Executive Summary

This report presents the results of a Transportation Analysis (TA) for the proposed advanced manufacturing building development located at 350 West Trimble Road (APN 101-02-013) in the City of San Jose. The project site is located along the south side of Trimble Road and adjacent to Orchard Parkway and is currently vacant.

The proposed project would consist of the construction of a 208,000-square-foot (s.f.) advanced manufacturing building on an approximately 10-acre vacant site. Approximately 280 vehicular parking spaces and 15 truck docks are proposed on-site. Direct access to the site would be provided via an existing limited right-turn in and right-turn out only driveway along Trimble Road, an existing full-access driveway, and a right-turns only driveway located along Orchard Parkway. However, the project's surface lots and drive aisles would connect to the adjoining properties along its southern boundary. Therefore, there also would be additional access points at existing driveways along Orchard Parkway.

The applicant for the project has requested that the transportation analysis allows for the flexibility to utilize the building with either warehouse, industrial, or research & development (R&D) space since a tenant and use of the proposed building have yet to be identified. Of the above-identified uses, R&D space generates the greatest number of daily and peak hour trips per 1,000 s.f. of space. Therefore, this study evaluates the proposed project as 208,000 s.f. of R&D space for the purpose of providing the flexibility to allow for the use of the proposed building with low traffic generating warehouse uses or a greater traffic intensity traffic generating use such as R&D space.

Transportation Analysis Scope

The transportation analysis of the project was evaluated following the standards and methodologies set forth in the City of San Jose's Transportation Analysis Policy (Council Policy 5-1), the City of San Jose *Transportation Analysis Handbook 2020*, the City of Santa Clara, the Santa Clara Valley Transportation Authority (VTA) Congestion Management Program's *Transportation Impact Guidelines* (October 2014), and by the California Environmental Quality Act (CEQA). Per the requirements of the City of San Jose's Transportation Policy and *Transportation Analysis Handbook 2020*, the TA report for the project consists of a CEQA vehicle-miles-traveled (VMT) analysis and a supplemental Local Transportation Analysis (LTA).

CEQA Transportation Analysis Scope

The CEQA transportation analysis for the project consists of a project-level VMT impact analysis using the City's VMT tool and a cumulative impact analysis that demonstrates the project's consistency with the Envision San Jose 2040 General Plan.

Local Transportation Analysis Scope

The LTA includes the evaluation of weekday AM and PM peak hour operations at a limited number of intersections for the purpose of identifying operational issues (queuing, signal operations, and potential multi-modal issues) at intersections in the general vicinity of the project site. The LTA supplements the CEQA VMT analysis and provides analysis for use by the City of San Jose in identifying potential improvements to the transportation system with a focus on improving multi-modal travel. The LTA is required per the City of San Jose Transportation Policy, however, the operational deficiencies identified as part of the LTA are not considered impacts per CEQA guidelines.

CEQA VMT Analysis

CEQA Transportation Analysis Exemption Criteria

The City does not provide screening criteria specific to AMD/R&D uses. However, per the City of San Jose VMT screening criteria, industrial uses of 30,000 square feet or less are considered small infill projects and do not require a CEQA VMT evaluation since the VMT generated by such a small project would likely not result in a significant impact to VMT. AMD/R&D uses are similar to light industrial uses since both land uses have an emphasis on activities such as manufacturing and product storage and typically have minimal office space. Therefore, the number and origination/destination of daily trips generated by both light industrial and R&D uses should be similar.

Presuming that AMD/R&D uses have similar trip generating characteristics as industrial uses, AMD/R&D uses can be converted to an equivalent amount of industrial space based on estimates of daily trips. The conversion of the proposed AMD/R&D space was converted to an equivalent amount of industrial space based on trip generation estimates derived utilizing trip rates published in the Institute of Transportation Engineers' (ITE) Trip Generation Manual, 11th Edition (2021). Based on the ITE daily trip rate for R&D uses (ITE Land Use Code 760), the 208,000-s.f. of AMD/R&D space is estimated to generate 2,305 daily trips, which is equivalent to the daily trips estimated to be generated by approximately 473,000-s.f. of industrial space. The 473,000 s.f. of equivalent industrial space for the proposed project would exceed the City's small industrial infill project criterion of 30,000 s.f. In addition, the existing VMT per industrial employee in the project area currently exceeds the City's established CEQA threshold of 14.37 per industrial employee. Therefore, the proposed project would not meet the screening criteria for VMT analysis exemption.

Project Impacts and Mitigation Measures

Project Impact: Since the VMT per industrial employee (15.82) generated by the project would exceed the impact threshold of 14.37 VMT per industrial employee, the project would result in a significant transportation impact on VMT, and mitigation measures are required to reduce the VMT impact.

Mitigation Measures: The project will be required to implement a Travel Demand Management (TDM) plan that includes the implementation of one of the following TDM measures to reduce the project's VMT impact to less than significant levels. It should be noted that the selected TDM measure must be incorporated within a TDM plan for the project which may include additional TDM measures. However, per the City's VMT tool, the project's VMT impact would be mitigated with the implementation of one of the TDM measures.

- **Telecommuting and Alternative Work Schedules:** Encourage employees to telecommute from home when possible, or to shift work schedules such that travel occurs outside of peak congestion periods. This strategy reduces commute trips, thereby reducing VMT. At a minimum, the measure would require that 65% of employees work a 4/40 work week schedule (10-hour workdays for four days a week). **Or**

- Operate a Free Direct Shuttle: Provide direct shuttle service to the project site from areas with high concentrations of employees. This strategy reduces drive-alone commute trips, thereby reducing VMT. At a minimum, the measure would require at least 20% participation by employees. **Or**
- Subsidize Vanpool: Provide subsidies for individuals forming new vanpools for their commute. This encourages the use of vanpools, reducing drive-alone trips, and thereby reducing VMT. The project would be required to subsidize 100% of the cost of the vanpool cost with at least 20% employee participation.

The project's VMT could be reduced further with the implementation of the following multi-modal facility improvements as identified by the City of San Jose staff. However, per the City's VMT tool, the project's VMT impact would be mitigated with the implementation of one of the TDM measures identified above.

- Provide Pedestrian Network Improvements for Active Transportation (Tier 2): Implement pedestrian improvements both on-site and in the surrounding area. Improving pedestrian connections encourages people to walk instead of drive and reduces VMT. Improvements would include the removal of the pork chop islands located at the southwest and southeast corners of the Orchard Parkway/Trimble Road intersection along with a signal modification, and the implementation of a protected intersection to accommodate Class-IV bikeways to improve pedestrian safety and access.

Cumulative (GP Consistency) Evaluation

Projects must demonstrate consistency with the *Envision San José 2040 General Plan* to address cumulative impacts. Consistency with the City's General Plan is based on the project's density, design, and conformance to the General Plan goals and policies. If a project is determined to be inconsistent with the General Plan, a cumulative impact analysis is required per the City's *Transportation Analysis Handbook*.

According to the *Envision San Jose 2040 General Plan*, the project site is designated for *Industrial Park (IP) and Combined Industrial/Commercial (CIC)* uses. This designation permits development with retail and service commercial uses on the first two floors; with office, research and development or industrial use on upper floors; as well as wholly office, research and development, or industrial projects.

Since the *Industrial Park (IP) and Combined Industrial/Commercial (CIC)* designation allow industrial/office uses, the proposed manufacturing land use project is consistent with the *Envision San Jose 2040 General Plan* and would not require a General Plan Amendment (GPA). The project would be considered part of the cumulative solution to meet the General Plan's long-range transportation goals and would result in a less-than-significant cumulative impact.

Local Transportation Analysis

The intersection operations analysis completed as part of the LTA is intended to quantify the operations of intersections and to identify potential negative effects due to the addition of project traffic. However, a potential adverse effect on a study intersection operation is not considered a CEQA impact metric. The LTA included the analysis of AM and PM peak-hour traffic conditions for 16 signalized intersections in the Cities of San Jose and Santa Clara.

Trip Generation

After applying the ITE trip rates and appropriate trip reductions, it is estimated that the project would generate a total of 2,117 daily vehicle trips, with 197 trips (161 inbound and 36 outbound) occurring

during the AM peak hour and 187 trips (30 inbound and 157 outbound) occurring during the PM peak hour.

Future Intersection Operation Conditions

The results of the intersection level of service analysis show that the added trips as a result of the project would not have an adverse effect on intersection operations at any of the study intersections under background plus project conditions and cumulative plus project conditions..

Recommended Site Access and On-Site Circulation Improvements

The following improvements are recommended to improve access to the project site and on-site circulation:

- Each of the site driveways that provide access to the site drive aisles and parking lots must be designed to meet the City's 32-foot minimum width.

Parking Supply

Vehicular Parking

The proposed 208,000 s.f. building will include up to 20,000 s.f. of supporting office space. According to the City of San Jose Zoning Code (Section 20.90.060), one off-street vehicle parking space per 350 s.f. of floor area is required for both R&D and light industrial uses while one off-street vehicle parking space per 250 s.f. of floor area is required for office use. According to the City's Zoning Code, "floor area" is defined as 85 percent of the "total gross floor area" (188,000 s.f. of industrial/R&D & 20,000 s.f. of office) which equates to 159,800 s.f. of industrial/R&D space and 17,000 s.f. of office space. Based on the City's parking requirements, the project is required to provide a total of 525 off-street parking spaces (457 parking spaces for the R&D and light industrial/manufacturing uses and 68 spaces for the office space). The proposed 280 vehicle parking spaces would be 245 spaces less than, or a reduction of 46.7 percent from the City's requirement of 525 parking spaces.

In accordance with Section 20.90.220 of the San Jose Code of Ordinances, which allows up to a 50% parking reduction, the 46.7 percent reduction in off-street parking could be allowed with the implementation and maintenance of a TDM plan. A separate TDM plan for the proposed project that meets the requirements set forth in the City's Zoning Code must be prepared and approved by the City of San Jose Planning Department to support a reduction in the required off-street parking.

Bicycle Parking

According to the City's Bicycle Parking Standards (Chapter 20.90, Table 20-190), the project is required to provide one bicycle parking space per 5,000 s.f. of floor area of manufacturing space and one bicycle parking space per 4,000 s.f. of floor area of office space.

Based on the City's bicycle parking requirements and the total gross floor areas as calculated above in the vehicle parking section, the project is required to provide 36 bicycle parking spaces. Of the required bicycle parking, City standards require that at least 80 percent be short-term bicycle spaces and at most 20 percent be secured long-term bicycle spaces. This equates to at least 29 short-term bicycle parking spaces and at most 7 long-term bicycle parking spaces.

The project proposes a total of 42 bicycle parking spaces, consisting of 6 long-term spaces and 36 short-term spaces located throughout the project site. Therefore, the proposed bicycle parking spaces will exceed the City's bicycle parking requirements and encourage the use of non-auto modes of travel and minimize the demand for on-site parking described above.

Pedestrian, Bicycle, and Transit Facilities

All new development projects in San Jose should encourage multi-modal travel, consistent with the goals of the City's General Plan. It is the goal of the General Plan that all development projects accommodate and encourage the use of non-automobile transportation modes to achieve San Jose's mobility goals and reduce vehicle trip generation and vehicle miles traveled. In addition, the adopted City Bike Master Plan establishes goals, policies, and actions to make bicycling a daily part of life in San Jose. The Master Plan includes designated bike lanes along all City streets, as well as on designated bike corridors. In order to further the goals of the City, pedestrian and bicycle facilities should be encouraged with new development projects.

Pedestrian and Bicycle Facilities

Pedestrian and bicycle facilities in the study area consist of sidewalks, crosswalks, pedestrian signals at signalized intersections, and bike lanes on Trimble Road and Orchard. The site plan shows sidewalks and pedestrian walkways along the eastern and western perimeters of the building. The sidewalks along the eastern building perimeter will connect to designated crosswalks through the parking lot and connect to existing sidewalks on Orchard Parkway and Trimble Road connecting to pedestrian facilities and destinations outside of the project site, including the LRT stations on First Street.

The bikeways within the vicinity of the project site would remain unchanged under project conditions. Currently, Trimble Road and Orchard Parkway have bike lanes that would provide connections to other bicycle facilities in the project vicinity. The San Jose Better Bike Plan 2025 and Envision 2040 General Plan, as described below, identify planned improvements to the bicycle network within the City and provide policies and goals that are intended to promote and encourage the use of multi-modal travel options and reduce the identified project impacts to the roadway system.

Public Transit/Pedestrian/Bike Improvements

The Trimble Road and Orchard Parkway intersection currently includes right-turn "pork-chop" channelization islands at each corner. The channelization islands allow for better traffic flow by separating right-turning traffic from other controlled approach traffic. However, the islands are not conducive to pedestrian flow at intersections that serve a large volume of pedestrians due to limited pedestrian waiting areas and conflict with vehicle traffic.

Recommendation: The City will require the project to remove the pork chop islands located at the southwest and southeast corners of the Orchard Parkway/Trimble Road intersection along with a signal modification and implementation of a protected intersection to accommodate Class-IV bikeways to improve pedestrian safety and access.

Recommendation: The City will require the project to construct four new curb ramps per the City of San Jose and ADA standards at the existing Trimble Road entrance.

The planned improvements discussed below are intended to provide for a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies. The San Jose Better Bike Plan 2025 indicates that a variety of bicycle facilities are planned in the study area, some of which would benefit the project and adhere to the goals of the Envision 2040 General Plan. Of the planned facilities, the following are relevant to the project.

Class I bike trails are planned for:

- Component Drive, between Guadalupe River Trail and Orchard Parkway

Class IV protected bike lanes are planned for:

- Trimble Road, along its entire length
- First Street, between Taylor Street and Alviso
- Orchard Parkway, along its entire length
- Component Drive, between Orchard Parkway and Zanker Road
- Zanker Road, along its entire length
- Plumeria Drive, along its entire length
- Bonaventura Drive, along its entire length

The project would not impede the implementation of the planned bicycle facilities. However, the full implementation of the above-listed improvements is beyond the means of the proposed project given that they may require right-of-way from adjacent properties and benefit multiple properties.

Recommendation: The project will be required to construct, or provide a monetary contribution for an in-lieu fee of \$144 per linear foot, Class IV 7-foot protected bike lanes along the project frontages on Trimble Road and Orchard Parkway per the City of San Jose Better Bike Plan 2025.

Transit Facilities

The VTA Green and Blue LRT lines operate along First Street in the project vicinity. The Bonaventura and Component LRT station platforms on First Street are located within walking distance, approximately 2,000 feet, east of the project site. The existing pedestrian and bicycle facilities described above will provide for and encourage the use of multi-modal travel options and reduce the use of single-occupant automobile travel.

With the convenient location of LRT stations, it can be assumed that some employees of the proposed project would utilize the existing transit services. Applying an estimated three percent transit mode share, which is a conservative estimate that could be expected for the project, equates to approximately six transit riders during the AM or PM peak hours. VTA operations reports indicate that the Green and Blue LRT lines as well as several other bus routes in the area currently serve less than ideal ridership. Therefore, the new riders due to the proposed project could be accommodated by the current available capacity of the bus service in the study area and improvement of the existing transit service would not be necessary with the project.

1. Introduction

This report presents the results of a Transportation Analysis (TA) for the proposed advanced manufacturing building development located at 350 West Trimble Road (APN 101-02-013) in the City of San Jose. The project site is located along the south side of Trimble Road and adjacent to Orchard Parkway and is currently vacant (see Figure 1).

The proposed project would consist of the construction of a 208,000-square-foot (s.f.) advanced manufacturing building on an approximately 10-acre vacant site. Approximately 280 vehicular parking spaces and 15 truck docks are proposed on-site. Direct access to the site would be provided via an existing limited right-turn in and right-turn out only driveway along Trimble Road, an existing full-access driveway, and a right-turns only driveway located along Orchard Parkway. However, the project's surface lots and drive aisles would connect to the adjoining properties along its southern boundary. Therefore, there also would be additional access points at existing driveways along Orchard Parkway. The project site plan is shown in Figure 2.

The applicant for the project has requested that the transportation analysis allows for the flexibility to utilize the building with either warehouse, industrial, or research & development (R&D) space since a tenant and use of the proposed building have yet to be identified. Of the above-identified uses, R&D space generates the greatest number of daily and peak hour trips per 1,000 s.f. of space. Therefore, this study evaluates the proposed project as 208,000 s.f. of R&D space for the purpose of providing the flexibility to allow for the use of the proposed building with low traffic generating warehouse uses or a greater traffic intensity traffic generating use such as R&D space.

Scope of Work

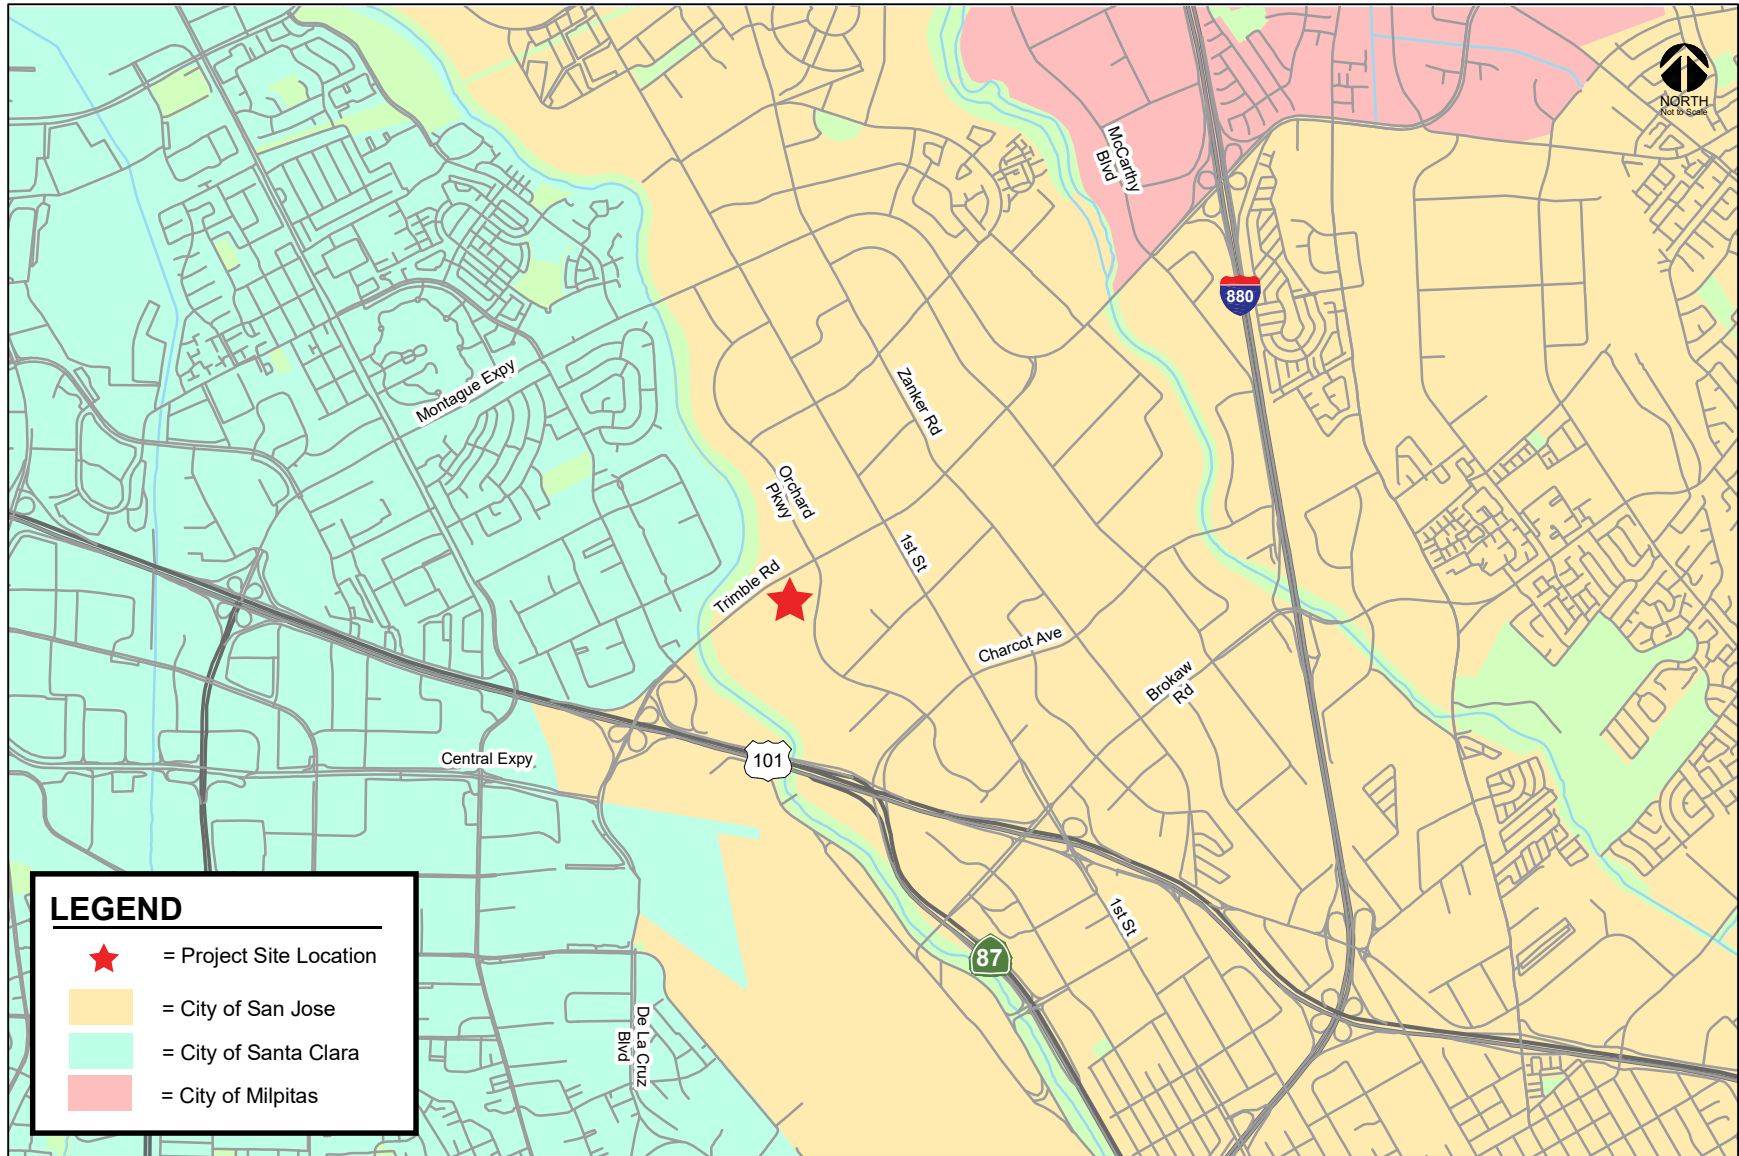

The transportation analysis of the project was evaluated following the standards and methodologies set forth in the City of San Jose's Transportation Analysis Policy (Council Policy 5-1), the City of San Jose *Transportation Analysis Handbook 2020*, the City of Santa Clara, the Santa Clara Valley Transportation Authority (VTA) Congestion Management Program's *Transportation Impact Guidelines* (October 2014), and by the California Environmental Quality Act (CEQA). Per the requirements of the City of San Jose's Transportation Policy and *Transportation Analysis Handbook 2020*, the TA report for the project consists of a CEQA vehicle-miles-traveled (VMT) analysis and a supplemental Local Transportation Analysis (LTA).

