).

Response to Comment 10

The intersection of Rattler Road and Ramon Road was studied in the Section 24 Traffic Study to address the potential for impacts associated with traffic from Rancho Mirage High School. Pedestrian and motor vehicle volumes were counted at this intersection during the hours of 2 PM to 4 PM to include the peak exiting traffic from the high school. As shown in Table S-7, this intersection was projected to operate at LOS A with the critical movements using 49 percent of the intersection capacity. The addition of Phase 1 of the project utilized approximately one percent of the intersection capacity.

As shown in Table 5-7 of the traffic study, the first phase of the Section 24 Project, which consists of the Active Adult residential housing generated traffic that would utilize up to 2 percent of the capacity at any off-site intersections with existing off-site lane configurations. With a maximum volume-to-capacity of 84 percent, none of the off-site key intersections were close to requiring mitigation with year 2022+Phase 1traffic volumes. Even with higher off-peak traffic generation from the senior housing development, none of the off-site key intersections would require mitigation, especially with the reduced commuter travel during these off-peak hours.

Review of Response to Comment 10

The discussion of the measures taken to ensure that local peak conditions related to schools presented in the response should be incorporated into the environmental documentation to clearly document the defensibility of the document.

Response

All of the information provided above in the response to this comment is included in the traffic study. Details regarding the traffic counts are discussed in the baseline and impact sections and the count locations and actual count data are included in Appendix 1 of the traffic study. A detailed discussion of the time periods selected for analysis is provided on pages 4-1 and 4-2 of the traffic study. The potential impacts of the residential community designed for active seniors are addressed separately as the Initial Phase and shown in the peak hour intersection level of service analysis. The number of trips generated by the Initial Phase would represent only six percent of the trips generated upon project build out.

Urban Crossroads Comment 11

The report (pg. 4-2) includes a section describing the "Horizon Years and Development Scenarios Evaluated". Given the increase of trips compared to the City of Rancho Mirage General Plan, additional analyses addressing General Plan buildout conditions shall be included in the analysis.

Response to Comment 11

As discussed above in detail, the RivTAM model was determined to be the best analysis tool available to consider long term cumulative impacts, including the growth allowed by the City's General Plan.

Urban Crossroads Review of Response to Comment 11

Please refer to previous review of Responses 1, 2, 4, and 7. The response requires further investigation and documentation to verify defensibility.

Response

Please refer to earlier responses, especially the response to comment 5. A General Plan buildout analysis is not required because the project is located in Riverside County and consistent with the Riverside County General Plan. In addition, as discussed above, RivTAM 2035 growth forecasts include all of the population and housing growth identified in the City's General Plan and an updated employment projection.

Urban Crossroads Comment 12

Trip generation assumptions and estimates presented in the traffic study report (pp. 4-4 through 4-7) have been reviewed. Additional data pertaining to the land use categories and trip rates used in the analysis shall be presented in the report. Only summary information is presented, which is inadequate to determine the accuracy and defensibility of the traffic study assumptions.

Response to Comment 12

The footnotes to Table 4-1 identify the land use codes used. The trip generation estimates in this table were developed from the regression equations and weighted average rates (when appropriate) in the ITE Trip Generation Manual as described in the text on pages 4-3 to 4-7.

Urban Crossroads Review of Response to Comment 12

The response to comment 14 refers to very detailed adjustments reflecting the on-site circulation and numerous site access points. This detailed information and the resulting adjustments should be included in traffic study report.

Response

The traffic study includes five tables, twelve figures, and seven pages of narrative detailing the trip generation forecast and the methodology utilized to develop the site traffic volumes at the site access points. Appendix 2 provides a map of the RivTAM TAZs and includes the modifications made to the RivTAM SED and circulation network. This documentation is extensive and adequate to justify the assumptions made. The RivTAM modifications were all made by an approved Riverside County consultant, in accordance with the County's procedures for use of the RivTAM model. Endo Engineering does not have direct access to RivTAM and requested no modifications other than the correction of obvious deficiencies, as documented in Appendix 2 of the traffic study.

Urban Crossroads Comment 13

Using the standard Riverside County criteria of 50 peak hour trips representing the threshold for requiring peak hour intersection analysis, the project impacts shall be evaluated at all intersections within a five mile radius where the project trip distribution is higher than 0.7%.

Response to Comment 13

As discussed above the scope of the traffic impact analysis was determined based on a review of initial RivTAM model runs and consultation with the City to include all intersections where the proposed Project would be likely to result in any potentially significant impacts. As the Project did not result in significant impacts at the study intersections, analysis of more distant intersections is not warranted or necessary to determine the impacts of the Project.

Urban Crossroads Review of Response to Comment 13

The project is located in a relatively undeveloped area of the City of Rancho Mirage. It is inaccurate to assume that more distant intersections in more developed areas of Rancho Mirage and the adjacent jurisdictions are not nearing capacity and will not be potentially impacted by the proposed project.

Response

It should be noted that the Section 24 Specific Plan area is not located within the City of Rancho Mirage. It is located entirely within unincorporated Riverside County territory. As discussed above, the Tribe has the discretionary authority to determine the scope of the traffic study, the study area, the key intersections to be evaluated, and the scenarios to be analyzed. Prior to the preparation of the traffic study, the guidelines in the Riverside County TIA Preparation Guide were carefully considered and coordination with the City of Rancho Mirage was undertaken and consensus was achieved at that meeting. The traffic study reflects that consensus in that it utilized RivTAM to develop the future traffic projections for the year 2035, expanded the study area as requested by City of Rancho Mirage staff, evaluated the additional key intersections requested, and included two near-term cumulative developments identified by City representatives.

Future individual development projects within the Section 24 Specific Plan area will contribute on a fair-share basis to the cost of mitigating any potential incremental regional traffic impacts by contributing impact fees equivalent to those required by the TUMF program. These contributions will be made prior to the issuance of building permits.

The Riverside County General Plan Circulation Element roadway classifications were established to accommodate the land uses in the Land Use Element, which are similar to but more intense than the proposed project. Since the proposed land uses are consistent with, and less intense than the uses shown in the Riverside County General Plan, the study area extends over an area of 7.5 square miles and includes 23 key intersections (including intersections in Cathedral City and Palm Desert as well as Rancho Mirage and unincorporated Riverside County). The future travel demands associated with the land uses in the Riverside County General Plan have been evaluated in the Riverside County Comprehensive General Plan EIR. The future transportation system required to accommodate those travel demands is shown in the Circulation Element of the Riverside County General Plan.

Urban Crossroads Comment 14

The project trip distribution discussion appears to be primarily based on the CVAG 2004 Origin Destination survey. Data from the RivTAM forecasting tool shall also be included in the traffic study report. RivTAM is based on a calibration to conditions more recent (2008) than the CVAG study.

Response to Comment 14

Although the CVAG 2004 Origin Destination Survey was used to develop RivTAM, the RivTAM projections were used as the basis for impact analysis of future conditions. The trip distribution was verified by the traffic counts at the key intersections. The proposed Section 24 Specific Plan Project includes seventeen access points with different components of the project sharing the access locations. The project traffic distribution was adjusted to reflect the detailed access and internal circulation plan associated with proposed project.

Urban Crossroads Review of Response to Comment 14

This additional information regarding how the project trip distribution was developed should be included in the traffic study report to enhance defensibility.

Response

No RivTAM calibrations were modified. The intent was to avoid making modifications beyond the project boundaries to maintain consistency with the approved subregional travel demand model.

Urban Crossroads Comment 15

Standard accepted practice is to evaluate project impacts at all intersections within a five (5) mile radius of the project where the project contributes more than SO peak hour trips. This corresponds to less than 1% of the project traffic as presented in the report for adjusted project trip generation.

The study area must be expanded in accordance with this criterion to ensure defensibility. The trip distribution is substantially higher than 1% at the edges of the study area on the 1-10 Freeway to the northwest (9.8%), the I-10 Freeway to the southeast (12.9%), Ramon Road to the east (22%), Bob Hope Drive to the south (16.1%), etc. Subsequent data (for instance, Figure 4-S) confirm this issue.

The Riverside County TIA Preparation Guide reads as follows:

In general, the minimum area to be studied shall include any intersection of "Collector" or higher classification street, with "Collector" or higher classification streets, at which the proposed project will add 50 or more peak hour trips, not exceeding a 5-mile radius from the project site.

Response to Comment 15

As discussed above, the Project does not result in significant impacts at any of the intersections studied, where the Project will contribute a greater percentage of traffic. Study of additional high capacity major arterial intersections that are more distant from the site is, therefore, not warranted.

Urban Crossroads Review of Response to Comment 15

Please refer to the review of Responses 5 and 13.

Response

As discussed above, the scope of the traffic study was based on the Riverside County TIA Preparation Guide and coordinated with the City of Rancho Mirage, prior to preparation of the traffic study. The circulation network was designed and approved by Riverside County to accommodate land uses consistent with the proposed project. The traffic study identifies, discloses and focuses on those impacts that were determined to be potentially significant.

As discussed above, prior to the preparation of the traffic study, the guidelines in the Riverside County TIA Preparation Guide were carefully considered and coordination with the City of Rancho Mirage was undertaken and consensus was achieved at that meeting. The traffic study reflects that consensus in that it utilized RivTAM to develop the future traffic projections for the year 2035, expanded the study area as requested, evaluated the additional key intersections identified, and included two near-term cumulative developments identified by City representatives. The traffic study identifies, discloses and focuses on those impacts that were determined to be potentially significant.

Urban Crossroads Comment 16

The traffic study report does not include sufficient information regarding the development of future 203S traffic volumes. The RivTAM forecasting tool is based on peak period traffic volume projections. These projections

should be used to develop 2035 conditions peak hour forecasts. The report forecasts do not appear to utilize this RivTAM data and are based instead on daily projections obtained from the RivTAM forecasting tool.

Response to Comment 16

As specified in the Riverside County Transportation Department TIA Preparation Guide, future traffic forecasts in the Section 24 Specific Plan traffic study used the RivTAM year 2035 traffic projections as the basis for determining turning movement volumes for the intersection analysis. The RivTAM daily forecast was used to establish the projected growth in the study area. New peak hour and daily traffic counts were combined with the RivTAM projections to identify future peak hour traffic volume projections. This methodology was discussed and accepted during the meeting with City staff in Rancho Mirage.

Urban Crossroads Review of Response to Comment 16

The methodology and supporting data (RivTAM plots, etc.) should be included in the Appendices to the traffic study report to the extent necessary to allow the reviewer to confirm /replicate the forecasting process.

Response

Consistent with Riverside County approved procedures, the RivTAM forecast was prepared by AFSHA Consulting, Inc., one of the consulting firms approved by the County to conduct modeling using the RivTAM. A TAZ map and the horizon year 2035 SED inputs used to address project buildout are provided in Appendix 2 of the traffic study.

Urban Crossroads Comment 17

All of the analysis scenarios shall be expanded to include all additional intersections where the project is anticipated to contribute more than 50 peak hour trips.

Response to Comment 17

Please see the responses above on the scope of the analysis in the traffic impact study.

Urban Crossroads Review of Response to Comment 17

Please refer to the review of Responses 5 and 13.

Response

Please refer to earlier responses. As discussed above, the scope of the traffic study was based on the Riverside County TIA Preparation Guide and coordinated with the City of Rancho Mirage, prior to preparation of the traffic study.

Urban Crossroads Comment 18

Analysis of General Plan Buildout conditions shall be included in the traffic study report, as an intensification in use compared to the City of Rancho Mirage General Plan is contemplated.

Response to Comment 18

As discussed above, the RivTAM 2035 traffic projections reflect the housing and population growth anticipated by the City's General Plan as well as the an updated employment growth forecast for the City, and the proposed Section 24 Specific Plan would generate less traffic than the uses allowed on the site by the Riverside County General Plan that are assumed in RivTAM. For these reasons, RivTAM reflects all growth that would be allowed by both the City and County General Plans.

Urban Crossroads Review of Response to Comment 18

Please refer to previous review of Responses 1, 2, 4, and 7.

Response

Please refer to earlier responses. As noted previously, a General Plan buildout analysis is not required for the proposed project by the Riverside County TIA Preparation Guide. The project is located in unincorporated Riverside County and would be less intense than the land use designations in the Riverside County General Plan which are reflected in the RivTAM model. In addition, as noted above, in addition, as noted above, the RivTAM 2035 traffic projections reflect the housing and population growth anticipated by the City's General Plan as well as the employment growth per the SCAG 2004 Growth Forecast.

Urban Crossroads Comment 19

The recommendations state (pg. 6-4) that the project proponent shall dedicate appropriate right-of-way to accommodate the ultimate improvement of the abutting General Plan roadways and full improve those roadway in conjunction with adjacent development. The project shall therefore be required to dedicate right-of-way and construct half-section improvements on Ramon Road, Bob Hope Drive, Dinah Shore Drive, and Los Alamos Road in accordance with the City of Rancho Mirage General Plan Circulation Plan.

Response to Comment 19

Based on discussions with the City, appropriate right-of-way will be dedicated as development of the areas adjacent to the surrounding streets occurs and appropriate improvements will also be constructed.

Urban Crossroads Review of Response to Comment 19

The response acknowledges the role of the City in determining the appropriate right-of-way and improvements in accordance with CEQA and the subdivision map act.

Response

All roadways within and adjacent to the project site will be improved consistent with the Section 24 Specific Plan.

APPENDIX H

Water Supply Assessment/Water Supply Verification

RESOLUTION OF THE BOARD OF DIRECTORS OF
COACHELLA VALLEY WATER DISTRICT

RESOLUTION NO. 2014-226

BE IT RESOLVED by the Board of Directors of the Coachella Valley Water District assembled in regular meeting this 12th day of November, 2014, that it hereby approves the Water Supply Assessment and Water Supply Verification for the Proposed Section 24 Specific Plan.

* * * * * * * * * * *

STATE OF CALIFORNIA)
COACHELLA VALLEY WATER DISTRICT) ss.
OFFICE OF THE SECRETARY)

I, JULIA FERNANDEZ, Secretary of the Board of Directors of the Coachella Valley Water District, DO HEREBY CERTIFY that the foregoing is a full, true and correct copy of Resolution No. 2014-226 adopted by the Board of Directors of said District at a regular meeting thereof duly held and convened on the 12th day of November, 2014, at which meeting a quorum of said Board was present and acting throughout. The Resolution was adopted by the following vote:

Ayes:	Four
Directors:	Powell, De Klotz, Nelson, Livesay
Noes:	None
Absent:	Pack

Dated this 12th day of November, 2014.

(SEAL)

Julia Fernandez
Board Secretary

COACHELLA VALLEY WATER DISTRICT

Board Action Item

Board Meeting Date: November 12, 2014

TO: Board of Directors

SUBJECT: Water Supply Assessment and Water Supply Verification for Proposed Section 24 Specific Plan

---

Description and Location

The proposed Section 24 Specific Plan (Section 24) consists of approximately 577 acres of land on the Agua Caliente Indian Reservation and is bounded by Ramon Road on the north, Bob Hope Drive on the east, Dinah Shore Drive on the south and Los Alamos Road on the west. It is surrounded by the City of Rancho Mirage on all four sides.

The proposed development includes 2,406 residential units and up to 3 million square feet of commercial space including retail, office, restaurant, hotel and entertainment uses.

Please see the attached map.

Purpose and Benefit of Project

The requirements for the preparation of a Water Supply Assessment (WSA) are set forth in Section 10910 of the California Water Code in accordance with SB 610, which was enacted in 2001 and became effective January 1, 2002. The Code requires that a WSA be prepared for any project, which would consist of one or more of the following:

- A proposed residential development of more than 500 dwelling units;
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space;
- A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space;
- A mixed-use project that includes one or more of the projects specified above;
- A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

Requirements for preparation of a Water Supply Verification (WSV) are set forth in Section 11010 of the Business and Professional Code and Sections 66455.3, 66473.7 and 65867.5 of the Government Code, as amended by SB 221, which was enacted in 2001 and became effective as of January 1, 2002. SB 221 established the relationship between the WSV for the project and the project approval under the Subdivision Map Act. Pursuant to California Code Section 66473.7, a Public Water System (PWS) must provide a written verification of sufficient water supplies prior

to the approval of a new subdivision. The WSV provides the legislative body of a city, or county with written verification from the PWS that a sufficient water supply is available for the project.

The Section 24 project requires a WSA/WSV because it proposes over 500 housing units and has over 250,000 square feet of commercial floor space.

The Section 24 WSA/WSV estimates total project water demand to be 1,780 acre-feet per year, or about 3.1 acre-feet per acre. Based on the projects proposed occupancy rates, it will have an average water demand of approximately 270 gallons per capita per day (gpcd) which is below CVWD's 20 by 2020 urban water use target of 473 gallons per capita per day.

This project will incorporate the elements of the 2010 Coachella Valley Water Management Plan Update (2010 CVWMP Update) and the 2010 Urban Water Management Plan (2010 UWMP). The urban water supply will come from the Whitewater River Subbasin for indoor and outdoor use. The project will be required to participate in all CVWD's water management programs, including the most current landscape ordinance, conservation programs, outreach and education programs, and tiered water pricing in place at the time of development. If additional supplies such as treated Colorado River water are available for use, the project will use these additional supplies.

The attached Section 24 WSA/WSV analyzes demand and supply based on the 2010 CVWMP Update, 2014 Status Report, and 2010 UWMP. These documents evaluate future supplies with and without Quantification Settlement Agreement in place and with long term reliability of State Water Project supplies at 50 percent.

Until the project begins construction, this WSA/WSV will be reviewed every five years or in the event that the 2010 CVWMP Update assumptions have changed. The project applicant shall notify the District before construction begins. The reviews will ensure that the information included in this WSA/WSV remains accurate and no significant changes to either the project or the District's water supply have occurred. If neither the project applicant nor the lead agency contacts the District within five years of approval of this WSA/WSV, the water supply assessment provided by this document will become invalid.

Procurement and Expenditures

This project does not utilize CVWD funds.

Environmental Impact

☐ No, this item is not a "project" as defined by CEQA; therefore, approval does not require any CEQA action.
☒ Yes, see below.

This project is defined as a subdivision in accordance with the Subdivision Map Act. The Agua Caliente Band of Cahuilla Indians is the Lead Agency for planning and environmental review of the project and is preparing an Environmental Impact Statement in compliance with both the Agua Caliente Tribal Environmental Policy Act (TEPA) and CEQA. As the Public Water Supplier (PWS) CVWD has determined that a WSA/WSV is necessary to complete CEQA compliance. However approval of this WSA/WSV does not require CVWD to take any additional CEQA action.

Legal Review

☒ Reviewed by Counsel
☐ N/A

Fiscal Impact

This project does not utilize CVWD funds and therefore has no negative fiscal impact on the Budget.

Prior Authorizations

☐ Yes, see attachment.
☒ N/A

Staff Recommendation

District staff has thoroughly reviewed this WSA/WSV and has determined that it demonstrates that sufficient water supplies exist to meet the demands of the project, and the project commits to participating in CVWD's 2010 CVWMP Update programs. It is recommended that the Board of Directors approve the Water Supply Assessment and Water Supply Verification for the proposed Section 24 Specific Plan.

Please see the attached proposed resolution.

TABLE OF CONTENTS

LIST OF FIGURES

LIST OF TABLES

EXECUTIVE SUMMARY

The Section 24 Specific Plan (proposed Project) is proposed to consist of up to 3,138,600 square feet of commercial retail, office, restaurant, hotel, and entertainment uses, and up to 2,406 residential units on approximately 577 acres of land on the Agua Caliente Indian Reservation (Reservation). The overall vision for the Section 24 Specific Plan is to create a master planned, mixed-land use community. The proposed Project will accommodate a higher density mix of retail, entertainment, office, hotel, and residential land uses within a commercial and mixed use development, in combination with a lower density active adult community in accordance with the objectives of the Agua Caliente Band of Cahuilla Indians (Tribe).

The Section 24 Specific Plan area (Project Site) is surrounded by the City of Rancho Mirage on all sides and is bound by the following roadways: 1) Ramon Road on the north; 2) Bob Hope Drive on the east; 3) Dinah Shore Drive on the south; and 4) Los Alamos Road on the west.

The public water supplier for the Project Site is the Coachella Valley Water District (CVWD). The domestic water supply (potable) for all water users of the Project will be groundwater from the western portion of the Whitewater River Subbasin in the Coachella Valley. This water supply assessment/water supply verification (WSA/WSV) commits to implementing the 2010 Coachella Valley Water Management Plan Update (2010 CVWMP Update) activities that apply to this development, including following the CVWD landscape ordinance in effect at the time of development.

This WSA/WSV relies on the water supply and demand planning considerations established in the 2010 CVWMP Update, the 2014 CVWMP Status Report, the CVWD 2010 Urban Water Management Plan (2010 UWMP), and the State of California, Department of Water Resources, Delivery Reliability Report 2011, Draft Delivery Reliability Report 2013 (Draft Delivery Reliability Report 2013).

As discussed in the 2010 CVWMP Update, the 2014 CVWMP Status Report, the 2010 UWMP, and this WSA/WSV, CVWD has implemented many programs to ensure a long-term sustainable water supply, including use of its Colorado River and SWP supplies, recycled wastewater, desalinated agricultural drain water, conversion of groundwater users to canal water users, and water conservation including tiered water rates, a landscaping ordinance, and outreach and education.

The proposed Project incorporates a number of features that reduce the overall water demand and provide for a reduction in use. These features include a number of water conservation measures for both indoor and outdoor use for both residential and commercial development. The proposed Project's total water demand estimate is approximately 1,780 acre-feet per year (afy); this total water demand corresponds to approximately 3.1 afy per acre which is within the average future water use per acre

estimated in the 2010 CVWMP Update. The Project's total urban water use would be 277 gallons per capita per day (gpcd), or 0.74 afy per residential dwelling unit. CVWD's 20 by 2020 urban water use target for urban water use is 473 gpcd. The Project's demand of 277 gpcd is below the 20 by 2020 per capita target of 473 gpcd. The Project is consistent with the application of the conservation requirements of the CVWD regulations including the Landscape Ordinance 1302.1, which requires reduced water allowances for landscaped and recreational areas. Similarly, the Project is consistent with the Agua Caliente Land Use Ordinance. Specifically, Article VII of the Tribal Land Use Ordinance, Landscaping Standards, ensures maximum water efficiency in comprehensive landscaping plans, irrigation plans, plant materials, and decorative water features. The Project is also consistent with the County of Riverside Ordinance No. 859, Water Efficient Landscape Requirements Ordinance, which establishes provisions for water management practices and water waste prevention for new and rehabilitated landscapes.

The proposed Project is required to secure approval of a WSA (Senate Bill [SB] 610) and a WSV (SB 221). In compliance with these legislated requirements, this WSA/WSV examines the current condition of the Coachella Valley groundwater basin (aquifer) and finds the water supply from the aquifer, the SWP, the Colorado River, and other sources are adequate to supply the proposed Project in accordance with California Water Code Section 10910 *et seq*. This WSA/WSV also verifies the ability of the water supplies from the aquifer, the SWP, the Colorado River, and other sources are available to serve the proposed Project in accordance with the California Government Code Section 66473.7.

This WSA/WSV will be reviewed every five years, or if CVWD determines that the planning assumptions of this document are no longer valid, until the Project begins construction. Each individual Project proponent shall notify CVWD when construction has begun. The review will insure that the information included in this WSA/WSV remains accurate and no significant changes to either the proposed Project or CVWD's water supply have occurred. If neither the individual Project proponent nor the lead agency contacts CVWD within five years of approval of this WSA/WSV, it will be assumed that the proposed Project no longer requires the estimated water demand calculated and the water supply assessment and water supply verification provided by this document will become invalid.

1.0 INTRODUCTION

1.1 BACKGROUND

The environmental review of the proposed Project is being prepared in compliance with both the Agua Caliente Tribal Environmental Policy Act (TEPA) (Tribal Ordinance No. 28) and the California Environmental Quality Act (CEQA) process and is a subdivision as defined by the California Government Code Section 66473.7 as consisting of 500 or more dwellings. The Coachella Valley Water District (CVWD), the Public Water System (PWS) for the proposed Project, has determined that a water supply assessment (WSA) is necessary to complete the proposed Project's TEPA and CEQA process and that a written water supply verification (WSV) is needed as a condition of any necessary County of Riverside (County) and/or City of Rancho Mirage (City) approvals for the proposed Project.

The Agua Caliente Band of Cahuilla Indians (Tribe), acting as the Lead Agency for the planning and environmental review of this proposed Project, has decided to prepare an Environmental Impact Statement (EIS) in compliance with the both TEPA and CEQA, and CEQA Guidelines (California Code of Regulations Title 14 Section 15000 et seq.) in order to minimize the duplication of environmental studies and documentation by other public agencies involved with the review and approval of actions related to the proposed Project that are required to comply with TEPA and CEQA, including the City and the Riverside County Local Agency Formation Commission (LAFCo). The Tribe has ultimate jurisdiction over land use decisions in Planning Areas 1 to 7, as discussed below. The City will have jurisdiction over land use decisions if Planning Area 8 is annexed into the City, and the County will have jurisdiction if Planning Area 8 is not annexed into the City.

CVWD prepared and adopted the 2010 CVWMP Update and the 2010 UWMP to manage water supplies and eliminate overdraft. These Plans identify programs necessary to ensure reliable water supplies. The proposed Project will participate in the CVWMP programs that are available to it including compliance with the most current landscape ordinance in place at the time of development, conservation programs, outreach and education programs and budget based tiered water rates. This WSA outlines how these programs eliminate overdraft and how the proposed Project will support the CVWMP programs.

1.1.1 Tribal Water History

The Reservation was established in 1876, and expanded in 1877. Documented reports by Federal Indian Agents in the Valley in the mid-1890s confirmed substantial ongoing Cahuilla agricultural activities, as well as the presence of an elaborate system of irrigation ditches and dams developing the water from the Whitewater River system, including a more than one mile long irrigation conveyance ditch from Tahquitz Canyon constructed around 1830.

In 1910, the United States Indian Irrigation Service (IIS) initiated a systematic effort to provide the Tribe with water resource development in support of the Tribe's irrigation as well as household and other water needs. In 1922, the Division of Water of the California Department of Public Works began the process of determining rights to the Whitewater River system, including tributaries of Andreas Creek and Tahquitz Creek. Further discussion on tribal information can be found in **Appendix A, Water Resource Litigation and Other Actions**.

1.2 PROJECT DESCRIPTION

1.2.1 Location

Regional Setting

The Section 24 Specific Plan area is surrounded by the City of Rancho Mirage which is considered to be in the heart of the Coachella Valley in Riverside County, nestled at the base of the Santa Rosa Mountains and conveniently located to utilize the southern California freeway system via Interstate 10 (I-10), as shown in **Figure 1, Regional Location Map**. The majority of future development in this area of the Coachella Valley is expected to occur near the I-10 corridor.

Community Setting

The Project consists of the development of a Specific Plan for a portion of Section 24, an approximately 577-acre area of the Reservation located within unincorporated Riverside County (Project Site), which is surrounded on all four of its sides by the City as illustrated on **Figure 2, Project Location Map**. The Project Site is bounded by the following roadways: 1) Ramon Road on the north; 2) Bob Hope Drive on the east; 3) Dinah Shore Drive on the south; and 4) Los Alamos Road on the west. The Section 19 Specific Plan is located directly east across Bob Hope Drive from the Project Site and directly southeast of the Agua Caliente Casino/ Resort/ Spa.

1.2.2 Specific Plan Overview

The Section 24 Specific Plan provides for approximately 577 acres of the Reservation, located within the City Sphere of Influence designated as Section 24, Township 4 South, Range 5 East of the San Bernardino Meridian, as illustrated on **Figure 2.** The Section 24 Specific Plan would be approved and adopted by the Tribal Council and serve as the zoning for the Project Site. The City would subsequently adopt the Specific Plan and approve any request(s) for annexation into the City. The Specific Plan would establish the necessary plans, development standards, regulations, infrastructure requirements, design guidelines, and implementation programs on which subsequent project-related development activities would be founded.

It is intended that local public works projects, design review plans, detailed site plans, grading and building permits, water use plans, or any other action requiring ministerial or discretionary approval applicable to the Project Site would be consistent with the Specific Plan.

1.2.3 Land Use Plan

The proposed Project would provide a potential mix of up to 3,138,600 square feet of commercial, retail, office, restaurant, hotel and entertainment uses, up to 1,206 medium density multifamily/single family attached residential units and up to 1,200 single family age restricted residential units. The proposed Project is designed to accommodate these uses through the creation of seven land use categories and eight Planning Areas that cover approximately 529 acres, as shown in **Figure 3, Conceptual Land Use Plan**. These Planning Areas, in addition to approximately 48 acres for public street rights-of-way, would total approximately 577 acres for the Project Site. The land use categories and Planning Areas would allow for a greater variety and flexibility of land uses and development standards, as shown in **Table 1.0-1, Land Use Plan Summary**.

The **Mixed-Use Core** (MXD CORE) land use category would provide the most intense and compact component of the Project Site, supporting the potential vertical integration of housing with ground floor retail commercial uses and services. Located within an approximately 25-acre area of the Project Site, the mix of uses is intended to produce a unique and walkable shopping, working, and living experience. This land use category allows a maximum of 1,090,000 square feet of mixed retail, restaurant, office, business campus, and hospitality-oriented indoor amusement/entertainment uses. Flexibility is also provided for possible hotel, multifamily, single family attached residential units within this category with a possible maximum Floor Area Ratio (FAR) of 1.0. Although this category would allow for various land uses, it does not require a specified mix of uses.

The **Resort Flex** (RESORT) land use category would permit uses such as retail, restaurants, resort hotels, and regional entertainment to create a lively and comfortable atmosphere for business and leisure travelers. The Resort Flex category accounts for approximately 81 acres of the Project Site with a maximum FAR of 0.40.

The **Retail** (RETAIL) land use category would provide the Project's primary shopping destination and would offer a range of commercial, office/ service, entertainment, and eating establishments on approximately 52 acres. These uses would be located at the northeast and southeast corners of the Project Site and would be exposed to the high volumes of traffic along Ramon Road, Bob Hope Drive and Dinah Shore Drive. A maximum FAR of 0.35 is specified for these areas.

The **Multi-Family Residential** (MFR) land use category would provide a more urbanized style of residential living on approximately 58 acres adjacent to the Mixed-Use Core, Retail, and Resort Flex land use areas. Permitted uses would include single and multi-family residential developments. Buildings of two stories in height could contain dwelling units at densities up to a maximum of 18 units per acre. These residential uses would serve as a transition between the higher intensity commercial areas and the low-density single-family residential area, which is planned as an Active Adult Community.

The **Single Family Residential** (SFR) land use category would accommodate an approximately 313-acre Active Adult Community up to 1,200 single-family dwelling units at an overall density of 3.8 units per acre. Building heights would be primarily one story with some potential for two story units within the interior of the Active Adult Community. Approximately 85 acres, or 27 percent, of the Active Adult Community would be devoted to Private Open Space, consisting of a system of pedestrian, bicycle and golf cart trail linkages, neighborhood parks, water features, community clubhouse/ pool/spa and associated amenities.

A total of eight Planning Areas delineate and describe the amount, type, and distribution of development throughout the Project Site. The Planning Areas have also been constructed to recognize the current ownership patterns, thus enabling the Project to be constructed in an incremental fashion while still achieving a unified development. Each Planning Area is subject to a distinct list of allowed uses and development standards. Planning Areas 1 to 7 (Tribal Planning Areas) and Planning Area 8 (the Active Adult Community) are proposed within the Project Site.

Planning Area 1 is approximately 35-acres in size and would be located at the northwest corner of the Project Site at the Ramon Road and Los Alamos Road intersection. This Planning Area would allow up to a maximum of 435,600 square feet of retail, restaurant and office/ services and hotel uses, or any combination thereof, in a planned Resort Flex development along Ramon Road and up to a maximum of 180 residential dwelling units accessible from Los Alamos Road and a planned local street.

Planning Area 2 is approximately 36-acres in size and would be located along the south side of Ramon Road and would allow up to a maximum of 1,090,000 square feet of mixed retail, restaurant, office, business campus and hospitality-oriented indoor amusement/ entertainment uses. This Planning Area would also allow up to a maximum of 180 residential dwelling units. Flexibility is also provided for possible hotel, multi-and single-family attached residential uses within this area.

Planning Area 3 is approximately 27-acres in size and would be located at the northeast corner of the Project Site, would be a gateway planning area accessible from three signalized intersections on Ramon Road and Bob Hope Drive, and would allow up to a maximum of 396,000 square feet of commercial retail, restaurant and entertainment uses around a planned “Main Street” village center.

Planning Area 4 is approximately 37-acres in size and would be located immediately south of Planning Area 3 along the west frontage of Bob Hope Drive, and represents a Resort Flex land use opportunity for commercial retail, restaurant, and hospitality-oriented indoor amusement/ entertainment uses which would allow up to a maximum of 505,000 square feet of mixed-use commercial development.

Planning Area 5 is approximately 18-acres in size and would allow up to a maximum of 486 residential dwelling units. This area would be located directly west of Planning Area 4 and would provide a land use-to-land use transition buffer from the more intense commercial uses in Planning Area 4 to the east and the lower density Active Adult Community in Planning Area 8 to the west.

Planning Area 6 is approximately 28-acres in size and would be located immediately south of Planning Areas 4 and 5 along the west frontage of Bob Hope Drive and would consist of two subareas: Planning Area 6A and Planning Area 6B. Planning Area 6A would consist of an approximately 19 acre Resort Flex land use for. Two signalized intersections on Bob Hope Drive would provide access to this sub planning area along with a mid-point right-in/ right-out turning lane. This Planning Area would allow up to a maximum of 331,000 square feet of mixed use commercial development, including a combination of commercial retail, restaurant, and hospitality-oriented indoor amusement/ entertainment uses, and would allow up to a maximum of 180 residential dwelling units.

Planning Area 7 is approximately 35-acres in size and would be located at the southeast corner of the Project Site. This Planning Area would allow up to a maximum of 381,000 square feet of mixed use commercial development, including neighborhood-scale retail, restaurant and office/ services center, and would allow up to a maximum of 180 residential dwelling units.