Transportation Policies

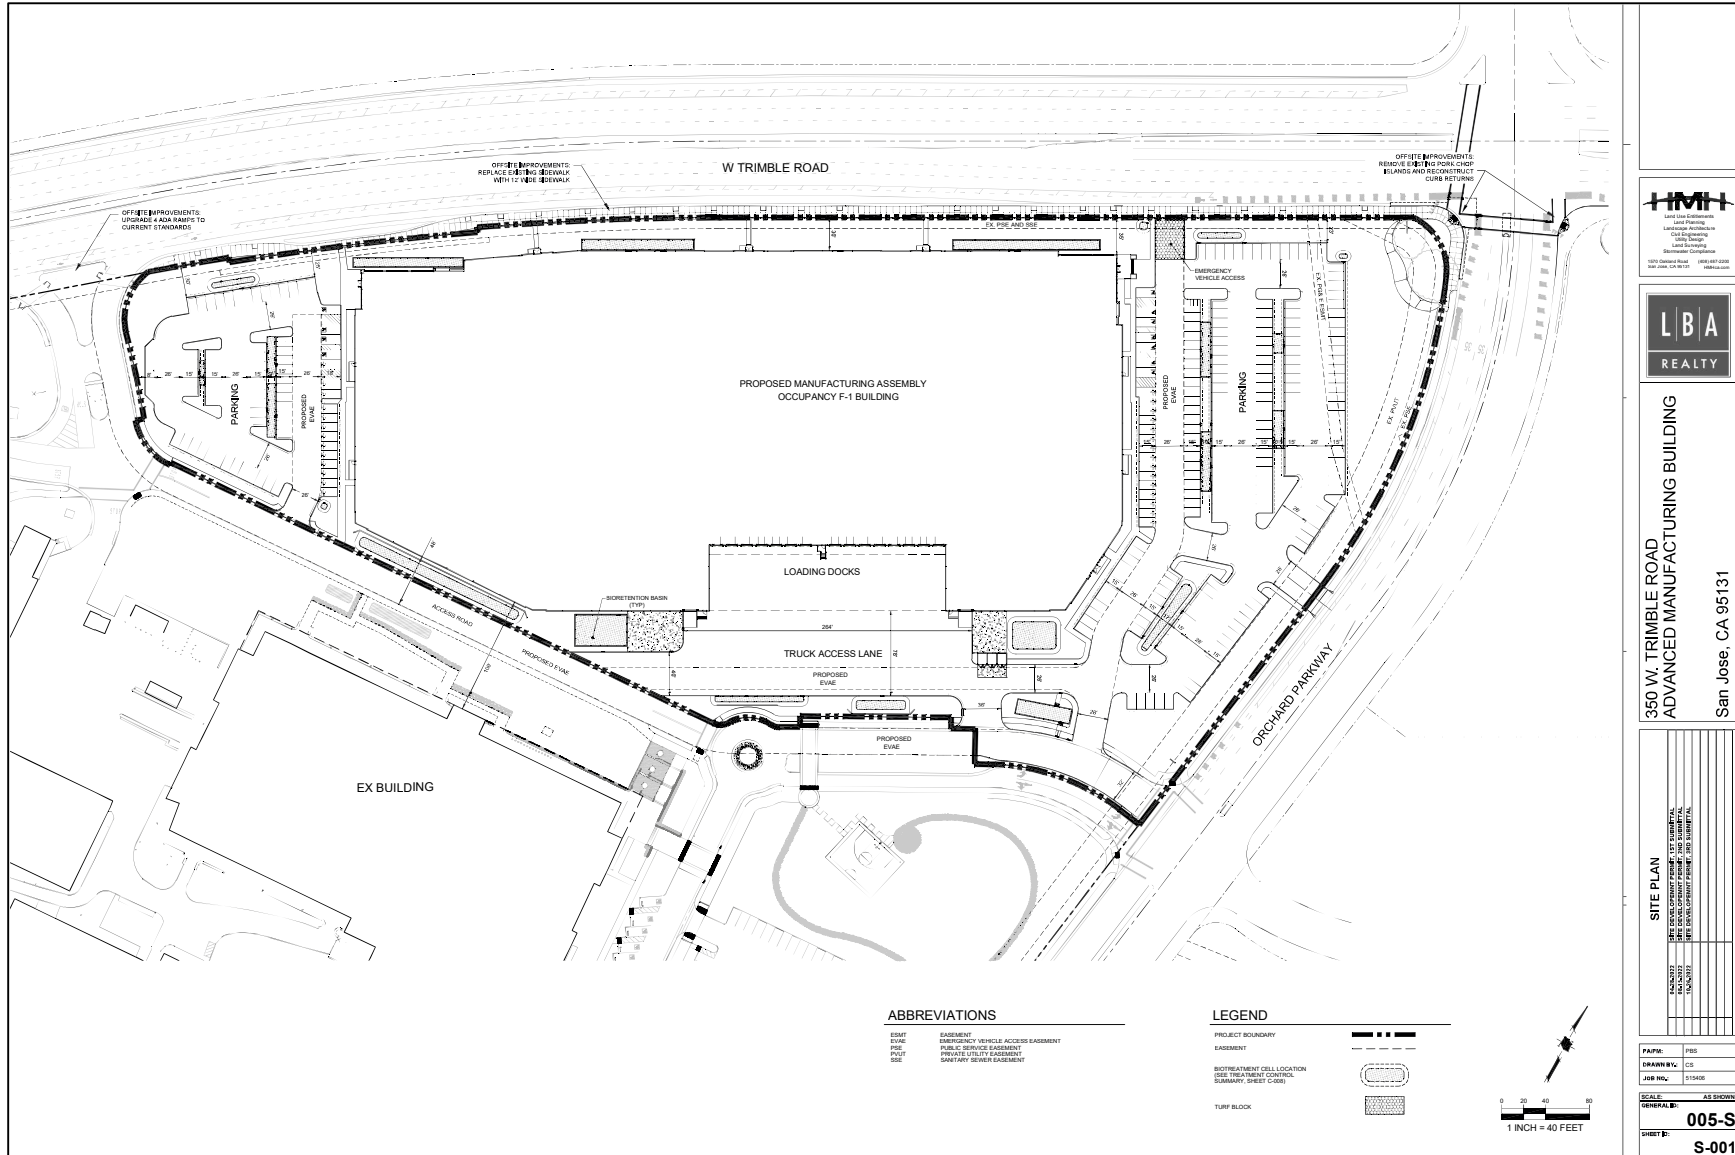

Council Policy 5-1

Historically, transportation analysis has utilized delay and congestion on the roadway system as the primary metric for the identification of traffic impacts and potential roadway improvements to relieve traffic congestion that may result due to proposed/planned growth. However, the State of California has

Figure 1
Site Location

**Figure 2
Proposed Site Plan**

recognized the limitations of measuring and mitigating only vehicle delay at intersections and in 2013 passed Senate Bill (SB) 743, which requires jurisdictions to stop using congestion and delay metrics, such as Level of Service (LOS), as the measurement for CEQA transportation analysis. With the adoption of SB 743 legislation, public agencies are now required to base the determination of transportation impacts on Vehicle Miles Traveled (VMT) rather than level of service.

In adherence to SB 743, the City of San Jose has adopted a new Transportation Analysis Policy, Council Policy 5-1. The policy replaces its predecessor (Policy 5-3) and establishes the thresholds for transportation impacts under the CEQA based on vehicle miles traveled (VMT) instead of levels of service (LOS). This change intends to shift the focus of transportation analysis under CEQA from vehicle delay and roadway auto capacity to a reduction in vehicle emissions, and the creation of robust multimodal networks that support integrated land uses. The new transportation policy aligns with the currently adopted General Plan which seeks to focus on new development growth within Planned Growth Areas, bringing together office, residential, and supporting service land uses to internalize trips and reduce VMT. All new development projects are required to analyze transportation impacts using the VMT metric and conform to Council Policy 5-1.

General Plan Goals & Policies

The Circulation Element of the *Envision San José 2040 General Plan* includes a set of balanced, long-range, multi-modal transportation goals and policies that provide for a transportation network that is safe, efficient, and sustainable (minimizes environmental, financial, and neighborhood impacts). These transportation goals and policies are intended to improve multi-modal accessibility to all land uses and create a city where people are less reliant on driving to meet their daily needs. The Envision San Jose 2040 General Plan contains the following policies to encourage the use of non-automobile transportation modes to minimize vehicle trip generation and reduce VMT:

- Consider impacts on overall mobility and all travel modes when evaluating transportation impacts of new developments or infrastructure projects (TR-1.2);
- Through the entitlement process for new development, projects shall be required to fund, or construct needed transportation improvements for all transportation modes, giving first consideration to the improvement of biking, walking, and transit facilities and services that encourage reduced vehicle travel demand (TR-1.4);
- Require new development where feasible to provide on-site facilities such as bicycle storage and showers, provide connections to existing and planned facilities, dedicate land to expand existing facilities or provide new facilities such as sidewalks and/or bicycle lanes/paths, or share in the cost of improvements (TR-2.8);
- As part of the development review process, require that new development along existing and planned transit facilities consist of land use and development types and intensities that contribute towards transit ridership. In addition, require that new development is designed to accommodate and provide direct access to transit facilities (TR-3.3);
- Discourage, as part of the entitlement process, the provision of parking spaces significantly above the number of spaces required by code for a given use (TR-8.4);
- Allow reduced parking requirements for mixed-use developments and for developments providing shared parking or a comprehensive transportation demand management (TDM) program, or developments located near major transit hubs or within Villages and Corridors and other growth areas (TR-8.6);
- Encourage private property owners to share their underutilized parking supplies with the general public and/or other adjacent private developments (TR-8.7);
- Within new development, create and maintain a pedestrian-friendly environment by connecting the internal components with safe, convenient, accessible, and pleasant pedestrian facilities and

by requiring pedestrian connections between building entrances, other site features, and adjacent public streets (CD-3.3);

- Encourage all developers to install and maintain trails when new development occurs adjacent to a designated trail location. Use the City's Parkland Dedication Ordinance and Park Impact Ordinance to have residential developers build trails when new residential development occurs adjacent to a designated trail location, consistent with other parkland priorities. Encourage developers or property owners to enter into formal agreements with the City to maintain trails adjacent to their properties (PR-8.5).

CEQA Transportation Analysis Scope

The CEQA transportation analysis for the project consists of a project-level VMT impact analysis using the City's VMT tool and a cumulative impact analysis that demonstrates the project's consistency with the Envision San Jose 2040 General Plan.

To determine whether a project would result in CEQA transportation impacts related to VMT, the City has developed the San Jose VMT Evaluation Tool to streamline the analysis for development projects. For non-residential or non-office projects, very large projects, or projects that can potentially shift travel patterns, the City's Travel Demand Forecasting (TDF) model can be used to determine project VMT. The City's VMT tool was used to estimate VMT for employment uses proposed by the project.

The City of San Jose's Transportation Analysis Policy establishes procedures for determining project impacts on VMT based on project description, characteristics, and/or location. The City's VMT methodology also includes screening criteria that are used to identify types, characteristics, and/or locations of projects that would not exceed the CEQA thresholds of significance. If a project or a component of a mixed-use project meets the screening criteria, it is then presumed that the project or the component would result in a less-than-significant VMT impact and a VMT analysis is not required. However, the proposed project will not meet all applicable VMT screening criteria as described in further detail in Chapter 3. Therefore, a CEQA-level transportation analysis that evaluates the project's effects on VMT is required and is presented in Chapter 3.

Local Transportation Analysis Scope

A local transportation analysis (LTA) supplements the CEQA VMT analysis and identifies transportation and traffic operational issues that may arise due to a development project. The LTA includes an evaluation of the effects of the project on transportation, access, circulation, and related safety elements in the proximate area of the project.

The LTA includes the evaluation of weekday AM and PM peak hour operations at a limited number of intersections for the purpose of identifying operational issues (queuing, signal operations, and potential multi-modal issues) at intersections in the general vicinity of the project site. However, the determination of project impacts per CEQA requirements is based solely on the VMT analysis.

Traffic conditions at the study intersections were analyzed for both the weekday AM and PM peak hours of adjacent street traffic. The AM peak hour typically occurs between 7:00 AM and 9:00 AM and the PM peak hour typically occurs between 4:00 PM and 6:00 PM on a regular weekday. These are the peak commute hours during which most weekday traffic congestion occurs on the roadways in the study area.

Intersection operations conditions were evaluated for the following scenarios:

- **Existing Conditions.** Existing AM and PM peak hour traffic volumes were obtained from the City of San Jose, the CMP, and available manual turning-movement counts. New turning

movement counts were not collected due to the continued effects of the COVID-19 pandemic on normal traffic conditions. Therefore, as recommended by the City of San Jose, a 1% compounded annual growth factor was applied to counts that were collected prior to the pandemic and are older than two years to estimate traffic conditions in 2022.

- **Background Conditions.** Background traffic volumes were estimated by adding to existing peak hour volumes the projected volumes from approved but not yet completed developments. The added traffic from approved but not yet completed developments was provided by the City of San Jose in the form of the Approved Trips Inventory (ATI) and by the City of Santa Clara in form of an approved project list. Background conditions represent the baseline conditions to which project conditions are compared for the purpose of determining potential adverse operational effects of the project.
- **Background Plus Project Conditions.** Background plus project conditions reflect projected traffic volumes on the planned roadway network with completion of the project and approved developments. Background plus project traffic volumes were estimated by adding to background traffic volumes the additional traffic generated by the project.
- **Cumulative Conditions.** Cumulative conditions represent future traffic volumes on the future transportation network. Cumulative conditions include traffic growth projected to occur due to the approved development projects, the proposed project, and other proposed but not yet approved (pending) development projects in the study area. Lists of pending projects in the project vicinity were provided by the Cities of San Jose and Santa Clara.

The LTA also includes a vehicle queuing analysis, an evaluation of potential project impacts on bicycle, pedestrian, and transit facilities, and a review of site access, on-site circulation, and parking demand.

Report Organization

The remainder of this report is divided into four chapters. Chapter 2 describes the existing transportation system including the existing roadway network, transit service, bicycle and pedestrian facilities. Chapter 3 describes the CEQA transportation analysis, including VMT analysis methodology, baseline and potential project VMT impacts, and potential cumulative transportation impacts. Chapter 4 describes the LTA including the method by which project traffic is estimated, intersection operations analysis methodology, any adverse intersection traffic effects caused by the project, intersection vehicle queuing analysis, site access and on-site circulation review, effects on bicycle, pedestrian, and transit facilities, and parking. Chapter 5 presents the conclusions of the transportation analysis.

2. Existing Transportation Setting

This chapter describes the existing conditions of the transportation system within the study area of the project. It describes transportation facilities in the vicinity of the project site, including the roadway network, transit services, and pedestrian and bicycle facilities.

Existing Roadway Network

Regional access to the project site is provided via US 101 and I-880. Local access to the site is provided by Trimble Road, First Street, Zanker Road, Charcot Avenue, Orchard Parkway, and Component Drive. These facilities are described below.

US 101 is a north/south freeway with six mixed-flow lanes and two high-occupancy-vehicle (HOV) lanes through Santa Clara and San Jose. US 101 extends northward through San Francisco and southward through Gilroy. Access to and from the site is provided via an interchange at Trimble Road.

I-880 is an eight-lane freeway (three mixed-flow lanes and one high-occupancy vehicle (HOV) lane in each direction) in the vicinity of the project area. It extends along the eastern side of San Francisco Bay from San Jose to Oakland. South of its interchange with I-280 in west San Jose, I-880 becomes SR 17 and extends southward to Santa Cruz. Access to the project site from I-880 is provided via an interchange at Montague Expressway.

Trimble Road is a six-lane arterial extending southward from Montague Expressway to De La Cruz Boulevard near US 101. Trimble Road has a posted speed limit of 45 mph with bike lanes on both sides of the street. Direct access to the project site along Trimble Road is proposed to be provided via one right-in/right-out driveway.

First Street is a north-south roadway that extends from the north San Jose area through downtown San Jose. The Green and Blue light rail transit (LRT) lines run along the middle of First Street from downtown San Jose to Tasman Drive in north San Jose. In the vicinity of the project area, First Street is a four-lane (plus LRT line) roadway. First Street, in conjunction with Brokaw Road, provides full access to US 101. First Street has a posted speed limit of 45 mph.

Zanker Road is a four-lane arterial that extends from US 101 northward past SR 237 where it transitions to Los Esteros Road. Zanker Road has a posted speed limit of 45 mph, intersects with Trimble Road, and provides a parallel route to First Street in the study area.

Charcot Avenue is a two- to four-lane east-west roadway with a posted speed limit of 35 mph that begins at the US 101/SR 87 junction as the SR 87 off- and on-ramps to/from North First Street and runs eastward to O'Toole Avenue, just west of I-880, where it terminates. West of North First Street, Charcot Avenue is a four-lane roadway that provides direct access to SR 87, while the segment east of North First Street functions as a two-lane collector roadway providing access to adjacent employment areas.

Orchard Parkway is a two to four-lane north-south roadway that begins at First Street and extends to Charcot Avenue, where it transitions to O'Nel Drive. The roadway provides two travel lanes with bike lanes between North First Street and Trimble Road. South of Trimble Road, four travel lanes with bike lanes are provided. Orchard Parkway runs along the eastern project's frontage and has a posted speed limit of 35 mph with bike lanes on both sides of the street. Direct access to the project site is proposed via an existing signalized intersection just south of Trimble Road and via a right-turns-only driveway along the project's frontage on Orchard Parkway.

Component Drive is a two to four-lane east-west roadway that extends from just west of Orchard Parkway to Zanker Road. The roadway provides two travel lanes between Zanker Road and North First Street then widens to provide four travel lanes west of North First Street. Component Drive has a posted speed limit of 35 mph and provides access to the project via its intersection with Orchard Parkway.

Existing Pedestrian Facilities

Pedestrian facilities in the study area (shown in Figure 3) consist of sidewalks along nearly all the surrounding streets, including the project site frontages along Trimble Road and Orchard Parkway. Crosswalks and pedestrian signal heads are located at all signalized intersections within the project area, including the intersections of Trimble Road, the existing site access point, and Component Drive with Orchard Parkway. ADA-compliant ramps are located at all crosswalks at these three intersections with the exception of the northeast and southwest corners at the existing site access point and Orchard Parkway.

Existing Bicycle Facilities

The existing bicycle facilities in the project area are shown in Figure 4 and described below.

Class I Bikeway (Trail or Path) is an off-street trail or path with exclusive right-of-way for non-motorized transportation used for commuting as well as recreation. Class I bikeways are currently provided along the Guadalupe River. The Guadalupe River multi-use trail system runs through the City of San Jose along the Guadalupe River and is shared between pedestrians and bicyclists and separated from motor vehicle traffic. The Guadalupe River Trail is an 11-mile Class I bikeway from Curtner Avenue in the south to Alviso in the north. In the vicinity of the project site, the Guadalupe River Trail can be accessed via Trimble Road approximately 800 feet west of the project entrance on Trimble Road.

Class II Bikeway (Bike Lane). Class II bikeways are striped bike lanes on roadways that are marked by signage and pavement markings. Within the vicinity of the project site, striped bike lanes are present on the following roadway segments.

- Junction Avenue, between Brokaw Road and Trimble Road
- Zanker Road, between US 101 and SR 237
- First Street, north of Brokaw Road
- Orchard Parkway, along the entire length of the street
- Trimble Road, between De La Cruz Boulevard and Montague Expressway
- Plumeria Drive, along the entire length of the street
- Charcot Avenue, along the entire length of the street