Planning Area 8 is approximately 313 acres in size and is planned for the development of a master planned Active Adult Community of up to a maximum of 1,200 single family dwelling units. The gated Active Adult Community would be master planned consisting of four neighborhoods accessed by a system of private streets and recreational open space amenities located in neighborhood parks and trail linkages.

The proposed Section 24 Specific Plan includes lists of permitted uses including those permitted without any conditions and those that require conditional use permits (CUPs) and public use permits.

Table 1.0-1
Land Use Plan Summary

Planning Area	Land Use Category	Typical Permitted Uses							Net Land Area (Acres)	Non-Residential Square Footage	Dwelling Units
		Community Retail	Restaurants	Office /Service	Resort Hotel	Multi-Family Residential	Single Family Residential	Mixed-Use			
1A	RESORT	X	X		X				25	435,600	-
1B	MFR					X	X		10	-	180
2A	MXD CORE	X	X	X	X	X	X	X	25	1,090,000	-

Conceptual Land Use Plan

1.3 REGULATORY REQUIREMENTS

The Project is subject to the CEQA process and is a subdivision as defined by the California Government Code Section 66473.7. The CVWD, as the PWS for the Project, has determined that a WSA is necessary to complete CEQA compliance, and that a written WSV is required pursuant to the Subdivision Map Act.

CVWD completed its 2010 UWMP in compliance with the Urban Water Management Planning Act established in 1983 and most recently amended by SBx7-7 which requires a 20 percent reduction in per-capita water use by 2020. The CVWD also maintains a separate water management planning document, the 2010 Coachella Valley Water Management Plan (2010 CVWMP Update). The two planning documents are considered the primary reference documents for this WSA/WSV. The 2010 CVWMP Update discusses the Quantification Settlement Agreement (QSA). The QSA and related agreements were signed in 2003. A number of lawsuits have unsuccessfully challenged the QSA in state and federal courts. Both the 2010 UWMP and the 2010 CVWMP Update evaluate the water supplies under the QSA and prior to the implementation of the QSA.

The State of California Department of Water Resources (DWR) issues its final State Water Project Reliability Report every two years. The 2009 report was utilized in the 2010 UWMP and the 2010 CVWMP Updates; however, the Draft Delivery Reliability Report 2013 contains the most recent information. This report accounts for the impacts to water delivery reliability through 2029 associated with climate change and recent federal litigation. Based on information from the draft 2013 report, the average reliability of SWP Table A deliveries through 2029 is projected to be 62 percent of Table A amounts after taking into consideration the effects of climate change. In order to anticipate future reductions in reliability, the 2010 CVWMP Update and 2010 UWMP assumed an even lower long term reliability of 50 percent.

1.4 PURPOSE OF DOCUMENT

CVWD, as a PWS, is required by law to provide a WSA/WSV during the CEQA process and is required by law to provide a WSV following approval of the Tentative Map for the residential portion of the Project. This information is included in the CEQA documentation and it becomes evidence used in the approval process for the proposed development. It should be noted that this WSA/WSV addresses the overall water supply available to the CVWD to meet the demands of existing customers and other future demands. The WSA/WSV does not address the water delivery system within the CVWD's system since the focus is on the overall water supply. Adequacy of water supplies is addressed via CVWD's water master planning efforts. The WSA/WSV reviews and makes a finding of reasonable sufficiency of water supplies that either are available or will be available to CVWD to meet future demands. The

California Water Code requires a determination for a 20-year period (2017–2036) from the start of project construction.

The WSA/WSV must be reviewed every five years or in the event the water planning assumptions have changed, until the Project begins construction. The Project applicant shall notify CVWD when construction has begun. The review will insure that the information included in the WSA/WSV remains accurate and no significant changes to either the Project or CVWD's water supply have occurred. If neither the Project applicant nor the lead agency contacts CVWD within five years of approval of this WSA/WSV, it will be assumed that the Project no longer exists, and the water supply assessment and verification provided by this document will become invalid.

1.4.1 Water Supply Assessment

Requirements for the preparation of a WSA are set forth in Senate Bill 610 (SB 610), which was enacted in 2001 and became effective January 1, 2002. SB 610 amended Section 21151.9 of the Public Resource Code. It requires cities and counties to request specific information on water supplies from the PWS that would serve any project that is subject to CEQA and is defined as a Project in Water Code Section 10912. This information is to be incorporated into the environmental review documents prepared pursuant to CEQA.

State Water Code Section 10912 defines a Project as any of the following:

- A proposed residential development of more than 500 dwelling units
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space
- A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space
- A proposed hotel or motel, or both, having more than 500 rooms
- A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area
- A mixed-use project that includes one or more of the projects specified above
- A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project

The proposed development is a project, as defined by Water Code Section 10912, and requires a WSA because it proposes over 500 housing units; more than 500,000 square feet of commercial space; and would employ more than 1,000 people.

1.4.2 Water Supply Verification

Senate Bill (SB) 221 was enacted in 2001 and became effective as of January 1, 2002. SB 221 amends Section 11010 of the Business and Professional Code, and Sections 66455.3 and 66473.7, and Section 65867.5 of the Government Code. SB 221 establishes the relationship between the WSA prepared for a project and the project approval under the Subdivision Map Act. Pursuant to California Government Code Section 65865.5 and 66473.7, the approval of a development agreement or tentative map that includes a subdivision, as defined, shall be conditioned on obtaining a WSV.

The purpose of the WSV is to provide the legislative body of a city, county, or the designated advisory agency with written verification from the applicable public water purveyor that a sufficient water supply is available or, in addition, a specified finding is made by the local agency that sufficient water supplies are, or will be, available prior to completion of the project. Therefore, a WSV is required since this proposed Project has over 500 housing units, more than 500,000 square feet of commercial space, would employ more than 1,000 people, and is a subdivision, as defined by Government Code Section 66473.7.

1.5 WATER SYSTEM AND SUPPLY

1.5.1 Water System

The proposed potable water master plan is the backbone system for the Project. All of the in-tract water distribution facilities will be shown on subsequent improvement plans and will be designed and constructed in accordance with CVWD requirements.

CVWD's existing water supply and conveyance systems include, or will include, adequate capacity for daily demands and emergency fire protection. This includes groundwater pumping, transmission pipelines, distribution storage and surface pumping within internal roadways or other rights-of-way to provide domestic service to each residential and commercial tenant within the Project. In the future, CVWD's supply and conveyance system may also include delivery of Colorado River water treated for municipal use.

1.5.2 Water Supply

CVWD is the PWS for the area in which the Project Site is located. CVWD provides services for domestic water, irrigation water, sanitation sewerage collection, wastewater reclamation and recycling, imported water, stormwater protection and agricultural drainage.

CVWD currently has approximately 108,050 domestic water connections[1] and pumped approximately 115,800 acre-feet of groundwater in 2013.[2] However, the annual pumping capacity is approximately 300,000 afy. Areas served with domestic water by CVWD include portions of land near Desert Hot Springs, the Indio Hills area, and a portion of Cathedral City. CVWD serves all of Rancho Mirage, Thousand Palms, Palm Desert, Indian Wells, La Quinta, and a portion of Indio and Coachella. CVWD also serves other rural communities, including Thermal, Mecca, Oasis, Desert Shores, Salton Sea Beach, Salton City, North Shore, Bombay Beach, and Hot Mineral Springs and other portions of unincorporated Riverside County.

CVWD service area encompasses 639,857 acres, mostly within Riverside County, but also extends into northern Imperial and San Diego counties. The Coachella Valley is bordered on the west and north by high mountains, which provide an effective barrier against coastal storms, and which greatly reduce the contribution of direct precipitation to recharge the valley's groundwater basin. The majority of natural recharge comes from runoff from the adjacent mountains.

Development throughout the Coachella Valley has been dependent on groundwater as a source of supply. The demand for groundwater has annually exceeded the limited natural recharge of the groundwater basin. Therefore, imported water is used to recharge the aquifer and reduce groundwater overdraft. CVWD and the Desert Water Agency (DWA) work in conjunction as State Water Project Contractors to import State Water Project water supplies for recharge in the Western Coachella Valley.

1.5.3 Historical Context

The need to enhance the public water supply in the Coachella Valley has been recognized for many years. The formation of CVWD in 1918 was a direct result of the concern of local residents about a plan to export water from the Whitewater River to Imperial County. Early on, valley residents also recognized that action was needed to stem the decline of the water table, which was occurring as a result of local pumping in the eastern Coachella Valley. As a result, CVWD entered into an agreement for the construction of the Coachella Branch of the All-American Canal in order to bring Colorado River water to the Coachella Valley. Since 1949, the Coachella Canal has been providing water for irrigation use in the area that generally encompasses Indio and La Quinta southerly to the Salton Sea. Colorado River water is delivered to the Coachella Valley via the All American and Coachella Canals and distributed through an underground irrigation distribution piping system to farms and a

1 Coachella Valley Water District, *2013 Operations Production Consumption Totals,* (September 2014).
2 Coachella Valley Water District, *2013 Operations Production Consumption Totals,* (September 2014).

growing number of golf courses in the Coachella Valley. In recent years, CVWD has begun a program of recharging the Aquifer in the eastern Coachella Valley with this source.

The need for additional water supplies was recognized due to the onset of development in the western Coachella Valley. As a result, in 1963 CVWD and DWA, which serves water to the Palm Springs area and a portion of Cathedral City and imports water for these areas and the Desert Hot Springs area, entered into separate contracts with the State of California in order to ensure that SWP water would be available. Because a direct pipeline from the SWP system to the Coachella Valley does not exist, CVWD and DWA entered into an exchange agreement with the Metropolitan Water District of Southern California (MWD) to receive water from the MWD Colorado River Aqueduct, which crosses the upper portion of the Coachella Valley near Whitewater. In exchange, CVWD and DWA have their SWP water allotment delivered to MWD. Since 1973, in exchange for their SWP water, CVWD and DWA have been receiving Colorado River water from MWD's Colorado River Aqueduct turnout located at Whitewater Canyon to replenish groundwater in the Coachella Valley.

In addition, CVWD has recognized the need to provide other sources of water to supplement its water supplies. CVWD has been recycling reclaimed wastewater since 1967 and operates six water reclamation plants, three of which currently recycle water. Recycled water is currently used for golf course and greenbelt irrigation in the cities of Palm Desert, Indian Wells, and Indio, thereby reducing demand on groundwater in the basin.

1.6 EXISTING WATER MANAGEMENT PLANS

1.6.1 2010 Coachella Valley Water Management Plan Update

CVWD initiated the first water management planning process in the early 1990s to address the overdraft conditions in the Aquifer and to ensure that there would be adequate water supplies in the future. The plan is a 35-year blueprint for wise water management and the basis for all the Districts efforts to preserve the Valley's groundwater source.

The Coachella Valley Water Management Plan was adopted by the CVWD Board of Directors (Board) in September, 2002. A Programmatic Environmental Impact Report was prepared for the plan and certified under the California Environmental Quality Act. The goal of the Water Management Plan is to reliably meet current and future water demands in a cost effective and sustainable manner, by achieving the following objectives:

- Meet current and future water demands with a 10 percent supply buffer
- Eliminate long term groundwater overdraft
- Manage and protect water quality

- Comply with state and federal laws and regulations
- Mange future costs
- Minimize adverse environmental impacts.

The Board recognized the need to update the Water Management Plan periodically to respond to changing external and internal conditions. The 2010 CVWMP Update meets that need. It defines how the goal will be met given changing conditions and new uncertainties regarding water supplies, water demands, and evolving federal and state regulations.

The Plan calls for a multifaceted approach including:

- increased water conservation by all types of water users;
- increasing the imported water supply from the Coachella Canal and State Water Project;
- increasing the use of the imported supply and recycled water, instead of groundwater, for irrigation; and
- expanded groundwater replenishment and source substitution efforts.

The 2010 CVWMP Update identifies several water conservation measures with the overall goal to reduce urban water consumption by 20 percent by 2020, and the overall goal to maintain this level of reduction through 2045. These measures include water efficient landscaping and irrigation controls, water efficient plumbing, tiered or seasonal water pricing, public information and education programs, alternative water supplies, water restrictive municipal development policies, appointing a CVWD conservation coordinator and refining the maximum water allowance budget for landscaped and recreational areas. The 2010 CVWMP Update reduces reliance on groundwater sources by fully utilizing Colorado River water, SWP water and recycled water supplies and implementing more conservation over the long term. For reference, the Executive Summary of the 2010 CVWMP Update is provided in **Appendix C**.

The 2010 CVWMP Update emphasizes cooperation with municipalities, local water agencies, and tribes in regional planning and implementation. The following are among some of the recommended conservation measures and activities outlined in the 2010 CVWMP Update for the Board to consider over the next 35 years:

- Provide incentives and support to agricultural customers to conserve water, such as through converting from flood/sprinkler irrigation to more efficient micro-sprinkler/drip systems.
- Encourage existing golf courses to convert landscaping to meet the most current Landscape Ordinance, requiring no more than 4 acres of grass per hole and 10 acres of grass per practice area.

- Expand landscape conversion rebates for domestic customers to encourage less grass and more desert appropriate landscaping
- Complete construction of subsequent phases of the Mid-Valley Pipeline system to provide a blend of recycled and Colorado River water for up to 50 golf courses in lieu of groundwater.

The 2010 CVWMP Update recognizes that groundwater storage makes up the difference between supply and demand. Other than canal water for irrigation, recycled water and desalinated drain water, all water delivered to the end users is obtained from the groundwater basin. The groundwater basin has a capacity of approximately 28.8 million acre-feet. It is capable of meeting the water demands of the Coachella Valley for extended periods.

The 2010 CVWMP Update discusses that CVWD has many programs to maximize the water resources available including:

- Recharge of Colorado River and SWP supplies
- Recycled wastewater, desalinated agricultural drain water, conversion of groundwater uses to Canal water
- Water conservation including tiered water rates, landscaping ordinance, outreach and education.

The 2010 CVWMP Update and CVWD's replenishment assessment programs establish a comprehensive and managed effort to eliminate the overdraft. These programs allow CVWD to maintain the groundwater basin as its primary water supply and to recharge the groundwater basin as its other supplies are available.

CVWD recently prepared a 2014 CVWMP Status Report to evaluate the effectiveness of the 2010 CVWMP Update including progress on eliminating overdraft. The 2014 CVWMP Status Report demonstrated that the 2010 CVWMP Update is working and continued implementation of the programs in the 2010 CVWMP Update ensures that overdraft will be eliminated by 2021 as shown in **Figure 4, Status of the Overdraft – Annual Change in Storage**. Over the last ten-year period there has been no overdraft mainly as a result of increases in urban conservation and increases in imported water deliveries to the Coachella Valley. Water levels have increased in the Palm Springs area and in the East Valley. However water levels are still declining in the Mid-Valley areas near Rancho Mirage, Palm Desert and Indian Wells. Groundwater levels in this area will continue to decline until full implementation of Mid Valley programs that reduce pumping. These Mid-Valley Programs include urban conservation to reduced urban demand 20% by 2020; source substitution programs including non-potable water system expansion to golf courses, Colorado River water treatment for municipal use; and additional recharge. The 2014 CVWMP Status Report is included in **Appendix D.**

1.6.2 CVWD 2010 Urban Water Management Plan, SBX7-7, and Water Shortage Contingency Ordinance

The 2010 CVWD Urban Water Management Plan (UWMP) was approved by the State on November 10, 2011. Water Code Section 10910 (c)(2) states that if demand from potential future growth is accounted for in the most recently adopted 2010 UWMP, the water supplier may incorporate the requested information from the 2010 UWMP in preparing the WSA/WSV. CVWD demand projections contained in the 2010 UWMP take into account the increased growth throughout its service area.

In November 2009, SBx7-7 was approved and adopted by the State. DWR provides alternative water use reduction targets for urban water suppliers to select, and guidance to achieve the target goal. The legislation includes requirements to improve the management of CVWD water resources by monitoring groundwater basins, developing agricultural water management plans, reducing statewide per capita water consumption by 2015 and 2020, and reporting water diversions and uses in the Delta.

SBx7-7 creates a framework of future planning and actions by urban and agricultural water suppliers to reduce California's water use. This bill requires the development of agricultural water management plans and requires urban per capita water consumption to be reduced by 20 percent by the year 2020.

Water Shortage Contingency

The CVWD developed its Water Shortage Contingency Plan during the 1986-92 drought pursuant to the requirements of the Government Code 10632. The key element of CVWD's water shortage contingency plan is an ordinance with phased water use restrictions and a drought rate structure. The Water Shortage Contingency Plan provides the stages and action levels shown in **Table 1.0-2, Water Shortage Contingency Plan.**

Table 1.0-2
Water Shortage Contingency Plan

Stage	Action	Water Use Reduction Goal
1	Voluntary	10%
2	Mandatory	10%
3	Mandatory	20%
4	Mandatory	50%

Source: Coachella Valley Water District, 2010 Urban Water Management Plan, *(2011).Table 5-17.*

The trigger levels (to move from one state to the next) depend on the State-wide and local water situation. Based on voluntary response during Stage 1, CVWD's General Manager-Chief Engineer can determine that it is necessary to implement Stage 2 to protect the public welfare and safety. Also, in the case of a State-wide water shortage declaration, the Governor can determine that it is necessary it implement Stage 2. Prior to the implementation of each mandatory phase, CVWD will hold a public hearing for the purpose of determining whether a shortage exists and which measures should be implemented. The public will be informed of the public hearing at least ten days prior to the hearing and CVWD will notify the public of its determination by public proclamations.

California Drought Update

On January 17, 2014, Governor Jerry Brown Issued a Drought Declaration and requested a voluntary 20 percent reduction in urban water use Statewide. At that same time he also directed the State Water Resources Control Board (SWRCB) to adopt Emergency Regulations. As a result, on July 15, 2014, the SWRCB adopted Emergency Regulations for Statewide Urban Water Conservation. They became effective on July 28, 2014 and were documented in Title 23, Sections 863-865, of the California Code of Regulations. The regulations will remain effective for 9 months and could be extended if drought conditions persist.

The regulations prohibit applying water to outdoor landscapes in a manner that causes runoff such that water flows onto adjacent property, non-irrigated areas, private and public walkways, roadways, parking lots, or structures; using a hose to wash an automobile except where the hose is equipped with a shut-off nozzle; applying water to any hard surface including, but not limited to, driveways, sidewalks, and asphalt; and using potable water in a fountain or other decorative water feature, except where the water is part of a recirculating system.

The regulations also require that Urban Water Suppliers must move to the first mandatory level of water reduction designated in their 2010 Urban Water Management Plan. For CVWD this is Stage 2 which requires a mandatory 10 percent reduction in water use.

In response to the Governors Drought Declaration and the SWRCB's emergency regulations, CVWD Adopted a Water Shortage Contingency Ordinance implementing Stage 2 of its Water Shortage Contingency Plan, and implemented the following restrictions:

- Outdoor irrigation is limited to between 10:00 AM and sunset
- Customers should follow the CVWD drought watering guide which reduces irrigation demand 20%
- Broken sprinklers should be repaired within 24 hours of notice
- Water should be served in restaurants only upon request

- Hotels should maintain messaging in hotel rooms asking guests to conserve water

Allowances are provided for essential maintenance and overseeding.

1.6.3 Integrated Regional Water Management Plan

Integrated Regional Water Management Planning is a collaborative approach to managing all aspects of water resources in a region and is encouraged by the DWR. It involves multiple agencies, stakeholders, individuals and groups; and attempts to address the issues and differing perspectives of all the entities involved through mutually beneficial solutions. In 2008 the five public water agencies in the Coachella Valley formed the Coachella Valley Regional Water Management Group (CVRWMG); in 2010 they adopted the Coachella Valley Integrated Regional Water Management Plan (IRWMP.) These efforts insure that the Coachella Valley as a whole will focus on sustainable water resources. All water agencies in the valley work together, share information discuss concerns and viewpoints and build consensus in supporting future projects that benefit the entire region. Since its formation the CVRWMG has added members and is working toward adding the Agua Caliente Tribe as its newest member.

1.6.4 Agua Caliente Cahuilla Band of Indians

The purpose of the Agua Caliente Band of Cahuilla Indians Land Use Ordinance (Tribal Land Use Ordinance) is to provide standards and regulations to control land uses on Indian Reservation Lands, maintain and protect the Reservation's unique natural and cultural resources, and to preserve the natural environment. Article VII, Landscaping Standards, of the Tribe's Land Use Ordinance promotes the use of native, desert, and other drought tolerant plants to reduce water demand on the Reservation. The landscape management practices identified in this article of the Tribal Land Use Ordinance ensure maximum water efficiency in comprehensive landscaping plans, irrigation plans, plant materials, decorative water features, and places limitations on turf material.

1.6.5 City of Rancho Mirage

The City of Rancho Mirage has adopted by reference the CVWD Ordinance No. 1302.1 and incorporates CVWD's water management planning efforts in the City's General Plan Updates.

1.6.6 County of Riverside

The County of Riverside Ordinance No. 859, Water Efficient Landscape Requirements Ordinance, establishes provisions for water management practices and water waste prevention for new and rehabilitated landscapes and to implement the requirements of the California Water Conservation in Landscaping Act 2006 and the California Code of Regulations Title 23, Division 2, Chapter 2.7. The County also incorporates CVWD's water management planning efforts in its General Plan Updates.

2.0 WATER DEMANDS

2.1 PROJECT SPECIFIC WATER DEMAND

2.1.1 Project Specific Water Demand Estimate

The unit water usage for this WSA/WSV are based on indoor water use performance standard as provided in the California Water Code for residential water demand; the American Water Works Association Research Foundation for commercial water demands; and the CVWD's Landscape Ordinance No. 1302.1[3] which meets the water conservation goals of the DWR Model Water Efficient Landscape Ordinance (MWELO). The overall goal of the ordinance is to reduce landscape water use, reduce or eliminate runoff in streets, and limit turf. Specific landscape design for the project is unknown at this time. CVWD's Maximum Applied Water Allowance (MAWA), as outlined in Appendix D of the District's Ordinance No. 1302.1 is used to estimate outdoor irrigation usage. The MAWA complies with Division 2, Title 23, California Code or Regulation, Chapter 7, Section 702.

The Project planning area includes a total of 577 acres within the Reservation. In order to provide a more accurate estimate of the proposed Project's water demand, a site-specific analysis was completed. Potable water demand was calculated for all indoor uses based on Project-specific estimates.

The following factors are pertinent to the proposed Project:

- Indoor Residential (Multifamily) = 55 gallons per day (gpd)/person
- Active Adult Community density per home is 1.8 people per home[4]
- Multifamily residential density per home is 2.97 people per home[5]
- Outdoor irrigation based on CVWD's MAWA
- Indoor non-residential (commercial/retail, office, restaurant) based on American Water Works Association (AWWA)
  - Clubhouse 0.096 gallons per square foot
  - Restaurant 0.907 gallons per square foot
- Common Area landscape (parks/catchment/medians) based on MAWA

3 Assembly Bill 1881, "Water Conservation" (September 28, 2006).

4 Based on the Riverside Traffic Analysis Model (RivTAM) which is within a negligible margin of error for the City of Rancho Mirage's open space calculation.

5 Based on the Riverside County General Plan Land Use Element for Medium Density Residential land uses.

Residential

The projected water demands are distinguished between indoor and outdoor usage. **Table 2.0-1, Indoor Residential Water Demands,** summarizes the indoor water demands of the residential portion of the Project.

Table 2.0-1
Indoor Residential Water Demands

Planning Area	Land Use	Units	gpd/unit	Demand (gpd)	Indoor Residential Annual Demand (afy)
1	Multifamily Residential[1]	180	163.35	29,403	32.94
2	Multifamily Residential[1]	180	163.35	29,403	32.94
5	Multifamily Residential[1]	486	163.35	79,388	88.93
6	Multifamily Residential[1]	180	163.35	29,403	32.94
7	Multifamily Residential[1]	180	163.35	29,403	32.94
8	Single Family Residential[2]	1,200	99.0	118,800	133.07
Total		**2,406**		**315,800**	**353.76**

1 0.55 gpd/person x 2.97 person/unit = 163.35 gpd/unit
2 0.55 gpd/person x 1.80 person/unit = 99.0 gpd/unit
Abbreviations: gpd = gallons per day; afy = acre-feet per year

Nonresidential

For the purposes of this WSA/WSV, the AWWA Research Foundation's Commercial and Institutional End Uses of Water (2000), the most recent AWWARF document, was used to estimate indoor non-residential water use. In the absence of documented local indoor non-residential usage factors that would accurately represent water use trends, the AWWARF document provides water use data applicable to mixed use commercial/industrial development projects of desert areas within southern California and Arizona, and sets water efficiency benchmarks for specific commercial uses. Based on these benchmarks, usage factors for the distinct uses of Retail, Restaurant, and Office were developed for the Project. **Table 2.0-2, Indoor Nonresidential Water Demands**, summarizes nonresidential water demands.

Table 2.0-2
Indoor Nonresidential Water Demands

Planning Area	Land Use	Building Area (sq. ft.)	gpd/sq. ft.	Demand (gpd)	Annual Demand (afy)
1	Mixed Use Commercial	217,800	0.096	20,909	23.42
1	Mixed Use Restaurant	108,900	0.907	98,772	110.64
1	Mixed Use Office	108,900	0.096	10,454	11.71
2	Mixed Use Retail/Commercial	817,500	0.096	78,480	87.91
2	Mixed Use Restaurant	272,500	0.907	247,158	276.85
3	Mixed Use Retail/Commercial	297,000	0.096	28,512	31.94
3	Mixed Use Restaurant	99,000	0.907	89,793	100.58
4	Mixed Use Retail/Commercial	378,750	0.096	36,360	40.73
4	Mixed Use Restaurant	126,250	0.907	114,509	128.27
6	Mixed Use Retail/Commercial	165,500	0.096	15,888	17.80
6	Mixed Use Restaurant	82,750	0.907	75,054	84.07
6	Mixed Use Office	82,750	0.096	7,944	8.90
7	Mixed Use Retail/Commercial	190,500	0.096	18,288	20.49
7	Mixed Use Restaurant	95,250	0.907	86,392	96.77
7	Mixed Use Office	95,250	0.096	9,144	10.24
8	Clubhouse	12,000	0.096	1,152	1.29
8	Clubhouse Restaurant	3,000	0.907	2,721	3.05
Total				**941,530**	**1,054.66**

Abbreviations: sq. ft. = square feet; gpd = gallons per day; afy = acre-feet per year.

Landscape Irrigation Demand

The Coachella Valley receives annual rainfall between 1.5 and 3.0 inches and experiences extremely high temperatures and large daily temperature ranges. Annual rainfall is normally less than 5.5 inches during the period and several maximum monthly average temperatures reached above 100 degrees Fahrenheit.

The total potential evapotranspiration is well above the total rainfall, and is due to the high temperatures and the great amount of sun. The Coachella Valley never experiences a water surplus

condition with respect to precipitation versus evapotranspiration. Prime evapotranspiration sites in the valley are the well-watered lawns and golf courses.

A formula called MAWA is based on the Project area's reference evapotranspiration, ET adjustment factor, and the size of the Project's landscape area. This calculation determines the upper limit of irrigation water allowed for the project. To meet the requirements of MAWA, a landscape design must use highly water efficient plant material laid out in a spare manner, and irrigated with efficient irrigation technology including drip emitters and smart controllers.

Landscape water demand for the Project is based on the estimated landscape irrigation area and water usage equations of the Districts Landscape Ordinance 1302.1. Although the landscape design is unknown, this method ensures that a sufficient budget is provided to have a sustainable landscape that meets the criteria established in CVWD's ordinance. Therefore, the MAWA equation for the Project was used to project irrigation demand. The equation uses an evapotranspiration rate of 93.9 inches per year (CVWD Zone 5) and a plant factor to irrigation efficiency ratio of 0.5. The following demand characteristics apply to the proposed Project:

- Demand of 3.89 acre feet/year/acre is applied to the landscaped area (10 percent for Planning Areas 1 through 7 and 100 percent for Planning Area 8 of the Net Land Area is used to reflect desert scape type landscaping).
- CVWD's Maximum Water Allotment per CVWD table is 3.89 acre feet/year/acre.
- Retention Basins are minimally landscaped (5 percent of Net Land Area).

Adherence to the MAWA requirements as outlined in the CVWD ordinance assures compliance with CVWD water conservation goals and requirements.

Open space for the proposed Project includes a system of pedestrian, bicycle and golf cart trail linkages, neighborhood parks, plazas, courtyards, lawn areas, water features, community club house/pool/spa and associated amenities. The CVWD Maximum Water Allotment of 3.89 afy/acre is inclusive of varying types of open space/landscaping uses, including all uses included in the proposed Project. Planning Area 8, which includes 1,200 residential units and 15,000 square feet of clubhouse/restaurant uses, also includes the largest net area of open space. Planning Area 8 provides a variety of outdoor amenities including neighborhood parks, trail linkages, water features, fitness trail, gathering areas, garden plots, and a golf putting green. For this reason, it is assumed that 100 percent of the open space area would be irrigated, using the standard water allotment of 3.89 afy/acre.

Table 2.0-3, Outdoor – Open Space Water Demands, estimates the water use for the Project's common area landscaping.

Table 2.0-3
Outdoor – Open Space Water Demands

Planning Area	Net Total Outdoor Acreage	Landscaped Acreage	Percent Irrigated	Water Allotment (afy/acre)[2]	Annual Demand (afy)
1	27.5	2.75	10	3.89	10.70
2	28.7	2.87	10	3.89	11.16
3	26.6	2.66	10	3.89	10.35
4	29.6	2.96	10	3.89	11.51
5	19.7	1.97	10	3.89	7.66
6	22.8	2.28	10	3.89	8.87
7	29.1	2.91	10	3.89	11.32
8	77.0	77.0	100	3.89	299.53
Total	**261.0**				**371.11**

1 Based on CVWD Maximum Water Allotment from Landscape Ordinance. This generation rate is inclusive of the varying types of open space uses associated with the proposed Project.

Summary

Table 2.0-4, Summary of Project Demands, provides a summary of the water demand that would need to be provided to the Section 24 Specific Plan.

Table 2.0-4
Summary of Project Demands

Planning Area	Land Use	Total Estimated Demand (afy)
1	Multifamily residential	32.94
	Non-residential	145.77
	Open Space	10.7
	Subtotal	***189.41***
2	Multifamily residential	32.94
	Non-residential	364.76
	Open space	11.16
	Subtotal	***408.86***
3	Non-residential	132.52
	Open space	10.35
	Subtotal	***142.87***
4	Non-residential	169.00
	Open space	11.51

Planning Area	Land Use	Total Estimated Demand (afy)
	Subtotal	***180.51***
5	Multifamily residential	88.93
	Open space	7.66
	Subtotal	***96.59***
6	Multifamily residential	32.94
	Non-residential	110.77
	Open space	8.87
	Subtotal	***134.72***
7	Multifamily residential	32.94
	Non-residential	127.50
	Open space	11.32
	Subtotal	***171.76***
8	Single family residential	133.07
	Non-residential	4.34
	Open space	299.53
	Subtotal	***436.94***
	Total Project Demand	**1,779.53**

Note: Based on totals from ***Table 2.0-1, Table 2.0-2,*** and ***Table 2.0-3.***

The Section 24 Specific Plan Project would require approximately 1,780 afy using the Project-specific demand factors. A detailed year by year projection is provided in **Appendix B, Water Demand Calculations**. This estimation includes indoor and outdoor use for the Residential and Nonresidential areas. This quantity is approximately 1.5 percent of CVWD's 2013 total urban water production.[6]

2.2 WATER CONSERVATION MEASURES

CVWD has made significant effort to provide private and public consumers of local water resources with information to help conserve these resources through the use of drought tolerant desert plants and efficient irrigation systems. As discussed in **Section 1.6.4**, the Tribe has adopted landscaping standards similar to CVWD's landscape ordinance. In addition, the City of Rancho Mirage has adopted the landscape ordinance and requires that development within the City be water efficient.

6 Coachella Valley Water District, *2010 Urban Water Management Plan (2011) Table 3-10*.

The 2010 CVWMP Update identifies several conservation measures with the goal of reducing urban water demand by 20 percent by 2020. The 2010 CVWMP Update includes water efficient landscaping and irrigation, water efficient plumbing and appliances, tiered or budget based water pricing, public information and education programs, alternative water supplies, water restrictive municipal development policies and maximum water allowance for landscaped and recreational areas. CVWD employs a full-time conservation coordinator with sufficient staffing to review all new landscape plans for compliance with the CVWD's Landscape Ordinance.

2.2.1 Desert Landscaping: Native and Other Drought Tolerant Plants

The need for progressive water conservation and control of landscape maintenance costs has also prompted the greater use of native and other drought-tolerant planting materials within the Project Site. The Coachella Valley and CVWD have been a leader in the promotion of these desert landscape materials and design themes, most notably in Landscape Ordinance 1302.1. As a result, thoughtful and conservative management and use of water resources have guided development of the conceptual Project landscape plan.

2.2.2 Project-Specific Water Conservation and Groundwater Reduction Measures

A broad range of Project Design Features have been included in the Section 24 Specific Plan to address the Project's potential impacts on water resources.

Project developers shall be required to implement the following features to assure the most efficient use of water resources and to meet and maintain the Tribe's and the 2010 CVWMP Update goals throughout the life of the Project:

1. The Project will require use of xeriscape planting principles and establishes a palette of drought-tolerant trees, shrubs and plants that require little irrigation.

2. Turf is restricted to active outdoor recreation areas only in compliance with the Landscape Ordinance in effect at that time.

3. The Specific Plan allows the use of grey water recycled water infrastructure and rainwater collection systems.

4. Decorative water features shall be designed to recirculate water to minimize water consumption and evaporation.

5. New development will meet CVWD water efficiency goals and will be strongly encouraged to incorporate creative designs that exceed those goals.

6. The Active Adult Community incorporates many sustainable and water saving features:

    a. Reduced width streets (32 foot) that reduce impervious surfaces that generate run-off.

    b. Retains and treats all stormwater on site from up to a 100-year storm event.

    c. Low flow toilets and low gallon per minute (gpm) plumbing fixtures in compliance with the City, Tribe, and California Plumbing Code.

    d. Tankless water heaters.

    e. Timed irrigation watering systems and irrigation rain sensors for maximum efficiency

3.0 WATER SUPPLY ASSESSMENT

3.1 GENERAL

Having established that the 2010 CVWMP Update and 2010 UWMP are applicable to this Project, the next requirement of a WSA is to identify and describe the water supply sources of the PWS that will serve the Project. State Water Code Section 10910(d) requires a WSA to include identification of any existing water supply Table A amounts, water rights, or water service contracts relevant to the identified water supply for the proposed Project. The WSA shall also include a description of the quantities of water received in prior years by the PWS. According to the 2010 UWMP, the aquifer and other sources of supply are adequate for an average year, single dry year, and multiple dry years for a 20-year period.

3.2 IDENTIFICATION OF WATER SOURCE

3.2.1 Primary Water Sources

The primary source of water supply for this Project is groundwater. The groundwater basin is recharged by Colorado River Water, reclaimed water, SWP supplies and potentially desalinated agricultural drain water. Colorado River water is also available for potential domestic use if treated. Colorado River water via the Coachella Canal supplies water for irrigation of the eastern valley. The proposed Project is located in the western portion of the Coachella Valley which does not currently have access to this water.

3.2.2 Additional Water Sources

In addition to Colorado River water and groundwater, CVWD and the Coachella Valley have additional water sources, including the Colorado River, imported SWP water, recycled water and a limited amount of surface water. These sources are described in the following analysis in **Section 3.3, Analysis of Water Supply**. In the future, drainage water from the shallow, semi-perched groundwater zone, which is collected by CVWD's drainage system, will be treated and used to meet non-potable uses as described in the 2010 CVWMP Update. The area within the Specific Plan is planned for access to grey water and recycled water. Potential sources of grey water include dual plumbing fixtures for large commercial projects to capture commercial dishwasher water and capturing runoff water from roofs and parking structures. Grey water would irrigate landscapes within the Specific Plan Area. The Project could also utilize storm water contained on site for reuse.

3.3 ANALYSIS OF WATER SUPPLY

3.3.1 Groundwater

Since the early part of the 20th century, the Coachella Valley has been dependent primarily on groundwater as a source of domestic water supply. Groundwater is also used to supply water for crop irrigation, fish farms, duck clubs, golf courses, greenhouses, and industrial uses in the Coachella Valley.

Water Code Section 10910 (f) requires additional information when a groundwater basin is cited as the water supply source for a project including a description of the basin, the rights of the PWS to use the basin, the overdraft status of the basin, any past or planned overdraft mitigation efforts, historical use of the basin by the PWS, projected use of the basin by the project, and a sufficiency analysis of the basin that is to supply the Project.

3.3.2 Description of the Aquifer

Groundwater is the principal source of municipal water supply in the Coachella Valley.[7] CVWD serves domestic water to most of the developed portions of the Coachella Valley and along both sides of the Salton Sea in Imperial Valley. CVWD obtains water from both the West and East Whitewater River subbasins and the Mission Creek subbasin. A common groundwater source, the Whitewater River subbasin, is shared by CVWD, DWA, the cities of Indio and Coachella, Myoma Dunes Water Company and numerous private groundwater users.

The Coachella Valley Groundwater Basin, as described by the California Department of Water Resources (DWR), is bounded on the north and east by non-water bearing crystalline rocks of the San Bernardino and Little San Bernardino Mountains and on the west by the crystalline rocks of the Santa Rosa and San Jacinto Mountains.[8] At the west end of the San Gorgonio Pass, between Beaumont and Banning, the basin boundary is defined by a surface drainage divide separating the Coachella Valley Groundwater Basin from the Beaumont Groundwater Basin of the Upper Santa Ana drainage area.

The Coachella Valley Groundwater Basin can be described as a giant tilted bathtub full of sand, with the high end at the northwest edge of the Coachella Valley near the community of Whitewater and the low end at the Salton Sea. The aquifer underlies the cities of Palm Springs, Cathedral City, Rancho Mirage, Palm Desert, Indian Wells, La Quinta, Indio, and Coachella, and the unincorporated communities of Thousand Palms, Thermal, Bermuda Dunes, Oasis, and Mecca.

---

7 Coachella Valley Water District, *2010 Urban Water Management Plan,* (June 2011). 4-4.

8 Coachella Valley Water District, *2010 Urban Water Management Plan*, (June 2011). 4-9. CVWD, *Coachella Valley WMP 2010 Update,* (January 2012). 4-1.

The Subbasins present in the Valley are Mission Creek, Desert Hot Springs, Garnet Hill, and Whitewater River (Indio) Subbasins. The Whitewater Subbasin includes four subareas: Palm Springs, Thermal, Thousand Palms, and Oasis.[9] The Palm Springs Subarea is the forebay or main area of recharge to the subbasin, and the Thermal Subarea comprises the pressure or confined area within the basin. The Thousand Palms and Oasis subareas are peripheral areas having unconfined groundwater conditions. The subbasins with their groundwater storage reservoirs are defined without regard to water quantity or quality. They delineate areas underlain by formations, which readily yield the stored water through water wells and offer natural reservoirs for the regulation of water supplies. From a management perspective, the Whitewater River (Indio) Subbasin is commonly divided into a west and east portion, with the dividing line extending from Point Happy in La Quinta to the northeast, terminating at the San Andreas Fault and the Indio Hills at Jefferson Street. The west portion of the Whitewater River (Indio) Subbasin is defined generally as that portion of the Thermal Subarea west of this line including the Palm Springs Subarea, and the Thousand Palms Subarea.

The Whitewater River Subbasin comprises the major portion of the floor of the Coachella Valley and encompasses approximately 400 square miles. Historical fluctuations of groundwater levels within the Whitewater River Subbasin indicate a steady decline in the levels throughout the Subbasin prior to 1949. With the importation of Colorado River water from the Coachella Canal after 1949, the demand on the groundwater basin declined in East Valley (generally east and south of Washington Street) below Point Happy, and the groundwater levels rose sharply[10] although water levels continued to decline in the western portions of the subbasin. Water levels in the deeper aquifers of the East Valley rose from 1950 to 1980. However, since the early 1980s, water levels in this area have again declined, at least partly due to increasing urbanization and groundwater usage.

The Whitewater Subbasin is located northwest of the Salton Sea and receives low precipitation, averaging about 6 inches per year, and a wide range of temperatures.[11] The Banning fault bounds the subbasin on the north and the semi-permeable rocks of the Indio Hills mark the northeast boundary. Impermeable rocks of the San Jacinto and Santa Rosa Mountains bound the subbasin on the south. A bedrock constriction separates the Indio Subbasin from the San Gorgonio Pass Subbasin on the northwest. The Salton Sea is the eastern boundary and the subbasin's primary discharge area. A low drainage divide forms a short boundary with the West Salton Sea Groundwater Basin in the southeast.

11 Department of Water Resources, *California Groundwater,* Bulletin 118, Coachella Valley Groundwater Basin, Indio Subbasin (2004).

In the upper part of the Whitewater Subbasin, groundwater is unconfined, whereas to the south and southeast groundwater is mostly confined except on the edges of the subbasin where unconfined conditions are found. Depth to groundwater varies widely in the southeast part of the subbasin and some wells historically delivered artesian flow.

As shown in **Table, 3.0-1, Groundwater Storage Capacity of the Coachella Valley Groundwater Basin**, DWR estimated that the Coachella Valley Groundwater Basin contained a total of approximately 39.2 million acre-feet of water in the first 1,000 feet below the ground surface, much of which originated from runoff from adjacent mountains. However, the amount of water in the aquifer has decreased over the years due to pumpage to serve urban, rural, and agricultural development in the Coachella Valley, which has withdrawn water from the aquifer at a rate faster than its natural rate of recharge.

Table 3.0-1
Groundwater Storage Capacity of the Coachella Valley Groundwater Basin

Area	Storage (AF)
San Gorgonio Pass Subbasin	2,700,000
Mission Creek Subbasin	2,600,000
Desert Hot Springs Subbasin	4,100,000
Garnet Hill Subbasin	1,000,000
Subtotal	**10,400,000**
Whitewater River (Indio) Subbasin	
Palm Springs Subarea	4,600,000
Thousand Palms Subarea	1,800,000
Oasis Subarea	3,000,000
Thermal Subarea	19,400,000
Subtotal Whitewater River Subbasin	**28,800,000**
Total all Subbasins	**39,200,000**

Source: Coachella Valley Water District, Engineer's Report on Water Supply and Replenishment Assessment, West Whitewater River Subbasin Area of Benefit 2040-2015. *Coachella, California (April 2014).Table 1.*

Although water levels have been declining throughout most of the Subbasins since 1945, water levels in the southeastern portion of the Valley had risen until the early 1980s because of the use of imported water from the Coachella Canal and the resulting decreased pumpage in that area.[12] The rate of

12 Coachella Valley Water District, *Engineer's Report on Water Supply and Replenishment Assessment, West Whitewater River Subbasin Area of Benefit 2040-2015.* Coachella, California. (April 2014). 14.

groundwater level decline increased from the early 1980s until about 2010 due to increased urbanization and increased groundwater use by domestic water purveyors, local farmers, golf courses and fish farms. Since 2010 groundwater levels in the eastern portion of the Coachella Valley have risen due to recharge of Colorado River water at the Thomas E. Levy Recharge Facility.

The historic declining water table in the Whitewater River Subbasin led to a determination by CVWD and DWA that a management program is required to stabilize water levels and prevent other adverse effects such as water quality degradation and land subsidence. CVWD's East and West Whitewater River Subbasin Groundwater Replenishment Programs are reducing declining water levels in this subbasin. Groundwater recharge in the West Whitewater River Subbasin began in 1973 and the benefits of recharge can be seen in recent groundwater level measurements.

As presented in the 2010 CVWMP Update, total groundwater production within the West Whitewater River Subbasin Area of benefit from all producers was estimated to be 208,439 afy in 1999. The reported production for 2013 was 181,994 afy.[13] Groundwater production within the East Whitewater River Subbasin Area of Benefit was estimated to be 168,300 afy during 1999. The reported production for 2013 was 119,194 afy.[14]

Surface runoff and subsurface inflow are significant sources of recharge to the Indio Subbasin. In addition, the Whitewater River spreading grounds northwest of Palm Springs receives Colorado River Aqueduct water and has a maximum capacity of 300,000 afy.[15] Although the Whitewater River spreading grounds recharged only 26,620 afy in 2013, annual recharge has averaged 70,500 afy since 1973. Annual water quantities delivered vary as a result of varying State Water Project delivery reliability, drought and advance deliveries associated with the exchange agreement. Average historical natural recharge is approximately 49,000 afy. Colorado River water is conveyed into the West subbasin via the Coachella Canal, which also supplies recharge project facilities located in the southwestern part of the subbasin.[16] DWR has calculated the storage capacity of the subbasin to be 28.8 million acre-feet.

The annual amounts of water delivered for recharge are shown in **Table 3.0-2, West Whitewater River Subbasin Annual Recharge Deliveries.**

Aquifer Adjudication

The groundwater basin has not been adjudicated. CVWD shares a common groundwater source with other PWS's, including DWA, the Mission Springs Water District (MSWD), the City of Coachella, the City of Indio, and the Myoma Dunes Mutual Water Company. Other groundwater users include some individual residents mostly in rural areas, farmers, golf courses, businesses, and commercial facilities. DWA and CVWD both operate groundwater replenishment programs whereby groundwater pumpers

(other than minimal pumpers) pay a per acre-foot charge that is used to pay the cost of importing and recharging the aquifer.

Status of the Aquifer

The groundwater supply of the Whitewater River Subbasin consists of a combination of natural runoff, inflows from adjacent basins, returns from groundwater, recycled water and imported water use. The supply is supplemented with artificial recharge with imported SWP Exchange and Colorado River Water. The long-term average of natural inflow from mountain-front runoff is about 46,000 afy. Runoff varies from about 8,000 afy in very dry years to over 200,000 afy in extremely wet years. For the 10 year period of 2000 through 2009, natural inflow from mountain-front runoff was below normal averaging about 29,000 afy. Subsurface inflow from adjacent groundwater basins averages about 11,000 afy and is relatively consistent from year to year. Returns from use vary with water demand. From 2000 to 2009 returns from use are estimated to average about 240,000 afy. During this same period, about 51,000 afy of imported water was recharged into the basin. Total inflows are estimated to be about 331,000 afy.[17]

Outflows from the basin consist of pumping, flows to the agricultural drainage system, evapotranspiration by native vegetation, and subsurface outflow to the Salton Sea. For the 2000 through 2009 period, groundwater pumping averaged about 389,000 afy. Drain flows are estimated to be about 48,000 afy while evapotranspiration and subsurface outflow averaged about 4,000 afy. Total basin outflows for this period averaged 441,000 afy. Average net outflow from storage for this period was 110,000 afy.

California DWR Bulletin 108 and Bulletin 118 are the most current bulletins published by the DWR that characterize the condition of the aquifer as a whole.[18,19] In 1964, Bulletin 108, DWR noted that the amount of usable supply in the overdrafted aquifer was decreasing. CVWD estimates the annual water balance in its Engineer's Reports on Water Supply and Replenishment Assessment. These reports estimated the annual change in storage for the Coachella Valley to be approximately 62,700 afy in 2013.

Over the last ten year period urban per capita water use has decreased as a result of ongoing conservation programs. In addition imported water supplies have increased. As a result, the 2014 CVWMP Status Report showed that overdraft has not occurred between 2003 and 2013, and with continued implementation of 2010 CVWMP Update Programs overdraft will be eliminated by 2021.

17 Coachella Valley Water District, *2010 Urban Water Management Plan,* (June 2011). Table 4-3.
18 California Department of Water Resources, Bulletin 108 (1964).
19 California Department of Water Resources, Bulletin 118 (2003).

The historical overdraft in the Coachella Valley has caused groundwater levels to decrease in portions of the Coachella Valley particularly in Mid-Valley region of Rancho Mirage, Palm Desert, and Indian Wells and raised concerns about water quality degradation and land subsidence. Groundwater overdraft is manifested not only as a prolonged decline in groundwater storage, but also through secondary adverse effects including decreased well yields, increased energy costs, water quality degradation and land subsidence. Groundwater levels in the West Valley from Palm Springs to La Quinta have also decreased historically. However, in the last ten years groundwater level increases have been seen in the Palm Springs area where artificial recharge has successfully raised water levels.

The effectiveness of the groundwater replenishment program has been demonstrated by rising water levels in Palm Springs area and by slowing water level declines in some wells of the upper portion of the Whitewater River Subbasin.[20]

Overdraft Mitigation Efforts

Coachella Valley Water Management Plan Update

In addition to the requirements for the 2010 UWMP, as previously mentioned, CVWD maintains water management policies within its 2010 CVWMP Update to comprehensively protect and augment the groundwater supply. As defined in the 2010 CVWMP Update, CVWD is reducing reliance on groundwater sources by utilizing more Colorado River water, SWP water and recycled water. Per this plan, CVWD also implements source substitution and conservation measures to reduce demands on the aquifer. The goal is to reduce the urban water demand by 20 percent by 2020 pursuant to SB7-7. The CVWD anticipates this water use reduction level will be permanent.

CVWD Landscape Ordinance

CVWD Landscape Ordinance 1302.1 requires a series of reduction methods, including requirements that new developments install weather-based irrigation controllers that automatically adjust water allocation.[21] Additional requirements include setbacks of spray emitters from impervious surfaces, as well as use of porous rock and gravel buffers between grass and curbs to eliminate runoff onto streets. With the exception of turf, all landscaping, including groundcover and shrubbery, must be irrigated with a drip system. In addition, the maximum water allowance for landscaped areas throughout the CVWD

20 Coachella Valley Water District, *2014 Status Report for the 2010 Coachella Valley Water Management Plan Update*, 2014.
21 Coachella Valley Water District, *Landscape and Irrigation System Design Criteria,* November, 2009.

service area has been reduced.[22] This new reduction goal requires that developers maximize the use of native and other drought-tolerant landscape materials, and to minimize use of more water-intensive landscape features, including turf and fountains.

Source Substitution

Source substitution is the delivery of an alternate source of water to users currently pumping groundwater. The substitution of an alternate water source reduces groundwater extraction and allows the groundwater to remain in storage, thus reducing overdraft. Alternative sources of water include municipal recycled water from Water Reclamation Plant (WRP)-7, WRP-9, WRP-10, and the City of Palm Springs Wastewater Treatment Plant; Colorado River water, desalinated agricultural drain water, grey water, and re-use of water used in aquaculture.

Source substitution projects include:

- Conversion of existing and future golf courses in the East Valley from groundwater to Colorado River Water
- Conversion of existing and future golf courses in the West Valley from groundwater to recycled water and/or Colorado River water via SWP Exchange Water
- Conversion of existing and future golf courses in the East Valley from groundwater to Colorado River Water via the Mid-Valley Pipeline
- Conversion of agricultural irrigation from groundwater to Colorado River water, in both the Oasis area and Mecca area
- Conversion of some municipal use from groundwater to treated Colorado River Water

Examples of effective alternative source substitution efforts include the following:

- CVWD has a non-potable water system that delivers treated recycled water from three water reclamation plants, blends it with canal water and delivers it to golf courses, schools, and open spaces for irrigation. Approximately 8,750 acre feet of recycled water was delivered in 2013.
- CVWD has completed construction of a 54-inch diameter pipeline to deliver Colorado River water to the Mid-Valley area for use with CVWD's recycled water for golf course and open space irrigation. A total of 45 golf courses within CVWD’s service area now use either recycled or canal water or a combination of both. This reduces the pumping from the groundwater basin for these uses.

22 For design purposes, the upper limit of annual applied water for the established landscape area as identified in Division 2, Title 23, California Code of Regulations, Chapter 7, Section 702. It is based on an area's calculated evapotranspiration rate. The estimated applied water for landscaping shall not exceed the maximum applied water allowance.

- CVWD has secured rights to the Colorado River and participated in the construction of the All-American Canal and the Coachella Canal. Beginning in the late 1940's, CVWD worked with the U.S. Bureau of Reclamation (USBR) and constructed a distribution system to deliver Colorado River water to the farms in the Lower Coachella Valley. This system delivered 245,894 acre-feet of Colorado River water in 2006, and increased deliveries to approximately 331,000 acre-feet in 2013.
- CVWD recharges the Coachella Valley groundwater basin with Colorado River water at three locations. The largest recharge program is operated at the Whitewater River Recharge Facility. The Thomas E. Levy Groundwater Replenishment Facility recharges up to 40,000 afy in the East Valley.
- CVWD has secured rights to SWP water and negotiated exchange and advanced delivery agreements with the MWD to exchange CVWD's SWP water for MWD's Colorado River water source. The SWP exchange water is used to recharge the aquifer in the West Coachella Valley. This recharge program was started in 1972 and has replenished the aquifer with almost three million acre-feet of water. CVWD plans to utilize treated agricultural drainage water for irrigation purposes. A desalination pilot study was completed in 2007.
- CVWD has worked with an aquaculture farm and developed water efficiency programs that include water treatment and reuse.
- CVWD intends to implement expansion of the Oasis area irrigation system. This project will reduce groundwater pumping by extending Colorado River water delivery to the Oasis Slope. The Oasis system would deliver Canal and desalinated drain water to serve urban non-potable water uses such as irrigation.

Conservation Programs

CVWD continues to work with the cities in its service area to limit the amount of water that can be used for outdoor landscaping, and maintains an ongoing turf rebate program to encourage homeowners to replace turf areas with desert friendly landscaping. As the result of the adoption of statewide indoor water conservation measures requiring low flush toilets, shower and faucet flow restrictors and other devices, the amount of water used inside homes has been significantly reduced. In addition, in 2010 CVWD adopted water budget-based tiered rates to discourage excessive water us, and implemented a 20 by 2020 urban water use reduction target. CVWD is also working with the golf course industry to reduce their water use. In 2014 CVWD began a partnership with the Southern California Golf Association and formed the Golf and Water Task Force to reduce overall golf course water use by 10 percent. Key activities being implemented are the establishment of water budgets to limit golf course groundwater pumping and a region wide golf course turf reduction program. With the large number of new communities constructed, these conservation programs have reduced impacts of new development on the Aquifer.

The Section 24 Specific Plan would be required to implement the CVWD conservation measures in order to assure the most efficient use of water resources and to meet and maintain the CVWMP goals throughout the life of the project. In addition, the Project will strictly adhere to CVWD's landscape ordinance and the Tribe's landscape ordinance, which mirrors CVWD's landscape ordinance.

Historical Groundwater Use

The CVWD's annual Engineer's Report on Water Supply and Replenishment Assessment for each of the groundwater basins reviews the historical use of groundwater in the Coachella Valley. In 1936, groundwater use was 92,400 afy and increased continually to about 376,000 afy in 1999. The groundwater use in 2009 dropped to about 359,000afy due to a combination of water conservation efforts, source substitution projects and the effects of the ongoing economic recession. In 2013, as a continued result of conservation and source substitution programs total groundwater use dropped even further to approximately 301,000 afy. This more than a 20 percent reduction in reported Coachella Valley groundwater pumping since 2007.

Groundwater Sufficiency Analysis

The 2010 UWMP reported CVWD's 2010 urban water demand at 109,488 afy. CVWD's projected urban water demand in the 2010 UWMP for the year 2035 is 242,700 afy. When adding groundwater recharge and non-potable water demands (agriculture, golf course and municipal), these CVWD UWMP demand estimates are 588,700 afy in 2010 and 689,400 afy in 2035.

The proposed Project would begin construction in 2016. Total water demand of the Project is estimated to be 1780 afy, which represents approximately 1.6 percent of CVWD's 2010 UWMP urban demand and approximately 0.3 percent of CVWD's total potable and non-potable 2010 demand. With a total of 577 acres, buildout of the proposed Project would result in a total demand of 3.08 afy/acre. The remaining development of the higher-density mix of retail, entertainment, office, hotel and residential land uses will begin construction at a later date following the completion of the Active Adult Community component and occur over a longer period of time.

With almost 30 million acre-feet of combined storage and the groundwater management planning in the 2010 UWMP and 2010 CVWMP Update, the aquifer is sufficient to supply the Project and other present and anticipated needs for normal year, as well as single dry and multiple dry years, over the next 20 years.

3.3.3 Additional Water Sources

Groundwater provides the main water supply for the Project. This WSA/WSV focuses on the adequacy of these sources and other alternative water sources to supply sufficient amounts of water to meet the

water demands of this Project. Additional water sources are considered as a supplement to groundwater in that they are used to recharge the aquifer, serve as a source substitution for groundwater, or are used for irrigation in other locations in the subbasin.

If it becomes available to the Project Site, the proposed Project will utilize recycled water on site to supplement non-potable water demands. Additionally, the project may also use drainage water (storm water) contained on site for landscape irrigation and to recharge the groundwater basin.

Colorado River Water

The Coachella Canal is a branch of the All-American Canal, which brings Colorado River water into the Imperial and Coachella valleys. Under the 1931 California Seven Party Agreement, CVWD has water rights to Colorado River water as part of the first 3.85 million acre-feet allocated to California. CVWD is in the third priority position along with the Imperial Irrigation District. This priority is ahead of the 550,000 acre-feet allocation to the MWD, which has the lowest priority of the California Seven Party.

California's Colorado River supply is protected by the 1968 Colorado River Basin Project Act, which provides that certain Colorado River supplies to Arizona and Nevada after 1968 shall be reduced to zero before California will be reduced below 4.4 million acre-feet in any year. It is estimated that this reduction is about 1.5 million acre-feet. This reduction together with the reduction by California agencies with lower priorities than CVWD results in reduction in excess of 2 million acre-feet in Colorado River water available to the Lower Basin States before the Colorado River supply available to CVWD are impacted. This assumes that the California agricultural agencies with rights to Colorado River water are using less than 3.85 million acre-feet.

Historically, CVWD has received approximately 330,000 afy of Priority 3a Colorado River water. **Table 3.0-3, Annual CVWD Colorado River Diversions at Imperial Dam – 1964 to 2013 (after Measured Returns),** contains the diversions of Colorado River water after measured returns at Imperial Dam to CVWD for the period 1964-2013. The 2003 QSA, among some of the California Colorado River contractors, resulted in a firm contractual obligation for the supply to CVWD. A number of lawsuits have unsuccessfully challenged the QSA agreements and transfers in state and federal courts.

Table 3.0-3
Annual CVWD Colorado River Diversions at Imperial Dam – 1964 to 2013
(after measured Returns)

Year	Diversion Volume (acre-feet)	Year	Diversion Volume (acre-feet)
1964	526,417	1989	359,419

Source: Records of releases of water through regulatory structures in accordance with Article V(A) of the Decree of the Supreme Court of the United States in Arizona v. California dated March 9, 1964.

The 2003 QSA was entered into and between CVWD, Imperial Irrigation District (IID) and the San Diego County Water Authority (SDCWA). The QSA quantifies distribution allotments of Colorado River water rights in California, including CVWD's Colorado River Rights, for the next 75 years. The agreements provide for additional transfer of Colorado River allocations to CVWD from the IID and MWD. Under the QSA, CVWD will receive up to 459,000 afy of Colorado River water as shown in **Table 3.0-4, Colorado River Deliveries to CVWD under the Quantification Settlement Agreement (QSA).**

Table 3.0-4
Colorado River Deliveries to CVWD under the QSA

Component	2010 Amount (afy)	2045 Amount (afy)
Base Entitlement	330,000	330,000
1998 MWD/IID Approval Agreement	20,000	20,000
Coachella Canal Lining (to SDCWA)	-26,000	-26,000
To Miscellaneous/Indian PPR's	-3,000	-3,000

Total Deliveries to CVWD	**337,000**	**428,000**

Source: Coachella Valley Water District, Coachella Valley Water Management Plan 2010 Update *(January, 2012).Table ES-1.*
afy = acre-feet per year

Water from the Coachella Canal provides a significant supply source for the East Valley. In 1999, the Coachella Canal supplied over 60 percent of the water used in the East Valley, but provided less than 1 percent of the water supply to the West Valley. Most of the canal water was used for crop irrigation in the East Valley.

In 1995, CVWD began operating the Dike No. 4 pilot recharge facility in La Quinta. This facility has successfully demonstrated the adequacy of this site to recharge the aquifer. This facility was expanded in 1998. This site, the Levy Facility at the Dike 4 site was expanded in 2009 and put into full operation.

Future development and associated increases in water demand, as well as quality concerns, are expected to increase use of Colorado River water for domestic purposes. Determining the best way to treat this water in order to substitute for and decrease the area's dependency on groundwater is an important objective of the 2010 CVWMP Update and the 2010 UWMP. 2010 CVWMP Update calls for

the treatment and distribution of as much as 62,000 acre-feet of Colorado River water for domestic use annually.

State Water Project Water

CVWD and DWA are SWP contractors for the Whitewater River basin aquifer. The SWP includes 660 miles of aqueduct and conveyance facilities extending from Lake Oroville in the north to Lake Perris in the south. The SWP has contracts to deliver 4.1 million afy to 29 contracting agencies. CVWD's original SWP water right (Table A Amount) was 23,100 afy and DWA's original SWP Table A Amount was 38,100 afy—for a combined Table A Amount of 61,200 afy. In 2004, CVWD purchased an additional 9,900 afy of SWP water from the Tulare Lake Basin Water Storage District, which brought CVWD's SWP allotment to 33,000 afy.

In addition, CVWD and DWA have also negotiated an exchange agreement with MWD for 100,000 afy of SWP Table A Amount. MWD has permanently transferred 88,100 afy and 11,900 afy of its SWP Table A Amounts to CVWD and DWA, respectively. This exchange agreement increases the total SWP Table A Amount for CVWD and DWA to 178,100 afy, with CVWD's portion equal to 126,350 afy. This agreement provides that CVWD and DWA generally receive this water from the SWP during wet years, which allows the two agencies to recharge the groundwater basin and operate a conjunctive use program, storing water in wet years and pumping the groundwater basin in dry years.

In 2007, CVWD and DWA made a second purchase of SWP water from the Tulare Lake Basin Water Storage District. CVWD purchased 5,250 afy and DWA purchased 1,750 afy. In 2007, CVWD and DWA completed the transfer of 12,000 afy and 4,000 afy, respectively, from the Berrenda Mesa Water District for a total Table A amount of 16,000 afy. Therefore, the total SWP Table A Amount for CVWD and DWA is 194,100 afy, with CVWD's portion equal to 138,350 afy. **Table 3.0-5, State Water Project Water Sources**, summarizes CVWD and DWA total allocations of Table A SWP water to be delivered when available.

Table 3.0-5
State Water Project Water Sources (afy)

	Original SWP Table A	Tulare Lake Basin 2004 Transfer	Metropolitan 2003 Transfer	Tulare Lake Basin 2007 Transfer	Berrenda Mesa 2007 Transfer	Total
CVWD	23,100	9,900	88,100	5,250	12,000	138,350
DWA	38,100	--	11,900	1,750	4,000	55,750
Total	61,200	9,900	100,000	7,000	160,000	194,100

Source: Coachella Valley Water District, Coachella Valley Water Management Plan 2010 Update *(January, 2012).Table 4-4.*

SWP contractors make annual requests to the DWR for water allocations and DWR makes an initial SWP Table A allocation for planning purposes, typically in the last month before the next water delivery year. Throughout the year, as additional information regarding water availability becomes available to DWR, its allocation/delivery estimates are updated. **Table 3.0-6, Department of Water Resources Table A Water Allocations,** outlines the historic reliability of SWP deliveries, including their initial and final allocations since 1988. The 2014 initial allocation of SWP water for CVWD is 6,918 acre-feet and DWA is 2,778 acre-feet, for a combined total of 9,696 acre-feet or 5 percent of the requested total.[23]

2014	5%	5%
Average	44%	75%

Source: California Department of Water Resources, Notice to State Water Project Contractors (2014).

As noted previously, CVWD and DWA do not directly receive SWP water. Rather, CVWD and DWA have entered into an exchange agreement with MWD that allows MWD to take delivery of CVWD and DWA SWP Table A water. In exchange, MWD provides an equal amount of Colorado River water that MWD transports through its Colorado River Aqueduct, which crosses the Coachella Valley near Whitewater. The exchange agreement allows for advanced delivery and storage of water, thereby providing better and more efficient water management. Water is recharged when SWP and exchange waters are available. The large storage capacity of the Coachella Valley aquifer and the large volume of water in storage allow CVWD and DWA to pump from the aquifer for a number of years without recharging and to recharge large amounts of water to refill the aquifer when the water is available.

Factors Potentially Impacting SWP Delivery Reliability

DWR issues the State Water Project Delivery Reliability Report every two years, with the 2013 draft report currently available for public review. This updated report accounts for impacts to water delivery reliability associated with climate change and recent federal litigation (see **Appendix A**). Based on information in the Draft 2013 State Water Project Delivery Reliability Report, the average long term reliability of future SWP Table A deliveries through 2029 is projected to be 62 percent.[24]

This allocation percentage is based on computer modeling of the state's watersheds, and past hydrology adjusted for factors that affect reliability. In considering future water supply needs in the 2010 CVWMP Update, CVWD considered an even lower SWP delivery reliability to allow for the uncertainty of future court decisions, Water Resources Control Board actions, ESA and other restrictions, modeling error, levee failure and relaxation in the biological opinions (BO) as the result of better science.

24 California Department of Water Resources, Bay-Delta Office, Draft *State Water Project Delivery Reliability Report 2013.*

There are three significant factors contributing to uncertainty in the delivery reliability of the SWP: 1) possible effect from climate change and sea level rise; 2) the vulnerability of the Delta levees to failure, and 3) greater operation restrictions imposed by the United States Fish and Wildlife Service (USFWS) and National Marine Fisheries (NMFS) in response to decreasing population of endangered fish species. Each of these uncertainties is discussed in **Appendix A**.

CVWD considers purchases of additional Table A Amounts from SWP contractors as they become available.

Surface Water

Surface water supplies come from several local rivers and streams, including the Whitewater River, Snow Creek, Falls Creek, and Chino Creek, as well as a number of smaller creeks and washes. In 1999, surface water supplied approximately three percent of the total water supply to the West Coachella Valley to meet municipal demand, and none to the East Coachella Valley. Because surface water supplies are affected by variations in annual precipitation, the annual supply is highly variable. Since 1936, the estimated historical surface water supply has ranged from approximately 4,000 to 9,000 afy.

Recycled Water

Wastewater that has been highly treated and disinfected can be reused for landscape irrigation and other purposes; however, treated wastewater is not suitable for direct potable use. Recycled wastewater has historically been used for irrigation of golf courses and municipal landscaping in the Coachella Valley since the early 1960s. In addition, fish farm effluent is available in certain localized areas of the East Valley and is being recycled for reuse. Although recycled water is not planned for use in the project vicinity, the project will utilize recycled water if it becomes available in the future.

Desalinated Drain Water

The 2010 CVWMP Update identifies desalinated agricultural drain water as a future additional local water supply available for use in the Upper and Lower Whitewater River subbasins. CVWD plans to use treated agricultural drainage water for irrigation purposes. It is planned that agricultural drain water from the CVWD will be desalted to a quality equivalent to Canal water for irrigation use with an initial rate of 4,000 afy in 2013, increasing to 11,000 afy capacity by 2023. The amount of drain water that would be treated and recycled depends on supply availability (the amount of drain flow occurring), the overall supply mix (the amount of additional water needed), and the cost of treatment and brine disposal. According to the 2010 CVWMP Update the amount of water recovered through drain water desalination will range from 55,000 afy to 85,000 afy by 2045.

Treated drain water could be delivered to the Canal water distribution system and used as a non-potable supply for agricultural, golf course and landscape irrigation and potentially for potable water supply. Since the desalinated drain water is local water, it could be used anywhere within the CVWD service area.

A brackish groundwater treatment pilot study and feasibility study was completed in 2008 (Malcolm-Pirnie, 2008a and 2008b). The 2008 study recommended a combined source water strategy involving wells and direct connection to the open drain outfalls. Such a combined approach will provide additional flexibility and reliability to this new water supply. This study concluded that agricultural drainage water can be treated for reuse as non-potable water and potentially as new potable water.

Permanent Water Purchases

CVWD purchases Table A Amounts from SWP contractors as they have become available and meet CVWD's needs. Additional purchases from the SWP and from others with water rights, mainly in the Central Valley of California, will be evaluated as they become available to determine whether they meet CVWD's needs. If they do, CVWD may purchase additional SWP water rights.