Figure 3
Existing Pedestrian Facilities

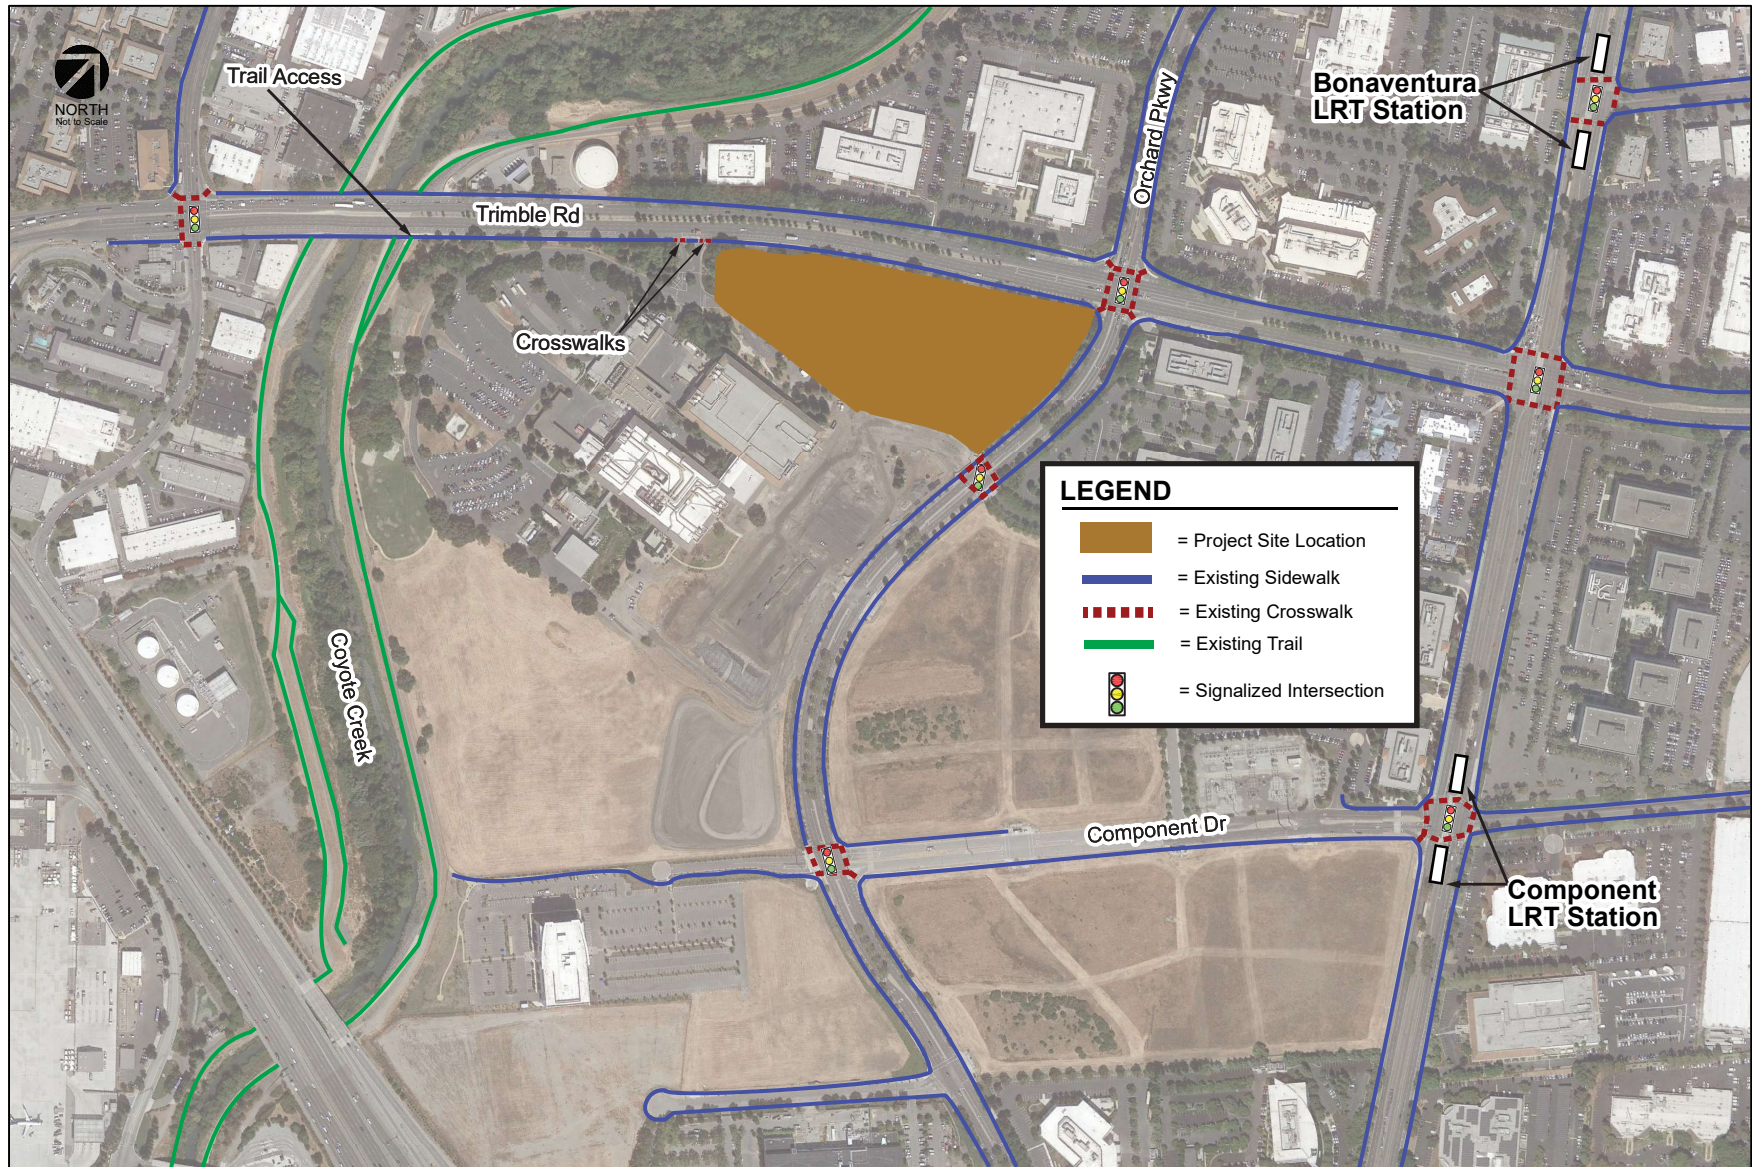

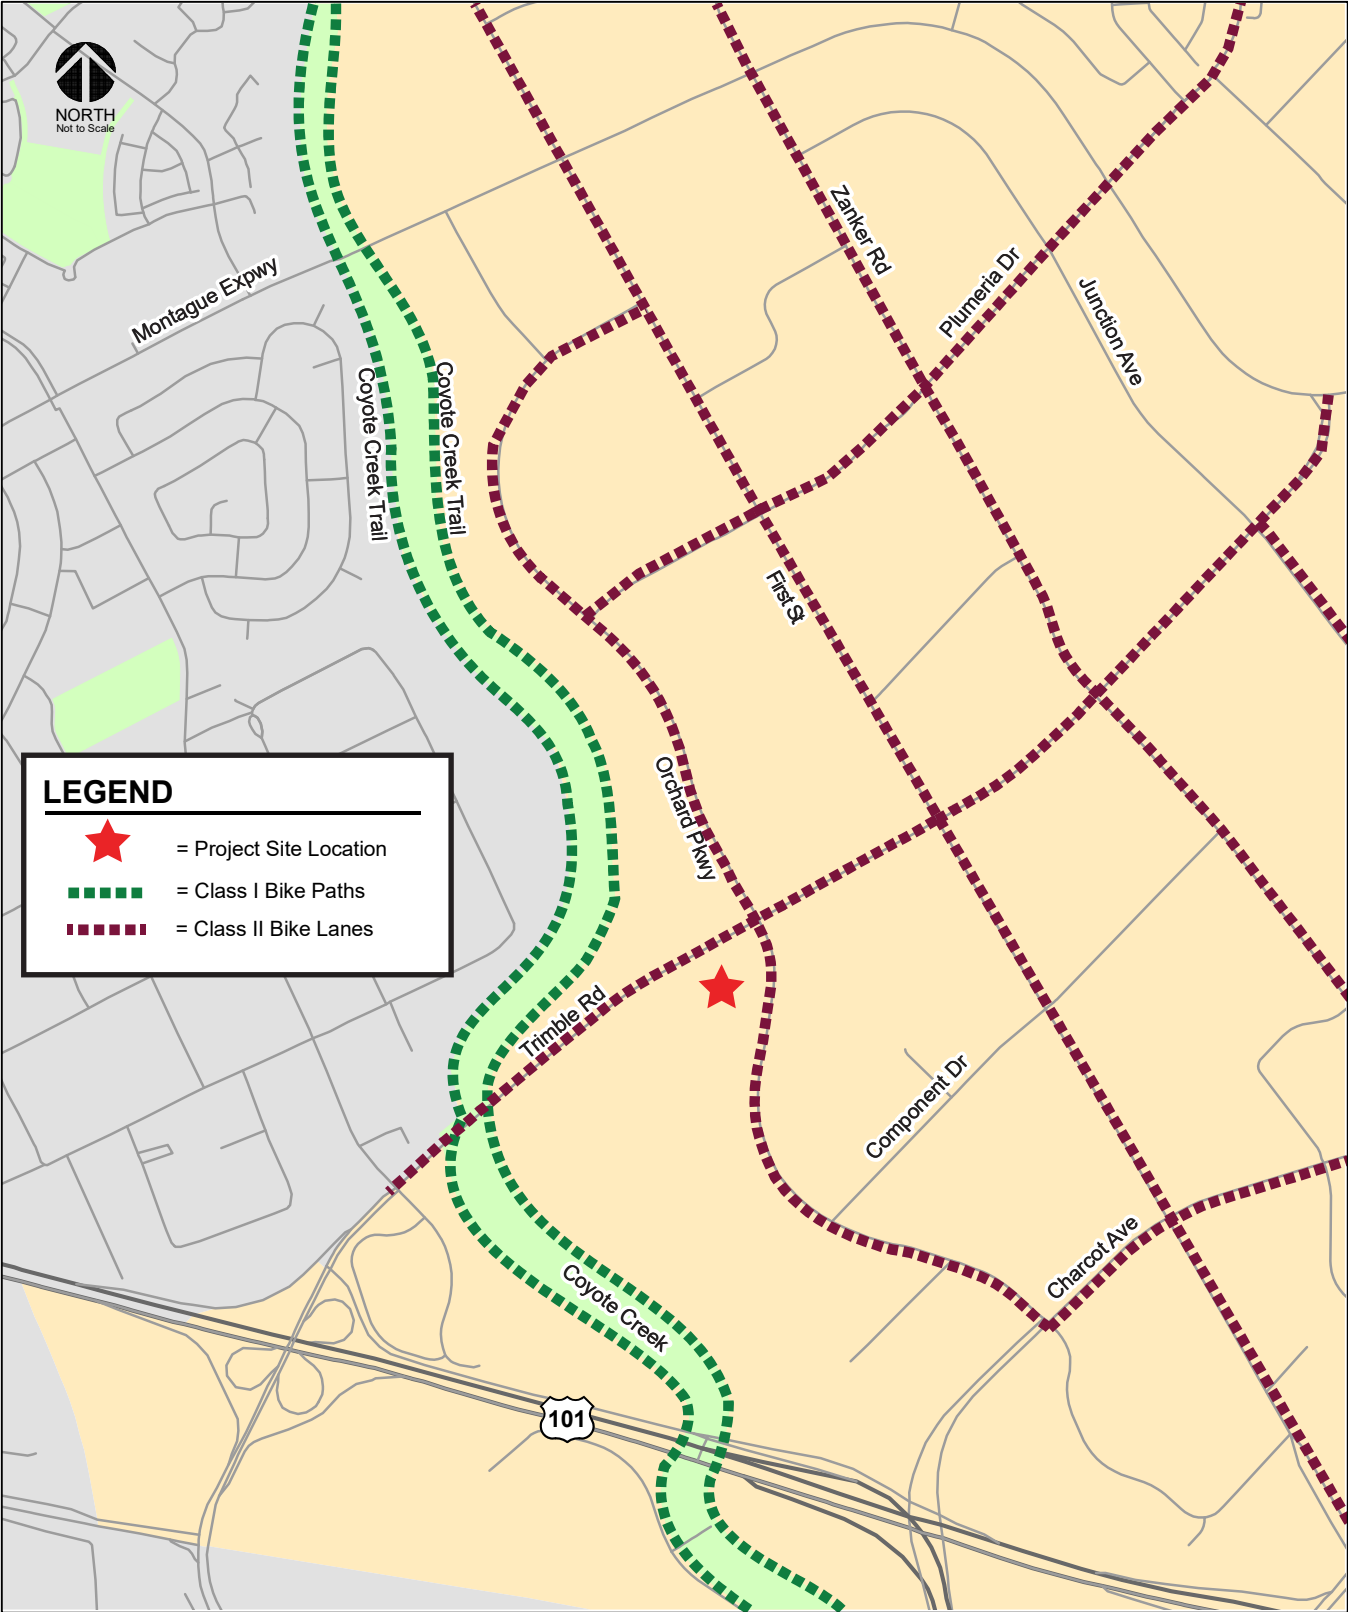

Figure 4
Existing Bicycle Facilities

Existing Transit Services

Existing transit services to the study area are provided by the Valley Transportation Authority (VTA). The VTA transit services are described below and shown in Figure 5.

VTA Bus Services

The project site is not served directly by any bus routes. The nearest bus service near the project site is provided by local bus route 20 which operates along Montague Expressway, First Street, and Plumeria Drive. Route 20 provides services between the Milpitas BART Station and Sunnyvale Transit Center with approximately 30-minute headways during the commute periods. The nearest route 20 bus stops to the project site are located near the intersection of First Street and Plumeria Drive approximately 0.6 miles northeast of the project site.

VTA Light Rail Transit (LRT) Service

The Santa Clara Valley Transportation Authority (VTA) currently operates the 42.2-mile VTA light rail line system extending from south San Jose through downtown to the northern areas of San Jose, Santa Clara, Milpitas, Mountain View, and Sunnyvale. The Green (Old Ironsides – Winchester) and Blue (Baypointe – Santa Teresa) LRT lines operate along First Street. The Green and Blue LRT lines operate from approximately 5:00 AM to 1:00 AM with approximately 20-minute headways during the commute periods. The Bonaventura and Component LRT station platforms on First Street are located within walking distance, approximately 2,000 feet, east of the project site.

CEQA Transportation Analysis

This chapter describes the CEQA transportation analysis, including the VMT analysis methodology and significance criteria, potential project impacts on VMT, mitigation measures recommended to reduce significant impacts, and an evaluation of consistency with the City of San Jose's General Plan.

CEQA Transportation Analysis Screening Criteria

The City of San Jose *Transportation Analysis Handbook* identifies screening criteria that determine whether a CEQA transportation analysis would be required for development projects. The criteria are based on the type of project, characteristics, and/or location. If a project or a component of a mixed-use project meets the City's screening criteria, it is presumed that the project would result in a less-than-significant transportation impact and a detailed VMT analysis is not required. The type of development projects that may meet the screening criteria include the following:

- (1) small infill projects
- (2) local-serving retail
- (3) local-serving public facilities
- (4) projects located in *Planned Growth Areas* with low VMT and *High-Quality Transit*
- (5) deed-restricted affordable housing located in *Planned Growth Areas* with *High-Quality Transit*

Table 1 summarizes the screening criteria for each type of development project as identified in the City of San Jose Transportation Analysis Handbook. Figures 6 and 7 identify areas within the City that currently have low VMT levels estimated by the City for residents and workers, respectively, for which transit-supportive development located within a priority growth area would be screened out of the evaluation of VMT.

Evaluation of Screening Criteria

The City does not provide screening criteria specific to AMD/R&D uses. However, per the City of San Jose VMT screening criteria, industrial uses of 30,000 square feet or less are considered small infill projects and do not require a CEQA VMT evaluation since the VMT generated by such a small project would likely not result in a significant impact to VMT. AMD/R&D uses are similar to light industrial uses since both land uses have an emphasis on activities such as manufacturing and product storage and typically have minimal office space. Therefore, the number and origination/destination of daily trips generated by both light industrial and R&D uses should be similar.

Presuming that AMD/R&D uses have similar trip generating characteristics as industrial uses, AMD/R&D uses can be converted to an equivalent amount of industrial space based on estimates of daily trips. The conversion of the proposed AMD/R&D space was converted to an equivalent amount of industrial space based on trip generation estimates derived utilizing trip rates published in the Institute

**Table 1
CEQA VMT Analysis Screening Criteria for Development Projects**

Type	Screening Criteria
Small Infill Projects	<ul style="list-style-type: none"> • Single-family detached housing of 15 units or less; <u>OR</u> • Single-family attached or multi-family housing of 25 units or less; <u>OR</u> • Office of 10,000 square feet of gross floor area or less; <u>OR</u> • Industrial of 30,000 square feet of gross floor area or less
Local-Serving Retail	<ul style="list-style-type: none"> • 100,000 square feet of total gross floor area or less without drive-through operations
Local-Serving Public Facilities	<ul style="list-style-type: none"> • Local-serving public facilities
Residential/Office Projects or Components	<ul style="list-style-type: none"> • Planned Growth Areas: Located within a Planned Growth Area as defined in the Envision San José 2040 General Plan; <u>AND</u> • High-Quality Transit: Located within ½ a mile of an existing major transit stop or an existing stop along a high-quality transit corridor; <u>AND</u> • Low VMT: Located in an area in which the per capita VMT is less than or equal to the CEQA significance threshold for the land use; <u>AND</u> • Transit-Supporting Project Density: <ul style="list-style-type: none"> ◦ Minimum Gross Floor Area Ratio (FAR) of 0.75 for office projects or components; ◦ Minimum of 35 units per acre for residential projects or components; ◦ If located in a Planned Growth Area that has a maximum density below 0.75 FAR or 35 units per acre, the maximum density allowed in the Planned Growth Area must be met; <u>AND</u> • Parking: <ul style="list-style-type: none"> ◦ No more than the minimum number of parking spaces required; ◦ If located in Urban Villages or Downtown, the number of parking spaces must be adjusted to the lowest amount allowed; however, if the parking is shared, publicly available, and/or “unbundled”, the number of parking spaces can be up to the zoned minimum; <u>AND</u> • Active Transportation: Not negatively impact transit, bike or pedestrian infrastructure.
Restricted Affordable Residential Projects or Components	<ul style="list-style-type: none"> • Affordability: 100% restricted affordable units, excluding unrestricted manager units; affordability must extend for a minimum of 55 years for rental homes or 45 years for for-sale homes; <u>AND</u> • Planned Growth Areas: Located within a Planned Growth Area as defined in the Envision San José 2040 General Plan; <u>AND</u> • High Quality Transit: Located within ½ a mile of an existing major transit stop or an existing stop along a high quality transit corridor; <u>AND</u> • Transit-Supportive Project Density: <ul style="list-style-type: none"> ◦ Minimum of 35 units per acre for residential projects or components; ◦ If located in a Planned Growth Area that has a maximum density below 35 units per acre, the maximum density allowed in the Planned Growth Area must be met; <u>AND</u> • Transportation Demand Management (TDM): If located in an area in which the per capita VMT is higher than the CEQA significance threshold, a robust TDM plan must be included; <u>AND</u> • Parking: <ul style="list-style-type: none"> ◦ No more than the minimum number of parking spaces required; ◦ If located in Urban Villages or Downtown, the number of parking spaces must be adjusted to the lowest amount allowed; however, if the parking is shared, publicly available, and/or “unbundled”, the number of parking spaces can be up to the zoned minimum; <u>AND</u> • Active Transportation: Not negatively impact transit, bike or pedestrian infrastructure.

Low VMT per Capita Areas in San Jose

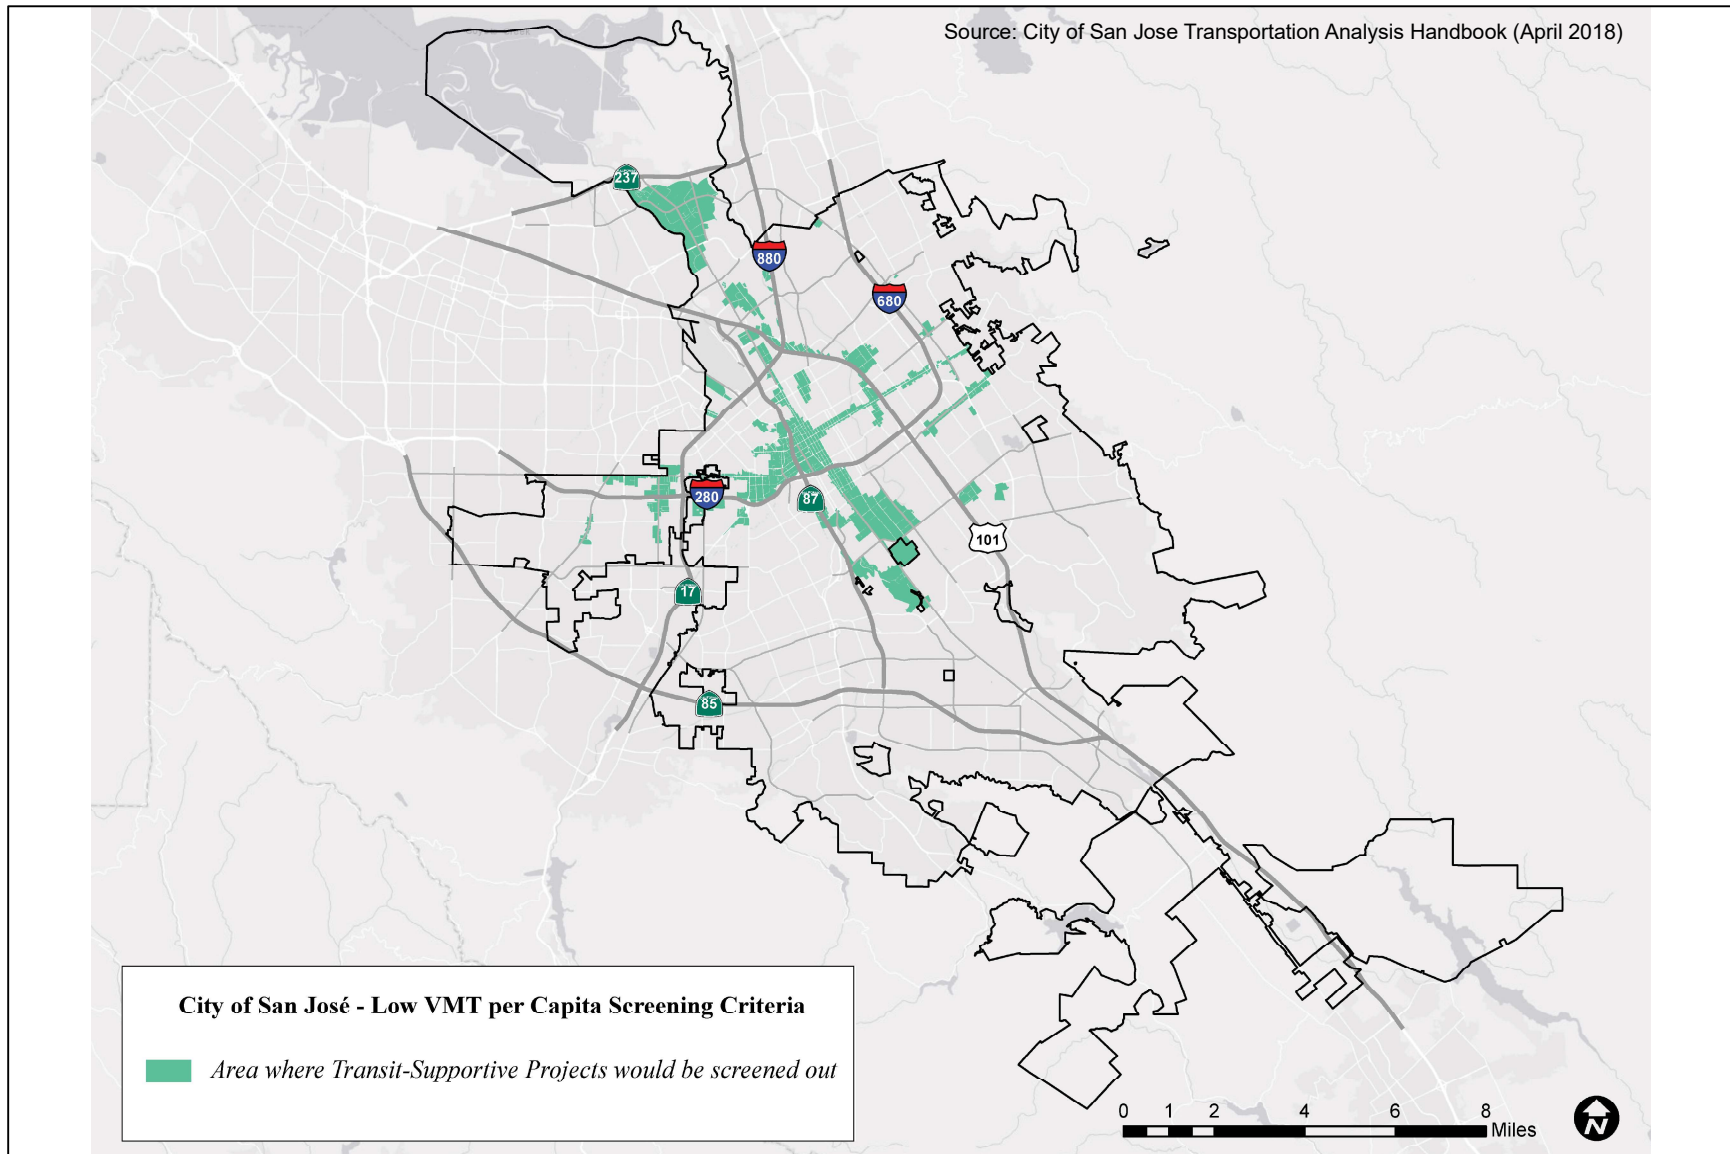

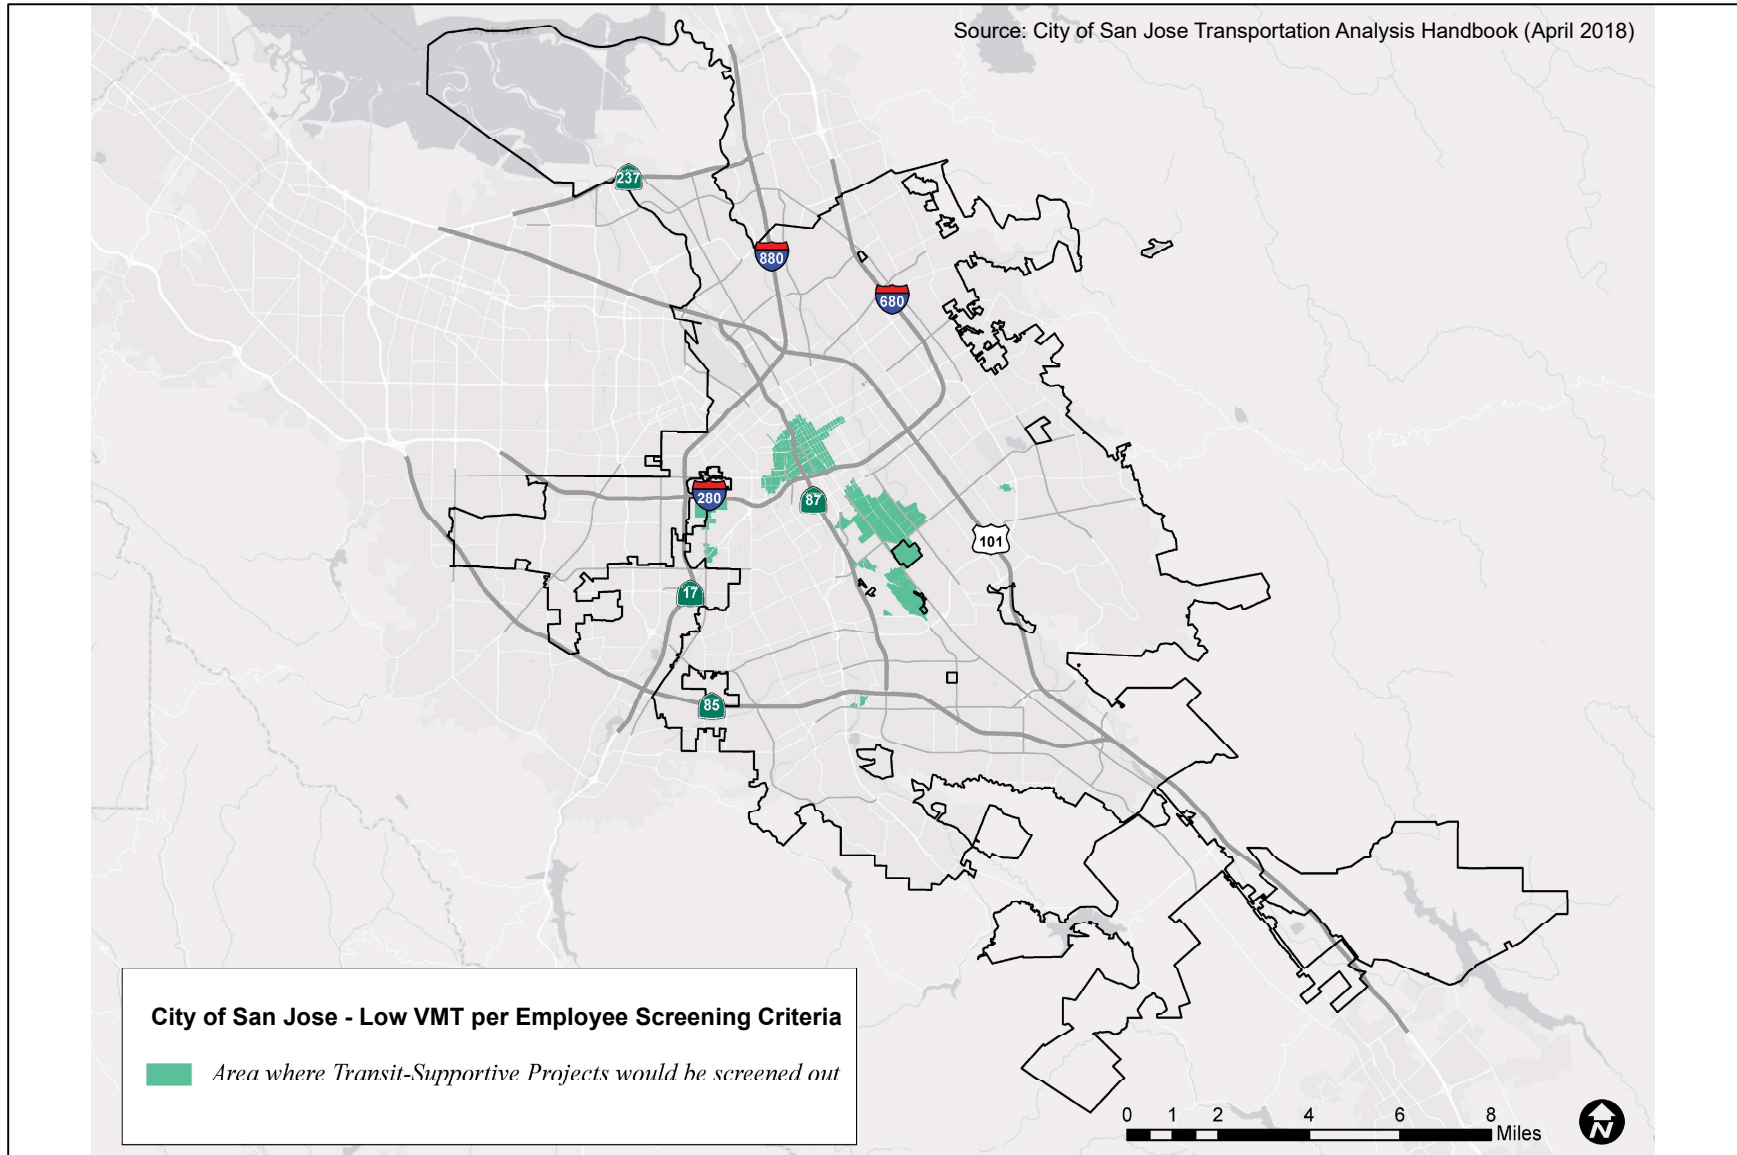

Figure 7
Low VMT per Employee Areas in San Jose

of Transportation Engineers' (ITE) *Trip Generation Manual, 11th Edition* (2021). Based on the ITE daily trip rate for R&D uses (ITE Land Use Code 760), the 208,000-s.f. of AMD/R&D space is estimated to generate 2,305 daily trips, which is equivalent to the daily trips estimated to be generated by approximately 473,000-s.f. of industrial space. Table 2 presents the industrial space equivalency calculation. The 473,000 s.f. of equivalent industrial space for the proposed project would exceed the City's small industrial infill project criterion of 30,000 s.f. In addition, the existing VMT per industrial employee in the project area currently exceeds the City's established CEQA threshold of 14.37 per industrial employee. Therefore, the proposed project would not meet the screening criteria for VMT analysis exemption.

Table 2
Equivalent Industrial Space for the Proposed AMD/R&D Space

Land Use	Size	Daily	
		Rate	Trip
Research & Development (#760) ¹	208,000 Square Feet	11.08	2,305
General Light Industrial (#110) ¹	Equivalent Industrial Space : 473,000 Square Feet	4.87	2,305

¹ ITE Trip Generation Manual, 11th Edition 2021

VMT Evaluation Methodology and Criteria

Per Council Policy 5-1, the effects of the proposed project on VMT were evaluated using the methodology outlined in the City's *Transportation Analysis Handbook*. The City of San Jose defines VMT as the total miles of travel by personal motorized vehicles a project is expected to generate in a day. VMT is calculated using the Origin-Destination VMT method, which measures the full distance of personal motorized vehicle trips with one end within the project. A project's VMT is compared to established thresholds of significance based on the project location and type of development.

Typically, development projects that are farther from other, complementary land uses (such as a business park far from housing) and in areas without transit or active transportation infrastructure (bike lanes, sidewalks, etc.) generate more driving than development near complementary land uses with more robust transportation options. Therefore, developments located in a central business district with high density and diversity of complementary land uses and frequent transit services are expected to internalize trips and generate shorter and fewer vehicle trips than developments located in a suburban area with low density of residential developments and no transit serve in the project vicinity.

When assessing a residential project, the project's VMT is divided by the number of residents expected to occupy the project to determine the VMT per capita. When assessing an office or industrial project, the project's VMT is divided by the number of employees. Non-residential and non-employment uses, such as retail and hotel uses are assessed based on their effects on total VMT.

VMT Evaluation Tool

To determine whether a project would result in CEQA transportation impacts related to VMT, the City has developed the San Jose VMT Evaluation Tool to streamline the analysis for development projects. Based on the assessor's parcel number (APN) of a project, the VMT evaluation tool identifies the existing average VMT per capita and employee for the project area. Based on the project location, type

of development, project description, and proposed trip reduction measures, the VMT evaluation tool calculates the project VMT.

Projects located in areas where the existing VMT is greater than the established threshold are referred to as being in “high-VMT areas”. Projects in high-VMT areas are required to include a set of VMT reduction measures that would reduce the project VMT to the greatest extent possible. The VMT evaluation tool evaluates a list of selected VMT reduction measures that can be applied to a project to reduce the project VMT. There are four strategy tiers whose effects on VMT can be calculated with the VMT evaluation tool:

1. Project characteristics (e.g. density, diversity of uses, design, and affordability of housing) that encourage walking, biking, and transit uses;
2. Multimodal network improvements that increase accessibility for transit users, bicyclists, and pedestrians;
3. Parking measures that discourage personal motorized vehicle trips; and
4. Transportation demand management (TDM) measures that provide incentives and services to encourage alternatives to personal motorized vehicle trips.

The first three strategies – land use characteristics, multimodal network improvements, and parking – are physical design strategies that can be incorporated into the project design. TDM includes programmatic measures that aim to reduce VMT by decreasing personal motorized vehicle mode share and by encouraging more walking, biking, and riding transit. TDM measures should be enforced through annual trip monitoring to assess the project’s status in meeting the VMT reduction goals.

Baseline VMT Estimates

The thresholds of significance for residential and employment development projects, as established in the Transportation Analysis Policy, are based on the existing citywide average VMT level for residential uses and the existing regional average VMT level for employment uses. Figures 8 and 9 show the current VMT levels estimated by the City for residents and workers, respectively. Areas are color-coded based on the level of existing VMT:

- Green-filled areas are parcels with existing VMT less than the City’s residential and employee thresholds of 10.12 VMT per capita and 12.21 per employee. The thresholds are calculated by subtracting 15 percent from the citywide average of 11.91 VMT per capita and regional average of 14.37 per employee.
- Yellow-filled areas are parcels with existing VMT between the residential and employee thresholds and the city-wide average of 11.91 VMT per capita and regional average 14.37 VMT per employee.
- Orange-filled areas are parcels with existing VMT greater than the residential and employee thresholds. However, a project’s VMT impact may be mitigated by implementing VMT-reducing measures.
- Red-filled areas are parcels with existing VMT greater than the residential and employee threshold. Implementing VMT-reducing measures will not be sufficient to reduce a project’s VMT to less than the threshold of significance.

Average per-capita and per-employee VMT for all the existing developments within ½ mile buffer of each parcel in the City serves as the baseline from which a project is evaluated. Figure 10 shows the current VMT levels estimated by the City for workers in the immediate project area.

Thresholds of Significance

If a project is found to have a significant impact on VMT, the impact must be reduced by modifying the project to reduce its VMT to an acceptable level (below the established thresholds of significance

Figure 8
VMT per Capita Heat Map in San Jose

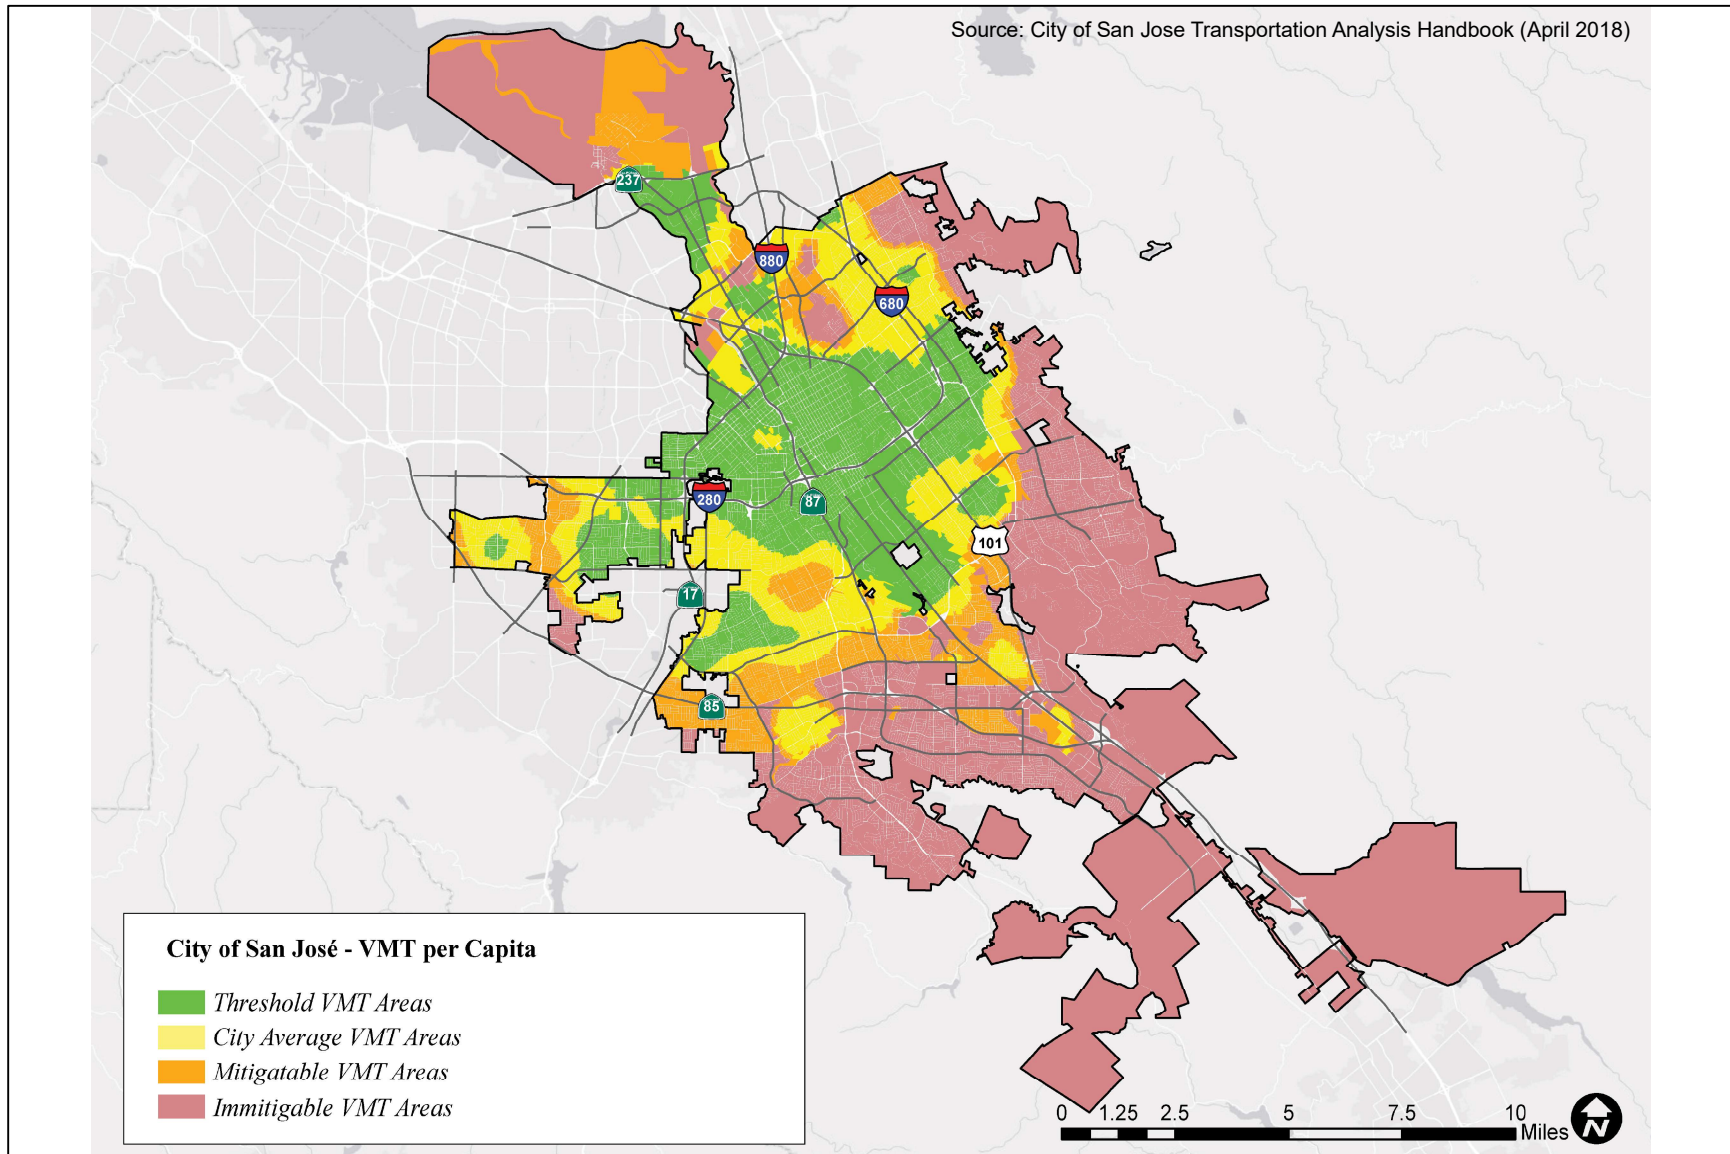

Figure 9
VMT per Industrial Employee Heat Map in San Jose

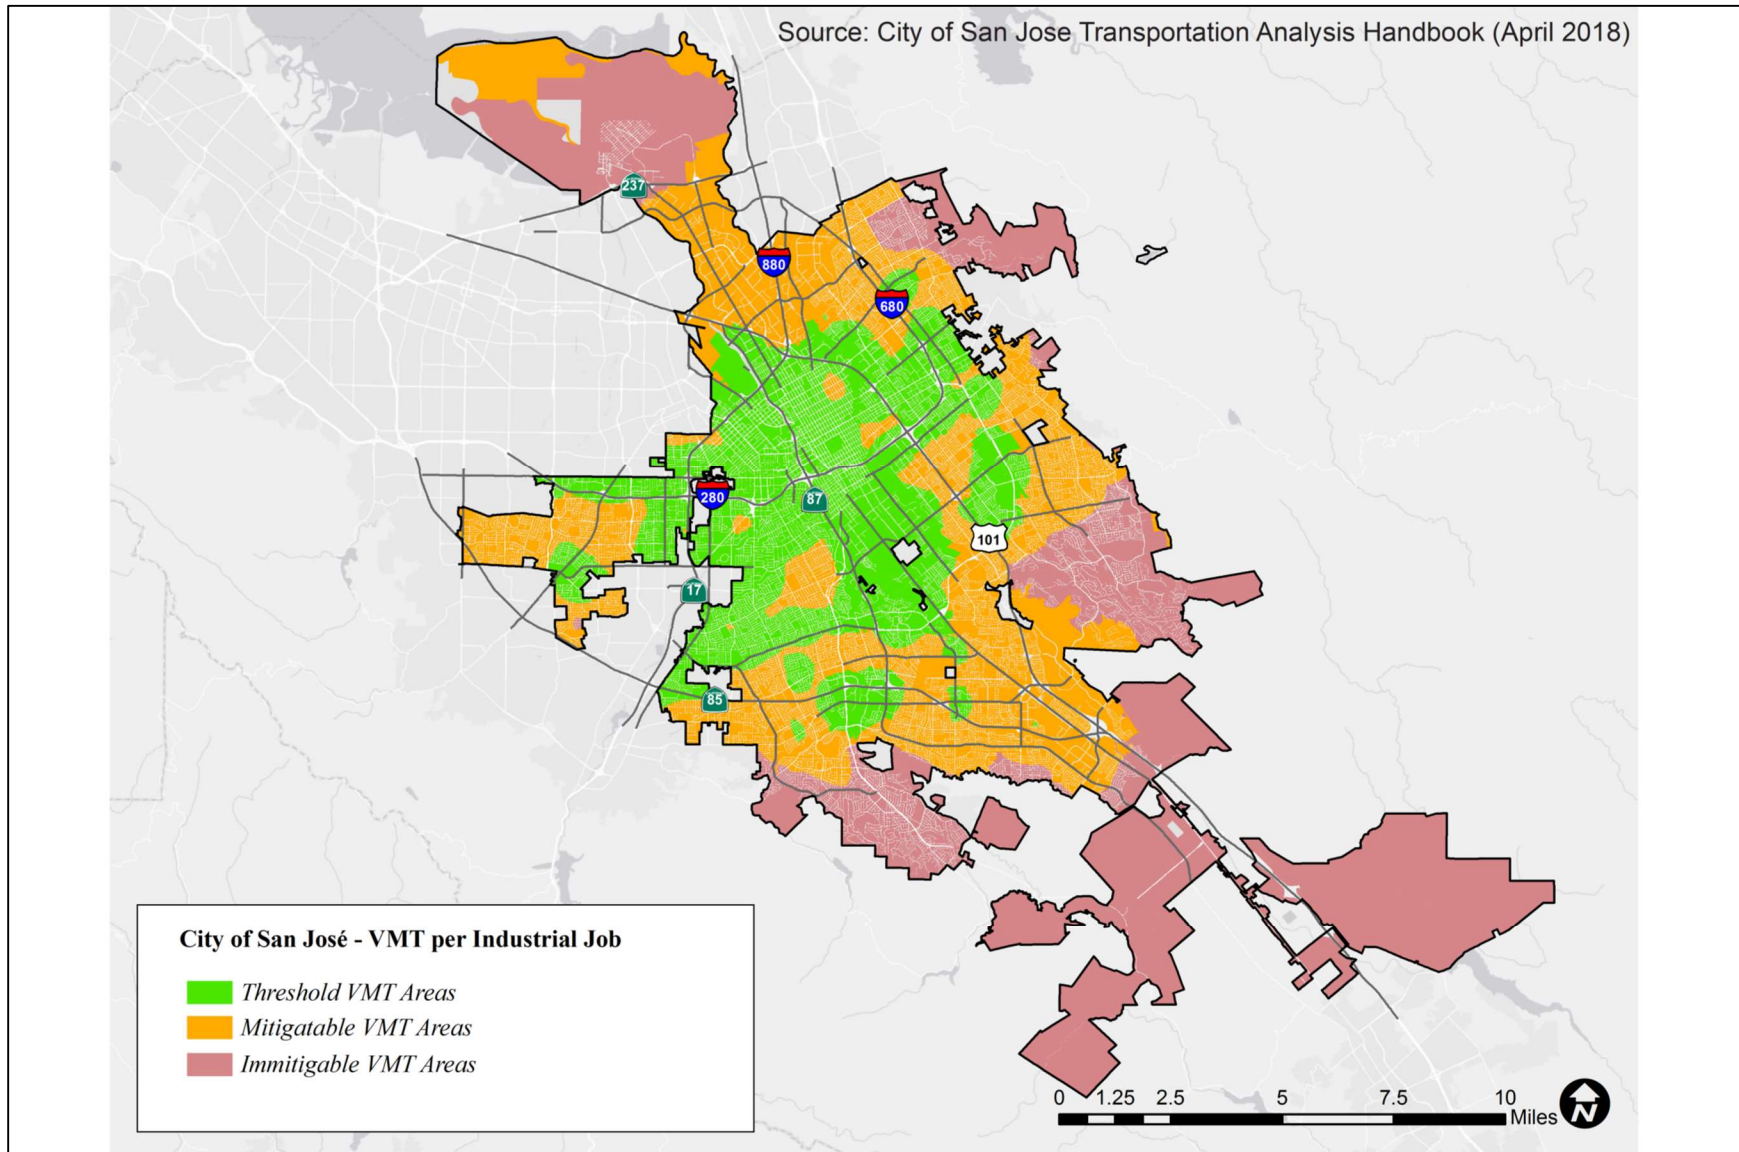

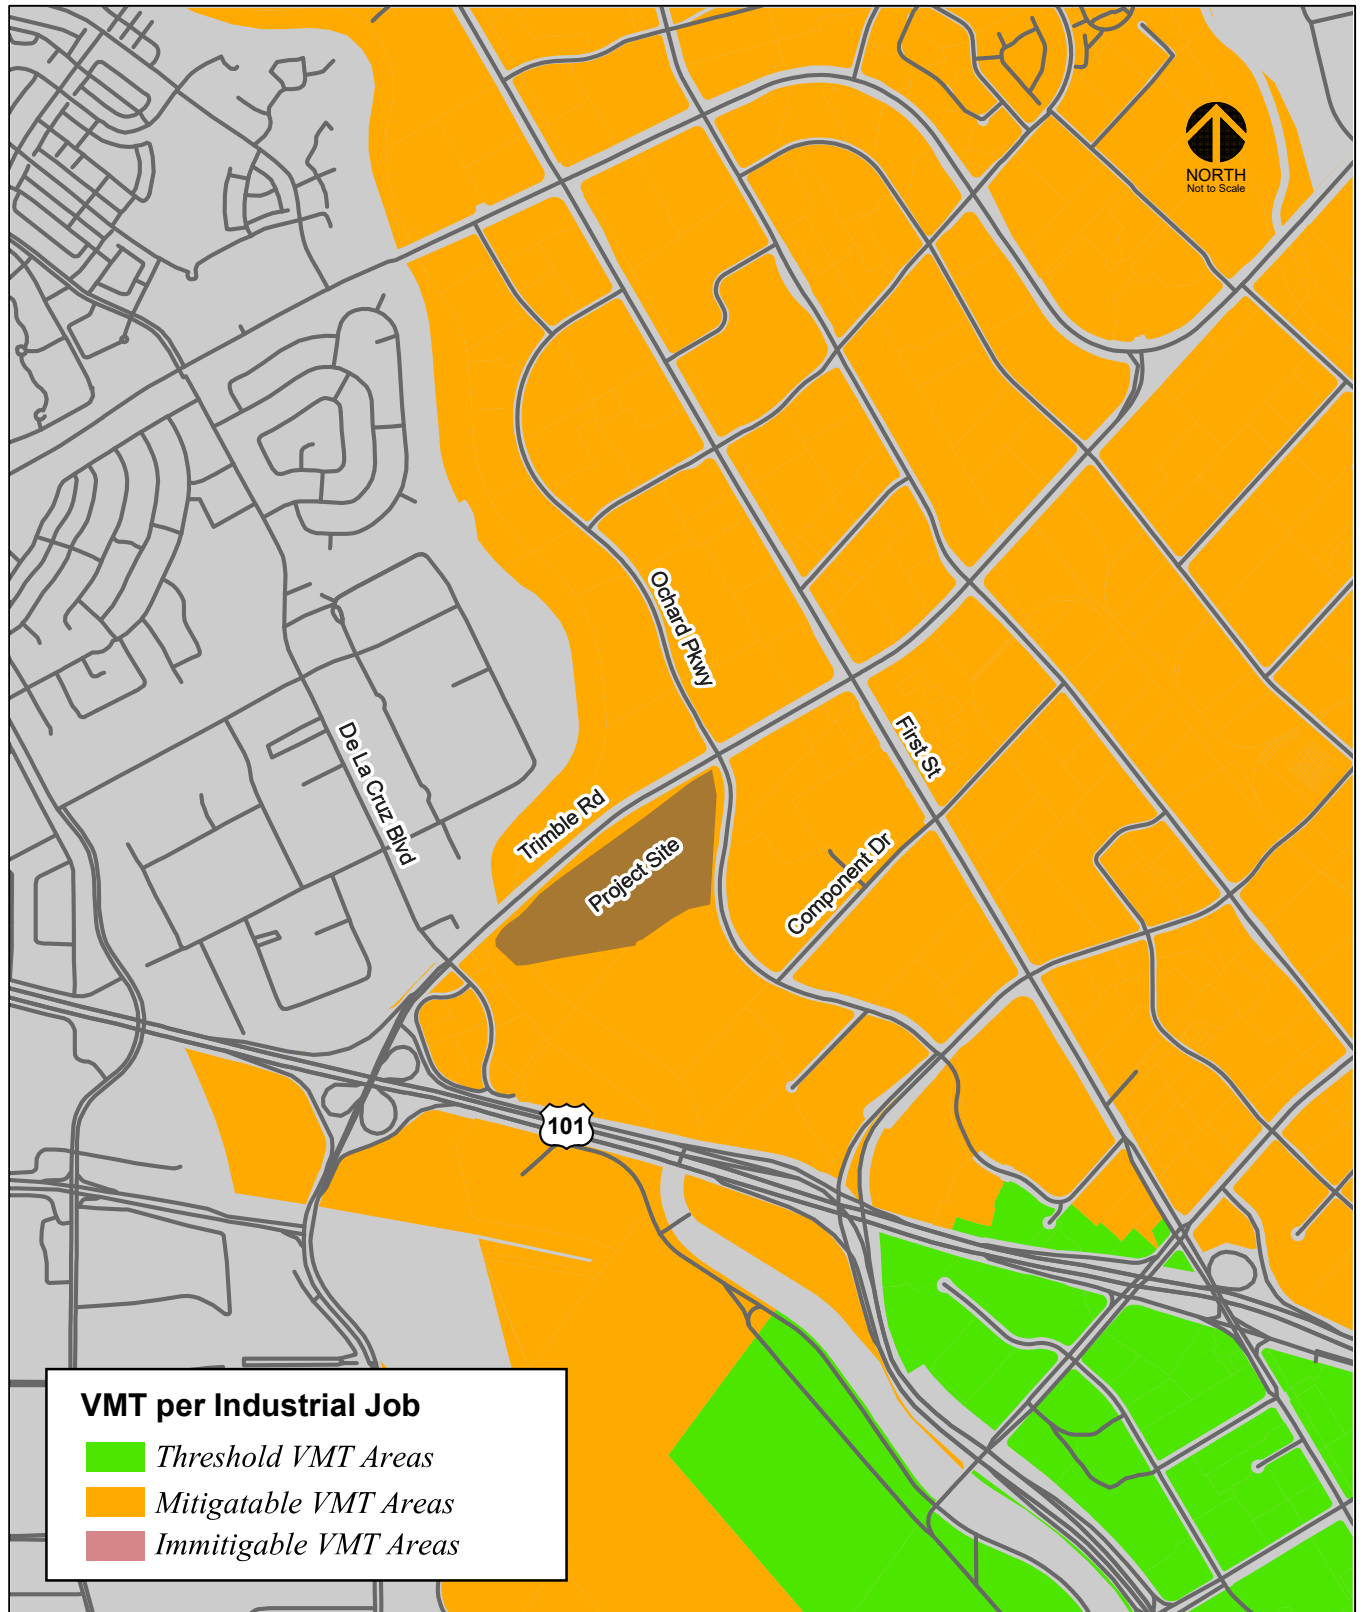

Figure 10
VMT per Industrial Employee Heat Map in Project Area

applicable to the project) and/or mitigating the impact through multimodal transportation improvements or establishing a Trip Cap. Table 3 shows the VMT thresholds of significance for development projects, as established in the Transportation Analysis Policy. Projects that include industrial employment uses, such as the proposed project, are said to create a significant adverse impact when the estimated project-generated VMT exceeds the existing regional average VMT per employee. Currently, the reported regional average is 14.37 VMT per industrial employee.