Summary of Primary and Additional Water Sources

Table 3.0-7, Existing CVWD Water Supply Table A Amounts Water Rights and Water Service Contracts, shows CVWD's existing water supply entitlements, rights and service contracts.

The 2010 UWMP projects that the percentage of water from each of the current water supply sources will change significantly by 2035, relative to 2010 conditions.

To provide an estimate of the proposed Project's contribution to CVWD water demand, the proposed Project is assumed to build out in a 20-year span between 2017 and 2036[25] with an average annual increase in demand of 254.4 afy for the Active Adult Community, and 137.6 afy for the Tribal Planning Areas.

25 The proposed Project anticipates the first residential units occupied in 2017. To meet the requirements of SB610, this WSA uses a 20-year buildout period. However, it should be noted that the actual project development schedule is for a 6-year period for the Active Adult Community, and for an unspecified period following the construction of the Active Adult Community to complete development of the retail, entertainment, and hotel uses on the Tribal Planning Areas. The 20-year scenario is used to illustrate total project demand within the required 20-year WSA time frame established by SB610. As the actual development will occur over a longer period of time, the 20-year demand forecast is considered conservative.

Table 3.0-7
Existing CVWD Water Supply Table A Amounts
Water Rights and Water Service Contracts

Supply	Existing Supplies (afy)	Entitlement	Right	Contract	Other	Ever Utilized?
Groundwater	Unspecified[1]				X	Yes
Coachella Canal	459,000[2]			X		Yes
SWP Exchange Water[3]	138,350[4]	X	Yes			
Recycled Water	14,000				X	Yes

1 CVWD shares a common groundwater source that has not been adjudicated
2 As quantified in the Quantification Settlement Agreement between IID, MWD, and DVWD, October, 2003.
3 Imported SWP Exchange Water is not used as a direct water supply source, but rather is used to recharge groundwater supplies in the Coachella Valley.
4 Includes Original Table A Amount, Tulare Agreement, Berrenda Mesa Agreement and MWD Agreement.
afy = acre-feet per year

As shown in **Table 3.0-8, Current and Projected Average Urban Water Supply (afy),** the 2010 UWMP projects that the percentage of water from each of the current water supply sources will change significantly by 2035, relative to 2010 conditions.

Table 3.0-8
Current and Projected Average Urban Water Supply (afy)

Water Supply Source	2010	2015	2020	2025	2030	2035
Supplier-Produced Groundwater	109,488	118,700	125,600	129,900	133,500	128,700
Treated Colorado River Water	0	5,700	19,300	31,400	39,500	49,100
Untreated Colorado River Water	0	1,300	11,100	26,300	39,000	54,800

3.4 ANALYSIS OF WATER SUPPLY AND DEMAND

The analysis of supplies and water demands for the Section 24 Specific Plan WSA/WSV is based on the 2010 UWMP and the 2010 CVWMP Update. The 2010 UWMP was prepared in accordance with the

Urban Water Management Planning Act as most recently amended by SBx7-7 which required a state-wide 20 percent reduction in per capita water use by the year 2020. The purpose of the 2010 UWMP is to document CVWD's projected water demands and its plans for delivering water supplies to CVWD's service area through 2035. In accordance with SBx7-7, CVWD's 2010 UWMP sets interim and final urban water use targets for complying with California's 2020 conservation program based on DWRs defined Target Method No. 1 which provides for an agency goal of 80 percent of baseline demands. The 2010 UWMP relies on and summarizes the water supplies and water supply programs detailed in the 2010 CVWMP Update.

The 2010 CVWMP Update is a 35 year plan to reliably meet current and future water demands in a cost effective and sustainable manner. The planning areas for the 2010 CVWMP Update are the Whitewater River Subbasin including Salton City and areas north of the Banning Fault that are within the service areas in Indio and Coachella. The 2010 CVWMP Update evaluates all of the water demand and supplies in the planning area through 2045, for all water users including urban, agricultural and golf and provides a preferred alternative water supply plan for meeting demands. The 2010 CVWMP Update evaluates long-term risks to water supplies such as reduced SWP reliability and reduced Colorado River supplies and provides contingencies for addressing these risks. The elements of the preferred alternative are imported water supplies, recharge, source substitution and conservation. The preferred alternative identifies projects and programs that implement these plan elements.

Both the 2010 UWMP and the 2010 CVWMP Update rely on the Riverside County Population Projections 2006 (RCP-06). In 2005, Riverside County was experiencing rapid growth. Recognizing the need for more accurate growth forecasts the Riverside County Center for Demographic Research (RCCDR) was established under the joint efforts of the County of Riverside, the Western Riverside Council Governments, the Coachella Valley Association of Governments, and the University of California Riverside for the development of demographic data and related support products to serve all of Riverside County. The RCCDR was tasked with developing the RCP-2006 growth forecast to provide agencies with a consistent and standard set of population, housing, and employment forecasts. The RCP-06 was adopted by Southern California Association of Governments for use in their regional growth forecasts.

Although the growth forecast indicated significant future growth for the Coachella Valley, these forecasts were based on potential development that had not yet been approved by the cities and county within the Coachella Valley. Prior to 2008, there was substantial development pressure to transition from agricultural to urban land uses. As agricultural land converts to urban uses, the characteristic of its water demands and infrastructure will change. The 2010 CVWMP Update reflects these changes in its water demand projections and the ways that water is used in this area. As urban development occurs,

land that currently is irrigated with untreated Coachella Canal water could begin using groundwater replenished with the canal water, or use treated canal water for indoor use and untreated canal water for outdoor use.

Tribal land in the Coachella Valley makes up over 49,000 acres. While much tribal land in the West Coachella Valley has been developed to varying degrees, a substantial amount of tribal land in the East Coachella Valley is undeveloped. An understanding of the timing and degree of development on tribal lands is important. All of the Coachella Valley tribes have developed one or more casinos, which have provided them important economic opportunities. As development continues in the Coachella Valley, it is expected that additional growth will occur on the remaining tribal lands.

In other portions of the Coachella Valley, development of tribal land is closely coordinated with the Coachella Valley cities where they are located. RCP-2006 and RCP-2010 growth forecasts are assumed to include development of these lands.

Riverside County has been hit particularly hard by the past economic downturn. The County has some of the highest rates of foreclosures and unemployment in the country. Due to this economic downturn, growth in the County has significantly decreased over the last two to three years. The Riverside County Planning growth forecasts were developed and adopted in late 2006 and early 2007, before the onset of the widespread recession. Therefore, the slowdown in the housing market, which was one of the primary components of the recession, was not accounted for in the forecasts.

Some economists and real estate professionals who have been studying the effects of the recession on the County predict that economic recovery rate in the County will be slow. This would result in a lower than projected growth rate for the Coachella Valley. The timing and extent of this reduced growth rate cannot be accurately predicted. Because the planning period for the 2010 CVWMP Update is through 2045, it is expected that the effect of the recession on growth in the Coachella Valley will attenuate over the long term.

In CVWD's 2014 CVWMP Status Report the RCP 2010 population projections were considered and future water demands were re-evaluated. Using RCP 2010 results in an estimated 22 percent lower urban water demand in 2035 and a 13 percent higher agricultural water demand. Overall demand would be about 14 percent lower in 2035. It is important to note that this is not an elimination of demand but a deferral of demand to later years. Growth will continue but at a slightly slower rate.

Water conservation is a major component of future water management. CVWD is committed to reducing its urban water use to 20 percent by 2020. In the 2010 UWMP, CVWD's baseline water use was derived by calculating the highest ten-year average per-capita water use. Per-capita water use for any

given year is defined as gross water production divided by the 2000 US Census based population. Using this method the highest average baseline water use was calculated to be 591 gpcd. CVWD's 2020 target is 80 percent of this average, 473 gpcd, which indicates that CVWD has already met 90 percent of its 2020 target.

The golf industry represents a significant water demand sector in the Coachella Valley and is expected to remain so in the future. Estimates developed for the 2010 CVWMP Update indicate that up to 75 new golf courses could potentially be constructed within the Whitewater River Subbasin boundary area by 2045. Since most of the future growth is anticipated to occur in the East Coachella Valley, this estimate is based on a ratio of the total number of existing golf courses in the East Coachella Valley to the East Coachella Valley population. This ratio is then applied to future population growth in the Coachella Valley. This method assumes that the existing pattern of development (golf course acres per acre of urban development) within the Coachella Valley will continue into the future.

The 2010 CVWMP Update assumes that the fish farm and duck club growth will be much lower than projected in the 2002 CVWMP. Some of the large fish farms have moved from the traditional fish farming business. The replacement use at these farms is suspected to significantly reduce the water demand. Based on the available information at this time, further fish farm demand of 8,500 afy and duck club demand of 2,000 afy is assumed.

It is assumed that the growth that occurs on tribal land will be similar to the Coachella Valley as a whole and land uses will be proportional to the growth that occurs on non-tribal land in the East Coachella Valley. Corresponding water demands are calculated based on this growth assumption.

The 2010 CVWMP Update increases the water conservation requirement during the next 35 years. A 14 percent reduction in agricultural water use is targeted by 2020. Urban water use is targeted for a 20 percent reduction by 2020. CVWD's Landscape Ordinance will govern the irrigation demands of new golf courses as well as reduce the demands of existing golf courses by 10 percent.

2010 CVWMP Update water demand projections for the Whitewater Subbasin increase from 678,600 afy in 2010 to 783,300 afy in 2030, or 15 percent. During this same period, the population in the Coachella Valley is estimated to increase by almost 100 percent, or about four percent per year, according to CVWD's 2010 UWMP. In the 2014 Status report RCP 2010 projections were used and this water demand was revised to 691,500 in 2030, a 12 percent reduction.

Groundwater and Groundwater Storage

As supply and demand changes, the amount of groundwater in storage changes to make up the difference between the demand and the supply. Other than Canal water, recycled wastewater and

desalinated agricultural drain water, all water delivered to the end users is obtained from the groundwater basin. The groundwater basin has the capacity of approximately 28.8 million acre feet. It currently contains about 25 million acre feet and acts as a very large reservoir. It is capable of meeting the water demands of the Coachella Valley for extended periods.

As discussed in the 2010 CVWMP Update, CVWD has many programs to maximize the water resources available to it including recharge of its Colorado River and SWP supplies, recycled wastewater, desalinated agricultural drain water, conversion of groundwater uses to Canal water and conservation including tiered water rates, a landscaping ordinance, outreach and education. The 2010 CVWMP Update and CVWD replenishment assessment programs establish a comprehensive and managed effort to eliminate the overdraft. These programs allow CVWD to maintain the groundwater basin as its primary water supply and to recharge the groundwater basin, as its other supplies are available.

Coachella Canal Water

Colorado River supplies available to CVWD under the 1931 Seven Party Water Priority 43 Agreement and other agreements and savings are considered in the 2010 UWMP and 2010 CVWMP Update. The annual CVWD Colorado Diversions at Imperial Dam for the period 1964 to 2008 were prepared as required by the U.S. Supreme Court decree. CVWD average annual diversion for said 45 years was 475,662 afy. CVWD average annual diversion for the period 1983 to 2008 (last 26 years of decree records) was 330,286 afy. The difference of 145,375 afy is the result of the water conserved by the lining of the first 49 miles of the Coachella Canal by the USBR under repayment contract with CVWD. The Section 24 Specific Plan is not geographically located to enable it to rely on canal water for outdoor use.

Additional Table A Amounts

DWA and CVWD have increased their SWP supplies from a total of 61,000 afy in 2002 to 194,100 afy currently.

State Water Project Reliability

SWP reliability projections are the result of computer modeling by DWR and reflect the results of adjusting 82 years of hydrology to incorporate the results of climate change models. SWP reliability projections also take into account the existing physical facilities and the regulatory restrictions, including the restriction on the SWP and Central Valley Project (CVP) operations in accordance with the biological opinions of the USFS and NMFS issued on December 15, 2008 and June 4, 2009 respectively. Modeled SWP deliveries were divided by the Table A amount requests for each year (maximum Table A amount of 4.132 million acre feet) to obtain the reliability percentage for each year. This data was then ranked and the long term average demand for 2009 and 2029 was determined. The 2013 percentage values

determined using this method results in a long term delivery reliability of 62 percent for both wet year and dry year models.

This reliability was adjusted to allow for the uncertainty of future court decisions, Water Resources Control Board actions, ESA and other restrictions, modeling error, levee failure and relaxation in the biological opinions as the result of better science. Linear proration was used to obtain the reliability for years 2010 to 2030.

The 2010 CVWMP uses an even more conservative long term reliability of 50 percent to compensate for the additional uncertainty of a 35-year planning period.

Metropolitan Water District Callback

In 1984, MWD and CVWD entered into an advanced delivery agreement, which allowed MWD to store water from its Colorado River Aqueduct in the Coachella Valley. Prior to this agreement, DWA and CVWD were exchanging their annual SWP Table A amount with MWD for the same amount of water from MWD's Colorado River Aqueduct. This was done because the SWP does not extend into the Coachella Valley. This 1984 agreement allows MWD to deliver more water into the Coachella Valley during wet periods or periods when it has excess water and to build a credit that it can use to provide the water to exchange for DWA and CVWD's Table A amounts during dry periods. This creates a conjunctive use program among the three agencies.

In 2003, MWD, DWA and CVWD entered into an exchange agreement whereby MWD transferred title to 100,000 acre-feet of its SWP Maximum Table A amount to DWA and CVWD. Under the agreement, MWD obtained the right to callback the SWP water for its use for a maximum number of times in a given period of years. The 100,000 acre-feet was divided into two 50,000 acre-foot blocks. The 2010 UWMP assumes that MWD will exercise its option to callback the 100,000 afy in four wet years out of every 10 years. This is also in accordance with the 2010 CVWMP Update. The actual callback would depend on availability of MWD's supplies to meet their demands. Since 2003, MWD exercised its callback option once in 2005.

Data from DWR’s State Water Project Reliability Report 2009 was used to determine the average water deliveries in the 50 percent driest years and the 75 percent driest years. Linear proration was used to obtain the yearly values for years 2010 through 2029. This data was used to obtain the MWD callback water for the first and second 50,000 acre-feet, and they were summed to obtain the total MWD callback for each year. The reliability percentage and the DWA and CVWD Maximum Table A amount without the MWD 100,000 acre feet transfer were used to obtain the amount of SWP water deliveries for DWA and CVWD after the total MWD callback was deducted. These values were multiplied by the

share that CVWD obtained for its use based on the ratios from the 2005 UWMP. The ratios were linearly prorated to obtain the values for each year.

Long Term Average SWP Deliveries

The amount of SWP supply that is available to CVWD for its own use was considered as the long-term average SWP supply.

The published reliability of the SWP water has decreased over time. The 2005 SWP Delivery Reliability Report (DRR) estimated a reliability of 77 percent in 2025; the 2007 DRR estimates a reliability of 66 to 69 percent in 2027, and the 2011 draft DRR estimates a reliability of 58 percent in 2029. There are additional uncertainties related to SWP reliability in the future, which further reduce the reliability factor. The factors that could affect the SWP reliability considered in the 2010 UWMP and the 2010 CVWMP update are:

- Uncertainty in modeling restrictions associated with biological opinions,
- Risk of levee failure in the Delta,
- Additional pumping restrictions resulting from biological opinions on new species or revisions to existing biological opinions,
- Impacts associated with litigation such as the California ESA lawsuit, and
- Climate Change impacts.

Because of these factors and the need to plan for higher contingency, the planning assumption in the 2010 CVWMP Update and the 2010 UWMP is that the long-term future average SWP reliability is 50 percent until successful completion of the Bay-Delta conservation Plan and delta conveyance facilities.

Groundwater basin recharge through direct and in-lieu recharge is a major element of CVWD's water management activities. CVWD has spent over $43.5 million on the construction of the Thomas E. Levy Replenishment Facility in the Lower Valley and over $42 million on the construction of the Mid-Valley Pipeline to move Canal water into the Upper Valley for source substitution for groundwater. The protection of the aquifer storage will be addressed through additional water supply purchases, water conservation, and source substitution similar to the ones described in the 2010 CVWMP Update.

The available supplies and water demands for CVWD's service area were analyzed in the water supply conditions of the 2010 UWMP to assess the region's ability to satisfy demands for current and future demands, including the Section 24 Specific Plan, under three scenarios: a normal water year, a single dry year, and multiple dry years. According to the CVWD 2010 UWMP, the urban water demands of the CVWD are estimated to grow from 109,488 afy in 2010 to 242,800 afy in 2035. The estimated Project

demands of 1,780 afy represent approximately 1.6 percent of the 2010 demand, 0.7 percent of the 2035 demand, and 1.3 percent of the growth.

Tables 3.0-9, 3.0-10, and **3.0-11** outline the water supply and demand scenarios for normal, single-dry, and multiple-dry years respectively.

Multiple Dry Year Period Supply and Demand

Since groundwater production is driven by demand, the 2010 UWMP report assumes supplies are equal to demand. This is a result of the large amount of water stored in the underground aquifer as described in **Section 3.3.2 Description of the Aquifer**. However, with implementation of the 2010 UWMP and 2010 CVWMP Update programs described in detail in this WSA, long-term groundwater overdraft will be eliminated, and this supply is considered reliable in single dry and multiple dry water years.

Summary

Table 3.0-12, Project Supply and Demand Comparison, shows the proposed Project water demand as a percent of total supply throughout various milestones in the build-out schedule. By 2020, the Project is estimated to demand 356 afy of water. This amount translates to 147 gpcd, or 0.3 afy per residential dwelling unit, which is within the CVWD 20 by 2020 per capita target of 473 gpcd water use. Projected water demand associated with the Project represents 0.71 percent of CVWD's total projected urban water demand at full buildout in 2035. By 2036, the Project's total urban water use would be 277 gpcd, or 0.74 afy per residential dwelling unit.

Table 3.0-12
Project Supply and Demand Comparison (afy)

	2020	2022[1]	2025	2035	2036[2]
Total Supply	156,100	168,059	187,700	242,700	249,329
Project Demand	356	534	801	1,691	1,780
Percent of Supply	0.23	0.32	0.43	0.70	0.71

*Source: Total supply extrapolated from data in **Table 3.0-11.** Project demand extrapolated from data **Table 2.0-4,** based on a 20 year build-out.*
[1] *2022 is the final buildout year of the Active Adult Community with buildout of the Tribal Planning Area expected to begin in this same year.*
[2] *2036 is the final buildout year for the Tribal Planning Areas and completion of the Project.*

The 2010 CVWMP Update, projects total water demands for the Coachella Valley through 2035 and demonstrates that supplies are sufficient to meet demands without long term overdraft. The projected demand for the Project will account for only a small fraction of the projected demands.

3.5 CONCLUSIONS

Coachella Valley Water District Service Area

Based on the information, analysis, and findings documented in this WSA/WSV there is substantial evidence to support a determination that there will be sufficient water supplies to meet the current and future demands of the Project in addition to all forecasted demands in In the Whitewater subbasin the

next 20 years. This is based on the volume of water available in the aquifer, CVWD's Colorado River contract supply, SWP Table A Amounts, and water rights and water supply contracts. CVWD has committed sufficient resources to further implement the primary elements of the 2010 CVWMP Update and the 2010 UWMP, which include the purchase of additional water supplies, water conservation, and source substitution.

The domestic water supply (potable) for the Project will be the West Whitewater River Subbasin in the Coachella Valley. Groundwater storage will be used in dry years to make up the difference between supply and demand. The groundwater basin has a capacity of approximately 28.8 million acre-feet and currently contains about 25 million acre-feet and acts as a very large reservoir. It is capable of meeting the water demands of the Coachella Valley for extended normal and drought periods.

As discussed in the 2010 CVWMP Update, the 2010 UWMP, and this WSA/WSV, CVWD has many programs to eliminate overdraft and maximize the water resources including recharge of Colorado River and SWP supplies, recycled wastewater, desalinated agricultural drain water, conversion of groundwater uses to Canal water and water conservation including tiered water rates, landscaping ordinance, outreach and education.

Project Water Requirements

As shown in this WSA/WSV analysis, the projected demand for the proposed Project is 1,780 afy, or approximately 3.1 afy per acre which is within the average future water use per acre estimated in the 2010 CVWMP Update, and accounts for approximately 1.6 percent of the total projected growth in CVWD urban water demands presented in the 2010 UWMP for 2035. By 2036, the Project's water demand equates to 367 gpcd, or 0.74 afy per residential dwelling unit, and is within CVWD's 20 by 2020 urban water use target of 473 gpcd.

It is anticipated that the Project will incorporate the elements of CVWD's water conservation plan as required by SBx7-7. These include conservation elements for indoor and outdoor use for both multi-family residential and commercial developments. This may further reduce the ultimate project demands.

4.0 WATER SUPPLY VERIFICATION

4.1 GENERAL

The residential component of the Section 24 Specific Plan development Project will be subject to the requirements of Senate Bill 221 pursuant to the Subdivision Map Act since more than 500 residential dwelling units are proposed.

4.2 WATER SOURCE

Project domestic water supplies and associated landscape irrigation supplies will be provided from groundwater. The WSV addresses: (1) information included in CVWD's 2010 Coachella Valley Water Management Plan Update and the 2010 Urban Water Management Plan; (2) information related to groundwater recharge of non-groundwater sources, namely Colorado River water and SWP water; and (3) consideration of historical litigation regarding the Quantification Settlement Agreement.

4.3 SUPPORTING DOCUMENTATION

This WSA/WSV relies on CVWD's 2010 CVWMP Update, the 2014 CVWMP Status Report (see **Appendix D**), the Subsequent Program Environmental Impact Report (EIR) for the CVWMP Update (see **Appendix C** for the Executive Summary), and the Final Subsequent Program EIR for the CVWMP Update and are incorporated by reference. The 2010 UWMP contains specific details regarding the Water Shortage Contingency Plan which discusses phased water use restrictions and a drought rate structure to minimize water use during a multiple dry year period. Supporting information is also used from the 2010 UWMP, as permitted by Government Code Section 66473.7.

4.4 FACTORS OF RELIABILITY

4.4.1 General

Government Code Section 66473.7(a) requires that all of the following factors be considered: (1) the availability of the supply over 20 years, (2) the applicability of CVWD's urban water shortage contingency analysis found in the 2010 UWMP, (3) the reduction of water supply to a specific user by ordinance or resolution, and (4) the reasonable amount of groundwater supply that can be relied upon, considering natural sources as well as the supporting recharge sources within agreements for Colorado River water and SWP water.

4.4.2 Historical Availability of Supply

The Coachella Valley has been primarily dependent on groundwater as a source of domestic water supply for several decades. The 2010 CVWMP Update and the CVWD 2010 UWMP review the historical

use of water in the Coachella Valley. In 1936, groundwater use was 92,400 afy. Current use is at approximately 301,188 afy. Deliveries of Colorado River water and MWD SWP transfer water help offset the groundwater use. The Colorado River water deliveries have averaged approximately 300,000 afy over the past five years with MWD deliveries to the Coachella Valley expected to average 60,000 afy.

4.4.3 Reduction of Water Supply

No reduction of water supply is expected to any user due to the Project's use of water resources, or due to CVWD's ongoing management of water resources and planning for growth within their service area and throughout the Coachella Valley.

4.4.4 SWP and Colorado River Water

CVWD's Colorado River water rights and SWP Table A allotments will provide supplemental water for direct use and groundwater recharge to the Coachella Valley. CVWD proposes to develop direct treatment of Colorado River water for potable uses in the future. The Coachella Valley Groundwater Basin has the capacity to meet future demands. Based on the information provided in the 2013 draft State Water Reliability Report, CVWD's Colorado River water rights, recycled water, desalinated drain water and CVWD's water conservation program, water supplies will be sufficient to meet the Project's demands and CVWD's existing and future demands. In the event that additional conservation and/or limitations are necessary, the Project would adhere to any and all limitations associated with this potential reduction in supply.

In addition, the USBR has developed interim surplus and shortage guidelines for management of the Colorado River water supplies.[26] The USBR preferred alternative provides flexibility for the potential storage of additional conserved Colorado River or non-Colorado River water in Lake Mead. The guidelines that were adopted by USBR have been updated and extended through 2026. The revised guidelines address the operation of Lake Mead at relatively full elevations, and determine when surplus water supplies would be available to water users in Southern California, including the Coachella Valley. As currently drafted, the guidelines indicate that water shortages will not negatively impact the Colorado River water supply for the Coachella Valley. CVWD is part of the California agricultural agencies' Colorado River entitlement and is protected by over two million acre-feet of Lower Basin Colorado River entitlement that has a lower priority. The lower priority water would be used to meet shortages before the agricultural entitlements would begin to be impacted.

---

26 US Department of the Interior Bureau of Reclamation, *Colorado River Interim Guidelines for Lower Basin Shortages, Final Environmental Impact Statement* (November, 2007).

4.5 IMPACTS ON OTHER PROJECTS

The Project is within the goals of the 2010 CVWMP Update and the 2014 CVMWP Status Report, and should not have a significant impact on agricultural, potable, or industrial users. CVWD's 20 by 2020 urban water use target for urban water use is 473 gpcd.[27] As previously indicated, the Project's urban water demand of 277 gpcd is below the 20 by 2020 per capita target of 473 gpcd necessary to manage the groundwater basin. In addition, this Project should not affect the water supply for future lower-income housing projects.

The Project will adhere to the Tribe's Land Use Ordinance which regulates landscape irrigation and CVWD Landscape Ordinance 1302.1. The proposed Project's potential groundwater demand would be reduced due to the future use of grey and recycled water for landscape irrigation when made available to the Project Site. The Project may be responsible for funding the purchase of additional imported water supplies to support its projected demands on the PWS. Based on the findings of the WSV, it is expected that the impacts to the groundwater basin will be fully mitigated.

4.6 RIGHTS TO GROUNDWATER

The Coachella Valley groundwater basin has been the principal source of water for the Valley since the early 1900s in the West Valley, urban development relies mainly on groundwater. CVWD, DWA, Indo Water Authority and Coachella Water Agency are the 4 public water purveyors in the Indio Sub basin. CVWD has the legal authority to manage the groundwater basins within its service area under the County Water District Law (California Water Code, Division 12). The Coachella Valley Groundwater Basin has not been adjudicated. CVWD has the right to extract the groundwater as needed to supply this project. CVWD recognizes the need to responsibly and reliably manage the groundwater basin and adopted the 2002 CVWMP, and the 2010 CVWMP Update to reliably meet current and future water demands in a cost effective and sustainable manner.

4.7 VERIFICATION

This document verifies the water supply for the proposed Project as required by California Government Code Section 66473.7 is available.

USFWS	U.S. Fish and Wildlife Service
UWMP	Urban Water Management Plan
WSA	Water Supply Assessment
WSV	Water Supply Verification

APPENDIX A

Water Litigation and Other Water Issues

1. Quantification Settlement Agreement (b)

On October 10, 2003, a series of agreements were signed by various parties including CVWD, Imperial Irrigation District (IID), San Diego County Water Authority (SDCWA), The Metropolitan Water District of Southern California (Metropolitan), The State of California and the U.S. Department of the Interior to quantify water distribution allotments of the Colorado River water in California. The agreements further provide for additional transfer of Colorado River water to CVWD from shares of IID and Metropolitan. The total ultimately available to CVWD is 459, 000 acre-feet/ year during the lifetime (75 years) of the agreements collectively known as Quantification Settlement Agreement (QSA). The QSA includes:

- Capping IID and CVWD Priority 3 water at 3.1 million acre-feet and 330,000 acre-feet, respectively
- Modification of the 1988 IID/Metropolitan Water Conservation Agreement
- Amendment of the 1989 Metropolitan/IID/CVWD/PVID Approval Agreement and transferring 20,000 acre-feet/year to CVWD
- Conservation and transfer of200,000 acre-feet/year from IID to SDCWA
- Exchange Agreement between SDCWA and Metropolitan
- Conservation and transfer of 103,000 acre-feet/year from IID to CVWD
- Lining the All-American Canal and the Coachella Canal and transfer of conserved water to Metropolitan less 16,000 acre-feet/year for the San Luis Rey Indian Water Rights Settlement
- Sharing obligations to provide 14,500 acre-feet/year from IID and CVWD for miscellaneous present perfected rights
- Transfer of35,000 acre-feet/year of SWP water from Metropolitan to CVWD
- Potential water transfers between 25,000 and 111,000 acre-feet annually from the Palo Verde Irrigation District to Metropolitan
- Quantifications of surplus water available under Priority 6 and 7
- Sharing of shortages between CVWD and IID when there is less that 3.85 million acre- feet/year available to Priorities 1, 2, 3a, and 3b

After the QSA was executed, a number of lawsuits were filed including, but not limited to, actions seeking vaIIDation of the agreements and CEQA challenges. To date the QSA has been successfully upheld in several state and federal Courts against challenges to the CEQA process and other issues.

2. Intentionally Created Surplus on Colorado River (f)(g)

Intentionally Created Surplus (ICS), a new type of surplus water, was created by the Colorado River Interim Guidelines for Lower Basin Shortages and Coordinated Operations for Lake Powell and Lake Mead in December 2007. There are four ICS categories:

- Tributary Conservation: Allows a water user to fallow water rights in tributaries of the Colorado River that were in use prior to the effective date of the 1928 Boulder Canyon Project Act and transport this water to the Colorado River for credit.

- Imported ICS: Allows a Colorado River contract holder to convey non-Colorado River water for credit.

- System Efficiency: Allows a user to fund a system efficiency project that would conserve Colorado River water. The project must increase the amount of water available in the United States and a portion of the saved water would be credited to the user funding the project.

- Extraordinary Conservation: Allows a water user to implement a project, such as land fallowing or canal lining, to conserve water through extraordinary measures which would increase Lake Mead levels

ICS allows agencies with contracts for Colorado River water to develop some water resources that were formerly identified as "in-state water" by conveying them to the Colorado River and receive credits.

If this water is not used in the year it is created, it converts to extraordinary conservation ICS credits, which can be used like a bank account and can be stored in Lake Mead for multiple years for future use.

The Yuma Desalting Plant was constructed under authority of the Colorado River Basin Salinity Control Act of 1974 to treat saline agricultural return flows from the Wellton-Mohawk Irrigation and Drainage District. The treated water is intended for inclusion in water deliveries to Mexico thereby preserving the like amount of water in Lake Mead. Construction of the plant was completed in 1992 and it has operated on two occasions since then. The plant has been maintained, but largely not operated due to surplus and then normal water supply conditions on the Colorado River.

In 2009, Reclamation developed a plan for a Pilot Run of the plant. The Pilot Run is being funded by a consortium of municipal utilities which agreed to provide the funding in exchange for receiving ICS for the water created during the Pilot Run. The Pilot Run operations started in May 2010.

The Drop 2 Reservoir project captures United States' Colorado River water that would otherwise go unused in the Lower Basin and pass into Mexico and not be counted as part of Mexico’s entitlement. A

consortium of municipal utilities has agreed to fund the construction of the Drop 2 Reservoir storage project along the All-American Canal in California in exchange for receiving ICS credits for the water saved. The Drop 2 Reservoir was renamed the Warren H. Brock Reservoir and was completed in 2010. Mr. Brock was a prominent, innovative Imperial Valley farmer who participated in numerous commercial ventures as well as experimental farming with different varieties of crops and arid and semi-arid farming methods.

The Pilot Run project and the Warren H. Brock Reservoir project are two examples of the type of projects that CVWD can undertake to increase its water supply to help resolve the overdraft.

3. Colorado River Augmentation (i)

Recognizing the importance of a reliable water supply for the entire Southwest, the seven Colorado River Basin States agreed to conduct an analysis of potential measures that could be used to augment the water supply provided by the river.

Colorado River Water Consultants, a project-specific partnership between engineering firms CH2MHill and Black & Veatch, undertook the task of evaluating potential concepts based upon several key parameters and developed a report for the basin states.

Twelve augmentation options analyzed as part of this study as follows:

- Brackish water desalination
- Coal bed methane production water
- Ocean water desalination
- Power plant reduction of consumptive use
- Reservoir evaporation control
- River basin imports
- Stormwater storage
- Vegetation management (salt cedar and forest management)
- Water imports using ocean routes
- Water reuse

- Weather modification

It is important to note that the augmentation study is intended to provide technical information to water managers; thus, it does not include specific recommendations, prioritization of options or timelines. The report recognizes the legal, political and environmental issues associated with options, but does not attempt to provide guidance related to how they may be addressed.

4. Bay Delta Conservation Plan (a)

The Bay Delta Conservation Plan (BDCP) is being developed to promote the recovery of endangered, threatened and sensitive fish and wildlife species and their habitats in the Sacramento-San Joaquin Delta in a way that will also protect and restore water supplies.

Key provisions of the BDCP include:

- Identify conservation strategies to improve the overall ecological health of the Delta
- Identify ecologically friendly ways to move fresh water through and/or around the Delta
- Address toxic pollutants, invasive species, and impairments to water quality
- Establish a framework and funding to implement the Plan overtime

In July 2012, the governor and U.S. Interior Secretary outlined revisions and alternative proposals to the proposed Bay Delta Conservation Plan (BDCP). Subsequently, the California Natural Resources Agency released four draft chapters of the BDCP in March 2013. On December 9, 2013, the State released an updated BDCP, along with a draft EIR/Environmental Impact Statement (EIS) for formal public review. The formal public review and comment period for the draft EIR/EIS was from December 13, 2013 through July 29, 2014.

5. Biological Opinions on Effects of Coordinated SWP and CVP Operations (a)

Several fish species listed under the federal Endangered Species Act (ESA) as endangered or threatened are found in the Delta. The continued viability of populations of these species in the Delta depends in part on Delta flow levels. For this reason, the U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) have issued several Biological Opinions (BOs) since the 1990s on the effects of coordinated SWP/CVP operations on several species.

These BOs affect the SWP's water delivery reliability for two reasons. Most obviously, they include terms that specifically restrict SWP pumping levels in the Delta at certain times under certain

conditions. In addition, the BOs' requirements are based on physical and biological phenomena that occur daily while DWR's water supply models are based on monthly data.

The first BOs on the effects of SWP (and CVP) operations were issued in February 1993 (NMFS BO on effects of project operations on winter-run Chinook salmon) and March 1995 (USFWS BO on project effects on delta smelt and split tail). Among other things, the BOs contained requirements for Delta inflow, Delta outflow, and reduced export pumping to meet specified incidental take limits. These fish protection requirements imposed substantial constraints on Delta water supply operations. Many were incorporated into the 1995 Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta (1995 WQCP), as described in the "Water Quality Objectives" section later in this chapter.

The terms of the USFWS and NMFS BOs have become increasingly restrictive in recent years. In December 2008, USFWS issued a new BO covering effects of the SWP and CVP on delta smelt, and in June 2009, NMFS issued a BO covering effects on the winter-run and spring-run Chinook salmon, steelhead, green sturgeon, and killer whales. These BOs replaced BOs issued earlier by the federal agencies.

The USFWS BO includes additional requirements in all but 2 months of the year. The BO calls for "adaptively managed" (adjusted as necessary based on the results of monitoring) flow restrictions in the Delta intended to protect delta smelt at various life stages. USFWS determines the required target flow, with the reductions accomplished primarily by reducing SWP and CVP exports. Because this flow restriction is determined based on fish location and decisions by USFWS staff, predicting the flow restriction and corresponding effects on export pumping with any great certainty poses a challenge. The USFWS BO also includes an additional salinity requirement in the Delta for September and October in wet and above- normal water years, calling for increased releases from SWP and CVP reservoirs to reduce salinity. Among other provisions included in the NMFS BO, limits on total Delta exports have been established for the months of April and May. These limits are mandated for all but extremely wet years.

The 2008 and 2009 BOs were issued shortly before and shortly after the Governor proclaimed a statewide water shortage state of emergency in February 2009, amid the threat of a third consecutive dry year. NMFS calculated that implementing its BO would reduce SWP and CVP Delta exports by a combined 5% to 7%, but DWR's initial estimates showed an impact on exports closer to 10% in average years, combined with the effects of pumping restrictions imposed by BOs to protect delta smelt and other species. The 2008 USFWS and 2009 NMFS BOs have been subject to considerable litigation. Recent decisions by the U.S. District Judge Oliver Wanger changed specific operational rules for the fall/ winter of 2011-2012, and both the USFWS BO and NMFS BO have been remanded to the agencies for further review and analysis. However, the operational rules specified in the 2008 and 2009 BOs

continue to be legally required and are the rules used in the analyses presented in Chapters 5, 6, and 7 of this report. Chapter 5 presents a comparison of monthly Delta exports as estimated for this 2011 Report with those estimated for the 2005 Report, illustrating how the 2008 and 2009 BOs have affected export levels from the Delta.

The final judgment remands the 2009 salmon biological opinion to the NMFS and directs that a new draft salmon biological opinion be issued by October 1, 2014, and that a final biological opinion be issued by February 1, 2016, after completion of environmental impact review under NEPA.

The California Department of Fish and Game (DFG) issued consistency determinations for both BOs under Section 2080.1 of the California Fish and Game Code. The consistency determinations stated that the USFWS BO and the NMFS BO would be consistent with the California Endangered Species Act (CESA). Thus, DFG allowed incidental take of the species listed under bother the federal ESA and CESA to occur during SWP and CVP operations without requiring DWR or the U.S. Bureau of Reclamation to obtain a separate State-issued permit.

6. Delta Water Quality Objectives for Salinity (a)

Because the Delta is an estuary, salinity is a particular concern. In the 1995 WQCP, the State Water Board set water quality objectives to protect beneficial uses of water in the Delta and Suisun Bay. The objectives must be met by the SWP (and federal CVP), as specified in the water Delta outflows, limits on SWP and CVP Delta exports, and maximum allowable salinity levels are enforced through the provisions of the State Water Board's Water Right Decision 1641 (D-1641), issued in December 1999 and updated in March 2000. DWR and Reclamation must monitor the effects of diversions and SWP and CVP operations to ensure compliance with existing water quality standards.

Among the objectives established in the 1995 WQCP and D-1641 are the "X2" objectives. D-1641 mandates the X2 objectives so that the State Water Board can regulate the locations of the Delta estuary's salinity gradient during the months of February-June. X2 is the position in the Delta where the electrical conductivity (EC) level, or salinity, of Delta water is 2 parts per thousand. The location of X2 is used as a surrogate measure of Delta ecosystem health. For the X2 objective to be achieved, the X2 position must remain downstream of Collinsville in the Delta (shown in figure 4-1) for the entire 5-month period, and downstream of the other specific locations in the Delta outflow must be at certain specified levels at certain times-which can limit the amount of water the SWP may pump at those times at its Harvey 0. Banks Pumping Plant in the Delta. Because of the relationship between seawater intrusion and interior-Delta water quality, meeting the X2 objective also improves water quality at Delta drinking-water intakes; however, meeting the X2 objectives can require a relatively large volume of water for outflow during dry months that follow months with large storms.

The 1995 WQCP and D-1641 also established and export/inflow (E/I) ratio. The E/I ratio, resented in Table 3 of the 1995 WQCP (SWRCB 1995:18-22), is designed to provide protection for the fish and wildlife beneficial uses in the Bay-Delta estuary (SWRCB 1995:15). The E/I ratio limits the fraction of Delta inflows that are exported. When other restrictions are not controlling, Delta exports are limited to 35% of the total Delta inflow from February through June and 65% of inflow from July through January.

7. Ongoing Environmental and Policy Planning Efforts (a)

The Delta is an essential part of the conveyance system for the SWP. SWP pumping at the Banks Pumping Plant is regulated to protect the many uses of the Delta. However, today's uses in the Delta are not sustainable over the long term under current management practices and regulatory requirements. Two large-scale plans for the Delta that are in development could affect SWP water delivery reliability: the Delta Plan and the Bay Delta Conservation Plan (BDCP).

After years of concern about the Delta amid rising water demand and habitat degradation, the Delta Stewardship Council was created in legislation to achieve State-mandated coequal goals for the Delta. As specified in Section 85054 of the California Water Code:

"Coequal goals" means the two goals of providing more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem. The coequal goals shall be achieved in a manner that protects and enhances the unique cultural, recreational, natural resource, and agriculture values of the Delta as an evolving place.

The draft Delta Plan seeks to reduce reliance on Delta water supplies. In a series of policies and recommendations, the draft plan aims to encourage farms and cities to increase conservation and become more self-sufficient, particularly in the event of a disaster in the Delta. It calls for agriculture water agencies to change pricing to encourage conservation. It also urges the State Water Board to set enforceable flow objectives for the Delta and its tributaries that take into account wildlife and habitat need. In the future, government projects in the Delta must prove they are consistent with the Delta Plan. The Delta Stewardship Council is preparing the draft Delta Plan and environmental impact report. Scheduled for adoption and implementation in 2012, the Delta Plan is intended to serve as California's guiding policy document for the Delta and Suisun Marsh for the next 88 years (that is, through the year 2099), with frequent updates.

8. Delta Levee Failure (a)

Delta levees provide constant protection from flooding because most lands in the Delta are below sea level. Most Delta levees, however, do not meet modem engineering standards and are highly susceptible to failure. Levees are subject to failure at times of high flood flows, but also at any time of

the year due to seepage or the piping of water through the levee, slippage or sloughing of levee material, or sudden failure due to an earthquake. According to the URS Corp./Jack R. Benjamin & Associates report, *Report; Phase l:RiskAnalysis, Delta Risk Management Strategy (DRMS),* December 2008, the risk of levee failure in the Delta is significant, as shown by the fact that most islands in the Delta have flooded at least once over the past 100 years, with many flooding at least twice. Since 1900 there have been 158 levee failures.

A breach of one or more levees and island flooding may affect Delta water quality and water operations. Depending on the hydrology and the size and locations of the breaches and flooded islands, a significant amount of saline water may be drawn into the interior Delta from Suisun and San Pablo bays. At the time of island flooding, exports may be drastically reduced or ceased to evaluate the salinity distribution in the Delta and to avoid drawing higher saline water toward the pumps. The introduced salinity then could become dispersed and degrade Delta water quality for a prolonged period because of complex relationships between Delta inflows, tidal mixing, and the time taken to repair the breaches.

A large earthquake in the Delta causing significant levee failures and island flooding could lead to multiyear disruptions in water supply, significant water quality degradation, as well as permanent flooding of several islands. Such permanent multi-island flooding would probably lead to increased salt water intrusion into the Delta during seasonal low inflows. Maintaining Delta water quality when several islands are flooded and breaches are open would require additional Delta inflow because the volume of water coming into the Delta on the flood tide would increase, requiring more fresh water from the rivers to prevent the saline water from extending into the Delta. When SWP and CVP pumping are restarted, Delta inflow would need to increase again beyond the pumping amount in order to prevent water quality degradation in the Delta. This chain of events would significantly affect water supply reliability.

A worst case scenario for water supply effects would be a moderate or large earthquake causing extensive levee failure in the late summer or fall of a dry year. A strong earthquake affecting the Delta could cause simultaneous levee failures on several islands, with these islands flooding simultaneously. Preliminary analysis indicates that some water may not be treatable by municipal agencies for many months due to high organic carbon concentrations. This would extend the period that Delta water supply would be unavailable for urban users.

Possible effects on SWP deliveries due to earthquakes are:

- There is about a 40% chance of 27 or more islands simultaneously failing during a major earthquake in the next 25 years
- A moderate to large earthquake capable of causing multiple levee failures could happen in the next 25 years. Under such an earthquake, extensive levee failure would most likely occur in the west and central Delta. Levee repairs could take more than 2.5 years and exports from the Delta could be disrupted for about a year with a loss of up to 8 million acre feet of water
- By 2050, the risk of island flooding from seismic events is expected to increase by 35%over 2005 conditions, if a seismic event has not occurred

9. Monterey Amendment Environmental Impact Report (d)

The Monterey EIR is aimed at identifying potential environmental impacts resulting from modifications to SWP water supply contracts. In 1994, DWR and some of the SWP contractors, meeting in Monterey, executed the Monterey Agreement to modify the long- term water supply contracts. These modifications were incorporated into the long-term water supply contracts in what became known as the Monterey Amendment.

An EIR for the Monterey Amendment was prepared by the Central Coast Water Authority (CCWA), a joint powers agency representing several Central Coast contractors. After the EIR was certified in 1995, the Planning and Conservation League challenged the adequacy of the EIR. Later, the Citizen's Planning Association of Santa Barbara and Plumas County Flood Control and Water Conservation District joined the action as plaintiffs. In 2000, the committee ruled that the EIR was inadequate because it failed to analyze invocation of Article 18(b) of the then-existing SWP contracts as a no-project alternative, and that DWR must serve as the lead agency for a new EIR. Following the court's ruling, DWR, the SWP contractors and the plaintiffs executed the Settlement Agreement in 2003. The Settlement Agreement specifies a process for the plaintiffs and the contractors to advise DWR in preparation of the new EIR, sets forth some specific items to be included in the content of the new EIR, and establishes a process for mediation of CEQA issues raised by either the plaintiffs or contractors. The Settlement Agreement also requires DWR to carry out various actions and modify some of its administrative practices.

In June 2010, Central Delta Water Agency, South Delta Water Agency, California Water Impact Network, California Sportfishing Protection Alliance, Center for Biological Diversity, Carolee Krieger and James Crenshaw filed a lawsuit challenging (1) the validity of the Monterey Amendment and the contract amendments executed as part of the settlement agreement and (2) challenging the EIR. A second

lawsuit challenging the EIR was filed by Rosedale-Rio Bravo Water Storage District and Buena Vista Water Storage District. The trial court has ruled that the challenge to the validity of the Monterey Amendment and settlement agreement amendments is baited by the statute of limitations. The challenges to the EIR are set for hearing in January 2014.

10. State Water Bond

The 2014 water bond is the product of a comprehensive legislative package crafted in 2009 by Governor Schwarzenegger and state lawmakers to meet California's growing water challenges. This package represented a major step toward ensuring a reliable water supply for future generations, as well as restoring the Sacramento-San Joaquin Delta and other ecologically sensitive areas. The package was composed of four policy bills and an $11.14 billion bond.

The water bond measure was originally set to be on the state's 2010 ballot and was later moved to the 2012 ballot. The California State Legislature, on July 5, 2012, approved a bill to take the measure off the 2012 ballot and put it on the 2014 ballot to provide a public cost share for elements of the package that benefit the public.

The Safe, Clean and Reliable Drinking Water Supply Act of2014 is a multi-billion dollar general obligation bond proposal that would provide funding for California's aging water infrastructure and for projects and programs to address the ecosystem and water supply issues in California.

In its current form, the bond would allocate roughly funds for local resources development, ecosystem restoration and public benefits associated with new surface and groundwater storage projects. It is planned that every $1 authorized as pmi of the bond would leverage $3 to $4 in other funds, for a total of up to $40 billion for needed investments.

The vast majority of public funds allocated by the bond would be awarded via competitive process to ensure dollars go to a public benefit. There would also be careful review of dollars targeted for ecosystem restoration and a competitive process to determine the highest value investments.

11. Salton Sea (e)(g)

The Salton Sea is a saline terminal lake located at the east end of the Coachella Valley. It is California's largest lake and is a main stop on Pacific Flyway for migratory birds. Over 400 bird species have been documented there. The Sea is about 35 miles long and 9-15 miles wide with approximately 360 square miles of water surface and 105 miles of shoreline. The surface of the Sea currently lies approximately 232 feet below mean sea level (MSL). One of the major functions of the Salton Sea is to serve as a sump for agricultural wastewater from the Imperial and Coachella Valleys. Executive Order of Withdrawal (Public Water Reserve No. 114, California No. 26), signed by President Coolidge in 1928, designated lands within the Salton Basin below elevation 220 feet below MSL as storage for wastes and seepage from imitated lands in the Imperial Valley. Approximately 90 percent of the freshwater inflow to the Sea is agricultural drain water from Imperial Valley, Coachella Valley and Mexicali Valley (Salton Sea Authority website, 2010). Because the Sea has no outlet, salts concentrate in it by evaporation and concentrated nutrients increase the formation of eutrophic conditions. Salt concentrations in the Sea are currently about 51,000 mg/L or about 45 percent higher than ocean water, with salinity increasing at approximately 1 percent per year.

The Salton Sea Reclamation Act of 1998 (Public Law 105-372) directed the Secretary of the Interior, through Reclamation, to study options for managing the salinity and elevation of the Sea to preserve fish and wildlife health and to enhance opportunities for recreation use and economic development while continuing the Sea's use as a reservoir for irrigation drainage.

In January 2003, a status report was released by the Secretary of the Interior about the Salton Sea Restoration Project. The legislation directed DWR to prepare an ecosystem restoration study and programmatic environmental document. The study, conducted in consultation with a legislatively mandated advisory committee and with the Authority, included a proposed funding plan for implementing the preferred alternative.

The California State Legislature, by legislation enacted in 2003 and 2004, directed the Secretary of the California Resources Agency (CRA) to prepare a restoration plan for the Salton Sea ecosystem, and an accompanying Environmental Impact Report. In September 2003, legislation was passed in which the State of California accepted responsibilities for ecosystem restoration at the Sea. The Secretary has established an Advisory Committee to provide recommendations to assist in the preparation of the Ecosystem Restoration Plan, including consultation throughout all stages of the alternative selection process. DWR and CDFG are leading the effort to develop a preferred alternative for the restoration of the Salton Sea ecosystem and the protection of wildlife dependent on that ecosystem.

In June 2006, the Salton Sea Authority (SSA) published a study entitled "Salton Sea Authority Plan for Multi-Purpose Project". As part of this study, the SSA developed a combined, multi- purpose revitalization/restoration project. The preferred project design resulting from this study included components such as in-sea circulation channels, water treatment facilities, habitat enhancement features, Colorado River water storage reservoir, park, and open space and wildlife areas.

In May 2007, the State published the "Salton Sea Ecosystem Restoration Program Preferred Alternative Report and Funding Plan". The Plan and the accompanying PEIR/EIS considered eight restoration alternatives along with a no project alternative. The preferred alternative includes Saline Habitat Complex in the northern and southern sea bed, a Marine Sea that extends around the northern shoreline from San Felipe Creek to Bombay Beach in a "horseshoe" shape, Air Quality Management facilities to reduce particulate emissions from the exposed playa, Brine Sink for discharge of salts, and Sedimentation/Distribution facilities.

On January 24, 2008, the California Legislative Analysis Office released a report entitled "Saving the Salton Sea." The preferred alternative outlined within this draft plan calls for spending a total of almost $9 billion over 25 years and proposes a smaller but more manageable Salton Sea. The amount of water available for use by humans and wildlife would be reduced by 60 percent from 365 square miles (945 square kilometers) to about 147 square miles (381 square kilometers). Fifty-two miles (84 km) of perimeter dikes- constructed most likely out of boulders, gravel and stone columns - would be erected along with earthen beams to corral the water into a horseshoe shape along the shoreline of the sea from San Felipe Creek on the west shore to Bombay Beach on the east shore. The central portion of the sea would be allowed to almost completely evaporate and would serve as a brine sink, while the southern portion of the sea would be constructed into a saline habitat complex. If approved, construction on this project is slated to begin in 2011 and would be completed by 2035.

Salton Sea Restoration Project- SB 187 was approved by Governor Arnold Schwarzenegger on September 27, 2008 and chaptered by the Secretary of State (Chapter 374, Statutes of2008). SB 187 limits expenditures of funds from Proposition 84, upon appropriation by the Legislature, to those activities to be completed in the first five years (Period I) identified in the Resources Agency's report entitled "Salton Sea Ecosystem Restoration Program Preferred Alternative Report and Funding Plan." Activities identified for completion in Period I included a demonstration project, early start habitat, and additional biological, inflow, sediment, water and air quality investigations.

In 2010 in response to inaction by the legislature, SB 51 was passed creating the Salton Sea Restoration Council. To lead restoration efforts, The Council was never formed, members were never appointed and in 2012, Governor Brown eliminated the council by executive action. In late 2013, Governor Brown

signed AB 71 the Salton Sea restoration plan authored by Coachella Democratic Assemblymru1 V. Manuel Perez. The law gives local stakeholders greater say in the revitalization of the Salton Sea and aims to have the local Salton Sea Authority work directly on a plan with the state's Natural Resources Agency. It also authorizes those agencies to study "short- and long-term funding opportunities to help determine a financially sustainable restoration project.

The draft 2010 Water Management Plru1 Update (201 0 WMP) projects that in order to meet the 2045 demand conditions in the Coachella Valley, up to 85,000 AFY of drain flow to the Salton

Sea could be captured and desalinated for urban use. This might result in a significant reduction of projected flow to the Salton Sea from the Coachella Valley. However, it is predicted that these reductions will be offset by higher drainage flow to the sea from the Coachella Valley Aquifer as a result of overdraft reduction. The impacts associated with flow to the Salton Sea are evaluated in the 2010 WMP Update Subsequent Programmatic Environmental Impact Report.

12. Climate Change and Sea Level Rise (a)(l)(g)

State Water Protect:

California's climate is expected to continue to change into the future. Mean temperatures are predicted to increase by 1.5 degrees to 5.0 degrees Fahrenheit by mid-century and 3.5 degrees to 11 degrees by the end of the century. These rising air temperatures are expected to continue to reduce snowpack, especially in low elevation watersheds where more precipitation may fall as rain rather than snow. Reduced snow pack is expected to lead to higher winter runoff and lower spring runoff. This could increase flooding during the winter and reduce river flows in the spring and summer, which may require water managers to evaluate the tradeoffs between flood protection and water supply. Future sea level rise estimates range from 4 to 16 inches by mid- century and 7 to 55 inches by the end of the century. Higher sea levels could threaten the existing levee system in the Sacramento-San Joaquin Delta. Salinity intrusion into the Delta could also require increased releases of freshwater from upstream reservoirs to maintain compliance with water quality standards.

For the SWP, these climate changes have the potential to simultaneously affect the availability of source water, the ability to convey water, and users' demands for water. This may exacerbate the existing mismatch in California between where and when precipitation occurs and where and when people use water.

Colorado River:

Recent studies suggesting substantial changes in runoff may occur over the next century in the Colorado River Basin are of great concern to the region's water managers. The range of estimated impacts on Colorado River discharge has been from slight increases to a 45% decrease by mid-century. While this range of projections and associated hypotheses may be of intellectual interest and stimulate scientific debate, to users and decision makers at the federal level, in the seven basin states, and internationally, providing conflicting information on future conditions is a serious impediment to drought and climate change planning.

Given the wide range of projected flows, the four NOAA Regional Integrated Sciences and Assessments in the western US (RISAs: Western Water Assessment, Climate Assessment for the Southwest, Climate Impacts Group of the Pacific Northwest, California Applications Program), Bureau of Reclamation and NOAA engaged in a coping with drought study to reconcile the range of estimates for future Colorado River flows. A secondary goal was to inform the National Integrated Drought Information System (NIDIS) on the process needed to convey to policy and decision makers the nature of the uncertainties associated with projections of future climate impact.

An intercomparison was initiated to assess how the methodological approaches and models used to generate estimates of Colorado River flow in 2050 reflect actual uncertainty with associated risks, and how much uncertainty is due to differences in the methodological approaches and model biases. First, the various approaches simulated the 20th century record of Colorado River stream flow due to shifts in the average and seasonality of temperature and precipitation, snow pack development and decline, and antecedent soil moisture conditions were examined. Precipitation elasticities and temperature sensitivities of these approaches to simulate stream flow were evaluated by imposing a 10 percent reduction of precipitation and

1°C and 2 °C increases in temperature. The elevation dependency of runoff contributing to stream flow among the simulations and in comparison to the observed record was also examined.

An initial result of the intercomparison is a narrowing of the range of projected Colorado River flows at 2050 to decreases between -6% and -20%. Precipitation elasticity across the approaches for annual flows at Lees Ferry is on the order 2, whereas temperature sensitivity for annual flows at Lees Ferry ranges from 2%/°C to -9%/°C. In addition, differences in gridded time series of precipitation and temperature (Oregon State University PRISM approach versus University of Washington Maurer approach) were found to impact the simulated 20th century flows and sensitivity of future flows to climate change at 2050.

Extended droughts in the southwestern United States are believed to have occurred a number of times in the past 1,200 years. A study published in 2007 reconstructed Upper Colorado River flows at Lee Ferry (below Lake Powell) using tree-ring data for the period A.D. 762 to

2005. This study indicated that the Colorado River basin may have experienced two droughts extending for 60 to 80 years during the Medieval period, including a drought in the mid-11OOs where the average flow over a 25-year period decreased by 15 percent. One of these droughts is believed to have caused the decline of the Anasazi culture in the Southwest. Several droughts lasting 20 to 30 years are also inferred from the tree-ring data. Although basin-wide inflows have exceeded water use over the past 100 years, the reconstructed hydrology suggests that the average flow at Lee Ferry might be 14.65 million AFY, which is significantly lower than the 16.5 million AFY allocated to Colorado River users.

CVWD will continue to monitor the supply conditions on the Colorado River, make adjustments to its operations as appropriate, and actively participate in efforts to augment the water supplies of Colorado River. For the 20 year period that the Water Supply Assessment looks into the future and assuming a linear relationship, these studies would have a decrease in runoff in 2030 of between -35 to -10%. As discussed under the "Law of the River", reductions of these magnitudes would not impact CVWD's rights to Colorado River water.

13. Law of the River (h)

The Colorado River is managed and operated under numerous compacts, federal laws, court decisions and decrees, contracts, and regulatory guidelines collectively known as the "Law of the River." This collection of documents apportions the water and regulates the use and management of the Colorado River among the seven basin states and Mexico. Following is a synopsis of the most significant documents:

The Colorado River Compact of 1922- The cornerstone of the "Law of the River", this Compact was negotiated by the seven Colorado River Basin states and the federal government in 1922. It defined the relationship between the upper basin states, where most of the river's water supply originates, and the lower basin states, where most of the water demands were developing. At the time, the upper basin states were concerned that plans for Hoover Dam and other water development projects in the lower basin would, under the Western water law doctrine of prior appropriation, deprive them of their ability to use the river's flows in the future.

The states could not agree on how the waters of the Colorado River Basin should be allocated among them, so the Secretary of Commerce Herbert Hoover suggested the basin be divided into an upper and lower half, with each basin having the right to develop and use 7.5 million acre-feet (mat) of river water

annually. This approach reserved water for future upper basin development and allowed planning and development in the lower basin to proceed.

The Boulder Canyon Project Act of 1928 - This act: (1) ratified the 1922 Compact; (2) authorized the construction of Hoover Dam and related irrigation facilities in the lower Basin; (3) apportioned the lower basin's 7 million acre-feet (maf) among the states of Arizona (2.8 mat), California (4.4 mat) and Nevada (0.3 mat); and (4) authorized and directed the Secretary of the Interior to function as the sole contracting authority for Colorado River water use in the lower basin.

California Seven Party Agreement of 1931- This agreement helped settle the long- standing conflict between California agricultural and municipal interests over Colorado River water priorities. The seven principal claimants Palo Verde Irrigation District, Yuma Project, Imperial Irrigation District, Coachella Valley Irrigation District, Metropolitan Water District, and the City and County of San Diego- reached consensus in the amounts of water to be allocated on an annual basis to each entity. Although the agreement did not resolve all priority issues, these regulations were also incorporated in the major California water delivery contracts.

The agreement provides for the following priorities:

- First Priority- Palo Verde litigation District for beneficial use exclusively upon lands in said District as it now exists and upon lands between said District and the Colorado River, aggregating a gross are of 104,500 acres, such waters as may be required by said lands.

- Second Priority- Yuma Project of United States Bureau of Reclamation for beneficial use upon not exceeding a gross area of 25,000 acres of land located in said project in California, such waters as may be required by said lands.

- Third Priority (a) Imperial Irrigation District and other lands under or that will be served for the All American Canal in Imperial and Coachella Valleys, and (b) Palo Verde Irrigation District for use exclusively on 16,000 acres in that area known as the "Lower Palo Verde Mesa", adjacent to Palo Verde Irrigation District, for beneficial consumptive use, 3,850,000 acre feet of water per annum less the beneficial consumptive use under the priorities designated in Section 1 and 2 above.

- The total beneficial consumptive use under priorities stated in Sections 1, 2 and 3 of this article shall not exceed 3,850,000 acre feet per annum.

- Fourth Priority- The Metropolitan Water District of Southern California and/or the City of Los Angeles, for beneficial consumptive use, by themselves and/or others, on the Coastal Plain of Southern California, 550,000 acre feet of water per annum.

- Fifth Priority, (a) The Metropolitan Water District of Southern California and/or the City of Los Angeles, for beneficial consumptive use, by themselves and/or others, on the Coastal Plain of Southern California, 550,000 acre feet of water per annum and (b) the City of San Diego and/or County of San Diego, for beneficial consumptive use, 112,000 acre feet of water per annum.

- Sixth Priority (a) Imperial Irrigation District and other lands under or that will be served from All American Canal in Imperial and Coachella Valleys, and (b) to Palo Verde Irrigation District for use exclusively on 16,000 acres in that area known as the "Lower Palo Verde Mesa," adjacent to Palo Verde Irrigation District, for beneficial consumptive use, 300,000 acre feet of water per annum.

- Seventh Priority - All remaining water available for use within California, for agricultural use on designated lands in the Colorado River Basin in California.

1934 IID/CVWD Compromise Agreement- An agreement between Imperial Irrigation District (IID) and CVWD which addressed the sale of power within the Coachella Valley and provided a priority for IID ahead of CVWD for Colorado River water in Priorities 3 and 6 of the Seven Party Agreement of 1931 for water put to reasonable beneficial use in its service area.

The Mexican Water Treaty of 1944 -Committed 1.5 maf of the river's annual flow to Mexico.

Upper Colorado River Basin Compact of 1948- Created the Upper Colorado River Commission and apportioned the Upper Basin's 7.5 maf among Colorado (51.75 percent), New Mexico (11.25 percent), Utah (23 percent), and Wyoming (14 percent); the portion of Arizona that lies within the Upper Colorado Basin was also apportioned 50,000 acre-feet annually.

Colorado River Storage Project of 1956- Provided a comprehensive Upper Basin- wide water resource development plan and authorized the construction of Glen Canyon, Flaming Gorge, Navajo and Curecanti dams for river regulation and power production, as well as several projects for irrigation and other uses.

The Arizona v. California Supreme Court Decision of 1964- In 1963, the Supreme Court issued a decision settling a 25-year-old dispute between Arizona and California. The dispute stemmed from Arizona's

desire to build the Central Arizona Project so it could use its full Colorado River apportionment. California objected and argued the Arizona's use of water from the Gila River, a Colorado River tributary, constituted use of its Colorado River apportionment, and that it had developed a historical use of some of Arizona's apportionment. This, under the doctrine of prior appropriation, precluded Arizona from developing the project.

The Supreme Court rejected California's arguments, ruling that lower basin states have a right to appropriate and use tributary flows before the tributary co-mingles with the Colorado River, and that the doctrine of prior appropriation did not apply to apportionments in the lower basin.

In 1964, the Court issued its decree. This decree enjoined the Secretary of the Interior from delivering water outside the framework of apportionments defined by the law and mandated the preparation of annual reports documenting the uses of water in the three lower basin states.

1979, The Supreme Court issued a Supplemental Decree which addressed present perfected right referred to in the Colorado River Compact and in the Boulder Canyon Project Act. These rights are entitlements essentially established under state law, and have priority over later contract entitlements. The case was finalized in 2006.

The Colorado River Basin Project Act of 1968 - This Act authorized construction of a number of water development projects in both the upper and lower basins, including the Central Arizona Project (CAP). It also made the priority of the CAP and portions of Nevada's Colorado River water supply subordinate to California's apportionment in times of shortage, and directed the Secretary to prepare, in consultation with the Colorado River Basin states, long-range operating criteria for the Colorado River reservoir system. This priority for California provides additional reliability for California's Colorado River supply as approximately an additional 1.4 maf of Colorado River water of Arizona and Nevada will take the first storage in the Lower Basin.

The Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs of 1970 (amended March 21, 2005) -Provided for the coordinated operation of reservoirs in the upper and lower basins and set conditions for water releases from Lake Powell and Lake Mead.

Minute 242 of the US Mexico International Boundary and Water Commission of 1973 required the U.S. to take actions to reduce the salinity of water being delivered to Mexico and Morelos Darn.

The Colorado River Basin Salinity Control Act of 1974 authorized desalting and salinity control projects, including Yuma Desalting Plant, to improve Colorado River quality.

Colorado River Storage for CVWD- Under the 1931 Seven Party Agreement and the Colorado River Basin Project Act of 1968, the Colorado River supply to the Lower Basin must be reduced from 7.5 maf to 5 maf before CVWD is subject to a shortage reduction. Under these conditions, the Colorado River supply to CAP and MWD would be reduced to zero.

There are several other laws, contracts and documents which are part of the "Law of the River" in addition to these provisions, the federal Endangered Species Act and various Native American water claim settlement both affect the extent to which water developments and diversions can be utilized in the Colorado River Basin.

14. Agua Caliente Law Suit

On May 14, 2013, the Agua Caliente Band of Cahuilla Indians, a federally recognized tribe, filed a complaint for declaratory and injunctive relief against CVWD and Desert Water Agency (DWA) in U.S. District Court. The complaint alleges that the Agua Caliente Indian Reservation is entitled to groundwater rights prior and paran1ount to the rights of CVWD and DWA under an aboriginal rights theory (in an amount needed to provide for the aboriginal uses of the tribe with a priority date of time immemorial) and under a federal reserved water rights theory (in an amount needed to fulfill the purposes of the reservation, with a priority date of the Executive Orders of 1876 and 1877 establishing the reservation), that CVWD and DWA are overdrafting the Upper Whitewater River and Garnet Hill sub-basins, that CVWD and DWA are degrading groundwater quality by recharging the sub-basins with Colorado River water, and that the tribe owns the "pore space" beneath the reservation lands and has a prior right to use that space for storage of water. The tribe seeks a declaration quantifying the amount of its claimed water rights and an injunction prohibiting CWVD and DWA from producing groundwater in conflict with the claimed water rights, from overdrafting the sub- basins, from recharging the sub-basins with untreated water, and from using the pore space beneath the reservation in conflict with the tribe's claimed rights to use the storage space.

CVWD and DWA have filed answers to the complaint, denying the tribe's allegations and asserting various affirmative defenses, including that any claimed aboriginal water rights have been extinguished by law, that the reserved water rights theory is not applicable to groundwater, that CVWD and DWA have the right to recharge the sub-basins with water diverted from surface streams and imported from the Colorado River, and that the balance of equities weigh in favor of CWVD's and DWA's efforts to address overdraft and preclude granting relief to the tribe.

APPENDIX B

Water Demand Calculations

To provide an estimate of the proposed Project's contribution to CVWD water demand, the proposed Project is assumed to build out in a 20-year span between 2017 and 2036 with an average annual increase in demand of 254.4 afy for the Active Adult Community, and 137.6 afy for the Tribal Planning Areas, as illustrated in **Table 1, Projected Annual Project Demand.**

Table 1

Executive Summary

The Coachella Valley Water Management Plan was adopted by the Board of Directors, Coachella Valley Water District (CVWD) in September 2002. The goal of the Water Management Plan is to reliably meet current and future water demands in a cost-effective and sustainable manner. The Board recognized the need to update the Plan periodically to respond to changing external and internal conditions. This 2010 Water Management Plan Update (2010 WMP Update) meets that need. It defines how the goal will be met given changing conditions and new uncertainties regarding water supplies, water demands, and evolving federal and state laws and regulations.

ES-1 THE COACHELLA VALLEY

The Coachella Valley is located in the central portion of Riverside County. For purposes of this Water Management Plan, the Coachella Valley is divided into the West Valley and the East Valley. Geographically, the East Valley is southeast of a line extending from Washington Street and Point Happy northeast to the Indio Hills near Jefferson Street, and the West Valley is northwest of this line (**Figure ES-1**).

The West Valley includes the cities of Palm Springs, Cathedral City, Rancho Mirage, Indian Wells, and Palm Desert, a portion of the city of Indio, and the unincorporated communities of Sun City and Thousand Palms. The West Valley has a predominately resort/recreation-based economy. Water demand in the West Valley is supplied by several sources: groundwater, surface water from local streams, and recycled water. The East Valley includes the cities of Coachella, Indio, and La Quinta, and the unincorporated communities of Bermuda Dunes, Mecca, Oasis, Thermal, and Vista Santa Rosa. Historically, the East Valley has had an agricultural-based economy. Urban growth is occurring in the East Valley and is projected to continue in the future. East Valley water sources consist primarily of Coachella Canal water and groundwater, with a small amount of recycled fish farm effluent for agricultural uses.