Table 3
CEQA VMT Analysis Significant Impact Criteria for Development Projects

Type	Significance Criteria	Current Level	Threshold
Residential Uses	Project VMT per capita exceeds existing citywide average VMT per capita minus 15 percent <u>OR</u> existing regional average VMT per capita minus 15 percent, whichever is lower.	11.91 VMT per capita (Citywide Average)	10.12 VMT per capita
General Employment Uses	Project VMT per employee exceeds existing regional average VMT per employee minus 15 percent	14.37 VMT per employee (Regional Average)	12.21 VMT per employee
Industrial Employment Uses	Project VMT per employee exceeds existing regional average VMT per employee	14.37 VMT per employee (Regional Average)	14.37 VMT per employee
Retail/ Hotel/ School Uses	Net increase in existing regional total VMT	Regional Total VMT	Net Increase
Public/Quasi-Public Uses	In accordance with the most appropriate type(s) as determined by Public Works Director	Appropriate levels listed above	Appropriate thresholds listed above
Mixed Uses	Evaluate each land use component of a mixed-use project independently, and apply the threshold of significance for each land use type included	Appropriate levels listed above	Appropriate thresholds listed above
Change of Use or Additions to Existing Development	Evaluate the full site with the change of use or additions to existing development, and apply the threshold of significance for each project type included	Appropriate levels listed above	Appropriate thresholds listed above
Area Plans	Evaluate each land use component of the area plan independently, and apply the threshold of significance for each land use type included	Appropriate levels listed above	Appropriate thresholds listed above

Source: City of San José Transportation Analysis Handbook, April 2020.

VMT of Existing Land Uses

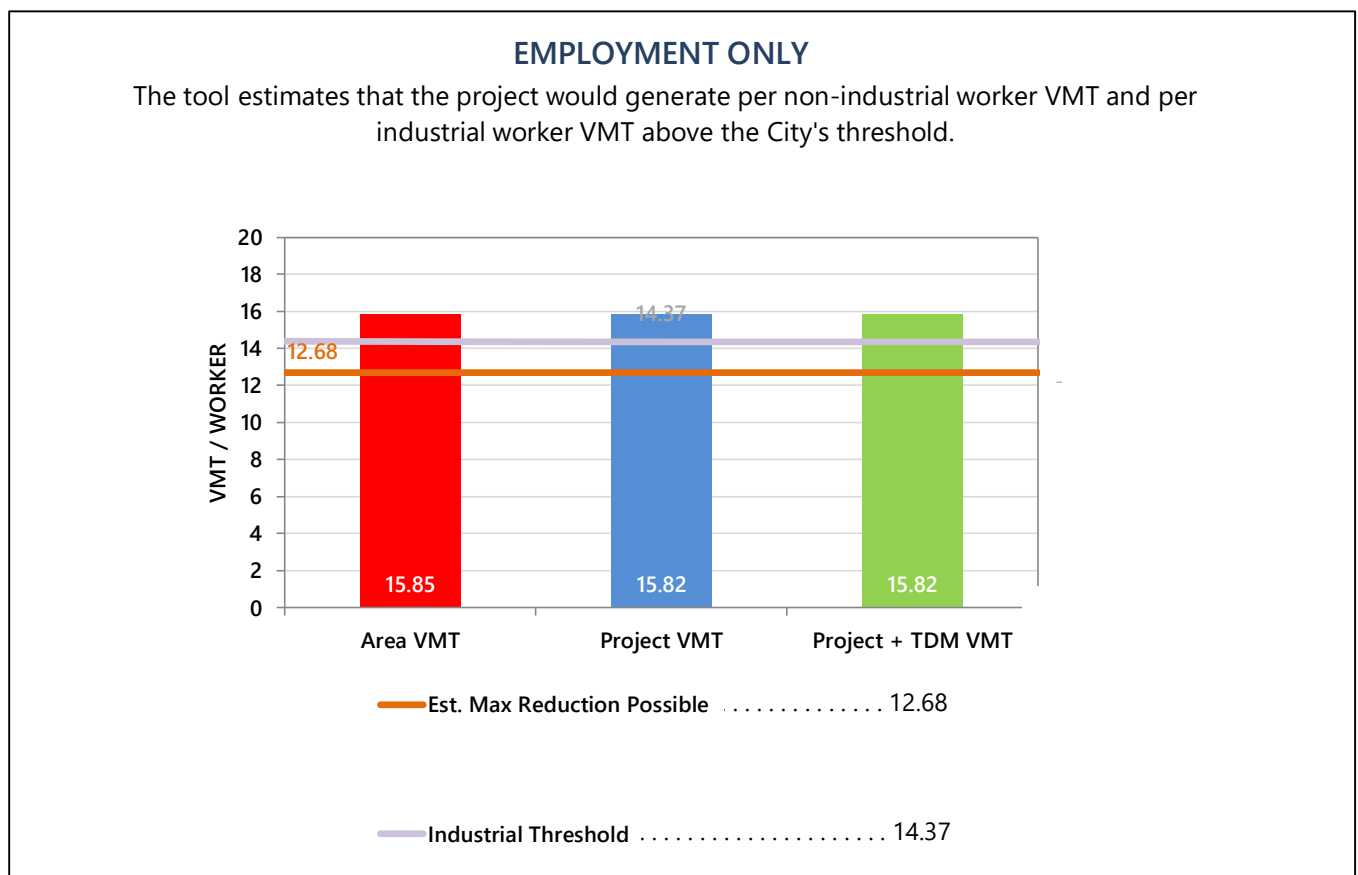

The results of the VMT analysis using the VMT Evaluation Tool indicate that the existing VMT for industrial employment uses in the project vicinity is 15.85 per industrial employee. As shown in Table 3, the current regional average VMT for employment uses is 14.37 per employee. Therefore, the existing VMT levels of industrial employment uses in the project vicinity are currently greater than the regional average VMT. Appendix A presents the VMT Evaluation Tool summary report for the project.

Project-Level VMT Impact Analysis

The City’s Transportation Policy identifies an impact threshold for industrial uses to be the regional average per employee VMT of 14.37. Thus, the proposed project will result in a significant impact if it results in VMT that exceeds the per industrial employee VMT of 14.37.

The results of the VMT evaluation, using the City’s VMT Evaluation Tool, indicate that the project is projected to generate VMT per industrial employee (15.82), which would exceed the established impact threshold of 14.37 VMT per employee for industrial employment uses. Therefore, the project would result in an impact on the transportation system based on the City’s VMT impact criteria. Figure 11 shows the VMT evaluation summary generated by the City of San Jose’s VMT Evaluation Tool.

Figure 11
VMT Analysis

Project Impacts and Mitigation Measures

Project Impact: Since the VMT per industrial employee (15.82) generated by the project would exceed the impact threshold of 14.37 VMT per industrial employee, the project would result in a significant transportation impact on VMT, and mitigation measures are required to reduce the VMT impact.

Mitigation Measures: The project will be required to implement a Travel Demand Management (TDM) plan that includes the implementation of one of the following TDM measures to reduce the project’s VMT impact to less than significant levels. It should be noted that the selected TDM measure must be incorporated within a TDM plan for the project which may include additional TDM measures. However,

per the City's VMT tool, the project's VMT impact would be mitigated with the implementation of one of the TDM measures.

- **Telecommuting and Alternative Work Schedules**: Encourage employees to telecommute from home when possible, or to shift work schedules such that travel occurs outside of peak congestion periods. This strategy reduces commute trips, thereby reducing VMT. At a minimum, the measure would require that 65% of employees work a 4/40 work week schedule (10-hour workdays for four days a week). **Or**
- **Operate a Free Direct Shuttle**: Provide direct shuttle service to the project site from areas with high concentrations of employees. This strategy reduces drive-alone commute trips, thereby reducing VMT. At a minimum, the measure would require at least 20% participation by employees. **Or**
- **Subsidize Vanpool**: Provide subsidies for individuals forming new vanpools for their commute. This encourages the use of vanpools, reducing drive-alone trips, and thereby reducing VMT. The project would be required to subsidize 100% of the cost of the vanpool cost with at least 20% employee participation.

The project's VMT could be reduced further with the implementation of the following multi-modal facility improvements as identified by the City of San Jose staff. However, per the City's VMT tool, the project's VMT impact would be mitigated with the implementation of one of the TDM measures identified above.

- **Provide Pedestrian Network Improvements for Active Transportation (Tier 2)**: Implement pedestrian improvements both on-site and in the surrounding area. Improving pedestrian connections encourages people to walk instead of drive and reduces VMT. Improvements would include the removal of the pork chop islands located at the southwest and southeast corners of the Orchard Parkway/Trimble Road intersection along with a signal modification, and the implementation of a protected intersection to accommodate Class-IV bikeways to improve pedestrian safety and access.

The mitigation measures and the resulting VMT are summarized in Table 4. Figure 12 shows the VMT evaluation summary with mitigation generated by the City's VMT Evaluation Tool. Appendix A presents the VMT Evaluation Tool summary report for the project without and with the mitigation measures.

TDM Implementation, Monitoring, and Reporting

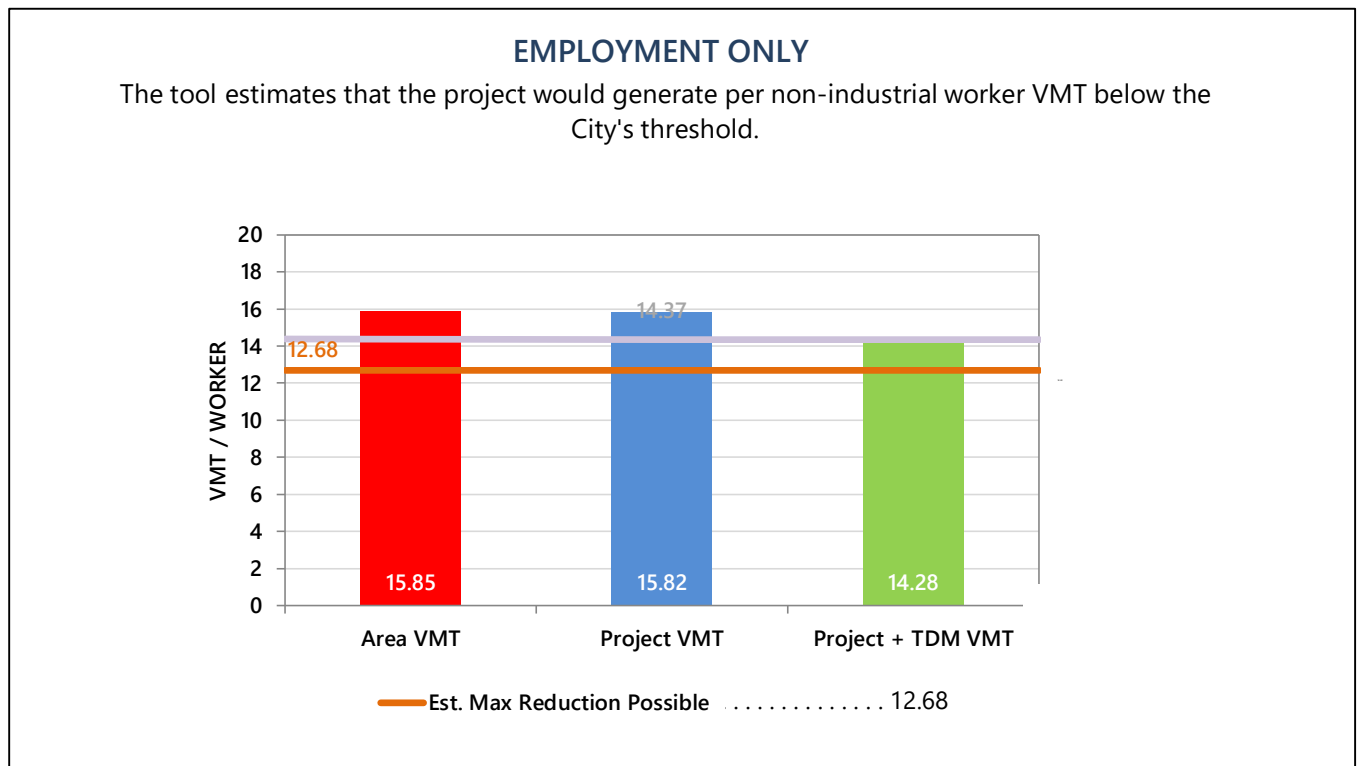

The TDM Plan would require coordination with the City of San Jose staff. The project applicant should submit the TDM Plan to the City of San Jose for approval. The project applicant would also be responsible for ensuring that the TDM strategies are incorporated into the project. After the proposed building is constructed and occupied, the project applicant should identify a TDM Coordinator. The TDM Coordinator would be responsible for implementing the ongoing TDM program. Having a main contact person would help ensure that transportation-related questions from employees are responded to promptly. If the TDM Coordinator changes for any reason, City staff and all office employees shall be notified of the name and contact information of the newly designated TDM Coordinator.

The TDM Plan would need to be re-evaluated annually for the life of the project. It is recommended that the designated TDM Coordinator consults with City staff to ensure the monitoring and reporting meet the City's expectations. Monitoring should include the following components:

**Table 4
VMT with Mitigation Measures**

#	Mitigation	Mitigation Description	VMT		
			Per Employee	Threshold	Impact?
	Project	None	15.82	14.37	Yes
<u>One of These Tier 4 (TDM) Mitigation Measures Needs to be Implemented:</u>					
1	Telecommuting and Alternative Work Schedules	Encourage employees to telecommute from home when possible, or to shift work schedules such that travel occurs outside of peak congestion period. This strategy reduces commute trips, thereby reducing VMT. At a minimum, the measure would require that 65% of employees work a 4/40 work week schedule (10-hour work days for four days a week).	14.28	14.37	No
2	Operate a Free Direct Shuttle	Provide direct shuttle service to the project site from areas with high concentrations of employees. This strategy reduces drive-alone commute trips, thereby reducing VMT. At a minimum, the measure would require at least 20% participation by employees.	14.33	14.37	No
3	Subsidize Vanpool	Provide subsidies for individuals forming new vanpools for their commute. This encourages the use of vanpools, reducing drive-alone trips and thereby reducing VMT. The project would be required to subsidize 100% of the cost of the vanpool cost with at least 20% employee participation.	14.02	14.37	No
<u>Tier 2 (Multimodal Infrastructure)</u>					
4	Provide Pedestrian Network Improvements for Active Transportation	Implement pedestrian improvements both on-site and in the surrounding area. Improving pedestrian connections encourages people to walk instead of drive and reduces VMT. Improvements would include the removal of the pork chop islands located at the southwest and southeast corners of the Orchard Parkway/Trimble Road intersection along with a signal modification, and implementation of a protected intersection to accommodate Class-IV bikeways to improve pedestrian safety and access.	--	--	--
<u>One of the Tier 4 (TDM) and Tier 2 (Multimodal Infrastructure) Mitigation Measures Identified Above:</u>					
	1 & 4		13.99	14.37	No
	2 & 4		14.04	14.37	No
	3 & 4		13.74	14.37	No

Figure 12
VMT Analysis with Recommended Mitigation Measures (Telecommuting and Alternative Work Schedule)

- Annual Vehicle Trip Generation Counts (conducted by a third party). It is assumed that every percent reduction in peak-hour vehicle trips generated by the project is equivalent to a one percent reduction in per-employee VMT. If the counts show the project trip generation is higher than expected, then the TDM Plan may need to be altered or enhanced.
- Annual Mode Share Surveys. A survey to be administered to all office employees would provide qualitative data regarding employee perceptions of the alternative transportation programs and perceptions of the obstacles to using an alternative mode of transportation. The survey also would provide quantitative data regarding the number of employees who utilize alternative modes of transportation (e.g., bike-to-work, carpool, or use public transit) to commute to work, including the frequency of use. The mode share survey results should measure the relative effectiveness of individual TDM program components and facilitate the design of possible program enhancements in order to reduce single-occupant vehicle trips.
- Annual Monitoring Report. The TDM Coordinator would be responsible for submitting the monitoring reports to the City of San Jose (Department of Building and Code Enforcement’s Environmental Review) annually for three years, and then upon request of the Zoning Administrator for the life of the project.

Cumulative (GP Consistency) Evaluation

Projects must demonstrate consistency with the *Envision San José 2040 General Plan* to address cumulative impacts. Consistency with the City's General Plan is based on the project's density, design, and conformance to the General Plan goals and policies. If a project is determined to be inconsistent with the General Plan, a cumulative impact analysis is required per the City's *Transportation Analysis Handbook*.

According to the *Envision San Jose 2040 General Plan*, the project site is designated for *Industrial Park (IP) and Combined Industrial/Commercial (CIC)* uses. This designation permits development with retail and service commercial uses on the first two floors; with office, research and development or industrial use on upper floors; as well as wholly office, research and development, or industrial projects.

Since the *Industrial Park (IP) and Combined Industrial/Commercial (CIC)* designation allow industrial/office uses, the proposed manufacturing land use project is consistent with the *Envision San Jose 2040 General Plan* and would not require a General Plan Amendment (GPA). The project would be considered part of the cumulative solution to meet the General Plan's long-range transportation goals and would result in a less-than-significant cumulative impact.

4. Local Transportation Analysis

This chapter describes the Local Transportation Analysis (LTA) including the method by which project traffic is estimated, intersection operations analysis for existing, background, background plus project, cumulative no project, and cumulative plus project, any adverse effects on study intersections caused by the project, intersection vehicle queuing analysis, freeway segment capacity, site access and on-site circulation review, effects on bicycle, pedestrian, and transit facilities, and parking.

The LTA supplements the CEQA VMT analysis and identifies transportation and traffic operational issues that may arise due to a development project. The LTA is required per the City of San Jose Transportation Policy, however, the determination of project impacts per CEQA requirements is based solely on the VMT analysis presented in the previous chapter. The LTA provides supplemental analysis for use by the City of San Jose in identifying potential improvements to the transportation system with a focus on improving multi-modal travel.

Project Description

The proposed project would consist of the construction of a 208,000-square-foot (s.f.) advanced manufacturing building on an approximately 10-acre vacant site. Approximately 280 vehicular parking spaces and 15 truck docks are proposed on-site. Direct access to the site would be provided via an existing limited right-turn in and right-turn out only driveway along Trimble Road, an existing full-access driveway, and a right-turns only driveway located along Orchard Parkway. However, the project's surface lots and drive aisles would connect to the adjoining properties along its southern boundary. Therefore, there also would be additional access points at existing driveways along Orchard Parkway.

The applicant for the project has requested that the transportation analysis allows for the flexibility to utilize the building with either warehouse, industrial, or research & development (R&D) space since a tenant and use of the proposed building have yet to be identified. Of the above-identified uses, R&D space generates the greatest number of daily and peak hour trips per 1,000 s.f. of space. Therefore, this study evaluates the proposed project as 208,000 s.f. of R&D space for the purpose of providing the flexibility to allow for the use of the proposed building with low traffic generating warehouse uses or a greater traffic intensity traffic generating use such as R&D space.

Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the site is estimated for the AM and PM peak hours. As part of the project trip distribution, the directions to and from which the project trips would travel are estimated. In the project trip assignment, the project trips are assigned to specific streets and intersections. These procedures are described below.

Trip Generation

Proposed Project Trips

Through empirical research, data have been collected that indicate the amount of traffic that can be expected to be generated by common land uses. Project trip generation was estimated by applying to the size and uses of the development the appropriate trip generation rates. The average trip generation rates for Research & Development Center (Land Use #760) as published in the Institute of Transportation Engineers (ITE) *Trip Generation Manual, 11th Edition* (2021) were applied to the proposed manufacturing used to estimate the project trips. Based on the trip generation rates, it is estimated that the project would generate a total of 2,305 daily vehicle trips, with 214 trips (175 inbound and 39 outbound) occurring during the AM peak hour and 204 trips (33 inbound and 171 outbound) occurring during the PM peak hour before any reductions.

Trip Reductions

In accordance with San Jose's *Transportation Analysis Handbook* (April 2020, Section 4.8, "Intersection Operations Analysis"), the project is eligible for adjustments and reductions from the baseline (gross) trip generation described above.

Based on the San Jose guidelines, the project qualifies for a location-based adjustment. The location-based adjustment reflects the project's vehicle mode share based on the "place type" in which the project is located per the San Jose Travel Demand Model. The project's place type was obtained from the San Jose VMT Evaluation Tool. Based on the evaluation tool, the project site is located within a *Suburb with Multifamily Homes* place type. Based on Table 6 of the City of San Jose *Transportation Analysis Handbook*, April 2020, office/industrial developments within *Suburb with Multifamily Homes* areas have vehicle mode shares of 92%. Thus, a reduction of 8% was applied to the trips generated by the proposed project.

Additionally, based on the San Jose VMT Evaluation Tool, the proposed project is anticipated to generate 15.82 VMT per industrial employee in an area that currently generates approximately 15.85 VMT per industrial employee. Per City guidelines, every percent reduction from the existing VMT is equivalent to one percent reduction in peak-hour vehicle trips. Thus, the project trip estimates were reduced by 0.19 percent for the proposed employment uses to reflect the reduction in peak hour trips.

After applying the ITE trip rates and appropriate trip reductions, it is estimated that the project would generate a total of 2,117 daily vehicle trips, with 197 trips (161 inbound and 36 outbound) occurring during the AM peak hour and 187 trips (30 inbound and 157 outbound) occurring during the PM peak hour. The project trip generation estimates are presented in Table 5.

**Table 5
Project Trip Generation Estimates**

Land Use	Reduction %	VMT		Size	Daily		AM Peak Hour					PM Peak Hour						
		Existing	Project		Rate	Trip	Split		Trip			Rate	Split		Trip			
							In	Out	In	Out	Total		In	Out	Total

<i>VMT-Based Reduction²</i>	0.19%	15.85	15.82			-4				0	0	0				0	0	0
Total Project Trips						2,117				161	36	197				30	157	187

Source: ITE Trip Generation Manual, 11th Edition 2021.

¹ The place type for the project site (Suburban with Multi-Family Homes) is obtained from the City of San Jose VMT Evaluation Tool (February 29, 2019). The location-based vehicle mode shares are obtained from Table 6 of the City of San Jose Transportation Analysis Handbook (April 2020). The trip reductions are based on the percent of mode share for all of the other modes of travel beside vehicle.

² Existing and project VMTs were estimated using the City of San Jose VMT Evaluation Tool. It is assumed that every percent reduction in VMT per-employee is equivalent to one percent reduction in peak-hour vehicle trips.

Trip Distribution and Trip Assignment

The trip distribution pattern for the project was developed based on existing travel patterns on the surrounding roadway system and the locations of complementary land uses. The peak-hour vehicle trips generated by the project were assigned to the roadway network in accordance with the trip distribution pattern, with an emphasis on freeway access and project driveway location. Figure 13 shows the trip distribution pattern, and Figure 14 shows the assignment of project traffic on the local transportation network.

Intersection Operations Methodology

This section presents the methods used to evaluate traffic operations at the study intersections. It includes descriptions of the data requirements, the analysis methodologies, the applicable level of service standards, and the criteria defining adverse effects at the study intersections.

The intersection operations analysis is intended to quantify the operations of intersections and to identify potential negative effects due to the addition of project traffic. However, a potential adverse effect on a study intersection is not considered a CEQA impact metric.

Study Intersections

The study includes an analysis of AM and PM peak-hour traffic conditions for 16 signalized intersections in the Cities of San Jose and Santa Clara. Intersections were selected for study if the project is expected to add 10 vehicle trips per hour per lane to an intersection that meets one of the following criteria as outlined in the *Transportation Analysis Handbook*.