The Coachella Valley's principal groundwater basin, the Whitewater River (Indio[1]) Subbasin, extends from Whitewater in the northwest to the Salton Sea in southeast. The basin has an estimated storage capacity of approximately 30 million acre-feet[2] (AF) (DWR, 1964). Water placed on the ground surface in the West Valley will percolate through the sands and gravels directly into the groundwater aquifer. In the East Valley, however, several impervious clay layers lie between the ground surface and the main groundwater aquifer. Water applied to the surface in the East Valley does not readily reach the lower groundwater aquifers due to these impervious clay layers. The only outlets for groundwater in the Coachella Valley are through subsurface outflow under the Salton Sea or through collection in drains and transport to the Salton Sea via the Coachella Valley Storm Channel (CVSC).

[1] The California Department of Water Resources (DWR) assigned the name "Indio Subbasin" in its Bulletin 108. CVWD and Desert Water Agency use the designation "Whitewater River Subbasin."

[2] One acre-foot (AF) is the amount of water that would cover one acre of land (approximately the size of a football field), one foot deep or about 326,000 gallons.

ES-2 WATER MANAGEMENT IN THE COACHELLA VALLEY

Water management in the Valley began as early as 1915. With groundwater levels falling, the need for a supplemental water source was recognized for the Valley to continue to flourish.

The Coachella Valley Stormwater District was formed in 1915 followed by formation of CVWD in January 1918. CVWD's first directors quickly filed paperwork to secure rights to all unclaimed Whitewater River water, an important source for aquifer recharge. In 1918, a contract was awarded for construction of water spreading and recharge facilities in the Whitewater River northwest of Palm Springs.

CVWD next focused on obtaining imported Colorado River water. In 1934, negotiations with the federal government were completed, and plans were put in place for the construction of the Coachella Branch of the All American Canal. Construction of the Canal began in 1938, but was interrupted by World War II. The first deliveries of imported Colorado River water to East Valley growers began in 1949. The service area for Canal water delivery under the CVWD's contract with the U.S. Bureau of Reclamation (Reclamation) is defined as Improvement District No. 1 (ID-1). The impact of imported water on the Valley was almost immediate. By the early 1960s, water levels in the East Valley had returned to their historical high levels.

Although groundwater levels in the East Valley had stabilized, water levels in the West Valley continued to decline as growth occurred. Desert Water Agency (DWA) was formed in 1961 to import State Water Project (SWP) water into the Palm Springs and Desert Hot Springs areas. In 1962 and 1963 respectively, DWA and CVWD entered into contracts with the State of California for 61,200 acre-feet per year (AFY) of SWP water. To avoid the then estimated $150 million cost of constructing an aqueduct to bring SWP water directly to the Valley, CVWD and DWA entered into an agreement with the Metropolitan Water District of Southern California (Metropolitan) to exchange SWP water for Colorado River water.

Starting in 1973, the CVWD and DWA began exchanging their annual SWP allocation with Metropolitan for Colorado River water to recharge West Valley groundwater at the Whitewater River Recharge Facility. CVWD, DWA, and Metropolitan also signed an advance delivery agreement in 1984 that allows Metropolitan to store additional water in the Valley. Since 1973, the spreading facility had percolated in excess of 2.6 million AF of Colorado River water exchanged for SWP water.

By the 1980s, groundwater demand in the East Valley had again exceeded supplies, resulting in significant groundwater level decreases in some parts of the East Valley. Because relatively impervious clay layers in the Valley floor impede groundwater recharge in the East Valley, CVWD began looking for sites sufficiently far away from the main clay layer to allow groundwater recharge. In 1995, the CVWD began operating the Dike No. 4 pilot recharge facility located on the west side of the East Valley in La Quinta. The pilot successfully demonstrated the feasibility of East Valley groundwater recharge. The facility was expanded in 1998 to determine the ultimate recharge capacity at this location. In October 2009, the Thomas E. Levy Groundwater Replenishment Facility (Levy facility, formerly Dike 4) was dedicated. It has a current recharge capacity of 32,000 AFY, upgradable to 40,000 AFY.

Recycled water has been a priority water supply in the Valley since 1965. Currently, CVWD and DWA provide more than 14,000 AFY of recycled water for golf course and greenbelt irrigation purposes from four wastewater treatment facilities. While recycled water is available in the East Valley, it is not currently treated to sufficient levels for unrestricted reuse. Water conservation is also a key element of managing water demands.

ES-3 CURRENT CONDITION OF COACHELLA VALLEY GROUNDWATER BASIN

The demand for groundwater has annually exceeded the limited natural recharge of the groundwater basin. The condition of a groundwater basin in which the outflows (demands) exceed the inflows (supplies) to the groundwater basin over the long term is called "*overdraft.*" Overdraft has caused groundwater levels to decrease in significant portions of the East Valley. Groundwater levels in the West Valley have also decreased substantially, except in the areas near the Whitewater Recharge Facility where artificial recharge has successfully raised water levels.

Overdraft has serious consequences. The immediate and direct effect is increased groundwater pumping costs for all water users. With continued overdraft, wells will have to be deepened, pumps that are more powerful will have to be installed, and energy costs will increase as the pump lifts increase. The need for deeper wells and more powerful pumps will increase the cost of water for agriculture, municipalities, resorts, homes, and businesses. Continued decline of groundwater levels could result in a substantial and possibly irreversible degradation of water quality in the groundwater basin due to the intrusion of lower quality, high TDS water applied at the surface for irrigation and reduced drain flows carrying the salts out of the basin. Continued overdraft also increases the possibility of land subsidence. As groundwater is removed, the dewatered soil begins to compress from the weight of the ground above, causing subsidence. Subsidence can cause ground fissures and damage to buildings, homes, sidewalks, streets, and buried pipelines – all of the structures that make the Valley livable. Subsidence also reduces storage capacity in the aquifer. Continued overdraft would eventually stifle growth in the Valley, as it would not be possible to demonstrate that adequate water supplies exist to support growth.

The 2010 WMP Update uses a calculation of change in storage based on long-term local hydrology and imported water deliveries to estimate long-term overdraft. Since the local hydrology varies significantly from year to year, a long term average provides a better method for estimating the local inflows, which are dampened by the large storage volume of the basin. Because imported water recharge deliveries in the West Valley also vary widely from year to year, recharge is based on estimated long-term average SWP Exchange reliability rather than year-to-year values. Other inflows and outflows are estimated using the groundwater model. This approach dampens the variations in the annual change in storage and gives a more accurate indication of long-term overdraft. Based on these adjustments, the average annual overdraft for 2000 through 2009 is estimated to be 70,000 AFY. When the 2010 WMP Update was adopted in January 2012, CVWD and DWA experienced two years of very high recharge with nearly 461,000 AF recharged at Whitewater (including advanced deliveries).

ES-4 THE 2002 WATER MANAGEMENT PLAN

Continued decline of groundwater levels and ongoing overdraft is unacceptable. CVWD and DWA are charged with providing a reliable, safe water supply now and in the future. In order to fulfill obligations to Valley residents, these agencies must take action to prevent continuing decline of groundwater levels and degradation of water quality on a long-term basis. To meet responsibilities for ensuring adequate water supplies in the future, the CVWD and DWA initiated planning in the early 1990s. The comprehensive Water Management Plan developed in 2002 guides CVWD and DWA in efforts to eliminate overdraft, prevent groundwater level decline, protect water quality, and prevent land subsidence.

The 2002 Water Management Plan clearly identified the significant groundwater overdraft that had occurred over decades and, equally important, the threat of continued overdraft to the economy and quality of life in the Valley. It was based on then current projections of growth and corresponding water demand. The Plan identified the actions needed to eliminate overdraft while maintaining the quality of life and avoiding adverse impacts to the environment. The Plan area originally included the Whitewater River and Garnet Hill Subbasins. Portions of Desert Hot Springs Subbasin east of Indio and Coachella were added to the planning area for this Update, as shown in **Figure ES-1**.

ES-4.1 Goals and Objectives

The goal of the 2002 Water Management Plan is to reliably meet current and future water demands in a cost effective and sustainable manner. To meet this goal, four objectives were identified for the 2002 WMP:

1. Eliminate groundwater overdraft and its associated adverse impacts, including:
    - groundwater storage reductions
    - declining groundwater levels
    - land subsidence, and
    - water quality degradation,
2. Maximize conjunctive use opportunities,
3. Minimize adverse economic impacts to Coachella Valley water users, and
4. Minimize environmental impacts.

The 2002 WMP included five major elements:

- water conservation (urban, golf course, and agricultural),
- substitution of surface water supplies (Colorado River water, SWP water, recycled water) for urban, agricultural, and golf course uses in lieu of pumping groundwater,
- continued groundwater recharge at the Whitewater Recharge Facility and development of two new groundwater recharge facilities in the East Valley,

- increasing surface water supplies, and
- monitoring of groundwater production, levels, water quality and land subsidence.

Within each element, the 2002 WMP identified specific actions to aid in eliminating overdraft. Many of the elements of the 2002 WMP have been accomplished as described in **Section ES-4.2**.

ES-4.2 Accomplishments Since 2002

The actions to eliminate overdraft pursuant to the 2002 WMP taken by CVWD, DWA, other water agencies, municipalities, and tribes are summarized below.

ES-4.2.1 Water Conservation

A broad range of water conservation actions was included in the 2002 WMP. Most of those actions have been achieved, some ahead of schedule.

Urban Conservation

CVWD first passed a Landscape Ordinance in 2003. The ordinance was updated in 2007, and changes were made in 2009 for consistency with the State's updated model landscape ordinance. The ordinance has been adopted by nearly all Valley cities. The ordinance sets a maximum applied water allowance for new developments, requires efficient irrigation systems, specifies the use of climate appropriate plant materials, reduces applied water runoff and overflow, reduces non-recreational turf at golf courses, and mandates smart irrigation controllers on all new landscapes. The ordinance, in combination with other water conservation measures, results in a significant reduction in existing and new water use.

CVWD established an urban water conservation program in 1988. A water conservation coordinator was appointed in 2007, and the program now has a full-time staff of twelve employees. In 2009, CVWD established tiered domestic water pricing for customers based on individual water budgets. A turf buy-out partnership was established with the cities of Cathedral City, La Quinta, and Palm Desert. CVWD also provides weather-based irrigation controllers to eligible customers in participating cities. CVWD maintains water efficient demonstration gardens at the CVWD offices in Coachella and Palm Desert. CVWD sponsors well-attended semi-annual landscape workshops and tours, and creates displays for special events. CVWD produces the popular book, "*Lush & Efficient: Landscape Gardening in the Coachella Valley*," and various other publications. Analysis of water use for CVWD's 2011 Urban Water Management Plan shows water usage has declined by 18 percent compared to average usage from 1996 through 2005.

DWA offers large water users (condominiums, public parks, and businesses) comprehensive irrigation system water audits at no charge and assists in implementing recommended improvements. In partnership with CVWD and Cathedral City, DWA furnishes irrigation controllers at cost to customers. Free controllers are provided with new water meter installation. In addition, DWA recently installed artificial turf and recycled water drip-irrigation for

xeriscaping at its operations center (DWA website, 2010). The City of Palm Springs also promotes water efficiency programs including landscape water training programs and rebates for water efficient toilets (City of Palm Springs website, 2010). Analysis of per capita water use for DWA's 2011 Urban Water Management Plan indicates a comparable 18 percent reduction in water use. Indio and Coachella have also implemented water conservation programs that are described in their respective Urban Water Management Plans. Their plans show 14 percent and 20 percent per capita demand reductions compared to their respective demand baselines.

Agricultural Conservation

The 2002 WMP established a goal of seven (7) percent agricultural water use reduction through conservation. Based on a comparison of the average water use per acre in the 2000 through 2002 period, agricultural water use has generally declined about 9.9 percent through 2008. While this estimate may be due in part to variations in weather conditions, crop water needs, and crop patterns, it represents a significant decrease in agricultural water use over the period. Agricultural water conservation measures included irrigation scheduling, salinity management, and irrigation uniformity evaluation programs for irrigators.

Golf Course Conservation

The 2002 WMP goal was to reduce water demand at existing courses by at least five percent by 2010 and for new courses by up to 25 percent compared to historical use by existing courses. Actual use per irrigated acre in the West Valley, where data are available, indicates a reduction of about 14 percent compared to the 2000 to 2002 average. Adoption of the 2009 Landscape Ordinance throughout the Valley is expected to reduce water use by new courses through turf limitations by about 22 percent compared to existing courses. CVWD initiated a program of monitoring golf course water use to ensure that maximum water allowances are not exceeded. A symposium for golf course operators to promote golf course water conservation is held each year.

Stakeholder Review and Input

In 2006, CVWD completed, with extensive stakeholder involvement, a Water Management Plan Implementation Program. This effort included review, evaluation, and prioritization of water conservation programs and other elements of the 2002 WMP by stakeholders with recommendations to the CVWD Board (Water Consult, 2006). The Board uses the recommendations in the Implementation Program to guide development of annual budgets.

ES-4.2.2 Additional Water Supplies

The 2002 WMP identified the need for CVWD and DWA to acquire additional water supplies to manage current and future groundwater overdraft. Supplies identified included the Colorado River, State Water Project, other transfers, recycled water, and desalinated drain water.

Quantification Settlement Agreement

In 2003, CVWD, IID, and Metropolitan, along with the State of California and Reclamation, successfully completed negotiation of the Quantification Settlement Agreement (QSA). The QSA quantifies the Colorado River water allocations of California's agricultural water contractors for 75 years and provides for the transfer of water between agencies. Under the QSA, CVWD has a base allocation of 330,000 AFY. In accordance with the QSA, CVWD has entered into water transfer agreements with Metropolitan and IID that increase CVWD supplies by an additional 159,000 AFY as shown in **Table ES-1**.

As of 2010, CVWD received 368,000 AFY of Colorado River water deliveries under the QSA. This includes the base allocation of 330,000 AFY, the Metropolitan/IID transfer of 20,000 AFY, 12,000 AFY of the IID/CVWD First transfer, and 35,000 AFY of Metropolitan/SWP transfer. CVWD's allocation will increase to 459,000 AFY of Colorado River water by 2026. After deducting conveyance and distribution losses, approximately 428,000 AFY will be available for CVWD use.

Table ES-1
CVWD Deliveries under the Quantification Settlement Agreement

Component	2010 Amount (AFY)	2045 Amount (AFY)
Base Allocation	330,000	330,000
1988 Metropolitan/IID Approval Agreement	20,000	20,000
Coachella Canal Lining (to SDCWA)	-26,000	-26,000
To Miscellaneous/Indian PPRs	-3,000	-3,000
IID/CVWD First Transfer	12,000	50,000
IID/CVWD Second Transfer	0	53,000
Metropolitan/SWP Transfer	35,000	35,000
Total Diversion at Imperial Dam	**368,000**	**459,000**
Less Conveyance Losses [1]	-31,000	-31,000
Total Deliveries to CVWD	**337,000**	**428,000**

Note:
1 Assumed total losses after completion of All-American and Coachella Canal lining projects

State Water Project

CVWD and DWA have made significant progress toward meeting the 2002 WMP goal of 140,000 AFY average delivery target (103,000 AFY to Whitewater Recharge Facility; 37,000 AFY via Mid-Valley Pipeline (MVP)) of SWP Exchange water in the Whitewater River Subbasin. CVWD's and DWA's SWP Table A Amounts[3] are used to replenish both the Upper Whitewater River and the Mission Creek subbasins. Per an interagency agreement, water for

[3] Each SWP contract contains a "Table A" exhibit that defines the maximum annual amount of water each contractor can receive excluding certain interruptible deliveries. Table A Amounts are used by DWR to allocate available SWP supplies and some of the SWP project costs among the contractors.

recharge is allocated in proportion to pumping in each subbasin. CVWD's and DWA's Table A water is exchanged with Metropolitan for a like amount of Colorado River water from Metropolitan's Colorado River Aqueduct (CRA).

Under the 2003 Exchange Agreement, CVWD and DWA acquired 100,000 AFY (88,100 AFY and 11,900 AFY, respectively) of Metropolitan's SWP Table A water as a permanent transfer. In any given year, the agreement allows Metropolitan to call-back the 100,000 AFY and assume the entire cost of delivery if it needs the water. This transfer became effective in January 2005.

In 2004, CVWD purchased an additional 9,900 AFY of SWP Table A water from the Tulare Lake Basin Water Storage District (Tulare Lake) in Kings County, CA. In 2007, CVWD and DWA made a second purchase of 7,000 AFY of SWP Table A water from Tulare Lake: 5,250 AFY for CVWD and 1,750 AFY for DWA. In 2007, CVWD and DWA completed the transfer of 16,000 AFY of SWP Table A water (12,000 AFY and 4,000 AFY, respectively) from the Berrenda Mesa Water District (Berrenda Mesa), effective in January 2010. With these transfers, the combined SWP Table A Amounts for CVWD and DWA total 194,100 AFY, with CVWD's portion equal to 138,350 AFY and DWA's portion equal to 55,750 AFY. **Table ES-2** summarizes CVWD and DWA total allocations of SWP Table A water.

Table ES-2
State Water Project Sources

	Original SWP Table A (AFY)	Tulare Lake Basin 2004 Transfer (AFY)	Metropolitan 2003 Transfer[1] (AFY)	Tulare Lake Basin 2007 Transfer[2] (AFY)	Berrenda Mesa 2007 Transfer[2] (AFY)	Total (AFY)
CVWD	23,100	9,900	88,100	5,250	12,000	138,350
DWA	38,100	—	11,900	1,750	4,000	55,750
Total	61,200	9,900	100,000	7,000	16,000	194,100

Notes:
1 Transfer became effective on January 1, 2005.
2 Transfer became effective on January 1, 2010.

SWP supplies vary annually due to weather and runoff variations and regulatory limitations on exports from the Delta. When the 2002 WMP was prepared, average SWP supply reliability was estimated to be about 82 percent. Under current conditions, DWR estimates the SWP can only provide about 60 percent of the Table A Amounts indicated in CVWD's and DWA's contracts based on an 82-year hydrologic average (DWR, 2011). The current availability of SWP Table A Amounts is presented in **Table ES-3.** In the absence of state and federal actions in the Bay Delta to improve supply reliability and to protect and enhance the Delta ecosystem, it is anticipated that long-term average SWP reliability (deliveries) could decrease to 50 percent of the Table A Amounts over the next twenty years. Additionally, growth and associated groundwater production increases in the Mission Creek Subbasin will result in more SWP Exchange water being delivered to that subbasin reducing supplies for the Whitewater River.

Other Water Transfers

In March 2008, CVWD and DWA entered into separate agreements with DWR for the purchase and conveyance of supplemental SWP water under the Yuba River Accord Dry Year Water Purchase Program. This program provides dry year supplies. The amount of water available for purchase in a given year varies and is based on DWR's determination of the Water Year Classification. The available water is allocated among participating SWP contractors based on their Table A Amounts. CVWD and DWA may be able to purchase up to 5,600 AFY, and 1,820 AFY, respectively. These agreements provide for the exchange of these supplies with Metropolitan for Colorado River water in accordance with the existing exchange agreements. CVWD and DWA received a total of 5,300 AF of water from this source in 2008 and 2009.

Table ES-3
Current (2010) SWP Supply Availability (60% Reliability)

SWP Components	AFY [1]
Table A Amount (Base)	194,100
Average Deliveries with Current SWP Reliability (60%) [2]	116,500
Less Average Metropolitan Callback [3]	(32,900)
Net Average SWP Supply [4]	83,600
Whitewater River Subbasin Recharge (93% of net) [5]	77,800
Mission Creek Subbasin Recharge (7% of net)	5,800

Notes:
1 Values shown are rounded to nearest 100 AFY.
2 Current reliability is based on California DWR's 2009 SWP Reliability Report.
3 Average supply conservatively assumes Metropolitan calls back its 100,000 AFY transfer in four wet years during a 10-year period.
4 Net supply is calculated by deducting the Metropolitan callback from the Table A Amount with current SWP Reliability.
5 Allocation of SWP water to Upper Whitewater River and Mission Creek subbasins is based on production in each basin.

In 2008, CVWD also executed an agreement with Rosedale-Rio Bravo Water Storage District (Rosedale) in Kern County for a one-time transfer of 10,000 AF of banked Kern River flood water that is exportable to CVWD. Deliveries to CVWD began in 2008 and will be completed by December 31, 2012.

Desalinated Drain Water

The 2002 WMP recommended that a drain water desalination facility commence operation between 2010 and 2015 with a 4,000 AFY facility to treat agricultural drainage water for irrigation purposes. The facility would be expanded to 11,000 AFY by 2025. Product water would be delivered to the Coachella Canal distribution system for non-potable use.

A brackish groundwater treatment pilot study and feasibility study was completed in 2008 (Malcolm-Pirnie, 2008a and 2008b). Reverse osmosis (RO) was recommended to meet water quality goals and provide additional flexibility in the level of water quality produced should the facility's objectives change in the future. The recommended approach to brine management was

to convey the RO concentrate via pipeline to constructed wetlands located at the north shore of the Salton Sea. This study concluded that agricultural drainage water can be treated for reuse as non-potable water and potentially as new potable water.

Recycling of Municipal Effluent

CVWD and DWA currently deliver approximately 14,000 AFY of recycled water in the West Valley for golf course and other large irrigation uses. Wastewater generated in the West Valley that is not reused for irrigation is percolated into the groundwater basin. Current recycled water usage in the East Valley is approximately 700 AFY for agricultural irrigation. East Valley wastewater that is not reused is discharged to the CVSC.

ES-4.2.3 Source Substitution

Source substitution involves the delivery of alternative water supplies, such as Coachella Canal water or recycled water, to replace of groundwater pumping. Significant efforts have been made to implement source substitution projects in the Valley.

Mid-Valley Pipeline (MVP)

In the West Valley, the demand for non-potable water typically exceeds the available recycled water supply, especially in the summer months. Golf courses using recycled water currently must supplement that supply with local groundwater to meet their demands. This limits the amount of overdraft reduction that is possible to the available recycled water supply. Groundwater modeling shows a local pumping deficit (overdraft condition) that cannot be remedied by recharge at Whitewater. The MVP is a pipeline distribution system to deliver Colorado River water to the Mid-Valley area for use with CVWD's recycled water for golf course and open space irrigation. This source substitution project will reduce groundwater pumping for these uses. Construction of the first phase of the MVP from the Coachella Canal in Indio to CVWD's Water Reclamation Plant No. 10 (WRP-10) (6.6 miles in length) was completed in 2009.

At WRP-10, Canal water supplements recycled water for delivery to large irrigators. There are eight golf courses and five other users in the West Valley currently connected to the WRP-10 recycled water system that can receive both recycled water and Canal water via the MVP. If these courses meet at least 90 percent of their irrigation needs with non-potable water, 2,700 AFY of additional groundwater pumping will be eliminated. There are four golf courses adjacent to the MVP that can be connected to the system with minimal construction, thus making them ideal candidates to receive Canal water through the MVP. Construction of Phase 1 of the MVP included outlets along the pipeline to serve these courses. However, pipeline connections to deliver Canal water from the MVP to each course have yet to be constructed. When these four courses are connected, about 4,500 AFY of additional pumping could be eliminated. At least ten additional courses can be connected to the MVP downstream of WRP-10 with relatively simple pipeline connections, reducing pumping by another 11,200 AFY. When fully implemented, the MVP system will be capable of eliminating about 50,000 AFY of groundwater pumping.

Pilot Study of Canal Water Treatment for Urban Use

As projected growth occurs in the East Valley and farms are converted to urban land uses, agricultural demand for Canal water will decrease. To avoid increased urban groundwater pumping and to use the Valley's Colorado River water supply fully, there will be a need to treat Canal water for urban use. The 2002 WMP anticipated this need and proposed that treatment be provided beginning in the late 2020s with about 32,000 AFY being treated by 2035. Present projected domestic water demand coupled with reduced agricultural demand is expected to increase this amount substantially. Potable use will require Canal water treatment to meet drinking water standards. In anticipation of constructing potable water treatment facilities, CVWD completed a pilot treatability study for Canal water in 2008 (Malcolm-Pirnie, 2008c). This study investigated alternative approaches to treatment of Colorado River water delivered for urban use. The study recommended that blending treated Colorado River water with local groundwater be further evaluated to ensure customer satisfaction.

ES-4.2.4 Groundwater Recharge

Groundwater recharge is a critical component of basin management that involves putting water directly into the groundwater basin through surface percolation ponds. The 2002 WMP included continuing recharge at the existing Whitewater Recharge Facility in the West Valley, proposed recharge in the East Valley using Colorado River water at Dike 4, now the Thomas E. Levy Groundwater Replenishment Facility (Levy facility), and recommended another major recharge facility at Martinez Canyon.

Whitewater Recharge Facility – West Valley

The 2002 WMP established a future average annual recharge target at this facility of about 100,000 AFY. The Whitewater River Recharge Facility has a recharge capacity in excess of 300,000 AFY. Because this capacity is enough to capture the full SWP Table A amount with additional capacity for supplemental recharge, no recharge capacity expansion is required. The available capacity is valuable for conjunctive use operations by CVWD and DWA as well as Metropolitan or other interested parties. Currently, the SWP Exchange supply is expected to provide about 78,000 AFY for the Whitewater facility on average. Under future conditions, it is possible that average recharge at Whitewater could be limited to the available future supply of about 61,400 AFY of SWP Exchange, unless it is augmented with other supplies. To reach the 100,000 AFY recharge goal for the Whitewater facility, CVWD and DWA would need to acquire additional SWP Table A Amounts or other imported water sources.

Thomas E. Levy Groundwater Replenishment Facility - East Valley

Construction of the full-scale Levy facility was completed in mid-2009. Located on the west side of the Valley in La Quinta, this facility has an estimated average recharge capacity of 40,000 AFY. The current capacity may be limited by hydraulic, water delivery, and maintenance constraints within the Canal water distribution system to an average of about 32,000 AFY. Construction of an additional pipeline to the Levy facility and pumping station from Lake Cahuilla may be required in the future to reach the 40,000 AFY capacity on a consistent basis.

Martinez Canyon Pilot Recharge Facility Feasibility Assessment – East Valley

The Martinez Canyon pilot recharge facility began operation in 2005 and currently recharges about 3,000 AFY. When this project is expanded to full scale, it is expected to recharge up to 40,000 AFY.

ES-4.2.5 Groundwater/Subsidence Monitoring

CVWD maintains an extensive ongoing groundwater production, level, and water quality monitoring program throughout the Valley. The program includes monitoring of potential saltwater intrusion from the Salton Sea. The data are periodically reviewed to determine impacts of management actions on overdraft and water quality. The data are also applied to re-calibrate the groundwater model that assesses the impact of proposed management actions.

The United States Geological Survey (USGS), working with CVWD, completed subsidence monitoring reports for the Coachella Valley in 2001 and 2007. The reports indicated that subsidence was taking place in varying degrees throughout the Valley.

These studies to date have not confirmed the relationship between land subsidence and declining water levels. The USGS Scientific Investigation Report 2007-5251 states, "Although the localized character of the subsidence signals is typical of the type of subsidence characteristically caused by localized ground-water pumping, the subsidence may also be related to tectonic activity in the valley." This report also concludes additional monitoring is needed to permit meaningful interpretations of the aquifer-system response to water level changes. CVWD's Board of Directors has approved additional funding to continue these cooperative subsidence studies with the USGS. Future studies include additional monitoring designed to evaluate the potential relationship between declining water levels and land subsidence. Potential land subsidence caused by declining water levels was addressed by mitigation measures described in the 2002 Coachella Valley Water Management Plan Programmatic Environmental Impact Report (CVWMP PEIR).

ES-5 2010 WMP UPDATE

Significant actions have been taken since 2002 to alleviate overdraft in the long term. Changes in internal and external factors mandate new activities and increased levels of current activities to eliminate overdraft and assure reliable long term water supplies to the Valley. These new activities are identified in the 2010 WMP Update.

ES-5.1 Population and Water Demand

Since 2002, significant changes have occurred in projections of population and future water demands, including:

- Significantly increased population growth, mainly in the East Valley (**Figure ES-2**);
- Changes in land use from agricultural to urban land use and water demand in terms of both quantity and quality;

- Development on tribal lands and related water demands;
- Potential development located northeast of the San Andreas fault in the spheres of influence (SOI) of the cities of Indio and Coachella;
- Projected urban development outside the 2002 WMP study area and corresponding increases in water demands;
- Uncertainty in the timing of growth and water demands.

Figure ES-2 shows the difference in population projections used in the 2002 WMP and projections used in the 2010 WMP Update. The 2010 WMP Update provides water for approximately 500,000 more people in 2045 than the 2002 WMP.

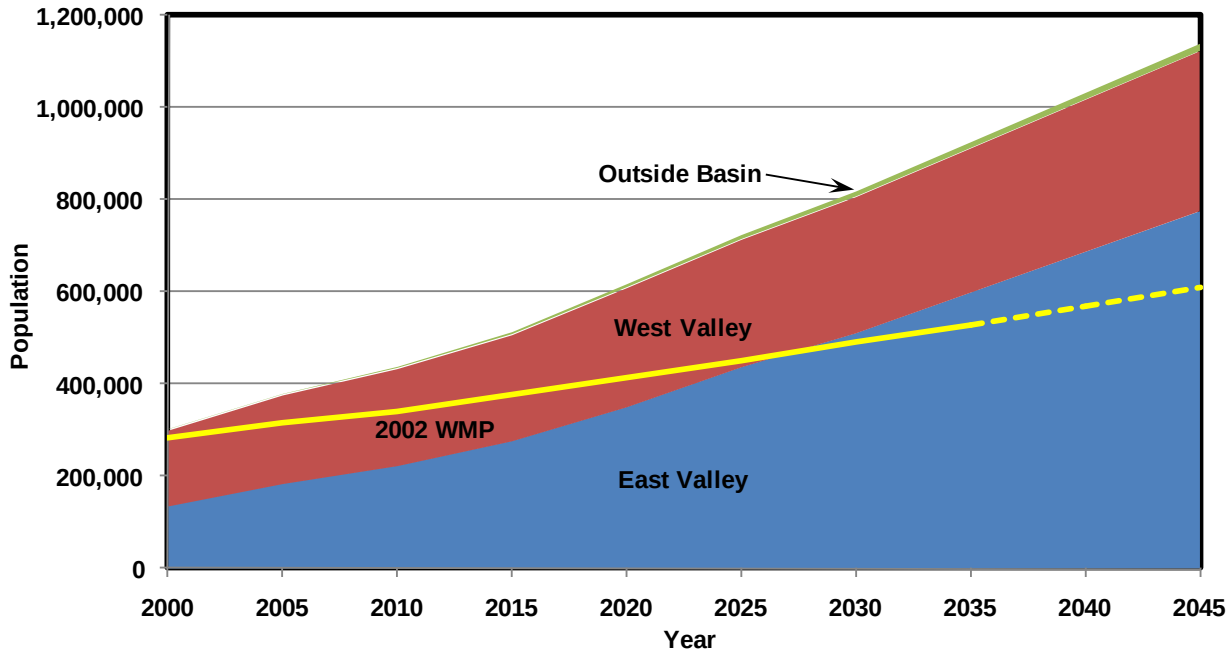

Figure ES-2
Comparison of Population Projections for the Coachella Valley

ES-5.1.1 Future Water Demands

Projected water demands for 2045 resulting from projected population growth and associated assumptions regarding land uses and water demands for land uses are shown by economic sector in **Table ES-4**. Water use by new development is expected to be more efficient due to plumbing code requirements and the Landscape Ordinance. Consequently, water demands are expected to be less than projected in the 2002 WMP. Factoring potential variations in future land use and growth forecasts into these demand projections, water demands in 2045 could range from 793,600 AFY to 971,500 AFY with a mid-range planning value of 885,400 AFY as shown on **Figure ES-3**. If the growth projection in the 2002 WMP, with assumed water conservation measures, were projected to 2045, the projected demand would be approximately 950,000 AFY.

The reduction in projected demand results primarily from the conversion of agricultural lands to urban use and increased water conservation factored into the 2010 WMP Update.

Table ES-4
2045 Baseline Water Demand Projection for the Coachella Valley

Component	2045
Agricultural	
Crop Irrigation	166,300
Total Agricultural Demand	**166,300**
Urban	
Municipal	537,000
Industrial	2,300
Total Urban Demand	**539,300**
Golf Course Demand	**169,500**
Fish Farms and Duck Clubs	
Fish Farms	8,500
Duck Clubs	2,000
Total Fish Farms and Duck Clubs	**10,500**
TOTAL DEMAND	**885,400**

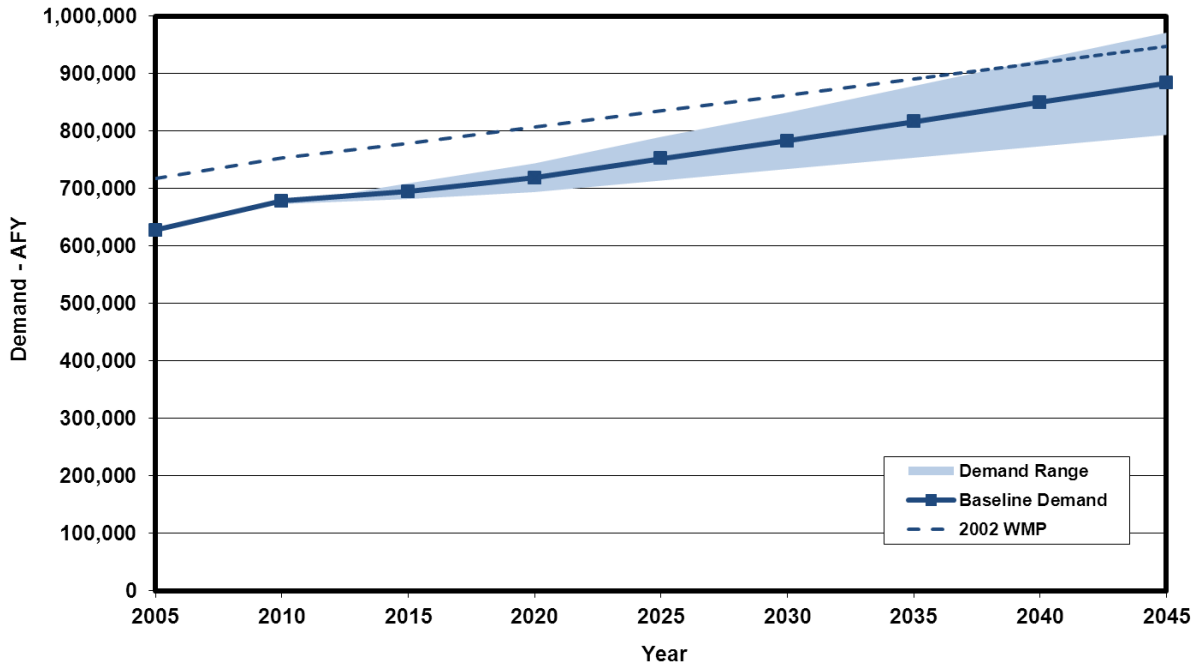

Figure ES-3
Projected Water Demands in the Study Area

ES-5.1.2 Demand Uncertainty

Future water demands are based on the latest approved population growth projections (2006) by Riverside County and assumptions regarding impacts of population growth on land uses, impacts of water conservation on water uses, and resulting water demand associated with each type of land use. There are a number of uncertainties inherent in the demand projections, including:

- Growth forecasts or rates of growth may be too high or too low
- Impacts of economic booms and busts
- Reductions in fish farm operations
- Rates of development on Tribal lands
- Rate of agricultural/vacant land conversion to urban use
- Future water demand factors for various land uses
- Growth outside the Whitewater River subbasin
- Number of future golf courses developed in the East Valley
- Acceptance and effects of water conservation measures

Figure ES-3 shows the range in potential future water demands for the study area.

ES-5.2 Future Water Supply Needs

In addition to changing water demands, changing external factors could affect Valley water supplies:

- SWP allocations fluctuate annually due to snowpack and runoff variations, and the environmental needs in the Bay-Delta.
- Recent environmental rulings have restricted the State's ability to move water through the Delta to the SWP, potentially decreasing supply reliability and deliveries. The degree to which the long-term supply of the SWP will be affected is uncertain.
- The outcome of efforts underway to prepare the Bay-Delta Conservation Plan (BDCP), which is intended to restore the Delta's ecosystem and improve water supply reliability, is uncertain.
- The QSA has been upheld in the appeals court but, as of plan adoption, environmental litigation is still pending, creating uncertainty in future Colorado River supplies.
- Climate change could affect the long term supplies of both the SWP and Colorado River and water demands within the Valley.

These changing conditions and uncertainties reinforce the need for a flexible long term Plan and for updating the Plan periodically.

Additional water supplies needed by 2045 are evaluated for four water supply scenarios that incorporate the uncertainties associated with current supply sources, with the exception of climate change. A 10 percent supply buffer addresses potential climate change impacts and other currently unforeseeable factors affecting future water supplies. **Table ES-5** shows the future water supply needs range from 300,000 to 461,000 AFY. The 2010 WMP Update identifies how this future need will be met through a combination of water conservation measures and new supply development. **Figure ES-4** presents the future water supply plan assuming Scenario 2 without the supply buffer.

Table ES-5
Water Supply Needs – 2045

Scenario	QSA Validated	Delta Conveyance Improvements	Demand (AFY)	Demand with 10% Buffer (AFY)	Available Supply (AFY) [1]	Additional Supply Required (AFY)
1	Yes	Yes	885,400	974,000	674,300	299,700
2	Yes	No	885,400	974,000	640,900	333,700
3	No	Yes	885,400	974,000	546,300	427,700
4	No	No	885,400	974,000	512,900	461,100

Note:
1 Available supplies consist of local runoff and streamflow, recycled water, returns from use, Canal water and SWP Exchange water minus anticipated drain flows and subsurface outflows from the basin as explained in Section 7.2.

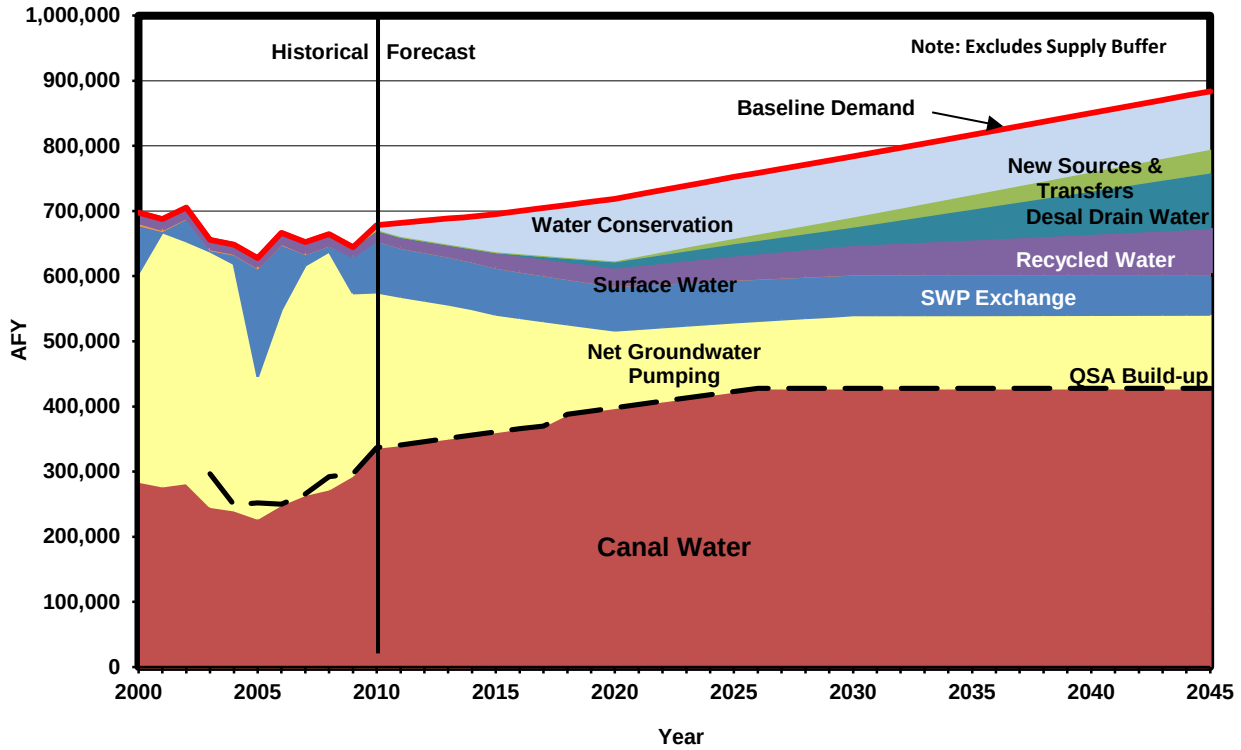

Figure ES-4
Water Supply Mix for 2010 WMP Update

ES-5.3 What is New in the 2010 WMP Update?

The 2010 WMP Update identifies proposed ways and means of meeting future water needs in light of changing conditions and uncertainties. To meet future needs, the 2010 WMP Update includes many new features in the areas of water conservation, source substitution, new supplies, and groundwater recharge. The 2010 WMP Update emphasizes enhanced cooperation in Plan implementation. The 2010 WMP Update incorporates a "bookends" approach to define target ranges for each major supply group and incremental "building blocks" of projects to deal with uncertainties in future demands and supplies.

Revised Goals: The basic goal of the WMP remains the same but has been modified to reflect a more holistic planning approach: "to reliably meet current and future water demands in a cost-effective and sustainable manner." The underlying objectives of the WMP have been refined as follows to reflect the water resources uncertainties facing the Valley:

- Meet current and future demands with a 10 percent supply buffer
- Eliminate long-term groundwater overdraft
- Manage and project water quality
- Comply with state and federal laws and regulations
- Manage future costs
- Minimize adverse environmental impacts

Bookends on Demands and Supplies: To account for the uncertainty and potential variability in demands, the 2010 WMP Update assigns bookend targets (ranges) for each of the major categories of water supplies (see **Section 6)**. The book-ends represent reasonable minimum and maximum amounts for potential supply and project development. Depending on the actual demands that are encountered in the future, the 2010 WMP Update elements can be implemented within these ranges to meet demands.

Building Block Approach: The 2010 WMP Update incorporates a flexible approach to meeting future needs that reflects uncertainties in supplies, demands and future circumstances by combinations of Plan elements. For example, the 2010 WMP Update includes an aggressive program of water conservation for urban, golf course and agricultural water users. However, there are limits in terms of cost, effectiveness, and acceptability of water conservation activities. As those limits are reached, other Plan elements for meeting future needs also can be adjusted. One source of supply is desalination of drain water, the most expensive alternative for providing new supplies. This source will only be implemented as other sources of supplies reach practical limits. Therefore, the Plan includes a range of 55,000 to 85,000 AFY for desalination of drain water. The actual amount of water from this source will depend upon how much can be obtained first from other, lower cost sources.

Enhanced Cooperation in Plan Implementation: The Plan emphasizes cooperation among municipalities, local water agencies and tribes in regional planning and implementation. This occurs through the implementation of activities described in the 2010 WMP Update,

implementation of related planning activities (see **Section 1.0**), and the development of monitoring and data sharing programs among CVWD, other water agencies, cities, and tribes to better manage Valley water resources.

ES-5.4 2010 WMP Update Elements

In developing the 2010 WMP Update, CVWD evaluated the success of 2002 WMP elements and determined future needs, supplies, and uncertainties. Like the 2002 WMP, the 2010 WMP Update has the same five major elements:

- Water conservation (urban, golf course, and agricultural)
- Increasing surface water supplies for the Valley from outsides sources
- Substitution of surface water supplies for groundwater (source substitution)
- Groundwater recharge
- Monitoring and evaluation of subsidence and groundwater levels and quality to provide the information needed to manage the Valley's groundwater resources

Activities included in the 2010 WMP Update in each of these elements are described below.

ES-5.4.1 Water Conservation

New water conservation targets and actions are included for agriculture, urban, and golf course water users. In addition to the water conservation included in the baseline demand projections, the 2010 WMP Update includes a minimum water conservation target of 117,300 AFY by 2045 as shown in **Table ES-6**. This amount could increase to 147,000 AFY to provide a portion of the supply buffer.

Table ES-6
Ranges of Potential Water Conservation Savings – 2045

Type of Conservation	Low Range [1] (AFY)	High Range [2] (AFY)
Urban	82,400	106,200
Agriculture [3]	23,300	23,300
Golf Courses	11,600	17,400
Total	**117,300**	**146,900**

Notes:
1 The low range represents the minimum amount of demand reduction required assuming successful completion of the BDCP and provides a portion of the supply buffer.
2 The high range represents the amount of demand reduction required if the BDCP is not successful and provides a portion of the 10 percent supply buffer.
3 Agricultural savings decline over time as agricultural land is converted to urban uses.

Agricultural Conservation

The new agricultural conservation target is a 14 percent savings by 2020 utilizing a phased approach. The first phase will involve low cost voluntary programs. Depending on the success of those programs, more expensive and vigorous programs could be implemented, as needed. If the 14 percent target can be achieved, the agricultural conservation program is expected to save about 39,500 AFY of water in 2020, decreasing to 23,300 AFY by 2045 as agricultural land uses transition to urban uses. Progress toward meeting agricultural conservation goals will be evaluated and reported every five years.

Urban Conservation

The urban water conservation program will be expanded and enhanced in order to meet changing demands and to comply with the State's requirement of a 20 percent reduction in per capita water use by 2020 compared to average per capita usage for the period of 1995 through 2004. This program could save at least 39,700 AFY by 2020 and achieve a 39 percent reduction in per capita demand by 2030 as it is applied to new growth.

Achievement of the state's 20 percent conservation target in conjunction with on-going conservation programs could result in urban water savings of 82,400 to 106,200 AFY by 2045 depending on the water supply scenario. Progress toward achieving the urban water conservation goals will be reported in urban water management plans prepared on five year intervals.

Golf Course Conservation

The golf course conservation target is a savings of 11,600 to 17,400 AFY by 2045. For existing courses, the minimum target is a 10 percent reduction in water use through golf course irrigation system audit, and soil moisture monitoring services. The 2009 Landscape Ordinance will apply to all new golf courses with turf limitations of 4 acres of per hole and 10 acres for practice areas. Progress toward meeting golf course conservation goals will be evaluated and reported every five years.

ES-5.4.2 Additional Supplies

Table ES-7 summarizes the range of additional supplies that will be developed.

Acquisition of Imported Supplies

CVWD and DWA will continue to acquire additional imported SWP water supplies by transfer or lease where cost-effective, given Delta environmental restrictions and conveyance capacity limitations. For this update, a planning range of 50,000 to 80,000 AFY of average annual supply has been identified to meet future needs including the supply buffer. This amount includes about 35,000 AFY to meet estimated demand east of the San Andreas fault; the amount will be refined as planning proceeds for this area. Changes to the assumed call-back frequency for the MWD 100,000 AFY SWP transfer could provide up to 33,000 AFY of additional supply to the

Whitewater River Subbasin. Option-type contracts could be considered to meet a portion of the supply buffer.

Table ES-7
Range of Additional Supplies Through 2045

Action	Low Range (AFY)	High Range (AFY)
Bay-Delta Conveyance Improvements	0	33,400
Purchases and Transfers [1]	50,000	80,000
Changes to MWD Call-back Provisions [1]	0	32,700
Increased Recycled Water - East and West Valleys	14,000	63,000
Recycled Water Use East of San Andreas Fault	10,800	10,800
Canal Water Loss Reduction	0	10,000
Desalinated Drain Water	55,000	85,000
Stormwater Capture – East Valley	0	5,000
Groundwater for Non-potable Use East of San Andreas Fault	9,700	9,700
Total	**139,500**	**329,600**

Note:
1 High range represents potential supplies with Bay Delta conveyance improvements and no call-back.

Increased Recycled Water Use

Recycled water in the West Valley is currently used beneficially, either through direct non-potable use or percolation for wastewater disposal. At least 90 percent of all wastewater generated in the West Valley will be recycled for direct non-potable use. All wastewater generated by new growth in the East Valley will be recycled. All wastewater from development east of the San Andreas fault could be recycled for irrigation or groundwater recharge to meet demands in that area and reduce the need for additional imported water supplies. Up to 34,500 AFY of recycled water could be utilized in the West Valley, and 33,000 AFY of recycled water could be utilized in the East Valley. Up to 10,800 AFY of recycled water could be utilized in the new growth area east of the San Andreas fault for direct non-potable uses by 2045.

Canal Water Loss Reduction

Water losses in the All-American Canal in the first 49 miles of the Coachella Canal may be as high as 10,000 AFY. Reducing this loss could increase the amount of water delivered to the Valley. CVWD will determine water lost to leakage in the first 49 miles of the Coachella Canal, evaluate the feasibility of corrective actions to capture the lost water, implement cost-effective water saving measures, and work with IID to share losses.

Desalinated Drain Water

A demonstration scale facility will be constructed to gain operational experience in desalinating drain water and brine disposal. Between 55,000 and 85,000 AFY of drain water and shallow

groundwater will be recovered, desalinated, and distributed for non-potable and potable uses in the East Valley. The amount of desalinated water needed will depend upon the resolution of Bay-Delta issues and the resulting amount of SWP water available.

Stormwater Capture

Stormwater capture has been identified as a potential method for increasing local water available for either groundwater recharge or direct use. CVWD will conduct a study to investigate the feasibility of additional stormwater capture in the East Valley. Feasible stormwater capture projects will be developed in conjunction with new flood control facilities as development occurs in the East Valley. For planning purposes, the potential yield is assumed to be 5,000 AFY based on a reduction in evaporation losses with more efficient capture and percolation.

Development of Local Groundwater Supplies for Non-Potable Use

Growth in the areas northeast of the San Andreas fault will create additional demands for both potable and non-potable water. CVWD, the City of Coachella, and the City of Indio will jointly conduct an investigation of groundwater in Fargo Canyon Subarea of the Desert Hot Springs Subbasin to determine the available supply and suitability for use in meeting non-potable demands (outdoor irrigation) of development east of the San Andreas fault. Based on assumed development, up to 9,700 AFY of groundwater could be developed in this area.

ES-5.4.3 Source Substitution

Due to the expected changes in water use patterns from continued development, source substitution will receive increased emphasis in the future to eliminate overdraft and ensure full use of the Valley's available surface water supplies. The ranges of reduction in groundwater overdraft due to source substitution programs are shown in **Table ES-8**.

Table ES-8
Range of Groundwater Pumping Reductions Due To Source Substitution

Action	Low Range (AFY)	High Range (AFY)
Mid-Valley Pipeline	37,000	52,000
Agricultural Canal Water Conversion	5,300	32,000
Oasis Area Conversion to Canal Water	0	27,000
East Valley Golf Course Conversion	43,900	51,700
West Valley Golf Course Conversion	15,200	17,800
Canal Water for Indoor Urban Use – East Valley	48,000	90,000
Canal Water Use for Outdoor Use – East Valley	95,000	115,000
Total	**244,400**	**385,500**

Mid-Valley Pipeline

The MVP system delivers Canal water and recycled water to golf courses in lieu of their pumping groundwater. Activities to fully implement the MVP include preparing an MVP system master plan to lay out the future pipeline systems, near-term expansions to connect golf courses along the MVP alignment and extensions of the existing non-potable distribution system, and completion of construction of the remaining phases of the MVP system by 2020 to provide up to 37,000 AFY of Canal water and 15,000 AFY of WRP-10 recycled water on average to West Valley golf courses.

Conversion of Agricultural and Golf Course Use to Canal Water

It is expected that agricultural use of groundwater could decrease from about 66,000 AFY in 2009 to about 7,000 AFY by 2045, a decrease of 59,000 AFY or 89 percent. A large portion of this reduction could come from the Oasis area that does not currently have access to Canal water. The Oasis area distribution system feasibility study will be updated to include future conversion to serve urban non-potable water. Cost-effective facilities will be constructed. If conversion of the Oasis system is feasible, it could deliver up to 27,000 AFY of Canal and desalinated drain water for irrigation.

In the 2010 WMP Update, it is estimated that for existing East Valley golf courses having Canal water access, Canal water use will increase to 90 percent of demand by 2015. Conversion to Canal water by East Valley golf courses will reduce groundwater use by 43,900 AFY or more.

Colorado River Water for Urban Use

In light of the projected increase in population and change of land use from agricultural to urban in the East Valley, treated Colorado River water for indoor residential use will be essential. In addition, untreated Colorado River water will be used in the future in large developments in the East Valley for outdoor purposes, i.e., lawn and park irrigation. These measures are necessary to reduce overdraft and to insure continued full use of the Valley's Colorado River water supplies.

This program will offset the reduced Canal water use by agriculture as agricultural land use transitions to urban development in the East Valley. Canal water will be treated to meet future indoor urban water demands in the East Valley. The target for urban indoor use of Canal water ranges from 48,000 and 90,000 AFY by 2045.

Dual source plumbing systems will be a feature of new development in the East Valley to provide outdoor use of untreated Canal water. Untreated canal water should provide 67 percent to 80 percent of the landscape demand for new development. This will result in the utilization of 95,000 to 115,000 AFY of non-potable Canal water by 2045. Where found to be cost-effective, existing developments will be retrofitted with distribution systems to provide for outdoor use of untreated Canal water.

ES-5.4.4 Groundwater Recharge

Groundwater recharge will be expanded to reduce overdraft. The ranges of groundwater recharge operations at various facilities under the 2010 WMP Update are shown in **Table ES-9**.

Table ES-9
Range of Groundwater Recharge

Facility	Low Range (AFY)	High Range (AFY)
Whitewater	61,000 [1]	100,000
Levy	40,000	40,000
Martinez Canyon [2]	20,000	40,000
Indio	0	10,000
Total	**121,000**	**190,000**

Notes:
1 Recharge is limited by available supply.
2 High range will depend on overdraft conditions and implementation of East Valley source substitution projects.

Whitewater Recharge Facility

Operation of the Whitewater Recharge Facility will continue with the goal of recharging an average of at least 100,000 AFY of SWP exchange water over the long-term. Unused SWP water and available desalinated drain water from the QSA will be transferred to the Whitewater Recharge Facility. Additional water acquired by transfer or lease will augment the existing SWP exchange water.

Thomas E. Levy Recharge Facility

The Levy facility will recharge 40,000 AFY on average. A second pumping station and pipeline will be constructed if needed to achieve and sustain 40,000 AFY of deliveries for recharge.

Martinez Canyon Recharge

Siting studies, land acquisition, environmental compliance, design, and construction will be conducted for the full-scale Martinez Canyon facility. The project will be implemented in phases with an initial capacity of 20,000 AFY with potential future expansion to as much as to 40,000 AFY based on groundwater overdraft conditions and implementation of East Valley source substitution projects.

Groundwater Recharge in Indio

The City of Indio will evaluate the feasibility of a nominal 10,000 AFY groundwater recharge project in Indio and construct if feasible. The final capacity will be based on pilot studies conducted by Indio.

Investigation of Groundwater Storage Opportunities with IID

CVWD will work with IID to identify options for storing Colorado River water on behalf of IID with currently planned Valley recharge facilities or additional facilities, including facilities to recover the stored water for use by Canal water users if necessary when IID calls for its stored water.

ES-6 WATER QUALITY MANAGEMENT

ES-6.1.1 Additional Groundwater Treatment for Arsenic

CVWD will work with other agencies to assist communities having high levels of arsenic in groundwater supplies to connect to the potable water system. As needed, CVWD will expand its arsenic treatment facilities to allow treatment of additional wells and construct water transmission pipelines as needed to meet future demands.

ES-6.1.2 Development of Salt/Nutrient Management Plan

The State Water Resources Control Board (SWRCB) requires preparation of a salt/nutrient management plan by 2014 as part of the 2009 State Recycled Water Policy. As stated in the Policy, its purpose is to "establish uniform requirements for recycled water use and to develop sustainable water supplies throughout the state" (SWRCB, 2009). CVWD will work with other Valley water agencies, tribes, and stakeholders to develop a salt/nutrient management plan that meets the State requirements and allows the cost-effective recycling of municipal wastewater in the Valley.

ES-6.1.3 Drainage Control

For both basin management (groundwater level and salt export), as well as the prevention of adverse impacts, the existing drainage system should be maintained, replaced as needed, or expanded as urban development occurs. CVWD will investigate alternative methods for funding the drainage system, conduct an investigation of the improvements needed to continue system operation in the future, and maintain and expand the drainage system.

ES-7 MONITORING AND DATA MANAGEMENT

Monitoring and data management programs aid in evaluating the effectiveness of the water management programs and projects identified in the Plan and to identify needed changes in management strategy and/or implementation.

The existing hydrologic monitoring program of weather data, streamflow data, well data (drilling logs, production, water levels), surface and ground water quality monitoring, and subsidence monitoring should be maintained and expanded. Key features of the expanded program are described below.

ES-7.1 Water Quality

CVWD will work with water agencies, tribes and cities to develop a coordinated water quality monitoring program to ensure that local water quality concerns and state/federal regulatory issues are addressed.

ES-7.2 Subsidence

CVWD will continue the USGS subsidence monitoring/reporting program and construct additional extensometers at critical locations to monitor subsidence, as needed.

ES-7.3 Water Resources Database

CVWD will work with water agencies, cities and tribes to develop a shared water resources database. The database could include well ownership data, well logs, groundwater production, water level and water quality data.

ES-7.4 Groundwater Model Update and Recalibration

Prior to the next Plan update, the CVWD groundwater model will be updated, recalibrated and peer reviewed.

ES-7.5 Water Quality Model

CVWD will initiate development of a model capable of simulating the water quality changes in coordination with preparation of the salt/nutrient management plan.

ES-7.6 Water Demand and Conservation Monitoring

Water purveyors will monitor and report demands by water use sector and correlate demands with implementation of water conservation measures to determine the effectiveness of water conservation measures in achieving goals and the need for additional measures.

ES-8 PLAN COSTS

The cost of not eliminating overdraft would be far more than the cost of the actions needed for eliminating overdraft identified in the 2010 WMP Update. Cost of overdraft includes increased subsidence with its impacts on individual homes, commercial structures, and infrastructure (streets, highways, water and sewer lines, and other utilities), water quality degradation, and increased pumping costs. Colorado River supplies would go unused as agricultural land is converted to urban land, and groundwater pumping would increase without alternative sources of supplies. At some point, it would not be possible to demonstrate the availability of water supplies to support new growth.

The estimated cost to implement the 2010 WMP Update is shown in **Table ES-10** for the period 2011 through 2045. Capital, operation and maintenance cost, total cost, and average annual cost are shown for each Plan element in 2010 dollars. These are total costs, not incremental costs,

and include the costs of many current activities such as groundwater pumping, acquisition of Colorado River water, current levels of recycling and water conservation, and groundwater recharge. The costs shown are the total costs for the entire Valley.

Table ES-10
Cost by Plan Component
2011-2045

Component	Total Capital Cost $millions	Total O&M Cost $millions	Total Cost $millions	Average Annual Cost[1] $millions
Water Conservation	$ 1	$ 230	$ 231	$ 6.6
Recycled Water	161	153	314	9.0
Colorado River Water		409	409	11.7
SWP Water		1,907	1,907	54.5
Delta Conveyance		472	472	13.5
Desalinated Drain Water	462	277	739	21.1
Groundwater Pumping and Treatment	135	1,950	2,085	59.6
Water Transfers	0	282	282	8.1
Other New Water		262	262	7.5
Source Substitution	1,142	782,	1,924	55.0
Recharge	48	181	229	6.5
Total Cost	**$1,949**	**$6,907**	**$8,856**	**$253.0**
Average Annual Cost [1]	$56	$197	$253	

Note:
1 Average annual cost is the total cost divided by 35 years.

The total estimated capital cost through 2045 is $1.95 billion. Total O & M cost is $6.91 billion bringing the total cost of the Plan implementation to $8.86 billion over 35 years. The average annual cost is $253 million. This annual cost does not reflect the amortized cost of capital projects that may be bond-funded over several decades, thus increasing the annual cost of capital projects.

ES-9 IMPLEMENTATION AND IMPLEMENTATION COSTS

In developing the 2010 WMP Update, CVWD relied on the latest population projections developed by Riverside County. CVWD does not develop population growth projections for use in water management planning. The 2006 Riverside County projections were prepared before the recent recession, which has slowed growth and is expected to have negative effects on growth in the near term. Over the long term, growth will continue. Future population projections will be adjusted in terms of the timing and magnitude of growth. These realities necessitate adjustment of Plan implementation to meet actual near term needs and continued updates of the Water Management Plan in the future to reflect revised population projections.

Near Term Projects to Meet Water Management Needs

Even with the current recession and lack of growth, continuation of existing projects and a few new projects are needed to reduce overdraft and its adverse affects. Ongoing projects that will be continued include:

- Whitewater Recharge with SWP Exchange Water and SWP purchases
- Implementation of the QSA
- Levy Recharge operating at current level of 32,000 AFY
- Martinez Pilot Recharge at current level of 3,000 AFY
- Water conservation programs at current levels, including implementation of the Landscape Ordinance
- Recycling in the West Valley
- Increased use of Canal water by golf courses with Canal water connections
- Conversion of East Valley agriculture to Canal water as opportunities arise
- Groundwater production/level/quality monitoring
- Cooperative subsidence monitoring with USGS

Assuming that growth remains relative low during the next five years, CVWD will focus on three new or expanded activities to reduce overdraft and comply with state regulations:

- Increased use of the Mid-Valley Pipeline project to reduce overdraft in the West Valley by connecting golf courses and reducing groundwater pumping by those courses.
- Implementation of additional water conservation measures, including the Landscape Ordinance, to meet the State's requirement of 20 percent conservation by 2020.
- Preparation of a salt/nutrient management plan for the Valley by 2014 to meet SWRCB Recycled Water Policy requirements

Long Term Projects

Projects to eliminate and control overdraft that are likely to be needed as future growth occurs are described in the 2010 WMP Update. These projects include:

- Additional water conservation.
- Desalinated drain water.
- Additional water transfers.
- Additional recycled water.
- Canal water treatment for urban indoor use.
- Canal water treatment for urban outdoor irrigation.
- Recharge in the Indio area.

As growth ramps up, the projects will be implemented based on cost effectiveness and need.

Implementation Costs

In 2010, Valley water agencies expended approximately $414 million on all water and wastewater management activities. This total cost includes approximately $106 million per year on activities associated with eliminating overdraft. Since 2002, CVWD and DWA have invested over $240 million in water conservation, supply acquisition and facilities to reduce overdraft. During the next five years (2011-2015), it is estimated that Valley water agencies will expend an additional $5.4 million on activities to eliminate overdraft, assuming growth remains slow.

As growth occurs, additional projects to control overdraft will be needed. Ultimately, costs associated with growth to eliminate and control overdraft could approach an additional $100 million per year in capital project and annual operations and maintenance costs.

Much of the future costs, both capital and operation and maintenance, will not be borne by CVWD. These costs will be borne by developers, other water organizations, and Valley municipalities. Capital costs and operation and maintenance costs associated with new growth will be paid by new growth. For example, the entire cost of systems for treating and delivering Colorado River Canal water for indoor use in East Valley developments and development of dual plumbing systems to provide untreated water to those developments for outdoor use will be paid for by new development.

ES-10 CONCLUSION

Groundwater overdraft is a significant problem in the Coachella Valley. The 2002 Water Management Plan was developed to identify and guide the long term implementation of measures to eliminate groundwater overdraft in the Valley. Since completion of the 2002 Water Management Plan, much has been accomplished by Valley water agencies and agricultural, municipal/residential, and golf course water users to reduce overdraft. Water conservation efforts have expanded, out-of-basin water supplies have increased, surface water and recycled water use is being used in lieu of groundwater, and new groundwater recharge facilities are online and an additional facility is being developed.

However, changing future demands and water supply uncertainties require additional actions to eliminate groundwater overdraft in the future, which are identified in the 2010 WMP Update. Continued implementation of the Water Management Plan will result in unavoidable costs for water users and water agencies alike. Each agency, including CVWD, will consider costs, available resources, funding mechanisms and priorities to eliminate overdraft in a timely manner. The success of the Plan to date indicates broad support for eliminating overdraft and the threats to the economy and quality of life in the Coachella Valley.

The CVWD Board of Directors certified the Supplemental Program EIR and adopted the 2010 WMP Update on January 24, 2012.

APPENDIX D

2014 Status Report for the 2010 Coachella Valley Water Management Plan Update

2014 Status Report

for the

2010 Coachella Valley Water Management Plan Update

Prepared for:

Board of Directors
of the
Coachella Valley Water District

Prepared by:

Patti Reyes, Planning and Special Programs Manager, Coachella Valley Water District
David Ringel, Principal Water Resources Engineer, MWH

2014 Status Report Overview

The purpose of this 2014 Water Management Plan Status Report (2014 Status Report) is to accomplish the following:

1. Evaluate changes in the planning environment that impact water demand projections and warrant adjustments to the 2010 Coachella Valley Water Management Plan Update (2010 WMP Update).

2. Review the effectiveness of the 2010 WMP Update including overdraft reduction progress.

3. Evaluate implementation progress of the 2010 WMP Update programs and recommend new implementation targets.

The 2014 WMP Status Report demonstrates that the 2010 WMP Update is working. Continued implementation ensures that long-term overdraft will be eliminated by 2021 with increased groundwater levels in the Palm Springs area and the East Valley. Groundwater levels in the Mid-Valley Area will continue to decline until programs are implemented in this area to reduce groundwater pumping. These Mid-Valley programs include urban conservation programs to reduce municipal pumping 20% by 2020; source substitution programs including non-potable water system expansion to golf courses and Colorado River treatment for domestic water use; and direct groundwater recharge.

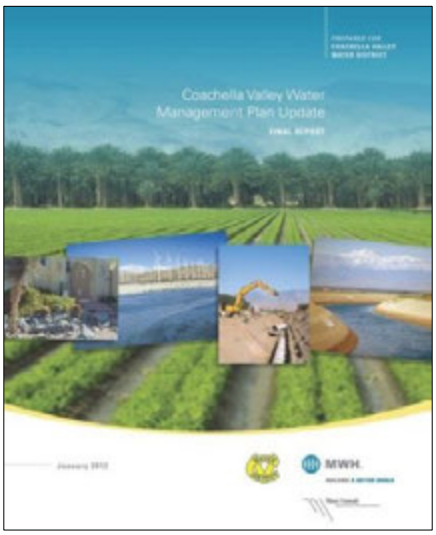
The most significant change in the planning environment is that regional growth projections have been reduced to reflect the impacts of the sustained economic downturn. Population projections through 2045 are reduced in the 2014 Status Report based on revised regional growth projections. The result is that long-term water demands increase at slower rate and estimated total water demand in 2045 is approximately 14% lower in the 2014 Status Report than in the 2010 WMP Update. It is estimated that the 2010 WMP Update demands will not be realized until after 2055 allowing more time to plan for future needs.

The 2010 WMP Update Implementation Plan is summarized in **Table 8-1** of the Plan. **Table 8-1** has been revised and is included in this document as **Table 8-1 REVISED - for the 2014 Status Report**.

Purpose of 2010 WMP Update

The Coachella Valley Water District (CVWD) adopted the Coachella Valley Water Management Plan in 2002 (2002 WMP) to eliminate groundwater overdraft. The Plan was updated in 2010 in response to changes in the water planning environment such as increased growth projections and reduced State Water Project (SWP) reliability. The 2010 Coachella Valley Water Management Plan Update (2010 WMP Update) was adopted by the CVWD Board of Directors in January 2012, following completion of a supplemental program environmental impact report. This plan has a 35 year planning horizon and serves as a roadmap for water resources planning and development for the Coachella Valley.

The 2010 WMP Update focuses on a flexible management approach that allows CVWD to increase or decrease the magnitude and implementation rate of Plan elements in response to changes in supply availability, population projections, and water demands. The 2010 WMP Update uses a "building block approach" so that new supply increments and projects are developed as needed, rather than in response to a pre-defined schedule. Consequently, periodic review of water demands, supplies and implementation progress is an important element of the planning process. This 2014 Status Report is the first periodic review of the 2010 WMP Update.