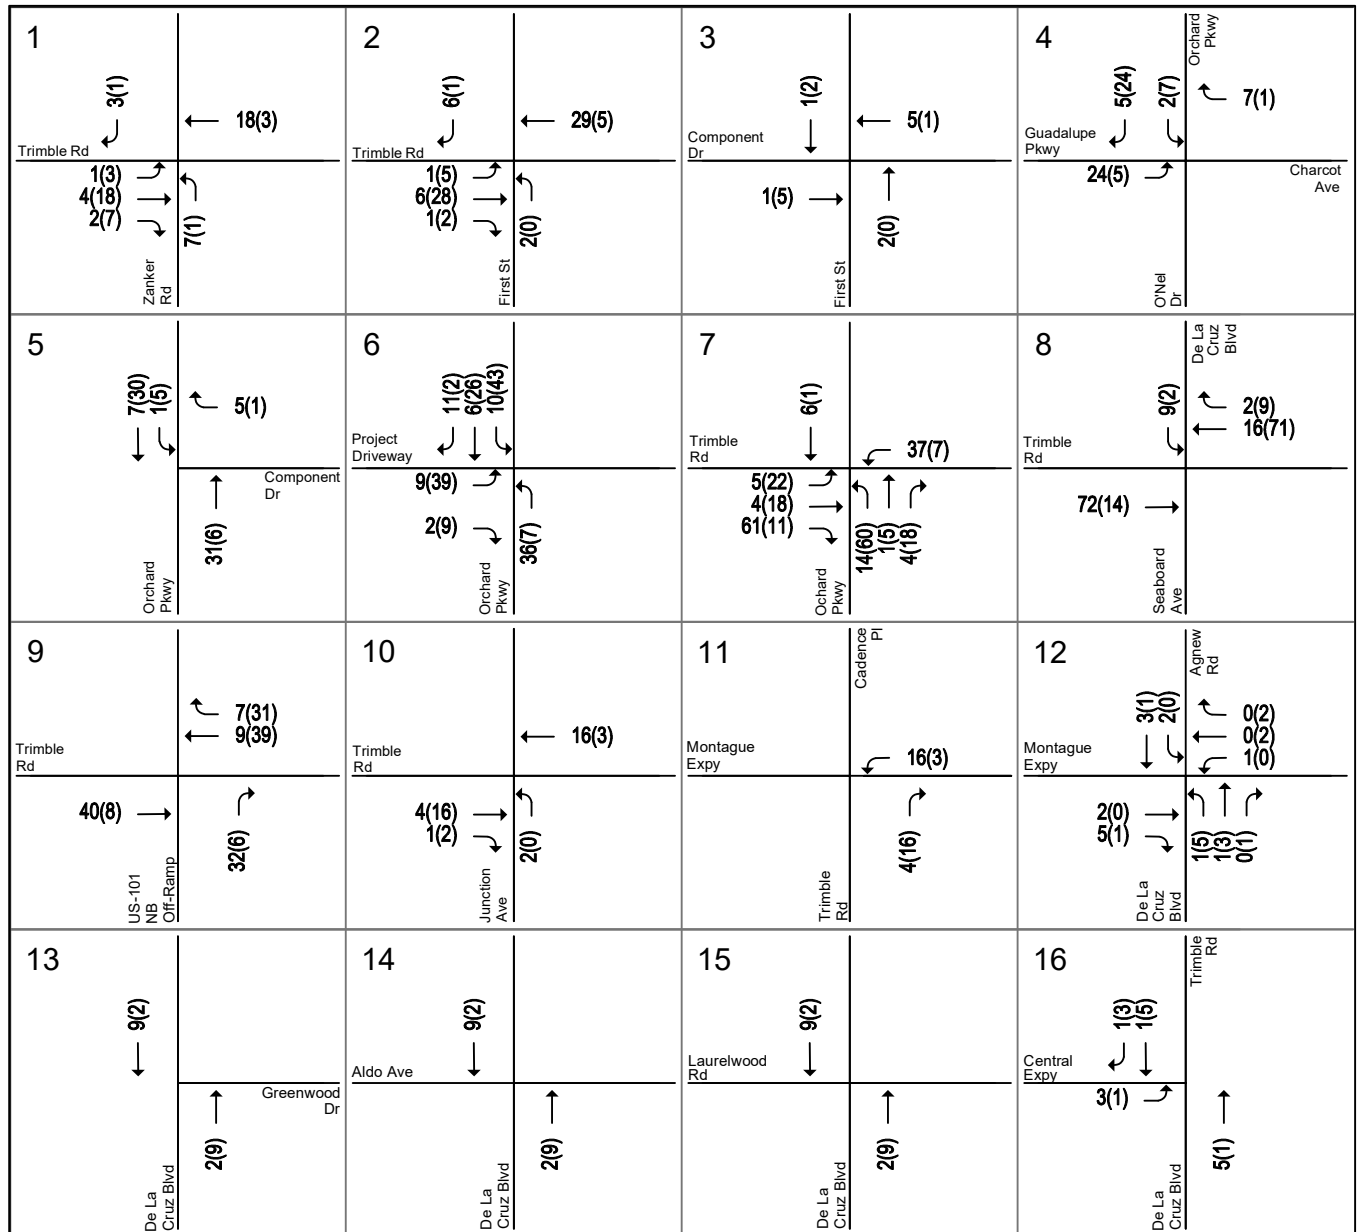

- Within a ½-mile buffer from the project's property line;
- Outside a ½-mile buffer but within a one-mile buffer from the project AND currently operating at D or worse;
- Designated Congestion Management Program (CMP) facility outside of the City's Infill Opportunity Zones;
- Outside the City limits with the potential to be affected by the project, per the transportation standards of the corresponding external jurisdiction;
- With the potential to be affected by the project, per engineering judgment of Public Works.

The following study intersections were selected based on the above criteria.

City of San Jose Study Intersections

1. Zanker Road and Trimble Road *(IOZ)
2. First Street and Trimble Road *(IOZ)
3. First Street and Component Drive
4. Orchard Parkway/O'Nel Drive and Guadalupe Parkway/Charcot Avenue
5. Orchard Parkway and Component Drive
6. Orchard Parkway and Project Driveway
7. Orchard Parkway and Trimble Road
8. De La Cruz Boulevard/Seaboard Avenue and Trimble Road *
9. US 101 and Trimble Road
10. Junction Avenue and Trimble Road
11. Trimble Road/Cadence Place and Montague Expressway *

City of Santa Clara Study Intersections

12. Agnew Road/De La Cruz Boulevard and Montague Expressway *
13. De La Cruz Boulevard and Greenwood Drive
14. De La Cruz Boulevard and Aldo Avenue
15. De La Cruz Boulevard and Laurelwood Road
16. Trimble Road/De La Cruz Boulevard and Central Expressway *

* Denotes CMP Intersection; IOZ = Infilled Opportunity Zones

Data Requirements

The data required for the analysis were obtained from other recent traffic studies, the Cities of San Jose and Santa Clara, the CMP TRAFFIX database, and field observations. The following data were collected from these sources:

- existing traffic volumes
- existing lane configurations
- signal timing and phasing
- approved and pending project trips

Lane Configurations

The existing lane configurations at the study intersections were determined by observations in the field and are shown in Figure 15. It is assumed in this analysis that the transportation network under background and background plus project would be the same as the existing transportation network, with the exception of the planned roadway improvements described below:

US 101 and Trimble Road Interchange - VTA, in partnership with Caltrans and the City, is currently implementing improvements at the US-101 and Trimble Road Interchange that include the following components:

- Reconstruct the existing three-quadrant cloverleaf interchange to a partial cloverleaf interchange;
- Replace the existing De La Cruz Boulevard-Trimble Road overcrossing structure to provide six through lanes and accommodating bike and pedestrian facilities;
- Widen De La Cruz Boulevard between Trimble Road and Central Expressway from four to six lanes;
- Construct a new intersection at the terminus of US-101 southbound off-ramp at De La Cruz Boulevard;
- Reconstruct the intersection of De La Cruz Boulevard and Central Expressway to provide bike lanes and additional through and turn lanes.

Traffic Volumes

Existing Traffic Volumes

Existing peak hour traffic volumes at all study intersections were obtained from the City of San Jose, the CMP TRAFFIX database, or recently completed traffic studies. Due to the current COVID-19 pandemic situation, and its effect on traffic patterns, the City of San Jose is requiring that all new traffic counts for study intersections be put on hold until further notice. Therefore, as recommended by the City of San Jose staff, a 1% compounded annual growth factor was applied to traffic counts that are older than two years to estimate traffic conditions in 2022. The existing peak-hour intersection volumes are shown in Figure 16. The traffic counts are included in Appendix B.

Figure 15
Existing Lane Configurations

Figure 16
Existing Traffic Volumes

LEGEND:

XX(X) = AM(PM) Peak-Hour Traffic Volumes

Existing Traffic Volumes 7-15-22

Future Condition Traffic Volumes

The background traffic scenario predicts a realistic traffic condition that would occur as approved development is built. Background peak hour traffic volumes were estimated by adding to existing volumes the estimated traffic from approved but not yet constructed developments. The added traffic from approved but not yet constructed developments was obtained from the City of San Jose's Approved Trips Inventory (ATI) database. Trips associated with approved projects in the City of Santa Clara were estimated based on a list provided by the City of Santa Clara. Per the City's direction, the North San Jose (NSJ) Phase 1 project trips were removed from the ATI because the North San Jose Development Policy has been retired and all of the approved NSJ phase 1 developments have either been constructed or no longer have approval.

Background traffic volumes are shown in Figure 17. Project trips were added to background traffic volumes to obtain background plus project traffic volumes (see Figure 18).

Traffic volumes under cumulative conditions were estimated by adding to the background traffic volumes the trips from proposed, but not yet approved (pending), development projects within the Cities of San Jose and Santa Clara. Pending project trips and/or pending project information was obtained from each of the cities. Cumulative conditions include trips generated by the following San Jose pending development projects in the area of the proposed project. The pending project list for Santa Clara is included in Appendix C.

City of San Jose Pending Projects:

- **San Jose Data Center (SJC04)** – 616,592 s.f. data center located at 370 West Trimble Road.
- **550 East Brokaw Road Office Development** – 2,000,000 s.f. of office space located near the intersection of Junction Avenue and Brokaw Road.
- **Seely Avenue Mixed-Used Development** – 1,473 residential units and 55,000 s.f. of retail space located near the intersection of Seely Avenue and Montague Expressway.

Cumulative plus project peak-hour traffic volumes were estimated by adding to cumulative traffic volumes the additional traffic generated by the project. Cumulative no project traffic volumes are shown in Figure 19. The cumulative plus project traffic volumes at study intersections are shown in Figure 20.

The approved and pending project information is included in Appendix C. The approved trips, proposed project trips, pending project trips, and traffic volumes for all components of traffic are tabulated in Appendix D.

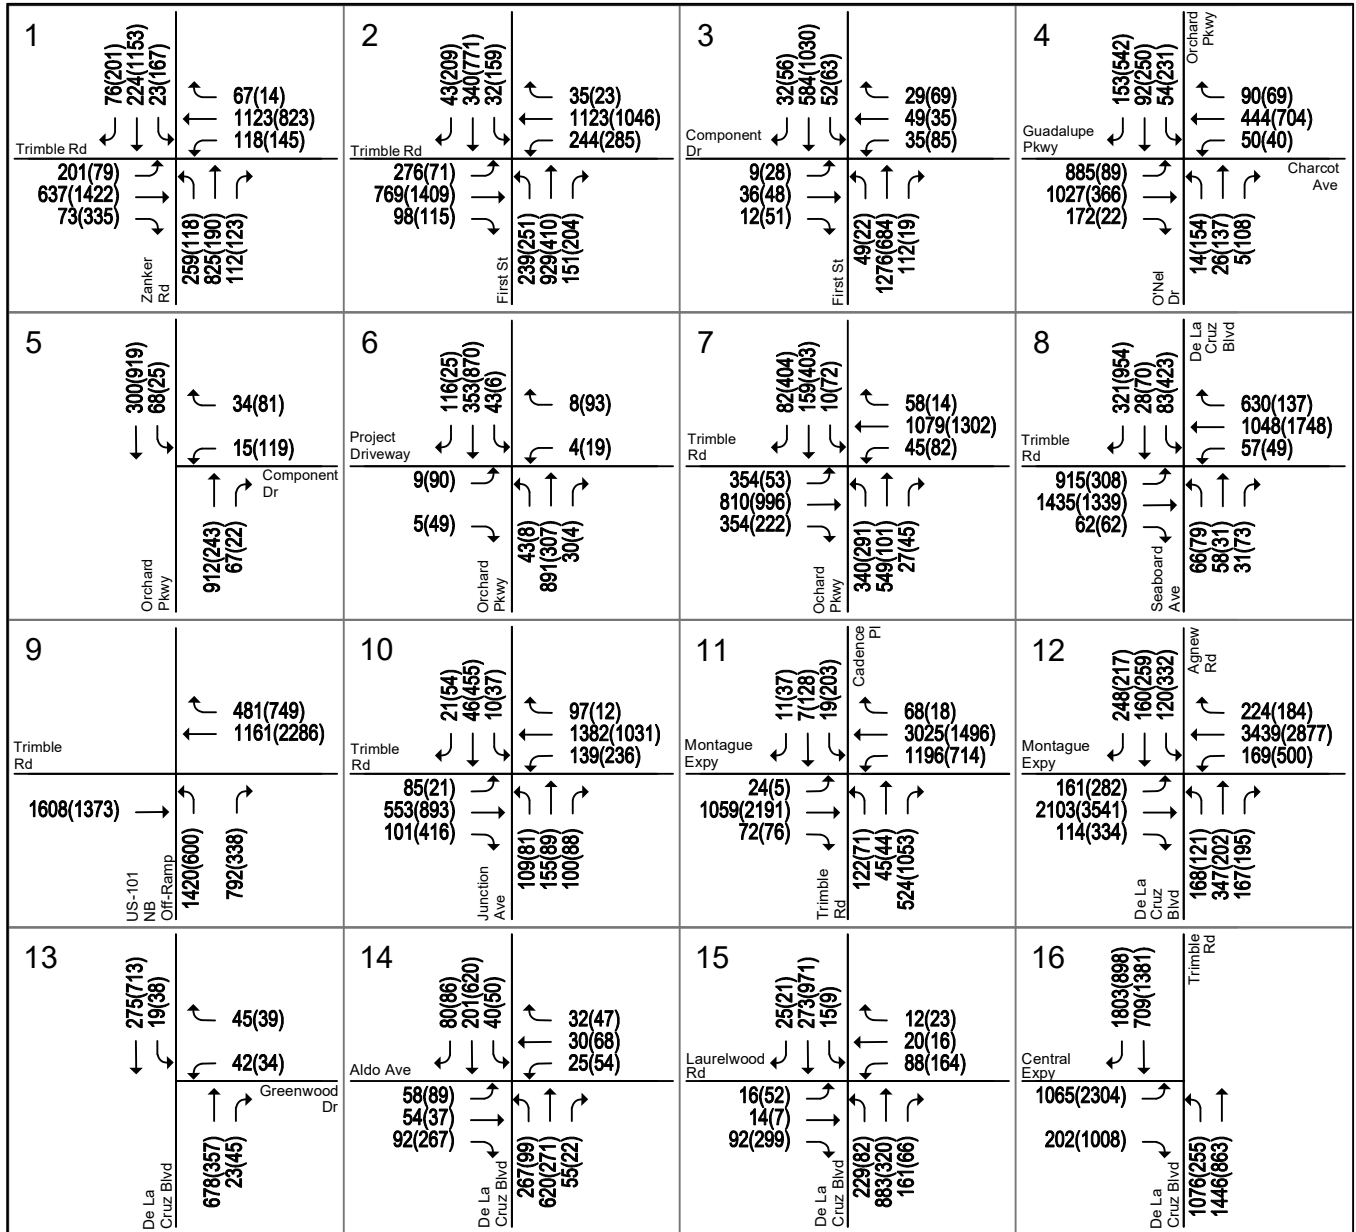

Level of Service Standards and Analysis Methodologies

Traffic conditions at the study intersections were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The analysis methods are described below.

All study intersections were evaluated based on the *2000 Highway Capacity Manual* (HCM) level of service methodology using the TRAFFIX software. This method evaluates signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. TRAFFIX is also the CMP-designated intersection level of service methodology, thus, the Cities of San Jose and Santa Clara employ the CMP default values for the analysis parameters. The correlation between average control delay and level of service at signalized intersections is shown in Table 6.

Signalized study intersections are subject to the applicable City of San Jose and Santa Clara level of service standards with the exception of intersections located within IOZs in the City of San Jose. The Cities of San Jose and Santa Clara have established LOS D as the minimum acceptable intersection

Table 6
Signalized Intersection Level of Service Definitions Based on Control Delay

Level of Service	Description	Average Control Delay per Vehicle (sec.)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	up to 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 20.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.1 to 80.0
F	Operation with delays unacceptable to most drivers occurring due to oversaturation, poor progression, or very long cycle lengths.	Greater than 80.0

operations standard for all signalized intersections unless superseded by an Area Development Policy. CMP designated intersections located within IOZs in the City of San Jose are exempt from both the City of San Jose and CMP LOS standards. The City of Santa Clara LOS standard for all local (non-CMP designated) intersections is LOS D.

Cities of San Jose and Santa Clara Definition of Adverse Intersection Operations Effects

According to the City of San Jose's *Transportation Analysis Handbook 2020* and City of Santa Clara guidelines, an adverse effect on intersection operations occurs if for either peak hour:

1. The level of service at the intersection degrades from an acceptable level (LOS D or better for all San Jose intersections and local intersections in Santa Clara and LOS E or better for CMP and regionally significant intersections in Santa Clara) under background conditions to an unacceptable level under background plus project conditions, or
2. The level of service at the intersection is an unacceptable level (LOS E or F for all San Jose intersections and local intersections in Santa Clara and LOS F for CMP and regionally significant intersections in Santa Clara) under background conditions and the addition of project trips cause both the critical-movement delay at the intersection to increase by four or more seconds and the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

The exception to this threshold is when the addition of project traffic reduces the amount of average control delay for critical movements, i.e., the change in average control delay for critical movements is negative. In this case, the threshold is when the project increases the critical v/c value by 0.01 or more.

An adverse effect on intersection operations by the City of San Jose standards may be addressed by implementing measures that would restore the intersection level of service to background conditions or better. The City recommends prioritizing improvements related to alternative transportation modes, parking measures, and/or TDM measures. Improvements that increase vehicle capacity are secondary

and must not have unacceptable effects on existing or planned transportation facilities. Unacceptable effects on existing or planned transportation facilities include the following:

- Inconsistent with the General Plan Transportation Network and Street Typologies;
- Reduction of any physical dimension of a transportation facility below the minimum design standards per the *San José Complete Streets Design Standards and Guidelines*; OR
- Substantial deterioration in the quality of existing or planned transportation facilities, including pedestrian, bicycle, and transit systems and facilities, as determined by the Director of Transportation.

Adverse effects at signalized intersections in the City of Santa Clara can be addressed by one of the following approaches:

- Construct or pay a fair share towards improvements to the subject intersection or proximate to the intersection to increase overall capacity (e.g. traffic signal modifications, construction of additional turn lanes), or
- Construct or pay a fair share towards improvements to the pedestrian or bicycle facilities within the intersection or proximate to the intersection, or
- Construct or pay a fair share towards improved access to transit or transit facility proximate to the intersection, or
- Implement transportation demand management (TDM) measures that will reduce the project traffic at the intersection and improve the deficiency.

Conformance to the CMP Standard

Based on CMP criteria, a project would fail to meet the CMP intersection standard if the additional project traffic caused one of the following during either peak hour:

1. The level of service at the intersection degrades from an acceptable LOS E or better under background conditions to an unacceptable LOS F under project conditions, or
2. The level of service at the intersection is an unacceptable LOS F under background conditions and the addition of project trips causes both the critical-movement delay at the intersection to increase by four (4) or more seconds *and* the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

An exception to this rule applies when the addition of project traffic reduces the amount of average delay for critical movements (i.e. the change in average delay for critical movements is negative). In this case, the threshold is an increase in the critical V/C value by .01 or more.

An adverse intersection effect by CMP standards is said to be satisfactorily addressed when measures are implemented that would restore the intersection level of service to background conditions or better.

Intersection Operations Analysis Results

The intersection level of service analysis is summarized in Table 7. Intersection levels of service were evaluated against the applicable municipal and CMP intersection operations standards.

Existing Intersection Operation Conditions

The results of the level of service analysis show that the following two intersections are currently operating at unacceptable levels of service during at least one of the peak hours based on the Cities of San Jose and Santa Clara intersection operations standards.

**Table 7

Notes:

* Denotes CMP Intersection

Bold indicates unacceptable level of service.

Bold and boxed indicate adverse operations effect.

[IOZ] = Intersection is located within an Infill Opportunity Zone (IOZ) and is exempt from the provision of both City of San Jose and CMP's intersection operations standards.

8. De La Cruz Boulevard/Seaboard Avenue and Trimble Road * (PM Peak Hour)
16. Trimble Road/De La Cruz Boulevard and Central Expressway * (AM and PM Peak Hours)

* Denotes CMP Intersection

The intersection of Trimble Road/De La Cruz Boulevard and Central Expressway currently operates at unacceptable LOS F conditions during both peak hours based on the CMP LOS standard of LOS E.

The remaining study intersections are currently operating at acceptable levels of service during both the AM and PM peak hours based on the Cities of San Jose and Santa Clara and CMP LOS standards. The intersection level of service calculation sheets are included in Appendix E.

Background Intersection Operation Conditions

The results of the level of service analysis show that the following two intersections are projected to operate at unacceptable LOS F during the PM peak hour under background conditions based on the Cities of San Jose, Santa Clara, and CMP intersection operations standards.

8. De La Cruz Boulevard/Seaboard Avenue and Trimble Road *
16. Trimble Road/De La Cruz Boulevard and Central Expressway *

* Denotes CMP Intersection

The remaining study intersections are projected to operate at acceptable levels of service under background conditions during both the AM and PM peak hours based on the Cities of San Jose and Santa Clara and CMP intersection operations standards. The intersection level of service calculation sheets are included in Appendix E.

Background Plus Project Intersection Operation Conditions

The results of the level of service analysis show that, based on the Cities of San Jose, Santa Clara, and CMP intersection operations standards, the same two intersections identified to operate at unacceptable levels of service under background conditions would continue to operate at unacceptable levels of service under background plus project conditions. However, the added trips as a result of the project would not have an adverse effect on intersection operations at either of these two intersections.

The added trips as a result of the proposed project would not have an adverse effect on intersection operations at the remaining study intersections based on the Cities of San Jose and Santa Clara guidelines. The intersection level of service calculation sheets are included in Appendix E.

Cumulative No Project Intersection Operation Conditions

The results of the level of service analysis show that the following two intersections are projected to operate at unacceptable levels of service during the PM peak hour based on the Cities of San Jose and Santa Clara intersection operations standards.

8. De La Cruz Boulevard/Seaboard Avenue and Trimble Road *
16. Trimble Road/De La Cruz Boulevard and Central Expressway *

* Denotes CMP Intersection

Both of the identified intersections above are projected to operate at unacceptable LOS F conditions during the PM peak hour based on the CMP LOS standard of LOS E.

The remaining study intersections are projected to operate at acceptable levels of service under cumulative no project conditions during both the AM and PM peak hours based on the Cities of San

Jose and Santa Clara and CMP intersection operations standards. The intersection level of service calculation sheets are included in Appendix E.

Cumulative Plus Project Intersection Operation Conditions

The results of the level of service analysis show that, based on the Cities of San Jose, Santa Clara, and CMP intersection operations standards, the same two intersections identified to operate at unacceptable levels of service under cumulative no project conditions would continue to operate at unacceptable levels of service under cumulative plus project conditions. The added trips as a result of the project would not have an adverse effect on intersection operations at either of these two intersections.

The added trips as a result of the proposed project would not have an adverse effect on intersection operations at the remaining study intersections based on the Cities of San Jose and Santa Clara guidelines. The intersection level of service calculation sheets are included in Appendix E.

Intersection Queuing Analysis

The analysis of intersection operations was supplemented with a vehicle queuing analysis at intersections where the project would add a substantial number of trips to the left-turn movements. The queuing analysis is presented for informational purposes only since the City of San Jose has not defined a policy related to queuing. Vehicle queues were estimated using a Poisson probability distribution, which estimates the probability of “n” vehicles for a vehicle movement using the following formula:

$$P(x=n) = \frac{\lambda^n e^{-\lambda}}{n!}$$

Where:

P (x=n) = probability of “n” vehicles in queue per lane

n = number of vehicles in the queue per lane

λ = average # of vehicles in the queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95th percentile maximum number of queued vehicles for a particular left-turn movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the left-turn movement. This analysis thus provides a basis for estimating future turn pocket storage requirements at intersections.

For signalized intersections, the 95th percentile queue length value indicates that during the peak hour, a queue of this length or less would occur on 95 percent of the signal cycles. Or a queue length larger than the 95th percentile queue would only occur on 5 percent of the signal cycles (about 3 cycles during the peak hour for a signal with a 60-second cycle length). Thus, turn pocket storage designs based on the 95th percentile queue length would ensure that storage space would be exceeded only 5 percent of the time for a signalized movement. Vehicle queuing at unsignalized intersections is evaluated based on the delay experienced at the specific study turn movement.