The goal of the plan is to reliably meet current and future water demands with a 10 percent supply buffer in a cost-effective and sustainable manner. The key water management plan elements identified to meet this goal are:

- Water conservation
- Acquisition of additional imported water supplies
- Development of local water supplies such as recycled water and desalinated drain water
- Source substitution
- Groundwater recharge

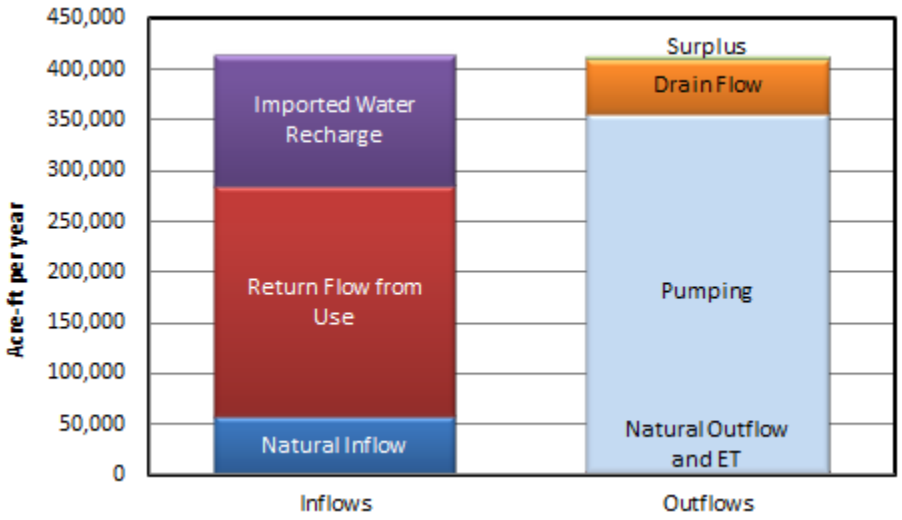
The 10 percent supply buffer is necessary to protect against unanticipated loss of supplies and growth.

2014 Overdraft Status

The California Department of Water Resources defines overdraft as the condition of a groundwater basin in which the amount of water withdrawn by pumping exceeds the amount of water that replenishes the basin over a period of years during which water supply conditions approximate *average* conditions. The 2010 WMP Update estimates *long-term* overdraft using a calculation of change in storage based on long-term local hydrology and imported water deliveries. Change in storage is calculated by subtracting total basin outflows from total basin inflows.

In the Coachella Valley groundwater basin, water is withdrawn by pumping, through natural outflow and agricultural drain flows to the Salton Sea, and through evapotranspiration from native vegetation with root systems. The only sources of groundwater basin replenishment are natural inflow from storms, return flows from irrigation, and imported water recharge. **Figure 1**, on page 3, shows that in the last ten years inflows have exceeded outflows with a slight surplus meaning the groundwater basin has not been in overdraft over the specified ten-year period, and the amount of groundwater in storage has slightly increased. This was accomplished by implementation of conservation and source substitution programs which reduce pumping, and by receiving Table A allotments and advanced deliveries of State Water Project water supplies via CVWD's and DWA's advanced delivery agreement with Metropolitan Water District of Southern California.

Figure 1
Average Inflows and Outflows from 2003 through 2012



It is important to note that although drain flows to the Salton Sea are outflows, they consist of higher salinity discharges and serve as a means of exporting salt from the groundwater basin which reduces the rate of increase in groundwater salinity over time. As overdraft is eliminated and groundwater levels increase, drain flows are predicted to increase exporting additional salt from the groundwater basin. The 2010 WMP Update proposes to recycle a portion of drain flows in the future to satisfy future increases in demand.

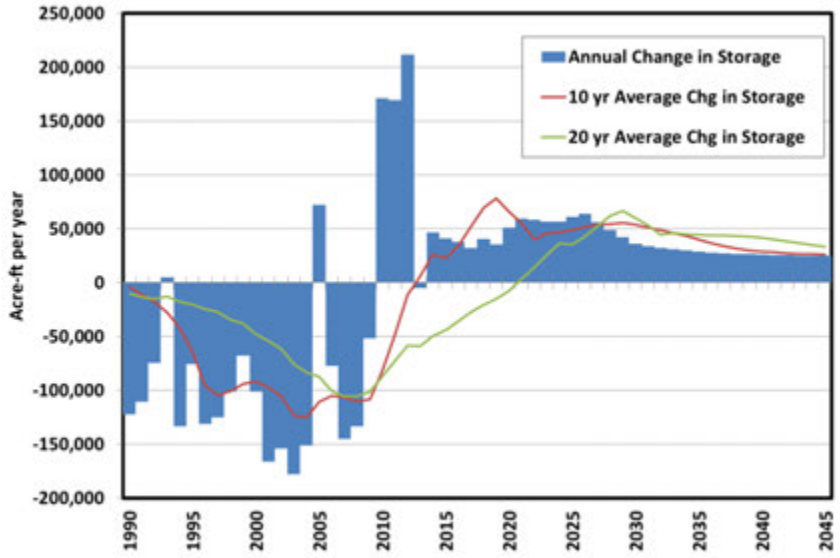
In addition to looking at average inflows and outflows over the last ten years, the annual change in storage from 1990 to 2045 is shown in **Figure 2** and shows long-term progress toward eliminating overdraft. **Figure 2** estimates future annual changes in storage based on the following assumptions:

- Natural inflows and outflows are based on average hydrologic conditions.
- Long-term State Water Project reliability is estimated to be 50%.
- Colorado River Water Supplies will be fully utilized within the groundwater basin.
- 2010 WMP Update programs including conservation, source substitution and recharge programs will continue to be implemented.

Figure 2 illustrates the benefits of fully utilizing and storing imported water supplies for the future. For instance from 2010 to 2013, approximately 260,000 acre feet of advanced deliveries were recharged at the Whitewater Replenishment facility. This amount is in addition to CVWD's and DWA's Table A allotments that were recharged. These advanced deliveries resulted in a significant increase in both 10-year and 20-year average storage volumes. **Figure 2** shows that with successful 2010 WMP Update implementation, long-term overdraft is eliminated in 2021.

Figure 2

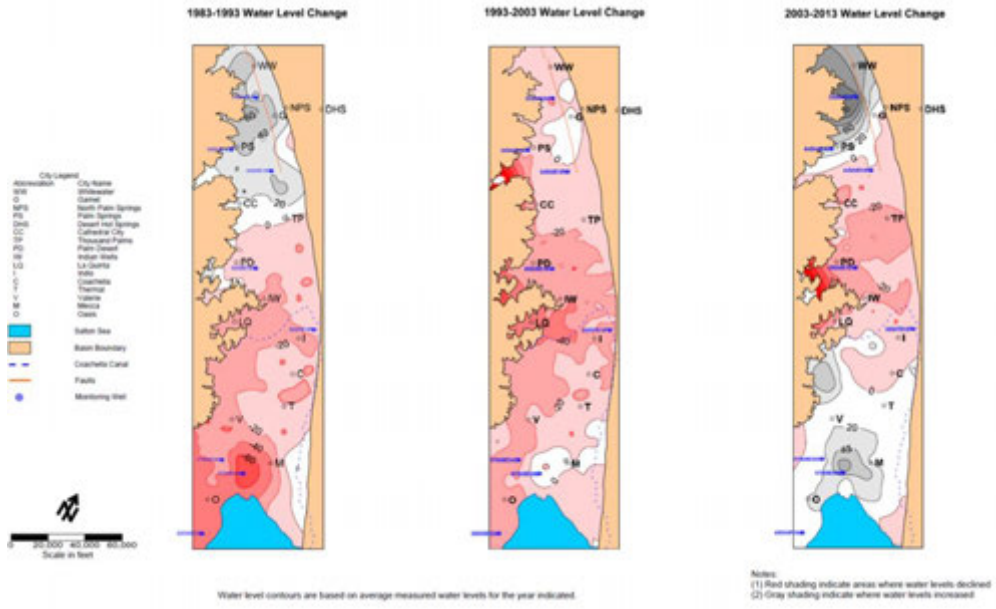
Status of the Overdraft - Annual Change in Storage



It is important to note that even with the recent positive change in groundwater storage, groundwater levels still continue to decline in portions of the Coachella Valley. **Figure 3** shows that increased groundwater levels, shown in gray, have occurred in the Palm Springs area and the East Valley from 2003 to 2013. However decreased groundwater levels, shown in pink, in the Mid-Valley Area will continue until 2010 WMP Update Programs are implemented in this area to reduce pumping. These programs include urban conservation programs to reduce municipal pumping 20% by 2020; source substitution programs including non-potable water system expansion to golf courses and Colorado River treatment for domestic water use; and direct groundwater recharge.

Figure 3

Water Level Changes over the last 30 years in 10-year Increments



Specifically, **Figure 3** shows that in the ten-year period from 1983 to 1993, groundwater level decline was most severe in the East Valley while groundwater levels in the West Valley were stable and actually increasing in the vicinity of Palm Springs and Cathedral City due to large advance deliveries of State Water Project (SWP) that occurred at the Whitewater Replenishment Facility from 1984 through 1986. In the ten-year period from 1993 to 2003 low recharge levels at Whitewater Replenishment Facility resulted in groundwater level decline. Until 2003, CVWD's and DWA's combined Table A allocation was only 62,000 afy and urbanization was causing increased groundwater pumping. Because of these continued groundwater level declines, the first WMP was adopted in 2002. One of the key implementation efforts of that first plan was to increase imported water supplies. CVWD's and DWA's combined allocation is now 194,100 afy and delivery is subject to annual SWP reliability. In the ten-year period from 2003 to 2013 the benefits of additional recharge at Whitewater and Thomas E. Levy replenishment facilities are verified by the increase in groundwater levels at east and west ends of Valley. Reductions in pumping, especially in the East Valley also contribute toward this upward trend. However, in spite of recharge and increases in storage, declining water levels are still occurring in the Mid Valley Area.

Factors Affecting Future Water Needs.

The population projections utilized in the 2010 WMP Update have been updated with current population projection data. The new lower population projections result in lower future water demands during the 35-year planning period.

In April 2014 CDPH adopted a standard of 10 µg/L for chromium-6, putting approximately 50% of the municipal wells in the Coachella Valley are out of compliance. It is anticipated that this new standard will expedite the need to treat Colorado River water for municipal use in portions of the Coachella Valley. Both factors are discussed below.

Recent Population Trends

Population in the Coachella Valley is estimated to have increased from 318,125 in 2000 to 421,146 in 2010, an average annual increase of 10,300 people per year and a corresponding average growth rate of 3.2 percent per year (US Census, 2010). According to the US Census, most of the growth from 2000 to 2010 occurred in the incorporated areas of the Coachella Valley. Based on California Department of Finance (CADOF) population estimates, annual growth rates within the Coachella Valley cities reached a high of 18,000 people per year or 5.65 percent per year in 2005 prior to the recession. Some of the greatest increases in population occurred in the cities of Coachella, La Quinta, Indio, and Desert Hot Springs. These cities had population increases ranging from 55 percent in Indio to 80 percent in Coachella over a ten year period.

Since 2010, growth rates within the Coachella Valley cities have averaged about 5,500 people per year or 1.3 percent based on CADOF estimates. CADOF population estimates are based on changes in indicators such as housing unit counts, home vacancy rates, driver's license address changes, births and deaths, school enrollment, and foreign and domestic migration data. CADOF population estimates show a slight decrease in population for unincorporated Riverside County as a whole, and show virtually all

growth occurring within the incorporated cities of the Coachella Valley. While several large developments have been approved within the unincorporated areas of the Valley, few of these have proceeded to construction.

The Coachella Valley has a significant seasonal population, especially during the winter months. Seasonal population is not counted in the US Census or estimated by the CADOF. Consequently, reliable estimates of seasonal population do not exist. The City of Palm Springs estimates 30,000 to 35,000 people live in the city on a seasonal basis in addition to its 45,000 permanent population (Palm Springs, 2011). A study for the Greater Palm Springs Convention Center and Visitors Bureau estimated 5.1 million annual overnight visitors and 6.4 million day trip visitors to the Valley in 2011. While the seasonal and visitor population clearly have an effect on water usage, in the 2010 WMP Update total water use is divided by permanent population to determine per capita water use. Thus the water use by both visitors and permanent residents is reflected in both per capita and total water use projections. Consequently, as long as the ratio of visitor to permanent population remains roughly the same in the future, no adjustments are required to estimate future water needs of visitors.

The principal sources of population data for the Coachella Valley are:

- **RCP06** - Riverside County Center for Demographic Research 2006 growth forecasts were the most detailed data available at the time that the Plan baseline was established. They were adopted by CVAG and SCAG and used to develop the Regional Transportation Plan (RTP).
- **SCAG RTP 2008** – The Southern California Association of Governments Regional Transportation Plan projections for 2008 were the same as the RCP06 projections.
- **RCP10** – In 2010 before Census data was available, the Riverside County Center for Demographic Research adjusted the RCP06 downward to account for the economic downturn.
- **2010 Census** - United States Census data for 2000 and 2010 (Decennial Census) is available in GIS Census blocks for the Coachella Valley.
- **SCAG RTP 2012** – the Southern California Association of Governments adjusted the RCP2010 projections downward based on the 2010 Census.
- **CADOF 2000 through 2013** - The California Department of Finance Demographic Research Unit annually estimates current populations by city and county (total unincorporated county). Specific data for unincorporated areas of the Coachella Valley is not considered separately.

The 2010 WMP Update used the 2006 Riverside County Projections (RCP06) as the basis for urban water demand projections. The RCP06 projections were adopted by the Coachella Valley Association of Governments (CVAG) and the Southern California Association of Governments (SCAG) as part of the 2008 Regional Transportation Plan. In order to calculate future demands in the 2010 WMP Update, per capita water use was reduced for current and future users by applying the 2010 WMP Update conservation targets. Then the future per capita demands were multiplied by the population projections to determine total future urban demand. Since population projections only extend to 2035, a straight line projection of the average slope was used to estimate 2045 demands. The RCP06 projections were established during a period of significant economic growth and development. In the

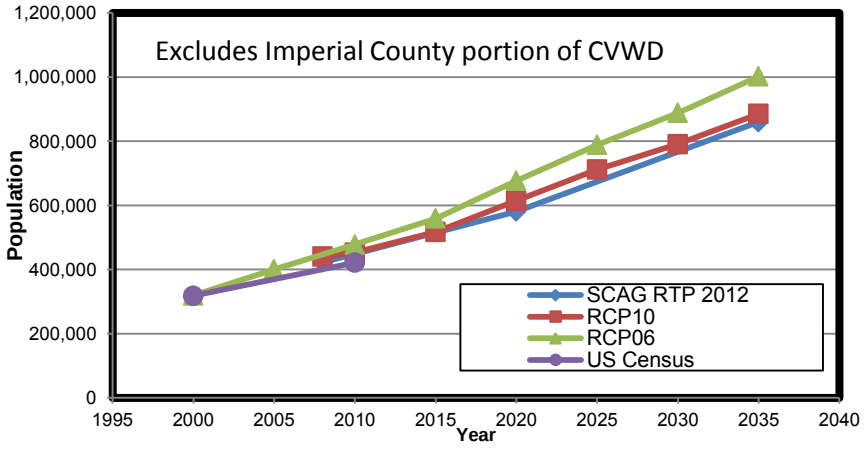
years immediately following publishing of the RCP06 projections and before the 2010 WMP Update was complete, the nation experienced a severe economic recession impacting housing development and population growth in the Coachella Valley. The economy is now showing signs of improvement but at a slower rate than was projected in RCP06.

Figure 4, presents a comparison of the available growth forecasts and the Census data. Based on the SCAG RTP 2012 growth forecast, significant population growth in the Valley is still expected over the next 25 years. Growth within the cities is expected to add about 215,000 people while growth in the unincorporated portions of the Valley will add about 220,000 people by 2035. The total population within the WMP study area is expected to be about 812,000 by 2035, more than double the current population. Assuming growth continues at this rate beyond 2035, the population in the WMP study area would reach almost 990,000 by 2045. In comparison, the 2010 WMP Update estimated a population of 1,120,000 in 2045 (excluding the Imperial County portion of CVWD). The population of the Mission Creek area would increase from 44,600 in 2010 to 96,000 by 2035 and 110,000 by 2045 based on the RCP10 projection. The following observations are made regarding the projections:

- CADOF's reported population estimates for Coachella Valley cities continue to increase but at a lower rate than prior to the recession. The rate of increase is currently less than the SCAG RTP 2012 rate of increase.
- RCP10 projections are lower than the RCP2006 projections for the CVAG area as a result of the prolonged recession.
- SCAG RTP 2012 projection for the Coachella Valley area is about 40,000 people lower than the RCP10 projection. This difference is believed to be the use of the actual 2010 Census numbers as a starting point. No breakdown between East and West Valley population is readily available for this projection.

The 2010 WMP Update assumed that growth would occur equally on vacant desert land and existing agricultural land. Consequently, a decline in agricultural land use (and corresponding water demand) is expected as growth occurs.

Figure 4
Comparison of Coachella Valley Growth Forecasts



Summary of WMP Impacts Related to Growth Projections

The 2014 Status Report recommendation is that population projections are reduced from 1,136,739 in 2045 published in the 2010 WMP Update, to approximately 920,000 , based on SCAG RTP 2012 projections. This is approximately an 18 percent reduction in population in 2045 compared to that of the 2010 WMP Update. **Table 1** on Page 9, shows revised water demand projections compared to the 2010 WMP Update demand projections. The Table 1 values were determined by revising the basis for the 2010 WMP Update population projections from RCP06 to SCAG RTP 2012. While urban and golf course demands are reduced by 22 percent and 16 percent, respectively, agricultural demand is increased by approximately 13 percent. This agricultural demand increase results from a slower rate agricultural land conversion to urban uses. Total reduction in 2045 water demands is approximately 14 percent. However, it is important to note that this is not an elimination of demand but a deferral of demand to later years. Build-out growth will occur over a longer period of time.

As shown in **Figure 5**, long term supply programs may be reduced by a combined value of 70,000 AFY in 2045, as a result of the approximately 14% reduction in demand. Programs that may be deferred or slowed based on this reduction include desalination of agricultural drain water, purchase of additional imported allocations, and conversion of non-potable water supplies to urban uses, except as necessary for full utilization of Colorado River water supplies.

A reduction in growth projections does not reduce the rate at which development of Colorado River water supplies occurs. These supplies available through the Quantification Settlement Agreement (QSA) will continue to increase at an average rate of 5,500 AFY through 2026. Therefore, the need for source substitution and recharge programs to utilize this supply is not affected by changes in population projections. Also a reduction in growth projections does not reduce the need to implement conservation programs for existing and future customers.

Hexavalent Chromium

The 2002 WMP focused on water supplies and overdraft and did not discuss water quality in detail. The 2010 WMP Update devoted a chapter to emerging issues including groundwater quality issues. At the time of the 2010 WMP Update adoption, hexavalent chromium (chromium-6) was regulated in California under the 50 µg/L Maximum Contaminant Level (MCL) for total chromium. No CVWD wells exceed this limit. Also at that time the Office of Environmental Health Hazard Assessment (OEHHA) had recently finalized a Public Health Goal for chromium-6 of 0.02 parts per billion (µg/L) and the California Department of Public Health (CDPH) was developing a proposed MCL for chromium-6.

In August 2013 CDPH published the nation's first draft MCL for chromium-6 of 10 µg/L. It was approved in April 2014, and became effective on July 1, 2014. It is expected that approximately 50% of municipal wells in the Coachella Valley will not comply with the new standard. CVWD, Mission Springs Water District, Coachella Water Authority, and Indio Water Authority all have wells that are expected to exceed the MCL. The cost to comply with this standard is of significant concern, and will expedite the need to treat Colorado River water for direct municipal use in portions of the Coachella Valley.

CVWD is conducting a source of supply study to evaluate chromium-6 treatment options. A final report is expected to be available in December 2014, and it is anticipated that project design and implementation will begin in early 2015.

Evaluation of 2010 WMP Implementation Progress

The key water management plan elements identified to meet 2010 WMP Update goal are:

- Water conservation
- Acquisition of additional imported water supplies (Water Supply Development)
- Continued development of local water supplies such as recycled water and desalinated drain water (Water Supply Development)
- Source substitution, and
- Groundwater recharge.

Prior to the 2010 WMP Update adoption and in direct response to the economic downturn, the Board of Directors expressed concerns over the cost of Plan implementation. In response to their concerns, **Section 8 – Implementation Plan**, of the 2010 WMP Update included a list of priority activities to be implemented by 2020. This priority list is summarized in **Table 8-1** on page 8-16 of the Plan. Table 8-1 has been reviewed and adjusted to recognize progress to date. **Table 8-1 REVISED - for the 2014 Status Report** is located at the end of the document. It is important to note that the 2010 WMP Update identifies many additional future activities not included in **Table 8-1** that will be reconsidered in future plan updates. Examples of such activities are recycled water development in the Eastern Coachella Valley, and participation in desalination of seawater.

Final 2014 Status Report Recommendations

As shown in **Figures 1 and 2,** the 2014 Status Report demonstrates that the 2010 WMP Update is working. Continued Plan implementation ensures that long-term overdraft will be eliminated by 2021

with increased groundwater levels in the Palm Springs area and the East Valley. Although groundwater levels in the Mid-Valley Area will continue to decline, continued implementation of Mid-Valley programs is the most effective means of curtailing these declines. The Programs in **Table 8-1 REVISED - for the 2014 Status Report** should be implemented as scheduled and the four key activities below are recommended:

- Continue to Support Water Conservation Programs
- Accomplish Source Substitution Program Implementation as Scheduled
- Evaluate Additional Recharge Opportunities
- Continue to Evaluate Water Purchase Opportunities

Table 8-1 REVISED - for the 2014 Report

Implementation Plan

Plan Element	Responsible Entity(ies)	2010 Update Goal	Status	Status Report Recommendation
Water Conservation Program				
• Adopt and implement 2009 CVWD/CVAG Landscape Ordinance or equivalent	CVWD, water purveyors, cities, Riverside County	Ongoing	Complete	Revise as needed based on State legislation
• Establish urban water conservation baseline	CVWD, other urban water purveyors	Complete	Complete	Assess status annually and report in 2015 UWMP
• Achieve minimum 10 percent reduction in existing golf course use	CVWD, DWA	2015	Underway	Work via Golf Task Force to implement and monitor custom water budgets. Budget program funds in CIP
• Achieve 14 percent reduction in agricultural water use	CVWD	2020	Underway	2020
• Achieve 20 percent reduction in urban use	CVWD, other urban water purveyors	2020	Underway	Continue funding conservation programs in CIP
Water Supply Development Program				
• Complete siting studies, environmental impact evaluation and design for CVSC drain water capture and treatment facilities	CVWD	2013	Deferred	Re-evaluate need in next WMP Update
• File for water rights application for change of point of use for wastewater effluent discharges to allow water recycling	CVWD, VSD, Coachella	2015	Deferred	Work with Legal Staff to complete filing
• Complete construction of initial CVSC drain water capture and treatment facilities	CVWD	2015	Deferred due to changes in needs	Re-evaluate need in next WMP Update
• Conduct a feasibility study to investigate the potential for additional stormwater capture in the East Valley	CVWD	2015	Ongoing with Stormwater studies	Maximize stormwater capture in facilities design
• Conduct a study to determine the amount of water lost to leakage or otherwise unaccounted in the first 49 miles of the Coachella Canal and evaluate the feasibility of corrective actions to capture the lost water	CVWD	2015	Complete	Continue to monitor annual system losses

Plan Element	Responsible Entity(ies)	2010 Update Goal	Status	Status Report Recommendation
• Conduct a joint investigation with Indio and Coachella of groundwater development potential in Fargo Canyon Subarea of the Desert Hot Springs Subbasin to determine the available supply and suitability for use in meeting non-potable demands of development east of the San Andreas fault	CVWD, IWA, Coachella	2020	Deferred due to changes in needs	Re-evaluate need in next WMP Update
Source Substitution Program				
• Prepare a master plan for Mid-Valley Pipeline completion Phase 2	CVWD	2011	Complete	Budget for Phase 2 in CIP
• Connect four golf course users along the MVP alignment to MVP	CVWD	2011	2 connected 7 scheduled by end of 2015	Monthly Progress Report to Board
• Work with existing East Valley golf courses having Colorado River water access to increase their use to 90 percent of demand	CVWD	2012	Underway – revised to 85% via non-potable agreements	Report Progress in annual Non-Potable Water Report
• Investigate regional opportunities for Colorado River water treatment facilities for domestic water use	CVWD, IWA, Coachella	2012	Underway via Source of Supply/Treatment Study (SS/TS)	Complete by 12/2014 Budget funds in 2015/16 CIP
• Develop policy requiring the installation of non-potable water systems for new development	CVWD	2012	Complete	Required via WSA's/WSV's and Development Design Manual
• Work with large agricultural groundwater pumpers to determine what obstacles exist that prevent them from using additional Colorado River water and encourage them to reduce their groundwater pumping	CVWD	2012	Underway Example: Oasis Irrigation System Expansion Project	Complete Oasis Irrigation System Expansion and Golf Course Conversions
• Construct north and east extensions to the MVP system	CVWD	2013	Partially addressed in Phase 2 master plan	Monthly Progress Report to Board
• Complete siting studies, environmental impact evaluation and design for Colorado River water treatment facilities	CVWD	2013	SS/TS Underway	Re-evaluate schedule based on SS/TS
• Complete construction of initial Colorado River water treatment facilities and connect to domestic water distribution system	CVWD	2015	SS/TS Underway	Re-evaluate schedule based on SS/TS

Plan Element	Responsible Entity(ies)	2010 Update Goal	Status	Status Report Recommendation
• Complete Oasis study update	CVWD	2015	Complete. Design by 2015 Construction by 2018	Form Assessment District Budget funds in CIP Complete by 2018
• Prepare a non-potable water distribution master plan Phase 3	CVWD	2015	Deferred	2017
• Complete construction of MVP backbone system	CVWD	2020	Deferred	Re-evaluate schedule based on Phase 3 master planning
Groundwater Recharge Program				
• Operate and monitor the Levy replenishment facility with a 40,000 AFY goal	CVWD	2010	Underway with lower goal of 32,000 AFY	Re-evaluate need in next WMP Update
• Investigate groundwater storage opportunities with IID	CVWD	2010	Complete	
• Transfer the unused portion of the 35,000 AFY of SWP water available under the QSA to the Whitewater Recharge Facility	CVWD	2011	Complete	Budget transportation funds annually. Maximize advanced delivery opportunities.
• Work with the City of Indio to evaluate the feasibility of developing a groundwater recharge project that reduce groundwater overdraft. If feasible, work with Indio to construct the facility.	CVWD, IWA	2011	Deferred	Recommend changing priority to working with Indio on supply development opportunities.
• Design and construct an additional pumping station and pipeline from Lake Cahuilla to the Levy facility if the existing pumping station and pipeline cannot provide sufficient water to meet the annual goal	CVWD	2015	Deferred	Re-evaluate need in next WMP Update
• Conduct siting studies, environmental impact evaluation and design for Martinez Canyon Replenishment Facility	CVWD	2018	Deferred due to monitoring results	Budget Oasis Expansion funds in CIP
Monitoring and Data Management				
• Continue to monitor the extent of land subsidence	CVWD, USGS	2010	Ongoing Phase VI Underway	Continue monitoring and evaluate results relative to Groundwater modeling in next WMP Update.

Plan Element	Responsible Entity(ies)	2010 Update Goal	Status	Status Report Recommendation
• Provide additional information in the annual engineers' reports: o Annual precipitation and stream flows o Additional groundwater level data and hydrographs o In-lieu recharge water deliveries from imported and recycled water that offset pumping o Imported water deliveries for direct use	CVWD, DWA	2011	Complete Hydrographs added, more consistency with DWA's reports achieved.	
• Obtain DWR designation as groundwater level monitoring and reporting entity for the Coachella Valley within their respective service areas	CVWD, DWA, water purveyors	2011	Complete via the CASGEM Program	Budget funds as needed to Continue Program Participation
• Prepare a comprehensive groundwater monitoring plan	CVWD, DWA, water purveyors, wastewater agencies, tribes	2012	Deferred	Pursue IRWM Grant Funding
• Enhance the CVSC gauging station at Lincoln Street to provide continuous flow recording	CVWD, USGS	2012	Complete	Budget CIB funds as necessary to continue to drain flow monitoring.
• Develop centralized groundwater database	CVWD, DWA, water agencies, tribes	2012	Complete via the CASGEM Program	Budget funds in CIB as necessary to maintain program participation
Other Programs				
• Continue to operate a groundwater advisory committee regarding groundwater management issues in the East Valley	CVWD, water agencies, pumpers, tribes	2010	Complete	Budget CIB funds as necessary to continue annual meetings
• Develop a program to educate and work with well owners to properly control artesian wells	CVWD	2011	Complete	Budget funds in CIB/CIP. and Pursue Grant funding
• Update and recalibrate the CVWD groundwater model based on the most current information	CVWD	2012	Deferred	Complete in parallel with next WMP Update
• Develop a water planning interface to the groundwater model	CVWD	2012	Deferred	Add to scope of work for next groundwater model update
• Prepare a plan to maintain and enhance the existing drainage system to allow its future use for urban purposes	CVWD	2012	Complete Legal Authority Established	

Plan Element	Responsible Entity(ies)	2010 Update Goal	Status	Status Report Recommendation
• Develop well construction, destruction and abandonment policies	CVWD, DWA, water agencies, tribes, Riverside County	2012	Complete	Support County's efforts to enforce. Pursue IRWM Grant Funding
• Add groundwater quality simulation capabilities to the model that will allow simulation of salinity (TDS) and nitrogen in the groundwater	CVWD	2013	Deferred	Add to scope of work for next groundwater model update.
• Prepare a salt/nutrient management plan for the Valley to meet SWRCB Recycled Water Policy requirements	CVWD, CWA,DWA, and IWA	2014	Underway	Work with RWQCB to amend completion date to March 2015
• Extend urban water and sewer service to trailer/RV park communities with deficient infrastructure and poor water quality	CVWD	2015	Ongoing Mountain View Estates Connected, Short Term Arsenic Treatment, DAC Program	Continue to sponsor applications for USDA, IRWM, CDPH, SWRCB funding
• Investigate the feasibility of installing nitrate treatment on selected high nitrate wells to avoid redistribution of nitrates.	CVWD	2015	Underway via SS/TS	Complete by 12/2014 Budget funds in 2015/16 CIP
• Undertake a cooperative program to identify and cap wells that are no longer being used for groundwater production	CVWD, DWA	2015	Underway	Support County's efforts to enforce. Pursue IRWM Grant Funding
Environmental Enhancement and Mitigation Projects				

• Develop plans for the creation of:
  • 25 acres of managed pupfish replacement habitat
  • 66 acres of managed rail replacement habitat
  • 44 acres of Sonoran cottonwood-willow riparian forest habitat
	CVWD	2010	Underway: Received Wildlife Agency approval of site; Under Review by Corps.	Work with Corps to complete review. Update project implementation Schedule. Budget funds in CIB/CIP

• Remove tamarisk, restore and enhance mesquite and Coachella Valley round-tailed ground squirrel habitat on land CVWD owns in the East Indio Hills Conservation Area	CVWD	Not Specified	Study Underway by CVCC	Support CVCC efforts to complete feasibility study

Plan Element	Responsible Entity(ies)	2010 Update Goal	Status	Status Report Recommendation
• Conserve approximately 1,200 acres of land owned in the CVFTL HCP Whitewater Floodplain Preserve in perpetuity as part of the CVMSHCP Reserve System	CVWD	2010	Underway: Resource Agencies reviewing Draft Conservation Easement prepared by CVCC & CVWD	Work with Resource agencies to achieve conservation easement approvals

APPENDIX I

Alternative Air Quality and Greenhouse Gas Emissions Worksheets

Alternative 2

Salton Sea Air Basin, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	50.00	Acre	50.00	2,178,000.00	0
Parking Lot	12,425.00	Space	111.82	4,970,000.00	0
City Park	12.00	Acre	12.00	522,720.00	0
Condo/Townhouse	2,190.00	Dwelling Unit	497.00	2,190,000.00	3942
Regional Shopping Center	1,200.00	1000sqft	80.00	1,200,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.4	**Precipitation Freq (Days)**	20
Climate Zone	10			**Operational Year**	2030
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Water Unpaved Roads

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

3.2 Site Preparation - 2015

Unmitigated Construction On-Site

Alternative 2

Salton Sea Air Basin, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	50.00	Acre	50.00	2,178,000.00	0
Parking Lot	12,425.00	Space	111.82	4,970,000.00	0
City Park	12.00	Acre	12.00	522,720.00	0
Condo/Townhouse	2,190.00	Dwelling Unit	497.00	2,190,000.00	3942
Regional Shopping Center	1,200.00	1000sqft	80.00	1,200,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.4	**Precipitation Freq (Days)**	20
Climate Zone	10			**Operational Year**	2030
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Alternative 2 - City General Plan

Construction Phase - Based on similar combined construction schedule

Off-road Equipment -

Off-road Equipment - Default construction equipment

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Based on Trenching Equipment used for EIR model

Trips and VMT - SCAQMD Building Construction Worker and Vendor Trips

On-road Fugitive Dust - Paved Roads

Grading -

Architectural Coating -

Vehicle Trips - Per Traffic Study

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Road Dust - Based on previous EIS model

Woodstoves - No woodstoves

Area Coating -

Construction Off-road Equipment Mitigation - Similar mitigation to EIS model

Mobile Land Use Mitigation -

Area Mitigation - Similar to EIS model

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Water Unpaved Roads

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

3.2 Site Preparation - 2015

Unmitigated Construction On-Site

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Water Unpaved Roads

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

3.2 Site Preparation - 2015

Unmitigated Construction On-Site

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Water Unpaved Roads

Reduce Vehicle Speed on Unpaved Roads

3.2 Site Preparation - 2015

Unmitigated Construction On-Site

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Water Unpaved Roads

Reduce Vehicle Speed on Unpaved Roads

3.2 Site Preparation - 2015

Unmitigated Construction On-Site

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Water Unpaved Roads

Reduce Vehicle Speed on Unpaved Roads

3.2 Site Preparation - 2015

Unmitigated Construction On-Site

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Improve Destination Accessibility

Increase Transit Accessibility

Improve Pedestrian Network

Provide Traffic Calming Measures

Implement NEV Network