The results of the vehicle queuing analysis indicate that the projected queues at the study locations could be accommodated by the existing storage capacities. The vehicle queue estimates and a tabulated summary of the findings are provided in Table 8. The queue length calculations are included in Appendix F.

Site Access and On-Site Circulation

A review of the project site plan was performed to determine if adequate site access and on-site circulation would be provided and to identify any access or circulation issues that should be improved. The evaluation of site access and circulation is based on the site plan dated October 26, 2022. Site access was evaluated to determine the adequacy of the site's access points with regard to the following: traffic volume, delays, vehicle queues, geometric design, and corner sight distance. On-site vehicular circulation was reviewed in accordance with generally accepted traffic engineering standards and transportation planning principles.

Site Access

Access to the site from the surrounding roadway system would be provided via an existing full-access intersection along Orchard Parkway located approximately 600 feet south of Trimble Road, a right-turn-only driveway (Driveway D) along Orchard Parkway located approximately 400 feet south of Trimble Road, and an existing right-turn-only driveway located along Trimble Road located approximately 1,200 feet west of Orchard Parkway. Direct access to the project's surface parking lots and drive aisles will be provided via three driveways (Driveways A-C) along a shared roadway that will extend between the signalized Orchard Parkway intersection and the Trimble Road access point and will run along the project's southern boundary. Driveway B would mainly be used by trucks accessing the loading docks during the off-peak hours.

Driveway Design

Per City standards (City of San Jose Department of Transportation Geometric Guidelines), the typical business/industrial driveway width with two-way traffic is 32 feet. The site plan shows that Driveway A to be 28 feet wide, Driveway B to be 36 feet wide, Driveway C to be 26 feet wide, and Driveway D to be 26 feet wide. Therefore, Driveways A, C, and D would not meet the City standards.

Recommendation: Each of the site driveways that provide access to the site drive aisles and parking lots must be designed to meet the City's 32-foot minimum width.

Project Driveway Operations

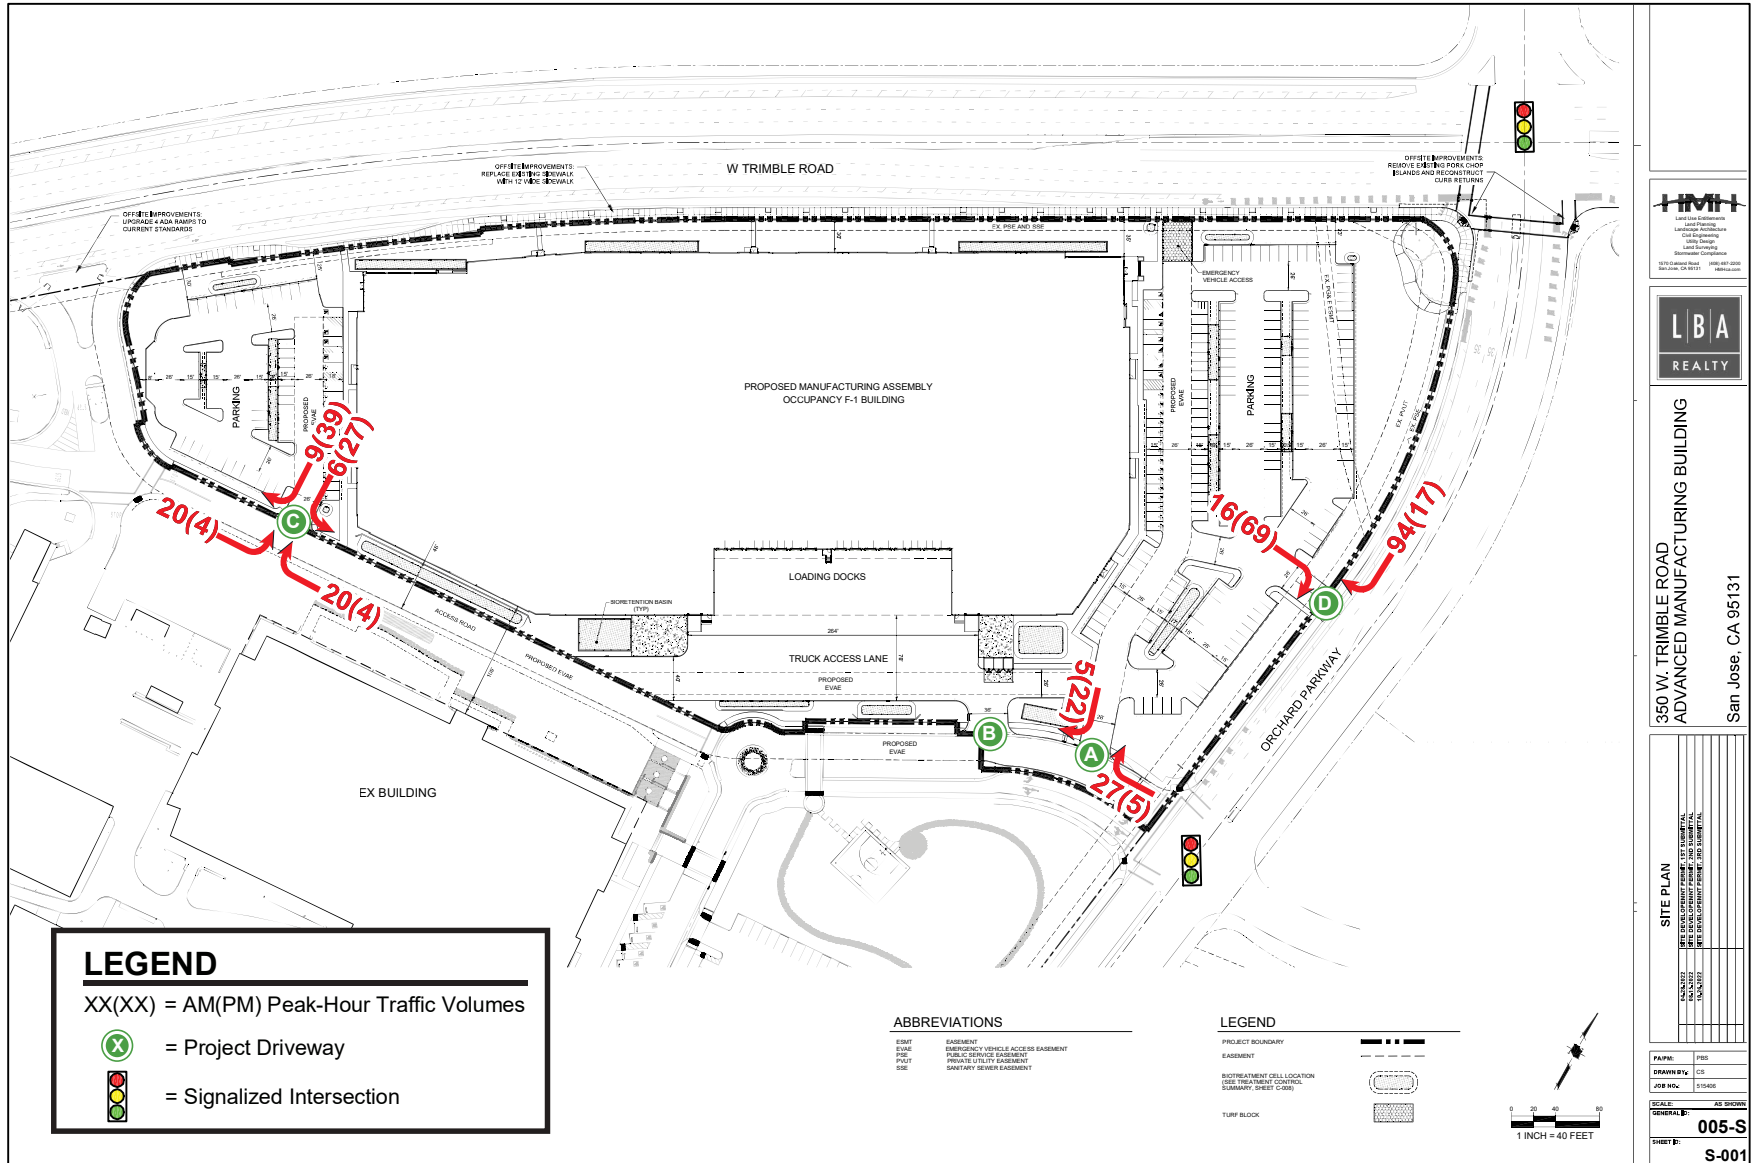

Figure 21 indicates the project trips at each of the driveways along Orchard Parkway, Trimble Road, and the internal roadway that runs along the south side of the project site. The driveways along the internal roadway (Driveways A-C) will have minimal conflicting traffic and there are no obstructions that would restrict traffic flow into or out of the driveways. Therefore, vehicle queuing issues are not expected to occur at the driveways along the internal roadway.

Sight Distance at Unsignalized Project Driveways

Adequate sight distance (sight distance triangles) in accordance with the *American Association of State Highway Transportation Officials (AASHTO)* standards should be provided at the unsignalized site right-turn-only driveway on Orchard Parkway. Sight distance triangles should be measured approximately 10 feet back from the traveled way. Providing the appropriate sight distance reduces the likelihood of a collision at a driveway or intersection and provides drivers with the ability to exit a driveway and locate sufficient gaps in traffic.

The minimum acceptable sight distance is often considered the AASHTO stopping sight distance. Sight distance requirements vary depending on the roadway speeds. Orchard Parkway has a posted speed limit of 35 miles per hour (mph). The AASHTO stopping sight distance for facilities with posted speed limits of 35 mph is 250 feet. Thus, a driver exiting the proposed project driveway on Orchard Parkway must be able to see 250 feet to the north along Orchard Parkway. On-street parking is prohibited along

Figure 21
Project Trips at Site Driveways

both sides of Orchard Parkway. The right-turn-only driveway will be located approximately 400 feet south of Trimble Road.

On-Site Circulation

On-site vehicular circulation was reviewed in accordance with the City of San Jose Zoning Code and generally accepted traffic engineering standards. In general, the proposed site plan would provide vehicle traffic with adequate connectivity through the parking areas.

The City's standard minimum width for two-way drive aisles with 90-degree parking along both sides of the aisle is 26 feet wide. This allows sufficient room for vehicles to back out of the parking spaces. Based on the site plan, the drive aisles are lined with 90-degree parking stalls on both sides and all drive aisles are indicated to be 26 feet wide. Therefore, the proposed drive aisle widths would satisfy the City's requirement. The site plan shows no dead-end aisles.

Truck Operations and Turning Templates

The number of trucks that could be generated by the project is not known at this time since there is no specific use or tenant yet identified for the proposed building. However, per the site plan, the project will include 15 truck loading bays and doors. Presuming, that each of the dock doors would turn over a minimum of once per day, an average of 15 trucks per day (30 daily truck trips) may be generated by the project site. The anticipated number of trucks equates to approximately two to three trucks per hour on average entering or exiting the site when presuming a 12-hour daily operations schedule.

Per the applicant, trucks will be directed to enter via Orchard Parkway and exit via Trimble Road. Figures 22 and 23 show the route for trucks entering from Orchard Parkway, circulating to the loading docks, and exiting at the Trimble Road entrance. There would be no issues with truck routes exiting to Trimble Road. However, the route for inbound trucks from southbound Orchard Parkway would require the truck to turn from the inside (median) lane on Orchard Parkway, thus blocking both southbound lanes during the turn. As indicated in Figure 22, the median along the project entrance will need to be narrowed and cut back from the intersection to accommodate the turning path of trucks entering from southbound Orchard Parkway.

Truck Turning Templates at Loading Docks

The truck turning templates also indicate the maneuvering of trucks into and out of the loading docks located at the rear of the building. The turning templates appear to indicate a WB-67 truck, representing the largest semi-trailer truck accessing the site, would be able to pull into and out of the loading docks without any issues.

Parking Supply

The proposed 208,000 s.f. building will include up to 20,000 s.f. of supporting office space. According to the City of San Jose Zoning Code (Section 20.90.060), one off-street vehicle parking space per 350 s.f. of floor area is required for both R&D and light industrial uses while one off-street vehicle parking space per 250 s.f. of floor area is required for office use. According to the City's Zoning Code, "floor area" is defined as 85 percent of the "total gross floor area" (188,000 s.f. of industrial/R&D & 20,000 s.f. of office) which equates to 159,800 s.f. of industrial/R&D space and 17,000 s.f. of office space. Based on the City's parking requirements, the project is required to provide a total of 525 off-street parking spaces (457 parking spaces for the R&D and light industrial/manufacturing uses and 68 spaces for the office space). The proposed 280 vehicle parking spaces would be 245 spaces less than, or a reduction of 46.7 percent from the City's requirement of 505 parking spaces.

Figure 22
Truck Turning Templates – Ingress

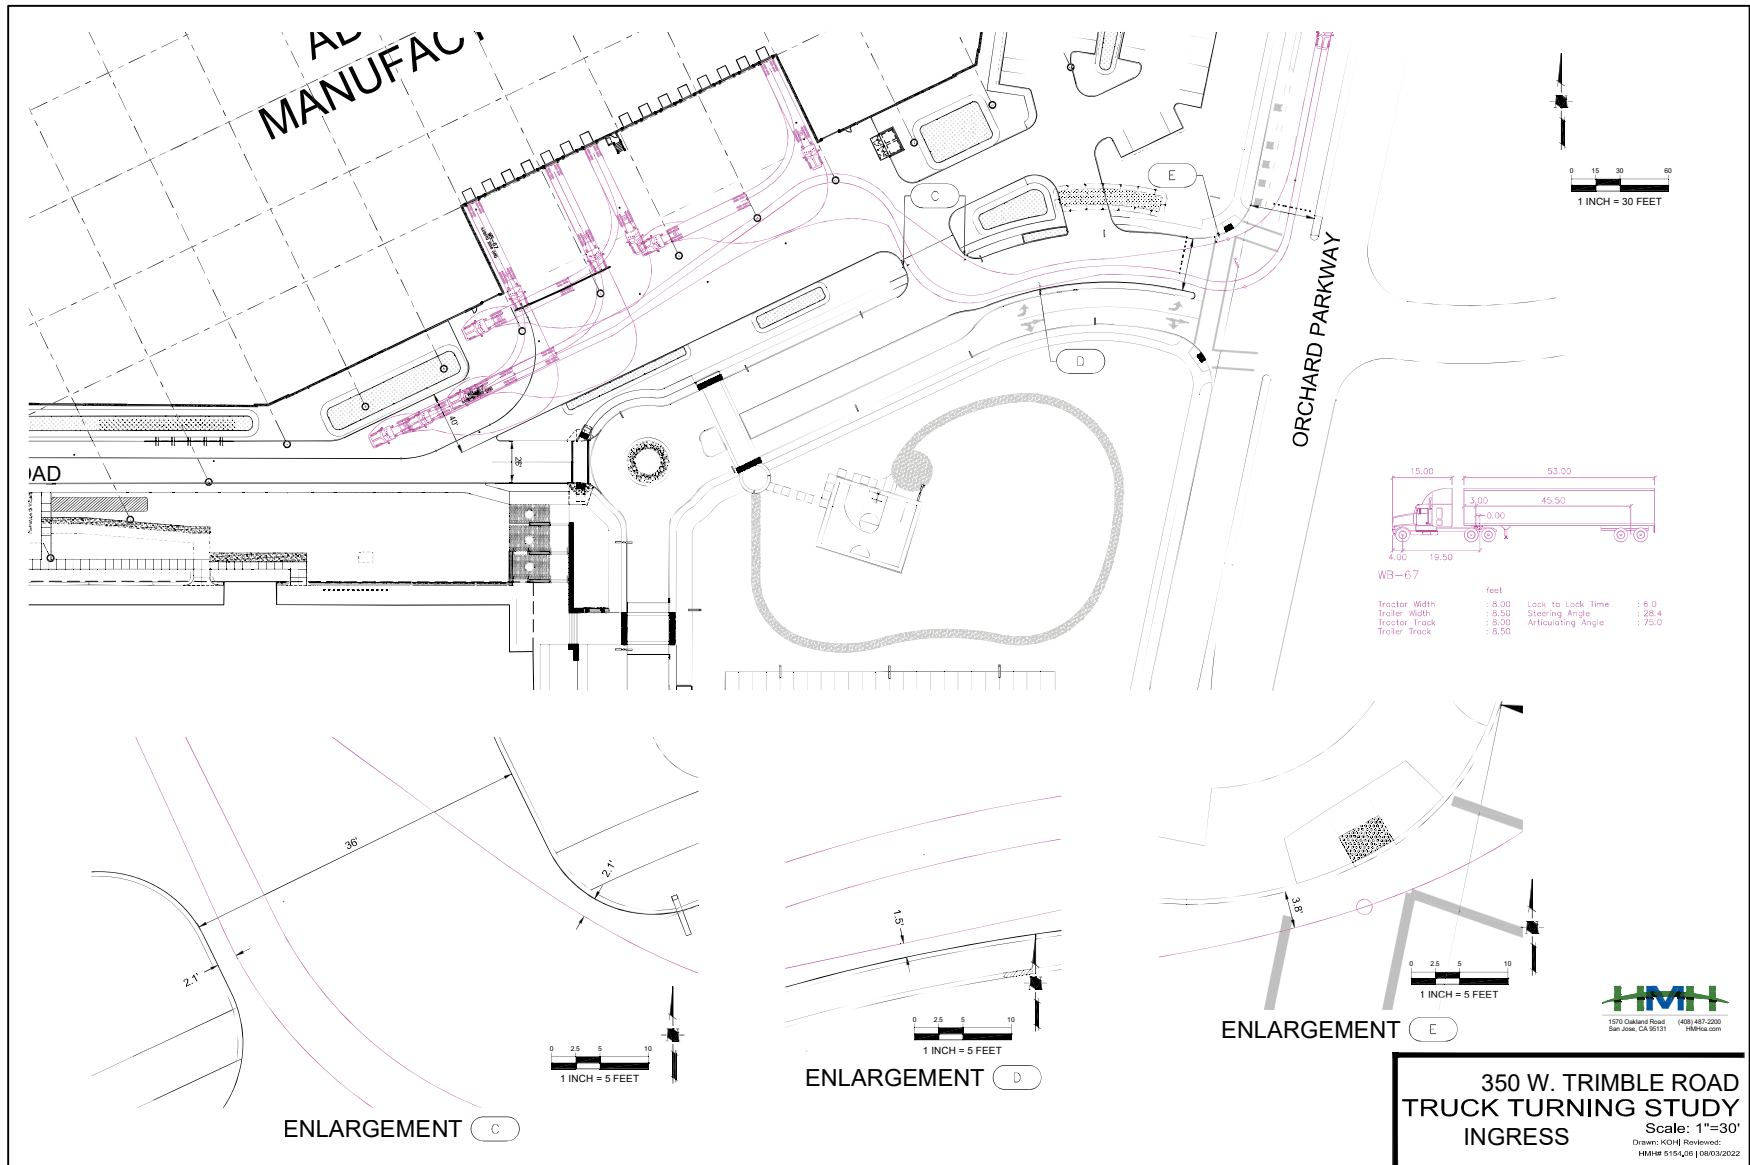

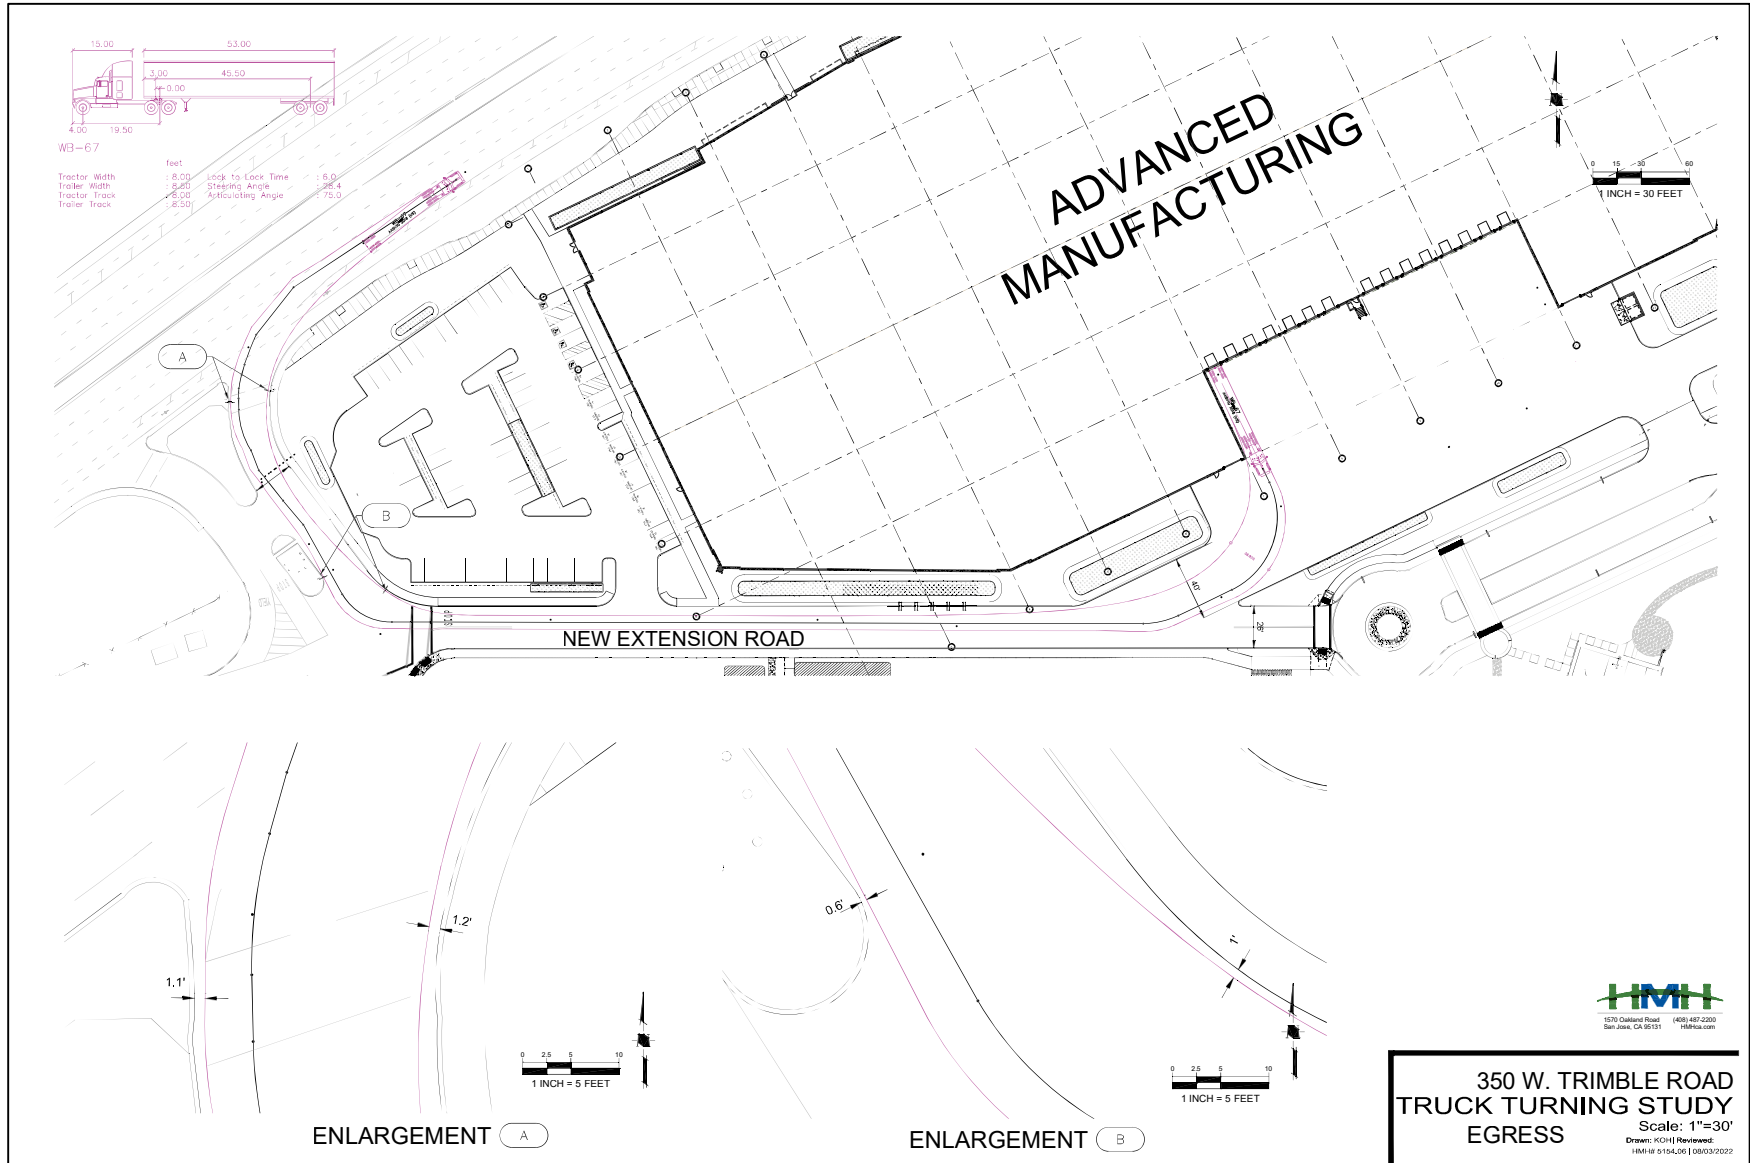

Figure 23
Truck Turning Templates – Egress

In accordance with Section 20.90.220 of the San Jose Code of Ordinances, which allows up to a 50% parking reduction, the 46.7 percent reduction in off-street parking could be allowed with the implementation and maintenance of a TDM plan. A separate TDM plan for the proposed project that meets the requirements set forth in the City's Zoning Code must be prepared and approved by the City of San Jose Planning Department to support a reduction in the required off-street parking.

Bicycle Parking

According to the City's Bicycle Parking Standards (Chapter 20.90, Table 20-190), the project is required to provide one bicycle parking space per 5,000 s.f. of floor area of manufacturing space and one bicycle parking space per 4,000 s.f. of floor area of office space.

Based on the City's bicycle parking requirements and the total gross floor areas as calculated above in the vehicle parking section, the project is required to provide 36 bicycle parking spaces. Of the required bicycle parking, City standards require that at least 80 percent be short-term bicycle spaces and at most 20 percent be secured long-term bicycle spaces. This equates to at least 29 short-term bicycle parking spaces and at most 7 long-term bicycle parking spaces.

The project proposes a total of 42 bicycle parking spaces, consisting of 6 long-term spaces and 36 short-term spaces located throughout the project site. Therefore, the proposed bicycle parking spaces will exceed the City's bicycle parking requirements and encourage the use of non-auto modes of travel and minimize the demand for on-site parking described above.

Construction Activities

Typical activities related to the construction of any development could include lane narrowing and/or lane closures, sidewalk and pedestrian crosswalk closures, and bike lane closures. In the event of any type of closure, clear signage (e.g., closure and detour signs) must be provided to ensure vehicles, pedestrians and bicyclists are able to adequately reach their intended destinations safely. Per City standard practice, the project would be required to submit a construction management plan for City approval that addresses the construction schedule, street closures and/or detours, construction staging areas and parking, and the planned truck routes.

Pedestrian, Bicycle, and Transit Analysis

All new development projects in San Jose should encourage multi-modal travel, consistent with the goals of the City's General Plan. It is the goal of the General Plan that all development projects accommodate and encourage the use of non-automobile transportation modes to achieve San Jose's mobility goals and reduce vehicle trip generation and vehicle miles traveled. In addition, the adopted City Bike Master Plan establishes goals, policies, and actions to make bicycling a daily part of life in San Jose. The Master Plan includes designated bike lanes along all City streets, as well as on designated bike corridors. In order to further the goals of the City, pedestrian and bicycle facilities should be encouraged with new development projects.

The Envision 2040 General Plan identifies goals and policies that are dedicated to the enhancement of the transportation infrastructure, including public transit and pedestrian/bike facilities. The Transportation Policies contained in the General Plan create incentives for non-auto modes of travel while reducing the use of single-occupant automobile travel as generally described below:

- Through the entitlement process for new development, funds are needed for transportation improvements for all transportation modes, giving first consideration to the improvement of bicycling walking, and transit facilities.

- Give priority to the funding of multimodal projects to provide the most benefit to all users of the transportation system.
- Encourage the use of non-automobile travel modes to reduce vehicle miles traveled (VMT)
- Consider the impact on the overall transportation system when evaluating the impacts of new developments.
- Increase substantially the proportion of travel modes other than single-occupant vehicles.
- Provide a continuous pedestrian and bicycle system to enhance connectivity throughout the City by completing missing segments.
- Build pedestrian and bicycle improvements at the same time as improvements for vehicular circulation.
- Give priority to pedestrian improvement projects that improve pedestrian safety, and improve pedestrian access to and within the Urban Villages and other growth areas.

The City's General Plan identifies both walk and bicycle commute mode split targets as 15 percent or more by the year 2040. This level of pedestrian and bicycle mode share is a reasonable goal for the project.

Pedestrian and Bicycle Facilities

Pedestrian and bicycle facilities in the study area consist of sidewalks, crosswalks, pedestrian signals at signalized intersections, and bike lanes on Trimble Road and Orchard Parkway (see Chapter 2 for details). The site plan shows sidewalks and pedestrian walkways along the eastern and western perimeters of the building. The sidewalks along the eastern building perimeter will connect to designated crosswalks through the parking lot and connect to existing sidewalks on Orchard Parkway and Trimble Road connecting to pedestrian facilities and destinations outside of the project site, including the LRT stations on First Street.

The Trimble Road and Orchard Parkway intersection currently includes right-turn "pork-chop" channelization islands at each corner. The channelization islands allow for better traffic flow by separating right-turning traffic from other controlled approach traffic. However, the islands are not conducive to pedestrian flow at intersections that serve a large volume of pedestrians due to limited pedestrian waiting areas and conflict with vehicle traffic.

Recommendation: The City will require the project to remove the pork chop islands located at the southwest and southeast corners of the Orchard Parkway/Trimble Road intersection along with a signal modification and implementation of a protected intersection to accommodate Class-IV bikeways to improve pedestrian safety and access.

Recommendation: The City will require the project to construct four new curb ramps per the City of San Jose and ADA standards at the existing Trimble Road entrance.

The bikeways within the vicinity of the project site would remain unchanged under project conditions. Currently, Trimble Road and Orchard Parkway have bike lanes that would provide connections to other bicycle facilities in the project vicinity. The San Jose Better Bike Plan 2025 and Envision 2040 General Plan, as described below, identify planned improvements to the bicycle network within the City and provide policies and goals that are intended to promote and encourage the use of multi-modal travel options and reduce the identified project impacts to the roadway system.

Public Transit/Pedestrian/Bike Improvements

The planned improvements discussed below are intended to provide for a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies. The San Jose Better Bike Plan 2025 indicates that a variety of bicycle facilities are planned in the study area, some of which

would benefit the project and adhere to the goals of the Envision 2040 General Plan. Of the planned facilities, the following are relevant to the project.

Class I bike trails are planned for:

- Component Drive, between Guadalupe River Trail and Orchard Parkway

Class IV protected bike lanes are planned for:

- Trimble Road, along its entire length
- First Street, between Taylor Street and Alviso
- Orchard Parkway, along its entire length
- Component Drive, between Orchard Parkway and Zanker Road
- Zanker Road, along its entire length
- Plumeria Drive, along its entire length
- Bonaventura Drive, along its entire length

The project would not impede the implementation of the planned bicycle facilities. However, the full implementation of the above-listed improvements is beyond the means of the proposed project given that they may require right-of-way from adjacent properties and benefit multiple properties.

Recommendation: The project will be required to construct, or provide a monetary contribution for an in-lieu fee of \$144 per linear foot, Class IV 7-foot protected bike lanes along the project frontages on Trimble Road and Orchard Parkway per the City of San Jose Better Bike Plan 2025.

Transit Services

The VTA Green and Blue LRT lines operate along First Street in the project vicinity. The Bonaventura and Component LRT station platforms on First Street are located within walking distance, approximately 2,000 feet, east of the project site. The existing pedestrian and bicycle facilities described above will provide for and encourage the use of multi-modal travel options and reduce the use of single-occupant automobile travel.

With the convenient location of LRT stations, it can be assumed that some employees of the proposed project would utilize the existing transit services. Applying an estimated three percent transit mode share, which is a conservative estimate that could be expected for the project, equates to approximately six transit riders during the AM or PM peak hours. VTA operations reports indicate that the Green and Blue LRT lines as well as several other bus routes in the area currently serve less than ideal ridership. Therefore, the new riders due to the proposed project could be accommodated by the current available capacity of the bus service in the study area and improvement of the existing transit service would not be necessary with the project.

Freeway Segment Evaluation

Per the CMP technical guidelines, freeway segment level of service analysis shall be conducted in all segments to which the project is projected to add one percent or more to the segment capacity. The CMP specifies that a capacity of 2,300 vehicles per hour per lane (vphpl) be used for mixed-flow lane segments that are three lanes or wider in one direction, and a capacity of 2,200 vphpl be used for mixed-flow lane segments that are two lanes wide in one direction. A capacity of 1,650 vphpl was used for high occupancy vehicle (HOV) lanes.

Since the project is not projected to add one percent to any freeway segments in the area (see Table 9), a freeway analysis was not required per the CMP technical guidelines.

**Table 9
Freeway Segment Capacity**

#	Freeway Segment	Direction	Peak Hour	Capacity				Project Trips			
				Mixed-Flow Lanes		HOV Lane		Mixed-Flow Lanes		HOV Lane	
				# of Lanes	Capacity (vph)	# of Lanes	Capacity (vph)	Volume (vph)	% of Capacity	Volume (vph)	% of Capacity

		SB	PM	3	6,900	1	1,650	20	0.3	11	0.7

5. Conclusions

The transportation analysis of the project was evaluated following the standards and methodologies set forth in the City of San Jose's Transportation Analysis Policy (Council Policy 5-1), the City of San Jose *Transportation Analysis Handbook 2020*, the City of Santa Clara, the Santa Clara Valley Transportation Authority (VTA) Congestion Management Program's *Transportation Impact Guidelines* (October 2014), and by the California Environmental Quality Act (CEQA). Per the requirements of the City of San Jose's Transportation Policy and *Transportation Analysis Handbook 2020*, the TA report for the project consists of a CEQA vehicle-miles-traveled (VMT) analysis and a supplemental Local Transportation Analysis (LTA).

CEQA VMT Analysis

CEQA Transportation Analysis Exemption Criteria

The City does not provide screening criteria specific to AMD/R&D uses. However, per the City of San Jose VMT screening criteria, industrial uses of 30,000 square feet or less are considered small infill projects and do not require a CEQA VMT evaluation since the VMT generated by such a small project would likely not result in a significant impact to VMT. AMD/R&D uses are similar to light industrial uses since both land uses have an emphasis on activities such as manufacturing and product storage and typically have minimal office space. Therefore, the number and origination/destination of daily trips generated by both light industrial and R&D uses should be similar.

Presuming that AMD/R&D uses have similar trip generating characteristics as industrial uses, AMD/R&D uses can be converted to an equivalent amount of industrial space based on estimates of daily trips. The conversion of the proposed AMD/R&D space was converted to an equivalent amount of industrial space based on trip generation estimates derived utilizing trip rates published in the Institute of Transportation Engineers' (ITE) Trip Generation Manual, 11th Edition (2021). Based on the ITE daily trip rate for R&D uses (ITE Land Use Code 760), the 208,000-s.f. of AMD/R&D space is estimated to generate 2,305 daily trips, which is equivalent to the daily trips estimated to be generated by approximately 473,000-s.f. of industrial space. The 473,000 s.f. of equivalent industrial space for the proposed project would exceed the City's small industrial infill project criterion of 30,000 s.f. In addition, the existing VMT per industrial employee in the project area currently exceeds the City's established CEQA threshold of 14.37 per industrial employee. Therefore, the proposed project would not meet the screening criteria for VMT analysis exemption.

Project Impacts and Mitigation Measures

Project Impact: Since the VMT per industrial employee (15.82) generated by the project would exceed the impact threshold of 14.37 VMT per industrial employee, the project would result in a significant transportation impact on VMT, and mitigation measures are required to reduce the VMT impact.

Mitigation Measures: The project will be required to implement a Travel Demand Management (TDM) plan that includes the implementation of one of the following TDM measures to reduce the project's VMT impact to less than significant levels. It should be noted that the selected TDM measure must be incorporated within a TDM plan for the project which may include additional TDM measures. However, per the City's VMT tool, the project's VMT impact would be mitigated with the implementation of one of the TDM measures.

- **Telecommuting and Alternative Work Schedules:** Encourage employees to telecommute from home when possible, or to shift work schedules such that travel occurs outside of peak congestion periods. This strategy reduces commute trips, thereby reducing VMT. At a minimum, the measure would require that 65% of employees work a 4/40 work week schedule (10-hour workdays for four days a week). **Or**
- **Operate a Free Direct Shuttle:** Provide direct shuttle service to the project site from areas with high concentrations of employees. This strategy reduces drive-alone commute trips, thereby reducing VMT. At a minimum, the measure would require at least 20% participation by employees. **Or**
- **Subsidize Vanpool:** Provide subsidies for individuals forming new vanpools for their commute. This encourages the use of vanpools, reducing drive-alone trips, and thereby reducing VMT. The project would be required to subsidize 100% of the cost of the vanpool cost with at least 20% employee participation.

The project's VMT could be reduced further with the implementation of the following multi-modal facility improvements as identified by the City of San Jose staff. However, per the City's VMT tool, the project's VMT impact would be mitigated with the implementation of one of the TDM measures identified above.

- **Provide Pedestrian Network Improvements for Active Transportation (Tier 2):** Implement pedestrian improvements both on-site and in the surrounding area. Improving pedestrian connections encourages people to walk instead of drive and reduces VMT. Improvements would include the removal of the pork chop islands located at the southwest and southeast corners of the Orchard Parkway/Trimble Road intersection along with a signal modification, and the implementation of a protected intersection to accommodate Class-IV bikeways to improve pedestrian safety and access.

Cumulative (GP Consistency) Evaluation

Projects must demonstrate consistency with the *Envision San José 2040 General Plan* to address cumulative impacts. Consistency with the City's General Plan is based on the project's density, design, and conformance to the General Plan goals and policies. If a project is determined to be inconsistent with the General Plan, a cumulative impact analysis is required per the City's *Transportation Analysis Handbook*.

According to the *Envision San Jose 2040 General Plan*, the project site is designated for *Industrial Park (IP) and Combined Industrial/Commercial (CIC)* uses. This designation permits development with retail and service commercial uses on the first two floors; with office, research and development or industrial use on upper floors; as well as wholly office, research and development, or industrial projects.

Since the *Industrial Park (IP) and Combined Industrial/Commercial (CIC)* designation allow industrial/office uses, the proposed manufacturing land use project is consistent with the *Envision San Jose 2040 General Plan* and would not require a General Plan Amendment (GPA). The project would be considered part of the cumulative solution to meet the General Plan's long-range transportation goals and would result in a less-than-significant cumulative impact.

Local Transportation Analysis

The intersection operations analysis completed as part of the LTA is intended to quantify the operations of intersections and to identify potential negative effects due to the addition of project traffic. However, a potential adverse effect on a study intersection operation is not considered a CEQA impact metric. The LTA included the analysis of AM and PM peak-hour traffic conditions for 16 signalized intersections in the Cities of San Jose and Santa Clara.

Trip Generation

After applying the ITE trip rates and appropriate trip reductions, it is estimated that the project would generate a total of 2,117 daily vehicle trips, with 197 trips (161 inbound and 36 outbound) occurring during the AM peak hour and 187 trips (30 inbound and 157 outbound) occurring during the PM peak hour.

Future Intersection Operation Conditions

The results of the intersection level of service analysis show that the added trips as a result of the project would not have an adverse effect on intersection operations at any of the study intersections under background plus project conditions and cumulative plus project conditions.

Recommended Site Access and On-Site Circulation Improvements

The following improvements are recommended to improve access to the project site and on-site circulation:

- Each of the site driveways that provide access to the site drive aisles and parking lots must be designed to meet the City's 32-foot minimum width.

Parking Supply

Vehicular Parking

The proposed 208,000 s.f. building will include up to 20,000 s.f. of supporting office space. According to the City of San Jose Zoning Code (Section 20.90.060), one off-street vehicle parking space per 350 s.f. of floor area is required for both R&D and light industrial uses while one off-street vehicle parking space per 250 s.f. of floor area is required for office use. According to the City's Zoning Code, "floor area" is defined as 85 percent of the "total gross floor area" (188,000 s.f. of industrial/R&D & 20,000 s.f. of office) which equates to 159,800 s.f. of industrial/R&D space and 17,000 s.f. of office space. Based on the City's parking requirements, the project is required to provide a total of 525 off-street parking spaces (457 parking spaces for the R&D and light industrial/manufacturing uses and 68 spaces for the office space). The proposed 280 vehicle parking spaces would be 245 spaces less than, or a reduction of 46.7 percent from the City's requirement of 525 parking spaces.

In accordance with Section 20.90.220 of the San Jose Code of Ordinances, which allows up to a 50% parking reduction, the 46.7 percent reduction in off-street parking could be allowed with the implementation and maintenance of a TDM plan. A separate TDM plan for the proposed project that meets the requirements set forth in the City's Zoning Code must be prepared and approved by the City of San Jose Planning Department to support a reduction in the required off-street parking.

Bicycle Parking

According to the City's Bicycle Parking Standards (Chapter 20.90, Table 20-190), the project is required to provide one bicycle parking space per 5,000 s.f. of floor area of manufacturing space and one bicycle parking space per 4,000 s.f. of floor area of office space.

Based on the City's bicycle parking requirements and the total gross floor areas as calculated above in the vehicle parking section, the project is required to provide 36 bicycle parking spaces. Of the required bicycle parking, City standards require that at least 80 percent be short-term bicycle spaces and at most 20 percent be secured long-term bicycle spaces. This equates to at least 29 short-term bicycle parking spaces and at most 7 long-term bicycle parking spaces.

The project proposes a total of 42 bicycle parking spaces, consisting of 6 long-term spaces and 36 short-term spaces located throughout the project site. Therefore, the proposed bicycle parking spaces will exceed the City's bicycle parking requirements and encourage the use of non-auto modes of travel and minimize the demand for on-site parking described above.

Pedestrian, Bicycle, and Transit Facilities

All new development projects in San Jose should encourage multi-modal travel, consistent with the goals of the City's General Plan. It is the goal of the General Plan that all development projects accommodate and encourage the use of non-automobile transportation modes to achieve San Jose's mobility goals and reduce vehicle trip generation and vehicle miles traveled. In addition, the adopted City Bike Master Plan establishes goals, policies, and actions to make bicycling a daily part of life in San Jose. The Master Plan includes designated bike lanes along all City streets, as well as on designated bike corridors. In order to further the goals of the City, pedestrian and bicycle facilities should be encouraged with new development projects.

Pedestrian and Bicycle Facilities

Pedestrian and bicycle facilities in the study area consist of sidewalks, crosswalks, pedestrian signals at signalized intersections, and bike lanes on Trimble Road and Orchard. The site plan shows sidewalks and pedestrian walkways along the eastern and western perimeters of the building. The sidewalks along the eastern building perimeter will connect to designated crosswalks through the parking lot and connect to existing sidewalks on Orchard Parkway and Trimble Road connecting to pedestrian facilities and destinations outside of the project site, including the LRT stations on First Street.

The bikeways within the vicinity of the project site would remain unchanged under project conditions. Currently, Trimble Road and Orchard Parkway have bike lanes that would provide connections to other bicycle facilities in the project vicinity. The San Jose Better Bike Plan 2025 and Envision 2040 General Plan, as described below, identify planned improvements to the bicycle network within the City and provide policies and goals that are intended to promote and encourage the use of multi-modal travel options and reduce the identified project impacts to the roadway system.

Public Transit/Pedestrian/Bike Improvements

The Trimble Road and Orchard Parkway intersection currently includes right-turn "pork-chop" channelization islands at each corner. The channelization islands allow for better traffic flow by separating right-turning traffic from other controlled approach traffic. However, the islands are not conducive to pedestrian flow at intersections that serve a large volume of pedestrians due to limited pedestrian waiting areas and conflict with vehicle traffic.

Recommendation: The City will require the project to remove the pork chop islands located at the southwest and southeast corners of the Orchard Parkway/Trimble Road intersection along with a signal modification and implementation of a protected intersection to accommodate Class-IV bikeways to improve pedestrian safety and access.

Recommendation: The City will require the project to construct four new curb ramps per the City of San Jose and ADA standards at the existing Trimble Road entrance.

The planned improvements discussed below are intended to provide for a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies. The San Jose Better Bike Plan 2025 indicates that a variety of bicycle facilities are planned in the study area, some of which would benefit the project and adhere to the goals of the Envision 2040 General Plan. Of the planned facilities, the following are relevant to the project.

Class I bike trails are planned for:

- Component Drive, between Guadalupe River Trail and Orchard Parkway

Class IV protected bike lanes are planned for:

- Trimble Road, along its entire length
- First Street, between Taylor Street and Alviso
- Orchard Parkway, along its entire length
- Component Drive, between Orchard Parkway and Zanker Road
- Zanker Road, along its entire length
- Plumeria Drive, along its entire length
- Bonaventura Drive, along its entire length

The project would not impede the implementation of the planned bicycle facilities. However, the full implementation of the above-listed improvements is beyond the means of the proposed project given that they may require right-of-way from adjacent properties and benefit multiple properties.

Recommendation: The project will be required to construct, or provide a monetary contribution for an in-lieu fee of \$144 per linear foot, Class IV 7-foot protected bike lanes along the project frontages on Trimble Road and Orchard Parkway per the City of San Jose Better Bike Plan 2025.

Transit Facilities

The VTA Green and Blue LRT lines operate along First Street in the project vicinity. The Bonaventura and Component LRT station platforms on First Street are located within walking distance, approximately 2,000 feet, east of the project site. The existing pedestrian and bicycle facilities described above will provide for and encourage the use of multi-modal travel options and reduce the use of single-occupant automobile travel.

With the convenient location of LRT stations, it can be assumed that some employees of the proposed project would utilize the existing transit services. Applying an estimated three percent transit mode share, which is a conservative estimate that could be expected for the project, equates to approximately six transit riders during the AM or PM peak hours. VTA operations reports indicate that the Green and Blue LRT lines as well as several other bus routes in the area currently serve less than ideal ridership. Therefore, the new riders due to the proposed project could be accommodated by the current available capacity of the bus service in the study area and improvement of the existing transit service would not be necessary with the project.

Approved Projects (350 Trimble)

Applicant/Owner/Project Name	Address/Location	Proposed Project Description
Lawson Lane	2200 Lawson Lane	613,800 s.f. of office space
City Place	5155 Stars and Stripes Drive	5.7 m.s.f. office; 1.1 m.s.f. retail; 1,360 mixed density residential units; 700 hotel rooms; 250 k.s.f. restaurant uses; 190 k.s.f. entertainment space
3000 Bowers	3000 Bowers Avenue	330,000 s.f. office buildings and parking structure
Great America Parkway	4301 Great America Parkway	12-story office buildings totaling 718,000 s.f. & (1) four-story parking garage on a developed property w/ (2) 300,000 s.f. existing office buildings
3375 Scott Office	3375 Scott Boulevard	237,104 s.f. office building, 4 story parking structure and 14,000 s.f. amenity building
San Tomas Business Park Phase II (NVIDIA)	2788 San Tomas Expressway	754,100 s.f. office
Scott Menard	3305 Kifer Road	45 attached townhomes and stacked flats with 109 parking spaces (Lawrence Station Area Plan)
Johnathon Fearn/Summerhill Homes	3505 Kifer Road	996 residential units with 37,000 s.f. retail (Lawrence Station Area Plan)
Westlake Urban/Gaye Quinn	3069 Lawrence Expressway	333 unit multi-family development (Lawrence Station Area Plan)
Summerhill	2961 Corvin Drive	38 townhomes (Lawrence Station Area Plan)
Allied Housing, Inc.	3335 Kifer Road	80 units affordable senior rental apartments (Lawrence Station Area Plan)
Boston Properties	3625 Peterson Way	672,000 s.f. of office space. Existing 260,000 s.f. building to be demolished.
Prometheus	575 Benton Way	Mixed-use residential development project consisting of 355 apartment units, and approx.
SCS Development	1375 El Camino Real	53 townhomes inclusive of 8 live work units
Summerhill	2232 El Camino Real	151 senior apartment homes, 17,909 s.f. commercial space
Raging Wire/NTT	1150 Walsh Avenue	248,000 s.f. data center
Holland Partner Group	2200 Calle De Luna	600 residential units
Related California	2300 Calle De Luna	575 multi-family dwelling units, 25,000 s.f. retail space
Ensemble Investments	5185 Lafayette St.	147 residential units and 3,650 s.f. retail space
Ensemble Investments	5123 Calle Del Sol	504 residential units and 23,170 s.f. retail space.
Ensemble Investments	2233 Calle Del Mundo	182 multi-family dwelling units
SummerHill Apartments Communities	2343 Calle Del Mundo	347 multi-family dwelling units
ZAEN Partners	2302 Calle Del Mundo	150 multi-family dwelling units with 5,000 s.f. retail
Ensemble Investments	2354 Calle Del Mundo	89 multi-family dwelling units
Freebird	2330 Monroe Street	65 residential affordable units
MEP1	2201 Laurelwood Road	737,093 s.f. data center
Jacobs	651 Walsh Avenue	435,050 s.f. data center
CyrusOne	2600 De La Cruz Boulevard	702,114 s.f. data center
Gateways Crossings	1205 Coleman Drive	1,600 residential units, 15,000 s.f. retail, and 225 room hotel
